Chapter 32
Mastering Change Management for Successful Digital Supply Chain Transformations

Ehap Sabri
KPMG LLP, USA & University of Texas at Dallas, USA

ABSTRACT

In response to the dramatic changes in the business landscape over the last few years, many companies are launching business transformations leveraging digital technologies to drive sweeping changes in their supply chain processes. The digital supply chain transformation can be evident establishing collaborative forecasting processes, optimizing networks and inventories, etc. Digital supply chain transformation is not a new buzz word. It is the application of digital capabilities to processes, products, and assets to improve supply chain efficiency, enhance customer value, manage risk, and achieve competitive advantage. However, organizations are still facing numerous challenges to transform and perform. Perhaps the most common misunderstanding is that digital transformation is all about the implementation and use of cutting-edge technologies. This chapter will dive deep to understand major challenges to digital supply chain transformations, identify the key drivers and enablers of digital opportunity, and provide a change management framework for digital supply chain transformation.

INTRODUCTION

In today's complex and ever-changing business world, firms of all types are rethinking every aspect of their supply chain performance. Firms are exploring new enablers like digital technologies to optimize and manage their supply chains; beginning with demand planning and order management reviewing the entire supply chain up to procurement and transportation.

In today's globalized world, firm's success is not just dependent on its own efforts. However, the success of an organization depends largely on how effectively it can orchestrate a vast, global network of supply chain partners to deliver goods and services that meet the needs of individual consumers. It's all about engaging with customers efficiently through new and improved customer experiences. Early

adopters of digital disrupters such as Amazon, Uber, Netflix have redefined the traditional business model and demonstrated how it's to be done. They focused on customers and not just provided exceptional, unique customer experience, but also engaged customers that keep coming back for more.

Digital Transformation is not restricted to the supply chain; it's everywhere. It's in the marketing, sales, products, Support, HR, Supply chain etc. It opens new opportunities, challenges traditional methods and changes the way we think and act. One of the key challenge faced in transforming a business is to train workforce new skills necessary to participate in the new way of doing business and to make the changes for digital transformation.

In all kinds of industries from the relatively slow-moving ones such as Utilities and Cement to the rapidly changing businesses of the High-Tech and Retail industries, efficient and agile supply chain processes have become critical in achieving competitive advantage. Companies can no longer view the supply chain as a back office and a transactional focused function. It is becoming extremely prevalent in that companies are not simply looking to drive cost out of their businesses, but also striving to be more agile in securing a supply chain that can quickly adapt to a rapidly changing market.

Taking the initiative to transform supply chain leveraging best practices and the latest digital technologies is no longer an option; it is a strategic mandate in order to stay relevant in the industry. Evidently, it is crucial to act rapidly and launch transformation activities. However, the industry's reality is that 70% of all transformation initiatives (programs) fail. The author has witnessed several firms struggle with implementing the transformation improvement programs and achieving the promised value or "Return on Investment" (ROI).

The low success rates of other transformation programs and the scary statistics make firms who are about to take the transformation journey to reconsider moving forward. These firms typically have doubts and questions about the best practice in integrating new digital technologies into supply chain operations. At times they even postpone their efforts until an expert is able to address their concerns. Firms seek how to:

- Master change management and ensure users' adoption
- Address the need for new skills to support processes that span across suppliers and partners
- Ensure continuous senior management support
- Identify comprehensive metrics and ensure continuous monitoring
- Choose the right digital technology and the right software provider

Based on relevant research and the author's professional experience, the main cause for the low success rates of business transformation initiatives can be grouped into two categories: 1) The lack of preparation and familiarity with the transformation lifecycle, and 2) People-related aspects that are poorly managed or altogether neglected. This chapter provides the top 7 challenges under each respective category and explains how to address these challenges during supply chain transformation programs. This chapter also provides a practical change management framework to ensure a smooth and successful digital supply chain transformation programs. This framework includes 8 steps (phases) needed to implement change in the culture of the organization and 5 success factors for companies to maintain throughout the lifecycle of change. These five factors can be used as a checklist to evaluate the readiness of the organization to change and its chances of a successful digital transformation.

Historic background on change management in the context of digital supply chain transformations is provided in the next section.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

BACKGROUND

Direct Correlation Between Change Management and Transformation

The complex, cross-functional nature of supply chains forces executives and managers to be more knowledgeable about the successful implementation of change. Greer and Ford (2009) conducted an extensive study on this topic and provided evidence in support of the differences between implementing non-supply chain management (NSCM) changes and supply chain management (SCM) changes, and a lower level of success was shown to be realized when implementing SCM changes than when implementing NSCM changes due to complexity. Therefore, the majority of supply chain leaders are keen to transform their organizations, but they recognize that their organizations lack the knowledge and readiness to do so successfully.

Nadler and Tushman (1989) mentioned that because broader change programs are often more difficult to implement, the degree of success realized from implementing SCM changes might differ as well. Their article provides a good insight into managing large-scale planned change.

Research shows the success rate of supply chain transformation has a direct correlation to the degree of mastering change management. Ford and Greer (2005) research has indicated relationships between various change management activities and change achievement or success.

In Prosci's 2009 benchmarking study (http://www.change-management.com/tutorial-case-mod3.htm), the top trend identified by study participants was a greater recognition of the need for mastering change management. The same study showed a direct correlation between struggled projects and lack of effective change management as shown in Table 1.

Table 1. Change management impact on meeting project objectives, staying on schedule and budget

Project Criteria for success	Poor Change Management	Effective Change Management
Correlation of excellent change management to **meeting project objectives**	16%	95%
Correlation of excellent change management practice to **staying on schedule**	16%	71%
Correlation of excellent change management practice to **staying on budget**	51%	82%

Source: Prosci's 2009 Change Management Benchmarking Report

The table shows a clear correlation between effective change management practice and meeting project objectives while staying on budget and according to the schedule. For example, of the participants that had effective change management programs in place, 95% met or exceeded objectives; while only 16% - or about 1 in 6 - of those with poor change management programs met or exceeded objectives. The Prosci's benchmarking studies over the last few years suggest that mastering change management increases the success rate of organizational changes to as high as 95%.

Therefore, mastering change management is very crucial for successful supply chain transformations.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Effective Change Management Practices

Effective change management practices embrace both the inner shift in the individual's values, aspirations and behaviors and the outer shift in process, strategy, policies, and systems (Karp 2005). So, effective change management practices target the organizational culture, organizational structure and recruiting, performance measurements, incentive compensations, and alignment with corporate goals and strategies.

Carolyn Aiken and Scott Keller (2009) have identified insights into how human nature gets in the way of successfully by applying the following four conditions required for behavioral change:

Creating a Compelling Story

What motivates senior leaders may not motivate most of the employees. Therefore change leaders need to be able to tell change story that covers what motivates employees the most in their work. In doing so, they can unleash a tremendous amount of drive. Secondly, Leaders should give an opportunity for employees to write their own story. It's detected in human nature that when we choose for ourselves, we are far more committed to the outcome. So, employees should be asked to suggest change rather than directly implementing change. Then this will help drive change that comes through a sense of ownership.

Role Modeling

It is a misconception that if we believe that if the leader is strong and influential then change will be successful irrespective of employees view. Carolyn and Scott (2009) has experienced that working with change program suggest that success depends less on how persuasive a few selected leaders are and more on how receptive the society is to the idea.

Reinforcing Mechanisms

Although it's difficult to establish a clear linkage between the successful change and money to be compensated, token of appreciation for the hard work of employees boost them to be more productive.

Capacity Building

Often change management initiatives require employees to develop the skills and talent needed for the desired change (new state of business). The important thing to understand here is that if employees are expected to play a new role with no proper training, they often feel neglected and lose belief. So, training is crucial and should include elements related to personality types, emotional intelligence, and another new process specific training.

Transformation Programs' Common Mistakes

Ramanan and Anil (2011) from Wipro Consulting Services believe that most of supply chain transformation fails because most companies tend to make common mistakes such as: Falling Into the "Leading Practices" Trap, where companies fails to understand its own supply chain situation in order to make the right choices and try to follow leading practices in market. They believe that companies will be more

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

successful if they rethink their supply chain in a way that is driven by how it supports their business strategy and meets customer requirements. They believe that if supply chain technology is deployed without incorporating critical business requirements and process redesign then it will be simply a collection of an automated system with routine supply chain issues.

Use of technology as an enabler is definitely important for effective supply chain but one needs to understand that technology can't fix the flawed supply chain design. Whenever processes are refined and new technology is implemented, organizational structure must be aligned to support these initiatives.

In the quest for growth, many companies implement change initiatives to create strong, differentiated and better customer experience. Leonard and Coltea (2013) believe that majority of failed transformation change initiatives didn't focus front-line managers on the exact actions they need to take to achieve the company's desired business outcomes.

In many companies, front-line employees receive dozens of high priority messages from managers, executives and change managers daily. These messages become conflicting to front-line managers to know what task or metrics should focus on during a given day to deliver service. So, in this situation, front-line managers are unclear about work to perform which ultimately affects the productivity of the company.

Leonard and Coltea (2013) highlighted also that implementing a successful change management initiative isn't a one-time thing. Creating lasting change requires companies to evolve, and those that evolve successfully can achieve stronger financial performance.

Mastering Change Management Framework

Sabri and Verma (2015) provided a detailed analysis of the most common transformation failures. They also suggested a practical and comprehensive framework to master change management addressing typical challenges and common mistakes in addition to leveraging best practices. This framework will be leveraged and enriched in this book chapter to support digital supply chain transformation.

The next section will explain the top 7 transformation challenges for supply chain transformations based on research, including the above ones, and the authors' experience.

TRANSFORMATION LIFE CYCLE CHALLENGES

"Where" and "When" to Start

When making these kinds of drastic changes, the biggest challenges are often to know when and where to begin in order to translate the vision into goals, goals into strategies and strategies into process changes and projects. Very few companies have a good digital supply chain strategy. Some reasons are: 1) The lack of resources and time, 2) The lack of familiarity with the strategy development process in general, 3) The lack of knowledge of the full opportunities that digital technologies can bring to supply chain processes, and 4) The difficulty of securing a consensus since digital supply chain strategy is an integrated cross-functional strategy and requires investment from resources and money standpoints.

The author has observed some companies try to take the easy route and avoid spending time on rethinking their supply chain in a way that is driven by how it supports their business strategy; meets customer needs, and deploys key enablers like digital technologies.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Environment Is Not Ready

The culture of "playing it safe" is the first challenge. Firms get used to executing low-risk incremental improvements on the same business environment for an extended period of time, and they become resistant for big ideas of significant improvement because they do not know how to handle transformation programs and target big results.

Specific related challenge, which is relevant to digital supply chain transformation, is the need for intensive cooperation and cross-functional collaboration among executive peers. This would force executives to get out of their comfort zones and their respective areas of responsibility and find time out of their busy daily operation schedule to envision an entirely new business.

In a consulting engagement for the author with a semiconductor company, and after conducting a risk analysis workshop with the respective managers and directors, the highest significant and probable risk for the transformation initiative came to be a definite commitment from executives to follow through and provide the needed support. There were 3 previous half-baked and half-hearted transformation initiatives in the past targeting the same supply chain processes, which undermined confidence that the current program will be treated differently (Sabri and Verma, 2015). When a company has a previous record of transformation failure, lack of strong vision, no visible commitment from above, and no clear articulation of why this program is different, then the result would be upsetting.

Also, McKinsey research (2009) showed that organizations that took the transformation journey for defensive reasons (to stem trouble) due to the difficult circumstances had lower success rates than the companies that took the journey for offensive reasons (like boosting growth or increasing market share). Extra care from the top is much needed when a transformation initiative is taken for defensive reasons, and more emphasis on people change management and sufficient resources are crucial.

Lack of Convincing "ROI"

Several companies struggled to find the best way to determine the business case and ROI (return on investment), and identify the right metrics that would capture and display the benefits in addition to defining "success" when it comes to business transformations. Therefore, they couldn't sustain the buy-in from executives.

Also, success and performance measures' targets have to be defined for the intermediate phases of the transformation in addition to the end state to sustain a high level of energy and focus. In one of the industry conferences, the author asked an audience of more than 80 managers to raise their hands if they are "OK" with their own performance measurement governance (metrics identification, measuring, tracking, and controlling), only 3 managers raised their hands! The widespread feeling among managers is that they are measuring too much or too little, or are measuring the wrong metrics. The majority also feel that their performance measurement governance doesn't drive good behavior.

Inability of Selecting "the Right" Software Provider

Selecting a software provider is a hard undertaking and consumes time and internal resources. Companies is not just struggling in identifying the right software provider (partner) for digital technology but they are still struggling with choosing the right supply chain planning technology platform. In addition, executives frequently express their concern about their companies' ability to ensure that the technology

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

is fully utilized once deployed. Supply chain applications especially the planning ones require a steep learning curve for most companies.

New Technology Is the "Silver Bullet" Perception

Some executives perceived the new technology to be the "silver bullet" to all of their business problems and forgot the fact that it is just an enabler for best practice processes and requires effective change management to be adopted.

When the transformation program is driven by a date given by IT instead of a value achieved the milestone, then it is a recipe for disaster. In an attempt to meet the target date (often unrealistic); training, documentation, and change management are often neglected, resulting in something that has a short life span (people stop it after some time) or that does not deliver the full benefit. These transformation programs might be able to "go live" from an IT standpoint but will not be well accepted or embraced by end users.

For transformation programs to work, an amalgamation has to happen between process changes, new technology capabilities, people readiness with the required new skills, and organization structure alignment changes.

No Clear Priorities for Day-to-Day Operations

Typically, the day-to-day operation is already at full capacity when the executives call for a transformation program. Some companies try to add transformation activities to the preexisting calendar of "run the business" meetings, but it doesn't work because short-term operational issues typically come first. People are in most cases occupied more than 100% of their capacity. This affects the productivity of transformation activities since people find it difficult to prioritize their activities. Sometimes due to unavailability of the right person for transformation activity because of their preoccupancy with another day to day jobs, a substitute is chosen who may not be fully aware of the desired transformation activity and hence overall productivity is affected.

Also, when companies are in the process of implementing several incremental improvement projects like six sigma or Kaizen projects, it will be a challenge to add a transformation program to the mix targeting the same functions. Companies that try to stuff too much into the organization will clog it causing employees and managers' capacity to execute to become a choke point unless the programs are prioritized and sequenced correctly.

Lack of Proven Transformation Methodology

Not having a proven, comprehensive and practical methodology to show the way in the transformation journey makes it impossible to address any of the above challenges. To be successful, the transformation team will require having not only knowledge and skills in organizational design and change management, but also a comprehensive methodology for planning, implementing, and sustaining the transformation changes (Sabri and Verma, 2015). There are at least three common methodology mistakes:

1. Some companies put more emphasis on IT activities compared to change management activities. They rush things and focus only on IT activities that they have to accomplish and cannot shorten.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. The author has also witnessed the other extreme, where companies spent a huge amount of time on the planning phase, little time on implementing the change, and no time on sustaining it.
3. Other companies put significant emphasis on the transformations' soft factors, such as culture, leadership, and motivation while missing out on the hard factors of change management like financial results, commitment level of executives, the resources required to execute the program, and program roadmap and duration.

The following real-life story would provide examples for some of the challenges mentioned in this section. A few years back, the author was asked to play the executive process advisory role for a global high-tech company. Their largest end-to-end supply chain transformation program was underway. The program included process improvement and technology implementation to the following processes: Sales and Operation Planning (S&OP), Demand Management, Supply Planning, Order Planning, Inventory Planning, Order Fulfillment, Logistics, and Channel Management. The author joined 18 months after the program started. In the first phase of his engagement, he spent two weeks on site conducting his own assessment and came to a conclusion that the transformation is at risk and immediate corrective action is desperately needed. Here are a few of the findings:

First, the company is taking the transformation journey for defensive reasons; they were losing market share to competition, their margin was getting smaller and smaller, and they wanted to reverse the trend. Everyone in the company was fearful for his or her job.

Secondly, the author uncovered that the employees did not understand why the business must change and their own role in making it happen, so before providing any specific recommendations, the author wanted to investigate this further to find out why there was a lack of communication and articulation of the need for change to employees. He started by asking for the business case and to his surprise, the sponsor didn't have it handy. During the meeting with the finance representative on the program regarding the business case, the author discovered that the major cost-saving element was "laying off" employees! This was the main reason why the company didn't want to give enough clarity to employees about the program.

Thirdly, all program tracks were working in silos with little coordination. There was no master project plan covering the overall program progress and dependency. The author had to attend the project status meetings for all tracks to have a good picture about the status of the program. It was easy to notice the mistrust that every team had regarding the other teams' ability to deliver on time. In addition, around the same time, the blame game had just started.

Fourthly, the author investigated the transformation program structure, and he found out that 9 different tracks were identified to execute the program; like program management, process, technology, data, testing, suppliers, and change management track. The role for the author was under the process track. The shocker was that appropriate expertise was identified for all tracks except for change management track, it was "TBD"! Basically, a major transformation program was underway for defensive reasons, a layoff is one of the outputs of the program, the culture of the company to work in silos, the company has not done this type/scale of transformation before, and yet no one is assigned for change management!

Fifthly, there was no clear and structured transformation methodology. The transformation team took 18 months to identify the business requirements and socialize it with the IT organization. And since the duration of the first phase of the transformation program was two years; everyone was under pressure to implement, go-live, and transition in the remaining 6 months. Senior management from the business organization decided to take the IT date to "go-live" as the date they would communicate to their execu-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tives. They thought that IT will be the bottleneck and assumed that all other activities like designing the new (to-be) process, coming up with new policies, developing training manuals, conducting training sessions, defining roles and responsibilities for the new processes, defining new metrics and reports to support the new processes, and overcoming resistance issues will not be the bottleneck and will fall within the IT timeline!

Finally, there were no supply chain strategies defined. The transformation team came up with all the business requirements without considering the new strategies that they have to adopt to address their challenges and reverse the trend of losing market share.

It took this company several months and several drastic adjustments to clean this mess and start going in the right direction. Unfortunately, several senior managers and executives lost their jobs because they were slow to react.

The challenges of supply chain transformation related to people are explained in the next section.

PEOPLE CHANGE MANAGEMENT CHALLENGES

This section will cover the top 7 people change management challenges based on the authors' experience and relevant research.

Executives Are Slow to Come Aboard

Not having all executives on the same page early on is one of the first challenges that the change agent has to address. It is highly recommended, for this purpose, to schedule a 15-minute one-on-one meeting with all executives in the first week of the engagement. This practice is used by the author and it was very effective in highlighting the disconnect and identifying the root cause behind it, which would make it easier to address it and bring all executives on board to support the transformation program.

Reluctant executives to support the transformation program visibly will disrupt the speed of the company's progress in planning effectively and undermine transformation significantly. Even the best-planned supply chain transformation initiative would fail if top management fails to demonstrate a commitment to creating the sense of urgency necessary to overcome resistance to change. Executives' support is key to set proper expectations for their employees.

Keeping Stakeholders Engaged and Motivated

Stakeholders are the employees and managers who will be impacted by the process changes or will play a role and have an impact on the success of the transformation program. In a nutshell, the stakeholders are the people who will make the transformation happen. Disengaged stakeholders can really slow down progress and can be a reason by itself for transformation failure.

Many firms underestimate this challenge which results in catastrophic implications because no matter how sophisticated and powerful the software applications or digital technologies are and how effective best practices processes may be, in the end, it is the stakeholders who play the most significant role in the success or failure of the program. Supply chain stakeholders represent different organizations and different roles (operators, managers, planners, suppliers, customers, warehouse receivers, carriers, etc.) which add another dimension to the challenge.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Lack of Organizational Structure Alignment

It is necessary to look at the structural support for the change transformation program. If the foundation structure is deemed to be inadequate, restructuring becomes critical. Restructuring changes range in degree from minor adjustments to large-scale organization-wide changes that affect virtually every member of the organization.

One of the author's organizational change management engagements was to help a tire manufacturing company become a global supply chain organization and to streamline and standardize their processes. One of the deliverables was to recommend a structure for the global supply chain organization and the related roles and responsibilities. Assigning an executive vice president reporting to CEO and leading a centralized and global supply chain organization was one of the recommendations. Unfortunately, the sponsor did not have enough political clout with the CEO to make it happen before starting the design phase. This was one of the main reasons that the transformation program ran into serious delays in the program and severe change management and ownership issues.

Gartner research (July 2012) captured several organizational alignment challenges: the top two are: 1) determining the optimal level of centralized leadership, and 2) finding and cultivating capable planning talent.

Inability to Build the Right Transformation Team

Building the right transformation team is the most important change management activity in a business transformation program. In the process of building the team, senior management must be sensitive to the unique needs of the program environment. For example, it requires training and experience for the transformation team members to identify resistance and find its root causes, then, come up with strategies to handle and overcome resistance.

Building the right (effective) team optimizes the efforts of the team and increases the chances of having a successful program. On the other hand, a weak team structure would undercut the efforts of hard-working team members, reduce moral, and impede project success.

Lack of Effective Communication Plan

Most of the time when people resist change it is not because they are unwilling to change, it's just because they don't know why. Effective communications within the transformation team and between the team and other program stakeholders are essential for a smooth and successful journey.

It's a common misconception that if people are talking to each other it means they are communicating; communication needs to have a framework and format to be effective. Another common pitfall is that one communication plan template fits all programs or projects. While all programs or projects share the need for a communication plan, they differ in the type of information needed, frequency, and methods of communication (Sabri, Gupta, and Beitler, 2006).

Inability to Sustain On-Going Learning and Coaching

Supply Chain transformation programs require extensive and on-going training especially when it includes digital technologies and new skills and attitudes for the users of the new or improved processes.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The proper allocation and commitment of resources (time, energy, and money) to conduct training and coaching to help employees in their skills acquisition is critical to the success of implementing and sustaining changes.

Although the "sustain" phase is the most difficult phase in any transformation program, there is relatively little attention by executives concerning sustaining change in organizations. While planning and implementing a change can occur relatively quickly, sustaining change involves a long period of time. Maintaining a sense of urgency and a significant level of interest is difficult over a long period of time. This phase can take months and sometimes a few years. Therefore, the author typically suggests a separate budget for this phase to bring attention to it.

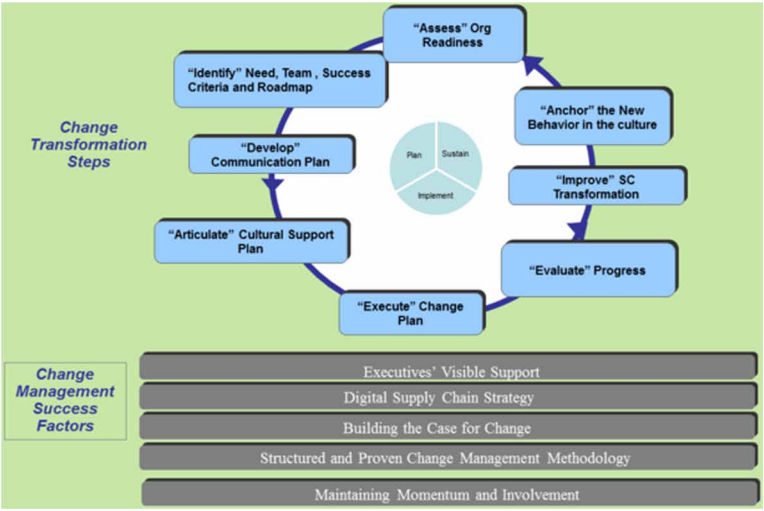
During this phase, the new process must be reinforced by the policies for recruiting, selecting, promoting, compensating, evaluating, and on-going training of employees. Also, acknowledging and rewarding stakeholders for new behaviors are essential to stabilize the new process and anchor the new culture.

Lack of Comprehensive Incentive Program

While the Communication plan addresses the "why" question by providing the "awareness" about the importance of change and the risks of not changing for the company, the incentive plan addresses the "what's in it for me" question and creates the "desire" to change. Only when managers and employees have the "awareness" of the need to change and the "desire" to support the change, then learning "how" to change can start.

Unfortunately, the lack of comprehensive incentive programs is an issue in almost every transformation program that the first author has audited. In some companies, they make the incentive programs limited to managers and executives and don't include the employees. In other companies, incentive programs are in place, but not aligned to support the desired behavior and new process. Very few companies go the extra mile to come up with an incentive program for every member of the transformation team and stakeholders who are responsible to plan and implement change.

The rule of thumb that every stakeholder, which their processes will be impacted by the change or who will have an impact on the transformation, should be part of the incentive program. Also, the objectives of the transformation should be reflected in the stakeholders' scorecards and aligned with their incentives. Therefore, the company's human resources (HR) department should be involved early on.



COMPREHENSIVE FRAMEWORK FOR MASTERING CHANGE MANAGEMENT

Figure 1 provides a comprehensive framework for mastering change management to ensure a smooth and successful digital supply chain transformation programs, and address the above challenges. This framework includes 8 steps (phases) needed to implement change in the culture of the organization and 5 success factors for companies to maintain throughout the lifecycle of change.

What follows are the required steps to be taken during the life cycle of change transformation and success factors for effective change management (as shown in Figure 1). Using these steps as a systematic and comprehensive framework, executives and managers can understand what to expect and how to engage the entire organization in the process.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Digital supply chain change management framework

Eight Change Transformation Steps

The proposed framework proposed suggests eight steps to go thru the life cycle of change transformation effectively as shown in Figure 1 which are summarized as follows: 1) Assess, 2) Identify, 3) Develop, 4) Articulate, 5) Execute, 6) Evaluate, 7) Improve, and 8) Anchor. These steps can be also grouped under 3 phases:

- **Plan phase** which includes steps 1 to 4
- **Implement phase** which includes steps 5 & 6
- **Sustain phase** which includes steps 7 & 8

Let's understand about every step in more details:

Step 1: "Assess" Organization Readiness

Organization Readiness for change gives an idea about the current state of the organization with respect to the desired position after the change. So the first activity in assessing organizational readiness is to identify the anticipated and desired change (end state). To clearly define the desired change, start off with program description which an organization is considering for change. This will help assure whether stakeholders have the same vision. Then next activity is to assess the alignment of the proposed change project with the organization's current vision, mission, and strategic plan.

A SWOT Analysis is a beneficial exercise in assessing organizational readiness for implementing a new program. SWOT identifies an organization's strengths and weaknesses and may identify any areas that need a change in order to move forward. It identifies opportunities which can contribute towards success and also identifies threats which may be barriers in the process.

Another major activity for this step is evaluating the existence of the five success factors for mastering change management: 1) executives' engagement and visible support, 2) commitment to developing end-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to-end SC strategy, 3) the ability to develop a convincing business case, 4) deciding on change management methodology, and 5) the ability and previous record in maintaining the engagement & involvement of all stakeholders. This evaluation can be accomplished by scheduling one-on-one interviews, group meetings, questionnaire, and reviewing documentations.

Step 2: "Identify" Need, Team, Success Criteria, and Roadmap

Once the problem statement is defined, stakeholders are identified, the scope of supply chain transformation is fixed and aligned with organizational goals then there is a need to articulate clearly the need for change. This activity is crucial to answering the question that everyone in the organization across all levels will have "why we need to change". It provides the "elevator pitch" or the key message that will be communicated to provide awareness. One example of a key message from a Manufacturing company is "we need to transform our supply chain to penetrate new market channels while maintaining low inventory levels and gain a competitive advantage in order to increase market share profitably" (Sabri, 2015). This activity is also important to secure the buy-in from the upper management who typically ask for an explanation of how the change helps in implementing the organization's strategic plan and achieving corporate goals.

Building the right (effective) team optimizes the efforts of the team and increases the chances of having a successful program. One of the biggest challenges of building and developing a transformation team for supply chain improvement programs in today's business is that every transformation program has its own nature and resources requirements. The senior management and sponsor must be sensitive to the unique needs of the program environment. Also, the structure of the organization plays also a big role in selecting and building the transformation team. There is a need to document the required skills for every role (functional consultant, change agent, process consultant, developer, architect, program manager, project manager, etc...) based on the program charter document. This includes also determining the number of resources needed for every role. In addition, establishing a process to evaluate the performance of resources and define an incentive plan to keep them motivated is crucial (Sabri and Shaikh, 2010).

This activity should consider "why we are changing" key message to come up with the success criteria which typically provides some guidance on the expected benefits and how to measure success. A success criteria example for a company trying to improve market share by gaining competitive advantage in customer service would be; 1) improve customer service level by 10%, 2) improve market share by 2% next year, 3) and maintain inventory turnover rate.

This activity is needed to identify the required process, technology and governance (KPIs, policies, roles, and responsibilities. etc.) changes and finalizes the implementation timeline to achieve the expected benefits (success criteria) of the transformation program. This activity includes conducting process analysis for supply chain processes based on the transformation scope. Process analysis determines the extent of process & governance changes and identifies additional software capabilities required to support the "end state" processes. Several industry-proven process analysis methodologies can help in this exercise like six sigma, value stream mapping, benchmarking, etc.

Step 3: "Develop" Communication Plan

Communications should have majorly two focus areas: communications about the program (why and how we are changing), and communications about the end state and solution being delivered. This includes

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

communication with stakeholders, team members, support team members, functional group members and, front-end users (both inside and outside the company).

Communications about the project to stakeholders is very important for the success of supply chain transformation programs. Lack of information about the project progress to stakeholders can be threatening to the program. Regular, targeted communication enables stakeholders to be educated, prepared and confident that the project is supporting their business needs. The mode and interval of communication should be clearly defined and shared with stakeholders. Program communication should be based on facts and figures. Showing progress helps to maintain confidence among stakeholders, instill pride in program members, and continue program energy. Program communication includes setting expectations, creating awareness of the desired solution, organizational changes, concerns, success. This communication should flow across all the stakeholders not only within the organization but also to vendors, suppliers, and customers etc. Many organizations underestimate the value of this part of the communication but awareness of solution to suppliers and customer helps them to prepare and understand their role and if required also help them plan their resources in advance.

Effective communication provides a clear understanding of what is taking place, motivates the team members, avoids any miscommunication between transformation team members, keeps senior executives committed, reduces the risk of conflicts, and more importantly keeps everyone informed on the progress.

The communication plan should be comprehensive enough to satisfy the information needs of all of the stakeholders. It should provide a description of what piece of information is needed, who needs it, why it is needed, when it is needed, how it is communicated, and by whom. In addition, the communication plan identifies meetings, reporting, methods and format of communications that will occur with the transformation team, program sponsor, stakeholders, partners, IT, internal and external organizations.

Step 4: "Articulate" Cultural Support Plan

Once the communication plan is established, it's necessary to articulate a culture support plan which includes the education plan and organization structure realignment activities. Any transformation program requires culture support. Organizational culture by its very nature refuses to accept change, but over time and with education, organization structure realignment, enforcement from executives, culture does change.

Leadership development is essential if some of the individuals who will be responsible for the program who have little or no leadership experience. The education plan should be tailored to help the individuals acquire these skills. Conflict resolution is one example of the soft skills that leaders need to master if the transformation program is to be effectively implemented and sustained.

Training and skills acquisition for end users should be part of the education plan as well. Digital supply chain transformation programs require training, new skills, and attitudes for the end users of the new or improved processes. The proper allocation and commitment of resources (time, energy, and money) to conduct training and help employees in their skills acquisition is critical to the success of changes.

On major activity of this step is to plan for organizational realignment to support the end state. Human resources department might need to update job descriptions and bonus structure to reflect the changes. This might require a pipeline of candidates with a mix of demand, supply and product expertise. Also, incentives for the company's talent should be aligned with the skill requirements for the end state.

Change leaders and agents (part of the transformation team) must anticipate resistance and be prepared to deal with various change adoption rates. It is important to focus on pioneers and early adopters

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

first. These individuals who are a subset of the stakeholders group are the most open to change; they are the first to embrace something new. Therefore, it is recommended to get these stakeholders on board as quickly as possible to help in changing the culture.

Step 5: "Execute" Change Plan

Once the change plan (which includes change implementation roadmap, communication plan, education plan, and organization structure alignment changes) is approved by senior management/executives, then transformation team has the green signal to go ahead and execute the plan.

Supply chain transformation program typically takes two to five years, with several intermediate projects (Go-Lives) that can pay for the rest of the program. Therefore, it is recommended to develop the change plan on the idea of incremental value delivery. It is crucial to have long-term (program) plan for success, but one should not ignore the importance of providing some quick wins (projects). Organizational stakeholders look for short-term results, and transformation team is under pressure to present short-term wins. Short-term wins should be woven into the timetable of the program. Each project delivers a set of capabilities that have a positive impact on process, metrics, and people and addresses a distinct business need and contributes to the success criteria.

Step 6: "Evaluate" Progress

In the transformation program, regular evaluation (health check) helps to understand the current progress status and also helps anticipate the future progress trend. It is critical that the transformation team understand the current progress and take key actions to avoid any unwanted delays. The prompt and proactive actions of the transformation team can save the transformation program from going off-track. If the program is delayed and the team is not able to bring back on track, then most of the time it goes off the radars of high-level executives' dashboard and eventually importance is lost and the program fails. Progress evaluation should be done against the schedule and expected benefits (success criteria). Since the implementation delivery strategy is to accomplish it in incremental steps (projects), the achieved value of the projects need be tracked and checked off with time.

It is acceptable for the program manager and sponsors while tracking the transformation progress toward achieving the expected benefits and reaching the new targets of the KPIs to rethink the goal and even adjust the targets either because of encountering roadblocks or because of some emerging opportunities that didn't exist earlier.

This step requires senior management's best efforts to stay engaged to build momentum for the change. Whenever executives or senior management let up before the job is done, critical momentum can be lost and the change effort can stall.

Step 7: "Improve" Supply Chain Transformation

Although the sustaining phase is the most difficult phase in any transformation, there is relatively little research concerning sustaining change in organizations. While planning and implementing a change can occur relatively quickly, sustaining change requires a significant amount of time. Maintaining a sense of urgency and a significant level of interest is difficult over a long period of time. This phase can take months or years.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Once positive a successful project improvement (short-term win) is accomplished, management must work to make it part of the organizational culture. Step # 7 helps in this aspect by encouraging the culture of continuous improvement and fine-tuning the new solution (combination of new process and technology). Improvement can also be achieved by enforcing the new process through drafting policies, providing additional coaching when needed and recruiting people based on the new required skills. In addition, developing corrective actions for the root causes when performance measure targets are not achieved would achieve incremental improvement.

Step 8: "Anchor" the New Behavior in the Culture

Acknowledging and rewarding stakeholders for new behaviors are essential to stabilize the new process and anchor the new culture. Because using new skills involves risk (the risk of failure), and acknowledging and rewarding those who use the new skills encourages others to do the same.

This step is also responsible for updating performance measures to reflect the process or the new performance baselines, by coming up with new performance measures, modifying existing ones, modifying targets or establishing owners to the performance measures.

Five Change Management Success Factors

Success Factor 1: Executives' Visible Support

Since change is difficult and inherently unsettling, stakeholders will turn to the CEOs and executives for direction and answers. The leaders of the organization must embrace change first and then display their commitment and support. They must speak with one voice and model the desired behaviors especially since supply chain transformations require intensive cooperation and cross-functional collaboration among executive peers. This would force executives to get out of their comfort zones and their respective areas of responsibility and find time out of their busy daily operation schedule to envision an entirely new business.

While there are many reasons for the failure of the transformation initiatives, but lack of executive's commitment is ahead of all the reasons. Interestingly enough, many executives don't know there is a direct correlation between leadership engagement levels and the success of a transformation initiative.

Having a broad picture about change in mind, executives would need dashboards and indicators in order to successfully pilot an organization to the desired destination. Actively executives will build planned benefits/results into their own and the leadership team's performance plans. They will initiate project-relevant communications in direct report meetings on a regular basis, visibly hold the organization's leaders accountable for the change and if required will ask frequently for their direct participation. They also engage in communication events at all levels of the organization, try to resolve resource issues or constraints, understand the implications of the change across the organization's groups and demographic groups, also monitors, identify and address organizational resistance.

Another important aspect regarding the leadership of change is to understand the level of effort required for success. The executive's role and importance continue to increase over the life of the project. At times while leading change the change leaders will have to let go some of their functional responsibility and tasks as their efforts become more critical than the roles of the program team. Towards the end of the change cycle, efforts from transition team are maximum because of sustain phase of change cycle.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Everything done up to implementation phase can fall apart if leader's proper attention and commitment are not there in the last phase of the change process.

Success Factor 2: Digital Supply Chain Strategy

Very few companies have a good and documented supply chain strategy. Executives struggle with assessing the current state of the supply chain and envisioning the new state that is required to support the vision and address current challenges, from digital technologies and processes to human resources and governance. They also struggle to decide when and where to begin and how to translate the vision into goals, goals into strategies and strategies into process changes and projects. Serious considerations should be given to following while developing strategy.

There is a growing trend to assign a Chief Digital Office role to responsible for defining and executing the digital use cases. This role would work closely with the head of supply chain on the digital supply chain strategy.

- **Market changes** - Strategies often fail because the market conditions which were intended to be exploited change before the strategy takes hold. Reasons can be shorter product life cycle, competition with new technology, and unexpected change in the financial market etc.
- **Uniqueness of the strategy** - Good strategy is one which can distinguish the company from others in ways that it makes a difference to customers. Michael Porter (1996) has written extensively and persuasively on this topic. So leaders should take three simple steps in developing a distinctive strategy – understand the company's genuine strengths (particularly those that span multiple functions), examine the marketplace to understand what market positions are unoccupied, focus the company's strategies on bringing its variable strengths to bear in capturing those unoccupied strategic positions. Also, the strategy must consider the potential reaction to a strategy by competitive companies. In order to effectively anticipate the reaction of competitors over strategy, a company should have competitive intelligence capability. The study should involve understanding the competitor's market position, their competitive advantages, and disadvantages, future planning, management decision trends etc.
- **Organizational design, capabilities and business models with the strategy** – Sometimes companies' fail to align their digital supply chain strategy with the organizational goal. This is a critical step which is often overlooked. A basic assessment of organizational capabilities and the capability gaps created by a change in strategy is a very direct means of improving alignment. Also, some strategies fail because they are based on the poorly conceived business model. Lack of research of market trend, miss connecting to customers, gap or misunderstanding of how demand would be met in the market can lead to a poor business model.
- **Culture of "playing it Safe"** – Companies get used to executing low-risk incremental improvements on the same business environment for an extended period of time, and they become close-minded for drastic improvements because they do not know how to handle transformation programs and target big results. The scope can be overwhelming.

When companies are in the process of implementing several incremental improvement projects like Six Sigma or Kaizen projects, it will be a challenge to add a large transformation program to the mix especially when it includes new technology like digital technologies. Companies that try to stuff too

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

much into the organization will clog it causing employees and managers' capacity to become a choke point unless the projects are prioritized and sequenced correctly.

Digital Supply Chain Strategy Ideally Includes

1. Flexible strategy as changes occur in the global marketplace,
2. Prioritized, actionable and practical improvement plans,
3. A three-to-five year roadmap that guides the transformation of supply-and-demand capabilities and takes planning processes to the next level,
4. Linkage to one or more corporate goals like growth or customer service levels,
5. Both large opportunities for improvement that deliver significant ROI over time, as well as "quick win" operations improvements with a fast payback,
6. Elimination to outdated roles and responsibilities, unnecessary activities, and performance metrics that no longer reflect current realities, and
7. Metrics across the supply chain to reflect the overarching digital supply chain strategy.

Success Factor 3: Building the Case for Change

The author believes strongly, in coming years, no better core competency will help companies to compete in the market other than the ability to effectively implement transformation change. With increasing pressure both external and internal, organizations will tend to undertake more projects and initiatives to remain competitive in the market. So the ability to achieve profit and benefits will directly be tied to how effectively we manage change by engaging employees. Building the business case for change is crucial to compel leadership to give the go-ahead for the transformation change program.

Developing a good business case for change is very important where every stakeholder's requirement is taken into consideration. Three steps should be followed in developing the case: First, articulate a convincing need for change based on the company's current situation and market opportunities. Here supporting details have to be strong enough to draw the attention of executives. The change case should be directly linked to the organizational goals, as this helps in grabbing the attention of stakeholders.

Second, quantify the expected operational and financial benefits, estimate cost, and calculate the return on investment (ROI). This can be a challenging step sometimes because when the case is in initial stage one has to come up with expected financial benefit and return on investment close to actual. If the exercise is done with detailed consideration then the case becomes very convincing and can grab the attention of executives based on the extent of research that went through developing the case.

Third, explain how to show progress and measure success, which metrics will be improved to achieve the expected benefits, what will be the new performance targets and deadlines, and who will accountable. If this step is not developed well then whole change process efforts can fail. As a part of developing the case, equal consideration should also be given in developing performance measurement governance to track progress (Sabri, 2015).

As mentioned earlier, when 80-plus member audience were asked to raise their hands if they are "OK" with their own performance measurement governance only three managers raised their hands. The root causes of these challenges can be summarized under four categories:

- The difficulty in identifying the metrics that would yield the most information on success

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Difficulty in identifying root causes when metrics targets are not achieved
- Lack of clear ownership and responsibilities
- Lack of consistently clean data

During business case development if consideration is given on identifying the key performance measures then while executing change program these performance indicators (measures) becomes more refined and can give accurate information on success. These measures should be able also to measure the additional improvement in efficiency and effectiveness of leveraging digital technologies.

Success Factor 4: Structured and Proven Change Management Methodology

Ensuring a structured and proven methodology to show the way in the change transformation journey is a must. Any significant supply chain transformation program creates uncertainty and people resistance. New leaders emerge, job descriptions are changed, new skills and capabilities must be developed for the digital age. Dealing with these change management issues on a reactive, case-by-case basis puts timeline, morale, and results all at risk.

A structured and formal plan for managing change—beginning with the transformation team and then engaging key stakeholders and leaders—should be developed early and executed effectively as changes move through the organization. The plan should be comprehensive to cover planning, implementing, and sustaining the transformation changes. It should also allow enough time for covering the soft factors of change management such as culture, leadership, and motivation because it takes time to change attitudes or relationships which are deeply ingrained in people as well as the organization. It requires time and efforts to change the culture.

In addition, the structured change plan should not miss out on the hard factors of change management like financial results, commitment level of executives, the number of resources and skills required to execute the program successfully, benchmarking and gap analysis, and program roadmap and duration which are vital for the success of the transformation program.

Success Factor 5: Maintaining Energy and Involvement

As transformation programs progress from defining strategy and setting targets to design and implementation, they affect different organizational levels and stakeholders. Disengaged stakeholders can really slow down progress and can cause by itself for transformation failure. Setting right KPIs & tracking, performance measurement and, award & recognition have the most significant impact in sustaining organizational improvement.

- **Right KPIs & tracking:** In order to maintain the momentum and involvement of people in change programs, it's important to develop and measure right performance tracking metrics. For example, as part of change initiatives a company adopts a new pricing strategy to obtain high margins. Measuring volume of sales was chosen to tracking the progress. But if were observe deeply we find that measuring volume encourages discounts, rebates, and warranties, all of which erode margins. So it becomes very important to measure the right things in order to create the right change (Sabri, 2015).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Performance measurement and support mechanism**: When an organization is going through change then management's fostering of organizational trust, respect and caring pays off. Mistakes and unwanted things will occur in the change process but at that time benefit of the doubt and continuing support to employees helps build trust. Having a structured performance system also pays off. Communicate goals and performance targets to employees upfront and let them know about the expected behavior and importance of the change with respect to the employee (what's in it for them) and organization is crucial.

It is important to provide resources, key materials, training and enable tools for employees to achieve target performance. This proactive activity helps build positive energy among employees which signifies support of senior management in change implementation phase. Evaluating the performance of employees based on their target whether not achieved or exceeded, and providing feedback is a critical activity. Performance feedback activity should be motivating, encouraging including performance compensation to maximize the target performance. If employees are in sync and excited about the change initiatives they will give their maximum to achieve the target.

- **Award & recognition**: This is closely related to above two and refers how positive attitude and work gets rewarded. It's been observed that reward may not be exact compensation to the amount of effort put by employees but even a small token of appreciation encourages employees to such an extent that they may be able to boost their level of effort. So, highly visible incentives, such as promotion, bonuses, and recognition should be provided as reinforcements to maintain energy and sustain change.

To summarize, stakeholders should understand why change is happening, how their work will change, what is expected of them during and after the transformation program, how they will be measured, and what benefits success will bring to them personally. Transformation team leaders should be addressing all of these questions explicitly and keep stakeholders involved in the process and informed to maintain momentum throughout the organization.

The key driver for this success factor is the transformation team. Building and empowering an effective transformation team is very crucial to maintaining excitement and eventually embracing change. In building the transformation team, executives must be sensitive to the unique needs of the program environment and ensure that the team is having the right skills like identifying resistance root causes and coming up with strategies to overcome resistance. The team should also try to avoid resistance in the first place by being proactive and mitigate the risk ahead of time (Sabri, 2013).

CONCLUSION

Success of digital supply chain transformation depends majorly on mastering the change management throughout the life cycle of the change program. To be successful in the journey, the change leaders have to be more knowledgeable about the change lifecycle since digital supply chain transformations are complex and multifunctional in nature. For an effective supply chain, one must undergo a regular change in order to respond to the ever-changing operating environment.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

For effective change management, it is very important to have strong support from executives throughout the transformation cycle. Attacking change management with Digital Supply Chain Strategy and proven change management methodology makes transformation change cycle smooth. In order to sustain change management outcome, it is necessary to maintain energy and assurance of everyone's involvement.

When firms make the decision to implement digital supply chain management transformation programs which typically includes process improvement, software implementation, and organizational realignment across their global operations, there is a strong influence of cultural component to this program. The changes include in the way work gets done every day, in individual roles and responsibilities, and in key performance indicators (KPIs).

A proven and well-defined change management framework for digital supply chain transformation can help companies overcome the culture of "this is the way we've always done it" and get employees at every level on board with the transformation plan — and achieve the expected benefits from improving supply chain performance. It will also help in accelerating the pace of change and achieve the success criteria quicker.

Every digital supply chain transformation program is unique because every firm has its own culture, industry challenges, organizational structure and skills, process maturity, and performance. However, the proposed framework in this chapter is a comprehensive one that addresses all common challenges in implementing digital supply chain transformation programs and a practical one which provides executives and managers a good roadmap on what to expect and how to engage the entire organization in the process. This would ensure a successful and smooth supply chain transformation journey.

FUTURE TRENDS

Mastering change management is critical for the success of Digital SC Transformation. Importance of change management as a separate department within an organization is increasing. Development of structured approach and a formal process is a concern for many industries as the still failure rate of transformation programs is high. Several initiatives around the industry are under progress to develop the effective and efficient methodology on how to adopt a change in the organization. There is a demand to integrate change management throughout all levels of the organizational system. Leaders have to link organizations goals to functional level department goals to personal level individual goals. With the advent of increase in transformation initiatives, there is great demand for integration of project management methodology with change management cycle.

The author predicts more serious attention and enough allocated budget for change management track for transformation programs. This will be translated into higher industry success rate. This will have an impact on academia in two aspects: 1) more research and case studies will be available in this area, and 2) witnessing the introduction of change management as a separate MBA program in the universities.

Chapter 33
An Analysis of Web-based Document Management and Communication Tools Usage Among Project Managers

ABSTRACT

The article analyzes modern cloud document management systems and communication tools from the viewpoint of a EU project managers, who lead multidisciplinary, multilingual and international teams. It also explores the types of users who use these tools as well as the motivation factors guiding their choices. The research includes observation within the project group, interviews and semi-structured surveys among 40 EU project managers, who have managed 244 EU projects. The main finding is that a lot of project managers still don't use shared, cloud document system. The biggest obstacle to more efficient usage of existing systems is their un-friendliness, security concerns and lack of skills. Meetings are still perceived as the most efficient channel for distributing and receiving project tasks, but they are closely followed by communication software. Applying the authors' findings to the project management practice can lead to better communication and shared document storage management, which can influence overall effectiveness of project management.

INTRODUCTION

Imagine you are a project manager of an EU project, coordinating an international team. You are aware of the fact, that the single most significant factor affecting the success of a project is the communication ability of the project manager (Zulch, 2014).

How can you live up to such expectations when project participants come from various cultures and organizations? They have various beliefs and statuses within their organizations. Partners use their own documentation and communication information systems and processes used within their organizations. For shared project purposes, yet another documentation and communication system is usually selected. Project partners' knowledge and motivation to use such systems may vary significantly.

The question is: Is it possible to achieve smooth and effective collaboration of a virtual team and timely finalization of tasks, and eventually reach project objectives in such complex environment?

The authors of this paper are involved in management of virtual project teams on a daily basis and struggle with similar issues as described in literature. They are especially interested in the IT aspect of virtual team management: shared documentation and IT-supported communication. Cloud-based document management tools (such as Google Drive, Dropbox, SharePoint, Office 365 and similar) have been used for a decade and are quite mature in technological and usability terms. Nevertheless, their adoption and usage is still limited. Similarly, in the age of modern communication tools (email, sound & video conferences, chats, social media platforms), the selection of appropriate communication channels for different project management tasks is still an issue.

Firstly, we will present existing literature on the following topics: virtual teams, distributed teams, document management and similar. Then, we will present a typical EU project environment. Next, we will present the problem which is in the focus of our research: collaboration between project team members using online tools. We will summarize the types of project document management in 9 patterns. Next, we will present the results of the research (survey). These results include answers from various project participants and their attitude towards various communication tools and techniques. The results (descriptive statistics) were analyzed using pivot tables.

At the end, the results are discussed and guidelines for project managers are presented.

The results were used to create guidelines for project managers and reference processes for document and communication management, which are presented in the last chapter.

RELATED WORK

Virtual, Distributed Teams and Project Networks

Managing virtual teams is tightly integrated with effective usage of information technology (Olariu & Aldea, 2014). Electronic communication is ranked the highest among effective communication methods in some researches (Zulch, 2014) that were done among construction, occupational health, environment, safety, finance and claims managers in non-virtual teams.

Based on the vast research within project management area, the large share of knowledge-intensive projects performed by virtual teams struggle with serious issues (Ayoko, Konrad, & Boyle, 2012). Those issues can negatively influence achieving project objectives, communication and relations between team members.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Harej & Horvat, 2007) state that a virtual team is defined by the degree of online communication, not the geographical dispersion. A temporary team is established for a specific time-limited project, whereas a permanent team is established for long-term tasks (such as open-source development community).

In contrast, other authors (Guzmán, Ramos, Seco, & Esteban, 2010) state the difference between virtual and traditional teams: members work at different geographical locations, they come from different cultures, have different teamwork practices, speak different languages, knowledge management and distribution is different and time difference makes agenda management difficult. Same authors also emphasize (among others) problems related to virtual teams: ineffective management of shared knowledge among different team members causes duplication and inconsistency.

Moreover, (Ale Ebrahim, Ahmed, & Taha, 2009) identified 12 factors which influence the virtual teams. The same authors compiled a comprehensive literature review on this topic and defined virtual team as geographically dispersed, driven by a common purpose, enabled by communication technologies and involved in cross-boundary collaboration. Other characteristics of virtual teams are: they are not permanent teams, the team size is small, the members are knowledge workers and may belong to different companies. Other authors offer similar definitions (Hertel, Geister, & Konradt, 2005; Joinson, 2002; Shea, Sherer, Quilling, & Blewett, 2011), (Watkins, 2013).

The main advantage of a virtual team is its agility. At the same time, those teams are especially vulnerable to mistrust, communication issues, conflicts and power struggles. (Ale Ebrahim et al., 2009) also compiled a list of advantages and disadvantages of virtual teams. Some of a virtual team's disabling factors are addressed in this research, such as: requirements for complex technological applications, task-technology fitness, technophobia, training.

Project networks thus maintain a stable core of project team members while at the same time dynamically tapping into the expertise within the personal networks of members as necessary (Cummings & Pletcher, 2011). When the task is non-routine, this set-up often increases the chance of success of a project. A project network combines the advantages of the project team with those of the personal network. EU projects can be viewed as a special type of project networks. Core members of an EU project represent the core of the project team, while their associates/assistants and sub-contractors represent non-core contributors of the project network.

We are aware of the fact that trust is very difficult to develop and maintain in a virtual team (Huls, Piggott, & Zwiers, 2014), because of different barriers (Kimble, 2011) in culture, time and geography. It is therefore even more important to select the adequate technological solution to support and not to diminish trust in project teams. A thorough research of VT development in the last ten years (Gilson, Maynard, Young, Vartiainen, & Hakonen, 2015) found different results for impact of technology use in virtual teams: from no effect to better overcoming of teamwork challenges. It recommends more investigation and attention to newer technological solutions, which is actually what we are doing specifically for EU funded projects.

Software development projects in virtual teams are especially common. For example, most of the open source software is being developed in virtual teams. Several authors have researched the performance of the virtual software development team. (Colomo-Palacios, Casado-Lumbreras, Soto-Acosta, García-Peñalvo, & Tovar, 2014) found out that the performance of such projects is lower than in-house projects. One of main reasons of lower performance of a team is lack of attention of virtual project manager to development tasks.

(Misra, Colomo-Palacios, Pusatli, & Soto-Acosta, 2013) discusses the role of people in GSD (global software development). Challenges in GSD virtual teams can be summarized as: communication, knowl-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

edge management, coordination, collaboration, socio-cultural distance and lack of trust challenges. Authors propose several ideas to overcome these challenges such: investment in people, promotion of mobility and improvement of the software development process.

(Colomo-Palacios, Soto-Acosta, García-Peñalvo, & García-Crespo, 2012) performed a research (focus group and delphi study) with special attention on packaged software development. Their main conclusion is that people are still the most important resource in SW development, regardless of the type of software. Therefore, the transparency of competences, reporting and quality process are the areas which needs to be well managed in distributed software development teams.

Virtual project teams are here to stay and growing (Shea et al., 2011). For example, 145,463.81 M € are spent for EU projects in a single year (EU_comission, 2014). A big part of this funds (e.g. 17,551.69 M € for Competitiveness and for growth and jobs) are managed in virtual teams. To ensure more optimal expenditure of EU project funds, the management of project teams should be improved.

The existing literature mainly explores key success factors for managing project teams, but skips the technological dimension and its relations to the project team members' motivation.

Factors Affecting Performance of Project and Virtual Teams

(Ebrahim, 2015) identified the main groups of factors, which influence the effectiveness of virtual teams. He found out that the 'knowledge worker' and 'process' group of factors positively relates to the effectiveness of the virtual team while the 'technology construct' group of factors relates to it in a negative way. (Salaheldin, Sharif, & Al Alami, 2010) describe the driving and resisting forces within project management software implementation. Their research of the effect of various factors on the success of project implementation (understanding of business case, objectives, management support, defined plan etc.). The effect of the usage of PM tools is only partially addressed in this research.

Acceptance of Cloud-based Document Management Tools

Online collaboration platforms have existed since the very beginnings of the internet, for example PLATO in 1973 (Woolley, 1994), which was the predecessor of the wide-spread system Lotus Notes. With the advancement of Web 2.0 in 2004 (O'Reilly, 2005), real-time sharing and syncing platforms emerged, such as Google Docs.

The academic research in the field of contemporary, especially cloud-based document management systems (Gilson, 2015) and its usage for collaborative project work is slowly growing. For example, a search using keywords 'google docs' in Mendeley returns around 400 results and Emerald Insight returns 190 results. A partial research on the usage of Google Docs within a specific domain has been done by: (Mansor, 2012) – collaboration between academics, and (Blau & Caspi, 2009; Suwantarathip & Wichadee, 2014; Watson, 2006; Zhou, Simpson, & Domizi, 2012) – collaboration between students for the writing tasks. User acceptance of Google Docs within organizational setting has been investigated by (Tan & Kim, 2015). They found out that the perceived usefulness and satisfaction positively affect the intention to continue using such tools.

The goal of this research is to explore the behaviour of project managers of virtual teams in relation to supporting IT tools. From the literature review we can conclude that a lot of research has already been done, but it mainly focuses on different aspects of project management, IT supporting tools and factors

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

influencing the effectiveness of the communication. Our focus is on the usage of IT tools for managing EU funded projects, which are usually performed by virtual teams.

EU Projects

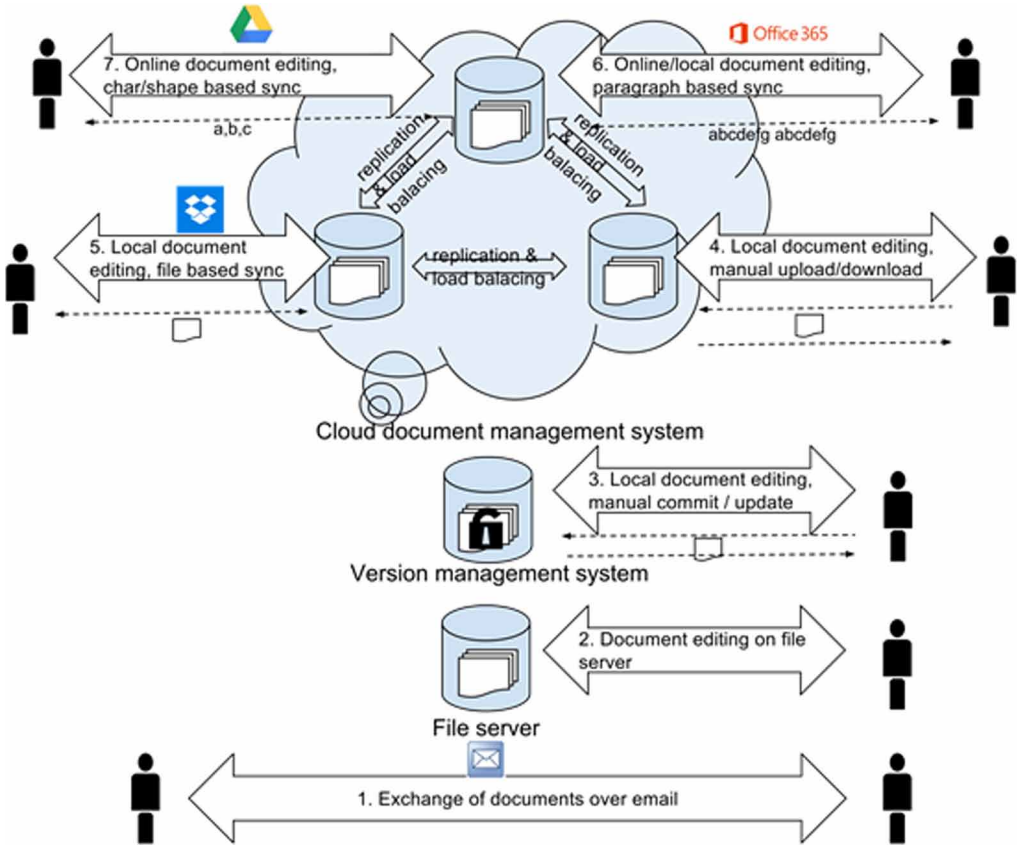
EU projects are usually long-term relationships between organizations. For example: three year project actually means that the organization is joining in project-related relationships for a much longer period (up to nine years) from proposal preparation to the end of the possible evaluation period (Horvat, Harej, & Rozman, 2006). Web-based collaboration tools are considered as enablers for successful cooperation, which is of the utmost importance in such long periods (Schwarz, 2005).

Numerous programs and funding opportunities (EU_Commision, 2014) exist for different types of activities. Different types of organizations can apply for funding. The main characteristics of EU co-financed projects (like Lifelong Learning – Leonardo da Vinci, FP7 or the latest Erasmus+ and Horizon 2020), which are considered in this article, are:

- Duration: 1-3 years
- Types of projects: research, development of innovation, transfer of innovation, partnerships, knowledge alliances and similar
- Number of partners (organizations): min. 3, average 8, max. 12 with 1-5 people/ partners
- Location of partners: minimum 3 different EU countries (core partners) and other countries (associated partners), but generally more than that (typically 4-5)
- Partners' organization type: private companies, public organizations, NGOs, academic institutions, associations etc.
- Partners' organization size: micro to medium companies
- Expected project results: mostly intellectual outputs like research reports, events, training materials, courses, e-content, software, new processes and services
- Project organization: network/virtual team
- Project scope: multidisciplinary

The skills and characteristics of a successful project manager, associated with EU projects like Lifelong learning – Leonardo Da Vinci have been already characterized to some extent by (Draghici & Draghici, 2013). The authors have analyzed project managers, who are directly or indirectly associated with projects that contribute to the development of training courses under ECQA (European Certification and Qualification Organization). Within this survey, they have found out that the most common managerial style is based on the Germanic culture encouraging rational plan development and control of changes; it focuses on the processes and the background of the project manager is mainly in IT sector. This research does not include operational or IT details of project management, which are described in our research.

Patterns of Collaboration in a Project Using D&CM Tools



The possibility to access distributed and distinct computing resources can bring substantial advantages to project management. Cloud computing is particularly useful to support a lean and digitalized approach to project management (Nicoletti, 2012).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Cloud-based document management systems are used for intellectual outputs (documents, spreadsheets, presentations, schemes, etc.) exchange within knowledge-intensive projects. For several years our project partners report the usage of Google Drive, Dropbox or proprietary document management systems with mixed success. According to our experience, document management within a project team can be summarized in at least 9 patterns [Figure 1].

The first and simplest pattern is represented by local editing of files and their exchange by email system. The second pattern is represented by a traditional file server, which enables central storage of files, with no locking mechanism. The third pattern of document management is represented by CVS, Subversion or similar system, which allow versioning, committing, updating and branching of files. Some examples of the fourth pattern are SharePoint, Blackboard, Moodle, or any other web based system which allows manual document uploading and downloading. Examples of the fifth pattern are Office365 and Microsoft SharePoint, which allow paragraph-based online editing. Examples of the sixth pattern include Google Drive (local sync client), Dropbox and OneDrive, which allow automatic synchronization of the files. Examples of the seventh pattern are Google Drive/Docs system, Draw.io or similar, which allow simultaneous real-time editing of the documents. The eighth pattern could be represented by cloud project management tools, which also include event, task and project portfolio management. The ninth pattern includes social messaging.

Figure 1. Different models of cloud /other document management systems usage patterns[1]

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Other tools for online project management, which include event/task management and social messaging (e.g. Wiggio, Teambox, Manymoon, BaseCamp etc.[2]), were omitted from the research. Nevertheless, these tools could be interesting candidates for future research, because within this research we have found out their efficiency for task distribution is on-pair with e-mail communication [Figure 10].

Document management does not eliminate a need for proper communication between project partners. Communication patterns and channels have been well known for quite some time (Katz & Tushman, 1979), but what we wanted to find out is which channel is the most efficient for assigning and accepting project tasks.

Communication within EU project virtual project team is usually performed using different channels. There is less face-to-face communication (except on yearly meetings) and more e-communication. The communication can be asynchronous (e-mail, chat) or synchronous (chat, voice (e.g. skype), phone, video conference (many-to-many), webinar (one-to-many). Those communication channels are the only way of the project manager to reach project members, therefore it is useful to know which one is the most appropriate for which situation. The effectiveness of different communication channels was addressed within our research.

Research Questions and Hypotheses

The main research question is: *Which factors influence the usage of modern document management and communication (D&CM) tools for managing virtual teams in EU projects?*

Specific research questions are:

- **RQ1:** *Is the usage of D&CM tools influenced by demographics (age, location, education, etc.)?*

Based on these research questions, hypotheses were formulated:

- **H1:** *The majority (>½) of projects performed by virtual teams uses some kind of IT supported documentation management system*
- **H2:** Younger project managers from private companies prefer *using cloud-based document management tools*
- **H3:** *The most effective communication channels for assigning and accepting project tasks are those with IT support*

Within this article, we will mostly tackle the collaboration and communication aspects of project management. We will take a look at the factors that are related to collaboration and communication tools, such as messaging systems (e-mail, skype) and document management systems (Google Drive, SharePoint, Dropbox, proprietary systems).

Our research focuses on collaboration using online tools within virtual project teams. We are especially interested in temporary virtual project teams, which are common in EU co-financed projects.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

RESEARCH DESIGN

The Context

A typical project, as observed here, is usually led by the main partner (contractor) and coordinator, who are not necessary the same person. Project team members usually meet face-to-face twice per year. Therefore, the majority of the communication and collaboration is performed on-line.

The team usually consist of the following roles: project manager, quality manager, developers, teachers, administrative staff and technical staff, all from different organizations. Therefore, the term 'project network' could be used instead of 'project team'.

For the best collaboration, the team should use central storage for documents and results, which are produced within the project. But as we will see from the results, the majority of projects still exchanged documents exclusively via e-mail.

The online cloud-based document management systems have a lot of advantages over exchanging files using e-mail. Those advantages are: a single point of document storage, less document duplication, the proper (automatic) version management, better document visibility, less time wasted for local classification and storage, better information circulation, better collaborative work etc.

We wanted to find out, what are the reasons behind the low acceptance rate of online document management systems.

In addition to document management tools, we were interested in online communication platforms. Since teams are geographically dispersed we wanted to find out, which communication medium is suitable for task assigning and accepting.

We were interested in the influence of personal characteristics (self-starter, leader, being part of the hierarchy, motivation for participation in the project) to the usage of online collaboration platforms. We also wanted to know if the usage of online collaboration platforms is influenced by age or the type of organization that project members come from.

Our research was motivated by our own work: we (authors) are project managers and face these issues on a daily basis.

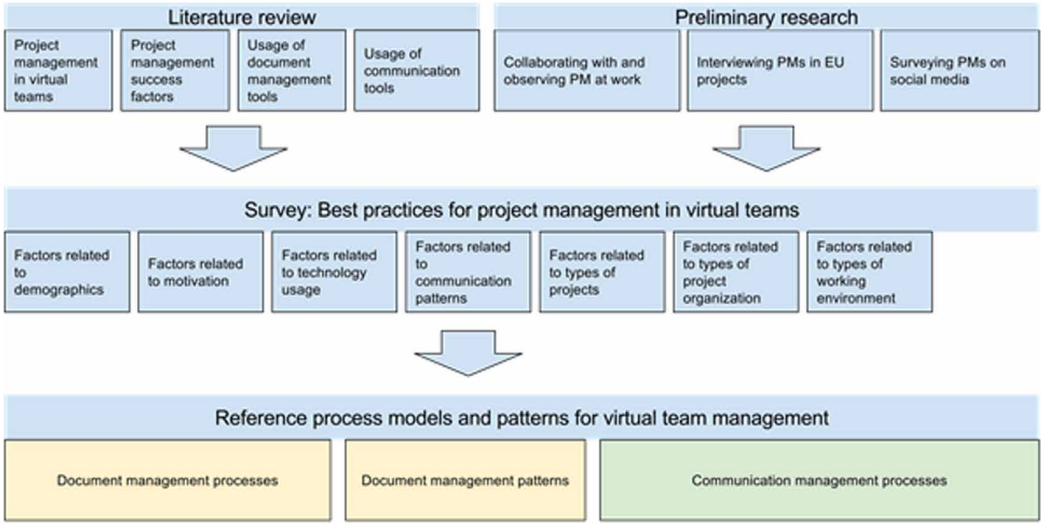
At the beginning of our research we suspected that acceptance of cloud-based IT tools for project management and communication depends on the age of the project team members. The younger generation (up to the age of 40) should be more inclined to using the tools mentioned above. But this theory was rejected by the fact that some of the older project team members have no problems using IT tools for project management. The next thought was: does it depend on the type of the organization? Each project manager who was interviewed had their own personal limiting factor of the usage of IT tools for collaboration.

Therefore, we started our research in 2014 by preparing a short article, which was posted on LinkedIn platform. We asked project managers: "Why do people resist using shared, cloud-based document management systems (such as Google Drive/Dropbox/Office365)?[3]" The received free-text answers were grouped in the following groups:

- I don't understand cloud based DMs
- I'm afraid of losing the files
- I'm concerned about my privacy
- Lack of knowledge (caused by generation gap)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- I don't know how to use it
- The DM system is not safe



The participants' answers became the starting point for broader research, where we conducted a survey and asked project managers about their motivation to use modern cloud-based IT tools for collaboration. We wanted to find out which are the factors influencing acceptance, therefore we asked the research participants about their demographics, experiences, motivation, self-drive and similar.

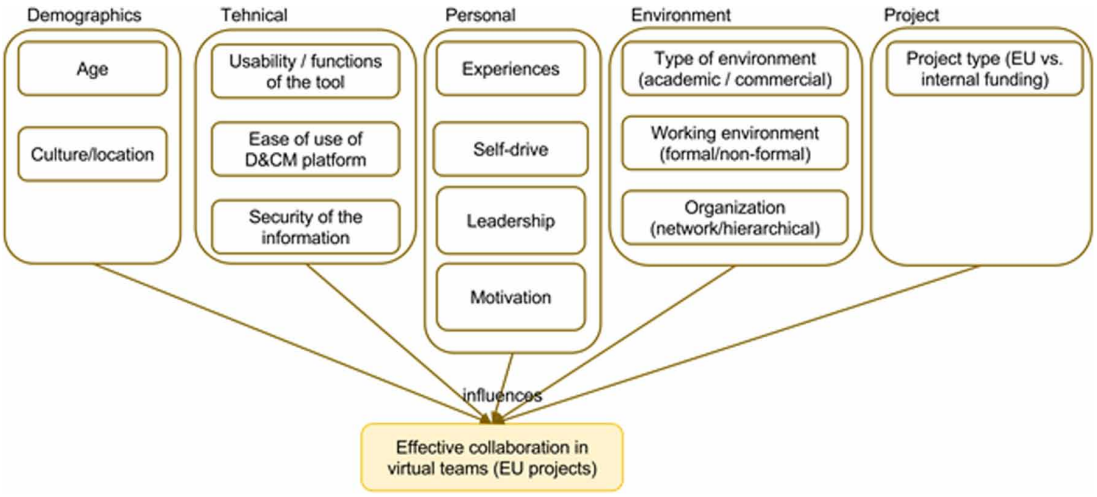
Type

Our research includes qualitative (observation and interviewing EU project managers) and quantitative techniques (web survey). This kind of methodological triangulation gives a more balanced picture of the situation. To establish a preliminary set of factors that influence effectiveness of virtual teams in project management, the authors have conducted preliminary research. Firstly, the authors have been collaborating in EU projects for more than a decade and have been observing collaboration processes from within. Next, the authors have queried social networks (LinkedIn) and gathered responses from fellow project managers regarding the usage of cloud-based document management systems for project management tasks.

Design overview is shown in Figure 2.

Figure 2. Research design

Preliminary Research



Within the preliminary qualitative research, the authors observed a small set of EU project managers for several years (fieldresearch - direct observation). The result of those observations and interviews is a set of factors which influences the effectiveness of project management in a virtual team. The main

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

research question was: What is the main reason for poor performance of a virtual project team? Each project manager had their own view of the reasons for poor performance and cooperation. For example, some older project managers thought that age is a limiting factor for effective use of online document management tools, while others thought that the difficulty of using the tools hinders their usage the most. The initial set of factors is shown in Figure 3.

As we can see from Figure 3, there is no clear consensus among project managers on which factors influence the effectiveness of collaboration in virtual teams. As it seems, the effectiveness itself is a term whose meaning depends on the observer.

Figure 3. Initial set of factors

A Survey

Using a web survey, we gathered data about project participant demographics (country, age, type of organization, educational background), experiences with project management (proposal preparation and coordination, the number of coordinated/collaborated/ administered projects), types of projects (source of financing, hierarchical structure), motivation (self-starter, being part of an organizational structure, leadership, motivation for participation). The most important questions included technology-related issues of collaboration and communication platform usage (main collaboration/communication platform, its effectiveness, user friendliness, obstacles for usage). In addition, we asked the participants, which factor is the most influential when assigning or receiving tasks. We also asked the participants about their self-drive, their motivation to participate in the most recent project and their leadership abilities.

Sampling and Validity of the Research

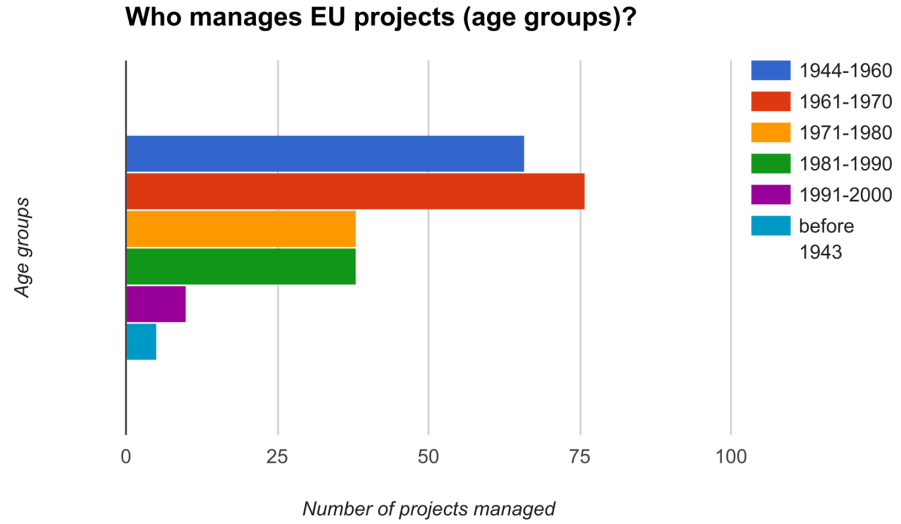
We used non-probability accidental sampling. We selected the participants for the survey from the authors' personal networks of current or past project partners. This type of sampling was used because we were mostly interested in collaboration improvement within our own project partner networks. We

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

extended the target group by posting a request to participate in the survey within a LinkedIn group, which is dedicated to EU project management. We are aware that the conclusions of this research are difficult to generalize to all project managers in EU but that was not our primary intention.

The survey was constructed using Google Forms and invitations were sent by e-mail and posted to LinkedIn groups. 44 persons who managed 244, partnered in 544 and administered 484 EU projects participated in this research. The full population of EU project managers is difficult to determine; there are currently more than 55 EU programmes (EU Commision, 2014) which comprise a large number of projects. Those calls/projects have various duration and funding. There is no summary information about the total number of EU projects granted per year for all calls. For example, only Horizon 2020 published 173 calls in the year 2014/2015 (EU commision, 2015).

Analysis



The data gathered was analyzed using Google sheets and IBM SPSS Software. First, we conducted a univariate analysis and then we used a bivariate analysis to investigate the correlation between the variables. Descriptive statistics were prepared using simple statistics (averages etc.). For the data summarization, pivot tables were used. Correlations were discovered using Pearson's' correlation coefficient.

There were no missing data to handle, because all questions, which used the 7-level Likert scale, were mandatory to answer. The answers to open questions were classified in groups (coded).

Demographics

Demographic data: age group (40% were born 1971-1980, 20%: 1961-1970, 22%: 1981-1990, 14%: 1944-1960) [Figure 4]; country of the respondents: France, Netherlands, Italy, Slovenia, UK, Romania, Iceland, Bulgaria, Spain, Belgium); organization type: 36% private institution, 28% public institution, 14% independent consultants, 11% NGOs, 11% others; educational background: 36% economics, 14% social sciences, 6% education, 22% technical sciences, 8% informatics.

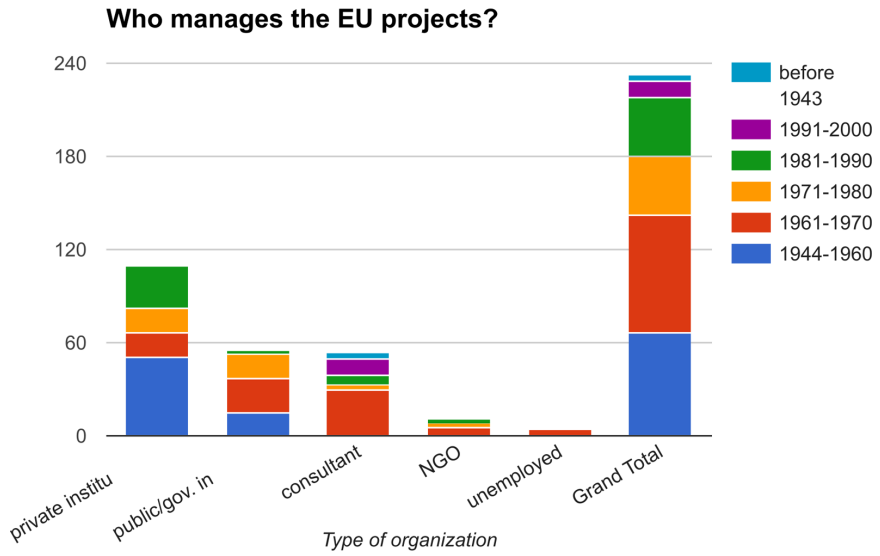


Figure 4. Who manages EU projects by age group

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Most projects overall are managed by the generation 1961-1970 (generation X).

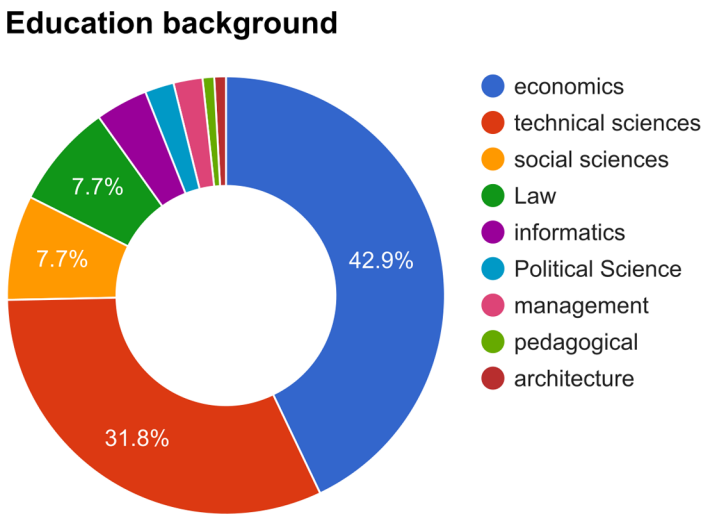

Figure 5. Who manages EU projects by types of organization

If we take a closer look, we notice, that most project managers in private organizations belong to the generation 1944-1960 (generation 'baby boomers') [Figure 5]. If we focus only on consultants, a majority of them are from generation X. Public/academic organizations show an interesting distribution: approximately one third of the sample is from 1944-1960, another third from 1961-1970 and the last third from the 1971-1980 generation.

Millennials (1980-2000) are underrepresented in all types of organizations except in private institutions.

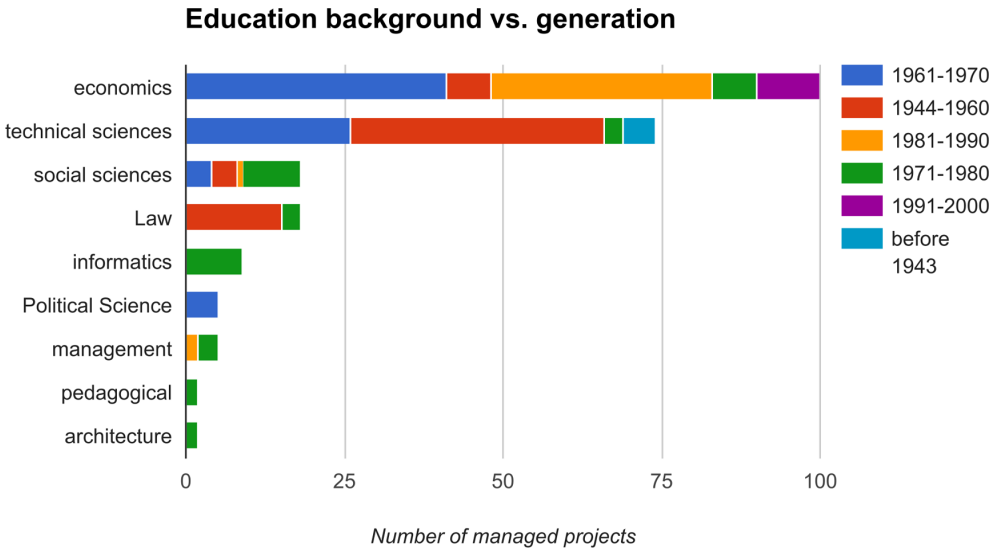

Figure 6. Education background of EU project managers

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Education background of the survey participants [Figure 6]: 32% technical sciences, 43% economics, 7,7% law, 7,7% social sciences and other. We have separated informatics and technical sciences categories to determine if there is any correlation with educational background and IT systems usage. Most projects are managed by persons with economics background, out of which most are from generation 1944-1960 [Figure 7].

Figure 7. Education background and age groups of EU project managers

Experiences: 66% participants have already prepared a full proposal, 30% have collaborated in one and 5% have not been involved in proposal preparation yet. 72% have coordinated preparation of a project proposal and 28% have not.

Project organization [Figure 8]: A majority of projects followed a network type of project organization (60%), followed by hierarchical organization (39%) and a mix of those (the remaining).

A network type of organization (as expressed by lead partners) is more common in Bulgaria, Italy and Slovenia whereas strict hierarchical organization is more common in Belgium [Figure 9]. Overall, the majority of teams are organized as networks.

This complies with the findings of (Hoch & Kozlowski, 2014), who have found out that shared leadership (including non-hierarchical organization) is significantly related to virtual team performance.

Receiving and Assigning Tasks Efficiency

As we see from Figure 10, live communication and formal meeting still present the most efficient communication channels, closely followed by live informal meeting. Surprisingly, e-mail is the third most efficient system for task assigning/receiving, closely followed by dedicated task assignment system.

It is not surprising that synchronous communication channels are seen as most effective. More interesting is the observation that asynchronous electronic communication channels (like e-mail & task assignment system) are seen as more effective as synchronous (skype, mobile, traditional phone). With

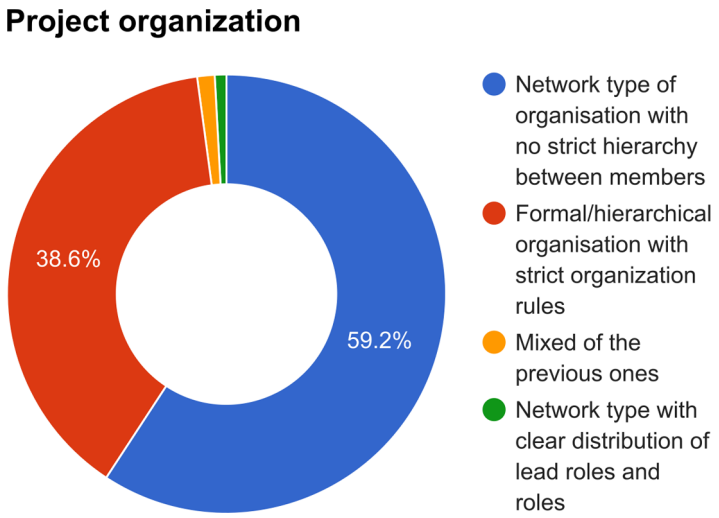
EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

focus only on asynchronous electronic communication channels, skype with voice and video is considered as the most effective.

There are subtle differences between different communication channels and assigning/receiving tasks, which are considered not significant (comparison of red/blue bars).

If we focus only on the use of communication tools, results [Figure 11] show that most users are concerned with security and improper use of web etiquette.

Figure 8. Project organization



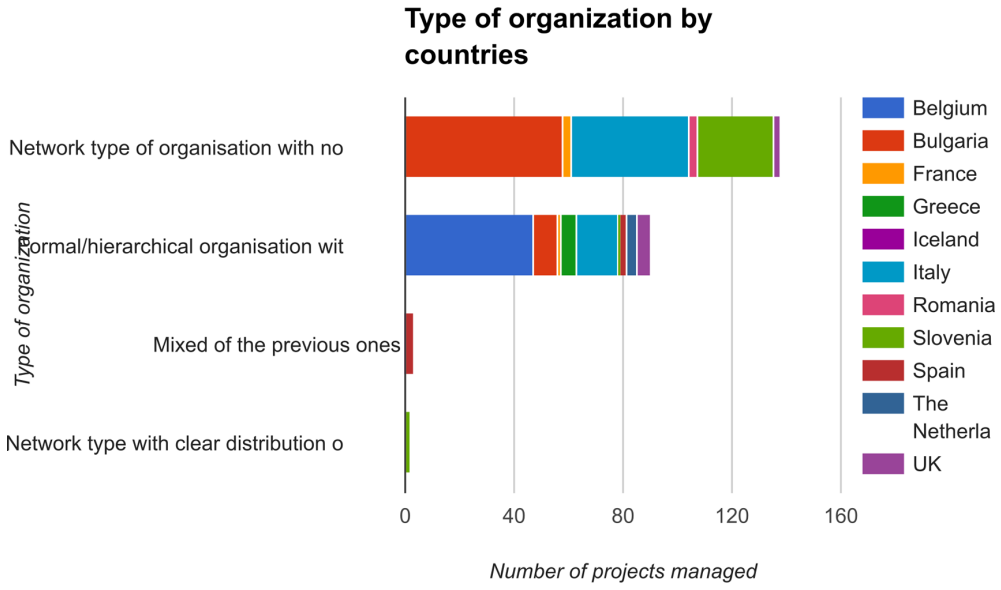


Figure 9. Demographics structure of survey participants by countries

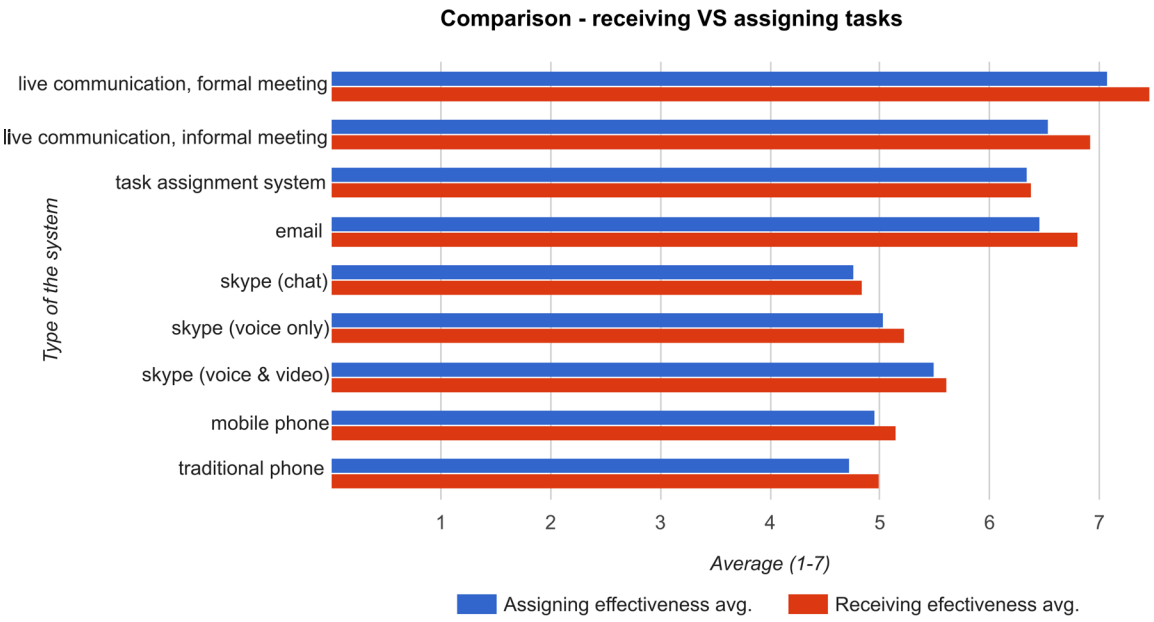
Figure 10. Effectiveness of various communication channels for delegating and accepting project tasks



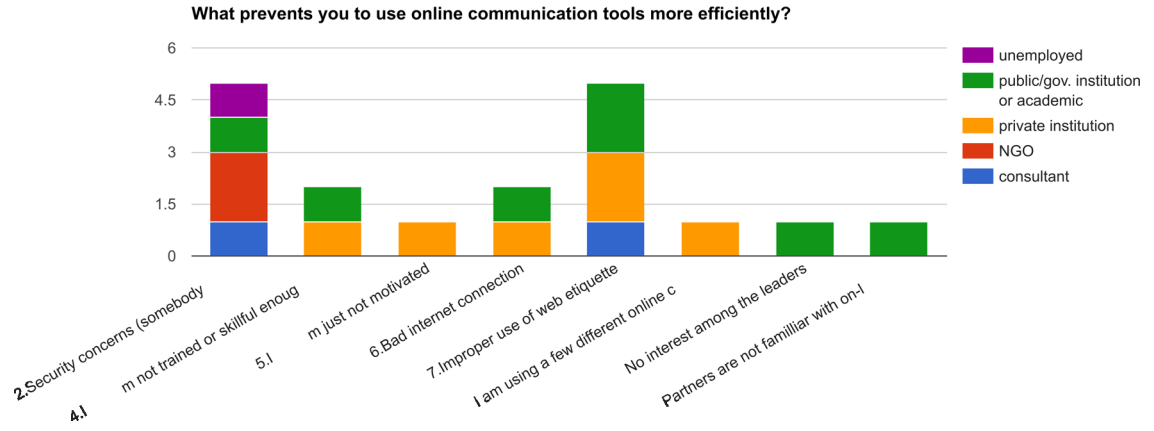


Figure 11. What prevents effective usage of online communication tools

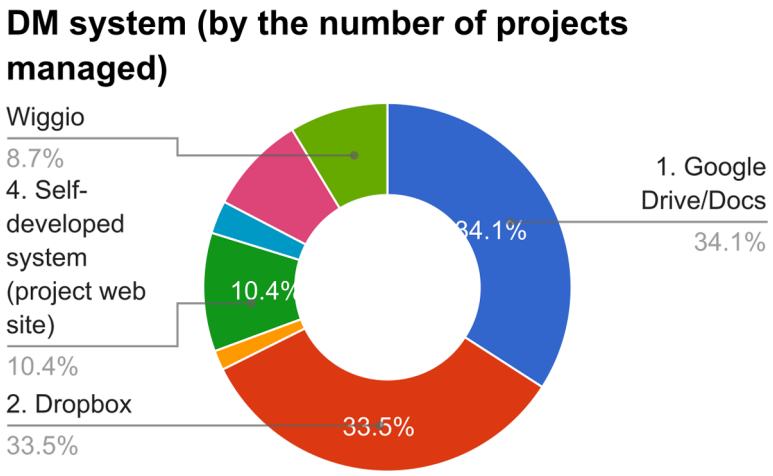
Document Management System

Many projects are still being managed without a shared documentation system (32%). Among others [Figure 12], Google Drive and Dropbox are the most used systems with an approximately equal share (GDrive-34.1% and Dropbox 33.5%).

If we observe only those answers, which use some kind of document management (DM) and group them by user types [Figure 13], we find out that Google Drive is mainly used by project managers, which work as consultants or come from private organizations. The reason could be in this product's attractive pricing, quick learning curve and broad product coverage. Public, governmental and academic institutions mainly use Dropbox or a self-developed system.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 12. Which DM systems EU project managers use



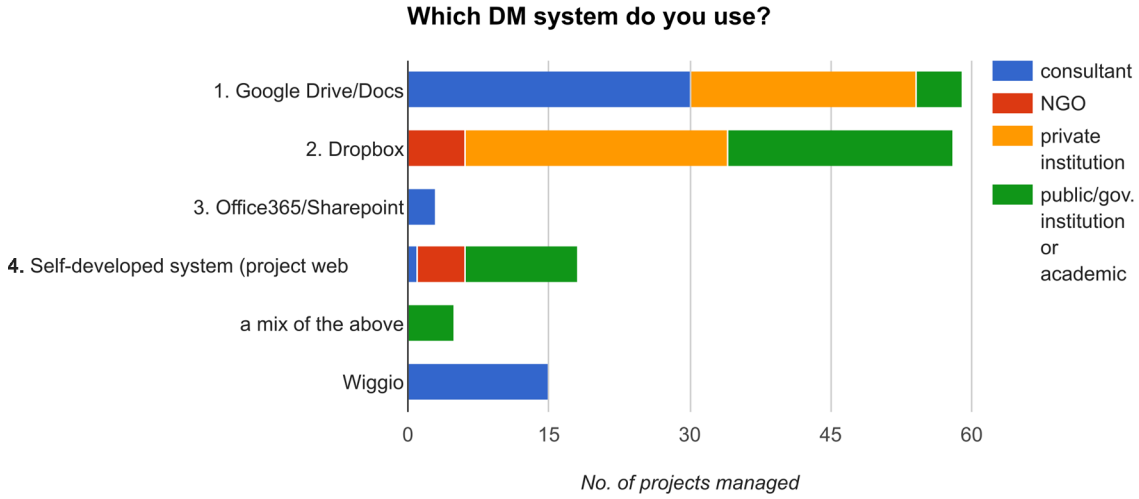


Figure 13. Which DM systems EU project managers use (by types of organizations)

An analysis of DM systems usage by age groups shows that generations 1961-1970 and 1944-1960 are less keen to use the cloud-based DM system [Figure 14].

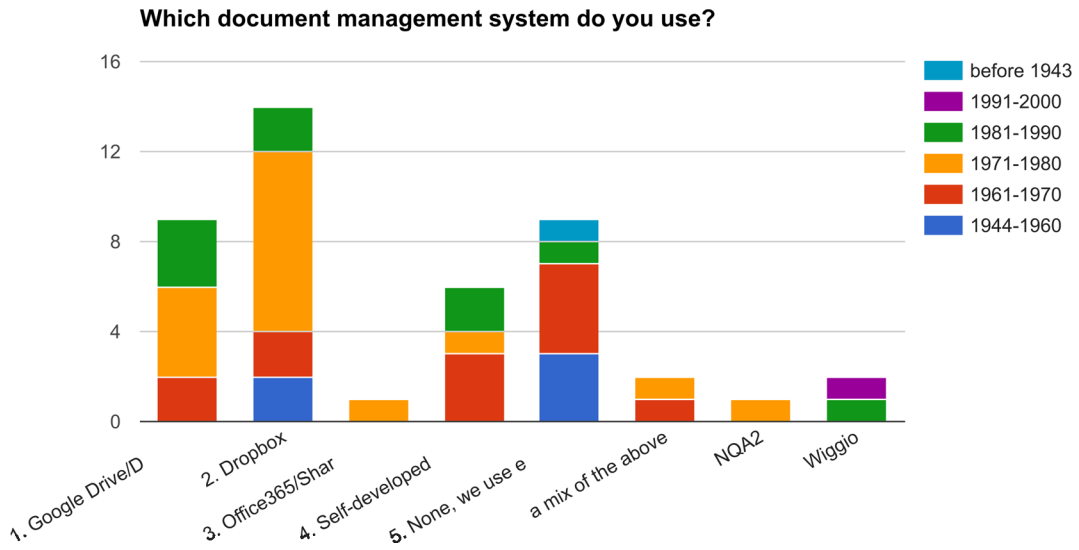
The two main obstacles for using cloud-based DM systems are: 1. the system is too cumbersome (it takes too many clicks to perform a task) and 2. security concerns. Other responses are presented in Figure 15.

Motivation and Leadership of EU Project Managers

We asked our participants questions about motivation and leadership: 1. Do you consider yourself as a self-starter? 2. Do you prefer being part of a well-organised and led structure? 3. Do you prefer leading others? and 4. Have you felt motivated to participate in your recent project?

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 14. Which DM systems EU project managers use (by age groups)



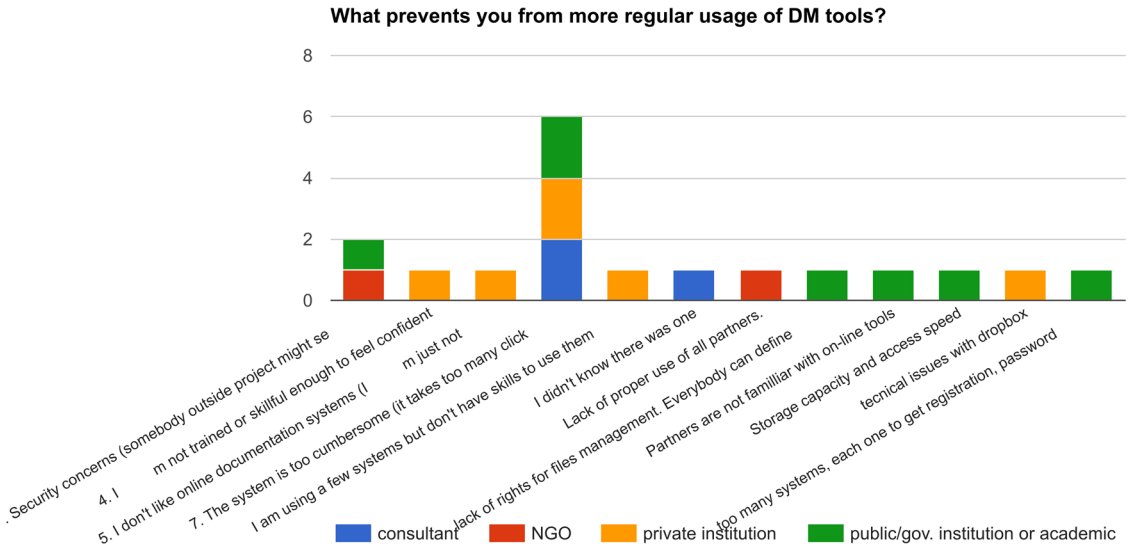


Figure 15. What prevents effective usage of document management tools

The results [Figure 16] show that most persons from the group of consultants consider themselves as self-starters, persons from the age groups 1981-1990 and before 1943 alike.

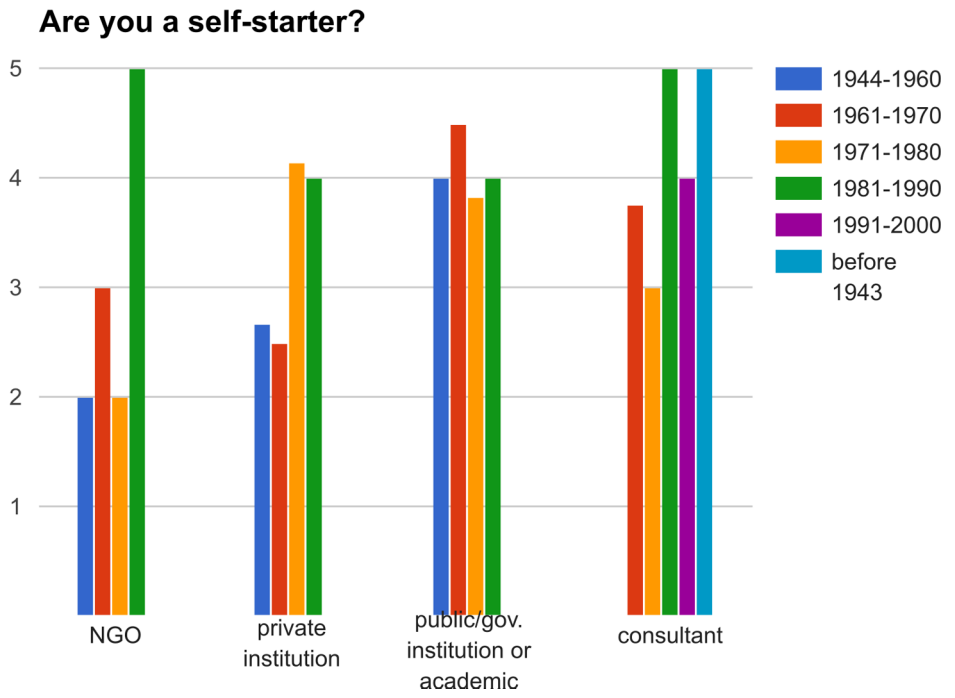
The majority of people from NGOs prefer to be part of a well-organized and led structure [Figure 17].

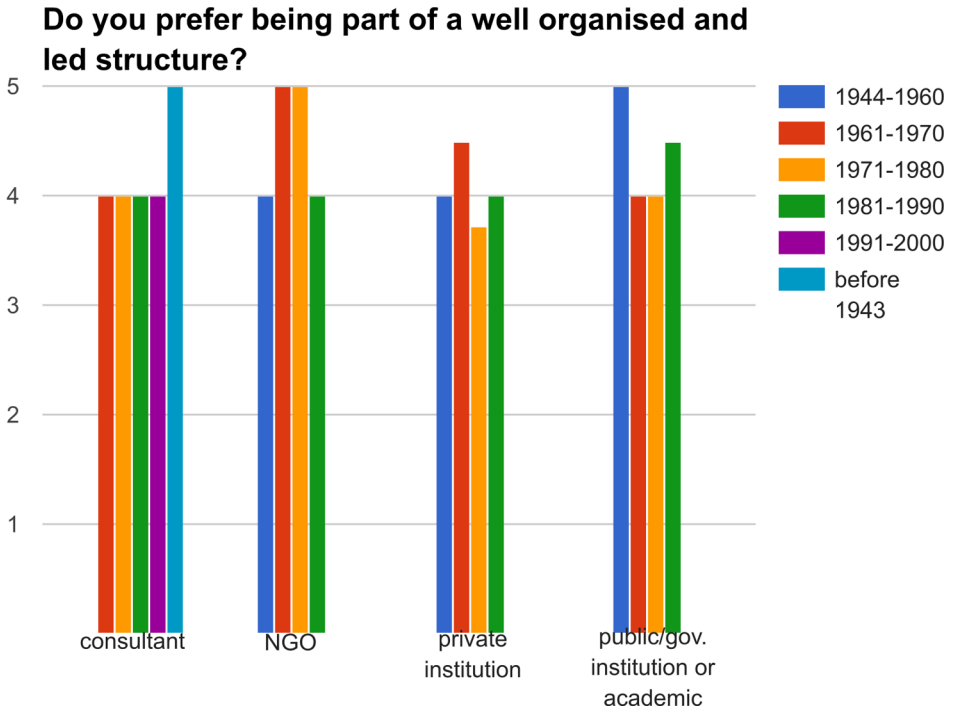
Persons who prefer leading others are mostly from private institutions and consultants [Figure 18]. An analysis by the age group shows the persons born before 1943 and between 1991 and 2000 prefer leading others. Persons born in 1971-1980 least prefer leading others, which is a very interesting result.

Most motivated to participate in recent project were persons from NGOs and private institutions [Figure 19].

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 16. Leadership attitude: self-starter





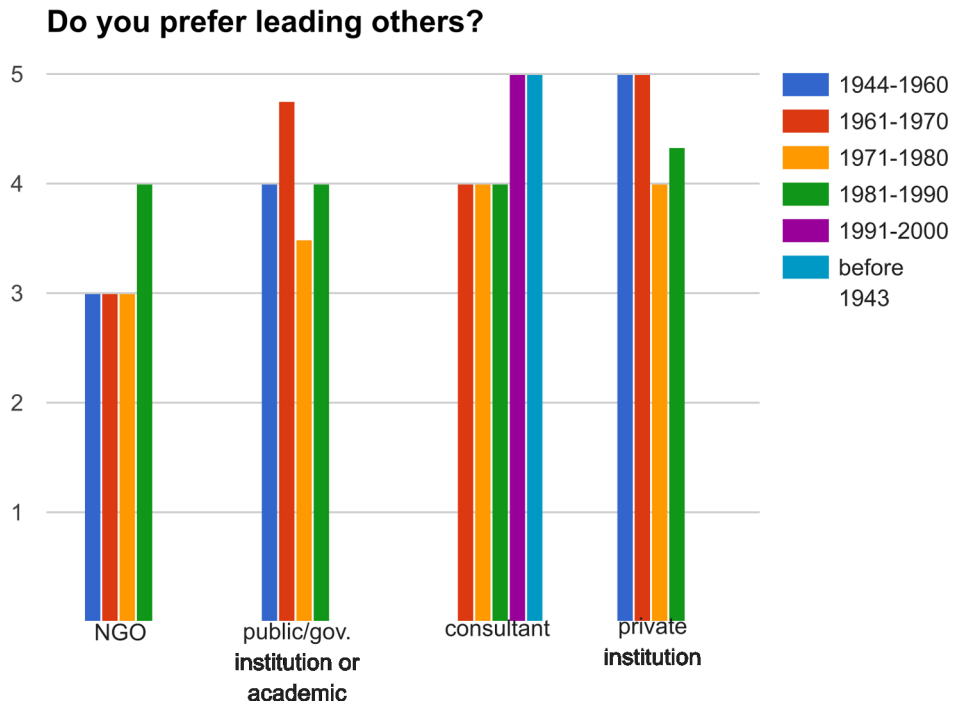


Figure 17. Leadership attitude: organization structure

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 18. Leadership attitude: leading others

An analysis of correlations between variables showed that project managers who consider themselves as self-starters were also motivated to participate in their most recent project (Pearson's coefficient 0,327* at 0.05 level, 2-tailed).

Open Comments from Participants

From the free-text answers we could extract and summarize the following useful information: 1. complex systems can cause problems in temporary project settings (e.g. people were unhappy with the introduction of Wigglio), 2. exchanging documents (only) via e-mail is not recommended because of poor version history tracking capabilities, and 3. training of project partners for efficient usage of DM tool is strongly advised.

RESULTS

Hypotheses

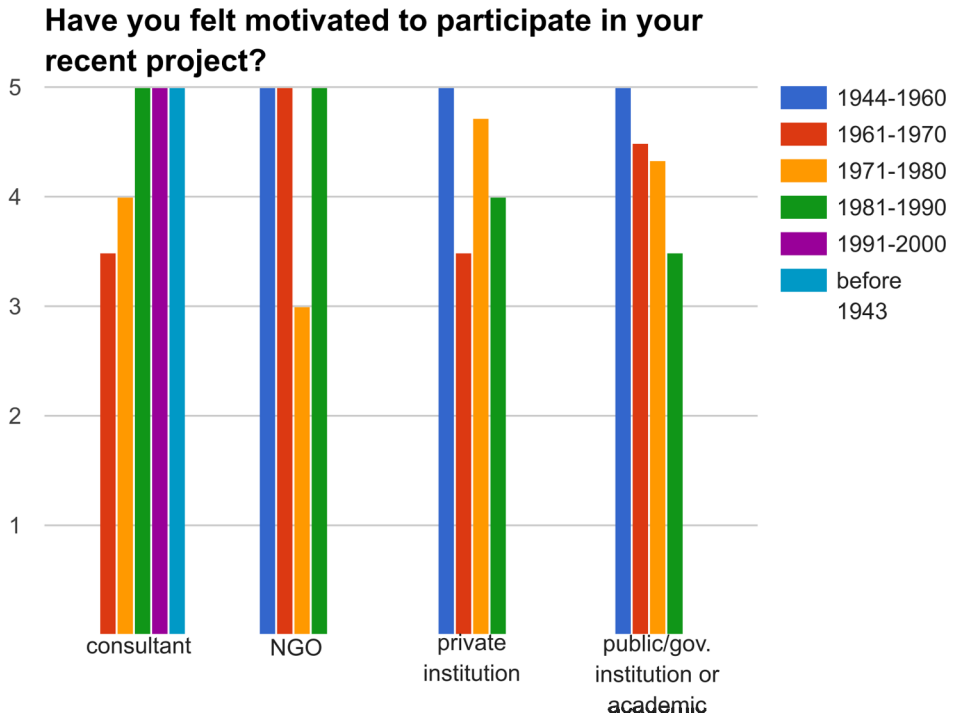
H1: The majority (>½) of projects performed by virtual teams uses some kind of IT supported documentation management system

The hypothesis is confirmed. We have found out that 64% of survey participants use some kind of cloud-based documentation system for project management.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

H2: Younger project managers from private companies prefer using cloud-based document management tools

The hypothesis is partially confirmed. We have found out that in generations 1971 and younger, the share of participants which do not use any of the cloud DM systems is almost zero. In generation 1944-1961-, almost half of the participants do not use any DM system, and in generation 1961-1970 approximately a quarter of the participants do not use any of DM systems.



H3: The most effective communication channels for assigning and accepting project tasks are those with IT support

The hypothesis is not confirmed. We have found out that live communication (formal and informal) is still most effective for assigning and receiving project tasks.

Suggestions for Better Document and Communication Management

The results derived from our research are a set of reference processes, DM patterns and recommendations, which need to be in place to ensure effective project management of virtual teams. Figure 20 shows a high level of key process areas and processes which need to be established for effective document and communication management.

Figure 19. Leadership attitude: motivation to participate in a project

Figure 20. Reference process models for document and communication management within virtual project teams

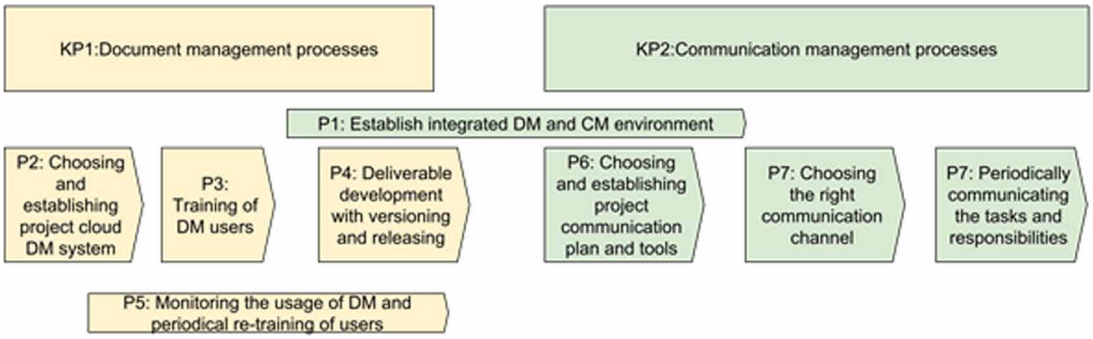

Table 1 shows suggestions for project managers which can be used for deployment of D&CM processes.

DISCUSSION AND FURTHER WORK

The results of our research are interesting: the biggest obstacles for more efficient usage of online communication tools are: bad web etiquette, security concerns and lack of skills. Results also show that live communication is still the most efficient method to delegate tasks, closely followed by e-mail or dedicated task assignment systems. Therefore, we suggest to project managers to use multiple channels for communication. Live meetings should be held at the major milestones (e.g. at project kick-off or intermediate reporting). E-mail (or other type of asynchronous) communication should be used for delegating packages of tasks to team members. Synchronous communication should be used for daily operation, micro- management and quick resolving of issues, which need immediate feedback. The communication system should be used simultaneously with online documentation system.

The biggest obstacle for more efficient usage of online document management systems is user (un-) friendliness (the system is too cumbersome/it takes too many clicks). Before conducting the research, we speculated that security concerns will be the major obstacle for online document management systems. Interestingly, respondents evaluated security concerns with a relatively low score of importance.

We have also found out that there is no consensus about which obstacle prevents more efficient usage of DM and communication tools the most. But we gathered a set of possible obstacles, which can be studied by the project manager or configuration/documentation manager when choosing the DM system for a virtual project team.

Despite the drawbacks detected in DM usage, we believe that cloud-based DM systems for project management provide many advantages: transparency of work, easy insight into history of changes, easier version management and, most importantly, simpler collaboration. These advantages can be seen as drawbacks by some: insight in document changes can be understood as breach into a person's privacy. Moreover, when collaborating in real time, a person's incompetence can be spotted more easily. Is this the issue most of us are afraid of?

Table 1. Suggestions for process deployment

Process	Suggestions for process deployment
P1: Establish integrated DM and CM environment	If the team is well trained, has cooperated and used integrated D&CM system before, introduction of an integrated system could be a good solution. If not, introduction of a new integrated system can be a burden (e.g. see results from our research chapter *Open comments from participants*). Sometimes less is more (e.g. combining simple DM with e-mail task delegation).
P2: Choosing and establishing project cloud DM system	Choose the DM system for a project team considering patterns presented in Figure 1. For example, if the majority of project deliverables are in the form of files, a cloud based repository with local file synchronization is a good solution (e.g. Dropbox). If you expect that collaborative work on the same deliverables (e.g. documents, spreadsheets, presentations) will be performed, choose Google Drive or Office 365. Establish repository, grant access rights. Consider edit/read-only access for different members. Establish initial folder structure. Dedicate one person as a document manager.
P3: Training of DM users	Allocate some time at the project kick-off meeting to perform initial training of project team members. Then, train core team members using video-conference and screen sharing. Perform individual trainings (one-on-one) if necessary. Employ social learning (e.g. learning from most IT literate in the partner groups)
P4: Versioning and releasing	Develop deliverables using versioning and releasing rules. Team members who have no background in software development, usually have difficulties managing versions. Standardize and set up rules (within configuration management plan) for file naming, classifying, versioning and releasing. Train users, explain how automatic history preservation of files works (if used). Avoid branching of deliverables development, because it takes a lot of effort to merge them. Instead, introduce shared files to develop (e.g. shared training content presentation or shared spreadsheet for status tracking).
P5: Monitoring the usage of DM and periodical re-training of users	A dedicated person must periodically track what is happening in the documentation system. This includes: monitoring of activity (e.g. Google Drive Activity stream), monitoring of file naming, classification, content, duplicates. Without regular monitoring, your DM repository will quickly become a mess. Use the insights of DM monitoring for re-training of users.
P6: Choosing and establishing project communication plan and tools	Establish a communication plan which includes: events, source, destination, frequency of communication and communication channels. Consider the findings from our research (see chapter Receiving and assigning tasks efficiency). Choose appropriate tools, e.g. Skype for virtual meetings, Doodle for planning communication events, GoToMeeting for webinars, e-mail or task assignment system for task distribution etc.
P7: Choosing the right communication channel	For each communication event, choose the appropriate communication channel. Consider the findings from our research (see chapter Receiving and assigning tasks efficiency). For the most important events (e.g. kick-off meeting), use live communication. Combine formal and informal communication. Example: Perform a formal project kick-off meeting in the morning and plan socializing activities for the afternoon and evening. For regular task distribution, use e-mail or task assignment system. Avoid using phone and chat tools for distributing tasks. People do not consider them effective, the message can get lost easier than in an e-mail. Synchronous channels (e.g. phones) are effective for resolving issues and getting quick feedback and less for distributing tasks.
P7: Periodically communicating the tasks and responsibilities	If no task management system is used, project manager should periodically communicate the status of the tasks (open, closed, cancelled …). Also, a simple shared spreadsheet – a list of tasks with statuses will work if updated regularly. Keep it simple, but don't oversimplify.

Chapter 34
Evaluating Wireless Network Accessibility Performance via Clustering-Based Model: An Analytic Methodology

Yan Wang
Xidian University, China

Zhensen Wu
Xidian University, China

ABSTRACT

Using the large amount of data collected by mobile operators to evaluate network performance and capacity is a promising approach developed in the recent last years. One of the challenge is to study network accessibility, based on statistical models and analytics. In particular, one aim is to identify when mobile network becomes congested, reducing accessibility performance for users. In this paper, a new analytic methodology to evaluate wireless network accessibility performance through traffic measurements is provided. The procedure is based on ensemble clustering of network cells and on regression models. It leads to identification of zones where the accessibility remains high. Numerical results show efficiency and relevance of the suggested methodology.

INTRODUCTION

The last few years have witnessed a quick development of wireless connections, together with a growth of smart devices consumers. Those induced a huge increase in the network flow of data. However, the network capacity is limited by infrastructure deployment. An heavy consumption leads to a deterioration of the network accessibility for users. Mobile operators have then to size correctly the network capacity. This capacity cannot be over-sized dues to infrastructure high price, but must be sufficiently large to avoid overloading.

Data collected by mobile operators can be managed and understood to evaluate wireless network accessibility performance. In the traditional method, accessibility is only related to the number of subscribers. Nowadays, this method fails to render the high diversity of traffic patterns and user behaviors. Indeed, consumption of the services becomes more versatile: In addition with classic phone use, there are data-based services such as web browsing, video communication or streaming. Therefore, a critical needs is to dedicate novel methodologies to evaluate accessibility performance. This is done by understanding when the network begins to degrade and to be less accessible.

Relationships between accessibility, capacity management and network performance have been studied, mainly throug h simulations, both for 3G UMTS (Universal Mobile Telecommunications System) and LTE networks.

About network design, heuristic algorithms (Tsao & Lin, 2002; Szlovencsak, Godor, Harmatos, & Cinkler, 2002) are developed to provide network topologies which ensure a low traffic loss. Also, an analysis of capacity through uplink and downlink is performed in Navaie and Sharafat (2003), resulting in new approaches for network sizing. In Amzallag, Bar-Yehuda, Raz, and Scalosub (2013), an optimization for choosing cells maximizing their use in LTE networks leads to a better usage of network's capacity.

About accessibility, quality of experience prediction models is presented in Khan, Sun and Ifeachor (2012), based on encoded videos. They introduce an adaptation scheme when the accessibility begins to degrade. In Engels et al., (2013), autonomous adjustment of some optimization parameters through time are performed for LTE networks, depending of the network resources. In Ouyang and Fallah (2010) and Ouyang et al., (2014), traffic behavior are simulated through different scenarios to understand the throughput behavior, for both UMTS and LTE networks. In Ouyang, Yan, and Wang (2015), and Ouyang and Yan (2015), this methodology is used again through crowdsourcing-based analytics to evaluate voice or app accessibility. Finally, in Hu, Ouyang, Yao, Fallah and Lu (2014), a relational algorithm between LTE network resources and an wireless network KPI (Key Performance Indicator) is introduced to forecast network resource consumptions.

In this paper, we introduce a new wireless analytic methodology to evaluate accessibility performance. This methodology links network accessibility with traffic measurements performed by the mobile carrier. As in Hu et al., (2014), the network accessibility is depicted with a wireless network KPI, and traffic measurements by network resources. A challenge is then to detect when network starts to deteriorate and to be less accessible.

The first innovation of our procedure is to take into account the non-homogeneous behavior of cells of the network. Cells are not considered individually nor agglutinate, but clustered into groups. This allows to bring out cells which behave similarly. For example, some cells may be constrained to an higher pressure than others, or to a different consumption of the services.

The second innovation is to get an automatic procedure, where each step can be monitored. After selecting features of interest, the whole process is driven by data through machine learning algorithms. It is intended to provide robust and adaptive predictions. For this purpose, an ensemble clustering method is used and an appropriate regression algorithm to predict the KPI is selected.

Then, from selected clusters and obtained prediction functions, we infer when the network begins to degrade. A comfortable zone is deduced as a function of the network resources. This zone indicates when the accessibility performance remains sufficiently high.

This methodology is therefore tested, using data provided by China Mobile.

The paper is organized as follows. The section titled: Methodology to Evaluate Accessibility defines KPI and network resources retrieved and necessary to conduct our methodology. Then, the whole procedure

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

is introduced in the section titled: Detailed Methodology Description. Specifically, we deduce from data a comfortable zone when accessibility remains high. In Section IV, major steps of the methodology are detailed. The results section focuses on numerical results, validation of each step of the procedure and discussion of those results, from the China Mobile data set. Finally, the last section draws conclusion.

DATA

Data are collected for different network cells on a fixed area. For each cell, recordings of various traffic measurement features are obtained. First, network features data are retrieved. They describe for each cell different variables of the network, such as the congestion ratio or mean time to establish connection. Those features are directly accessible by the network and will be used as predictor variables. Then, a sample data of a KPI related to wireless network accessibility performance is available. This KPI has to be deduced and is our target objective to evaluate accessibility. Therefore, we want to derive predictive functions of this KPI from network resources. For example, this KPI can be the RAB (Radio Access Bearer) Setup Success Ratio of all PS (Packet Switch) services. A third element is necessary to conduct the procedure: The knowledge of number of times the cell causes PS domain failed to establish the number of RAB (called later FailEstab).

Numerical results detailed in Section IV are based on data collected by China Mobile Communications Corporation. Those data have been obtained for analysis by co-operation with this company. They are retrieved on cells located at Xuanwu, a district of Nanjing (China), from July to November 2014. This area is divided in 1668 separated cells. For each cell, every 30 minutes, there is a record of network resources features, the KPI of interest and FailEstab. As a result, the number of recordings for each cell is usually about 5610, but many cells contain missing values. Here, the number of network resources features is 40. As an example, we show on Table 1 a sketch of retrieved data for a particular cell.

Table 1. Data retrieved to conduct our methodology

[a]Network resource

METHODOLOGY TO EVALUATE ACCESSIBILITY

A general description of model and methodology is done in this section. Given each network resource feature, the aim is to identify a zone where the considered KPI remains sufficiently high. Paragraph A describes an initial model which links network resource feature and KPI. This model is set as a reference, but one may keep in mind that data can differ from this initial model and fits have to adjust accordingly. Paragraph B deals with separation of the data set to obtain homogenous components. Two elements

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

modifying shape of the relationship are identified. First, change of the discrete FailEstab value leads to distinct curves. Then, different cells can be related to different behaviors and separation of cells have to be considered. Paragraph C formulates the global methodology to deal with data and evaluate accessibility.

1. Model of the Relationship

Behavior of the KPI as a function of the network features follows a specific curve. Basically, we assume that the value of the KPI follows a power law when a network resource x increase. This relationship is shown on (1), for scale parameter a, power parameter b, and constant parameter c. A graphical example of this shape is shown on Figure 2 (b).

$$KPI(x) = a / x^b + c \quad (1)$$

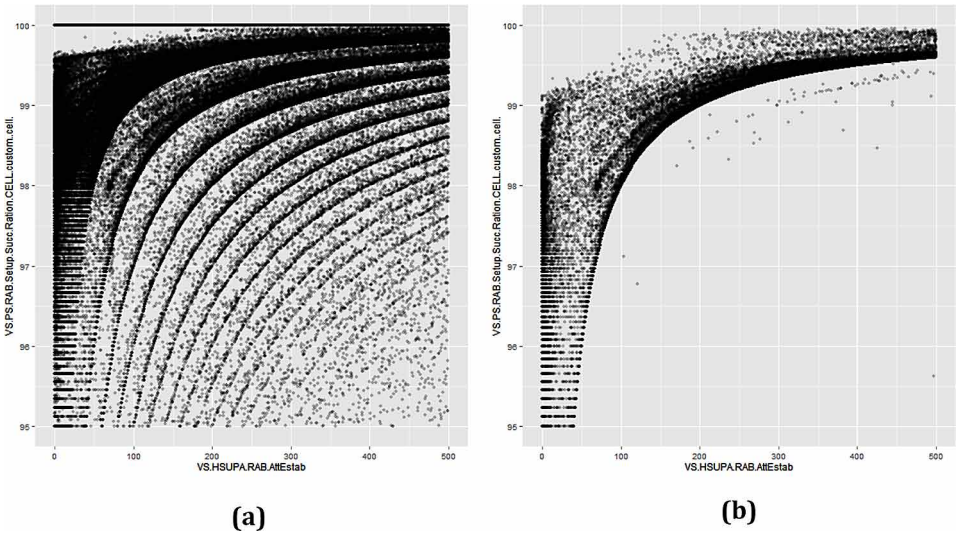
An interest of (1) is to deduce a linear link taking the logarithm. For example, a linear relation between log(x) and log(c – KPI(x)) can be exhibited (ensuring that those quantities exist). As mentioned before, the true relationship can differ from (1), therefore some non-linear regressions are used in our methodology to predict the KPI, instead of using linear regressions only.

2. Separation of the Data Set

Collected raw data are related to a combination of different behaviors. Then, it is initially difficult to distinguish curves described in (1). To get a functional relationship, separation of the data set into homogenous components is needed.

The first element to take into consideration is the FailEstab network feature. It takes discrete non-negative values, each of them being related to a specific shape. In the following, data restricted to each value is used to perform computations. On Figure 1 (a), the whole data set is plotted to show a KPI as a function of a network resource. The output looks like a mixture of different power law curves. On Figure 1 (b), this set is restricted to FailEstab = 2, exhibiting a curve closer to equation (1).

The second element is cell id. Each cell has its own behavior and can be related to a particular curve shape. Consequently, to agglutinate all cells together will make difficult the prediction of the KPI. However, to perform computations for each cell is also problematic, since cell may have been accessible for the whole measurement duration. An example of those behaviors is depicted on Figure 2, for data restricted to FailEstab = 2. On Figure 2 (a), all cells are plotted together. On Figure 2 (c), only one specific cell is plotted, but this cell only takes high accessibility values. Therefore, we need to collect a sufficient amount of data for each behavior. Introduced solution will be to cluster cells together into homogeneous groups, as shown on Figure 2 (b).



3. Whole Process Methodology

This paragraph intends to describe the global methodology. Further description of each step is available in the Section IV.

The first step is data retrieving and preparation. In this step, data is collected for each cell. Data set is separated into a training (60%), a cross-validation (20%) and a test set (20%). Then, each set is separated

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. A KPI as a function of a network resource. On (a), the whole data set is plotted. On (b), the set is restricted to FailEstab = 2.

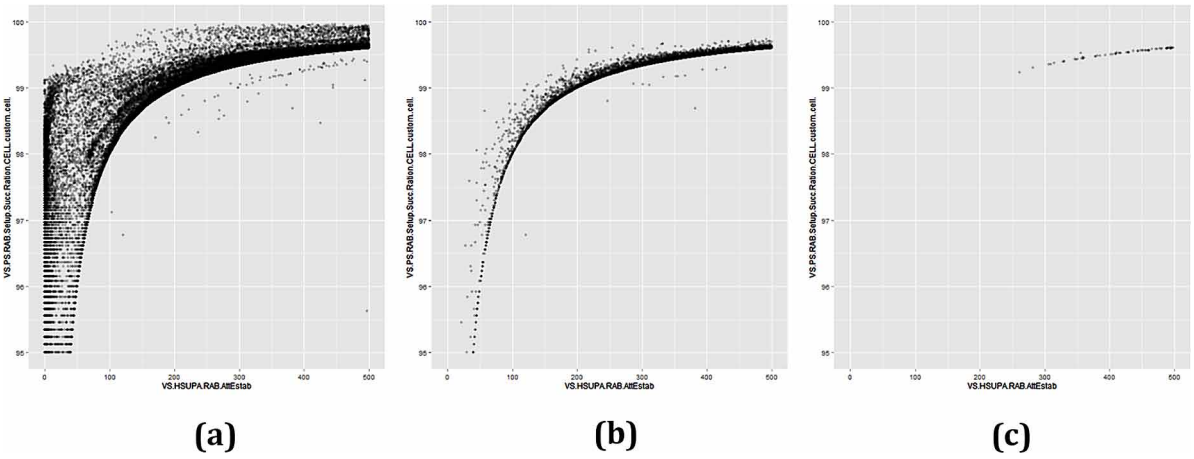
according to each value of FailEstab. Also, selection of features allowing to predict the KPI value is done in this step (manually, or by exhaustive search with linear regression (Miller, 2002)).

The second step is to group cells together into homogeneous groups. A clustering process is used for this purpose. The number of groups is not defined in advance. Consequently, at this step, the clustering process is performed for a number of clusters K varying from 1 to 20. Note that for each value of K, the defined groups of cells are identical for all values of FailEstab.

The third step has three parts. First, for each value of K, for each value of FailEstab, for each cluster from 1 to K, a regression process is applied to fit data (on the training set). Then, a summarizing value is defined for each K, taking into account prediction accuracies and difference of behavior of clusters (on the cross-validation set). Those summarizing values allow to select a best number of cluster K. Afterwards, prediction functions are retrieved for this K, for each value of FailEstab and each cluster from 1 to K.

The fourth step is to deduce a comfortable zone from those prediction functions for each cell and each value of FailEstab. The comfortable zone is defined such that the accessibility remains high.

DETAILED METHODOLOGY DESCRIPTION



In section III, the whole methodology has been introduced. In the current section, major steps of the methodology are described. First, clustering process is carried out with an ensemble clustering algorithm. Then, regression process combines different regression computations to fit data. Finally, deduction of a comfortable zone is explained.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. Clustering Process of Cells

Through a clustering process, similar cells are let into groups. For now, computations are performed for a number of clusters K varying from 1 to 20. Three steps are necessary: First, for each cell, extraction of summarizing values are deduced from the data set; Then, each cell being summarized, cells are set together using different statistical clustering algorithms; Finally, clustering results are put together into a final clustering, involving an ensemble clustering algorithm.

Figure 2. A KPI as a function of a network resources for data restricted to FailEstab = 2, plotted for the indicated cells. (a) all cells; (b) clustered cells; (c) one cell

In the first step, values are extracted from training data set to summarize each cell. We expect a relation as shown on (1) when plotting the KPI values as a function of each selected feature. Therefore, taking the logarithm, a slightly linear relationship exists. Performing a linear regression, we extract intercept and slope for each selected feature, for the first values of FailEstab (limiting to 99% of the data points). Those intercept and slope values summarizes the cell, but may contain redundant information. Then, a principal component analysis is done to retrieve 99% of the information from those extracted values. Resulting values contain relevant information of the cell behavior.

In the second step, multiple clustering algorithms are performed. The choice to compute more than one clustering arises from the fact that each particular clustering algorithms have some limitations and are usually specialized to a single task. Consequently, to overcome those limitations, 6 clustering algorithms are carried out. They are chosen to cover a broad spectrum of clustering methods. Those are: k-means (MacQueen, 1967), k-medoids (Kaufman & Rousseeuw, 1987), fuzzy C-means (Bexdek, 2013), CLARA clustering (Kaufman & Rousseeuw, 2009), Gaussian mixture model (GMM) (McLachlan & Basford, 1988) and agglomerative hierarchical clustering.

In the third step, an ensemble clustering is deduced from those six clustering methods. This ensemble clustering tries to find a single consensus from different clusterings. The algorithm used is the co-association matrix based method defined in (Fred, 2001), detailed as follows. First, for each clustering method, computation of the co-association matrix is performed. This matrix is a square matrix and the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

number of rows is the number of cells. It is defined such that (i, j) is let with 1 if i and j belong to the same cluster, and 0 otherwise. Then, from those matrices, a consensus matrix is deduced. This consensus matrix is defined as the mean of all seven matrices. The final consensus partition is generated by taking a threshold of 0.5 on the consensus matrix. In other words, i and j belong to the same final consensus cluster if the value (i, j) on the consensus matrix is greater than 0.5. It should be mentioned that this ensemble clustering algorithm can result in a greater number of cluster than K, especially when the clustering methods give quite different results.

2. Regression Process

The aim of this step is to fit KPI values from selected network features. At this point, computations are done for each choice K of clusters' number, each value v of FailEstab and each cluster i. Values of cells belonging to the same cluster are aggregated. Then, different regression algorithms of the KPI feature as a function of network resource features are executed. Those algorithms are computed after taking the logarithm, on the training set. They are defined to handle linear and non-linear relationships between KPI and network resource features. Five of them are used: the linear regression, a generalized additive model (GAM, following Wood (2000) and Hastie and Tibshirani (1990)), a gradient boost method (GBM, following Burges (2010), a single-hidden-layer neural network (see Ripley (1996) for reference) and the multivariate adaptive regression splines method (MARS, see Friedman (1991)).

After obtaining predictions, the best regression algorithm is deduced for each cluster. For this purpose, the error rate (ER) shown on (2) is computed. On (2), (y_l) stands for KPI data and $\left(\hat{y}_l\right)$ for fitted values, obtained on the cross-validation set.

$$ER\left(\left(y_l\right),\left(\hat{y}_l\right)\right) := \sum\nolimits_l \left|y_l - \hat{y}_l\right| \tag{2}$$

Two quantities are used to deduce the best number of clusters K. The first one is ER(i, v, K), computed for the regression giving the lowest ER in (2). It measures error of fit. The other quantity is called cluster separation. It measures how distant are clusters each other, by checking if considering different clusters give better results instead of taking only one cluster. In other words, it sees if each cluster describes a specific consumer behavior. This quantity is defined in (3). To compute it, for all clusters $i,j \in \{1,\ldots,K\}$, $\left(y_l^i\right)$ are KPI values for the cross-validation set for cluster i, and $\left(\hat{y}_l^{i,j}\right)$ are fitted values of $\left(y_l^i\right)$ using the best prediction function obtained for cluster j.

$$Sep\left(i,v,K\right) := Sep\left(\left(y_l^i\right)\right) := \left(K-1\right)\frac{\sum_l \left|y_l^i - \hat{y}_l^{i,i}\right|}{\sum_{j\neq i}\sum_l \left|y_l^i - \hat{y}_l^{i,j}\right|} \tag{3}$$

To understand (3), one can look at the case where the prediction is not dependent of the cluster. Then, terms in each sum of both numerator and denominator are equal, and lead to a final value of 1. If however all predictions are well fitted and lead to different predictions, we can expect to have Sep(i, v, K) smaller than 1 for all clusters i.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

To combine the different clusters and FailEstab values, those two quantities are weighted. Clusters are weighted with w(i | v, K), the proportion of values in cluster i among all clusters when FailEstab is v. FailEstab values are weighted with w(v) the proportion of values with FailEstab = v. Two summarizing values are deduced for each number of cluster K: one related to ER and the other to cluster separation. They are computed similarly, as shown on (4).

$$F\left(K\right) = \sum_{v}\sum_{i} F\left(i, v, K\right) w(i \mid v, K) w\left(v\right), F \in \left\{ER, Sep\right\} \tag{4}$$

Finally, the selection of the best cluster K is deduced with a combination of ER values and Sep values. This summarizing value is computed following (5). Number of clusters K with the lowest Summ value is selected.

$$Summ\left(K\right) = \log\left(ER\left(K\right)\right) + \log\left(Sep\left(K\right)\right) \tag{5}$$

This paragraph explains the choice to consider Summ value. If a small number of clusters K is selected, a large amount of data is available for each cluster but the clusters are not specific and can lead to an high bias in predictions. Therefore, ER and Sep values are first expected to decrease when increasing the number of cluster K (while the data training set is sufficiently large). But if a larger number of clusters K is selected, each cluster is specific to a behavior but few data are available and predictions suffer a high variance. Then, ER will begin to increase and in addition, the separation values will also increase when there is no more separation between clusters. On the whole, to choose K with the lowest Summ value is a compromise between those two extremes.

The last step is to retrieve the best regression predictions for this K, for each value of FailEstab and each cluster.

3. Deduction of a Comfortable Zone

For each value of FailEstab and each cluster, a comfortable zone is deduced. From prediction functions obtained with the selected number of clusters K, this zone is where KPI is greater than a fixed value, for example 99%. In this zone, accessibility will remain high. Therefore, for a new record, we will be able to predict if this record takes place in the low performance or the high performance zone.

RESULTS

The global methodology is applied on collected data introduced in Section II. In the following, the studied KPI is the RAB Setup Success Ratio of all PS services (written VS.PS.RAB.Setup.Succ.Ration.CELL. custom.cell in plots). From resources features, four of them have been selected: number of HSUPA (High-Speed Uplink Packet Access) RAB Establishment Attempts in a cell (written VS.HSUPA.RAB. AttEstab), average Number of HSUPA UEs (user equipment) in a cell, average of upload link connection credit used and average of download link connection credit used.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the following, ensemble clustering is first applied. Then, selection of the number of clusters K is obtained from ER and separation computations. Finally, comfortable zones are deduced from prediction functions.

1. Clustering Accuracy

Following our methodology, an ensemble clustering is obtained for each K from 1 to 20. An example of clustering visualization is shown on Figure 3 for K = 7, clusters 3 and 5 and for the selected feature VS.HSUPA.RAB.AttEstab. On this figure, data are restricted to FailEstab = 2 and plots are shown after taking logarithm. A good separation between clusters is observed, with a specific behavior in each cluster. On Figure 3 (a), the points are constrained into a linear zone, and the residual variance is almost homogeneous while network resource varies. On Figure 3 (b), the KPI is not a linear function of the network resource. Furthermore, points are noisy, especially for low values of the network resource. This latter behavior is due to inner variance in some cells rather than clustering performance, and is difficult to reduce here.

2. Number of Clusters Selection

Afterwards, the different regressions are computed. Error rate (ER) and clustering separation (Sep) are retrieved for each K, leading to the summarizing value (Summ). On Figure 4, the evolution of those three values is plotted as a function of the number of clusters K. On Figure 4 (a), the ER has a general decreasing trend while the number of clusters increases. The trend is also fluctuating. The lowest ER value corresponds to the highest number of clusters. On Figure 4 (b), the Sep value first follows a decreasing trend and then stabilizes with a slight increase (as expected in Section IV-B). The trend is similar on Figure 4 (c), showing more pronounced fluctuations. Taking the minimal Summ value from this figure, choice of K = 7 is done.

3. Comfortable Zone Identification

Finally, after choosing K = 7, regression predictions are used to fit data and deduce a comfortable zone for each cluster and each value of FailEstab. On Figure 5, obtained zone is plotted for two clusters, FailEstab = 2 and feature VS.HSUPA.RAB.AttEstab. On Figure 5 (a), the KPI steadily increases while the number of establishment attempts grows, to finally reach 99% value. Points related to each cell of the cluster have a limited variance, and the fitted line follows the scatter plot. On Figure 5 (b), accessibility reaches 99% more quickly on the fitted line. Then, a lower value of the network feature is necessary to reach accessibility. Contrary to the previous figure, some cells of this cluster have higher residuals around the fitted line.

DISCUSSION

The main implication of the work is to help mobile operators to elaborate a strategy of development of their network. They can have objective to achieve about accessibility, for example to reach 99% for some KPIs. Therefore, they have to determine where they should invest precisely and to elaborate net-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

work planning. Results deduced with the presented methodology can point out which network features mobile operators should increase to improve network accessibility. Also, the amount of resource can be quantified and is specific to each cluster. For comparison, on Figure 2 (a) and Figure 2 (c), to get a 99% accessibility value is difficult, whereas on Figure 5, a specific and accurate value is obtained. Consequently, mobile operators can optimize resources to allocate for each type of cell. In this way, efficient and customized networks may be built.

Figure 3. From data set, ensemble clustering obtained with K = 7, FailEstab = 2, for two clusters i, after taking logarithm. The plot represents aggregated cells with KPI as a function of a network resource. (a) i = 3; (b) i = 5

(a) **(b)**

CONCLUSION

A new wireless analytic methodology to evaluate wireless network accessibility performance is performed in this paper. The purpose is to detect when the network starts to become less accessible. The methodology is based on relationship between accessibility and network resource measurements. The non-homogeneous behavior of cells of the network is taken into consideration by clustering them into related sets. Also, the procedure is automatic and focus on robust computations. Finally, comfortable zones are identified and indicate when accessibility begins to degrade. A numerical study is performed to support our methodology, using data coming from China Mobile Communications Corporation.

The clustering processing scheme is a promising approach to improve accessibility predictions of wireless networks, paired with the combination of different regressions. Thereafter, new insights could be carried out to understand "in cell" variance, which remains important for some cells.

Chapter 35
Digitization and Sustainability: Threats, Opportunities, and Trade-Offs

ABSTRACT

Digitization and sustainability are two mega-trends. There are a lot of opportunities and threats discussed. However, a compiled and industry-wide analysis of SWOTs is missing. After a review of the literature on digitization and sustainability and compiling a SWOT table, a concept map is developed for visualizing key topics in light of digitization and sustainability. In addition, for illustrating unconscious knowledge, two exemplifying systemic structural constellations are presented in this context as well. The results show immense tensions between sustainability and digitization, but also offer progressive patterns. In light of a development towards sustainability, digitization is both boon and bane and often needs a clear analysis of all relevant issues and a careful handling in order to be progressive. Digital transformation requires a precise and honest value basis and sustainability added value. Therefore, societal progress and strict law regulation will be needed.

INTRODUCTION

According to Krys (2017), in particular seven megatrends will play a major role over the next 15 years: (1) demographic change, (2) globalisation and the markets of the future, (3) scarcity of resources, (4) climate change, (5) technology dynamics and innovation, (6) global science, and (7) sustainability and global responsibility. These profound changes can be grasped by specific aspects. Demographic change is particularly marked by a further increase in the world's population (United Nations, Department of Economic and Social Affairs, Population Division, 2017), a rising average age (Contis, Bennett, Mathers, Li, Foreman, & Ezzati, 2017) as well as migratory movements and migration to cities. Trend 2 captures

the shift in global economic equilibria towards specific countries that have tended to play a subordinate role until now. The increasing scarcity of resources and the associated rise in prices and possible supply bottlenecks will continue to impact the company's activities in the future. Climate change and the associated threat to ecosystems (due to droughts, extreme storms, floods, etc.) will also continue to progress in the next 20 years. Trend 5 is especially characterised by a globally faster spread of technologies, which means that innovative companies in particular can benefit. Less developed countries will follow suit, especially in terms of innovation capacity. Digitisation and life sciences are crucial key technologies. In connection with the Global Knowledge Society, three changes need to be emphasized in particular: Increased dissemination of knowledge, slight improvement in gender equality and increased competition for qualified employees. On the one hand, trend 7 indicates an increased significance of sustainability due to limited resources, and on the other hand, the relevance of cooperation by governments at a global level. A growing influence on increasing sustainability is attributed to both the individual and the impact of NGOs (Krys, 2017).

Digitisation, digitalisation or digital transformation as well as sustainability belong to the main global megatrends today. However, there are lots of positive developments, but also negative consequences in terms of sustainability. In order to create holistic sustainable concepts, attention to fundamental developments is essential. In addition to a wide range of positive developments, potential risks and challenges have already been, but still must be identified, analysed and implemented in order to prevent exponential technology adaptations from leading to a complete lack of transparency of the overall system. So, how is a responsible and sustainable management possible taking all relevant values and opportunities and threats into account? The main questions of positive and negative impacts of digitisation concerning sustainability impacts will be discussed based on given conceptual and theoretical reflections as well as gained by results used systemic structural constellations. Systemic structural constellations are able to spatially map patterns, connections, structures and relationships within a system and can thus be used in a variety of ways, like depicting complex challenges spatially and visually in order to point out new possibilities as well as revealing and closing the gaps between knowledge and lack of action or to open up paths to more sustainable action (Arnold, 2018, 2016). Systemic structural constellations address the unconsciousness and are based on unconscious thinking and processes; they provide an excellent supplement to conventional research designs. After a review of the literature on digitisation and sustainability and compiling a SWOT table, a concept map is developed for visualising key topics in light of digitisation and sustainability. In addition, two exemplifying systemic structural constellations are presented for illustrating unconscious knowledge in this context, too.

BACKGROUND

The digital ecosystem describes an open information landscape (Dini, 2007) with particular emphasis on the adaptability, dynamics and self-organizing mechanisms of inter-organizational information systems and encompasses a holistic perspective on the inter-organizational system of action (Müller-Mielitz & Lux, 2016). Actors and innovations can develop competitively, independently and co-evolutionarily. If it is possible to generate and maintain a critical mass of users, success can be achieved in terms of economic and social sustainability (Müller-Mielitz & Lux, 2016). Platforms, exposed to network effects can lead to dysfunctional social distribution and participation processes, will become central (BKA, 2015). Furthermore, network effects, information asymmetries, opportune behaviour and negative assessments

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

can have an impact on citizens' decisions and voting behaviour as well as on effectiveness and sustainability. Moreover, increasing digitisation may reduce the range of information and equal opportunities between technology-affine and technology-averse citizens. Technology-affine refers to the assumption that these users have a high degree of technological affinity and, for example, are more familiar with installation processes, because they have a strong connection to technology (Geisler, Zelazny, Christmann, & Hagenhoff, 2011). In contrast, technology-averse users show a high degree of technological repugnance and have a less experienced handling with technologies.

Prisecaru (2016) provides an overview of the main characteristics (energy resource, main technical achievement, main developed industries, transport means) of the fourth industrial revolution: Green Energies; Internet, Genetic Engineering, 3D Printer; High Tech Industries and Electric Car, Fast Train. All these points have a major impact on both industrial production and social relations as well as on people's relationship to production and its results. It is questionable, for example, whether strong productivity growth and technological progress lead to an improvement in wealth or increase social inequalities and unemployment (Prisecaru, 2016), thus strengthening the integration of socially sustainable criteria. There is also considerable potential in the area of environmental sustainability. For example, technological progress enables a reduction in industrial waste and more efficient processes for the use of resources (Prisecaru, 2016), but can lead to increased resource consumption as a result (rebound).

In addition, the ongoing digitisation process is raising expectations for achieving the Sustainable Development Goals. For example, changes are emerging in a wide variety of sectors that can make a contribution to sustainability (Osburg & Lohrmann, 2017): In the healthcare sector for instance, people are benefiting from new technologies that make medical solutions more affordable, accessible and of higher quality. In the automotive sector, networked applications can save several hundred thousand lives and reduce traffic accidents considerably. In this context, digitisation supports a healthy life in accordance with SDG 3 (GeSI Report, 2015). The demand for a fair, integrative and qualitative high-quality education can be achieved by solutions in the sense of an open education such as MOOCs. (SDG 4). Likewise, specific adaptations can help to reduce greenhouse gas emissions and promote a market transformation towards renewable energies, thus complying with the SDG 13. Significant opportunities and challenges can be identified in the markets and their players. SDG 9 aims to build a resilient infrastructure, promote innovation and sustainable, inclusive industrialisation. The market perspective is also included in SDG 12 and aims at sustainable production and consumption patterns. However, this is only an excerpt of aspects that need to be included in the context of digitisation with a focus on sustainable design (Osburg & Lohrmann, 2017).

Such effects and possible rebound effects have not been sufficiently researched in the context of sustainability. Rebound effects can occur at both the micro and macro level. According to Greening, Greene, & Difiglio (2000), a four-part typology can be used to identify these effects. The direct rebound effect (1) can be assigned to the micro level and is characterized in particular by increased demand due to price reductions. These in turn are the result of technological improvements in the area of fuel consumption, which can reduce the necessary use of raw materials. Secondary effects (2) can also be observed (Greening et al., 2000), which are characterised by an increase in demand for alternative services and goods. An aggregation of behaviour at the micro level, which may still be moderate, could be significant at the macro level due to economy-wide effects (3), especially for fuel supply markets (Greening et al., 2000.). Finally, transformational effects (4), such as changes in social institutions or consumer preferences due to technological change may also occur (Greening et al., 2000). In order to grasp the variety of digitisation and digital transformation a comprehensive literature review follows resulting in a SWOT analysis.

LITERATURE REVIEW

Leonard & Graf von Kospoth (2017) emphasize this rapid development with linear humanity and point out that society needs ways to ensure the preservation of what makes us human. Hyper-innovations should therefore be made humanely sustainable. A complete lack of transparency must be exerted by pressure from governments, organisations and officials on the companies behind this trend. Furthermore, it is relevant to anchor the addictive potential (e. g. specific platform designs) of technological innovations in a collective understanding and to develop rules in order to establish a human balance. Drivers that endanger addiction must be identified and transparency ensured. While there are fears that the technological innovations could be turned against the whole world, there are also weakened opinions. According to Kissinger, the instructions by humans could be misinterpreted due to a lack of context (Sturgeon, 2018). It can have catastrophic consequences if the artificial intelligence does not meet human expectations. The first applications in which people were not able to keep up with the computer also became apparent and it is questionable whether the human brain is able to adapt identical abilities (Sturgeon, 2018).

Digital human rights and ethics must be anchored in the form of central rules for conducting business within the digital market (Leonard & Graf von Kospoth 2017). The German Ethics Council also concludes in a recent statement focusing on specific health-related areas of application that the traditional data protection law is no longer sufficient to meet the challenges of Big Data in the sectors examined by means of existing protection mechanisms and forms of action. It calls for a design and regulatory concept with the aim of protecting and respecting values such as sovereignty, justice, privacy, freedom, responsibility and solidity. The concept should be oriented towards data sovereignty in the sense of an extension of informational self-determination according to an interactive personality development while preserving privacy in a networked world (Deutscher Ethikrat, 2017, p. 27). The social sustainability aspect should be emphasised.

Osburg & Lohrmann (2017) provide an overview of different perspectives on aspects of sustainability within the digital world. The focus here is on leadership, mobility, working life and corporate responsibility, mainly addressing change and new models of digitisation. While the high relevance of digitisation is being discussed in all areas of life, the extent to which this is happening is slowly coming to light. Every change and new innovation can have far-reaching consequences for other areas and thus disrupt beneficial balances between society, the environment and the economy (Osburg & Lohrmann, 2017). In a workshop on the subject of "sustainable digitisation", the Ministry of the Environment was able to uncover both significant opportunities and risks as well as potential opportunities that digitisation could achieve. The focus was on resource efficiency through digitisation, intelligent energy systems, sustainable digitisation in society and digital education for sustainable development (MUKEBW, 2018). Both a promotion and a counteraction of resource efficiency can be caused by the digital change in the area of production (MUKEBW, 2018). While digitisation and digitalisation will be able to achieve considerable efficiency gains on one hand, it can also lead to immense negative effects on the other one. Santaris (2017) points out that digitisation and digital transformation seem to shift the demand for energy and resources on a global scale. Increased consumption would lead to a destruction of efficiency gains due to rebound effects (Erdmann & Hilty, 2010). Sustainability-focused concepts must always be integrated into the development of innovations by beginning - well aware that rebound effects will always be effective in the use phase.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Due to the implementation of the shared economy concept, the shift from product to service orientation can be observed in many sectors, which leads to the questioning of existing business models. Building on service-dominant logic and interorganisational governance models, Aksin-Sivrikaya & Bhattacharya (2017) establish a conceptual framework for a digital ecosystem integrating multi-stakeholder and value-co-creation. They also identify potential emerging sustainable governance models within a proposed ecosystem. Future challenges are transferred into three categories: (1) the design of business models in a digital environment, (2) interruptions of existing businesses, and (3) environmental and social problems due to digitisation. If we learn how to deal with these challenges correctly, sustainable governance models can lead to a reduction of costs and frictions associated with management, manufacturing, processing, energy use, logistics, production and information collection (Aksin-Sivrikaya & Bhattacharya, 2017). Strictly centred views will be eliminated and integrated business ecosystems and value creation activities within multi-stakeholder networks will increase. Fixed boundaries will therefore fade (Aksin-Sivrikaya & Bhattacharya, 2017). The following table summarises current literature-based SWOTs.

In total, on the one hand, digitisation implies the risk of the non-transparency of the overall system, on the other hand it can serve to make specific areas more transparent - for example, by creating trust and transparency through digital dialogue and symbolizing complexity. In the financial sector, the use of digital media can thus lead to an intensified customer relationship and the integration of topics such as environmental awareness, social responsibility and economic activity; in the social media sector can thus contribute to increased sustainability in the sense of increasing efficiency and holistic consulting (Behringer, 2017). Zinnöcker (2017) also uses digital measures to create transparency. Accordingly, digital measurements support and activate the visualisation and billing of individual energy consumption as well as the actors and their energy savings.

METHODS

Beside analysing relevant literature in the topic sustainability and digitisation (both, English and German papers and literature) addressing challenges, opportunities and risks, and compiling a SWOT analysis, a concept map generated by content analysis of English papers was generated in order to analyse current linkages between sustainability and digitisation and digitalisation. Final, results of systemic structural constellations were integrated to combine conscious-based and unconscious-based knowledge.

A total number of 112 texts (scientific articles and summaries; e.g. Bondarouka & Brewster (2016); of acknowledged scientific journals; e.g. The International Journal of Human Resource Management, Human Geographies – Journal of Studies and Research in Human Geography, Journal of Security and Sustainability Issues, Journal of Urban Regeneration and Renewal) relating to the period 2015-2018 and accessible in the Ebsco and Scopus databases were included in the analysis. Within the Ebsco and Scopus databases, the keywords “digitisations” and “sustainability” were used as filters.

Content analysis can help to explore specific concepts from text-based information and uncover their structures and interdependencies. From a given amount of data, it filters out the most frequently occurring topics (Zawacki-Richter & Latchem, 2018). The computer-aided content analysis which is used under the purpose of this study may serve to map a specific area of research (Zawacki-Richter & Latchem, 2018). Smith & Humphreys (2006) highlight the advantages of such automated processes. Human analysis requires considerable financial and time resources to avoid the subjectivity associated with the method. For example, coders must be trained in advance, dictionaries and codebooks validated and

Table 1. SWOTs in the context of digitisation and sustainability

Strengths	**Weaknesses**
• digital ecosystems describe an open information landscape • digital ecosystems encompass a holistic perspective on the inter-organizational system of action	• lack of transparency • digitisation seems to shift the demand for energy and resources on a global scale • addictive potential (e. g. specific platform designs) of specific technological innovations • the traditional data protection law is no longer sufficient to meet the challenges of Big Data in the sectors examined by means of existing protection mechanisms and forms of action • environmental and social problems due to digitisation
Strengths and Weaknesses	
• complexity	
Opportunities	**Threats**
• **healthcare sector:** people are benefiting from new technologies that make medical solutions more affordable, accessible and of higher quality • **automotive sector:** networked applications can save several hundred thousand lives and reduce traffic accidents considerably • **education sector:** fair, integrative and qualitative high-quality education can be achieved by solutions in the sense of an open education such as MOOCs • **financial sector:** use of digital media can lead to an intensified customer relationship and the integration of topics such as environmental awareness, social responsibility and economic activity • **social media sector:** can contribute to increased sustainability in the sense of increasing efficiency and holistic consulting • **production sector:** • Material Flow Cost Accounting as a simulation and optimization tool for small and medium-sized enterprises in the manufacturing sector and control instrument in companies (e.g. by integration into existing Enterprise Resource Planning (ERP) environments • Learning networks for companies & integration of employees and their training and further education to increase resource efficiency • Environmental services 4.0: Digitisation opens up completely new possibilities and improved information for recycling companies. • Efficient production: Optimisation of internal material/energy efficiency, e.g. "One-piece-flow": no set-up times and production is started without any losses as well as a digital image of production can reveal optimization potentials • value chain 4.0: increasing modularization of companies → more interfaces between companies; transport of information along the value chain; the recyclability of production should already be taken into account at the design stage; definition of interfaces for resource efficiency and industry 4.0 • **decreased resource consumption in production due to** • Production is closer to the customer, is more demand-oriented → resulting in lower inventory levels and less overproduction • Product to Performance: product becomes less important, the benefit of the product becomes more important • Digitisation enables transparency of the by-product streams and better information across the value chain → optimizes the value chain • Losses in value added can be better evaluated through digitization and inefficient production can be avoided • digital measurements support and activate the visualisation and billing of individual energy consumption as well as the actors and their energy savings • specific adaptations can help to reduce greenhouse gas emissions and promote a market transformation towards renewable energies (SDG 13) • resilient infrastructure • promote innovation and sustainable, inclusive industrialisation • establish a human balance • sustainable governance models can lead to a reduction of costs and frictions associated with management, manufacturing, processing, energy use, logistics, production and information collection • by creating trust and transparency through digital dialogue and symbolizing complexity specific areas can become more transparent	• network effects can lead to dysfunctional social distribution and participation processes • information asymmetries, opportune behaviour and negative assessments can have an impact on citizens' decisions and voting behaviour as well as on effectiveness and sustainability • reduced range of information (lack transparency) and equal opportunities between technology-affine and technology-averse citizens • immense energy consumption • further rebound effects • every change and new innovation can have far-reaching consequences for other areas and thus disrupt beneficial balances between society, the environment and the economy • interruptions of existing businesses • Increased resource consumption in production due to: • Increasing complexity in the world of production, consumption and communication • Increasing technical and social innovation • Acceleration of processes in the areas of planning, production and logistics • a shortening of product lifetimes (not because of reduced shelf life, but because of faster product innovations • Extension of possibilities (product features, services...) & product offers • Increasing the specificity of customer requirements • Increase or shift in demand for products and services • a constantly growing individualisation of consumer wishes and products
Opportunities and Threats	
• opportunity to reduce the use of resources concerning an increasing scarcity of resources • far-reaching changes in processes, products, processes and business models • considerable efficiency gains on one hand, that can also lead to a negative effect (rebound) on the other one • digital human rights and ethics must be anchored in the form of central rules for conducting business within the digital market • the design of business models in a digital environment • rapid development of technologies • sector-specific requirements • new designs and regulatory concepts • shift from product to service orientation • integrated business ecosystems and value creation activities within multi-stakeholder networks

intercoder reliability tested (Smith & Humphreys, 2006, p. 262). In addition to cost savings, automation can shorten the analysis process. At the same time, it is a simplification when very large amounts of data are to be examined (Smith & Humphreys, 2006). In the context of this investigation the content analysis software Leximancer^{LM} (2017) was used for this research. This includes a two-stage process of simultaneous information extraction. For each of these levels (semantic and relational) a different algorithm is used (Smith & Humphreys, 2006). In the context of our analysis it produced a concept map which represents key concepts and the semantic structure of topics for the articles examined. Leximancer^{LM} has already been used for several content analyses of academic journals (Zawacki-Richter & Latchem, 2018). Analyses up to now relate amongst others to the Journal of Communication (Lin & Lee, 2012), Journal of International Business Studies (Liesch, Håkanson, McGaughey, Middleton, & Cretchley, 2011), Distance Education (Zawacki-Richter & Naidu, 2016) and the Journal of Cross-Cultural Psychology (Cretchley, Rooney, & Gallois, 2010).

The software generates a visual map whereby similar concepts are bundled (Zawacki-Richeer & Latchem, 2018). According to Smith and Humphreys (2006, p. 264) "The map is an indicative visualization that presents concept frequency (brightness), total concept connectedness (hierarchical order of appearance), direct interconcept relative co-occurrence frequency (ray intensity), and total (direct and indirect) interconcept co-occurrence (proximity)". Harwood, Gapp, & Stewart (2015) were able to demonstrate stable results using Leximancer^{LM} and a manual grounded theory approach. Nevertheless, it is of great importance always to pay attention to expert judgment and analytical sensitivity with regard to interpretation (Zawacki-Richeer & Latchem, 2018). In addition, the interpretation requires both knowledge and a thorough understanding of the context and theme of the study (Zawacki-Richeer & Latchem, 2018).

Moreover, facing this variety and complexity in the context of digital change, new approaches, methods and models are increasingly relevant for generating holistic sustainable concepts identifying strengths and challenges in organisations, institutions and companies. Meeting the requirements of current and future reality, e.g. complex strategic decision-taking, environmental behaviours and the maintenance or preserving of resilience of systems, scientific tools and practices often lack in complete mapping (Walker et al., 2002). According to Wade (2004, p. 194), constellations are a method meeting the mentioned challenges, because they "provide powerful and creative ways to clarify and resolving complex, possibly intractable issues associated with organisations." In addition, they offer the opportunity to experiment with specific solutions in a secure environment and thus support decision making (Wade, 2004). Intuition and unconscious knowledge play a major role in the area of relevant decision-making processes (Rosselet, 2013), therefore, unconsciousness should be integrated beside conscious-based methods.

In particular, top managers are often confronted with a variety of tasks, information and decisions that have to be taken in a very short time. Agor (1986) was able to show that the majority of the executives he examined trusted their intuition in particularly important decisions. A significant advantage of the systemic structural constellations over many other methods is that they allow the integration of both unconscious and hidden knowledge in the area of decision-making processes (Arnold 2018, Arnold 2016). Accordingly, a wider range of knowledge on a topic can be skimmed off. Systemic structural constellations can be used to train a careful handling of digitised systems and as an instrument for mapping relationship structures within a system for the analysis and creation of possible changes to these structures (Kopp, 2013). Depending on the system under consideration, specific constellations can be used. The common feature of the constellations is that they aim to show the correlation between the individual system elements (Kopp, 2013). According to Arnold (2016, p. 22), the three central components of this method

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

are a group of people who participate on a voluntary basis as representatives (1), an issue-holder (2) and a facilitator or process manager (3). An important component is also the so-called representative perception. This means that the representatives serve as resonators for the hidden and implicit knowledge (Arnold 2016, Rosselet, 2013). According to Schlötter (2005) representative perception is a basic ability of all humans. High-quality constellations are rule-guided and follow main structures.

There are five key phases in systemic structural constellation work (Arnold, 2018): (1) Starting with clarifying the context the constellator and the issue-holder clear up the concern and issues by figuring out the goal and key involved elements. In scientific contexts, beside practitioners researchers or professors (educated as a constellator) can take the part of the issue-holder. (2) The selection of representatives for representing the core elements (agreed on in step 1) of the specific system is taken by the issue-holder by intuition or based on unconscious decision. (3) Initial constellation and first pattern are formed by the issue-holder as he or she positions all representatives/elements in the room. That special positioning and grouping is called structural constellation. It enables the recognition of spatial perspectives, arrangements, distances, and directions. So, underlying dynamics of the represented and focused situation can become more visible and conscious (Arnold, 2018). The selected representatives can also position in the room themselves – following their impressions where to position best in the given systemic constellation. (3) Process work enables diverse interventions facilitating solutions, testing simulations or gaining new hypotheses, etc. Finding a solution, forming a final constellation setting or the issue-holder is satisfied with the current patterns, the constellation process will be finished. (4) In the Closure the representatives are released from their work and will be thanked for their service and assistance (Arnold, 2018). (5) A final reflexion on new insights and strategic options follows. Systemic structural constellation processes take 20 minutes up to two hours.

Within the scope of the chapter tangible examples of applications with students, carried out at the Chemnitz University of Technology, will be presented. Table 2 gives an overview of the methodical design. One of the constellations figures out tensions between technology-avers and -affine people in the context of sustainability and digitisation. The other focussed on health care and consisted the following elements *Sustainability*, *Digitisation*, *Company*, *Organisational Members*, *Health Care Effects* and *Competition*.

Table 2. Methodical design of the Application of Systemic Structural Constellation

Topic	Digitisation and Sustainability: Threats, Opportunities and Non-Conformity
Question/Goal	Which possibilities and threats dominate in the context of digital change and its sustainable development? Are there any overlaps in the results of the methods used? • Content-based: new hypotheses and theory development concerning Digitisation and Sustainability
Participants	Issue-holders: professors, researchers, students Representatives: experienced researchers and students from Chemnitz University of Technology
Year	Autumn 2017 and Spring 2018
Duration	Up two hours including reflexion
Research design	Exploratory case study
Data collection	Observation, interviewing, testing as well as heuristics
Data preparation	Video, protocol, joint reflexion
Data interpretation	Interpretative-hermeneutic methods, reference analysis

(own source)

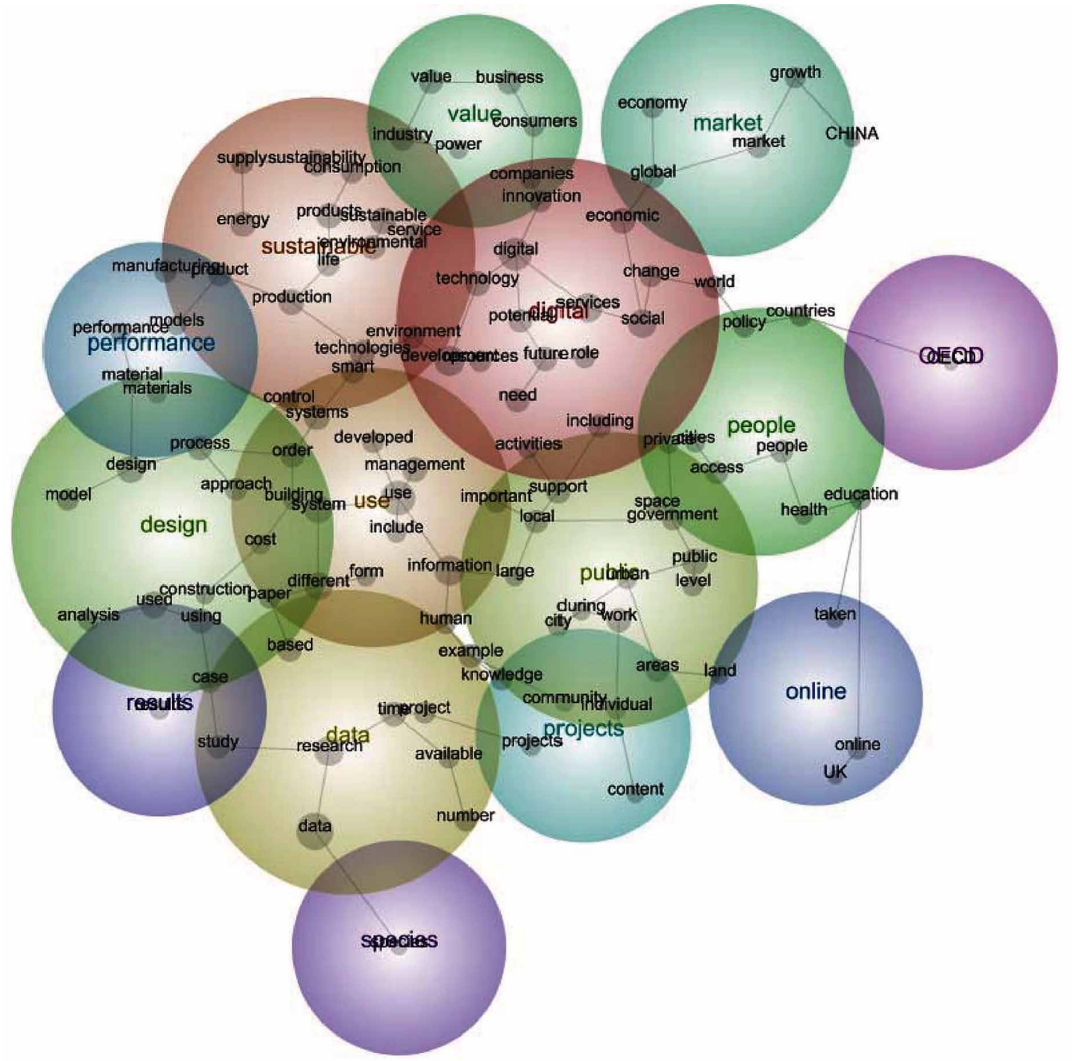
Limitations

It should be noted that the study has covered a period from 2015 to 2018. Digitisation is subject to constant change, which makes it virtually impossible to fix it in time. It only seems feasible to show a trend that reflects prevailing topics. The articles were accessed through the two databases: Ebsco and Scopus, but not limited to specific journals. It should be noted, however, that only accessible articles could be included. Only English articles and books were used. However, it may also be of interest to include literature in other languages and other types of sources. As already mentioned, Leximancer^{LM} can be used to create concept maps. Algorithms serve to find the most frequently occurring terms (Zawacki-Richter & Latchem, 2018). However, the co-word analysis should be viewed critically. According to Leydesdorff (1997, p. 418) "words change both in terms of frequencies of relations with other words, and in terms of positional meaning from one text to another." It should be noted that "the fluidity of networks in which nodes and links may change positions is expected to destabilize representations of developments of the sciences on the basis of co-occurrences and co-absences of word" (Leydesdorff, 1997, p. 418). Some authors point out that the words within a co-word analysis are only to be seen as indicators for the links between individual concepts (Courtial, 1998). Others see particular possibilities to carry out a narrative investigation concerning a specific subject in the co-occurrence of words (Liesch et al., 2011; Sowa, 2000). With regard to the maps created with Leximancer^{LM}, a careful interpretation and knowledge of the overall topic is indispensable (Zawacki-Richter & Latchem, 2018).

This is comparable to the systemic structural constellations. They have a high objectivity and reliability (Schlötter, 2005), but also face the reliability-validity dilemma (Lamnek, 1988). Meeting external validity a joint discussion and reflexion for balancing different perspectives and points of view is essential in scientific contexts (Arnold, 2018). As the main focus, here, is set on unconscious knowledge, the main quality criteria should assess how useful a constellation is to address new questions, formulate promising hypotheses and widening the context and understandings. However, in order to produce high quality in constellation settings, the frame-set of the constellator, how open-minded and respectful and how experienced she or he is, have strong impact on the outcome. In addition, the representatives can also manipulate the results when not being open-minded, but having strict frames or expectations. Therefore, hidden work, e.g. using tags, t-shirts, etc. for differentiation, is most successful – as it focuses on representation fundamentally. In addition, when repeating constellations, there might never be identical positioning, but always comparable patterns. So, the results of the constellation work was not interpreted as absolute truth, but as helpful patterns and indicators for challenges in complex settings addressing sustainability and digitisation. However, this method sensitises students to the topic and on the other hand, completely new impulses for reflexions, progress and changed frames can be generated, which can be used by the companies themselves.

SOLUTIONS AND RECOMMENDATIONS



In this section, our results of the concept maps and systemic structural constellations will be discussed on the background and literature review.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Concepts Maps

The following fifteen topics are associated with the literature studied: *Data*, *Design, Digital*, *Market*, *OECD*, *Online*, *People, Performance*, *Projects*, *Public*, *Results*, *Species*, *Sustainable*, *Use*, and *Value.* Figure 1 shows the concept map of the analysed texts.

Figure 1. Concept map for the analysed literature

The topics with the most common strokes are *digital* (13610), *sustainable* (11191), *use* (10396), *data* (9701), *design* (6166), the latter is already green. Warmer colours (of the other themes) show that these are the most frequently occurring themes within the texts studied. In particular, the interpretation will focus on the first three topics. Leximancer[LM] makes it possible to visualize the concepts related to the topics. "Digital" is associated with the following concepts for the texts used: *digital*, *development*,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

services, *social*, *economic*, *technology*, *future*, *need*, *potential*, *including*, *world*, *change*, *innovation*. The concepts *sustainable*, *sustainability*, *production*, *products*, *energy*, *technologies*, *environmental*, *product*, *smart*, *manufacturing*, *life*, *supply* and *consumption* are associated with "sustainability". *Use*, *information*, *system*, *different*, *systems*, *management*, *order*, *important* represent the concepts in connection with the theme bubble "use".

Linking the topics *digital* and *sustainable,* it has to be emphasised that the analysis merely shows one direct link path between the two thematic bubbles (*sustainable* and *digital*). The directly related concepts are: *sustainable*, *environmental*, *life*, *production*, *technologies*, *(smart)*, *environment*, *development (resources), technology*, *digital*. These topics reflect the analysed SWOTs (see table 1), as well. So, there is a high congruency. With regard to a sustainable design of digital change, the main focus seems to be on production. Extracts of the used literature with keywords such as manufacturing processes, production and production phase reflect this. An indirect connection between the two topics also becomes clear. The concept of technologies, which is linked to digital and sustainable through further concept points, is also included in the *use* area. In this sector, for example, the following problems may arise in connection with the use of digital technologies: According to Bondarouk & Brewster (2016), concrete case studies show that employees prefer to receive information from people rather than from a digital system. Incongruent frameworks can therefore result in divergent views and conflicting information. This in turn can be accompanied by losses in the area of processes, resistance and false expectations (Bondarouk & Brewster, 2016). According to this, it seems to be quite relevant on the part of social components to leave people in the function of superiors. In any case, it should be examined in advance what concrete problems a digital transformation can entail in such a case in order both to find a socially acceptable solution and to protect the company against possible losses. Another problem could be irreversible damage to data security if information systems are outsourced (Bergere, 2016). Even in connection with advanced metering infrastructure and the electronic storage of customer data, problems may arise in the area of data protection (Sooknanan, Bahadoorsingh, Joshi, & Sharma, 2016).

The first analysis of the literature used (without the help of the Leximancer^{LM} tool) shows *digitisation* presents a multitude of opportunities and risks that must be taken into account in order to achieve sustainable change in the overall system. But which areas are in focus and where could a sustainable design be particularly relevant? The following is a list of the main results in connection with the Leximancer^{LM} programme used. The structuring of the following sections is intended on setting the thematic focus of the analysis. Selected interrelationships have been integrated. In addition, the subheadings are used to illustrate the areas of topics that overlap and are bordering on the first analysis (SWOT). Since the use phase, especially in connection with potential rebound effects, is a major focus in connection with technological progress, opportunities and risks of this concept bubble are explained in a separate section.

Results concerning the specific topics and its concepts after analysis by the programme, which specify above listed points, complete or acknowledge them:

Global Development

Not only specific sectors (see table 1), but also global industries and specific groups of countries face new challenges. According to Alexander (2017), constant innovations in corporate technologies and an increase in the virtualisation of social spaces are key drivers of a transformation of the global retail industry. This could cause some difficulties, especially for emerging countries. According to Conschafter (2017), cities can also be made usable as respite from the digitised world. Thus, future urban planning

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

should reflect not only the advantageous and unobtrusive integration of technologies for people, but also the most appreciated places of the past. It should be emphasized that this integration must take place for all economic and social backgrounds and therefore a complete participation of all people should be striven for (Conschafter, 2017). He sees the risk of excluding certain groups, for example, in the decline in car traffic and car ownership. In addition to the exclusion of certain groups, according to Matser (2017), there is also the risk of an increased distance between customers and employees (business sector). Furthermore, there may be increased staff shortfalls if this problem is not counteracted in advance by means of increased attention (Matser, 2017). In specific sectors, such as services, fewer people are expected to be needed and unemployment is expected to rise. This can lead to output and quality increases (Matser, 2017), and suitable political measures are necessary to compensate an increased unemployment.

Demand for Sustainability and the Inclusion of Specific Groups

According to Lyons, Mokhtarian, Dijst, & Böcker (2018), it is necessary to understand how the basic social needs for the various approaches (to goods, people, services, opportunities) can be met sustainably. Uncertainties about future access depending on affordability and social preferences should also be taken into account. Scenario planning can play a decisive role here, for example by mapping divergent future perspectives and promoting group thinking (Lyons, Mokhtarian, Dijst, & Böcker, 2018.). Beside avoiding or reducing uncertainties as ways of including the various groups, Conschafter (2017) calls for the design of the built environment and addressing it through appropriate policies to counteract the exclusion of specific groups. He identifies great potential for artificial intelligence, increasing automation and the associated efficiency gains, and the use of renewable technologies to create environmentally friendly cities of the future. However, in order to achieve this and to create a resilience of the cities, it is relevant that the cities themselves push this forward, for example with the creation of green spaces (Conschafter, 2017). Lifelong learning can be seen as an essential way of promoting social inclusion. Both younger and adult groups of the labour market or the unemployed should be included (Dias, Alemdra, & Silva, 2017). For specific groups, such as the elderly, it is often a considerable challenge to face completely new challenges. A change is also increasingly expected on the consumer side to solve global environmental concerns. They must also assume responsibility in social, economic, ethical and ecological areas (Fuentes & Sörum, 2018). In order to meet this complex challenge, one should never start at just one point.

Company

In the future, it may be particularly relevant for companies to combine different types of innovation (organisational innovation, marketing, process, service and product innovation) in order to set themselves apart from other competitors (Luciana & Stan 2017). On the one hand, there are also clear effects on social factors in the field of digital, whose changes are also accompanied by market-economy transformations. On the other hand, the graphic shows no connection line between the theme bubbles *people* and the *market*. Thus, there should be greater importance regarding the inclusion of this concept (*people*) in the areas of *market* and *digital*.

In the automotive sector, green services can play a particularly important monitoring and control function for sustainable measures, such as in the area of raw material recycling (Opazo-Basáez, Vendrell-Herrero, & Bustinza, 2018). It is relevant to integrate these projects with digital skills in the case of

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

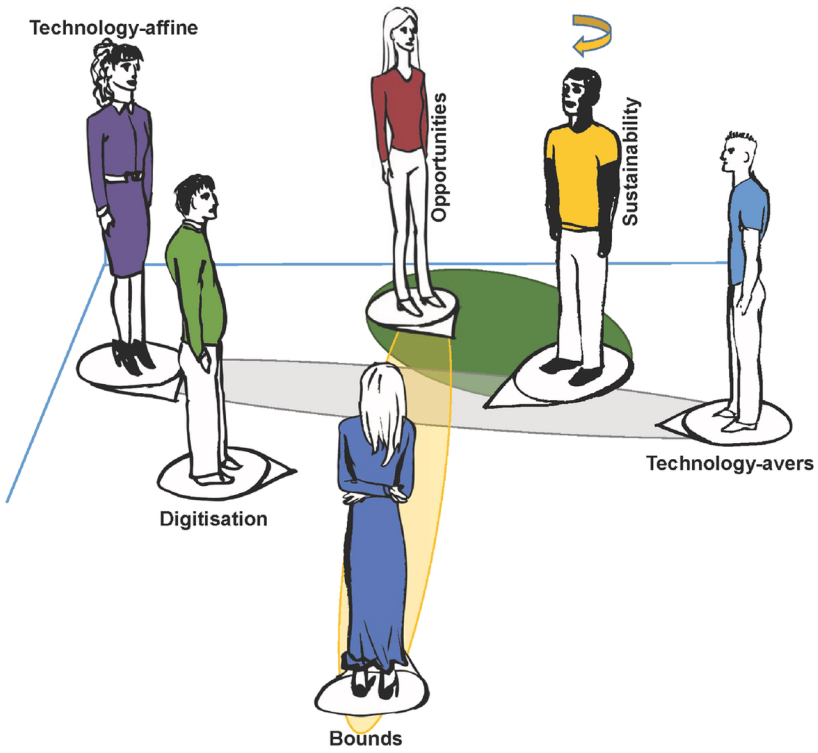
implementation effectively, taking into account the respective performance and sustainability objectives of the company (Opazo-Basáez, Vendrell-Herrero, & Bustinza, 2018). In addition, intelligent materials can provide significant opportunities to contribute to the sustainability of digital measures. These can be activated, for example, by specific environmental impacts and thus transformed (Teoh, Chua, Liu, & An, 2017). This could lead to other energy sources being saved. An increased service life can be particularly useful for products whose production phase has a considerable negative impact on the environment. The associated increase in efficiency leads to a reduction in the energy required for recycling materials (Dominish et al., 2018). This has both positive environmental effects and cost savings on the company side. However, potential rebound effects should always be considered in the context of efficiency improvements (Greening, Greene, & Difiglio, 2000). It is useless to extend the service life of products by means of new technologies if this results in higher consumption, which in turn increases the resource usage. Informing consumers about potential risks should be done by both the state and the companies themselves.

A study of 100 Canadian companies in 2015 shows that both management commitment and stakeholder pressure will lead to environmentally friendly supply practices and waste-free production. In this way, more innovative products, new skills, environmental improvements and financial gains can be increased (Rajala, Hakanen, Mattila, Seppälä & Westerlund, 2018). Under the focus of a sustainable design of the manufacturing processes, economically effective processes and products should predominate. According to Da Silva et al. (2017), these contribute to optimising energy procurement and consumption, the environmental impact, the safety of employees and society and the use of natural resources. Industry 4.0 can make a significant contribution to minimise the environmental damage. Intelligent systems, in the area of production, can achieve a reduction of the following main areas: overproduction, production waste, goods movements and energy consumption (Kamble, Gunasekaran, & Gawankar, 2018). According to Kamble et al. (2018) products can be made clearly identifiable by means of intelligent systems. This can help to facilitate the challenge of increasing complexity in the area of manufacturing processes (Kamble et al., 2018). It is crucial to analyse the effects of such systems (products, factories) (Kamble et al., 2018). These smart technologies seem to play a decisive role, especially with regard to sustainable development.

Specific Challenges and Opportunities in Connection With the Theme Bubble Use

According to Gebhardt (2017), ecosystems are directly related to a high degree of complexity and constant change. Managers must be able to cope with these tasks and take irrational behavior and complex system logic into account (Gebhardt, 2017). A control of social systems should include both belief systems and emerging characteristics (Gebhardt, 2017). Here, systemic structural constellations could support respective development. In connection with a stable design of storage management, long-term strategies and intelligent filter systems represent a major challenge (Scholz, 2016). This problem relates in particular to the problem of digital preservation of information. While printed paper makes it possible for a very long time to preserve information, such as cultural heritage, less than 20% of the information transmitted globally (in relation to 2007) could be stored in the context of technical ageing (Scholz, 2016).

There is considerable potential for optimization in the automotive sector. For example, real-time access to the entire system can improve flowing and stationary traffic and its safety (Rammler, 2017) (see table 1). A combination of infotainment systems and standard communication technologies can contribute to an increase in well-being, especially in conurbations, where, for example, waiting times can



EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

be bridged. Here entertainment, communication, information and work can play a major role (Rammler, 2017). The adaptation of e-government systems can contribute an increased benefit for municipalities in electronic transactions with stakeholders along the whole value chain (Khilji, Duan, Lewis, Bukoye, & Luton, 2017). According to Toonen & Bush (2018), fish attraction devices can help to get a more accurate picture of the shape of oceanic space using information and sensor technologies. It is relevant to make information and communication technology more environmentally friendly and energy efficient through appropriate measures, as they are used generously in the area of digital information over its entire life cycle (Chowdhury, 2016). In sum, according to the literature, central rebound effects can be: energy overconsumption, underestimation of human needs and ability to adapt, unlearn of diverse cap-/abilities, etc. (further see table 1). These rebounds might even get worse when differentiating technology-avers and technology-affine people.

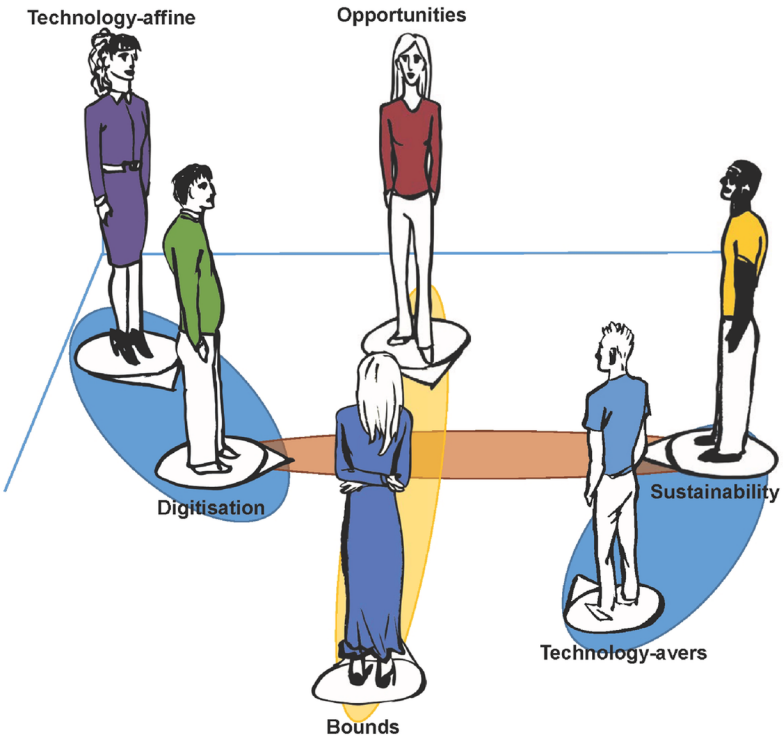
Systemic Structural Constellations

Figuring out main challenges, a constellation was conducted containing the following (hidden) elements: Digitisation, Sustainability, Opportunities and Bounds, Technology-affine and Technology-avers (figure 2).

Figure 2. Initial constellation representing technology-avers versus -affine people
(own source, figures © Antonia Wetzel)

Sustainability. Good position, can see all elements, strongest relationship to *Digitisation*;
Strengthened by *Technology-avers* in the back, i.e. "no detached view of sustainability desired"
Digitisation. *Technology-affine* should be promoted;
at the same time, wants to deal with the *Bounds* and overcome them;
does not feel any tension, but a desire for cooperation with all other elements ("no cut")
Opportunities. *Sustainability* is becoming increasingly important, must be taken into account.
Bounds. Focus on *Sustainability* is good, desire for contact with other elements
Technology-affine. Focus on sustainability is good;
Transition ongoing (towards an extreme pole - in own perception and in external attribution; wants to step back from *Digitisation*; Suggestions: Using digitisation to get closer to sustainability or not)
Technology-avers. on the same level with *Technology-affine* (crystallization as pole)

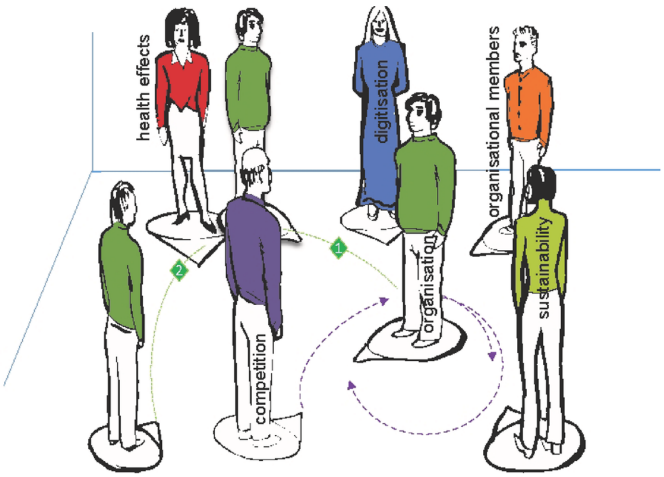
EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use



Issue-holder were a sustainability professor and a group of scientists and students in the field of sustainability management. The whole constellation work was conducted in a hidden way, meaning only the constellator knew what the respective representatives were representing. The single elements or respective representatives were asked to find a good place in the room related to the given system and searched their position themselves. The representatives were asked for their feelings, wishes to move and differences they can explain. After a first round of expressing their inner pictures and ideas, the representatives were allowed to move and interact further. This procedure was repeated until a final constellation was found as all representatives explicated a stable context. The figures convey pivotal expressions of the respective elements. The interpretation is based on the statements, the positions and systemic principles (Arnold, 2016).

In the beginning, it became quickly obvious technology-affine and technology-avers are in clear tensions and two different poles – as they positioned vis-à-vis (figure 2). During the constellation these two poles oriented towards digitisation and sustainability, but becoming more open for other positions and got more balanced. The element *Technology-affine* wanted to push digitisation without any constraint. In the beginning *Sustainability* mainly focussed on *Bounds* and *Technology-avers*, but changed to a more open-minded and balanced position stating *Opportunities* can operate as a mediating element; and a case-based analysis should be conducted in order to figure out all opportunities and bounds or SWOTs for taking sustainable decisions (figure 3). This is in line with Santarius' (2017) argument digitisation and digital transformation should be analysed case-based as well as support and strengthen sufficiency and overall sustainability. Yet, he already observed severe rebounds, as overconsumption, immense energy consumption, etc. So, in terms of sustainability, digital transformation needs a clear value basis and sustainability added value. In terms of responsible management, digitisation and digital transformation has to be reflected before implementing assumed digital progress. A company should assess digital changes against a sustainability framework, including social, environmental and economic indicators, case-wise. Part of a responsible management is also lab-orientation, meaning first simulating complex transformational processes in selected corporate parts before implementing digital change and devices company-wide. Therefore, societal progress and strict law regulation will be needed, too.

Moreover, stressing health as a particular focus in the constellation work, the following figure presents the initial constellation of the second conduced constellation. Particularly for the element *Organisation*, a clear area of conflict between the elements *Competition* and *Organisational Members* emerged within the constellation (see figure 4). Companies must be able to withstand competition in the face of digital change, but they must not ignore their employees. The *Company* felt that it was consistently driven by *Competition*. For the *Employees*, direct health effects were of particular relevance, and *Sustainability* was of secondary importance for this element in the course of the installation process. However, strong tensions and various trade-offs occurred and were not easy to solve. The versatile connections, topics and linkages can also be seen in figure 1. The concept map shows various influences and connections concerning digitisation and sustainability, like people, public, market, value, performance, design and use, etc. So, companies have to consider diverse topics and challenges for managing digitisation, digitalisation and digital transformation successfully. The constellation makes obvious that organisations cannot focus on all aspects at the same time and often prioritise topics. Likewise, sustainability is not always on the top agenda.



EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Finial constellation representing technology-avers versus -affine people
(own source, figures © Antonia Wetzel)

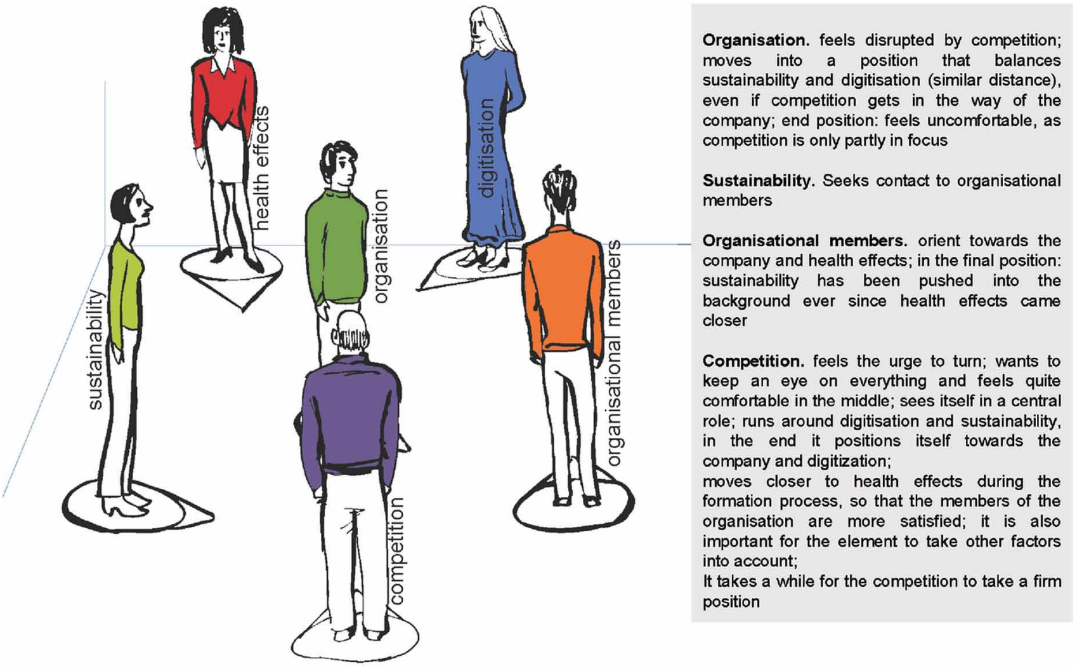
Sustainability. strongest connection to *Digitization*; does not see *Opportunities* as a connecting element; Opportunities and risks are only seen in terms of digitisation, not in terms of sustainability - "there are connections, but not in every case or not at all levels" Proposal: "there should be separate opportunities and risks for sustainability";
In the process - after a change of position of Technology-avers: loss of reinforcements; distances itself from *Digitisation*, sees *Digitisation* as a danger, more disadvantages than advantages; at the same time more opportunities for *Digitisation* than for *Sustainability* are perceived
Digitization. Coherent positioning; desire for proximity to *Opportunities* - these should predominate as legitimation for own element
Opportunities. Bounds as connecting element; nevertheless desire to turn to both elements *Sustainability* and *Digitisation* (no two delimited topics)
Bounds. No special reference to elements; desire for distance to all elements; wish that all elements - except *Opportunities* - turn with the back ("show cold shoulder")
Technology-avers. with all connected, would like to have contact with all, at the same time proximity to the element *Sustainability* desired; *Technology-avers* does not necessarily mean sustainability-avers; Desire for constant connection to *Technology-affine*, so that a whole is created
Technology-affine. wants to be close to *Digitisation*, because progress is pivotal; would like to go even further away from *Bounds*, but *Digitisation* does not go along with; *Bounds* should not come closer; sees *Opportunities* as a link between *Sustainability* and *Digitisation*

Figure 4. Initial constellation representing sustainability and digitisation in health contexts
(own source, figures © Antonia Wetzel)

Health effects. Feels the urge to sit down and feels exhausted

Organisation. would like to focus on employees, but does not want to ignore competition; wants to be progressive for competition; wants to do everything right for organisational members

Sustainability. regards employees as central, the following 3 areas are relevant: organisation, digitisation, organisational members, neutral tendency towards others



Digitisation. is focused on company, health does not matter

Organisational members. feel equally weakened and attracted by sustainability, because it stands for the success of the company; the element also wants to keep an eye on the competition; expresses its interest in other organisations; feels the impulse to focus on health; wants to take care of it, even if others may have to put back; neutral attitude to other elements.

Competition. wants to keep an eye on everyone; feels a strong urge to move; wants to be able to react quickly when health becomes worse

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. Final constellation representing sustainability and digitisation in health contexts
(own source, figures © Antonia Wetzel)

The constellation also showed that the inputs for a sustainable development of corporate structures should be provided directly by the company itself (see figure 5).

So, as stated above, people are benefiting from new technologies that make corporate solutions more affordable, accessible and of higher quality and can support health at all. However, there are also strict limitations by human that have to be considered for digital transformation. These results are absolutely in line with Leonard & Graf von Kospoth's (2017) arguments that rapid digital transitions have to be aligned and balanced with humanity, and digital innovations should be made humanely sustainable. Sustainability can be a concept for reorientation towards humanity and human limits beside environmental boundaries.

CONCLUSION AND FUTURE RESEARCH DIRECTIONS

There are a lot of opportunities and risks concerning sustainability in the context of digitisation and a digital transformation. Increased affordability, accessibility, quality, speed, transparency, etc. could be opportunities in a digital transformation. Main rebound effects to be considered are: network effects, security lags, increasing information asymmetries, immense energy consumption, mass consumption, loss of sufficiency, lack of humanity, etc. This is in line with the results of the constellation work. Immense tensions between sustainability and digitisation occurred within the constellations, but there were also linked and progressive items. So, in light of a development towards sustainability, digitisation is both, boon and bane, and often needs a clear analysis of all relevant issues and a careful handling in order to be progressive. Digital transformation requires a precise and honest value basis and sustainability added value. In the context of sustainability and digital transformation, responsible and sustainable management

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

requires a holistic technology and environmental assessment, a clear emphasis of human values and a proactive orientation towards balanced concepts of planet, people and profit. Responsible management should assess digital changes against a sustainability framework, including social, environmental and economic indicators, case-wise. In addition, applying a lab-orientation, meaning first simulating complex transformational processes in selected corporate parts before implementing digital change and devices company-wide, is helpful to identify corporate and value-chain driven rebound effects or unstainable properties. So, a company can govern before deep (irreversible) transformational processes have happened. Therefore, societal progress, innovative incentives and strict law regulation will be needed.

Further research is need on real-effect rebounds for estimating environmental harm, social stress and economic losses on micro-, meso- and macro-levels. Protected or regional separated real labs could indicate possible changes and rebounds and indicate sustainable solutions, incentives and restrictions before implementing digital systems on a large scale. Moreover, generalisable trade-offs and rebounds should be figured out more intensively. Therefore, a cross-industry study should be conducted, both cross section and longitudinal section. Final, patterns should be investigated how digitisation, digitalisation and digital transformation can serve developments towards sustainability and not thwart sustainability goals in a big way. Here, pivotal digitised limitations have to be discussed, too.

Chapter 36
Organizational Learning and Change:
Strategic Interventions to Deal with Resistance

Jieun You

Doo Hun Lim
University of Oklahoma, USA

ABSTRACT

This chapter discusses organizational learning as a strategic approach for organizational change. In the face of turbulent and uncertain environments, continuous involvement in organizational change is necessary. However, most organizations encounter resistance to change, thus fail to accomplish organizational change despite change efforts. Previous literature explains that resistance to change results from cognitive and psychological processes, social and power relationships, and organizational structural inertia. Given the findings from the previous research, organizational learning theories can provide strategic interventions to effectively deal with resistance and to achieve organizational change goals. The learning organization embrace learning activities – unlearning, experimentation, exploration, double-loop learning, and action learning - to develop the adaptability to environmental changes. This chapter suggests that HR/HRD should play a role in building the learning organization and facilitating organizational learning for change as a change agent.

INTRODUCTION

In contemporary society, rapidly changing environments and technologies in the local and global context of competition have required business organizations to cope with unpredictable situations through ongoing changes for their sustainable development (Burke, 2014). In order to smoothly ride this global wave of change, organizational learning has been essential to ensure the organizations' change and growth (Argote, 2012). Organizational learning enables members to lead changes to overcome several challenges whinin and outside of an organization and eventually, to accomplish organizational performance and objectives (Gilley & Maycunich, 2000; López, Peón, & Ordás, 2005). Given the usefulness of organizational learning in addressing various organizational issues, many organizations continue to encounter difficulties in effectively managing organizational changes. According to the Mckinsey Global Survey conducted in 2008, only about 30 percent of companies successfully achieve organizational change despite their extensive efforts (Isern & Pung, 2007). Research suggests that many organizations fail to accomplish successful organizational change primarily because most organizations and employees have a natural tendency to resist both organizational learning and change and thus, merely adapt to environments (Agocs, 1997; Beer, Eisenstat, & Spector, 1990; Burke, 2014; Kotter, 1995; Kotter & Schleginer, 1979; Walsh & Ungson, 1991). Namely, the organizational change process may involve an uncomfortable situation that denotes the organizations' and employees' needs to depart from routinized work practices and systems that are sociocultural in nature and have been accumulated over a long period of time (Piderit, 2000). In the face of these challenges, Human Resource (HR) and Human Resource Development (HRD) functions have become more vital in developing and implementing strategies of organizational learning that are well-aligned with business (Beer, Voelpel, Leibold, & Tekie, 2005; Buyens & De Vos, 2001; Gilley, Eggland, & Maycunich, 2002; Gilley & Maycunich, 2000). In the studies on organizations, scholars put emphasis on organizational learning as a strategic initiative for organizational change (Eggland & Maycunich, 2002; Hendry, 1996; Siebenhűner & Arnold, 2007; Sugarmen, 2001). Organizational learning, on the other hand, may inhibit successful organizational changes when it focuses on exploiting existing knowledge and competencies and reproducing the current norms, system, and culture (Hendry, 1996; Levinthal & March, 1993; Walsh & Ungson, 1991). This suggests that as a change agent, a key task of HR is to understand the nature and perspective of resistance within organizational learning. Doing so will facilitate a change process in order to timely achieve the organizational goals of improving individual and organizational performance. In this context, research on organizational learning should view HR/HRD professionals as change agents and provide them with critical implications so they can facilitate and manage organizational learning with strategic considerations and effectively deal with the resistance to organizational change (Crossan & Berdrow, 2003; Garvin, 1993; Kontoghiorghes, Awbre, & Feurig, 2005; Lawrence, Mauws, Dyck, & Kleysen, 2005; March, 1991; Tucker, Edmondson, & Spear, 2002).

Previous studies have provided extensive understandings regarding factors influencing the resistance to change (Baum, 1990; Bovey & Hede, 2001; Kelly & Amburgey, 1991; Reicher, 2004; Szabla, 2007; Thomas & Hardy, 2011) and how to effectively handle the resistance (Brucknman, 2008; Dass & Parker, 1999; Dent, 1999; Fosfuri, 2008; Thomas & Hardy, 2011; Waddell & Sohal, 1998). However, existing studies have paid little attention to how organizational learning can be effectively used for organizational change under the strategic functions of HR/HRD even though roles of organizational learning is repeatedly highlighted in a change process. In particular, there is limited research on the resistance to organizational change in organizational learning studies although organizational learning theories have provided po-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tential strategies to effectively handle the resistance to change issues (Akgün, Byrne, Lynn, & Keskin, 2007; Feldman & Pentland, 2003; Fosfuri & Ronde, 2009; van der Bent, Paauwe, & Williams, 1999).

This chapter aims to investigate how resistance can be compromised through organizational learning and lead to successful organizational change. To that end, we review a wide range of literature on organizational learning and change to identify how organizational learning through HR interventions could be an effective strategy for organizational change by overcoming resistance. This chapter starts with a review of the concept and process of organizational change and factors of resistance to organizational change. We then describe strategies to effectively deal with resistance while discussing organizational learning as a strategic intervention for organizational change. Finally the chapter concludes with suggestions on the specific roles of HR/HRD as a change agent that leads organizational change by overcoming resistances to change, as well as discussions and implications for future research and practice.

ORGANIZATIONAL CHANGE

Since Kurt Lewin (1947) proposed the concept of organizational change as a social nature, there have been various arguments and discussions on organizational change in social science fields (Armenakis & Bedeian, 1999; Armenakis & Harris, 2009; Pettigrew, Woodman, & Cameron, 2001; Woodman, 1989). In the management field, organizational change theories have been developed as one of the core themes embracing two contrasting perspectives. Particularly, these different perspectives have created different analytic frameworks and intervention theories in the management field. While one view assumes that organizational change is episodic, discontinuous, and intentional, the other view perceives that change is constant, continuous, and cumulative. In episodic change, organizations are inertial to change, thus organizational change is driven by external factors.

Organizational change is also a process to overcome organizational inertia and replace the currently existing organizational structure and practice. In episodic change, an organizational change process is based on Lewin's 3-step model of unfreezing, transition, and refreezing. Organizational change begins with recognizing disequilibrium in organization and ends with institutionalizing new behaviors and standards. However, it is difficult for organizations to 'refreeze' new behaviors in episodic change because organizations and their members can relapse into the previous state because of organizational inertia. Accordingly, episodic change interventions place emphasis on cognitive redefinition and restructuring through learning. Change agents play a role as a first mover to create change intentions and to leverage changes in episodic change.

On the other hand, in continuous change, organizations are in the ongoing change state, thus change is a process of ceaseless modifications and adjustments in work processes and organizational practices. In continuous change, images of organization are represented by three concepts, improvisation, translation, and learning. In an ongoing change system, organizations encounter a time gap between change planning and implementation. Improvisation reduces the time gap between planning and implementation so that organizations systematically respond to environmental changes. Translation is an act to adopt and edit change ideas to match with different situations. Organizations enhance and strengthen their knowledge and skills through learning, which includes creating an organizational repertoire for continuous change. In continuous change, a change agent is a sense maker to redirect a change through communication. Although Weick and Quinn (1999) distinguish episodic change and continuous change and provide dif-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ferent processes and interventions, it is certain that organizations should, in both perspectives, improve the continuous adaptability in turbulent environments.

Given that organizational change is critical for organizational performance and survival (Haveman, 1992), it is important for organizations to strategically cope with environmental changes. Thus, organizational change, particularly in the management field, is often regarded as planned and intentional change effort efficiently dealing with the external influencers (Nadler, 1981; Porras & Silvers, 1991; Weick & Quinn, 1999). In line with the viewpoint, scholars have been interested in understanding how and why organizational change occurs so that they can produce interventions to accomplish successful and ongoing organizational change. Kotter (1995) suggested the process for organizational transformation, regarded as one as of the representative perspectives.

Specifically, Kotter (1995) presents eight steps for organizational transformation claiming that people often skip one or more steps, which sets firms to fail at accomplishing their changing goals. First, organizational change process begins with establishing a sense of urgency for motivating people to commit to change. The second step is to build a powerful leading coalition. Their change efforts and successes become a vehicle of major change for the whole organization. Third, a guiding group creates a vision to clarify and direct the change efforts. Next, companies should communicate with their members about their vision and strategies. The fifth step is to empower others to act for change, which helps remove obstacles to change. Sixth, organizations should systematically plan and create short-term achievements. It makes change outcomes visible and employees commit to long-term change process. Seventh, organizations should consolidate improvement and produce a long-term improvement. Lastly, organizations institutionalize new changes into their organizational structure and culture. Kotter's model suggests that organizational change is not achieved in a short-time and by just a few people. Organizations can accomplish their change goals by carefully planning each step and engaging people in the whole change process.

Meanwhile, Armenakis and Harris (2009) propose six themes for successful organizational change in their change model. First, organizations should be aware of the importance of the five change beliefs – discrepancy, appropriateness, efficacy, principal support, and valence - and identify them to motivate people's commitment. Second, the change recipient's involvement and participation are critical for organizational change. Third, organizational diagnosis on change should be conducted effectively and accurately, and the accurate diagnosis pinpoints discrepancy, that is, urgency of organizational change. Fourth, change agents should create readiness for change. Readiness for change is referred to as antecedents of supportive or negative reaction to organizational change. Fifth, it is important to establish and implement strategies to persuade change recipients to recognize urgency of change and to participate in the change process. These strategies include participation, communication, management of information, human resource management practices, formal activities, diffusion practices, and rites and ceremonies. Sixth, assessment of change is important for both readiness for change and institutionalization of change.

Similarly to Kotter (1995), Armenakis and Harris (2005) also highlight that people's participation and involvement in change process are critical for achieving organizational change. Both suggest that communication with change recipients can help them support organizational change and commit to change efforts. However, only a few firms are successful in accomplishing their changing goals despite many change efforts (Beer, Eisenstat & Spector, 1990; Isern & Pung, 2007; Kotter, 1995). In organization studies, resistance to change is widely accepted as a main constraint why organizations fail to successfully accomplish organizational change.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

RESISTANCE TO ORGANIZATIONAL CHANGE

Resistance to organizational change is traditionally regarded as an obstruction to organizational change. In several previous studies, resistance to change is mentioned as something to be "overcome." However, there is a growing perspective that resistance to change can be used as a facilitator of the organizational change process (Agboola, & Salawu, 2011; Ford & Ford, 2010; Fosfuri & Ronde, 2008; Mabin, Forgeson, & Green, 2001; Piderit, 2000; Thomas & Hardy, 2011; Waddell & Sohal, 1998). In this regard, it is important to understand factors influencing resistance to change in order to effectively deal with resistance so that it can contribute to successful organizational change.

Factors of Resistance to Change

Discussions on resistance to change focus on identifying factors of resistance to organizational change, thus proposing strategies to effectively deal with resistance to change. Some scholars explain resistance to change with a cognitive and psychological process (Bovey & Hede, 2001; Kotter & Schleginer, 1979; Szabla, 2007; Vince & Broussine, 1996). Kotter and Schleginer (1979) found reasons why firms fail to accomplish organizational change for people's psychological fears. They claim that change efforts fail because people feel threatened with change and learning, thus change agents or managers need to diagnose resistance to change in organizations and appropriately deal with the resistance. Generally, there are four reasons people resist change. First, people are afraid of losing their own values and privileges due to organizational change. Key stakeholders, such as decision-makers, want to keep their status and power, which makes them resist change so as not to lose their political power. Next, resistance occurs when people do not understand the importance of the expected outcomes of change. Third, people resist change when they believe the cost is higher than the benefit of the change. Fourth, people resist change when they are afraid that they cannot learn and master the new skills and knowledge that the organizational change requires. It often takes a long time for individuals to master new skills and knowledge, but organizational change requires them to adapt to the change quickly. For successful organizational change, change agents and organizational leaders need to predict the reason of the resistance and take action to address the resistance.

Bovey and Hede (2001) also claim that resistance results from an individual's cognitive and emotional process. First, individuals' perception affects resistance to change. As individuals perceive the impact of change on themselves increasing, their resistance to change also increases. Additionally, as the individual's perception of the degree of change control increases, the resistance decreases. Second, irrational ideas or cognitive distortion that individuals hold bring about resistance. A lack of adequate information or compromised relationships between individuals and organizations can reinforce irrational ideas and cognitive distortion. Individuals misestimate the impacts of change, which consequently increases the resistance to change. Third, individuals experience emotions and feelings such as loss, anger, frustration, and grief when they face changes in their job and roles. Failure of emotional adaptation causes resistance during organizational change.

Some scholars pay attention to social aspects as a factor influencing resistance to change. Strebel (1996) explains that employees resist organizational change because of personal compacts with individual employees in organizations. A personal compact means an agreement on "reciprocal obligations and mutual commitments" between employees and organizations. Personal compacts include three dimensions: formal, psychological, and social dimensions. Social dimensions of personal compacts are related

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to building the contexts for organizational change. Unless personal compacts of organizations are revised, the personal compacts can obstruct organizational change and increase the resistance.

Lawrence (1953, 1969) also focuses on the social factors of organizational change and argues that the resistance to change is a reaction to social change. According to Lawrence (1953, 1969), people do not resist a technical change itself. They resist a social change with which a technical change is accompanied. Generally, organizational change is initiated by staff specialists and unless people have a close relationship with staff specialists, they are often excluded. This change process brings about changes in their social and power relationships. Thus, people feel threatened and resistant to change.

On the other hand, Hannan and Freeman (1984) insist that an organization is a "unitary actor" of change (p.155), and organizations have a structural inertia to maintain the current state. It suggests that resistance to change occurs not just as a function of individual cognitive or psychological process but in the organizational system and structure (Agocs, 1997; Dent & Goldberg, 1999; Hannan & Freeman, 1984; Kotter, 1995). When Lewin (1947) introduced the term of resistance, it indicated that an organization itself – system and structure – tends to maintain the current state and resist change. Organizations have a structure that accomplishes the goals or purposes through the individual members' collective actions. Individual actors in organizations agree with building their organizational structure for the common goals even though each individual has his/her own private goals. However, building the organizational structure often requires the organizations and their members to pay expensive costs, which makes it difficult to transform or change (Hannan & Freeman, 1984).

Agocs (1997) also claims that an organization's tendency to resist is institutionalized in their behaviors and structures. She defines institutionalized resistance as "the pattern of organizational behavior that decision makers in organizations employ to actively deny, reject, and refuse to implement, repress, or even dismantle change proposals and initiatives" (p. 918). Resistance to organizational change can occur throughout the whole change process, which is strongly related to political and power issues of relationship among organizational members. Individuals or groups with different power relationships perceive the needs of organizational change and their responsibilities for implementing the change process differently, depending on their status and power. Therefore, it is not easy for all participants or stakeholders to agree in leading and managing organizational change.

Dealing with Resistance to Change

Kotter and Schlesinger (1979) describe several traditional methods that are helpful for overcoming resistance and leading organizational change. First, educating people before change and communicating change ideas with them help people overcome resistance. Through communication, people can share a vision and purpose of organizational change as well as understand urgency of change. Also, communications help organizations overcome the resistance that comes from lack of information or asymmetric information (Armenakis & Harris, 2005; Ford & Ford, 2009; Kotter, 1995). Second, employee participation and involvement inhibit resistance to change. Lawrence (1954; 1969) also mentions that participation is critical for dealing with resistance. This participation facilitates social interaction between managers and employees and helps to lead change agreements between them (Agocs, 1997). The third method is facilitation and support. This method includes providing training programs for new skills and knowledge, listening to employees, and emotionally supporting employees. The fourth method is negotiation and agreement. For example, providing incentives or benefits to potential participants and converting resistors can prevent resistance to change. Fifth, manipulation and co-optation are important for overcoming

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

resistance. Manipulation means "selective use of information and the conscious structuring of events," and co-optation is "giving individuals a desirable role in the design or implementation of the change" (Kotter & Schlesinger, 1979, pp. 110-111). Sixth, managers and change agents push employees to engage in the change process by explicit and implicit coercion. This approach could be useful when a fast change is needed. These methods dealing with resistance are quite familiar and usually inexpensive, but can result in negative effects on organizational change and make organizations pay expensive costs. Hence, it is important to deliberately choose and apply these methods after analyzing an organizational situation and defining organizational change goals and business strategies.

Lawrence (1954; 1969) shows that participation is a key factor influencing resistance to the change. The more employees that participate in the change process, the less organizations face resistance to organizational change. This means that organizational leaders and change agents try to encourage employees to be more involved in an organizational change process. Employee participation in the change process is based on social relationship and interaction among organizational members, which means that resistance to learning and change is affected by social factors. Lawrence (1954) claims that "what employees resist is usually not technical change but social change – the change in their human relationships that generally accompanies technical change" (p. 49). Change has both aspects, technical and social aspects. In particular, the social aspect of change means "the way those affected by it think it will alter their established relationship in the organization" (Lawrence, 1954, p. 52). In other words, social relationship and interaction critically affect the presence of resistance. Organizational change requires employees' collaborative involvement in the change process. In order to facilitate employee participation in the change process and collaboration with each other, leaders should make efforts to facilitate social interaction such as communication with employees. That is why Lawrence (1969) emphasizes that effective communications and collaboration among groups are necessary for implementing organizational change.

Ford and Ford (2009) also suggest that appropriate and sufficient conversations can encourage individuals to engage in the change process and reduce their resistance to change. According to Ford and Ford (2009), there are four types of conversations to encourage employees to participate in an organizational change process: initiative conversation, understanding conversation, performing conversation, and closure conversation. Appropriate and complete conversations encourage employees to understand the change goals and create action for implementation of the change process. In order to accomplish successful organizational change, organizational leaders or change agents need to let employees know detailed and specific information, such as, what they want, when they should do it, how they should do it, and why they should do it. It is not enough to have a plethora of conversations between employees and change agents and leaders; if the conversation is incomplete and inappropriate, it will be unproductive.

Meanwhile, Bruckman (2008) suggests several strategies to overcome resistance to change and to effectively manage organizational change process. First, working with the group provides clues for change success from the previous experiences and behaviors of the group. Second, understanding and confronting people's fear of change are important, because leaders often underestimate people's fear and resistance. Third, it is necessary to consider the group's perspective of change so that the group supports organizational change. Fourth, leaders should build trust through open and honest communication. Fifth, leaders should be honest about their change process and outcomes even though they are not sometimes positive. Sixth, leaders should be willing to compromise with employees for the change plan, because when employees participate in the change process their support also increases. Seventh, the group members should be allowed to take ownership in the change process. Eighth, leaders need to enhance their credibility by keeping their words. Ninth, leaders should reinforce changes by reward-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ing new behaviors. Tenth, leaders often think that financial rewards are the most effective reward, but financial rewards, in fact, have little effect on behavioral change. Eleventh, leaders need to manage both myths and realities within their organization.

Lastly, Bruckman (2008) highlights that leader's integrity is most critical in the change process. Previous research also illustrates that the leader's credibility and integrity is important in order to manage resistance and change (Erhard, Jenson, & Zaffron, 2010; Kouzes & Posner, 1990). The credibility and integrity of organizational leaders and change agents facilitate trust-building between them and employees. High trust between managers and employees reduce employees' fear of change and increase employees' expectation of change benefits (Kotter & Schleginer, 1979). Communication with employees and leader's efforts to stay true to what they say to employees can increase the leader's credibility and integrity and build a trustful relationship between leaders and employees (Erhard et al, 2010; Kouzes & Posner, 1990).

In sum, to overcome resistance to change, most scholars highlight the importance of co-participation/involvement, trust-based dialogue/communication, and strategic supports/interventions from leaders, managers, and each organization wide. Those factors are closely related to the process of facilitating organizational learning and building learning organizations. In the next sections, we discuss how organizational learning could be a strategic approach to organizational change by compromising resistance to change.

ORGANIZATIONAL LEARNING AND CHANGE

Given that changes in knowledge and technologies are more unpredictable and competition is increasingly serious, it is more valuable for firms to be continuously involved in organizational learning and change (Dodgson, 1993; Watkins & Marsick, 1993). However, it is also true that organizational learning contributes to establishing an organization's own structure, routines, norms, and culture, which enables organizations to maintain their identity and to survive from environmental changes (Lave & Wenger, 1991; Levitt & March, 1988; van der Bent, Paauwe, & Willliams, 1999; Walsh & Ungson, 1991).

Organizational Learning and Resistance to Change

Although organizations try to engage their members in organizational learning, organizations and individuals focus on learning and reproducing organizational routines. In this respect, organizational learning is based on past experiences and organizational history. Under the uncertainty of environmental change, organizations try to maintain their identity, structure, and culture through the organizational learning process in order to survive competition (Levitt & March, 1988). This means that organizations and individuals are conservative and resistant to the change believing that it can be a potential threat to the survival of organizations. Organizational learning that reinforces the organizational structure and culture contributes to keeping an organizational identity despite the high turnover of organizational members.

Lave and Wenger (1991) mention that it is hard to change the organizational structure and culture because organizations have a tendency to maintain their structure including norms, rules, and routines. Even though new members with different perspectives or knowledge enter an organization, it is difficult to determine whether an organization changes their behavior or goals because they become accustomed to the organization's norms, rules, and routine. Organizations, thus, can maintain their identity and goals by resisting the change and keeping their current state despite constant replacement of individual members.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Organizational learning theories argue that organizations build their own memory throughout the organizational learning process to store and accumulate the organizational structure, culture, rules, and beliefs from organizational history and experiences (Levitt & March, 1988; Walsh & Ungson, 1991). Walsh and Ungson (1991) define organizational memory as "stored information from an organization's history that can be brought to bear on present decisions (p. 61)." Organizational memory can often be a barrier of organizational change even though it is useful for effective and efficient decision making in organizations. For decision making, organizations can automatically retrieve information from organizational memory, but automatic retrieval of information can prevent organizations from discarding existing knowledge and learning new knowledge for organizational change. Organizational leaders tend to follow the organizational routines as well because of a fear of wrong decision making when organizations face a new situation that requires organizational change (Walsh & Ungson, 1991).

As mentioned above, research on organizational learning suggests that organizational learning can be a barrier to organizational change even though it can play a positive role in leading and managing organizational change. Organizations and their members are forced to follow organizational routines but avoid unfamiliar and strange experiences that may pose potential threats to them. Organizations, hence, are afraid of "unlearning" the past routines and "learning" new experiences and knowledge, even though "unlearning" is necessary for organizational change and innovation (Hedberg, 1981). Furthermore, it suggests that if organizations and their members successfully unlearn, the resistance to change can be overcome. Similarly, Bain (1998) explains the resistance to organizational learning using a psychological term, "social defense". Organizations have social defenses against organizational learning and change because they are anxious about breaking their "system domain". A system domain includes organizational primary task, organizational structure and culture, policies and procedures, training, technology, knowledge, and environment. Organizations and individuals unconsciously tend to deny giving up their system domain because organizational change often results in stress and anxiety.

Meanwhile, organizational learning research focuses on learning outcomes such as organizational structure and culture embedded in organizations and their members in order to explain the resistance to learning and change. Individuals share organizational knowledge, beliefs, and norms with other organizational members through organizational learning processes, which contribute to building distinguished organizational system, culture, and structure. Such learning process and outcomes are important for stability and survival of organizations, even though it makes organizations and individuals fearful of organizational change.

In contrast, organizational routines and memory can be a source of change (Feldman & Pentland, 2003; van der Bent, Paauwe, & Williams, 1999). In a traditional perspective, organizational routines, and memory enhance organizational efficiency by reproducing a fixed structure and system. Thus, organizational routines and memory are considered unchangeable despite environmental change. However, in a new perspective, organizational routines and memory are flexible, which suggests that organizational routines and memory are continuously adjusted and modified to specific situational change (Feldman & Pentland, 2003). Endogenous and gradual changes in organizational routines and memory help people reduce their fear to change and balance between organizational stability and change under the uncertainty that consequences of organizational change are unpredictable (Feldman & Pentland, 2003; van der Bent, Paauwe, & Williams, 1999; Waddell & Sohal, 1998). Resistance to change can also play a role in revealing potential problems or conflicts which may occur during the change process and consequently result in a failure to achieve organizational change (Ford & Ford, 2009; Thomas & Hardy, 2011; Waddell & Sohal, 1998). Given that organizational change is an ongoing process, the resistance to change needs to

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

be prioritized as the first matter in order to continuously identify and fix situations and problems that may inhibit organizational change and bring about unexpected outcomes (Waddell & Sohal, 1998). It indicates that resistance to change can be considered part of the organizational learning process (Agyris, 1997; Rerul & Feldman, 2011).

Accordingly, given that organizational learning is an adjustment process between the existing organizational structure and culture and new changes and possibilities (Agyris, 1977; Crossan et al., 1999; Lave & Wenger, 1991; March, 1991), organizational learning can provide effective interventions for change. Appropriate learning interventions enable change agents use the resistance to change as a strategic tool to cope with environmental changes (Feldman & Pentland, 2003; Fosfuri & Ronde, 2009; Piderit, 2000).

Organizational Learning: Strategic Intervention for Organizational Change

It is not doubtful that organizational learning is critical for change despite arguments on organizational learning and change. In learning perspective, organizational change is an "iterative process," where organizations continuously engage in learning and change process in order to adapt to environmental change and enhance their competitiveness (Sackmann, Eggenhoger-Rehart, & Friesl, 2009). And, such processes encompass both organization's internal structures, systems, and culture and external environmental and technological changes. Organizational learning theories suggests that organizational learning can provide strategic interventions to effectively deal with resistance to change and to successfully accomplish organizational change.

According to organizational learning and related literature from management field, organizations can create sustainable and successful organizational change by building a learning organization (Akgün, et al., 2007; Alas & Sharifi, 2002; Garvin, 1993; Hendry, 1996; Rowden, 2001; Sibenhüner & Arnold, 2007; Sugarmen, 2001). Garvin (1993) defines a learning organization as "an organization skilled at creating, acquiring, and transferring knowledge, and at modifying its behavior to reflect new knowledge and insights (p. 80)." A learning organization is involved in five main learning activities: 1) systematic problem solving, 2) experimentation, 3) learning from past experience, 4) learning from others, and 5) knowledge transfer. Such learning activities begin with new ideas and insights, which stimulate organizational change and improvement. A learning organization can engage in an organizational change process by incorporating these learning activities into their daily work and routines (Garvin, 1993).

Hendry (1996) expanded the concept of learning organization into communities-of-practices, where organizational learning theories converge towards strategies for organizational change. Communities-of-practice are learning places, which integrates learning and work activities. Communities-of-practices enable experimentation and action learning (Hendry, 1996). In communities-of-practice, members learn organizational policies, norms, and cultures which the organization has accumulated from other members. At the same time, they accept new knowledge, rules, and culture from new members. Through such activities, communities-of-practice engages in a continuous organizational change process (Lave & Wenger, 1991). Communities-of-practice highlights learning as a social process, thus communication and social relationship play a critical role for strategic learning and change (Hendry, 1996).

Meanwhile, March (1991) claims that organizations should explore new possibilities and alternatives in order to adapt to environmental changes. Organizations tend to increase exploitation of the existing capabilities and decrease exploration of the new ones in organizational learning because it is time- and -cost efficient and requires less efforts. However, learning organizations explore new knowledge and

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

possibilities through continuous experimentation activities, which contributes to improving organizational performance and competitiveness.

Agyris (1977) also suggests that learning organizations can participate in a change process through double-loop learning, where organizations review and question their existing structure, norms, and policies and create new alternatives. Contrary to single-loop learning, which focuses on detecting and correcting organizational errors, double-loop learning helps overcome resistance to change and contributes to a long-term success of organizational change. Double-loop learning is "questioning the underlying organization policies and objectives (Agyris, 1977, p. 116)." Single-loop learning contributes to maintaining the organization's current state or to achieving short-term change goals. Single-loop learning enables people to reduce their resistance to change by achieving short-term and little gains (Agyris, 1977; Kotter, 1995). Organizational norms embedded within the organization inhibit double-loop learning and reinforce the existing policies and norms. Thus, organizations are relatively unfamiliar with double-loop learning. However, it is important for organizations to establish the learning system to facilitate double-loop learning in order to respond to the uncertain environmental change and accomplish the sustainable and fundamental change (Agyris, 1977).

In the learning organization, given that organizational memory can bring about resistance to change, unlearning is critical for organizational change (Akgün et al., 2007; Becker, 2008; Rampersad, 2004; Tsang & Zahra, 2008). Huber (1981) argues that when organizations do not "unlearn," the organizational learning process is incomplete. Tsang and Zahra (2008) refers to unlearning as "the discarding of old routines to make way for new ones, if any (p.1437)." Recognition of organizational problems initiates urgency of organizational change, which causes resistance to change. Resistance to change is an expression to conflicts between the existing organizational policies and rules and the new ones. Thus, organizational unlearning enables organizations and individuals to overcome resistance to change by eliminating organizational memory.

According to Akgün et al. (2007), organizational unlearning is a catalyst of organizational learning and change process and promotes double-loop learning in learning organizations. Organizations can be involved in the continuous organizational change by participating in four types of unlearning: reinventive unlearning, formative unlearning, adjusting unlearning, and operative unlearning depending upon conditions of environmental changes (Akgün et al., 2007). First, reinventive unlearning is the fundamental changes in organizational routines and beliefs, which occurs as a response to uncertain environmental changes. Second, formative unlearning indicates the creation of new belief system and incremental changes in organizational routines. Third, adjusting unlearning is defined as incremental changes in organizational belief systems and fundamental changes in organizational routines. Fourth, operative unlearning indicates the incremental changes in organizational beliefs and routines. In this context, organizational change is less unpredictable and uncertain, thus organizations relatively maintain stability.

During the organizational change process, organizational learning and unlearning are interrelated, and organizational learning often requires unlearning. When organizations are forced to build new beliefs, norms, or routines, organizational inertia refuses organizational changes, which are perceived as threats or fear for organizations. Organizational unlearning helps organizations to reduce organizational inertia and resistance to change by discarding the existing beliefs and routines (Tsang & Zahra, 2008). Rowden (2001) claims that learning organization-focused planning for strategic change aims to integrate constant change readiness, continuous planning, improvised implementation, and action learning. Rowden (2001)'s learning organization-focused model of strategic change planning suggests that the learning organization can be used as a strategic intervention to effectively handle resistance to change and to

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

accomplish organizational change. Four components in Rowden (2001)'s model embrace strategies for organizational change that previous research suggests as follows.

1. **Constant Readiness:** The learning organization is in a constant state of readiness for change (Rowden, 2001). Armenakis et al. (1993) define readiness as "the cognitive precursor to the behaviors of either resistance to, or support for, a change effort (p. 682)." A process to create readiness for organizational change is an integrative and system model including individual and organizational factors, and contextual factors, rather than simply a strategic approach to overcome resistance (Armenakis et al., 1993; Armenakis & Harris, 2009).
2. **Continuous Planning:** In the learning organization, people are involved in change planning and continuously revise change plans. Change plans are not created by senior management, but should be shared throughout the whole organization (Rowden, 2001). Senior management is willing to revise and adjust change plans when needed (Bruckman, 2008). When organizational members participate in change planning and share vision and goals of change through communication, resistance to change can be reduced (Kotter, 1995; Lawrence, 1953, 1969).
3. **Improvised Implementation:** The learning organization improvises changes. That is, every member can improvise changes with his or her own spontaneous and creative ways (Rowden, 2001). The senior management encourages people to seek creative and innovative ways through experimentation and explorative learning (Garvin, 1993; March, 1991), and rewards their small and short-term wins (Bruckman, 2008; Kotter, 1995). Accumulation of small wins motivates continuous change efforts and reinforces institutionalization of organizational change (Kotter, 1995). In the learning organizations, people collaborate with each other for exploration and experimentation. Teamwork and collaboration promote experimentation and exploration for change (Bruckman, 2008).
4. **Action Learning:** Organizational change is an ongoing process, where the learning organization takes action, reflects, and modifies the change efforts. Through continuous reevaluation, the leaning organization can accomplish fundamental and transformative changes in organizational routines (Rowden, 2001).

The learning organization integrates concepts of organizational learning for strategic change and strategic interventions to deal with resistance to change. Accordingly, the strategies to promote a learning organization can encourage people to effectively handle resistance and to be involved in the continuous change process.

DISCUSSIONS AND IMPLICATIONS

This chapter reviews organizational learning and change literature focusing on a strategic approach to handle resistance to change. From comprehensive literature review, the chapter suggests that the organizational learning as a strategic intervention can contribute to effectively dealing with resistance to change and leading and managing organizational change. While organizations are forced to continuously engage in organizational change, they inevitably encounter resistance to change. Despite their change efforts, resistance to change may result in the failure of fundamental change of organizations. A traditional perspective regards resistance to change as negative and something to be overcome, but a recent perspective suggests that resistance to change can be used in a productive way for organizational change.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Organizational learning theories suggest that resistance to change plays a strategic role in a change process by helping maintain a balance between change and stability (Waddell & Soral, 1998). Namely, organizational learning is a process to identify and overcome the resistance to change in order to successfully accomplish organizational change. In particular, the learning organization provides strategic interventions for continuous organizational change. The learning organization expands organizational adaptive capability and reinforces creative and innovative changes. Accordingly, the management needs to nurture the learning organization for organizational performance and change. For the learning organization, the management supports employees' participation in organizational learning (Marsick & Volpe, 1999; Skule, 2004).

In addition, the management should allow employees to learn their mistakes and failures (Garvin, 1993). The management's rigid attitudes toward mistakes and failures make employees afraid of exploration and experimentation. That is, the management should not just blame the resistance, but use it strategically by facilitating communication and interaction among employees (Ford & Ford, 2009; Siebenhűner & Arnold, 2007). In order to foster the learning organization, the management needs to empower employees and allow them to enhance the autonomy and leadership (Yang, Watkins, & Marsick, 2004). Employees' voluntary and spontaneous participation in the learning and change process helps them overcome resistance and commit to learning and change (Kotter, 1995).

Furthermore, HR/HRD should align interventions of the learning organization with the whole organizational change goals and collaborate with other parts of organizations. The organizational change process is a complicated and long-term process. It is easy to lose direction and goals when organizations focus on providing change programs (Beer et al., 1990; Schaffer & Thomson, 1992). HR/HRD functions also need to repeatedly clarify their goals of change when providing learning interventions for organizational change. Strategic alignment with organizational goals and collaboration with the whole organization helps HR/HRD play a strategic role in organizational change and enhances their strategic importance in the organization.

Roles of Human Resources as a Change Agent

Concepts of organizational learning and appropriate application of the concepts to strategies for learning organization create alternatives to overcome resistance to change and to accomplish organizational change. For strategic organizational change, change agents play a central role in the learning and change process.

First, as a change agent, HR/HRD should build a learning organization and strategically integrate a learning organization with a change process (Hendry, 1996; Gilley & Maycunich, 2002). HR/HRD needs to understand the purpose of the change and the goals of the whole organization and plan and implement a learning process. Even though it is hard to predict the directions and pace of environmental change, HR/HRD should establish learning and change goals as a change agent. This approach provides motivations for change and leads learning and change efforts, which help organizations achieve improved results of change (Schaffer & Thomson, 1992). In addition, HR/HRD should redirect organizational change when facing specific situations and changes in a continuous change process (Weick, & Quinn, 1999).

Next, HR/HRD needs to diagnose organizational readiness for change and resistance to change. In learning organizations, resistance should be renamed as a response to a change, which can be a change initiative to diagnose readiness for change and to direct change efforts (Ford & Ford, 2010; Pidertit, 2000; Waddell & Sohal, 1998). Resistance identifies fallacies and errors in a change process, and HR/HRD can fix them and revise change strategies based on diagnosis of resistance (Rowden, 2001; Waddell

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

& Sohal, 1998). Resistance reveals conflict between stability and change, which help organizations and individuals recognize urgency of change. Resistance also enables people to balance between exploitation and exploration, and learning and unlearning (Akgün et al., 2007). Thus, HR/HRD should play a role in diagnosing readiness for change and persuade urgency of change to organizational members.

Moreover, HR/HRD should lead and facilitate communication among individuals. Scholars highlight the importance of communication in a change process (Armenakis & Harris, 2009; Bruckman, 2009; Ford & Ford, 2009, 2010; Kotter, 1995). As a change agent, HR/HRD can initiate organizational change and enhance people's participation through appropriate and effective conversations (Ford & Ford, 2009). Furthermore, HR/HRD needs to facilitate and guide communication between management and employees. Honest and open communication can reduce resistance to change and promote people's commitment to organizational change (Bruckman, 2009).

HR/HRD also needs to consider and integrate interests of all stakeholders in a change process. Different perspectives and interests of organizational changes among stakeholders can bring about conflicts and resistance to change within organizations (Buchanan & Badham, 1999; Feldman & Pentland, 2003; Lawrence, 1954, 1969). As Lawrence et al. (2006) suggest, organizational learning and change is a dynamic process of social psychological and political factors. Given that organizational learning and change is a collective action of individual learning and change, HR/HRD needs to interpret power-relations and lead cooperation and collaboration for learning and change (Gravenhorst, 2003; Lawrence et al., 2006). Furthermore, HR/HRD should not only promote integrity and credibility but also help the top management to enhance their integrity and credibility through education (Bruckman, 2009; Erhard et al., 2010; Kouzes & Posner, 1990). For the integrity and credibility, HR/HRD itself focuses on action rather than words as well as facilitates action learning among organizational members.

FUTURE RESEARCH DIRECTIONS

The chapter brings out several implications for future research. At first, even though there are numerous studies on organizational learning and change, there is a relative lack of empirical research on the change process in the learning organization. In particular, there is little empirical research to identify how resistance to change plays a role in organizational learning and change within the learning organization. Future research hence may conduct empirical research and identify evidences to show the strategic importance of learning organization for organizational change.

In addition, in the change process, most scholars highlight the importance of communication, trust, and social relationship. In order to explain the impact of social factors such as communication and trust on organizational learning and change, future research may adopt a social network approach (Burkhardt & Brass, 1990; Tenkasi & Chesmore, 2003).

Finally, although previous literature suggests that power or politics is critical for organizational learning and change, there is little empirical research on the role of power-relationship in organizational learning and change. Therefore, future research needs to have a positive approach to examine the impact of power-relationship on organizational learning and change and provide guidelines or evidences for political approach in organizational learning and change.

KEY TERMS AND DEFINITIONS

Double-Loop Learning: A learning method to question and change organizational underlying policies, norms and assumptions.

Explorative Learning: A learning method to seek new possibilities and alternatives to adapt to environmental change through continuous experimental activities.

Learning Organization: An organization that continuously develops its competitiveness by creating and transferring new knowledge and insights.

Organizational Change: A planned change in organizational structure and culture to respond and adapt to environmental changes.

Organizational Learning: A constant process to create, acquiring, and sharing knowledge within the whole organization.

Resistance to Change: A reaction or response to a change. It can be either an initiative of change or inhibitor of change.

Unlearning: A process to discard the existing knowledge and routines to acquire new knowledge.

Chapter 37
Facing Organizational Change:
An Italian Perspective on Six Challenges for Organizational Change Practitioners

Filippo Ferrari
https://orcid.org/0000-0002-7509-2320
University of Bologna, Italy

ABSTRACT

This chapter aims to present the obstacles both scholars and practitioners must overcome in facing organizational change. Indeed, too often practitioners lack any rigorous evidence-based background and rely on their previous experience and common sense. At the same time, scholars too often work in a very separated academic world, thus ignoring the actual problems that professionals face in actual firms. Being both a scholar and a practitioner, the author highlights the common challenges likely to be faced by change agents when facilitating organizational change: recognizing the readiness of the involved people to change, their skill mismatch, their previous change history, and the level of cynicism. A fully reflective change agent must consider these factors in designing and implementing an evidence-based organizational change and development (EBOCD) initiative and change agency process if he or she wishes to achieve positive outcomes both from the organizational and the involved people's point of view.

INTRODUCTION

EBOCD: The Training and Consulting Process and Change Resistance

As suggested by current literature (see for instance Hamlin in Chapter 1 of this book), the impact of organizational change (OC) pressures have resulted in several undesirable and unwanted outcomes at every organizational level, and not least increasing stress levels at work (see, for example, Hamlin, 2001; Gunnigle, Lavelle & Monaghan, 2013; Shook & Roth, 2011). Facing successfully the impact of OC and, more generally, working with managers of an organization during this change is the real current challenge of both HR managers and practitioners. In fact, continues Hamlin in this book, when

top managers initiate programs of organizational change and development (OCD) they tend to rely on lower level managers to facilitate and implement the change processes. Thus, in a very real sense, most managers in most organizations are agents of change (Axley, 2000); but regrettably many if not most are not skilled in OCD change agency. Consequently, there is an argument that they need the support of colleague HR functional specialists who happen to be skilled as change agents.

However, as Hamlin (2016) has discussed elsewhere, "one of the major challenges facing contemporary managers and HRD professionals is how best to help people through the transitions of change, and to survive or thrive in working environments that are in a constant state of flux" (p.121). Therefore, to make the organizational change easier to facilitate, management literature should (Hamlin, this book): (i) highlight certain obstacles to OCD; and (ii) describe/illustrate how these may be overcome based on change agents using 'best evidence' to inform, shape and critically evaluate their OCD initiatives, such as that resulting from collaborative 'professional partnership research' and empirical generalization 'replication research' (see Chapter 1).

Regarding the potential obstacles, Miller, Johnson, and Grau (1994) posit that while the failure to successfully implement planned change may be attributed to many factors, few issues are as critical as the employees' *attitudes toward change*. Rafferty and Restubog (2013) agree with this conclusion and argue that "change readiness is the most prevalent positive attitude toward change that has been studied in the organizational change literature" (p.111). Indeed, in a review of the literature, Bouckenooghe (2010) concluded that over 90% of conceptual work on change attitudes has been conducted on either 'change readiness' or 'resistance to change'. As suggested by several authors (Altman & Iles, 1998; By, 2005; Davidson & De Marco, 1999; Dunphy & Stace, 1999) an organizational change is a continuous learning process (see also Burnes, 1996; 2004). Following this approach, a firm's specific knowledge and the ability to transfer it is considered a key strategic asset for generating competitive advantage (Spender & Grant, 1996). Knowledge is viewed as the sum of expertise, skills, and abilities applied by individuals in the form of theoretical knowledge and actions taken to solve problems (Davenport & Prusak, 1998). Therefore, the field of *Organizational Learning Theories* offers a well-suited theoretical background to better understand the relevance of knowledge preservation during change processes in organizations. In fact, an organizational change can trigger a highly disruptive knowledge process that could in turn lead to skill obsolescence, skill shortage, and/or skill mismatch of the involved employees. However, empirical literature on change management has until now paid scarce attention to the role played by knowledge and skills in change processes (Reed & Vakola, 2006).

Beyond the role played by the training process in ensuring a proper level of skill-based readiness to change, the difficulty of accomplishing this task is highlighted in extensive and expanding literature devoted to the problems of change fatigue and cynicism among personnel (Wanous, Reichers, & Austin, 2000). Understanding negative employee reactions to change is important: change efforts often fail because organizations and their leaders underestimate the importance of employee reactions to the change process (Choi, 2011; Greenhalgh, Macfarlane, Bate, & Kyriakidou, 2004; Self, Armenakis, & Schraeder, 2007). As recently suggested by Brown, Kulik, Cregan, and Metz (2017) "Employee change cynicism represents a relatively malleable form of cynicism (i.e., an attitude rather than a trait)" (p.5). Thus, the organization's approach to change has the potential to influence the level of employee cynicism (Andersson & Bateman, 1997; Davis & Gardner, 2004; Wanous et al., 2000).

As suggested by Bordia, Hobman, Jones, Gallois, and Callan (2011), change research has largely focused on understanding employee reactions to one particular change episode and overlooked the fact that "past events play an important role in shaping employee reactions to current organizational events"(p.192).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In a review of the OCD literature, Pettigrew, Woodman, and Cameron (2001) noted that research had tended to ignore time and history as important contextual forces that influence the frequency of change in organizations. Thus, change agents should pay great attention to the role played by organizational history in the change process, that is the history of employees' experiences of previous OC initiatives which can influences their reaction to new OCD initiatives.

Given this scenario, this chapter aims to discuss the role played by training and consulting processes in the field of evidence-based organizational change and development (EBOCD), and the effect they have on the level of employee 'readiness to change' and particularly on the employees' confidence to change and personal valence, and on their perceptions of managerial support. Another purpose of this chapter is to shed light on the role played by cynicism in employee reactions to organizational change. Finally, the chapter aims to understand the role of change management history in shaping employee change-related beliefs, attitudes, and behaviour.

To achieve these aims the following questions will be addressed: How does the hard side of change (i.e. the business model, the job system) interact with the soft side of change (i.e. the skills and the knowledge) in successful (and unsuccessful) change initiatives? How can employee change cynicism be understood? How does organizational history help in understanding the contextual forces shaping employee reactions to change? What is the relationship between organizational change and undesired outcomes such as weak job satisfaction, low trust in the organization, and high turnover among employees?

A CRITICALLY REFLECTIVE CHANGE AGENT

The Strategic Management Approach

As argued in Chapter 1, engaging in 'critically reflective' as well as 'evidence-based' practice should become an essential feature of managing/facilitating OCD programs. Senior (2002) suggests that management of an organizational change should be *strategic*, that it ought to be based on the ability to identify the type of change (rate of occurrence: continuous/discontinuous), how it comes about (planned/emergent), and the scale (level of impact: fine-tuning/corporate transformation).

Researchers in the field of Strategic Human Resource Management (SHRM) have increasingly relied on the resource-based view of the firm to explain the role of human resource practices in firm performance (Collins & Clark, 2003; Wright, Dunford, & Snell, 2001). In the resource-based view (e.g. Grant, 1991; Barney & Wright, 1998; Boxall & Purcell, 2000) the emphasis is on gaining sustainable competitive advantage by means of effective and efficient utilisation of the resources of an organisation. Unfortunately, this efficient resource utilisation does not occur automatically (Martìn-Alcazar, Romero-Fernandez, & Sanchez-Gardey, 2005; Paauwe & Boselie, 2003): it is the outcome of human resource managerial practices carried out by human resource (HR) managers and executives, often with the help of trainers and consultants. Hence, to achieve the best strategic performance it is necessary that all HR professionals are guided by relevant evidence-based knowledge. According to Rousseau (2006), "evidence-based management means translating principles based on best evidence into organizational practices" (p. 256). For evidence-based management (EBMgt) to take root, it is at least necessary that managers be exposed to, and apply scientific evidence.

However, although literature provides robust evidence and suggests guidelines to carry out an EBOCD initiative, practitioners' experience suggests that there is no direct causal relationship between strategy,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

HRM practices and organizational performance, as suggested previously by some scholars (Boxall, 1993). This chapter highlights that several factors, both strictly HRM process-related (the research-beliefs gap) and external (firm size, managerial culture, entrepreneurial values), strongly influence this relationship. Hence, a *fully reflective* and *evidence-based* approach becomes necessary.

For instance, from a critically reflective point of view, a weakness has been to identify 'evidence-based knowledge' (i.e. 'best evidence') with knowledge derived only from empirical research. However, a more scientific approach posits that 'best evidence' has other sources of knowledge. More recent writers argue that to make the most effective organizational decisions it is necessary to consider at least four different sources of knowledge: empirical evidence, organizational evidence, personal experience-based evidence and finally stakeholders' experience-based evidence (Barends *et al*., 2014; Pfeffer & Sutton, 2006a; 2006b). Using a combination of these sources of 'best evidence' ensures a more appropriate and better context-situated decision-making process (Olivas-Luján, 2008), and in turn leads to a fuller application of a 'critically reflective' and 'evidence-based' approach to OCD.

Finally, as suggested by De Massis, Chua, and Chrisman (2008), "an approach to solve the access problem would be to collect data from or through consultants" (p. 193). Therefore, reflective practitioners (i.e. managers, trainers and OCD consultants) seem better suited than scholars in carrying out longitudinal research, thus playing a fundamental role as organizational change agents in the mid-long term.

MANAGING ORGANIZATIONAL CHANGE

Six Attention Points and Six Challenges for Scholars and Practitioners

Since the need for change is often unpredictable, it tends to be reactive, discontinuous, ad hoc, and often triggered by a situation of organisational crisis (Burnes, 2004; De Wit & Meyer, 2005; Luecke, 2003; Nelson, 2003). Although the successful management of change is accepted as a necessity to survive and succeed in today's highly competitive and continuously evolving environment (Luecke, 2003; Okumus & Hemmington, 1998), Balogun and Hope Hailey (2004) report a failure rate of around 70 percent of all change programmes initiated. Dunphy and Stace (1993) suggested that in a turbulent environment, organizations which face the change as an open learning system rather than using detailed plans are more likely to succeed. Therefore, in their everyday practice of designing, planning and implementing an organizational change strategy, change agents should take into consideration at least six different issues or attention points, as follows.

Attention Point 1: Readiness to Change

Readiness to change has been defined as an individual's "beliefs, attitudes, and intentions regarding the extent to which changes are needed and the organization's capacity to successfully undertake those changes" (Armenakis, Harris, & Mossholder, 1993, p. 681). However, literature offers several definitions of this construct, many of them underlining the role played by cognitive elements (e.g., ability, self-efficacy) in fostering the perception of being ready for a change. For instance, Cunningham et al. (2002) suggest that readiness involves "a demonstrable need for change, a sense of one's *ability* to successfully accomplish change (self-efficacy) and an opportunity to participate in the change process" (p. 377, *italics* added for emphasis). Holt et al. (2007) propose that readiness for change is "the extent to

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

which an individual or individuals are *cognitively* and emotionally inclined to accept, embrace, and adopt a particular plan to purposefully alter the status quo" (p. 235, *italics* added for emphasis). This chapter adopts the well-validated 5-dimension model of readiness to change proposed originally by Armenakis, Harris and Mossholder (1993). (see also Armenakis, Harris, Cole, Fillmer & Self, 2007; Armenakis, Harris, & Field, 1999). This model was revised and improved by Holt et al. (2007), and posits that change management effectiveness depends on five different dimensions as follows:

i) Personal Valence, that is "the extent to which one feels that he or she will or will not benefit from the implementation of the prospective change" (p. 238)
ii) Organizational valence, that is "the extent to which one feels that the organization will or will not benefit from the implementation of the prospective change" (p.239)
iii) Change Confidence, that is "the extent to which one feels that he or she has or does not have the skills and is or is not able to execute the tasks and activities that are associated with the implementation of the prospective change" (p. 238)
iv)) Managerial Support, that is "the extent to which one feels that the organization's leadership and management are or are not committed to and support or do not support implementation of the prospective change" (p. 239)
v) Discrepancy, that is "the extent to which one feels that there are or are not legitimate reasons and need for the prospective change" (p. 238)

A wide range of personal characteristics, attitudes, and individual difference variables have also been identified as antecedents of individuals' change attitudes (see Holt et al., 2007). Regarding individual characteristics, evidence exists in organizational change literature supporting the importance of self-esteem, perceived control, and optimism in coping with change. For example, Ashford (1988) reported that self-esteem and personal control were negatively correlated with stress; furthermore, internal locus of control which is a concept closely related to perceived control, has been associated with increased openness to change (Lau & Woodman, 1995) and increased job satisfaction after the organizational change, (Nelson, Cooper, & Jackson, 1995). Wanberg and Banas (2000) found that resilience (i.e. self-esteem, optimism, and perceived control) was related to higher levels of change acceptance but was not predictive of a more positive view of the changes.

In summary, literature provides some evidence of the role played by *readiness to change* in making the achievement of positive outcomes in an organizational change process easier, and suggests how to assess it (Armenakis et al., 2007; Holt et al., 2007); it also shows the organizational elements which can support the change process (Andersen, 2008). It appears that all five sub-dimensions have a significant impact on the overall level of readiness to change.

Bearing in mind the research findings discussed above, fully reflective change agents (defined as being evidence-based) should pay attention to the empirically demonstrated relationship between each specific *readiness to change* dimension and the ease of achieving positive outcomes from an OCD initiative. The change agent does not limit itself to attributing meaning, it activates sense-making processes. Additionally, this dynamic imposes continuous reflection on the objective and subjective dimensions of the OCD in the change agent (and, more generally, at the OCD level). Change agents themselves can be sources of resistance to change, and this does not appear in the currently available OCD-related models (for example, Holt et al., 2007). Thus, the first phase of the EBOCD intervention (i.e. measuring the resistance to change) requires the change agent to also critically consider its role in triggering change

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

resistance. A critically reflective approach could be based on open process advice, not based on the so called 'doctor-patient model' (Schein, 1999). Therefore, the reflective Change Agent (CA) is not exposed in the first person as an 'official' agent of change but works in the background; the CA does not follow the approach of many organizations that push forward the consultant as a front-man (external, or internal in the case of an HR) 'because they are freer and perceived as neutral'.

Attention Point 2: The Perceived Skill Match

Going beyond Attention Point 1, differences in *readiness to change* could be due to other factors such as the level of skill (mis)-match. Although literature suggests that an *affective* dimension has a role in change readiness (Rafferty & Restibog, 2013), research should also focus on the impact that cognitive aspects (such as skills and knowledge) may have because until now scarce attention has been paid to these issues as possible antecedents of employee *readiness to change.* Furthermore, past researchers have seldom focused on the individual and organizational training/learning associated with OC processes, particularly those that can foster change readiness. Stata (1989) argues that "the rate at which individuals and organisations learn may become the only sustainable competitive advantage" (p. 64).

From a psychological point of view, *readiness to change* is considered at least partially grounded on the Person-Environment (P-E) fit model, and it has come to be viewed more as a set of cognitive beliefs (Cable & Parsons, 2001). Research has found that fit between individuals and their jobs has significant effects on job satisfaction, stress, organizational commitment, and turnover (Cable & DeRue, 2002; Kristof-Brown, Jansen, & Colbert, 2002; Saks & Ashforth, 1997). In this sense, preserving the P/E fit during and after an organizational change becomes a strategic goal for a firm to foster the individuals' change confidence/self-efficacy. Following Caldwell, Herold and Fedor (2004), research should focus on the most common dimension of individuals' P-E fit: the degree to which an individual's abilities match the demands of their job (person–job [P-J] fit). A good match between demanded and possessed skills enables the employee to develop a higher perceived level of control of the situation. However, within the field of change management studies, the relationship between skill mismatch and change confidence has not so far been formally investigated. The available literature suggests the overall perceived skill match level, as well as each area of the skill portfolio, are positively related to *change confidence* (see Ferrari, 2017). The *skill match* level also shows a significant but lower correlation with the overall level of *readiness to change*, thus suggesting that skill match has a specific impact on change confidence rather than more generally on the readiness to change. Thus, fully-reflective change agents should be mindful of 'best evidence' that has empirically demonstrated that: '*the higher the level of employee-perceived skill-match, the higher the change confidence level'.*

Moreover, the P/E fit and P/J fit are not only necessary for fostering the change confidence level, but they could also perhaps lead to further benefits. Literature shows that several job characteristics have a differential impact on the worker's utility derived from the job. This is important since higher perceived utility is likely to result in higher performance at work, and decreased absenteeism and tardiness (Borjas, 1979; Freeman,1978; Hamermesh, 1977; Lawler & Porter, 1967; Locke, 1969). In this view, each job is thought to have several aspects or facets from which utility is derived. This is similar to Lancaster's (1966, 1971) theory of consumption behaviour where the utility that is derived from consuming given goods depends on the utilities that are associated with its characteristics (see also Skalli, Theodossiou & Vasileiou, 2008). Thus, literature shows that the application of possessed skills is a highly desirable aim. Ferrari's (2017) recent research suggests the correlation between the current skill match (i.e.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

domain specific P/J fit) and *personal valence* is quite weak, though *domain-specific skill match* does have a strong impact. Furthermore, domain specific P/J fit shows no correlation with the other items of readiness to change, therefore suggesting a direct and independent effect on the level of *personal valence.* Thus, fully-reflective change agents should pay attention to the fact that '*the higher the level of employee-perceived skill-match, the higher the personal valence of a given change.*

In suggesting that change is better defined as learning, Schein (1999) states that "the involvement of the learner is crucial to any kind of planned change or, as we might better conceptualise it – 'managed learning'" (p. 71). Given this theoretical scenario, individual characteristics (skills especially) and the organizational capability to transform such skills into a shared value (*organizational learning*) become fundamental assets for the organization. A reflective change agent should also bear in mind that in the post-modern paradigm, training is in place to support knowledge management and organizational learning, not limited to providing skills. The need to overcome linear / mechanistic paradigms (see Chapter 2 of this book) emphasizes a different role of training and in general of the skills that the management of change is called on to preserve and develop. The reflexive professional (Schon, 1991) should follow a descriptive rather than a prescriptive logic (typical of linear models). A reflective CA should adhere to a contingency model that ensures the best fit with the situation rather than the application of 'good practice' as a supposed universal aspect. At the same time, following a post-modern paradigm imposes strategic choices on the training process and, more generally, to organizational learning. The need to face organizational and environmental complexity requires ad hoc support work that contrasts resistance to change at an individual level. People should be trained in learning (or rather, in deutero-learning: learning to learn (see Watzlawick et al., 1974) Likewise, organizations must focus on organizational learning rather than routinization, and therefore on developing knowledge management systems. The reflective change agent is called on to guide this dynamic balance between individual and organizational needs, with a logic of complexity and contingency.

Attention Point 3: Training Characteristic

Within a scenario focused on P/J fit, there is evidence that direct and personal consequences of the change for affected individuals is important, (Brockner & Wiesenfeld, 1996; Herold, Fedor, & Caldwell, 2007). That is, individuals' commitment to a change is a function, in part, of the degree to which the change impacts their own or their work team/department's day-to-day routine, (Caldwell et al., 2004; Fedor, Caldwell, & Herold, 2006). In such a scenario, managerial support should provide workers with the proper job-specific skills to reduce uncertainty and the perceived skill-mismatch at the job level. Furthermore, workplace stress literature has suggested that being fair and providing adequate resources are key aspects of manager behaviour that can positively influence individuals' responses to significant workplace events (Spector, 2002). Training processes should provide workers with specific, intangible resources such as skills and knowledge, thus fostering the perception of received support from the organization. Furthermore, regarding the effectiveness of training, Altman and Iles (1998) suggested that much of the force behind the perspectives of learning organisations are grounded in the field of adult learning (e.g. Knowles, 1984; Rogers, 1986). They suggest that "adult learners learn most effectively in processes which recognise dynamic growth, self-determination, prior experience, expectations, meaningfulness, the wider social context, and the preferred learning styles of adult learners" (Altman, Iles, 1998, p. 47). Such learners typically learn in episodic, intensive, problem-oriented, learner-specific ways, and are less oriented to learning from general overall principles (Mabey & Salaman, 1995; Rogers, 1986).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The provision of job-specific, problem-oriented and experiential training seems to be the best way to improve skills and knowledge, at least with adult learners. According to Ferrari (2017), usually the overall level of training provision and its effectiveness have a strong impact on the perceived *managerial support* dimension of change readiness. Thus, fully-reflective change agents should bear in mind as they formulate and implement their respective OCD strategies that *the more effective, transferable and job-specific the training, the higher the level of perceived managerial support,* and that this leads to easier achievement of the desired positive outcomes.

However, whichever type of change strategy is implemented, the impact and consequences can either be beneficial or detrimental depending upon the effectiveness of the respective change agents (see Chapter 2). In general, considering the perceived skill mismatch, the domain-specific P/J fit and the training characteristics, a broader reflection on EBOCD strategies is appropriate (see Chapter 2). The need to adopt a descriptive logic and to avoid the 'side effects' of the change suggest that the CA should pursue strategies strongly oriented to organizational reliability. A change strategy must nonetheless focus on organizational reliability during and after change, rather than on excellence or efficiency, to prevent the inevitable side effects of the change process from being lethal to the organization. All OCD interventions must ensure a highly reliable organization, addressing the deep and often hidden elements that make the organization vulnerable during change: personal change history and the cynicism level of involved people/personnel.

Attention Point 4: The Personal Change History

Until now, empirical research has paid great attention to understanding factors that affect employee reaction toward organizational change (Jimmieson, Peach, & White, 2008; Jones, Jimmieson & Griffiths 2005; Miller, Johnson, & Grau, 1994; Oreg, 2006; Wanberg & Banas, 2000). In general, this research has increased our understanding of employee responses to organizational change and generated a great deal of knowledge on how to implement change. However, change research has largely focused on understanding employee reactions to one particular change episode, hence overlooking the fact that "past events play an important role in shaping employee reactions to current organizational events" (Bordia et al, 2011, p. 192). In a review of the change literature, Pettigrew et al. (2001) noted that organizational change research has tended to ignore time and history as important contextual forces. Bordia et al. (2011) developed and tested a model of the effects of *poor change management history* (PCMH) on employee attitudes (trust, job satisfaction, turnover intentions, change cynicism, and openness to change) and actual turnover. They found that PCMH, through PCMH beliefs, led to lower trust, job satisfaction and openness to change, and higher cynicism and turnover intentions. Although more empirical research is required to demonstrate further that *there is a positive correlation between a negatively-perceived personal organizational change history and both anxiety level and intention to quit,* fully-reflective change agents should still pay attention to this factor that can impact positively or negatively on change management effectiveness

PCMH is only one aspect of the more general problem of managing effectively the political and cultural aspects of OCD (see Chapter 2). The consultant is a 'political agent' in the 'service of established power' (ownership, leadership, dominant coalitions), and is perceived as such by those involved in change. This imposes the utmost transparency towards all those involved, highlighting both the discrepancy and the organizational and personal advantages of the change in a logic of organizational justice (Colquitt et al., 2013; Cropanzano et al., 2007). In any case, the role of the CA will always be defiled. From this

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

point of view, the CA intervention could be inspired by methodologies such as *participant observation* or *action research*. Both models propose a researcher / consultant who collects data (participant observation) and acts (action research) limiting the impact on pre-existing dynamics as much as possible or orienting them from within. The CA that chooses to adopt these intervention models should pay the utmost attention to avoid counterproductive protagonisms. Entering into a political arena actually leads the CA to become part of it, and therefore to be easily perceived and categorized by all the people involved according to the friend/foe axis. This is undoubtedly an issue to be overcome in the challenge for the reflective change agent.

Attention Point 5: The Level of Cynicism

At an *organizational* level, much of the literature and many of the research projects on organizational change relate to organizational culture in one sense or another. Culture is often seen as either the key issue to be changed, or something that is crucial and needs to be taken seriously to make change possible. Given this scenario, *organizational mergers* seem to be the most critical of change events impacting at both the individual and organizational level. In such OC situations the extant employees are more exposed to the risk of change fatigue and anxiety due to a prevailing consolidated strong and resilient organizational culture (i.e. shared values, routines and work expectations). Understanding negative employee reactions to change is important: change efforts often fail because organizations and their leaders underestimate the importance of employee reactions to the change process (Choi & Ruona, 2011; Self, Armenakis, & Schraeder, 2007). One explanation for the failure of change programmes is employee change cynicism, "a pessimistic viewpoint about change efforts being successful because those responsible for making change are blamed for being unmotivated, incompetent, or both" (Wanous et al., 2000, p. 133). As recently suggested by Brown et al. (2017), "Employee change cynicism represents a relatively malleable form of cynicism (i.e., an attitude rather than a trait)" (p.5). Thus, the organization's approach to change has the potential to influence the level of employee cynicism (Andersson & Bateman, 1997; Davis & Gardner, 2004; Wanous et al., 2000). However, cynicism could also play a role in protecting people from change-related anxiety and intention to quit. For example, it could lead to lower emotional involvement and affective investment level in organizational goals which in turn could lead people to the so called 'indifference area' (Barnard, 1938), and thus protect them from undesired change-related psychological consequences.

Given this theoretical scenario, fully-reflective change agents should be calling for more studies in this area of change management research whilst taking serious note in their change agency practice that *the level of cynicism* of employees correlates negatively with *intentions to quit* and *anxiety levels* (i.e. the higher is the level of cynicism, the lower are the intentions to quit and anxiety levels).

Attention Point 6: The Role of Organizational History

Organizations have had to deliver more value for money services and products and pursue the highest standard of effectiveness, but at the same time achieve the greatest level of cost saving and efficiency gains (see Barkema, Baum & Mannix, 2002; Champy & Nohria, 1996; Dess & Picken, 2000; Yukl, 2006). These pressures have often resulted in multidimensional restructuring, for instance in mergers (see, for example, Gunnigle, Lavelle & Monaghan, 2013; Hamlin, 2001; Shook & Roth, 2011). Contemporary literature suggests (Kunze et al., 2013) a prominent role in moderating organizational change outcomes

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

could be played by *organizational tenure*. Long-term employment at the same workplace may decrease the developmental experiences than those of colleague employees who have previously worked in other organizations, and consequently have had contact with a greater variety of work situations and exposure to different organizational change initiatives. These (decreased) developmental experiences may, in turn, affect negatively the psychological impact and outcomes of change (Abraham & Hansson, 1995; Baltes & Baltes, 1990). However, at the same time, due to their organizational history, employees may more likely have developed defence mechanism such as *cynicism* and *disillusionment*.

Given this theoretical scenario, when involved in facilitating merger-related OCD initiatives fully-reflective change agents need to anticipate that long-term employees in either of the merged organizations are likely to show a higher intention to quit than those who have short organizational histories or are not involved in the merger process.

In summary, (as highlighted in Chapter 2), there have only been a few longitudinal studies that have effectively evaluated change agency processes within different organizational contexts. From this point of view, the change agent must have a perspective along the chrono-context, starting from the past experiences (reconstruction of the organizational change history) and oriented towards future strategies. The 'hic et nunc' dear to psychologists must be enriched by historical-narrative elements, which suggest to the CA how the identity of the organization has developed over time. All this is not to propose solutions incompatible with the organization's past history but with its future objectives (and in accordance with the need to consider the discrepancy of the five-factor model of readiness to change).

CONCLUSION

In summary, a reflective OCD practitioner should follow a contingent model rather than a linear one, postmodern rather than mechanistic. He or she should aim at deuteron-individual learning rather than content-based training and strive for organizational learning rather than to the routinization of change. Furthermore, a reflective evidence-based change agent considers the time axis that precedes and follows the consulting intervention; acts in a secluded way, with the maximum political and institutional transparency, rather than being a protagonist. Thus, the main lesson to be learned from this chapter is that EBOCD practitioners should prepare and lead people through a multi-linear, learning-based path. During an organizational change, well-consolidated routines could become a trap rather than an added value. In summary, reflective evidence-based change agents should foster individual (and, as a consequence, organizational) learning-to-learn capabilities.

As mentioned in the Introduction, this paper aimed to address several questions, and now it is possible to suggest some answers:

How does the hard side of change (i.e. the business model, the job system etc.) interact with the soft side of change (i.e. the skills and the knowledge) in successful (and unsuccessful) change initiatives? This chapter suggests (Attention Point 2) preserving the P/E fit during and after an organizational change becomes a strategic goal for a firm to foster the individuals' change confidence/self-efficacy.

How can employee change cynicism be understood? Attention Point 5 highlights one explanation for the failure of change programmes is employee change cynicism: A CA should properly consider this dimension and its relation with other factors, as Poor Change Management History in designing OC.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

How does organizational history help in understanding the contextual forces shaping employee reactions to change? Attention Point 6 addresses this issue. For instance, in case of mergers, we now know a prominent role in moderating organizational change outcomes could be played by *organizational tenure*

What is the relationship between organizational change and undesired outcomes such as weak job satisfaction, low trust in the organization, and high turnover among employees? Attention Point 4 suggests that PCMH, through PCMH beliefs, leads to lower trust, job satisfaction and openness to change, and higher cynicism and turnover intentions.

However, both scholars and practitioners have until now paid scarce attention to the role training and consulting processes can play in bringing about effective organisational change. Regarding the issue of training, research has only investigated specific phases of the training process in OC (e.g. the role of the training needs analysis: Reed & Vakola, 2006) but has overlooked its effectiveness in terms of the required outcomes, such as the desired changes in behaviour and confidence. Given this scenario, this chapter contributes to current reflections on change management suggesting some 'lessons learned' to be considered in designing and implementing an OC initiative. Particularly, change agents should pay attention to the following key-points resulting from the evidence-based nature of a fully-reflective approach.

1. Empirical evidence highlights the importance of training in the organizational change process, and its contribution to the fostering of personal change readiness, though only when it is perceived effective and job-specific. Consequently, it becomes necessary to pay strong attention to conducting specific training needs analyses at the bottom line level of management.
2. Moreover, empirical evidence confirms the pivotal role played by individuals in organizational change, even when change happens at a macro-level. The real- life experience of the author as a change consultant demonstrates the role that training activities can play in: (i) increasing personal valence in OC situations; and ii) achieving a better skill-match which itself is a valuable goal and consistent with the P/J demand approach to fostering change confidence.
3. The case made by this chapter which demonstrates with empirical evidence that training which provides participants involved in OC with highly transferable skills, is perceived as a form of senior *managerial support* which increases readiness to change. Thus, in accordance with the organizational learning approach (Davenport & Prusak, 1998), and shifting from an individual to an organizational perspective, this chapter supports the idea that during an OCD initiative a properly planned training process preserves skills and knowledge as fundamental intangible assets.
4. The prominent role that could be played by individual characteristics such as *personal history* of previously experiencing organizational change, and *cynicism* and *organizational history* (Bordia et al., 2011; Brown et al., 2017; Pettigrew et al., 2001; Wanous et al., 2000) in making change management easier.

In conclusion, as suggested by some authors, the change process is continuous rather than being a moment of passage from one state to another (Weick & Quinn, 1999). Thus, maybe the main lesson gained from reviewing the literature, personal experience and evidence-based research is that a change agent should prepare involved people to engage in a continuous learning process. It means sharing strategic goals rather than simply providing new organizational routines. In this situation, paying attention to the chrono-context (both individual and organizational) becomes fundamental in making the change process smoother.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In summary, due to the complexity of an organizational change, only a longitudinal approach permits an explicit and direct observation of the change process in action, and thereby allows a description and account of how some entities or issues develop and change over time (Pettigrew et al., 2001). Although extant cross-sectional research has focused on a set of stable and enduring personal characteristics (e.g. *readiness to change*), several other characteristics both organizational and individual, such as training, have been overlooked. Hence, future research should investigate if and how the training process enables *readiness to change* over time, or instead shows its utility only when it is relating to a specific and limited period. Beyond P/E fit, future research should also attempt to shed light on other contextual factors that could affect the relationship between training and organizational justice, especially concerning informational and international justice.

Beyond its contributions, this chapter also shows some limitations. By focusing on *readiness to change* as a desired outcome it overlooks other possible/potential organizational outcomes at the individual, group, and organizational level. Although the change management literature shows the robustness of this construct at the individual level (for a review see Rafferty et al., 2013), it also shows some limitations. Hence, future research is called for to show if *self-perceived readiness to change* leads to actual organizational outcomes.

This chapter adopts a single-level perspective for discussing self-reported data about readiness to change obtained from employees and based on their perceptions. However, literature highlights that another limitation of the readiness to change model is that researchers have until now seldom adopted a multilevel analysis (Rafferty et al, 2013). Hence, for instance, it could be useful to compare the employees' self-perceived readiness to change with the perceptions of their direct supervisors, or to shift from an individual level to a group level to explore the group readiness to change.

Finally, although results have usually been controlled for age, gender, type of qualification and tenure, differences in readiness to change could be due to latent variables that are included in current models. Therefore, future research should investigate other elements to overcome these limitations; for example, the role played by personality traits and other personal characteristics.

Chapter 38
Mapping Innovation in the Digital Transformation Era:
The Role of Technology Convergence

Elona Marku
University of Cagliari, Italy

Manuel Castriotta
University of Cagliari, Italy

Maria Chiara Di Guardo
University of Cagliari, Italy

Michela Loi
University of Cagliari, Italy

ABSTRACT

Digital transformation is imperative for gaining and sustaining a firm's competitive advantage. Hence, understanding the dynamics of technology evolution becomes salient for both scholars and practitioners. This chapter aims to provide a complementary perspective to the field of innovation by mapping and visualizing the patterns of digital transformation at the industry level with a particular focus on the role of technology convergence. The authors tracked 20 years of the technology of the U.S. communications industry in order to investigate how digital transformation has shaped the industry technological structure, which are the technological gaps and potential future technology trends. The results show a deep transformation of the industry with many interconnections between technology domains and a high degree of overlap between technology areas.

INTRODUCTION

In the past few decades, high-technology industries have experienced an important evolution connected with the advancement of digital innovations, regulatory changes, as well as new consumer preferences (Curran & Leker, 2011). At the same time, scholars have been drawing increasing attention to the phenomenon of digital transformation, defining it as crucial for firm growth and success (Yoo, Boland, Lyytinen, & Majchrzak, 2012; Hess, Matt, Benlian, & Wiesböck, 2016; Soule, Puram, Westerman, & Bonnet, 2016; Schweer & Sahl, 2017; Singh & Hess, 2017). Indeed, the potential benefits resulting from this digitization trend—including big data, the Internet of things, mobile computing and cloud computing—are enormous (Fitzgerald et al., 2014; Peppard & Ward, 2016). Digitalization has reshaped the way we work and live by introducing new and more disruptive technologies. This rapid transformation continually leaves traces in the technological space reshaping the industry's technological structure. In order to capture these changes across time, the present study aims at mapping and visualizing technology and innovation in the digital transformation era. More specifically, the authors attempt to explore the technology trajectory and patterns at the industry level in order to unveil the dynamics of the evolution of digitalization, to identify its most active technological areas and focal streams.

Digital transformation is a very broad phenomenon that covers several aspects. Zhu, Kramer, and Xu (2006) have examined the digital transformation process in different countries showing that it is influenced by contextual factors including the technological, organizational, and environmental contexts have focused on the technological, organizational, and environmental factors. Other studies have revisited the innovation appropriability dynamics (Teece, 2018; Helfat & Raubitchek, 2018), while other works have examined digital transformation at individual level (i.e. Stolterman & Fors, 2004; Lanzolla & Giudici, 2017) or at the industry level (*i.e.* Agarwal, Gao, DesRoches, & Jha, 2010). However, studies that investigate the digital transformation process within the technology convergence and industry evolution paradigms are still absent.

Our goal in this chapter is to explore one aspect of digital transformation related to how it has affected the technology innovations generated by firms and how it can be explained through the technological convergence paradigm. Consistent with our goal, we analyzed the communication services industry as its digital transformation is evident, it has been a key driver of the worldwide digitization and as such it is positioned at the forefront of the deep transformation that comprehends new information technologies such as broadband networks, mobile communications, and the Internet (Maitland, Bauer, & Westerveld, 2002; Andal-Ancion *et al.,* 2003).

Moreover, the technology literature has widely shown the crucial role of patents as a meaningful instrument to measure the innovation performance (Trajtenberg, 1990; Ahuja & Katila, 2001; Hagedoorn & Cloodt, 2003; Di Guardo & Harrigan, 2016), to capture the multifaceted dimensions of technology (*i.e.* Hall, Jaffe, & Trajtenberg, 2001; Harrigan, Di Guardo, Marku, & Velez, 2017), to track the knowledge flows and spillovers (*i.e.* Jaffe A., 1986), and to monitor convergence and emerging technologies in the digital transformation era (Tijssen,1992; Engelsman & van Raan, 1994; Archibugi & Pianta, 1996; Curran & Leker, 2011; De Rassenfosse *et al*., 2013; Lee, Park, & Kang, 2018).

Based on patent co-classification analysis (Engelsman & van Raan, 1994), this study examines the digital transformation of the U.S. communications industry in a 20-year time interval that goes from 1992 to 2011. Patent co-classification analysis is widely acknowledged as a valid alternative to the most widespread patent co-citation analysis (Tijssen, 1992; Leydersdorf, 2008; Luan, Liu, & Wang, 2013; Marku, Castriotta, & Di Guardo, 2018; Marku & Zaitsava, 2018). Furthermore, the present work intro-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

duces a new approach for mapping and visualizing an industry's profile and evolution by focusing on fine-grained patent data. Departing far from extant literature, we map the co-occurrence of the technology classification codes using a novel and validated tool in management studies: the VosViewer software, whose algorithm for computing the similarity measure allows the overcoming of some of the artifacts produced by the multidimensional scaling (van Eck, Waltman, van den Berg, & Kaymak, 2006; van Eck & Waltman, 2007; Waaijer, van Bochove, & van Eck, 2010; van Eck, Waltman, Dekker, & van den Berg, 2010; Zupic & Čater 2015). In addition, following the latest trends in technology studies and avoiding the limitations of the International Patent Classification (IPC) system (Luan, Liu, & Wang, 2013), we use the Derwent World Patent Index (DWPI) classification codes (Calcagno, 2008; Luan, Liu, & Wang, 2013; Luan, Hou, Wang, & Wang, 2014). The peculiarity of the DWPI system consists of the assignment of one or several manual codes to a single patent document, aimed at covering all the relevant aspects of the invention. In this way, we can capture the smallest technology elements possessed by firms.

The remainder of this chapter is structured as follows. First, the authors discuss the relevant characteristics of digital transformation, technology convergence, and patent analysis. Second, the method based on patent co-classification and a brief explanation of the VosViewer algorithm are introduced. Third, descriptive results are presented and last, discussion, concluding remarks and implications are provided.

LITERATURE BACKGROUND

Digital Transformation

Digital transformation is imperative for firm growth and success, and even for firm survival (Andal-Ancion, Cartwright, & Yip, 2003; Fitzgerald *et al.,* 2014; Abolhassan, 2016; Riedl *et al.,* 2017; Reis *et al.,* 2018). Although terms like "digitization", "digitalization", or "digital transformation" are increasingly appearing in management studies, no clear definition has been provided yet (Agarwal et al., 2010; Andal-Ancion *et al.,* 2003; Yoo *et al.,* 2012; Hansen & Sia, 2015; Hess *et al.,* 2016; Lanzolla & Giudici, 2017; Teece, 2018; Helfat & Raubitchek, 2018). In this chapter, the authors conceive "digitization" as the creation of a digital version of physical objects such as paper documents, photographs, etc., "digitalization" encompasses the adoption and the leverage of digital technologies and digital data, meanwhile, "digital transformation" refers to the transformation from partial digitized businesses to fully digitized ones, it is an is an umbrella concept that includes artificial intelligence, robotics, machine learning, Internet of things, etc. (Riedl *et al*., 2017).

Although, existing literature has pointed out that the digital transformation represents an autonomous field (Mckelvey, Tanriverdi, & Yoo, 2016; Urbach, Drews, & Ross, 2017), the concept of digital transformation is very broad and covers several aspects. Most studies have focused on the analysis of the phenomenon at firm level, for example, Andal-Ancion, Cartwright, and George (2003) investigated the digital transformation of traditional businesses pointing out that the key to success consists in knowing how and when to apply new technologies. Other studies have examined the digital transformation process in different countries showing that it is influenced by contextual factors including the technological, organizational, and environmental contexts (Zhu, Kramer, & Xu, 2006). Moreover, other works have analyzed digital transformation at the individual level (i.e. Stolterman & Fors, 2004; Lanzolla & Giudici, 2017) as well as industry level (*i.e.* Agarwal *et al.,* 2010; Angst et al., 2017; Wang et al., 2018).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In this chapter, we examine the aspect of digital transformation related to technology innovation at the industry level. We refer to the concept of innovation in terms of inventions since they represent essential outputs of the R&D and inventive activities (Valentini & Di Guardo, 2012). It is extensively acknowledged that digital transformation has changed our work, our home, and our life, producing in this way far-reaching effects on our entire society, including firms and their inventive activities (Brynjolfsson & McAfee, 2014; Fitzgerald et al., 2014). Thus, digital technologies with their capability to enable pervasive connectivity, immediacy of interaction as well as wide access to data have changed radically the nature of innovations produced by firms (Yoo *et al.,* 2012; Matt, Hess, & Benlian, 2015; Lanzolla & Giudici, 2017). Digital transformation, empowered by the combination of different digital innovations, provides the building blocks for the development of new products and services (Hinings, Gegenhuber, & Greenwood, 2018; Teece, 2018). For this reason, no industry is immune to digital transformation as it continually modifies entire ecosystems (Hess *et al.,* 2016); almost all firms have started a process of exploration of new digital technologies in order to exploit their benefits and potentiality (Matt *et al.,* 2015; Hess et al., 2016).

In particular, the way the digital transformation has affected the technology innovations is evident in the case of the communication services industry. The latter has been a key driver of the worldwide digitization and as such it is positioned at the forefront of the deep transformation that comprehends new information technologies such as broadband networks, mobile communications, and the Internet (Maitland, Bauer, & Westerveld, 2002; Andal-Ancion *et al.,* 2003). Firms operating in this industry including hardware, semiconductors, network-based, and new information and communications technologies (ICT) have been growing up simultaneously creating a unique ecosystem progressively permeated with digital technology (Suh & Lee, 2017). Very often, the integration of digital technologies goes beyond the firm's boundaries redefining the rules of the game of the whole industry (Downes & Nunes, 2013; Matt *et al.,* 2015).

In the last decades, new technologies introduced in this industry have been disruptive leading to a paradigm shift that has changed not only the boundaries but especially the core technologies of the communications industry (Li & Whalley, 2002; Peppard & Rylander, 2006; Kim, Cho, & Kim, 2015; Lee, Kang, & Shin, 2015). The crucial role of the Internet and data communication services has moved the industry towards greater convergence and complexity (Maitland *et al.,* 2002). Indeed, everyday products such as smartphones or TVs have embedded software digital capabilities which include intelligent machines with sensors, network, and processors (Yoo *et al.,* 2012). Finally, this rapid transformation process with radical changes and technology convergence has continually left traces in the technological space, redesigning the industry's technological structure and landscape.

Technological Convergence

The concept of *technological convergence* was introduced by Rosenberg (1963) who defined it as "the process by which two hitherto different industrial sectors come to share a common knowledge and technological base". Other scholars have defined it as the blurring of boundaries between disjoint fields of science, technology, markets, or industries (Curran & Leker, 2011; Curran, 2013; Kim *et al*., 2015). In this vein, technological convergence is a process where technologies move from their prior positioning to new and common place. Consistent with this stream of research, we conceive technological convergence as the merging or overlapping of different fields of technology as a result of scientific and technological progress. More specifically, in this chapter technological convergence is defined as

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

a combination of at least two existing technologies into hybrid technologies (Kodama, 1995; Curran et al., 2010; Kim *et al.,* 2018).

Technological convergence has become a key feature of all high-tech industries as they have rapidly evolved to meet market demands (Iwai, 2000; Yoo *et al.*, 2012; Lee *et al.,* 2015) moving the boundaries of existing technologies and increasing their overlapped technological area (Gambardella & Torrisi, 1998; Athreye & Keeble, 2000; Borés, Saurina, & Torres, 2003; Kim *et al.,* 2015; Aharonson & Schilling, 2016). For example, the '90s were characterized by a great technological convergence in many fields: the power of computers boosted the information technology and at the same time the communications technology rapidly evolved leading to a convergence in the ICT; personal digital assistants evolved into the omnipresent Blackberry, iPhone, MP3; the digitalization involved an integration between analog and digital technologies, voice and data, leading to a convergence of telecommunication and broadcasting (Maitland *et al*., 2002; Lee et al., 2010; Suh & Lee, 2017).

At the same pace, the innovation literature has analyzed this phenomenon (Lee et al., 2010; Curran & Leker, 2011; Jeong et al., 2015; Kim, Kim, & Lee, 2018). Caviggioli (2016) examined the main drivers of technological convergence, using patents granted by the European Patent Office (EPO) from 1991 to 2007 he found that merges are more frequent if the focal technology fields are closely related. Curran and colleagues (2010) focused on the specific phases of the convergence process such as science, technology, market, and industry. Moreover, the study of Curran and Leker (2011) highlighted how these phases are not static and convergence may occur without including all these steps, a new product, service, or business model can cause convergence in an industry. Although, technological convergence is important because it can lead to a convergence of whole industries (D'Aveni, Dagnino, & Smith, 2010; Hacklin, Marxt, & Fahrni, 2010; Zhang & Li, 2010; Hacklin & Wallin, 2013), *how* technological convergence reshapes the industry technological structure and landscape is still unexplored.

Indeed, the gaining of awareness about the features of converging technologies in a wide scenario becomes essential since technological convergence is a key driver of innovation (Curran & Leker, 2011; Karvonen & Kässi, 2013; Lee et al., 2015). Innovations that come up from converging fields seem to be more novel and breakthrough (Schumpeter,1939; Fleming, 2001; Hacklin, 2007; No & Park, 2010; Nemet & Johnson, 2012; Karvonen & Kässi, 2013). Last, sectors that face technological convergence appear to have higher innovation performance and technological impact on industry evolution, making the phenomenon even more interesting to disentangle (No & Park, 2010; Kim & Kim, 2012; Curran, 2013; Hacklinetal, 2013; Caviggioli, 2016).

Patent Analysis

Digital transformation and technology convergence have intensified the technological competition among firms leading to a higher need to secure technologies via the patenting activity (Lee *et al.,* 2016; Lee & Kim, 2017). Patents grant to their owners an exclusive monopoly power over the use of an invention and as such they play a pivotal role of patents to protect a firm's R&D output (Oh, Cho, & Kim, 2014). The technology literature broadly acknowledges their importance of assessing firm innovation performance (Trajtenberg, 1990; Ahuja & Katila, 2001; Hagedoorn & Cloodt, 2003), seizing the different dimensions of technology (*i.e.* Hall *et al.*, 2001; Harrigan *et al.,* 2017), tracking the knowledge flows and spillovers (*i.e.* Jaffe A., 1986), and also monitoring technology convergence and industry evolution (Tijssen,1992; Engelsman & van Raan, 1994; Archibugi & Pianta, 1996; Curran & Leker, 2011; De Rassenfosse *et al*., 2013; Karvonen & Kässi, 2013; Suh & Sohn, 2015; Han & Sohn, 2016; Lee, Park, & Kang, 2018).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Moreover, in comparison with other information sources, patents can signal the latest technological change (Soete & Wyatt, 1983; Chen, 2011).

Specifically, patent analysis represents a common method to transform patent data into useful information (Tseng, Hsieh, Peng, & Chu, 2011; Niemann, Moehrle, & Frischkorn, 2017). In order to better understand the dynamics of technology evolution and convergence in different time frames, prior research has applied occurrence and co-occurrence network analysis using technology classification codes, assignee, applicants, inventors, citations, and co-citations analysis (Curran et al., 2010; Curran & Leker, 2011; Karvonen & Kässi, 2013; Jeong, Kim, & Choi, 2015; Castriotta & Di Guardo, 2016; : Loi, Castriotta, & Di Guardo, 2016; Di Guardo, Galvagno, & Cabiddu, 2012). Patent citation analysis is more suitable for the identification of technology flows among different elements as well as the investigating of convergence mechanisms using those knowledge flows (Kim & Lee, 2017). Instead, patent co-occurrence analysis through a science mapping approach allows a more detailed visualization of the phenomena occurring in contexts with technology convergence.

Patent co-classification analysis is widely acknowledged as a valid alternative to the most widespread patent co-citation analysis (Tijssen, 1992; Leydersdorf, 2008; Luan, Liu, & Wang, 2013; Marku, Castriotta, & Di Guardo, 2018). It draws upon the assumption that patents classification systems assign one or several manual codes to a single patent document aimed at covering all the relevant aspects of the invention. In this regard, the DWPI patent co-classification codes analysis is a more appropriate tool for mapping and visualizing an industry's profile and evolution by focusing on fine-grained patent data (Calcagno, 2008; Luan *et al*, 2013; 2014).

Operationally, two codes that co-occur within the same patent are an indication of their technological relatedness (Park & Yoon, 2014). Then, the presence of many co-occurrences around the same patents or firms' portfolios contributes to forming a technological structure map of an entire industry or sector (Park & Yoon, 2014). In the context of co-occurrence patent studies, Curran and Leker (2011) applied patent co-classification to monitor technology convergence while Karvonen and Kässi (2011) used large-scale patent data to anticipate the early stages of technology convergence. Lee, Kang, & Shin (2015) by adopting a patent maps approach focused on the identification of potential technology opportunities in a wider scenario like an industry. In summary, this study adopts a Derwent codes patent co-classification analysis in order to detect the patterns of digital transformation and technology convergence.

METHODOLOGY

Sample and Data

Technology convergence has involved many ICT fields including telecommunications, broadcasting, information technologies, and entertainment (Borés *et al*., 2003; Han & Sohn, 2016). In particular, the technology convergence faced by the communications industry has been fueled by the introduction into the market and subsequent adoption of several radical digital technologies that have transformed the industry structure into a complex network created by the combination of wireless technologies, the Internet, and data communications (Maitland *et al*., 2002; Suh & Lee, 2017). Mainly for this reason, in this chapter, we examine the U.S. communications industry because of its high technological dynamism and complexity (Di Guardo, Harrigan, & Marku, 2018; Harrigan *et al*., 2017). Indeed, the U.S. Telecom Act of 1996 deregulated the provision of specialized communications services and the technology con-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

vergence began. Communications services technologies evolved rapidly as it became possible to digitize and transmit voice, data and video over one network and many firms made acquisitions in the late 1990s to supplement their internal technology gaps. Entry into the various service specialties brought diffusion of communications technologies that were used elsewhere. The result of this cross-pollination was a huge disruption in industry structure.

Using the COMPUSTAT database (Standard & Poor's, 2013), firms were selected according to the following SIC (Standard Industrial Classification) codes: 4812 (Radiotelephone communications), 4813 (Telephone communications, except radiotelephone), 4822 (Telegraph and other message communications), 4841 (Cable and other pay television services), and 4899 (Communication services not elsewhere classified). Patent information was retrieved from the DWPI database (2013) using a 20-year time interval that goes from 1992 to 2011; in addition to the whole dataset, four 5-year time-frame datasets were created. In order to capture the earliest stage of technology convergence, the earliest priority year was considered. This selection procedure led to a final sample that consists of 120,476 U.S. patents granted to 180 firms.

Moreover, different from prior research that mainly uses IPC (International Patent Classification) codes or U.S. classification codes, this work adopts the Derwent classification system. Although, the Derwent manual codes——similarly to the IPC codes or the U.S. classification codes——have a logical hierarchy assigned to the primary inventive features of a basic patent, their peculiarity consists of the assignment of one or several manual codes to a single patent document aimed at covering all the relevant aspects of the invention (Calcagno, 2008; Harrigan & Di Guardo, 2017; Harrigan, Di Guardo, & Marku, 2018). From an operational point of view, co-classifications can be represented by a frequency matrix of co-occurrences in which the patents fitting with our sample are paired (Engelsman & van Raan, 1994, Curran & Leker, 2011; Karvonen & Kässi, 2013).

We retrieved the co-classification codes frequencies for each patent in our sample and compiled them into a raw matrix. In our case, the co-occurrence matrix is composed of 284 Derwent codes. This 284 X 284 asymmetric matrix is the source from which we ran multivariate science mapping analysis (Van Eck *et al.,* 2010). Further, these fine-grained data allow to account for a multiplicity of technological domains and to better monitor the technology convergence and digital transformation of the industry.

Multivariate Analysis

By relying on previous patent and bibliometric studies (Di Stefano, Gambardella, & Verona, 2012), and in coherence with our research goals of exploring technology convergence and evolution of the U.S. communications industry, we apply two patent co-occurrence techniques to perform our co-classification analysis: cluster analysis and multidimensional scaling (MDS). Furthermore, a network visualization is applied to better identify the connections among the different technology classification codes and clusters (if any). Cluster analysis is a common technique well suited to find subgroups in a field that gathers the similarity among groups' constituting objects (McCain, 1990). As regards to the MDS, it attempts to find a structure in a set of proximity measures between objects (Kruskal, 1977) by producing a map in a low dimensional space (usually two) that optimizes distances between those objects and that reflects a similarity measure. Accordingly, similar items will appear closer in the map (Leydesdorff & Vaughan, 2006).

Visualization Software: VosViewer

The increase of the amount of patent documents has fostered the development of sophisticated patent analysis instruments (Abbas, Zhang, & Khan, 2014). In this study, we introduce a novel instrument to track technology convergence by using the VosViewer software. The latter is a validated tool in management studies whose algorithm for computing the similarity measure allows the overcoming of some of the artifacts produced by the multidimensional scaling (van Eck *et al.* 2006; van Eck & Waltman, 2007; Waaijer, van Bochove, & van Eck, 2010; van Eck *et al.,* 2010; Zupic & Čater 2015). The VosViewer methodology is developed by van Eck & Waltman (2007) and it is based on the association strength s_{ij} between items (concepts) that can be synthetized as follows:

$$s_{i,j} = \frac{c_{i,j}}{w_i w_j} \tag{1}$$

where c_{ij} refers to the number of co-occurrences of items i and j, while w_i and w_j concern to either the total number of occurrences of items i and j or to the total number of co-occurrences of these items. It could be considered a weighted MDS that presents the advantage to overcome two artifacts of the latter: the first regards the MDS tendency to map the most important items in the center while the less important on the periphery, and the second concerns the use of a circular structure (van Eck, *et al.,* 2010). This situation occurs because when the MDS approach is applied to similarity data, it tries to assign the same distance to each pair of items, including those with similarity equal to zero. In our case, there are many classification codes that are never combined together in a patented invention, their frequency and similarity measure is equal to zero. According to van Eck et al., (2010), in the case of similarity data that consists largely of zeros, it is not possible to build a map with an exact same distance between each pair, hence, the MDS provides an approximation of this distance. In contrast, the VosViewer approach, being a weighted MDS, it does not give equal weight to all pairs of items, it gives more weight to more similar pairs of items, low weight to pairs of items with low similarity. As similarity data are typically dominated by low values, the VosViewer pairs of items with low similarity will have little weight and consequently will receive a little effect on the map.

RESULTS

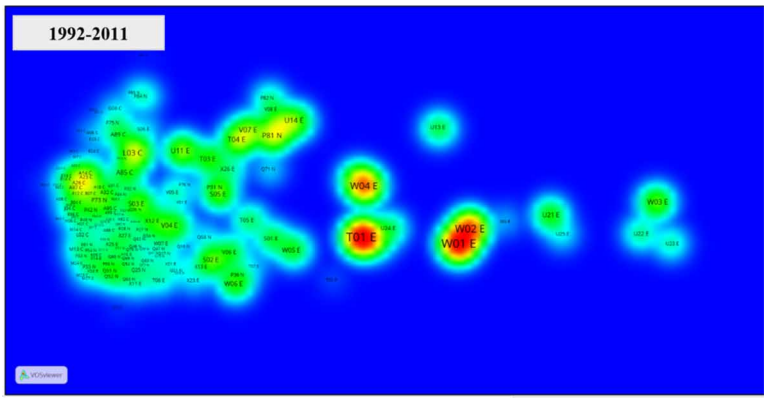
Evidence of the digital transformation experienced by firms operating in the U.S. communications industry clearly emerges by looking at Table 1 which summarizes the top-20 technologies in the four 5-year time intervals. Not surprisingly, this list includes technology groups that strongly characterize the industry, namely, “W” (Communications), “T” (Computing and control), “L” (Refractories, ceramics, cement and electro(in)organics), “P” (General), “U” (Semiconductors and electronic circuitry), “V” (Electronic components), “S” (Instrumentation, measuring and testing), “A” (Polymers plastics), and “X” (Electric power engineering). The first rows of Table 1 highlight those technologies that can be defined as core, we find “T01 E” - Digital computers (data processing), “W01 E” - Telephone and data transmission systems (wireless), “W02 E” - Broadcasting, radio and line transmission systems, and “W04 E” - Audio/visual recording and systems.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In particular, it is interesting to observe the paths of two dominant technologies, Digital computers (T01 E) and Telephone (W01 E). In the first and second time frame the percentage of patents that contains a technology classified as "W01 E" was 6.49% and 9.72%, respectively. This frequency was higher than the technology "T01 E" that was embodied in the 5.02% (1992-1996) and 9.45% (1997-2001) of the patented inventions. This result can be explained by the predominance of the telephone technologies during 1992-2001, however, starting from the third time frame (2002-2006), the situation is overturned as "T01 E" boosted and scored 13.14% (2002-2006) increasing even more in the last time frame (2007-2011) with 17.44%. Although "W01 E" shows a positive trend, its speed was lower than "T01 E". The digital transformation process has started.

Table 1. Frequency percentage of the top-20 technologies in each 5-year time frame

Technology		1992-1996	1997-2001	2002-2006	2007-2011	Trend
T01 E	Digital computers (data processing)	5.02%	9.45%	13.14%	17.44%	↑
W01 E	Telephone, data transmission syst. (wireless)	6.49%	9.72%	10.31%	13.95%	↑
W02 E	Broadcasting, radio and line transmission syst.	6.96%	7.95%	6.14%	5.56%	↓
W04 E	Audio/visual recording and systems	6.65%	4.62%	4.80%	7.11%	↑
L03 C	Electro-(in)organic (electric discharge lamps)	3.94%	3.25%	2.73%	2.45%	↓
P81 N	Optics	3.37%	2.57%	2.42%	2.39%	↓
T04 E	Computer peripheral equip. (graph reading)	1.72%	1.75%	2.73%	3.73%	↑
U11 E	Semiconductor materials and processing	2.66%	2.34%	1.92%	2.19%	↑
W03 E	Tv and broadcast radio receivers	1.44%	1.45%	1.85%	3.71%	↑
U14 E	Memories, film and hybrid circuits	1.68%	1.54%	1.80%	3.01%	↑
V07 E	Fibre-optics and light control	2.13%	2.13%	1.68%	1.57%	↓
U12 E	Discrete devices	1.60%	1.73%	2.02%	2.08%	↑
P85 N	Education, cryptography, adverts	1.85%	1.93%	1.71%	1.42%	↓
S03 E	Scientific instrumentation	1.51%	1.52%	2.33%	1.24%	↓
W06 E	Aviation, marine and radar systems	1.62%	1.31%	1.42%	1.78%	↑
T03 E	Data recording (tape(/filament) transport)	2.78%	1.61%	-	-	↓
V04 E	Printed circuits and connectors	1.30%	1.43%	-	1.57%	↑
U21 E	Logic circuits, electronic switching and coding	1.46%	1.45%	1.38%	-	↓
W05 E	Alarms, signalling, telemetry and telecontrol	-	-	1.57%	1.49%	↓
P86 N	Musical instruments, acoustics	1.39%	1.44%	-	-	↓
A85 C	Electrical applications	-	1.17%	-	1.33%	↑
S05 E	Electrical medical equipment	-	-	1.85%	-	↓
V06 E	Electromechanical transducers	-	-	1.59%	-	↓
U13 E	Integrated circuits	1.39%	-	-	-	↓
S02 E	Engineering instrumentation	-	-	1.29%	-	↓
X26 E	Lighting (portable lights)	-	-	-	1.14%	↑
A89 C	Photographic, laboratory equipment, optical	-	-	-	1.10%	↑



The last column of Table 1 depicts the technological trend of the different technologies, most of them seem to have a negative trend; digitalization fosters the development of technologies like digital computers while it hinders other technologies such as data recording (tape/filament). Among technolo-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

gies that decreased their technological presence in the industry, we identify: Broadcasting, radio and line transmission systems (W02 E); Electro-(in)organic (L03 C); Optics (P81 N); Fibre-optics and light control (V07 E); Scientific instrumentation (S03 E); etc. Technologies with a positive trend comprehend: Computer peripheral equipment (T04 E); Semiconductor materials and processing (U11 E); Receivers of Tv and broadcast radio (W03 E); Memories (U14 E); etc. Another interesting result is connected with the appearance and especially the disappearance of technologies from the top-20 ranking technologies. While Data recording technologies that use tape or filament (T03 E) and Musical instruments (P86 N) were shifted out from this ranking, other technologies reinforced their position, this is the case of Portable lights (X26 E) and Photographic laboratory equipment (A89 C).

The same data can be seen from another perspective, by mapping and visualizing innovation. Figure 1 illustrates the most active technological areas in the 20-year span. The core industry is held by the communications technologies "W01 E" and "W02 E" that are positioned very close to each other, and the digital technology "T01 E" which seems to have a similar distance from "W01 E" and "W04 E". The other technologies are shaped like clouds around the core presenting different densities.

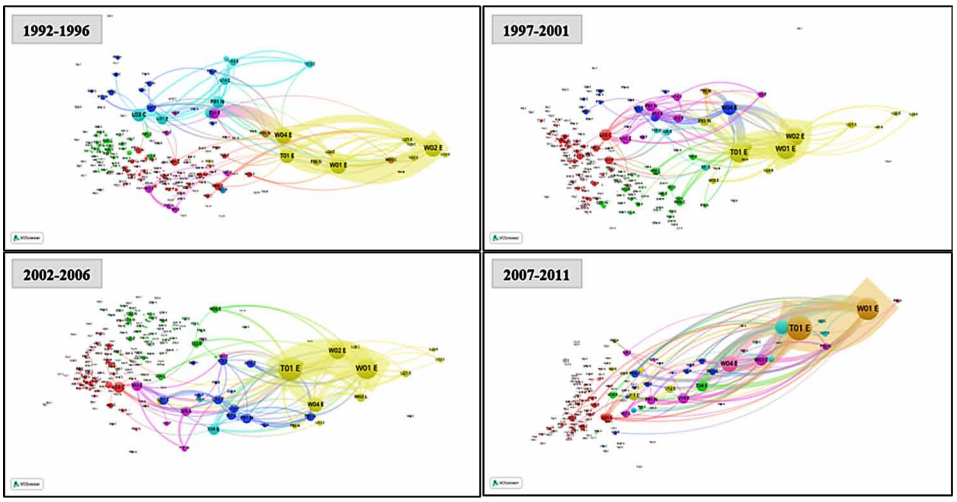


Figure 1. Density map of the 20-year time span

Moreover, Figure 2 shows four maps (one map per time window) that can be useful to understand the dynamics of technology convergence in the industry. In general, technology classification codes present our nodes in the map, thick swaths evidence a high frequency of two technology codes classified together in the same patent document. Nodes are also gathered into different clusters according to their degree of similarity. Specifically, the first quadrant of Figure 2 (1992- 1996) shows an industry characterized by clusters with well-defined boundaries with few links between them. The core technologies identified by the big nodes are commonly combined with each other with few hubs (T01 E and W04 E). Moreover, the industry appears to gain more dynamicity in the second time frame, technologies are positioned closer to each other and they are more intertwined. This signals a cross-pollination of the field. This process continues during the years that go from 2002 to 2006. Finally, the most meaningful picture of the industry is enclosed in the map that refers to the last time span (2007-2011). Technology boundaries are blurred, the map does not present distinct clusters, it is a massive cloud with a specific trajectory pulled by the core technologies (T01 E and W01E), showing in this way a high convergence among different technologies.

Figure 2. Visualization of technology convergence in four 5-year time frames

DISCUSSION AND CONCLUSION

The present study explored the technology trajectory and emerging patterns at the industry level in order to unveil the dynamics of the evolution of digitalization, to identify its most active technological areas and focal streams. Our analysis exploited the information included in patent documents which are commonly used as a proxy of technology innovation and their classification provides a useful means to identify technological domains and their overlap across time. Using a co-classification methodology on 20-year window data, it was possible to identify the different phases in which the digital transformation affected the technology innovations in the specific case of the U.S. communication services industry. The mapping and visualization of the industry's technological structure in different landscapes show a deep transformation of the industry, from a polycentric structure (in the timespan that goes from 1992 to 1996) to a diffused overlap between technology fields (in the timeframe 2007-2011). This is consistent with the technological convergence paradigm, two or more technologies move together in the technological space, overlapping or merging with each other while generating new innovations.

It is interesting to observe how the entry and further development of a disruptive innovation (this is the case of digital computers and data processing technologies) lead to a redefinition of all the existing links in terms of strength, new links formed or even canceled. In general, being aware of the strength of links between the technology portfolio possessed by the firm and the industry's technology core can be fundamental for the sustaining of competitive advantage or identifying new opportunities. This exploratory study increases the awareness of scholars by detecting and visualizing the technology management phenomenon as it provides a descriptive overview of the positioning of the technologies involved in the industry's inventive activity, as well as the links between them.

The contributions of the present study are threefold. It contributes to the digital transformation literature by exploring how it shapes the technology structure of an industry. Second, it sheds new light on the dynamics of technology convergence in the process of digital transformation, contributing to the technology innovation literature. A methodological contribution was provided by introducing a novel

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(although validated) tool for mapping the co-occurrence of the technology classification codes, the VosViewer software.

Managerial contributions can be also highlighted. This paper examined 20 years technology of one of the industries in which digital transformation was more evident, our findings suggest a potential scenario to managers of industries that now are facing digital transformation. If an industry's picture is similar to the first 5-year window in the case analyzed in this chapter, a suggestion for managers could be the development of a higher degree of heterogeneity of the resources involved in the R&D and inventive activities as well as the enhancement of firm's capabilities to recombine new knowledge. Moreover, the industry analyzed is characterized by a fast pace of technology, having an idea of how much time does it take for a technology structure to change its connotations can be useful for managers in their decision-making process.

In addition to the above-mentioned contributions, the present study presents several limitations. First, in this chapter, we analyzed the effect of digital transformation at a sector level on the technological structure from 1992-2011, future research might focus on what happened from 2011 to 2018 in terms of technological change as well as changes in the industry structure. Second, we examined the technology structure of a single industry, future research might focus on two more industries in order to provide a broader overview of industry convergence. Third, although the industry under examination has a high intensity of patent activities, not all inventions are patented; one common reason is the firms' reliance on secrecy.

Chapter 39
The Accessibility, Usability, Quality and Readability of Turkish State and Local Government Websites an Exploratory Study

Yakup Akgül
https://orcid.org/0000-0001-5344-4359
Alanya Alaaddin Keykubat University, Alanya, Turkey

ABSTRACT

With significant development in Internet technology contributing to daily lives in nearly every aspect, it is important that government websites and e-government services offered through them are used effectively, efficiently, and satisfactorily. Achieving accessible, usable, qualified, and readable e-government services that enable citizens to fulfill different users' requirements by everyone involved in the target group, implying a lack of equality between disabled and non-disabled people in benefiting from online governmental services regardless of time and location constraints, has become a global aim. This study investigated whether the websites of the state and local level e-government in the Turkish Republic comply with prevailing standards of accessibility, heuristic usability, mobile readiness, performance and, the readability of website content with six different indices and whether these qualities depend on the type of the government websites. After examining 77 state and 247 local e-government sites, the results indicate that the Turkish government websites have made many of the accessibility, usability, quality, and readability mistakes as predicted. In light of the study findings, this paper will present some recommendations for improving Turkish government websites, as well as discuss future implications.

INTRODUCTION

Recently, web accessibility and usability are becoming major attributes in both developed and developing countries, primarily for public and government institutions that rely on the web for providing the full range of usable, accessible, easy to use, readable, and easily reached services based on mobile readiness for their users. Moreover, electronic government services are expected to expand; thus, guaranteeing equal access for everyone in terms of providing citizens with more effective, efficient, and satisfactory government services that enable everyone to benefit from them and fulfilling different users' requirements based on usability, accessibility, readability, and quality dimensions, regardless of time and location constraints, have become a global aim. Disabled people constitute a noticeable percentage of the world's population (over 1 billion people), obtaining accessible e-government services that enable citizens to facilitate them and carry out different users' demands.

During the last two decades, governments in developing countries have increasingly accepted e-government as a fundamental means and crucial infrastructure of leveraging their general performance for government interaction with citizens and other stakeholders. Accessibility is crucial to usability. The usability of a website by users with disabilities was assigned as website accessibility. Cognitive, visual, mobility, auditory, or neurological disabilities are related to these disabilities (Loiacono, McCoy, & Chin, 2005). Site usability is a significant constituent of website quality, and as Scott (2005) indicates that the developers of government sites "must regularly monitor and enhance the quality of their sites to attract and satisfy users" as site content and site use raise (Scott, 2005:151). The usability of the website can leverage the trust and success in e-government services. It must be noted that trust is a crucial aspect of people's behavior to e-government websites. The usability of website leveraging trust and success in e-government services and that trust is a crucial aspect in people using e-government (Ansari, Baqar, Hassan & Saeed, 2016; Huang et al., 2009; Mensah et al., 2017; Parent, Vandebeek, & Gemino, 2005; Venkatesh, Hoehle & Aljafari, 2014). Users' trust can be leveraged by usability in e-government. At the state and local level, however, e-government websites often have usability and accessibility violations (Alryalat, 2017; Al-Yafi et al., 2016; Ho, 2002; Youngblood and Mackiewicz, 2012; Shi, 2007; Pribeanu and Fogarassy-Neszly, 2011; Pribeanu et al., 2012; Pribeanu et al., 2014; Akgül and Vatansever, 2016a; Akgül and Vatansever, 2016b; Akgül, 2016a; Akgül, 2016b; Ismailova and İnal, 2017; Ismailova, 2017). These issues become further complicated as the way citizens access the Internet is changing. The Turkish Statistical Institute reports that over forty-three percent of Turkish adults now own tablets, and ninety-seven percent of Turkish adults use the mobile phone (incl. smartphones) (TUİK, 2018). Thus, state and local websites should be usable, accessible, qualified, readable, well coded, and mobile-device ready. 53.2% of Internet users interacted with public authorities over the Internet for private purposes between April 2014-March 2015 in Turkey (TUİK, 2018). This study utilizes usability heuristics and accessibility to investigate 77 state and 247 local government websites and assess whether sites result in better site usability and accessibility. It is essential and reasonable to compare usability, and accessibility of websites depending on the state and local e-government websites.

Usability, accessibility, and readability attributes should be utilized at the design phase, especially in government websites, since they aim to provide prospective users with information about e-services. Poorly designed websites affect usage negatively and reduce website interaction (Baker, 2009; Clemmensen & Katre, 2012). The usability is acknowledged as a crucial reputation aspect of any website to provide the optimum services to the citizens of the developing countries. In this study; to assess usability, 19- dichotomous web usability standards were utilized to each site's homepage, based on prior usability

studies (Youngblood and Mackiewicz, 2012; West, 2008; Cappel & Huang, 2007; Galvez, and Youngblood, 2016; King & Youngblood, 2016; Youngblood and Youngblood, 2018; Akgül and Vatansever, 2015). As shown in Table 1, overall design standards; hypertext; navigational standards; readability; language option; and findability aspects have been evaluated.

The websites were checked for their compliance with existing accessibility standards including WCAG 2.0, the World Wide Web Consortium's Web Content Accessibility Guidelines, to assess state and local government websites accessibility (W3C, 2008). A combination of testing was run for compliance, an automated accessibility checker utilized each webpage for its compliance by using AChecker, automated testing cannot easily identify issues followed by manually inspecting the code for that. For instance, the presence or absence of an image's ALT attribute can be identified by using automated testing; but, it cannot promptly verify the usability ALT information.

And also, mobile-device readiness has been investigated by using the HTML and CSS of each homepage. Each webpage was also tested on a mobile device to see whether the webpage responsive to the mobile screen. Responsive Web Design makes your web page look good on all devices (desktops, tablets, and phones). Web technologies using the following guidelines can help to make information accessible to all citizens so that they will have equal accessibility opportunities to all e-government resources at any time and anywhere.

The speed of load time, response time, mobile load time, total HTTP requests, total images, total scripts, total CSS, total HTML, size, total objects, response connection errors, HTML Validation, CSS Validation, percentage of ARIA standards usage, and the number of broken links have been evaluated in the context of the quality parameters.

Citizens are increasingly using the Internet as a vehicle to acquire information for themselves of government-related topics and procedures, including e-government services. The readability of the contents of the state and local government websites have been measured through Flesch Kincaid reading ease, Flesch Kincaid grade level, Gunning fog, SMOG, Coleman-Liau index, and Automated Readability index.

Current study will help fill the gap in the existing researches, while most of the studies have investigated the usability and accessibility issues at the national (West, 2008; Jaeger, 2006; Olalere and Lazar, 2011), state (Fagan and Fagan, 2004; Lazar et al., 2013; Akgül and Vatansever, 2016a; Akgül and Vatansever, 2016b; Akgül, 2016a; Akgül, 2016b; Ismailova and İnal, 2017; Ismailova, 2017), and local (Youngblood and Mackiewicz, 2012; Cassell and Mullaly, 2012; Scott, 2005; Akgül and Vatansever, 2016b) levels. To the best of authors' knowledge, this is the first study to assess both the state and local websites in the context of Turkey. By examining mobile issues, it is very important that HTML and CSS can be resized to any screen. The study assesses that state and local governments may need to address in their current websites. This is particularly important because the higher penetration of powerful smartphones and high-speed mobile internet access (3G and 4G mobile networks) are leading to the better offer and higher usage of powerful mobile devices -especially smartphones- for mobile governmental services among people. In addition to this, usability, accessibility, quality, and readability data link the dots holistically. The main aim of this study is to connect the dots such as accessibility, usability, quality, and readability in the context of the state and the local government websites of Turkey.

RELATED LITERATURE

Accessibility Evaluation of Government Websites

Over the past few years, a number of studies on government web pages were carried out to measure the accessibility and usability of sites. Kurniawan and Zaphiris conducted the first study for comparing governmental, organizational, educational, and commercial aging/health-related websites according to their accessibility and usability (Kurniawan, 2001).

Galvez and Youngblood (2016) investigated the accessibility, usability, and mobile readiness of 132 state and local e-government websites in Rhode Island. The authors identified substantial problems in both usability and accessibility in Rhode Island state and local government websites.

A follow-up study has been conducted by Al-Khalifa et al., (2017) revisited the homepages of his 2010. In order to track how the Saudi government websites accessibility evolved from 2010 to 2017, The results show an improvement in the accessibility of Saudi government websites since 2010. Moreover, Ismailova and Inal (2017) have analyzed the accessibility of government websites of four countries including Kyrgyzstan, Azerbaijan, Kazakhstan, and Turkey. In another study, Ismailova (2017) investigated the usability, accessibility, and security aspects of covered 55 e-government websites in the Kyrgyz Republic. The results revealed accessibility, usability and security issues, which is listed in the State Information Resources of the Kyrgyz Republic. The same year, Verkijika and De Wet (2017) examined the conformance to Web Content Accessibility Guidelines (WCAG) 2.0 levels of government websites in Sub-Saharan Africa (SSA). The results indicated that none of the 217 government websites examined adhered to all the WCAG 2.0 guidelines.

In a recent study, Ismail et al., (2018) presented a multi-tool accessibility assessment of Indian state of Jammu and Kashmir government department websites based on six accessibility tools with 14 different parameters.

Some similar studies on the accessibility of websites and web contents were also conducted by Potter (2002); Kuzma et al., (2009a); Kopacka (2010); Kuzma (2010); Latif and Masrek (2010); Lazar et al. (2010); Al-Radaideh et al. (2011); Byun and Finnie (2011); Goodwin et al. (2011); Isa et al., (2011); Olalere and Lazar (2011); Al-Khalifa (2012); Baowaly and Bhuiyan (2012); Bakhsh and Mehmood (2012); Grantham et al. (2012); AbuAli et al., (2013); Al-Faries et al. (2013); AlJarallah (2013); Al Mourad and Kamoun (2013); Kamoun and Almourad (2013); Kamoun et al. (2013); Patra et al. (2014a); Patra et al., (2014b); Youngblood (2014); Wentz et al. (2014); Lujan-Mora et al. (2014), Ismail et al., (2017) and give suggestions for accessibility improvements.

Heuristic Usability Evaluation of Government Websites

The usability of e-government defined as "the extent to which a website can be used by citizens to achieve specified goals with effectiveness, efficiency, and satisfaction in a specified e-government service context." (Venkatesh et al.,2014:670). Usability has been known to play a central role in the success of any e-government initiative (Youngblood & Mackiewicz, 2012). That's why, e-government usability has been a crucial research field (Akgül and Vatansever, 2015; AlFawwaz, 2012; Asiimwe & Lim, 2010; Baker, 2009; Cappel and Huang,2007; Clemmensen & Katre, 2012; De Róiste, 2013; Donker-Kuijer, Jong & Lentz, 2010; Galvez and Youngblood, 2016; Huang & Benyoucef, 2014; King and Youngblood, 2016; Kirui & Kemei, 2014; Pew Center on the States, 2008; Usability.gov n.d.; Venkatesh et al., 2014;

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

West, 2008; Youngblood & Mackiewicz, 2012; Youngblood and Youngblood, 2013; Youngblood and Mackiewicz, 2012;Youngblood and Youngblood, 2018).

In the literature, relatively few studies have evaluated the usability of government websites by using dichotomous usability standards, checking for the presence or absence of site features as a usability inspection method. Youngblood and Mackiewicz (2012) investigated the websites' usability of municipalities in Alabama. The results of the study revealed substantial usability and accessibility problems.

Akgül and Vatansever (2013) evaluated the usability, accessibility, HTML and CSS validity, current use of HTML 5 and ARIA sides of sixty-one Turkish government websites. The results indicated that the analyzed sample has one or more issues.

Youngblood and Youngblood (2013) assessed a state-wide population of county web portals based on 14-point usability heuristic and accessibility. Researchers found that a few met all the usability standards whereas most sites did not pass a basic accessibility analysis.

King and Youngblood (2016) examined the county voting and election websites according to the content and quality of Alabama by means of a 22-point Election Information Content Score (EICS)s. Accessibility, usability, and mobile readiness aspects have been assessed. The results indicated that voting and election information are not in full compliance with accessibility, usability, and mobile readiness standards.

Galvez and Youngblood (2016) examined the accessibility, usability, and mobile readiness aspects of 132 state and local e-government websites in Rhode Island. The leveraging attributes of usability, accessibility, and mobile readiness suggested that practice-based templates may be helpful.

In a recent study, Youngblood and Youngblood (2018) evaluated usability heuristics, trust and site's usefulness of LEMA websites in Alabama.

In the context of company websites (Cappel and Huang, 2007), the same heuristic-based content analysis has been also used in these studies (Usability.gov, n.d.; Pew Center on the States, 2008; West, 2008).

Some similar studies on the usability of websites and web contents were also conducted by Al-Khalifa (2010) Alotaibi (2013) Islam et al. (2017) Hasan (2013) Ansari et al. (2016) Donker-Kuijer et al. (2010) Holzer & Kim (2007) Karaim and Inal (2017) Verkijika and De Wet (2018) and give suggestions for improvements.

Materials and Methods

This paper presents a first examination of the accessibility, usability, quality, and readability of a sample of Turkish state and local websites' homepages. E-government homepages were evaluated because they can represent the tone of the entire website (Potter, 2002). The list of Turkish state and local level e-government covering different government sectors and their web addresses was obtained from the turkiye.gov.tr as government "services A-Z" (The e-Government Gateway, 2018). The "A-Z" list included the state and local-level agencies. In Turkey, there are 77 state level and 247 local level websites. Data collection began for this study in January 2018, and evaluation was completed in February 2018.

Materials

The main aim of this paper is to test the usability, accessibility, quality, and readability of the state level and the local level e-government websites in the Turkish Republic. For accessibility testing, AChecker was used to test each homepage against the WCAG 2.0 standards.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

To test for usability standards, the coder visually inspected each homepage. Borrowing from previous studies (Cappel and Huang,2007; Youngblood and Mackiewicz, 2012; Youngblood and Youngblood, 2013; Galvez and Youngblood, 2016; King and Youngblood, 2016; Usability.gov n.d.; Pew Center on the States, 2008; West, 2008), overall design standards, conventions for hyperlinked text in main text, navigational standards, findability, and readability aspects have been utilized as five usability attributes. Splash pages, autoplay, and horizontal scrolling have been examined regarding the overall design standards category, these attributes are considered as violating design standards. The text links category examined to assess whether text links were blue if links were a different color than regular text if the link color changed after being clicked, and if text links were underlined. Then, the analyzed sample sites were evaluated for their navigational standards. The "home" link or "return" home text link was adopted as good navigational standards. Also, a navigational group should have no more than 10 items (excessively long navigational groupings). The usability measure included findability. Each homepage was assessed for its findability at the first page of Google search results. Lastly, readability was counted by assessing whether each homepage used left-aligned text, had no more than one contiguous sentence of all capitalized text, only hyperlinked text is underlined, and if there was an option to view the page in a language other than Turkish.

To evaluate mobile readiness, the Safari Web browser on an iPhone 6S was used to examine the responsiveness of a site to mobile devices, i.e., if the homepage conformed to the smaller screen size.

For the quality test, the researcher utilized the Web Page Analyzer tool, which was chosen for its online availability and wide usage by researchers in quality tests. The evaluation of the websites' performance was utilized using the speed test tool provided by Pingdom AB, available at http://www.pingdom.com. The size and composition of, and downloads time for websites have been given by this tool. Pingdom has been used in previous studies regarding the evaluation of government websites (Gopinah et al., 2016; Ismailova and İnal, 2017; Ismailova, 2017; Jati and Dominic, 2009; Manhas, 2014; Ismailova, 2017; Akgül, 2016a; Akgül, 2016b) and university websites (Jange, 2014; Kaur et al., 2016). Websitepulse has been used for the response time and PageSpeed Google tools have been used for mobile loading time. Moreover, the Chrome extension of the LinkMiner tool has been utilized to count the numbers of broken links in the analyzed websites (Cooper, 2015).

Hypertext markup language (HTML) code validation is a primary step in evaluating web accessibility (Baowaly et al., 2012). HTML and cascading style sheets (CSS) documents (CSS specifications) need to create international technical specifications (detailed rules regarding syntax or grammar) to work properly for assistive technologies (Baowaly et al., 2012; Grantham et al., 2012). HTML Markup Validation Service (https://validator.w3.org) and CSS Validator Service (http://jigsaw.w3.org/cssvalidator/) have been utilized to examine whether the analyzed sample websites follow international standards, which are both available online for free from W3C. Similarly, the validation icons did not necessarily reveal the actual up-to-date accessibility conformance (Gilbertson and Machin, 2012). In the present study, the presence of validation icons and conformance icons as an indication of the awareness of web accessibility in Turkey governmental websites have been examined. Moreover, if the conformance icon was present on a website, the author observed whether WCAG 1.0 or WCAG 2.0 conformance icons are used and whether they reflect the actual conformance level. The same measures were applied to HTML and CSS validation icons. Author checked the presence of HTML and CSS validation icons and, if they existed, the author checked whether they represent an up-to-date version of the respective website.

After the accessibility evaluation process, the readability must be checked. Readability is also an important component in evaluating the accessibility of a web page. For the readability analysis, the col-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

lection of readability score was utilized by using the calculation tool provided by Online-Utility.org based on the Flesch-Kincaid Reading Ease, Flesch-Kincaid Grade Level, Gunning FOG, Simple Measure of Gobbledygook, Coleman-Liau Index and Automatic Readability Index.

RESULTS

Usability Analysis

The overwhelming majority of sites followed the overall design standards, regardless of whether or not the site state or local level. There were only four instances in which a website used a splash page, meaning that 97% of the state level sites and only eleven instances in which a website used a splash page, meaning that 96% of the local level sites met design standard 1. Only one state-level site and seven local level sites had an audio and/or video autoplay, and only fifteen state-level sites and eighty-two local level sites required the user to scroll across the page horizontally.

Overall, state and local level sites did not fare as well with meeting hyperlinked text conventions as they did with meeting design standards. Of the four categories used to create the hyperlinked text measure, both state and local level sites scored highest for the following: "All text links are a different color than the main text". Surprisingly, "All text links are blue", "all text links change color after being clicked," and "all text links are underlined" (see Table 1). Surprisingly, state and local level sites were more likely to have text links that -had a different color than the main body text.

Not all but one (0.01%) of the websites used the color to help differentiate hyperlinks from the surrounding text. At the same time, however, four state level and seventeen local level of the websites underlined hyperlinks in the main text, presenting a potential problem for colorblind users unable to use color to separate hyperlinks from the surrounding text. When it came to navigational standards, all of the websites had a primary navigation at the top or left the side of the page. 35% of state level and 47% of local level websites have a Home link on internal pages.

Just under 95% of the state level and 86% of local level websites relied on the use of a header graphic, such as a logo, as a supplemental home link. More troubling, the majority of the state level (61%) and local level (32%) sites had overloaded with navigation—navigational groupings with more than ten items make it difficult for users to remember where information in the navigation is as they move between pages.

The websites perform reasonably well in terms of readability, with none of the websites relying on more than one continuous line of all capitalized text and only seven state-level websites (79%) having text that was underlined but was not a hyperlink. That said, all of the websites had the main body text that was not left aligned, i.e. text that was centered.

All sites were tested for their "findability," how easy they were to find by using a Google search. All of the state and local level websites (100%) met the findability criteria and appeared in the first page of Google search results.

Only forty-four local level (18%) and state level (81%) of the websites provided translated content, and the translation was always handled through a Google translate option rather than providing professionally translated material.

Table 1. Results of usability evaluations

Usability Standard	State Level N=77 N (%)	Local Level N=247 N (%)
Overall design standards		
1. A splash page is not used (on the opening screen)	73 (97)	236 (96)
2. Audio and video do NOT auto play when page loads	76 (99)	240 (98)
3. Horizontal scrolling is not required with the browser window set to 1024 pixels across.	62 (82)	165 (67)
Conventions for hyperlinked text in the main text		
4. All text links are blue (some shade of blue, not necessarily the default shade, counts as blue).	7 (0.1)	20 (0.09)
5. All text links are a different color than the main text	77 (100)	242 (98)
6. All text links color changes after a link is clicked.	0 (0)	1 (0.01)
7. All text links are underlined.	4 (0.06)	17 (0.07)
Navigational standards		
8. A "home" or "return" text link (HTML text or text appearing in a graphic) appears on internal pages[a].	26 (35)	116 (0.47)
9. A logo or other header graphic serves as a "home" link on internal pages.	72 (95)	211 (0.86)
10. Main navigation is on the top and (or left side of the page)	73 (97)	225 (0.92)
11. There are 10 or fewer visible items per navigational grouping	46 (61)	79 (0.32)
12. A breadcrumb trail is provided on internal pages.	40 (53)	114 (0.47)
13. Site search capability is provided on the home page.	69 (91)	149 (0.61)
14. A FAQ or Help option is provided	24 (32)	14 (0.06)
Findability		
15. Website is in the first page of results from Google	77 (100)	247 (100)
Readability		
16. Use of left-aligned text	77 (100)	247 (100)
17. Does not include more than one contiguous sentence of all-caps text	77 (100)	247 (100)
18. All underlined text is hyperlinked	60 (79)	247 (100)
19. Page has a non-Turkish version or a translation option	61 (81)	44 (0.18)

[a]Always assessed on internal pages

Accessibility Analysis

For the analysis of compliance with accessibility guidelines in Turkey, the AChecker tool was utilized on their availability, the ability to assess manually for WCAG 2.0 conformance Level A, AA, and AAA. Table 2 depicts the average number of parsing errors in the different governmental levels. Most parsing errors have appeared at the conformance level A, with 45,41 (state) and 139,55 (local) average errors, respectively. The average number of errors at conformance level AA was lower for both the state and local level sites. Again, the lowest number of errors was found in the state level websites (13,95 errors in average) and the highest was observed in the local level websites (18,71 errors). In brief, of the 77 websites from state-level sites, only two satisfied the accessibility conformance level A, level AA and level AAA, of the 247 websites from local level sites, only twenty-three satisfied the accessibility confor-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

mance level A, level AA, and Level AAA. It was found that the most failed success criteria include: SC 1.1.1 (missing appropriate Alt Text). In the state level sites, 80% of all the errors were due to violating this criterion. In the local level websites, this error constituted more than half of all errors (49%, respectively). Among the state level websites, the violation of criterion 1.1.1 was 80%, the violation of criterion 1.4.4 resize text was 9,8% and some of the failed success criteria include SC 1.4.6 (Contrast) (17% of all errors). In the local level websites, this error was observed 2015 times, which constituted 21% of all errors (at the state level 914 times 6%), respectively, SC 1.4.4 (Resize text) local level websites (4265 times and 9.8% of all errors). In the state level websites, this error was found 623 times, respectively, constituting 8.8% of all errors (Table 3).

Table 2. Average number of accessibility errors by service level

Level	Average Number by Conformance Level		
	A	AA	AAA
State Level	45,41	13,95	12,38
Local Level	139,55	18,71	10,08

Quality in Use Analysis

The quality of websites has been assessed on the basis of selected quality parameters; the speed of response and load time of the websites (Nielsen, 1994). For the quality and performance analysis, the download time was performed as one of the first measurements, response time and mobile loading speed of state and local level websites using the website pulse, Pingdom and PageSpeed Google tools. The results for each quality attributes summarized in Table 4. The best performing website scored the websites of the local level with the average response time being 2.17 s, ranging from 0,315 to 32.63 s. The average response speed of the Turkish state level websites was higher at 3.09 s., with the minimum and maximum being 0.563 and 65.959 s, respectively. The lowest response speed among the tested websites belonged to the http://www.ubak.gov.tr/ with a minimum response time of 0.563 s and local level a minimum of 0,315 s. belonged to the Bozüyük websites (Table 5). Following the response time, the download times of websites were measured. According to the results presented in Table 4, the best performing website scored 9.74 s. with the average load time at the websites of state level, ranging from 2,37 to 60s. The average load speed of the Turkish state level websites was higher at 12.37 s., with the minimum and maximum being 1.36 and 60 s, respectively. The lowest load speed among the tested websites belonged to the state level website with a minimum load time of 1.36 s. Following the download times, the mobile loading speed of websites was measured. According to the results presented in Table 4, the best score was obtained from the websites of the local level with the average mobile loading time being 2.08 s, ranging from 0,4 to 9,5 s. The average mobile loading speed of the Turkish state level websites was higher at 2.17 s., with the minimum and maximum being 0.8 and 5,9 s, respectively. The lowest mobile loading speed among the tested websites belonged to the local level website with a minimum mobile load time of 0.4 s.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Accessibility checkpoints violated by websites by service level

Checkpoints	State Level (N=77)	Local Level (N=247)
Conformance Level A		
1.1.1	2677	29298
1.3.1	191	1511
1.4.1	0	3
2.1.1	116	764
2.2.1	39	30
2.2.2	3	18
2.4.1	0	1
2.4.2	4	20
2.4.4	189	1458
3.1.1	79	285
3.2.2	0	15
3.3.2	99	572
4.1.1	47	410
4.1.2	7	84
Conformance Level AA		
1.4.3	389	262
1.4.4	623	4265
2.4.6	48	94
Conformance Level AAA		
1.4.6	914	2015
2.1.3	27	139
2.4.9	0	282
2.4.10	0	53

Following the load, response, and mobile loading times were evaluated. The results of the average number of total HTTP requests summarized in Table 5, which shows that the average total HTTP requests of the state government websites were 78.23 s, with the minimum and maximum being 3 s and 235 s, respectively. The total number of objects were evaluated with the number of HTML files, images, style sheets, and scripts. Increase in the number of HTTP requests causes a slowdown in the loading webpage. The average number of requests of the local government websites was 12.89 requests, with the minimum and maximum being 2 and 269, respectively. The lowest and highest average the size of the websites performing scored 0.08 (state) and 0.29 (local) megabytes, respectively. The number of detailed information regarding the components is given in Table 5. It is observed that the state government websites had the lowest connection errors, of which only 29% had connection errors, with the average numbers of errors being 0.82 and 3.45, respectively. For the remaining, the percentage of websites with connection errors was found to be 49% (local level) (Table 6).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Broken links were detected in 77% of the local level websites, 77% of the state level websites. Moreover, the lowest numbers of broken links were observed on the websites of local level websites, with the maximum numbers being 350, respectively. In contrast, the maximum numbers of broken links in the websites of state-level websites were 380, respectively (Table 7).

The further details of performance were obtained by using the Pingdom tool on the state and local websites. The overall average performance of the websites was as follows: On average, 100 points of the performance of local government websites had the highest average score, followed by the state government websites in Turkey (91 points). That is, the majority of the state level websites scored higher than 77 points. The state and local government websites of Turkish scored on average 80.16 and 77.51 points, respectively.

Table 4. Load time of websites by service level

LEVEL	Load Time (s)			Response Time (s)			Mobile Load Time (s)		
	Min.	Average	Max.	Min.	Average	Max.	Min.	Average	Max.
State level	2,37	9,736623377	60	0,563	3,097844	65,959	0,8	2,17	5,9
Local level	1,36	12,37296	60	0,315	2,167579	32,627	0,4	2,08	9,5

HTML and CSS Evaluation

Table 8 depicts that the highest number of HTML validation errors scored with an average of 97.23 errors in local government websites. Also, the websites of state had the lowest number of errors with only 63.97 average errors. Regarding the CSS validation results, the highest number of CSS validation errors scored with an average of 115.76 errors in state government websites. On the other hand, the lowest number of errors with only 123.89 average errors obtained from the websites of the local level.

Presence of Validation Icons and Conformance Icons

In addition, the examination of the presence of WCAG, HTML, and CSS validation icons carried out and found that none of the websites have conformance icons. The WAVE tool was also used to detect the usage of ARIA standards in the state and local level websites. We found that most of the websites use ARIA standards. Table 9 depicts the percentage of ARIA usage in the state and local government websites.

The state and local government websites were also conducted in order to identify mobile friendliness level. Each website was browsed by using smartphones and measured by the website design adoption. It is found that only 22% of the state government websites and 18% local government websites were mobile friendly.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 5. Size and the number of components of websites by service level

	State Level	Local Level
Total HTTP requests		
Min.	3	2

WAVE Tool

As per WAVE tool report for the state level, HTML5 & ARIA violations are least in these websites and alerts are larger in number. The mean values for errors were observed as 24, alerts were 19, features was 11, structural elements was 31.5, HTML5 & ARIA was 3.5 and contrast errors was 22. The standard deviations of errors, alerts, features, structural elements, HTML5 & ARIA, and Contrast errors are 23.27, 81.37, 18.04, 36.63, 20.33 and 60.21, respectively. As per WAVE tool report for the local level, HTML5 & ARIA violations are least in these websites and alerts are larger in number. The mean values for errors were observed as 24, alerts were 19, features were 11, structural elements were 31.5, HTML5 and

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ARIA were 3.5 and contrast errors was 22. The standard deviations of errors, alerts, features, structural elements, HTML5 & ARIA, and Contrast errors are 23.27, 81.37, 18.04, 36.63, 20.33 and 60.21, respectively. Hence, the result indicates that a number of alerts and contrast errors are high. For achieving better results in terms of accessibility, we need to minimize these alerts and contrast errors. The WAVE report of state and local government websites which were used for our accessibility analysis and their mean and standard deviation are given in Table 10.

Readability Test Results

On the basis of readability score calculated by all readability tools, the overall average grade level per the name of the website is mentioned in Table 11. To prevent human error during calculations and for ease of use, both readability tests were performed by using an online readability calculator. The average FRES, FKGL, SMOG, and Gunning Fog Index (GFI) scores of state level and local level websites were found to be 20.24 (state level) 23.40 (local level), 11.47 (state level) 11.18 (local level), and 6.87 (state level) 7.17 (local level), 5.83 (state level) 6.61 (local level) respectively. Both state level and local level of the websites had difficult to read FRES score (0–49). State level websites had score 5.0-5.9 Easily understood by an average 5th or 6th-grade student. Local level sites had score 6.0-6.9 Easily understood by an average 7th or 8th-grade student.

Table 11. Readability indices of government websites of Turkey

	State Level			Local Level		
	Min.	**Average**	**Max.**	**Min.**	**Average**	**Max.**
FKRE	-49	20,24306	121,2	-132,6	23,39978	121,2
FKGL	-3,4	11,46528	20,6	-3,4	11,17733	32
GFOG	0,4	5,829167	17	0,4	6,609052	16,38
SMOG	1,8	6,868056	6,7	1,8	7,168664	15,6
CLI	-16,1	15,68333	16,4	-16,1	16,29909	60,5
ARI	-20,9	5,898611	14,8	-20,9	7,193664	47

Note: Readability Tools (FKRE: Flesch-Kincaid Reading Ease, FKGL: Flesch-Kincaid Grade Level, GFOG: Gunning FOG, SMOG: Simple Measure of Gobbledygook, CLI: Coleman-Liau Index, ARI: Automatic Readability Index).

DISCUSSION AND CONCLUSION

In this study, state and local government websites of Turkey have been evaluated in terms of usability, accessibility, quality, and readability. In terms of the usability, it is an urgent need for promoting the use of usability heuristics, particularly in the main text and navigation, to guide the website development, as well as the need for hands-on usability testing. The majority of state and local government websites also need to work on making their websites more usable on mobile devices, so mobile readiness will be more efficient. This finding aligns with the researches by Ismail et al. (2018); King and Youngblood (2016); Verkijika and De Wet (2018a); Verkijika and De Wet (2018b); Youngblood and Mackiewicz (2012); Youngblood and Youngblood (2018). According to the results on the accessibility tests, of the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

2 websites in the state government websites and 23 websites in the local government websites attained conformance level A, level AA, and Level AAA. Furthermore, the analysis of the distribution of error showed that in the local government websites, accessibility checkpoints were violated more often than in state governments' websites. Therefore, in designing government websites, the developers need to pay more attention to guidelines such as WCAG 2.0 to achieve a higher accessibility. The findings of this research support previous studies that examined the web accessibility level of e-government websites around the world (Al-Khalifa et al., 2017; Ismail et al., 2017; Moreno et al., 2018; Verkijika and De Wet, 2017; Verkijika and De Wet, 2018b). In terms of the usage quality, the speed of load time, response time, mobile load time, total HTTP requests, total images, total scripts, total CSS, total HTML, size, total objects, response connection errors, HTML Validation, CSS Validation, percentage of ARIA standards usage and as well as the number of broken links were evaluated. Overall, it can be said that local government websites have a higher load, response and mobile load speed and less broken links and higher performance score. They are followed by state government websites. Broken links are known to affect the quality of a website as they pose a navigation challenge for users trying to access information on the given website (Dani and Agrawal, 2018; Ismailova and İnal, 2017; Verkijika, 2017; Verkijika and De Wet, 2018a; Verkijika and De Wet, 2018b). In terms of readability, both state and local government websites had a difficulty to read FRES score. These findings further confirm previous studies that examined Patra et al. (2017) studied the compliance of WCAG 2.0 on Indian websites and specified that 39.60% of educational sites are violating the rules of readability. Karhu et al., (2012) evaluated the accessibility and readability of the contents of the websites of seven universities in Finland. A few other studies have examined the readability of the topic-specific information on the world wide web (Grewal and Alagaratnam (2013); Schloman (2004); Schutten and McFarland (2009), predicting helpful user reviews O'Mahony and Smyth (2010); Redish and Selzer (1985). Ismail et al., (2017) With respect to readability, the score was computed using six well established techniques. It was observed that the readability score of these sites were in the acceptable range. Recently, the readability of government websites in India (Ojha et al., 2018).

The findings from this study indicated that the overall usability, accessibility, quality, and readability of e-government websites in Turkey was quite poor, with both state and local level websites performing very badly in usability, accessibility, quality, and readability.

Today, primary access channel of information is the World Wide Web. They should be accessible and communicable to the people irrespective of their disabilities. In order to make the web pages accessible, we have to add some accessibility features such as screen reader link, text size, skip to main content, contrast theme, multi-language, and accessibility statement, etc. By doing this, we will make the websites universally accessible for all. This work also will help to allow IT administrators to implement websites as per WCAG guidelines to avoid these types of violations in the future.

First, it is inappropriate to generalize the findings of this study. Although generalizing the findings may seem to be inappropriate, they signify the importance of the usability, accessibility, performance, and readability in forming well-created e-government services.

LIMITATIONS AND FUTURE RESEARCH

In the context of this work, the tests (accessibility, quality, and readability) were carried out by using online evaluation tools. Although a wide range of errors of a website can be checked by using semi-automatic

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

evaluation tools, the expectations of the visitors of a website play a significant function in the website assessment. Thus, the main limitation of this work is that only semi-automatic tools examination was utilized for aspects of accessibility, quality, and readability. Also, the evaluation of accessibility based on other standards such as Section 508 should be considered. User experience tests will be conducted in the context of future work to deepen the evidence basis for the evaluation for further research. For the analysis of usability, accessibility, and readability, target groups from each website user will be selected. Accessibility analysis will be performed with users with visual impairments. Moreover, the present study was limited to the homepage rather than the entire site. Future studies should focus on the entire site to have a deeper evaluation. Thus, it would be valuable to investigate why state and government sites carry on having significant accessibility, usability, quality, and readability. Lastly, this study used a heuristic evaluation and automated testing without including user-based methods. Future studies in Turkish state and local level websites could, therefore, use user-based methods to evaluate the usability of the websites to consolidate the present literature with the identification of usability issues from the user's perspective.

The implication of this study was to provide a snapshot of usability, accessibility, quality, and readability at the time of the study, in terms of technological context things change forever. Also, as in this study, the data gathered were cross-sectional, a longitudinal study could help gain a deeper understanding of the variables of the usability, accessibility, quality, and readability to compare results with the findings of this study to determine and observe the progress made by Turkish governments. The contribution of this work both theoretically and practically. In terms of the theoretical contribution, this work (to the best author's knowledge) was the first comprehensive e-government website usability, accessibility, quality, and readability of evaluation in Turkey both in terms of the websites covered and the total number of websites evaluated. This study highlights the need to promulgate regulations, which clearly define the institutions' legal obligation of Web accessibility. Such legislation is crucial to encourage the creation of a governmental Web environment better suited for citizens with disabilities. Consequently, governments in the developed world are continuously enforcing stringent legislation to mandate the accessibility of these websites. This is, however, not the case with countries in the developing world regions, like Turkey, where accessibility laws are either non-existent or less stringent (Kuzma et al., 2009b; Verkijika and De Wet, 2017). Practice-based templates may be helpful to improve accessibility, usability, quality performance, readability, and mobile readiness for compliance with industry and legal standards.

Chapter 40
Transformational Leadership and Attitude Toward Enterprise Resource Planning System:
A Perspective of Organizational Change

Paul Chou
Department of Business Administration, Minghsin University of Science and Technology, Xinfeng, Taiwan

ABSTRACT

In order to survive in competitive markets, modern organizations introduce enterprise resourcing planning systems to enhance their competitive positions and their survivability in competitive markets. Nevertheless, organizations often fail to utilize and explore this new system's functionalities to achieve business objectives and have not fulfilled their expected effectiveness after adopting it. Given that countless companies fail to implement ERP systems successfully in recent decades, the aim of this study is to explore the inner workings of employees' attitudes towards ERP systems from the perspective organizational change. The results from a sample of 334 respondents in Taiwan provide additional insight into the mechanism through which transformational leadership influences employees' attitudes towards ERP systems.

INTRODUCTION

Modern organizations strove to retain their competitive edge by adopting information system (IS), such as hardware, software, data in paper or electronic form, as it enables them to enhance their operation's efficiency, increase productivity and service quality in order to secure their competitive positions and their survivability in competitive markets (Avgerou, 2001; Hammer & Champy, 1993; Lu et al., 2011). For example, Enterprise Resourcing Planning (ERP) systems have been introduced by many organizations with purpose to improve workflow and efficiency for the last two decades (Jacobson, Shepherd, D'Aquila, & Carter, 2007; Momoh, Roy & Shehab, 2010).

For decades, information technology acceptance and use is a critical issue that has received much attention from researchers and practitioners (Venkatesh, 2000). In practice, successful investment in IS can lead to enhanced productivity, while failed systems implementation can lead to undesirable consequences such as financial losses and dissatisfaction among employees (Venkatesh, 2000). Nevertheless, organizations often fail to utilize and explore the new IS's functionalities to achieve business objectives and have not fulfilled their expected effectiveness after the new systems are committed to routine operation (Bhattacherjee & Premkumar, 2004; Kaplan & Norton, 2008). Consequently, from the perspective of organizational level, successful implementation of new IS has become an important management task. In other words, "organizations need to ensure the success of the new IS project in order to succeed in executing their strategy and in turning their vision into reality" (Serra & Kunc, 2015, p. 53).

In many cases, the reason for new IS implementation failure is a lack of change management (Momoh, Roy & Shehab, 2010; Ziemba & Obłak, 2015). Indeed, according to Carnall's (1986) definition of organizational change, adopting new IS within an organization can be seen as one form of organizational change. However, very little effort has been devoted to understanding the determinants of new IS acceptance and usage from the perspective of organizational change. In addition, leadership is posited as one of the most important variables affecting the attitudinal dimension of organizational life (Jaskyte, 2003). Therefore, to make up for such deficiency, the present study attempts to examine the antecedents of employees' attitude towards ERP system from the perspective of leadership and organizational change. More clearly, the present study hypothesizes that transformational leadership exerts it influences on employee's affective commitment to organization which, in turn, enhances affective commitment to change and, ultimately, influences employees' attitude towards ERP system.

LITERATURE REVIEW ON ERP DEPLOYMENT

Adoption of ERP System and Organizational Change

Current literature on information systems has sought to provide guidance on the actions that management should take to harness the effectiveness of information systems in order to secure a competitive position of a firm within its environment (Hammer & Champy, 1993). However, despite significant technological advances and increasing organizational investment in these new information systems, the problem of underutilized systems annoys businesses. Indeed, in many cases, the process of adopting new IS involved creates fear, uncertainty and doubt because employees are skeptical about it and concerned about its outcomes, and may fear failure as they are faced with this new system (Vakola and Nikolaou, 2005), thus hampering user acceptance and usage of the new system.

Conceptually, organizational change refers an attempt or series of attempts to modify an organization's structure, goals, technologies, systems, or work tasks (Carnall, 1986). Following this definition, introducing a new information system into an organization can be seen as one form of organizational change. In other word, change is an inevitable consequence of implementing various new IS projects (Hornstein, 2015; Serra & Kunc, 2015). In essence, it is well accepted that organizational changes are viewed as a formidable stressor in organizational life because it creates fear, uncertainty, and doubt, and adopting new information systems within an organization is viewed as a formidable stressor in organizational life (Allen et al., 2007; Judge et al., 1999).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Further, as Dawson (1994) notes, resistance to organizational change can result from substantive change in job (skill requirements) and/or psychological threats (whether perceived or actual). As such, adopting new information systems experienced by employees may cause their resistance to accept and use new information systems. Thus, the premise of successful adoption of new information systems is to gain employees' positive attitude (i.e., acceptance and support) toward this change (Fedor, Caldwell, & Herold, 2006; Miller, Johnson, & Grau, 1994). In summary, in order to enhance the possibility of successful adopting of new IS, organizations should devote their efforts on understanding employees' attitudes towards new IS from the perspectives of organizational change.

Transformational Leadership and Attitude Towards ERP System

It is suggested that employees engage in an exchange relationship with both the organization as a whole and their immediate supervisor (Stinglhamber & Vandenberghe, 2003). At workplace, the supervisor is the most immediate and salient person, as employees tend to view actions by agents of the organization (i.e., supervisor) as actions of the organization itself (Livinson, 1965). In that case, the supervisor must have a direct influence on their subordinate's attitudes and behaviors through leadership.

For long, leadership has been seen as one of the most important variables affecting the attitudinal dimension of organizational life (Jaskyte, 2003). With respect to leadership, Burns (1978) and Bass (1985) distinguished transformational leaders from transactional leaders. Specifically, Bass and Avolio (1994) identified four behaviors associated with transformational leaders: (1) idealized influence, which refers to serving as a charismatic role model to followers; (2) inspirational motivation that involves articulation of a clear, appealing, and inspiring vision to followers; (3) intellectual stimulation of follower creativity by questioning assumptions and challenging the status quo; and (4) individual consideration, which involves attending to and supporting the individual needs of followers.

Indeed, supervisors play an important role in structuring the work environment by providing information and feedback to employees (Griffin, Patterson & West, 2001) and by controlling the powerful rewards that acknowledge the employee's personal worth (Doby & Caplan, 1995). As such, the social interaction between an employee and his/her immediate supervisor is the primary determinant of an employee's supportive attitude and behavior to organizational change (adopting new IS in this case) (Wayne, Shore, & Liden, 1997). More clearly, it is logical to assume that transformational supervisor should have a direct influence on subordinate's attitudes towards new IS through daily interaction.

Further, in light of the concept of personifying the organization (Levinson, 1965), the immediate supervisor's behaviors are likely to be perceived by employees as representative of organizational decisions (Griffin et al., 2001). Accordingly, favorable treatment provided by a transformational leader is interpreted as the organization's benevolent orientation towards them (Loi, Ngo, & Foley, 2006). In that case, employees with high perceived organizational support, based on the norm of reciprocity (Gouldner, 1960), are likely to develop a generalized felt obligation to care about the organization's welfare and help the organization achieve its objectives (i.e., successful implementation of new IS) (Eisenberger et al., 2001).

Moreover, leaders are characterized by change-oriented and inspiring (Hogg, 2001). In order to extract extra efforts from their followers, they arouse team spirit, reframe stressful events into developmental opportunities, and inspire followers to perceive difficult situations as meaningful challenges necessary for developing one's professional and personal skills (Sosik & Godshalk, 2000). In other words, transformational leadership evokes followers' higher-order needs and motivates them to identify with a vision

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

that reaches beyond their own self-interest (Judge & Bono, 2000). Thus, it is reasonable to assume that transformational leaders tend to orient their followers to perceive new IS in a positive way and enhance their supportive attitude towards new IS. Accordingly, hypothesis 1 is stated as:

H1: There is a positive direct positive relationship between transformational and attitude towards ERP system.

Transformational Leadership and Affective Commitment to Organization

Affective commitment to organization is defined as an individual's identification with, involvement in, and emotional attachment to an organization, making the company's goals their own (Allen & Meyer, 1990; Meyer & Allen, 1991, 1997). Evidence has been provided that employees do engage in enduring exchanges with both the organization as a whole and their immediate supervisor (Stinglhamber & Vandenberghe, 2003). In that case, according to the norm of reciprocity (Gouldner, 1960), employees led by transformational leaders would develop a generalized felt obligation to care about the organization's welfare and help the organization achieve its objectives (Eisenberger et al., 2001).

Further, the influence of transformational leaders is based on their success in connecting followers' self-concept or identity to the mission and goals of their organization (Kark and Shamir, 2002). In other words, transformational leaders are able to influence followers' behavior by promoting higher levels of intrinsic value associated with goal accomplishment, emphasizing the linkages between followers' effort and goal achievement, and by creating a higher level of personal commitment on the part of the leader and followers to a common vision, mission, and organizational goals (Avolio, et al., 2004).

Specifically, transformational leadership has been empirically linked to organizational commitment. For example, Judge & Bono's (2000) findings support the argument that leaders who were rated by their subordinates as transformational were more likely to be associated with subordinates who expressed commitment to their organizations. In particular, Gillet and Vandenberghe (2014) found the relationship between transformational leadership and affective commitment. Thus, it is reasonable to assume that transformational leaders tend to enhance their followers' affective commitment to organization. Accordingly, hypothesis 2 is stated as:

H2: There is a direct positive relationship between transformational leadership and affective commitment to organization.

Affective Commitment to Organization and Affective Commitment to Change

Affective commitment to change captures the notion of positive, proactive intent that is not just the lack of resistance to change or the absence of negative attitudes (Piderit, 2000). As mentioned earlier, organizational commitment involves manifesting strong desire to remain a member of the organization and entails a high level of identification with the goals of the organization and the values it stands for (Allen & Meyer, 1990).In that event, employees with a strong affective commitment to an organization are likely to value the course of action, that is necessary for successful change, are therefore willing to do whatever is required to achieve the target of that action (Meyer, Srinivas, Lai, & Topolnytsky, 2007). In other words, employees with strong organizational commitment to change are prone to be willing and committed to make extra effort towards realizing these goals and manifesting these values. More clearly,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the higher the employees' affective commitment to their organization, the greater their willingness to accept organizational change (i.e., affective commitment to change) will be.

Empirically, organizational commitment has been found to act as both a determinant and mediator in the management of change (Iverson, 1996). In particular, previous studies indicated that affective commitment to organization plays a significant role in influencing employee's affective commitment to change (Darwish, 2000; Herold et al., 2008; Iverson, 1996; Lau & Woodman, 1995; Neubert & Cady, 2001; Vakola & Nikolaou, 2005; Yousef, 2000). Thus, the present study argues that those who strongly identify with the company (i.e., strong affective commitment to organization) are likely to perceive the company's goals as their own and are then willing to do more than is required of them during adopting new IS (Vakola & Nikolaou, 2005). Accordingly, Hypothesis 3 is stated as:

H3: There is a direct positive relationship between affective commitment to organization and affective commitment to change.

Affective Commitment to Change and Attitude Toward ERP System

In practice, those who buy in to adopting new IS (i.e., strong affective commitment to change) should be willing to go above and beyond the call of duty to find ways to ensure its success. Indeed, some researchers (e.g., Armenakis & Bedeian, 1999; Kotter, 1995) specifically highlighted the importance of employees' commitment to change in carrying out successful change efforts. For example, research findings provide some evidence that variations in commitment to change are related to variations in the level of behavioral support during the process of organizational change (Herscovitch & Meyer, 2002; Meyer et al., 2007).

Empirically, commitment to change has been found to be a better predictor of specific change-related behaviors (Fedor et al., 2006; Herscovitch & Meyer, 2002; Meyer et al., 2007). According to the theory of reasoned action (Fishbein & Ajzen, 1975), most human behavior can be predicted from intentions alone. Intention, based on the theory of planned behavior (Ajzen, 1991), is thus assumed to be the immediate antecedent of behavior. In that event, it is plausible to assume that employees with strong affective commitment to change are prone to demonstrate positive attitudes towards the new IS which, in turn, motivate their usage of new IS. Accordingly, Hypothesis 4 is stated as:

H4: There is a direct positive relationship between affective commitment to change and attitude toward ERP system.

Mediators - Affective Commitment to Organization and Affective Commitment to Change

Transformational Leadership and Affective Commitment to Change

Conceptually, leaders provide direction to the people they lead. In terms of leadership behavior, transformational leaders are characterized by idealized influence, inspirational motivation, intellectual stimulation and individual consideration (Bass and Avolio, 1994). With these behaviors, transformational leaders make followers more aware of the importance and values of task outcomes, activate their higher-order

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

needs, and induce them to transcend self-interest for the sake of the organization (Bass, 1985, Meyer and Herscovitch, 2001).

Specifically, Herscovitch and Meyer (2002) asserted affective commitment to change as a belief in a change's inherent benefit and the desire to provide support on its behalf. Indeed, employees' affective commitment to change is critical to the successful implementation of organizational change (Meyer et al., 2007). In practice, the changes experienced by employees are best represented by the new demands affecting their jobs, which are governed by their immediate supervisors. Thus, the impact of a particular change on employees' commitment to such change is expected to be based on their daily interaction and experience with their immediate supervisors.

In summary, during the period of change, transformational leadership stimulates team spirit, reframes stressful events into developmental opportunities, and inspires others to perceive tough situations as meaningful challenges necessary for developing one's professional and personal skills (Sosik and Godshalk, 2000). Therefore, it is reasonable to assume that such behaviors demonstrated by a transformational leader positively orientate their subordinates' perceptions towards change which enhance their employees' affective commitment to change.

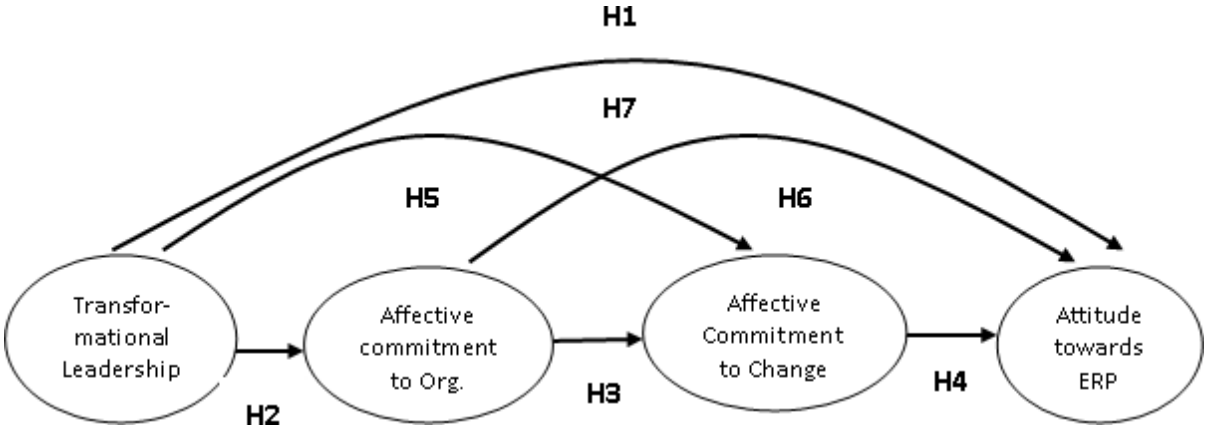
Affective Commitment to Organization and Attitude Toward ERP System

It is suggested that individuals with high affective commitment to organization would strongly identify with the vision of the organization and the goals/values of change initiatives (Dvir, Kass & Shamir, 2004). In other words, employees with a strong affective commitment to an organization are likely to value the course of action that is necessary for successful organizational change (in this study, adopting a new information system) and are therefore willing to do whatever is required to achieve the target of that action (Meyer et al., 2007). Thus, this study argues that those who strongly identify with the company (i.e., strong affective commitment to organization) are likely to perceive the company's goals as their own and are then willing to do more than is required of them during organizational change (Vakola & Nikolaou, 2005), even if it involves some personal sacrifice (Meyer & Herscovitch, 2001; Meyer et al., 2007).

Empirically, prior studies indicated that affective commitment to organization plays a vital role in employees' acceptance of change initiatives (Yousef, 2000; Iverson, 1996). In particular, according to Iverson's (1996) findings, affective commitment to organization can predict behavioral intention. In this regard, it is reasonable to expect that there is a positive relationship between affective commitment to organization and attitude towards the new information system. Therefore, it is plausible to expect a positive relationship between affective commitment to organization and attitude towards the new IS.

In summary, on the basis of all of the inferences discussed above for the simple bivariate associations between transformational leadership and affective commitment to organization, LMX relationships and attitude towards the new IS, Hypotheses 5, 6 and 7 are stated as:

H5: Affective commitment to organization mediates the relationship between transformational leadership and affective commitment to change.



H6: Affective commitment to change mediates the relationship between affective commitment to organization and attitude towards ERP system.

H7: Affective commitment to organization and affective commitment to change mediate the relationship between transformational leadership and attitude towards ERP system.

In summary, with respect to research framework, Figure 1 depicts the research framework of this study.

Figure 1. Research framework

METHODS

Participants

Invitations for participation were sent to three companies located at Hsinchu County which are undergoing ERP project less than 8 months. Procedure-wise, a total of 600 questionnaires with a cover letter explaining the purpose of the survey were sent to the head of the Human Resource Department of the three surveyed companies along with a return envelope for each participant to ensure that participants could send back the completed questionnaire on their own. A total of 350 questionnaires were returned (58% response rate), with 334 valid questionnaires after screening (56%).

Descriptive statistics for the valid respondents are presented in Table 1.

Measures

Unless otherwise stated, all responses were made on a 6-point scale ranging from (1) strongly disagree to (6) strongly agree:

- **Transformational Leadership (TL):** Transformational leadership was assessed through four dimensions, namely individual consideration, intellectual stimulation, inspirational motivation, and idealized influence, using Chou's (2013) 12 items which was adapted from Sosik and Godshalk's (2000) 15 items. The responses were measured along a 6-point Likert scale ranging from "strongly disagree" to "strongly agree" with respect to the respondent's certainty as to their immediate supervisor's leadership ability. The internal consistency of this 12-item scale was .97 in the current sample;

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Affective Commitment to Organization (ACO):** Affective commitment to the organization was measured using the six items developed by Meyer, Allen and Smith (1993) (e.g., "I really feel that this organization's problems are my own."). The internal consistency of this six-item scale was 0.88 for this sample;
- **Affective Commitment to Change (ACC):** Affective commitment to change was measured with the six items developed by Herscovitch and Meyer (2002). The internal consistency of this six-item scale was .81 for this sample;
- **Attitude Toward ERP System (ATE).** Attitude towards ERP System was measured using three items adopted from Porter and Donthu (2006) (e.g., "I am positive toward the ERP system". The internal consistency of this three-item scale was .89 in the current sample.

Overall, the strength of the internal consistency estimates of the variables in this study suggests homogeneity of the scale items.

Table 1. Descriptive profile of respondents

Gender	Male	63%
	Female	37%
Job Rank	Managerial position	17%
	Non- managerial position	83%
Age(years)	<30	30%
	31-40	44%
	41-50	21%
	>50	5%

ANALYSIS AND RESULTS

Analysis

Before testing the study hypotheses, confirmatory factor analysis (CFA) was conducted with the AMOS software (Arbukle, 2003) to examine the convergent and discriminant validity of the study measures. Given the large number of items (27) relative to the sample size (334), the procedures recommended by Mathieu and Farr (1991) were followed by creating four (dimension), three, and three composite indicators for transformational leadership, affective commitment to organization, affective commitment to change respectively, in order to maintain an adequate sample-size-to-parameter ratio (Landis, Beal, & Tesluk, 2000).

Following the approach suggested by Andersen and Gerbing (1988), convergent validity is demonstrated when the path loading (λ) from an item to its latent construct is significant and exceeds 0.50 in addition to the constructs have an average variance extracted (AVE) of at least 0.50 and composite reliability (CR) greater than 0.6 (Hair, Anderson, Tatham, & Black, 2006). As shown in Table 2, the AVEs of all four constructs in this study exceed 0.50 (0.59-0.79); the CRs of all four constructs are also above 0.6 (0.82-.94); all path loading (λ) in this study was above 0.50 (0.70-0.95). Thus, all constructs in this study demonstrate adequate convergent validity.

To assess discriminant validity, the procedures outlined by Fornell and Larcker (1981) were employed to examine whether the square root of AVE for the two constructs exceeds their correlation. As shown in Table 2, the square root of AVE for the two constructs is greater than their correlation. Thus, all tests of reliability and validity lead to the conclusion that the measures used in the subsequent statistical analyses are of acceptable reliability and validity.

Table 2. Descriptive statistics and correlations among study variables

Variable	Mean	SD	Cronbach α	CR	Item Loading(λ) (min-max)	1	2	3	4
1. TL	4.36	.91	.97	.94	(.86-.91)	(.89)			
2. ACO	4.43	.88	.88	.88	(.84-.85)	.67**	(.85)		
3. ACC	4.25	.69	.81	.82	(.70-.84)	.46**	.54**	(.77)	
4. ATE	4.56	.90	.89	.90	(.80-.95)	.41**	.38**	.44**	(.86)

Note:
TL= Transformational leadership
ACO= Affective Commitment to Organization
ACC=Affective Commitment to Change
ATE=Attitudes towards ERP System
CR=Composite reliability
Item Loading (λ) is standardized.
Values along the diagonal represent the square root f average variance extracted (AVE)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In addition, given that the data were collected from a single source and Harman's test is insensitive (Podsakoff, Mackenzie, Lee, & Podsakoff, 2003), the procedures recommended by Podsakoff, et al. (2003) were employed to examine whether the hypothesized four-factor model was influenced by the common-method bias. The result shows that the hypothesized four-factor model (X2(59) =104.229; GFI = .953; CFI = .985; TLI = .981; RMSEA = .048) had a better fit than the single-factor model (X2(59) =1089.343; GFI = .628; CFI = .671; TLI = .605; RMSEA =.218). Thus, although the present data may have common-method variance, the common-method bias does not seem to be a serious problem in this study.

Hypothesis Testing

Means, standard deviations, internal reliabilities, and inter-correlations among the variables are reported in Table 2. All measures show high internal reliabilities, with coefficient alphas ranging from .81 to .97. In addition, transformational leadership has a significant positive relationship with the potential mediators, affective commitment to organization (0.67, $p < 0.01$) and affective commitment to change (0.46, $p < 0.01$), and with the outcome variable of attitude towards ERP (0.41, $p < 0.01$). Moreover, affective commitment to organization has a statistically significant positive relationship with affective commitment to change (0.54, $p < 0.01$) and attitude towards new IS (0.38, $p < 0.01$). In addition, affective commitment to change has a statistically significant positive relationship with attitude towards ERP (0.44, $p < 0.01$). By and large, the pattern of correlations is consistent with the hypothesized relationships.

Next, structural equation modeling was performed using AMOS 5.0 (Arbukle, 2003). According to Anderson and Gerbing's (1988) recommendation, the measurement model was tested before actually testing the hypothesized model. The full measurement model was tested whereby all latent variables in this study were allowed to correlate. The fit, according to Hu and Bentler (1999), was a good fit, with relative fit indices of 0.985 for CFI, 0.981for TLI and 0.048 for RMSEA ($X^2 = 104.229$. df = 59, $p < 0.000$). With the fitness of the measurement model confirmed, the hypothesized model was then tested.

The last step is to test the mediating roles of affective commitment to organization and affective commitment to change in the relation between Transformational leadership and attitude towards ERP. Bootstrapping was employed to test directly for the mediators with AMOS software since it is currently regarded as a more powerful tool for testing the mediating effects in comparison with Baron and Kenny's (1986) approach (Preacher & Hayes, 2008).

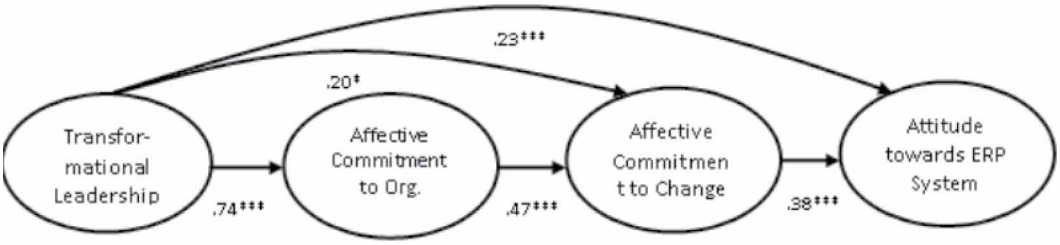
The standard estimated indirect effect of transformational leadership on affective commitment to change thus obtained was 0.35 (95% CI: 0.187-0.510), the standard estimated indirect effect of transformational leadership on attitude towards new IS was 0.21 (95% CI: 0.123-0.329), and the standard estimated indirect effect of affective commitment to on attitude towards ERP was 0.18 (95% CI: 0.78-0.303). These results confirm the mediating roles of affective commitment to organization and affective commitment to in the hypothesized relations.

Further, in order to test whether a fully mediating relationship exists between transformational leadership and attitude towardsERP, a competitive modeling test was conducted. Table 3 presents fit indices for the hypothesized model, along with three alternative models. Results of comparison show that Alternative Model 2 is the most adequate for explaining the data as indicated by a RMSEA of 0.047, a CFI of 0.985, a GFI of 0.953, and a TLI of 0.981, whereas the Alternative Model 3, albeit shows similarly better fit indices in comparison with Alternative Model 2, indicates affective commitment to change fully mediates the relationship between affective commitment to organization and attitude towards ERP.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Competitive model test

	X^2	df	X^2/df	ΔX^2	RMSEA	CFI	TLI	GFI
Hypothesized Model	124.022	62	2.000		.055	.980	.975	.945
Alternative Model 1[a]	110.058	61	1.804	13.964	.049	.984	.980	.950
Alternative Model 2[b]	104.467	60	1.741	19.555	.047	.986	.981	.953
Alternative Model 3[c]	104.229	59	2.267	19.793	.048	.985	.981	.953



[a] Alternative Model 1 only added the direct path from transformational leadership toward ERP system

[b] Alternative Model 2 added (1) the direct path from transformational leadership to attitude toward ERP system (2) the direct path from transformational leadership to affective commitment to change.

[c] Alternative Model 3 added (1) the direct path from transformational leadership to attitude toward ERP system (2) the direct path from transformational leadership to affective commitment to change (3) the direct path from affective commitment to organization to attitude toward ERP system.

Standardized parameter estimates for the best-fitting model (Alternative Model 2) are shown in Figure 2. For ease of presentation, only the structural model is presented rather than the full measurement model. Examination of the path coefficients reveals that transformational leadership is related to affective commitment to organization in the positive direction and has significant direct associations with affective commitment to change and with attitude towards new IS; affective commitment to organization is related to affective commitment to change in the positive direction, and affective commitment to change is related to attitude towards new IS in the positive direction. Thus, both Hypotheses 1, 2, 3, 4 and 6 are supported whereas, Hypotheses 5 and 7 are partially supported.

Figure 2. Research results

DISCUSSION AND CONCLUSION

Summary of Findings

The results of hypotheses testing are presented in Table 4.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 4. Hypotheses testing results

H1	There is a positive relationship between transformational leadership and attitude towards ERP system.	Supported
H2	There is a positive relationship between transformational leadership and affective commitment to organization.	Supported
H3	There is a positive relationship between affective commitment to organization and affective commitment to change.	Supported
H4	There is a positive relationship between affective commitment to change and attitude towards ERP system.	Supported
H5	Affective commitment to organization mediates the relationship between transformational leadership and affective commitment to change.	Partially Supported
H6	Affective commitment to change mediates the relationship between affective commitment to organization and attitude towards ERP system.	Supported
H7	Affective commitment to organization and affective commitment to change mediate the relationship between transformational leadership and attitude towards ERP system.	Partially Supported

This study proposes an integration of two of the dominant streams in organizational behavior – leadership and organizational change. The results of this study indicate that transformational leadership has positive association with attitude toward ERP system, whereas Affective commitment to change mediates the relationship between affective commitment to organization and attitude towards ERP system and affective commitment to organization partially mediates the relationship between transformational leadership and affective commitment to organization.

By and large, the present findings are consistent with considerable research's findings that leadership as one of the most critical success factors in adopting new IS (Law & Ngai, 2007; Rai, Brown, & Tang, 2009). In other words, certain leadership is efficacious in determining the success of implementing new IS (ERP in this case). Specifically, the present findings indicate the efficacy of transformational leadership in enhancing affective commitment to organization which, in turn, uplifts affective commitment to change and, ultimately, fostering employees' supportive attitudes towards new IS (ERP in this case).

Practical Implications

This present study has several practical implications for organizations while adopting ERP system. First, the findings of this study suggest that the success of implementing ERP system depends on, at least in part, transformational leadership. Realizing the importance of transformational leadership in the process of adopting ERP system, organizations should consider how to develop transformational leadership skills for their managers. More clearly, management and HRM practitioners should focus on certain practices, such as leadership development/training program with the intention of enhancing the characteristics of transformational leadership. For example, training their supervisors on how to articulate a clear, ap-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

pealing, and inspiring vision to followers, act as a charismatic role model to followers, and support the individual needs of followers.

Second, the results of this study confirm that affective commitment to organization also account for variances in employees' attitude towards ERP system via affective commitment to organization as well as affective commitment to change. In that event, organizations, while adopting ERP system, should also pay particular attention on how to enhance their employees' affective commitment to organization and to change. To this end, management and HRM practitioners should devote efforts to establish a fair and supportive working environment in order to develop high-quality employee-employer relationship which has been found very productive in enhancing employee's affective commitment to the organization (Eisenberger et al., 2001; Meyer, Stanley, Herscovitch, & Topolnytsky, 2002).

Finally, as Hornstein (2008) noted, it is not the technology that provides an organization with a successful implementation of new IS systems, but the integration of technology into an organization change management process. The findings of this study reveal that a successful ERP system implementation requires, among other things, management and HRM practitioners to enhance employees' affective commitment to change from the perspective of change management.

Limitations and Directions for Future Research

Like other previous research, this study also has certain limitations. First, the data were collected from only three organizations which might in turn limit the generalizability of its findings and conclusions to other enterprises. Thus, further replication is needed prior to generalization. Second, despite the appropriateness of using self-report validated measures, this approach introduces potential problems of common-method bias as the research variables were gathered from the same source, although a test shows that common-method bias is not a serious problem in this study. Third, one must be cautious when interpreting the findings of this study due to the possible constraint of non-response bias, such that non-respondents might hold different views with respect to the variables in question, leading to possible bias in survey estimates. Finally, this study suffers from the common limitations of cross-sectional field research. In this regard, caution is necessary for its inability to make causal inferences with confidence between the variables examined in the study.

Regarding the directions for future research, as noted by Podsakoff et al. (2003), using self-reported measures for both constructs may inflate their correlations due to self-reporting bias. Thus, future research should focus on other ratings of employee's attitude towards ERP systems to reduce common-method variance. For instance, the use of immediate supervisors or coworkers' assessments of affective commitment to organization and attitude towards new information systems would further validate the use of individuals' self-reported data only. Further, given that transformational leadership, in this study, has been found efficacy in fostering employees' supportive attitudes towards ERP, it would be an interesting avenue to explore whether leader-member exchange relationship exerts its influence on employees' supportive attitudes towards adoption of ERP.

Contributions

In spite of the above-mentioned limitations, this study has a couple of unique contributions. First, as noted above, although TAM has been and still is extensively used, its universality to predict across all situations has recently been called into question (Greenfield & Rohde, 2011). In this regard, this study

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

sheds new light on understanding the critical determinants of employee's attitude toward ERP system from the perspectives of organizational change. Such understanding can assist in the proactive planning of intervention mechanisms for maximizing the possibility of success in implementing ERP system in addition to TAM's knowledge. In other words, the findings of this study contribute as a supplement of TAM, which focuses on "ration" (i.e., ease of use and perceived usefulness), by providing an alternative approach with focus on "human emotion" (i.e. social support) to gain a deeper understanding of employee's attitude toward ERP.

Second, in regard to organizational change management, this study confirms that individuals' attitude toward ERP system as a function of transformational leadership and affective commitment to change. Given that the available knowledge of how HR professionals perform effectively as "change agents" is relatively limited (Alfes, Truss, & Gill, 2010), results of this study confirm transformational leader's effects on employee's attitude towards ERP system partly via enhancing affective commitment to the organization and affective commitment to change.

Third, although considerable studies have shown that transformational leadership behaviors are related to high employee performance (Lowe, Kroeck, & Sivasubramaniam, 1996), scholars have given little attention to what underlying mechanisms, in the process of organizational change(adopting ERP in this case), enable transformational leaders to affect followers' attitude and to arouse different types of motivation among their followers (Avolio, et al., 2004; Bono & Judge, 2003; Kark & Shamir, 2002; Kirk & Dijk, 2007). In this regard, the present study's findings about the efficacy of transformational leadership provide organizations a new path towards successful adoption of ERP system.

CONCLUSION

Given that almost all organizations are experiencing pressure to adopt new information systems, such as ERP system, in order to survive in the competitive markets, improving our understanding of the inner working mechanism associated with employees' supportive attitude towards ERP system has become increasingly important. The present study's findings shed new light on understanding the critical determinants of employee's attitude towards ERP system from the perspectives of organizational change. That is, successful ERP system project depends, at least in part, on change management (Ziemba & Obłak, 2015). Such understanding can contribute in the proactive planning of intervention mechanisms for maximizing the possibility of success in adopting ERP system beyond Davis' (1989), DeLone and McLean's (1992) and the Seddon's (1997) models which suggested that system quality, information quality, perceived usefulness, user satisfaction, and IS use are major variables in explaining successful adopting of new IS systems.

In summary, the present findings suggest that transformational leadership not only cultivates employees' supportive attitudes towards ERP system directly, but also indirectly exerts its influence via affective commitment to organization and affective commitment to change on employees' attitudes towards ERP system.

Chapter 41
Organization-Wide Culture Change in a Large Healthcare Organization: A Case History

University of Minnesota, USA

Jane M. Kuhn
University of Minnesota, USA

ABSTRACT

This reflective case history explores a large-scale organizational culture change in a private, global organization based in the United States. The organizational culture concept first emerged in the 1970s and is an influential and controversial concept in research and practice. The success rate of change initiatives is only about 30%, while success for culture-change drops to 10%. Because culture change is not easy, this case history highlights evidence-based practices, supportive factors, barriers, and recommendations for culture change.

INTRODUCTION

The U.S. health care industry has undergone considerable upheaval and public scrutiny over the past 30 years and continues to experience challenges as the Trump Administration is challenging the Affordable Care Act (ACA), which President Obama signed in 2010. To address the current challenges of health care costs and government regulations, while managing the delicate balance of numerous stakeholders, health care organizations are looking for ways to do business more efficiently and effectively.

With the increased rate of change and uncertainty plus the added pressure from the ACA implementation, this large (>300,000 employees) global health care organization, headquartered in the United States, considered various opportunities to prepare for these changes and pressures. Additionally, the organization had recently experienced other challenges, including service concerns and reputation issues. One of these opportunities to ensure on-going success was to implement an organizational culture change to serve as an organizational foundation and a common frame of reference to encourage collaboration and innovation.

Schein's (2004) research suggested that crises create new norms, thus driving the culture change. These crises usually cause anxiety, and people are more open to shift their thinking to help reduce the anxiety. Schein (2004) noted that there must be "some sense of threat, crisis, or dissatisfaction … before enough motivation is present to start the process of unlearning and relearning" (p. 324). Schein (2000), however, warned that "management should seek not to change culture, but to change effectiveness. Only if it can be shown that the culture is actually a constraint should one launch a culture change program" (p. xxix).

Shifting the organizational culture at this time in its company history and industry environment was strategically important for the organization; as Ribando and Evans (2015) noted, a dynamic culture should change as the organization changes and the old culture behaviors considered part of their success are no longer effective.

However, making large-scale changes is not easy; researchers report that the great majority of change efforts fail (Choi & Behling, 1997; Kotter, 1995). According to Griffith (2010), "Given the dismal record of organizational change, it is imperative that a prescriptive protocol for effective and rapid change be made available to practitioners" (p. 2). Implementing organizational culture change is particularly difficult, due to organizational cultures' complexity of shared beliefs, behaviors, and assumptions of people. Hofstede (2015) acknowledged that "understanding, and dealing with, culture is strategically important for organizations" (p. 566). Because of the complexity of organizational culture change and the low likelihood for success, this global organization implemented a planned approach by partnering with an external culture change consultancy.

EVIDENCE-BASED OCD INITIATIVE

Implementing Organizational Culture Change

Changing a culture is not easy and is not a "one-shot process;" rather, "it takes sustained attention from top management, persistence for several years, and usually a second culture assessment to see whether the intended changes have, indeed, been attained" (Hofstede, 1994, p. 11). Over a timeframe of eight years (and on-going), the organization attempted to use an evidence-based approach to organizational change and development. According to Hamlin (2016), "evidence-based organizational change and development is the conscientious, explicit and judicious use of current best evidence and/or of action research to inform, shape, critically reflect upon, and iteratively revise decisions made in relation to the formulation and implementation of organizational change and development interventions and the associated change management processes" (p. 129). The approach taken by this organization reflects the persistent attention recommended by Hofstede, particularly his observation that sustained culture change takes time and requires implementing numerous actions to transform the organization's culture to align with its business strategy.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The organization implemented changes in four categories drawing upon evidence-based practices identified in the literature on culture change along with an action research approach to guide the culture change process. These broad focal areas provide the structure for the next section of the case history:

1. Creation of Leadership Buy-in and Support;
2. Implementation of Learning and Development Opportunities;
3. Alignment of Human Resources Processes with Culture Transformation; and
4. Involvement of Employees throughout Transformation.

Creation of Leadership Buy-In and Support

The first area of focus was work by the senior leadership team to define both the current state and the desired future state of the organization. They believed that leadership behavior was key to driving culture evolution, as suggested by Kotter (1996) and Schein (1999). Kotter (1996) noted that "management is a set of processes that can keep a complicated system of people and technology running smoothly . . . leadership is a set of processes that creates organizations in the first place or adapts them to significantly changing circumstances . . . successful transformation is 70-90 percent leadership and only 10-30 percent management" (p.25-26). Schein (1999) found that leaders controlled mechanisms that influenced culture, including how to adapt to the environment, evolve workgroups, empower subcultures that represent ideal norms, and create committees to manage the culture.

According to Chaudhry, Yuan, Hu, and Cooke (2016), there are two distinct schools of thought regarding the evolution of organizational culture. The first perspective is that organizational culture is unique and is shaped by numerous factors such as senior leadership values (Berson, Oreg, & Divr, 2008), leaders' shared vision and behaviors (Blattner & Walter, 2015; Schein, 1983), and organizational HR practices (Jung & Takeuchi, 2010). The second is a contingency approach in which culture is shaped by contextual values including societal values (Hofstede et al., 1990; House et al., 2004) and industry characteristics (Dickson, Aditya, & Chhokar, 2000; Dickson, BeShears, & Gupta, 2000; Gordon, 1985).

Research conducted by Chaudhry et al. (2016) of 3,245 respondents in 424 organizations in 12 different industries suggested that "while cultures might vary across industries as well as organizations, the differences are much greater across the latter than the former. The strength and direction of cultures within an organization appear to evolve mainly in response to attributes specific to the organization and do not necessarily reflect industry characteristics and trends" (p. 582). They found that "leaders have a powerful influence on cultures", which "underscores and parallels the conclusions of numerous qualitative studies, beginning with the work of Schein (1983)" (Chaudhry et al., 2016, p. 583).

Smith (2003) found that "over half of the culture change efforts were sponsored by either the CEO or the COO" (p. 260). While these top executives were most often the sponsors, "success was more likely when the sponsors were perceived to be 'other' officers and division/department heads rather than only the chief executive officers (CEOs) and chief operating officers (COOs)" (Smith, 2003, p. 252). Smith (2003) noted the crucial role of the middle rank of leadership at the department, division, or business unit level to successful change and that "… their sponsorship was perceived as more related to successful culture change than sponsorship by the highest corporate officers…" (p. 259).

Conner (1992) contended that "change cannot succeed without a network of sustaining sponsorship that constantly reinforces the importance of a change as it moves through the organization" (p. 121). This organization gained support of senior leadership through a top-down implementation strategy led

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and supported by the CEO. Furthermore, the organization formed culture leadership teams to drive and support the culture transformation across the organization.

Thus, at the start of the culture transformation initiative, senior executives participated in the development of a company-wide set of shared values to establish the language and the foundation for the culture shift. This was done through a facilitated process, in which external consultants guided the senior executives to identify the top values to drive preferred behaviors that would support the organization's mission. The core values are the organization's goals, strategies, and philosophies that the organization advocates about itself and "are also reflected in an organization's strategy, structure, systems and processes, leadership style, staffing, and resources; and in its rules, policies and procedures" (Higgins & McAllaster, 2004, p. 69). These are often well known within organizations considered to have strong cultures and "public companies have been making their own culture, and concepts of vision, mission and values a regular part of their literature" (Ortega-Parra & Sastre-Castillo, 2013, p. 1071). Schein (1990) indicated that "through interviews, questionnaires, or survey instruments one can study a culture's espoused and documented values, norms, ideologies, charters, and philosophies" (p. 112).

Hogan and Coote (2014) proposed that "values serve an important function guiding specific norms, or expectations of behavior, within organizations" (p. 1611). Behavior that reinforces these organizational values and norms can be seen in what is rewarded, and what is not (Higgins & McAllaster, 2004). They suggested that "values and norms can, in turn, manifest into artifacts (e.g., organizational rituals, language and stories, and physical configurations) and lead to desired behaviors such as innovation" (Hogan & Coote, 2014, p. 1613).

The intrinsic worth of values is to serve as social principles of philosophies to guide behaviors and set a framework for organizational routines and practices (Hatch, 1993; O'Reilly, Chatman, & Caldwell, 1991). Values, therefore, provide a subtle way that senior management can exercise influence (Hogan & Coote, 2014; Mumford, Scott, Gaddis, and Strange, 2002).

Implementation of Learning and Development Opportunities

The second crucial area of focused activity in the organization was the implementation of a curated set of learning and development opportunities, selected and deployed to equip people at all organizational levels with the knowledge, skills, and attitudes to succeed in the new organizational culture. As an organizational culture is established, it reflects the groups' values; however, the cultural norms are often not easy to identify. Researchers noted that these norms are passed on to new employees and applied to new situations (Beckhard & Pritchard, 1992; Cameron & Quinn, 2006; Schein, 1999, 2004). These cultural or behavioral norms tell employees how to behave, make decisions, and approach tasks in a way that allows them to fit in the organization. While organizational culture helps create commitment and a sense of identity, it can, unfortunately, be a liability "when the shared values are not in agreement with what is needed to enhance organizational effectiveness" (Simpson & Cacioppe, 2001, p. 396).

The desired new cultural norms and values were shared with employees through several learning and development opportunities, including classroom offerings, webinars, and eLearning. These various training sessions provided the opportunity for all employees to gain an understanding of the shared values and expectations. In addition to these offerings, the organization introduced a facilitated problem-solving process using the culture values as the foundation for decision making.

To support these facilitated sessions, the organization created an internal facilitator certification process to learn the culture principles and demonstrate their facilitation competency. This certification process

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

included classroom sessions to learn facilitation techniques, understand culture principles, practice facilitation, and receive feedback. Additionally, the facilitators in training delivered workshops, being observed by internally certified culture coaches. This process created a strong, supportive facilitator community, with relationships created across the organization. In total, the organization trained and certified over 100 internal culture facilitators who facilitated culture workshops, webinars, and problem-solving sessions. Furthermore, these senior leader facilitators served as change champions across the organization because "change cannot succeed without a network of sustaining sponsorship that constantly reinforces the importance of a change as it moves through the organization" (Conner, 1992, p. 121).

These learning and development opportunities were viewed as investments in the employees, as supported by human capital theory, which determined that education, training, and development, and obtaining other knowledge are all investments. Beyond the personal benefits of improved health and increased earnings, human capital theory suggests that society derives economic benefits from investments in people as well.

Furthermore, offering learning and development opportunities to all employees supported an equitable perspective across all employees. As noted by Harder (1991), "According to equity theory, outcomes will be perceived as fair when the ratio of outcomes to inputs is equal across individuals" (p. 458). Inequity exists when the outcome-input ratios between two individuals appear to be unequal. This inequity is thought to create tension which motivates the individual to "alter inputs, outcomes, or social referents to restore equity or to withdraw from the exchange in either psychological or actual terms" (Duchon & Jago, 1981, p. 728).

In addition to the creation and roll-out of the culture-focused offerings, the organization embedded the culture values and principles into existing training and development programs. This ensured continuous reinforcement of the culture language to advance the culture.

Alignment of Human Resources Processes with Culture Transformation

The third area of intentional planning and focus was to align human resources processes with the desired cultural behaviors, as organizational culture impacts virtually every aspect of organizational life, from how decisions are made, to how rewards are distributed, to how people are treated. All processes are affected, including goal setting, learning and development, compensation and rewards, and espoused values. According to Hofstede, Hofstede, and Minkov (2010), "no group can escape culture" (p. 12). Denison (1996) proposed that "Culture refers to the deep structure of organizations, which is rooted in values, beliefs, and assumptions held by organizational members" (p. 624).

Organizational culture runs broad and deep, covering all areas of life. According to Hofstede (2015), "any group of people that spends time together, of whatever size, forms culture" which means they are creating "shared and transferable perceptions, values, or practices" (p.546). Because of the power of organizational culture, shifting the culture does not occur in isolation; rather, organizational culture evolves over years and the preferred behaviors need to be aligned with human resources processes and observable cultural artifacts.

These observable cultural artifacts are particularly important in the workplace, as they "are those sets of attributes - objects and behaviors – that help definitively characterize one organization as opposed to another" (Higgins & McAllaster, 2004, p. 64). Furthermore, cultural artifacts add value by playing a critical role in changing organizational behavior to support a change in the organizational strategy (Higgins, McAllaster, Certo, & Gilbert, 2006). Cultural artifacts are also effective in reinforcing values

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and practices that have been used for a long period of time (Higgins et al., 2006). Due to the power and impact of cultural artifacts, failing to remove or modify the old artifacts with the desired new artifacts may result in the failure of a change initiative (Higgins & McAllaster, 2004). Higgins et al. (2006) proposed that "it is because an organization's culture (its values, norms, and practices) and its strategy are so very interdependent that using cultural artifacts to reinforce a culture or modify it to align with strategy is so effective" (p. 398).

As a result, the organization embedded the culture behaviors and expectations into the performance management and feedback processes, aligned its compensation and reward systems to acknowledge the demonstration of the culture values and behaviors; incorporated organizational culture into the talent recruiting process; implemented a company-wide online recognition tool to acknowledge culture behaviors and create a culture of appreciation and gratitude; and updated organization signage and artifacts to include culture messaging.

This on-going reinforcement was crucial, as cultures are never static (Greenwood, 2015; Kotter and Heskett, 1992). Rather, culture evolves over time and becomes a pervasive force and its systemic impacts underlay much of the organization's practices. Culture is a dynamic system in a natural state of movement in which there is continued shuffle, selection, variation, and retention of culture components that are shaped by the organization's adaptations to its environment (Weeks & Galunic, 2003; Zheng, Qu, & Yang, 2009). According to Ribando and Evans (2015), "A dynamic culture should change as the organization changes, restructures, is merged with other institutions, responds to environmental shifts, adds new members, or loses others" (p. 102).

Involvement of Employees Throughout Transformation

The fourth area of focused activity was the constant involvement of people at all levels of the organization in the culture change effort. Organizational culture is highly complex and includes shared beliefs, behaviors, and assumptions of people. Hofstede (2015) proposed that "… understanding, and dealing with, culture is strategically important for organizations" (p. 566). Changing an organization's culture requires employees to alter what they say, in addition to altering the myths, rituals, symbols, and signs that signify the preferred change (Ford & Ford, 1995). Making these changes is not easy, however, as change programs often fall short (Beer, Spector & Eisenstat, 1990). Perhaps the most important reason to involve employees is that one of the most commonly cited reasons for change implementation failure is not appropriately addressing people-related issues in the change process (Kotter, 1995; Maheshwari & Vohra, 2015; Spiker & Lesser, 1995).

Beer, Spector, and Eisenstat (1990) found that very little changed in organizations where strategies were 'sold' to employees and followed up with communication and implementation plans. Rather, successful companies leveraged employee involvement to identify and implement desired behaviors and competencies to achieve their goals, leading to the preferred culture (Maheshwari & Vohra, 2015).

So, in a planned way, employees were involved throughout the culture transformation, from the creation of the organizational culture values to the facilitation of culture workshops to the alignment of culture within human resources processes. Additional employee involvement and support was through the creation of a grass-roots change agent community, which started with just two employees wanting to change the culture and do more after participating in the culture workshop. This community grew from these two employees to thousands of employees who supported the shift and intentionally embedded culture into daily activities and decision making. These change agents received additional information

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

on an on-going basis, in addition to learning opportunities experienced in monthly meetings and an annual conference designed to expand networks and introduce adjacent concepts to support existing culture principles.

The creation of this change agent community was supported by the resource-based view theory that accentuates the importance of a pool of resources and capabilities that drive performance. Lado and Wilson (1994) proposed that "the resource-based view suggests that human resource systems can contribute to sustained competitive advantage through facilitating the developing of competencies that are firm specific, produce complex social relationships, are embedded in a firm's history and culture, and generate tacit organizational knowledge" (p. 699).

According to Barney (1995), resources and capabilities are "all of the financial, physical, human, and organizational assets used by a firm to develop, manufacture, and deliver products or services to its customers" (p. 50). Barney (1991) postulated that firms that develop resources that are valuable, rare, and hard to imitate create a sustained competitive advantage. In particular, Barney (1995) noted that organizational talent can develop a culture, social networks, and a management structure that is very difficult to duplicate, thus creating a competitive advantage.

RESULTS: WHAT ACTUALLY HAPPENED

According to research, there are three factors required in order for change to be successful: (a) individuals must understand and believe there is a need for organizational change (Armenakis & Harris, 2009; Fernandez & Rainey, 2006); (b) individuals must be involved in the change process planning and implementation (Oswald, Mossholder, & Harris, 1997); and (c) the benefits of change must be communicated throughout the organization at multiple levels (Conway & Monks, 2011; Dent & Goldberg, 1999).

The culture transformation described in this case history was initiated about 8 years ago and current activities continue to support and reinforce the culture change. Since initiating these changes, the organization has grown considerably, with positive outcomes:

- Revenue more than doubled;
- Employee engagement scores increased by over 10%,
- Stock price increased by more than 800%, and
- Earnings per share more than doubled.

The work during these 8 years has addressed the three factors for successful organizational change (noted above). There have been tremendous business results, and the organization continues to grow as a global organization and provide shareholder value. While the culture transformation may not be the sole reason for the organization's success, it is likely a contributing factor.

Due to the success of these culture efforts, these evidence-based practices are being leveraged to drive the organization's Diversity and Inclusion efforts:

1. **Creation of Leadership Buy-in and Support:** Establishment of sponsors and council;
2. **Implementation of Learning and Development Opportunities:** Identification of topics to advance diversity and inclusion understanding and advancement;

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

3. **Alignment of Human Resources Processes With Culture Transformation:** Opportunity for reinforcement and implementation within existing human resources processes; and
4. **Involvement of Employees Throughout Transformation:** Employee involvement at all levels to drive change deeper within the organization.

It is being considered the next generation of the culture journey to continue to reinforce the culture values, while creating a highly engaging, inclusive work environment in which employees can leverage their strengths, contribute fully, and be their authentic selves at work.

Recommendations for OD Practitioners

Organizational culture change is difficult and highly complex. It cannot be done in a short timeframe and is not a one-time implementation. Furthermore, there is no 'quick-fix' or 'simple' solution that can be duplicated using another organization's approach. Rather, organizational culture change is the combination of many aligned initiatives over time that truly changes and sustains an organizational culture. While these changes and initiatives may be different for other companies, there are some 'best practice' approaches and recommendations for OD practitioners:

1. Understand your role as a change agent;
2. Respect the organization's learning environment and ability to change;
3. Leverage employee passion and involvement;
4. Celebrate short-term wins for long-term change; and
5. Relish the opportunity to work on a major change initiative.

Understand Your Role as a Change Agent

According to Smith (1998), "in the most successful organizations, employees understand their role in the change effort" (p. 47). Research done by Shaw et al. (2012) noted that successful change agents or champions demonstrated several key behaviors: (a) actively promoting a new innovation; (b) networking across the organization; (c) identifying and leveraging resources; (d) navigating the socio-political organization; (e) building support by sharing the vision and increasing employees' understanding; and (f) ensuring that the innovation is implemented, even with potential organizational resistance.

As an evidence-based change agent, understand your competencies and knowledge of strategic thinking, organizational change, communications, and organization development. These key areas provide the foundation for your change agent role to conduct the analysis of the situation and your organization, planning and development of a change strategy, the implementation of a major change, and the evaluation of the effectiveness of the process and the outcomes.

Additionally, throughout the process, build in time for critical reflection and evaluation to understand the effectiveness of your practices and your lessons learned to leverage for future changes. This time will be invaluable to support the long-term effectiveness of a major organizational change and your resiliency as a change agent.

Respect the Organization's Learning Environment and Ability to Change

The implementation of organizational culture change has organizational learning implications. These organizational learning implications refer to the organization's capacity to bring them closer to their targets, with the focus on improving organizational life (Argyris & Schön, 1996; Edmondson & Moingeon, 1998; Senge, 2006). As a result, change agents need to understand the importance of analyzing and creating a learning environment in which employees learn how to welcome the change and adapt to the culture shift. This shift may include sequential steps to move the organization from the current 'undesired' state to the future 'desired' state, which may work for organizations operating in a relatively stable environment; however, for organizations operating in a dynamic, turbulent environment, this sequential approach may not be effective to implement sustainable change. Rather, practitioners must be open to new opportunities that may support the change.

Leverage Employee Passion and Involvement

Numerous change management authors emphasized the importance of employee involvement during the change process (Conner, 1992; Fullan, 2008; Hall & Hord, 1987; Kahan, 2010; Wheatley, 2006, 2009). According to Burt (2011), "While it is important for leaders to involve employees under normal circumstances, it is even more critical to involve them during an organizational change, particularly when that change has an impact on the underlying culture of the organization" (p. 5).

Beer, Spector, and Eisenstat (1990) found that very little changed in organizations where strategies were 'sold' to employees and followed up with communication and implementation plans. Rather, successful companies leveraged employee involvement to identify and implement desired behaviors and competencies to achieve their goals, leading to the preferred culture (Maheshwari & Vohra, 2015).

Organizational culture change requires employee involvement at all levels. While it is key to gain leadership buy-in and the demonstrated support by walking the talk and recognizing others for supporting the cultural change, true organizational change happens throughout the organization at multiple levels. Additionally, successful organizational change occurs by allowing and encouraging the grass-roots, 'bottom up' change initiatives, rather than dictating changes and plans through a 'top down' command and control environment. The ability to leverage these 'bottom up' changes demonstrate the value of all employees and their passion to support the change.

Celebrate Short-Term Wins for Long-Term Change

Organizational culture change takes time, considerable effort, and on-going reinforcement. It takes on-going perseverance and determination to stick with the plans and efforts to change an organization's culture. Because of this long-term perspective, it is particularly important to celebrate short-term wins on the transformation journey to ensure that the employees are appreciated and recognized for these changes; celebrating short-term wins is one of the stages in Kotter's (1996) eight-stage change process. This is particularly important in large-scale change implementation, as "short-term wins help to demonstrate the viability of change and to build momentum" (Pollack & Pollack, 2015, p. 59).

Building on the momentum requires on-going reinforcement; it is not about only changing the values or the principles, but supporting these changes through learning and development opportunities, processes, and continued alignment with other human resources processes. McAllaster (2004) noted that

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

"no strategic change will occur if it is not constantly reinforced and monitored by the people at the top, and then repeated throughout the management chain of command" (p. 326). This reinforcement and alignment process takes time, as it requires an approach that includes a planned blend of both continuity and change.

Relish the Opportunity to Work on a Major Change Initiative

Organizational change is constant due to competitive pressures, local and global economies, and innovative advancements. To keep up with these many challenges, organizations must continuously change and evolve to remain competitive. Unfortunately many organizational changes fail, so it is imperative that a prescriptive protocol for effective change be available for practitioners (Griffith, 2010). Whether these changes are intended to improve workplace processes, systems, or strategies, they all have an impact on people. This is the exciting aspect for an OD practitioner – understand the desired changes and the effects on people and the organization as a whole.

While working on large-scale organizational change can be daunting, look at the challenge as an opportunity to leverage your knowledge of OD models, best practices, and theories, as researchers noted that individuals who are scholar-practitioners are more effective than their non-scholar peers (Holton, 2004; Lombardozzi, 2013; Short & Shindell, 2009). Throughout the journey there will be many ups and downs, as well as starts and stops; these are the moments for your critical reflection to understand your lessons learned and develop transferable skills for the next challenge. Opportunities to make a difference and have a large-scale impact on an organization do not happen often, so relish the opportunity to work on a major change initiative.

CONCLUDING REFLECTIONS

With today's competitive landscape, organizations are focusing on ways to create a competitive advantage for organizational success and growth. Health care organizations are particularly challenged, due to the recent health care reform changes, combined with considerable competitive challenges. Worley and Mohrman (2014) noted that "the traditional models of change management that served organizations well during the old normal are no longer sufficient to guide them through the types of changes they are facing today. The new normal calls for different theories of change and changing" (p. 221).

The "new normal" is an opportunity for practitioners to catalyze and steer the on-going changes, with the goal to help the success rates of change efforts, which are estimated to be a dismal 10 to 32 percent success (Smith, 2003). Furthermore, organizational culture changes prove even more challenging, with only a 10 percent success rate.

To ensure a higher success rate for a culture change, this case history highlighted four categories of evidence-based practices to leverage for culture transformation:

1. Creation of Leadership Buy-in and Support;
2. Implementation of Learning and Development Opportunities;
3. Alignment of Human Resources Processes with Culture Transformation; and
4. Involvement of Employees throughout Transformation.

Chapter 42
Digital Transformation in the Utilities Industry:
Industry 4.0 and the Smart Network Water

ABSTRACT

Nowadays, there is a digital transformation in industry, which is being referred to as a new revolution, known as the fourth industrial revolution. Today, we are in the fourth industrial revolution, which strongly supports itself at enabling technologies, such as: Internet of Things (IoT), big data, cyber-physical systems (CPS) and cloud computing. These technologies are working cooperatively to promote a digital transformation in the forms of: Industry 4.0, Industrial Internet Consortium and Advanced Manufacturing. To meet these needs and as a proof of concept, a platform for digital transformation for a water issue is proposed with the objective of achieving an efficient management of resources linked to rational use of water. For the platform definition, a survey was performed of the process of a water treatment plant from the third industrial revolution and improved the process by applying the concepts of digital transformation to improve the new platform.

1. INTRODUCTION

Digital transformation is part of a major ongoing technological process and it is associated with the application of digital technology in all aspects of human society. According to Khan (2016) and Westerman (2014), digital, digitization and digital transformation are concepts that are commonly confused, and there is no clear or broadly accepted definition of digital transformation.

Also, according to Khan (2016), it is first necessary to establish the concepts of digital and digitization in order to be able to define digital transformation. Digital is associated with the process of converting analogical information into digital format; in Collin et al. (2015), it is defined as a condition for converting, for example, a print photograph into a digital format. Meanwhile, according to Bounfour (2016), digitization is related to the issue of transforming physical processes into virtual processes using specifically tailored technologies. In accordance with Khan (2016) and Collin et al. (2015), digital transformation is the effect of this digitization, and thus not only pertains to the adoption of new technologies, but also to new ways of making business operations more efficient and competitive. However, it is still not known how digital transformation will be implemented, its degree of complexity, the nature of its interconnections among different sectors and, above all, its impact on society.

The new technologies involved in this transformation will bring far-reaching changes to all sectors of society, affecting current business, production, consumption, transportation and delivery methods, as well as the very way people live. Therefore, it is necessary to obtain a comprehensive vision of how this digital transformation will change all aspects (social, cultural or economic) of the world in which people live.

In recent centuries, industry has undergone vast operational changes, generating innovation and far-reaching social and economic shifts. The first industrial revolution took place in England at the end of the 18th Century and beginning of the 19th Century, and it was characterized by coal as the primary energy source, leading to the development of the steam engine and, consequently, the locomotive. One of the first areas to implement this new technology was the textile industry, which, prior to this revolution, was intensively manual. This new industrial model accelerated the rural exodus, thus leading to burgeoning urban centers. The second industrial revolution triggered from the second half of the 19th Century as part of the quest for continual improvement. This basically comprised the discovery of fossil fuels and electromagnetism as energy sources, with electricity arising as an alternative to steam power. Use of these resources accelerated the industrial steamroller with the discovery of the potential for reducing both costs and product manufacturing time, with the result that goods could be consumed on an ever-greater scale. One of the most evident examples of this revolution is the introduction of the assembly line, the most traditional reference of which is the Ford Model T automobile. The third industrial revolution began in the middle of the 20th Century, characterized by the intensive use of electronics and information technology (IT) in order to achieve the objective of automation in manufacturing. In the industrial area, Supervisory Control and Data Acquisition (SCADA) systems, in conjunction with the programmable logic controller (PLC) were its most significant feature, and these systems are currently converging to open-source systems that, in some cases, are connected to corporate networks or even the internet. The use of telecommunications resources and technological advances have enabled remote access, sharing, integration and, consequently, long-distance data processing using these resources. Integration with different systems is aimed at increasing productivity and efficiency in decision-making processes.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Currently, according to Schwab (2016), we are currently on the cusp of a fourth industrial revolution, the so-called Cyber-Physical Systems (CPS) systems-based industrial revolution. In addition to Cyber-Physical Systems, new technologies are arising in the form of the current enabling technologies, whose use is leading to the breakdown of the current paradigm. Such technologies include Internet of Things (IoT), big data analytics and cloud computing, intended to address the requirements of an advanced manufacturing system through integration of the entire supply chain. This new revolution is characterized by the intensive use of digital technologies with the purpose of manufacturing products rapidly, with an agile response to demands and real-time production and supply-chain optimization. Also, according to Schwab (2016), the fourth industrial revolution basically comprises three pillars, namely: the physical, digital and biological, which have already impacted the economy, business, society, private individuals and government.

This research is intended to contribute to the understanding of digital transformation and its impacts. This new paradigm shift affects both existing business models and the entire supply chain. Considering the current moment in time, this study identifies enabling technologies that form the technological pillars on which this new revolution is to be based, in order to do the same work as global visions that attempt to comprehend, qualify and guide companies, the government and civil society towards this transformation.

Given that digital transformation affects the entire production chain in its different branches and sectors, it has become a very wide-ranging and complex issue. Accordingly, this research attempts to contextualize the issue based on a single niche, that of the Utilities industry and, specifically, the issue of rational water use in Brazil. The Utilities industry is defined by Mcnabb (2005) as companies operating in the production, transportation, distribution and commercialization of energy (electricity and gas) and water and its main attribute is that it is essential and, in the case of failure, critical for society.

1.1. Objectives

The objective of this chapter is to understand the impacts of digital transformation on the industry and to improve the currently existing architecture for an all-new platform. The current 5-layer pyramid automation architecture is transformed into a new model that makes use of enabling technologies to digitally transform the entire supply chain of a certain market niche. This research is supported by digital transformation in the context of the Utilities industry, in order to promote efficient management with rational water use linked to existing risks and threats.

1.2. Rationale

Digital transformation is becoming a reality, although studies on the impact of the adoption of technologies that enable digital transformation to be implemented have not yet matured to the degree that they inspire the confidence required to make it a reality.

The choice of industrial segment was made based on the fact that no balance between the knowledge of the managers of these industries and visions of digital transformation has been identified in research conducted to date. At the current moment, industries are operating with SCADA systems in the 5-layer pyramid model, in order to continue executing vital functions for society. With the recent appearance of enabling technologies, change in this architecture is now possible and, consequently, it is also possible to achieve the gains expected from digital transformation.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The definition and concept of digital transformation is not unanimous, and it requires investigation in several fields, such as the creation of standards, reference architecture, training, adaptation to legislation, platform and regulatory framework, among others. The absence of digital transformation policies linked to the criticality of the industries provides the grounds for this research.

Furthermore, specifically with regard to the water issue, according to Torres (2008), there is an executive order in the United States identified under the number 13,010, which names the water supply system as one of the eight critical infrastructures most targeted by terrorists and, accordingly, it requires greater protection. Although, as the author himself states, the probability of contamination is slight, attempts and actual attacks on the water supply system in the United States have proven to be a real issue, as shown in Table 1.

Table 1. Attacks against the American water treatment system

Year	Attacker	Event	Agent
1984	Religious Cult	Contamination of municipal potable water tanks in the state of Oregon/USA	Salmonella
2001	Bin Laden sympathizers	Detection of a potential contamination event in the water distribution network in 28 American states.	N/A
2002	Moroccans	Development of an initiative to contaminate water pipes at the American embassy in Rome.	Cyanide
2002	Al Qaeda	Resident arrested with plans and procedures for contaminating the water distribution network.	N/A
2003	Iraqi agents	Poisoning of food and water distribution networks.	Botulinum toxin
N/A	Religious Cult	Acquisition of cyanide to contaminate some of the reservoirs in Minneapolis	Cyanide

Source: Torres (2008)

Although there is very extensive literature available on mitigation, response and recovery, this work is most related to natural disasters. However, it is possible to observe a gradual increase in attacks on the water distribution system this decade. The American Water Works Association (AWWA), the American Society of Civil Engineers (ASCE) and the Water Environment Federation (WEF) recently drafted an experimental common standard on guidelines for improvement of the physical safety of facilities used for the treatment and distribution of potable water.

2. THEORETICAL REFERENCE

In this chapter, the bibliographical references that serve as the basis for the development, structure and execution of this study are analyzed and discussed. The proposed subject, in its entirety, is very wide-ranging and may cover many areas of knowledge; accordingly, the references also cover several correlated areas, including concepts, applications, protocols and theoretical and practical examples. Furthermore, IoT visions in industry and a description of emerging technologies are presented, such as IoT, machine learning, M2M, CPS, big data, analytics and risk analysis. The main purpose of this item is to contextualize the research by exploring approaches to IoT in industry, emerging technologies that contribute to these visions and the issue of risk (security and safety).

2.1. Related Works

In "*Security and Privacy Challenges in Industrial Internet of Things*" (Sadeghi, Wachsmann & Waidner, 2015), the authors base their work on the principle that, due to the strong tendency of connectivity and IoT-based initiatives, everyday equipment is becoming more and more connected, from vehicles to critical infrastructure and, accordingly, it is more exposed to safety and privacy issues. Thus, this article briefly introduces the systems that use the industrial IoT concept related to safety and privacy challenges, presenting a holistic perspective on the potential solutions to these issues. Furthermore, the authors research details pertaining to attacks on an IoT industrial system and relate the existing architecture to CPS and protection techniques. Finally, they conclude that current systems are inadequate and conclude that a holistic approach is necessary for the development of a framework for cybersecurity that takes into consideration all the abstract layers of the IoT system, as well as the frontiers that interact with the platform; however, there is no practical demonstration of the concepts and solutions presented, only a conceptual consideration.

In the study entitled "*Internet of Things Applications in Future Manufacturing*" (Soldatos et al., 2016), the authors base their work on the principle that the factory of the future will be governed by flexibility in manufacturing and rapid responses to market demands, thus providing a new production model that goes beyond mass production. Accordingly, manufacturing will migrate from the stock production model to a new demand-oriented model. This also means that a new platform to support this new model will be required. The study discusses initiatives, IoT technologies and applications related to future internet technologies, including the FITMAN project. One of the purposes of the article is to demonstrate how IoT can transform manufacturing by using emerging technologies and thus to illustrate the potential factory of the future.

The article entitled "*Towards Manufacturing 2.0: an Innovative Architecture for the Factory of the Future*" (Fiaschetti, Pietrabissa, & Priscoli, 2015) proposes an information management system for the new paradigm of the factory of the future. The authors start with the initial idea that the new production model incorporated by the factory of the future will produce a huge amount of data to be processed by operators, and with the current tools available, data management is not very effective for decision making. With this in mind, the authors conclude that new technologies are necessary in order to deal with innovative manufacturing processes. Accordingly, the article demonstrates an innovative architecture solution based on use and integration in ICT, based on the Future Internet framework, specifically, the PLATINO project.

On the other hand, the starting point for "*A Cyber-Physical Systems Architecture for Industry 4.0-based manufacturing systems"* (Lee, Bagheri, & Kao, 2015) is the evolution of the manufacturing industry; the authors propose a unified architecture based on five levels working as a guide for the implementation of CPS (Cyber-Physical Systems), with the purpose of improving the quality of products and the reliability of the system with more intelligent and resilient equipment. Accordingly, five steps are proposed, including: intelligent connection, conversion of data to information, cyber, cognition and configuration.

In the article entitled "*Implementing Smart Factory of Industry 4.0: An Outlook*" (Wang, Li, & Zhang, 2015), the authors describe the concept of Industry 4.0 and the requirement for horizontal, *end-to-end* and vertical integration in order to fulfill the Industry 4.0 proposal. The primary objective of the article is to address the issues of vertical integration; in order to fulfill this objective, the authors propose a framework for control systems engineering that incorporates industrial wireless networks, cloud computing, big

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

data and intelligent terminals, in order to form a self-organized system assisted by cloud-implemented feedback blocks and coordination, based on big data analysis.

In the article entitled "*Smart Factories in Industry 4.0: A Review of the Concept and of Energy Management Approached in Production Based on the Internet of Things Paradigm*" (Shrouf, Ordieres, & Miragliotta, 2014), the authors present a reference architecture for intelligent factories based on the internet of things, defining the main characteristics of these factories with a focus on sustainability perspectives. Subsequently, they propose an approach for energy management, wherein decision making is carried out using energy consumption data from the factory floor (production line), providing *on-line* consumption in real time for any device.

The integration of these data improves efficiency, because they can be used to discover and reduce waste, and to allow conscientious decision making at the production management level (for example, maintenance, production programming and management).

The study entitled "*Service innovation and smart analytics for Industry 4.0 and big data environment*" (Lee; Kao, & Yang, 2014) is based on the principal that, in Industry 4.0, machines are connected like a collaborative community and its evolution requires use of advanced prediction tools. This article addresses the tendencies in the transformation of production services in a *big data* environment, as well as the availability of tools to manage *big data*, in order to achieve transparency and productivity.

In the article entitled "*Classification Model for Water Quality using Machine Learning Techniques"* (Muhammad et al., 2015), machine learning techniques were employed with the purpose of classifying water quality, revealing the best model for undertaking this classification. Accordingly, five models were applied: Naive Bayes, Conjunctive Rule, J48, Kstar and Bagging. In the tests proposed by the authors, the Kstar algorithm proved to be the most accurate.

The research outlined in the article entitled "Cloud based machine learning approaches for leakage assessment and management in smart water networks" (Mounce et al., 2015) is based on the problem that one third of public services worldwide report losses of almost 40% of clean water due to leaks, and this loss could be minimized by means of an intelligent water system. In order to prove this concept, a loss analysis in a controlled environment was proposed using machine learning techniques to predict leaks, with historical flows and pressure data as parameters.

In the study entitled "*Mathematical Model for Detection of Leakage in Domestic Water Supply Systems by Reading Consumption from an Analogue Water Meter*" (Oren & Stroh, 2013), a mathematical model is presented to detect domestic leaks in real time. The model uses data measured from a water meter and it employs two criteria simultaneously, namely: deviations in mean consumption and comparisons of water consumption over time. The simulation of a domestic consumption model was implemented in a device called Antileaks that was constructed by the authors. This device transforms analogical consumption data into digital format in real time.

In the study entitled "A Medição Setorizada Como Instrumento De Gestão Da Demanda De Água Em Sistemas Prediais – Estudo De Caso: Programa De Uso Racional Da Água Da Universidade De São Paulo" [Sectorized Measurement as an Instrument for Managing Water Demand in Buildings - Case Study: University of São Paulo Program for Rational Water Use] (Tamaki, Sanches, & Gonçalves, 2006), concluded that many benefits obtained and reported in the case of the University of São Paulo can be extrapolated to similar situations involving the implementation of sectorized measurement in order to manage water demand, taking into account considerations raised and the peculiarities of each application.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the article entitled "*Towards an IoT Based Water Management System for a Campus*" (Verma et al., 2015), the design and results of an IoT based system for water distribution management on a university campus are discussed. The scope is focused on two main components, namely: 1) low-cost ultrasound water level measurement sensors; and 2) a sub-GHz wireless network to connect the sensors. The network is connected to a gateway that can update the data online for viewing and analytics.

In the study entitled "*Managing the water distribution network with a Smart Water Grid*" (Walter, 2018), the author base their work on the implementation of a Smart Water Grid system supports the Public Utilities Board (PUB)'s mission to supply good water 24/7 to its customers. With sensors and analytic tools deployed island-wide to provide a real-time monitoring and decision support system.

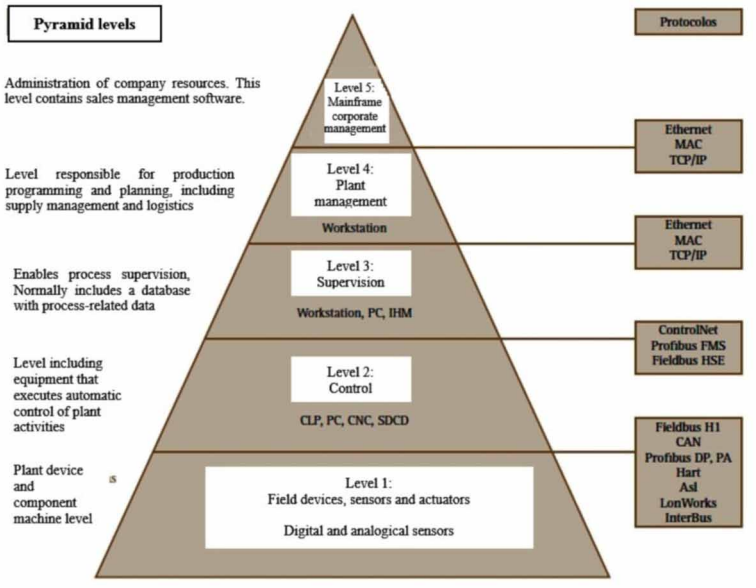
In the other study "LIFE SWSS - Smart Water Supply Systems", (SWSS, 2018) is based on the propose to decrease to 15% the energy consumption and CO2 emission associated with the water supply for the Singapore customers based on the use of enable technologies.

In line with the aforementioned studies, this study intends to contribute with projects in the area of intelligent cities and, specifically, the issue of water treatment through the use of enabling technologies and approaches to digital transformation.

3. THEORETICAL GROUNDS

The architecture of industrial automation is represented by Moraes and Castrucci (2007) by means of a pyramid called the Pyramid of Automation, whose primary objective is to divide equipment levels involved in accordance with their role in industry. This pyramid can be observed in Figure 1, where:

Level 1: The level of machines.
Level 2: The level of digital, dynamic and logic controllers.
Level 3: Enables the production process in the plant to be controlled.
Level 4: Responsible for production programming and planning.
Level 5: Responsible for management of company resources.



The next items identify new technologies that led changes in this traditional pyramid toward a new concept based on enabling technologies, which are discussed below.

Enabling technologies are the technological pillars for digital transformation, permitting the development of new processes and products. According to the European Commission, the formalization of enabling technologies, called KETs (Key Enabling Technologies) is characterized by the huge potential of knowledge and abundance of research and development (R&D), containing rapid innovation cycles and intensity in capital and qualification (Key Enabling Technologies, 2016). According to the European Commission, key technologies are:

- Advanced Materials
- Nanotechnology
- Micro and nanoelectronics
- Industrial Biotechnology
- Photonics
- Advanced Manufacturing Systems

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Automation pyramid
Source: Moraes and Castrucci (2007)

Advanced manufacturing is based on the use and coordination of automation, information, computation, software, sensing and networking, and it requires intensive use of enabling technologies (Loural, 2014). The North American government drafted a document entitled A National Strategic Plan for Advanced Manufacturing, which defined advanced manufacturing as follows:

... is a family of activities that depend on the use and coordination of automation, information, computation, software, sensing, and networking, and/or make use of cutting edge materials and emerging capabilities enabled by the physical and biological sciences, for example nanotechnology, chemistry, and biology. It involves both new methods for manufacturing existing products, and the manufacture of new products emerging from new advanced technologies. (NSTC, 2012)

3.1. IoT (Internet of Things)

The first reference to the concept to what is now known as IoT - Internet of Things was in 1982, when researchers from Carnegie Mellon University developed the first Coca-Cola machine with IoT characteristics (Oldest Internet of Things Objects in the World, 2017). Subsequently, at the beginning of the 1990s, Mark Weiser developed the widest ranging-concept of these characteristics, describing specialist hardware and software elements connected by cables, radio and infrared waves whose presence could not be perceived, thus introducing the term “Ubiquitous Computing” (Weiser, 1992). The term Internet of Things was defined around 1999 by Kevin Ashton, during a presentation at Procter & Gamble (P&G), in which it was connected to the RFID concept within the supply chain, with the subject in focus at the time, which was the Internet (Ashton, 2009). Subsequently, IoT was formally introduced by the International Telecommunication Union (ITU) through the 2005 ITU Internet Report. Then, in 2012, IoT was defined by the ITU-T Y.2060 recommendation as a global infrastructure for the information society, enabling

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

advanced services to be supplied through the interconnection of things (physical and virtual) based on the already existing information and communication technology, as well as its evolution.

The term Internet of Things (IoT) is a new paradigm that has been gaining space in the modern wireless telecommunications scenario, wherein the main idea is the pervasive presence around individuals by means of a variety of things or objects, such as Radio-Frequency Identification (RFID) tags, sensors, actuators, mobile telephones, etc.

3.2. Big Data and Analytics

Nist (2015) defines the term big data as a huge data set, in which the great mass of data is not structured and requires real-time analysis. The term big data addresses the inability of traditional data architecture to efficiently handle large quantities of data, requiring a scalable platform to effectively store, process and analyze them. The characteristics of big data imply a new architecture known as the "V's" of Big Data, which are:

- Volume (size of the data set);
- Variety (data from multiple repositories, domains or types);
- Velocity (data flow rates);
- Variability (coherence in the data set).

3.3. Cloud Computing and Fog Computing

The definition of cloud computing given by Nist (2011) is a model that permits ubiquitous, convenient and on-demand access to shared and configurable resources, which can be rapidly provided and released with minimal management effort. It comprises five essential characteristics, three service models and four implementation models, and its essential characteristics are as follows:

1. **On-demand and self-service:** Consumers may provision computational capacity without requiring human interaction with the service provider;
2. **Wide-ranging access to the network:** The resources are available through the network and can be accessed by means of heterogenic platforms, such as: mobile phones, tablet computers, laptop computers and work stations;
3. **Set of resources:** The access provider's computer resources are grouped to serve several consumers with different physical and virtual resources, which are dynamically assigned according to consumer demand;
4. **Rapid Elasticity:** The resources may be elastically provisioned (in any quantity and at any moment) and released according to demand;
5. **Measurement Service:** The cloud service automatically manages and optimizes use of the resources, and these are monitored, controlled and reported in a manner that is transparent both to the provider and to the consumer of the acquired service.

The three service models are:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. **Software as a Service (SaaS):** Use of applications in a manner that is accessible by different platforms. Consumers have no managerial control whatsoever over computer resources;
2. **Platform as a Service (PaaS):** Consumers have control over the implementation of the application and the possibility of configurations in the application environment; however, they do not manage the infrastructure of the cloud computing resources;
3. **Infrastructure as a Service (IaaS):** Provides consumers with the capacity to manage cloud-computing resources and to implement and execute applications of their choosing.

The four implementation models are:

1. **Private Cloud:** Cloud infrastructure is provisioned for exclusive use of a single organization, comprising several consumers;
2. **Community Cloud:** Cloud infrastructure is provisioned for community use and specific use by certain users with shared interests;
3. **Public Cloud:** Cloud infrastructure is provisioned for open use and for the general public;
4. **Hybrid Cloud:** The cloud infrastructure comprises two or more cloud infrastructures (for example, private, public or community), which remain single entities, but which are linked according to standardization.

3.4. Machine Learning

The first definition of machine learning was made by Samuel (1959), who defined it as a field of study that provides computers with the ability to learn without being specifically programmed to do so. Later, it was redefined by Mitchell (1997) as techniques capable of improving performance in a given task using prior experience. Further according to Mitchell (1997), the machine learning algorithms can be divided in 04 ways, namely: supervised, unsupervised, semi-supervised and reinforcement learning.

In supervised learning, data (inputs and outputs) are presented in a model, providing the desired output for each input, where the primary objective is to learn a general rule in order to understand the inputs and outputs. In unsupervised learning, no type of information is given to the algorithm, and the algorithm itself is left to understand the data structure. In the semi-supervised algorithm, a training set with several missing outputs is provided. Reinforcement learning involves interaction with a dynamic environment in which a certain objective is proposed; autonomous vehicles are the classic example.

Learning algorithms can be divided into predictive (classification and regression) and descriptive (grouping, summarization and association) algorithms. Algorithms are used according to the objective and the issue to be resolved. For example, it is possible to highlight analyses of temporal series that use algorithms with the purpose of learning a function that maps a real value example. Examples of algorithms for this class of problems are regression trees, artificial neural networks, linear regression and support vector machines. On the other hand, the purpose of learning a function that associates the description of an example to a class can be exemplified by Bayesian, logistic regression and K-NN networks, among others.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

3.5. Information Security and Process Safety

The importance of defining the two areas of activity in this study (security and safety) is obvious, because both are included in the risk analysis and verification of failures for the improvement of process safety.

In order to obtain a better definition of the terms security and safety, we should first understand the term 'risk'. According to Almeida Jr. (2003):

…risk can be viewed as being directly related to the frequency of potentially hazardous events and with the severity of their consequences. The greater the frequency of a hazardous event, the greater the risk and severity of its outcomes, and, thus, the greater the risk assumed. ...any system has inherent associated risks, and the risk presented by one system may or may not be accepted by society, which, ultimately, will define the concept of acceptable risk. (p. 15)

With regard to the nomenclatures of the terms security and safety, Almeida Jr. (2003) presents the following definitions:

Although there is a difference, in Portuguese, these two factors have the same denomination; i.e. 'segurança', which in English can mean either 'safety' or 'security'. The term safety is used to refer to the safety of Critical Systems, while the term security is used to refer to the security of Information Systems. (p. 19)

In this study, the term security is used for the definitions of procedures, structures and processes for the improvement of information security systems, data and architecture of the communication network; while the term safety refers to the state of protection of a system, person, object or process, and it covers several types of error, failure and problem. The term is differentiated in a way similar to that adopted by Almeida Jr. (2003) in his research: safety for process safety (the safety of critical systems) and security for information security (information systems).

Process safety correlates quality, reliability, maintenance and safety of people and the environment. The primary objective is to know and manage risks.

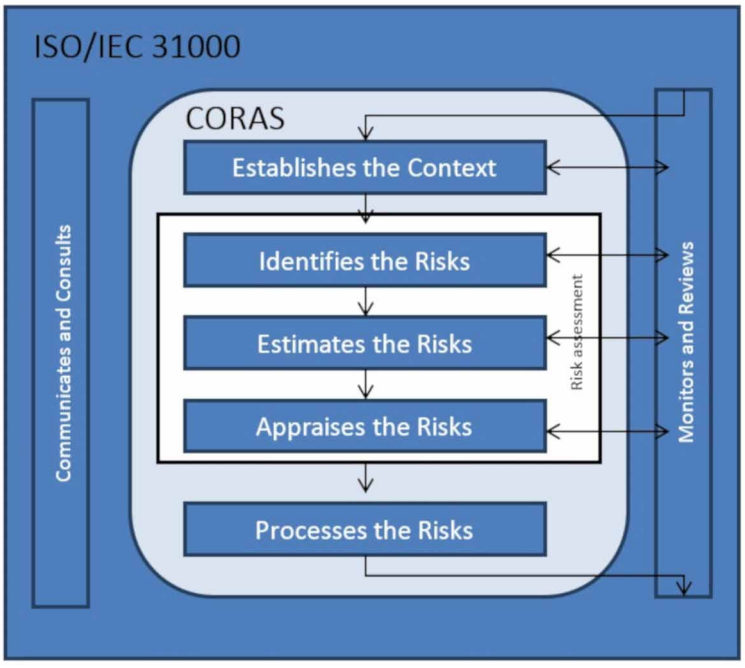
Risk analysis means the process of understanding the nature of the risk and ascertaining risk levels. According to Braendeland, Refsdal and Stolen (2010), risk is defined as a combination of the consequences and probability of an undesired event.

According to the CETESB P4.261(2003) standard:

Recommendations and measures resulting from the risk analysis and assessment study for the reduction of the frequency and consequences of potential accidents, must be considered as integral parts of the risk management process; however, regardless of the adoption of these measures, premises containing hazardous substances or processes must be operated and maintained throughout their useful lives within standards considered tolerable, which is why the Risk Management Program [Programa de Gerenciamento de Riscos, PGR] must be implemented and used in all the activities, both routine and otherwise, of an industrial plant. (p. 34)

The requirement for more and more reliable systems is included in a context that demands a point of equilibrium to be reached, since poor reliability may result in loss of human life and material losses; however, on the other hand, extreme reliability may not be financially feasible.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use



In the process of this study, several standards and measurement and risk analysis techniques are addressed, such as IEC 61508, Reliability, FMEA, CORAS, QSP 31000 (ISO/IEC 31000), CETESB P4.261 and others.

3.6. Consultative Objective Risk Analysis Systems (CORAS)

CORAS is a methodology that includes several techniques to appraise risk based on Unified Modeling Language (UML). The project was initiated in 2001 by four European Union countries (Greece, Germany, Norway and the United Kingdom), with support from IT companies (Intracom, Solinet and Telenor) and seven institutes (CTI, FORTH, IFE, NCT, NR, RAL and Sintef), as well as the QMUL University in the United Kingdom. The project was conducted in two stages: the main task in the first phase (2001-2003) was to develop an information evaluation platform and the primary objective of the second phase (2004-2007) was to improve CORAS functionalities.

CORAS complies with international standards, such as Austria Standard/New Zealand Standard (AS/NZS) 4360:1999 and ISO/IEC 17799-1:2000. However, its main basis lies in the risk management norm that establishes the international standard, ISO/IEC 31000:2009 – General Guidelines for Principles and Implementation of Risk Management, which, in turn, was based on the AS/NZS 4360 standard. The risk management process according to the ISO/IEC 31000 standard has the scope presented in Figure 2, which includes the CORAS stages.

Figure 2. ISO/IEC 31000 diagram
Source: IEC (2027)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Phase 1 - Identify the context: Aims to characterize the target of the analysis, and the focus and scope of the risk analysis. To what level is risk tolerable?
Phase 2 - Identify the risks: Identify threats and vulnerabilities to assets.
Phase 3 - Estimate the level of risk, evaluate risks: Not all risks can be eliminated, and thus we need to decide which risks need to be processed.
Phase 4 - Process the risks: Identify the processing of undesirable risks. Evaluate and prioritize different methods of processing.

CORAS uses identification and risk analysis tools originating from process accident prevention (safety), such as:

1. Hazard and Operability Study (HAZOP);
2. Failure Tree Analysis (FTA);
3. Failure Mode and Effect Criticality Analysis (FMECA);
4. Markov quantitative analysis methods (Markov);
5. CCTA risk analysis and management (CCTA *Risk Analysis and Management Method* – CRAMM).

The primary objective of CORAS is to improve traditional risk assessment methodologies in order to achieve better outcomes. Analysis is performed over eight stages.

Table 2. 8-stage analysis

Context	1. Analysis preparation (scope definition); 2. Definition of targets; 3. Detail of origin (asset diagram); 4. Approval of detail of the objective;
Risk assessment	5. Risk identification (threat diagram); 6. Risk estimate (threat diagram); 7. Risk assessment (risk diagram); 8. Risk processing (processing diagram).

CORAS is the risk analysis method that identifies, analyzes and describes risks in standardized language. The CORAS structure can be split into three different instruments:

1. **Risk modeling language:** Graphs and textual syntax;
2. **Method:** Description of the safety analysis process and guidelines for creating CORAS diagrams;

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

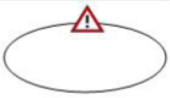
3. **Tool:** For documentation, maintenance and communication of the risk analysis outcomes.

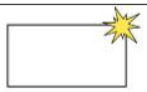
CORAS method resources:

1. Open-source solution;
2. Free updates and software;
3. Supplied with five risk assessment methods, including HAZOP, FMECA, Markov analysis and CRAMM;
4. Portable with XML standard;
5. In modules, which facilitate the inclusion of new functionalities;
6. Integrated with three main eXtensible Markup Language (XML) data models, including:
   a. XML Metadata Exchange (XMI) standardized per Object Management Group (OMG);
   b. Compatible with XML, formatted risk assessment indicator data;
   c. Intrusion Detection Messaging Exchange Format (IDMEF) by the Internet Engineering Task Force (IETF).

Furthermore, CORAS UML and Unified Process (UP) are applied in risk assessments for information security and process safety.

The CORAS language is a graphic modeling language for documentation, communication, security threat and risk scenario analysis. In risk analysis, it is common to use the structured brainstorming technique in meetings to obtain information. In these brainstorming sessions, the CORAS language is applied to create threat and risk scenario models. One of the advantages of using the CORAS language in brainstorming session is to promote standardization in a heterogenic environment, in which many people with specific knowledge are involved. The CORAS language improves the efficiency of the analysis process, as well as the quality of the outcomes obtained. According to Lund, Solhaug and Stolen (2011), standardization is facilitated mainly by the limited use of icons to represent the different environments, such as described in the Table 3.





3.7. MTBF

Mean time between failures (MTBF) is the reliability parameter of a component, measured between the initial functioning timepoint and the occurrence of an incident that causes a stoppage in the regular functioning of this system (unavailability). The value is normally given by the manufacturer of the component in its technical specifications and it indicates, in accordance with the testing procedure employed, the mean time between failures of that product in the manufacturer's laboratories.

In this study, an assessment of the failure probability and unavailability time was made for the system under analysis, taking into account the data provided by the suppliers of the components and the parameters referenced by the IEEE 493-2007 standard.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Icons representation

	Assets: something of value for the interested party that requires protection.
	Internal threats: unconscious – a potential cause of an undesirable incident.
	External threats: conscious.
 Threat (non-human)	Non-human threats.
	*Stakeholders:* people or organizations that may be affected, or that may influence an assessment or activity under analysis.
	Vulnerability: weakness that may be exploited by threats.
	Threat scenario: something that may occur because of a threat that exploits a particular vulnerability.
	Undesirable incident: something that we want to avoid, because it may cause damage to assets.
	Risk: the possibility of something happening that will impact assets.
	Treatment scenario: failure correction tools and techniques.

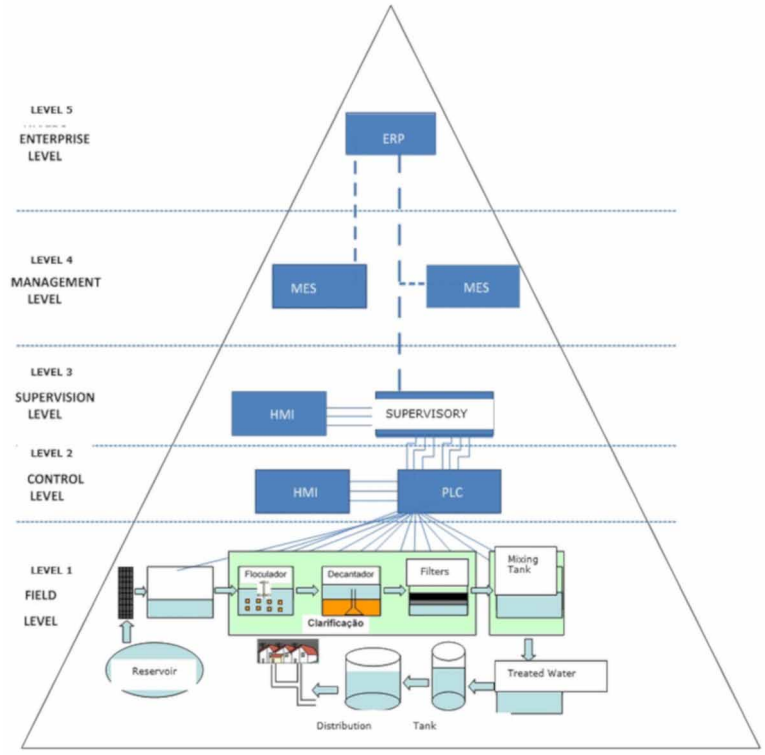
4. PROPOSED SOLUTION

Considering the entire process pertaining to the Utilities industry for water treatment and based on the FINESCE Smart Energy platform, we propose a new architecture involving enabling technologies and approaches to digital transformation. As stated in the introduction, the pyramid architecture for automation is based on the 5-layer concept. For the purposes of illustration, Figure 3 demonstrates the water treatment plant inside this current model.

Using enabling technologies and approaches to digital transformation, we propose a new collaborative architecture based on 3 layers, rather than the pyramid-based scheme. The new high-level architecture can be seen in Figure 4, which works as described below:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Pyramid architecture of an ETA (water treatment station)
Source: Author



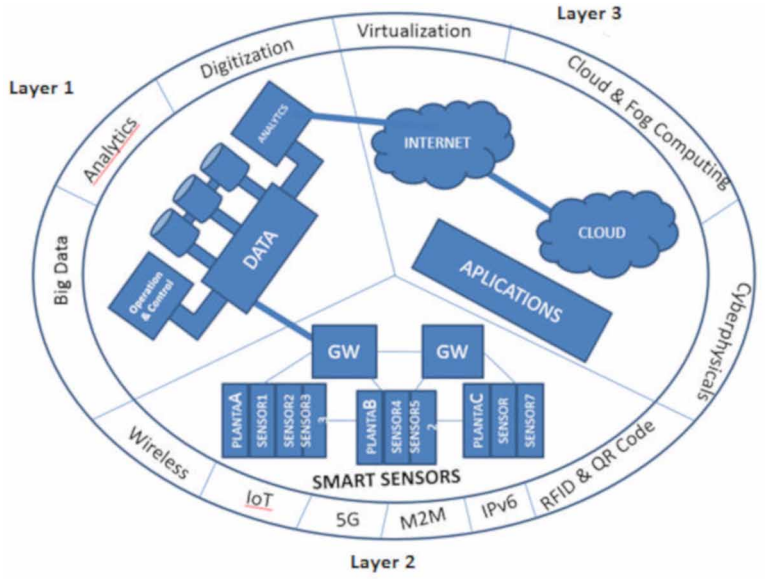


Figure 4. New proposed high-level architecture
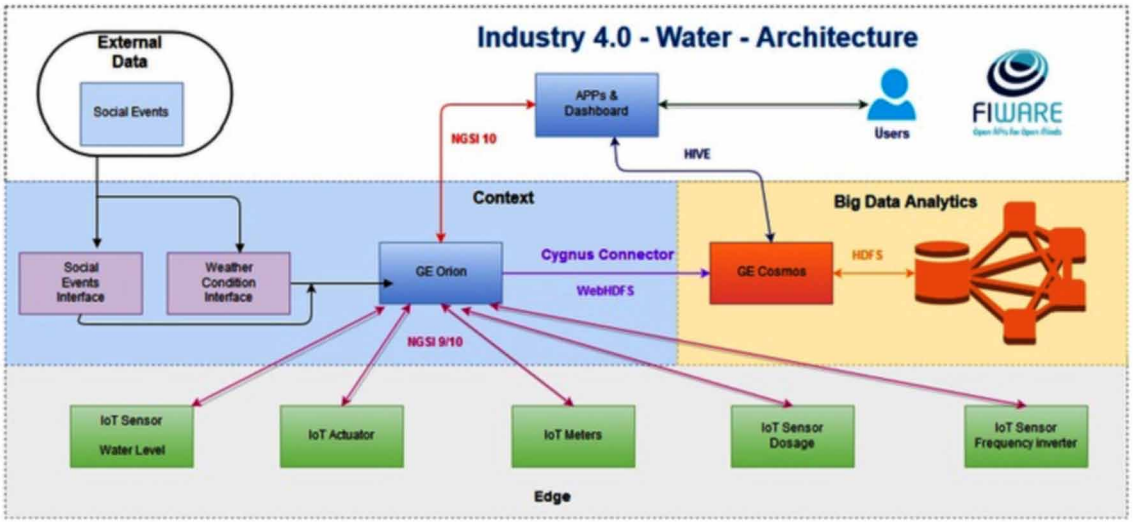
Source: Author

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Layer 1: The edge layer, called edge computing. This layer contains the cyberphysical and IoT systems, as well as their communication with higher layers.
Layer 2: This layer contains plant operation and control, which can be executed manually – by operator decision – or automatically, by means of a machine learning decision algorithm. This layer also contains the data for managerial decisions.
Layer 3: Applications with real-time interaction on the factory floor and reorganization according to demand or climate conditions.

In order to enable a discussion regarding the new model, migration of the water treatment system to this new architecture was undertaken whilst taking into account the following levels of automation described in Table 4.

Table 4. Activation of the ETA



Id	Stages	Physical Action	Analysis	Non-Conformity	Action
01	Catchment	Activation of the pump, valve, level sensor and dosing	Turbidity, pH and DO	Provide a corrective solution	Manage pre-dosing of calcium hydroxide Manage dosing of Aluminum Polychloride Manage pre-chlorination
02	Flocculation	Pump, Level sensor, dosing and frequency inverter	Loss of flocculation	Provide a corrective solution	Apply normalization solution by identifying which dose is required (calcium hydroxide, aluminum polychloride or pre-chlorination)
03	Decanting	Pump, level sensor and dosing	Loss in decanting	Provide a corrective solution	Apply normalization solution by identifying which dose is required (calcium hydroxide, aluminum polychloride or pre-chlorination)
04	Filtering	Pump and level sensor	Filtering within the norm	Wash filter	Stop pump, empty filter and start manual washing
05	Disinfection	Pump, level sensor and dosing	Water quality	Control addition of fluorine and pH	Dose recommended value
06	Distribution	Pump and level sensor	Water loss	Identify leak	Activate maintenance team
07	Consumption	Consumer's meter	Consumption	Identify losses and/or leaks	Activate maintenance team

Source: Author.

The choice of FIWARE among CRYSTAL and SOFIA2 was due to the fact that it is an open-source innovation ecosystem that provides programmers with the functionalities and properties necessary for the development of cloud solutions and applications, and it enables the provision of open data and communication of its specific requirements. Furthermore FIWARE is partnering with the Global City Teams Challenge 2016 programmer, GCTC2016, which is being organized under the lead of the U.S. Department of Commerce's National Institute of Standards and Technology (NIST). Based on these definitions and in the FINESCE energy platform, the following architecture was devised (Figure 5).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. Architecture using FIWARE for water treatment based on Industry 4.0
Source: Author

Compared to traditional architecture, the gains from use of this architecture are:

1. Use of historical data to predict necessities, collaborating with the entire supply chain in order to fulfill demands;
2. Management of water sources and exert control and use defined by automated processes from a remote location;
3. Integrate non-water related data sources, such as: government, research and industry, in a general manner, in order to accompany the conservation and continued improvement efforts of the existing operation;
4. Increase the visibility of installations of assets and improve performance and data analysis using dashboards;
5. Use of real-time data regarding climate events in order to anticipate changes in resource availability or requirements;
6. Provide consumers with greater control and visibility of consumption and residential and municipal resources in order to manage resource conservation efforts;
7. Use of data to discover improvements in procedures and thus serve citizens more effectively;
8. Improvement in the accuracy of water meter readings with greater frequency.

5. METHODOLOGY

Methodology is based on the following stages, and research planning includes theoretical and documentary study; consequently, an empirical study with the development of a case study for intelligent water use employing enabling technologies:

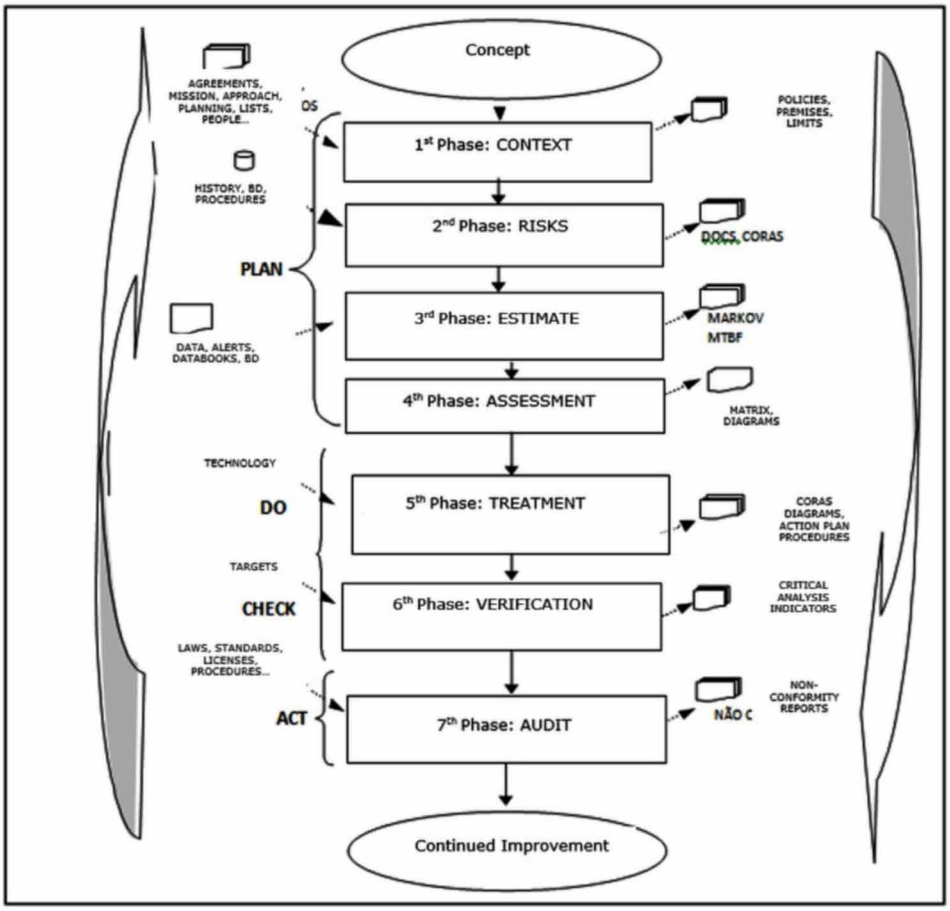
EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Identification of the critical systems and components, assessment, quantification and modeling of a water treatment and distribution plant following the classic 5-layer pyramid model;
- In the theoretical and documentary study, an analysis of the enabling technologies and digital transformation was undertaken in light of Industry 4.0 (Schwab, 2016);
- Definition of the platform of use, with enabling technologies as a reference, visions from around the world for digital transformation and the FINESCE energy platform (Finesce, 2016);
- Validation of the proposal through use of the platform in experiments;
- Risk analysis, proposing a methodology for risk management, with the CORAS method as the main basis. During this research, it was noted that CORAS does not include several important stages for full risk management, especially with regard to the risk estimate, quantitative method and inspection with auditing of the process risk management system.

This study assumes that the concessionaire of the case study has an operational automated sanitation plant; therefore, the methodology for risk and failure management of the process in this environment will be validated, with emphasis on automated technology.

The conventional analysis of reparable system failures establishes the study of two random variables of interest: Time Between Failures (TBF) and repair time (RT). It is assumed in this work that any failure will be immediately repaired, and that this maintenance is capable of returning the item that failed (component or system) back to its original condition, with the same characteristics as a new component. As a consequence, the distribution of the random Time to Failure (TTF) variable will be considered equal to the distribution of the random TBF variable.

The proposed methodology performs the risk/failure analysis based on mathematical modeling for MTBF and the Markov chain, using the history of the existing base in the SCADA system.



The main point of risk management is to discover problems, and then to diagnose risks, find out where they occur and how to resolve them; finally, they need to be audited, taking into account the entire process as a cyclical flow. Risk analysis starts with a description of the situation, indicating potential threats, their consequences and how they can be avoided. A seven-phase methodology for risk management is considered in this thesis, involving a definition of the context, risk identification, risk estimate, risk assessment, treatment, inspection of outcomes and periodic follow-up audits, in a continuous flow based on the PDCA, according to Figure 6.

The methodology begins with a characterization of the process by describing the environment it is linked to, its mission, cultural issues and its requirements. Phase one (1st Phase) is the context definition stage, the time point at which the basic parameters are defined, through which risks that need to be managed and the scope of the rest of the risk management process will be identified. The criteria to be used in the identification, assessment, impact and acceptance of the risks will also be defined. The definition of the context takes into account all the relevant information about the organization that is relevant for defining the context of safety risk management.

The main step towards obtaining the context is the correct application of techniques such as HAZOP, which enable a description of the objectives, premises and criteria of the environments that will be used to determine the risks pertaining to the process. These criteria involve determining the safety consequences and the methods used for risk analysis and assessment.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 6. Risk management methodology cycle
Source: Author

The next step (2nd Phase), pertains to identification of the risks, according to Brandão and Fraga (2008) and this is one of the most critical stages, because any risks that are not identified will not subsequently be analyzed or treated. The purpose of this stage is to determine the events that may cause potential losses and it should be clear how, where and why a loss may occur. Identification must include the risks that are and are not under control of the study process. In practice, risk identification is much more complex, because the information is almost always based on subjective experience and criteria of those responsible for conducting the project. (Brandão & Fraga, 2008). Risk identification involves identifying threats, existing controls, vulnerabilities and consequences. It was in this phase of the project that the CORAS method made the most significant contribution to the development of the risk analysis, as outlined in Section 4.4 of this thesis.

The third phase (3rd Phase) of the methodology pertains to estimates; in this stage, data are produced that will support the decision about which risks will be treated and the treatment methods to be adopted, taking cost efficiency into consideration. Accordingly, it involves considerations regarding the origin of the risks, their consequences and their probability of occurrence, as well as a reliability study and process availability. The estimate may be either qualitative or quantitative, or even a combination of the two.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The qualitative estimate uses a scale with qualifying attributes that describe the magnitude of the potential consequences and the probability that these consequences will occur, and they are duly represented in the CORAS tool, while the quantitative estimate adopts mathematical modeling in order to determine risks, with failure and process reliability estimates and an analysis of the availability of process components. A combination of two types of estimates is adopted for this study. Outputs from this phase of the risk management methodology are recorded in FMEA forms, MTBF spreadsheets, Markov models and consolidation in the CORAS, as detailed in the following sections.

The fourth phase (4th phase) of the methodology pertains to assessments; the purpose of the risk assessment is to facilitate decision making, based on outcomes of the risk analysis in phases 2 and 3 of the methodology. It is necessary to define the priorities and the real necessity for treating the risks analyzed. This assessment involves a comparison of the risk levels encountered, with the criteria established when the context was considered. In this phase, it is relevant to evaluate corporate security, the impacts of the decision made on the selection of the accepted risks. However, nothing will prevent a new assessment from being made at any time and new risks being treated, because the risk management process is a dynamic one.

The fifth phase (5th phase) pertains to the risk treatment, including identification of the treatment options, assessment of the options and the costs of preparing for implementation of the treatments in the study scenario. This stage is equivalent to the state of risk mitigation of the SP800-30 specification or even the ISO/IEC 31000. Treatment is identified in the CORAS treatment diagram, associated with the possible scenarios of incidents that cause them. Treatment options are related to each of the risks. There are four potential options for the risk treatment: reduction, retention, prevention and transfer. The residual risks are identified at the end of the treatment process. If these risks are not acceptable, treatments may be reworked or, alternatively, the entire risk management process may be revised. (Brandão & Fraga, 2008). The implementation of treatment may or may not involve the acquisition of technologies, or it may simply involve the creation of standards, training of personnel and development of internal rules to be followed.

The verification phase (6th phase) involves monitoring and verification of the outcome; therefore, it is essential for the risk management process, because risks are not static and must be monitored in order to ensure the efficacy of implementation strategies and the outcome of the management mechanisms used in risk treatment. Thus, the monitoring process must be ongoing and dynamic. In addition to continuous monitoring, organizational or external changes may alter the context of the analysis, leading to the necessity for a full revision of risk management.

The last phase of the methodology (7th phase) pertains to the audit, which we consider to be very important for ensuring the efficacy of the risk management and that the process is kept up-to-date. The audits may be periodically initiated by an internal team or undertaken by third parties. The purpose of internal audits is to verify, based on objective evidence, whether the following conditions occur satisfactorily:

- The operational procedures and instructions are adequate and effective;
- The areas have been acting in accordance with the instructional documents and checklists have been completed;
- The alert reports and logs are being assessed.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Any non-conformities (real and potential) detected must be recorded in accordance with a specific procedure, including initiatives for registration and actions to conclude them. A critical analysis of the non-conformities is indicated and, if necessary, their causes are investigated, corrective actions are defined and implemented and amendments to procedures are recorded. After the implementation of corrective actions, their efficacy must be evaluated before they are concluded.

Therefore, the first four phases are actually sufficient to determine the impact of risks and they are included in the CORAS method, or even by making an analogy with the PDCA quality cycle, pertaining to the planning phase, while phases five and six (execution) correspond to the process of implementing treatment, risk mitigation and verification of the outcome, and in the last phase, periodic auditing is indicated, which must be performed in order to ensure that the risk analysis system is always up-to-date and that it reflects the actual status of the operational system.

Each stage of the risk management process must be properly documented. Suppositions, methods, origins of data, analyses, outcomes and rationale for decisions made must be recorded. The reports produced must be as succinct and objective as possible. (Brandão & Fraga, 2008).

The suggested cycle in this work, if implemented, will lead to true risk management, and not just to a one-off assessment of the risk in a system. The difference is that, in a one-off risk assessment, normally a risk is only identified and estimated, whereupon its existence is considered, whereas, in risk management, in addition to being identified, the risk is treated and efforts are made to prevent it from happening.

6. OUTCOMES AND CONCLUSION

This research project was based on the necessity for assessing digital transformation in order to implement improvements in the traditional automation and control architecture of Utilities industries and the associated risk analysis. Up-to-date bibliographical research was undertaken in order to implement this proposal, covering a wide range of subjects related to digital transformation; accordingly, enabling technologies were studied that allow for this paradigm shift. It has been concluded that the new technologies that enable this change must work in a collaborative and integrated manner, because the complete solution for digital transformation depends on correct functioning of enabling technologies, including: Internet of Things, Machine Learning, Cloud and Fog Computing, cyberphysical systems, M2M, 5G and big data analytics. The approaches that guide this digital transformation around the world have also been studied, as well as research into work related to the subject in question. Special attention was paid to the Industry 4.0 approach, due to its pioneering and unique nature.

Based on this initial analysis, it was decided to apply the concepts of digital transformation to the Utilities industry. The choice of this segment was due to the fact that water treatment and distribution is more widespread among citizens, rather than being restricted to a segment of traditional industry. Additionally, and during this study, a platform was encountered for energy, where the concept of intelligent cities was the starting point; however, no platforms were found for the processing and/or management of water consumption. Accordingly, this study intends to contribute to the issue of water treatment and distribution in intelligent cities, combining with other equally important priorities.

Based on this lack and the need for contribution, a visit was made to a water treatment and distribution unit. The purpose of this visit was to conduct interviews regarding the process of generating the documentation, flow charts and steps for a correct understanding of the entire water treatment and distribution cycle. The study is intended to contribute to knowledge regarding the operation of a water distribution

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

station and the characterization process enables knowledge to be gained regarding industrial equipment and the system for managing and acquiring data, as well as the protocols used.

The classic 05-layer architecture has been improved based on this research regarding water treatment and distribution linked to studies of enabling technologies and approaches to digital transformation, and it now comprises 03 layers employing enabling technologies by means of an open-source innovation ecosystem called FIWARE, which provides the functionalities and properties necessary for the development of cloud solutions and applications, permitting the availability of open-source data and communication of its specific necessities.

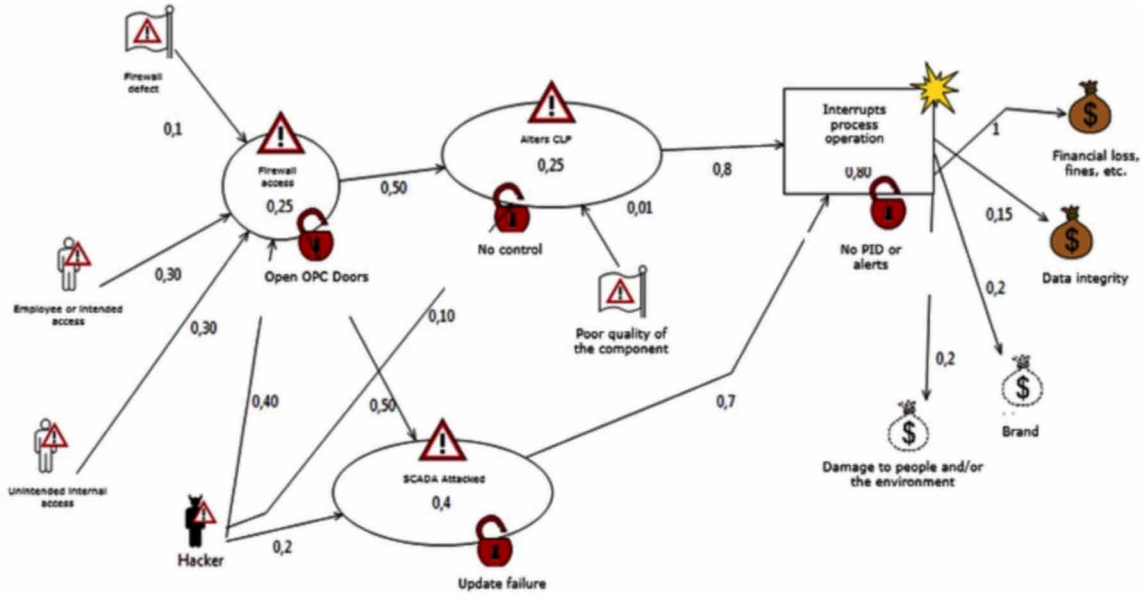
The improvement in the architecture was put to the test within the concept of intelligent cities and the improvements outlined below were attained:

- All decision making was automated, based on decisions made by machines with known values as parameters;
- Integration of the different components and manufacturers, because this is an open-source architecture with an equally open communications protocol;
- Use of historical data to predict necessities, collaborating with the entire supply chain in order to fulfill demands;
- From a remote location, plant management, control and use was defined by automated processes;
- General integration of data sources not related to water, such as: government, research and industry, in order to keep up with conservation efforts and continued improvement of the existing operation;
- Using dashboards, it is possible to increase visibility of the asset installations and improve data performance and analysis;
- Use of real-time data regarding climate events in order to anticipate changes in resource availability or requirements;
- Provide consumers with greater control and visibility of consumption and residential and municipal resources in order to manage resource conservation efforts;
- Use of data to discover improvements in procedures and, thus, provide better services to citizens;
- Accuracy improvements by more frequent water meter readings.

Risk management in a sanitation plant focused on process safety, information security and continued improvement has been applied to the new model. However, it was ascertained that use of the CORAS method alone was not sufficient for the development of risk management, because CORAS is limited to a diagnosis of risk analysis and documentation of the treatment; i.e., it is very occasional and it does not permit monitoring, verification and auditing of risk management in the environment.

However, for the purpose of risk diagnosis, CORAS provided excellent outcomes, enabling a reduction in analysis time due to ease of use of the tool and standardization of process implementation. In addition, CORAS permitted documentation with the use of several techniques to be consolidated in a single tool.

The development of a seven-phase risk management methodology enabled implementation of a targeted, objective and ongoing risk management program without any complications, in addition to facilitating the consolidation of several characteristics of already existing tools.



The operational safety and efficiency of sanitation systems are significantly affected by their automation bases and consequently the availability and vulnerabilities of their equipment. Understanding the interface between information technologies (IT) and automation technologies (AT) was of particular

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

relevance in achieving the conclusions obtained in this study, because the risk management developed included the different stages of the plant process, with security and safety analysis.

It was ascertained that a basic vulnerability could cause major losses to an organization or even to the community surrounding a plant; however, these risks are predictable and quantifiable in a risk management project, as presented in the Figure 7, during one of the stages of implementation of the methodology.

Figure 7. Risk analysis
Source: Author

The simulation of reliability of several plant components was relevant for decision making, especially for maintenance management regarding the list of replacement parts or even the technology replacement process, such as the change in the CLP model, because the studies of wear failures and failures that occur before wear present a mathematical model that quantifies the unavailability time of equipment in hours.

Modeling with the Markov chain for verification of the state of components and the behavior of the process, developed during validation of the methodology, presented favorable outcomes, because the flexibility in executing the simulation including new states, and consideration of the interdependence between plant equipment favored comprehension and quantification of the connection between field instruments and the pumping system, including in terms of stoppage time and the frequency quantification process, through the execution of probability analyses.

A positive outcome was also ascertained in the use of tools such as the CARMS software program for simulation of the Markov chain, enabling use of this mathematical modeling in systems of greater complexity, and in many states, as well as providing the necessary information regarding the idle period for the environment under analysis in the risk management methodology.

The FMEA stages executed consolidated in CORAS were relevant in the verification of the subjective items and in the qualitative analysis of the operational process of the sewage treatment station.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

With the application of the risk management methodology, it was easy to ascertain in the simulations executed by the mathematical models that small investments can produce significant returns, in large part due to a reduction in costs with operational unavailability or even reduced billings (which, in this case, due to the evaluable QID grade, enables higher financial penalties to be levied under the agreement). One of the outcomes of the implementation of the risk management methodology was precisely the improvement of performance indicators over the last 12 months, because a considerable margin of progression has been recorded in this indicator with a mean increase of 22% in plant availability, resulting solely from one improvement program defined by risk management.

Among the outcomes ascertained during validation of the methodology, the supply of quantitative information that aids in decision making was observed; for example, in the case study, there was a necessity to assess the time information between failure, criticality and repair time in order to aid in decision making, with regard to the option for treatment architecture adopted in the risk mitigation of harmonics in the study environment. Another favorable attitude observed in risk management was the flexibility that the methodology offers in emphasizing the most relevant phase according to the profile of the study scenario, and including a social risk analysis. It should also be emphasized that the methodology flow is continuous, thus favoring revisions of maintenance, safety and quality, as well as supervision and control efforts, without forgetting the motivational and cultural aspects that, as is well known, induce a potential for continued improvement that is difficult to quantify.

Therefore, the risk management flow developed throughout this study demonstrates that it is also able to assess systems dominated by uncertainty and scarcity of reliable data. It is also apparent that there is a window of possibilities to conduct risk management in similar plants using analysis codes, reusing models defined for equipment and diagrams developed in the CARMS and CORAS, thus facilitating the reliability analysis process of the different processes in sanitation plants.

Finally, it is possible to use the new platform obtained in this study to generate benefits with regard to conscientious consumption and management of water resources. It may be extended, with adaptations, to other equally critical environments, such as energy supply, nuclear power plants and the petrochemical industry, among others.

Chapter 43
The Transformation of the Public Administration in the Multi-Level Governance Era

Elif Yucebas
Dokuz Eylul University, Turkey

ABSTRACT

The speed of transformation and development in information and communication technologies is an important fact triggering the restructuring process of public administration. The developing countries have become integrated into this process through public administration reform methods presented by international institutions. Transfer of information and communication technologies have become important for modernizing public administration organizations of developing countries and adapting them to the global system. In multilevel governance, use and implementation of the information technologies enabling network structuring between institutions have a particular importance. In this sense, the purpose of this study is to present the process followed by Turkey for adapting information and communication technologies to public administration organization and provision of public services in the frame of a multilevel governance approach.

INTRODUCTION

Beginning from the second half of the 20th century, production processes have begun developing jointly with the information and communication technologies. Especially, this process has evolved towards the information society in developed countries. Increasing importance of research and development activities in production processes and creating added value has revealed the important function of information. Particularly considering the connection of information with technology, it has carried both the public administration organizations and economical developments to different direction. This difference has influenced the forms of service provisions, production processes, employment structures and development of sectors in economical sense.

Multilevel governance is a concept focusing on integration of Europe as well as sharing of authority and policy making processes between supranational, national, local and regional actors. The concept which was among several disciplines during 1990s is a frame for member states through the White Book "EU Governance" prepared by the European Commission in 2001. In this report including fundamental principles of European governance is not only important for the member states but also has a particular importance for nonmember states. Openness, participation, accountability, coherence and efficiency principles basically emphasize the need for transformation in decision making processes between the public, private, citizen and non-governmental organizations.

The rapid development and transformation in information and communication technologies beginning from the second half of the 20th century has caused changes in the ways that states providing public services as well as lives of individuals. Low-cost and rapid access to services has forced the states to change their structure. This situation caused by the information and communication technologies has made it necessary to reorganize the relation between states and citizens. Especially the developing countries have amended several plans and programs in order to adapt their countries to this change and transformation process. Turkey is one of these developing countries which have been influenced from this process and trying to change its public administration structuring. There have been several changes in public administration of Turkey due to the impact of international institutions especially during and after 2000. The candidacy of Turkey in the European Union has accelerated the reform process in public administration.

In the first chapter of this study, restructuring process of public administration is taken into consideration by carrying out a literature scan on governance, multilevel governance and e-Government concepts. In the second chapter, transfer process of information and communication technologies into public administration field of Turkey is explained in the frame of national and international plans and documents. Finally, in the third chapter, the e-Government projects implemented in Turkey are taken into consideration.

BACKGROUND

Restructuring in Public Administration

One of the processes causing restructuring of governments in the 20th century is rapid development and expansion of information and communication technologies and the other one is transition from fordism to post-fordism which has reflections in production processes. The production processes shaped in the frame of Keynesian economy have revealed the functions of a government in the field of economy (Yucebas & Cobanoglu, 2017, p.746). The concept of restructuring can be described as radical changes of economic, politic and cultural institutions as well as transformation of the ways of thinking or paradigms assumed to be valid for these fields" (Şaylan, 2000, p.3). Another definition of restructuring concept is changing roles of a state and organizing accordingly in governance extent (Bayramoğlu, 2006, p.33). One of the principal developments in restructuring of a state is the welfare state practices. Functionalities of states have shaped in this frame and practices penetrating all aspects of society have been implemented. In this process, state is positioned through Keynesian economical policies as "having the capacity to intervene the economy as the regulator, producer and spender" (Şayan, 2000, p.10). In this process, state is a character personally undertaking production function and directing and intervening economy.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the frame of restructuring of state, transition from fordism to post-fordism has caused changes in functions and functionalities of state. Fordism has been effective in international field as an accumulation regime shaping the society, culture, production and labor processes between 1914-1973 (Yucebas, 2014, p.8). The process began in 1914, accelerated in 1945 and continued its influence until the 1973 oil crisis. Fordism concept does not only indicate restructuring process in production sense but also for political, ideological, social and economical sense (Belek, 1999, p.59). According to Lipietz, fordism is correlated with modernity, bureaucratic system and rationality as well as being an accumulation regime (Lipietz, 2006, p.239). Technological developments have increased liquidity of capital and improved its capacity to reach new markets and enter new production fields and speed and competitiveness have become the fundamental conditions for sustainability of capital (Finkelstein, 2003, p.251). While the process of globalization has been transforming the structure and functions of state, development of new production sectors and production methods has increased liquidity of capital and the capital has rapidly become globalized and turned the world into a single market (Dunn, 1999, pp.189-190). On the other hand, state has become a corporate tool facilitating accumulation of global capital (Farazmand, 2001, p.445).

One of the impacts of structural crisis of fordism was upheaval of neo-liberal ideology (Tickell & Peck, 1995, p.368) and intervention of state on economy has begun to be questioned during that process. In the frame of neo-liberal policies, state has undertaken a passive role rather than an effective one and it has been requested from it to act to ensure distribution and reproduction of sources.

While, post-fordism has been taking place of fordism as a capital accumulation regime, it has become a process which does not only influence production but also the place and functionalities of state (Yucebas, 2014, p.11). The structural crisis of fordism began at the end of 1970s has changed accumulation regime and flexible production systems rather than global production have become prominent. Therefore, post-fordism is also called as "flexible accumulation". According to Harvey, flexible accumulation is emergence of new production sectors, new methods and new markets in financial service and significant acceleration in tempo of commercial, technological and organizational innovations (Harvey, 2003, p.170). In 1980s, capitalism has gone into a comprehensive economical and organizational restructuring process in this process where new information technology has undertaken an important role (Castells, 2005, p.77).

From Government to Governance

In the process of globalization, transformation of production processes along with the development of information and communication technologies have changed social state approach. States have lost their regulating powers in the fields such as transfer expenses, education and healthcare services related with redistribution of income which were a part of their social functions (Hobsbawn, 1996, pp.424-425). The functions of state in economical field have been discussed and its influence on the field of economy desired to be restricted through integration of capitalism in the process. While, the welfare state practice rapidly increases scope and diversity of public services and increasingly more sources are used through public bureaucracy, organization theory and operational approaches have begun increasing their importance within public administration discipline (Şaylan, 2000, p.11). Need for restructuring has especially revived searches for new organizational structures especially as a result of deficiencies of bureaucracies and restrictions on making innovations and showing flexibility (Özer, 2005, p.371). This restructuring become concrete in "new public operation" approach covering management of public sector in accordance with market mechanisms (Christiansen, 1998, p.273).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

At the first phase, the reforms in public administration have been implemented on unit and sector level in the fields as personnel and financing and during the second half of 1980s, have been tried to be implemented in a holistic approach in all public sector institutions as the "managerialist model" and this new approach has been identified as "new public management" (Osborne & McLaughlin, 2002, p.10). According to this approach, the public policies involving the whole society are determined in accordance with customer preferences and competitive conditions rather than through a pursuit for social conciliation. During 1980 and post-1980 period, new public operation approach which supports techniques and practices and growth and strengthening of private sector has been prevailing in public administration field.

During the era of social state, state has played an active and efficient role in economical and political fields. Economical interventions and market regulations have been implemented by states. Neo-liberal ideology has affected after the Oil crisis in 1973. During this era, the "small state, strong market" formulation was recommended and accordingly, it has become necessary to redefine the role of state (Güzelsarı, 2004, p.2). In this sense, state has withdrawn from its active economical and political role and turned into a tool ensuring permanence of order. Along with new public operation approach, traditional public administration approach has begun to be left behind and a market-oriented administration approach have become prevailing. New public administration approach includes efforts for downsizing government through reducing expenditures for public personnel and public services, localization of public services and functionalities (Wise & Szücs, 1996, p.43). According to Dreschler, especially along with the effect of Anglo-American impact, this approach has been imposed by International Financial Institutions such as the World Bank and UPF. Neo-liberal policies implemented by Thatcher and Reagan beginning from the 1980s and crisis of social welfare state have played a significant role in emergence of this approach and it has completed its evolution in 1990s (Dreschler, 2005, p.2). The key factor of new public operation approach is assigning functions of central government to departments and regulatory institutions acting as enterprises and implementing the "corporate governance" model of private sector by regulatory commissions (James, 2001, p.234).

While, governance describes the changing role and form of state, on the other hand it is a concept showing the entirety of mechanisms and new rules to ensure that change (Bayramoğlu, 2005, p.33). Some institutions have played part in forming and developing governance concept such as; DB, OECD and the United Nations Development Program (UNDP). The World Bank is important with regards to establishing the foundation of governance concept in corporate perspective. The concept has been used firstly in the Africa report of the World Bank, in 1989 (World Bank, 1989). The essential elements of the model have been determined in the World Bank's "1992 Governance Report" as; "public operation" (establishing a public administration mechanism governed as an enterprise), "accountability" (accountability against the served communities/clients), "transparency and informing" (World Bank, 1996, p. xiii). Governance confronts us as a coordination method based on mutual dependence of organizations, institutions or actors. Governance model denies the state-society contrast in the form of governing and governed. Instead, it expresses a "cooperative management" including mutual dependency at equal status (Bayramoğlu, 2005, p.31). Osborne and Gaebler have defined the government model they develop as the "entrepreneur government". An entrepreneur government should be privatized, have market orientation and undertake risks, employ its personnel in an enterprise approach and focus on performance measurement (Osborne & Gaebler, 1992, p.18). An entrepreneur government is a "competitive" government which is embraced by "societies". In order to become a government embraced by societies, it should enable societies "able" (Osborne & Gaebler, 1992, p.44). In this model, government is conceptualized as government acting in a competitive environment while it is also considered to assign some public services to communities and

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

civil society for making societies able. The third sector segregation has been brought into the separation of public and private sector and a new network method called as public-private-civil partnership has been developed. Smith considers governance as a search for an identity and management model for the form of a new government with diminished social extent which has been segmentalized through neo-liberal reforms of 1980s and lost its global aspect and sovereignty (Smith, 1998, p.59).

Governance is established on ensuring participation of communities and non-governmental organizations and capital in public administration as stakeholders. The non-governmental organizations undertaking the function of providing public services conceptually undertake the function of supervising public administration through the principles of "accountability" and "transparency". However, in practice, some problems have arisen with regards to "accountability" and "transparency" of non-governmental organizations which have become a source user and service provider, therefore, the legitimacy and representation capacity of them have become an object at issue (Polidano & Hulme, 2001, p.300).

In the public administration reforms recommended by international institutions, government will adapt technological changes within the global economic system and reconfigure them in the frame of an efficiency, productivity and economy. In the report titled as the European Governance which has been prepared by the European Commission and published in 2001, five principles of good governance are as: Transparency, participation, accountability, efficiency and consistency. The purpose is to expand the governance mechanism in international, national and local level in the frame of these principles (Commission, 2001, pp.7-8). The World Bank defining good governance as the form of implementing political power in developing a country and managing social resources, describes the concept through administrative and managerial elements by emphasizing a technical aspect of governance expression (Güzelsarı, 2004, p.14). Good governance means a political and economical order with representation, participation and supervision in government, rule of law, decentralization, responsibility for transparency and accountability in administration, quality and ethics, rules and restrictions, alternative service provision methods in accordance with competition and market economy and finally an adaptation with the digital revolution of the world (Aktan & Özler, 2008, p.182). Specific processes and mechanisms in accordance with new functions of decentralization have been developed within the sense of "good governance". The management approach established based on domestic and foreign competition and functioning within the system of multiple networks has been structured on indigenization, making communities able and high-level financial decentralization (Pickvance, 1997, p.130).

In the frame of the principles (openness, participation, responsibility, effectiveness and coherence) indicated in the report titled as the European Governance, multilevel governance allows implementation, sustainability and development of these principles (EU, 2009, p.13). These principles:

Openness means more open operation of institutions. Especially, it covers explicitly communicating the decisions made by the EU and the member states to the public and making them accessible and understandable by citizens.

Participation: The EU should have an approach to cover the participation of central governments while developing and implementing its policies. This is considered as a factor determining the quality and efficiency of EU policies.

Accountability means, making the roles clear in legislative and executive processes. Each of EU institutions must explain and take responsibility for what it does in Europe.

Effectiveness is presenting required policies in accordance with clearly determined targets by considering their future impacts and past experiences if possible.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Coherence: The policies and the actions for implementing them should be coherent and easy to understand (Communities, 2001, p.7).

MLG aims that all local, national and supranational actors participate in the decision making process in accordance with their knowledge and abilities. According to the multilevel governance model, decision-making competencies are shared by actors at different levels rather than monopolized by state executives (Marks, Hooghe, & Blank, 1996, p.346). MLG theory derived frames have been applied to a wide set of issues spanning from political mobilization (politics) to policy-making (policy), to state restructuring (polity) (Ongaro, 2015, p.3). According to Piattoni, in multilevel governance, government focuses on the center and region, government and society and local and international relations (Piattoni, 2009, p.163).

The White Paper on European Governance (CEC 2001) started with force this reading of the complementarity between regional and local authorities, on the one hand, and civil society organizations, on the other, in the formulation, implementation, monitoring and evaluation of Community policies (Piattoni, 2009, p.174). Multi-level governance actually serves the fundamental political objectives of the European Union: a Europe of citizens, economic growth and social progress, sustainable development and the role of the European Union as a global player (EU, 2009, p.9).

MLG can be defined as a type of policymaking arrangements characterized by the simultaneous activation of governmental and non-governmental actors at different jurisdictional levels and such that the interrelationships thus created defy existing hierarchies and rather take the form of non-hierarchical networks (Piattoni, 2015, p.327). In this sense, multilevel governance is the form of cooperation institutionalized on network structuring of government with other actors in local, national and international fields.

Technological transformation is accompanied with organizational transformation and redesign of processes. Organizational transformation is emergence of new institutions for new forms of interaction between public institutions. The transformation in public service approach is formation of new processes in new service provisions. In addition, personnel should be educated and trained for adapting new technologies (Valdes, et al., 2011, p.177). In multilevel governance, use and implementation of the information technologies enabling network structuring between institutions have a particular importance.

E-Government

Since the middle of the 1990s, the internet has been carrying out for everyone a fundamental role in the access, dissemination and communication of information and knowledge (Gandia & Archidona, 2008, p.35). The developments in information and communication technologies have made the relations of government with its citizens, public institutions and organizations, central and local administrations different. Carrying out the services and duties for which local governments are responsible and citizens' duties and services to the state have gained importance in the sense of being fast, economic, uninterrupted and secure electronically (Yucebas, Bulut, & Dogan, 2017, p.412).

New public administration approach features performance measurement, accountability, productivity, effectiveness, result-orientation and transparency aspects of the relations between the government and the citizens, government and the private sector and government and other international institutions. E-Government faces us as a tool of governance for reforms in public administration. In the last few years, the use of IT in government has also responded to the need of a policy framework involving better public services and government operations, but also citizen engagement and interorganizational collaboration with public and private organizations, involving then the themes of democracy and governance as key results of IT implementations (Luna, Duarte-Valle, Picazo-Vela, & Luna-Reyes, 2015, p.167). As a result

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of technological advancement and economic changes, policy makers have had further incentive to shift the focus of information technology usage from internal managerial needs to external linkages with the public (Ho, 2002, p.436).

In the literature, e-Government concept is defined in different aspects by researchers and international institutions. Although, their order varies, the OECD basically gathers e-Government definitions in 3 categories in accordance with the strategies and objectives (OECD, 2003, p.63):

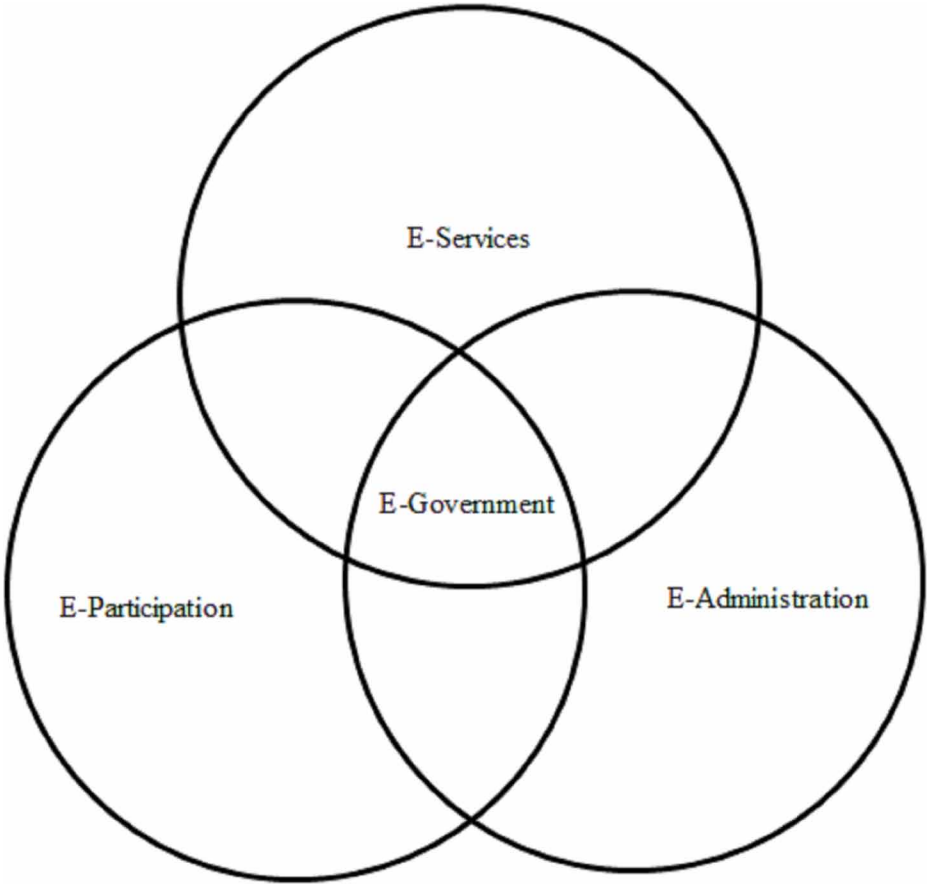
- E-government is defined as internet (online) service delivery and other internet-based activity such as e-consultation.
- E-government is equated to the use of ICTs in government. While the focus is generally on the delivery of services and processing, the broadest definition encompasses all aspects of government activity.
- E-government is defined as a capacity to transform public administration through the use of ICTs or indeed is used to describe a new form of government built around ICTs.This aspect is usually linked to Internet use.

  In 2003 report of the EU, e-Government is defined as; "the use of information and communication technologies in public administrations combined with organizational change and new skills in order to improve public services and democratic processes and strengthen support to public policies" (Communities C. o., 2003, p.7).

Chadwik defines e-Government as; E-government (electronic government) refers to the impact of information and communication technologies, particularly the Internet, on the values, processes, and outcomes of public bureaucracies. Chadwick also refers to three aspects while describing the e-Government concept which change the relations between the government and public institutions and organizations, the government and the private sector and the government and its citizens. (Chadwick, 2006):

- Government-to-government interactions are concerned with the use of technologies to enhance the internal efficiency of public bureaucracies, through, for example, the automation of routine tasks and the rapid sharing of information between departments and agencies.
- Government-to-business interactions typically involve the use of the Internet to reduce the costs to government of buying and selling goods and services from firms.
- Government-to-citizen interactions involve using the Internet to provide public services and transactions online, and to improve the design and delivery of services by incorporating rapid electronic feedback mechanisms, such as instant polls, Web surveys, and e-mail.

Ziemba gathers the e-Government concept under four titles in accordance with the definitions in the literature (Ziemba, Papaj, Zelazny, & Jadamus, 2015, p.88);



- Improving government processes by using ICT and government process management (e-administration)
- Providing government services electronically for citizens, businesses and employees and other stakeholders (e-government services)
- Improving transparency and democratic decision making as well as citizens' participation (e-democracy)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Developing cooperation, networking and partnership between government units, citizens and business (e-governance)

As it is seen, there are several definitions in the literature related with the e-Government concept. These definitions have common or different characteristics in the frame of the field they are related. A key reoccurring theme, however, centers on the transformational aspect of government in using technology (Curtin, 2007). In this sense, it can be said that the related fields of the E-Government concept are e-services, e-administrations and e-participation.

Figure 1. Relationship of e-government spheres (Curtin, 2007)

E-administration refers broadly to the internal mechanisms, processes, and structures of government. While the most immediate goal of most e-administration initiatives is to increase efficiency of administrative processes, a longer term and potentially more important goal is that of government transparency, one of the key hallmarks of democratic societies (Curtin, 2007). According to Torres; e-administration refers to back-office information systems that support the management and administrative functions of

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

public institutions. It includes data and information management, electronic records maintenance, and the cross-departmental flow of information (Torres, Pina, & Royo, 2005, p.535).

E-Services: The delivery of public information and direct services to citizens via electronic channels has revolutionized the way many governments deliver and think about public services (Curtin, 2007).

E-Participation encompasses the range of engagement between citizens, as individuals and as members of groups, and their governments. This participation includes formal interaction, including e-voting, formal participation tools such as electronic input on policies, regulations and legislation, as well as informal participation mechanisms such as online citizen forums, direct access to government officials and policymakers (Curtin, 2007).

In the frame of these definitions, e-Government approach faces us an important stage in restructuring of public administration. This process has especially influenced developing societies more and e-Government policies and mechanisms have been transferred due to the influence of international institutions. In order to depart classical public administration approach and establish an accountable and participatory government structuring within an open cooperation, e-Government projects and practices have gained importance for developing countries. Turkey, as a developing country, has been influenced from the transformation in public management approach after the post 1980 era. During this era, Turkey has tried to change the organization and functions of the government through public administration reform formulas presented by international institutions in accordance with the development of information and communication technologies.

THE TRANSFORMATION OF PUBLIC ADMINISTRATION IN TURKEY

1980s and 1990s have caused a transformation in public administration paradigm as a reflection of changes in economic policies. While, the government used to be in the center of processes for establishing economic policies and decision-making processes, it has transformed into a structuring where citizens, private sector and non-governmental organizations participate in decision-making processes. Turkish public administration has been influenced from this change and it has gradually become coherent with the system by making changes on organization and operation and duties of public administrations.

Both the internal and external dynamics have influenced the process of restructuring public administration in Turkey. Necessity of restructuring Turkish public administration derives from deficiency of the public administration system to meet developing needs of the current age and public administration related expectations of society either through its organizational frame or its functional structure (Saran, 2005, p.39). The global effects experienced in international field are the external dynamics of restructuring process of Turkish public administration. The developing countries have been taken within the scope of this change in public administration field through the post-1980s "Structural Harmonization Programs" of international institutions (IMF, DB, OECD and UN). Turkey is one of the countries participated in the structural harmonization programs of international institutions for overcoming financial crisis. The reforms in public administration have been accelerated as Turkey has become a candidate to EU membership and establishing integration with the EU. In the frame of harmonization to the EU acquis, restructuring liabilities in social, economical, political and administrative fields were in question (Saran, 2005, p.40). Changes and innovations in information and communication technologies have influenced societies and administrations at global scale and have caused differentiations in provision of public services.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The reasons considered to be necessary for Turkey to participate in this process are indicated as below in the Ninth Development Plan, the Report of Specialization Commission of Information and Communication Technologies of the Ministry of Development (Ministry of Development, 2007, p.10):

- Limited resources allocated for public services,
- General displeasure in public opinion on Public Services,
- Reflections of managerial changes in private sector on public sector,
- New technologies which can increase service quality,
- Increasing expectations and demands of citizens due to improving quality in education and developments in communication technologies.

Global effectiveness of new public administration approach and rapid changes and developments in information and communication technologies have forced changing the central and local level organizations of public administration established for meeting these needs as well as social requirements (Ministry of Development, 2000, p.42). In the Report of Specialization Commission on Improving and Restructuring Public Administration included in the Eight Five-Year Development Plan, it is emphasized that the activities and methods for performing functions and tasks for establishing an efficient and productive public administration within administrative transparency should be determined in detail through task and activity directives (Ministry of Development., 2000, p.44). In the same Report, it is indicated that simplicity of processes should be ensured within institutions through regulated and fast information flow and "electronic information" management should be considered important for preventing bureaucracy, paperwork and filing and archive problems (Ministry of Development, 2000, p.42).

It is necessary to use information and communication technologies for making public administration efficient and productive. One of the aspects accelerating this process in Turkey is the policies of the EU for establishing an e-Government structure. With its Lisbon Strategy determined in 2000, the EU has set the goals of being competitive and coherent with the information economy and initiated the e-Europe initiative, the first action plan on this purpose. The goal of Lisbon Strategy is to ensure transition to a society based on information economy. Parallel to the e-Europe Initiative, the e-Europe+ Initiative covering Turkey and other EU candidate countries has been initiated in 2001 (Ministry of Development, 2007, p.1). During 2000 and later, a series of action plans covering both the member states and the candidate states have been prepared and put into practice by the EU. These plans are the e-Europe Initiative, e-Europe 2002 Action Plan, e-Europe+ Action Plan, e-Europe 2005 Action Plan and i2010: A European Information Society for Growth and Employment. The common goals of the reports prepared by the EU are as below (EU, 2000) (EU, e-Europe 2002, 2000) (EU, 2004) (Information Society Department, 2014) (EU, 2005):

- Affordable internet access
- Accelerating e-commerce
- Fast internet for researchers and students
- Secure electronic access and secure information database
- Online government services (e-Education, e-Health)
- Smart Transportation
- Investing in human resources
- Encouraging use of Internet

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Widespread broadband access through competitive prices
- R&D investments and increasing resources allocated for innovativeness

It has been indicated that the candidate countries should modernize their corporate organization in compliance with the information economy in order to achieve these goals. Parallel to the process of establishing information society in Europe by the EU, Turkey has prepared plans determining the frame of e-Government policies and then begun implementing them (Table 1). In the Report of Specialization Commission on Well Governance in Public Administration in the Ninth Development Plan, it is indicated that the e-Government applications will be expanded and consequently participation of citizens in public services will be facilitated. By this means, access to information and transparency will be provided for public services (Devlet Planlama Teşkilâtı, 2007, p.44).

Table 1. Plans and documents determining the frame of e-government policies in Turkey

1993	Information and Economic Modernization Report
1999	Main Plan for National Information of Turkey
2002	e-Turkey Initiative Action Plan / Action Plan for Shifting PublicNet e-Government
2003	e-Transformation of Turkey Project 2003-2004 Short-Term Action Plan
2005	e-Transformation of Turkey Project Action Plan
2006	2006-2010 Information Society Strategy and Action Plan
2015	2015-2018 Information Society Strategy and Action Plan
2016	2016-2019 National e-Government Strategy and Action Plan
2017	2017-2020 National Broadband Strategy and Action Plan

(Ministry of Transport, Maritime and Communications, 2016, p.2)

The Information and Economic Modernization Report has been prepared in 1993 with the cooperation of Turkey and the World Bank. The World Bank has stated action plans in computer use, software market, human resources in information economy, communication networks and legal infrastructure for establishing the information society in Turkey (World Bank, 1993). The purpose of this report is to ensure technological development and economic modernization in the frame of new industrial policies of Turkey. These action plans could not be implemented because the credit agreement between Turkey and the World Bank was not completed.

Another plan considered for developing technological infrastructure of Turkey is the National Information Modernization Report of Turkey (TUENA) completed by the Ministry of Transportation and TÜBİTAK in 1999. In this report, the global development of information and communication technologies are taken into consideration and a situation determination is done for Turkey. According to this, use of new information and communication technologies, especially internet is very low in the transition process of Turkey to information society. While, the rate of households with a computer is 6.5%, the rate of internet use by businesses is at 1.9% (Ministry of Transportation, 1999). In this frame, it is emphasized that infrastructure activities for using information and communication technologies in public and private sector should be done and it should be ensure that the citizens participate in new communication networks. As the supplementary of TUENA considered on long-term basis, PublicNet e-Government

Transition Action Plan of the Primer Ministry covering 1998-2002 and e-Turkey Initiative Action Plan have been prepared in 2001.

The purpose of PublicNet e-Government Transition Action Plan is to ensure that e-Institutions are established through efficient, transparent, secure, fast and uninterrupted services by the government by taking advantage of information and communication technologies during the transition process to information society and establish the State e-Gate (portal) for transferring the relations between the government and its citizens to electronic environment (DPT Yönetim Bilgi Merkezi Dairesi, 2002). E-Europe Action Plan covering the member states and directing the candidate countries of the EU has been effective in development of the e-Government process. In 2001, e-Turkey Initiative Action Plan has been prepared in Turkey in the frame of the goals of the e-Europe Action Plan. Within this sense, bringing the developing internet technology into conformity with the system in order to establish the infrastructure of information society is ensuring creation of a competitive and dynamic information based economy (Prime Ministry, 2002). Within the scope of e-Turkey, there are real and corporate entities as well as public, private and non-governmental institutions. It was not possible to implement both plans due to economical and political crisis in Turkey.

In 2003, e-Turkey Transformation Project is included in the Emergency Action Plan of the Prime Ministry for determining information society-oriented strategies and ensuring institutionalization in that field. The Ministry of Development is charged with coordinating, monitoring, evaluating and directing the project. The Information Society Department has been established within the Ministry of Development (Information Society Department, 2018). In the frame of e-Europe+ Initiative and benefiting from the activities conducted up to that era, e-Transformation Turkey Project 2003-2004 Short-Term Action Plan has been put into practice.

The objectives of the Project have been described in the frame of eight topics (Ministry of Development, 2003):

- Information Society Strategy
- Technical Infrastructure and Information Security
- Education and Human Resources
- Legal Infrastructure
- Standards
- e-Government
- e-Health
- e-Commerce

In this sense, the Project will be tried to be implemented by covering all parts of society for improving national benefit and added value.

In the frame of the e-Transformation Turkey Project Action Plan in 2005, the 2006-2010 Information Society Strategy and Action Plan has been prepared. The strategies which will be executed by Turkey until 2010 in the process of transformation into an information society are included in this plan. These are (Devlet Planlama Teşkilâtı, 2006);

- Social Transformation
- Penetration of Information and Communication Technologies in Business World
- Citizen-Oriented Service Transformation

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Modernization in Public Administration
- Global Competitive Information Technologies Sector
- Competitive, Prevalent and Affordable Communication Infrastructures and Services
- R&D and Strengthening Innovativeness

The strategies mentioned in the plan show parallelism with the i2010: A European Information Society for Growth and Employment Plan of the EU. Thus, according to the EU, the international competitive capacity of governments are effective for producing, using and expanding information. Therefore, Turkey has emphasized in its action plans that it is necessary to develop the information technologies sector and make it competitive. On this sense, 2015-2018 Information Society Strategy and Action Plan focuses on the following topics based on growth and employment (Ministry of Development, 2015):

- Information Technologies Sector
- Broadband Infrastructure and Sectoral Competition
- Qualified Human Resources and Employment
- Penetration of Information and Communication Technologies in Society
- Information Security and User Safety
- Innovative Solutions Supported by Information and Communication Technologies
- Internet Entrepreneurship and e-Commerce
- User-Orientation and Efficiency in Public Services

2016-2019 National e-Government Strategy and Action Plan has been prepared in the frame of the 10th Development Plan and Information Society. In this sense, 2016-2019 the goal of the National e-Government Strategy and Action Plan is to strengthen efficiency, participation, transparency and accountability in public administration by using information and communication technologies (Ulaştırma & Denizcilik Bakanlığı, 2016). Another significance of the Action Plan which has caused a change in e-Government strategy of Turkey is that the government has redefined all relations between all other stakeholders. This new strategy is called as "Effective e-Government Ecosystem". According to this, e-Government will be a facilitator of transition to information society and sustainable development in an integrated, technological, participating, innovative and qualified way (Ulaştırma & Denizcilik Bakanlığı, 2016). It will be ensured that the government and the stakeholders accommodate to changing conditions by providing efficiency in presentation of e-Government services. The contents of an efficient e-Government Ecosystem are making dynamic infrastructure of technology suitable for needs, participation in e-Government system in a citizen-oriented way and using a high-quality service which can adapt itself, access and have information security. Communication, coordination and cooperation of all stakeholders will be ensured permanently in the activities carried out for determining e-Government policies and developing, presenting and using services. Within the scope of the e-Government Ecosystem strategy; it is aimed to establish an interactive structure where universities, central and local governments, non-governmental organizations, professional chambers, citizens, private sector, international institutions and other states take an active role in e-Government activities (Ulaştırma & Denizcilik Bakanlığı, 2016).

In 2017, under the coordination of the Ministry of Transport, Maritime and Communications, the National Broadband Strategy and Action Plan (2017-2020) has been prepared with the cooperation of the Ministry of Development, the Information Technologies and Communications Authority, non-governmental organizations and related sector representatives (Ulaştırma & Denizcilik Bakanlığı, 2017,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

p.33). One of the goals of the EU covers development of infrastructure systems for fast and widespread internet access. Developing broadband access throughout the country, expanding fiber access, increasing the capacity and speed of broadband connections, ensuring competition-based sectoral development in accordance with Market requisites and increasing demand on broadband internet services have been adopted as principles (Ulaştırma & Denizcilik Bakanlığı, 2017, p.33).

E-GOVERNMENT PRACTICES OF TURKEY

In Turkey, there are series of plan and document based practices related with using information and communication technologies in public services. The e-Government practices in Turkey serve by providing introductory information to citizens on institutions and services through the web pages of central and local management agencies. Use of information and communication technologies for providing public services has differentiated the relation between the government and citizens throughout the process. E-Government portal has been established for ensuring sustainability, transparency, openness and quality in public services of Turkey. Within this scope, there are series of projects of the central government and the local administrations for providing services to citizens, central and local units, public institutions and organizations and private sector (Table 2).

Use of internet in Turkey beginning from 1993 and transferring e-Government related action plans executed by the EU to Turkey have accelerated e-Government process and increased number of practices. The investments on information and communication technologies made by public institutions during this era have increased both on sectoral basis and allowances of institutions.

Analyzing the investments of public institutions and organizations in Turkey on information and communication technologies, while the allowance allocated in 2002 was 848 million of TRY, this has become 4 billion and 444 million of TRY in 2017. The allowance allocated in 2017 is for 256 projects.

The ICT investments of the public covers agriculture, mining, energy, transportation, communication, tourism, education and health sectors and the public services of central institutions. As of 2017, considering the cross-sectoral distribution of public ICT investments, e-Government projects of the central institutions (the Ministry of Internal Affairs, the Social Security Agency, the Ministry of Justice, the General Directorate of Security) take the first place with 49% and the e-Government projects of the Ministry of National Education and universities take the second place with 29% (Ministry of Development, 2017, p.1-2). In this sense, e-Government projects and practices executed by Turkey in the process of transformation into an information society will be present in next processes.

CONCLUSION

For the 20th century, there are two significant developments influenced the change and transformation of public administration. These are developments in information and communication technologies and changes in economic policies. With the impact of post-1980s neo-liberal policies, governments' intervention on economic field has been criticized and it has been emphasized that it should undertake a regulating and supervising role. This process has especially been executed by international institutions as the World Bank, IMF and OECD. International institutions have prepared a series of public administration reform formulae for aligning developing countries with the system. As is known, there are differences

Table 2. Edited from the report on e-government projects and practices in Turkey

INSTITUTION	PRACTICE	CONTEXT	USER GROUP
The Ministry of Justice	National Judiciary Network Project (UYAP)	Began in 2000 as a two-phase project. In 2001, the UYAP I project ensuring automation of Central Units of the Ministry of Justice and in 2005, the UYAP II covering automation of legal and administrative judiciary units and penitentiaries have been completed and become operational (National Judiciary Network Informatics System, 2018). Currently, all judiciary and administrative activities of all legal units in Turkey are executed in electronic environment.	The central and local units of the Ministry of Justice, citizens, business world
The Ministry of Internal Affairs The General Directorate of Population and Citizenship Affairs	Central Population Management System (MERNIS)	The idea of MERNİS project was based on 1972 dated and 1587 numbered Population Law. It has been designed by the SPA in 1976. Although, the project design activities continued almost for 20 years, they gained momentum in 1997 through financing of the World Bank and computer systems were established (The Republic of Turkey, the Ministry of Internal Affairs, the General Directorate of Population and Citizenship Affairs, 2018). Currently, the services of keeping and collecting birth records in computer environment and the informatory services related with the collected records to the public institutions and citizens in electronic environment are provided.	Institution employees, the public institutions and organizations, citizens
The Ministry of Internal Affairs The General Directorate of Local Administrations	Local Administrations Information Database Project (LOCAL DATA)	Collecting corporate information on local administrations and the enterprises, floating capital funds, companies and foundations established by them and basic data related with the services executed by them through internet technology and evaluating at institutions, provinces and country level.	Institution employees, the public institutions and organizations, citizens
The Ministry of Internal Affairs General Directorate of Security Affairs	POLNET	The application opened to the use of the Law Enforcement Agency since 2002 has been used by the whole Law Enforcement Agency and its units and mechanisms. It ensures fast access to any information needed for the duty of the police and allows inquiring all national and international information networks and banks. PolNeT includes communication and infrastructure related information systems.	Institution employees and citizens
The Ministry of Customs and Trade	The Project for Modernization of the Customs Authority (GİMOP) Computerized Customs Activities (BILGE) Customs Data Warehouse System (GUVAS) The Customs Gates Security Systems Project (GÜMSIS)	GİRMOP is a project financed by the World Bank. The purpose is to modernize and dynamize all customs services, facilitate legal trade and automate all customs transactions. Conducting all customs procedures in computer environment on full-time basis. It is a system enabling fast and health communication of information to the decision-makers by collecting the information on import, export, transit and smuggling events in all customs authorities of Turkey in a database to be established at the General Directorate of Customs. This is a project executed for efficient management with smuggling. Data exchange with national and international intelligence agencies is among its objectives.	Institution employees, business world Institution employees, related public institutions and organizations, business world Institution employees, public institutions and organizations, business world Institution employees, related public institutions and organizations
The Ministry of Finance The General Directorate of National Estate	National Estate Automation Project (MEOP)	MEOP which has been active since 2001 enables establishing the real-estate information bank and National Estate information systems and conducting all processes through computers.	Institution employees, the public institutions and organizations, citizens
The Ministry of Finance The Revenue Administration	Tax Office Full Automation Project (VEDOP)	VEDOP consists of VEDOP I began in 1998 and VEDOP II began in 2004. Reducing work-load by conducting all tax office processes by computers, increasing efficiency and productivity in tax office activities and establishing a healthy decision support and management system from the information collected in computer environment.	Institution employees, citizens, business world
The Ministry of National Education	The Ministry of National Education, Integrated Management Information System (MEBBIS)	Covers ensuring flow of information between the central and local units of the Ministry and providing services by utilizing information technologies. In addition, the information management systems of MEBBİS execute processes related with personnel, institutions, students and administrations.	Public and private institutions, institution employees
The Ministry of Labor and Social Security, The Institute of Public Administration for Turkey and the Middle East (TODAİE)	Local Administrations Portal (YerelNet)	It is an interactive network structuring where local administrations and other public institutions and organizations can directly access information and regulations related with this field and exchange information and experience(YerelNet Local Administrations Portal, 2018).	Central and local administration units, citizens, business world
The Minister of Environment and Urban Planning: The General Directorate of Land Registry and Cadastre	The Information System of Land Registry and Cadastre (TAKBIS) TAPUNET	Analyzing the land registry and cadastre services throughout the country in the frame of the Geographical Information Systems and Land Information System, determining problems, presenting current information and conducting services in electronic environment. Citizens can access their own land registry and cadastre information of their real-estates through their user code and password automatically generated during a process in units where TAKBİS is implemented.	Institution employees and other related public institutions and organizations Citizens
The Ministry of Health	The Health Information System of Turkey (e-Health)	This is the health information system covering the public institutions and organizations, private sector, universities and non-governmental organizations in health sector and the citizens utilizing from health services. Aims to establish a standard on health informatics in the frame of the European action plans.	Institution employees, the related public institutions and organizations, citizens

(Devlet Planlama Müsteşarlığı, 2005)

Figure 2. ICT Investments of public (2002-2017) (Ministry of Development, 2017, p.1)

between the developed and developing countries with regards to use and expansion of information and communication technologies. Therefore, developing countries have gone into a transformation process of public administration for using and expanding information and communication technologies. In this sense, e-Government process has caused a transformation in organizations and service provision methods of public administrations.

Turkey is a developing country involved in changes in economic policies as well as the process of utilizing information and communication technologies. Beginning with the use of internet in Turkey in 1993, for almost 25 years, information and communication technologies have caused changes in presenting public services and organizational structure of public administration. The plans prepared and implemented in Turkey between 1993-2017 for transforming into an information society have not only intended to use and expansion of information and communication technologies but also for transforming public administration into a management structure ensuring participation of other actors as well as the government. In this regard, e-Government practices have been a means of governance for the reforms made in public administration. This study describes the implementation process of information and communication technologies in public administration field of Turkey within the frame of a multilevel governance approach. The Department of Information Society which has been established in 2003 within the Ministry of Development and integration of information and communication technologies in services of public institutions and organizations are important developments. Especially, the e-Government portal established within this process is an important milestone for providing and coordinating of public services and providing cooperation. As of 2017, 4 billion and 444 million of TRY allowance has been allocated in Turkey for 256 projects covering citizens, private sector, non-governmental organizations and public institutions and organizations. The allowance allocated for public ICT investments has gradually increased

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

in years. In Turkey, the activities for using and improving information and communication technologies have been continued. Turkey aims to establish an interactive structure of public administration through its e-Government activities which will include its citizens, private sector, non-governmental organizations, central and local administrations, universities, international institutions and other countries.

Chapter 44
Measuring Business-IT Alignment in a Digitally Revolutionized Economy

Pablo Alfonso Gajardo
University of Lleida, Lleida, Chile

Ariel I. La Paz
University of Chile, Lleida, Chile

ABSTRACT

Although the concept of business-IT alignment was once considered one of the most important concerns of organizations, in terms of IT administration, the attention it has received has decreased significantly over the years. This article postulates that strategic alignment initiatives still have the same relevance—in particular for non-IT companies—which means that digital transformation strategies should consider the strategic alignment as a critical issue for their success. Therefore, the persistent relevance of this concept and the need to measure it with updated instruments capable of assessing the degree of maturity reached and feeding back the results to the organizations remains a key topic in IT administration. Based on an updated instrument, adequate for a digital framework, our study surveyed a sample of mostly large Chilean companies. The results obtained reveal the importance to count with an improved model that captures the changes this new digital scenario imposes.

INTRODUCTION

No company, no industry, no market can avoid the impact of the pervasive force of technology, changing the business models and processes, as they have traditionally been known and applied.

The digital revolution has changed the rules of business. With the constant diffusion of digital technologies, each industry faces its own challenges and threats. New players enter the market, leveraged by cutting-edge technology that shakes up the solid and recognized companies. (Herbert, 2017; Peppard & Ward, 2016; Rogers, 2016; Venkatraman, 2017).

To be successful in the digital world, companies must think of technology not only as a support function, but also as a strategic and competitive weapon, so it is not just about applying technology to the business as a commodity, but rather creating new business models and operational models, leveraged by the innovative use of technology. When raising this point, it is assumed that the concept of business-IT alignment is still valid, for non-IT companies, in the process of becoming a digital entity. And while, for a long time, the IT units have been treated as subordinate to the commercial strategy, in light of the literature surveyed, we coincide with scholars and practitioners, emphasizing the importance of the alignment between business and IT, and the value that it brings to the organizations.

Even though the number of papers published on strategic alignment between business and IT has declined markedly since the appearance of the Digital Transformation concept, some authors continue to reveal the benefits it generates for organizations, with new approaches or extensions of the traditional concept. (CIO Wiki, 2019; Horlach, Drews & Schimer, 2016; Tejada-Malaspina & Un Jan, 2019; Wan & Ge, 2018).

The need for a strategic alignment between the business and IT is vital for the functional areas and IT departments to work together and reach mutual understanding. This synergy means that both, functional and IT units must be partners in the development and execution of the organizational business strategy, recognizing that IT and business strategy are closely related, and companies are not competitive if both strategies are not strongly linked and aligned (Aversano, Grasso, & Tortorella, 2016; Avison, Jones, Powell, & Wilson, 2004; Coltman, Tallon, Sharma, & Queiroz, 2015; Johnson & Lederer, 2010; Fonstad & Robertson (2006); Luftman, Lyytinen, & Zvi, 2015; Reich & Benbasat, 2000), among others.

Having revealed the need to bring the concept of business-IT alignment to the center stage once more, especially for non-IT companies, under the current conditions, it is critical to go a step beyond simply understanding the importance of the concept and the factors that impact it. This implies the necessity of measuring the degree of alignment reached in this process, understanding that the alignment between the business and IT, is not maintained in a passive state, but a dynamic and permanent process. This requires updated tools with the capacity to capture the changes that this new scenario imposes, feeding organizations with the results of its measurements in a continuous improvement process.

Granting the importance of measuring the alignment and its implications for the success of the aforementioned organizations, now in a digital environment, the research question of this article is: What aspects need to be updated in a model whose purpose is to measure the maturity of the strategic alignment between the business and the IT function in this digital scenario? In order to answer the research question, the authors analysed seminal papers and models, and ultimately contributed an updated model for measuring the business-IT alignment maturity level, and a digital transformation strategy framework, under which the updated model operates.

BACKGROUND

The alignment between business and IT has been an important topic in the IT administration literature for more than three decades (Kappelman, McLean, Johnson & Gerhant, 2014), nevertheless, studies on the subject consistently indicate that the alignment of information technology with the business is an unsolved problem. As it is commented by Luftman et al., (2015): “While significant progress has been made to understand alignment, research on IT alignment is still plagued by several problems”. (p.1). Despite the existing awareness about the need for alignment, and the evidence documented in academic

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and professional publications, companies spend most of their time aligning the IT services and operations with corporate objectives instead of figuring out innovations and improvements for the business performance. (IT Web Brainstorm CIO Survey, 2014; Peppard & Ward, 2016). The latter could indicate that the concept of strategic alignment between business and IT is still managed at the operational level. In that sense: "The challenge is, as it has always been, to harness these technologies in support of enterprise objectives and to create new high value strategies." (Peppard & Ward, 2016, p. 16). In other words, to harness digital technologies for achieving alignment with enterprise objectives and co-creating innovative strategies and new business capabilities.

In order to provide a context to this research and its objectives, an extensive literature review was conducted on the concept of business and IT alignment – based on the Scopus database - from its origins to the present. In this regard, by tracing a timeline in the theoretical evolution of this topic, we can see how the concept of business-IT alignment began to acquire general interest since the mid-1980s, based on the works of Benjamin, Scott-Morton and Wyman (1983), Scott-Morton and Rockart (1984), McFarlan (1984), Wiseman and MacMillan (1984), Keen (1986), among others, however, it was Scott-Morton who gave the initial impulse to this new field of academic interest. As described by Coltman et al. (2015), research on the strategic alignment of IT and its relationship with business strategy emerged in the 80s as part of the "MIT90s" project, led by Michael Scott-Morton at the Information Systems Research Center (CISR) at MIT.

Since the end of that decade, this topic began to be strongly promoted by new researchers who fed this new body of knowledge. (Chan, Huff, Barclay and Copeland, 1997; Henderson & Venkatraman, 1990; Henderson & Venkatraman, 1993; Lederer & Mendelow, 1989; Luftman, Lewis & Oldach, 1993), to name just a few of the seminal works. From all of them, Henderson and Venkatraman were the ones who achieved greater notoriety in the academic community, with the proposal of the SAM framework – Strategic Alignment Model, which is cited in most of the research articles referring to the concept of business-IT alignment, and in many of the later publications.

At that time, academics and company managers were called to think about the conditions under which the IT strategy should support the business strategy, so that IT becomes a facilitator and co-participates in the formulation of the business strategy.

Bughin, Catlin, Hirt, & Willmott (2018), more than 30 years later - in a more technologically turbulent and dynamic environment, reinforce the need for a comprehensive vision of the organization, which translates into the need for this alignment. In this regard, they point out that when talking to business leaders about what they understand by digitalization, some see it as the improved version of what the IT function does, others focus on digital marketing or sales, but very few have a broad and holistic vision of what a digital proposal really means. Providing a strong support for these authors, Herbert (2017) points out: "I speak a lot about digital transformation, from keynotes at conferences with thousands of attendees to leadership retreats with an organization´s executive suite. I've never once witnessed instant consensus on what digital transformation means" (p. 2).

A NEED FOR AN UPDATED MODEL IN A DIGITAL AGE

A Baseline for an Updated Model

In the review of maturity models created for measuring the business-IT alignment, the authors chose to include only those works published since 2000. This exclusion criterion was intended to consider only those models formed after having the opportunity to consider all of the information published on the topic during the 90s when the academic community began focusing very heavily on the concept of business-IT alignment. This was done, in order to ensure a minimum maturity of the concept amongst scholars and their ability to understand the factors that positively and negatively influence this type of implementation.

After completing a thorough review of several models, the SAMM framework, Strategic Alignment Maturity Model, (Luftman, 2000), and subsequent publications, was chosen as the baseline for this work, because of its greater recognition among academics and the business community. SAMM stands out from those analyzed, because of its theoretical support and a clear methodology to assess the level of maturity, aspects that are not well developed in other models of maturity measurement analyzed.

SAMM considers a total of six components or dimensions, as constructs in its structure: 1) Communications, 2) Measurement of the competence and value of IT, 3) IT governance, 4) Partnership between the IT and business, 5) Scope and architecture of the IT infrastructure, and 6) skills. The instrument that operationalized the model consists of a questionnaire with 39 questions, distributed in the six dimensions indicated. Each question has five possible answers, from which the interviewee chooses the most representative. SAMM postulates that alignment between the business and IT is the result of these six dimensions acting together, which in turn has a positive impact on the performance of the company, while none of these dimensions acting separately has such an effect. According to this, each dimension is presented with the hypotheses of positive impact on business and IT alignment. This model allowed the authors to construct an updated model by integrating new components, which fill in the gaps that according to the research need to be covered.

In order to avoid confusion, it is important to note that Luftman denominates his model as SAM, nevertheless, the authors had referred to it above as SAMM (Strategic Alignment Maturity Model), differentiating it from SAM (Henderson & Venkatraman, 1990). Now that SAMM has been chosen as the baseline and formally introduced, the authors will refer to it as the original model or the reference model, interchangeably.

Fundamentals of the Updated Model Proposed

Having reviewed the fundamentals of the original model, the constructs that compose it, and the instruments that operationalize it, the authors considered that in the scenario with large-scale digital transformations, the model needs to be improved to adequately capture such changes, and although it has been an effective instrument to measure and align IT, it needs to be updated in order to more efficiently capture the state of maturity of the strategic alignment in this new scenario.

Based on this model, an improved one is proposed, echoing Luftman's words, when he points out that efficient tools are required with the capacity to provide useful and updated information to the organization in those aspects that should improve. "A tool that can provide both a descriptive assessment and a prescriptive roadmap on how to improve" (Luftman & Kempaiah, 2007, p. 167).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In this regard, when confronting the reference model with the key pillars for driving a successful digital strategy (which will be discussed in detail in Driving a digital transformation section), it was found that four aspects, considered critical for a tool whose purpose is to measure the business-IT alignment level in this new environment, where absent. These aspect, are: 1) Engagement of the personnel and its contribution to the organizational goals and objectives, 2) Innovation as an engine for the future of any organization, 3) A rewards systems in concordance with an innovation culture, and 4) The necessary planning of the information systems, in a collaborative work, involving the whole organization. Once the aspects that complement the reference model, to achieve a more efficient measurement of the level of strategic maturity between the business and the IT function in a digital scenario were defined, names were selected for those aspects that were absent in the reference model, which in turn become four new dimensions. In this way, the authors, proposed an updated model that maintains the first five dimensions of the original model, adding four new dimension, building, in this way a stronger tool. Table 1 summarize the aspects that complement the reference model, with names assigned.

Table 1. Aspects complementing the reference model

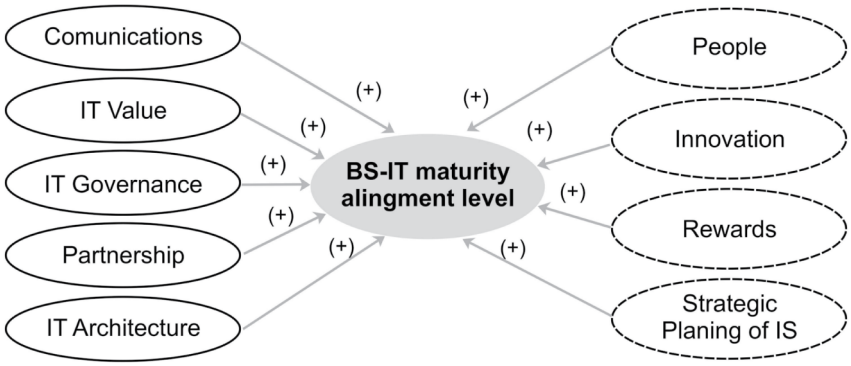
	Aspect Description	Name/Dimension Assigned
1.	Engagement of the personnel and its contribution to the organizational goals and objectives.	People
2.	Innovation as an engine for the future of any organization, ensuring new initiatives come from anywhere in the company.	Innovation
2.	Reward systems, in concordance with an innovation culture.	Rewards
4.	Necessary planning of the information systems, in a collaborative work, involving the whole organization.	Strategic planning of information systems

In the proposed model, the new dimension "people", took the place of the dimension skills (sixth dimension in the reference model), which was eliminated. The decision to replace the skills dimension was adopted because the reference model concentrates in this construct a wide range of categories, impeding the appropriate and independent measurement of each. Under this consideration, a new construct was introduced, in order to capture how the company involves their personnel and endows them with the appropriate tools for contributing to reach the organizational objectives and goals. (Kane, O'Palmer, Nguyen, Kiron & Buckley, 2015; Kane, Phillips, Copulsky & Andrus, 2019; Mokhber, Tan, Vakilbashi, Zamil & Basiruddin, 2016).

Upon further investigation, another point that caught the author's attention, was that three more important constructs were absent in the reference model. They are: 1) Innovation, 2) Rewards, and 3) Strategic planning of information systems.

In regard to innovation and rewards, it is true that a couple of questions are isolated from other dimensions of the reference model, but the existence of independent dimensions that specifically measure the state of the organization in these areas is considered vital. Such dimensions, although closely related to each other, measure different aspects, so it is necessary to define a specific set of questions in each case to operationalize these constructs.

Innovation and reward systems that promote a culture of innovation can be considered as the engine of the future development of any company that aspires to remain current and competitive. (Davenport,



EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Leibold & Voelpel, 2006; Fichman, Dos Santos & Zheng, 2014; Jehanzeb, Rasheed, Rasheed A. & Aamir; 2012, Mokhber, et al. 2016).

In reference to the strategic planning of information systems dimension, which by definition, aims to align the business with IT (Altameen, Aldrees & Alsaeed, 2014; Amrollahi, Ghapanchi & Talaei-Khoei, 2014), providing users with appropriate tools at their disposal through a formal and systematic process, cannot be absent in a model of maturity measurement. Such updating - in accordance with the new scenario – is considered to contribute greatly to a better measurement of the level of maturity of the strategic alignment between the business and the IT function.

As it is possible to observe in Figure 1, the updated model - containing the four new dimensions, postulates - in the same way- a positive relationship of each construct on the Business-IT maturity alignment.

Figure 1. Updated SAMM

A New Approach in the Operationalization of the Construct

After reviewing the way in which the questions are formulated in the construct that operationalizes the reference model, the authors decided to propose a simpler and easier to understand structure for the interviewee, noticeably different from the structure of the first one. The original questionnaire, according to the analysis conducted, presents questions - to some extent - confusing and complex, which tried to measure more than one characteristic with the same question, technically known as double-barreled questions. While in the reference questionnaire, each question has 5 possible answers, the new instrument uses a 5-level Likert scale, in consistency with the 5-level maturity scale of the reference model. Doing this, the interviewee chooses the level - from 1 to 5 - that best represents the practices of their organization for each question formulated, with 5 being the best possible result to reach theoretically.

It is considered that the aforementioned changes, in reference to the format of the new construct, make it easier for the interviewee to interpret, while at the same time, make it easier for the interviewer to apply.

DRIVING A DIGITAL TRANSFORMATION

Digital Transformation Concept: Implications to the Organizations

According to Herbert (2017), everyone has a different definition of the conditions, extent, and purpose for digital transformations (DT). This lack of clarity is one of the reasons why these programs fail. In the recent increase in DT processes, we have witnessed failures, where more than two thirds of these processes fail or do not reach the expected potential (Baculard, Colombani, Flam, Lancry & Spaulding, 2017; Remes, Manyika, Bughin, Woetzel, Mischke, & Krishnan, 2018; Robinson, 2019; Walker, 2017). Regarding this, Davenport & Westerman (2018), indicate that such initiatives do not end well, in part because digital is not just something that can be bought and connected to the organization. This is a multidimensional process, which not only involves technology, but is a continuous process that changes the way of doing business.

In the author's point of view, the different interpretations about what DT really means, entails two considerations, which are not always explicitly commented in the literature. First, the lack of maturity of DT initiatives, does not allow for a better understanding of this phenomenon in all its dimensions. As Venkatraman says: "We are in the early stages of this digital transformation" (Venkatraman, 2017, p. 8). In this regard, we can argue that DT - as a new concept – is not mature enough. Second, the need for strategic alignment between the business and the IT function, regardless of the levels of integration that the IT function has in the organization, understanding that the speed of fusion between business and IT will depend on the type of firm, industry, and market in which it develops.

In reference to these points, it is necessary to establish a difference in two aspects: On one hand, the necessary digitalization of all key processes in an organization, together with the creation of new business models and operational models to be successful in the digital era, and on the other hand, the complete fusion between business and IT. According to this, a distinction is established between companies where the entire business uses technology for the execution of its operations, and those that need to harness the technology to be more competitive, while striving to avoid obsolescence and extinction.

When explaining the points above, the authors intend to give support to the distinctions that exist among different types of companies, such as "tech giants", "tech entrepreneurs" and "legacy or incumbent companies". While tech giants and tech entrepreneurs are digital-driven companies, the opposite can be said about non-IT companies, that continue operating by old playbooks (Rogers, 2016, Venkatraman, 2017). This produces a continuous and ever-increasing gap among these companies, giving the former a huge advantage over the latter. If these non-IT companies are aware of this reality and conscious of the towering disadvantages they face, they can change the way that they conduct their business, preparing themselves to utilize the digital resources they have available, introducing new business models and processes, making themselves more competitive, ultimately closing the gap between them and the other types of companies. Paraphrasing Gupta's words (Gupta, 2019), strengthening their core business while simultaneously facing this turbulent environment, in order to become an entirely digital company. When presenting these points, the authors are making the argument for focusing on non-IT companies when applying this updated model and DT Strategy framework.

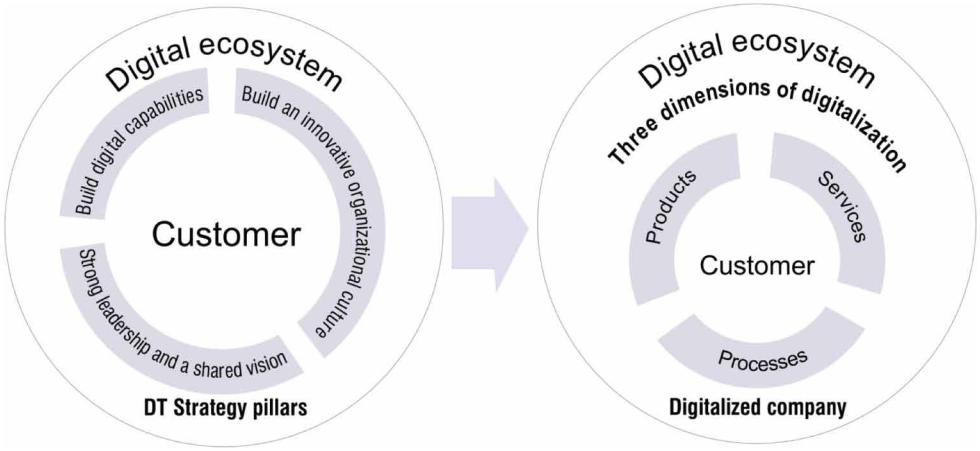
EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Digital Transformation Strategy Framework

Having proposed an updated model for measuring the business-IT alignment maturity level in a digital scenario, it is necessary to define a digital framework under which the updated model will operate. In this regard, based on a review of the most recent publications about the concept of DT and other closely related concepts, a framework was developed by the authors, which considers three fundamental pillars for executing a DT strategy. They are: 1) Building digital capabilities, 2) Building an innovative organizational culture, and 3) Strong leadership and a shared vision. (Herbert, 2018; Kane et al, 2019; Jansson & Andervin, 2019; Sacolick, 2017; Venkatraman, 2017; Vial, 2019; Weill & Woerner, 2013; Westerman, Bonnet & McAfee, 2014). These three pillars work together allowing non-IT companies to face this digital environment successfully.

These pillars contain in themselves all of the key necessary factors for driving a successful digital strategy, which means products, services and processes become digitally supported (Bharadwaj, El Sawy, Pavlou, & Venkatraman, 2016; Venkatraman, 2017), putting the customers at the center stage, focusing on the "pain points of the consumer" while driving any digital initiative. (Gupta, 2018). All three pillars work together in a digital ecosystem. Figure 2 shows the DT strategy framework proposed for non-IT companies, working to achieve an entire digitalization of their business.

Figure 2. DT strategy framework (transit of non-IT companies on the path to becoming a digital entity)



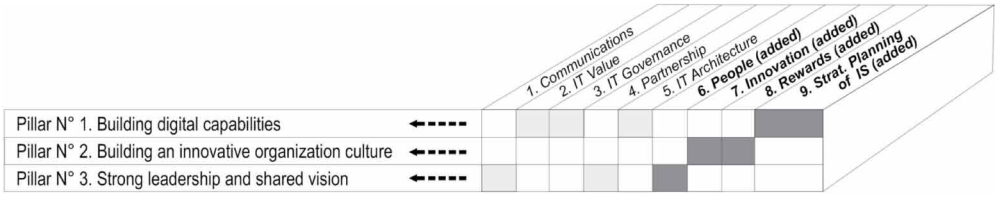


Figure 3. Dimensions of the updated model fill in the gap of the DT Pillars framework

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

INTEGRATING THE UPDATED MODEL INTO THE DT STRATEGY FRAMEWORK

When the updated model is integrated to the TD Strategy framework, it is possible to observe how the fundamental aforementioned pillars, are now complemented with previously absent aspects, that allow us to have an even stronger and more complete measurement of the phenomena studied. Figure 3 shows how DT pillars contain the relevant aspects necessary for being successful when implementing a DT strategy.

Figure 4. Dimensions supporting each DT strategy pillar

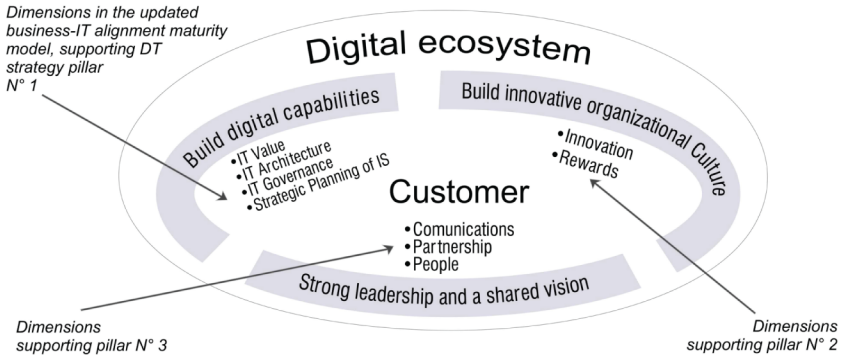

Figure 3 demonstrates how pillar N° 2 was not supported by any of the previously existing dimensions, leaving us with an important gap in the reference model, that we close by adding dimensions 7 and 8. On a smaller scale, similar gaps were identified in pillars N°1 and N° 3, where we added new dimensions to fill in existing gaps.

Now that the updated model and the newly proposed DT strategy framework have been integrated, a company is now better equipped to measure the business-IT alignment maturity level and form a roadmap of how to further improve. Having this in place, the company must now work to complete two tasks simultaneously: 1) Strengthening their core business, and 2) Preparing the whole organization to initiate a complete transformation in the three dimensions that the digitalization involves. Complementing the previous figure, Figure 4 shows the factors (dimensions) that each pillar in the proposed DT strategy framework contains.

RESEARCH METHODOLOGY

General Aspects

An exploratory research was carried out for conducting the investigation. The study considered two phases: 1) Application of the new construct to the pilot sample, 2) In-depth interviews of the same sample, once the questionnaire was completed. The sample was composed of executives from IT and non IT areas in same proportions. The purpose of having two groups of respondents, from IT and operational areas, was to explore differences or similarities of perception in the measurement of maturity of business-IT alignment, which enriches the results of the study.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Pilot Sample

The pilot sample consisted of 30 interviewees, 15 of them from the IT areas, and 15, from areas related to the business operations, who expressed their opinions regarding the business IT alignment organizational practices. The interviewees came from mostly large and renowned Chilean companies from industries such as non-metallic manufacturing companies, hotels and restaurants, financial intermediation, real estate activities, social and health services, transportation, storage and telecommunications, and companies classified as other activities.

Data Collection Instruments

Two instruments were used for the implementation of the investigative process. First: A structured questionnaire, which purpose was to operationalize the updated model. The questionnaire consisted of 54 questions, all of them posed as statements. Second: A semi-structured protocol, acting as a guide for in-depth interviews, in order to contrast the results obtained after the subsequent analysis of the new construct, and to enrich the investigative process itself, with new findings, which are not possible to capture with the sole application of a structured questionnaire.

Validity and Reliability Testing of the New Construct

In relation to the questionnaire applied, and considering that it corresponds to a new instrument, evaluations were carried out using correlational techniques (Cronbach's Alpha for reliability analysis) and multivariate techniques (Exploratory factor analysis for validity test, based on the principal components analysis - PCA). (Corral, 2009; Meraz & Maldonado, 2015; Morales, 2007).

Thematic Analysis

With respect to the data collected from the in-depth interviews, the thematic analysis method was chosen, characterized by its flexibility and practicality when analyzing results from unstructured information. The method allowed the construction of taxonomies according to the criteria of significance inherent to the nature of the research, and to establish the essential ideas that guided this work (Braun & Clarke, 2006).

RESULTS AND DISCUSSION

Validity and Reliability Tests

After having tested the new construct, validity and reliability tests were applied. As a result, the evaluation of the construct concluded that the new instrument is stable, showing internal consistency, obtaining a general result of 0.984 (Cronbach alpha index), which leads in the first instance to indicate that the test is reliable in its entirety. Technically, to a high degree the individual differences of the scores are attributable to real differences and not to random measurement error. As a complement to the previous coefficient, a reliability analysis was added to analyze each dimension of the instrument separately, by

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

inquiring about the high overall value obtained. As a result, the coefficients decrease while maintaining a sufficient value to maintain the internal consistency by dimension, which makes it possible to conjecture that the greater overall value in this respect is attributable to the complementation of these dimensions when they are integrated to form the construct.

In the validity test (PCA), six components captured more than 80% of the heterogeneity of the data, representing almost all of the variables. In the same way, a deeper analysis suggested to eliminate five questions from the questionnaire, considering that they do not provide more information to explain the variability of the construct. Tables 2 and 3 summarize the results of the reliability and validity tests.

In reference to the validity test (Table 3), a search for underlying concepts was carried out, with the purpose of explaining the theoretical grouping of questions in these six components suggested by the test. As a conclusion, the authors decided to maintain their original design, considering that the instrument better segments those aspects which it desires to emphasize, by measuring its status and evolution.

Table 2. Cronbach's alpha values

Dimensions of the Updated Model	Cronbach Index	No. Elements	Item-Test Correlations		
			Min	Ave	Max
D1: Communications	0.898	6	0.62	0.73	0.81
D2: IT Value	0.937	8	0.63	0.78	0.90
D3: IT Governance	0.932	6	0.73	0.81	0.87

Preliminary Descriptive Score

With favorable results in the validity and reliability evaluations of the new construct, we proceeded to analyse the results of the scores obtained by the interviewees with the new instrument. To carry out this task, were calculated the scores at the consolidated level, in the 9 dimensions that compose the construct, adding to the results, the scores of the two groups of interviewees. The first part yielded a weighted average consolidated score - including all dimensions, and all respondents, of 3.22, with significant differences between scores by dimensions, innovation and rewards being the weakest. In the separation by groups of interviewees, the average IT score exhibited a higher value, with 3.39, while, for business executives, it was 3.06. Within the dimensions by groups of respondents, an important variability was observed, which was measured through the Standard Deviation - SD (Business Executives) / SD (IT executives) ratio. This ratio was very useful to measure the level of variability of the responses of the interviewees from the Business (BS) and IT areas, subject to the same questions for each dimension of the construct. Table 4 presents a preliminary descriptive summary of the scores obtained from the entire sample submitted to the pilot test.

Table 4. Summary of preliminary descriptive scores

Dimensions	Weighted Averages	Min	Max	Average IT Executives (TI)	Average Operational Areas (BS)	(SD BS)/(SD IT)
D1: Communications	3.33	2.90	3.73	3.59	3.07	1.00
D2: IT Value	3.08	2.60	3.40	3.37	2.80	1.14
D3: IT Governance	3.29	2.97	3.63	3.43	3.16	0.75
D4: Partnership	3.45	3.10	3.70	3.65	3.24	1.23
D5: IT Architecture	3.56	3.07	3.80	3.69	3.43	1.23
D6: People	3.29	2.90	3.50	3.51	3.06	0.43
D7: Innovation	2.95	2.80	3.23	2.88	3.02	1.29
D8: Rewards	2.30	1.87	2.80	2.32	2.28	0.72
D9: Strat. Plan. of IS	3.43	3.27	3.67	3.57	3.30	1.57
All dimensions	**3.22**	**1.87**	**3.80**	**3.39**	**3.06**	**0.83**

Regrouping Companies According to Their Scores

After reviewing the results at the aggregate level, a criterion of segmentation was applied, in order to differentiate the behaviour of the different companies submitted to the study. The criteria used to segment the companies consisted of grouping them according to the scores obtained in the questionnaire. For scores above this average, the companies were considered with a greater development in the level of alignment between the business and IT. Following this criterion, the companies with a score above the weighted average of the whole sample were assigned to group 1, while the companies with scores below this average, were assigned to group 2. The regrouping procedure gave as a result 16 companies with scores above the weighted average and 14, below. The procedure also meant separating the scores between the two types of executives subject to the process (IT and operational areas).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

After calculating the new scores, the variability presented in the first approach to the scores (Table 4), decreased significantly, not only between dimensions, but also between type of executives. It was possible to observe this behavior amongst both the scores of group 1, and group 2, which are represented partially in Figure 5.

At the same time, it was possible to observe that the ratio (SD BS) / (SD IT), obtained for companies in group 1, was closer to 1 for each dimension, compared to the same calculation shown in the preliminary scores, a fact that indicates that the variability in the responses of the reporting units for this group is smaller. In other words, there would be less discrepancy in how the practices of the organization are perceived from the point of view of each reporting unit, for each of the dimensions evaluated.

Treatment of the In-Depth Interview Phase

The answers obtained in the application of the semi-structured interview protocol were tabulated, seeking spontaneous answers from the interviewees, which were not possible to obtain by applying the new construct alone. as a result of this phase, and following the methodology of thematic analysis, the different responses were categorized. After that, the resulting categories were characterized as facilitators (+) or inhibitors (-) of strategic alignment processes between the IT function and the business. This categorization and characterization was carried out separately, both for the responses of IT informants, and for informants coming from functional areas, as is possible to observe in Table 5.

Table 5. Facilitating and inhibitory categories

Facilitating Categories (+)						**Inhibitory Categories (-)**		
IT Executives			**Business Executives**			**IT Executives**	**Business Executives**	
IT-1	IT-8	IT-18	BS-1	BS-12	BS-23	IT-12	BS-2	BS-22
IT-2	IT-9	IT-22	BS-4	BS-13		IT-16	BS-3	
IT-3	IT-10	IT-23	BS-5	BS-14		IT-17	BS-6	
IT-4	IT-11	IT-24	BS-7	BS-15		IT-19	BS-9	
IT-5	IT-13	IT-25	BS-8	BS-17		IT-20	BS-16	
IT-6	IT-14	IT-26	BS-10	BS-18		IT-21	BS-20	
IT-7	IT-15	IT-27	BS-11	BS-19			BS-21	

According to Table 5, out of 98 spontaneous responses from IT interviewees, 27 categories were identified, 21 of them as enablers in business-IT alignment process, while 6, as inhibitors. In the same way, a total of 86 spontaneous responses were reduced to 23 categories, 15 of them, as enablers in business-IT alignment process, and 8, as inhibitors.

Perceptions of New Dimensions According to the Interviewees

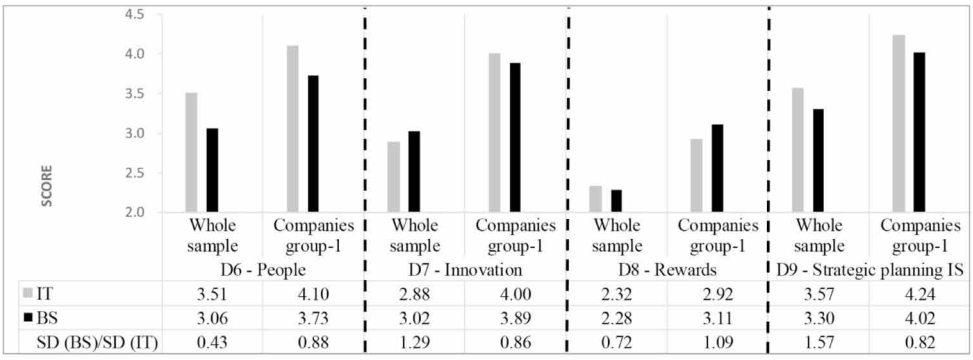
Among the multiple responses of the interviewees, which support the inclusion of the 4 new dimensions that update the reference model, we can mention the following.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In reference to the people dimension, an IT executive from an air transport company commented: "As a result of involving personnel, giving them knowledge of organizational objectives and goals, and understanding their needs, we use new applications that promote collaborative work and the efficiency of operations". In contrast, the following quote, was made by an executive from a functional area of a company, classified under other services, regarding the lack of more active involvement of the people in the progress of the company. "There is some degree of understanding between IT and the business at the managerial level, but this does not reach the operational level. The operating personnel do not have the vision of the business, because the management does not share it with them".

In reference to the innovation dimension, which together with the rewards dimension, presented the lowest score in the applied instrument, we find this spontaneous answer: "As a technology company, the contribution of IT to the business is fundamental. Without IT the company could not operate, however, innovation is lacking to be more competitive" - comment indicated by a commercial executive of a technology company. In the same sense, an executive of a company of the retail sector said: "The company does not have a budget to innovate without guarantee of results, and if that were not the case, it would encourage the IT area and its personnel to be more proactive in the search for new solutions for the final and internal clients".

Regarding the rewards dimension, closely linked to the innovation dimension, but measuring different variables, the interviewees did not directly express spontaneous answers regarding the degree of conformity or disagreement with the reward system in their organizations, which encourages an innovation culture. Therefore, the results for this new dimension are based on the findings obtained after applying the new instrument, and the analysis of the questions associated with it. According to that, is possible to observe a lack of a reward system that encourages innovation as the engine of future development of the companies.



Lastly, in reference to the dimension strategic planning of information systems, an interviewee from an IT unit whose company participates in the real estate sector said: "Different areas of the company were equipped with information systems according to their needs and requirements, with which the productivity of the employees improved. This initiative has been encouraged by the management committee of the holding, as a generalized practice for all companies in the group."

Behaviour of New Dimensions Separately

As a summary of the behaviour of the 4 dimensions that complement the reference model, Figure 2 shows the scores of these dimensions, and the variability ratio used as a measure of discrepancies among responses of the interviewees. As it is possible to see, in all cases the scores increased when grouping the interviewees, both from the IT as well as the functional areas, in companies that present a greater development in processes of alignment between the business and the IT (Group 1 as criterion of segmentation). At the same time, the degree of variability of the answers decreases notably among groups of respondents, as demonstrated by an SD ratio closer to 1. A fact that demonstrates a greater alignment between both groups, faced with the same set of questions in the dimensions that modify the original model. Figure 5 shows only the results of group 1 in comparison with result of the whole sample, for these 4 dimensions.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. Behavior of new dimensions in the updated model

	D6 - People		D7 - Innovation		D8 - Rewards		D9 - Strategic planning IS	
	Whole sample	Companies group-1	Whole sample	Companies group-1	Whole sample	Companies group-1	Whole sample	Companies group-1
IT	3.51	4.10	2.88	4.00	2.32	2.92	3.57	4.24
BS	3.06	3.73	3.02	3.89	2.28	3.11	3.30	4.02
SD (BS)/SD (IT)	0.43	0.88	1.29	0.86	0.72	1.09	1.57	0.82

The score levels of these new dimensions are found in the average scores of the dimensions that were not modified, which provides consistency to the updated model as a whole, with the additional contribution of these 4 new dimensions, filling in the gaps of the original model. However, the low score shown by dimension 8 (rewards) - regardless of the group in which it was measured - is undoubtedly a concern, revealing that this dimension is not well perceived by IT and non-IT executives alike.

Combined Analysis After Regrouping (Scores and In-Depth Interviews)

Based on the previous segmentation by score and the findings of the interview phase, a combined analysis was made. The results reveal consistency between scores considered high for this analysis, with categories of responses considered as facilitators (+) in alignment processes of this nature. In the same way, consistency was evidenced between scores considered low, with categorizations of responses characterized as inhibitors (-) in strategic alignment processes.

The response categories of the in-depth interview phase, revealed by the reporting units, gave broad support to what was previously reviewed in the literature, in reference to such processes. Table 6 represents the segmentation described above, combining scores gotten from the new construct, with spontaneous answers.

Table 6. Summary of combined analysis (scores and in-depth interviews)

Group According Score	No. Informants	Consolidated Average Score	IT Average Score	BS Average Score	Categories In-Depth Interview IT (+)	Categories In-Depth Interview IT (-)	Categories In-Depth Interview BS (+)	Categories In-Depth Interview BS (-)
Group 1	16 (9 IT - 7 BS)	3.91	4.00	3.79	IT1, IT2, IT3, IT4, IT5, IT6, IT7, IT8, IT10, IT11, IT13, IT14, IT8, IT22, IT23, IT24, IT25, IT26	IT12, IT17, IT21	BS1, BS4, BS5, BS7, BS8, BS10, BS11, BS12, BS13, BS14, BS15, BS17, BS18, BS19, BS23	BS6, BS9, BS20, BS21
Group 2	14 (6 IT - 8 BS)	2.37	2.34	2.39	IT2, IT6, IT9, IT10, IT11, IT15, IT17, IT27	IT16, IT19, IT20, IT21	BS5, BS7, BS13, BS14, BS17, BS23	BS2, BS3, BS6, BS9, BS16, BS20, BS22

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Summarizing the findings of both phases, the questionnaire and in-depth interviews, we can conclude that there is consistency between the scores and the answers obtained from the interviewees, i.e. high scores equal positive answers, demonstrating good perception and conversely, low scores paired with negatives answers, demonstrating poor perception. Practices such as those indicated, have a positive impact on the scores obtained, and therefore a desirable impact on any organization that aspires to align the business with the IT function.

Furthermore, the results obtained through the empirical approach of this investigation have revealed underlying correlations to all of the information provided by the academic community that was studied during the preliminary stages of this investigation.

Business-IT Alignment Maturity Level in Chilean Companies - Implications

Once the results obtained for each of the dimensions provided by the updated model were known - at an aggregate level - the calculation of the average scores for each pillar of the proposed DT strategy framework was calculated. The purpose of this task was to know first: The level of maturity of the alignment between the business and the IT function, achieved by Chilean companies - part of the sample - in a digital context provided by the framework. Second: Know the robustness (or weakness) of each of the three pillars that make up the framework, such that it guarantees a successful transition towards a digitalization of the Chilean companies submitted to this evaluation, but also strengthening their core business while making such transition.

As it can be seen in Table 7, pillar 1 - *build digital capabilities* and pillar 3, *strong leadership and a shared vision* - are very similar in their scores, with an average of 3.34 for pillar 1 and an average of 3.36 for pillar 3. On the other hand, pillar 2 - *build an innovative organizational culture* - appears as the weakest of the three, with an average score of 2.63.

Table 7. Scores by dimensions of the updated model integrated in the DT strategy framework

Pillar N° 1	Ave. Score	Pillar N° 2	Ave. Score	Pillar N° 3	Ave. Score
IT Value	3.08	Innovation	2.95	Communications	3.33
IT Governance	3.29	Rewards	2.30	Partnership	3.45
IT Architecture	3.56			People	3.29
Strat. Plan. of IS	3.43				
Average by Pillar	**3.34**		**2.63**		**3.36**

As a result of this analysis, it is possible to observe that a general score of the sample under evaluation, with an average score of 3.22 (which was previously presented in Table 4), conceals an important point, which is possible to observe by means of the analysis of the pillars of the proposed framework. This finding, in the context of an exploratory study, indicates that Chilean companies, part of this sample, would show a notoriously low development in a pillar closely related to the ability of organizations to innovate in new and more creative ways of conducting their operations.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Therefore, the results obtained for pillar N° 2, would make evident the lack of innovation of Chilean companies, and a reward system consistent with this dimension. This issue directly affects companies in their capacity of achieving the alignment with enterprise objectives and co-creating innovative strategies and new business capabilities.

Since a comparative study with similar characteristics to the present investigation does not exist, it is not possible to evaluate or compare the evolution or involution - among other aspects - of the Chilean companies when interpreting the overall score of 3.22 for the sample as a whole.

Because of this limitation, it is useful to refer back to the results of the study presented in Table 6. When interpreting this table, we can conclude that there are companies with better results when compared with their peers, in the evaluation of almost all dimensions that the updated model contains. This indicates that differences do exist among companies when analyzing the level of maturity reached. In this way, when comparing the overall maturity level reached by companies in the sample, it is possible to appreciate companies with greater development in reaching the higher levels of alignment.

At this point, it is necessary to emphasize that, the score obtained in this process is an indication of the maturity level at a certain point in time, representing a measurement of a dynamic process in constant change, but in no case, a passive state desirable to reach and maintain.

RESEARCH SCOPE

Approach to the Investigation

The research was proposed and implemented in a sequence of formal stages, following a traditional approach when testing a new instrument, adhering to the precepts of the scientific method, until arriving at the application of a pilot test of the instrument to a subset of the population of interest, in order to test the updated model in a first "staging". The purpose of applying this sequence was to explore how the model can be operationalized by means of this new instrument, allowing the contextual adjustment and balance of its content, showing a preliminary version of its scope through its results. The exploratory results would give us an advanced look at its massive application to firms in the industry, and a firsthand knowledge of potential conclusions about the degree of maturity in the business-IT alignment processes.

Limitations

Considering the nature of the investigation, with a non-probabilistic conformation of the sample, it is understood that the results of the study exploring the modifications to SAMM are limited by such definition; therefore, this study is neither predictive nor confirmatory. Accordingly, it is not possible to make inferences about the results, despite the application of an empirical, rational and analytical method.

Future Improvements

The authors recommend to test the updated model with a larger sample, by means of a sample design that allows confirmatory conclusions, as well as to reinforce this application with qualitative techniques that can suggest revisions to the alignment maturity measurement model proposed. Also leaving open the possibility of adding new elements to modify the dimensions already incorporated in the updated model.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

In order to answer the research question, the authors made a thorough review of the information available by the academic community on the topic of business-IT alignment and the tools for measuring the degree of maturity reached in this process. After this investigation, a conviction existed that the SAMM model, proposed by Luftman (2000), was the most efficient in measuring the alignment before the emergence of the new digital environment. For this reason, it was chosen as a baseline for constructing a new model that could integrate the aspects determined to be absent for measuring the business-IT alignment in a more efficient way, considering the new digital scenario.

Since, the reference model was created under different conditions, it was necessary to construct a digital transformation strategy framework, under which it could operate. In order to do this, the authors turned once more to the information published by the academic community on this topic and identified three key pillars necessary for non- IT companies to be successful on the path to becoming a digital entity.

Once the reference model was updated, and the DT strategy framework was built, an investigative process was applied to a relevant sample of companies.

Having therefore evaluated the behavior of the updated model, and the construct that operationalizes it, in a relevant sample of companies, it is possible to observe that the new construct obtained favorable results in the validity and reliability tests. Therefore, the results obtained from it—measured in scores—are relevant when establishing exploratory conclusions from its implementation, which, combined with the in-depth interview phase of this investigation, reinforces the results obtained by the application of the new questionnaire. This demonstrates consistency with the literature reviewed, that deals with these kinds of processes, getting positive results when contrasting both phases. In this regard, it is possible to conclude that the decision to use two data collection tools, is considered a valuable contribution to the research.

By explicitly observing the four dimensions that update the reference model, it is possible to point out that they are an important contribution to these kinds of tools, so it is suggested that they should be incorporated into models whose objective is to measure the degree of maturity of alignment between the IT function and the business.

In the author's opinion, these elements cannot be absent in models that aspire to capture changes in the new environment, aligning the IT function with the operational areas. The lack of an updated business-IT alignment maturity level tool will limit the chances of being successful when carrying out a DT Strategy.

Regarding the business-IT alignment maturity level obtained in this study, for companies operating in Chile, which could possibly reflect the level of alignment in companies with similar characteristics to the sample, with a large number of them showing a concerning misalignment between the business strategy and the IT function, limiting their chances of success in this digital environment.

When integrating the scores obtained by the application of the updated model with the DT strategy framework, an important finding emerges. This finding reveals that Chilean companies, would show a notoriously low development in the pillar N° 2 of this framework - in the context of an exploratory study - impeding at the same time companies from strengthening their core business, on the path to becoming a digital entity, constraining the results of technological transformation initiatives.

Therefore, the results obtained in regard to pillar N° 2, could be a recurrent issue, making the lack of innovation and congruent reward system, evident. This issue directly affects companies in their ability to achieve alignment with enterprise objectives and co-creating innovative strategies and new business capabilities.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Findings like the ones presented by this investigation, applied to a single company can be enriched by cross analyzing the available data at different levels, for example: The score as an overall result integrated with the DT strategy framework, magnitude of the scores obtained, splitting the scores and dimensions by grouping the interviews, etc. Then, this information can be fed to organizations highlighting the aspects where the companies need to improve.

In this way, one of the main purposes of the authors, when looking for an updated tool, with the capacity to capture in a better way the changes in this digital environment has, in the author's opinion, been achieved, by a tool that can detect the weaknesses of the alignment, providing a continuous improvement process and acting as a roadmap for the entire organization.

Finally, after a theoretical review on the concept of strategic alignment between the business and IT, and having carried out an empirical implementation of an updated model to measure the maturity of this alignment, the results of the research are placed at the disposal of the academic community and practitioners for its evaluation and consideration.

Chapter 45
Measuring the Digital Transformation of Education and Teaching

Christian Glahn
Leiden-Delft-Erasmus Center for Education and Learning, Switzerland

ABSTRACT

The digital transformation has reached higher education and many faculty members find teaching in the digital environment hard. A key question for educational institutions is whether the uptake of blended learning within their digitization strategies matches the pace of technological innovation. This chapter discusses a model for monitoring the progress of educational digitization that has been in use throughout four years at HTW Chur, Switzerland. The model connects technologies to practices rather than abstracting technologies from them. This helps identifying performance indicators in campus-wide information systems for understanding the diffusion of technology uses among the faculty, and it helps categorizing new technologies towards their organizational innovation potential. The combined use of these performance indicators with the model supports tailoring faculty development activities for digitization strategies that are based on the actual development needs within the institution.

INTRODUCTION

This chapter is based on a journey of digitalizing higher education programs from traditional face-to-face teaching to blended learning at the level of an entire university. It is a response to the uphill struggle between expectations, assumptions, scale, and impact on the one hand, and organizational culture, practices, technologies, and budgets on the other. In this process, the role of faculty development is to prepare and empower the professors and lecturers for the efficient use of digital technologies and infrastructures for teaching. Conventional approaches to these challenges are training sessions, information events, competitions on innovative teaching, communities of practice or communities of inquiry (Garrison & Vaughan, 2008). However, these approaches require a good knowledge of the development needs, are

hard to scale with the pace of technological innovation, are resource intensive, or have a limited impact on the organization as a whole.

The present work is rooted in combined investments in digital technologies and faculty development in relation to changing organizational practices from traditional university teaching to blended learning. Development interventions are a crucial success factor for this process because the transformation from primarily analog to digitally incorporated teaching practice also changes the faculty's development needs. Aiming these interventions too low, creates the impression among the faculty that they surpass the expectations of the transformative process, while aiming too high, creates the impression that the actual development needs are not respected. Both cases lead to tensions and to frustration in the organization that can endanger the transformative process and challenge faculty development as an organizational change agent if the organization's uptake of new practices is tied to ambitious timeframes and implementation plans. This raises questions on the nature and speed of transitions from traditional teaching to blended learning.

Responding to such questions requires faculty development units to be aware of the dynamics within their organizations while digitalizing education. This turns out to be a difficult problem because many activities are not communicated or are hidden, because the activity has been shifted into the digital realm.

The present research started from the fundamental question about the changing practices during transformation projects: *What data accounts for the organizational adoption of digital technologies and blended learning?*

Answers to this question help to choose appropriate supportive strategies for the different groups among the faculty. Such answers are also crucial for managing the complexity of digital transformation projects. This chapter addresses this question by presenting a meta-framework for planning and monitoring the dynamics and progress of faculty development interventions during the digital transformation of universities, in which blended learning practices are no longer considered as educational innovation but as non-optional elements of the teaching practice.

The framework presented in this chapter strives to structure the transformative process, to communicate progress, and to support the in-situ identification of barriers and bottlenecks as well as to guide the decisions to overcome them. Such transformations are closely related to the adoption of innovation (Rogers, 2003). Therefore, this chapter analyses the driving factors of the adoption of innovation that influence the cascades of smaller adoption processes that structure the overall transformation. From the viewpoint of faculty development, each adoption process is related to the mastering of different competencies, which in turn define the development needs. Moreover, adoption models represent the dynamics of the faculty's uptake of new practices by predicting the quantities within a cohort and a timeframe. This makes these models particularly useful for faculty development as these models help to identify competence gaps, barriers, bottlenecks, or diversions *during* the transformation process as well as provide performance and cost indicators for strategic decisions.

This chapter discusses the rationale of the framework in three parts: The first part focuses on the background of university scale transformation from conventional teaching to blended learning. This includes the present body of research as well as the environment that frames faculty development activities as part of the digital transformation of an organization. The second part links innovation adoption to the transformative process towards blended learning. This leads to a generic innovation cascade for transforming towards blended learning and explains the rationale that can guide faculty development interventions. The last part presents a case study in which the model has been applied and demonstrates the application of the indicators for monitoring the transformation process and selecting faculty development interventions.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

This part demonstrates that faculty development must not constrain itself to conventional approaches but has to address technological factors that accelerate or limit the empowerment of the faculty.

BLENDED LEARNING IN HIGHER EDUCATION

Despite the rise of massive open online courses (MOOCs) and years of institutional, national, and multinational innovation initiatives, the higher education sector as a whole appears relatively unaffected by the digital shift that otherwise touches all aspects of contemporary societies. Consequently, university boards set new digitization objectives, which are as high and ambitious as they create tensions and fear among the faculty. Faculty members typically use digitalization as a homogeneous and yet fuzzy concept that often grounds on a dichotomy between non-digitized and digitized, in which physical environments and social presence are either absent or ignored.

The physical environment and social presence are essential characteristics of campus-based institutions in higher education and most institutions do not seek to transform into distance teaching universities. Therefore, many campus universities invest in developing blended learning practices that connect the benefits of on-campus interactions with those of digital tools.

The understanding of the institutional intentions behind the digital transformation requires a definition of "blended learning": *blended learning* is an educational design principle that relies on connecting face-to-face and online learning experiences. "Typically, an onsite course becomes blended when online activities are designed to replace [some] onsite sessions." (Stein & Graham, 2014, p. 12). This definition implies that these learning experiences neither rely only on onsite interactions nor have they organized as fully online distance teaching. "Blended learning is not an addition that simply builds another expensive educational layer. It represents a restructuring of class contact hours with the goal to enhance engagement and to extend access to Internet-based learning opportunities. Most important, blended learning is a fundamental redesign that transforms the structure of, and approach to teaching and learning." (Garrison & Vaughan, 2008, p.5). This definition captures the rationale that is often underpinning the introduction of blended learning at the organizational level.

In order to facilitate blended learning, many institutions host central infrastructures in the form of virtual learning environments (VLE) and learning management systems (LMS). These infrastructures provide complex sets of functions for running and managing online learning experiences. Lecturers can customize online components of their courses by arranging these functions for meeting the requirements of their learning and teaching objectives. Typically, the faculty already has access to at least one LMS with the related faculty development support in place when their institution enters a digital transformation process. These initial activities are often complemented by targeted workshops for advanced features and new practices.

While the primary use case of the LMS is to support educational-administrative processes, these systems are also valuable sources for data that reflects the uptake and intensity of online teaching practices, because every course in these systems represents the digital parts of the educational design of the courses. The following sections explore the background that led to the development of the framework for monitoring the organizational adoption of blended learning practices.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

A Literature Perspective on Digital Transformation of Higher Education

The most recent comprehensive literature review on blended learning in higher education included publications until 2012 (Torrisi & Drew, 2013). Drawing on 827 publications, Torrisi and Drew (2013) identified an emphasis on "how to" contributions mostly made up of program and course cases (65.9%). The second largest group of publications addressed the "student focus" towards using digital tools (25.6%). The review indicated a deficit in the literature regarding the faculty's practice (4.7%) and about the factors that influence the uptake of blended learning in organizations (0.72%).

For capturing the recent state of research, the review of indexed publications in the "web-of-science" database that were published between 2012 and 2018 was replicated. The new literature search returned over 3500 journal publications and conference papers on blended learning in higher education. The majority of these publications report on individual tools, course-level cases, and the student perspective (96%). The faculty's perspective on blended learning (2%) is addressed in 101 publications. The majority of these publications report on case studies around introducing specific tools, small scale interviews on the faculty beliefs towards blended learning, or subject-specific design practices for combining onsite and online communication. Only seven publications (0.2%) address technology acceptance and adoption processes in educational institutions. This distribution shows an increased emphasis on research of tools and the student perspective, while the previously identified deficit on research on the organizational dimension remains. The following paragraphs focus on those recent studies that address the organizational adoption of blended learning in higher education that is not covered by the previous review.

Graham, Woodfield and Harrison (2012) interviewed administrators of six higher education institutions in the U.S. regarding institutional policies that structure and facilitate the development of their blended learning practices. The study used the stages of organizational innovation processes (Rogers, 2003) as a baseline and analyzed the policy frameworks for common strategies. The authors identified three stages of adopting blended learning in the selected institutions:

1. Awareness and exploration,
2. Adoption and early implementation, and
3. Mature implementation and growth.

The authors suggest three main categories that guide the adoption process: *strategy* and advocacy, (infra-) *structure* and governance, as well as technical, educational, and organizational *support*.

Tshabalala, Ndeya-Ndereya and Van der Merwe (2013) interviewed the faculty of a South African university using the technology acceptance model together with concepts of innovation diffusion theory (Rogers, 2003) to identify influencing factors for different adoption strategies. The study put a special focus on negative attitudes towards technological support in higher education. The results show four key factors that influence the non-adoption of blended learning practices: institutional policy, faculty support, computer skills of students and lecturers, as well as inadequate access to computers by students.

Porter, Graham, Spring and Welch (2014) studied institutional strategy, structure, and support markers in relation to factors that influence the awareness and exploration of blended learning practices in 11 U.S. higher education institutions. The study contains interviews with experts from blended learning service centers in their role as change agents. The study reports common approaches for combining management strategies, infrastructure provisioning, faculty support, and development, as well as evaluation of student performance. The relatively low number of blended classes per participating institution reported by the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

study indicates early adoption of blended learning practices among the faculty members. A follow-up study (Porter, Graham, Bodily, & Sandberg, 2016) analyzed the faculty perceptions of their institutional strategies. The results indicate that the lecturers are aware of the integrated aspects of the institutional approaches but find it difficult to implement in their own educational practice. The study revealed a number of non-educational factors that influence technology adoption, such as employment status, time compensation, and monetary incentives.

Martín García, García del Dujo and Muñoz Rodríguez (2014) conducted a survey on the technology acceptance of 445 university lecturers from Spain. The study seeks to verify the utility of the unified theory of acceptance and use of technologies (UTAUT) for measuring the influencing factors of adopting blended learning practices in Spanish higher education. The results suggest three primary drivers: outcome expectancy, facilitating conditions (infrastructure and support), and social influence.

Porter and Graham (2016) compared the self-characterization of adoption strategies with the self-reported blended learning adoption of 214 professors at a U.S.-based higher education institution. The study clustered the responses into the adoption strategy groups of the innovation diffusion theory (Rogers, 2003). The findings reveal that professors characterize their personal adoption strategies more positively than their self-reported blended learning practices would suggest. The study further identified different attributions of factors among faculty members that influence their adoption decisions: professors who report more progressive adoption strategies tend to put more emphasis on factors related to infrastructures, whereas professors who report more conservative adoption strategies tend more towards faculty support and training. Additional findings indicate that professors raise structural and support deficits as highly relevant if the overarching blended learning within their department focused less on the related factors.

Boelens, Voet and De Wever (2018) analyzed the relation of educational design competencies of lecturers to their beliefs towards blended learning. The study involved interviews with 20 participants at two Dutch teacher training centers. The findings indicate that educational design competencies and teaching experiences are positively related to transformative beliefs of blended learning. The study also indicated that the organization of the curriculum and student cohorts in the institution influence the beliefs towards blended learning. The results suggest that blended learning is more positively perceived when the institution already groups students in alignment with their characteristics and interests.

All studies rely on qualitative and quantitative methods. The primary source of these studies is self-reported beliefs and practices that are conveyed through interviews or surveys. This does not reflect the full picture of the actual state of practice and can be doubly skewed as Porter and Graham (2016) indicated.

None of the studies compared the faculty's self-reported blended learning adoption with their actual practice. Moreover, the studies report only on snapshots in the digital transformation and do not cover the transformative process. This is insofar not surprising because the applied methods are not suited for frequent and representative measurements across entire organizations. This limits the evidence that can inform the strategic planning and management of digital transformation in organizations.

The present body of research does not provide methods that can guide the faculty development decisions during digital transformation projects in higher education, which are typically multi-year projects of high strategic value. Therefore, faculty development personnel and university management cannot draw on validated tools for supporting decision-making processes and interventions by monitoring the transformative process.

Information Infrastructures in Educational Organizations

Digital transformation processes target the connection between information systems and organizational practices. Therefore, change agents need to understand how digital infrastructures shape the learning environment and how this transforms the practice of lecturers. Analyzing the existing infrastructures provides insights into the relation of educational practices with other processes and systems within an institution. Therefore, any digitalization strategy in education has to align these systems and build on their role for the educational activities in an institution.

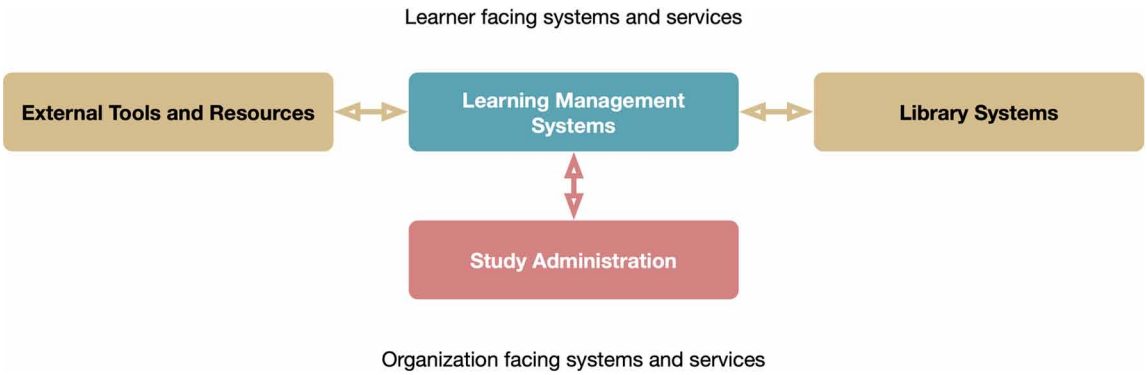
In Swiss higher education, four types of information systems that influence learning and teaching experiences can be identified:

1. Administrative systems,
2. Library information systems,
3. Learning management systems, and
4. External tools and resources.

Administrative systems support the administrative processes of educational institutions. These systems range from financial and accounting through Human Resource management to academic administration. They typically remain in the background of educational and research activities. However, course and student management systems in academic administration often have a direct impact on educational processes, because they channel student trajectories through a curriculum by recording the student enrollment status, participant management, as well as grade and certification management. Because these systems are marginal to educational activities, they are typically not considered by research on educational technologies. Yet, it is the data collected, stored, and managed by these systems that are legally binding for recognizing learning.

Library information systems play a vital role to access the scientific publications that are used in different courses. The most prominent are digital catalogs to locate literature and media resources. Several institutions have started integrating these systems with modern reference managers to replace the traditional lecture readers. Another type of library information system with educational relevance is plagiarism checkers for verifying the authenticity of the scientific artifacts provided by students for grading.

Learning management systems (LMS) are the educational counterpart to the administrative course and student management. LMS are complex process management systems that provide a wide range of tools for common educational tasks and learning activities. An important feature of an LMS is their automation capability for basic educational interventions and for orchestrating learning activities. This automation includes automatic grading, documenting formative performance development, as well as performance-based personalization and adaptive processes.



External tools and resources provide optimized solutions for specific tasks. These tools can relate to specific professional practices or provide optimized support for learning processes that are not covered by either of the other system types. This group of information systems includes most prominently mobile apps, video streaming and conferencing tools, collaboration services, and virtual laboratories. These solutions are key components for bridging among face-to-face situations, out-of-class activities, and online learning experiences. Apart from education-specific solutions, this category also includes subject-specific information systems and software. Examples for such solutions are statistics software

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

in the social sciences, programming environments in computer sciences, or modeling and CAD systems used in architecture and mechanical engineering.

Together, these systems contribute to shaping the students' learning experiences. The digital transformation in higher education targets particularly the organizational performance and efficiency by integrating the different systems and infrastructures for providing high-quality education to the students. In this transformation, the LMS plays an important role in integrating the different services into the processes that are underpinning the educational experiences (Figure 1). The central role of the LMS for educational processes is evident in their usage that tends to be among the most intensively used systems in academic institutions. Swiss higher education institutions provide an example of this pattern of high usage.

Figure 1. Relations among educational infrastructures and services

The Swiss universities jointly collect data on user authentications to information services provided by the institutions to their members. This data is based on the use of information services that are authorized via the national identity management federation. The dataset contains the statistics about how many times users authenticated to the connected services (Lenggenhager, 2016). The data shows that the most used services within the national higher education area are (web-) mail services and the LMS. Cross-relating this data to the official statistics on enrolled students and faculty (Bundesamt für Statistik, 2016), the data suggests that more than 80% of the Swiss students and faculty access these systems daily.

Most LMS solutions are designed as open systems that can be extended through other services using IMS Learning Tools Interoperability (LTI) (IMS Global, 2015). This standard helps to link external tools and library services into LMS-hosted courses as part of the digital learning experience. Because of this integrative role of the LMS, the data provided by them can serve as indicators for transformative progress.

THE TRANSFORMATION COSTS OF EDUCATIONAL INNOVATION

The transition to blended learning has been recognized as an innovation diffusion process in organizations (Graham, Woodfield & Harrison, 2012; Tshabalala, Ndeya-Ndereya & Van der Merwe, 2013; Martín García, García del Dujo & Muñoz Rodríguez, 2014; Porter & Graham, 2016). The diffusion is guided by individual *adoption* of new concepts, ideas, tools or practices. Faculty development needs to respond

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to the factors that influence or hinder adoption at an organizational scale. However, blended learning with the great variety of digital tools and the complexity of integrating them into educational processes makes blended learning a concept that depends on the mastery of a range of concepts and skills. This makes blended learning hard to adopt across the members of an institution. Therefore, it is the task of faculty development to structure the adoption of new digital practices in a way that reduces perceived and real obstacles for adopting blended learning practices.

Rogers (2003) investigated how new ideas, products, and practices come into markets and organizations which facilitate exchanges and transactions between actors. Rogers' research focused on the conditions when and why market actors and organization members change from an old product or practice to a new one. This transition is called *diffusion of innovation*, which is guided by the individual *adoption* of ideas, tools, and practices. The number of adoptions during a time period is called the *adoption rate*. The adoption rate is typically characterized by starting off slowly followed by an acceleration phase. The acceleration leads to an almost steady growth for a longer period of time and then decelerates when it approaches the full market reach.

Rogers remarks that the phases of adoption processes reflect the strategies of the individual actors. He identifies five actor groups that expose different strategies that are dominant in subsequent phases of the diffusion process: The innovators, the early adopters, the early majority, the late majority, and the late adopters ("laggards"). Moreover, these groups are not evenly distributed within a market: Rogers attributes approx. 68% of the market actors to the early and late majority. The late adopters account for approximately 16%, while the innovators are typically a mere 2.5% of the market actors. The "critical mass" for major market uptake is reached as soon as the adoption rate is above 16% and reaches into the early majority. Other research highlights that the adoption strategies of innovators differ from those of the other groups, which often accounts for the market failure of high-technology innovations (Moore, 2004).

Diffusion theory only describes the external characteristics of the adoption processes, but it does not explain their internal dynamics. One theory that targets the internal dynamics is transaction cost theory. Transaction cost theory is an economic framework that was introduced in the late 1930s (Coarse, 1937, 2000, Williamson, 1998). It addresses performance differences of transactions in free markets, institutions (regulated markets), and organizations (firms). Transaction cost theory analyzes the behavior of market actors or organization members by focusing on the influence of product-specific factors and costs of adoption. Transaction costs refer to the "overhead" costs that contribute to pricing and influence buying decisions. Common forms of transaction costs in market interactions are typically covered by marketing or training budgets. Organizations optimize repetitive market transactions through organizational structures, processes and procedures. Such internalization masks the direct financial costs of market transactions with less obvious investments, such as time for learning or reorganization when adopting new tools or practices. From this perspective, the adoption of new tools or practices is the same as making buying decisions.

Transaction costs may also increase through necessary investments in developing new procedures and practices, competence development and training, as well as infrastructure. In the context of higher education, transaction costs of adopting new practices refer, for example, to the time investments required of the faculty for re-planning existing course designs in a blended learning mode, or for learning how to use the functions of a particular online tool.

The transaction costs increase with "asset specificity." The term refers to the unique features of products, ideas, or practices that differentiate them from other solutions. Asset specificity contributes to uncertainty factors that hinder potential adoption (Geyskens, Steenkemp, & Kumar, 2006). In other

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

words, each product feature that does not relate to existing concepts, practices, or processes adds to the product's relative complexity and increases the related transaction costs.

How transaction costs are perceived is related to "opportunistic" factors that influence "self-conscious attention," "trade-off," and "uncertainty" (Williamson, 1998, 2008). These factors include customer demands, incentives and sanctions, social status, organizational culture, professional attitude, performance benefits, and regulations. Whether or not an actor perceives transaction costs as acceptable depends on the *personal* ranking of opportunistic factors, which are unrelated to the actual solution or its objective benefits.

Applications of Transaction Cost Theory

Transaction cost theory has been applied to adoption processes in which the different factors influence the perceived transaction costs that lead to the adoption or rejection of new designs (Roberts & Greenwood, 1997), practices (Tate, Dooley, & Ellram, 2011), or information services (Yigitbasioglu, 2014). The results of these applications indicate that a reduced level of uncertainty lowers the transaction costs and therefore increases the likelihood for adoption. However, opportunistic factors such as existing practices or alternative solutions contribute to the transfer costs inherent in abandoning old practices or solutions and adopting new ones. This is also known as conversion or switching costs (Beggs & Klemperer, 1992).

Transaction cost theory helps to operationalize and to explain the dynamics of adoption processes because the theory relates opportunistic factors to the adoption strategies of different groups. Therefore, it is important to identify the key factors for the different phases of adoption processes.

The technology acceptance model (TAM) (Davis et al. 1989) and its variant, the unified theory of acceptance and use of technology (UTAUT) model (Venkatesh, 2000; Venkatesh & Davis, 2000), focus on personal factors for accepting technological innovations. These models describe opportunistic factors that guide the adoption process by generalizing technological acceptance among the actors. These concepts are also present in frameworks for the development of blended learning in organizations (Garrison & Vaughan, 2008; Graham, Woodfield & Harrison, 2013). However, it has been remarked that acceptance is not a deterministic process and is different from adoption (Bagozzi, 2007), which suggests that these models are optimized to monitor the *preconditions* for adopting innovative technologies, ideas, and practices.

TAM considers the opportunistic factors, such as usefulness, usability, attitude towards technology, experience, reliability, and demonstrability, quality and relevance, as well as social norms and public image. However, in the context of technology diffusion, additional factors were mentioned, such as novelty, awareness, available support, and innovation consequences (Rogers, 2003). Innovation diffusion theory suggests that the different adoption groups prioritize different opportunistic factors to guide their adoption strategies. Moore (2004) illustrates this for the innovator group who primarily value the novelty factor and are willing to accept additional effort and costs for satisfying this factor.

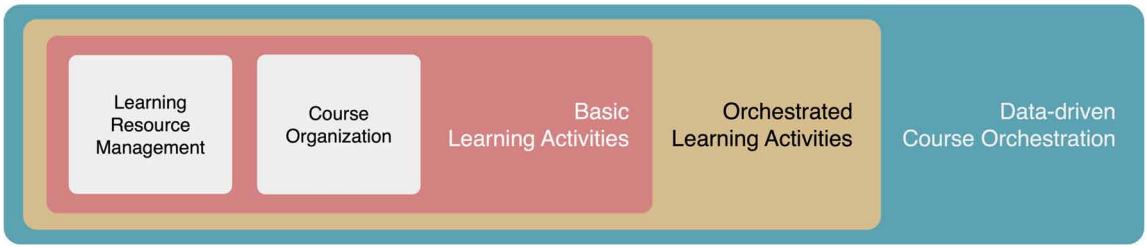
Levels of Digitizing Education

Educational design concepts are drawn on to estimate the transaction costs of blended learning,. Educational design influences learning processes by structuring and aligning activities and resources across learning contexts. The arrangement of functions and resources in online course components directly reflects the lecturers' educational design decisions. Because these parts of educational designs are expressed

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

in the digital environment, they become available for analytical processing that provides insights into the faculty's blended learning practices. Given that these data are automatically generated as part of the educational practice, the data support frequent and non-invasive evaluation. In this section, a structuring attempt for relating the data of online course components to blended learning practices is presented.

Instead of analyzing specific course arrangements and structures, the levels rely on LMS functions as indicators for the adoption of different blended learning practices. The configured course functions relate to the intended complexity of the related learning experiences. Since course designs are part of the lecturers' regular activities, this enables monitoring the adoption of blended learning practices without additional inquiry of the lecturers. Additionally, the course data also includes information about students' performance that indicates which practices contribute to a course's learning experience.



Drawing from the prior work on SCORM (ADL Initiative, 2004) and IMS Learning Design (Koper, Oliver & Anderson, 2003), five functional levels were identified for structuring the practices related to the data:

- Learning resource management,
- Course organization,
- Basic or independent learning activities,
- Orchestrated learning activities, and
- Data-driven course orchestration.

Each category groups different competencies and teaching skills that can be linked to concrete LMS functions. The categories are hierarchically related, so a less complex category forms a subset of functions and practices for the more complex ones (Figure 2). This structure assumes common opportunistic factors that influence the uptake of functions in the same category. Similarly, the hierarchy can be linked to the faculty's development needs.

The most fundamental LMS usage is *learning resource management*. This includes all resource level functions of the LMS, including text documents, images, infographics, HTML text, videos, audio files, as well as links to Internet resources. In their default configuration, these LMS functions are designed for unidirectional information provisioning. Courses that use only resource management functions resemble information collections and are similar to websites or blogs.

Figure 2. Functional categories of LMS features and tools

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Course organization functions support administrative tasks in courses. These tasks include delivering information to students using LMS internal messaging, course scheduling using calendar functions, assignment collection, and group organization. These functions allow lecturers to offload administrative tasks to the online space. The functions in this category require basic procedural considerations but do not affect the educational practice. Courses that use only course organization features typically include an announcement board, use messaging features, calendar dates, and collect student assignments. If the LMS is used to organize group work, the related courses will include group organization functions.

Learning resource management and course organization does not change the actual educational practice but support and structure course administration. Both categories represent fundamental applications of LMS functions starting either from resource-centric or process-centric needs.

Courses at the *basic learning activities* level include some of the LMS activity functions, such as wikis, discussion fora, tests, data inquiry tasks or peer assessments. The definition of online learning activities operationalizes LMS functions towards the requirements of a course's learning objectives and helps to move onsite activities to the online learning environment. The related LMS functions are used in their basic configuration and are not logically arranged or used for orchestrating online activities. Courses that use basic learning activities are expected to combine the activity functions with functions for learning resource management and course organization. These courses are the most basic form of blended learning according to common definitions (Garrison & Vaughan, 2008; Stein & Graham, 2015).

More advanced educational applications fall into the *orchestrated learning activities* level. Courses at this level define learning flows that help lecturers to monitor learning processes and to place interventions, if necessary (Dillenbourg, 2015). Functions in this category include activity and course completion features for setting rules for independent activities. For using the functions of this category, lecturers have to anticipate the learning processes and its outcomes. Courses that use functions of this category allow students to monitor their learning progress through gamification elements such as learning badges.

Data-driven course orchestration includes functions for automated orchestration of connected learning activities. These rules use the outcomes of other activities in a course for controlling and guiding learning processes automatically. Data-driven approaches depend on operationalizing the dependencies between learning activities as a learning process. Courses that use functions at this level include prerequisite rules for learning activities and organizational tasks. This results in automated course orchestration and the definition of personalized learning experiences through alternative activities. Courses that use functions of this category have many similarities with games and simulations (Gruber, Glahn, Specht & Koper, 2010).

Content-centric components with control questions such as interactive SCORM sequences or Moodle "lecture" activities fall in between orchestrated learning activities and data-driven orchestration. These components utilize some features for automated orchestration that are based on the data provided in control questions at decision points. Depending on how these control questions are defined, they mark the completion of a content section or prerequisites for the following resources.

External educational tools may support some or all categories of digital educational processes. Categorizing tools and their features along the lines of these categories are expected to forecast their potential adoption rate within the institution.

Each category of LMS functions enables lecturers to create more complex educational experiences by adding new aspects and functions to their educational designs. While each level increases the possible design decisions, it also requires more explicit educational intentions and performance expectations. Seemingly simple approaches such as the flipped classroom (Gerstein, 2012) or inverted classroom

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Lage, Platt, & Treglia, 2000) require the mastering of a range of organizational and operational skills before they can be successfully applied with the available tools. This includes

- The organization of learning resources at the content management level,
- Class time management at the course organization level,
- The ability to create active and aligned learning activities at the basic learning activities level, and
- Skills for arranging, connecting and moderating learning activities both in-class as well as online.

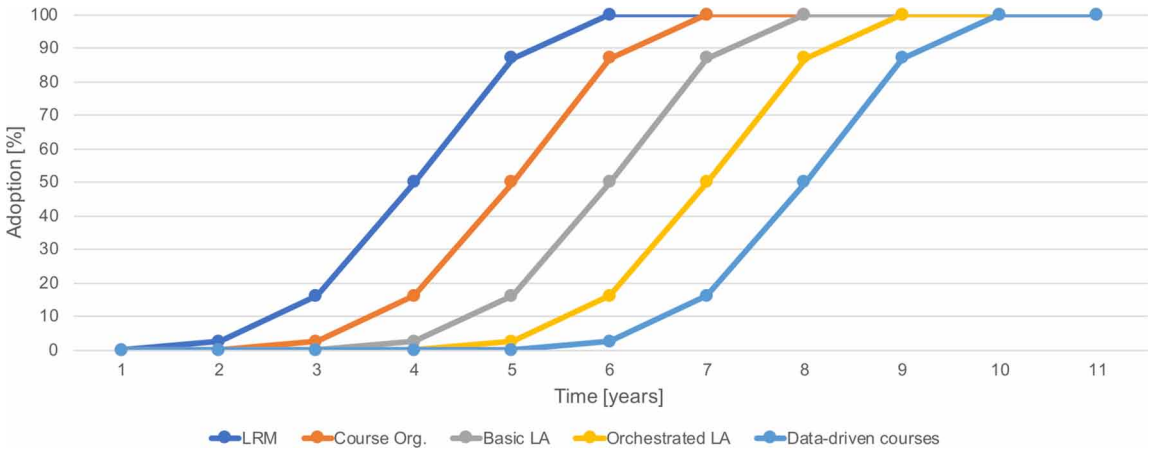
Adding personalized or gamified experiences to learning arrangements requires further computational-thinking skills at the level of data-driven orchestration, as these arrangements require partially automated moderation of the students' learning processes (Gruber, Glahn, Specht, & Koper, 2010).

Cost-Sensitive Adoption of Blended Learning Practices

Transaction cost theory suggests that each category with its skill requirements, tools and features adds to the opportunistic factors that influence the adoption of the related practices. Therefore, the adoption of the LMS features should show gradual development that follows these complexity levels, because of the temporal developments of diffusion processes (see Figure 3). The transaction cost theory suggests that fewer opportunistic factors increase the potential for adoption as fewer factors contribute to the *perceived* transaction costs.

The levels for online educational practice are based on the principles of increasing "asset specificity." In this case, each level of the hierarchy follows its own adoption process. This suggests that the less complex categories should receive faster uptake than the more complex ones. As the categories are linked to each other, it is expected that the adoption of lower complexity functions and practices reduces the "asset specificity" of the more complex categories. Consequently, higher level categories should show delayed adoptions of the related functions as the adoption groups progress through the lower level categories. The cascaded dynamic of independent adoptions is depicted in Figure 3.

The dynamics of diffusion theory suggest that a proportion of the faculty members will naturally advance to more complex solutions and novel practices. Therefore, gradual advancement towards more complex functional categories can be expected and overlapping adoption behavior should appear (see. Figure 3).



This model is open to "leapfrogging," in which members of the community can move from a lower category to a higher category while bypassing intermediate categories. Leapfrogging is explained through higher individual investments in order to reach a targeted level. This kind of additional investment is characteristically attributed to the group of innovators in diffusion theory. Therefore, this kind of behavior is not expected for the mainstream of the faculty.

A critical strategic question for university management is the speed of the adoption process. Higher education institutions can expect that such developments are tied to the rhythm of the academic year because it structures the educational activities. Additionally, the teaching frequency has to be considered. For courses with a bi-semester rhythm, changes towards new educational practices and technologies are only expected to become visible at an annual rate.

Under ideal conditions, the full adoption of new digital educational approaches in one category would need five years to reach the entire faculty. These conditions would require that all courses are fully reworked every year, the organization has an ideal distribution of faculty members across the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Ideal adoption process (adoption rate in percent over time in years)

adoption groups, and each adoption group fully adopts new concepts during the same year. Under the realistic operational, organizational, and scientific constraints of academic education, these processes would require more time.

A CASE OF INTRODUCING BLENDED LEARNING

The model of increasing complexity of digital learning has been developed over the course of four years in a major digital transformation project at HTW Chur. HTW Chur is a university of applied sciences in the southeast of Switzerland. The universities of applied sciences are young institutions in the national higher education sector with their roots in the Swiss higher professional education system (Bundesamt für Berufsbildung und Technologie, 2009). All Swiss universities of applied sciences are younger than 25 years old and offer bachelor's and master's degree programs for students that achieved professional A-levels. Professional A-levels ("Berufsmatura") require the completion of an apprenticeship in a company with top grades. This opens career trajectories to young professionals that depend on scientific skills and practices. The professional background of the students also leads to a higher degree of students that work alongside their studies.

HTW Chur is among the smaller institutions in the sector with approximately 300 full- and part-time lecturers (State Spring 2018). It offers nine study programs in the domains of economics, information systems, media studies, architecture, engineering, and photonics. Due to its geographic location in the Swiss alpine region, it faces considerable competition from similarly oriented institutions in the more urban regions of the country. To attract students beyond the immediate region, HTW Chur initiated a digital transformation project for its study programs. The objective of this transformation was to combine the benefits of campus-based study programs with the flexibility offered by digital technologies. The project aimed at the digital transformation of strategic courses in all study programs. The strategic courses were selected based on shared learning objectives across study programs in order to maximize the impact on the overall teaching.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The digital transformation of this institution has been accompanied by several faculty development initiatives over the course of four years. These interventions included targeted information and training events, faculty development certificates, personal and group coaching for redesigning strategic courses, on-demand support for individual courses and lecturers, working groups for common needs and practices, as well as general information events and untargeted support in the form of an online blended learning handbook.

The reach of the faculty development activities ranged from as low as 5% of the faculty for targeted information events and training, 10% for course redesign coaching, and 15% for on-demand support and working groups. Additionally, generic information and untargeted online support reached more than 50% of the faculty per year.

The working groups primarily targeted innovators and early adopters. Information and training events, as well as coaching and on-demand support, were designed for supporting lecturers with more conservative adoption strategies. The faculty development was complemented by support for media content development and technical activities for improving the reliability and user friendliness of the LMS as well as its integration with the local academic administration system. The LMS at HTW Chur runs on the Moodle platform. Due to the schedule of the academic calendar, major technical updates are only possible once per year during the summer break.

Method

In order to monitor the diffusion of blended learning practices, the LMS was used to collect information about the course design across all study programs. The monitoring was comprised of course-level data for supporting the faculty transforming courses to understanding the impact of the online activities. Additionally, a baseline and a reference measurement across all courses was conducted. Different from course-level data, the results of the additional measurements needed to be agnostic towards subject-specific educational practices and course structures in order to enable comparison across the different study programs.

The measurements were conducted at the end of the term in order to acknowledge online teaching during the semester. This was necessary because many lecturers exposed manual course orchestrating strategies by uploading complementary course material after the related face-to-face sessions. Therefore, these courses unfolded throughout the semester and the actual adoption of online teaching practices was not fully visible at an earlier state.

The curricula of all study programs are organized annually. Thus, every course runs once per year. Therefore, the baseline was collected in June 2015 at the end of the Spring term and in January 2016 at the end of the 2015 Autumn term. Additionally, a reference measurement was conducted for all courses on the 2017 academic year in January 2018, which was possible with a new course archiving policy starting in Spring 2017. As of 2015, all courses automatically had an online component available, the data includes all courses in all study programs.

The course data was structured into the five complexity categories based on the active functions in the courses at the end of the term. All courses share a basic course structure of an announcement forum and 14 topics. Lecturers can alter this structure to their specific needs.

Courses were considered as unmaintained if they only contained the basic course structure or if all components were inaccessible to the students. These “empty” courses refer to no adoption of digital educational practices.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Learning resource management was considered as adopted if courses used at least one of the resource tools of Moodle. These tools include the following course elements: "file," "folder," "text page," "text block," "lesson," "SCORM," "URL Link," and "glossary."

Course organization functions are counted for courses that post messages in the announcement forum, use calendar events to communicate special events, include the "assignment" activity for collecting study results, and use the "survey" tool or "group select" activity. These activity functions were only considered if student data was also present.

Courses that include basic learning activities utilize Moodle's learning activity functions. Courses at this level typically include functions of the first categories and learning activities with student contributions. Learning activities include the functions "choice," "database," "forum," "LTI-external tool," "quiz," "wiki," and "workshop." The adoption was considered successful if at least one of these activities was configured and used. The activities at this level utilize only the basic functions for configuring the activities, such as the activity description, group access, and deadlines.

Orchestrated learning activities are identified by the use of the automatic task completion feature for learning activities. This feature requires the definition of indicative learning outcomes that mark the minimal completion requirements for an activity. Moodle uses this feature to highlight completed and uncompleted tasks to the students. Lecturers can use this feature for monitoring task completion of preparatory activities. The adoption was recorded for courses in which at least five participants completed the specified tasks. Moodle's task completion rules were not considered for resources, because these rules are triggered by accessing or downloading a resource. However, the adoption was also considered successful if a course used completion rules for organizational activities, such as assignments, group selections, or surveys, as long as other basic learning activity functions were also present.

Data-driven course orchestration utilizes learning outcomes of activities for controlling the flow of the individual learning processes. Courses that expose this level of adoption connect learning activities through prerequisite rules. The successful adoption is marked if courses create valid rule-based connections between learning activities or learning path variants. A valid connection is given if both ends of the connection show student activity. Again, prerequisites for learning resources are ignored.

Results

The baseline measurement included 410 of 422 courses that were present in the LMS during the 2015 autumn term. The reference measurement included 545 LMS courses during the 2017 autumn. The difference in the course number is caused by the launch of four new bachelor programs. Table 1 summarizes the results of the adoption rates.

The baseline measurement indicated that most courses already included an online component: 85% of all courses in the LMS included learning resources, 15% were unmaintained, and 3% made additional use of online learning activities. Functions for course administration were not used. Because 2.3% of the courses of the curricula had no representation in the LMS, this increased non-digitized courses to 16.8%. The baseline data revealed that 80% of courses that used learning resource management functions distributed external files, such as text documents in PDF or Word format, spreadsheets, or presentation slides.

The reference measurement counted for 94% of courses that used learning resource management functions, 27% combined course administration functions, 6% included online learning activities, 2% used the orchestration support of the LMS, and 6% of the courses were unmaintained. Of the courses that used functions for basic and orchestrated learning activities, 2% did not include course administra-

Table 1. Measured adoption rates

Function category	Baseline measurement 2016 (academic year 2015, n = 410)	Reference measurement 2018 (academic year 2017, n = 545)
No adoption/unmaintained	16.8%[1]	6%
Learning resource management	85%	94%
Course administration	0%	26%[2]
Basic learning activities	3%[2]	8%[2, 3]
Orchestrated learning activities	0%	2%[2, 4]
Data-driven course orchestration	0%	0%

[1]includes courses without LMS components;[2] also counted in learning resource management; [3] partial use of course administration, [4] also counted in basic learning activities and course administration

tion functions. While the relative use of learning resource management functions for external files did not change, the data showed that courses that used course administration functions and learning activity tools also used more embedded resources such as HTML pages, text blocks, and embedded images.

The number of basic learning activities in the baseline suggested that these functions were used by a group of educational innovators. This group matched those faculty members that were already publicly recognized by the University management. The reference measurement showed increased uptake of basic learning activity functions and new applications for orchestration functions that support inverted classroom settings. By comparing the educational innovators at the baseline and reference measurement, the data revealed that the more advanced functions were adopted by an entirely different group of lecturers. This new innovative group included 1/5 of new faculty members. Both measurements showed no uptake of the available functions for data-driven course automation or personalization.

SOLUTIONS AND RECOMMENDATIONS

It was expected to find higher adoption rates in courses related to "strategic modules" that were primarily targeted by the transformation project. Instead, the data indicated an almost homogeneous adoption rate across the different study programs, with the exception of architecture and civil engineering that show lower adoption rates.

Secondly, it was expected to find similar adoption of tools and practices in courses of the same lecturers. With the exception of learning resource management, this was not the case for the other categories. Instead, lecturers choose "experimental" courses before they started using similar practices in their other courses. The data shows that these choices are clearly not courses with the least impact in terms of group sizes, position in the curriculum, or maturity of students. This indicates a rejection of "secure" adoption strategies with small-scale teaching experiments before bringing the new practices into bigger or more relevant courses. Informal feedback by faculty members suggests that the choice is guided by the expected immediate benefit. However, the available data cannot confirm or reject this suggestion.

The baseline indicated that functions for learning resource management were already well established by the start of the project. Innovative practices were also found at the baseline. The high adoption of resource level LMS usage was not expected on the grounds of the available strategic information, whereas

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

finding innovative practices outside the mainstream adoption was predicted by diffusion theory (Rogers, 2003; Moore, 2004).

Despite the high adoption of learning resource management functions, the baseline data documented no functions for course administration. This was partly due to the system's user interface that made these functions hard to identify. After system improvements for the Fall 2016 semester towards better visibility and accessibility of course administration functions, lecturers started integrating these functions into their courses. Because of the low impact of targeted faculty training, these changes were only announced as part of the generic update information. After a short protest by the faculty about the user interface changes, this intervention led to the immediate uptake of these features. This adoption wave became visible in the reference measurement of the following academic year.

Comparing the Ideal Adoption and Measurements

The transaction cost model suggests that the adoption of new technologies and practices depends on the necessary "investment" by the adopting actors for performing a transition of practices. These investments are influenced by opportunistic factors. The complexity of the educational environment of academic institutions and the versatile functions of a modern LMS point towards a cascade of adoption steps, in which some functions have lower transaction costs than others. The categorization of LMS functions into five levels (see Figure 2) is an attempt for structuring and monitoring the complexity of digital transformation processes.

The predicted ideal adoption suggests that the uptake of LMS functions follows along the lines of the functional categories. Diffusion theory predicts that under ideal conditions the adoption groups among the faculty could follow with an annual delay. This process is separate but overlapping for the functional levels.

The baseline measurement indicated that learning resource management functions were well adopted by the late majority at the beginning of the transformation process. This measurement also indicated practices by a group of innovators. The gap between the two groups represents the high transaction costs for moving from learning resource management to online learning activities.

According to the model, the adoption of functions for course administration should have received major uptake among the faculty. The complete absence suggested that the lecturers were unaware of these functions. This was supported by the design of the LMS' user interface, which did not place these functions prominently. By removing this usability barrier, lecturers started adopting these functions although no faculty development activities were conducted to promote these functions. According to the ideal adoption model, an adoption rate of approximately 14% was expected one year after this modification. Instead, the data showed an adoption rate above 25% that indicates uptake from well within the early majority group. This shows that the system usability raised the transition costs to a point that it blocked the adoption of these functions. The high adoption rate without major faculty development interventions suggests that the related functions integrate well with existing educational practices. This lowers the transaction costs and enables faster adoption.

The baseline data showed an initial adoption of basic learning activity functions provided by the LMS. Two years into the project it was expected to find adoption reached the early majority group. Instead, 6% of the courses that utilized basic learning activity functions indicates that the early adopter group has started integrating these functions into their practices.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Following Moore's (2004) line of arguments, the lower adoption rate of basic learning activities is due to the "chasm" that developed between the innovators and the rest of the faculty. The other groups had to bridge the gap of the functional complexity before progress could be made. The adoption within the early adopter group is plausible from the viewpoint of the model because the less "expensive" functions for administering courses have started to reach the early majority. This suggests that the adoption of the different functional categories is connected to each other through the increasing transaction costs. This dependency is also supported by the starting adoption of functions within the orchestrated learning activity category.

The measurements show that groups of innovators may not follow sequential improvements but aim for personal achievements and may leapfrog directly to new technologies and practices. This is shown by the innovator group that was identified in the baseline measurement as well as by the "new" innovator group of the reference measurement. The data suggest that educational innovators expose temporal characteristics that are unrelated to a persistent intrinsic precondition for taking additional transaction costs. However, the scale of this leapfrogging is in line with what diffusion theory would predict.

IMPLICATIONS FOR FACULTY DEVELOPMENT

The role of faculty development is to enable and to empower the faculty in an institution. One aspect of the related activities is educational support and the alignment of the initiatives to the faculty's development needs. This is particularly challenging in a multi-year digital transformation process. Therefore, it is important to develop an understanding of the changing practices and habits among the faculty.

Garrison & Vaughan (2008) suggest the concept of a community of inquiry as a key principle for the digital transformation from purely campus-based to blended learning practices. This should support lecturers to find the most appropriate combinations of technology and conventional didactics for their subjects and personal approach to higher education. This approach assumes implicitly that all members of the faculty share attitudes towards education, educational approaches, and proceed at the same pace when adopting new ideas and practices.

The experience from the presented case indicates that this approach is limited with respect to reach and impact. Moreover, the community of inquiry setting did not reflect the transitional practice, but the discourse raised new and complex challenges outside of the immediate practice as exposed in on-demand support. This discouraged interested "mainstream" faculty members and lowered the impact of these interventions even further.

The data of the used LMS functions provided important insights about the organizational transition towards blended learning. Using the different LMS functions as indicators for separate adoption processes improved the understanding of the dynamics of the transformation processes and helped to estimate when to expect new practices to occur across the organization. This has been an important element for channeling relevant information to the mainstream faculty.

Through the data lens, a gap between the practices of innovators and the mainstream faculty was identified that was otherwise undetectable and unexpected. In the presented case, the gap was partially caused by the LMS user interface and how it provided access to educational functions. Instead of developing the faculty members to be able to work around these user interface flaws, the choice was to improve the user interface. This technical change resulted in immediate uptake and effectively closed the gap between the mainstream and the initial innovators.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The data also revealed that willingness to innovate is not a personal trait, but a situational motivation that depends on "opportunistic factors" that change for different adoption processes. As the initial gap closed, new innovators emerged among the faculty. For faculty development, these new actors were easily identified without using the data because they were actively seeking support. However, these innovators were not helpful for guiding the overarching faculty development.

CONCLUSION

An important insight from this case study is that the adoption of digital education at the organizational level is not the single homogeneous process presented in the literature. Instead, online learning environments are collections of tools that support different educational practices. Each practice has its independent characteristics and educational functions. These differences lead to distinguishable adoption processes. Faculty development needs to account for such differences and their temporal dynamics. With this respect, meeting the mainstream's needs poses a key challenge, because mainstream faculty members are often not proactively seeking support. The data from the LMS helps to understand their digital teaching practice and to tailor scalable faculty development solutions that target the specific needs of these professors and lecturers. In the presented case, this intervention took the shape of an online blended learning handbook that helped lecturers within the mainstream not to expose their support needs.

The innovation adoption model helped to explain the dynamics and to identify bottlenecks of the adoption processes. Although the model derives factors from the theory that influence the adoption processes for different groups among the faculty, this chapter could only verify the plausibility of these factors based on the observations. It does not suggest their validity or consistency. Yet, the work led to a refined insight on the influencing factors in digital transformation projects and the presented framework provides tools for structured monitoring of the educational practice. Because this monitoring is non-invasive, it can be frequently applied and therefore contributes to the awareness about the development needs and technology acceptance among the faculty.

KEY TERMS AND DEFINITIONS

Adoption: The integration of a concept, idea, product, or service into an existing practice.

Adoption Rate: The number of adoptions by market actors or organization members at a given time.

Asset Specificity: The number of product or concept specific factors that refers to the unique features of products, ideas, or practices that differentiate them from other solutions. Asset specificity contributes to uncertainty factors that hinder potential adoption.

Basic Learning Activities: The parts of educational processes that require student activity that are not related to other learning activities other than by their co-location.

Blended Learning: An educational design principle that relies on connecting face-to-face and online learning experiences. Typically, onsite courses become blended when online activities are designed to replace some onsite sessions.

Course Organization: The administrative tasks that are part of educational processes. These tasks include student information, organization of group work, scheduling of activities, and collecting assignments for grading.

Data-Driven Orchestration: Automated orchestration of learning activities by using performance data of individual students or groups of students. The automated orchestration is based on conditions and completion rules that are defined in an educational design.

Digital Transformation: The reorganization of organizational processes towards the optimal usage of digital technologies and resources.

Educational Design: The process of planning and preparing educational processes. Educational designs determine the experiences of learners.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

IMS LTI: Learning tools interoperability (LTI) is a standard created by the IMS Global Learning Consortium that links content and resources to learning platforms.

Learning Resource Management: The organization and arrangement of learning resources, including text documents, images, infographics, HTML text, videos, audio files, and links to internet resources.

Orchestrated Learning Activities: Sequences or arrangements of learning activities that allow lecturers and students to monitor the learning progress. Lecturers may decide to change the arrangement and flow of their educational design based on this information.

Transaction Costs: The "overhead" costs that contribute to pricing and influence adoption decisions. Transaction costs include necessary investments in developing new procedures and practices, competence development and training, as well as infrastructure.

Chapter 46
Transformative Organizational Communication Practices

Philip J. Salem
Texas State University, USA

ABSTRACT

Most efforts at transformational organizational change fail. In order to explain that failure and the potential for success, this chapter introduces the construct of organizational communication practices and develops a theory to explain how these processes constitute organizations as complex adaptive social systems. Five axioms anchor the theory, and the author derives theorems explaining the important features of attempting to change transformative organizational communication practices.

INTRODUCTION

Communication and Organizational Change

First order organizational change is about simple learning and minor adaptations—the continuous, incremental adjustments that lead to differences in degree and more efficient outcomes (Argyris, 1992). Second order change, transformational change, involves altering the core features of organizations – goals, authority relationships, organizational structures, markets, or technologies (Aldrich & Ruef, 2006; Rao & Singh, 1999). Transformational change may appear to be discontinuous or episodic (Nadler, Shaw, & Walton, 1995), but it involves learning that challenges the premises behind first order change (Argyris, 1992). First order change refers to differences in degree, but second order change denotes differences in kind (Adler, 1967). First order change is about doing things better, but second order change is about doing better things. Change management is an expression that refers to efforts at controlling and directing both types of change.

Strategic initiatives are efforts at managing transformational change. These are typically top-down efforts aimed at employee commitment to the changes. Enduring improvements appear to be impossible without a change of culture (Cameron & Quinn, 1999). Some classic research indicated transformational

change efforts were successful only about a third of the time (Cameron & Quinn, 1999; Meyer, Goes, & Brooks, 1995) and more recent estimates place the figure at or below 20 percent (Cabry & Haughey, 2014; Towers Watson, 2013). Strategic initiatives with the purpose of changing organizational culture succeed less than 20 percent of the time (Smith, 2002). There is a body of literature just dealing with these failures and a multitude of explanations (see Robbins & Finley, 1996), effective communication separates those that were most successful from those that were not (Cabrey & Haughey, 2014), and there are specific identifiable communication patterns associated with failed change efforts (Salem, 2008). Transformational change may be less a product of strategic initiatives and more about the natural ways changes emerge in any social system.

Most organizational change literature treats communication as a separate part of "the organization". Weick (1969) argued that investigating the process of organizing was more true to the experiences of people than researching organizations. Farace, Monge and Russell (1977) offered one of the first organizational communication textbooks attempting to focus on process. Johnson (1977) contended "the 'organizing' of organizations can be examined as communication. Without communication, no organizations exist. Communication is not just something that happens within organizations. Communicating is organizing" (p. 3). Extending her earlier work (Johnson, 1976/1999), she went on to describe three communication coordination formats that organize social activity. These works were some of the earliest attempts to investigate the constitutive nature of communication (cf. Putnam, Nicotera, & McPhee, 2009).

Theory Development

When transformational efforts fail to alter "core processes", it is because the efforts did not produce changes in organizational communication or the changes in organizational communication were not transformative. The purpose of this paper is to describe a theory that will answer the following questions. (1) What are the dynamic features of human communication? (2) How do human communication practices constitute the boundaries of social units such as organizations? (3) How do communication practices naturally affect the way social systems adapt and learn? (4) How do communication practices evolve? (5) How can organizational communication practices changes transform an organizational communication system?

What follows is a theory building attempt that will lead to set of theorems. The theory building strategy involves defining constructs and creating relational statements (Dubin, 1978). I will define constructs as I explain relational statements.

There are several taxonomies for relational statements (Bachrach, 1989; Kaplan, 1964), and I will adopt a modified version suggested by Hawes (1975). Primary statements consist of statements the theorist assumes to be true because of semantics, logic, or past research. Theorists normally label the primary statements as either axioms or propositions. Axioms are the most general and contain definitions or constructs that are not readily observable. Propositions describe how observable phenomena relate to each other, and they are often summary statements reflecting past research. Corollaries are supplemental statements that help explain or highlight important features of a superordinate primary statement. This essay employs axioms and corollaries, but there will be references to past research.

Secondary statements are derived from primary statements and may involve adding constructs not in the primary statements. This theory building effort ends with theorems, a type of secondary statement, suggesting hypotheses, another type of secondary statement. Theorems are more general statements about how observable phenomena might relate to each other, and hypotheses are more specific.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

If communication is more than a way to assist organizational change and if communication is the way human beings coordinate actions and sustain all manner of relationships, then a change in communication is organizational change. This theory introduces the construct of organizational communication practices. When individuals communicate, their actions become part of emerging relationships and episodes. Individuals repeat communication, suggesting that the actors use rules for their performances. Organizational communication practices are the set of communication behaviors along with the rules for their enactment that constitute an emerging organization. When individuals change the organizational communication practices necessary to sustain and distinguish one organization from another, they are attempting to change transformative organizational communication practices. This theory explains how that happens and when it does not happen.

ORGANIZATIONAL COMMUNICATION PRACTICES

Axiom 1: Human Communication Occurs when Individuals Construct Messages as Part of Emergent Relationships and Episodes

The axiom sets boundaries and specifies a scope for the theory. Human communication is a process, and this theory is about how social phenomena emerges. This definition of human communication in the axiom points to four sets of factors (Salem, 2013). Individual humans, the creators of messages, is an expression inclusive of a host of psychological constructs (e.g., identity, motivation, social perceptions) located within individuals. Messages are behaviors and artifacts individuals use when trying to communicate with each other, and the boundary includes a host of familiar constructs referencing verbal and nonverbal aspects of messages. Relationships are emerging sets of shared or complementary perceptions individuals have about each other with each other. Examining relationships, in this model, makes room for broader social and cultural factors such as communication rules, cohesion, interdependence, and flexibility. Episodes are coherent sequences of interdependent messages developing as individuals communicate. Episodes suggests social interaction, stochastic processes, conversation analysis, and discourse studies. What may be lost is that since communication is about the development of episodes, any of the previous factors become irrelevant unless they help to explain episodes in general, types of episodes, sequences of episodes, or specific episodes.

Corollary 1.1 Human Communication is About the Tension Between Similar and Different

The dialectical tension between difference and similarity drives human communication. Page (2011) identified three levels of difference. Variance refers to difference within a type. Speakers have different amounts of credibility, for example. Diversity denotes differences across types. How many different ways did people discuss a given topic, and with what frequency did they employ these types? Configuration includes the different ways elements or types connect. Configuration is about communication networks, and configuration is also about how sequences, such as conversations, and the connections between sequences evolve over time. I will refer to difference, variety, or relative variety to refer to the general phenomenon, but use the other more specific terms as needed.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In its simplest form, the tension is between information and redundancy. Shannon's (1963/1949) use of the entropy formula (H) began with the tautology that information was the amount of relative variety in an array and that redundancy was the maximum relative variety possible minus the actual relative variety. The formula also described individual choices (information) as constrained (sources for redundancy). Fisher (1978) described several different ways others have labeled these extremes. Consider the following terms associated with difference: change, contrast, distinct, diverse, exploration, uncertain, and varied. Contrast these with terms suggesting similarity: alike, common, comparable, exploitation, organized, predictable, and stable. How do individuals recognize differences and integrate them into their knowledge? What is the proper balance between the potential stimulation of the message structure and how easily others will understand it? How well will individuals integrate into a group or any social relationship? When is the proper time to introduce a topic with the potential for conflict? This tension will be part of nearly all the topics in this piece. In this section, examples of that tension are between agency and constraint and between loose and tight coupling.

Corollary 1.2 Human Communication Involves a Mix of Individual Agency and Social Constraints

Agency refers to the ability of an entity to make a choice to act, to carry out that action, and to be responsible for an action; it means the entity can affect change (Littlejohn & Foss, 2009). In human communication, individuals have agency. They choose what to perceive, how to make sense of the objects of their attention, how to make sense of others and their social relationship to others, which rules might apply to those relationships, how to create a message, and what impact their messages might have had as part of an episode.

Humans, like all living systems, have limited agency. There are constraints. Passive constraints are the limitations on agency from sources that do not have agency themselves. For humans, passive constraints are likely to be invariant, delayed and emergent, and mindless factors associated with anything physical, biological, cultural, social, and psychological. Furthermore, the choices people have made and the messages they have constructed in the past alter the probabilities for consequent choices. To attempt to develop a relationship and an episode automatically limits individual agency.

Active constraints are limitations on agency from sources having their own agency. Active constraints occur naturally in human communication as individuals inform, motivate, persuade, and instruct each other (Ackoff & Emery, 1972). Individuals choose the enactment of their performances, but the separate performances act as mutual constraints on the participants as episodes and relationships develop. Engaging in human communication automatically constrains individuals' choices.

Corollary 1.3 Human Communication Sequences Vary by the Extent to Which Individual Behaviors are Coupled to Each Other

Weick (1976, 1979) employed coupling constructs to explain sequences of behavior to accomplishing a task and the strength of relationships between systems. He identified over fifteen uses of the expression "loose coupling" (Weick, 1976). In the current theory, coupling refers to the extent to which behaviors constrain each other. Tight coupling will refer to those sequences with high predictability between behaviors, loose coupling will refer to those sequences in which there are several behaviors that could follow each other in a sequence while still maintaining some coherence for the sequence, and decoupling refers

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to those sequences in which behaviors are not connecting to each other. By defining coupling in this way, the focus becomes the overt behaviors of actors, and actors' constraint on each other as perceptions about each other emerge concomitant to the patterns of behavior.

There are several different types of episodes. A simultaneous monologue refers to a minimally coherent episode in which actors express their own interests with little or no references to each other. In some instances, actors may talk over each other and turn-taking breaks down. An impromptu episode refers to instances in which actors struggle to learn each other's rules or to discover new rules. In these instances, the actors may develop coherence toward the end of the episode or abandon the episode altogether. Improvisation involves individuals accepting but adding to previous comments, responding in the moment, and placing comments within a sense of an emerging collective whole (Sawyer, 2001a). Coherence varies within an improvised episode as actors switch topics and cue each other to different rules. Most conversation is improvisation, and actors' communication resembles jazz (Eisenberg, 1990; Hawes, 1973). Messages are decoupled or minimally coupled in simultaneous monologues or impromptu episodes but loosely coupled in improvisation.

Messages become tightly coupled in social routines. Social routines refer to intended repeated sequences of behavior in which actors discard, expand, limit, or refine their interactions to better accomplish an outcome. The development of tight coupling in a routine resembles trial-and-error learning as actors improve their ability to accomplish outcomes (Rerup & Feldman, 2011). Actors employ rules, but the sequences may be so tightly coupled that they can also employ a script. Rothenbuhler (1998) suggested that ritual differs from other social routines in that it expresses or reinforces a social order. A social ritual is a social routine that cues, reflects, or reinforces some socio-cultural aspect (e.g., cohesion, interdependence, power) of the relationships between actors. Rites and ceremonies are the most tightly coupled and scripted forms of these rituals, but more loosely coupled rituals such as a Friday happy hour together or meeting for morning coffee are common. Alternatively, actors perform or complete some task with instrumental social routines (ISRs). Enacting routines involves the most constraints.

Others have investigated repeated organizational behaviors. Nelson and Winter (1982) sought to describe regular and predictable patterns of organizational members as "routines", but their analysis did not highlight how communication constitutes such patterns, and they used the same construct, "routines," to refer to the behaviors and the "decisions rules" related to the construction of the sequences. Similarly, Aldrich and Rueff (1999) highlighted the importance of routines in creating organizational forms, but they focused more on knowledge and other psychological factors and failed to recognize how communication constitutes goal direction and boundary management as well as task and management activities. Pentland and Feldman (2005) saw routines as dynamic and generative, they provided a model classifying research about routines, but they failed to mention communication. Johnson (1976/1999, 1977), a communication scholar, developed her model of communication coordination formats by investigating communication regularities.

Axiom 2: Organizational Communication Practices Define the Boundaries of Organizations

Communication Practices (CPs) are a set of communication behaviors along with the rules for their enactment. Although some research focuses on the typical ways individuals create messages (e.g., style research), the focus of this theory is about how messages become part of episodes and contribute to the development of relationships. All social units (e.g., families, organizations) are sets of identifiable episodes

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and episode sequences, and the emergence of such events and sequences also suggests the emergence of concomitant social relationships. This theory is about improvisations and social routines – how they might have originated and how they change. This theory is also about how impromptu episodes might become communication practices.

Organizational Communication Practices (OCPs) are the set of communication behaviors along with the rules for their enactment that organizational members perform. A common feature of traditional definitions of organizations is that they are constituted to produce some task – products or services (Scott, 2003). Organizations are a system of identifiable episodes and episode sequences involved with (a) the production of some task or (b) the creation or alteration of concomitant emerging relationships. And so, the OCPs consisting of the patterns of instrumental social routines along with the improvisations attendant to them constitute the emerging task structure of an organization, and the OCPs consisting of the patterns of social rituals along with improvisations attendant to them constitute the emerging organizational culture. Some episodes are part of sequences that do both.

Communication practices include rules. Giddens (1984) regarded rules as generalized procedures applied in the enactment or reproduction of social practices, Weick (1979) described assembly rules as policies, procedures, instructions, or guides for mobilizing social interaction, and Shiminoff (1980) explained communication rules as followable prescriptions indicating the obligated, preferred, or prohibited behavior in certain situations. Axelrod and Cohen (1999) conceived of rules as instructions for agent behavior, and the set of rules constituted the generative mechanisms for how agent's acted and interacted. Lundberg (2000) developed a model of social rules noting that rules may apply to individuals or social systems and that they may cluster into rule systems and sets of meta-rules he called rule regimes. All would agree that rules may be explicit or implicit, and, although actors may employ codified explicit rules, actors make sense and interpret all rules.

Ultimately, the locus of rules is part of an actor's social cognitions and schemata (Kunda, 1999; Moskowitz, 2004). For an organization to function well, it is more important for the members to have a shared or complimentary sense of the rules than it is for them to share or align their goals (Weick, 1979). Social actors can employ rules because they repeat much of their interaction with variation, and actors can adjust to variation in performance by changing rules or improvising.

Rules take the form of conditional statements about behavior, "If (when) situation, then behave (or not)". These are generative or regulative rules that lead to actions, they constrain communicators, and they may become the accepted procedures for conducting an episode. Others think of some rules as being constitutive, about linking actions to meaning or defining a situation (condition) (Farace, Monge, & Russell, 1977; Searle, 1969). Such rules are more about framing and making sense than about social actions (Weick, 1995), but one or more of these constitutive rules may define the situation that is the "situation" in regulative rules. For example, "When communicating with a person of superior rank in a formal situation, address that person as "Sir,"" clearly states how a person should act and acts as a constraint, but the person using this rule must have some sense of "rank" and of a "formal situation," part of constitutive rules or frames, before that person could activate the regulative rule. Indeed, when social actors use a given combination of regulative and constitutive rules they are attempting to constitute the situation.

There is a long history of studying the behaviors that are part of OCPs. In the past, organizational communication researchers classified communication by organizational function. Farace, Monge, and Russell (1977) and Stohl and Redding (1987) reviewed multiple categories of communication or message functions. McPhee and Zuag (2000) reviewed later literature on functions before settling on a classifica-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tion of flows constituting organizations. In some instances, the categories are similar to organizational goals (e.g., innovation). In other instances, some researchers may use the same terms for superordinate categories while others use the term for subordinate categories (e.g., Is innovation a type of goal function or a separate function). When organizational researchers identified "core" organizational features, functions, or processes, they used similar terms (cf., Aldrich & Ruef, 2006; Rao & Singh, 1999). What is clear is that researchers should use some classification that contributes to understanding OCPs and to understanding how those practices might change.

Some OCPs are archetypical OCPs that distinguish one group of organizations or groups within an organization from each other. Consider the differences between the first customer service interview between a patient and a receptionist at a health services organization such as a hospital or physician's office and the first encounter between a customer and employee at a fast-food restaurant. For OCPs to be archetypical, the OCPs must be similar across some groups but different than other groups.

Idiotypical or idiomatic OCPs distinguish and identify one group of social actors from another. Idiomatic OCPs may constitute a unique function, or they may constitute a common function in a unique manner. Furthermore, ideotypical OCPs may consist of configurations (e.g., connections or sequences) between otherwise common or archetypical OCPs. For an OCP to be idiomatic, the OCP must be common across members of a group but different than other groups.

The sets of OCPs employed by those identifying themselves as members of an organization create a boundary between one group of social actors and another. Some OCPs are archetypical OCPs and others are idiomatic OCPs. The mix and configuration of OCPs is idiotypical, however.

When individuals change the OCPs necessary to sustain and distinguish one organization from another, they are attempting to change idiotypical OCPs. This theory explains how that happens and when it does not happen. Additionally, some OCPs may be more important to generating and sustaining the emergence of higher levels of coordination.

Axiom 3: Communication Practices Constitute Complex Adaptive Social Systems

A system is a set of interacting components that constitute a dynamic whole with emergent properties (Buckley, 1998, p. 35). Any system becomes complex when the interactions of components lead to an evolving whole at a higher level of organization. That is, the local interactions between components are necessary for global properties of the whole (Merali & Allen, 2001; Miller & Page, 2007). A complex adaptive system (CAS) is a system in which changes in an environment can affect the system, and changes within the system can affect the environment (Buckley, 1968). As components alter their local interactions to account for each other and the environment, the global system properties change. A CAS is a system that learns.

When researchers study CASs, they often do so through agent based modeling. Agent based models are computer simulations of how components interact with the environment and each other to produce emergent properties (Railsback & Grimm, 2012). Researchers begin with a set of hypotheses, research questions, or developed theory, they program the traits of the various components and the rules for interaction, and they run the model using one or more computer programs designed for simulations. In addition to satisfying the initial research goals, the models may also demonstrate unanticipated emergent phenomena.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Researchers refer to the components as agents. Agents are unique and autonomous components capable of interacting with other agents in some local space (Railsback & Grimm, 2012), and so, researchers include agency and constraints when they design the system. Each component has its own set of traits and rules for interaction. The similarities between components may be an effort to represent a species or the members of a common system or subsystem. When components repeat interactions, the repetition may reinforce particular rules for the interacting agents or trigger new rules shared by the interacting agents to represent the emergence of a system or subsystem. Some agent modeling researchers represent this "sharing", by giving all agents or groups of agents the same rules. A more realistic representation would account for the emergent character of rules as communication develops. The outcomes of simultaneous interactions or sequences of interactions become social constraints altering the next performances of behaviors.

When models use agents to represent just two humans, the models produce the relationship between humans, their communication (interactions), their episodes, and the arrangement of their sequences of episodes. The emergent relationship and episodes have properties that do not describe individuals or individual messages (actions), and the humans (agents) come to have characteristics they did not have before the emergence of the system. What researchers would be modeling is how the development of communication practices constitutes a complex adaptive social system.

Corollary 3.1 Communication Practices are Autopoietic

CASs are autopoietic, meaning the parts organize themselves into a system. Adaptation and evolution occur from the bottom up. When CASs adapt, it is because the components have adapted (Page, 2011). The components construct the patterns of interaction, and the arrangement of repeated interactions is the structure of the system (Buckley, 1998). The system has no agency, but the system represents and acts as a passive constraint on the components collectively (Buckley, 1998). When components change, the structure changes, and the system changes.

Communication is the process that humans use to organize themselves into a complex adaptive social system. Ashby (1968a) suggested that constraint was the minimal condition for organization. When a person considers the state or behaviors of another person before that first person behaves, the condition or behavior of the other person acts as a constraint on the actions of the first person. Social relationships evolve as a set of mutual constraints on the individuals in a relationship. When people communicate with each other, they use mutual or compatible individual constraints (rules) concomitantly as coordinated behaviors (episodes) emerge. Coupled systems achieve coordination as individual systems discover and match the appropriate mix of variety and constraint to sustain the links to each other. The Law of Requisite Variety suggests that living systems can achieve this matching naturally (Ashby, 1968b).

Corollary 3.2 Communication Practices are Autocatalytic

Organizing a CAS involves autocatalytic processes. That is, once set in motion, the processes will continue to function on their own. The processes repeat themselves with the output from one iteration acting as a recursive input for the next iteration. The processes have the potential to be multiplicative so that the relationships between inputs and outputs are nonlinear. Some parameters define constraints for processes, and the removal of constraints acts to improve the likelihood of nonlinearity. Removing

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

constraints increases variety in the system and can push a relatively stable structure to transformative change or dissolution.

Communication practices are the primary autocatalytic process in complex adaptive social systems. The practices repeat themselves and have rules. An episode emerges as individuals use a set of rules to make messages that are input into the episode, and the emerging episode, the output, becomes input for the evaluating the effect of the last message and for creating the next message. The practices have the potential to be multiplicative such that the relationships between inputs and outputs are nonlinear. For example, episodes can involve innovation within or across practices, and there can be conflict. Parameters such as rules for formal roles and the assumed topics or functions for the practices define constraints, but the removal of constraints acts to improve the likelihood of nonlinearity. Removing constraints increases variety and can push a stable practice to transformative change or termination of the practice. As variance within practices increase, more diverse practices emerge, and the overall configuration may change.

The system emerges as a configuration. On the one hand, the configuration includes a social network of actors with links representing the nature of their relationships to each other. On the other hand, the configuration also includes the arrangement of the episodes emerging as relationships emerge. This second arrangement may be more sensitive to the sequence of episodes such that the arrangement suggests cycles of episodes. Social network analysis can display both arrangements as either separate networks or as one network combining both relationships and episodes (Scott, 2000; Wasserman & Faust, 1994). CASs consist of diverse, rule-governed, interdependent entities interacting over a network (Page, 2011).

The actors in a social system are human beings developing relationships and performing role behaviors. This means there is much more plasticity or variance with social systems than other CASs (Buckley, 1968, 1998). There are many organizational roles for organizational members, and each role is part of different relationships with its own rules. A person may be a clerk, but that same person develops different relationships, requiring different roles and rules, with the people with whom they interact. People negotiate their roles with each other. Furthermore, each person plays other roles outside their organizational experiences, and other relationships and experiences affect the performance of organizational roles. The abilities for actors to learn and adapt is even more important when the components of the system are naturally so varied, and their interactions can be so different.

Local communication involves the emergence of relationships between the actors and the development of episodes. The configurations of the relationships between actors form an emerging communication network, and the temporal connections between episodes form emerging communication sequences. It is the emergence of these arrangements that become a complex adaptive social system. Local communication leads to higher order systems such as a local unit, a department, a division, and the organization as a whole. The sets of OCPs that sustain the emergence of these arrangements constitute an organization.

Theorem 1: Strategic initiatives will fail to accomplish transformational change when they do not alter idiomatic organizational communication practices.

Organizational members create and modify OCPs on their own (autopoietic), the processes become self-stimulating (autocatalytic), and these practices become emergent task structures and cultures that identify the social system as an organization. OCPs are the core processes. Organizational goals, for example, are emergent phenomena happening through communication, and any regular effort at reviewing, assessing, or changing goals is an instance of OCPs. Likewise, any effort at changing the way

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

an "organization" performs a task function necessarily means changing the communication practices identified with those functions since communicating is organizing.

Transformational organizational change is about transforming communication. Rao and Singh (1999) framed different types of organizational change as the evolution of a new species, and they concluded that strong speciation occurs when most of the core processes change. Especially important were those parts of core processes that identify an organization and distinguish it from other organizations. Idiomatic OCPs are those communication practices that identify an organization and distinguish it from other organizations, and transformative organizational change happens only when there are changes in these practices.

Strategic initiatives fail when the directors of these efforts fail to account for idiotypical OCPs. For example, anyone strategically attempting a functional transformational change must consider questions like the following. What are the distinguishing OCPs associated with a given function? Which of these practices do people wish to change, and how do they wish to change them? Which episodes do people wish to change, how will the arrangement of episodes change, and how might these changes alter the task structure, climate, and culture? How might organizational members modify the changes, and how might these modifications change the answers to the previous questions? How much time will be needed for the communication associated with trying to make this change? Without tentative answers to these types of questions, the effort will not succeed.

CHANGING ORGANIZATIONAL COMMUNICATION PRACTICES

Axiom 4: Organizational Communication Practices Evolve Through a Modified Four Phase Natural Selection Process

Behavioral science researchers have attempted to use Darwin's natural selection model as an analog for the development of social behavior for some time. Campbell's development of his sociocultural evolution model may have been the most successful (Campbell, 1965). Organizational researchers have used it to frame a variety of research, and Campbell's work led to the development of population ecology research (Aldrich & Ruff, 2006; Baum & McKelvey, 1999). Weick (1969, 1979) modified Campbell's original model to explain learning as making sense. Natural selection has also been part of the assumptions made by researchers studying nonlinear processes in organizations (Marion, 1999, 2002; Stacey 1996, 2003). Communication researchers often refer to this approach as part of evolutionary or ecological models (Monge et al., 2011)

Original models identified three parts to evolution. Variation is the process in which the entities perform different behaviors and produce different outcomes. Invention may account for some differences, and these novel occurrences may happen through combining previous behaviors or outcomes (e.g., crossovers). There are also errors (e.g., mutations), mistakes made trying to copy previous behaviors or outcomes from pervious performances. Variation provides a range of behaviors and outcomes for accomplishing a range of functions. Campbell (1965) referred to this stage as Blind Variation to emphasize the chance or blind characteristics of most variation. In an organization, the natural differences between people and among people and the differences in their interactions inside and outside organizational relationships are a continuing source for Blind Variation. Rational variation occurs when social actors develop variations strategically, to fulfill one or more conscious purposes. Weick (1969, 1979) called this first stage enactment to emphasize that social actors create those situations of which they will then make sense.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Selection is the second process related to natural selection. In natural systems, the environment provides a set of passive constraints (e.g., the availability of resources, the weather, the number and types of predators) that form selection criteria. In socio-cultural systems such as organizations, there are passive constraints such as each actor's personality, previous decisions, and the sequences of past behaviors, but the goals, decisions and efforts at persuasion or compliance become a set of active constraints forming selection criteria. If entities, behaviors, or outcomes fail to meet criteria, they are less likely to find opportunities to reproduce, and so selection pressures winnow what variation produced.

Retention is the last process. Retention refers to all those mechanisms to copy and preserve the selected organisms, behaviors, and outcomes. In biological systems, reproduction is the most obvious retention mechanism. In organizations, developing policies and procedures and storing them in documents are efforts at retention. All efforts at reinforcing routinization are part of retention. Reading documents and trying to conform to policies, a part of the enactment following retention, seldom produces completely uniform behavior. There will always be copying with variation.

When some of the early researchers of chaos theory and complexity theory developed their ideas, they began by exploring biological systems and natural selection. Kauffman (1993, 1995) investigated how biological life could emerge through the natural selection of chemicals in the primordial soup. His agents in his models were the chemicals that would constitute genes, and so his agents represented the distribution of genes across a fitness landscape. His models demonstrated that adding the interaction of the agents to the models made the emergence of life probable.

Traditional models of natural selection involved variation, selection, and retention, but Kauffman's model involved variation, interaction, selection, and retention. Newer agents interacted among themselves and older agents, and selection acted to insure that the most adaptive configurations of agents survived the environment to reproduce. There was also a mutually causal link between selection and agent interaction as selection pressures acted to alter the intensity of the interactions.

Interaction in the Kauffman model and similar models refers to the creation of a link between agents and the development of conditional behaviors – coordination. Some agents must rely on others while other agents rely on each other in a specific sequence. In an organization this could be as simple a link as a sales person waiting for another worker to deliver a product to the sales person before the sales person delivers the product to the customer. Of course, human communication is a form of interaction.

In analyzing communication networks, these distinctions would be about the direction and strength of ties between actors (Monge & Contractor, 2003). Some actors have links that are one directional (e.g., actor A gives to/influences/sends to actor B), and others have links that are bidirectional (e.g., actor A and B communicate with each other). The coupling distinctions are ways of defining the strength of the ties between each other. Weak links are loosely coupled and strong links are tightly coupled.

Human communication differs from other forms of "interaction" because it involves social actors in the process of constructing things together. As actors create individual messages they partially include themselves and define their roles as part of an emergent relationship (Katz & Kahn, 1978). The various messages connect to each other in some meaningful ways as part of an emerging episode. The actors create, reproduce, and potentially transform coherence and order as they mesh individual actions (Stacey, 2001).

When viewing communication as constituting organizations, the variation stage is exclusively about the performances of episodes and primarily about OCPs. Actors will repeat some episodes with little variation, and these episodes are tightly coupled. Other actors will repeat episodes with greater variation, and these episodes are loosely coupled. Some actors will improvise to account for differences, events or

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

circumstances not a part of routines. Impromptu episodes introduce the greatest variety into the system and may lead to improvisations and social routines if the episodes can survive the next two stages.

In the second stage, interaction, actors will communicate about the episodes they have created in variation. That is, the episodes at this stage are about the arrangement and coordination of episodes in the last stage. In some instances, the communication patterns will reinforce routines and the emerging system, in other instances communication will challenge or question routines, and there will be communication about the performances of the improvisations and recognition of any impromptu episodes. The arrangement of communication events following this stage becomes the input for the next stage. In this phase, human communication produces the whole people call the organization.

In the third stage, selection pressures will favor some links, network configurations, episodes, and episode sequences over others. Improvisations may be the most common communication in this stage. Actors will begin to act on what was observed at the end of the interaction stage and begin communication about how to retain, expand or eliminate some links, episodes, or arrangements between them. Some actors may construct explicit episodes to evaluate what is happening.

The last stage, retention, also involves communicating about other communication. Story-telling episodes, policy meetings, ceremonies, and training sessions are all good examples. The outputs for this stage are the rules for performing retained communication practices and the records of different performances that become the basis for the variation stage.

Theorem 2: The longer an organizational communication practice or set of practices have been in place, the more difficult they will be to transform.

As OCPs evolve, they become more efficient at accomplishing their functions. There will be incremental changes to OCPs that survive each iteration of the evolutionary process, and the incremental changes will become smaller and smaller the longer the OCPs persist. Episodes will become more tightly coupled as improvisations become routines. The OCPs will contain what members have learned. This is the essence of continuous, first order change.

This pattern of squeezing more and more variety out of the OCP is also part of improving the fit of the various OCPs to each other. Coordination becomes easier within units and then across units. History becomes a passive constraint on change. The performance of the OCPs can become mindless and can become a self-fulfilling prophecy about the efficacy of the OCPs (Kilduff, Crossland, & Tsai, 2008).

Organizational members will retain the rules for past communication practices even as there are attempts to install alternative OCPs. It is not uncommon for organizational members to employ old OCPs once a change management effort has ended or the champions of such an effort have left (Robbins & Finley, 1996; Salem, 2008). Members comply with such efforts, but they do not commit because they have experienced the success of the older OCPs and they know the newer OCPs will be temporary.

Changes enter as part of variation, but transformational change will involve changing idiomatic OCPs, the way people communicate about changes, selection criteria, and retention mechanisms. Transformational change will take time, and if the current OCPs have been in place for a long time, it will take a long time to change them. It will also take more communication to change.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Axiom 5: Transformational Change is Possible Because of the Nonlinear Potential Inherent in the Autopoietic and Autocatalytic Nature of Organizational Communication Practices

The traditional view of an organization was that it was a contrived or rational system (Katz & Kahn, 1977; Scott, 2003). This view meant that organizations may be a system, but they were a system with goals, technologies, and structures, and there were special components involved with management. However, in a CAS, there may be a system hierarchy (e.g., component, subsystem, system), but there is no hierarchy of components – no vertical authority differentiation. There may be actors who are involved with leadership or management, but that means those actors have different constraints and rules than others. It means there cannot be "top-down" change, but just the changes emerging from the nature of the actors and their interactions. The decider mechanism in a social system is dispersed downwardly – individual components make local decisions (Miller, 1978). Management's efforts achieving transformative change through a formal strategic initiative would face the same challenges as any effort challenging current practices. Leaders often view themselves as outside the system as they make attempts to change organizational behavior, and this tendency may account for their failure to appreciate the challenges facing their efforts (Griffin, 2002).

There has been considerable research in mathematics and the natural sciences about nonlinear processes since the 1940s. Likewise, social and behavioral science researchers have employed CAS models since at least the 1930s. There was a special issue of *Nonlinear Dynamics, Psychology, and Life Sciences* in 2013 devoted to organizations, there have been edited volumes devoted to nonlinear processes and organizations (Allen, Maquire, & McKelvey, 2011; Uhl-Bien & Marion, 2008), and communication scholars have incorporated these ideas into their research (Contractor, 1999; Monge et al., 2011). The development of basic ideas for these efforts goes back several centuries (Goldstein, 2008; Salem, 2013).

Stacey (1996) described organizational life in such a way that highlighted the autopoietic and autocatalytic features of organizational communication. Furthermore, this description highlights how variety bubbles up to affect organizational change. I will employ this model emphasizing OCPs.

Stacey (1996) begins his description by explaining that any organization has both a legitimate system and a shadow system. The legitimate system consists of the formalized task structure and the dominant culture. As noted earlier, the formal task structure consists of the arrangement of those OCPs involving the central instrumental social routines and the improvisations associated with them, and the dominant culture consists of the arrangement of those OCPs involving the prevailing social rituals and the improvisations associated with them. The shadow system begins as impromptu episodes and improvisations developing into communication practices as alternatives to those that constitute the legitimate system. Actors may organize the alternative communication practices into arrangements that become one or more shadow systems challenging the legitimate system.

A shadow system emerges from communication differences people experienced performing organizational roles and their roles in other relationships. Different communication experiences become part of the variance when performing organizational social routines. Actors may discover that the modified routines result in more beneficial episodes, and so the actors may repeat the modified routines as alternatives to the prevailing practices. The differences challenge the legitimacy of current constraints, and some of those challenges coalesce as alternative mixes of variety and constraint.

Notice that variety enters at the level of individuals and specific practices. There is variance between individuals in performing the same practices. This moves to diversity among types or between groups.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Actors perform similar OCPs within a group, but different actors perform different OCPs between groups. Variety enters into configurations by comparing structural and sequential OCP arrangements across time or by comparing large segments of an organization to each other. Stacey's description suggests that variety progresses from individual to group to configuration as a shadow system develops, and this pattern mirrors Page's (2011) levels of difference.

Stacey (1996) described four possible outcomes to dealing with these challenges. The legitimate system may continue to dominate as members ultimately reject one shadow system as others emerge, or the legitimate system may adapt by incorporating some alternatives as first order change. There will be little or no modifications in idiomatic OCPs as the organization exhibits stability and maintains an equilibrium state. When organizational theorist adopted a systems perspective, they thought of maintaining equilibrium as the ultimate measure of success. Indeed, systems researchers were emphasizing stability over change (Buckley, 1968). This first organizational outcome corresponds to a point attractor, a stable outcome in the nonlinear research literature occurring when little variety is part of an autocatalytic process (cf. Vallacher & Nowak, 2008).

When organizational members have been together for a long time, social routines dominate OCPs, and there are less frequent improvisations. There is the potential for inertia, stagnation, and cult formation as the system loses its robustness (Kilduff et al, 2008; Page, 2011). Difference can be threatening. There is also the danger for disintegration, as noted below.

A second outcome occurs when there are somewhat fewer constraints and greater variety than when a process leads to equilibrium. The legitimate system may split while members examine two or more structures as alternatives for behaving or may sustain multiple but competing sets of OCPs. The most obvious examples occur when organizations have project teams or members adopt a project structure. Actors may have one set of OCPs for the majority of members, but reserve a special set of OCPs for members working with special clients, exceptional task lines, or crises. In a purely project structure organization, the system maintains a central core coordinating separate continuing projects. In a matrix structure, the project managers emphasize the differences between their projects, but functional managers for the entire organization attempt to insure some uniformity across projects. In a brokered system, a central core may coordinate independent organizations to complete one task and may coordinate completely different organizations to complete a different task. The only sustainable legitimate system involves the OCPs at the core.

The movement from project teams to project structures to matrix structures to brokered systems is one of increasing variety, looser coupling, and greater improvisation. In the nonlinear literature, this archetype is called a period attractor in which multiple outcomes are possible from the same process (Vallacher & Nowak, 2008). The dean's office of an academic college faces these challenges with the shadow systems in different departments.

As variety increases, there is still a legitimate system with an increasingly more flexible system at the core as the number of shared OCPs becomes smaller. Some OCPs that were part of the legitimate system become part of a shadow system. The most obvious instances of this kind of turbulence happen with mergers, but any expansion or contraction of tasks stimulates movement between legitimate and shadow systems. The members may be in danger of losing their collective identification with other members, and the organization may be losing its distinctiveness.

The third outcome is disintegration of the system (Stacey, 1996). This can happen in two very common trajectories. First, the system may have become brittle over time as members squeezed so much variety out of the system that any change in routines could bring down the entire structure. People only know

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

one thing and one way to do it, they have been in the system for a while, and they have lost any desire to change, for example. Second, small changes magnified their impact to the point that the old system has lost viability. For example, an organization that evolved into a brokered system could die because the separate units may decide to do their own coordination.

The fourth outcome is the emergence of new legitimate systems (Stacey, 1996). That is, organizations undergo transformational changes and continue to transform themselves over time. Transformational change is possible because the legitimate system acts as a shield for internal turbulence as alternatives develop. The legitimate system is a source of order while disorder develops simultaneously. As the emerging shadow system gains momentum, creative destruction occurs and the former shadow system becomes the new legitimate system. Then the process begins again.

The third outcome is possible because autopoietic and autocatalytic process have led to chaos, the third outcome. Chaos appears to be random, but the system moved to this state because of a rule-governed autocatalytic process. With non-living systems (e.g., physics, chemistry), the state had the potential for self-re-organization, the fourth outcome, but in living systems (e.g., biology), the result was disintegration. Researchers labeled the state that can continuously produce the fourth outcome a strange attractor, the edge of chaos, or the complexity regime (cf. Salem, 2013). The significant difference between the autocatalytic process that led to chaos and the ones that led to the edge of chaos is that the amount of variety introduced into the processes at the edge of chaos is high, but it is less than the amount of variety introduced into the processes at chaos.

Theorem 3: When the diversity of communicators is high, strategic initiatives are more likely to accomplish transformational change than when the diversity is too low or too high.

Theorem 4: When the diversity of messages is high, strategic initiatives are more likely to accomplish transformational change than when the diversity is too low or too high.

Theorem 5: When the diversity of ways of communicating is high, strategic initiatives are more likely to accomplish transformational change than when the diversity is too low or too high.

Theorem 6: When the connectivity between communicators is high, strategic initiatives are more likely to accomplish transformational change than when the diversity is too low or too high.

The theorems are amenable to empirical investigation. There are ways of measuring or gathering data about variety, both quantitatively and qualitatively. Researchers can determine how much is too high, high, low, and too low.

All of the theorems are ways of increasing variety and reducing constraints on communication between organizational members. This is similar to what happens when researchers increase parameters using agent modeling. Increasing variety also has the effect of increasing the load for members.

The theorems posit how greater diversity of communicators, messages, ways to communicate, and opportunities to communicate affect the potential for transformational change. Episodes will become more improvisational, and there is the increasing possibility of impromptu episodes questioning old rules and establishing newer ones. Members will transform their communication and the configurations of communication that constitute their organization.

The particular transformations are unpredictable. None of the theorems posit an intended outcome. Rather, the theorems are about the likelihood of strategic initiatives being part of transformational change. Leadership in such an effort is about creating opportunities for members to learn from each other while managing inevitable tensions and conflict (Uhl-Bien & Marion, 2008).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

Most strategic initiatives fail to accomplish transformational change. Human communication is a dynamic process in which individuals co-construct their relationships and episodes. Individuals confront variety and the tensions between agency and constraints as they construct organizational communication practices. Accomplishing transformation change involves recognizing how individuals organize themselves with organizational communication practices that evolve and constitute organizations.

Organizational communication practices are the process by which a group of individuals become a complex adaptive system. These practices evolve naturally, but the autopoietic and autocatalytic nature of communication means that the process can sustain the system or challenge it as variety increases in the processes. The outcomes of autopoietic and autocatalytic processes are minimally predictable. Ultimately, transformational change is possible when individuals bring enough variety to their communication to challenge older idiomatic OCPs and develop newer ones. However, introducing too much variety could also lead to the dissolution of the system.

KEY TERMS AND DEFINITIONS

Agency: The ability of an entity to make a choice to act, to carry out that action, and to be responsible for an action; it means the entity can affect change.

Autocatalytic Process: An iterative and recursive self generating process with the potential for nonlinear outcomes given the proper conditions.

Autopoietic Processes: A process in which components organize themselves into a system.

Complex Adaptive System: A set of diverse, rule-governed, interdependent entities interacting over a network such that the system can adapt and learn. However, the system changes only as a function of changes in the entities or their interactions.

Constraint: The limitations on agency or the source of limitations on agency. Passive constraints are the limitations on agency from sources that do not have agency themselves. Active constraints are limitations on agency from sources having their own agency.

Idiomatic or Idiotypical Organizational Communication Practices: The set of communication behaviors along with the rules for their enactment that identify and distinguish one organization from another.

Organizational Change: Organizational differences at different times.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Organizational Communication Practices (OCPs): The set of communication behaviors along with the rules for their enactment performed by organizational members. OCPs consisting of the patterns of instrumental social routines along with the improvisations attendant to them constitute the emerging task *structure* of an organization, and OCPs consisting of the patterns of social rituals along with improvisations attendant to them constitute the emerging organizational culture.

Variety: Refers to the tension between similar and different. Greater variety means the extent of difference is greater than or has increased while similarities are less or have decreased from one circumstance or period compared to another.

Chapter 47
Reflections on the Effect of Organizational Restructuring: Evidence From Albania

Ionica Oncioiu
Titu Maiorescu University, Romania

Diana Andreea Mândricel
Titu Maiorescu University, Romania

ABSTRACT

This chapter presents a new perspective on processes of change and adaptation to changes in Albanian telecommunications companies in order to maintain their position on the market. The objective of organizational changes, as a continuous process of experimentation and adaptation, is to correlate the capacities of an adaptation company to the business environment. The results of the study have shown that successful management of change is important for the survival and success of any company in the current environment in Albania. To take advantage of the benefits of organizational change stimulated mainly through innovation, companies need to think, act holistically, and make multi-level changes.

INTRODUCTION

The management of organizational change is a continuous process of experimentation and adaptation that has as its main target the correlation of capabilities of an organization to adapt to an environment business (Rojon et al., 2015; Pieper et al., 2017).

At the same time, contemporary society launches industrial and organizational challenges that trigger a new rhythm of change with many faces (Ericksen & Dyer, 2005; Lee et al., 2016; Pattnaik & Sahoo, 2018). The ensemble of forces as components of the external environment is extremely difficult in the existence and survival of prosperity (Podsakoff & Organ, 1986; Pettigrew et al., 2001; Meuer, 2017).

Moreover, the main concern of the telecommunications system is the efficient management of initiatives of strategic change, and the fundamental difference between the success of an organization's success and the failure of others is merely the ability to adapt to any change (Schulz, 2004; Wu et al., 2011; Briggs et al., 2012). Thus, telecommunications organizations need to permanently study and monitor the external environment to anticipate changes and adapt quickly.

The management of change underlines the problematic of managing change, being in itself a phase that has at least two meanings (Sementelli, 2016). The first one refers to adopting changes in a structural way, planned and organized in order to efficiently implement some methods and systems within an organization in activity, as changes that have to be managed are found within an organization and are controlled by it. The second meaning of management of change refers to the reaction and the answer to changes that the organization does not control them in a small measure (legislative changes, the change of social or political climate, competitiveness, and the changes of economic boundaries).

This article takes a fresh look at empirical studies that have tried to demonstrate the connection between change management and organizational development in telecommunications system and it has three main contributions.

First, in support of the theory, we derive two different testable hypotheses that allow us to formulate a strategy of change within the telecommunications companies in Albania. A better understanding of change was supported by empirical proofs from various authors, including Renn et al. (2014), Weiss (2001), Bloodgood and Morrow (2000), Bolman and Deal (1999), and Chahal et al. (2016), who proposed a model of the stages of change relatively similar to the reaction of employees.

Second, in the investigative approach to new change management challenges in the contemporary economy, we used a complex strategy of research, combining quantitative and qualitative methods of investigation. All the scientific process involved taking into account all the parameters/variables considered useful in identifying the answer to the central research question. The entire research process involved completing specific rules, collection, analysis, and the selection of information that can be proven objectivity with a lot of rigor over a predetermined length of time. The results obtained are valid and reproducible because they are based on a methodology of well-chosen research that lends credibility to the conclusions we have reached at the end of the research period.

Third, using a qualitative model design, we demonstrate that no matter how well the strategies of change are formulated, the implementation of change is a decisive step in its successful realization. Managerial practice has shown that strategy implementation failure is the basic reason why people are anxious about organizational change (Song et al., 2015). More specifically, the diversity of views expressed in the literature specifically referring to change and management helped us determine the best approach for positioning our scientific research on the new change management challenges in the contemporary economy (Guo et al., 2017).

The results of this study show that successful management of change is very important for the success of the organization and its survival in the current business environment (Kemper et al., 2017), also in the private telecommunications environment. In the light of the apparent logical hole, the theories and approaches of management of change that are available for theoreticians and practitioners often argue between themselves, and many of them lack the empirical evidence supported by incontestable hypothesis regarding the nature of contemporary organizational management of change (Munro, 2014).

Finally, our findings have revealed that the transition from passive status to the active status of personnel in an organization is possible when change occurs and is implemented.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The rest of the article is organized as follows: Section 2 provides the materials and methods development; Section 3 presents the results and discusses our findings. Finally, the conclusions are presented.

BACKGROUND

According to specialists, Albanian telecommunications companies as well as other organizations face problems in anticipation and adaptation to changes in their environment (Guillén & Saris, 2013). The factor that causes lack of performance in the field of competitiveness is precisely the inability to recognize the changes that occur in the business environment. Adopting a systematic approach to change contributes to the success of an organization (Bostan, 2016; Popa, 2012). In this respect, they will have to simultaneously manage all the challenges of change. One of the challenges of organizational change is the importance of managing experience in changing personnel (Strauss et al., 2012; Jung et al., 2016).

Through major changes with impact on all members of an organization, it is trying to eliminate uncertainties (Wu & Chen, 2014). The insuring conditions that Albanian companies remain on the market and can adapt to market requirements are: (1) good knowledge of the company; (2) transparency of management processes in order to increase the quality of services; (3) creation and diversification of internal mechanisms of reaction to disruptive forces outside the company (Popa, 2012).

Many specialists have approached the concept of management of change (Frese & Fay, 2001; Kotey & Slade, 2005; Paton & McCalman, 2008; Pfeffer, 2012). However, organizational change is far from being understood in terms of dynamics and effects in time, of the processes that occur, of discontinuity and context. The technical change in the industry of services represents an area poorly represented in the literature of speciality, despite the importance that innovation and employment have (Bakotic & Krnic, 2017).

RESEARCH METHODOLOGY

The design of our model was based on the view of Kets de Vries (2003), who stated that change is based on five categories of behaviour: behaviour of concern, confrontation behaviour, behaviour of classification, behaviour of convergence of the efforts to achieve the organization's goals, and behaviour of change.

Although some statistical works ignore the existence of improbability techniques (for reasons that are related to the impossibility of applying the theory of probability), because of the characteristics specific to the socioeconomic domain—which sometimes make it almost impossible to fulfil the conditions of compliance of a sample that will not violate the laws of probability—we believe that improbability techniques are important and useful for this study. For this phase of the study, we used the technique of sampling improbable (non-random), that is, proportional quota sampling, because the literature considers it adequate for exploratory studies given its greater accessibility and low cost.

Modifying the operational framework will achieve the scientific approach required the development of a questionnaire to obtain the views of respondents, and the selected respondents represented overall characteristics of the included population. The model of research proposed by this study started from the premise highlighted in the literature that there is a directly proportional correlation between organizational change and organizational culture.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The logical structure of the questionnaire allowed us to quantify each item from the process of implementation of change by subdividing the components and classification of variables according to the criterion of causality. The evaluation of the respondents' opinions was done using the 5-level Likert scale to avoid their reluctance: strongly agree, agree, indifferent, disagree, and strongly disagree. All questions were closed-ended questions. The distribution and filling of the questionnaires were conducted from July 2018 to October 2018 in Albanian telecommunications companies (Albtelecom, Eagle Mobile, Plus Communication, Telekom Albania). To ensure the objectivity of the answers, the respondents were provided with a climate of anonymity.

The adoption of empirical research conducted on the four sections (D - the level of acceptance of change, E - appreciation towards the way of communication of change, F - evaluation of determining factors in the success of change, G - evaluation of the level of resistance to change) of the hypothesis (H_1 The evaluation of the attitude towards change is positively influenced by the necessity of change within the organization, and the circulation of information within organization) allowed the calculation of scores for each item facilitated our analysis of the scores.

Based on the results obtained by submitting the scores and comparing them with those identified in the strong points (SP) and weak points (WP), we can proceed to the validation and invalidation of items in the next step. According to the research model, the questionnaire was structured in a logical sequence in seven sections; in step two, the items established in determining the interdependence of components that allow the identification and characterization H_1 will be analysed and interpreted.

RESULTS

Triggering the process of change in companies requires identifying the main problems the companies face and the opportunities for the establishment and development of collaborative relationships between specialists in change management and the members of the organization that is going to make the change (Latham & Pinder, 2005; Belbin et al., 2012; Leyer et al., 2017).

The results of the analysis and their interpretation were carried out in two stages:

1st Stage: Identifying the strengths and weaknesses of management of change in the Albanian telecommunications companies in terms of the important motivation in the success of change and the attitude toward change.

2nd Stage: Analysis and interpretation of items for determining the management of change in organizations according to H_1 using statistical and econometric methods.

The hypothesis is explained by the following equation:

$$H_1 = \beta_0 + \beta_1 (Y_1^D) + \beta_2 (Y_1^E) + \beta_3 (Y_1^F) + \beta_4 (Y_1^G) \quad (1)$$

where:

Y_1^D = the need of change within the organization—the values show the average of items 1, 4, 5, 6, 7, 8, 9, and 10;

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Y_1^E = the circulation of information within the organization—the values show the average of items 2, 4, 5, 6, and 9;

Y_1^F = level of effort needed to eliminate barriers in the way of change—the values present the average of items 1, 2, 3, 5, and 6; and

Y_1^G = the behavior of the personnel responding to change—values present the average of items 3, 4, 6, 7, 8, 10, 13, 14, 15, and 17.

The modelling of the equation was done by selecting the items validated in Table 1 and the resultative ones, Y_1^D, Y_1^E, Y_1^F, and Y_1^G, that involved a multicollinear direct equation. Using the regression linear function from Excel, we estimated the parameters and the statistics of additional regression for Y_1^D, Y_1^E, and Y_1^F.

Besides, β1, β_2, β_3, and β_4 parameters are expected to be positive (see Table 2).

$H_1 = 0.44 + 0.20\ (D) + 0.10\ (E) + 0.25\ (F) + 0.34\ (G)$

Table 1. Continued

Symbol	Items	Indicators of central and variation tendency				
		Media	Standard deviation	Coeff. de variation%	PF/ PS	Validation/ invalidation
$x_{1.3}^{G}$	Changing plans seems a real drudge for me	2.69	1.19	1.41	PS	Validation
$x_{1.4}^{G}$	I often feel a little bit uncomfortable even when it is about changes which. possibly can improve my life	2.62	1.16	1.35	PS	Validation
$x_{1.5}^{G}$	When someone puts pressure on me to change something. I have the tendency to oppose myself. even if in the end it will be in my advantage	2.56	1.12	1.26	PF	Invalidation
$x_{1.6}^{G}$	Sometimes I have the tendency to avoid changes of any kind even if I know I will benefit from them	2.07	1.12	1.26	PS	Validation
$x_{1.7}^{G}$	When I am informed of the changes of plans I start to be tensed	2.71	1.08	1.18	PS	Validation
$x_{1.8}^{G}$	When things do not go according to the plans I am stressed	2.99	1.03	1.06	PS	Validation
$x_{1.9}^{G}$	If my supervisor changed the evaluation criteria of performance I would probably feel uncomfortable	2.59	0.10	0.93	PF	Invalidation
$x_{1.10}^{G}$	If I were informed that there will be some significant changes at work I would probably feel stressed	2.80	0.98	0.95	PS	Validation
$x_{1.11}^{G}$	I would chose an ordinary day instead of a day with unexpected events anytime	2.80	0.98	0.96	PF	Invalidation
$x_{1.12}^{G}$	Things would go better if your supervisor changed?	2.28	1.40	1.95	PF	Invalidation
$x_{1.13}^{G}$	Do you say that you do not have time? When in fact you are not in a mood?	2.08	1.39	1.94	PS	Validation
$x_{1.14}^{G}$	Do you make your breaks as long as you can?	1.93	1.41	2.01	PS	Validation
$x_{1.15}^{G}$	Do you do overtime?	3.63	1.22	1.48	PF	Validation
$x_{1.16}^{G}$	Are you late for work?	2.22	1.40	1.96	PF	Invalidation
$x_{1.17}^{G}$	Is my job too tiring?	2.58	1.01	1.01	PS	Validation

The influence of the first factor on the variation of the resultative factor H_1 is higher and is justified by identifying the behavior of the personnel in response to change before we can determine the level of effort needed to eliminate barriers of change, the need for change within an organization, and the circulation of information within the analyzed organizations.

As a result of the findings, 62.08% of items were validated. Due to the fact that the hypotheses were validated, there was no need for subsequent re-formulations. Thus, our findings have indicated that there is a need for a model of change implementation.

SOLUTIONS AND RECOMMENDATIONS

From the perspective of change, the complex problems managers face cannot be analysed objectively and continuously within the current tasks (Wang & Ahmed, 2003). Each manager forms a set of beliefs and specific premises that are relevant to the organization where he or she works (Basten & Haamann, 2018).

For Albanian telecommunications companies, the change, motivation and performance paradigm has a mandatory cultural character. Creating a model of value compatible with the basic rules of market economy, forming and consolidating a strong managerial organizational culture within these companies must be declared and sustained through concrete actions. Ensuring survival through a strong organizational culture requires an attachment to value even in the sacrifice of short-term financial interests as in the case of Western firms.

Over the years, this paradigm has included different categories of premises that have strengthened the history and success of organizations by creating a set of actions and responses to those signals that managers can interpret and consider relevant to their decisions. In any case, the leaders of the future need to understand the depth and impact of what managing change in organizational development means in their pursuit of performance, productivity growth, and selection and motivation of the human resource appropriate to the specific business.

A key element in transferring a company to another economic level or that can help the company in a situation that can remove it from the market is about: (1) evolving, developing, gaining new market segments; (2) maintaining market position; (3) the influence of a strong managerial culture. Managerial culture contributes significantly to guiding business change processes, especially through managers' actions and decisions.

Among the qualities and knowledge gained by outstandingly successful specialists in the field of organizational change we can list: (1) the knowledge of human communication; (2) knowledge of human behavior; (3) abilities to set goals, diagnosis and solving problems; (4) other qualities: objectivity, flexibility, imagination, conscientiousness, charisma, self-confidence and people.

A paradigm like this can be more easily understood by those outside telecommunications companies than by those inside them, because the elements that compose self-explanatory are understood by itself. In this way, managers receive a great deal of information that is contradictory in most cases due to the interpretation of the information through the paradigm. Albanian telecommunications companies use the paradigm to formulate their strategies, considering the paradigm as a tool of interpretation and formula of action.

CONCLUSION

Organizational change consists of establishing a new model of thinking and behavior (Argote, McEvily & Reagans, 2003; Rerup & Levinthal, 2014). The confrontation between the old model and the new organizational model can lead to oversized resistance being subject to failure (Harms & Credé, 2010). That is why designing a plan of change is essential by incorporating it into an organizational context. Given the changes that are constantly changing in the national and international business environment, it is a good idea for modern telecommunications companies to keep up with the changes, as they may lose their development opportunities. This can lead to a positive change in the mentality of all employees, benefiting from financial and competitive advantages, which gives companies a high degree of competitive advantage and efficiency.

Due to global competition, technological advances and economic change, specialists need to redesign the organization map, change organizational culture, and align strategies to external demands and opportunities. By aligning organizational development practices and techniques, it is possible to adapt to the values and cultures of the organizations in which they are to be implemented. Specialists need

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

structures, systems, strategies and systematic and congruent organizational models to successfully implement changes in organizational development.

According with the results, the first and most important change will be that they will no longer be workplaces but places to work so that the human resource involved achieves maximum productivity yields. The performance measurement system is affected by the changes made in an organization, just as in the case of the transition to a market economy. The synergy of economic performance brings together those management tools that best meet the new challenges and are based on the relationship strategy-organizational culture.

Chapter 48
Knowledge of Management Tools and Systems in SMEs: Knowledge Transfer in Management

Adam Pawliczek
Technical University of Ostrava, Czech Republic & Moravian University College Olomouc, Czech Republic

Miroslav Rössler
Moravian University College Olomouc, Czech Republic

ABSTRACT

The chapter deals with knowledge management principles and their implication to knowledge in management represented by contemporary sophisticated management tools and systems. The most important management branches and methods, tools and systems, generally considered as very helpful for professional business operating, are presented. Further research results of management tools knowledge in contemporary enterprises are presented impacting the need of education and knowledge transfer in management responsible positions. The need of management knowledge for the competitiveness of enterprises is accented. Business and competitive intelligence as media for competitiveness are introduced. In the last part of the chapter, a model of the knowledge management system applicable in SMEs is suggested. The purpose of the chapter is to make the reader familiar with some of the most important management tools, methods and systems and suggest principles for an easy and effective knowledge management system in the enterprise.

INTRODUCTION

The entire society is constantly evolving and, recently, the fact that knowledge is arriving at the forefront is typical for it. We live no longer in an industrial society, but in a post-industrial society, sometimes referred to as information society which gradually merges into a knowledge society. Every day the amount of information increases and the need for its efficient classification and management grows. Information,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

however, to be useful, needs to be converted. This transformed information is called knowledge. Knowledge has some important extra over information. It is contextualized and enriched by our own experience.

The main goal of the chapter is to describe and discuss important interconnections of modern management tools with knowledge management principles and suggest a knowledge management model process applicable in SMEs. The chapter works with important terms of knowledge management. The partial goal is to summarize the most important modern tools used in different branches of management, which can be considered as a base of professional management knowledge. The second partial goal is to present a selection of IT support instruments (software) on the market applicable in SMEs. The reader will be familiar with different branches of modern management and tools used in them as well as with the sophisticated software support suitable for SMEs and the model of knowledge management. The acquired knowledge will improve the management skills of entrepreneurs and open new perspectives for competitiveness and prosperity.

The chapter is partially derived from an unpublished habilitation thesis concerning management methods, tools and system. Added value of the chapter is in focusing of readers on sophisticated management tools which certainly help to improve competitiveness and business results. The core contribution of the paper is in practical research results seen in part 3. The main contribution of the paper for readers is the increasing of awareness and orientation on what management knowledge to focus and adapt in order to improve business competitiveness. The chapter is dedicated mainly to students of management, entrepreneurs and SMEs managers.

The chapter layout (contents):

1. **Theory of Knowledge Management in Management:** Describing basic terms and ideas as data, information, explicit, implicit, tacit knowledge, knowledge management and knowledge in management.
2. **Knowledge in Management:** Management tools, methods and systems in particular segments of management – fields and areas of management methods, tools and systems – overview.
3. **Knowledge of Management Tools, Methods and Systems in SMEs:** Primary and secondary research results from worldwide data and the Czech Republic.
4. **Competitiveness, Innovation and Knowledge Management:** Innovation, intellectual capital and learning organization ideas, management tools, methods and systems and business performance.
5. **Business and Competitive Intelligence:** Systematic data collection and processing by the management information system.
6. **BI/CI Software Support:** Selected specific MIS software products.
7. **Solutions and Recommendations:** Design of knowledge management system for SMEs based on basic knowledge management and knowledge in management ideas.

THEORY OF KNOWLEDGE MANAGEMENT IN MANAGEMENT

As reported by Peter Ferdinand Drucker:

The most important and truly unique asset of the management of the twentieth century was the fifty times increased productivity of manual workers (laborers) in production. The most important asset which the management of the twenty-first century should make is the increase of the productivity of knowledge

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

work and knowledge workers. The most important asset of companies in the twentieth century was the production equipment (machines). The most important asset of institutions (whether profit or non-profit) in the twenty-first century will be knowledge workers and their productivity (Drucker, p. 79-94, 1999).

Knowledge and technology-based economies are performing generally better than economies based on natural resources. Knowledge can be seen as an asset to some extent, but unlike physical assets it is difficult for us to grasp and quantify. On the other hand, it has a great advantage. Knowledge can be shared with others without losing it. Knowledge sharing does not diminish its usefulness, it only reduces its value, becoming less rare (Still, pp. 8 to 9, ...).

To create knowledge in management we have to work with:

- **Data:** Can be viewed as a characteristics of a system, object, and is under the influence of chaos.
- **Information:** Usefully interpreted data can also be understood as entries on the relation of one subject to another or other.

The mutual relationship between data, information and knowledge can be illustratively described the way that data as properly expressed symbols is considered as feedstock which is transformed into information. Knowledge defines the basic framework for thinking cognitive processes of data interpretation (Veber, p. 196, ...).

Knowledge creates a mental system framework for evaluating and integrating new information. It is mainly the result of active learning based on own knowledge and experience, to a lesser extent the result of passively acting lessons. The process of learning and teaching classifies individual knowledge elements into certain relations. Sometimes yet another level of knowledge is featured, known as the wisdom. Knowledge is a necessary part of competent managerial decisions.

TYPES OF KNOWLEDGE

For the purposes of knowledge management, knowledge is usually divided into the following three types:

- Explicit (explicit)
- Implicit (implicit)
- Unformulated (tacit).

Table 1. Explicit, implicit and not-formulated knowledge

Types of Knowledge			
	Explicit	**Implicit**	**Tacit (Not-Formulated)**
Description	Formalized or documented knowledge, usually well-structured and transferable. Mostly in ICT form.	Knowledge in heads of workers which can be transferred to the explicit form any time.	Knowledge hidden in heads of workers which cannot be easily transferred to explicit form, formalized or documented.
Example	Documents, manuals, computers codes, etc.	Knowledge of process and its limitations in the head of the process owner.	Expert knowledge in the area, gained experience, etc.

(Own processing, 2016)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Definition of Knowledge Management

A large amount of definitions can be found. Three of them are presented as they are understandable and concise:

Knowledge management can be defined e.g. as a systematic and inclusive process of management and coordination of a wide portfolio of the company activities, i.e. retrieving, creating, storing, sharing, merging, developing, evolving, and use of the knowledge of individuals and groups with the goal to achieve greater business efficiency. Knowledge in this context is certainly not a mere academic neologism, but it is a productive embodied intelligence obtained by "positive education and learning" through which the man - worker receives the amount of knowledge that allows them to orient themselves, formulate opinions, enrich their analytical and deduction skills, conclude to synthesis, fully within the meaning of the needs of the organization (Petříková, p. 115, 2010).

Another definition says:

Knowledge management is very difficult to define. This applies to acquiring, creating, sharing and using the knowledge. This knowledge includes both explicit and implicit knowledge. Knowledge does not only mean the know-how – to know how to, but also who knows, knows why and knows when. It does not relate to the wise books and best practices, but rather people – working communities that maintain knowledge about a topic and share what they know, build on it and adapt it for their own use. It is not a brief summary of what is known at a certain moment in time, but developing a body of knowledge maintained in its recent form by people who use it regularly (Collison, p.13, 2005).

Arian Ward from the company Work Frontiers International defines knowledge management as follows:

It is not creating an encyclopedia that encompasses everything that anyone has ever known. Knowledge management is more about observing those who know and develop a company culture and technology that will encourage them to speak (Collison, p.49, 2005).

Knowledge in Management

Knowledge pools in management can be simply divided into theory and experience (case studies). The theoretical part can be characterized by a number of management methods, tools and systems regarding to the particular branches of management and the practical one is merely dependent on the amount of professional practice.

KNOWLEDGE IN MANAGEMENT: MANAGEMENT METHODS, TOOLS, AND SYSTEMS IN PARTICULAR SEGMENTS OF MANAGEMENT

There are many different tools, methods and systems for the effective implementation of the basic management functions such as planning, monitoring of objectives, organizing, leadership, communication, decision-making, monitoring, etc. These have been developed over more than a century of the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

democratic market business, particularly in Europe, North America, and Japan. Managerial methods are traditionally divided into deductive, inductive and dialectical. Another classification sees them as empirical, exact and creative approaches (Mohelská et al., 2012). These authors divide the field of the use of management methods as follows:

- Managerial decision-making,
- Risk management,
- Scheduling
- Organization
- Management of employees,
- Control and management of work activities,
- Organization performance evaluation.

Management Methods

Management methods are procedures, methods, techniques or "ways" that lead to achieving effective negotiations and management objectives. The usual managerial objectives are financial business performance, competitiveness, growth, long-term prosperity, and sustainability. Management methods can include simple rules, more complex techniques and tools, or comprehensive management systems containing a complex of partial methods (Pearce, 1995). Descartes assumed that even the most difficult problems can be decomposed into long chains of simple steps and if their order is preserved, a solution must be found (Fajkus, 2005). The methodical approach (in contrast to intuitive management) leads to measurable results, self-reflection and the possibility of implementation of a cycle of continuous improvement. Modern trends suggest that the choice of the appropriate management methods and their implementation is the key activity to the dynamism of the enterprise performance according to the required indicators (e.g. by using the KPI). There is no clear border among the concepts of managerial methods, tools, systems, and techniques.

Management Tools

Management tools are formalized for the performance of managerial functions in an enterprise with the aim to build a creative environment in order to increase the efficiency of managerial work. And yet, they include a wide range of management tools and techniques - from simple planning software to complex social sciences, organizational, technological, economic and social instruments which co-create the current paradigm of management. A paradigm is understood as the main idea, a given concept of managerial thinking and action. A paradigm is thus age-conditioned, based on a concept valid only for a certain era and is therefore dependent on time. Generally speaking, a paradigm is based on a system of principles (postulates) which create the particular concept of thinking.

Management Systems

A system is a whole (1), composed of parts that interact with each other. Between the parts of the system, flows of information, matter and energy (money) can occur. A system (2) is a deliberate process, method of action and implementation of something (Klimeš, 1981). The following cases can be seen as

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

a management systems: (A) an enterprise, logistics chain, manufacturing, project, or (B) the knowledge structure and software to support the optimal management of these activities – management information system (MIS). Management systems in the business can be regarded as open, continuous, stochastic, and dynamic. Similar properties must be also in the characteristics of the IT support means that model the actual systems themselves. The management systems can be considered as systems of processes and procedures (management methods and tools) which ensure that the organization fulfils the given tasks to achieve its goals. An important group of management systems (QMS/EMS quality management) is based on cyclical processes as Deming's PDCA.

Table 2. Systematic overview of the selected important managerial techniques, tools, methods and systems according to the areas of management

Area of Management	Name of the Tool, Technique, Method, System
Strategic Management	7 Classes of Strategic Risks (Slywotzky), **5F** (Five Forces) Analysis, **BCG** (Boston matrix), **BSC** (Balanced Scorecard), the Blue Ocean Strategy, Gap Analysis, EFE Matrix, IFE Matrix, Hierarchy of Strategies, Management by Objectives, **MOST**, **PESTLE** Analysis, the Strategy → Structure Principle, Forecasting, Scenarios Technique, **SPACE** Analysis, **SWOT** Analysis, **SMART** - Goal Design, **VRIO** Analysis, Winterling Crisis Matrix, Critical Success Factors, **KPI** (Key Performance Indicators).
Management Organization	**BSC** (Balanced Scorecard), ERP (Enterprise Resource Planning), MBC (Management by Competencies), **MBO** (Management by Objectives), Organizational Development, Process Management, Project Management, Change Management, SOEM (Service Oriented Enterprise Management), SOM (Service Oriented Management), 5F (Five Forces) Analysis, Boston matrix, Critical Success Factors, Pareto principle, Strategy → Structure Principle, **PESTLE** Analysis, Reengineering, **SMART** - goal design, SWOT analysis, VRIO analysis, KGI (Key Goal Indicators), **KPI** (Key Performance Indicators), Excellence Model EFQM.
Quality Management	APQP (Advanced Product Quality Planning), PDCA (Deming Cycle), DMAIC Improvement Cycle, Excellence Model **EFQM**, **Kaizen**, Quality Rings, Lean, Poka-yoke, Six Sigma, **TQM** (Total Quality Management), the 5S, DOE (Design of Experiments) Ishikawa diagram, Kano model, Pareto Principle, **FMEA** (Failure Mode and Effect Analysis), FTA (Fault Tree Analysis), QFD (Quality Function Deployment), House of quality, **G8D** (Eight Disciplines), MSA (Measurement System Analysis), PPAP (Production Part Approval Process), Quality Management Systems ISO 9001,
Innovation Management	Blue Ocean Strategy, **CAF** (Common Assessment Framework), **DMAIC** Improvement Cycle, **PDCA** (Deming cycle), Excellence Model **EFQM**, Kaizen, Quality Rings, Open Innovation, Six Sigma, **TQM** (Total Quality Management), User Centered Design, Brainstorming, Mindmaps, Pareto principle, SMART- goals design.
Change Management	Three step change (Lewin), Four step change, Eight step change, organizational development, change management by CSF (Critical Success Factors), 5F (Five Forces) Analysis, Kolb Cycle of learning, Delphi method, Pareto principle, **SMART** - goals design, **SWOT** analysis, **SWOT** analysis, Scenarios Technique, **PESTLE** analysis.
Production Management	ABC-D, BOA (Belastungorientiere Auftragsfreigabe), CIM (Computer Integrated Management), CRP (Capacity Resource Planning), DBR (Drum Buffer Rope), JIT (Just-in-time), MRP (Material Requirements Planning), MRP II (Manufacturing Resource Planning), ERP (Enterprise Resource Planning), KANBAN, FIFO (First In First Out), **FEFO** (First Expired, First Out), HIFO (Highest In First Out), **LIFO** (Lowest In First Out), Lean Production, BCG Matrix, Pareto principle, **VRIO** analysis, ISO 9001, ISO 14000.
Marketing and Sales	5K Method, TLM (Total Loyalty Marketing), Branding, Blue Ocean Strategy, Holistic marketing concept, Marketing strategy, Marketing mix 3V, 4C, 4P, Positioning, **CRM** (Customer Relationship Management), Brand Management, PR (Public Relations), Market segmentation, Targeting, Product concept, Web marketing mix 4S, WOMM (Word of Mouth Marketing), 5F (Five Forces) analysis, An off matrix, **BCG** (Boston matrix), Kano model, Customer portfolio matrix, **PESTLE** analysis, **SWOT** analysis, **VRIO** analysis.
Process Management	BCM (Business Continuity Management), **BPM** (Business Process Management), ITIL (ICT processes management), Six Sigma, PDCA (Deming cycle), **DMAIC** improvement cycle, reengineering, Time frames, statistical methods, ISO 9001, TQM (Total Quality Management).

Table 2. Continued

Area of Management	Name of the Tool, Technique, Method, System
Economy and Finance Management	Pareto principle, Financial leverage, PESTLE analysis, SWOT analysis, VRIO analysis, Break Even Point Analysis, Financial statements analysis, Determination of financial indicators (liquidity, rentability, investments, indebtedness, activities, market value, productivity), TCO (Total Cost of Ownership), EBIT (Earnings before Interest and Taxes), Gross margin, Cash Flow, NOPAT (Net Operating Profit after Taxes), EVA (Economic Value Added), MVA (Market Value Added), WAAC (Weighted Average Cost of Capital), 29NPV (Net Present Value), IRR (Internal Rate of Return), Altman analysis (Altman Z-score).
Service Management	**BCG** matrix, Pareto principle, CorSet Framework, ITIL, ITSM (IT Service Management), SSME (Service Science, Management and Engineering), SOEM (Service Oriented Enterprise Management), SOM (Service Oriented Management), Services management system ICT ISO 20000.
Computer science and IT Management	SOA (Service Oriented Architecture), Code and Fix, EUP (Enterprise Unified Process), MSF (Microsoft Solutions Framework), MMDIS (Multidimensional Management and Development of Information Systems), DSDM (Dynamic System Development Method), ASD (Adaptive Software Development), BPEL (Business Process Execution Language), BPMN (Business Process Modelling Notation), ISO 8000, **ISO 9001**, ISO 15504, ISO 20000.
Facility Management	Process analysis, Benchmarking, Insourcing, Business Process Improvement, Outsourcing, Spatial optimization, SLA (Service Level Agreement), SLM (Service Level Management), **SWOT** analysis, Maintenance, **FMS** (Facility Management Systems), CAFM (Computer Aided Facility Management).
Logistics and Transport	APS (Advanced Planning & Scheduling), Benchmarking, **ERP** (Enterprise Resource Planning), JIT (Just-in-time), KANBAN, MRP (Material Requirements Planning), MRP II (Manufacturing Resource Planning), Outsourcing, SCM (Supply Chain Management), CPM (Critical Path Method), **TOC** (Theory of Constraints), Network Analysis, model SCOR (Supply Chain Operations Reference-model).
Project Management	Gantt chart, Project schedule, Network analysis methods, RACI and RASCI responsibility matrix, Project plan, Project-Based Management, WBS (Work Breakdown Structure), Impact Analysis, **PMBOK** (Project Management Body of Knowledge), PRINCE2 (Projects in Controlled Environment), Project management standards ISO 10006, ISO 21500.
Risk Management	BASEL I-III, CorIA (Core Impact Assessment), Checklist analysis, CCA (Cause-Consequence Analysis), CRI (Continuous Risk Improvement), Delphi method, **CCTA** Risk Analysis and Management Method), **CPQRA** (Chemical Process Quantitative Risk Analysis), EWRM (Enterprise-Wide Risk Management), ETA (Event Tree Analysis), FMEA (Failure Modes and Effects Analysis), FMECA (Failure Mode, Effects and Critical Analysis), FTA (Fault Tree Analysis), HAZOP (Hazard and Operability Study), HAZID (Hazard Identification Study), HRA (Human Reliability Analysis), **PHA** (Preliminary Hazard Analysis), PPAP (Production Part Approval Process), Forecasting, RIPRAN (Risk Project Analysis), **RR** (Relative Ranking), SA (Safety Audit) SR (Safety Review), VaR (Value at Risk), W-I (What-if Analysis), Winterling Crisis Matrix, Risk Management ISO 31000, OHSAS 18001.
Crisis Management	Crisis plan, Winterling Crisis Matrix, Pareto principle, Forecasting, SMART - objective design, Scenarios technique,
Knowledge Management	SECI process, Social network analysis, Sociogram, Sociometrics, Management epistemology, Learning.
Human Resources Management	360° feedback, Jobs analysis, Social network analysis, BEI (Behavioral Event Interview), Jack Welch Matrix, Job description, Staff audit, Role prosets, Sociogram, Sociometry, Job specification, Satisfaction Survey Methods.

(Own processing with Management Mania data, 2015)

Table 2 presents a systematic overview of management methods, tools and systems (information systems with ICT support) according to the area of management. The main reason of this table is to make the reader familiar with the most known and popular management tools according to the wide international management community at www Management Mania. Many methods, however, are universal and are used in multiple areas of management. Knowledge and implementation of an appropriate set of tools as well of their knowledge transfer through the organization is a significant condition of wise management and business prosperity.

KNOWLEDGE OF MANAGEMENT METHODS, TOOLS AND SYSTEMS IN SMES: SECONDARY AND PRIMARY RESEARCH RESULTS

The important question is: Which management methods, tools and systems are really worth to learn and apply? The question can be answered from two points of view:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. Do specific management tools influence enterprise performance and how?
2. Which management tools are utilized by other successful enterprises?

The point of view (2) is answered with the help of Bain and Company, the Czech Association of SMEs and own research (primary data) research results in the world and Czech/Slovak conditions. The point of view (1) is answered later.

On the basis of the discussed basic ideas on management tools the following hypothesis was formulated: The knowledge of modern management methods, tools and systems in enterprises is generally heavily minor (under 30%).

Management Tools Used Around the World

Bain & Company has been performing its research since 1993. The purpose of it is to provide information to managers about which management methods and tools will improve their business results and how managers of global enterprises perceive the strategic challenges and priorities. The 15th survey of Bain & Company has shown that in the year 2014, executive managers used mostly the following 10 management tools – see Table 3.

Table 3. The best known management methods according to Bain & Company

Name of the Tool, Technique, Method, System	
• Customer relationship management (CRM), • Benchmarking, • Employee engagement survey, • Strategic planning, • Outsourcing,	• Balanced Scorecard, • Expression of Vision and Mission, • Supply Chain Management (SCM), • Change management, • Customer segmentation.

(Own processing with Bain & Company data, 2015)

The company focuses on 25 key tools. The list can only include tools that are current, significant for senior managers, and measurable. The company approaches 13 000 respondents from more than 70 countries of America, Europe, Asia and Africa and, over the years, systematically monitors the effectiveness of managerial tools in enterprises (Bain & Company, 2015).

Management Tools Utilized in the Czech Republic

In 2011, the Association of Small and Medium-Sized Enterprises implemented the survey no. 10 ASMEC CR "Opinions of Entrepreneurs on the Modern Methods of Management of the Company" which states that the active knowledge of modern methods of management for enterprises in the Czech Republic is at a low level (Modern management, 2011).

The survey focused on the following three main areas:

- Evaluation of the competitiveness of Czech enterprises and barriers to their growth as seen by entrepreneurs.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Knowledge and attitude of Czech entrepreneurs of and towards modern methods of enterprise management.
- Knowledge and attitude of Czech entrepreneurs of and towards the EFQM model.

Target group: The segment of B2B companies with more than 25 employees with activity in manufacturing, trade and services (n = 541). Research method: CATI (Computer Assisted Telephone Interviewing). Data collection date: May 2011.

The results of the research investigation suggest that the active knowledge of modern enterprise management methods is at a relatively low level. Only 22.55% of respondents spontaneously stated some of the methods of enterprise management. A considerable part of the respondents, however, stated a non-existent method of modern management. A frequency graph shows that only very few respondents actually know any of the methods of modern business management. The awareness of modern enterprise management methods is at a low level.

When asked the question: "Do you know any modern methods of enterprise management? If so, which ones?", only 22.55% of the respondents said they knew a management tool. The best known methods are named in Table 4.

Table 4. The best known management methods according to ASMEC

Name of the Tool, Technique, Method, System	
• Six Sigma, • Lean, • BSC, • Kaizen, • ISO norms,	• Controlling, • Project management, • Coaching, • SWOT, • Planning, • Leadership.

(Own processing with ASMEC data, 2015)

Modern methods of enterprise management are currently used by 28.1% of the surveyed enterprises. There is therefore a large space for the implementation of these procedures and methods, taking into account the fact that the management of the companies attributes this enterprise management tool great importance. Overall, 152 respondents said that they use one of the methods of business management. The most commonly used methods are:

- Lean enterprise (28,9%),
- Six Sigma (12,5%) and
- Balanced Scorecard (13,2%).

The category "Others" often named methods that are not among the modern management methods, which again highlights the ignorance of these specific management tools. It shows that the enterprises belonging to the production sector have the most extensive experience with the modern methods of management.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The results of the research show that only 16.9% of respondents are considering the introduction of some of the modern management methods. This group represents the potential enterprises interested in the EFQM model. The responses show that almost 80% of Czech entrepreneurs do not know of the existence of the most successful European management model (EFQM) which is used by more than 30,000 European enterprises. This is a very significant competitive disadvantage for the Czech Republic because, according to independent analyses, the EFQM model brings enterprises improvement of their business results by tens of percent.

The survey shows that although the Czech entrepreneurs realize the importance of modern management methods, they only have minimal information about these methods and practically do not use them. Yet almost 80% of the Czech entrepreneurs in the survey said that they consider the modern management methods crucial for quality enterprise management. Moreover, 98% of the respondents considered the quality and conceptual business management important for the long-term competitiveness of the enterprise. 77% of Czech entrepreneurs actively do not know any modern management method and almost the same percentage of enterprises does not make use of any such method. One of the key elements in maintaining and increasing competitiveness is therefore among entrepreneurs neglected in such a way that this means a significant risk to the success of the Czech enterprises on the world markets. (ASMEC, 2011).

RESULTS OF OWN RESEARCH: PRIMARY DATA: CZECH REPUBLIC AND SLOVAKIA

The questionnaire research was realized during the spring semester 2012 by students of the Business Entrepreneurship Faculty in Karvina, Silesian University in Opava (Czech Republic). 722 companies active in the Czech and Slovak Republic in the time period 2009-2011 were subjects of interest (SMEs create 89% of the sample group in accordance with the number of employees' criterion). The interview protocol included a controlled dialogue of a student with an enterprise owner, an executive manager or a top manager, so the collected data has the character of an expert guess opinion. Company identification (10 questions) and identification of the student and their opinion on the questionnaire relevance (5 questions) was a necessary part of each form. The initial sample size of 722 companies was filtered and reduced to 677 credible items. The questionnaire form also includes the nondisclosure statement to provide business and privacy protection. Moreover, the data was analyzed anonymously and published as no-name data only. The questionnaire was focused on seven areas of interest and contained 61 questions.

The data was processed by Microsoft Excel® and IBM SPSS®. Analyses, results and discussion are presented later (Pawliczek, 2013).

Data Structure

The analyses of the bulk sample (the all firms group including 677 enterprises) and their attitude to business strategic management brought the following information (Pawliczek, 2013).

- **Enterprise Size:** More than 51% of the questioned enterprises (the all firms group) are the so-called "micro" enterprises with no more than 10 employees, approximately 24% are "small" enterprises up to 50 employees and approximately 14% are "medium" enterprises – all together 89%

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

are SMEs (small and medium – incl. micro enterprises up to 250 employees). Only about 11% of the researched group are created by big enterprises with more than 250 employees.

- **Geographical Point:** From this point of view, 89,1% (603 enterprises) of the all firms group (counting 677 enterprises) are settled in the Czech Republic; 10,9% (74 enterprises) are in the Slovak Republic. 63,5% (430 enterprises) are from the Moravian-Silesian region, (34) questioned enterprises are from Prague, the capital of the Czech Republic. Overall 79,6% of enterprises are from Moravia regions and 9,5% from Bohemia regions including Prague.
- **Structure of Economic Activity:** Concerning branches according to NACE-CZ industry classification we can say that almost a quarter (24%) of the questioned enterprises were active in section C – Manufacturing. Than very closely with 23% the section G – Wholesale and retail trade; repair of motor vehicles and motorcycles is covered. On the third place, there is the section F – Construction (13%). No other sections exceed 7% and all other sections together create 40% of the all firms group.

Selected Management Tools

Selected evaluated management methods, tools and systems:

1. **ISO 9000 Family:** (ISO 9001): A part of the family of international standards issued by the ISO (International Organization for Standardization). Standard ISO 9001 is not a management method, it is a standard or norm which serves as a reference model for setting the basic management processes in an organization that continuously helps to improve the quality of the provided products or services and customer satisfaction (that is why quality management system).
2. **ISO 14000 Family:** In the world, ISO 14001 is the most recognized and used one for environmental management systems. This standard requires the organization to identify all environmental impacts and related aspects of its business. In addition, it defines the objectives of environment and introduces measures to improve performance through process improvement in areas of high priority.
3. **EFQM Excellence Model:** (EFQM Model). The EFQM Model was developed by the EFQM Foundation as a framework for the implementation of quality management methods in the organization.
4. **TQM:** (Total Quality Management): A very complex management method that puts emphasis on the quality management in all dimensions of the organizational life. It goes beyond quality management and it is also a method of strategic management and it is a management philosophy for all of the activities of the organization. There are many different forms and interpretations of TQM.
5. **BSC:** (Balanced Scorecard) A system of management and measurement of the performance of the organization which is based on defining a balanced system of interrelated indicators of business performance. Hence the "balanced". Balanced Scorecard was developed by American consultants Robert S. Kaplan and David P. Norton in the nineties of the 20th century.
6. **KPI:** (Key Performance Indicators) A term that refers to the performance indicators/metrics associated with the process, service, organizational unit or the entire organization. KPIs reflect the desired performance (quality, efficiency or economy).
7. **EVA:** (Economic Value Added) A term that refers to the currently very important valuation measurement of the enterprise performance. The basic idea of the indicator is that the invested capital has to have a greater benefit that the cost of this capital.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

8. **Porter's 5 Forces:** The work of Michael E. Porter. It is a way of analyzing the industry and its risks. The model works with the five elements (Five Forces). The principle of this method is a forecasting of the development of the competitive situation in analyzed industry, based on the estimate of the potential behavior of the subjects and objects involved in a given market and forecasting of the risk of imminent business (Porter, 1980).
9. **SWOT Analysis:** A universal analytical technique focusing on the evaluation of internal and external factors affecting the success of an organization or any other evaluated system. Most often, the SWOT analysis is used in the strategic management of an organization in the evaluation of a strategic intention. The author of the SWOT analysis is Albert Humphrey who designed it in the sixties of the 20th century.
10. **BCG Matrix:** (Growth-Share Matrix) A method that comes from the consulting company Boston Consulting Group (BCG). The name BCG matrix or Boston matrix comes from here. The BCG matrix is used for the evaluation of the product portfolio of the organization in marketing and sales planning.
11. **SMART:** An analytical technique for designing objectives in management and planning. SMART is an acronym from the initial letters of the English names of the objective attributes (Specific, Measurable, Achievable/Acceptable, Realistic/Relevant, Time Specific/Track-able).
12. **PEST(LE) Analysis:** An analytical technique used for the strategic analysis of organizational surroundings. PESTLE (sometimes also PESTEL) is an acronym and each letter represents a different type of external factors (Political, Economic, Social, Technological, Legal, Ecological).
13. **MBO:** (Management by Objectives) was designed by Peter F. Drucker as a method based on setting and mutual agreement of the objectives and evaluating the success of their achievement. The task implementers are allowed to decide which method is the most appropriate to achieve the objective. It is a delegation of responsibility for the objective to the implementer. The method is applicable in virtually all management fields.
14. **6-Sigma:** A complex method of management and, like Lean, it is known more as a philosophy that the organization (enterprise) must take. It is focused on continuous improvement (innovation) of the organization by understanding customer needs, using the process analysis and methods standardization in the measurement. It is a comprehensive, flexible management system that is based on understanding customer needs and expectations, on the disciplined use of information and data to management and decision-making.
15. **Kaizen:** A method of gradual improvement based on cultural traditions of Japan (the word itself comes from Japanese). The improvement focuses on the gradual optimizing of the processes and work practices, quality improvement and scrap reducing, material and time savings leading to cost reduction, work safety and reducing workplace accidents.
16. **Lean:** (Lean Management) is a very broad management method. The term philosophy that the organization (enterprise) must accept is most often used in the connection with Lean. Lean is based on several basic principles. Primarily it is the effort of the organization to continuously improve in all areas and to avoid unnecessary wastage. The second principle is the best possible customer needs satisfaction, no matter how. Lean is often used with different attributes; depending on what fields this philosophy is applied to (Baranov, 2011; Kotler, 2007; Management Mania, 2013).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Research Results: Utilization of Management Tools

Research results of the original research of the author on utilization of management tools are shortly summarized in Table 5. There is well visible that the most utilized technique is the SWOT analysis (47% of enterprises are familiar with it). Further QMS and EMS systems ISO 9000 and ISO 14000 are recognized. The most of the researched methods are not recognized and used by less than 7% of the researched enterprises.

Table 5. The percentage of management methods utilized by the examined enterprise group

Number	Name of the Tool, Technique, Method, System	Percentage of utilization
1.	SWOT	47%
2.	ISO 9000	37%
3.	ISO 14000	18%
4.	TQM	16%
5.	SMART	16%
6.	EVA	9%
7.	BCG	7%
8.	BSC	6%
9.	Kaizen	6%
10.	KPI	6%
11.	MBO	4%
12.	Six Sigma	4%
13.	EFQM	3%
14.	Lean	3%
15.	PESTLE	2%
16.	5 Forces – Porter	2%

(Own processing, 2016)

The quadratic index which results 3 can be easily calculated and it can be interpreted as follows:

18% (3) of the selected researched management tools is applied by 18% of the researched enterprises.

With the help of own original research supported by the research of ASMEC, we can approve the following hypothesis: The knowledge of modern management methods, tools and systems in enterprises is generally heavily minor (under 30%). This fact show potential for improving competitiveness by studying and adapting modern management methods, tools and systems and implement it to their knowledge management systems.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

COMPETITIVENESS, INNOVATION, AND KNOWLEDGE MANAGEMENT

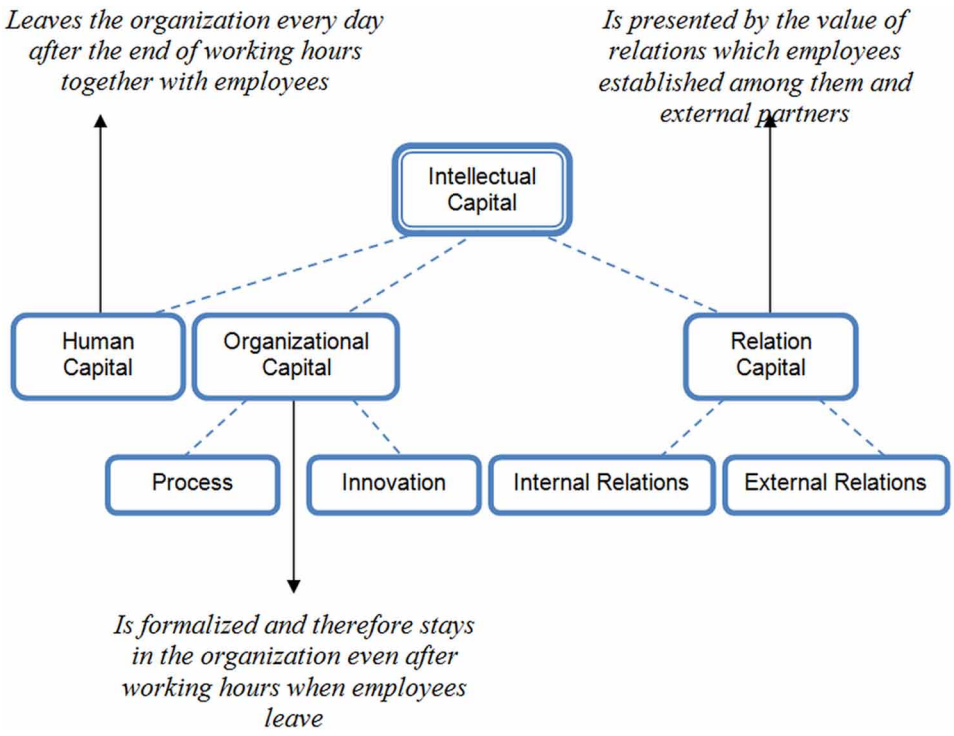
Long-term adaptation of effective and progressive set of management tools, methods and systems in enterprise is the task for knowledge management. Proper knowledge management in new economy is clearly the way to improve competitiveness. Nowadays knowledge is a necessary source of the competitive advantage. The gap between the book and the market value of the company grows in all companies regardless of their size. This difference is more pronounced in higher labor intensive sectors compared to the financial and physical means (Grublová et al., P. 39-40, 2014). One of the aspects that increase the value of the companies is the knowledge that the company possesses. Well utilized knowledge enables companies to be more successful in the market than companies that do not use their knowledge correctly.

Innovation is the outcome of a complex (company-wide) management system of innovation activities. Information that without knowledge is elusive is important. Therefore, we are talking about the chain (transfer): Information → Knowledge → Innovation. But, even here, it holds true: "to be at the right time in the right place". Innovations are considered to be the main boosters for the economic growth. Gradually the wide economic community has increasingly focused on finding ways to manage innovations, monitor and exploit their potential to create new values. Interest was mainly in factors from which innovations arise. Innovative businesses therefore focused on developing precisely these factors. This is essentially a creation of new knowledge, application of that knowledge in the development of products and processes, and their subsequent evaluation in terms of commercial exploitation (Grublová et al., P. 1-2, 2014).

The basic SECI model (see Figure 2) of the creation (transfer, reproduction) of knowledge is a cyclical process and therefore it is always necessary to focus on the development of knowledge, by which the organization supports its innovation potential.

Intellectual Capital and Learning Organization

Continuous adaptation of an effective and progressive set of management tools, methods and systems in an enterprise is a part of important intellectual capital. Intellectual capital of an organization is much more than just the sum of knowledge, skills and abilities. *Intellectual capital is a set of intangible assets that an organization possesses and can be used in the implementation of targeted changes in its business behavior through which it achieves the necessary implementation of their innovative projects. Intellectual capital of organizations therefore represents only the potential effect that, when combined with tangible assets, leads to added value and increased competitiveness of organizations offering innovative solutions (Pitra et co., P. 32, 2015).*



The chasm between the book and market value of the company is growing in all companies regardless of their size. This difference is more pronounced in more labor intensive industries in comparison to financial and physical resources. For this reason the concept of "intellectual capital" emerged which summarizes all the intangible factors contributing to the predominance of the market value of the company above its book value. These factors can include the loyalty of employees and their commitment, brand, goodwill, organizational values, customer loyalty, experience and skills of employees (Grublová et al., P. 39-40, 2014).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Composition of the intellectual capital of an organization can be seen in Figure 1. Intellectual capital consists of three basic components, namely: human capital, organizational capital and relational capital:

- ***Human Capital:*** *Consists of a set of knowledge, skills and abilities of individual employees of the organization and is bound on the individuality of each employee. When leaving, the staff of the organization leaves the human capital with them as well.*
- ***Organizational Capital:*** *Formalized by intangible assets, represented by purposeful linking of the contents of the database and the knowledge base of the organization. Represents the component of intellectual capital which remains in the organization even after the quitting of workers who created it.*
- ***Relational Capital:*** *Represents a set of relations that workers of the organization created with their partners within the organization and with partners who operate outside the organization.*

Figure 1. Composition of the intellectual capital of the company
(Own processing with Bureš, 2016)

After the leaving of workers, only the formalized component (external knowledge) of the relational capital remains in the organization, the tacit component (internal knowledge) leaves along with its bearer (Pitra et co., P. 33, 2015).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In accordance with principles of the learning organization described by one of the most important books related to knowledge management, the book The Fifth Discipline by Peter M. Senge, the following disciplines of knowledge creation and transfer must be addressed:

- **Personal Mastery:** The discipline of continuous brightening and deepening of individual personal vision, concentrating energy sources, developing patience and objective perception of reality.
- **Mental Models:** Our deeply ingrained assumptions and generalizations, affecting our world comprehension and acting in it.
- **Shaping a Common Shared Vision:** Only a true vision (not a mere declaration of a vision) is what gets people together and encourages the desire to achieve outstanding performance and learning in them – they do it because they want to, not because someone ordered them.
- **Team Learning:** Intellectual abilities of the team that can exceed the cognitive abilities of individuals (but beware, it can be vice versa).
- **Systems Thinking:** The fifth discipline, a discipline that integrates all the previous ones and creates one single associated unit.

The author accents that the basis for the success of any organization is to change its mind – the organization needs to retreat from the traditional models, have its view of itself and its surroundings changed, and begin to work on a change, a change towards a learning organization (Senge, p. 25-30, 2006).

Management Tools, Methods and Systems and Business Performance

The previous paragraphs focused on systematic learning and the creation of intellectual capital in management aiming to successful innovativeness and competitive advance, but the point of view (a) still needs to be answered: Do specific management tools influence enterprise performance and how? Is creation and transfer of knowledge in that area meaningful?

The answer is not simple, previous research results of the authors aimed at the influence of management methods, tools and systems on different factors of enterprise performance with an impact on strategic management tools and continuous improvement tools. The research was properly documented and published (Pawliczek, 2015).

BUSINESS AND COMPETITIVE INTELLIGENCE

Knowledge management and system thinking can be strongly supported by ICT, ensuring increase in the speed of operation, memory and sharing of results. Acronyms as MIS, BI, CI, ERP need to be clarified.

Management Information Systems

At present, ICT support is of crucial importance for managerial decision-making. Management information systems (MIS) are systems for data processing. These systems make the information relevant for both basic as well as advanced (strategic) enterprise management decisions available. The data in MIS should include as many working systems and departments of the enterprise as possible. Currently, MIS is relevant for all medium-sized and large companies as well as for SMEs that want to be able to

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

make decisions quickly and with confidence when dealing with everyday business problems. In order to achieve this, it is naturally necessary to have the data from many systems in one place. These systems would usually include accounting, controlling, planning, production, sales, and more. On this basis, it is possible to perform a flexible analysis of data depending on various factors and parameters, such as location (of the branch), products, time, sector of activity, customers, employees, etc. (Andersen, 2001, Pentaho, 2015).

Business Intelligence

Business Intelligence (BI) are the skills, knowledge, know-how, technology, application, quality, risk management, security, and processes used in business to obtain a better understanding of the global context. For this purpose, enterprises undertake the collection, integration, analysis, interpretation, and presentation of business information. Business intelligence is a follow-up to MIS implementing modern management methods, tools and systems (Bartes, 2005, Lichtenthaler, 2008).

Enterprise Resource Planning

Enterprise resource planning (enterprise information system) is an ICT assisted system whereby an enterprise (organization) manages and integrates all or most of its activity areas such as planning, inventory, purchasing, sales, marketing, finance, human resources, manufacturing, and more. The important and most popular MIS include the following (SOL, 2015):

- **Enterprise Resources Planning (ERP):** Systems for the management and planning of the resources of the enterprise.
- **Customer Relation Management (CRM):** Systems for customer relationship management.
- **Human Resources Management (HRM):** Systems for human resources management.
- **Advanced Production Systems (APS):** Systems for advanced production planning and control.
- **Computer Aided Facility Management (CFM):** Systems for the management of buildings with the support of ICT.

Competitive Intelligence

Competitive Intelligence (CI) – competitive intelligence is one of the advanced Business Intelligence disciplines, i.e. it is an interdisciplinary field related to knowledge management. It is a systematic and ethical process of gathering, analyzing, and the use of external information which can affect the intentions of the organization, its decision-making, and behavior. CI is supposed to work as a decision-making support in order to ensure the competitiveness of the company and also as an early warning system in case of a crisis. The basis of CI is formed by the so-called news cycle using as many free Internet information resources as possible. Furthermore, the cycle uses resources of a commercial character - database centers, press agencies, etc. (Molnár, 2012). The CI should form a basis for the use of management tools which work with the obtained information (PEST, Porter 5F, SWOT, and others) for the needs of management. All of this should be linked via ICT to form a comprehensive management information system (Pawliczek, 2015).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

BI/CI SOFTWARE SUPPORT

Creating of the organizational memory for knowledge retention is connected with the implementation of the MIS software. A few examples of the MIS software with an accent to business and competitive intelligence:

- **Asseco Helios Solutions:** Provides a perfect and up-to-date overview of the market situation, the basis for strategic decision-making and automates routine operations (Helios, 2015).
- **FaMa+ CAFM:** Provides comprehensive management and maintenance of buildings and technologies, management of lease relationships (contractual relations, rental provisions and services, payments, billing, reminders), repairs, reconstruction, and related services (Tesco SW, 2015).
- **IS Karat:** Allows successful planning and decision-making, leads to the efficient use of resources. Facilitates communication and management, simplifies and accelerates the key processes in the areas of production, trade, finance, marketing, or logistics (Karat, 2015).
- **K2 Atmitec:** A comprehensive system for the management of enterprises. In its modules, the system can manage business processes, create enterprise activity overviews and provide relevant data for decision-making in a complex manner. It is divided into a number of scalable products to suit all business segments (K2 Atmitec, 2015).
- **Pentaho-Business Analytics:** A system providing an interactive visual analysis, KPI-suitable user grid, adjustable reporting, current information for management and administration, complete data integration, and predictive analysis (Pentaho, 2015).
- **Pohoda Business Intelligence:** Accounting, warehouses, documents (Stormware, 2015).
- **SAP Business Objects Business Intelligence:** Makes use of the analysis of the trade data in order to describe, predict and increase the performance of the enterprise (SAP, 2015).
- **Tovek CI:** Enables the effective processing of large amounts of unstructured data. Professional tools based on full text technology for information searching (Molnár, 2012).

SOLUTIONS AND RECOMMENDATIONS: DESIGN OF THE KNOWLEDGE MANAGEMENT SYSTEM FOR SMES

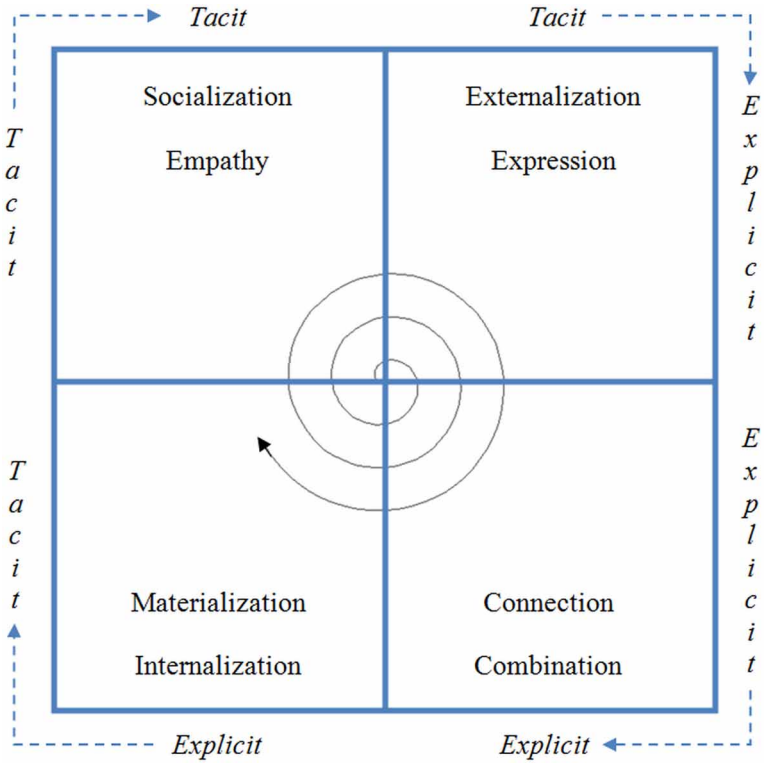
The suggested knowledge management system is based on two interconnected phases:

- Knowledge creation,
- Knowledge continuity – interpersonal (intergenerational) transfer.

Both parts integrally include the knowledge transfer. As the knowledge transfer is intensively active, so the chance for knowledge continuity is better.

Knowledge Creation Process

First it is necessary to realize that the process of knowledge creation is important because the development of competences (abilities to perform certain activities, use management tools) is mainly about the knowledge creation.



EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The organization develops knowledge through interaction between explicit and tacit knowledge. These interactions between the two types of knowledge are referred to as the knowledge conversion. Through the process of converting, knowledge is expanding both in terms of quality and quantity. The four types of knowledge conversions include socialization, externalization, combination and internalization (Urbancová, p. 26, 2013).

As well-known from Nonaka's theory, the knowledge creation process consists of (Bureš, p. 48-49, 2007). The spiral is shown in Figure 2**.**

- **Socialization:** The process of converting new tacit knowledge through experience sharing (interpersonal communication).

Figure 2. Model SECI: Elements of the knowledge conversion process
(Own processing with Pitra, 2016)

- **Externalization:** The process of articulation of tacit knowledge into explicit knowledge (publication).
- **Combinations:** The process of transformation of explicit knowledge into a comprehensive and systematic set of explicit knowledge (by IT software support).
- **Internalization:** The process of the embodiment of explicit knowledge into tacit knowledge (providing of products or services).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

As the Figure 2 indicates, it is a cyclic process which comprises in different stages individual and group activities and the interaction of people with environment. From the process of knowledge production (a process known as SECI) and with respect to the laws of the SECI process, effective methods of managerial development should also be derived (Urbancová, p. 26, 2013).

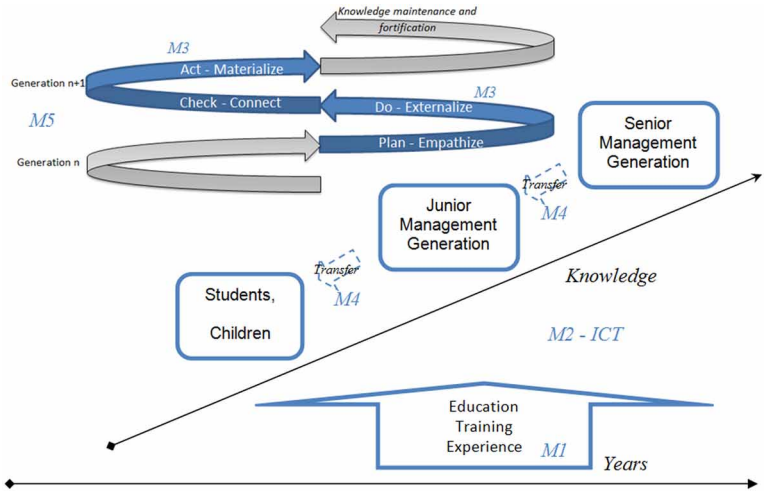
Knowledge Continuity

An essential part of knowledge management is the continuity of knowledge. Important reasons why the continuity of knowledge in the organization is so important (Urbancová, p. 28, 2013):

- Accelerates the training of new employees enabling them to be more productive sooner.
- Unifies knowledge and allows employees to focus on acquiring new knowledge.
- Allows increasing the productivity of the organization.
- Increases creativity, innovation, continuous improvement and organizational learning (everything depends on the knowledge of history).
- Improves decision-making, reduces errors of new workers.
- Reduces stress of employees, boosts the morale and loyalty of employees to the organization.
- Maintains knowledge networks that would otherwise be lost with leaving workers.
- Prevents the accumulation of knowledge in one person (often problem of family businesses).
- Retains organizational memory, knowledge remains in the organization.
- Reduces fluctuation and its financial implications.
- Reduces the vulnerability of organizations in the use of contingent workers (temps, etc.).

Knowledge Management System Chart

The presented chapter focuses on knowledge in management represented by sophisticated management tools, accented by knowledge management in that area and its influence on enterprise competitiveness.



The suggested knowledge management system should content the following interconnected working components:

1. Module: Creation of knowledge in management tools supporting better knowledge of the business system and its surroundings and consequent better decision-making.
2. Module: Provide the enterprise with quality management information systems (BI/CI) to work effectively with implicit and explicit knowledge.
3. Module: Practical usages increase the amount of practical work and case studies.
4. Module: Transfer of tacit know-how (management kabbalah) from senior generation with more experience to junior generation and students by cooperation and experience.
5. Put previous activities under PDCA-SECI type cycle of continuous improvement.

Figure 3 summarizes the above mentioned modules in complex system maintaining, fortifying and increasing knowledge in an organization. The solution of the knowledge management problem lies in long-term continuously improved PDCA-SECI processes (M5) based on knowledge creation (M1) and mutual inter-employees transfer: tacit to explicit and vice versa (see Figure 2) and knowledge usage (M3). The intergeneration transfer (M4), where rare and valuable knowledge can be gained from (often

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Knowledge management system chart
(Own processing, 2016)

undervalued) oldest and most experienced generations, is especially useful. This feature is often a very important competitive advantage of family businesses.

The knowledge management system is a part of the enterprise know-how and has to be sensitively adjusted to the specific enterprise conditions. Selection of proprietary software support (M2) is also an important task. As results from the previous research with other management systems (strategic management) have shown, it is certainly better to implement some knowledge management system and tune it slowly, than neglect this activity.

FUTURE RESEARCH DIRECTIONS

Future research opportunities can be seen in:

- Deeper theoretical research of contemporary publications.
- Deeper mapping of management support software and management tools adapted in them.
- Specific characteristics of the knowledge management systems process in enterprises with relation to specific characteristics of the enterprise competitive performance.
- More detailed definition of suggested knowledge management model regarding coherent modules and their interconnection.

CONCLUSION

The chapter discusses the issue of knowledge in management related to knowledge management where knowledge in management is represented by external, internal and tacit knowledge of sophisticated management methods, tools and systems. The empiric research (primary and secondary) indicated that the knowledge of sophisticated management methods, tools and systems on management positions in SMEs

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

is very low. This knowledge, however, due to the increase of innovativeness and competitive advantages of enterprises has to be permanently created by tools of a learning organization and transferred, ensuring its continuity. ICT support of MIS, ERP, BI and CI for management of especially explicit knowledge is very helpful. A simple knowledge management system containing 5 modules was formulated and introduced for application.

KEY TERMS AND DEFINITIONS

Business Intelligence: Set of skills (knowledge, know-how, technology, application, quality, risk management, security, and processes used in business) aiming better understanding of global business context.

Competitive Intelligence: Systematic process of gathering, analyzing, and the use of external information which can affect the intentions of the organization, its decision-making, planning and behavior.

Competitiveness: Ability of survival or expansion in global surrounding based on elasticity, adaptation, innovation, intellectual capital and knowledge management in a learning organization.

Enterprise Resources Planning: An ICT assisted system whereby an enterprise (organization) manages and integrates all or most of its activity areas such as planning, inventory, purchasing, sales, marketing, finance, human resources, manufacturing, and more.

Knowledge Management System: Systematic creation, classification, fortification, transfer and continuity of knowledge from senior to junior generations in organization based on PDCA and SECI cyclic processes.

Management Information System: Usually ICT based data processing (software) support for management by providing sophisticated structured information about an organization, processes, resources, personnel, market, etc.

Management Tools, Techniques, Methods and Systems: Simple, intermediate or complex analytical or creative plan activities applicable in different branches of management serving a sophisticated and effective management executive.

Chapter 49
Change Management Serving Knowledge Management and Organizational Development: Reflections and Review

Moria Levy
Bar Ilan University, Israel

ABSTRACT

Changes are considered a challenge to organizations. Seventy percent of organizational initiatives are not completed. Various Change Management approaches have been developed over the years, yet organizations continue to find changes difficult to implement. This applies to all types of change, but the challenge of change is critical in human resources disciplines, specifically those dealing with Knowledge Management and Organizational Development. This chapter connects changes in these two fields and links them to leadership. It examines theories and implementation models of Change Management, starting with classic approaches, through to new models developed in recent years. Based on this examination, a practical approach drawing on components of the reviewed models is proposed. The suggested approach takes into particular consideration the demands of change in Knowledge Management and Organizational Development.

INTRODUCTION

Knowledge is discussed and researched for centuries, starting with the Greek, and up till the late 20th century with Michael Polanyi's publications discussing knowing as a personal asset (Polanyi, 1958) and tacit knowledge (Polanyi, 1966). Shortly before, we find Peter Drucker first mentioning the term of the "knowledge worker" (Drucker, 1957). However, Knowledge Management, as a discipline, researched and managed in organizations, emerged some 20 years ago.

Knowledge Management

Knowledge Management covers a large spectrum of knowledge activities within organizations, and between them and related groups of interest. Knowledge retention deals with knowledge continuity and how organizations transfer the experts' knowledge and insights to the next generation (Levy, 2011). Knowledge sharing deals with means of transferring knowledge between people and communities, fostering reuse and minimizing re-invention of the organizational knowledge again and again (Den Hoof & Ridder, 2004). And Knowledge development focuses on models enabling the organizational knowledge growth (and the business growth), starting from debriefing and lessons learned (Milton, 2010), through learning models for development of professional frameworks (Levy, 2008), ending with innovation (Swan etc., 1999).

In 1988, an opinion survey conducted by The Harris Research Center revealed that organizations actually are interested in managing their knowledge. Contra to the conventional wisdom of the time (that is, in 1988), people were not afraid of losing power through sharing. Knowledge, as the survey revealed, was not shared mainly because of a lack of time or because organizations simply didn't know how to go about sharing; they were short on Knowledge Management methodologies (KPMG, 1998). Sharing knowledge mainly depends on the culture of the organization (Ruppel & Harrington, 2001; Al-Alawi etc, 2007). Over time we learned that, in some cases, workers did indeed refuse to share their knowledge due to a fear of losing their power or position. However, this was hardly a major obstacle. In fact, the current technological state of most organizations seems optimal for Knowledge Management. The advanced technologies utilized in most organizations today facilitate the process of Knowledge Management; Knowledge Management methodologies are common knowledge in many organizations (primarily in those which manage their knowledge by hiring a professional, either internal or external). Nevertheless, even today, managing knowledge isn't an easy task. Even in cases where maximum effort was invested, and talented, experienced personnel were assigned the task, success was hardly guaranteed.

In Knowledge Management terms, success can be defined as improving performances as a result of utilizing knowledge preserved, developed, shared and/or made accessible to workers. Improved performance can be derived from enhanced efficiency and/or increased quality of performance. Usually, accessible knowledge assists workers in making better decisions, thereby improving overall performance.

When evaluating the success of a Knowledge Management system assimilated in an organization, we might find evaluating the improvement of business output to be quite a complicated task. Obviously, there are cases in which output is more easily evaluated (e.g. customer service), yet in most cases, evaluation is far from simple. This task is challenging because linking improvement directly to Knowledge Management is not obvious, especially when a variety of alternative factors might be equally responsible for this change. The market is constantly transforming, whether it is our clients, our competitors, or our organization itself; and more than one change is usually taking place in the three aforementioned fields. Hence, differentiating the Knowledge Management factor from the rest is tricky, and it becomes an even harder task when the work process is an ongoing, complex one.

Some organizations measure their success by employing usage of shared documented knowledge as a parameter. This is an obvious mistake: Workers accessing shared knowledge do not ensure success. If the knowledge is not good enough, instructing our workers to use it will not yield improvement. It might possibly even lead to the contrary.

There are many prerequisites for success: Valuable knowledge, well-documented and organized knowledge, easy to use technologies enabling share and access, etc. For the purpose of this chapter, it is assumed that the relevant knowledge does exist, is saved in some knowledgebase, and that the knowledge

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

is organized and accessed easily and intuitively. Furthermore, it is assumed that we are dealing with a technological platform in which knowledge is stored and updated according to predefined work procedures.

This chapter aims to reflect on how Change Management models and methodologies can be means to successful implementation of Knowledge Management, Organizational Development and Leadership. It focuses on the challenges to attracting users, in Organizational Development and Knowledge management activities held in organizations. Users must actively participate in order for the knowledge to be used. Managing the change that may yield this participation is not as easy as it might seem. Some believe that a high-quality knowledgebase is a sufficient reason for workers to use it and actively participate in managing organizational knowledge. This is an industrial myth. Hard work is required to attract workers. Change must be managed in order to shift the workers' attitude and actions.

BACKGROUND

Challenges of Change Management

Organizational Development

Worren et. al (1997) view the Organizational Development (OD) as a developing discipline: "The field of OD has evolved over time since its beginnings in the 1930s" (Worren et al., 1997, p. 274). By 1997, they argue, OD in its classic definition had become irrelevant. The new OD had developed into a new profession – Change Management. "In terms of scope, the term change management is currently used in a manner that encompasses theory and intervention strategies associated with what is known in the academic literature as OD, human resource management (HRM), project management and strategic change" (Worren et al., 1997, pp. 276-277).This understanding is problematic on two levels: If OD equals Change Management, what discipline remains to indicate HRM solutions, defining the directions of change for them? And, if Change Management equals OD, it is technically difficult to analyze and further define how Change Management will serve OD, i.e. itself (the term used in computers for this conundrum is bootstrapping).

Kaplan (1996) defines Organizational Development as "the facilitation of an organization's capacity to self-reflect, self-regulate and take control of its own processes of improvement and learning" (p. 89).

This definition is wider. Change Management may be one of its components, but does not encompass its full scope. OD includes employees' development, talent management, debriefing, and other organizational strategies. Change Management, in such a definition, serves in two roles: First, it is a component of Organizational Development, serving all operational, professional and organizational needs. However, Change Management specifically is also a critical factor, an enabler for of all complementary components of OD. A well-planned Change Management program and its effective implementation are keys to success in each OD component implementation, whether learning or defining new organizational norms, values and other behaviors.

Leadership and Change Management

People associate the term 'leadership' with characteristics as 'inspiration' (Owens, 1995) and 'idiosyncratic' (Buckingham, 2012). Researchers searched for the precise traits of leadership: for example,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

"Stogdill (1974) identified six categories of personal factors associated with leadership: capacity, achievement, responsibility, participation, status, and situation" (Mendez-Morse, 1992, p. 12). However, this search has yet to yield the expected results. No combination of traits was found to provide an ideal formula. Interestingly, other key definitions of leadership do not link the term with characteristics, but rather with change:

Rauch & Behling (1984): *Leadership is the process of influencing the activities of an organized group toward goal achievement.*

Wills (1994): *The leader is one who mobilizes others toward a goal shared by leaders and followers. Leaders, followers, and goals make up the three equally necessary supports for leadership.*

Kotter (1994): *The fundamental purpose of leadership is to produce useful change, especially non-incremental change.*

Northouse (2012): *Leadership is a process whereby an individual influences a group of individuals to achieve a common goal etc.*

Summerfield (2014): *In his reflections on leadership definition quotes eight different ideas (some quoted above), all discussing change and influence.*

In other words, in order to lead one must know how to influence those to follow; to move them through a non-trivial change. Leadership is Change Management.

Knowledge Management, Organizational Development and Leadership are major components of the 'intelligent human' asset management in organizations. Managing intelligent organizational change is one of the most difficult challenges that businesses face, even the most difficult for some (Kanter, 2003). The purpose of this chapter is to unpack the idea of Change Management, as it is used in these three fields.

CLASSIC CHANGE MANAGEMENT THEORIES

Change Management is understood to be a managerial approach. It deals with the changes required to cause an individual, a group or an organization to change their habits or routines in a specific way. Professional literature differentiates between Change Management theories concerning individuals and Organizational Change Management theories. Some further refine the definition, differentiating between additional levels of Change Management teams or groups.

According to Cameron & Green (2004), there are four approaches to Change Management concerning individuals:

1. **The Behavioral Approach:** An approach that focuses on changing behavior by identifying desired behaviors that yields the desired performance. The elements of the current state of these performances are then analyzed and altered accordingly (Watzlawick, Weakland & Fisch, 1974).
2. **The Cognitive Approach:** An approach based on the perception that people act according to the beliefs and values they hold. Successful management of change is rooted in influencing cognitive activity which in turn affects behavior, and will be based on defining the goals for desired results (Beck, 1976).
3. **The Psychodynamic Approach:** According to this approach, people go through a psychological process when experiencing change. Different researchers describe different stages of the process,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

which are essentially identical. Elizabeth Kubler-Ross, who was the first researcher to develop a model of this sort, defined the following stages: denial, anger, bargaining, depression, and acceptance (Kubler-Ross, 1969. Also see: Satir, 1991).

4. **The Humanistic Approach:** This approach combines different elements of the three approaches above, while regarding each individual holistically. The best-known representation of this approach is Maslow's hierarchy of needs, starting with basic physiological needs, through safety, love and acceptance, and finally, self-actualization (Maslow, 1970; also see Rogers, 1967).

In addition to these theories focusing on individuals, we find the field of Organizational Change Management. Morgan (1986) for example, reviews the theoretical state of the field while presenting his own theory, arguing that each of the various theories suit at least one of the following metaphors:

1. **Organizations as Machines:** A process-related approach focusing on strict organizational structure. Perspectives of organizational Change Management are similar to the theories focusing on individuals: There might be some resistance to change, but eventually, through order and moderation, the change will be implemented. The change will be managed, according to this metaphor, by authority figures.
2. **Organizations as Political Systems:** This metaphor highlights a distinction between the operational conduct and the political system, viewing the latter as a higher, separate level of management. In this view, Change Management changes will only occur if supported by a powerful figure or a strong coalition.
3. **Organizations as Organisms:** Like living organisms, organizations develop, change and adapt. Change Management Changes should be directed only as a reaction to some external need. Individuals and groups should be aware of the need for change in order for them to adapt to it. Companionship and psychological support are essential for successful change.
4. **Organizations as Ever-Changing Flows:** Organizations are complex systems and are part of a wider environment. Change Management, in this understanding, cannot be managed; it can only evolve. Managers are an integral part of the organizational environment and conflicts are an important part of Organizational Development. Change Management is there to provide options and to enable.

There are a range of practical implications for these metaphors. In 1947, Lewin formulated a simple, yet critically important, Change Management model, comprised of three stages: The first stage, known as the 'unfreeze' stage, consists of analyzing the current state of the organization, as well as identifying change-promoting and change-inhibiting factors and presenting the desired status. The second stage, the 'move' stage, deals with implementing the change. The final stage, the 'freeze' stage, deals with stabilizing the organization, setting a policy, rewarding success and writing relevant standards. Lewin's model is an example of model which implements the theories presented above. It is based on a combination of the "organizations as machines" metaphor (1) and the "organizations as organisms" metaphor (3).

Other researchers developed additional models, most notably Bullock & Batten (1985) who offered the plan-act-integrate model; Carnall (1990), who highlights managers as change leaders in processes, culture and organizational politics; and of course, Senge (1990) with the Spiral dynamics: Start small, grow moderately.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

THE NEED FOR NEW OR RENEWED APPROACHES

Clearly, there is no shortage of approaches to the topic of Change Management. Furthermore, the existing theories demonstrate sophistication and depth. Consequently, it is somewhat surprising to discover that organizations continue to fail in the majority of initiated changes:

Despite an increase in academic and practitioner awareness of the importance of organizational change (Kotter, 1995), many initiatives still fail to yield the increase in profits and performance promised (Caldwell, 2003). Even with dozens of change models developed and countless changes implemented, in a study of 210 North American businesses, Smith (2002) found that 75 per cent of initiatives fail to make an impact (Raelin & Cataldo, 2011, p. 482).

From years of study, I estimate today more than 70 per cent of needed change either fails to be launched, even though some people clearly see the need, fails to be completed even though some people exhaust themselves trying, or finishes over budget, late and with initial aspirations unmet (Kotter, 2008, p. 12).

The number 70 is repeated in additional researches as the rate of failure of organizations who aim to change:

Despite some individual successes, however, change remains difficult to pull off, and few companies manage the process as well as they would like. Most of their initiatives—installing new technology, downsizing, restructuring, or trying to change corporate culture—have had low success rates. The brutal fact is that about 70% of all change initiatives fail. (Beer & Nohria, 2000, p. 9)

In light of this phenomenal failure rate, there is clearly a pressing need for reassessing existing approaches and offering new ones in order to better understand change and suggest how Change Management can be successfully applied both generally and specifically in Knowledge Management and Organizational Development in organizations. Ashkenas has pithily pinpointed the issue: "Change Management needs to change" (2013, page 1).

NEW APPROACHES TO CHANGE MANAGEMENT

A new wave of thinking and scholarship in the field of Change Management attempts to address this need:

One group of researchers consists of leading scholars with direct expertise in the discipline of Change Management. Two of the best-known are John Kotter and Jeff Hiatt. More than anyone else in the past twenty years, Kotter is indisputably associated with the promotion of Change Management and his model is recognized and implemented internationally across numerous leading organizations. According to Kotter (1995), organizational Change Management consists of eight stages:

1. Creating a sense of urgency.
2. Forming a guiding Coalition.
3. Forming a vision and a change strategy.
4. Communicating the change and the need for it; getting the workers' consent.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

5. Empowering others to act.
6. Creating initial success, generating short term achievements.
7. Not giving up: sustaining acceleration.
8. Institutionalizing change: Creating a new culture in which the implemented change is an integral part.

These eight steps are not strictly sequential, but rather spiral: One begins with step 1 and advances, yet sometimes reversing and skipping are required. However, Kotter was not satisfied simply with creating a model. After the model was implemented in nearly every international fortune 500 company, he was still not content. Kotter tried to understand why most organizations that attempt to initiate a change don't complete the implementation process. Kotter conducted research in approximately 250 organizations that implemented a change process, yet didn't succeed in completing it, in an attempt to understand what difficulties these organizations faced and in which specific stage. Surprisingly, Kotter's research revealed that most organizations fail to complete the very first of the eight stages (creating a sense of urgency) either due to organizational complacency or, on the contrary, because of a sense of urgency led to a rush to complete this stage successfully. In 2008, Kotter published the aptly named book *A Sense of Urgency*, in which he suggests how to methodically create a sense of urgency in organizations in order to continuously promote change.

Another useful, innovative model was developed by Jeffrey M. Hiatt of Procsi and described in his book *Change Management: The People Side of Change* (2003. Co-written with Timothy J. Creasey). This model is one component of an inclusive Change Management theory developed by the two.

The model is titled ADKAR, an acronym of the 5 elements that can inhibit organizational Change Management:

- **Awareness:** Every worker must be aware of and comprehend the importance of said change.
- **Desire:** Every worker must want to support and participate in this change.
- **Knowledge:** Every worker must know what he must do in order to change.
- **Ability:** Every worker must possess the ability to exercise new skills and behavior as required in order to perform this change.
- **Reinforcement:** Tools to helping the internalization of the change; turning it to a regular habit.

The second group of researchers developing new approaches to Change Management is scholars working on leadership, including the investigation of leadership characteristics and behaviors, leading to insights into Change Management approaches and models. Three researchers in this group worthy of note are Michael Fullan, Gary Hamel and Simon Sinek. Fullan is known as a leadership researcher, yet many of his books' titles employ the terminology of change: for example, *Leading in a Culture of Change* (2001), *The Six Secrets of Change* (2008), *The Challenge of Change* (2009), *Change Leader* (2011), and *Freedom to Change* (2015)., Other titles present change as part of the suggested methods: for example, *Motion Leadership* (2009), and *The Principal* (2014).

Gary Hamel is another influential leadership researcher with expertise in innovative management (*The Future of Management*" (2008); *What Matters Now* (2012)). Both Hamel and Fullan share the understanding that changes can be promoted and applied when those who direct them act as leaders to look up to, basing their leadership on values, respect and care for the people expected to follow. Fullan (2008) lists the keys to change and leadership success as follows: Love of employees; connecting peers

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

with purpose; transparency; constructive feedback request; and learning, both as individuals and as a system. Hamel (2012) describes the qualities of a new leader (the one leading the change) as having values; driven by ideology; innovation capabilities (see also 2008); adaptability; and desire.

Sinek has a different background, in marketing and strategic communication, yet his talks and books also focus on leadership and change. In *Start With Why: How Great Leaders Inspire Everyone to Take Action* (2009), Sinek emphasizes the importance of answering the "WHY" question, defining the reasoning and beliefs, as the basis of every strategy; as well as how this emotionally engages those to follow (or buy). The bottom line is: Leadership is the ability to apply changes, and change can be achieved when leadership answering the criteria described involves a clear purpose.

A third group of new approaches to Change Management is offered by social scientists. Two eminent researchers within this group are Peter Senge and Kurt Lewin. We mention Lewin's work here again, even though his theories are not part of the new wave (his change theory was introduced back in 1947), because his three-step process remains a foundational model for making change in organizations. From the three stages of 'unfreeze,' 'change,' and 'freeze,' an important lesson is learned: Before initiating any change, one must first transform the existing mindset, enabling the change to take place.

In *The Dance of Change* (1999), Senge et al. describe the basic conditions enabling the initiating of changes (pp. 55-56): Raising commitment; starting small and growing steadily; finding the time (if too short on time to change, fix crisis before starting); and continually identifying barriers and limits and lessening them.

The final set of perspectives completing the new wave of studies about Change Management is of Business Management thought leaders. The approach here is very practical, as is that of the first group mentioned above, of Change Management specialists. In their book *Switch: How to Change Things When Change Is Hard* (2010), two of these Business Management specialists, the brothers Dan and Chip Heath, refer to three scales one should employ when managing substantial Change Management (whether individual or organizational):

1. The rational dimension (titled "Direct the rider"):
    a. Creating a clear direction to the destination.
    b. Finding positive elements in the current situation.
    c. Defining specific tasks for critical stages.
2. The emotional dimension (titled " Motivate the elephant"):
    a. Connecting with emotions.
    b. Shrinking the change.
    c. Growing the people.
3. Adjusting the environment (titled "Shape the path"):
    a. Making small amendments and adjustments in change-oriented environments.
    b. Creating new habits in the new environment.
    c. Creating peer pressure in order to implement the change.

These four grouping provide a summary of the new generation of Change Management approaches and models: approaches grounded directly in Change Management theory; change based on leadership studies; change based on social psychology; and change based on business management theories. These four groups complement one another and, as in many other domains, the variation and the combination of approaches from different disciplines are of value.

SOLUTIONS AND RECOMMENDATIONS

As noted above, getting workers to change their behaviors and perceptions is not a simple task. There is no single formula for success, and there is no guarantee that a formula proven successful in one setting will be successful in another (sometimes even within the same organization). However, two notable trends offer a reason to be optimistic about the chances to defeat the 70% curse - the number recurring time and again in research, representing the rate of failure in cases of organizational initiated changes.

The first of these trends is the new generation of thought leaders described in broad strokes above, researching the issue and suggesting new approaches and possibly better models. These researchers have in common their combination of theory and practice, through academia and business careers. This characteristic, indeed, gives rise to practical, well-grounded ideas that are tested time after time in real life situations. Even though these researchers represent different classes of theory, they share a number of core concepts (such as a focus on change or, more accurately, lack of change; and distinguishing lack of change from resistance to change (Lewin, 1947), as well as theoretical roots in early ideas that are present in the work of later researchers (for example, Kotter's 'sense of urgency' (2008) which is incorporated in almost every subsequent model).

The second notable trend has to do with organizations. Organizations are recognizing the need to proactively manage changes. While in the past, not many organizations assigned budgets and organizational resources to Change Management activities, one today finds that Change Management has a clear role in organizations. A Google search for "Change Management" and "job description" in April 2017 yielded over 1,000,000 results.

Blended Approach Based on New Change Management Approaches

The combinations of these two trends – the development of well-grounded directions in the management of changes, and organizations that are recognizing the importance of Change Management and assigning it resources –are the basis for some cautious optimism and a justification for offering a blended approach for implementation in managing change, which fosters success.

What is suggested here is an approach; an approach rather than a model, because it provides no recipes; an approach that must be adjusted to each organization's specific culture, current situation and type of need.

The approach is three staged, the two first stages based on the WHY strategy components (Sinek, 2009):

Initiate: Ask WHY

In order to initiate any change, the organization has to verify that the change serves a real need; that the added value is significant; and that it can be communicated clearly and loudly (Senge et al., 1999; Heath & Heath, 2010). Furthermore, the need for change should be urgent in the perception of those who will take part in the change. Important changes are not good enough. In order to convince organizations to actually initiate the move, a sense of urgency is key (Kotter, 2008).

When these conditions do occur, unfreezing must take place (Lewin, 1947). People are overwhelmed by knowledge and protect themselves by shutting down their attention and blocking new inputs. A sense of urgency is the key to cracking the status quo, unfreezing the current situation, and enabling a change.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Finally, initiating change focuses on the why question, recognizing it to be the starting point of a good strategy (Sinek, 2009).

Examples and tips for implementation:

Need and sense of urgency: Demonstrate the cost of not managing the knowledge. If for example, the change deals with debriefing and learning from lessons, demonstrate recurring mistakes. If the change has to do with reusing information in projects, demonstrate samples of documents with significant overlap, developed more than once.

Why: Present management a short list of business advantages, answering known needs as to why a social media network is required in the organization, and leading to the importance of their commitment to the change. Present existing known challenges, as low level of employees' engagement and the role the platform to improving this need.

Plan: Ask HOW and WHAT

Once the 'why' is defined, planning can take place focusing on the HOW and WHAT (Sinek, 2009):

The HOW question can be understood in several levels. It is suggested that the HOW be interpreted as the purpose and engagement, the planning of how those who follow can be respected and treated with care and compassion, and transparently sharing purpose with them (Fullan 2001, 2007; Hamel 2008, 2012).

Answering the question WHAT defines the actual plan. It is suggested to ease the change as much as possible, for example by:

- Slicing it into pieces (Heath & Heath, 2010).
- Being accurate as to expectations (Heath & Heath, 2010).
- Adjusting the environment to support it, by making it natural to navigate in the new pane, embedding hyperlinks in forms, new activities in current processes, where they naturally fit, etc. (Heath & Heath, 2010).
- Applying the suitable change to each target group, in accordance with the specific time and situation, using the ADKAR model (Hiatt & Creasey, 2003). Some may mainly have to be made aware (the A component), while others will need all the components (Awareness, Desire, Knowledge, Ability, and Reinforcement). Nonetheless, just one or two are those appropriate to focus on in a given timeframe.

Examples and tips for implementation:

Slicing into pieces: Design a reduced implementation of the process to take place, yielding a quick win. After first success, ask for additional budget and organizational commitment. For example, if knowledge continuity is the need, start with one expert, intended to retire. Demonstrate the knowledge captured, and only then present the full project and change.

Adjusting the environment to support the change: Embed an additional paragraph, for example into the template or form serving for project planning, requesting the project manager to list potential lessons from previous projects, that may be relevant to the new project.

Do: Verify Progress

Action is the third stage. While enacting the change, the main emphasis should be on:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Monitoring progress (Paton & McCalman, 2008).
- Continually learning and gently directing and refining the path (Heath & Heath, 2010).

Examples and tips for implementation:

Monitoring progress: Send a weekly update as to progress, listing the work and progress of each department. When managers will observe that their department is less than others (and there are always some that are behind), knowing all other managers are seeing the same report, many of them will urge their employees to whatever is required to achieve better relative results.

The pace of change in every aspect of our world has increased dramatically since Lewin presented his model back in 1947. The final 'freeze' stage, instituting the changes and freezing the new way of behavior may sound naive in today's work culture. In modern society, and even more so in the world of Knowledge Management, Organizational Development, and leadership, the promotion of change is an infinite process (or at least, one of an unfathomable length). The more we succeed, the more new needs appear, new changes are required, and new models and tools are discovered or invented. All these are accompanied by ever new Change Management projects. There might be a starting point, but there is no finish line in sight. This might not be the optimal setting for an organization to operate in, yet it is undoubtedly the current reality to which we must learn to adapt.

FUTURE RESEARCH DIRECTIONS

There is of yet no scientific proof that this approach can improve upon the sad statistic of 70% failures in initiated changes. However, the practical experience of organizations that have implemented this model in Knowledge Management projects seems to indicate that it works. Further research to ascertain the model's effectiveness is recommended over the next few years. At the same time, additional new approaches that are still being developed in the constantly evolving world of Change Management should be examined, in order to learn how they can contribute to the suggested approach and improve it. Our work is far from being done.

CONCLUSION

This chapter elaborated on the importance of appropriate Change Management and presented different theories and implementation models. Both classical and new approaches and models were presented and, based on the new generation of ideas, a hybrid approach was suggested. The suggestion combines elements from the various approaches and models addressing the needs of Knowledge Management and Organizational Development and Leadership that were discussed – all components of organizational intelligent asset management.

KEY TERMS AND DEFINITIONS

Development: 'Steady progress' and stresses effective assisting in hastening a process or bringing about a desired end, a significant consequence or event, the act or process of growing, progressing, or developing.

Globalization: Tendencies of businesses, technologies, or philosophies to spread throughout the world or the process of making this happen. Worldwide integration and development, the process enabling financial and investment markets to operate internationally, largely as a result of deregulation and improved communications.

Initiative: Readiness to engage in daring or difficult activity, the condition of being initiated into some experience or sphere of activity: knowledgeableness.

Knowledge: Human or organizational asset enabling good decisions and effective action in context. There are diverse views on the scope covered within knowledge, based on context and purpose. The definition above is general as to the various perspectives. Examples of knowledge: insights, know-hows, etc.

Knowledge Management: Management with regard to knowledge. Use of a systemic and holistic approach to improve results and learning; it includes optimizing the identification, creation, analysis, representation, distribution and application of knowledge to create organizational value.

Organization: Person or group of people that has its own functions with responsibilities, authorities and relationships to achieve its objectives. The concept of organization includes, but is not limited to sole-trader, company, corporation, firm, enterprise, authority, partnership, charity or institution, or part or combination thereof, whether incorporated or not, public or private.

Perspective: Is a way of regarding situations, facts or topics or a mental view or the state of one's ideas; prospective means concerned with or related to the future and judging their relative importance. It includes the proper or accurate point of view or the ability to see with objectivity so as to try to get some perspective on issues for better solutions.

Chapter 50
Impact of Social CRM Capabilities on Firm Performance:
Examining the Mediating Role of Co-Created Customer Experience

ABSTRACT

The emergence of social media technologies have drastically changed the face of customer relationship management (CRM), hence firms are incorporating social media technologies in their existing CRM systems which has led to the evolution of social CRM. This article extends capability-based perspective of traditional CRM by integrating it with social media technologies and to assess empirically their significant impact on firm performance. It also examines the mediating role of co-created customer experience. The developed hypothesis and proposed model were tested through structural equation modeling (SEM). The results show that co-created customer experiences play a role of mediator between social CRM capabilities and performance outcomes. Sales/marketing centric technology resources significantly influence four dimensions and customer centric technology resources influence two dimensions of relational information processing capability. The findings also depict that there is an influence of Sales/marketing and customer centric technology resources on customer linking, market sensing and social CRM capabilities.

INTRODUCTION

Social media has transformed the role of consumers online. The consumers presently are not just passive receivers of information available online instead they have become active participant and co-creators of information online. Most of the comments posted by using social media, is in the form of "self-created content sharing" and placed by eighteen or older age online users (Lenhart, Purcell, Smith, & Zickuhr, 2010). To the interpersonal communication, the social applications enabled users to act together with firms and allow them for actively participating in the co-creation of experiences (Prahalad & Ramaswamy, 2004). Approximately 41 percent of the people online were found to be engaged with the brand they preferred with the help of various social media platforms (Mintel Group, 2011).

Now days, companies are focusing their marketing efforts towards social customers and highly expends on social media advertising. Businesses have approached to these social changes and technologies by following advertising network for online users instead of traditional advertising means (Trainor, 2012).

Most of the firms are starting to make use of social media for creating and retaining customer relations in the word-of-mouth marketing to customer-to-customer communications (Kozinets, De Valck, Wojnicki, & Wilner, 2010) for innovation co-creation (Sawhney, Verona, & Prandelli, 2005) and for community-based customer support (Greenberg, 2010). Most of the companies integrate their existing customer database with social data (VanBoskirk, Shar, Overby, & McGann, 2009) in order to enhance it and thus focusing on social customer relationship management (Social CRM).

The word "Social CRM" has been newly added into marketing, which represent a wide set of activities comes under social media (Greenberg, 2010). Social CRM capability: "the integration of traditional customer-facing activities, including processes, systems, and technologies with emerging social media applications to engage customers in collaborative conversations and enhance customer relationships" (Trainor, 2012, p. 319).

Although the usage of social media application is increasing, still the research in the field of marketing needs to build a conceptual model which relates Social CRM to the firm performance by considering extensive literature on CRM. This study makes an attempt in this direction and develop a conceptual model based on traditional CRM literature and integrating it with social media technologies and empirically to assess their significant impact on firm performance. In addition, it also examines the mediating role of co-created customer experience between social CRM capabilities and performance outcomes. This is the first study to empirically examine the impact of social CRM capability on customer based relational performance, customer based profit performance and new product performance.

This paper proceeds as follows: First, we review the literature related to the key constructs of research model and their relationships in order to propose hypotheses. Then, discuss the method utilized in this paper. Thereafter, present the findings and at the last, we conclude the article with research implications, restrictions and forthcoming research opportunity

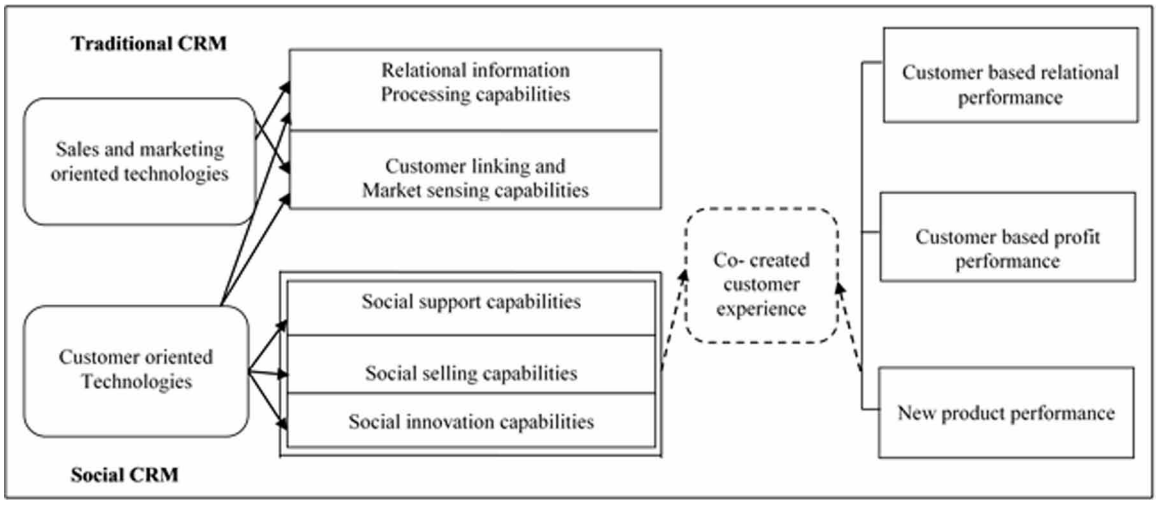
THEORETICAL CONTEXT AND HYPOTHESIS DEVELOPMENT

Social CRM is based on both resources and capabilities based view which advocate that "performance is largely a function of a firm's resource endowment and its effectiveness at converting these resources to advantage-generating competencies" (Barney, 1991; Day, 1994).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

CRM is oldest and widely used concept since 1990s, yet there is no generally accepted definition of it. According to Boulding, Staelin, Ehret and Johnston (2005, p. 157) "CRM relates to strategy, the management of the dual creation of value, the intelligent use of data and technology, the acquisition of customer knowledge and the diffusion of this knowledge to the appropriate stakeholders, the development of appropriate (long-term) relationships with specific customers and/or customer groups, and the integration of processes across the many areas of the firm and across the network of firms that collaborate to generate customer value".

Most of the literature in the field of CRM has not covered social media. Therefore, the definition of traditional CRM mainly focuses on organisms which facilitates sales and marketing support, data integration and analysis (Jayachandran, Sharma, Kaufman, & Raman, 2005; Rapp, Trainor, & Agnihotri, 2010). The definition may remain valid, but still due to the broader usage of social media applications, there is a need to integrate this view of traditional CRM with social CRM. It is because of the expansion in the applications, which comes under CRM technology and also to know that how the traditional CRM view changed in the age of social customers.



As a result of social media applications, a new term social CRM comes into existence that integrate both changes technological as well as social. This emerging concept of CRM integrates a network focused and more collaborative approach to customer relations. The labels "social CRM" or "CRM 2.0" have been adopted to explain this innovative way of developing and sustaining customer relationships inside the existing business and IT scenario (Trainor, 2012). According to Trainor (2012), "Social CRM is the integration of traditional customer-facing activities including processes, systems, and technologies with emerging social media applications to engage customers in collaborative conversations and enhance customer relationships" (p. 319). Social CRM is not an alternative in place of traditional CRM, instead of it is an extended view that adds on social capabilities, functions and processes. It facilitates the interaction between customers and firms (Greenberg, 2010). Existing CRM definitions provides interaction in technologies, processes and customers (Zablah, Bellenger, & Johnston, 2004). Literature on CRM shows that till now efforts to engage with customers were limited, but the usage of social media technologies by businesses and customers enables them more interactive (Kaplan & Haenlein, 2010).

Social CRM and Capabilities based View

The capabilities based view suggests that how the investment in marketing and IT capabilities leads to enhanced firm performance (Nath, Nachiappan, & Ramanathan, 2010; Rapp et al., 2010). Trainer, Rapp, Beitelspacher, & Schillewaert (2011) found that the integration of IT, business and human resources facilitates the growth of e- marketing capabilities, which have a constructive influence on firm performance. Rapp et al. (2010) suggest that how with the CRM technologies and firm resources, customer linking capabilities can be developed. They also described that these capabilities have an impact on both relational performance (customer acquisition, satisfaction, retention and loyalty) and firm performance (return on investment, competitive position and profitability). Trainor, Andzulis, Rapp and Agnihotri (2014) measured the impact of social CRM capabilities on customer relationship performance. Similarly Vorhies, Orr and Bush (2011) measured the impact of customer focused marketing capabilities on financial performance. In the same line Raman, Wittmann and Rauseo (2006) identified various organisational capabilities in CRM implementation.

Figure 1. Conceptual model on Traditional and social CRM: technologies, capabilities and performance outcomes

These existing works provide guidance that through the integration of CRM technology resources, capabilities can be created. However, the past studies have not considered the latest technological changes brought by social media applications. The focus of these past studies lies in capabilities and resulting variables and examined in traditional CRM literature. Therefore, the investigation of social media capabilities and their outcomes keep aside from the scope of CRM research. In figure 1 a conceptual model based on both traditional and social capabilities shown. It depicts that social CRM is an extended version of traditional CRM and makes it more effective.

Sales, Marketing Centric Technologies and Traditional CRM Capabilities

Traditionally, technology was considered as a tool for sales or marketing that enhances the efficiency of employees. Ahearne and Rapp (2010) give the name "sales person oriented" or "sales person centric technology" to this perspective. They also believed that in sales and marketing, technology comes under sales person to customer interface continuum. In traditional CRM, technology oriented resources termed as sales/marketing centric. They include systems for customer analytics, e-mail, sales force automation, interactive voice response systems and database marketing. The main objective behind these technologies is to increase the efficiency of employees and to improve data analysis. As per Day (1994) these technologies, termed as *inside-out* processes. "Salesforce.com, a vendor of CRM and sales force automation software, offers a product called Sales Cloud that provides tools to manage accounts and contacts (data capture), leads and opportunities (data analysis), and e-mail and calendaring (efficiency and effectiveness)" (Trainor, 2012).

In the field of CRM, communication includes the information sharing between an enterprise and its consumers (Jayachandran et al., 2005). "Relational information processing ensures that the information needed to build trust and commitment between a firm and its customers is developed, provided to decision makers, and used effectively" (Rapp et al., 2010). This capability includes five dimensions; information use, information capture, information reciprocity, information incorporation, information

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

retrieval (Jayachandran et al., 2005). Relational information processing capability has a positive impact on customer retention and satisfaction (Jayachandran et al., 2005).

Based on the aforementioned opinions, we proposed that traditional CRM, sales and marketing technologies will influence information capture, integration, access and usage dimensions of relational information processing, and therefore we proceed with the following hypothesis.

H1: Sales/marketing-centric technology will positively influence information capture, integration, access and usage dimensions of relational information processing capability.

According to Trainor, "Customer-linking capability refers to how well a firm deploys its marketing resources to build durable relationships with customers" (2012, p. 323). This capability involves the ability to recognize customer necessities along with the capability to nurture relationships with consumers. "Market sensing refers to the ability of firms to continuously sense and act on events and trends by learning about customers, competitors, and channel members" (Day, 1994). The literature in the field of market orientation and CRM, involves both market sensing as well as customer linking capabilities and both positively affects firm performance (Hooley Greenley, Cadogan, & Fahy 2005; Rapp et al., 2010).

H2: Sales/marketing-centric technology will have a positive influence on market sensing and channel linking capability.

Customer Centric Technologies and Social CRM Capabilities

Customer centric technologies allow customers in social network to interact with others and to become network members. Twitter, YouTube, LinkedIn and Facebook depict social media applications which have converted from customer specific to customer centric tools and enables firms to interact with network members. Other examples can be blogs, user-generated content Sites, discussion forums and user-created communities. Another type of customer-centric technology may include the use of social media technologies to specially engage customers in interactions related to the organization.

Like, Starbucks in 2008 introduced its user community Web site named "My Starbucks Idea" (http://mystarbucksidea.force.com/ideaHome/) for providing a common platform to share ideas and get comments from its customer community. One more example in this context is "Salesforce.com's Idea Exchange" (http://success.salesforce.com/ideaHome/). It is a social media application that enables its customers to participate and give new ideas and interact directly with sales and marketing managers. Both sales and marketing as well as customer oriented technologies enable CRM. "A functioning "traditional CRM system may be necessary to take advantage of the opportunities afforded by social media applications and social CRM" (Greenberg, 2010).

"Information reciprocity—the activities and processes that encourage customers to interact and share information—has a logical relationship with social CRM technologies because reciprocity and interaction are cornerstones of social media applications" (Trainor, 2012). "It is logical to expect that information capture, or the acquisition of information from customer interactions with various sources and channels, can be developed by either sales/marketing-centric or customer-centric technology resources" (Jayachandran et al., 2005).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

H3: Customer centric technologies will have a positive influence on information capture and reciprocity dimensions of relational information processing capability.

These customer-centric technologies are the part of Social CRM technology. The traditional CRM only confined to those customers that are directly related to the firm, whereas, these Social CRM technology confined to the conversations of both official and unofficial customer. "Social CRM technologies, such as social media monitoring software, are likely to have a direct relationship with a firm's customer linking and market sensing capabilities because of the rich information afforded to managers who use them" (Trainor, 2012).

H4: Customer centric technologies will have a positive impact on market-sensing as well as channel linking capability.

Social service and support capability referred as "the ability (1) to interact with networks of customers to solve problems during service and support encounters and (2) to create and disseminate knowledge from these interactions throughout the organization" (Trainor, 2012. P. 325). "Social CRM technologies are already accepted forms of business–customer communications, and their implementation in customer service settings is rapidly growing" (Kingstone, 2010)

H5: Customer centric technologies will have a positive influence on social service and support capability.

Social selling capability referred "as the ability to use knowledge about customers and the network of customer relationships to effectively navigate the firm's sales cycle" (Trainor, 2012, p. 324). "Salesforce.com provides a Facebook integration toolkit that allows companies to combine traditional CRM data with dynamically updated personal data from Facebook. This gives the salespeople real-time personal data (i.e., status and profile updates) about their customers. This toolkit can also be used to cross-check consumers' Facebook "friends" with the existing contacts and accounts in the CRM database, allowing the formation of a network map of consumers and the associations among them, which gives salespeople another piece of valuable information that can be used during a sales call" (Trainer, 2012). Social network theory reveals that "each stage may require a unique network configuration because certain configurations are better suited to certain tasks" (Ustuner & Godes, 2006).

H6: Customer centric technologies will have a positive impact on social selling capability.

The notion of involving customers in new product development process is based on idea that customers are not only gives information regarding their preferences, but they also act as an innovation's valuable source (Von Hippel, 1986). According to Ernst, Hoyer, Krafft and Krieger (2011), "There appears to be a logical relationship between social CRM and NPD because social CRM addresses the interactions between the customer and the firm and the customer and his or her peers". Sawhney et al. (2005) founded that "how firms can engage customers in virtual environments and integrate their knowledge into the ideation, concept development, product design, product testing, and product introduction phases of the product development process". Social media technologies results into increased customer interactions and their incorporation into traditional CRM technologies leads to increase social innovation capabilities (Trainor, 2012).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

H7: Customer centric technologies will have a positive influence on social innovation capability.

Co-Created Customer Experiences, Social CRM Capabilities and Firm Performance

Recently, co-created customer experience is becoming an important part of CRM activities. According to an emerging view within the marketing literature, "as customers take a more active role in communicating and interacting with companies, these quality interactions, which enable customers to co-create unique experiences, are the key to unlocking new courses of competitive advantage" (Prahalad & Ramaswamy, 2004). The co-created customer experiences consist of collaborative support as well as Innovation co-creation and may affected by social CRM capabilities. Innovation creation referred as "the integration of existing knowledge with new knowledge" (Von Hippel & Katz, 2002).

Trainor (2012) suggested that co-created customer experience has direct relation with customer-based relational as well as profit performance. Customers may facilitate higher satisfaction through participating in co-created activities. "The interactive dialogs with the firm lead to greater communication intensity and information sharing—two activities that are recognized to be fundamental antecedents to trust and relationship development" (Morgan & Hunt, 1994).

By participating in co-creation activities, customers may also exhibit greater satisfaction. All these factors may have an impact on customer-based relationship to performance. "Firms that are able to develop the innovative co - creation and collaborative support outcomes may be able to spread development and support costs across their customer communities" (Trainor, 2012).

This may lower down the support costs and allow personnel to provide more time to profitable customers instead of unprofitable one, thus positively influences customer centric profit performance.

H8: Co-created customer experiences mediate the influence of social CRM capabilities on the firm's performance.

METHODOLOGY

It covers sample and data collection along with measures used in this study.

Sample and Data Collection

In this study, survey method was used for collecting data. The final data was acquired by managers through a random sample of top firms selected from the Forbs India 500 list. The respondents were from both the consumer and business markets. The respondents that were assured that, only aggregate results would be disclosed and their individual responses would keep confidential. The overall responses were obtained over a three week time frame and out of the firms approached, only 203 respondents given complete data. The responses on an average crossed five (s = 5. 63). Respondents were also asked about their acquaintance of their business operations and from how long they are into this business, in order to appraise their appropriateness to give responses. Subsequently, under experienced (experience < 1 year) respondents in the company were deemed to be invalid. In order to maintain greater accuracy in

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the results, the respondents who were given invalid and incomplete responses were eliminated from the survey. In total, 132 responses were considered useful, with 26% response rate.

In this study, the key informants consist of managers of these companies due to the below mentioned reasons: Previous studies on the linkage of social media with firm performance and capability have also taken managers into consideration for giving information (Li & Calantone, 1998). Furthermore, some researchers recommended to make use of the various informers (Barnes, 1984). However, another study has reinforced that managers offer reliable and effective data (Li & Calantone, 1998) as they have control over the functions of their company and they had thorough information concerning the functions of the firm, the market and their competitors.

The non-response bias was analyzed by considering mean scores of initial and late respondents on the resource items. At the .05 levels in t-test, no significant differences were realized and all these lead to the confidence that non-response bias was not a matter of dispute in this research.

Measures

A multi item scale was employed to measure the theoretical constructs of the recommended model. The measures taken and their items are explained in detail below.

Sales/Marketing centric technology was measured by considering Ahearne and Rapp (2010) study. The customer-centric technology was operationalized using six items ($\alpha = .92$) from the Jayachandran et al. (2005) scale. This scale confine to the degree to which firm's customers are a center point of estimation.

Relational information processing capability was measured using an adapted scale from Jayachandran et al. (2005), which represents an organization system for information Reciprocity, capture, integration, access and use. The aforementioned five underlying factors were evaluated by multi-item scales. Four items were considered to evaluate information reciprocity

($\alpha = .91$), five items were taken to assess information capture ($\alpha = .90$), four items were used to evaluate information integration ($\alpha = .92$), four items were considered to evaluate information access ($\alpha = .91$) and seven items were used to evaluate information use ($\alpha = .95$). These five sub dimensions were then clubbed under individual scale scores and were taken as a single indicator for relational information processing capability construct, which represented an adequate reliability ($\alpha = .92$).

We used Vorhies and Morgan (2005) scale to measure market sensing capability. The respondents have to answer that how well their own firm performed market sensing activities relative to their competitors. A seven point Likert type and relative to the competitor anchors scale was used. Five items were used to assess market sensing capability

($\alpha = .87$).

The specific measures for customer linking capability used scale items adapted from Hooley et al. (2005) and were designed to capture how well a firm takes on customer linking activities in relation to its closest competitors. Five items were considered to evaluate customer linking capability ($\alpha = .83$). At five-point Likert type scale anchored at (1 = "strong competitors' advantage" and 5 = "our strong advantage") each item on a scale was measured.

We operationalized social service and support capability of adapting scaling from Sarason, Sarason, Shearin and Pierce (1987). The respondents were requested rate their firm on social service performance as compared to their competitors. Six items were considered to evaluate social service and support capability ($\alpha = .94$). Each item on a scale was measured using five-point Likert type that was anchored relative to competitor.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The particular measures for social innovation capability used scale items adapted from Bulut, Eren and Halac (2013). Eight items were considered to evaluate social innovation capability ($\alpha = .86$). A seven point Likert scale labeled at (1 = "strongly disagree" and 5 = "Strongly agree") was used.

Social selling capability was operationalized using an adapted scale from Rowley (2014). We used five items, namely "users' social presence", "social selling view", "quality and size of network", "source of deal to CRM" and "content sharing". Klout scores measure users' social presence. Social selling view is based on four things; engage with insights, professional brand development, find the right people and building strong relationships. The reliability was adequate for all five items ($\alpha = .82$). A five point Likert type scale was used to measure at what degree the respondents agree or disagree with the statements given in the questionnaire.

Co-created customer experiences were measured using an adapted scale from Prahalad and Ramaswamy (2004). It is considered as higher-order construct consisting of innovation co-creation and collaborative support.

Customer based relational performance (CBRP) and Customer based profit performance (CBPP) was measured by adopting a scale developed by, Ramani and Kumar (2008). We measured both of these constructs using three items for each with CBRP ($\alpha = .88$) and CBPP ($\alpha = .92$). CBRP measured the extent of customer ownership, satisfaction and their word of mouth in a firm. CBPP represented the efficiency of a firm in forecasting customer-based profitability, balancing acquiring and maintenance profitably, and converting loss-making customers into profit delivering ones. On a five point Likert scale, respondent's agreement or disagreement was asked.

We adapted Cooper and Kleinschmidt (1995) scale to measure new product performance. Four items were used ($\alpha = .86$) and these were measured on a seven point Likert type scale ranging (1= "very weak" and 7 = "very strong").

RESULTS

In this study, data analyzed at different levels; firstly, confirmatory factor analysis (CFA) with AMOS 20.0. Were applied to the measurement model. All items of eleven constructs loaded in the measurement model significantly. The measurement model generated a model fit with $x^2 = 218.5$, $p < 0.001$and acceptable values of CFI = .96, GFI = .92 and RMSEA = .05 Thereafter, structural model was developed, then mediation test was conducted and lastly, developed hypotheses were checked through structural model. In this study, to test the proposed hypothesis, we considered a two-step method of Anderson and Gerbing (1988). The resulting values of hypothesis testing are presented in table 1 and 2. As depicted from these tables sales or marketing and customer centric technologies, has both a positive as well as substantial impact on relational information processing, market sensing and customer linking capabilities, which support H1, H2, H3 and H4. Similarly, customer centric technologies have a positive as well as substantial impact on social service and support, social innovation capabilities, and for social selling capabilities it has insignificant impact. Therefore, it fully supports H5 and H7 and partially to H6 also.

Baron and Kenny (1986) analysis was applied for finding out the mediating impact of co-created customer experiences between social CRM capabilities and firm performance outcomes. For this, a chronological sequence of SEM models (with and without mediator) was generated that are depicted in

Table 1 and 2. The results in table 1 show that Social CRM capabilities have a positive impact on firm performance outcomes.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

On customer based relation performance the impact of social service and support capability was found insignificant, whereas social selling capability ($\beta = .172$, $p < .05$) and social innovation capability ($\beta = .402$, $p < .001$) was significant. Similarly, on customer based profit performance the impact of social service and support capability were founded insignificant.

Whereas social selling capability ($\beta = .270$, $p < .001$) and social innovation capability ($\beta = .426$, $p < .001$) was significant. For new product performance also the impact of social service and support capability was found insignificant, whereas social selling capability ($\beta = .278$, $p < .001$) and social innovation capability ($\beta = .191$, $p < .001$) was also found significant.

Whereas in table 2 when co-created customer experiences is added into the model, it depicts that all three social CRM capabilities has a positive and substantial influence on co-created customer experiences and which in turn have a significant impact on all three firms performance outcomes. Therefore, the linkage from social CRM capabilities to firm performance outcomes is indirect and mediated by co-created customer experiences, which fully support H7 and H8.

DISCUSSION AND IMPLICATIONS

This paper contributes to the body of CRM and social media literature. This study contributes to the dearth of empirical studies on social CRM. It is the first study to investigate the mediating role of co-created customer experiences between social CRM capabilities and firm performance. Our study is in conformation with previous studies (Raman et al., 2006; Vorhies et al., 2011) stating the role of various customer focused new technologies implementation and thereby renovating the role of CRM from a technological capability to advantage generating capability. Our study is in conformance with a recent study by Trainor et al. (2014) that social CRM capability affect customer relationship performance, also this study has adopted a holistic approach by investigating the impact of social CRM capability on customer based relational performance, customer based profit performance and new product performance.

The theoretical operationalization and evaluation of social CRM capabilities provide evidence for the argument that as a resource, social media technology positively affects firm performance. This finding is in conformance with the previous IT literature which argued that technology itself, not able to create competitive advantage. Similarly, social media technology only facilitates the capabilities, which in turn enable firms to perform effectively.

Although the existing marketing literature has highlighted the significance of information processes (Moorman, 1995) information processes pertinent to CRM have not obtained adequate consideration (Jayachandran et al., 2005). This article contributes to conceptualize and provide the measurement of relational information processes with the demonstration of its antecedents. We also developed a measure for Sales/marketing and customer centric technology resources and showed that Sales/marketing centric technology resources significantly influence the four dimensions (information integration, capture, access and usage) of the relational information processing capability. Similarly, customer centric technology resources also significantly affect the two dimensions (information capture and reciprocity) of the relational information processing capability. Overall, the findings of this study support the argument that relational information processes give guidelines to assist firms interact with customers and manage customer information in line with the demands of CRM. These processes are essential to improve customer relationship performance whereas CRM technologies carry out a supportive role. Reinartz, Krafft and Hoyer (2004), consider that CRM technology use may have a negative impact on performance

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

outcomes, and this study entails the same that this may occur if suitable relational information processes are not put into practice.

The findings also depict that there is the positive influence of sales/marketing and customer centric technology resources on customer linking and market sensing capabilities. Similar to recent research, the findings of this study are consistent with the conception that the superior market knowledge resulting from strong market-sensing capabilities is significantly valuable while determining firm performance. (Hult, Ketchen, & Slater, 2005; Morgan, Slotegraaf, & Vorhies, 2009). Whereas, customer centric technology found to have a positive influence on social CRM capabilities. This finding is conformance to Trainor et al. (2014) and support the notion that information collected from close communication and customer's collaboration may facilitate an advantage to better understand the needs of customer and provide appropriate responses towards these needs. A blend of customer-centric technology, business resources and relationship-focused strategy may relate directly to the marketing capability of maintaining strong customer relationships.

Another crucial contribution of this research is the assessment of the mediating role of co-created customer experiences on social CRM capabilities and firm performance outcomes. The results show that co-created customer experiences fully mediates between social CRM capabilities (social service and support, social selling and social innovation capabilities) and firm performance outcomes (customer based relational and customer based profit performance). The results are in line with previous studies (Prahalad & Ramaswamy, 2004; Trainor, 2012; Trainor et al., 2014). This study will act as a source and initiation point for future researchers and managers to find out how social CRM technologies can be utilize strategically to enhance firm performance.

This study offers important implications for managers. Managers should pay proper attention on their customers as well as their competitors, and should explore that what is the current and future relevance and importance of social media technologies in their industry. This study presents an evidence that investing in social media technologies can facilitate firm with an extensive CRM benefits. Hence companies not focusing in social media technologies are definitely missing an opportunity to enhance their firm's performance. The findings also suggest that social media technologies itself do not affect these performance outcomes concerned with customers directly. Instead, the usage of these technologies enables firms to develop capabilities that allow them to serve their customers better. Hence managers should not take it for granted that investing in social media technology alone is going to enhance firm performance.

The findings also suggests that mangers should not only utilize these social media technologies in developing firm level social CRM capabilities but also these technologies can be utilized as a source of valuable information for competitive intelligence and in turn better customer relationships and profit generation. The managers should take proper care in the integration of social media technologies into the existing CRM system to produce synergistic effect and enhance firm level capability. It is because the VRIO frame work (Barney, 1991) of resource based view the letter 'O' suggest organized for usage, hence the mangers should scan the internal and external capabilities of the firm with regard to integration of social media technologies so that the organization can make the best out of the Social CRM capability. Various companies implement CRM systems with social media presence but are not organized for its proper usage, hence the purpose of competency/capability development is defeated. Managers should develop social CRM capabilities, which complement the organization's objectives.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

LIMITATIONS AND FUTURE RESEARCH DIRECTIONS

This study does have limitations like other studies of this type, many of these offer exciting opportunities for further research. The sample used for the study was diverse. Therefore, across the industry this study results may be true, but it may not the same to specific industries that may not view much potential for social media use. In context of it, the differences were realized between B2B and B2C firms, specifically with regard to social CRM capabilities. Thus, it can treat as an interesting avenue for further research that it may explore the applicability of this research results to different industries, settings and contexts. Similarly, this article did not take into account the other contingent factors like position of a firm in industry, competitive environment. It is possible this article is considered an effect, which is applicable to firms who involves in taking initiatives in respect of their customer orientation strategy. The outcomes of this research can be less applicable to the firms, which are at the initial stage to adopt social media initiatives.

In addition, this study considered the self-reported technology, but in reality, this may be different from the actual technology use (Ahearne, Jones, Rapp, & Mathieu, 2008). The respondent reported that they used a specific social media technology, but the real or actual use of technology can be minimized. Therefore, future studies can focus on the actual usage of social media activities so to present a complete picture of the usage of technology across the firm. Another approach for measurement can be the usage of perceptual measure, which not only confined to technology usage, but also captures the usage intensity and the extent to which these technologies are used in the form (Wu, Mahajan, & Balasubramanian, 2003). Therefore, as a future research a more robust measure can be use for technology usage that can present a complete view of how social media technology linked to the different capabilities of firm and performance outcomes.

CONCLUSION

In the present era of social media and Web 2.0 various emerging social technologies, which facilitates building, maintaining and enhancing customer relationships, it has become quite crucial for firms to rethink the CRM perspective and to develop new capabilities that can assist in customer value co-creation. This research broadens an existing perspective of CRM by integrating social media technologies, which in turn facilitates increased firm performance. This study attempts to expand the perspective that how CRM have an impact on firm performance in the era of social customer. This research empirically examines the impact of social CRM capability on customer based relational performance, customer based profit performance and new product performance. The findings of this study depict a significant impact of social CRM capabilities on performance outcomes where co-created customer experiences contributed as a fully mediator.

Chapter 51
Policies Information Literacy, Equality, and Gender: The Case of Spanish Prisons

María Antonia Agúndez-Soriano
Colegio Universitario de Estudios Financieros, Spain

Aurora Cuevas-Cerveró
Universidad Complutense de Madrid, Spain

ABSTRACT

The development of information and communication technologies (ICT), especially the internet, means that not all the population has the same opportunities of access and use of these technologies or the training necessary to use them effectively. These technologies are producing socio-economic transformations. They also bring about important changes in the way they work, communicate, behave, and socialize. All these changes constitute a factor of social exclusion and have led to the emergence of the so-called digital divide (BD). This BD has accentuated the social gap and has contributed to the fact that certain population groups, such as female inmates, are considered to be "socially excluded" or "excluded digital," and in the case of these female inmates the gender gap would also be present. The authors presented results of the analysis carried out to know the policies, projects, and programs that are being carried out both in Europe and in Spain in the field of informational and digital literacy for social and labor inclusion, as well as equality and gender policies.

INTRODUCTION

The implementation of Information and Communication Technologies (TIC) requires citizens to acquire the necessary skills and abilities to ensure the proper use of TIC, training them to manage the large amount of available information and thus being able to solve their information problems on a daily and work basis throughout their life.

These technological changes bring a risk that can cause and increase the digital social exclusion of some groups or population groups. One of these population groups are women prisoners, these inmates are in clear risk of social and labor exclusion. As a woman and as a prisoner, we must add that most of these women are very poorly qualified, with a low self-esteem profile, school failure, most of them dependent on the male figure, with family, social, psychological problems and lack of freedom. All this causes them to have fewer opportunities of accessing the labor market, being doomed to unemployment or low-paid jobs, all of which makes it difficult to achieve their social and labor integration once they have obtained their freedom.

In prisons where women prisoners are deprived of their liberty, contact with the outside world is usually very limited or completely non-existent. Since they spend several years of their lives in these centers, they should be prepared to live in the information society that awaits them outside once they obtain their freedom. The knowledge about informational competences that they may already have is acquired before entering prison, so that in a brief time these will become obsolete. Therefore, their social and digital exclusion will be greater, the greater their sentence, becoming part of the group called "none -liners" "(Buchmueller et al, 2011).

Therefore, information literacy is presented as a great challenge to solve this situation of inequality for these women prisoners with their subsequent inclusion in society and the acquisition of the necessary knowledge and skills to become informationally literate. The objectives pursued by this research are:

- Determine and know the policies, projects and programs that are being carried out both in Europe and in Spain in the field of information and digital literacy for social and labor inclusion, as well as equality and gender policies.
- Diagnose if these policies are being carried out in the prisons of Spanish women.

The methodology used is a research and analysis methodology to identify existing policies on information literacy at a European level and at a Spanish level and see if they have reached the level of implementation in Spanish female prisons.

BACKGROUND

Information Literacy for Social Inclusion

The European Union (2006) links information literacy with lifelong learning, in its "Action Program in the field of lifelong learning", where it points out that new technologies are an instrument that can lead to social inclusion and that, therefore, people who do not use them for different reasons are excluded from a society of information that is increasingly digitized. Marzal (2007), states that information literacy is closely linked to other contexts such as economic, cultural and social, for this author a person informationally literate should be able to know what information is relevant to evaluate, select and communicate for this way to be able to participate actively within society. Another author Abid (2012), adds a new denomination of information literacy, calls it "information culture", this information culture is the sum of informational, digital and graphic literacy as well as reading and writing, it is a culture of collective exchange and enrichment. Authors such as (Bernhard, 2002, Gómez Hernández, 2002, Ponjuán, 2002) refer to the culture of information in an educational sense. Agúndez (2016: 60) defines information

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

literacy in the following way: "Information literacy comprises a set of competencies that lead to an adequate, reflective, critical and responsible use of information and that contribute to the social inclusion of citizens. For his part, Cuevas (2007) believes that this concept is linked to the historical, economic, cultural and social context, and points out that a person will be informationally literate when he or she is able to decode the relevant information and codify a new message to communicate.

The policies developed in relation to information and digital literacy for social and labor inclusion, as well as equality and gender policies, have generated different programs, projects and plans that aim at literacy in digital skills for the most disadvantaged groups, promoting equality between women and men in terms of training and employment and promoting the social and labor inclusion of population groups at risk of exclusion.

However, it has been possible to see how these policies, more than the acquisition of information skills and abilities that contribute to the digital and informational inclusion of female inmates, are aimed at increasing the connectivity to the internet.

Rights Derived From Tic: A New Human Right

The digital and social exclusion generated by information and communication technologies encourages the creation of a new human right that ensures equality among all citizens. In this sense, information literacy has been supported by different statements that recognize this type of literacy and lifelong learning, and point to it as an essential element for social, cultural and economic development. In addition, it is of mutual agreement that information literacy can end inequality between certain groups and countries by reducing the digital gap between them. The Prague Declaration (2003) states that information literacy encompasses knowledge of one's own information problems and needs, as well as the ability to identify, locate, evaluate, organize and effectively create, use and communicate information to address the issues or problems that arise; it constitutes a prerequisite for effective participation in the Information Society, and is part of the basic human right to lifelong learning. Similarly, the Declaration of Alexandria (2005) considers that information literacy is at the heart of lifelong learning and constitutes a basic human right in the digital world, as well as promotes the social inclusion of all nations. In the same line the Declaration of Fez (2011) highlights the importance of information literacy for social, economic and cultural development. They consider that it is the key for all citizens to participate actively in society.

Information Policies

The information policies initially arose in the face of the transformation of society with the arrival of new technologies. The objective of these policies was and still is to include all citizens in the information society, but this initial objective is still far from being fulfilled, especially in groups such as women prisoners. That is why we will have to continue formulating policies and plans that also include this group and that are truly effective. The definitions on information policies have been numerous, among them Almada de Ascencio, which understands these policies as "the study of guidelines that govern the actions of different sectors or groups of society in the information transfer, its availability, access and recovery as a means of communicating information between creators and users of information ". In the case of Michael W. Hill (1995:279) he describes this concept saying that: Information policies are designed to meet the needs and regulate the activities of individuals, industry and commerce, of all types of institutions and organizations and of national, local, or supranational governments. They must

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

regulate the ability and freedom to acquire, own and store their own information, use it and transmit it. Rowlands (1996) considers that the methodological processes in information policy studies are diverse and speaks of five methodological research instruments that are: Classification, identification of policy issues, reduction of complexity, prospection and reduction of scenarios and oriented research to the case study processes. Years later, this same author groups information policies into five groups: 1. Protection of government information. 2. Information market. 3. Broadcasting and telecommunication. 4. Access to public official information. 5. Information society and information infrastructure. For Cornellá (1997: 39), the information policies "could be framed in three areas: a) informational legislation, b) actions to promote and stimulate the use of information by public agents and c) improvement of the management of information resources in Public Administrations ".

In Europe, regarding these policies, different action plans have been drawn up in recent years that bear some relation to social digital exclusion, since they have literacy goals in digital skills of the most disadvantaged groups, although there are It should be noted that none of these plans have been designed exclusively for the collective of women prisoners. Important references about the information policies have been:

- **The Delors White Paper (1993):** "Growth, competitiveness and employment in Europe: challenges and clues to enter the XXI century" which proposed the strengthening of education and training throughout life.
- **The Bagemann Report:** "Europe and the Global Information Society", commissioned by the European Council, in which a strategic move was made for teleworking and the creation of companies of remote professional training services.
- **The Action Plan of the Commission of the European Communities:** "Europe in progress towards the information society", which presents guidelines for incorporating Europe into the information society. These references were points of reference for European information policies.

Since then, different plans and programs have been developed that seek to promote training in digital and information skills so that the entire population can be an active part of society. In the case of Europe, the Digital Agenda for Europe and the Europe 2020 Strategy must be cited as undisputed references.

Digital Agenda for Europe

The European Union has set out to achieve a series of challenges for the development of ICT, which are reflected in the European Digital Agenda, these challenges should be completed by the year 2020. On March 25th, 2010, a resolution draft was presented by the Committee on Industry, Research and Energy to the European Parliament for the creation of a new digital agenda for Europe, which was called Agenda 2015. The objectives of this resolution draft focus on literacy and digital skills and the access to digital technologies by the most disadvantaged social groups as a means of social inclusion and the fight against poverty and inequality. To this end, the entire population must be trained in these skills, contributing to the disappearance of differences between different social groups in terms of digital literacy and Internet use.

With the intention of meeting these objectives, the European Commission proposes a digital literacy and inclusion action plan on level with the EU and the Member States. This action plan includes training in digital literacy for the unemployed and groups at risk of exclusion, increasing accessibility to digital public services, ensuring that equality between women and men in the Information Society is a fact, and

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

contributing to the participation in digital inclusion activities by the civil society. Similarly, among the objectives of the European Digital Agenda 2020, the promotion of digital literacy, training and inclusion is also present. To this end, the Commission proposes that member countries prioritize skills and digital culture within the framework of the European Social Fund by promoting ICT training courses and providing equal access to the digital common space. Other objectives of the Europe 2020 Strategy are:

- Achieve a minimum employment rate of 75% of people from 20 to 64 years.
- Reduce by at least 20 million, the number of people living below the poverty line or at risk of social exclusion, ensuring that the skills required to continue training and the labor market are recognized throughout general education, professional, superior and adult, including non-formal and informal learning and developing collaborations between the educational / training world and the labor world, especially through the involvement of the social partners in the planning of education and the delivery of training.

We understand that these objectives could refer to the inmate population (although no specific mention is made) because it is a disadvantaged group and supports training in digital skills to achieve social and occupational integration.

Following this same line marked by Europe, in Spain there are also policies that establish ICT learning as a way to reduce the social, digital and labor exclusion suffered by some disadvantaged population groups, for which a series of projects and programs have been developed in relation to digital literacy and social and labor inclusion.

All these policies are aimed at literacy training in digital skills of the most disadvantaged groups, including women prisoners. Another objective is to promote equality between women and men in terms of training and employment. Its goal is to promote the social and labor inclusion of these population groups.

National Plan of Action for Social Inclusion (Pnain)

This Plan has among its objectives to promote the social inclusion of the most disadvantaged groups as well as to promote equality and non-discrimination, having the same opportunities in access to education, training and employment. In the elaboration of this Plan, different public bodies have intervened, such as the Ministry of Health and the Secretary of State for Social Services and Equality and have had the participation of the General State Administration through the ministries involved, as well as the State Council of ONG of Social Action and the Economic and Social Council (CES). The PNAIN follows the recommendations of the Council of the European Union for Spain regarding the National Reform Program, specifically addressing recommendation 6 on the need to adopt and apply measures to reduce the number of people at risk of poverty or social exclusion, as well as measures that reinforce policies aimed at increasing the employment of those who do not have access to the labor market. The plan is organized through a series of strategic objectives and specific actions to achieve its final objective, which is the social inclusion of the most disadvantaged groups and equal opportunities in education, training and employment. This plan devotes a section to the prison population in its actions 237 to 240, establishing in actions 238 and 240 respectively, that it is necessary to seek resources to promote the participation of the prison population in training, cultural and labor programs, among others, through the Participation of the Third Social Action Sector (non-profit associations) to achieve this group's social and labor

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

insertion. At the same time, it is intended to guide and educate prison staff and women prisoners on issues of gender violence to alleviate the consequences of this problem.

Throughout this document, the need to achieve social inclusion of the most vulnerable groups and achieve equality is emphasized. As for the prison population, they see, like us, the need to participate in training and work programs to achieve social and labor reintegration.

Inclusion Strategy of the Community of Madrid 2016-2021

The Office of Social Policies and Family of the Community of Madrid has the mission of favoring the integration and social inclusion of people who are in an inferior situation. For this purpose, it has developed a social inclusion strategy. This strategy is based on the principles of active inclusion, such as a sufficient income, employment opportunities and quality social services. It includes four groups of objectives. The first group refers to the development of inclusive policies in employment, education, health or housing; the second group is aimed at strengthening social services and supporting those population groups in situations of exclusion; the third focuses on organizational improvements to improve efficiency; and the last group is dedicated to active participation. Among these social policies are those aimed at the elderly or people with disabilities, to alleviate situations of dependency, to prevent and address situations of abuse and promote gender equality, to guarantee a minimum income in those households that lack resources and work for the inclusion of people who for various reasons cannot be integrated into society, whether for ethnic reasons, sexual orientation or gender or other circumstances that may jeopardize this inclusion.

Digital Agenda for Spain: Inclusion and Digital Literacy

This digital agenda for Spain currently in force has among its objectives to promote inclusion and digital literacy so that all people have access to ICT. In 2013, and following the steps set by Europe, a Digital Inclusion and Employability Plan was drawn up with the aim of improving the digital skills of those most disadvantaged groups of the population, regardless of their age, economic situation or place of residence who cannot or do not know how to use TIC. In this way they can incorporate them into their daily lives and cover their needs both personally and professionally. The way to achieve this goal is to encourage and promote digital literacy programs, advance in terms of equality between men and women and encourage the participation of these groups in digital inclusion activities to reduce their risk of social and digital exclusion. This plan is structured around four axes, among which is providing the most disadvantaged groups access to the Internet and ICT tools to reduce the risk of exclusion; provide the population with the basic digital skills needed to use ICT with emphasis on the older and less qualified population; reduce inequality between men and women regarding the use and access to ICT; allocate resources to acquire digital competences and reorient professional training related to ICT to be able to train future professionals. Each year a review of the plan is made to evaluate the results and determine if it is necessary or not to make any changes or evaluate a possible adaptation of objectives and measures and, if applicable, extend the time scope to meet the objectives already marked in the Digital Agenda for Europe or any new additional objectives that may arise.

It must be said that, although one of the objectives of this plan is to ensure that the most disadvantaged groups have access to the Internet and learn how to use TIC, we find that inmates do not have access to TIC and they do not have an Internet connection in prisons for security reasons.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Even so, we consider that these four axes in which this digital agenda is structured, are necessary to digitally and informationally literate the inmates; contribute to gender equity and achieve their social and labor inclusion by facilitating the learning of the necessary information and digital skills to achieve the full participation of these inmates in society.

Plan of Action for the Equality of Women and Men in the Society of Information

In June 2014, the action plan for equality of women and men in the information society was drawn up (2014-2017). The main objective of this plan developed by the Women's Institute, is the digital inclusion of women in equal opportunities than men to participate actively in the information society. To achieve this goal, measures are taken to provide Internet access as well as training programs to train women in ICT. Likewise, these programs should include learning about access to electronic administration and online public services.

This plan is already at a very advanced stage, but so far these measures have not been carried out in women's prisons. During the development of this chapter, it was found that the inmates still do not have an Internet connection and still do not have formative courses in information literacy. Therefore, it is difficult for these women to actively participate in an information society for which they have not been prepared.

Nowadays, information literacy is considered as one of the requirements to participate actively in society and reduce the risk of exclusion of the most vulnerable groups, as is the case of female inmates. The objectives of all these policies coincide in promoting the social and digital inclusion of these groups through courses or training programs and promoting equality between men and women. But the reality that women prisoners live in Spanish prisons about training in information literacy and even regarding equality between prisoners and inmates is quite different.

Solidarity Ciberaulas Project

The Ministry of the Interior and the "la Caixa" Foundation have signed different collaboration agreements in recent years, the last dated on August 23, 2017. The objective of these agreements is to proceed with the development of the CiberCaixa Solidarias Program, also named EspacioCaixa, in different Spanish penitentiary centers carrying out informative training activities for male and female inmates both young and old who are serving sentences in Spanish prisons. These activities are carried out both by professionals and by seniors who are already retired and who have been trained for this purpose. To achieve these objectives, they have planned to develop a "Preparation for freedom" program, instructing the inmates for their life in freedom. Basic computer courses and workshops are held to bring these inmate population groups closer to new technologies to ease their social and labor inclusion. To carry out this project, the "Fundación la Caixa" installs computer rooms in the prisons. The implementation of the program is carried out in different penitentiary centers, in closed regime: Teixeiro, Villabona, Badajoz, Valencia, Zaragoza, Las Palmas, Seville and Palma de Mallorca, and in open regime: the Centers of Social Insertion of Victoria Kent in Madrid, Guillermo Miranda in Murcia, Dulce Chacón in Cáceres, Mercedes Pinto from Santa Cruz de Tenerife, Carmen Avendaño from Vigo, Evaristo Martín Nieto from Málaga, Marcos Ana in Albacete, Alfredo Jorge Suar Wall from Jerez de la Frontera, Concepción Arenal from Ciudad Real and Jesús Hadad Blanco de León. It must be said that this project does not reach all Spanish prisons.

Equality and Gender Policies

Given that the inequality of opportunities between women and men in training and employment issues within women's prisons exists, this research is directly linked to equality policies and to normative references related to this concept. Equality between women and men is a universal legal principle recognized in various international texts on human rights, including the Convention on the Elimination of All Forms of Discrimination against Women, adopted by the General Assembly of the United Nations in December 1979 and ratified by Spain in 1983. For the European Union it is also a fundamental right and it was expressed in the Treaty of Amsterdam. This treaty enters into force on May 1st, 1999 and it can be seen how measures are adopted to fight against all types of discrimination based on sex, race, religion, disability, age or sexual inclination. This Treaty includes the obligation to promote equality of opportunities between men and women in all Union policies.

Equality Policies in Europe

As for the policies of equality in Europe, from the year 2000, the European Union adopts different directives to fight against gender inequality. These directives are: Directive 2000/43 / EC, on the application of equal treatment of persons in order to fight against discrimination; Directive 2000/78 / EC on the application of the principle of equal treatment in employment and occupation; Directive 2002 / 73CE on the application of the principle of equal treatment for men and women with regard to access to employment, training and working conditions and Directive 2006/54 / EC on the application of the principle of equal treatment between men and women in matters of employment and occupation. Years later, in 2010, the European Commission adopted the strategy of the European Commission for the equality of women and men. This strategy consists of five objectives that are: economic independence; equal salary for the same job; equality in decision-making; dignity, integrity and the end of sexist violence; and equality in foreign action. Likewise, this strategy addresses very important issues related to the roles assigned to the sexes and the instruments necessary to achieve gender equality. A year later, the Council of the EU adopted the second European Pact for Gender Equality (2011-2020).

In addition to these policies, there are institutional bodies that fight for equality between women and men. Among them are the UN Women, created by the United Nations General Assembly for Gender Equality and the Empowerment of Women and the European Institute for Gender Equality. In 2006, the European Parliament and the European Council created this Institute with the aim of elaborating measures in favor of gender equality throughout the European Union. In this struggle is also the Committee for the Elimination of Discrimination against Women (CEDAW), consisting of experts on women's issues from different member states of the UN, whose objective is to end discrimination against women.

Equality Policies and Normative References in Spain

The Spanish Constitution in its article 14, promulgates the right to equality and non-discrimination based on sex. In article 9.2 of this same Constitution, it attributes the obligation of the public powers to promote the conditions so that the equality of the individual and the groups in which they are integrated is real and effective. In Spain, in 1983, the Women's Institute was created with the objective of promoting equality between both sexes. The creation of this institute was the starting point of public policies on gender equality in Spain (Gil, 1996). Thanks to this effort, Spanish society and the different institu-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tions are becoming aware of gender discrimination and inequalities between men and women. In 2007, a law comes into force whose main objective is the right to equal treatment and opportunities between women and men. This new law is known as Organic Law 3/2007, of March 22, for Equal Opportunities between women and men (LOIEMH). This law was a great step forward for society in terms of equality. In its article 1.1 it establishes that women and men are equal in human dignity, and equal in rights and duties. The purpose of this Law is to give effect to the right to equal treatment and opportunities between women and men, through the elimination of discrimination against women, whatever their circumstance or condition, in any area of life. and, singularly, in the political, civil, labor, economic, social and cultural spheres. (LOIEMH, art.1.1).

In relation to education for the equality of women and men, article 23 of this same law includes the elimination of obstacles that hinder effective equality between women and men and the promotion of full equality between them. Another point to highlight within the LOIEMH is related to the Information Society. In its article 28.2, it is established that the Government will promote the full incorporation of women in the Information Society through the development of specific programs, which include access and training in information and communication technologies. This article also includes women at risk of exclusion.

We do not know to what extent the application of this article is effective for all Spanish women. What we can affirm, in the light of this investigation is that, in the case of the group of women prisoners, the article is not respected in what refers to their informational training.

From this law on, different plans and programs arise, such as the Program of actions for equality between women and men in the penitentiary (PAIHMAP). This program is carried out with the collaboration of the Ministry of Equality. The objectives of this law are aimed at eradicating the discriminations that could be detected due to gender, as well as knowing the characteristics of women inmates to adequately attend to their needs, reducing their vulnerability to situations of violence. To develop this program, a Mixed-Observatory Technical Commission was created in 2009, made up of 25 members from different fields (Women's Institute, Universities, Associations, Public Prosecution Staff and Prison Professionals) to examine and evaluate the impact of the program. The most important objective of the program consisted of promoting, examining and evaluating the impact of the program, the diversity of its composition guaranteed us the interconnection with the different social realities, which allowed us to have specialized advice on each of the topics that were undertaken and add a wide social network of collaborators. (Yagüe 2012: 2).

This Technical Committee must meet at least once a year, or when its members deem it necessary, and should promote the formation of working groups to deal with issues in a more specific manner and advance the proposals on the actions that the program contains. In 2014, the Government of Spain approved the Equal Opportunities Strategic Plan. Among the areas of action of this plan is political, economic and social participation; Education; and development of actions within the framework of other sectoral policies. There are also institutional equality bodies. Among these organisms is the Ministry of Health, Social Services and Equality. It is up to this Ministry to propose and carry out government policies on cohesion and social inclusion and equality, as well as to fight against all kinds of discrimination and against gender violence.

Other organizations committed to equality policies are the Women's Institute, a body under the Ministry of Health, Social Services and Equality. Its function is to promote the conditions that make possible the social equality between women and men and the participation of women in political, cultural, economic and social life, and the General Directorate of Women. This body depends on the Office of Social Affairs

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of the Community of Madrid and aims to achieve real and effective equality between men and women in the different areas of political, economic and social life of the Community of Madrid.

Prison Context

The prison is considered as a social institution oriented to reeducation and social reinsertion, as reflected in article 25.2 of the Spanish Constitution (CE): "prison sentences and security measures will be oriented towards re-education and social reintegration". On the other hand, Article 44.1 of the EC provides "that public authorities promote and protect access to culture, to which everyone has the right". Therefore, it is a fundamental right of the inmates to be able to access the necessary training for their subsequent reinsertion and it is the prison administration that must guarantee compliance. Likewise, the General Penitentiary Organic Law (LOGP) of September 1979, in its article 1 of the preamble, establishes that the penitentiary institutions regulated in said law have as their primary objective the reeducation and the social reinsertion of those sentenced to custodial penalties and penal measures. In article 59 of the same it is enacted that the prison treatment consists of the set of activities directly directed to the attainment of the reeducation and social reinsertion of the convicts. However, even though inmates have the right to training that facilitates their social reintegration, in reality we find that in Spanish prisons access to the Internet is prohibited due to security reasons. This situation leads to a total isolation of women prisoners in the field of ICT, whose knowledge and use is nowadays necessary both to integrate the labor market and to keep informed of what is happening in society. This situation also prevents women prisoners from developing the knowledge and skills necessary to use ICT. Therefore, it is very important to provide these women with adequate resources so that they can access training with the objective of acquiring the necessary information and digital skills to be an active part of the Society the moment they obtain their freedom.

In relation to the activities that are carried out in Spanish prisons, we observe that there are few experiences of training inmates in informational and digital competencies. We have only found seven focused on digital competences, none of which is oriented towards information competencies. 1) Ómnia prisons, is taught in Barcelona and focuses on notions of digital literacy and the construction of a blog for young inmates. 2) Alfadigital, taught in Barcelona, focuses on audiovisual workshops (radio, video, photography and music). 3) Alfablog Digital, this blog aims to compile all the creative productions made by the inmates of the different prisons in Catalonia. 4) Blog of the prison of Al lama, is given in the jail of Al lama (Pontevedra), collects the experiences lived by the prisoners of the modules of coexistence. In addition, it publishes poems and everything related to the activities that take place in the prison. 5) Cyberaula (promoted by la Caixa), extends throughout Spain and includes programs that cover digital literacy. These last two programs are taught to inmates and inmates. 6) The voice of mako, is a blog written by inmates of the penitentiary center of Albolote (Granada). They also have a digital literacy workshop conducted by social education students from the University of Granada. 7) Predis, takes place in the prison of Alcalá-Meco (Madrid) and covers digital literacy. This last experience is imparted to prisoners and disabled prisoners, which limits the scope of the activity. Of these seven experiences, in the Community of Madrid, only the Cyberaula and Predis programs are taught. Catalan penitentiaries have Internet connection in the classrooms since 2000, although they have filters so that inmates and inmates can not access certain pages. During the classes, it is only controlled that the prisoners and prisoners are connected to specific pages to carry out the activity. In the Community of Madrid, we find only one

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

penitentiary center, in which the program "Aula mentor" is developed. Aula Mentor, is a resource center where inmates have a computer room with Internet connect

CONCLUSION

Throughout these pages, the policies of information and digital literacy, equality policies and gender policies for social inclusion that are being developed both in Europe and in Spain have been projected. Perhaps this is a good time to reflect on whether these policies are being done well or if they could be improved. In the current social context, it seems necessary to raise awareness among the population about women prisoners and their reintegration into society. Equality policies, plans and programs in the penitentiary area advance very slowly. It would be necessary to turn these plans and programs into concrete facts, to move from the legislative to the real. These policies should be more than a mere set of good purposes.

It would be very important to be able to evaluate and analyze the achievements made in the application of these plans, as well as the objectives achieved after carrying out the implementation of these policies. Public administrations should give priority to this population group by investing and getting involved in achieving the social and labor reintegration of these women deprived of their liberty.

Currently, information literacy policies in the penitentiary area could be effective and obtain positive results, adapting the formation of prisons to the demands of the information society and the labor market. We are talking about a specific training in information skills, since most of the jobs currently use ICT and the Internet. Considering that the educational level of the inmates is low, access to work is limited, so the information literacy training programs will serve them to be able to adapt to the current demands of society. A necessary condition for these programs to be delivered is to improve technological resources so that they are up to date and ensure free access to the Internet (currently prohibited for security reasons) in prisons during the development of information and digital skills training for female inmates, taking the security and surveillance measures deemed appropriate. In addition, the policies and action models that are applied in the penitentiary centers continue to be oriented and designed for a male profile. Once she enters prison, a woman suffers a double discrimination, that of being a woman and that of being a recluse since we move in a society that still prioritizes the figure and patriarchal schemes and this is taken to all areas including the police, judicial and even in the penitentiary legislation itself (Piñeiro Zabala, 2010). Both in the penitentiary regulations and in the general organic prison law, there is very little presence of articles dedicated to women prisoners. In relation to this, it must be said that Penitentiary Institutions, through the program of actions for equality between women and men in the penitentiary, has committed to introduce the gender perspective in penitentiary policy, as well as a comprehensive plan to adapt the architectural structures where convicted female inmates serve their sentence. Hopefully this will be effective as soon as possible since it is necessary to build exclusive prisons for women with suitable facilities for them, as well as policies that are really aimed at the social and labor reintegration of this group, with training programs that can help meet this objective.

KEY TERMS AND DEFINITIONS

Digital Inclusion: Focuses on those population groups that have many difficulties in accessing new information and communication technologies, facilitating access to ICT for incorporation into society.

Equality Policies: These are specific measures implemented by public institutions in order to help overcome inequality between men and women and ensure equal opportunities.

Female Inmates: Women serving a prison sentence for committing some type of crime. Once obtained the freedom suffers of social/labor exclusion.

Gender Gap: The gender gap is present in work, in the economy, in new technologies, etc. The greater the gap, the greater the differences and inequalities between men and women.

Information Literacy: Is to acquire the necessary skills to know how to search, select, evaluate and communicate information in a responsible and critical way to be able to actively participate in the information society. It contributes to the social inclusion of citizenship and therefore of women prisoners.

Information Literacy Policies: These are policies aimed at ending inequalities among citizens in relation to access and use of new technologies, avoiding the so-called digital divide or information gap.

Prisons: The prison is an enclosure where people who have been convicted of committing a crime to serve a custodial sentence are imprisoned. They represent a danger to society.

Social Inclusion: Process to ensure that socially excluded groups of people have the necessary opportunities to be active people in society.

This research was previously published in Infocommunication Skills as a Rehabilitation and Social Reintegration Tool for Inmates; pages 126-145, copyright year 2019 by Information Science Reference (an imprint of IGI Global).

Chapter 52
Culture, Technology, and Education in the Digital Age:
A Conceptual Framework

Mehmet Kesim
Anadolu University, Turkey

ABSTRACT

The accumulation of information formed by the scientific studies whose foundation stones were put during the Enlightenment period, caused the Industrial Revolution. The most important feature of the modern era was to have a deterministic science approach. The period we are in is called the Postmodern Era. General and Special Relativity Theories, new findings in Quantum Physics and the advances in communication technology caused deep and rooted social, cultural, political and economic change and transformation, and ultimately led to a significant paradigm change. The most important feature of this period is that it has a Relative science approach. While change and transformation are continuing, it is not enough to simply feel and be aware of the rapid change and transformation of culture, education and training. In this study, changes and transformations during the Renaissance up to the present has been tried to be indicated by the results of scientific studies.

INTRODUCTION

As a historically new phenomenon, globalization has emerged at various periods of global interaction in different ways for hundreds of years (Reed, 2014, p.3). As a process that has continued for hundreds of years, globalization is a process that began in the 15th century. This process was accelerated by sailors from European countries with access to the ocean, who traversed distant sea voyages and established communication and trade relations with the continents they reached. Friedman indicates that there are three great periods of globalization (Friedman, 2007, pp.9-10).

Globalization 1.0, 1492-1800: The world was reduced from a large scale to a medium scale. The muscle power of nations carries great importance in global coalescence. Ownership of muscle power, in accordance with the development of the industrial revolution, gave way to horse power, wind power, and steam power. Previously inaccessible places beyond the oceans were reached, merchandise with monetary value retrieved from these places livened economies. During this period, the globalization of countries and competition between countries stands out. Globalization 2.0, 1800-2000: The world shrank a little more, from medium scale to small scale. During this period, the world went through three great disasters; The Great Depression, The First World War, and The Second World War. The driving force behind this period was multinational corporations. The primary agenda is the globalization of companies. Globalization 3.0, 2000 and Beyond: The world is scaled down even further during this period, from small to miniscule scale. Individuals are now the driving force of this period. During the third age of globalization, the number of individuals raised well and whom understand the world in accordance with the age we live in within a country is considered measure of development. Individuals must be creative. They must provide alternative solutions to problems. These all depend on the individual being open to learning.

It has been approximately 500 centuries since Friedman's first instance of globalization. The tools and utilities used by people have developed rapidly in each century, and the exchange of tools and utilities have changed and transformed societies. Globalization 3.0 may be defined as the age in which individuals became globalized. Various significant authors and intellectuals express the change in mankind and societies in different terms.

Toffler emphasizes that there are three significant waves of change in the history of mankind. The first wave, the Agricultural Revolution, was a process that took approximately one thousand years. The Industrial Revolution, on the other hand, lasted three hundred years. Toffler indicates that the Third wave in which we currently reside will be complete in even less time (Toffler, 2008, p.16). The understanding and definition of time varies in each wave according to Toffler. In agricultural societies, time was sliced into shifts and time was developed based on workload. Time itself was not divided into sections such as hours, minutes, and seconds. It was during industrialization that time was accepted as a linear concept (Toffler, 2008, pp.132-134). Hours, minutes, and seconds became important concepts in the definition of time. The use of machines in production initiated the age of mass production, and time became an important factor in the procurement of raw materials, stocking products, supplying products to consumers, just in time delivery and production planning. Both production and consumption is now global, and raw materials used in production are physical objects.

Within the third wave, the primary raw material is an endless supply of knowledge and imagination. This wave period is interactive, individual, and far from massification (Toffler, 2008, p.437). Even if raw materials used in production are physical constructs, the soul and appeal lies in the knowledge and imagination used in production. During this wave, the question of whether it is the product or the image of the product that is being consumed becomes extremely relevant.

Globalization carries a political weight as much as it does economic (Hassan, 2004, p.23). Today, the concept of globalization refers primarily to two processes: The globalization of the world economy and the global dissemination of cultural forms and meanings (Tubella, 2001, p.385). Globalization brings with it inevitable change in every aspect of human life. Each new technology, when it enters global use, carries with it the culture of the place and era in which it was produced. Regardless of which aspect of life it is used in, technology and the expectations from it remain misunderstood without an understanding of the culture that it carries (Kesim, 2007, p.376).

THE INDUSTRIAL REVOLUTION AND THE MECHANICAL ETHOS

Understanding the Industrial Revolution, which triggered globalization, along with its mechanical ethos carries great importance. The driving force behind the Industrial Revolution was the European Renaissance. There are, of course, various other periods of Renaissance in Europe such as the Carolingian Renaissance, however the European Renaissance that emerged in the 15th and 16th Century is an era that has made a significant mark in human history and taken its rightful place in the pages of history. The developments in art, science and philosophy that took place during this period paved the way for the Industrial Revolution.

Significant historic periods also require that we mention the defining thinkers and their approaches, or in other words their theories of those periods. The two foremost names that set the foundation of the age of industry, whom pioneered the mechanical ethos were René Descartes (1596-1650) and Isaac Newton (1642-1727). It was also Descartes whom explained in detail the concept of natural law (Hawking & Mladinow, 2011, p.37).

The mechanical ethos defines a world that is simple and easily understood. In this world, objects are mathematically defined through scientific observation and order is based on this understanding (Rifkin & Howard, 2010, p.27). If the founders of mechanical philosophy were to be ranked, Descartes would be at the top of the list. Mechanical philosophy itself, however, was not founded by Descartes. The basis of mechanical philosophy in Europe dates back to antiquity (Dobbs & Jacob, 2000, p.14). Descartes stands out as the first philosopher to express natural law in a way we understand today (Hawking & Mlodinow, 2012, p. 26). His mark on the world of science was his statement that phenomenon may be calculated and categorized in an exact manner via mathematical formulae (Rifkin & Howards, 2010, p.227). He is therefore considered to be the father of rationalism and the founder of 17th century philosophy. The source of rationalism in this century was mathematics and physics. Developments made during this period materialized the thought that nature may also be understood through mathematical formulae and mathematical expressions. The revered rationalist thought process was achieved through the notion that compatibility lies between the nature and logic, matter and the mind. Descartes adopted a determinist approach. He followed the notion that nature is a machine that operates on the rules of mathematics. This historically significant approach was a clear departure from the past. Descartes marginal approach was not just the beginning of modernity, but also the foundation of the theory of modernity (Jameson, 2004, p.33). Another significant acknowledgement was the departure of the antiquated notion that objects and subjects are intertwined, and the acceptance of differing approaches to objects and subjects. As such, Descartes was not only the founder of modernity, but is also considered the initiator of the separation of subjects and objects (Jameson, 2004, p.43).

Sir Isaac Newton was the most influential person in the European Industrial Revolution, and he himself was greatly influenced by Descartes. The Newtonian approach also evaluates nature from a mathematical perspective (Dobbs & Jacob, 2000, p.118). His Newtonian Mechanics inspired the Industrial Revolution. Newton, who left his mark on the modern definition of space and time, states that space and time are absolute. He indicates that space and time are independent and constant. Newtonian understanding is based on this notion that space and time are absolute (Russel, 2011, p.16). Thus, through mathematical models, everything – even the future – may be determined. As a follower of Descartes, he too followed a determinist approach.

In later years, Isaac Newton explained natural law through his three laws of motion (Hawking & Mladinow, 2011, p.39). From the 1680s to the early 20th century, Isaac Newton's "law of gravitation"

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

remained the foremost of explanations. However, during the dawn of the 20th century, Newton's scientific explanations began to crack. Namely, gravitational law which was sufficient on earth did not hold up regarding space. Albert Einstein tackled gravitational pull in space through his "theory of general relativity". This new approach does not necessarily negate the validity of Newton's model though. Calculating the trajectory of a rocket, for example, still utilizes Newton's theories (Gribbin, 2006, p. 17). Today, while Newton's laws are generally accepted in calculations below the speed of light, motion at or beyond the speed of light reveals the shortcomings of Newtonian physics in that they are simply insufficient (Hawking & Mladinow, 2011, p. 41).

Freyer mentions that industry emerged initially from relatively smaller regions of Europe such as Scotland, Middle England, Eastern France and the Rhine Province (Freyer, 2014, p. 12). The European continent stood out as a fountain of change previously unseen in any other part of the world. This new era initiated by the Industrial Revolution entails its own waves of change. Freyer indicates that there are seven waves within the age of industry. The first wave, which began with the textile industry in the first half of the 18th century has transformed and developed all the way up to nuclear power into the first half of the 20th century. The sequential waves in this timeline are; Textile, Iron, Steel, Transportation, Chemistry, Electricity, Internal Combustion and Nuclear Power. In approximately two hundred years, developments and changes have taken place at a rapid pace (Freyer, 2014, pp. 40-45).

When scrutinized further, we can see that within the periods mentioned by Freyer's waves of change, tools and equipment designed mechanically give way to those which are electronically controlled, and in recent years these controls have become entirely computer controlled. It is inevitable that the tools and equipment that we use cause change in our lives in accordance with developments in technical fields. Advances in techniques have altered and transformed societies in a previously unheard fashion. The most prominent example of this is the emergence of the working class.

One of the most significant structural changes in the 19th century was the birth of the working class. In Europe, various theories and programs that studied these emerging changes were established. Karl Marx, trained in the Hegel School, attempted to determine the anatomy of the bourgeois society and explain the laws of motion of this era known as the age of capitalism. The interesting aspect of this is that he recognized the superiority of large businesses over smaller businesses and machine manufacturing over manual (handmade) manufacturing. The situation, which Marx explained as the tendency for pooling of capital, posited that small and medium size businesses would not be able to compete with the rapid growth of large businesses (Freyer, 2014, pp. 37-38).

In the 19th century, previously nonexistent new classes also emerged. Civil servants, servants and the ruling class are some of these new classes. In time, the working class also began to divide into qualified and unqualified workers (Freyer, 2014, pp. 62-65). The importance of the deep social change around the world enabled by technical changes resulting from the Industrial Revolution may therefore be better understood.

FRANKFURT SCHOOL

Associated with the Institute for Social Research but more commonly known as the Frankfurt School, this institution was established in 1923 in Frankfurt. With World War I drawing to a close and the failure of working class movements in West Europe, the need for the re-evaluation of social circumstances not emphasized by Marx arose. Thinkers of the school developed critical theory in opposition to traditional

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

positivist understanding. Critical Theory, with a critical approach to dogmatic positivism and dogmatic scientific socialism, re-emphasizes the subject, which had fallen from grace. Some prominent members of the Frankfurt School were Max Horkheimer, Theodor Adorno, Herbert Marcuse, Walter Benjamin and Jürgen Habermas.

This movement differs from the traditional Marxist superstructure establishment based on Hegelian dialectics. The tradition of Enlightenment basically attributes superiority to nature, saves man from legends and myths, and in essence forces the individual to live in accordance with the law of predetermined relationships. The magical veil of the world was lifted with Enlightenment. The Frankfurt School posits that the cost of lifting this veil and disposing of myths and legends was paid in the creation of new legends. This meant a new kind of subservience to non-human powers, resulting in alienation. This new alienation also influenced the field of science, reducing everything to technical usefulness and personal gain.

The Frankfurt School placed emphasis on three primary subjects. The first was the critique of positivism in social sciences. The second was criticism towards the ideological influence of science and technology. The third was the culture industry. While criticism of the culture industry began in Europe, it developed in the United States of America. Society in the U.S.A. is on a different plane to that of Europe regarding production and consumption culture. The consumerist society established through Fordist mass manufacturing mechanisms has caused mass communication tools to be used as tools of oppression for political purposes. On the other hand, the appeal of cinema and the world of entertainment by the masses has caused entertainment itself to become an industry.

The Marxist theorists of the Frankfurt School state that "Fordist" philosophy is apparent in all aspects of mass culture, such as in exhibitions, cinema, and magazines. Their statements on the Culture Industry clearly portrays their dismay for these industrialized products and stereotyped packaging (Creeber, 2009, p.13).

RELATIVITY AND QUANTUM MECHANICS

With scientific research accelerating as a result of the Industrial Revolution, important theories in the fields of theoretical mathematics and physics were being developed and significant experiments and observations were made based on these theories. Most prominently, electronic tools and equipment allow the study of space and the macrocosm as well as subatomic particles and the microcosm. It was understood that the mechanical approach responsible for the establishment of the Industrial Revolution would not suffice for the macro and microcosm. Scientific research conducted early in the 20th century led to the development of important theories. These studies revealed the fact that the previously acknowledged mechanical world view was insufficient in its acceptance of space and time as absolutes. While theories of physics that expressed the traditional understanding of the universe were determinant in daily life, by the 1920s, it failed to explain the behavior of atomic and subatomic particles (Hawking & Mladinow, 2011, p.14).

It was therefore understood by the early 20th century that Newton's Laws would lack explanatory power regarding the world of the vast, such as the universe, along with the world of the miniscule, such as atoms and subatomic particles. For the vast, Einstein's theories of Relativity entered a previously undisturbed realm of bent time and space, an expanding universe, and black holes (Thorne, 2014, p.42-43). The conceptual understanding of absolutes and the acceptance of these approaches were changing in both the realm of the massive and that of the miniscule.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

THEORY OF SPECIAL RELATIVITY

While Newton claimed space and time to be absolute and unchanging, he was also emphasizing the need for the existence of an absolute space and an absolute time. The concept of absoluteness itself refers to the concrete lack of change under any state and circumstance. This was the foremost scientific understanding of the 18th and 19th centuries, and influenced all aspects of science. During this era, theories in physical sciences influenced the social sciences, and determinism became the integral approach of the field of social sciences.

In the early 20th century, certain scientists focused their research on the study of light. There were, of course, studies conducted on the speed of light in previous centuries. The Danish astronomer Ole Christensen (1644-1710) discovered that light travels at a very high, but finite speed (Hawking, 1988, p.18). This was a defining moment in the realm of science. Set to be the foundation of countless studies in later years, James Clark Maxwell (1831-1879) indicated that light is an electromagnetic wave travelling at almost 300,000 kilometers per second. Consequent research determined that electromagnetic waves travel at the speed of light when in a vacuum (Hawking, 2015, p.50). These revelations were the beginning of a new age for the field of communication technologies.

In Newton's model, time and space were separate, infinite, and absolute (Hawking, 2015, p.40). Albert Einstein's (1879-1955) Theory of Special Relativity, however, posits that Newton's absolute time is out of the question. Time is relative, and related to the speed of a moving object. The inexistence of absolute time was proven in 1905 through Einstein's Theory of Special Relativity. This theory states that two observers travelling at differing speeds experience distinct measures of time through the distance they travel (Hawking, 2015, p.117). Einstein stated that no matter how fast the observers were moving, the speed of light must be considered constant. "Time" was previously considered a universal construct. However everyone had a personal time. Two static people would have congruent times, but they would lose this congruence if they were in motion relative to each other (Hawking, 2015, p.17).

In Einstein's Theory of Special Relativity, he pressed on an important point by stating that each observer would have their own measure of time. When an observer takes a measurement, the period of time that passes depends on that observer. In a clock travelling near the speed of light, the time that this clock measures also slows down (Neffe, 2009, p. 165). As objects approach the speed of light, a lengthwise constriction is observed. For an outside observer, the object appears to become shorter (Neffe, 2009, p. 179). This can be interpreted as understanding that approaching the speed of light, time nearly comes to a standstill.

In Einstein's model of the universe, light travels at 300,000 kilometers per second and the speed of light is the only physical scale that is measurable and absolute in the universe. Special Relativity also indicates that the speed of matter may never exceed the speed of light, and all astronomical objects travel slower than the speed of light. Thus, Einstein concluded that the maximum achievable speed in the universe was the speed of light. He posited that as the speed of an object increased, so would it's mass; when the speed of light is achieved, the mass of an object would be infinite (Kaku, 2012, pp. 40-41).

Einstein had proven that there is no absolute stasis, and no absolute time. When energy is used to accelerate an object, it increases in mass and it becomes more difficult to accelerate. Accelerating an object to the speed of light would require infinite energy and therefore this cannot be attained (Hawking, 2015, p.20). An object can never achieve the speed of light. Or rather more distinctly, any object with mass can not move at the speed of light. Only light, or waves lacking mass may move at the speed of light (Hawk-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ing, 1988, p.21). Today's most powerful rockets can only achieve speeds of 15 kilometers per second. It is estimated that this may rise to 300 kilometers per second in the near future (Thorne, 2014, p. 86).

THEORY OF GENERAL RELATIVITY

Another key aspect of Albert Einstein was his work on gravitational pull in space. Einstein had proven that unlike Newton's assertion, there can be no absolute regarding time and space, and they cannot be expressed independently. Einstein likens space-time to a flexible and foldable cloth. This explanation draws heavily from curved surface geometry. Bernhard Riemann (1826-1866) was a scientist who studied curved surfaces. Riemann indicated that the sum of the interior angles of a triangle on a plane was 180 degrees, but it was greater than 180 degrees on convex surfaces and less than 180 degrees on concave surfaces. Einstein's supposition was that space is like a taut cloth. Large objects cause sagging in space. Light that is passing by these objects is thus influenced by their gravitational pull and the light is bent. With large astronomical objects bending space, time is also bent. This is called space-time interaction. General relativity states that the field of gravitational pull bends light. Thus, if space is bent, so is time.

Non-Euclidian geometric theory had saved Einstein. Movement in Newtonian equations are determined by Euclidian geometry. In Einstein's equations, nonlinear space-time is defined through Riemann geometry (Yalçın, 2008, p.113). In Newtonian laws, as long as gravitational pull does not influence them, objects such as planets in space move on a straight line. Einstein however indicates that the curvature caused by a planet bending space-time itself creates gravitational pull (Hawking & Mladinow, 2011, p.130). General Relativity uprooted our concepts of space and time previously defined by Newton. In his Theory of General Relativity, Einstein states that heavy objects bend the space around them due to their mass, and thus time is also bent.

Light travels at 300,000km per second. The distance it covers in a year is expressed as a light year rather than in kilometers. The spatial distances of astronomical objects are also expressed in light years. A beam of light would cover 186,000 miles (300,000 kilometers) every second. The closest star to us beyond our solar system, Alpha Centauri C, is four light years away. Getting there, even with the fastest spacecraft we have, would take ten thousand years. NASA's Voyager I spacecraft entered space in 1977. It has been travelling for 39 years, and is now 20.5 billion kilometers (38 light hours) away from us. The data sent from Voyager I at the speed of light takes 38 hours to reach us. (Nasa, 2016)

Alpha Centauri is 4 light years, Sirius is 9 light years, and the Andromeda Galaxy is 2 million light years away from us. Light is only able to reach us from these stars in the aforementioned time. Thus, we are only able to observe the states of these stars from 4, 9, and 2 million years ago respectively (Gott, 2005, p.75). While we assume we are looking into the distance when we peer through the lens of a telescope we are actually looking back through time. Looking forward into space in a sense brings us closer to the past.

QUANTUM MECHANICS

Another important field that progressed greatly in the 20th century was the study of the miniscule, atoms and subatomic particles. The behavior of subatomic particles is studied through Quantum Mechanics. An atom comprises of a nucleus of protons and neutrons, and electrons that orbit that nucleus. Protons and

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

neutrons are made up of quarks, which themselves are established through the combination of strings. String Theory states that in particles are not necessarily points or dots, but one dimensional strings. These strings vibrate at differing frequencies, and each distinct frequency creates a different particle. The greater the vibration of the string, the greater the mass of that particle (Hawking, 2015, p. 61).

Max Planck discovered in the early 20th century that light disperses as small particles, known as quantum packets. At the time, it was believed that light moved as a wave, or an electromagnetic vibration (Gribbin, 2006, p. 19). Light does not exhibit one specific behavior. Sometimes it behaves like a wave, and sometimes like a particle. This situation is called the wave-particle duality (Gribbin, 2006, pp.20-22). Heisenberg's Uncertainty Principle states that the location and speed of an electron cannot be measured with the same accuracy. This simply isn't possible on a microscopic scale. In essence, in quantum mechanics, the location of a particle and the momentum of a particle cannot be measured simultaneously. Werner Heisenberg's (1937-1976) Uncertainty Principle indicates that the speed and location of subatomic particles cannot be stated definitively. When their speed is measured definitively, their location remains uncertain and vice versa (Hawking, 2015, p.34). Heisenberg thus formulated one of the basic principles of quantum physics. His Uncertainty Principle establishes that the location and speed of a particle cannot be measured simultaneously (Hawking & Mladinow, 2011, p.90).

Quantum physics indicates that until it is measured by an observer, a particle has no specific location or velocity. When the measurement is conducted, the result of that measurement is only valid for the particular instance in which the measurement was made. Classical science assumes the existence of an external world with determined qualities, and that these assumed qualities are independent from the perception of the observer. The principles of quantum physics, however, indicate that until it is measured by an observer, no determinations can be made regarding the location and velocity of a particle (Hawking & Mladinow, 2011, pp.8-59). Quantum physics states that an object is itself influenced by the act of observation. Interaction with an object is therefore inevitable (Hawking & Mladinow, 2011, p.103).

Newtonian physics expresses that each particle emitted from a source follows a single predetermined path until it reaches an intersecting plane. Quantum physics, however, indicates that it is difficult to state the exact location of a particle in the time it takes to reach the plane from the source. Richard Feynman (1918-1988) posited that while travelling from the source to the plane, a particle uses all possible routes. Thus, he continues, if we wish to calculate the probability of a result, we must calculate all of the possibilities of that result. If done this way, it would mean that all events that may result in the same outcome are possible (Gott, 2005, p.16).

Each subatomic particle has an opposing antiparticle. An electron is negatively charged, and the corresponding antiparticle is the positively charged positron. These particles and antiparticles, however, eliminate each other. Renowned physicist Paul Dirac (1903-1984) contributed antimatter to physics. The opposing particle of an electron, which is in orbit in an atom, is called a positron. While both have similar characteristics, electrons are negatively charged while positrons are positively charged. One field of application for positrons is PET (positron emitting tomography) imaging systems (Yalçın, 2008, p.10).

In a design they constructed in the 1960's, physicists S. Tanaka, O. M. O. Blaniuk, V. K. Deshpande, and E. C. G. Sudarshan purported that there were virtual particles that moved faster than light, called tachyons (Gott, 2005, p. 124). Science is deducing that if virtual integers can exist in mathematics, virtual particles must also exist thereby inferring that the speed of light may be exceeded. From a theoretical perspective, the concept of time may be altered in unexpected ways when approaching, achieving, or exceeding the speed of light.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Virtual numbers and virtual time are actually mathematical concepts. Virtual numbers are perpendicular to real numbers. Since virtual time is perpendicular to real time, it acts as a fourth spatial dimension (Hawking, 2015, pp.67-68). In this second construct of time, namely virtual time, each past refers to a past in real time. As a result, a multitude of possibilities for the universe are obtained (Hawking, 2015, p.93).

APPROACHES POST RELATIVITY

The end of the 20th and the beginning of the 21st century saw acceleration in research in space and astronomy. Detailed studies of planets and space travel projects were prepared. Research on space in every field of science produced technological developments that were to be used both in space and on earth. A thorough analysis of outer space was necessary for future space travel. Many questions and many approaches followed each other. One of the questions that stood out was whether or not there was a beginning to the universe. The Big Bang Theory is one of the most significant approaches regarding the creation of the universe today. This theory posits that the universe started as a single point with immense density, and suddenly expanded, and this approach leads us to believe that there must be a beginning to the universe.

When Edwin Hubble (1889-1953) observed that galaxies were rapidly getting further apart, he observed that the universe is not static and is in fact expanding. This, in turn, was an indication that the universe has a beginning (Hawking, 1988, p.8). So the universe was expanding. The notion that the universe is stable and static, and will continue to exist as it is was abandoned through observations. The universe began with a finite time, and would end in a finite time. In short, the universe was not static but rather a dynamic universe (Hawking, 1988, pp.33-34). These explanations also show us that the concept of time began to exist with the creation of the universe, and that there was no such entity precluding the universe (Hawking, 1988, p.8).

There are billions of galaxies in the visible universe. The Milky Way galaxy, in which our solar system and the earth we live on resides, covers an expanse of 100,000 light years. The closest other galaxy to us is the Andromeda galaxy, and it is 2.5 million light years from us. The closest star to earth other than the Sun is Proxima Centauri, and is 4.24 light years away. Light travels at 300,000 kilometers per second. If we recall, one light year is the distance light covers in a year while travelling at 300,000 kilometers per second. Each galaxy has a massive Black Hole at their epicenter. When stars consume all their material fuel, they collapse into themselves, forming a black hole (Thorne, 2014, p.33-36). Black holes comprise of bent space and bent time (Thorne, 2014, p. 63). In other words, black holes are regions of space which have been bent to the point that light cannot escape them (Hawking, 2015, p.32).

During the same time period in which space and astronomy gained traction, important research was being conducted in the field of theoretical mathematics. New approaches that were previously unheard of were published. One such researcher, the renowned mathematician Kurt Gödel (1906-1978) published proof of his incompleteness theorems in 1931. The repercussions were quite interesting. Gödel had proven that problems which could not be solved with any rules or operation sets existed (Hawking, 2015, p.147). In other words, this proof shows that propositions which can not be proven right or wrong are possible.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

MODERNISM AND POSTMODERNISM

Max Weber's (1864-1920) utilization of the term "disenchantment", together with the emergence of modernity, emphasizes that meaning itself has been cast away from the earthly realm. With this disenchantment, people were trapped in what Weber referred to as an iron cage. Modernity has been defined in many different ways by many different authors and thinkers. While Weber uses modernity to define the disenchantment of the world, Marx defines the world as the evaporation of everything solid. The lifestyles that emerge as a result of modernity have torn us from traditional types of social structure (Giddens, 2012, p.12). Giddens postulates that we live not in a postmodern era, but in an era in which the consequences of modernity have radicalized and become universal. Creeber defines modernism as an umbrella term, as society's reaction to the industrial revolution towards the end of the 19th century (Creeber, 2009, p. 11).

In the time from the industrial revolution to today, developments and shifts in technologies have also caused deep alterations in many aspects of society, from economy to education. The modern era began with the emergence of the mechanical world view. Modernism, enlightenment, and the industrial revolution made many promises such as development, prosperity, and progress. This was a grand and significant narrative. However, following the tragedies of the Great Depression and two World Wars, averse reactions to modernism emerged throughout the world. Positivist and determinist approaches were criticized heavily. Following the aforementioned disasters of the mid 20th century, a new era was ushered in. In this new age, some considered the period a continuation of the modern era, while others categorized the period as the "next era", namely "the postmodern age".

Primarily, four pairs of concepts must be expanded upon to accurately define what is modern and what is postmodern (Şaylan, 2002, p. 55).

- **Modern/Postmodern:** The adjectives that refer to the period.
- **Modernization/Postmodernization:** Refers to a process, the emergence of two different stages.
- **Modernism/Postmodernism:** Refers to the ideological aspect of the narrative.
- **Modernity/Postmodernity:** Refers to two distinct periods.

Even though these four concept pairs are used interchangeably, they signify different understandings, acceptances, manufacturing and consumptions of two different eras. Emphasis should be made on the differences in settings and narratives.

Some authors accept the Age of Enlightenment as the beginning of the period of modernity. Institutionalization occurred through the Industrial Revolution, while politicization occurred with the 1789 French Revolution. It came under heavy criticism in the 1960s, and is considered to have ended with the fall of the Berlin Wall in 1989. The most prominent feature of modernism was that it prioritized the human mind. The trust placed in human intellect is immense. It follows a rhetoric of constant and uninterrupted progress. Modernity is considered to mean the rise of man compared to the premodern era.

Causality is a defining characteristic of modernity. Newton's universe is also founded in causality, absolute time, and absolute space. Modernism replaced traditional structures with reliable and certain rules, an approach known as rationalism. Rationality expresses definitiveness. Postmodernism, however, lacks clarity and does not express any form of precision or accuracy. Thus, the state of being definite and indefinite brings with it issues of understanding and interpretation today. Therefore, in both the modern and postmodern era, settings and narratives matter.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The characteristics of settings relating to modern and postmodern concepts may be summarized with the following pairs of terms (Hand, 2008, p.53): Material/discursive, continuous/discrete, objects/spaces, determined/undetermined, neutral (instrumental)/cultural, actual/virtual, centered/decentered, fixed/mobile, governable/un-governable, effects/performances.

While the modern terms are more apparent in these word pairings, there is a certain ambiguity to postmodern terms. The postmodern concept of virtuality especially has entered our lives in recent years as virtual reality products, finding widespread use in entertainment and education.

The narrative basis for modern and postmodern terminology may be more explanatory (Hand, 2008, p. 83):

- **Modern Discourse:**
  - **Collections:** The conservation of cultural values, universal knowledge and legitimate culture.
  - **Pedagogy:** Public education and knowledge sites relating to education.
  - **Legitimization:** The legitimate providers of symbolic and cultural capital.
  - **Gatekeeping:** Keeping track of the flow of history and collective memory.
- **Postmodern Discourse:**
  - **Interfaces:** The dispersion of gathered knowledge throughout social space in the form of cultural aggregates and information.
  - **Empowerment:** Self education rather than teaching, based on equal citizenship rights.
  - **Democratization:** The encouragement of multicultural heritage and tradition.
  - **Communitarianism:** From legitimization to applications possessed by society.

While universality, public legitimization and collective culture form the basis of modern narrative, these are replaced in postmodern narrative by social media, self-learning, and multiculturalism.

The definition of postmodernism draws back to the 1950s. At the time, Irving Howe and Harry Levin used the term as the destruction of the modernist movement. This definition was used in the 1960s by critics such as Leslie Fiedler and Ihab Hassan to explain postmodern literature. Postmodernism entered the arts initially through architecture, and was influential in other fields of the arts by the 1970s (Huyssen, 1994, p. 108). Huyssen asserts that modernism is not outdated, and that it is not the intention of postmodernism to do so. On the contrary, postmodernism shines new light on modernism, allowing the integration of different strategies and tactics (Huyssen, 1994, p.126).

Some thinkers emphasize that the understanding of knowledge and science of the modern era does not provide freedom to a person, and that this understanding must be reestablished. In the postmodernist approach, a new understanding of knowledge cannot be considered to express the truth. Careful study will show that many groups of truthfulness can exist side by side. Mankind therefore faces a plethora of paradoxes in the postmodern era. This situation may be defined as the "self reproduction paradox" (Şaylan, 2002, p.47).

Postmodernism may be associated with various changes that emerged following the industrial revolution. The new post-industrial or post-Fordist economy is an economic transition in which production based economy gave way to service based economy. The culture and politics created by a post-industrial society may be observed to be significantly different than the modern era culture and politics put forth by the industrial revolution (Creeber, 2009, p.15).

There has been plenty said regarding the modern and postmodern eras. The rapidity of technical developments, and the rapid manufacture and consumption of products of these developments has had

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

widespread influence from cultural to behavioral in the people that use these products, regardless of which culture they come from. In fact, neither has the modern era truly ended, nor has the postmodern era taken its place. Even the rarely mentioned premodern era continues in many societies. In essence, the premodern, modern, and postmodern periods are sometimes experienced as a sequence, and sometimes intertwined with each other within history. This is, in fact, the state that allows events to astonish us and escape meaning. If we know these periods and the circumstances surrounding their emergence, it will be easier for us to gauge events.

SIMULACRA AND SIMULATION

Abstraction has been an important form of expression for a very long time. "Abstraction today is no longer that of the map, the double, the mirror or the concept" (Baudrillard, 1994, p.1). We can feel the existence of the abstract, but cannot perceive its existence through our physical senses. In essence, it is the opposite of the tangible. Abstraction is the process of reducing the knowledge content of a concept, or in other words the process of reduction or simplification. Abstraction usually confronts us in the arts. Abstractions produced in primeval ages were object and figure abstractions that expressed the fear, curiosity, respect, and passion felt towards nature. Today's abstractions are more connected to technical advancements. Developments in the sciences are rapidly separating mankind from nature, triggering the proliferation of abstract works especially in the arts. While the subject matter of graphic novels and animations in our daily lives are established of abstract characters, abstraction itself is increasing. Another field prolific in abstraction is the abstractions conducted in advertising for all manners of production.

With the emergence of the photographic technique during the industrial revolution, we tend to consider photographs to be relational to the real world. Painting and drawing, however, is related to the imagination and creativity of whomever created them (Toffoletti, 2011, p. 13). Technological advances that emerged in the mid 19th century drove artists into new searches. The invention of the film camera allowed nature to be portrayed perfectly on paper. For an extended period, artists had strived to replicate nature on their canvas until the invention of the camera. Thus, they had to find new ways of expression rather than create these attempts at replication. Towards the end of the 19th century, we therefore observe in these arts the simplification and disruption of forms, and the increase of abstractions.

Today, global media has transformed art into an easily accessed and easily copied meta. Art is no longer confined to a certain space as it once was, and the elimination of spatial constraints has allowed more people to access it. These questions began emerging along with the significant changes in the creation, interpretation, circulation and consumption of images. Who are these images for, and what function do they serve? Unfortunately, there are no singular concrete answers to these questions (Toffoletti, 2011, p. 13). In the modern era, pretty much everything was expressed through the tangible, and perception was concrete. During this period, signs primarily had certain functions. Signs are abstractions of a tangible concept and are real. The postmodern era, however, deals more with images. An image is the mental copy and figment of something perceived by the senses. Thus, it is now images that are produced, circulated, and consumed.

In his studies and critiques of the postmodern era, Jean Baudrillard (1929-2007) emphasizes the terms simulacra and simulation. Simulation is the artificial reproduction of a tool, machine, system or the functioning of a phenomenon through a model or computer program for the purpose of its study, exhibition, or explanation. Simulacra means image, imitation, similarity and semblance. To simulate

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

is to try to present something that isn't real as if it were. To dissimulate means to behave as if one does not possess something they actually do. Simulation, on the other hand, is to behave as if one possesses something they do not. One represents that which is, and the other represents that which isn't (Baudrillard, 1994, p. 2). An important distinction lies between the concepts of simulation and dissimulation. Baudrillard emphasizes the mind bending cycle of production, circulation and consumption regarding acting as if something not possessed is so. Simulation is no longer the simulation of a region, a referred thing, or a material. It is the production of a reality through models, but without any past or truth: this is called Hyperreal (Baudrillard, 1994, p. 1). It is trying to explain a world in which untrue realities roam through ruthless criticism.

While placing important emphasis on simulation, or hyper reality in other words, Baudrillard states that the reality created has no origin and lacks reality. This unreal, origin-less reality is derived through models. Disneyland may be provided as an example for hyperreality. Disneyland is a perfect model in which all the formations of simulacra are intertwined (Baudrillard, 1994, p. 12). It is neither imaginary, nor is it reality. It is a perfect model where arrays of appearances (simulacra) that want to be perceived as a reality are intertwined. To the question of whether or not it is real, we cannot say that it is real. To the question of whether or not it is unreal, we also cannot say that it is unreal. In short, it is neither real, nor unreal. If something is simultaneously neither real, nor unreal, the solution is that it is hyperreal.

Baudrillard proposes four orders of simulacra. His theory of simulacra may help understand images' perception of reality of proponents of visual arts and what they represent (Toffoletti, 2011, p.17).

1. **First-Order Simulacrum:** The first order is the period between the Renaissance and the industrial revolution. In this period, called the pre-modern period, social relationships are formed through symbolic exchange (Toffoletti, 2011, p.17). During this era, objects in nature are imitated, thereby reproducing nature. Especially in the use of stucco in baroque décor, nature is mimicked and recreated through an architectural work (Toffoletti, 2011, p.20). In the reproduction of nature, the material used in the décor may be marble or plaster. While the wealthy use marble, people with more modest incomes use plaster.
2. **Second-Order Simulacrum:** The second order begins with the Industrial Revolution. Mass production techniques caused the mass production of images as well. Thus, the way objects and images are made along with their values and functions changed (Toffoletti, 2011, p. 20). Andy Warhol, an American painter, filmmaker, and publisher, is considered to be one of the most significant representatives of the pop art movement. He designs artworks in which mass production and objects of mass production are frequently used. His *Campbell's Soup Cans* work in the 1960s may help better understand the characteristics of Baudrillard's second order simulacrum. In this artwork, which resides in the New York Museum of Modern Art, there are 32 seemingly identical cans of soup with differing labels. While the cans containing Campbell's soup are identical, there are many different kinds of soup in them and they are named differently. The emphasis of this order is that despite differing ingredients, the meta that is produced is a product of mass production (Toffoletti, 2011, p.21).
3. **Third-Order Simulacrum:** The third order is the period of hyperreality, in which the discernible difference between image and reality has either disappeared or completely collapsed. Images are not connected to objects in the real world, and freely move about. Their ability to create meaning is only possible through their developing a relationship with one another (Toffoletti, 2011, p.24). Hyperreality is the production of a reality that lacks any reality. It is now possible to have infinite

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

production through advanced electronic devices. Rather than refer to reality, it may be more apt to state that the products that emerge are operational realities. As an example for hyperreality, the aforementioned Disneyland may be suggested. Most of the products we consume in our daily lives are products of hyperreality. We cannot decide whether or not they are real, but consume them with great pleasure. That which is consumed, however, is the hyperreality of the product rather than the product itself. Transcending exaggeration, all emotions and expressions have become hyper.

4. **Fourth-Order Simulacrum:** The fourth order is a period called ultra reality. Image has forgone it's unique function and objects are now forced to enter the image. One of the most meaningful examples of this is virtual worlds such as Second Life. Now ultra reality puts an end to both reality and illusion. This is ultra reality (Toffoletti, 2011, pp.29-30). Today, virtual worlds such as Second Life are multiplying. The most distinct examples of this are augmented reality and 4K resolutions on digital televisions. Augmented reality technologies have multiple definitions. One of the definitions that stand out is "wearable reality". By having a real body wear a non-real technology, ultra reality is created. 4K refers to Ultra High Definition, and carries greater image quality that High Definition. The feeling of ultra reality may be felt especially in large, curved displays. People are no longer simply observers of the image, they enter it, break from reality, and live a dream in worlds created virtually.

TECHNOLOGY AND DIGITAL CULTURE

The term "technology" is used frequently in our daily lives, in scientific and in applied works. Communication technologies, information technologies and educational technologies may be provided as examples.

Etymologically, the term technology is derived from the Greek words "techne" and "logos". Techne refers to art or craftsmanship while logos refers to discourse over something. Technology is the application of knowledge or science in a specific field. In other words, the contemporary meaning of technology is more abstract and unique than that which was afforded to it towards the end of the nineteenth century. In the contemporary world, technology carries cultural values, ideologies, and ethical concerns while being shaped by political and economic determinants (Murphie & Potts, 2003, p. 3-4). Thus, the meaning afforded to the term "technology" changes in time from antiquity to today and during all periods in between. It is especially meaningful that technology refers to a more abstract and unique concept in its contemporary form. It is abstract because rather than defining a new tool or utility it is the discourse it represents that matters. The discourse instilled on it is itself also unique. It holds a special place in its field of application that expresses its own era.

Technology incorporates the culture in which it was created. Therefore the relationship between technology and culture is inseparable, neither may be taken individually and applied thusly. The Latin "cultura" refers to either inclination or cultivation. While the phrase came to mean agricultural cultivation when it was adopted into the English language from French in the fifteenth century, the intellectual and artistic aspect of civilization was emphasized by the early nineteenth century. Culture is ideas and values, is dynamic, and therefore changes in time (Murphie & Potts, 2003, p. 7). It is traditional, developable, transformable, and expresses something different with the technology of each era. Premodern, modern, and postmodern cultures are determined by the technologies created in that particular era. Baudrillard states that contemporary culture is increasingly being determined by 'simulacra' created by technol-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ogy, while reality itself is being usurped. Baudrillard modified McLuhan's famous "the medium is the message" statement, instead indicating that "the medium is the model" (Murphie & Potts, 2003, p. 15).

Information communication technologies have opened many communication channels that overcome any national boundaries. Despite existing in different regions of the world at different densities and speeds, information has created an incredible number of new, fast-paced images and new cultural habits (Tubella, 2001, p.385). Developments in communication technologies in the early twentieth century rapidly found places of application, influencing societies and portraying different situations in the four generations leading up to today. Tapscott defines four generations from 1946 to today as follows (Tapscott, 2009, p.16):

1. The Baby Boom Generation (1946-1964).
2. Generation X (1965-1976).
3. The Net Generation or Generation Y (1977-1997).
4. Generation Next or Generation Z (1998-present).

The communication technologies of the first generation, the Baby Boom (1946-1964) were analog. This was the period in which electronic devices began developing. Radio was a widespread mass communication tool. Television broadcasts, on the other hand, were sparse and black and white. Both provide one way communication without interaction. Long range communication was conducted wirelessly. The determinist characteristics of the modern era continued. A new order was being established on a global scale following World War II, the economy was livening, and global consumption products were being manufactured more rapidly. The space race began with the Soviet Sputnik I satellite. Gere elaborates on this situation: The Second World War did not only accelerate the invention of the binary based computer, it also led to important developments in cybernetics, information theory, general systems theory, molecular biology, and artificial intelligence (Gere, 2008, p.51). The erection of the Berlin Wall in 1961 symbolized a binary world and initiated the Cold War Era.

The communication technologies of the second generation, Generation X (1965-1976) are also analog. While radio broadcasts continued, color TV broadcasting began in the U.S., Europe, and Japan. The prominent feature of this era is the emphasis on work in the field of ICTs. ICTs are primarily used in very large systems and work with large amounts of data. From a social perspective, developed nations began their critique of the modern era and postmodern works began proliferating in art and literature.

The third generation, Generation Y (1977-1997) is defined as The Net Generation. ICT networks achieved national and international prevalence. ICTs are becoming digitized. With the development of network protocols, systems and individuals have begun communicating seamlessly and continuously through common ICT languages. Regardless of whether they are systems or individuals, interaction is taking place between them. Desktop computers and individual terminals have become widespread. ICTs have mandated the use of automation systems in every field. Socially, the most significant development was the demolition of the Berlin Wall in 1989. In his statement that "walls were demolished and windows opened" in his book The World is Flat, Friedman in fact emphasized the globalization of the Windows program.

People born into the fourth generation, Generation Z (1998-present) are regarded to be Digital Natives. In this era, analog technologies are beginning to be abandoned and digital technologies proliferate rapidly. Both wired and wireless ICT networks are entrenched in every aspect of life. Hundreds of communication satellites orbiting the earth ensure continuous global communication. The Cyber Era gained

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

speed in the first quarter of the twenty first century. Production and consumption cultures changed, with products of hyper and ultra reality gaining prevalence. Virtual products have spread through all aspects of life via communication technologies, creating previously unheard of habits, transforming its own culture into a global one. Social networks are paramount for both people and institutions. Mobile technologies allow just-in-time access to everything, everywhere. They open all doors. Tapscott elaborates on this, stating that today's telephones are like Swiss Army knives, capable of much more than a phone call (Tapscott, 2009, p. 48).

When discussing the importance of digital technologies in our lives, we rarely consider the meaning of the term "digital". "Digital may be expressed as; metonym or rhetoric, equipped with virtual imitations, ensuring instant communication, creating the era in which we exist and which exists everywhere" (Gere, 2008, p. 15). Through digital communication technologies, the production of visuals, audio, graphics, games and written text is increasing rapidly. Cinema films are now digital. Everything produced within this scope complements each other. While cinema films previously could only be experienced in theaters, today small spaces and homes have become their own movie theaters. Adorno states that film aims to create a facsimile of the world of daily perception, and thus the outside world is a seamless continuation of that which is portrayed on the silver screen (Adorno, 2007, p.5). In other words, digital information is in global circulation. The global circulation of digital information is causing fundamental shifts in social and cultural organizations (Hand, 2008, p.18).

Digital culture is formed through the influence of existing and available digital technology. In the digital world, machines are more of a social phenomenon than a technical one. Digital culture is established on the objectification and specialization of the current sociopolitical status, culture, and economy (Han, 39). Digital communication technologies play an important role in the structuring of current economics and culture (Reed, 2014, p.3).

Industrialization is the driving force of the modern era. Electricity replaced machines that previously ran on steam power, and production transitioned to mass production. While the industrialization of the modern era focused on materials, it also created a Mass Culture. Today, with the manufacture of digital products, a Culture Industry has become a more prominent point of discussion. The term culture industry was coined by Adorno and Horkheimer in their 1947 book Dialectic of Enlightenment (Adorno, 2007, p.109). Culture industry refers to something other than mass culture. It forces the long separate fields of high and low cultures to unite to the detriment of both (Adorno, 2007, p. 110). The term culture industry is a critique of the standardization of culture – a characteristic of the paradigm of the modern era – by members of the Frankfurt School in social sciences. The concept of culture was a collection of values such as traditions, art, and literature produced internally through a dynamic process by each society before the industrial era. This culture was differentiated by the different societies in which they were created. Therefore, for an extended period of time the fields of high and low culture were distinct, with structures consistent within themselves. The culture industry emerging in the modern era standardized culture as a whole, causing changes and degradation in both cultural fields, forcing these different fields together.

The fourth generation, Generation Z, lives within cyberspace. Cyberspace is a place to which previous generations immigrated, but Generation Z was born into. In other words it is the world of Virtual Reality. Cyberspace is a term coined by science fiction author William Gibson to define virtual realities created by computers (Hassan, 2004, p.141). The virtual is another dimension of reality, but today the term "virtual" is used to refer to that which is not real. The word "real" implies certain material arrangements, a concrete and tangible existence. The term "virtual reality" however utilizes to contradictory concepts (Lévy, 2001, p.29). Virtual reality currently has applications in nearly every aspect of life. The

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Matrix, for example, is a science fiction film that covers how people living in a virtual reality come to the awareness and realization of this. Another exemplification of the popularity of virtual reality is Second Life, which many people live in (Hawking & Mladinow, 2011, p.57). In the film The Matrix, the protagonist Neo aims to save people from the slavery of an artificial intelligence of which they are unaware (Irwin, 2002, p. 6). In science fiction, despite the attempts to cover scientific possibilities, the Harry Potter film series also contains scientific fantasies that far exceed the subject matter of that which is truly scientific (Thorne, 2014, p.80).

Second Life is a completely virtual world in which people who exist in the real world may create a whole new life, either as themselves or as other personas. Everything within this world, even the currency utilized within it, is virtual. Individuals may exist as two distinct persons, one real and one virtual, in two distinct worlds. Thus, anything unachievable in this life becomes possible in virtual life. As a current field of science, artificial intelligence is dramatically portrayed in the film The Matrix as having enslaved mankind. Harry Potter films, however, are portrayed as a sequence of scientific fantasies.

THE NETWORK SOCIETY

The world has undergone a process of structural transformation for more than the past twenty years. This process is multifaceted and multidimensional, and is determined by the shaping and proliferation of ICTs in the 1970's as a new technological paradigm (Castells, 2005, p.3). The structural transformation is caused by the convergence of multiple mediums with very different characteristics. Simply put, it is ensuring different mediums speak a common language.

Electronic communication networks have been added to the list of requirements of daily life such as roads, electricity, water, sanitation, telephones and cable television. For the youth of developed nations, a world devoid of mobile phones, the Internet, and social networks such as Facebook in their daily lives is unfathomable. A single day of their absence may result in serious symptoms (Dijk, 2012, p.1-2). The most significant structural characteristic of new media is that it is the unification of data and mass communication in a single medium, and this unison is referred to as convergence. The stages of this unification may be summarized as infrastructure, transportation, management, services, and types of data (Dijk, 2012, p.7-8). Infrastructure is the foundation established by the convergence of different communication systems. Transportation refers to various media connections and their transportation. Management refers to the administration of different media and carries great importance. Services is the unifications of marketing and services such as information, communication, transaction and entertainment services. Types of data refers to the unification of sounds, data, text and images into what is known as multimedia.

Just as with the stages of convergence in new media, the stages of interaction also portray important qualities. The stages of interaction may be summarized as place, time, action, mental, digital code, and hypertext (Dijk, 2012, pp.10-11). Place is a multidirectional exchange. Time refers to a synchronous, equal and long circulation. Action is the equal controllability of action and reaction. Mental refers to mutual understanding. Digital code and hypertexts are two terms that complement each other. Digital code is the coding of all types of data in digital media as bits and bytes. Hypertext is the transformation of the connections between all types of data in digital media to code with a single structure. At the heart of this current revolution lies terms regarding the integration and interaction aspects along with the technical terms of digital code and hypertext that define the characteristics of new media (Dijk, 2012, p.7).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Within this process, the definitions of Information Society, Knowledge Society and Network Society are also significant. It is well established that in communication, the differentiation between the definitions of symbols, data, information and knowledge are important. Symbols come together to create data. The meaningful interpretation of data results in information. All communication tools today, in developed, developing and underdeveloped nations are capable of providing information. While highly valuable, information does not actually refer to knowledge. Information retained on a certain subject creates an accumulation of this information. Without this accumulation, the information obtained cannot be interpreted. In recent years, individuals have been bombarded with information. It is therefore plausible to state that individuals that lack a permanent store of information along with the society they establish is an information society. A knowledge society, however, is one that strives for production through a combination of their readily available stores of information and their transformation of information it receives into knowledge. Thus, not all network societies are knowledge societies. Athique, referring to this differentiation, states that the terms "knowledge society" and "network society" refer to the meeting point between technical passion and sociological understanding. Despite their close relation, there are important differences between them (Athique, 2013, p.17).

The information society is an expression of the industrial logic of Fordism while the network society defines the social structure of a Post-Fordist field (Athique, 2013, p.17). Network societies are formed upon communication networks and reach far beyond boundaries and borders. Therefore network societies are global (Castells, 2005, p.4). A network society is one that is fortified by ICTS based on microelectronics. A network is a cluster that is formed by the unison of nodes connected to each other. Nodes themselves to not have centers. They are simply nodes. The importance of nodes within a network increases based on their degree of internalization and efficient processing of information on a specific subject (Castells, 2001, p.3). Manuel Castells indicates that the culture of a network society is a culture of communication protocols between all cultures around the world (Castells, 2001, p.40). New cultures are established not by content, but by processes (Castells, 2001, p.39).

LEARNING IN THE DIGITAL AGE

As with many common words in the English language, the etymology of "pedagogy" is rooted in ancient Greek. Wealthy Greek families had many servants (usually slaves) among which one was tasked with the care of children. These servants usually accompanied them to educational facilities, or guided the children themselves. The Greek word for child (usually referring to male children) is "pais" (the root of which is "paid") and the word for guides is "agogus"; thus the meaning of "paid-agogus" or "pedagogue" (educator) is "guide of children". The term pedagogue later became synonymous with the teaching of youth. In essence, pedagogy involves the education of children. In the digital age, pedagogy is more of a social matter and joint learning process that involves questioning meaning and structuring knowledge in accordance. True pedagogy is educators providing opportunities of the age they live in to ensure they reach places that will amaze them in the future (Wheeler, 2015, p. 32).

Currently, people may utilize technology in the act of learning. This approach is quite different from traditional educational models. Lev Vygotsky stated that learning by oneself can not be as powerful as learning from the more knowledgeable other. The more knowledgeable other may be a peer, older brother or parent of the learner. Vygotsky's Zone of Proximal Development Theory (ZPD) hypothesizes that children learn in a broader scope when within a social context. Learning from a more knowledgeable

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

other increases in breadth and speed through the dialogue between them (Wheeler, 2015, pp.47-48). Vygotsky states that the act of learning takes place in a critical field which the individual is not aware of with their current knowledge, and defines this field as the Zone of Proximal Development. The more knowledgeable other that Vygotsky defined has for the most part been replaced by technology today. Now the interaction between the learner and the more knowledgeable other takes place via technology. From a Vygotskian perspective, this technology itself has become the more knowledgeable other in the ZPD due to it's facilitation of the learning process (Wheeler, 2015, p.49).

The need for learning has recently risen greatly compared to the past. Depending on the qualities of the era, various learning theories have been developed throughout history. From a theoretical perspective, learning was defined by Behaviorist approaches in industrial society, Cognitive approaches during the transition from industrial society to information society, and Constructivist approaches in the knowledge society. In the network society, Connectivist learning approaches stand out. George Siemens proposes Connectivism as a learning paradigm for the 21st Century and digital age. In this era, learning takes places on networks.

Learning is defined by Siemens as follows (Siemens, 2006, pp.27-28):

- **Chaotic:** Diverse and messy, not necessarily neatly packaged and arranged.
- **Continual:** Ongoing in development and communication. The model of "go to a course" is being replaced with learning and knowledge at the point of need.
- **Co-Creation:** Instead of content consumption (or passive learners involved in knowledge acquisition), experts and amateurs are now co-creators in knowledge.
- **Complexity:** Learning is a multi-faceted, integrated process where changes with any one element alters the larger network. Knowledge is subject to the nuances of complex, adaptive systems.
- **Connected Specialization:** Complexity and diversity results in specialized nodes (a single entity can no longer know all required elements). The act of knowledge growth and learning involves connected specialized nodes.
- **Continual Suspended Certainty:** We know in part. An attitude of tolerance for ambiguity and uncertainty is required. Certainty is for a season, not a lifetime.

Mobile technology is a key element in learning through networks. Mobile technology is a new facilitator that provides the opportunities required of connectivist learning environments. It incites the unison of mobility, social media and learning by providing a basic infrastructure. These changes in learning environments facilitated by mobile information and communication technologies allows for the determination of the needs of new learners. Learners now feel the need to ask these questions: How may I learn in a network environment? How may I manage the learning process on a network? How can I exist in a network environment? How can I utilize the tools of the network society? (Ozan, Kesim, 2013, p.116).

Connectivism has been praised as a learning theory for the digital age. Compared to previous generations, it attempts to explain how learners who use personalized, online and collaborative tools learn through different means and methods. It focuses on how knowledge is disseminated to an audience wider than ever through digital media. What matters today is not the personal internalization of knowledge by students, but for them to know where to access it when they need to (Wheeler, 2015, pp.36-37).

CONCLUSION

This study aimed to express the changes and transformations from the Renaissance to today based on scientific studies. Each era encompasses their own assumptions and understandings. The assumptions and understandings of an era is usually expressed by the term "paradigm". Kuhn defines the paradigm as a model in a scientific field consisting of scientifically accepted elements, which is generally accepted for a period of time (Kuhn, 1970, p.42). In other words, they are competing scientific approaches. Based on Kuhn's definition, the comparison of the scientific approach of one era with that of the next era depends on knowing both eras very well. Individuals whom comprise today's society face serious issues regarding facing, understanding and assigning meaning to new developments. The mechanical and determinist understanding of the modern era continues to be effective. On the other hand, developments in fields such as Relativity and Quantum Mechanics, along with their products already available in markets, are rapidly changing and transforming societies. New products present their own culture along with the products themselves. Individuals in every aspect of the field of education must be able to understand and create meaning from these rapid changes. It is the teachers and academics of the world who will explain these rapid changes with a strong scientific foundation. People in teaching positions must effectively internalize the premodern, modern and postmodern eras. Otherwise, they will struggle to understand the behavior and understanding of the students that they are teaching and training, causing irreparable ruptures in the communication between them.

KEY TERMS AND DEFINITIONS

Big Bang Theory: The Big Bang Theory is one of the most significant approaches regarding the creation of the universe today. This theory posits that the universe started as a single point with immense density, and suddenly expanded, and this approach leads us to believe that there must be a beginning to the universe.

Connectivism: Connectivism has been praised as a learning theory for the digital age. It attempts to explain how learners who use personalized, online and collaborative tools learn through different means and methods. It focuses on how knowledge is disseminated to an audience wider than ever through digital media (Wheeler, 2015, p. 36-37).

Digital Culture: Digital culture is formed through the influence of existing and available digital technology. In the digital world, machines are more of a social phenomenon than a technical one. Digital culture is established on the objectification and specialization of the current sociopolitical status, culture, and economy (Han, 39).

Frankfurt School: It was established in 1923 in Frankfurt. Thinkers of the school developed critical theory in opposition to traditional positivist understanding. Some prominent members of the Frankfurt School were Max Horkheimer, Theodor Adorno, Herbert Marcuse, Walter Benjamin and Jürgen Habermas.

General Relativity: There can be no absolute regarding time and space, and they cannot be expressed independently. With large astronomical objects bending space, time is also bent. This is called space-time interaction. General relativity states that the field of gravitational pull bends light. Thus, if space is bent, so is time.

Modernism: Modernism is an umbrella term, as society's reaction to the industrial revolution towards the end of the 19th century (Creeber, 2009, p. 11). The modern era began with the emergence of the mechanical world view. Causality is a defining characteristic of modernity. The characteristics of

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

settings relating to modern concepts can be summarized as: material, continuous, objects, determined, neutral, actual, centered, fixed, governable and effects (Hand, 2008, p.53).

Newtonian Mechanics: Newtonian Mechanics inspired the Industrial Revolution. Newton, who left his mark on the modern definition of space and time, states that space and time are absolute. He indicates that space and time are independent and constant.

Postmodernism: Postmodernism lacks clarity and does not express any form of precision or accuracy. The characteristics of settings relating to postmodern concepts can be summarized as: discursive, discrete, spaces, undetermined, cultural, virtual, decentered, mobile, un-governable and performances (Hand, 2008, p.53).

Simulacra: Simulacra are image, imitation, similarity and semblance. (Baudrillard, 1994, p. 2)

Simulation: Simulation is the artificial reproduction of a tool, machine, system or the functioning of a phenomenon through a model or computer program for the purpose of its study, exhibition, or explanation. (Baudrillard, 1994, p. 2)

Special Relativity: Time is relative, and related to the speed of a moving object. Light travels at 300,000 kilometers per second. The speed of matter may never exceed the speed of light.

String Theory: String Theory states that particles are not necessarily points or dots, but one-dimensional strings. These strings vibrate at differing frequencies, and each distinct frequency creates a different particle. The greater the vibration of the string, the greater the mass of that particle (Hawking, 2015, p. 61).

Uncertainty Principle: Heisenberg's Uncertainty Principle states that the location and speed of an electron cannot be measured with the same accuracy. Heisenberg formulated one of the basic principles of quantum physics. His Uncertainty Principle establishes that the location and speed of a particle cannot be measured simultaneously (Hawking & Mladinow, 2011, p.90).

Chapter 53
Digital and Collaborative Work: Winning Couple?

Christelle Lison
Université de Sherbrooke, Canada

Constance Denis
Université de Sherbrooke, Canada

ABSTRACT

Do digital and collaborative work go hand in hand? This chapter combines the practical experience of two university teachers and literature to answer this question. Basic notions are revisited: Collaborative work, Distance learning, Social constructivism, Authentic learning to establish the winning conditions. Collaborative work implies three types of action, i.e. communicating, coordinating, and producing. Digital technology finds its place in each of these, given the great diversity of tools available. To promote collaborative work with digital, the authors propose to clarify teaching objectives, to vary digital and pedagogical tools, and to develop the evaluation of collaborative work. The practical experience helps to clarify the main constraints of remote collaborative work and to identify some key elements to be aware of. Several concrete examples illustrate the problems and possible solutions.

INTRODUCTION

Digital technology and technological tools (ICT) are proliferating. They are as much a part of our daily life as of our professional life. Smartphones, tablets, computers: the possibilities are manifold, varied and often easy to use. Furthermore, social networks reunite us with our childhood friends whom we had lost track of 20 years ago, our old university friends, colleagues we met during our first job. Online search engines enable us to research something we are passionate about, or the country we will visit on our next holiday, or even the symptoms we are suffering from. According to a recent survey, *digital life links people to people, knowledge, education and entertainment anywhere globally at any time in a nearly frictionless manner* (Pew Research Center, 2018, p. 3). But what happens when it comes to

learning? We would use the technologies in a different way (Duguet & Morlaix, 2018) and probably less easily (Lison & Meyer, 2014), although digital uses are partly developed based on personal practices (Gremmo & Kellner, 2011).

When we think about learning into the context of higher education, it automatically calls for quality. So, many institutions of higher education nowadays choose to integrate digital technology into the courses they offer, even sometimes to "save" certain programmes by starting to offer them in a distance learning. Often conceived first and foremost in an economic perspective, this practice should above all be an opportunity to view teaching and learning differently (Puentedura, 2009), to question practices and to foster the development of new cognitive strategies, particularly in terms of information processing. These are elements that constitute part of the quality of education. In parallel with this movement linked to technologies, institutions of higher education in North America, but also in many countries across the world, increasingly consider the importance of implementing the foundations of constructivism and of social constructivism, thus assuming that what is learned is notably the "product" of social interactions. In this respect, Engeström (1987), in his model of collective activity, sees the subject as an individual or a group that carries out actions based on a collective objective. Thus, collaborative work may be regarded as a space in which the learners communicate, coordinate their activities and produce "a result". Considering the importance, today, of what one could call the "teamwork competency" on the labour market, it is not surprising that this is one of the configurations of the current academic reality. In this reality, it seems to us that digital tools may support or facilitate students' learning and teachers' practices, in a context that is intended to be authentic. This is at least what we would like, as a teacher and a researcher (Michaut & Roche, 2017). But what happens in the field? Can digital and collaborative work really be a winning couple?

This chapter supports the marriage of digital and collaborative work, at the level of a course or a program. It combines our experience in higher education with literature. We teach at all three university levels, including fully online programs in education. In such programs, learners must use technology to learn and collaborate with each other. The objective of this chapter is to provide a picture of the current pedagodigital context before defining collaborative work. The fundamental concepts are presented, e.g., distance learning, social constructivism and authentic context. Collaboration and cooperation are made explicit in order to distinguish them. The main issue is to respond to the question raised in the title of the chapter: is the marriage of digital and collaborative work possible? Our experience and literature allow us to present the main obstacles and winning conditions. To do this, it is important to clarify learning targets, use the right technologies and plan the assessment. Several constraints are presented to facilitate collaborative work in the pedagodigital context. The conclusion suggests presenting some examples of the use of digital technology in the francophone American university context in a reality of collaborative work.

BACKGROUND

This section of the chapter puts forward the current pedagodigital context as well as certain definitions, specifically with respect to collaborative work.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Current Pedagodigital Context

At the beginning of the century, if few people knew the modern social networks, they are omnipresent today. How many of us live "hooked on" our phones, having difficulty in restraining ourselves from consulting them at very frequent intervals? In 2017, Canadian Broadcasting Corporation revealed that Canadians spent about four hours per day on their smartphone, including in the bathroom (50%), during family meals (60%), in bed (90%). If this may seem extreme, we must imagine that students do not escape this reality. Besides, how many teachers complain about the distractions linked to digital tools (Houart et al., 2019)? Others feel uncomfortable when students contradict them, "validating" what they say as they go along with the help of their phone, sometimes mobilising quality resources, and at other times sources that would be described as unreliable. How to react when faced with these "new" reactions in class? The institution or teacher often responds by imposing a ban: blocking Internet in the classrooms or even banning laptop computers in class. But is this a "good" solution or a realistic solution in view of the omnipresence of the technologies?

Distance Learning

Although ICT may have negative effects on the involvement of students in class, it seems to us that they must also be regarded by the academic world as opportunities to adapt pedagogical practices and even to put forward things that were unthinkable in the past (Puentedura, 2009). For example, Distance Learning (DL), but also co-modal or hybrid courses, are gaining ground in universities every year. In class or DL, teachers are now able to offer interactive quizzes in class with different software packages or free sites, such as Kahoot or Socrative. We can also quote the Massive Open Online Courses (MOOCs) which have experienced an explosion in popularity over the past few years (Karsenti & Bugmann, 2016). Both in personal and professional life, it is important to emphasize that the technologies facilitate, closer ties between the users from different backgrounds. That is to say that technologies have an impact on the activities of daily life just as well as on teaching or learning strategies in the academic world (Lameul, 2017). It remains to be observed whether this impact is positive or not.

Manzoor (2017) mentions that curiosity is an important factor in the use of digital technology in pedagogy. *According to Dede et al. (2005) student curiosity is a very important feature […] for motivation. Designs of scenarios around some topics of interest can help develop this curiosity. […] Students also value other features such as collaboration with teammates, autonomy, and communication with others, actively working like a [professional] and using tools. More interestingly, the use of virtual worlds in education decreased students' absenteeism and even students who disliked [the subject area] become engaged and felt they could learn [more]* (Manzoor, 2017, p. 148). In DL, the interactivity made possible by digital tools improves the learning experience.

Social Constructivism

Let us take the example of the training programmes in mandatory education. For several years in North America, these have been based on the principles of constructivism and of social constructivism, with social interactions as well as cognitive and affective processes supporting the students' learning. Learning as such is intended to be a modification of what has been learned before or a reorganisation of the structure based on social interactions in the framework of an approach of personal knowledge ownership.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In other words, the student learns alone, but seldom without other people. Exchanges between learners in the framework of authentic learning situations, i.e. complex and significant, are presented as a context that is conducive to learning. In the digital age, these exchanges may be face-to-face or remote, in synchronous or asynchronous mode, with students from the same group, from the same institution or indeed from an institution from anywhere in the world. How can one fail to imagine the potential wealth of this type of solution?

Authentic Context

In a predominantly social constructivist pedagogical context, the learners engage in their learning in different ways, notably emotionally, socially and intellectually. This engagement implies a rethinking of teaching and learning situations in order to foster the set-up of an authentic context. On this basis, the learner finds him or herself in the heart of situations that are intended to be as close as possible to the tasks carried out in the practice environment. In today's digital age, *Students learn in authentic contexts, do tasks of their choosing, collaborate with others, and have access to peers who share expertise in the particular technology they wish to learn. This creates collaborative construction of knowledge, coaching and scaffolding, and embeds assessment within the learning process* (Barber, King, & Buchanan, 2015, p. 60). Learning in an authentic context benefits the learners in a collaborative construction of knowledge and an articulation of the process, while moving away from the focus on the product. As a matter of fact, the product is not the learning outcomes, but the result of the situation to learning. In other words, we will have probably never been as close to the famous "learning to learn", in a perspective in which we are preparing students for jobs that do not yet exist.

If the task is intended to be authentic, so is the context. It is therefore important that the learners familiarise themselves with the ICT available to them. Once again, this by contrast sometimes puts the teacher into a position that may trouble him or her: from the moment when the students master ICT that are unknown to him or her, the teacher may feel that he or she is losing control, the holder of knowledge no longer being the one we can envisage. But as Lameul (2015) emphasises, does the teacher have to take on absolutely everything? In other words, is it acceptable that the students choose, in an autonomous way, a work tool beyond the choices of the teacher? What resources are available to the teacher to allow him or her to support learning without the digital tool becoming a constraint?

Since learning in the digital age aims to be authentic, by proposing the most real possible tasks, the teacher concentrates on the way the student learns, reflects, structures, creates. He or she takes an interest in the process or the approach and not only in the product or the result. He or she thus focuses on high-level cognitive and meta-cognitive learning strategies. For his part, the learner, plunged into the heart of authentic situations, utilises the technologies to be active, make discoveries, check his hypotheses and reflect on the learning process. In addition, the technologies enable him of her to share and to exchange with the other learners while adopting a stance that may be qualified as social constructivist. For example, Chi, Kang and Yaghmourian (2017) have shown that *tutorial dialogue-videos enhanced observing students' learning more so than lecture-style monologue-videos, [bringing students] to be more constructive and interactive compared to watching monologue-videos* (p. 39). This study reveals that students will become learning models of for their peer when they are in collaborative work. In our opinion, this is a real added value.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

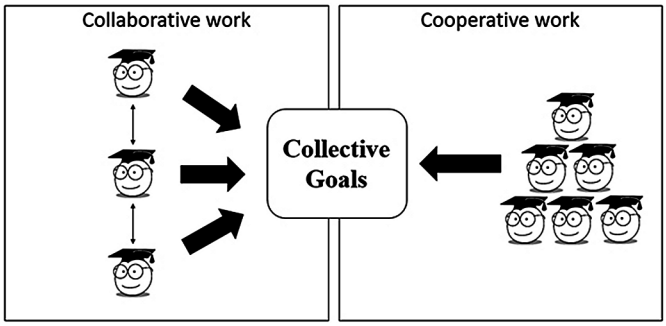
Communication With Technologies in Education

In the academic world, technologies should therefore be regarded as tools, and not as an end in themselves, to be implemented in order to simplify and/or facilitate, but above all to optimise teaching and learning. In this respect, they are sometimes used in tasks that would be impossible to carry out without them (Calixte, Gronier, Ben Rajeb, & Leclercq, 2018). We only have to think of the use of *Google Earth* in class to work on topics such as urbanism, agricultural systems or history (Demirci, Karaburun, & Kilar, 2013). We can also think about what they make possible in a flipped classroom type of philosophy. More than 20 years ago, Bates (1997) already drew attention to the fact that technologies were gaining in popularity, given the possibility of reducing the spatio and temporal aspects of teaching and of learning compared to that in face-to-face training. More recently, Patel and Patel (2017) mentioned that ICT provides tools to facilitate learning anywhere at any time. In our experience, we can say that the movement has only accelerated, although teachers' training has not always followed. Yet, what seems important to us, in the use of digital technology, is the meaning that this makes it possible to return to the teaching presence. In other words, what is the added value of face-to-face training? This is a question that should inspire teachers!

Communication with ICT is divided into two modes: synchronous and asynchronous (Johansen, 1988). In the first case, the learners can communicate at the same time, given a synchronised virtual presence; this is typically the chat. Communications are conveyed instantaneously, for example, with the help of videoconferencing tools, or of tools like Slack, WhatsApp or Zoom. In the second case, communications are not simultaneous. As they are available, the learners interact by sending files, emails, messages. In this way, information is picked up at different times, remotely, sometimes in places and at times that are completely outside academic time. Depending on the circumstances and the contexts, one of the two modes may be more effective. We have noted, specifically based on practices in different courses we teach, that synchronous and asynchronous information is not at the same level. If synchronous mode makes it possible to solve problems rapidly or to obtain brief responses to specific questions, asynchronous mode is better suited to exchanges that require reflection and greater depth. Otherwise, the synchronous sessions should be prepared to enable students to reflect on the questions they will be asked, for example by sharing them in advance. Furthermore, the length of the messages in themselves is significant. It is sometimes even important to remind students of the context of the exchanges, to avoid language that is too familiar or exchanges that are insufficiently based on the course matter or reliable sources. In our opinion, the question is not to know whether one mode is better than the other, but rather to use them in a pertinent way according to the teaching or learning objectives. If we use Facebook as an example, it must be noted that research is not yet clear with respect to the effect on students' learning of using this platform. Moreover, there is some ethical and/or copyright issues to discuss with the use of social media (Henderson, Auld, & Johnson, 2014). However, as emphasised by Lampe, Wohn, Vitak, Ellison, & Wash (2011), *While we do not expect Facebook to independently cause a paradigmatic shift in students' educational experiences, the repurposing of a tool that the vast majority of students are accessing on a daily basis has the potential to support new forms of interaction between students and instructors* (p. 346). This means that the teacher must demonstrate creativity in the pedagogical use of certain tools from the learners' daily lives. Of course, this creativity must work hand-in-hand with the targeted learning objectives. It is also important for the teacher to demonstrate a basic comfort level with the selected technologies in order to avoid technical problems and frustration for him of her and for his students. Particularly in the form of DL, certain training programmes or resources could be consulted, to facilitate the use of the various digital tools.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In this extent, the diversity of digital tools makes it possible to group most learners according to their comfort level with the technologies. Of course, in certain cases, this leads to a reorganisation of teaching or learning practices. The means of communicating, collaborating and producing are then numerous (Ellis & Wainer, 1994). Pavlovskaya and Perkins (2016) mention that there is important *to find effective ways to increase the students' level of socio-cultural competence that would allow them to communicate successfully in a new virtual learning environment* (p. 16). In the case of the younger generations, the use of ICT aims to be a way to reach, appeal and attract them, but also to break with the tradition and sometimes the isolation of the learners. We ourselves, as teachers in a specific discipline, sometimes appreciate being able to follow, from the comfort of our own living room, a course given by a specialist in our field via a MOOC or a YouTube video.



Collaborative Work: Theoretical Milestones

In the digital age, *it is possible today to work together, on a very large scale, on the same project, but remotely, synchronously or asynchronously, on modifiable supports while making it possible to have a direct relationship between the "collaborators" or "cooperants" thanks to the Internet* (Gangloff-Ziegler, 2009, p. 95). Collaborative work, irrespective of the domain, implies a horizontal organisation of the tasks to be carried out. In this way, the mutual commitment and responsibilities are distributed in a way considered to be uniform between the members of the team in a coordinated effort (Durand, 2009; Gangloff-Ziegler, 2009). Collaborative work implies the absence of a hierarchy where the roles are allocated under the supervision of a controller. It is therefore no longer up to the teacher to play this role. It is for the learners to put in place a structure that allows them to function in an effective and efficient way (Durand, 2009). In our experience, it is worth noting that they nevertheless sometimes need to be guided in the set-up of collaborative work because it does not suffice to simply put people together to make them work. Kozar (2010) explains that *While working together, students build new understanding by challenging others' ideas and defending their own. When successful, this creates a product that is different from what any individual could produce alone* (p. 17). In this context, the members of the team must regard themselves as partners who must help one another to produce a shared result that everyone endorses, thereby making them interdependent (Lanarès & Daele, 2013). It is therefore a challenge for the teacher who is in the habit of creating working teams or allocating roles in these teams. Indeed, in collaborative work, the tasks are not divided between the members with the aim of producing a common achievement but are instead worked on collectively. The tasks may be segmented but the result is a common "recomposition" by the adoption of a global point of view that is discussed and shared (Durand, 2009). For example, in our experience, teachers will have already received a "piece of teamwork" that is more like a patchwork than a real piece of teamwork; the style of writing differs from one section to the next or parts are repeated or contradict one another. It then rapidly becomes clear that this piece of work was not developed by a team but by individuals.

Figure 1 is inspired by the work of Henri and Lundgren-Cayrol (2001). It presents a comparison between collaboration and cooperation. In cooperative work, team members individually carry out part of the collective work. They have a group responsibility and not an individual responsibility. There is mutual interdependence between them. In collaborative work, everyone has individual responsibilities. They are associatively interdependent. Everyone does the task in their own way. Global production is discussed, negotiated and accepted by all (Henri and Lundgren-Cayrol, 2001).

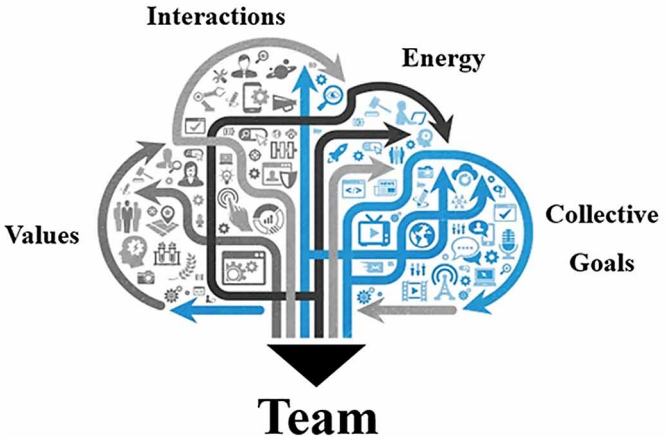

Figure 1. Comparison between collaborative and cooperative work
(Henri et Lundgren-Cayrol, 2001)

Common Values for a Collective Work

For collaborative work to be made possible, the common objective must be underpinned by shared values and constant interactions. It is particularly through these interactions that the group will be nurtured, thus producing collective energy and cohesion, enabling it to achieve its objective.

Figure 2. Team in collaborative work

In Figure 2, adapted from St-Arnaud (2008), the team shares common values. It is the team that produces a certain energy to mobilize interactions and cohesion around common objectives. Results can then be obtained in line with the team's values. There is no need for these interactions to systematically be in synchronous mode. Both modes of distance interaction can complement each other and can even add up to being present in class. This of course leads the student to contend with different timescales (Lesourd, 2009). Collective work might bring constraints that are sometimes onerous in the current context of life. In the light of the above, it is possible to appreciate the complexity of collaborative work. Its achievement compels the teacher to think this work through and to prepare the learners who will need to carry it out (Long & Meglich, 2013). Beware anyone who believes that improvisation is possible in carrying out such work.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Teacher's Role

In this context, collaborative work aims at individual and collective learning of varied skills, notably methodological, organisational, cognitive and metacognitive. Thus, as mentioned above, the focus is not on the result, but rather on the approach or the process. The teacher avoids focusing his energies and those of the learners on the solution or the result. Collaborative work may thus be the object of a - formative or summative - validation or of phased discussions. It is therefore important that the students avoid being absent during certain stages of the process of the collaborative work (i.e. definition of the roles, the common goals or the common values). Each person's tasks depend on those of the others. Furthermore, as a teacher, it is not appropriate to conduct one single assessment at the end of the training path. When reading the above, we recognise that the problems of collaborative work can be multiple i.e. organisational, temporal, technical, human. In order to prevent these, it is vital to take the time to discuss the values of each person and to provide the framework for the collaboration. Thus, this type of work must be presented by the teacher and adopted by the learners. This may require additional energy and time. Nevertheless, the multiple and complex learning that will arise from this, particularly through what may be called social-cognitive conflict, should exceed what the learner can achieve on his own and by listening to a teacher.

In the context of human resource management, Blais and Pouliot (2009) mention the importance, in order to foster teamwork, of concentrating on three pillars:

1. A common target that is understood and accepted by all, fostering the mobilisation of the individuals;
2. A clear and defined organisation of the task that is reviewed periodically, fostering the effectiveness of the team; and
3. Healthy relationships, with a view to ensuring the cohesion of the group.

We consider that these characteristics are completely transferable to the situations of teaching and learning. It is, in our opinion, up to the teacher to put these conditions in place so that the students can embark on effective, quality collaborative work. Furthermore, as in the case of many companies today, working teams do not always meet in the same location or do not always have schedules that foster face-to-face group meetings. Remote working and the recourse to digital tools may thus be elements fostering collaboration and reducing certain frustrations, particularly the impression that the work has not been done in an equitable way by the different members of the team. This means that collective learning with digital tools is work in an authentic situation.

Technologies in Collaborative Work

Technologies, used in a collaborative context, foster three types of action, i.e. they make it possible to communicate, to coordinate and to produce (Ellis & Wainer, 1994). Indeed, the learners exchange ideas in a formal way but sometimes also informal. Those exchanges are about the common work, as well as their understanding, as for example, of the teacher's instructions. By this very fact, they organise and coordinate their actions, giving themselves an operating structure and a calendar of work. As a result of collaboration, a concrete production arises from this which each person assumes his or her responsibility with respect to the production. In certain cases, several ICT are used in order to make the three types of action possible. Nevertheless, the present digital age makes available to learners certain tools that can

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

bring together the three types of action, as is the case, for example, with *GoogleDocs*. With this tool, it is important to consider intellectual property and confidentiality of information. Indeed, on this free platform, the learners can exchange ideas in synchronous or asynchronous mode with the help of a chat window, but also share feedback on the work produced. The different members of the team can easily monitor the changes that are made. Suggestions or comments can be proposed to facilitate a common understanding. Depending on the nature of the output, it may take the form of online files made available to the users. A tool of this kind makes it possible to support collaborative activities between learners who are located remotely. We can imagine how this can also be very useful for colleagues working together, pooling their pedagogical activities, exchanging resources or setting-up research projects in a team.

It is important to remember that collaborative work is a form of solidary organisation of work where each person is responsible for the whole thing, without it being possible to systematically isolate the individual share, coordination being made by mutual adjustment (Gangloff-Ziegler, 2009, p. 97). It therefore seems legitimate to ask oneself about the real potential of using ICT to support collaborative work. In this case, the technologies may present themselves as tools to communicate or to share information. We can think about discussion forums, instant messaging, online storage (cloud), shared site (wiki), organisational applications (shared calendars), online office suite with possible collaboration. Their diversity makes them appealing. The possibilities may be manifold, but the question of the winning couple remains.

DIGITAL AND COLLABORATIVE WORK: WINNING COUPLE?

Issues, Controversies, Problems

The three types of action in collaborative work: communicating, coordinating and producing (Ellis & Wainer, 1994), call for a wide range of competencies on the part of the learners, particularly with regard to ICT and their applications. The authentic context, which is intended to be complex and significant, places the learners in an environment where their strength consists of the diversity of competencies, among others, organisational, cognitive, metacognitive, methodological, technological. The success of the group is based on its capacity to take advantage of everyone's competencies. The flexibility of the digital tools then makes it possible to optimise this leverage. Mutual commitment and sharing of responsibilities are facilitated by the synchronous and asynchronous communications despite the possibility of conflicts (Gangloff-Ziegler, 2009). Indeed, although digital technology enables the sharing of messages, it does not always convey the tone of these messages. Feelings and impressions must be discussed in order to avoid a sense of uneasiness arising. Thus, the solidary nature of collaborative work constitutes both a lever and a constraint for learning.

In our experience, if students have a key role to play in the context of collaborative work, it should not be forgotten that teachers are most often the instigators of this. In this respect, they need to delineate it and give the students the keys to carry it out in an appropriate way. Indeed, the learners have only rarely been prepared to carry out collaborative work; even less so when it is remote. In a face-to-face classroom setting, this does not seem particularly complicated to us: give some instructions, move among the groups, allocate some time in class. But remotely, certain dimensions escape us, including the relationship between the technology and the learner (Meyer et Sanchez, 2015). As a teacher, this is more difficult to define and to delineate. However, it is becoming one of the levers of collaborative work.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Moreover, the choice of the technologies used and the way of using them may be sources of conflict or, on the contrary, drivers of productivity. In case of need, the teacher must not forget the role of mediator that he or she must play when necessary.

Explicit Teaching Goals

In the framework of teaching, our years of experience lead us to consider the importance, in the first instance, of defining the training targets. How important it is to collaborate to achieve these targets? How do these targets foster or support collaborative work? Why do we think is it important for the students to collaborate? In certain models of monologue-style DL (Chi, Kang, & Yaghmourian, 2017), as indeed most MOOCs are, the training targets probably do not involve a need for collaboration. Is it, then, relevant to suggest this? What is the added value? In what way will collaborative work be "sold" to the learners? Furthermore, once the teacher considers collaborative work to be relevant, other questions may arise. To what extent may learners circumvent collaborative work? How can one devise authentic situations that necessitate "real" collaborative work? If it is a question of collaborating for the sake of collaborating, it seems to us that this makes little sense. A certain number of students realise this, moreover, when teachers suggest group work simply to reduce the number of papers to mark. And it is reflected in the quality! Subsequently, once the teaching goals have been set, it is important to devise pedagogical methods that foster collaboration. Once again, although this may seem relatively simple to implement when the learners and the teacher are in class, it may become quite a challenge in DL. How can active learning online be fostered? Using the synchronous mode, it is possible, depending on the videoconferencing platforms, for example, to organise activities. This requires a certain dexterity of the teacher to organise this collaboration remotely, but without constituting real complexity. Of course, the first sessions may take more time and sometimes require the expertise of a pedagogical advisor or a more experienced colleague.

Furthermore, it is important to see how the collaboration may be prepared upstream and downstream of the synchronous meeting. It is at this level that students sometimes complain carrying out group work remotely with people you don't know is not easy. Indeed, the difficulty often lies at the level of establishing contact. How do you contact people? How to share values with them? How to state the operating rules? Many papers refer to the fact that a first synchronous meeting (in person, by telephone or by videoconference) is vital. Based on our experience, we consider that it can help things to fall into place. On the other hand, in remote programmes that are completely, in asynchronous mode, it is possible to create what Petit, Deaudelin and Brouillette (2016) call the feeling of remote presence. Jézégou (2010) declines remote presence across three dimensions, which are (1) cognitive presence, (2) social-emotional presence, and (3) pedagogical presence. Having reflected on this question in the context of the supervision of remote traineeships, Petit, Deaudelin and Brouillette (2016) consider that digital technology could enable students to participate in a Community of Practice with the help of videoconferencing tools (synchronous mode), to have instant discussions (synchronous mode) or to collaborate in a discussion forum (asynchronous mode). These interactions could foster the students' learning, remotivate them if they are experiencing a moment of doubt, lead to in-depth reflection, particularly through the confrontation of ideas. In a context of collaborative work, it seems to us that the feeling of remote presence is a guarantor to foster communication, coordination and production.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

A Variety of ICT for a Collaborative Work

Among the methods of active learning that can be implemented remotely, let us mention problem-based learning, case studies, games, simulation and the use of an ePortfolio. In certain areas, particularly in engineering, computing or in health sciences, digital tools may offer the advantage of reducing the material costs and risks to persons. The learners can use the simulators to carry out collaborative work where the abilities of each individual are used to advantage. It is also possible to include activities that involve videos (Lison & Petit, submitted 2019). In this way, the students can film themselves in practice, place their films on a secure platform and receive feedback from their peers. The students can comment on the videos at a time that suits them, and they can take note of the comments as and when they wish. In any case, what is important is to be clear about the instructions so that everyone knows their role and which rules govern the activity. Here, the role of the teacher is crucial as he or she has to clarify the training objectives. Let us not forget that online activities lead the students to mobilise different strategies (Lison, 2017). Indeed, the learners can rapidly access a wealth of human or material resources, including e-books or online audio books. In addition, in order for the students to be able to utilise these resources intelligently, it is important that they develop their intellectual stance across two dimensions that Hofer and Pintrich (1997) call the nature of knowledge (in terms of certitude and simplicity) and the nature of the act of knowing (in terms of source and justification). In this way, we consider that the learners must be trained in critical thinking. This means that such collaborative work cannot take place without preparation (Long & Meglich, 2013). In our own experience of teaching, it is sometimes easier for students and for the teachers to adopt this way of working in a program approach rather than in a single course. Consequently, the students could transfer the competencies they have developed from one course to another progressively.

Assessment of Collaborative Work

Once the activity of teaching and learning has been carried out, we should mention that the assessment of collaborative work often constitutes one of the teachers' main difficulties. First, what must be assessed? Next, how should it be assessed? How can one aim for an authentic training and learning situation by assessment? Let us not forget that the idea is to focus on the approach, the process, and not only on the product. The assessment must therefore correspond to this idea. In this respect, many teachers fear that collective work is primarily the work of a single person on whom the other students have relied. The development of the MLE (more, less, equal) matrix (an assessment that is plus, minus, or equal to that of the student who is assessing in accordance with a pre-established criterion) by teachers at the Faculty of Engineering of the Université de Sherbrooke (Bachelet, 2011; Doucet, 2007) represents an interesting approach (see figure 3).

The PME matrix enables students to self-assess via peer assessment. In brief, it facilitates the work of the teacher who is seeking to gauge the individual and collective contribution to collaborative work. The principle is simple; it is a matter of distributing a total number of points (for example five points for a team of six) between the students according to the perceived contribution (more, equal or less than oneself) (Doucet, 2007). If this seems complicated at first sight, it seems to us that it is difficult to envisage a pedagogical alignment that is tenable without having peer assessment. But when students are in distance learning, it is even more important to provide them quality feedback, including positive

feedback (Halawa et al., 2017) that comes from the teacher or the peers. If collaborative work is only put forward as a teaching and learning strategy, it does not necessarily lead to a group assessment.

With respect to assessment, let us also mention that digital technology makes a diversity of forms of work possible i.e. texts, conceptual maps, diagrams, video presentation, audio commentaries. Indeed, digital technology fosters, to a certain extent, pedagogical differentiation depending on the strengths of the learners and the type of work expected. This is an added value of the technologies. They also enable students to receive feedback from their peers and from the teacher in different forms, using the approach of both formative and summative assessment. In certain cases, the feedback will be more rapid and more frequent, given the use of digital technology. In this respect, Nguyen and Ikeda (2015) maintain that the use of the ePortfolio improves the possibility *for measuring competencies, capturing and sharing self-regulated learning principles, and practicing self-regulated learning processes. The system helps instructors to design programs, create program plans, observe learning activities, evaluate learning outcomes, give feedback, and hold discussions with students* (Nguyen & Ikeda, 2015, p. 201). The possibilities are manifold in the use of digital technology to carry out collaborative work. Indeed, in the case of the ePortfolio, several tools optimise collaboration, such as commentaries and audio feedback in such a way, specifically, to encourage social constructivism (Nguyen & Ikeda, 2015). Furthermore, both for the teacher and for students, oral feedback is sometimes much more effective and rapid than written feedback.

Informal Collaborative Work

We would like to share another example of the collaborative and digital couple. During their studies at graduate level, students often experience a certain isolation which sometimes contributes to them giving up their studies (Halawa et al., 2017; Denis, in press). Our practice leads us to think that setting up a collective, even an informal one, fosters effective collaborative work. It is in fact a matter of pushing the boundaries of projects that are specific to everyone, in order to instead encourage mutual commitment

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

along the process during a training path at graduate level. Several students have drawn our attention to the pertinence of these informal exchanges, organised by means of a digital platform. They also take advantage of them to exchange texts and relevant resources in different areas of their academic life. As a result of this experience, the teacher, or here the director of research, may be effaced, but without jeopardising his or her role or credibility. Nevertheless, the learners continue the three types of action presented by Ellis and Wainer (1994), i.e. communicating, coordinating and producing. In this context, the production approach, the process, proves to be of crucial importance and collaboration helps to make this happen. This example is a good reflection of the horizontal form of organisation where tasks are distributed based on mutual commitment.

Constraints of a Collaborative Work With ICT

Several constraints arise about replicating "real" collaborative work in the academic world. Indeed, thanks to ICT and, because of the very philosophy of the organisation [of collective work*] (a network with, necessarily, a head of the network), the management and the hierarchy are physically absent, but permanently present, virtually* (Gangloff-Ziegler, 2009, p. 95). The project leader or the manager responsible for a group of projects can and must follow the stage of progress of each person's work: *if this monitoring is no longer that of each task, as was the case yesterday […], it is replaced by milestones that punctuate collective work* (Durand, 2009, p. 22). In this way, technologies can facilitate collaborative work, but also prove to be an additional burden by presenting themselves as omnipresent tools to check each person's tasks. By way of example, *GoogleDocs* makes it possible to follow all the modifications and to restore them. These options are pertinent in themselves but could constrain mutual commitment if a learner decides to erase the modifications suggested by his colleagues without discussing this at the outset. Collaborative work can then slip quietly and subtly towards cooperative work (delegated responsibilities) or individual work (individual responsibilities). Moreover, ICT can, on the one hand, facilitate the distribution of tasks without the implication of segmentation. For example, by the use of wiki where creation, modification and collaborative work are put forward. On the other hand, ICT tools can, in a more traditional spirit, encourage the compartmentalisation of tasks and the simple pooling of results, with the objective of joint production with a greater or lesser degree of mutual adjustment.

About the constraints on the marriage of digital and collaborative work, if a learner encounters major technical problems or does not have the basic technological competencies to use the ICT, collective work will be constrained. This is a pre-requisite for communication, as well as for coordination or production. The advantages, for example, the speed of production or the feeling of remote presence, are rapidly reduced in the event of unsatisfactory technological competency. The collective contribution is therefore partly dependent on this. However, in certain cases, particularly with new tools, it can sometimes be difficult to assess the necessary technological abilities. Sometimes, a not "friendly user" technology could be very hard to work with. Where a task may have seemed simple, it turns out to be challenging. Tricot, Plégat-Soutjis, Camps, Amiel, Lutz, and Morcillo (2003) use the terms utility, usability and acceptability of computer and human based learning environments.

For the work to be collaborative, it is also not enough for a single learner to be able to carry out all the tasks. As indicated, mutual commitment is vital for success. It is therefore not a question of possessing the knowledge linked to the product, but of having the competencies relating to handling the digital tools. From the teacher's perspective, it is also important to be able to cope with the technologies that the learners wish to use. He or she must also design collaborative work that is feasible in a remote context.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Is it always easy to mobilise the students in a distance format? No! We only need to think of the forums that are set up and sometimes remain deserted until the teacher ends up writing a message or decides to add points, depending on the participation. It is also sometimes difficult to devise remote collaborative work when the students are not prepared. For example, when they have not read the texts, or if they do not understand the issues of the collaboration. One of the roles' teacher is to make them aware of the importance of preparation and to be careful not to overload them.

SOLUTIONS AND RECOMMENDATIONS

Currently, there are many remote, hybrid, co-modal courses in the academic world. These require a sustained use of digital tools. By way of example, the authors are both involved in a programme that is only offered remotely. Support in synchronous mode is offered to the learners to a greater or lesser extent. Collaborative work is in the spotlight when the time comes to optimise teaching and learning. The exchanges in synchronous or asynchronous mode make a mutual commitment of the learners possible in a context that is often informal. The discussion forums are presented as a convivial space to communicate understanding and to exchange queries. The learning is therefore the fruit of involvement that is both individual (for example, by completing the recommended reading, by popularising what is learned, by giving examples from one's context), but also a collective involvement (for example, by talking about authentic situations). It is quite easy to suggest to the students that they work in small groups in virtual classrooms, to lead them to make a summary or a conceptual map collectively. About work that is assessed summatively, this is often presented in the form of a critical reflection (written, oral or schematic) around practices in a digital portfolio space. The learners can then comment on their colleagues' work and help them to identify gaps or outstanding issues.

The use of digital tools may also be effective in face-to-face classes. In certain cases, universities make classrooms available to encourage collaborative work with digital tools. In such classrooms, the spaces are organised in islands of four to six learners who all have digital access to a screen. They can then easily work together in a digital environment. Without being remote, they can communicate, coordinate and produce with the ICT made available to them. The classrooms offer an environment close to that of the work environment and the problematic situations on which they work are usually authentic. The learners are active in these classrooms that are nicknamed "active learning classrooms" where the flipped classroom regularly makes an appearance. Digital meets traditional through the meeting of individual and shared screens, of diverse applications, of one console facilitating the movement of content to another, of whiteboards - whether digital or not - to reconcile the interventions. If the teacher is present, the mutual commitment of the learners to achieve the common objective remains vital for the success of the collaborative work.

Let us add that collaborative work does not always occur in a formal context. Several communities of practice emerge in graduate training, particularly to respond to the needs for socialisation (Denis, in press). Michaut and Roche (2017) estimate, moreover, that approximately 85% of university learners, at all levels, participate in digital groups. These are formed specifically to bridge the gap between the expectations of the learners and the tools offered by institutions. We can quote at least two examples in our practice. Firstly, a group of learners in continuing education created a team for themselves to exchange ideas on the digital tools that can be pooled between their institutions. Nothing and no one forced them to do this. This initiative arose from a conversation between two learners who invited the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

others to join in their reflections. Secondly, students enrolled in a doctoral research programme met once a month with the help of videoconferencing tools to exchange ideas about their topic. Collaborative work, which is less formal, found its purpose in the learners' need to produce a quality product, but also to communicate about the process in doctoral studies. The mutual commitment enabled a sharing of resources and material. Collaboration between students reflects a stronger commitment in their studies (Michaut & Roche, 2017, p. 9). In both examples, collaborative work, made possible thanks to digital tools given the physical distance between the learners, allowed students to combat social isolation and to share resources.

In the light of the different examples that we have shared in the text, we identify certain winning conditions for and certain constraints to the harmonious marriage between collaborative and digital work. Table 2 puts forward a summary of the main points discussed in the chapter. In our opinion, in order to foster and support this marriage, it is important to register in the Learning Paradigm (Barr & Tagg, 1995), to understand the foundations of collaborative work along with the advantages and limitations of digital work (beyond the tools themselves). In collaborative work, the teacher acts as a moderator, facilitator, facilitator and evaluator (Henri and Lundgren-Cayrol, 2001). It supports the students' approach while keeping a distance. It encourages students' autonomy and control. The teacher's interventions are modulated according to the progress in collaborative work (Henri and Lundgren-Cayrol, 2001).

Table 1. Winning conditions for and constraints on the marriage between digital and collaborative work

Winning Conditions	Constraints
• Good knowledge of the digital tools • Flexibility of the digital tools offered • Diversity of tools used • Clear definition of the training targets • Clarity and realism of the objectives of the collaborative work • Preparation for the collaborative work (for example, with a synchronous meeting) • An understanding of the distinctions between individual work and collaborative work • Peer assessment • Submission in different forms • Shared values • Mutual commitment • Sharing of responsibilities • Feeling of remote presence • Recognition of the collaborative work in a programme approach	• Accessibility to the digital tools • Inadequate technological skills • Poor assessment of the necessary technological abilities • Absence of an authentic task • Difficulty in establishing contact between the remote learners • Adoption of collaborative work in a single course • Single assessment of the final product • Development of a hierarchy within the work group • Presence of omnipresent tools • Segmentation of tasks

Of course, digital technology and collaborative work have one thing in common: the human element. Therefore, the technologies cannot replace the teacher or replace the students. Here, we are involved in actions that above all necessitate pedagogical, even curricular, commitment.

It implies a change in the way of thinking about teaching and learning.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

FUTURE RESEARCH DIRECTIONS

It seems important, in our opinion, to pay attention to pedagogical alignment in order to foster a marriage between digital and collaborative work. It would be pertinent to conduct research in the field concerning the training of teachers for collaborative work via digital technology. Certain initiatives have been taken, but it is important to analyse them in terms of a rigorous research approach. We are nevertheless, based on the literature, but also on our experience over more than ten years now, of the opinion that pedagogical training with the support of digital technology would be pertinent for most teachers in higher education, thus falling into line with what Lison et Paquelin (in press) call the professionalisation of the new job of teacher-researcher. It would also be interesting to set up a study in an epistemological and interactionist perspective (Morissette, Guignon, & Demazière, 2011), studying collaborative work in the digital age from the perspective of the interactions that link the students with one another or the teacher and the students and focusing on the significance that they put into their interactions.

Furthermore, it would be interesting to pursue research on the digital tools that foster the commitment of students in collaborative work. Several studies exist on digital tools in a pedagogical context, without necessarily shedding light on collaborative work at university, although this increasingly constitutes a training reality. The study of collective traces, as Bruillard (2008) defines them, accompanied by other methods of data collection like discussion groups and non-participative observation, could constitute avenues to explore in order to give rise to a model of collaborative work mobilising digital technology fostering lasting learning. The potential influence of data mining analytics on the students' learning processes and outcomes is an interesting research track (Addowah, Al-Samarraie, & Fausy, 2019), especially when it comes to students' commitment in collaborative learning.

CONCLUSION

In the academic world, as in the private sphere, the use of digital technology is omnipresent. Today, it is rare to find students who do not use their computers to write up their course notes or to hand in their work. It is rare to find teachers who do not use their computers for their research or their teaching. In addition, today, many courses are only offered remotely, whether this is for accredited training. However, ICT are not always easy to tame. Their use may remain basic, individualistic and not encourage collaborative work. Indeed, digital technology alone does not alter collaboration. The fact of having the opportunity is not enough. If it is not considered to be relevant, the miracle will not happen.

Collaborative work brings two or more learners together in a context of mutual commitment in order to aim for a common objective and implies three types of action, i.e. communicating, coordinating and producing. Digital technology finds its place in each of these, given the great diversity of tools available. The synchronous and asynchronous modes that are possible with the ICT facilitate communication, if they are used in an appropriate and efficient way. The learners can use instant messaging, videoconferencing tools or discussion forums. Coordination and production can be facilitated using shared documents both in synchronous and in asynchronous mode. Indeed, the amalgamation of the two modes of communication supports a feeling of remote presence. It is then possible to put digital technology to good use, both for the teacher and for the students.

However, obstacles arise in the path of the harmony that collaborative and digital work can offer. Some of the obstacles are the welfare at work, ethical issues and generation management. First, the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

philosophy behind collaborative work must be understood and respected. One must avoid "spying on" learners to validate their commitment or their involvement. It is important to aim for joint production including equitable responsibilities, explicit values, a shared vision of the common production, as well as a defined strategy. Of course, the use of ICT goes hand in hand with adequate technological skills, but this is most likely to be the simplest part. Learning to use a tool, from a technical point of view, is not particularly complicated. Using it in such a way as to promote in-depth and lasting learning is another thing. And when collaboration is added to this question, one sometimes has the impression of having opened Pandora's box.

To end this chapter, we would like to return to the question in the title: Digital and collaborative work is it a winning couple? It seems to us that digital technology, by means of its flexibility in time and space, can form a winning couple with collaborative work. However, this successful marriage is based on the ability of the actors (teacher and students) to take advantage of it within the contexts in which they work. In other words, it can change from a winning couple to ill-fated lovers if the appropriate conditions are not present in the environment. Our experience leads us to believe that digital without pedagogy is rarely a source of success. In these cases, teachers underuse the tools at their disposal. This therefore becomes a responsibility of all the stakeholders in higher education, teachers, students and institutions. It is indeed a mutual commitment!

ACKNOWLEDGMENT

This research received no specific grant from any funding agency in the public, commercial, or not-for-profit sectors.

KEY TERMS AND DEFINITIONS

Asynchronous: Communication not simultaneous but at the same place or with the same tools.

Authentic Learning Situations: Complex and significant situations presented as a context that is conducive to learning.

Collaboration: A form of work where students work together to achieve common objectives while valuing individual contribution in a spirit of shared responsibility.

Collaborative Work: Horizontal organization of tasks involving a mutual commitment and a division of responsibilities distributed evenly among team members in a coordinated effort.

Co-Modal: Training system where both face-to-face and distance learning modes coexist simultaneously.

Cooperation: Form of work where students work together to achieve common goals.

Distance Learning: Form of education using technologies and instructional systems design to students and/or teachers who are not physically "on site".

ICT: Information and communication technology.

Pedagodigital: Use of digital technology in a pedagogical context.

Social Constructivism: Learning through social interactions between learners intended by a modification of a previous learning or reorganizing a basic structure.

Synchronous: Instant communication mode allowing learners to communicate at the same time.

Chapter 54
Theorizing Virtuality in Enterprise Social Systems

James J. Lee
Seattle University, USA

Jessica L. Imanaka
Seattle University, USA

ABSTRACT

This chapter has built on research on today's modern organizations to lay the foundations for a comprehensive and systematic theorization of enterprise social systems. Theorizing virtuality marks a fundamental transformation in space-time parameters in communications. This is especially so in the context of rapid current advancements in IT such as cloud computing, as well as numerous other technological fronts. Current IT trends show that increased spatio-temporal plasticity heightens the effectiveness and the efficiency of modern enterprise social systems. In particular, subject-oriented asynchronous communications experience greater inferred plasticity and event-oriented synchronous communications experience greater referred plasticity. Finally, enterprise social systems vary in their degree of virtuality based on the perspective of the relevant stakeholder group considered.

INTRODUCTION

Due to fast evolving information techonologies (IT), organizations are always faced with a rapid chaning environment that requires flexible and dynamic responses to frequently changing business needs. Many organizations have responded by adopting decentralized, team-based, and distributed structures thanks to the communications through IT today. Advances in communication technologies have enabled organizations to acquire and retain such distributed structures by supporting coordination among people working from different locations (Ahuja, Carley 1998). Yet, IT implementations in cloud computing platform provide another dimension in enterprise social systems.

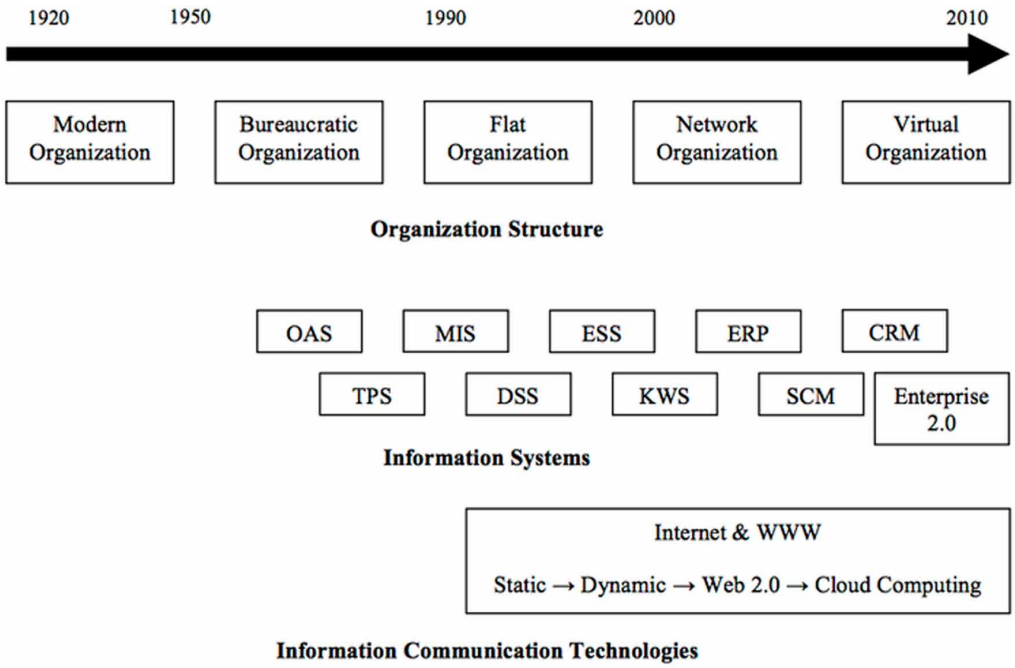
Since the early 2000, Web 2.0 has emphasized relationships using the Web technologies. With this social restructuration, companies are reaping the benefits of Web 2.0 as Enterprise 2.0 (McAfee, 2006). Enterprise social systems will use the communication benefits from Web 2.0 by emphasizing relationship management in the Enterprise's internal social networking. As Web 2.0 and Enterprise 2.0 in this context are now absorbed by the advancement of cloud computing (Wided Guedria, 2014), it is imperative to investigate what drives this virtualized environment in the form of cloud computing platform.

Ontologically, Cloud Computing has been empowered by the advancements in networking, providing three service models; Software as a Service (SaaS), Platform as a service (PaaS), and Infrastructure as a Service (IaaS). With the implementations in organizations' IT, cloud computing can builds an "emptying of organization" by separating the content and process of organizations. Cloud Computing today has many predecessors. Heavy use of relational database management systems made Business Process Reengineering (BPR) practically possible in the early 1990s, indicating the separation of data from its organizational practice. In the late 1990s, use of many process integration tools, such as ERP and EAI, achieved the separation of process from business organizations. A major concern is how to manage human agents. The Internet creates e-business markets as well as the e-management of organizational resources remotely, emphasizing relationship management.



Back in the 1990's companies like SAP AG, Oracle, Baan, PeopleSoft and J. D. Edwards created multi-billion dollar businesses with ERP technology that automated and connected what had once been disparate parts of corporations – human resources, manufacturing processes, inventory supply and financial planning. These companies rode the wave of the corporate BPR (business process re-engineering) trend that gained steam in the middle of the decade. Along the way, the ERP industry began to be saturated and experience its growth struggle due to its focus on internalization. The main reasons for this were the Internet revolution and the surprising speed with which e-business began to change the way business was done, i.e., externalization of enterprise. Almost immediately, businesses had started to become Web centric. In the 90's ERP was too inward looking and not global centric (internalization of enterprise integration). However, this does not mean that the internal efficiencies that can be achieved by ERP systems are no longer crucial. Many practitioners claimed that a well-implemented ERP system is more critical today than it has ever been because it provides a solid start to an externalization of enterprise.

Enterprise integration has been a great focus in the 1990s with its internalization slogan. With the big boom of e-business, companies now have moved their directions to the Internet, thus focusing on externalization. E-business revolutionized the market both in customers and business partners. Naturally, it leads business organizations to a global focus and to manage their own resources, creating the concept of Enterprise Social Systems.

Figure 1 summarizes the history of organization structure with the development of information systems (IS) and information communication technologies (ICT). It is obvious that advanced information technologies these days drive the structure of organizations. Modern organization structure formed in the 1920s with the demolition of feudalism. Along with systematic management from the military, the bureaucratic organization structure dominated through the middle of the 1900s. With help from IS, business process reengineering was adopted, which revolutionized the traditional business concept, introducing flat organizations. With ICT and a global network (internet), almost every part of an organization is interconnected, regardless of its location and time, transforming into network organizations, and now Enterprise Social Systems these days. A major difference between network organizations and Enterprise Social Systems is the use of information technologies in terms of relationships among resources. Enterprise Social Systems, interestingly, create unique images of business, freeing limitations

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Chronicle of IS Organizations

on human activities, but maintaining the same or higher levels of relationship management. As Figure 1 shows, collaborative systems and current web technologies are the main justifications for Enterprise Social Systems today.

Managing Virtuality

A few decades ago, the concept of a virtual organization captivated the attention of researchers. Many companies hadn't realized the importance, processes or functionality of virtuality, and subsequently went bankrupt - .com bubble, Borders, etc. Today, as multifarious aspects of virtuality have come to prevail in many dimensions of social life, some of the buzz around virtual organizations has faded. Yet, this widespread acceptance of virtuality is precisely a reason to deepen studies of the phenomena that characterize it. More businesses than ever before have come to rely upon virtual communications, from email to teleconferencing to social media, so much so that the virtuality of organizations is taken for granted. Indeed, pioneers like Amazon.com have expanded virtuality into marketspace, expanding even further the scope of virtual processes in business and markets. Most of functionalities in organizations now are virtual. Yet, the meaning and parameters of the concept of virtuality remain insufficiently understood.

This research extends the theoretical scope of virtuality in organization studies (Schultze and Orlikowski, 2001) to Enterprise Social Systems, by analyzing the experience of individuals with collective memberships in virtual space. Because Enterprise Social Systems inherit the attributes of virtual space, they do not have the same physical properties as an organization tied exclusively to material reality. For this reason, metaphors of consciousness are more useful in understanding Enterprise Social Systems than metaphors of physicality. A key contrast between a virtual and a traditional organization lies in

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the degree to which the former depends on mental construction whereas the latter depends on physical construction. The analysis of virtual organizations in this study applies to Enterprise Social Systems, although Enterprise Social Systems broaden the meaning of virtuality further than previous analyses of virtual organizations.

The main goal of Enterprise Social Systems remains the same as in a traditional organization, which is to serve the interests of its members. As a major component of any organization, human members historically have contributed the majority of the roles to prolong an organization (without the need for a virtual environment). However, the roles of members have now evolved as organizational practices come to depend upon advanced information technologies (IT) and forms of managed virtually, such as information systems (IS), information and communication technologies (ICT), networking, cloud computing, etc. (Lee, 2011). This phenomenon frees the traditional roles of members and the scope of actions they can perform. Along with this freedom, modern organizations now require knowledge workers who have the capabilities to utilize these new technologies responsibly. Ultimately, the rise of Enterprise Social Systems issue in new meanings in virtuality among their human members.

The prevalence of the trend toward virtuality in organizations can be most simply noted in the rise of 'Cloud Computing', a phenomenon lauded by the field of IT. Because of the separation of organizational processes from their previous physical bindings (such as office work practices in traditional organizational settings) and the advancement of IT (such as business processes in IS via networks), accessing and manipulating organizational activities can be achieved purely virtually. Indeed, virtualization is now happening all around us today. The term 'Cloud Computing' may be a buzz word for many academics, but it is not frequently known by the average person who makes use of it on a daily basis. The typical knowledge worker in a modern organization enjoys the world of cloud computing (Venters and Shitley, 2012) every day in the most basic business processes, such as free web mail services (Google email, Yahoo email, etc.). The trend toward 'Cloud Computing' turns a web browser into a new form of computing platform. The traditional meaning of a platform in computing implies operating system software such as Microsoft Windows or Mac OS. Now, most companies' websites run as web applications on web browsers (such as Firefox, Safari, Chrome, or Internet Explorer). Because we have achieved a technological state where any information system can be viewed as an interface on a website, web browsers play a key role in communications today and have become a new platform for the future of computing.

One of the values of cloud computing for organizations is the possibility of real-time communications between members and extended access to the organization's information systems. Members now have perpetual access as long as they possess computers with web browsers and an Internet connection. Cloud computing makes organizational management more cost effective. In addition to this efficiency implication and its financial ramifications, this trend toward virtuality impacts the experience of an organization's human members. As Enterprise Social Systems can be established in the clouds (via networks), the roles and work practices of their members have transformed. One of the most significant indications of this transformation can be identified in the nature of the dynamic, spatial, and temporal characteristics of a virtual organization. It is not just efficiency, but the mobility of work practices that has changed as workers can work with each other from different locations at the same time (synchronous collaboration) and at different times of the day (asynchronous collaboration). The spatio-temporal shift in human relations brought on by the liberation of the organization from traditional physical boundaries and extension into virtual reality is highly dynamic and continually evolving (Breu and Hemingway, 2004). Along with the evolved role of the knowledge worker due to the separation of practice from physical locations to virtual organizations (Giddens, 1990), human members can manage multiple memberships

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

effectively in the virtual organization settings. Without the limitations of face to face interaction between people in physical reality, workers can more easily control and manipulate the kinds of information they share about themselves and craft or even fabricate appearances online. Facebook and other forms of social media are notorious for the presentation of online persona that alter, amplify, and at times distort the identity of the person as they appear in physical reality (Venkataraman and Das, 2013). With an extension of spatio-temporal parameters, workers are freer to assume and manage diverse roles with different people and groups both within and outside of their organizations. In other words, a person can have virtual multiplicity of human identities and effectively manage multiple memberships in multiple groups, organizations, communities, and societies.

In the realm of business, we have experienced many of the 20th century's great discoveries through Google search engines and online stores like Amazon.com and eBay. These companies are almost pure e-businesses due to the introduction of the Internet, especially World Wide Web technology. Amazon.com started as a small e-store but the trend it helped spur became the *de facto* evolved form of business models in coming years of Internet technology. A major impetus for this research arises from this root planted and cultivated by Amazon.com. Regarding electronic communications as evolved business models enables us to envision the foundations of virtuality in human thinking and conceptualization. There has been extensive research in virtuality and virtual organizations (Maznevski, M. L. and Chudoba, K. M. (2000), Knights, D., Noble, F., Vurdubakis, T., and Willmott, H. (2001), Schultze, U., & Orlikowski, W. (2001), Orlikowski, W. and Yates, J. (2002), Verona, G., Prandelli, E., and Sawhney, M. (2006), McAfee, A. P. (2006), Linstead, S. and Thanem, T. (2007), Miller, R. (2007), Kolb, D. (2008), Lyytinen, & K., Newman, M. (2008), Wilson, J., O'Leary, M., Metiu, A., and Jett, Q. (2008), Overby, E. (2008), Kouyoumjian, V. (2010), Armbrust, M., *et. al.* (2010), Bailey, D., Leonardi, P., and Barley, S. (2012), Wilson, J., Crisp, C.B., and Mortensen, M. (2013), Child, J., Ihrig, M., and Merali, Y. (2014), Kamoche, K., Kannan, S., and Qixun Siebers, L. (2014). However, none of these studies has theorized these e-business models in terms of an encompassing conceptual framework, as we do in this paper with a theory of virtuality in organizations.

The purpose of this paper is to lay the foundations for a comprehensive and systematic theorization of Enterprise Social Systems by focusing on how virtuality figures in e-business companies. We explain the methodology generating this study, provide an overview of the virtuality phenomenon, detail communications evolutions in space and time, develop a new apply virtuality characteristics to Enterprise Social Systems, build a rubric for Enterprise Social System considering how virtuality is experienced across multiple stakeholder groups, discuss implications of this study, and conclude with recommendations for future directions in research and practice.

Methodology: Grounded Theory

Schultze and Orlikowski (2001) proposed the metaphors of virtuality with the stance of interpretive study. The study showed the insights of metaphors and identified how we treat virtuality. We adopted the approach of the above work and extended it with grounded theory methodology that would allow us to derive a generic set of metaphors that could explain the essence of the virtual organization.

There are six steps to analyze metaphors in their study based on Beer's method (Beer, 1984). Beer's scientific modeling (Beer 1984, Tsoukas 1991) explains the transformation of concepts when researchers conduct and build theories. Since this procedure discusses the role of metaphors, it is important to map Beer's method with the main strategy of this study, grounded theory (Glaser and Strauss, 1967). Grounded

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Methodological overview

Step	Beer's Method (1984)	Schultz and Orlikowski (2001) Activities	Grounded Theory
1	Insight	Find metaphoric content in the articles. Identify all of the metaphoric expressions contained in the articles, whether they appeared to be directly relevant to a virtual organization or not.	Data Collection
2		Each instance of a metaphoric expression was captured in a list together with the page number on which the trope was located, terms of source domain used for metaphorical expressions, and a short comment explaining the meaning or significance that the researcher had attributed to it at the time of reading.	Open Coding
3	Perception	From multiple analyses, eliminate from initial lists those metaphoric expressions that are unrelated to virtual organizations and refine the terms of metaphorical expressions.	Open Coding
4	Analogy	Review the terms of metaphorical expressions and create categories to put similar attributes together. Focus attention on the strategy in the texts – where authors contrast the "real" organization with the "virtual" one in order to construct a definition of virtual organizations.	Open Coding
5	Homomorphism	Analyze categories from the previous stage and discover the connections between each category using Meaning of Metaphors, Entailment, Affordance, and Challenge.	Axial Coding
6	Isomorphism	Establish a set of defining metaphors, using the concepts of Opposition, Meaning of Metaphors, Source, Entailment, Affordance, and Challenge.	Selective Coding

theory constitutes a series of theory building processes (Charmaz, 2000). Since both methods start from insights and end at scientific theory (grounded theory) and model (Beer's method), it is important to identify the gaps between the corresponding steps in each methodology due to different directions in their logics, induction vs. deduction. These gaps were further analyzed and used in metaphorical analysis as shown as 'Activities' in Table 1.

We also adopted the now of the data collection of Grounded Theory, *theoretical sampling* (Glaser, 1978; Glaser and Strauss, 1967). Authors decide which data will be analyzed and where they find interesting phenomenon. After initial data are collected, analyzing data is followed with iterative process of what additional data directed to be collected. The main focus is to collect selective data that are important for conducting research. In this way, researchers can enhance understanding and build theories. A data collection stage will be ended when researchers reach the point where no more new data is needed – theoretical saturation (Glaser, 1978).

By following the steps 1 – 3, we initially generated 555 terms from 59 articles in IS journals, spanning from the mid-1990s to mid-2000s. After a reevaluation of all the terms, we eliminated irrelevant terms. Final categorization resulted in 16 metaphors. Based on the above 16 metaphors derived from the aforementioned literature, seven groups emerged shown in the next section.

DATA DISCUSSION: VIRTUALITY PHENOMENON

IT- Information Technology is a crucial component of contemporary virtuality. Without advances in technology, many of the realities of today's virtual companies would be merely science fiction. These components include the Internet, LAN and WAN networks for business, email, online chat/bulletin

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

boards, video conferencing, instant messaging, etc. The rapid innovations with handheld devices such as smartphones, tablets, ultra-light laptops, and now Google glass and commercial drones cannot be underestimated for an understanding of contemporary virtuality. With advanced IT, we have access to a tremendous amount of information at the right time and the right place. Information systems we built on the basis of today's IT have become the backbone of our communications and activities. For example, information systems backed by cloud computing (IT) can virtualize an e-commerce site such as Amazon.com. By building such an information system, humans are experiencing the fastest progress in history by adding a most efficient and effective communication scheme (both manual and automatic) on top of the fastest and most accurate processing power (computer H/W and S/W). Contemporary virtuality may be characterized by the following seven features.

1. **Independence:** These technologies allow smaller workgroups as part of a larger company to operate independently of each other, across a room or the globe. This independence creates new forms of collaborative endeavor. The technologies also permit greater independence and convergence of interests for consumers, social and political groups.
2. **Flexibility:** Flexibility constitutes an essential characteristic of virtuality. Virtual organizations are, by their nature, flexible. Traditional organizational structures are rooted in the physical world and rely on structures, unalterable networks and specific locations to function properly. Consequently, when it becomes necessary to introduce change into a specific organization, a barrier is reached where further alteration requires costly, physical modifications. A virtual organization remains unhindered by these problems. These structures are designed so that they can operate regardless of time or place, independent of existing physical realities.
3. **Permeability:** Virtual worlds are defined by vague/fluid/permeable boundaries. As a continuation of flexibility, the virtual organization is characterized by vague boundaries as to the extent of its use and purpose. Since small tweaks can easily and largely affect the overall organization, it is quite possible to extend the boundaries of an organization so that they encompass new purposes, people or controls.
4. **Geographic Dispersion:** Geographical dispersion of individual workers/consumers/players/members characterizes virtual activities. The combination of a virtual organization with IT allows groups of employees to make progress on one project while working in tandem with another group in a distant physical location. The same geographic dispersion pertains to online stores, social events, and political action. Because information can be shared and meetings can be held with the use of high-speed networks and computers, tasks can be carried out in the location that is most appropriate and germane to that function. Hence, the geographic place where work occurs may change depending on the requirements of the job. Geographic dispersion is hence accompanied by malleability of geographic activity.
5. **Location Freedom:** Along with geographic dispersion, virtuality also enables us to overcome other spatial barriers. Since two members can theoretically connect to a virtual organization from any location around the globe (via network connections, the Internet or a private intranet), work can continue or be observed without regard to that location. If a business trip is necessary to meet with a supplier or provider, a virtual organization may establish virtual private networking (VPN) for its users so that they can log-on to the company's intranet as if they are work inside of company by checking emails, chatting with other members on the progress of the meetings and uploading work that has been completed in their absence.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

6. **Temporary Interactions:** Virtuality also engenders more temporary interactions. Virtual organizations are often formed to fill temporary needs, only extending to the end of the specific project that is charged to them. In a manufacturing project, a virtual organization may be formed between the engineers who design the project, suppliers who provide the raw materials and the factory that processes those into finished goods. At the end of that particular project, those alliances are dissolved, as they are no longer necessary to benefit the three independent groups. We see similar effects with consumers, social and political action groups.
7. **Time Freedom:** Just as virtuality enables us to overcome spatial barriers, so does it also enable us to overcome temporal barriers. Much like the limited barrier presented from spatial location, work in a virtual organization can theoretically take place twenty-four hours a day, regardless of time zone changes across the world. Members can constantly update their work at any time of day or night and have that information be instantly visible to a member who may be twelve hours apart.

In sum, independence, flexibility, permeability, geographic dispersion, temporary interactions, and the overcoming of spatial/temporal barriers (location and time freedom) make for greater plasticity in virtual domains. In what follows we engage in further concept clarification and build new rubrics for theorizing virtuality and Enterprise Social Systems.

FINDINGS: COMMUNICATION EVOLUTION IN SPACE AND TIME

Table 2 summarizes the characteristics of reality and virtuality. We differentiate the *place embedded reality* we use regularly and the *space embedded virtuality* from which we increasingly benefit.

Table 2. Place Embedded Reality vs. Space Embedded Virtuality

Reality	Virtuality
Body	Mind
Physical	Mental
Bounded	Permeable / Fluid
Rigid	Flexible
Fixed / Solid	Malleable / Plastic
Singular	Multiple

The benefits of the Internet revolution include the convergence of data and devices. This means we can use any device or media, and still communicate effectively. With today's networking, there are two important categories in computer-mediated communication modes: asynchronous and synchronous.

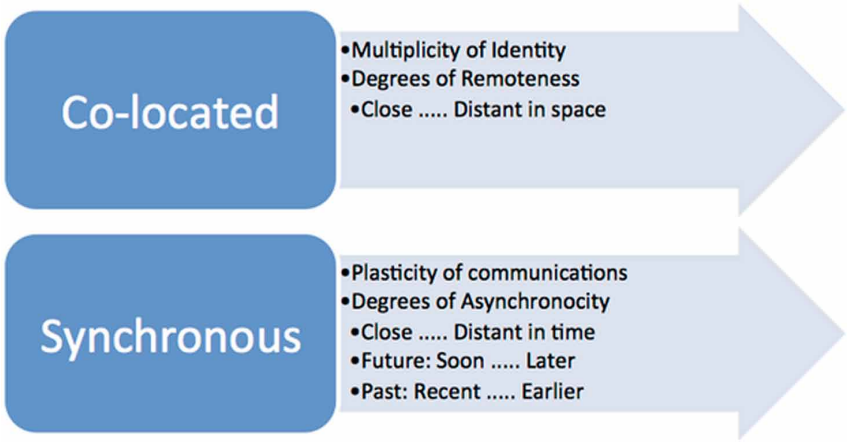
Asynchronous communications allow for *greater plasticity in time*. Asynchronous communications tend to be topic, material, or *subject oriented* and apply to interactions at different times between parties that may be at the same or distant places. It has been represented by the use of email, but with the revolution of the Internet and web technologies we now communicate not only through email, but through online postings, online shopping, online discussions, and even blogging, etc. These Internet communications

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

contrast greatly with letters, "snail mail", and the postal service in that there was a longer time delay for asynchronous communications in pre-computer eras. With networking today, asynchronous communications' travel time reaches virtually **zero** seconds. The major issue now involves the management of communications. For example, even in the same place of work, people do not have to respond right away to email they receive. They can wait for a time when it is more convenient to respond. Business communications across time zones have also become more convenient. All these changes in asynchronous communications reveal that time provides less of a restraint on connectivity. Time lags have grown shorter and people enjoy much more freedom in how to use time between correspondences. These effects lead to a perception of greater plasticity in time.

Perpendicularly, synchronous communications allow for *greater plasticity in space*. Synchronous communications have to be *event oriented* and apply to interactions that occur at the same time. Skype, teleconference, and the telephone are examples of this type of communication in different places. People across the globe can now enjoy near instantaneous communications, which is unprecedented in world history and another example of zero travel time. Contrast our present business practices to a time when merchants traveled for months or years at sea with often but a guess about what would be needed by the consumers of the goods to be acquired.

Greater plasticity in time and space has significant impacts on organizational performance in both efficiency and effectiveness. It is important to address that time and space are not two independent variables. Instead, time and space are woven together to create synergy effects. Efficiency is increased by sharing resources and core competences. The flexible and communicative nature of a virtual organization facilitates the sharing of resources amongst independent groups that are part of the same organizational structure. Each unit is expected to assist others by making their most important facilities and information easily available to others who may benefit from their use. The various technological components installed in the organization make this possible with ease.



One way that effectiveness is increased by virtuality is through the ease of switching. The switching principle offers a fundamental advantage that a virtual organization has over a traditional one. Because the links between organizational functions are largely electronic and non-physical, it is easy to replace a weak component with a stronger one. Where this activity could be considerably expensive if the item in question was a physical supply chain, it may only be a change of suppliers for the virtual organization and can be made with a phone call and database edit, as opposed to a building project.

In sum, asynchronous communications provide greater plasticity in time in that they engender a perceived minimization in spatial parameters, so that people far away are much more accessible in the subject they work on, as synchronous communications have similar effects in terms of space. Virtual time speeds up processes and enables better management of communications, making work and activities more efficient. Virtual space ends up feeling closer than real space, making ones job more productive, *effective*. This plasticity leads to greater efficiencies and effectiveness.

To be sure, the development of mobile devices like the iPhone, Blackberry, and Android, tablets, along with the good "old-fashioned" computer provides platforms for myriad forms of synchronous and asynchronous communications, labeled as social computers (Wareham, Busquets, and Austin, 2009). Social media like Facebook also blur the lines between synchronous and asynchronous as posting, chats, and messages can occur simultaneously, and with variable differences in time. While social media is mostly communication oriented, the above devices provide other forms of virtual interface with the environment, such as through mapping and search tools that help the user identify their directionality in space and plan trips with greater immediacy. In a sense, the ease of photo and video-documentation also

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Place and Time Dimensions (co-located and synchronous)

provides an intriguing upgrade in the virtual relationship to one's surroundings. These media promote virtual connectivity with the environment that parallel the virtual communications discussed above. This is another indication of "communications convergence".

Together, the shifts in asynchronous and synchronous communications that constitute the virtual world mark a fundamental transformation in space-time parameters. Greater space plasticity reduces the time needed to accomplish tasks with both reference (co-located) and inference (remote) modes of communications. For example, if someone works two jobs virtually, they save time in not having to commute or physically move their body around to interact with people. Yet, time restraints do not entirely disappear. People are still tethered to physical bodies that must make the communications, i.e., type the inputs. In addition, there is only so much work and activity someone can do in a single day. Finally, pure virtual communications remain undesirable to many people. Even given these restraints, there is a net shift in the perception that distance across space is shrinking, which results in a reduction in the time needed to accomplish tasks (zero travel time, efficiency).

Virtual Organization Characteristics in Enterprise Social Systems

From an organizational perspective, we are now coming to see that there is a spectrum of possibilities between the two polar opposites of a virtual organization and a real organization. On one extreme you might have a location-less organization managed entirely through networks and online communication. On the other extreme, you might have an organization strictly defined by its physical premises. Yet, even structuration theory suggests that there is really no such thing as a purely non-virtual organization. Likewise, there may be no such thing as a completely virtual organization. It is interesting to note that previously the concept of a virtual organization was a hot topic. Now virtuality is so prevalent in organizations that the term has become defunct as nearly all organizations have virtual dimensions. The views on virtuality we have delineated and developed serve to problematize the meaning of virtuality and its use in modeling organizations.

From an employee perspective, a virtual organization often implied a great degree of freedom in where and how to work. They enjoy the benefits of a Virtual office, remote work, meaning they can work

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

from home, other locations, or on their own schedules. Therefore, it is clear that the difference between a virtual organization and structuration is where we work. In human history, many people worked at work sites, such as farmers' work in farms or fields. As we invented 'money' for exchange, trade, and commerce, people can manage better business, contracts, or relationships. These supporting activities (value chain, Michael Porter, 1998) can be analyzed for better competition. And this phenomenon is mainly classified as office work. This systemized concept of business with the introduction of military strategy philosophy has formulated modern business organizations as offices in buildings, and a physical organization. With advanced computing and networking, people can work from anywhere, like virtual offices, virtual teams, and now even Enterprise Social Systems. Obviously, the work site determines if your job is more physical or virtual. In addition, employees experience the possibilities of multiplicity in human identity, with the benefits of expanded choices and multiple memberships.

Below we articulate a set of characteristics of Enterprise Social Systems that derive from virtual organizations..

- **Boundary Crossing:** An Enterprise Social System transgresses different boundaries, both physical and virtual. Traditional corporations can be constrained by the traditional boundaries of countries and continents, while a virtual one can move beyond those. In addition, there are certain virtual boundaries that are crossed with computer networks and telecommunications.
- **Network of Independent Organizations:** Many Enterprise Social Systems are comprised of independent companies who ally themselves under one central name in order to provide a comprehensive schedule of services in points across the globe. Therefore, many Enterprise Social Systems, while appearing to be one large corporation, are really many single entities that derive part (or all) of their business from this alliance with a larger entity.
- **Reconfigurable Structures:** The transience of an Enterprise Social System allows for components to be regularly switched in and out of use, altering the overall structure of the organization. Because this can be done with relatively little impact, the frequency with which components are switched is high and allows each organization to quickly adapt itself to a changing environment.
- **Modularized:** Since the components and functions of an Enterprise Social System can be changed with such ease, Enterprise Social Systems are categorized by a high level of modularity. Frequent changes are easily implemented and commonplace among Enterprise Social Systems.
- **Separability:** While each member of an Enterprise Social System is indeed linked to a much larger corporate structure that oversees them all, they each remain a separate and often self-sustaining entity. They rely very little on outside help from the larger organization and work independently of the majority of other members.
- **Division of Labor:** Each member of the Enterprise Social System exists to fulfill a specific need of the larger organization. Since assignments are divided up specifically, there is little overlap in job function.
- **Explicit Goals:** Similar to meta-management, each member of the organization is charged with an explicit task to complete as it relates to the overall function of the organization. Often times, after this single goal is completed, the link between the organization and the entity is dissolved until a further need for it is realized. At that point, the link is re-established.
- **Complementary Core Competencies/the Pooling of Resources:** The ease with which two members of an Enterprise Social System can communicate allows them to pool their resources, even

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

with members not directly involved in a specific project. Separate entities can quickly be called upon to provide secondary service or consult on a project via virtual channels.

- **Sharing of Knowledge:** Members of an Enterprise Social System collaborate to share their knowledge gained from individual activities performed. Since collaboration is facilitated through the communications channels that are afforded through virtuality, it is common to find "knowledge bases" or other database systems that contain information and documents pertaining to past experience.
- **Geographical Dispersion:** The nature of an Enterprise Social System lends itself to being spread across the globe; this is its primary reason for functioning. Enterprise Social Systems allow for members to be located at a distance apart.
- **Changing Participants:** Members of an Enterprise Social System, no matter their level of commitment, can be easily switched with new or other existing members if the project lends itself to that change. Since temporary alliances can be formed merely through the addition of a network node or the reconfiguration of an external network, a project participant can be added as changing conditions necessitate.
- **Electronic Communication:** A vital concept to the Enterprise Social System is the ability to communicate through purely electronic means, eliminating the need for physical contact and allowing the geographical dispersion of organization members. Online collaboration via email, discussion boards, chat and other methods, as well as telephone and facsimile communications are primary contributors to the removal of time and space in this new organizational concept.

Table 3. Work Practices in Real and Enterprise Social Systems

Real Organization	Virtual Organization
Geographic concentration	Geographic dispersion Boundary crossing
Semi-permanent needs	Separable units Modularized Changing participants Reconfigurable structures
Less cross standards	Sharing of knowledge Electronic communication
Weak co-operability	Networked independence Pooling of resources
Ambiguous value proposition	Division of Labor Explicit goals

Stakeholder Virtuality in Enterprise Social Systems

A virtual organization is regarded as virtual on the basis of stakeholder perspective. Enterprise Social Systems have extended beyond employees to consumers, and arguably to all other stakeholders. The table below articulates this broader view of a virtual organization, by showing how its meaning and techniques change depending on which stakeholders assume the virtual role. Examples are given for each category. Of course, it is possible for an organization to be virtual across multiple stakeholder dimensions. In that

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 4. Types of Enterprise Social Systems

Stakeholders	Meaning	Techniques	Examples
Traditional Stakeholders			
Employees	Remote Work	Meta-managed	Expedia
Shareholders	Absentee Ownership	E-trading	All publicly traded co.
Managers	Remote Management	Meta-management	
Customers	Internet Retailing	Online shopping	Amazon, E-bay
Suppliers	Remote businesses	Remote transactions	All global supply chains
Community	Remote Users of Products / Services	Social media	FB, Linked-in, Skype, Ventrilio
Expanded Stakeholders			
Government	Absentee voting; Great distance between politicians and constituencies Security State; Intelligence community	Electronic polling; E-communications, sometimes media mediated Surveillance	Amazon.com-CIA
Competitors	Internet rivalry	e-espionage; social media and advertising wars on internet	Amazon: Book Publishers, Grocery Stores, Netflix, Apple itunes
Industry	Remote membership	E-conferences	IT, retail,
Society	Remote relationships	Media-mediated	Seattle-Bellevue, Silicon Valley
Technological Environment Natural Environment – Places constraints on all of The above.	Global scope; cross-sector partnerships (especially Academia)	Moore's Law impacts all of the above	Google Glass, commercial drones

case, the meaning and techniques may be more than mere aggregations of each category, as the virtualization of multiple groups creates manifold virtual relationships between them (Riemer and Klein, 2008).

IMPLICATIONS

Virtuality carries social idenities, imposing the social, ethical, and political dimensions of organizational life. Ultimately, it is human beings who constitute and are constituted by these structures. Furthermore the cloud computing platform today forms virtuality in these structures and as such experience benefits and harms. Further research should assess the value-laden import for human players in virtual spaces. Below we identify implications to be considered for such future work.

- **Customer Based/Customized Products:** An Enterprise Social System provides the unique opportunity to provide their customers with highly specialized products as per their specific needs. This can be accomplished through outsourcing work to a separate organization or through the use of a virtually connected inter-organizational node located closer to the customer. Either way, it

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

becomes simple to add a function based on the customer's request and seamlessly integrate that function into the existing framework.

- **Participant Equality:** Since the ideal and practically achievable situation in an Enterprise Social System is that all members have equal access to the overall network, it is assumed that each member is able to and will participate equally to the work in progress. Each individual facet of an Enterprise Social System is expected to contribute an equal amount of work towards a given goal, if appropriate. While the equality may not be measured best in quantity, it can be restated as effort and the successful completion of all tasks assigned to it, be they large or small. Since every task is considered to be essential as a part of the project, the equality comes in the addition of that piece to a larger puzzle.
- **Open Communication:** The foundation of an Enterprise Social System is its communications components that exist in the absence of face-to-face exchanges. An Enterprise Social System can only survive if its members communicate freely through the provided channels between them, be they based on the Internet or more traditional telephone technologies. The organization cannot continue to function unless it is aware of what all its members are currently completing and often times, when communication is more closed, work that is being completed in tandem by more than one member can be hindered or brought to a halt.
- **Semi-Stable Relations:** While a stable relationship between entities can be expected during the course of normal progress on a project, the relationship between them becomes less stable once that work is completed. With no reason to remain aligned virtually, the relationship is expected to dissolve and, obviously, become less stable.
- **Trust:** The lack of physical interaction places a higher regard to the trust that exists between each entity involved in the organization. Since fewer "checks and balances" can be placed on appropriate departments, management and other entities trust that they will complete the appropriate work on time or be straightforward about delays or problems. If two entities working on a project together separated by thousands of miles are unwilling to trust each other, the work slows and suffers to a critical point.
- **Functionally or Culturally Diverse:** The nature of global diversity and the ability to locate organizational functions across the globe creates a diverse environment for the entire organization. Since members are all in different locations and charged with different tasks, diversity exists that is only found in the very largest multi-national corporations.
- **Cohesion:** An extension of the independent network, this component represents the coming together of separate entities to form an organization on a large scale and to provide one service on a smaller one.
- **One Identity:** Though comprised of separate entities that may be in themselves independent corporations, an Enterprise Social System takes on a single identity. This identity if most often how the public refers to the company, unaware of the complexities that lie beyond.
- **Focus on the Individual:** Though not always accurate in every Enterprise Social System, members can operate completely independently of each other within the organization.
- **Laterally Connected:** This model of an Enterprise Social System involves a group of members working together to complete one project with each member contributing equally but not assigned to a specific duty.
- **Vertically Integrated:** While a group of members remain assigned to the same project, they do their work independently of each other yet the work is not performed simultaneously. Each mem-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ber has one task, which they complete before passing the sum of completed work to the member who is assigned to the next step.

- **Hierarchical Framework:** An Enterprise Social System that bases the completion of its work on vertically integrated members is said to have a hierarchical framework. The separation of members into a path puts them on different levels of the framework.
- **Collaborative Culture:** By their nature, Enterprise Social Systems foster camaraderie between members even in the absence of face-to-face communications. Since the built-in communications tools are so easy to access and use, relationships form between members who haven't even met. A corporate culture forms out of friendship that produces a highly collaborative nature unlike traditional organizations where such extensive communicating is not required.

CONCLUSION

This study has built on research on today's modern organizations with cloud computing platform to lay the foundations for a comprehensive and systematic theorization of Enterprise Social Systems. The trend toward virtuality marks a fundamental transformation in space-time parameters in communications. This is especially so in the context of rapid current advancements in IT from cloud computing service providers as they open their internal IT engines to business organizations as cloud computing service models (Boukhedouma et. al., 2017).

Current IT trends show that increased spatio-temporal plasticity heightens the effectiveness and the efficiency of predominantly Enterprise Social Systems in the cloud computing platform. In particular, subject oriented asynchronous communications experience *greater inferred plasticity* and event oriented synchronous communications experience *greater referred plasticity*.

Finally, Enterprise Social Systems vary in their degree of virtuality based on the perspective of the relevant stakeholder group considered. Future research should study these effects on the value-laden experience of human players in virtual space.

Chapter 55
Coworking Spaces and the Transcendence of Social Innovation Knowledge in the Smart Territory

ABSTRACT

Smart territories favor social entrepreneurship, which develops in a collaborative effort requiring networking and skilled facilitation. Coworking spaces (CWS) advance as mediating organizations that bring together entrepreneurial communities in smart territories. This chapter develops a practical framework for knowledge dissemination in CWS. It bases this framework on the analysis of three spatial characteristics that allow for the assessment of the knowledge transcendence originating in CWS, namely, physical, social, and informational spaces. To test this framework, the authors analyze the Roma-Norte corridor in Mexico City, whose results indicate the presence of two models: one constituted of private organizations that place collaboration as a secondary value, subject to their office rental services, and an umbrella model that clusters other social innovation facilitators that transcend their territorial strip. This latter meta-space model expresses positive effects in terms of knowledge spillover, suggesting the concentrated bottom-up construction process of a smart territory.

INTRODUCTION

Entrepreneurship has transformed the urban space, and this space has welcomed entrepreneurship as a cornerstone component of the not-long-accepted concept of smart territory (Parada, 2017), redefining the

scope of territorial governance to include entrepreneurial bottom-up applications in its most renowned challenges. In general, entrepreneurial ecosystems are part of the urban space, defining another intelligent element in the constitution of a functional smart territory.

In this respect, motivated social entrepreneurs make proposals intended to improve their territorial milieu, including typical post-modernist problems such as urban mobility, pollution, community building, and lack of public services, among others, gathering together in collaborative environments that aim to maximize knowledge spillover and experience transfer. These environments are usually known as coworking spaces (CWS), which have increased as a modern urban setting to develop social innovations; numerous urban concentrations worldwide have embraced this type of collaborative structure. However, how knowledge is disseminated in CWS and how it influences the social innovations that transcend is a work in progress (Crepeau, 2016; Prado, Pelegrini, & Chaves, 2017; Surman, 2013). Additionally, though recent academic research targets the phenomenon of entrepreneurial collaboration in CWS (Mitev, de Vaujany, Laniray, Bohas, & Fabbri, 2019) or aims to typify CWS in a given urban location (Fiorentino, 2019), most scholars have widely ignored the interplay that takes place between several CWS in the same territory. For instance, Capdevila (2015) presented a qualitative study on coworking spaces in Barcelona, which analyzes their intermediating functions among various social groups, but with no further investigation about the clusters' configuration.

In this chapter, we develop a practical framework for knowledge dissemination in the CWS that would help scholars and practitioners to visualize the role of these milieus in a smart territory. We base this framework on the analysis of three spatial characteristics that would allow for the assessment of the knowledge transcendence that originates in CWS. Additionally, we illustrate this framework applied to an ecosystem of self-proclaimed CWS to search for configurations that may or may not influence knowledge spillover, delineating an original approach to the subject matter. For this study, central Mexico City was chosen as a case study, specifically the Roma-Norte corridor. The selection of this land strip concerned evidence of the settlement of an important cluster of CWS (20). Results and policy suggestions are also provided.

BACKGROUND

Entrepreneurship and innovation are essentially dynamic spatial phenomena that change over time (Groys, 2005). The pursuit of profit or the realization of economic sustainability in a social venture can only take place in a specific location, whose characteristics are defined by a functional space comprising interactions, ideas, and social context (Giddens, 2011). Social innovation has to do with the advance of solutions that aim to remedy certain social needs (Saiz-Álvarez & Palma-Ruiz, 2019; Mulgan, 2006), and each territory expresses different social demands, involving the development of tailored social innovations (Bencardinoa & Greco, 2014).

François Perroux may have been the first scholar to relate Schumpeter's work on innovation with the spatial dimension (Rozga, 2007). From that moment, a variety of conceptual frameworks have been developed to explain territorial innovation, which became the dominant paradigm at certain periods: industrial district and growth pole in the late 60s; high technology areas, technology parks, innovation environments, informational cities, Technopolis (70s and 80s); industrial clusters, regional innovation systems, learning regions (90s); virtual communities, cities, and regions; smart communities, cities, and territories (from the beginning of the 21st century) (González & Rozga, 2005; Rozga, 2007). Though

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

clusters are typically defined as economic enclaves that are distinguished by their enterprise agglomeration (Capdevila, 2013), in the context of CWS, a cluster becomes a space of intermediation between different social groups (Capdevila, 2013b).

More recently, part of the scholarly literature about territorial development refers to "smart cities" and their capacity to become "sensitive cities," whose public policies associate economic competitiveness with social and environmental sustainability (Castelnovo, Misuraca, & Savoldelli, 2016). Other authors designate this type of city as "enabling spaces of entrepreneurship" (Richter, Kraus, & Syrjä, 2015), in that social innovation is empowered by the entrepreneurial ecosystem. In return, the practice of the social entrepreneur impacts the ecosystem, and eventually, the community. From this perspective, the smart city is a space that favors social entrepreneurship, building a new urban configuration that rationalizes innovation from citizen problems and needs (Castelnovo et al., 2016).

On the other hand, intra- and extraterritorial entrepreneurial activities and their corresponding spatial interrelations create an alternative territorial logic based on the clustering of its key participants (Harvey, 2001), leading to the development of a new structure composed of multiple small specializations: the mini-cluster, which reduces the cost of information search and transfer, facilitating entrepreneurial outcomes (Grabher, 1993). One of the fastest-growing mini-clusters in today's new smart space is coworking spaces (CWS). In general, social networking and collaboration, as well as aesthetic design, distinguish CWS from other office services (Waters-Lynch & Potts, 2017); that is, CWS are differentiated from other Small-office-Home-office (SoHo) concepts in that they are aimed at building a more flexible and interactive working community (Bouncken & Reuschl, 2016). Consequently, to facilitate social relations in a CWS, spatial imagination and usage are more important than planning (Assenza, 2015).

In general, the CWS offering involves both tangible and intangible assets, including services such as rental of infrastructure and access to a social cluster (Bouncken & Reuschl, 2016), which usually target the solo entrepreneur (Assenza, 2015), aimed at making this individual part of an effective collaborative environment. Typical CWS users include self-employed individuals, microenterprises, freelancers, entrepreneurs, or contractors, who participate in CWS to take advantage of its infrastructure, acquire knowledge, or seek recognition (Bouncken & Reuschl, 2016). These CWS value development processes that create conventions around how users seek to build capabilities and fulfill their entrepreneurial goals (Thompson, Purdy, & Ventresca, 2018), which can target both business and not-for-profit projects (Bouncken & Reuschl, 2016).

The origins of CWS go back to the year 2001 when like-minded people held informal meetings around specific productive activities, a model that evolved into a movement to encourage collaboration in shared facilities (Assenza, 2015). Since collaborative spaces become channels that facilitate the flow of unstructured information, they are a key element in understanding the innovation processes that occur in urban networks (Capdevila, 2013). Thus, collaboration is at the core of CWS, which unveils several spatial scenarios that represent laboratories for the exploration and exploitation of the entrepreneurial opportunity.

THE ROLE OF THE COWORKING SPACE IN THE SMART TERRITORY

CWS comprises a multipurpose spatial design that simplifies the complexity of entrepreneurial knowledge, absorbing and codifying useful expertise scattered around a collaborative environment (Eaton, 2015). In other words, CWS convert tacit knowledge value into explicit cognitive maps. CWS develop

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

as hinges of knowledge between citizens and their territorial structures of governance, considering that geographical proximity and the persistence of unsolved problems favor the creation of a sort of "noosphere" that strengthens social capital in the smart territory, confronting people's heuristics to the territory's institutional design (Giddens, 2011). In one regard, CWS provides a public good through a private service (Waters-Lynch & Potts, 2017) in that they develop a community (Bouncken & Reuschl, 2016) that builds together a culture of shared values (Bouncken, Aslam, & Reuschl, 2018).

These knowledge platforms help entrepreneurs to cultivate ideas and strategies to address social, environmental, cultural, and economic challenges in their territories (Surman, 2013). Based on the CWS-facilitated social capital, entrepreneurs are encouraged to initiate innovative proposals for their different localities, leveraging social innovation that builds on urban knowledge to create problem-solving capacity (Gandini, 2015). How this innovation capacity facilitated by CWS transcends in the form of effective social innovation knowledge is a question that requires further investigation. However, in spite of the fact that there have been around 7,800 CWS worldwide, according to 2015 estimates (Waters-Lynch & Potts, 2017), the study of CWS has been barely analyzed by academic scholars (Bouncken & Reuschl, 2016), and there is little empirical information on the operation of CWS (Assenza, 2015), rendering it difficult for researchers and practitioners to indicate whether the collaborative knowledge that originates in CWS leads to spillover effects for social innovation.

That is why CWS advance as promoters of social innovation, in that they emerge as mediators in the identification of and response to local problems, representing the platforms of social capital that are necessary for the intermingling of collective visions. Hence, from a social innovation approach, the role of CWS is to act as intermediary organizations that connect markets, communities, and governments (Avelino et al., 2019) in the smart territory. Thus, territorial development occurs through social innovation, which takes an approach that diverges from the traditional top-down regional development perspective, in that development or change originates in the social relations of an entrepreneurial community (MacCallum, 2009). As envisioned, the peer-to-peer proximity offered by CWS is expected to favor learning, teamwork, and collaboration, which would eventually lead to creative thinking and the realization of individual projects (Assenza, 2015; Bouncken & Reuschl, 2016), decreasing entrepreneurial uncertainty by sharing multiple knowledge (Waters-Lynch & Potts, 2017).

In this line of thought, it would be relevant to identify the enabling character of CWS as knowledge spillover generators, whose intermediating function (role) produces a public good that services individuals willing to discover novel solutions to territorial challenges. Identifying these enabling factors would permit better considerations in designing an effective CWS model.

Enablers of Knowledge Spillover in CWS

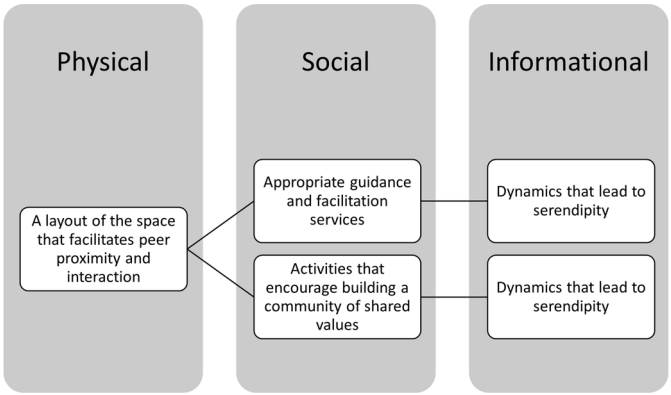
Taboada and García (2010) indicated that enterprises involve knowledge retention and knowledge spillover processes (called risks). The urban fringes of the city informally absorb the knowledge, previously retained by companies, which is disseminated and socialized in the figure of third places (connectors), such as clubs, bars, and coffee chains (Florida, 2002). According to Florida (2002), these places encourage the dispersion of knowledge, causing informal knowledge transfer, the socialization of images and symbols, and the use of physical and spatial objects that may lead to various patterns of action. The diffusion of knowledge will produce unexpected and peripheral cognitive organizations that would eventually facilitate information channels in the urban environment. To achieve the full transformation of collective knowledge into knowledge retained by organizations, it is necessary to count on another

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

connecting interface with the capacity to absorb scattered knowledge, formalize it and connect it with business players. This connecting interface is the coworking space.

Social interaction is the expected outcome of CWS, which ought to derive in learning and positive effects on innovation and new venture performance (Bouncken & Reuschl, 2016). However, users in CWS usually confront the challenge of identifying complementary knowledge to solve problems (Waters-Lynch & Potts, 2017), and they may require some level of guidance to profit effectively from this mutual interaction (Assenza, 2015). As seen before, this guidance is part of the CWS service portfolio, which facilitates trust creation and information exchange between participants as part of a social learning process leading to business matchmaking (Waters-Lynch & Potts, 2017).

Therefore, unpredictable encounters (serendipity) are a key component of the CWS dynamic (Waters-Lynch & Potts, 2017), and the value that users perceive in CWS would depend on the quality of these casual interactions or affordances that can be achieved as a result of being part of the CWS (Assenza, 2015). In this sense, the participants' behavior involves strong agency characteristics that may or may not contribute to the new networking environment, in that learning how to conduct effective networking requires a commitment to engage (Assenza, 2015). CWS can be ineffective when individuals end up in isolation as a result of their poor socialization skills (Bouncken et al., 2018). Additionally, some CWS participants may develop temporary links to peers, blocking any possibility of building a community of shared values (Bouncken & Reuschl, 2016).



To be relevant, CWS should pay attention to factors that empower or disempower individuals (Avelino et al., 2019). Depending on the user's personality, the layout of the space can encourage collaboration or discourage it (Assenza, 2015). It remains uncertain which configurations result in effective knowledge spillover that originates in collaboration. However, successful collaboration and knowledge spillover require useful casual interactions, which stem from like-minded peer proximity, either virtual or physical (Assenza, 2015). These social interactions are responsible for the creation of effective entrepreneurial ecosystems (Thompson et al., 2018), and consequently, smart territories.

To some, effective collaboration in CWS depends on social similarity among participants (Assenza, 2015), though other scholars expect CWS to create trust and collaboration among persons with diverse profiles (Bouncken & Reuschl, 2016). In any case, trust creation and the subsequent upsurge of collaborative ties take time (Bouncken & Reuschl, 2016), and time is one of the entrepreneur's valuable resources. According to Bouncken and Reuschl (2016), the pursuit of collaboration in a CWS may become a distractor that delays entrepreneurs in the development of their business ventures. In other words, there is a tradeoff between collaboration with the existing network and new contact exploration, between investment in contact enhancement and value appropriation (Bouncken et al., 2018). Contrary to this perspective, Letaifa and Goglio Primard (2016) point out that collaborative entrepreneurship presents more significant evidence of success than individual entrepreneurship. The authors maintain that contexts that present the best conditions for the establishment of collaborative networks produce effective incentives to associate with interest or reference groups.

Based on the contributions of the previously mentioned authors, we identify key enablers in CWS that may lead to effective collaboration and, consequently, knowledge spillover within the CWS ecosystem. These enablers involve building a physical space that encourages social and informational processes within the CWS, namely, a layout of the space that facilitates peer proximity and interaction to achieve effectual affordances and knowledge discovery (serendipity). Additionally, the CWS should ensure, as part of its service portfolio, the appropriate guidance and facilitation to encourage a community of shared

Figure 1. Knowledge spillover enablers of the CWS
Source: Own elaboration

values, leading to the anticipated informational outcome of opportunity discovery. These enablers are shown in Figure 1 below and are classified according to their character in assembling the CWS.

Identifying whether CWS comply with these characteristics to enable effective collaboration and subsequent knowledge spillover becomes instrumental. As expected, social entrepreneurs at CWS would operate locally though connected globally (Avelino et al., 2019), and international exposure provides incentives for entrepreneurs to engender new ideas that have the potential to flourish as long as the CWS informational processes effectively facilitate them. The extent to which CWS and guest projects produce this social innovation knowledge would determine whether these micro-spaces contribute to the development of the smart territory or are merely service islands in the local business landscape.

Network Effects That Favor Knowledge Spillover

At present, space acquires a new role within the context of global digital networks, including agile forms of interaction and governance (Perulli, 2000), which allow entrepreneurs to aspire to a quasi-planetary or multiregional scope. This level of reach is granted at high speed by the capabilities of digital technologies, building a complex system with network effects that influence CWS.

The formation of clusters is common in all networks whose individual members or nodes are not necessarily in the same "spatial neighborhood," constituting a space of flows (Castells, 1991). In this way, CWS act as nodes located in a specific territory but integrated into remote collaborative networks. These nodes can achieve significant effects on their geographical territory when they reach higher relative importance within the network: "hubs" or central nodes (nodes with many more links than others can). Thus, in a network of this type, the number of nodes with respect to the number of links of each does not follow (according to empirical experience) a bell curve (where there is a certain homogeneity), but a power law, where the vast majority of nodes have few links and a few, a huge amount of them (Barabási, 2002). A network has "hubs" when two basic conditions are met: the network is growing, and there are preferences toward the nodes with the largest number of links and that are the most robust ("fitness") (Barabási, 2002). Usually, the first nodes created have competitive advantages in the network (Velasco, 2003).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

There is, thus, a great variety of interconnection possibilities between nodes in the various CWS that locate in a smart territory, some more powerful or with better "fitness" than others, according to their capacity to form part of a global network of social innovation collaboration and value creation. Some nodes carry out activities that are structurally relevant to collaboration (influencers), others control and originate information flows (entrepreneurial ideas and projects), others are simply receivers of information with minimal control (peripheral or isolated CWS), and still others control access to the network (headquarters of global CWS) (Barney, 2004). Consequently, equality is a utopia in the face of the network effects of the CWS collaboration. While individuals can benefit from the information available on the network, this does not mean that more information leads to greater equity in terms of access and collaboration within the variety of CWS available in the territory.

Thus, CWS has enabled the creation of new levels of interaction among entrepreneurs within this network space, leading to different network architectural configurations that determine the transcendence of social innovation knowledge. These configurations allow for different forms of interaction that group collaboration characteristics among entrepreneurs who pursue specific objectives in their digital interrelations on the local and global scale.

Although the efficiency of the network requires the existence of central nodes, when groups with high local content and short links among them are achieved (small world pattern), productivity is enhanced more than any other hierarchical network (Van Alstyne & Bulkley, 2004). This means that it is possible to achieve greater efficiency within CWS when an interactive working community is built locally. The network architecture articulates nodes in a globalizing dynamic but forgets the segments of society that offer little interest from the perspective of value creation (Hilbert, 2001). That is why the study of network effects in CWS plays a fundamental role in the understanding of knowledge spillover at the territorial level: by explaining its structure, dominance, and relevant players.

In summary, collaboration networks through CWS develop as a complex system that adopts network effects with greater force. How CWS operates and interacts within the territory would determine success in terms of effective knowledge spillover, connecting individuals inside and outside of their spatial milieu.

Characterizing the Transcendence of Social Innovation Knowledge in CWS: A Framework Proposal

The smart territory informally absorbs the information spillover, previously enclosed in unconnected individualities. Interfaces built by CWS develop spaces that disseminate and socialize knowledge. Knowledge socialization produces unexpected and peripheral cognitive endeavors that may generate knowledge patterns or territorial trends, many of these fleeting and limited.

In other words, information spillover gives rise to tacit knowledge that had been scattered in the territorial space and without being used. For this reason, CWS becomes an interfacing solution that confers structure on this knowledge dispersion, transforming collective knowledge into retained knowledge for social innovation, which is absorbed, grouped, and formalized by the entrepreneur. During the entrepreneurial collaboration process, knowledge at the CWS and its surrounding territory is boundless, in that it remains safeguarded in the minds of its members. Hence, CWS are open spaces of social innovation possibilities whose members develop their vision collectively.

On the other hand, social entrepreneurship needs to confront an institutional context that favors profit maximization, short-term thinking, and business growth (Thompson et al., 2018), and CWS are physical spaces that generate the conversion of collective know-how into private knowledge value (Groys,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

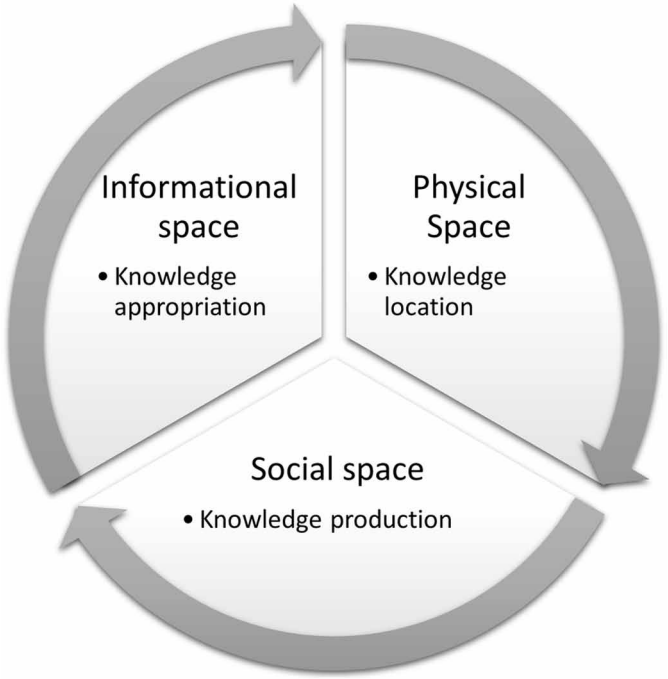
2005). Some CWS have clear regional economic development goals (Assenza, 2015), and others have been created with strong social or environment-oriented purposes (Avelino et al., 2019). It is this latter model that comprises the type of CWS that inspires social innovation knowledge spillover.

CWS encourages coordination between independent individuals, delivering an intermediating function between users (Capdevila, 2015) who, in the case of social innovation, seek to discover novel solutions to local or global problems, creating a social economy (social space) between them (Waters-Lynch & Potts, 2017). However, the transactional nature of this collaboration falls short if it cannot transcend to generate knowledge-based discoveries (informational space). The collection of dispersed knowledge from certain cognitive groups located in the smart territory is a process that originates in relationships where knowledge flows. CWS has the purpose of admitting this knowledge dispersion in order to explore new combinations and, finally, to grow codified knowledge in the form of cognitive maps (knowledge appropriation in the informational space).

Several frameworks have been proposed to examine change and social innovation dynamics in the smart territory that depart from a dimensional analysis of the territory's systemic functional aspects and their interrelationships. Avelino et al. (2019) conceive four shades of change and innovation, namely, social innovation, innovation system, game-changers, and narrative of change, which are systemic aspects that frame change and innovation from a social approach. Similarly, Assenza (2015) presents a proposal for the study of CWS that includes the organizational level (physical structure leading to production), the interactional level (where knowledge is disseminated), and the individual level (where innovation takes place). However, these proposals were not designed to express the process of knowledge spillover within CWS, but to distinguish functional characteristics.

As noted previously, knowledge spillover enablers can be classified according to their physical, social, and informational character. These characters can be taken to the spatial domain to develop an analytical framework for assessing knowledge spillover, which would provide a characterization of these coworking places and observe their territorial relationships. This framework is depicted in Figure 2.

In Figure 2, we base this framework on the analysis of the three spatial characteristics, i.e., physical, social, and informational, which represent processes of knowledge location, knowledge production, and knowledge appropriation, respectively. These three spaces of knowledge allow for the assessment of the transcendence of the social innovation knowledge that would have originated in CWS.



For our territorial analysis, we provide an alternative operational framework to accompany other models such as those proposed by Avelino et al. (2019) and Assenza (2015), which can be complemented by the viewpoint of physical space, social space, and informational space. We, therefore, think that constraining our research to these spatial features can help develop a better understanding of the predominant model of CWS in this land area.

METHODOLOGY

From a methodological approach, this chapter collects, organizes, and examines information that originates from a group of CWS to explore their character according to the analytical framework for knowledge spillover presented previously.

Territorial Description

The territorial target is the Roma-Norte corridor in Mexico City, which is the city area that has produced majority of knowledge clusters in that urban space: twenty Coworking spaces (CWS) are registered in that area of the thirty-two that exist in this metropolis, making this district a favorable space for the generation of social capital. This urban area is characterized by the presence of creative global and national companies and by the high density of diverse entrepreneurial activities that take place in its territory.

This business-cultural environment, clearly on the periphery, represents a territory of high spatial diversity and lifestyles. This is a corridor with a great diversity of groups, values, and ideas, assumed to be the type of innovative environment that permits the exchange of information and intermingling among different interests. The twenty collaborative spaces in the corridor share users with a wide range of third-party spaces, that is, environments that serve as connectors of the dispersed information flow on the periphery: restaurants, clubs, bookstores, theaters, public parks, coffee chains, among others.

Since CWS are functional in integrating dispersed information through these third-party spaces into packages of knowledge for entrepreneurship, the Roma-Norte corridor is known for its entrepreneurial lifestyle and global character, flexibility, and openness to outsiders, rendering this area decisive for the exchange of information and knowledge in Mexico City. As expected, coworking spaces in this corridor function as devices that simplify the complexity of this entrepreneurial environment.

Data Collection

After collecting Web and geographical data of the thirty-two CWS in the city (secondary sources), we analyzed and selected those CWS with readily available Webpage information and grouped within the Roma-Norte corridor. Twelve of these CWS were visited for site observation, and this investigation was complemented by phone calls and further web information searches, which were instrumental for exploring these coworking centers and recording their impacts on the territory. From a practical perspective, our investigation has undergone the following considerations:

1. **Data Sharing:** Most coworking spaces appeared reluctant to share data on and features of their communities
2. **Income Model:** We discounted CWS, whose model aimed mainly at the rental of office space. Hence, we directed our attention to five coworking spaces in this territory to carry out a focused, deeper exploration of these organizations and their relationship to territorial change and innovation dynamics
3. **Investigated CWS:** Selected CWS in the Roma-Norte corridor included COW Roma, UZone, 3er Espacio, Distrito Central Coworking, and Impact HUB

Method

We used the qualitative ethnographic research method. Qualitative research seeks to understand the action of the meanings inscribed in the discourses formed by diverse social groups, interpreting the contexts of social reality. Its scope is limited to the understanding that can be obtained from observation and communications. The symbolic world of individuals is understood through their contextual dialogues, which are decisive for the design of categories that allow for the generation of interpretative frameworks and the construction of social reality. The scope of the information search in this investigation included: secondary sources, telephone calls, and on-site visits, whose information supply tactics are shown in Table 1 below.

Table 1. Information supply tactics

Action	Information Supplies
Secondary sources	Websites
Phone calls	Registered numbers on the internet
On-site visits	Participating observation in coworking spaces

Source: Own elaboration

In this investigation, we essentially sought to specify the following aspects in each CWS:

- Purpose of the coworking space.
- Level of access to member affiliates.
- Impact that each of the coworking spaces had on their surroundings.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Challenges

Secondary analysis of qualitative data is a valid mode of research; however, limitations are always present. From a practical perspective, our research went through the following considerations:

- Some secondary sources did not provide enough information about coworking spaces.
- Regarding telephone calls, some coworking spaces did not provide quality information, or their attitude seemed reluctant to share data, including several characteristics of their communities.
- For some onsite visits to co-working spaces, access was restricted and could not obtain quality information.

Based on the analytical framework presented in Figure 2, we characterized the five CWS, whose features are summarized in Table 2 and Table 3.

RESULTS

As shown in Table 2, the physical space of four of the five coworking spaces is oriented toward offering office rental services, placing collaborative spaces as one more service, and not as the main value. These CWS are COW Roma, UZone, 3er Espacio, and Distrito Central Coworking. For this reason, we analyzed these four CWS separately. Despite being self-advertised as CWS, these spaces do not consider in their scope networking creation to facilitate information flows as a key component of their services portfolio (demonstrated by their lack of transparency), and only deal with restricted access groups that maintain few relationships among members.

Regarding the social space, we find that the four centers are hosts to for-profit organizations, which are offered office rental services. Networking arises mainly from the motivation of community members and not from the management's initiative, resulting in events, workshops, and competitions that originate essentially from the proactivity of the CWS guest participants. In this respect, education to support entrepreneurs in these centers is scarce and restricted to the community members' interests, resulting in limited or no-creation of startups within these spaces.

Concerning the knowledge space, the lack of open networking and participation beyond their own space instills barriers that impede the flow of knowledge with peers from other territories.

In summary, the services offered by these CWS target the rental of space (and offices), mainly for small companies, not entrepreneurs, resulting in a limited drive for the development of entrepreneurial groups. There is also a restricted offer of networking events, education for entrepreneurs, and invitations to competitions, whose organization is left to the members and their interests, considering that the role of management is confined to site administration. Consequently, few startups emerge from this type of coworking spaces. It is important to highlight that the few startups that have emerged from these spaces do not manifest themselves in the community as "game-changers," that is to say, their presence does not reveal an evident territorial impact. Additionally, interrelation among these centers and other players in the ecosystem is limited, resulting in diffuse, precarious, and dispersed inter-territoriality.

On the other hand, we were able to identify one coworking space that, despite possessing all of the characteristics mentioned previously, hosts organizations and startups that have strong social focus: Impact Hub. Created in 2014, Impact Hub's model combines CWS services with incubation services, building a

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Selected CWS-like organizations in the Roma-Norte corridor

CWS	MISSION	PHYSICAL SPACE Location of Knowledge	SOCIAL SPACE Production of Knowledge	INFORMATIONAL SPACE Appropriation of Knowledge
COW ROMA	To be agents of change and witnesses to the growth of companies and startups by helping them obtain their own space.	Office rental: Furniture, collaboration spaces (limited), virtual offices, and boardrooms.	Tech companies. Networking is not encouraged by the CWS. There is no collaboration. Few events or competitions, not open, restricted access community.	No workshops, only those from individuals No certifications (good practices) Does not become involved in local issues.
UZONE	To support entrepreneurs and independent professionals who seek to increase their income, through flexible space offering plans.	Office rental: Furniture, collaboration spaces (limited), virtual offices, and boardrooms.	Companies: Advertising, production company. Networking is not encouraged by the CWS. No events.	Education (individuals). No certifications (good practices). Does not become involved in local issues.
3er ESPACIO	To be an office alternative for independent professionals and entrepreneurs, offering multiple services and flexible schedules, with the possibility of developing creativity and expanding networks of contacts.	Office rental: Furniture, collaboration spaces (limited), virtual offices, and boardrooms.	Companies: software developers, public relations, architects. Networking is not encouraged by the CWS. Few events or competitions, not open, restricted access community.	There is education (topics to support entrepreneurs). No certifications (good practices). Does not become involved in local issues.
DISTRITO CENTRAL COWORKING	To be a shared environment in which entrepreneurs, startups, and freelancers are part of a community that connects them, creating business opportunities.	Office rental: Furniture, collaboration spaces (limited), virtual offices, and boardrooms.	Companies: advertising agencies, real estate, tech, architects, psychologists and, therapy Few events or competitions, not open, restricted access community. Networking is not encouraged by the CWS.	No workshops, only those organized directly by tenants. No certifications (good practices). Does not become involved in local issues.

Source: Own elaboration

community of social entrepreneurs who can access a worldwide network (Avelino et al., 2019). Impact Hub characteristics appear in Table 3.

Impact Hub leases its spaces to organizations with a social mission, including Ashoka, ANDES, and SistemaB, whose strategies are generally global in scope and not necessarily local. Despite the presence of these organizations, it should be noted that this coworking space does not have the creation of startups as a fundamental objective since all of its efforts are aimed at promoting the community settled in its space. In line with said community, it promotes proposals, competitions, and events that enhance the networking of its members. According to their "interests," the social-mission organizations in this space that promote social change and the empowerment of players, usually transcend their territorial strip.

DISCUSSION

The analytical framework proposed in this chapter has proved to be a useful tool for characterizing the Roma-Norte corridor in terms of CWS knowledge spillover configuration. The key features of this characterization are listed and discussed below.

- **Feature 1:** The Roma-Norte is not a distributed structure, in that social innovation appears to take place around a single entity: Impact Hub.

Impact Hub not only hosts social entrepreneurs but also is the physical and social space that concentrates relevant organizational players in the social entrepreneurship ecosystem. Thus, Impact Hub becomes a sort of umbrella space in which other spaces, such as Ashoka, ANDES, and SistemaB, cluster. Hence, we can deduce that the Roma-Norte corridor of CWS is mainly a star structure around Impact Hub, surrounded by CWS-like islands with limited collaboration and, subsequently, few knowledge spillover effects. The clustering of social mission organizations in Impact Hub is a recent phenomenon in that they formerly had separate physical but socially interrelated locations, constituting a social innovation ecosystem. Today, this ecosystem opts not only to have social but also physical proximity, potentially increasing knowledge spillover within their territorial influence. This process is an example of the bottom-up construction of a smart territory, in which key social innovation players decide to increase synergies by proximity.

- **Feature 2:** The existence of a set of isolated coworking spaces in the same territory implies the absence of an integrated regional innovation cluster.

These islands focus mainly on the commercial and little on the development of startups in the majority of their coworking spaces. This isolated configuration of CWS is a counterexample to the ecosystem built around Impact Hub in the form of a social innovation superstructure.

- **Feature 3:** Change narratives possess a strong presence in all coworking spaces, unlike the innovation and social innovation systems or "game changers" that, although appearing in all of the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

examples studied, their actions do not suppose a radical transformation of the dominant institutions of their social context.

From feature 3, we can point out that the studied territorial strip does not demonstrate strong interaction among all dimensions (social innovation, innovation system, game changers, and change narratives), in that some of these aspects are more developed than others, according to the four "shades" of Avelino et al. (2019).

- **Feature 4:** The number of global organizations involved in the clustering process around Impact Hub implies the creation of a meta-space of social innovation, which is expected to transcend their spatial boundaries and scale to become proposals that solve problems in other territories as well.

From a knowledge spillover approach, Impact Hub constitutes a meta-space for social innovation knowledge, which transcends the territory in that it has created links on a global scale. Since there are many challenges faced by CWS to influence problem-solving in their local environment, the existence of a physical umbrella space that facilitated a stronger social space may result in positive actions to face these challenges, creating an informational space beyond the territorial boundaries of the Roma-Norte corridor.

As a final remark, CWS is a buzzword that has been mimicked by more traditional office spaces to gain market share, as has been demonstrated by the island CWS-like organizations, whose services portfolio would correspond only partially to what is expected from CWS. However, the existence of a star superstructure may motivate these CWS to evolve their business models and become closer to more collaborative CWS models, expanding the social ecosystem, considering that the presence of more expert peers that share knowledge may encourage entrepreneurial behavior among these CWS participants (Assenza, 2015).

POLICY RECOMMENDATIONS

From a policy perspective, the umbrella configuration that has been born in the Roma-Norte area can be incorporated into other local initiatives to build a smart city, creating stronger linkages that drive the generation of more sensible solutions to territorial problems.

Several unsolved problems are characterized by their complexity, uncertainty, and appraising dimensions, and scholars recognize that innovative solutions to these grand challenges require collective action, whose systemic linkages are yet to be understood (Ferraro, Etzion, & Gehman, 2015). Solving these challenges calls for an approach that understands innovation from a conceptual framework that appreciates social issues (broad meaning), in opposition to the Schumpeterian technology-push perspective of innovation. This approach has been known as the demand-pull model of innovation, which confers social meaning on the economic demand, including human and social needs, and articulated in programs driven by various mission-oriented organizations (Godin & Lane, 2013).

Unsolved challenges produce a type of demand-pull phenomenon, consisting of motivated people that decide to take action in an attempt to discover alternate solutions. Instances of this trend can be found in a variety of sectors, including education, security, health services, and finance, where organized entrepreneurial mindsets have launched bottom-up endeavors to tap into the opportunity to act as

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

a substitute for traditional top-down activities. Great problems serve as a systemic demand-pull engine to generate entrepreneurial action and change, which can be encouraged or disincentivized by public support processes. Governments can partner with these entrepreneurs and be active in CWS to facilitate connections and networking. In this sense, CWS becomes the space to make alternative proposals to solve social problems, whose probability of success can be increased if relevant links exist between local authorities and CWS.

Nonetheless, it would be important to design the correct policies that provide the desired incentives, as it has been proven that CWS, supported by either government or private donors, may be tempted to prioritize short-term results according to their donors' requirements over user needs, confronting idealism with organizational realities as conventional norms prevail (Butcher, 2016). Additionally, since social entrepreneurs intend to target social or environmental problems that the public policy has been unable to solve, challenging dominant institutions (Avelino et al., 2019), public policy designers may see the social entrepreneurship that originate in CWS as a replacement for a public funding budget (Avelino et al., 2019), instead of a complement to solving local problems. CWS aid social innovators to determine entrepreneurial opportunities when participants receive this knowledge (spillover) or discover the opportunity to exploit it (Assenza, 2015). This is the challenge of this new umbrella structure that has been born in the Roma-Norte corridor in Mexico City, whose success needs to be tested to date.

On the other hand, as participants in a complex socio-economic system, organizations need to confront contradictory institutional signals, which would trigger distributed social involvement when top-down institutional and market-based mechanisms seem ineffective to members in a given society. A distributed and learning-focused entrepreneurial approach (robust action) has been proposed as an alternative to solving grand challenges (Ferraro et al., 2015).

Recent entrepreneurship methodologies such as Lean Startup or the Customer Development Model advocate for this robust action approach, which seeks to accomplish short-term goals that are constantly updated as part of a validated learning process (Ries, 2011), preserving long-term flexibility. Through distributed experimentation, intended solutions to challenges can be tested, posing new questions on their effectiveness at a large scale (growth engine).

CONCLUSION

In this chapter, we propose an analytical framework to assess the knowledge spillover that originates in coworking spaces as a key element for the development of a smart territory. This framework evolved from understanding the key enablers of social innovation within the coworking space. We used this framework to review the structure and transcendence of the Roma-Norte corridor in Mexico City from the perspective of its CWS-originated knowledge dissemination potential, whose configuration proved to be a tendency toward a clustering model. We also identified CWS-like models limited in their services scope and territorial impact.

The framework proposed in this chapter has implications for scholars, practitioners, and policymakers, including:

- A better understanding of how social ventures that emerge from these collaborative spaces affect the advance of smart territories.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The identification of patterns in knowledge overflow beyond the territory's spatial limits, leading to more research questions and strategic role considerations surrounding the design of CWS in the smart territory.
- The recognition of demand-based spatial elements (physical, social, and informational) with the potential to trigger distributed social innovations and organizations around great challenges.

We suggest that if the smart territory includes in its design a spatial configuration that considers these three knowledge-transcendence enabling mechanisms, people would be more encouraged to self-organize (network effects) and create distributed organizations as an alternative proposal to addressing significant challenges. The limitations of this chapter invite scholars to address a variety of research questions, including comparatives studies between the Roma-Norte corridor and other urban territories in the world. Additionally, this chapter poses questions about the cluster configurations that result in more effective to encourage collaboration, including incentives and social innovation focus. Finally, this chapter comprises an original contribution to the CWS research discussion by including a perspective that suggests triggering elements of knowledge spillover into the smart territory to build a distributed social organization.

ACKNOWLEDGMENT

This research was supported by Universidad Anáhuac México and received no specific grant from any funding agency in the public, commercial, or not-for-profit sectors.

KEY TERMS AND DEFINITIONS

Cluster: Agglomerate of several business organizations that share common objectives.

Coworking Space: A collaborative facility where the concepts of open and private areas are diluted, adopting an informal style to encourage the flow of information and ideas.

Entrepreneurial Ecosystem: A system of beliefs, values, ways of being, and doing that develops a particular social and economic environment with effects on local or regional entrepreneurship.

Knowledge Spillover: The process of tacit information dispersion in the territory, which is usually collected by business organizations in the form of systematized knowledge.

Mini-Cluster: Small spaces of social agglomeration in a fraction of a given territory, leading to information transfer processes and the construction of social capital.

Smart Territory: Geographical contexts that revolve around citizens, aimed at achieving efficiency and sustainable development in a given territory.

Social Innovation: Social practices that create alternative solutions to relevant societal problems, nurturing general well-being in a given community.

This research was previously published in the Handbook of Research on Smart Territories and Entrepreneurial Ecosystems for Social Innovation and Sustainable Growth; pages 287-305, copyright year 2020 by Business Science Reference (an imprint of IGI Global).

Chapter 56
Telework and People with Disabilities:
Perspectives of Managers and Employees from Australia

Rachelle Bosua
University of Melbourne, Australia

Marianne Gloet
University of Melbourne, Australia

ABSTRACT

People with disabilities face unique challenges to access work and participate in a work culture and environment. The increasing uptake of telework is promising from a digital inclusion perspective for people with disabilities. This qualitative study explored barriers and problems of including people with disabilities through telework in Australia. The study focused on management and worker perspectives and findings indicate that both parties face unique challenges to accommodate and include people with disabilities in telework arrangements. Worker barriers to access telework relate to management attitudes, physical and infrastructure problems, social isolation misconceptions, lack of management trust, insufficient telework opportunities and inadequate management knowledge of IT support and reasonable adjustment for people with disabilities. Management issues involve cultural intolerance towards diversity and disability in general, as well as a lack of policies and processes that create a supportive environment for people with disabilities who wish to telework.

INTRODUCTION

Over the last decade, there has been a major shift in thinking about 'work' regarding where and how work is conducted. New developments in Information Technology (IT) have greatly fostered a move towards more flexible modes of work commonly referred to as 'telework' or 'telecommuting' (Blok, Groenesteijn, Schelvis & Vink, 2012; Davison & Cotton, 2012; Maruyama & Tietze, 2012). Telework

allows workers to work flexible hours in any geographical location beyond the normal office, using IT or telecommunication technologies to communicate and collaborate (Olson & Primps, 1984; Maruyam & Tietze, 2012). Telework as a new way of work holds great promise as the *flexibility* of work provides multiple benefits to different types of workers. This includes saving commuting time, achieving work-family balance by extending work hours to accommodate family demands, or embracing flexible work hours to facilitate caring for elderly parents (Bailey & Kurland, 2002; Galvez, Martinez & Perez, 2012; Powell & Craig, 2015; Sullivan & Lewis, 2001). Also, prior studies indicate that access to telework increases employee wellbeing, which in turn increases productivity (Bosua, Gloet, Kurnia, Mendoza & Yong, 2012).

Once of the advantages of telework is the '*digital inclusion'* of workers who might otherwise be excluded from work, such as workers with disabilities. Disability can take many forms, be temporary, total or partial, lifelong, acquired, visible or invisible. In this study, 'disability' is the overarching term that covers impairments, activity limitations and participation restrictions resulting from problems with body function and structure (impairment), limitations to execute tasks/actions (activity restriction), and individual involvement in life situations (participation restriction) (World Health Organization, 2011). Disabled people's ability to engage in the workforce provides multiple benefits, including financial independence, a sense of self-satisfaction and improved physical and mental wellbeing (Randolph, 2004; Anderson & Douma, 2009; Stam, Sieben, Verbakel & De Graaf, 2015). Considering the benefits provided by telework, expectations are that this form of work opens up much more access to work for people with disabilities.

A recent report indicates that Australia has more than 4 million people (i.e. 1 in 5 people or 18.5% of the population) with disabilities (Australian Bureau of Statistics, 2013). Also, only 53% of people with disabilities participated in the Australian workforce in 2013, confirming that little change has occurred in this area over the last two decades. Recently, a World Health Organization report (World Health Organization, 2011) confirmed very little change in global workforce participation by people with disabilities over the last 20 years. Considering this gap and that telework may be a mechanism to include more people with disabilities in the workforce, this study poses the following research questions: *What are the issues and problems that both managers and people with disabilities face with respect to access to telework, and how can people with disabilities be included in the workforce through telework arrangements?*

In response to these questions, this study followed a qualitative research approach to explore the relationship between disability and telework from both a manager and worker perspective. This chapter is structured as follows: the next section provides background literature on telework and disability followed by a description of the research approach, participants, and data collection. Findings follow in the form of quotes, based on key themes that emerged from a deeper analysis of the data. The discussion highlights important elements that foster a more digitally and inclusive workforce for people with disabilities. The conclusion discusses limitations of the study and avenues for further research.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

BACKGROUND LITERATURE

Telework as a New Way of Work

Advances in ICT have brought about many changes in how individuals communicate and collaborate. Evidence of this includes new IT tools and technologies that facilitate the sharing of information, knowledge and the ability to conduct service-related work from any location at any time, using the Internet as a platform (Bayrak, 2012; Garret & Danziger, 2007; Pauleen, Campbell, Harmer & Intezari, 2015). Resulting from these changes, new flexible forms of work (defined as *telework* or *telecommuting*) have emerged, allowing individuals and teams to conduct their work from any location across time and space. Telework is defined as *the use of Information and Communication Technologies to conduct work at home or any other place that is removed from the physical infrastructure, colleagues, clients and the employer* (Haddon & Brynin, 2005; Nilles, 1975). Telework has shifted traditional views on work across the boundaries of the physical workplace, mode of interaction and collaboration, and hours of work.

Historically, telework has emerged into different forms resulting in a variety of discourses on problems, issues, and opportunities associated with each form. The most familiar elements cited in literature that shape forms of telework, involve technology, location (home-based versus a satellite office or smart workspace), contractual arrangements (occasional or routine telework) and time (duration and times of telework) (Haddon & Brynin, 2005). Forms of telework shaped by time include occasional telework days versus regular telework day agreements or full-time telework where workers work entirely from home a satellite office or other location. The latter includes call-centre and service-related work such as marketing, sales, and customer relationship management.

Recent studies identified three elements that influence successful telework arrangements:

1. IT support,
2. Management trust and
3. Hybrid telework i.e. a balance between time spent in the office and out of the office (Bosua et al., 2012).

The degree and extent of IT support greatly facilitate communication and collaboration between individuals and team members, managers and teleworkers i.e. telecommuting and networking tools that support awareness, online presence and the sharing of essential content such as electronic calendars, screen and virtual desktop sharing tools and audio/video conferencing tools.

Management trust in teleworkers is an essential ingredient in a successful management-teleworker relationship. Some studies report on the importance of trust as an incentive for positive teleworker attitudes and work outcomes (Baruch, 2000; Cascio, 2000; Kowalski & Swanson, 2005). Trust evolves depending on the degree and extent of control managers have on teleworkers. In addition to trust, telework arrangements allowing for a balance between working both in and out of the traditional office appear to deliver more positive outcomes from a management and teleworker perspective (Bosua et al., 2012; Halford, 2005; Peters, Den Dulk & de Ruitjer, 2010). Positive outcomes of hybrid arrangements relate to mentoring of younger employees, and the ability to learn from and socialize with workers that work full-time in the office.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Apart from eliminating traditional work boundaries related to the physical workplace, working hours and mode of communication, telework also brings about a shift in thinking on work-life-family balance, physical and emotional wellbeing and digital inclusion. A few studies report on the positive outcomes of telework arrangements that help parents balance work and family (Allen, Johnson, Kiburz & Shockley, 2013; Demeronti, Derks, Lieke & Bakker, 2014; Hilbrecht, Shaw, Johnson & Andrey, 2013), and the caring of dependents (Hartig, Kylin & Johansson, 2007; Hilbrecht, Shaw, Johnson & Andrey, 2008). From a wellbeing perspective, former studies have shown that the ability to work away from the office in a hybrid mode, contributes to individual wellbeing, which in turns increases productivity (Bosua et al., 2012; Maruyama & Tietze, 2012).

Regarding digital inclusion, there is the promise that flexible ways of work may help to integrate a large community of workers who may not otherwise be taken up into the workforce, such as people with disabilities. Even though flexible work may open up new employment opportunities for these workers, there may also be constraints related to telework, the workplace environment and interactions with other workers, as well as the social inclusion of disabled workers (Baker, Moon & Ward 2006).

Disability and Access to Work

Disability is

…a condition that may restrict a person's mental, sensory, or mobility functions to undertake or perform a task in the same way as a person who does not have a disability (Disability Works Australia, n.d.).

Disability varies in type, form, and severity, and is considered as a condition caused by accident, trauma, genetics or a disease. Australian Institute of Health and Welfare (AIHW, 2008) indicates that Australia has 4 million (or 18.5%) people that have some form of disability. 1.2 million of these have a profound or severe disability, with about 1,497,500 people with disabilities (about 8.8%) having difficulty in accessing employment and training which may also need workplace adjustments to enable employment. There is a lack of recent statistics that give a comprehensive indication of education and skill levels of people with disabilities, and there is almost no Australian literature that addresses the topic of telework for people with disabilities.

A study by Adams & Oldfield (2012) argues the need for disability equality in the workplace, suggesting that more effort should be made to provide better work and career opportunities for people with disabilities, as opposed to simply placing them in menial jobs with little or no opportunity for advancement. Research by Ali, Schur & Blanck (2011) suggests that the relatively low employment rates of people with disabilities are not related to a reluctance to work, but rather to the existence of a large range of barriers to employment. Their study indicates that people with disabilities could perform a large proportion of job roles, while they also make the case that access to employment for people with disabilities can result in many positive outcomes.

Technology is considered one means by which employment barriers for people with disabilities can be eradicated. Indeed, the proliferation of various forms of ICT has opened up a range of employment opportunities for people with disabilities, particularly telework, allowing people to work from any location without the need for commuting to work (Bilevičiūtė & Bilevičienė, 2010; Meshur & Ulusoy, 2013). There is certainly potential for technology and its application through telework to create more opportunities for people with disabilities to join the workforce (Breaugh & Farabee, 2012). In noting the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

high levels of unemployment facing people with disabilities, Barnes (2012) argues for a rethinking of the meaning of *disability and work* to create greater levels of awareness and work allowing the inclusion of people with disabilities who wish to access the job market.

While studies from the mid-2000s are full of promise of the potential of telework to eliminate employment barriers and integrate people with disabilities into the workplace, digital exclusion or a digital divide affects this group of workers (Atkinson, Black and Curtis, 2008). Bricout, Baker, Ward & Moon (2011) refer to this phenomenon as the '*disability divide,'* stating that the development and implementation of policies to address this situation is the most effective solution. Access to technology for the disabled is a significant issue, including affordability and general accessibility for blind, deaf and other forms of disability (Baker & Moon 2008; Davison & Cotton, 2010). However, significant recent growth in universal and exciting assistive tools and technologies (e.g. mobile applications), as well as a reduction in the cost of workplace accommodations for disabled workers can increase employment accessibility.

In summary, there is an acute shortage of accurate recent statistics and in-depth research in Australia that explores the uptake of telework, the challenges and barriers, as well as positive and negative aspects relating to telework for people with disabilities and their employers. Hence, this research seeks to fill this gap by exploring: 1) the issues that impact on the uptake of telework employment opportunities for people with disabilities, and 2) the relationship between telework and digital exclusion of people with disabilities from the workforce.

RESEARCH METHOD

Due to the exploratory nature of this study, a qualitative research methodology was undertaken. We were interested in the rich stories of both managers and people with disabilities in the field and therefore chose a narrative inquiry approach as the most appropriate method for this study (Connelly & Clandinin, 1990; Creswell, 2007). Narrative inquiry allows data collection in the form of participant stories based on personal experiences through semi-structured and structured interviews. Narrative inquiry therefore first allows a participant to narrate his/her story effectively through storytelling to the listener/researcher. The data collection phase is then followed by data analysis whereby the researcher aims to understand the lived storytelling experiences through content analysis and reflective accounts emerging from the data. The aim was to identify how people with disabilities can be included in the workforce through telework arrangements, and the issues and problems managers and people with disabilities face regarding access to telework. Once ethics approval was granted, senior HR, general and diversity managers and people with disabilities who have experience of telework were selected to participate in the study. Due to the sensitive nature of the study most participants preferred to stay anonymous, hence none of the participating organizations or participant details is revealed in this study.

Data Collection

The research unfolded in three stages, to gather rich insights, stories, and experiences from the participants over a period of six months, with each stage feeding into the next stage as outlined below:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Stage 1: Beginning the Story - Opinion Polls

This stage 'tested the ground' on general management perspectives of disability and telework by opening up the conversation about disability and digital inclusion. Seventeen managers in key HR/Managerial and Diversity Management positions were cold-called Australia-wide, and first briefed on the issue, then asked their opinions regarding the topic. Contact details were acquired through LinkedIn and personal networking. Five HR Managers, three 'HR/Diversity Managers,' seven Diversity Managers and two Managers of employment agencies for the disabled shared their stories. The aim was to hear initial stories that impact on disabled workers' access to telework considering changes in the workplace brought by various forms of technology. Responses were instrumental in shaping in-depth data collection of Stages 2 and 3.

Stage 2: Continuing Narrative Inquiry Through Stories of Working People with Disabilities

More data collection followed through the sharing of eight disabled workers' stories; six workers with physical disabilities and two with mental disabilities. Stages 2 and 3 were conducted either face-to-face or by telephone for some Stage 2 participants who preferred not to face the interviewee. In addition to Stage 2 interviews, to gain further insights and complement the study, seven case studies of disabled workers' experience in the workplace such as Australia Post and Government agencies were included.

Stage 3: Individual Stories from Senior HR/Diversity Managers

Finally, data was collected through stories and experiences shared by twelve senior HR/Diversity managers; eight from large- and four from medium-size organizations. Questions focused on telework and disability regarding diversity strategies, recruitment for telework, inclusion criteria, the technology used and provided, training given, and issues and problems associated with the management of disabled teleworkers.

Data Analysis

Opinion poll data was interpreted and summarized as notes, while all the stories were audio-recorded with consent and transcribed verbatim. Field notes taken while listening to the stories were merged with the transcripts followed by the use of NVivo 10 to support a thematic data analysis using principles of open, axial and selective coding (Corbin and Strauss, 1993; Neuman 2003). Both researchers first worked independently through the dataset and later combined views and interpretations. Findings presented are classified as a set of major themes that arose from a deeper analysis and interpretation of the data.

FINDINGS

Three key themes emerged from the data analysis: barriers impacting access to telework by people with disabilities, and management and technology issues hindering access to work for disabled workers as outlined below.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Theme 1: Barriers Impacting Access to Telework by People with Disabilities

Findings indicate that people with disabilities faced six key barriers regarding access to telework:

Barrier I: Attitudinal Barriers from Employers

One interviewee indicated that there were still stiff employer attitudinal barriers that hindered access to and uptake of telework for people with disabilities:

It's an attitudinal problem of employers - a prospective employer thinks here's a blind person who wants to work, how are they going to read? They don't think at all about options or possibilities. Other attitudes? They think there's a risk hiring someone who may not be able to read and write properly. Or risk associated with the possibility that a blind or visually impaired person might fall down in the office and get hurt – they might not want to take that risk. You know: I really like that person, but I don't want the liability. There is a range of different barriers, but that's just two examples.

This person also mentioned that managers were not prepared to build flexibility into work packages to facilitate telework uptake by people with disabilities:

We're even trying to build flexibility into enabled employment. For instance, an employer can choose how much work is in a job and how they want to pay. So you can pay by the day, and hire someone for five days of work. It doesn't matter how much he or she works in a day, but you are paying him or her for a block of work and you are expecting certain results from that. Then we also have hourly arrangements, and for those people who might not know how they are going to manage.

Barrier II: Physical and Infrastructure Barriers

People with disabilities faced physical and infrastructure barriers to access the physical workplace. Even though telework allowed working from home there were days that required workers to be present in the office:

Transport is an issue, because if you're blind or vision-impaired, you can't drive to the workplace, so you have to find another way to get there. That usually means public transport or a taxi. Taxis are prohibitive because they're costly. There is a government subsidy at state level to provide half-price taxi fares, but it's still a lot of money. So trying to get to work is complex, and you may have to take more than one form of public transport in your journey to work. So this helps to explain why 58% of blind and visually impaired people who want to work, can't get work.

Another participant confirmed this barrier by stating:

The biggest barrier to disability employment is potentially getting into the office (so accessibility), there are also attitudinal issues and capability issues. The biggest barrier is the employers themselves and how they think.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Barrier III: Lack of Management Awareness about Funding for Reasonable Adjustments

Participants noted managers' unawareness of government disability funding support for reasonable adjustments. One participant said:

Most [managers] think that it will cost thousands of dollars to make workplace modifications and adjustments, but that's not true.

The same participant noted:

I went to a conference recently, and they said that only 3% of employers know that there are funds out there to cover [reasonable] adjustments. In addition, they don't know that compensation and insurance are also covered by government funds. So we need to make employers more aware about all these resources. If they know about it, there are no more excuses for not hiring people with disabilities.

Barrier IV: Insufficient Telework Arrangements, Processes, and Access to Telework

Workers felt a need for more opportunities to work flexibly, particularly for recent university graduates, as two participants indicated:

There is a need for more flexibility around job arrangements – there are a lot of people [with disabilities] who cannot work full time.

The government disability employment services don't do anything for well-educated people with disabilities who lack work experience…. we aren't expecting them to be treating people like charity cases and we are dealing with people who already have skills.

The second participant further elaborated on the difficulty to hire people with disabilities:

And even employers - they want to hire people with a disability, but the process is so complex.

Barrier V: Social Isolation and Interaction Misconceptions

One potential risk of telework is social isolation, and many managers were fearful of isolating people with disabilities even more when giving them the opportunity to telework. Whereas this concern may be warranted, findings confirm that people with disabilities did not want to telework all the time, but also wanted to be present in the office some days. A vision-impaired worker commented that he enjoyed coming into the office despite the difficulty of moving around:

It actually turns out that going into the office every day, stopping at the coffee shop and getting a coffee, 'see' the people in the building, that sort of social interaction is extremely important. People get to know me around the building, and I think I would find it challenging if circumstances were different

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

at home and I had to miss out on that social interaction. So it's wonderful that I can come to work and have that social interaction.

Another participant felt the same and wanted to telework and be in the office:

I would prefer the hybrid telework approach because I am very social and I like coming to the office, but I would probably like to do 2 days.

Barrier VI: Managers Lacked Trust in Disabled Workers

Managers often lacked trust that people with disabilities are experienced and *can do* a specific job while some managers believe work is only conducted when physically at one's desk. One graduate participant described how he could handle 70-80% of IT problems in a non face-to-face role while another non-disabled worker attended to the other 20% of the problems face-to-face.

My new manager felt I wasn't being utilized enough and both of us should be attending to computer issues in person. And it didn't last long because all the jobs took much, much longer. They tried using wireless phones, which in the late 1990s didn't work very well; the whole thing just fell apart. The whole perception was that because I was sitting at my desk, I wasn't working. So jobs that would have taken a minute to solve over the phone were now taking half an hour by the time we had gone to the person and dealt with the problem. It is interesting that there is this perception about getting work done when it might not appear to some managers that work is actually being done.

The same worker described his current telework agreement and his ethical approach to his work:

I'm very fortunate to have a very strong working relationship with my manager, but having said that, I don't think that would have been the case if I had always been teleworking. I think the fact that I worked in Sydney for two and a half years, I built up that trust and that rapport - and he could see what my work was like. I also built up relationships with my colleagues, so I was not just a faceless person on the Internet or on the other end of the phone. Also I make a very active effort when I go to Sydney, to get to know new people, that sort of thing.

Theme 2: Management Issues Related to Telework and People with Disabilities

Four key thematic management issues related to culture and awareness arose from a deeper analysis of the manager interviews.

Issue I: Cultural Intolerance and Lack of Disability Awareness

A large organization's HR/Diversity Manager outlined the issue of management responsibility to create cultural awareness and tolerance associated with disability in their organizations by sharing his organization's story:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

A disabled athlete, a meningococcal victim with 80% burns on her body, 2 prosthetic legs, and an artificial arm joined our organization. She's is a very switched on, intelligent girl, has a degree and hasn't been able to get work. But being part of the [diversity] program I know what she has done, and she performs her job very well. We are trying to make it [diversity and disability awareness] a bit more universal across the organization, trying to break down the barriers a bit more. So I think you have to get people's awareness up in order for it [disability awareness] to be successful.

A second Diversity manager emphasized 'tolerance' as part of disability awareness:

Tolerance is one thing that workplaces need to develop further, and we also need to think more how to create a supportive work environment if we want to increase employment opportunities for the disabled generally and for everybody. So it's back to the universal design principle, that tools, equipment, and furnishings should be designed with everyone in mind. The same thing goes for awareness training; it should link more broadly to everyone and should include everyone in the organization. When you induct people, and you train people, this sort of stuff should be included.

Another Diversity Manager described her new disability awareness training program for managers:

We want to raise awareness in our workplace about what we felt was a pretty inclusive environment in a way. We also found there is a bit of a fear factor around disability in the workplace and when we thought about traditional methods of training, a lot of it is around discrimination, those sorts of things which scare people off. Many people think, oh I'm a bit uncomfortable about people with disabilities, so I'll just disengage and not talk to anyone.

Issue II: Lack of Awareness of the Need for Telework Arrangements for Diversity

Findings indicated the need for more access to telework regarding diversity:

Managers need to raise access [to telework] and awareness. They [managers] have all these unconscious biases that kick in, so my argument is: if you can shift the onus back to management - if I can do this, what do I need to get this done? People's working environments change from people with a disability to a mum who is just coming back in to the workforce and wants to come back differently. Managers face that on a day-to-day basis…I'm seeing more and more large organizations getting into awareness – making that first step.

Another manager supported this by stating:

I actually think that physical disability and telework could be quite successful - the fact is that if a person has the physical capability to work with a computer, work via Skype for instance if they need to attend meetings and the like. If they are capable of producing the work that's required, working via a consultancy role, that sort of thing, then I think there is a lot of scope for people with physical disabilities to access telework… However, there has to be a balance between working at home or in another location - just to keep a connection if workers are physically capable of doing that.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Issue III: Need for Diversity and Disability Policies and Processes

A senior manager spoke about the importance of policy for telework regarding diversity and people with disabilities:

I'm a huge fan of teleworking, of working remotely and working differently. People battle with that whole concept of working from home, but working differently could be from anywhere. It's about the language, the communication, the policy – I often talk about two things – policy and a process that enables people to work remotely, to allow the company to support that: the tools, technology, leadership, guidance – no longer is a single line of sight management required.

The same manager indicated how important it is for organizations to do the right thing with respect to disabled workers:

Organizations need to think what they do in their own organizational environment. Diversity, flexibility, mature age workers and disability are the major focus areas in most organizations. Managers should speak to people at the Australian Network on Disability. They help organizations think about and shape their views on diversity, and put systems in place to make sure that policy and vision is supported. Accessibility is an interesting policy, but sometimes it clashes with other policies, such as Occupational Health & Safety or heritage policies - I may not be able to dig up the front of an old bank building to make it accessible because it is heritage listed and therefore protected.

A senior manager of another large organization emphasized the importance of policy:

There has to be an inclusion policy - that is the first step. There are policies about equity and policies about positive discrimination, so people that say 'well I don't want to have a quota or a target,' which could be a policy. So in that case they would actively seek to fill positions through a disability employment agency.

Issue IV: The Need for a Changed Environment with Adjustments for Teleworkers

A senior diversity manager indicated the importance of change regarding management sensitivity towards thinking about disability and creating or adjusting a suitable work environment:

My argument is: how do we change the workforce, educating people by getting them to ask, how can I employ people differently? There is an organization I worked with that actually changed their interview and recruitment practices. So they ask questions like are you Aboriginal or Torres Strait Islander? But I cannot ask if you have a disability. What I can ask is 'Do you need any adjustments in order to perform this role'? I think telework should be available for all types of people, but if there is something that limits your ability to work at a certain level and standard, how do you adjust that work setting, be it the office or home? Management needs more communication skills, they need to set expectations, to adjust expectations.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Another senior manager indicated how her organization educates supervisors about adjustments for disabilities:

Supervisors get to work with me and learn how to interview someone with disability, how you see them in the workplace, how to talk about reasonable adjustments in the job. When that happens on an individual level, it actually makes change possible. I often see amazing changes…. the thought process has to change, we are still in that medical model where disability is a problem, how much do I hear disability and problem in the same sentence?

Theme 3: Technological Aspects to Consider for Digital Inclusion

Modern ICTs no longer restrict telework and can overcome barriers that previously prevented a disabled person from being employed. Two technology-related themes emerged as outlined below:

Issue I: Technology Should not be an Excuse to Exclude People with Disabilities

Technology has advanced sufficiently to allow for full digital inclusion as the Diversity Manager of a large organization stated:

We're in a better situation now than ten years ago [with technology support for mobile work] as cost has come down substantially. No longer can a company say it's too expensive for people to telework. You can work remotely with a laptop and phone these days. But it's more about labeling people who work differently. If they need special software, it's about asking the question, can I do that from home? Technology should not be a barrier these days, it should be an enabler.

Another senior manager indicated that technology has evolved to support disabled teleworkers, but felt there were some gaps:

With technology there are still gaps e.g., Skype is not suitable for deaf people using sign language, because of delays and drops outs the message gets muddled-up completely. We have got to address the universal design issues [of technology], because it often costs more to design things with everyone in mind. I think technology has improved the capacity for various disabled people to be more socially included

One of the managers who is disabled and also teleworks further commented:

I think technology is fantastic; I am as effective from home as when I'm here, because I've got access to everything. Obviously the technology gets better and better all the time.

Issue II: The Need to Provide Support for Assistive Technologies

Findings suggest that there was a need to provide support for introducing and using assistive technologies as one participant indicated:

Technology can help with adjustments, but management needs to empower the situation.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Another participant indicated that there are exciting advances in technology that can enable work for people with disabilities:

More and more we're seeing issues around the actual technology. Logistics are being addressed around what needs to be set up in and around the office itself, which is an exciting step forward. Where the issues come in is that sometimes employers may not fully appreciate that the disabled can contribute fully to a job [through these technologies].

This participant was excited about IT support for workers with disabilities:

Exciting in the disability employment landscape is that many employers are moving to Cloud computing. One benefit of this is workplace flexibility [for disabled workers] - if you put your storage and infrastructure in the Cloud, people can use it anyplace, anytime. From a disability perspective its particularly exciting, because if you have particular needs; your employer doesn't have to worry about buying equipment and software. The disabled person might have a home-office set up perfectly well to meet their needs. So this flexibility of the Cloud offers future potential - it works in real time.

One disabled worker expressed his concern that managers and other employees don't understand what disabled workers 'can' do with technology:

There has to be mechanisms so managers [and other workers] can understand what we [disabled workers] can do with technology. There is a government subsidy, so you can buy hardware and software, and the government will cover workplace modifications, so businesses don't have to fork out money for this.

A disability employment agency manager mentioned that many different available technologies used creatively could enhance disabled worker productivity:

I think the advent of and increased uptake of technology is really assisting a lot of disabled workers especially those with sensory impairments. Suppose you're looking at someone who is hearing impaired rather than deaf - Bluetooth works really well to assist people like that so they get clear phone contact. A lot to think about - just because someone is hard of hearing doesn't necessarily mean s/he can't do a lot of phone work these days. Someone with low vision that doesn't mean that they can't do a lot of computer-based work, it's incredible what's out there - and given a bit of training, it just opens up so many opportunities for the disabled. Then I think about technology assisting those people who have learning or have memory issues as well because they're able to use various applications to set up reminders for things, and so forth.

Another disabled worker who occasionally teleworks added his opinion on IT and management involvement by saying:

But there are a lot more people now who are working from many different locations. Technology nowadays can support these different ways of work. From an employee [disability] point of view, we have the appropriate accommodation at home if we are working from home, but also need the trust from the employer and the right technology to do the job.

DISCUSSION

This study posed two research questions: *What are the issues and problems that both managers and people with disabilities face with respect to access to telework, and how can people with disabilities be included in the workforce through telework arrangements?* In response to the second question, an interpretation of the empirical evidence identified three categories of issues that concern access to work for people with disabilities: disability worker issues, managerial issues and technology issues. Numerous studies on telework confirm multiple management and teleworker barriers that impact on telework arrangements for able-bodied workers i.e. manager trust and additional effort to manage teleworkers, technology support, synergy in teamwork, social isolation, creating a performance-oriented culture etc. (Bailey & Kurland, 2002; Baruch, 2000; Maruyama & Tietze, 2012). Our study confirms that people with disabilities face these challenges as well as many more unique challenges such as: access to telework arrangements, an accepting and welcoming cultural work environment, funding of reasonable adjustments to facilitate physical office access and IT support for work, unconscious bias, social isolation misconceptions and lack of management trust in capabilities to conduct work. It is clear that telework can facilitate the digital inclusion of workers with disabilities, thus leading to a range of positive outcomes.

One pertinent barrier that emerged from stories shared by disabled workers was limited access to telework roles/arrangements, and that they *would welcome an opportunity to prove themselves in the workplace*. Hence, people with disabilities are keen to gain management trust in their capabilities, contribute to the work in general and would embrace the opportunity to be part of any organization's workforce. Feeling a sense of exclusion as a natural consequence of disability, these workers are more than willing to overcome many of the obstacles associated with physical disability to contribute to the working environment, i.e. commuting to the workplace, being part of a work culture, team or workgroup, spending time in the office to build employer and collegial trust, and demonstrating individual accountability and loyalty. Once the necessary management trust has developed, and there are appropriate communication channels in place enabled by assistive technologies, managers can grant workers with disabilities some flexibility in the form of hybrid or occasional telework arrangements. This would foster work-life balance, in particular, for those who have families or are unable to work in more traditional, office-based environments. In fact, disabled workers were most willing to bear with the initial discomfort associated with physical access to the workplace to build collegial and manager trust as an antecedent to a more formal telework arrangement.

One other barrier evident from the findings involves task-related and non-task related workplace adjustments and assistive technologies to facilitate and support access to and the execution of work (Riches & Green, 2003). Findings indicate that managers were often uninformed about requirements, eligibility, and type of support provided by the Australian government in this regard. Moreover, most workers indicated they already had assistive technologies and devices they used in their everyday life activities that could be brought into the workplace to support and enable work. Considering recent advances in technology device usage by mobile workers, some reasonable adjustments may be necessary. These adjustments may not be the full responsibility of the organization as assistive tools and devices could be considered as additions to an organization's existing suite of bring-your-own-devices (BYOD) used by its non-disabled workers. Therefore, managers need to become more informed of categories of assistive technologies and type of adjustments required to accommodate workers with disabilities and government funding in this regard.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In response to the first research question, our findings suggest a clear *management responsibility,* particularly the need to treat disability as part of the larger *diversity* category as one of the diversity managers sensibly commented. Considering the limited change in workforce participation by people with disabilities over recent years in Australia, there is an imminent need for workplace reform in the area of social equity and balance for diversity in the workplace. Moreover, as Angeloni (2013) has suggested, more integrated and holistic approaches to disability management are required. Organizations need to review and adjust their cultural make-up to identify how and to what extent elements related to bias towards diversity could be eradicated. This calls for a number of changes at different levels. First, at the employee and employer level, tolerance and acceptance need to be cultivated, equity policies need to be reviewed and disseminated, and management needs to be open-minded regarding recruitment practices focused on diversity balance. Secondly, job and task structures need to be revisited or redesigned as part of a larger reasonable adjustment strategy to match specific and unique worker skills with tasks. This may impact on work allocation and corresponding remuneration associated with different tasks or categories of work. Finally, more comprehensive policies and Occupational Health & Safety arrangement should be required to cater for diversity and equity in the workplace.

This study clearly illustrates that flexible work brings about advantages for people with disabilities. While the study has not focused on specific disabilities, this study's results confirm that benefits of telework extend to people with various forms of physical, psychological and neurological problems, as well as those with chronic issues, fatigue, and pain. For those with chronic forms of illness or disability, flexibility of work allows a better balance between periods of illness and the capacity to work. Telework may also reduce social stigma associated with disability because people are judged more by the work they do, rather than their disability.

In conclusion, the study highlights that the worlds of managers and workers with disabilities are not yet adequately aligned nor transparent, i.e. managers do not yet fully understand the needs and potential that people with disabilities can contribute to the workplace. In addition, workers with disabilities have not yet expressed what they need and can deliver, to be part of the workforce. Hence, there is a need for these groups to open up discourse in this regard. Advocacy groups may play a more prominent role to support this discourse, while more networking activities are required to link different groups, role players, stakeholders, and agencies.

CONCLUSION

This study is the first exploratory research that investigates the relationship between telework and disability in Australia and identifies multiple barriers and issues associated with the uptake of telework for people with disabilities. The study has a number of limitations. First, the study was qualitative and relatively small considering the number of participants. Also, the study was largely focused on issues pertaining to workers with physical disabilities, as opposed to other forms of disability. In addition, the study did not consider specific aspects associated with workplace adjustments and equity from a policy and legal perspective. A larger, more in-depth quantitative study needs to be conducted that is more focused on different categories of disability and different attributes that relate to diversity and access to telework with respect to management and workers. Future work may, therefore, use the outcomes of this study as a basis for a quantitative study that involves a large-scale survey. Such a study may shed more light on best practices to accommodate diverse workers including people with disabilities. Best practices

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

regarding reasonable adjustments, specific IT use, task and job division and allocation aspects associated with diversity in the workplace in general, as well as issues relating more specifically to telework opportunities for people with disabilities would also be useful.

KEY TERMS AND DEFINITIONS

Digital Inclusion: Digital inclusion is social inclusion in the 21st century that ensures individuals and disadvantaged groups have access to, and skills to use, Information and Communication Technologies (ICT) and are therefore able to participate in and benefit from today's growing knowledge and information society.

Disability: Disability can take many forms, be temporary, total or partial, lifelong, acquired, visible or invisible. In this study 'disability' is the overarching term that covers impairments, activity limitations and participation restrictions resulting from problems with body function and structure (impairment), limitations to execute tasks/actions (activity restriction), and individual involvement in life situations (participation restriction) (World Health Organization, 2011).

Diversity: Refers to an understanding that every individual is unique, and recognizing our individual differences. These can be along the dimensions of race, ethnicity, gender, sexual orientation, socio-economic status, age, physical abilities, religious beliefs, political beliefs, or other ideologies.

Telework: Telework is defined in this study as the use of Information and Communication Technologies to conduct work at home or any other place that is removed from the physical infrastructure, colleagues, clients and the employer (Haddon & Brynin, 2005; Nilles, 1975).

This research was previously published in Anywhere Working and the New Era of Telecommuting; pages 145-169, copyright year 2017 by Business Science Reference (an imprint of IGI Global).

ABSTRACT

The chapter examines the comparison of the cross-cultural analysis of the green country, Australia (NSW), and the northern country, Russia (Republic of Karelia). Based on the results of the analysis, it shows how a small business from Russia, Green Roofs, overcomes barriers in Australia through the application of blockchain technology. The authors hope that examples of development and thoughts about the driving sources of these transformations, chosen by taking into account the interests of the development of the Russian digital economy, can be interesting and useful for Russian enterprises, small businesses that have begun their digital transformations.

INTRODUCTION

As shown by Chernychenko (2009,2013), intercultural experience is considered a valuable contribution to personal and professional growth, especially in urban promote social growth & cohesion of HHH University (Australia, NSW), Russian State Social University, Open University for the Humanities and

Economics (Russian Federation) and Petrozavodsk State University (Russian Federation, Republic of Karelia) in training teachers and social workers.

Nowadays literary review showed, in an urban environment, intercultural experience is useful in training teachers and social workers to training with students in multicultural classroom teaching. Our experience in the above mentioned team has shown that such work is especially important for the training of teachers and social workers in the city and urban environment at all levels, as Australia is recognized as a culturally diverse nation through its diverse immigration policies. Our experience in the Australian Federation has shown that Australian professional standards for graduate teachers and social workers require that teachers and graduates of social schools should have the knowledge and skills about learning strategies that meet the strengths and abilities of students in various linguistic, cultural, religious and socio-economic groups, especially in large, medium and small urban environment. In the course of our daily work, we became convinced that it is very important for teachers and social workers to be able to conduct a variety of professional experiences in different sociocultural settings and educate teachers prior to the start of training in order to understand teaching and learning in multicultural contexts and develop the student's ability to work with classes with multi-ethnic students from different cultures.

This chapter summarizes our reports on the intercultural pedagogical experience of pre-school teachers and social workers at HHH University (Australia, NSW) to three Russian Universities: Russian State Social University, Open University for the Humanities and Economics (Russian Federation) and Petrozavodsk State University (Russian Federation, Republic of Karelia). HHH University (Australia) was created in January 2001 by bringing together the resources All Armenian Internet University and Campus Armenian Catholic High School in Sydney. Our university offers higher education, social and vocational education and training on the Sydney campus. The University of HHH is an open access university, which is both regional and international. To provide teachers who have completed preliminary training, an international outlook and to enable graduates to effectively participate in studies in a multicultural class, HHH University has developed several foreign offices for teachers, which include the cities of Moscow, Petrozavodsk (Russian Federation). In accordance with the Memorandum of Understanding signed between the Petrozavodsk State University and the University of HHH, teachers and social workers of pre-school education in the third or fourth year of their undergraduate program were invited to the primary or secondary school in Petrozavodsk for three to four weeks prior to the beginning of the the main official program. During this training in the Russian Federation, we planned and implemented special, additional English lessons, attended regular training sessions for teachers and participated in joint preparatory activities for the lesson. They also had the opportunity to get acquainted with Russian culture and learn to understand the Russian education system, including strategies and approaches to teaching and teaching. Petrozavodsk is the capital of the Republic of Karelia in the northeast of the Russian Federation with a population of about one million people. Before the trip, none of the teachers before the start of the training did not have intercultural training in the classroom outside the Australian context. For four students, it was their first visit to Russia when they first saw the "big" class (with 50-60 students) taught by one teacher in the classroom, and their first experience was to start the work day before 7:00 am to prepare for the first the lesson of the day, which usually began at 8:00. For our students, these were new problems and experiences related to new opportunities in the learning and training process. The second author, a representative of the Russian-speaking university and the organizer of this placement in Russia, was in Karelia with four of his students. To study the broader picture of this international teaching practice, she interviewed four local instructors and interviewed 80 Russian students who were taught and trained by the University of HHH to find out their views and perspec-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tives on how they felt working with Australian teachers and what they perceived as the contribution of Australian teachers in their educational environment. The survey and survey data provided valuable information for this study, not only to inform the teaching experience in the Russian Federation, but also to better understand intercultural communication and teaching and learning, especially in the context urban promote social growth & cohesion. The third author represents the Moscow Open University (a HEI, providing distant education for the entire territory of Russia) and has wide international experience in higher education. He had professorship at universities of Russia, Ukraine, Germany and Poland, was a faculty dean, a national didactic committee member, manager of about thirty international projects in the field of higher education. His contribution to the new cross-cultural training programs will be based on his wide international experience.

BACKGROUND

The work carried out by the staff of the HHH university showed that the teacher-pupils will greatly benefit from the international experience of teaching, understanding more about children and opinions, beliefs and understandings and methods of teaching and learning in different contexts, urban conditions promote social growth and rallying (Mkrttchian, et al, 2011-2018). This section was considered by us on two positions: training and small business:

The Cross-Cultural Teaching Experience of Pre-Service Teachers and Social Workers

On a broader level, research literature suggests that the advantages of international teaching experience are professional and personal growth, including increased confidence, better evaluation and respect for differences in other and other cultures, and awareness of the importance of reflection in professional cultural development. Our research on similar pedagogical education programs in other regions and other countries shows that international experience can contribute to the development of students and teachers in various ways, such as: flexibility, tolerance, patience, self-confidence, self-criticism, courtesy, independence and the ability to adapt in another culture concluded that the international experience of teaching students can potentially change the beginning of the teacher's thoughts about himself, curriculum development and strategy training; increase the skills and abilities of effective teachers; resolve and encourage the study of personal beliefs, habits and values, and encourage a commitment to openness (Mkrttchian, et al, 2011-2018). All these factors should influence, finally, on quality of the teaching process (Gorbunova, et al, 2012) and should be directly taken into account during organization of education management (Chernyshenko, et al, 2012). We have seen that there is a convergence of views on the value of foreign professional experience and evidence of the use of such programs in numerous teacher training programs in Australia and internationally. Nevertheless, there is still a need for a new, focused study to determine the full effectiveness of such programs, including specific elements of pedagogical pedagogy and identity that they help to develop the system of international exchange and training (Mkrttchian, et al, 2011-2018). We noticed that the literature focuses on the perspectives and growth of the number of students - teachers and social workers during international pedagogical practice, our studies have shown that in very few studies reviews of local instructors-mentors and local students are considered, how they relate to approaches to learning, and also to what kind of harm they bring to local

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

schools and communities due to language barriers. Therefore, the answer to questions about the impact of the international experience of teaching students-teachers and social workers on the local context remains uncertain and needs further study. The main focus of this study was not only on how the teaching experience of the Russian Federation influenced the prospects for Australian teachers and social workers in teaching and learning, as well as their personal and professional development, but also to study that Australian student teachers and social workers bring in the local Russian context. This was achieved by studying the experience and voices of local instructors-mentors and students. (Mkrttchian, et al, 2011-2018) with using general approaches to development of international education standards (Chernyshenko, Okhrimenko, 2009).

The research proposed in this chapter was intended to answer the following questions:

1. How do Australian student teachers and social workers from the HHH university reflect their Russian experience and what is the impact of this intercultural placement on the personal and professional development of Australian student teachers and social workers?
2. How do the teachers and students of the Russian mentor perceive their experience with Australian student teachers and social workers, and how does this cross-cultural practice contribute to the local context from the point of view of teacher-mentors and students?

All the studies were organized around the study of these central issues. Based on these issues, more specific reflexive questions were developed to receive feedback from three different groups of participants. The study was approved prior to a trip to the Russian Federation by the Ethics Committee of the University of HHH, Australia.

The Small Business From Russia "Green Roofs" and Technology Green Roofs

Every year, green roofs are becoming an increasingly popular element of environmental construction. Now green roofs are covered by garages, shopping centers, they are used as playgrounds, restaurants and other recreational areas. Most green roofs are found in the southern climate, but there are also single projects in the northern conditions of Russia. The creation of green roofs in conditions with a high fluctuation of average annual temperatures is very effective.

The rapid pace of urbanization of the modern world leads to an inevitable deterioration of the ecological state of the environment. Thus, a high level of noise, dust, pollution of air emissions from road transport and industry, the reduction of optimal visual environment (a large number of homogeneous and aggressive visual fields) undermine people's health, violate the psychological balance and are generally characterized as unfavorable for living and working of the population.

The researches of the authors of the chapter, conducted in Faro (Portugal) and Petrozavodsk (Russia), showed a complicated ecological situation in the northern and southern European countries of different countries, which is connected with the lack of green spaces.

The territory of Petrozavodsk is 135 sq. M. km, including directly urban land -113 square meters. km, the rest - the city's forests. The green zone of Petrozavodsk covers an area of 48.2 thousand hectares, including 1.8 thousand hectares within the city limits. The forest park area of the green zone is 12.9 thousand hectares, the forestry part is 35.3 thousand ha. Parks, squares and street plantations occupy about 400 hectares, which is somewhat more than 14 square meters per one inhabitant.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

On the territory of the city of Petrozavodsk, the main indicators of the ecological situation in the area were investigated. We studied the noise level, the level of dust pollution, the degree of gardening of the city.

The noise level was measured in the summer and autumn (after the fall of the leaves), as well as in the absence of precipitation and strong wind. A route of measurements was compiled with the selection of certain points for the study. At each point, three replicates were measured at different time intervals: in the morning (7.00 - 9.00), in the afternoon (12.00 - 15.00) and in the evening (17.00 - 20.00). For the accuracy of each result, the computation duration was at least 5 minutes. The microphone of the sound level meter was directed towards the noise source at a distance of half a meter from the observer.

In summer, the minimum noise level of 25 dBA was observed in parks and squares. This is due to the presence of green spaces. The maximum value of 52 dBA was observed on Rovio Street. In the autumn (impersonal period), the minimum noise level was fixed at 30 dB on Lisa Chaikina Street. The maximum value of 59 dBA was observed on the Lososin Highway. The maximum values in most cases adjoin the places of delay of the traffic flow (pedestrian crossing, traffic light). Also, the noise level is increased in places where illiterate landscaping is created or not created at all.

The results of studies of the dustiness of the city's atmosphere show the level of dustiness in the central district of the city. The minimum amount of dust on the Topol Siberian leaves was recorded at a distance of 0.3 km from the lake - 0.0587 g / m2, maximum at a distance of 2.08 km 0.3108 g / m2. On the leaves of Lipa large leaf, the maximum value was found at a distance of 0.5 km - 0.2375 g / m2, the minimum - at a distance of 0.08 km -0.0406 g / m2. The distance from the water area of the lake has no effect on the dust content.

The results of the studies show the level of dustiness in the central district of the city. The minimum amount of dust on the leaves of the Topol Siberian was recorded at a distance of 0.3 km from the lake - 0.0587 g / m2, maximum at a distance of 2.08 km 0.3108 g / m2. On the leaves of Lipa large leaf (Figure 5) the maximum value was found at a distance of 0.5 km - 0.2375 g / m2, the minimum - at a distance of 0.08 km -0.0406 g / m2. The distance from the water area of the lake does not affect the content of dust in the air.

This numeral indicates the need to create additional green spaces. Regardless of climatic parameters and temperature conditions, cities experience an acute shortage of gardening.

Green plants are able to neutralize the harmful effects of many negative environmental factors. The problem of gardening is complicated in conditions of dense development, when in order to save space, similar houses are being built, leaving no space between them for parks and public gardens. One of the ways to solve the problem can be the creation of green roofs, when on the roofs of buildings, depending on the required functions, an exploited or unexploited construction, including green plantations, is created.

G. Petrozavodsk is a unique city. The range of fluctuations in average annual temperatures is from -40 to +30 degrees. The amplitude of the temperature fluctuation is 70 degrees. This number is typical for a few cities, some of which are located in the south near the equator (see cities). Therefore, in part, studies conducted in Petrozavodsk can be considered model for cities with wide amplitude of average annual temperatures.

The green roof allows you to reduce the air temperature in cities in summer (up to 10 ° C), thereby reducing the effect of the thermal island; Exclude the release of hazardous to human health volatile substances; Reduce air pollution (plants on the roof can catch up to 50% dust from the air streams); ensure the supply of oxygen; Reduce the total background noise from 2 to 10 dB; increase due to the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

slow evaporation of moisture from the soil humidity in the cities; regulate the number of storm drains; To exclude rapid spread of fire on the roof surface during fires.

Recent studies conducted in conditions with a wide range of fluctuations in mean annual temperatures have shown that the difference in temperature in the premises under the green roof and under the usual roof is 0.76 ° C. The difference in the room temperature under the green roof and the environment was 2.45 ° C. The difference in the room temperature under the usual roof and the environment was 1.69 ° C.

The Russian company "Green roofs" is a scientific and productive branch of Petrozavodsk State University. It was very interested to work in Australia, where there is no such technology for making roofs, but it did not have success in overcoming the existing barriers. The authors of the chapter before presenting their experience of overcoming these barriers below represent the company "Green roofs".

Green plants are capable of neutralizing the harmful effects of most negative environmental factors. The problem with planting of greenery is getting more challenging in the restrained urban conditions, namely when twin houses are built to save space, leaving no room for parks and public gardens. One of the solutions to this problem could be construction of green roofs, when on the surface of regular roofs a certain design with green plants is set which is either in or out of use, depending on its purpose.

A green roof is able to lower air temperatures in cities in summer (up to 10ºC), thus decreasing the heat island effect; to prevent emissions of volatile substances which are detrimental to people's health; to decrease air pollution (rooftop plants are capable of keeping up to 50% of dust from the air flow); to provide oxygen supply; to lower the general background noise by 2-10 dB; to increase air moisture in cities because of the slow water evaporation from soil; to adjust the number of storm drains; to prevent fire from spreading fast on the surface of the roof in case of emergency. Thanks to modern technologies and materials it is now possible to create rooftop gardens with lawns, flowerbeds, ponds and fountains.

An extensive downside of industrialization is waste management. If we take into consideration the cafe-coffee culture in Australia, it creates a colossal damage. According to sustainable campus of university of Melbourne it is estimated that Australians use one billion disposable coffee cups each year. Large amount of plastic and paper use goes towards the culture of industrialized societies however we have not yet reached a point where we can handle the waste created up to the present point. When considering a further industrialization of largely populated region such as Africa the factor of waste management cannot be ignored.

A green roof (ecological roof, accessible roof, living roof, and vegetation covered roof) is a roof that is partially or completely covered with vegetation located in the upper part of a roof panel on a waterproof membrane with a growing medium.

Researchers single out two types of green roofs: intensive and extensive. There are also some transitional options: half-intensive green roofs and half-extensive green roofs. All these types are mainly differentiated by thickness of a growing medium, mounting and running costs and by species of plants used in green roofs construction.

Extensive Green Roofs

An extensive way of roof greening is the easiest one. It is often used on roofs of industrial factories as well as in greening garage, gazebo and terrace roofs and roofs of different kinds of household buildings.

It is worth mentioning that extensive green roofs are not designed for walking or recreation and are mostly used for ecological or aesthetical purposes.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Such type of roofs has a very thin growing medium and besides that it does not require much maintenance. As far as economy goes, this type of roofs is considered the least resource-intensive.

Various species of moss, succulent plants, and herbs are often used in extensive roof construction. Such roofs are typically covered with sedum, and spurge, aye-green. These plants are officially approved for green roof construction in America and Singapore.

Features of extensive green roofs:

- Limited number of plants, few opportunities for creating a composition;
- Low running costs – normally not more than two checks a year;
- The roof is not thick;
- It does not weigh much;
- Cheap installation and technical maintenance are in Solution and recommendations.

Intensive Green Roofs

Such kind of roofs has a thicker growing medium that allows to grow trees and shrubs (except for species with a taproot system).

Permanent technical maintenance, irrigation and fertilizers are necessary for enabling intensive green roofs to function properly.

Intensive greening is characterized by:

- Thick layer of soil;
- Heavy weight;
- Higher capital costs;
- Increased diversity of plants.

An intensive green roof is a real garden that gives an opportunity to grow not only plants but also shrubs and trees. According to its performance characteristics, a green roof can hold from 100 to 700 kg for 1 m^2.

The technology of green roof construction includes several important stages.

1. Pre-design stage

This stage implies analyzing the given roof, how suitable it is to be turned into a green roof. Records of the building are looked into (the building's permissible load, roof coating materials), sizes of the planned roof are measured, the roof's susceptibility to winds is found out, and also a sunlight analysis is done (unless the data is provided in the records)

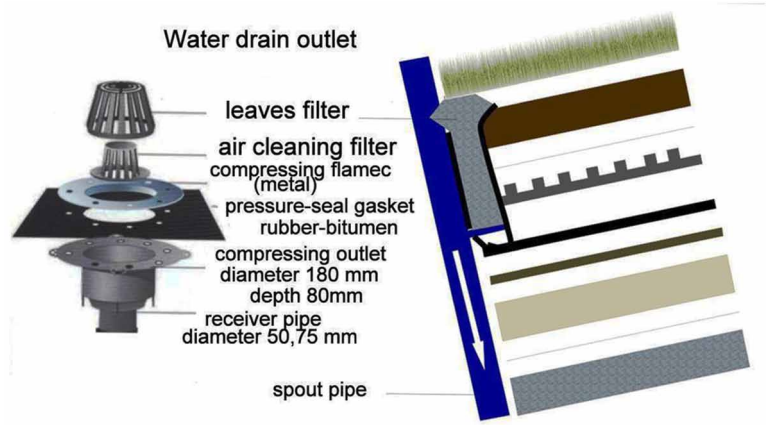
The building's permissible load must be no less than 200 kg for 1 m^2 (considering an average snow load to be 100 kg for 1 m^2). In this case it is possible to construct a roof of the extensive type. An intensive green roof requires the permissible load to be more than 200 kg for 1 m^2. It is crucial to be aware of the layers of the given roofing pie in order to specify the number of layers in a future green roof. So, if the given roof has liquid roofing, it means that a green roof can be created without any deconstruction.

It is necessary to measure the inclination of the given roof to determine the type of a green roof to be constructed. The inclination being less than 8 degrees allows constructing any type of roof. The inclina-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tion about 8 degrees is believed to be the most suitable for a green roof. With a bigger inclination only an extensive green roof could be constructed with the use of a volume georgic.

A sunlight analysis, the roof's susceptibility to winds as well as the wind diagram help to find proper plants that would naturalize best on this given roof.



At this stage the green roof type is chosen (extensive, half-intensive, intensive). A landscape design project of the green roof is created depending on its type; the basic structure of the green roof is determined in accordance with the given roof. Choosing the type of the roof implies analyzing the data gathered during the previous stage. Such a comprehensive approach allows constructing the roof type that best fits the building. The construction of an extensive green roof does not differ much from the construction of an intensive green roof. In making a rooftop garden with large-sized trees it is possible to make use of extra water isolation and a blocking layer (landscape fabric) to create a better protection from root penetration. Construction of different types of roofs depends on how thick the layer of the soil is.

It is advisable to use the following construction materials:

- VA pour barrier – Izospan A, Izospan B;
- Thermal covering – glass wool;
- Surface cast - cement-sandy mixture;
- Water isolation – liquid rubber;
- Drain membrane – graded membrane PLANTER TechnoNicol;
- Landscape fabric – polymeric nonwoven material 200 gr/m^2.

The water drain installation scheme is shown in figure 1.

Figure 1. The water drain installation scheme

A water drain outlet is used for this purpose; it is also waterproofed with a layer of liquid rubber. The water drain outlet is attached to the spout pipe of the roof. The outlet is put between the layer of green plants and water isolation in the lowest part of the roof. To provide the best water drain the inclination of the green roof must be 8 degrees.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The design of a green roof depends on certain conditions (insolation, exposure to winds, and the wind diagram). A set of documents is prepared: a general layout, a dendrological plan, a layout drawing, a plants drawing, and a lighting and watering plan (if necessary)

At this stage the green roof construction is carried out, its landscape design is created and the whole green roof construction process is supervised.

Upon finishing the construction of a green roof it is important to take a range of measures to take care both of the roof and the plants that are growing on it. So that the green roof could function properly, the following requirements must be met:

1. Monitoring leaks 2 times a year (in autumn and in spring after pouring rains and snow melting).
2. Using supplementary fertilizers or bio compost in the ground coat in order to provide better nutrition for green plants and help them naturalize - at least once a year.
3. Monitoring the plants' condition regularly. As the first symptoms of freezing or different diseases appear it is necessary to provide good quality treatment and care.
4. Conducting technical maintenance of water drain outlets at least two times a year (in autumn and in spring).
5. If applicable, conducting technical maintenance of automatic irrigation and illumination systems before and after use.
6. Immediate removal of weeds and other undesirable plants.
7. During construction and use of intensive and half-intensive roofs it is necessary to protect them against pests.
8. During construction and use of intensive and half-intensive roofs such measures are necessary as timely lawn mowing, repairing lawns, decorative and anti-age trimming of trees and shrubs.

The proposed technology should be based on theoretical understanding of the processes from the point of view of population ecology and mathematical modeling. The authors have an approach to consider the green technology as a population development process (Belozyorov, Chernyshenko, 2014), forming a succession, which leads to sustainable ecosystems (Chernyshenko, Ruzich, (2013).

MAIN FOCUS OF THE CHAPTER

Issues, Controversies, Problems

The main focus of the research, the results of which are outlined in this chapter, is how to solve the problems, disagreements and problems of the experience of intercultural students / teachers, and the business of green roofs and how these decisions are related to urban policies and / or urban growth in Australia and Russia. Proceeding from the foregoing, it is necessary to combine the results obtained in the Russian Federation on the experience of intercultural students / teachers, and the business of green roofs. To do this, we need to develop new, special principles and create a practice of qualitative case study by all the numerous participants engaged in this research project. The need to develop and create such a qualitative approach was dictated by the fact that the research of case studies is focused on the development of large descriptions of specific phenomena (events, experiences and meanings that are attributed to them) in the epistemology of the concrete. Therefore, we used the traditions of case studies,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

as our research was intended to provide a detailed, holistic and descriptive description of how Australian student teachers interpreted their experience in the Russian Federation and how the teachers and pupils of the Russian mentor perceived their experience with Australian students teachers, and how the Russian green roof business integrated into the Australian reality, breaking all intercultural barriers, The created opportunity are related to urban policies and / or urban growth in Australia and Russia. The study was also based on the belief that a case study is the preferred strategy when:

1. The question "how" or "why" is asked about a modern set of events, according to which the researcher has practically no control;
2. Researchers are interested in insight, discovery and interpretation, not in testing hypotheses;
3. The type of data required is what people tell you and what they do, which allows the researcher to understand the meaning of what is happening;
4. Using this approach of qualitative case study, we organized this research project so that we could hear the voices of the participants.

Using this approach of qualitative case study, we organized a poll so that the participants could hear the voices of both the Russian Federation and the Australian Federation. To protect the anonymity of participants, aliases were used during the study. Four students of the fourth year undergraduate education voluntarily participated in the study. These pedagogical students and social workers have already successfully completed more than 70 days of vocational training in primary and secondary schools in Australia. The minimum requirement for registration by the Victorian Teachers Institute in Australia is 80 days of supervised training. At the beginning of the trip they did not have the skills of the Russian language. During a three-week international training in the Russian Federation, they were already able to work with local journals that contained statistical information and that included daily experience in the school and other details of cultural experiences and excursions. Students, educators and social workers described what they observed in the school, and how they felt about Russian educational concepts, student training activities, strategies and approaches to learning, and about the lessons they taught. They also included observations and reflections on weekend activities outside the school. At the end of the trip, the student teachers completed the final analytical work, which was the main source of data for this study. In addition, records of researchers of class observation in the Russian Federation and e-mail messages from the teachers and social workers' judges were also used as sources of data. As noted above, the Russian company "Green Roofs", this scientific and productive division of Petrozavodsk State University was very interested in working in Australia, where there is no such technology for making roofs, but was not successful in overcoming the existing barriers. The authors of the chapter have developed a new on Solutions and Recommendations overcoming this barrier, which is described below decisions, are related to urban policies and / or urban growth in Australia and Russia.

SOLUTIONS AND RECOMMENDATIONS

To present the results of the research, we organized data on three broad topics; first, a valuable cultural experience for all participants; secondly, differences in educational concepts and learning strategies, and thirdly, student-teachers and social workers reflect on their personal and professional development. We recognize that these individual topics can be interpreted in several ways and distributed in differ-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ent categories. Where possible, for the purposes of this document, we focus on the initial voices of the participants.

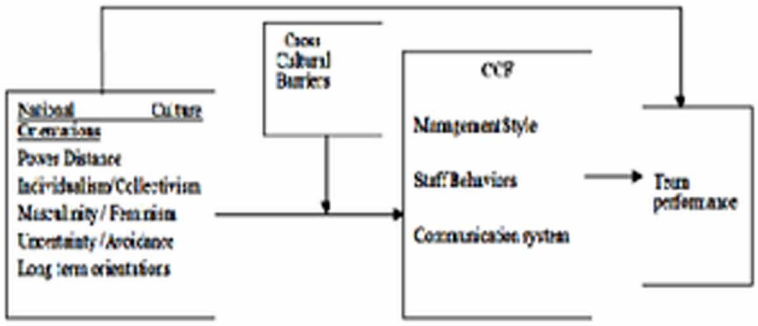
In general, Australian student teachers, local tutor teachers and local students appreciate this cross-cultural experience and consider it an unforgettable and meaningful life experience. Some of the basic values in traditional Russian culture, such as respect for teachers, hospitality and friendliness, impressed the Australians very much. The warm reception and friendly attitude of teachers and pupils of the school was repeatedly noted. Valuable cultural experiences and attitudes for Australian student teachers and social workers, as well as Russian teachers and students, along with the green roof business project, provided an interesting, new solution to the issues of urban and / or urban growth in Australia and Russia. In everything, everything was mentioned, how stimulating and exciting cultural experiences were for themselves and how they were warmly welcomed in schools and culture.

The goal is to link the barriers and style of management of intercultural communication (Gerald, 2000), the communication system and the behavior of employees of the Russian firm Green Roofs in Australia. Highlights define the basis of the conceptual model and hypothesis to achieve this goal (Huselid, et al, 1997; Becker et al, 1999; Wright, et al 1999). Therefore, we developed and tested six hypotheses, the verification of which served as a test for the purpose of the study, namely, is described below decisions, are related to urban policies and / or urban growth in Australia and Russia. These hypotheses are expressed as follows:

Hypotheses

- National culture does not influence the style of management of Russian companies
- National culture influences the style of management of Russian companies.
- The national culture does not affect the communication management system of Russian companies.
- National culture influences the communication system of management of Russian companies.
- National culture does not affect the behavior of Russian companies
- The national culture influences the behavior of Russian companies.
- National cultural values affect the productivity of the team in Russian companies.

Testing the Hypothesis



Based on the purpose of this study, three hypotheses were mainly proposed. Each hypothesis was tested using correlation analysis and multiple linear regression analysis and variance analysis. As for obtaining significant items related to the values of the national culture, intercultural communication barriers and efficiency, factor analysis was conducted. All variables, with the exception of communication systems, are positively and significantly correlated with Team Management. The style of behavior and management of personnel in terms of choosing hiring is up to 20% of the difference in the company's performance ($R2 = 0.2$). To test the mitigating effect of the communication barriers measured by the power distance on the relationship between the management style and personnel behavior, the coefficient of determination (R2) obtained when the cultural orientations were in the regression equation and when they were not compared. Communication barriers and national culture account for 30% of the total productivity of the group. We conducted a study in which we developed a conceptual model linking all variables by introducing intercultural communication barriers to mitigate the relationship between national culture

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and management style, communication system and staff behavior. Their joint influence on the work of the team earlier, before us was not considered in Russian firms operating in Australia.

The conceptual model of the small Russian company "Green Roof" to overcome existing barriers in Australia is shown in Figure 2.

Figure 2. A conceptual model of small Russian company "Green Roof" for overcoming the existing barriers in Australia

We found that the structure assumes that the relationship between the national orientation to culture, the style of management, the communication system and the behavior of personnel. It is proved that there is a direct link between the national culture and the teams. Our research put forward the hypothesis of a direct link between national culture and the work of the team. It was shown that existing intercultural barriers, a moderate relationship between national culture and managerial consequences in a multinational firm. It can be argued that the national cultural values do not directly lead to team productivity, but they affect the process, for example, motivate the work of employees, and these processes ultimately lead to the achievement of the team. As a result of our research, we emphasize a fundamental understanding of how the Russian company Green Roof is facing cultural barriers in communicating with the leadership of teams in Australia. Moreover, the result was influenced by the index of national cultural values (power distance, individualism / collectivism, masculinity / femininity and long-term orientation) to command management. From the analysis of the results, these communication barriers are associated with the influence of national culture on the workplace and the behavior of people with different identities (boss and subordinates). However, all the recommendations and decisions in today's conditions, namely, in the digital economy, require a digital transformation, only in this case it is possible that the results obtained were relevant for urban and / or urban growth in Australia and Russia. Therefore, based on the published works of Professor Mkrttchian (2018), technical solutions were summarized that are universal in nature and are given below.

Digital Economy and Digital Transformation

The analysis would be incomplete without mentioning the results of comparing the state of the digital economy and Green Roof in Australia and the Russian Federation, especially on digital transformation. As a result of the implementation of our project, it was established that Australia, developed by the level

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of the digital economy, can adopt the Russian experience of teaching the basics of digital transformation of participants in this process. We have established how the learning process takes place.

The two sides of digital transformation are centered on local hardware, software and infrastructure for a distributed virtual machine model, software as a service and cloud IT. This is the transition from the physically grounded world to the digital one. This is a digital transformation. This transformation consists of two parts: the technological side and the human side. Most business and IT leaders already have a technological side, but they do not pay attention to the human side: the understanding that effective digital transformation is related to how people adopt and use technology, at least as well as in technology itself. And this applies not only to people at the top of your organization, but to everyone who works for you, especially if they interact directly with customers.

The digital approach should help in forming a proper legal environment for the considering educational transformations including green roof, particularly, of international standards (Chernyshenko, Okhrimenko, 2009) and qualification frameworks (Mitrofanova, et al, 2105). According to the research (Mlrttchian, et al, 2018) the achievement of a complete and successful digital transformation depends not only on the right technology, but also on:

- From the leaders. People at the top of your organization must lead the way through digital transformations, for example, using the same tools that they expect everyone else will use;
- From managing an employee's trip, exactly the way you manage your customer's trip. Each user expects that the online experience will be as smooth as that of the world's leading digital companies.

These are small tasks, but they are much easier to accomplish with an integrated, seamless and secure solution. Just like cloud IT solutions can help you improve the quality of customer service, it will also help you provide the best experience with employees. This can become a real impact on the business when first-line employees feel able to help their clients in new and exciting directions.

Two Critical Business Effects

Collaboration uses the collective mental capacity of your employees. Two main components are basic for collaborative technologies: the ability to work from virtually anywhere and the ability to work with simple intuitive solutions on almost any device. Premium solutions offer integrated tools that help everyone to contribute. They are easier to adapt to your specific needs and culture, they are easily scaled, they have more life cycles, and their creators usually offer better long-term support. And since they are more common, new employees may already know how to use them, which reduces the time and cost of training.

Creativity depends on the ability to find innovative solutions to existing problems. From there, it expands the possibilities of finding these solutions, finding and fixing problems and testing them again. Creativity in business is not just a series of wild ideas, ideas must also work. Thus, the necessary tools for working together also help you stimulate creativity, simplifying the experiment and finding ideas that really work.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Security and Management

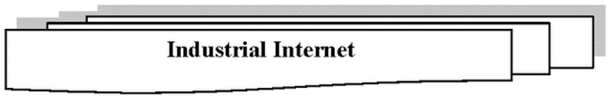
Digital transformation has opened up new opportunities, but it has also raised increased security concerns. Triple H-Avatar helps protect data that has been trusted with intelligent, permanent protection that protects data on many devices and scenarios. A simplified IT environment also allows your IT team to create and manage employees' devices and services, which reduces the burden on members of your IT team.

Business creativity depends on the ability to find innovative solutions to existing problems. Fortunately, there is a simple answer: Triple H-Avatar meets the needs of the enterprise. It integrates all existing technologies and equipment to help employees be more creative and work together safely, namely;

- Unlock creativity, helping its people to work with documents, voice and touch, all backed up by tools using AI and machine learning.
- Provides the widest and deepest applications and services, as well as a universal tool for collaboration, giving its people the flexibility and choice in how they connect exchange and communicate.
- Simplifies IT by integrating management of users, devices, applications and services.
- Helps protect customer data, company data and intellectual property with built-in intellectual protection.

Triple H-Avatar is designed for businesses with up to 50 users, but this is not limited, if necessary, the number of users can be increased to 3000. It combines all available resources with individual security and management functions. It also helps to expand the capabilities of employees, protect your business and simplify the management of IT. Namely;

- Helps your teams achieve more by better connecting employees, customers and suppliers.
- Helps your employees work anywhere on any device.
- Protects data on all devices with permanent protection.
- Simplifies the configuration and management of employees' devices and services using a single IT console.



Example of Industrial Internet in sharing use Triple H-Avatar technology from Small Russian Company "Green Roof" for overcoming the existing barriers in Australia show in fig.3

FUTURE RESEARCH DIRECTIONS

Future research on our chapter are related to intercultural progress on the part of countries and their institutions, green roof policies and urban growth policies will be aimed at studying the interaction of people, sensors, composing Internet of things, Internet sing, analysis and storage of Big Data and cyber physical systems.

Figure 3. Industrial internet in sharing use triple H-avatar technology from a small Russian company "green roof" for overcoming the existing barriers in Australia

WORLD MARKET	PILOT PROJECTS IN RUSSIA
IBM PTC GE Microsoft SAP Amazon Cisco	System integrators Foreign solution provider Software engineer
SCENARIOS OF USE	
User	**Goal**
Plants	Serviceability monitoring and optimization of equipment load
Logistic and transport companies	Transport optimization
Services and trade organizations	Analysis of clients' behavior, development of personal
Agricultural producers	Fields' monitoring, monitoring of cattle's health
Oil and gas companies	Percent increase in hydrocarbons' extraction

CONCLUSION

- As a result of our research, we underline a fundamental understanding of how the Russian firm "Green Roofs" faces cross cultural barriers to communication while managing teams in Australia. Moreover, the result was influenced by the index of national cultural values (power distance, individualism / collectivism, masculinity / femininity and long-term orientation) to command management. From the analysis of the results, these communication barriers are associated with the influence of national culture on the workplace and the behavior of people with different identities (bosses and subordinates).
- We have established that the structure assumes that the relationship between the national orientation to culture, the style of management, the communication system and the behavior of personnel. It is proven that there is a direct link between national culture and teams. Our research put forward the hypothesis of a direct link between national culture and the work of the team. It was shown that existing intercultural barriers, a moderate relationship between national culture and managerial consequences in a multinational firm. It can be argued that the national values of culture do not directly lead to team productivity, but they influence the process, for example, to motivate the work of employees, and it is these processes that ultimately lead to the achievement of the team.
- At the same time, a study of the problem of cyber-physics system for Digital Transformation showed that is section of information security, within the framework of which the processes of formation, functioning and evolution of cyber-physics objects are studied, to identify sources of

cyber-danger formed while determining their characteristics, as well as their classification and formation of regulatory documents, implementation of Digital Transformation in future. This also is certainly true, and this truth has again never been questioned. However, working in the application of Machine Learning for Digital Transformation with the using the author's Avatars-Based Management techniques, we came to the conclusion that this is not so, and the built-in cyber-physics systems can be destroyed by the same artificial intelligence.

- Example of Industrial Internet in sharing use Triple H-Avatar technology from Small Russian Company "Green Roof" for overcoming the existing barriers in Australia

Chapter 58
The Flexibility of the Workplace and Working Time:
Analysis of Employees' Preferences in Poland

Beata Skowron-Mielnik
Poznan University of Economics and Business, Poland

Grzegorz Wojtkowiak
Poznan University of Economics and Business, Poland

ABSTRACT

Organisations are more and more interested in ensuring flexibility of working time and space for their employees. This approach is enforced both by labour market volatility and company strategic plans, e.g. relocation. However, employers begin to realise that employees' flexibility is limited. While the reasons behind it might be objective (lack of legal regulations, commuting expenses), in some cases it is the employees' personal views that stand in the way. In such situation the company is much more limited in its attempts to offer a greater flexibility to its workforce. The research problem that arises here is as follows: is it possible to define the characteristics and situations in which employees are willing to accept flexible conditions of working time and space? Therefore, the aim of the study is to indicate how to increase work flexibility on the side of employees. The study focuses on four areas, i.e. changing the place of residence due to work, frequent business trips, long commuting and flexible work arrangements.

INTRODUCTION

"For employers, workforce flexibility refers to the ability to use labour in a more adaptable and variable way. For employees, flexibility refers particularly to the degree of choice available in their work arrangements" (Blyton & Jenkins, 2007, p. 74). While work flexibility can bring tangible benefits to the both parties, the diversity of available solutions and interests has put employers in a rather less comfortable situation. They are forced to adjust their working patterns not only to their business needs (e.g.

flexibility of production processes or customer requirements), but also to the needs of their workforce. In turn, employees analyse the available work arrangements from their own perspective, typically in terms of work-life balance (Bailyn, Drago, & Kochan, 2001). It is considered to be one of the key EVP (Employee Value Proposition) elements in building up employees' commitment to their organisation, so welcomed by employers (Aon, 2015; Aon, 2016; Gallup, 2013).

Companies cannot afford not to take into account employees' preferences, particularly in the so-called employee's labour market, as the Polish market has been known to be called these days. As cyclical labour market research in Poland shows, the employment rate has continued to grow while the working age population has been dropping (NBP, 2016). The unemployment rate has fallen below its historical low in 2008 and currently amounts to 6.3%, reflecting both a high demand for labour and a decreasing labour supply. This drop is partially compensated by increased market participation among the youngest and oldest populations of employees; however, the rising participation cannot offset the demographic decline in the number of working people (ageing society). Employers are aware of this change – 77% of the studied entities believe that the Polish labour market is shifting towards employee's domination (HRM Partners, 2015). Consequently, it is more and more difficult to recruit candidates, whose expectations are rising also in terms of work organisation. This refers particularly to talents and those representing younger generations of employees, who pay more and more attention to working conditions, including working time and place of work (Gibson, Greenwood, & Murphy, 2009; Weyland, 2011). At the same time, studies conducted in Poland reveal that the Generation Y employees value work stability and job security, which makes them less keen on having as high a degree of flexibility as their peers in other European countries and the US (Kmiotek, 2015).

In view of the above, a question arises: is it possible to draw conclusions about preferences of job applicants or employees regarding work flexibility, based on demographic characteristics and competence? With these features in mind, is it possible to select people whose preferences are consistent with the employer's needs or to offer them a solution acceptable to them? Can a workforce be recruited whose flexibility profile complies with that of the company, as enforced by the character of its business operations? The article tries to define the characteristics and situations in which employees agree to flexible conditions in terms of working time and space.

The authors deliberately did not consider legal aspects of flexibility in their analysis due to the variety of legislations of different countries around the world.

BACKGROUND

Organisational flexibility is a concept which has been defined and discussed by management science and in managerial practice for many years, with H.I. Ansoff (1965), H.W. Volberd (1997), Sushil (2001) and R.C. Pathak (2005) as its researchers (in: Osbert-Pociecha, 2011, pp. 136-137). It is a multifaceted term which refers to a variety of issues and solutions, differently approached by entrepreneurs, employees and governmental institutions, often used ideologically to reflect the views and understanding of the value of flexibility (Zeytinoglu, Cooke, & Mann, 2009). The diversity of the concept of flexibility makes it difficult to operationalise actions aimed at its promotion and determine the management methods and tools used in practice to achieve flexibility; its development is, however, one of the basic dimensions of the newly emerging paradigm of organisational management (Volberda, 1998, p. 13), next to securing effectiveness and quality. Due to the duality of its nature, flexibility is an equivocal term – it is associ-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ated both with changes and with stability that comes afterwards, only to be disturbed again and modified even further. As a feature of the organisation, flexibility is to ensure a smooth and the quickest possible transition through changes in between the consecutive periods of stability. The organisation may therefore be recognised as flexible not because of its ability to bring about changes but its ability to incorporate changes, which should occur spontaneously, by itself, without the need for major organisational operations. Approach to change is crucial here (is it provoked or managed), together with the source of resources (external or internal) which are necessary to ensure adequate flexibility, as discussed by H.I. Ansoff, D.J. Eppink or H.W. Volberd and others, in their concepts of flexibility.

Definition dilemmas arise in connection with labour flexibility recognised as flexible resources and as the basis for the flexibility of the organisation as a whole (Karuppan, 2004). As a feature of the organisation it takes into account the variability of external conditions and needs of the organisation and its employees, and describes labour development which is as much innovative, non-standard and deregulated, as it is adaptable and unstable (Thomas, 2009, p.13). The object it refers to is also diversified, as the category of flexibility is applied to work, labour market, employment, human capital and human resources. Out of various classifications of labour flexibility (Beardwell & Holden, 2001; Garsten, 2008; Grudney & Sarvutyte, 2007; Krol, 2014; Martinez-Sanchez, Vela-Jimenez, Perez-Perez, & de-Luis-Carnicer, 2008; Schief, 2010), two seem to be essential, i.e. that of space and type. The former denotes external flexibility which covers developments occurring in the labour market and between the organisation and the labour market, including recruitment of new employees and dismissal of those whose services are no longer required, and internal flexibility focused on changes of working conditions within the organisation. These two dimensions of flexibility are also respectively called macro- and microeconomic flexibility, with the first one interpreted as a way of ensuring the balance in the external labour market, and the second as the organisation's adaptability in labour resources management. The both types of flexibility cannot be separated, as they depend on and influence each other, i.e. a rise in the micro-scale flexibility will result in an increased macro-scale flexibility; similarly, it would be difficult to develop internal flexibility without taking external flexibility into account.

In terms of macro- and microeconomic flexibility, another classification may be proposed which focuses on what is to be made more flexible: number of employees, forms of employment and working time (numerical or quantitative); tasks/responsibilities, competence, working place, occupational and spatial mobility (functional or qualitative); or remuneration and labour costs (financial or payroll flexibility). Some authors (Grudney & Sarvutyte, 2007; Eamets & Masso, 2004) indicate that some of these flexibilities exist only in the macro, while others only in the micro terms. In fact, all of them may be found in the internal and external dimension, and all of them have a different effect on each other. For example, flexitime may be applied as a specific solution in a company, but it is at the same time regulated by the labour law as a macroeconomic phenomenon; on the other hand, the introduction of flexible forms of employment, e.g. contracts of mandate, is reflected in the flexibility of labour costs. Macroeconomic flexibility may be described as institutional, represented in formal regulations (labour regulations on working time, telework, pay). Microeconomic flexibility is organisational in its nature, as exemplified by the respective solutions implemented by organisations (flexible working hours, remote, part-time or temporary work, self-employment). The diversity of solutions proposed by organisations is reflected in numerous studies conducted in the recent years (Brown, Wong, & McNamara, 2009; Eurofound, 2016; Houseman, 2001; WorldatWork, 2015). Specific proposals depend on a number of exogenous (phenomena at the level of the economy) and endogenous (phenomena at the level of the organisation) conditions (Anxo & O'Reilly, 2000; Krol, 2014), which to a bigger or smaller extent force or encourage

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

companies to make changes in their models of work. The conditions result from the organisation's internal and external environment, and are generated by a number of legal, economic, technological and social factors. The last group of factors encompasses employees' individual characteristics and preferences that have an increasing impact on work organisation and which determine benefits for the both parties to the employment relationship (Eurofound, 2015; Zeytinoglu, 2005).

Zeytinoglu, Cooke, and Mann (2009) point to two most recent streams of literature devoted to flexibility. One discusses flexibility as demand-driven, i.e. a strategic initiative of employers to enhance business requirements of the firm. The other analyses flexibility as supply-driven, where employees have the ability to influence decisions about the nature of their work and where they, particularly women, can demand flexible work schedules to ensure a greater work-life balance. "Flexibility is about an employee and an employer making changes to when, where and how a person will work to better meet individual and business needs. Flexibility enables both individual and business needs to be met through making changes to the time (when), location (where) and manner (how) in which an employee works. Flexibility should be mutually beneficial to both the employer and employee and result in superior outcomes" (Aequus Partners, 2010). "A meta-analysis by Baltes, Briggs, Huff, Wright, and Neuman (1999) found that flexible work schedules had positive effects on both job satisfaction and satisfaction with work schedule. In a study of the 'virtual office', Callentine's (1995) participants attributed an increase in job satisfaction to increased flexibility in the location and timing of their work. Teleworkers in Quaid and Lagerberg's 1992 study (cited in Standen, Daniels, & Lamond, 1999) also reported higher levels of job satisfaction. In their 2007 meta-analysis, Gajendran and Harrison found that telework was associated with increased job satisfaction and reduced intentions to turnover, with these relationships partially mediated by lower levels of work-life conflict" (Beauregard & Henry, 2009).

In view of the above, the following research problem may be formed: when deciding about work organisation, to what extent is the organisation limited by its employees' needs? If flexible work arrangements are to motivate employees, they cannot be imposed purely for business reasons. However, if flexibility is necessary in order to ensure competitiveness, meet hard technological conditions or customer requirements, the company has to find employees willing to accept the solutions it offers. Organisations may find it easier if they know which characteristics to look for and objectively verify either in a recruitment process or workforce analysis. Given the development prospects for the Polish labour market (deepening labour shortages), key groups of employees include women, young people entering the labour market, people over 50, and, regardless of age and sex, people with higher education and a high potential for personal growth (NBP, 2016). Increased participation of women and people over 50 may result in an employment growth in organisations, while young people and those with higher education can have a positive effect on the amount and quality of work, thus compensating for quantitative shortages. Each of these groups is associated with a positive attitude towards work flexibility (Kmiotek 2015; Zeytinoglu, 2005; Zeytinoglu, 2009): women due to family responsibilities, older people may no longer have those but they are limited by health issues, young people are on the pursuit of diverse and constantly changing interests and seek professional development, while the well-educated and talented perceive flexibility as a privilege and compensation for their competence. However, as studies from the UK and Greece show, employees' attitude to flexible work arrangements is not always so positive and it depends on sex, place of work and previous opportunity to work in a flexible environment (with seniority and age as important factors) (Giannikis & Miahail, 2011; Sullivan & Smithson, 2007).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Based on the study results presented below, an attempt was made to evaluate the attitude of the Polish labour market to selected forms of working time and space flexibility, with respect to demographic characteristics and competence of the respondents.

FLEXIBILITY OF WORKING TIME AND SPACE IN THE LIGHT OF AN EMPIRICAL STUDY IN POLAND

Methodology

The data was collected by the means of the Paper and Pencil Interviews (PAPI) carried out in the period of July-August 2015 on a sample of 160 people – the structure of the sample is presented in Table 1.

Table 1. Structure of the Sample

Category		Persons in the sample (%)
Sex	Male	34.38%
	Female	65.00%
Age (years)	20-29	45.63%
	30-40	23.75%
	40-55	20.63%
	>55	10.00%
Years of work experience/ seniority	<3	23.75%
	4-9	25.63%
	10-20	17.50%
	>20	29.38%
Education	Primary and vocational	1.88%
	Secondary	23.75%
	Higher: BA degree	33.75%
	Higher: MA degree	40.63%

With such structure the sample is not representative. The main selection criterion was the respondents' availability and consent to providing information. Consequently, the analysis of the responses cannot be used for forming general conclusions about the whole population. Obtained in a sample survey, the responses allow for some observations to be made only as an example which may be subject to a further in-depth research. For this reason, what was carried out was in fact an analysis of the structure of the responses without an in-depth statistical analysis.

The study focused on spatial mobility and flexibility of working time, based on the assumption that the both are strongly interconnected. Spatial mobility affects the time devoted to work, typically by extending it without any temporal or financial compensation offered in return (working overtime).The

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

time available to the employee to organise their life outside work is limited, which affects their level of commitment and satisfaction.

The following were adopted as potentially different for the respondents and thus relevant to the subject of the study: demographic characteristics (sex and age) and competence (education and seniority, i.e. years of work experience). In terms of education it was assumed that higher education offers more opportunities to decide about working conditions; organisational talents are also mainly people with a solid formal education. For this reason, only the respondents with at least secondary education were included in the analysis. Those who described their education as primary (graduates of primary school or lower secondary school, in Polish: *gimnazjum*) and vocational (graduates of vocational school) constituted a small percentage of the sample and were therefore not taken into consideration.

All the respondents were professionally active before and/or at the time of filling out the questionnaire and had work experience allowing them to realistically assess the options offered in questions (verified against their seniority). The questionnaire included projection questions in which the respondents had to refer to hypothetical situations reflecting four aspects of labour flexibility: changing the place of residence due to work, business trips, commuting to work and organisation of working time. The first three are related to spatial and the last one to temporal flexibility. The results of the study are presented in these four categories.

Changing the Place of Residence Due to Work

In its most radical version, spatial flexibility or mobility, involves changing the place of residence due to the change of employer or job relocation. The survey outlines a situation which may occur both when the employer is changed and when the employer remains the same while the place of work changes. The respondents had to answer the following question:

If my employer offers me a relocation package (equivalent of the 6-month salary), will I be willing to move 300 km away from the current place of residence?

The amount of the relocation package was estimated as an offset between an attractive offer and potential removal expenses. The distance between the previous and new place of work was calculated to exclude daily commuting from the current place of residence (given the average transport conditions in Poland), with the option of weekend returns.

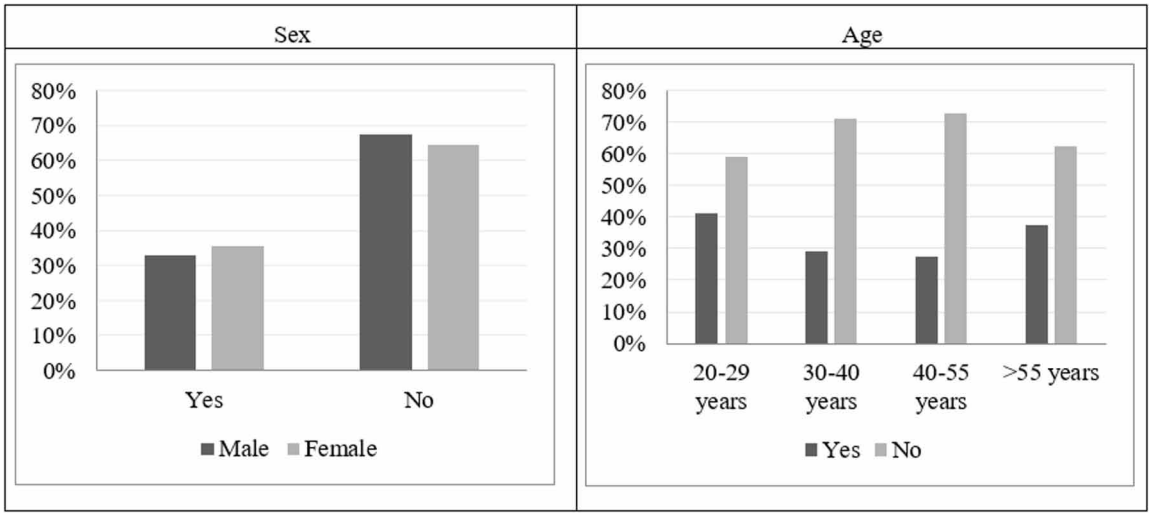
In total, the answer of 34% of the respondents was positive. Surprisingly, this percentage was slightly higher among women (36% compared to 33% of men; Figure 1). The difference in responses was negligible; however, the optional mobility was rather expected to be higher among men, as men are traditionally less obliged to perform house work and family duties which require daily presence at home.

The analysis of responses by age revealed that the older the respondents, the less willing they were to relocate; although those aged over 55 were already slightly more open to this idea.

The analysis of the structure of seniority in the group which responded positively showed clearly that people with the shortest professional experience were the most willing to accept the change (Figure 2). In the other seniority groups the situation was almost identical, with most respondents rejecting the offer. Professional experience seems therefore to contribute to a negative opinion about changing the place of residence due to work or results in significantly bigger demands in this respect.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Decision about relocation with respect to demographic characteristics



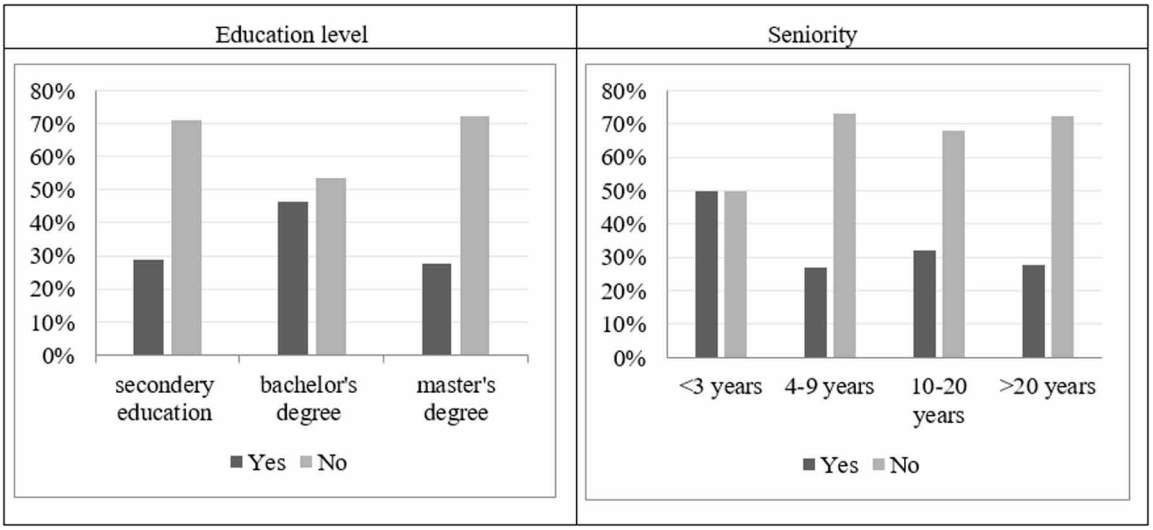


Figure 2. Decision about relocation with respect to competence

The analysis carried out with respect to education reveals significant differences. Those with the BA degree were most keen on consenting to moving (approx. 46%). This is mainly due to transition period in their professional life: people at this stage are typically still in the process of learning (which they later continue as MA studies), have a shorter work experience, are younger, and consequently, their family or life situation is different. Given the current generational changes in the approach to work, this group is most open to change and most mobile in its search for an optimal place of work. In most cases people with the MA degree have already completed their formal education and, sometimes even straight after graduation, they seek stability, want a dream/target job, have a greater sense of the significance of their competence, and are thus more ready to reject the proposal of moving, perceiving it rather as

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

destabilising their life, even if it means professional development for them. Similarly, those with secondary education will also see themselves as people with completed formal education (based on the respondents' declared seniority) and already formed competence and skills, and will rather expect their work to be stable and predictable.

Business Trips

Another question was about business trips which involve staying away from home. While it might be typical for certain jobs, such as salespeople, technicians, construction workers or consultants, it does not have to be a rule limited to specific sectors. For example, a construction company may operate exclusively in the local market and thus require no travelling on business; on the other hand, some jobs, although traditionally perceived as stationary, may require frequent business trips due to the specificity of the company operations. When choosing a profession, a career path and eventually a particular job, every employee considers their own preferences and acknowledges the fact that sometimes they will have to go away from home (e.g. to attend a training). Meanwhile, their job description, market demands or employer's expectations might change, in which case the ability to accept new conditions may be critical to boost their motivation and keep the job.

The following statement was presented to the respondents who had to choose one of the options:

As part of my job, I accept being away from home (as % of nights spent at work between working days per year): none at all, up to 10%, up to 25%, up to 50%, up to 70%.

The analysis of the distribution of the responses confirms what was assumed, i.e. a low mobility of the studied employees. Respectively, 31% and 34% of the respondents were not willing or agreed to spending approx. 10% of nights away from home as part of their job, 23% accepted spending every fourth night away from home, while less than 10% agreed to half of nights and less than 2% approved being away from home almost permanently (70% of nights per year).

The distribution by sex also reflects the general assumption (Figure 3). Among women, 41% would not accept staying away from home at all (compared to 13% of men), while 30% would agree to 10% of nights (compared to 40% of men). Extending the number of multi-day business trips was accepted by far fewer women than men; the longer the trips, the fewer respondents agreed to them.

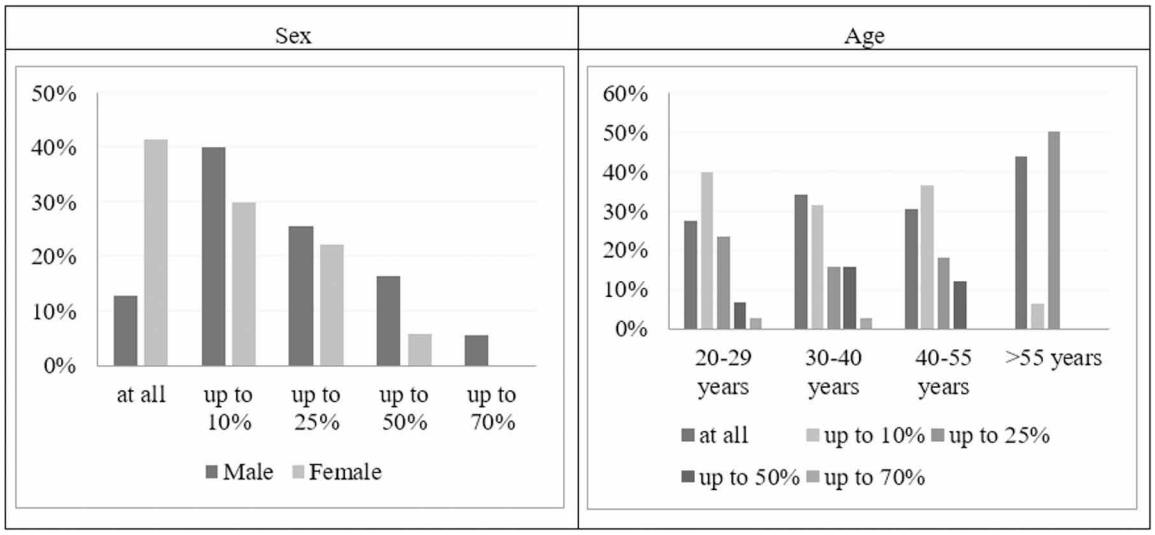
The structure of the responses by the respondents' age was relatively stable in all the groups: there was generally no consent to the longest business trips, while staying away from home for up to 10% of nights per year was approved. The older the respondents, the less willing they were to accept longer trips, with the longest option marked only in the first two age groups (up to 40 years of age). Compared to other age groups, the first one (20-29 years of age) declared a greater acceptance of shorter trips and a smaller one (10% of the respondents) of travels for over 25% of nights; in this group, however, work takes a different place among life priorities. The responses of those aged over 55 are the most interesting and homogenous; these respondents did not agree to the longest business trips at all and accepted trips for 10% of nights only to a small extent, while their approval for staying away from home for 25% of nights was the biggest.

Similar characteristics are revealed in the analysis of the responses with respect to seniority (Figure 4). The first two seniority groups (in total, up to 9 years of work experience) were most willing to spend up to 10% of nights away from home, with a similar percentage in each group objecting to making such

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

sacrifice for work (approx. ¼ of the respondents). In the third seniority group (10-20 years of work experience), the percentage of those against such solution was the highest (46%). The group of 4-9 years of working experience was the only one in which the longest trip option (up to 70% of nights away from home) was at all accepted. The last group with the longest seniority turned out to be the most polarised; the percentage of the respondents who did not accept any overnight trips and those who agreed to trips of up to 10% and 25% of nights was similar. At the level of 9%, the acceptance of trips taking up to 50% of nights per year was also similar to the other groups.

Figure 3. Approval for business trips with respect to demographic characteristics



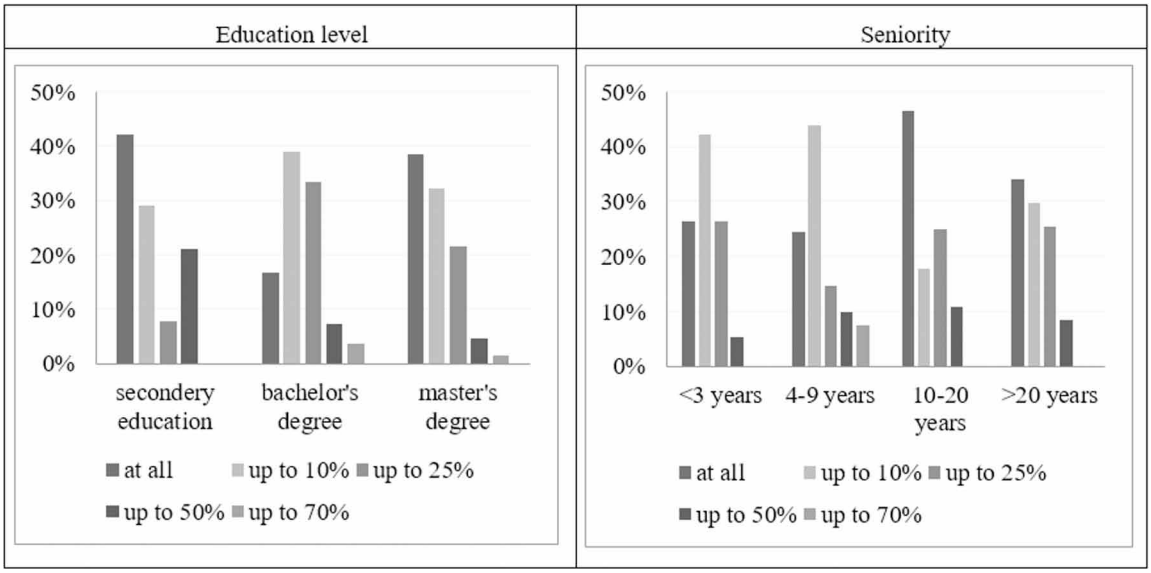


Figure 4. Approval for business trips with respect to competence

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The analysis of the results with respect to education suggests that people with the BA degree were the most open group to the idea of working away from home; in this group the percentage of those who did not accept this option at all was the smallest, while that of those who agreed to trips of up to 10% and 25% of nights was the biggest. The groups with secondary and higher education seem to be the least flexible or the most demanding in this respect, i.e. they were characterised by a high refusal to be away from home at night and a low acceptance of working away from home for more than 10% of nights (except for the respondents with secondary education whose acceptance of working for up to 50% of nights was relatively high, while they were totally against the option of 70% of nights).

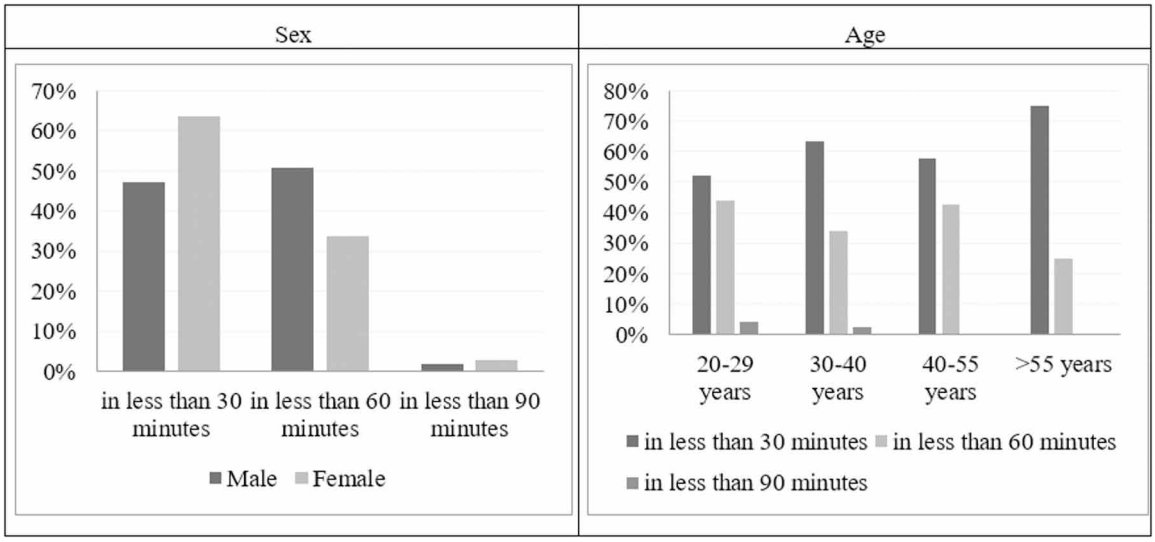
Commuting to Work

One of the responsibilities carried out directly at the expense of the employee's private life is regular commuting to work. Travel expenses depend on the means of transport and travel allowance offered (or not) by the employer (e.g. transport organised by the employer free of charge). However, time spent on commuting can truly affect the level of satisfaction with the workplace. Not everyone has the possibility to choose such work in which the commuting time would not exceed 30 minutes (one way), i.e. the time adopted by the authors as a standard value accepted by most employees under the Polish conditions. In many cases a change of the employer's seat may significantly affect the organisation of employees' private life; the distance of a few kilometres can add extra 30 minutes to the regular commuting time.

The organisation of private life connected with leisure time activities, children's education and/or spouse's work may be crucial to the logistics of commuting; unattractive commuting options or changes in this area may affect the employee's decision about their work. It is worth adding that the standard maximum time of 1 hour per day already represents as much as 12.5% of the working time.

In view of that, the respondents were asked the following:

As part of my job, I accept commuting to work which takes up to 30 minutes, up to 60 minutes or up to 90 minutes one way.



The analysis of the responses reveals that in general 30 minutes turned out to be the upper limit for 58% of the respondents, 60 minutes for 40% of the respondents, while only 3% accepted commuting for up to 90 minutes. Consequently, no further analysis of this question was necessary, whereas any future studies might consider adding the intermediate category of 45 minutes. The analysis of distribution by sex is consistent with the previous assumptions: 63% of women accepted commuting for only up to 30 minutes, compared to 47% of men (Figure 5).

In terms of age, the distribution of preferences is similar in all the groups up to 55 years of age, with small differences for the generally prevalent time of up to 30 minutes. The age groups of 40-55 and over 55 did not mark the longest commuting time of up to 90 minutes, probably for family (the former) and biological (the latter) reasons, such as health and physical condition. The group of the oldest respondents was strongly in favour of the shortest time of commuting (over 70%), with just over 20% of them accepting the commuting time of up to 60 minutes.

The analysis of the responses with respect to the seniority (Figure 6) also shows a fairly similar distribution of preferences in every seniority group: 50-60% chose the shortest time of commuting, 30-40% opted for 1 hour, while approx. 5% of the respondents (except for those with the longest work experience who did not mark this option at all) –1.5 hours. The group with the shortest work experience

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

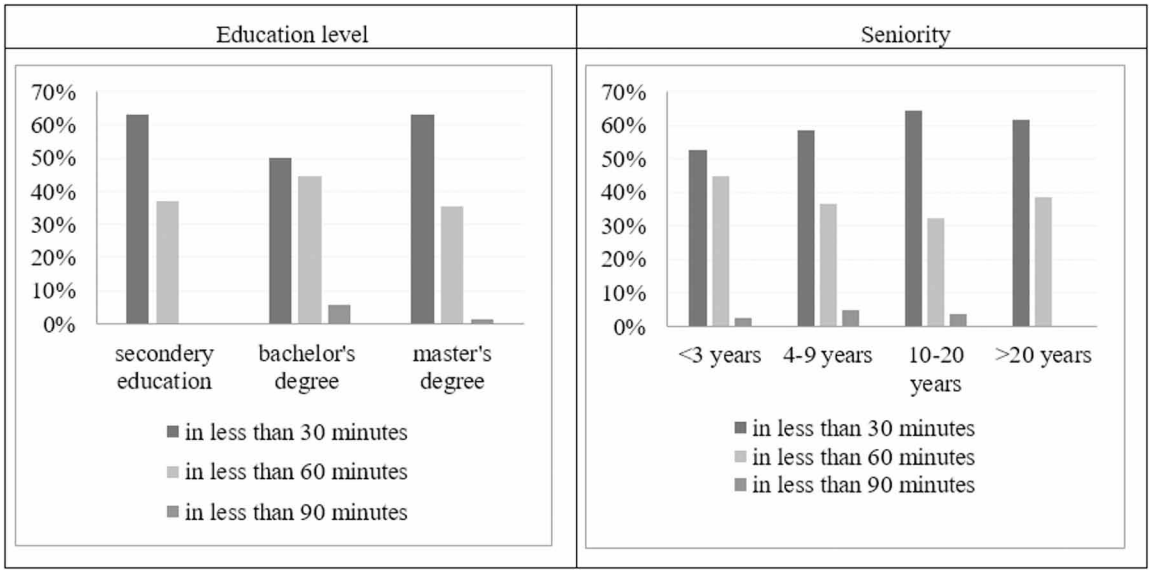


Figure 5. Approval for commuting to work with respect to demographic characteristics

was also the most balanced in terms of its preferences, i.e. commuting for 30 minutes was as good as commuting for 60 minutes.

It is more difficult to explain the discrepancy between the responses with respect to the respondents' education. The results for the groups with secondary and higher education are nearly identical; the only difference being that those with secondary education did not mark the longest time of commuting at all, while this option was accepted by 2% of the people with higher education. The respondents with the BA degree more willingly agreed to longer commuting (60 and 90 minutes), which can be linked to

Figure 6. Approval for commuting to work with respect to competence

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the respondents' age and the, already mentioned, transition period in their professional life (education still in progress).

Organisation of Working Time

Undoubtedly, flexibility of working time has the largest effect on the organisation of private life. The range of solutions available to employers is truly significant. They primarily include different working time arrangements and calculation, but also business phone calls and e-mails outside of the working hours, being at the employer's disposal even during holidays, overtime (not always correctly settled), or business trips interfering with private life (as discussed above). Naturally, flexitime is a solution that can be beneficial for the both parties. It allows the employer to reduce payments for overtime and adjust working hours to the actual requirements, while the employee may enjoy a longer weekend without taking a day off, start late or leave work early, or take brakes at work. Of course, for these solutions to be well-organised and to ensure mutual benefits for both the employee and the employer, clear rules have to be agreed in terms of planning and adjusting working hours, whereby the both parties need to respect each other's interests. This cannot be guaranteed with rules and regulations, and can only be verified in practice. Therefore, when interpreting the responses it is necessary to pay attention to the respondents' individual experience with managers representing their employers.

The study focused on the formal aspects of working time, i.e. those that determine how it is paid for and which in practice have the biggest effect on employees' private time, making it difficult for them to plan their life outside work.

The respondents had to consider the following situation:

Choose one of the two following work arrangements:

1. *Work starts at 8 am and ends at 4 pm, you need to take a day off to deal with any personal matters at this time, overtime paid in full.*
2. *Flexible working hours, overtime compensated only by taking time off on other days, unpredictability of working time (hours and days changing depending on the needs of customers and business partners).*

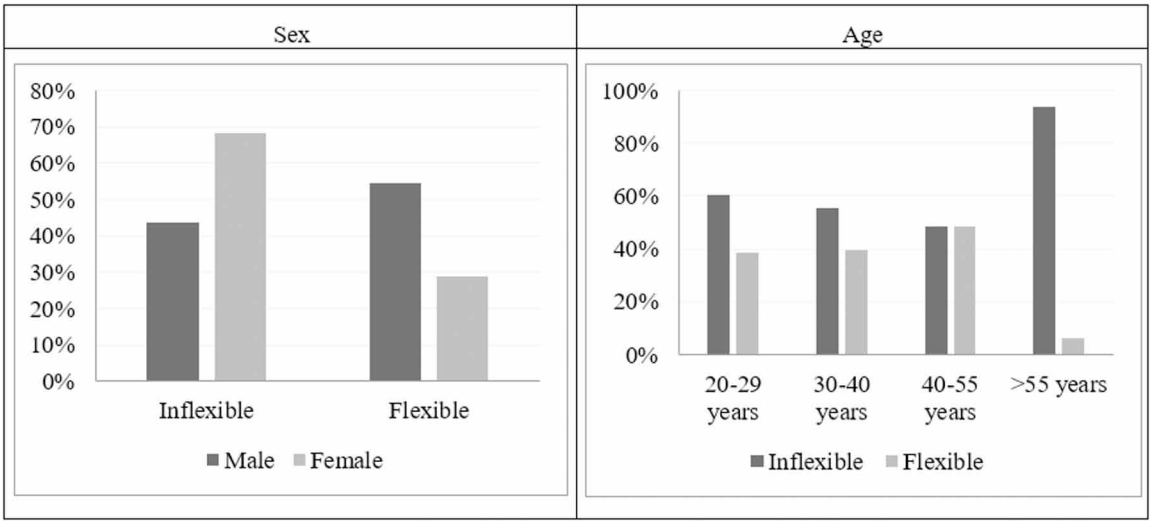
The distribution analysis of the preference of the fixed (option 1) or flexible (option 2) working time revealed that as many as 60% of the respondents opted for the traditional organisation of working time, with 68% of them being female (Figure 7). In the group of men, only 44% selected the fixed working hours. The traditional perception of male and female roles seems to be reflected in the decisions regarding the preferred working time arrangements.

The analysis of the responses with respect to age produced interesting results: among those up to 55 years of age, preferences for the both working time arrangements were rather balanced, with the acceptance of flexitime growing slowly but steadily. In contrast, a radical change was observed in the group over 55 years of age, in which only 6% marked option 2, compared to 94% of those in favour of option 1.

The analysis with respect to the respondents' seniority reveals a very balanced distribution of the responses, with the preference for the traditional, fixed work arrangements (approx. 60%) and a slightly higher than in the other groups level of acceptance of flexitime among those with the working experience of 4-9 years.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 7. Approval for working time arrangements with respect to demographic characteristics



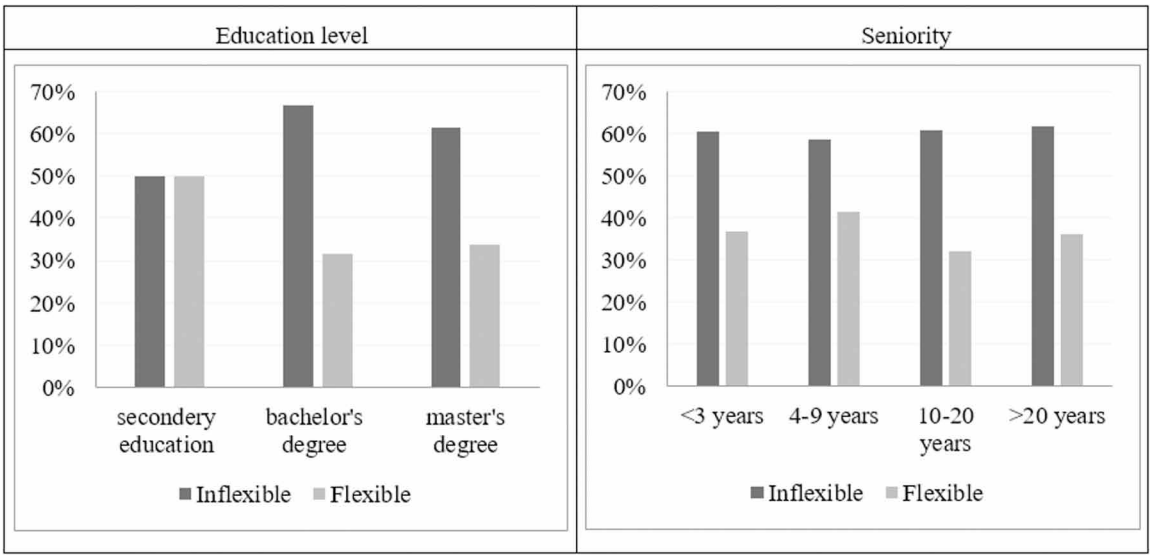


Figure 8. Approval for commuting to work with respect to competence

With regard to education, respondents with higher education (both with the BA and MA degrees) had similar preferences, with 60% of them in favour of fixed working time. Those with secondary education accepted the both options to the same extent. This may be the result of their previous experience with different work arrangements and acceptance of different solutions due to the situation in the labour market. People with the BA degree may require a greater stability, as they need to continue their education, while those with the MA may be more interested in being able to combine their professional and private life in a more predictable way.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

SOLUTIONS AND RECOMMENDATIONS

The results presented in the article come from a pilot study. Naturally, it is impossible to develop a universal profile of a flexible employee using only this data. However, based on the analysis of the respondents' social characteristics, a general hypothesis may be formed that contemporary Polish employees are rather reluctant to relocate because of their job. Similarly, they will not be very keen on too long business trips and commuting to work, which may generally point to the importance of work-life balance in their assessment of work arrangements.

In terms of sex, a similar proportion of women and men accept or do not accept (majority) changing the place of residence due to work. The same applies to business trips; the longer the stay away from home, the fewer respondents, particularly women, agreed to it. Not much changes in commuting to work, either. Most women accept the travel time of up to 30 minutes, men are equally fine with commuting for up to 60 minutes, while none of the sexes approved of longer commuting. In terms of work arrangements, women definitely opted for fixed working hours, in contrast to men. In the light of these analyses, a flexible employee would therefore be male.

In terms of age, young employees and those who are about to finish their professional career were more flexible about moving. The approval for business trips was also the biggest in the youngest group. On the other hand, the oldest respondents were more willing to agree to multi-day business trips rather than longer commuting time. This group, however, did not accept flexible working time at all. The results may be linked to the family and life situation of the respondents. People under 30 and over 55 years of age tend to have fewer non-negotiable family responsibilities, as they typically do not yet have a family of their own or their children are adult and do not require constant care anymore. Moreover, a greater mobility among younger employees may be explained by their search for an optimal model of work and professional development, and under Polish conditions, also fear of unemployment. In Poland, unemployment affects primarily young people. In Q1 of 2016, the unemployment rate among people aged 15-24 was 19.6%, compared to 16.1% in Q3 of 2008 (the lowest) and 46.5% in Q1 of 2003 (the highest). At the end of the quarter in which the study was carried out, i.e. Q3 of 2015, people aged 25-34 constituted the largest group among the unemployed (449,200), accounting for 28.1% of the total number of the unemployed. People aged 24 and younger accounted for 14.6% of the total unemployment rate. The percentage of the registered unemployed aged 35-44 was 21.6%, 45-54 – 18.1%, and over 55 – 17.6% (Central Statistical Office of Poland, 2016). It is therefore difficult to clearly identify the preferences based on age; every age group is flexible in certain categories, while it is not in others.

The analysis of the results with respect to education points to people with the BA degree as the most likely to take up work which involves moving, business trips and commuting. However, this group is the least willing to work flexitime, which makes it similar to the preferences of people with the MA degree. The latter group seems to be the least keen on flexible work arrangements, possibly because of their competence, which allows them to demand stable working conditions, and life outside work which is becoming more stable too. In the light of these analyses, the most flexible employee would therefore have the BA degree and, under Polish conditions, would typically be a young person, preferably still a student.

Seniority, understood as years of work experience, was the last category considered in the study. Approval for changing the place of residence was the biggest among those with the shortest work experience, while business trips were not accepted primarily by the employees with 10-20 years of experience, which could be the effect of their family situation. Seniority turned out to be practically irrelevant in case of commuting and working time arrangements – in the respective groups the responses were almost the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

same, with the approval for the shortest commuting time and fixed working hours. A flexible employee would therefore rather have a short work experience.

Based on these conclusions, it may be noticed that the career stage, focus on professional development and family situation have a significant effect on preferences regarding the organisation of work. This means that relatively competent people who develop their career and have families are not very willing to work under spatially and temporally unstable conditions. They see flexibility as something rather negative because it disrupts the predictability of their professional activity and private life, and may additionally have a negative impact on how their career path is perceived in the future (flexible solutions as offered to "worse" employees).

FUTURE RESEARCH DIRECTIONS

The analysis leads to the conclusion that according to Polish employees there is a category of "good" and "bad" work flexibility. Unfortunately, no clear criteria exist for what is considered to be a good or bad proposal in this respect. However, this should be an important recommendation for employers to implement such flexibility solutions which do not interfere too much with employees' private life, e.g. teleworking, home office or remote communication between branches. As many as 60% of the respondents preferred fixed solutions in terms of time directly spent at work, with a significant diversification of the responses with respect to age, sex and education, which – if interpreted as a solid and fixed conclusion – would require the implementation of extremely individualised work arrangements. While definitely welcomed by employees, such approach would not be possible in many organisations due to objective limitations (technological regime, contractors' requirements, and need for supervision). However, the diversity of preferences shows that sticking rigidly to one uniform type of work arrangement, regardless if flexible or fixed, is also not beneficial for the organisation, primarily due to the poor effect it may have on the employer's image and reputation.

A number of conclusions is difficult to interpret – particularly those regarding the analysis of the impact of seniority or education on flexibility. The interpretation of the results should be complemented with a wider social research including generational differences, with the primary focus on the position of work on young people's priority list and on the question whether the value of work changes with age or is characteristic of the given generation. Next to its scientific significance, this information may be crucial for employers in the future organisational planning and human resources management. The future studies should also address the topic of job security depending on the employee's position in the labour market, also to explore how it affects the employee's agreement to working conditions and flexibility, both formal and informal. Another interesting aspect is the question of work flexibility limits, i.e. to what extent and how the organisation can make work more flexible without it having a negative social impact (e.g. refusal to work under such conditions).

The difficulty with the interpretation of the conclusions also points to the need for collecting more extensive information on the social aspects of the respondents' life (e.g. their professional function, current form of employment, financial status or family situation).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

In the chapter, a microeconomic point of view was adopted, with the study focused mainly on employees' spatial mobility and flexibility of working time perceived as a social factor affecting the organisation of work. The observations presented in the chapter may be applied in companies – in operational management of human resources in terms of selecting and retaining employees, and in strategic management of human resources in terms of demographic changes and competence shift in the workforce. They point to the need to analyse the preferences of employees and job applicants in order to have the work organisation adjusted also to them. Even though it deals with the topic already explored for some time, the study shows that further in-depth research is needed in this respect, addressing also new aspects of work flexibility.

KEY TERMS AND DEFINITIONS

Commuting: To regularly travel from home to work and back, with all its implications (travel time, financial and organisational implications).

Flexible Working Time: Ability of both the employer and employee to modify working hours (e.g. flexitime, part-time, job sharing, compressed workweek).

Formal Flexibility: A policy officially approved by human resources or any other official policy which implements and regulates flexible work arrangements.

Informal Flexibility: A policy or practice that is not official or specified in writing but which in fact allows flexibility at work.

Mobile Working: To perform work remotely, in different locations, e.g. in the office, at home, at the customer's seat, also during commuting and business trips.

Organisation of Working Time: To regulate the length and schedule of the employee's working time (number of hours and work schedule).

Relocation: A permanent change of the location of the place of work.

Work-Life Balance: Ability to combine the professional and private life in a smooth, conflict-free way.

Workplace Flexibility: To modify and adjust the working conditions to the needs of the employer and employee.

Chapter 59
Strategic Leadership, Readiness for Change, and Innovative Work Behavior: A Field Study From Turkey

Meltem Akca
https://orcid.org/0000-0001-5544-5929
Istanbul University, Turkey

ABSTRACT

At the present time, business work environments are becoming more volatile and competitive. The development of information technologies, rapid changes of organizational structures, changeable customer attitudes are more important for today's organizations. These features of the marketplace direct organizations to be in search of new methods to achieve and maintain sustainable performance. Leadership, employee favorable work behavior, technological investments are some methods to provide continuity of an organization's existence. This chapter aims to obtain influence of strategic leadership on the employees' innovative work behavior. Furthermore, it is expected to obtain the mediator role of readiness for change in this relation. In the study, the sample is composed of four-star hotel employees in Antalya, Turkey. This evidence-based field study proves new implementation's impact on the employees.

INTRODUCTION

At the present time, the business work environment is becoming more volatile and competitive. The development of information technologies, rapid changes in organizational structures, changeable customer attitudes are more important for today's organizations. These features of the marketplace direct organizations to be in search of new methods to achieve and maintain sustainable performance. Leadership, employee's favorable work behaviours, technological investments are some of the interesting methods to provide continuity of the organization's existence.

Sustainability of an organization is related with leaders, employees and the market structure of the organizations. If leaders manage the organization with the orientation of the environmental requirements, the impact of the structural volatilities will be limited. In addition to that, employees' behaviours will be determinative on the sustainability of the organization. Particularly, employee's attitudes have a significant value when a change is planned or realized in the organization. If the logic of the environmental changes is perceived as favorable by the employees, it means that they are ready for a change. Besides, employees who expect a change is necessary for the organization generally demonstrate innovative work behaviours in the basic of related changes.

In this study, it is aimed to obtain the influence of strategic leadership on the employees' innovative work behaviours. Furthermore, it is expected to obtain the mediator role of readiness for change in this relation. In the study, sample is composed of 4-star hotel employees who live in Antalya, Turkey. This hotel is competing with other hotels in the region. In this hotel, most of the daily activities were performed manually. They have not used technological systems and information technologies in operations until their supervisor noticed that technology is everything for a volatile sector's organization. They bought technological practices, devices, and systems for the hotel's services. With this investment they aimed to i) compete with competitors, ii) open up to the world, iii) increase employee's performance, iv) minimize the failures. Managers decided to implement information technology applications on the hotel services. Most of the daily operations started to conduct through the use of new technologies. Hotelier and the leader of the employees know that the return of the investment will be profitable for them. In this study it is expected to prove mediator role of readiness for change on the relation between strategic leadership and innovative work behaviours.

BACKGROUND

Strategic Leadership

Leadership is both a process of inspiring others to accomplish planned aims and a function of sharing values (Tarigan & Kraus, 2017; Yukl & Lepsinger, 2006). Leaders are responsible for the formulation and implementation of organisational practices in the perspective of strategic requirements (Hosmer,1982). Bass (1981) defined leadership by emphasising on some points like; characteristic traits, focus on groups and teams, inducing power, an instrument to achieve aims and inspire. Basadur (2004) described the effective leader's characteristics as; helping subordinates for problem-solving, supporting them for creativity, mentoring employees for innovativeness, integrating individual and organisational aims, providing sustainability of innovative approaches, managing differences with the beneficial perspective, coordinating of all members in the organisation with harmony.

Strategic Leadership Theory goes back to "Upper Echelons Theory", which was developed by Hambrick and Mason (1984), which states output related dominance, social construct and symbolism refer to top management structure (Vera & Crossan, 2004). Leadership models and its outcomes relations were being investigated in the 1970s while upper echelons theory attracted the attention of scholars with defining the top management team's roles in mid-1980s (Boal & Hooijberg, 2000). Hambrick and Mason (1984) focused on the top management team's experience, characteristic traits, and values to understand how they perceive the environmental issues to compete with others. With this approach, the authors aimed to draw up the relationship between these specifications and the leader's profile.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Strategic leadership is considered as a leadership model at the top of the organisation who takes the whole responsibility of organisational operations. Strategic leadership is also evaluated as the top manager's perfections and skills for generating a vision to be a sustainable organisation in the uncertain business environment (Guillot, 2003). CEOs, general managers, chief executives, presidents top management teams and board members are accepted as the strategic leaders of organisations (Özer & Tınaztepe, 2017; Finkelstein & Hambrick,1996; Shrivastava & Nachman,1989).

Jooste and Fourie (2009) underlined the importance of strategic leadership in the implementation and control of strategic practices. Strategic decision producing, formulating organisational goals and strategies, adjustment of informational and compensational systems, selecting the best managers and coaches, making the resource and output balance, giving significance to customer requests and employee necessaries are the specifications of what makes a leader as a strategic leader (House & Aditya,1997). In this connection, Hosmer (1982) argues that strategic leaders have two main aims: i) making creative strategies and ii) integrating these strategies with implementations. In addition to these aims, strategic leadership generates strategic decisions making processes. Processes to make strategic decisions also bring up a mechanism for employees to develop organisational strategies (Shrivastava & Nachman,1989). Besides, strategic leadership includes forming of creative and sustainable strategic vision and sharing it with others (Lear, 2012).

According to Hambrick and Pettigrew (2001) leadership is considered at any level of an organisation or a structure while strategic leadership subsists in the top level of the organisation. Besides, Leadership Theory generally investigates the relations between leader and employees, whereas Strategic Leadership Theory also includes strategic and symbolic activities (Vera & Crossan, 2004). Kotter (1990) also emphasised that strategic leadership intends to generate change while management aims to maintain order and estimative results. Furthermore, managerial leaders plan and control the daily actions and regular operations in organisations with the power of past perspective while visionary leaders generally focus on future-oriented activities. In this context, strategic leaders try to make a synergy between visionary and managerial leaders (Tarigan & Kraus, 2017). Strategic leaders know what happened in the past, what is going on now and what will be in the future better than other leaders. This advantage of strategic leaders comes from the investigation of the environment detailed. It is well known that in today's business life, the environment of an organisation is one of the most important factors for its sustainability. Besides, the most valuable distinction between "management and strategic management" is regarded as environment and competitors. For this reason, strategic leaders tend to achieve sustainable success in the perspective of the short and the long term. Finally, it should be noted that the difference of supervisory leadership and strategic leadership here as the first one is a leadership model "in" organisations while the second one is a leadership role "of" an organisation (Tarigan and Kraus, 2017).

Strategic leaders are fit in leading others with positional power and inspirational energy. Hitt and Duane (2002) state that strategic leaders support, promote and motivate employees to benefit from their intellectual capital. There are many kinds of people in the organisations with a different language, religion, race, gender, ideology, opinion, education, and experience. Strategic leaders inspire all of the organisational members to achieve individual and organisational aims together whereas they have distinctness. According to Rowe (2001), strategic leaders inspire employees to do daily works innovatively to achieve and maintain better performance outcomes. In addition to daily activities, strategic leaders desire and plan long-term strategic activities to have a strategic advantage in the industry (Tarigan & Kraus, 2017). With this approach, strategic leaders obtain sustainable competitive advantage (Hosmer, 1982).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Ireland and Hitt (1999) expressed the strategic leader's personality traits as; flexible, creative, innovative, strategic and coherent with others. Therefore, strategic leaders generate a successful vision which includes innovation processes (Hansen & Kahnweiler,1997). According to Davies and Davies (2004) the organisational talents and policies of strategic leaders are listed as; strategy-oriented, enhancement of core competencies, integration of individual and organisational expectations, implementation of planned actions. Furthermore, Hinterhuber and Friedrich (2002) revealed the four characteristics of strategic leaders as; promoting and motivating of employees, usage of technology for adaptation of internal and external requirements, have a strong vision about future, formulating values for members and shareholders. Hunt (1999) described strategic leadership skills as; creating and sharing a vision, enhancing capabilities and competencies, coaching next generation leaders, formulation of ethical and innovative organisational culture (Quadri, 2018). In addition to these, Papadakis, Lioukas and Chambers, (1998) also indicated that strategic leaders can analyse the environment perfectly and make innovative decisions about the organisation's sustainability. Strategic leaders have good networks outside the organisation to sniff the market. They make healthy cooperation and partnerships to have a sustainable power in the industry. Otherwise, strategic leaders prepare the organisation to change processes which are mandatory for the adaptation of environmental and technological deprivations in the turbulent sectors (Quong & Walker; 2010).

Bloom (1956) also defined strategic leadership competencies under three dimensions as; cognitive, psychomotor and effective. Cognitive competencies are related to thinking (creation, obtaining, formulation and shaping of information for making strategies) while affective competencies (management of employee's emotions) are connected with feelings. Besides, psychomotor competencies are important for doing strategies and implementation of practices (Schutte & Barkhuizen, 2016; Kotze & Nel, 2015; Geldenhuys & Veldsman, 2011). Concordantly, communication, participation, political awareness, internalising, organizing and influencing are sub-specifications of affective competencies of strategic leaders. Remembering, understanding, applying, analysing, evaluating and creating are also considered as cognitive strategic leadership competencies. Finally, perception, readiness to act, guided response, mechanism, adaptation, and origination are involved in psychomotor competencies of strategic leaders (Schutte & Barkhuizen, 2016).

Terminally, it is embraced strategic leadership abilities under 8 headings in the perspective of 21st century's volatile business environment. 1)*Development and sharing a vision*. Determination of a vision has a major role to achieve success. With this step, leaders induce employees easily about the implementation of planned strategies and practices. 2)*Building new and dynamic core competences to have a better place in the market*. In addition to existing core competencies, creating new competencies for making organisational significant tasks brings a strategic advantage to maintain the organisational continuity. 3)*Developing and effective use of human capital is also important for maintaining organisational sustainability*. Strategic leaders work with successful employees. They attract and retain talented and skilful employees in the organisation. Moreover, they enhance the available employee's capabilities and perfections in the organisation. Strategic leaders believe that employees are the most valuable resources for creating new innovations in this era. 4) *Strategic leaders invest in new technologies to compete with others*. Usage of technology works up with better job outcomes. In most industries usage of technology in daily works not only speed up operations but also increase the quality of the services with the satisfaction of employees and customers. 5)*Engagement with required and valuable strategies which can transform opportunities to profit in organisations*. Strategic leaders have to perform the best strategies for organisations progress. 6) *Generating a successful organisational culture to have an effective learn-*

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ing, sharing and creating practices. Employees realize the new opportunities and transform them for beneficial activities and innovations when they have effective organisational culture. 7)*Control operations are important to reveal the differences between what was planned and done.* Strategic leaders develop flexible control norms to enhance employees innovative work behaviors. Besides, the establishment of a suitable model for control operations assists to continue organisational performance and competitive advantage. 8*) Ethic is also a very important concept for strategic leaders*. Establishment of ethical values plays a significant role in organisational prosperity. Trust, honesty, equity, transparency, and integrity in decision-making processes impact employees' perceptions about ethical values. Strategic leaders create an effective organisational culture that capable whole moral and ethical values are evaluated easily in it (Hitt, Haynes & Serpa, 2010; Hitt & Duane, 2002; Ireland & Hitt, 1999).

Readiness for Change

Organisations are generally confronted with the requirements of new implementations over their strategies and processes to compete with others (Armenakis et al., 1993). In addition to competition issues, organisations need to keep step with the environmental, technological changes to maintain sustainable operational and financial performance.

"Readiness for change" means that employees behaviourally, intentionally and psychologically are prepared and ready for change which is perceived as necessary implementation or an investment that have good results for them (Weiner, Amick & Lee, 2008). Conceptual definitions of readiness for change investigated in the literature detailed. Here it is aimed to summarize some significant points of related descriptions. Readiness is described as staff reaction for change, wanting to change, willingness to change and voluntary actions about change. Besides, beliefs, attitudes, intentions of organisational members that show change is required for organisational sustainability is considered as readiness for change. Employees perception for "*we need a change; we will do what is necessary for change"* is come up as readiness for change. Readiness for change is expressed as organisational member's acceptance level that shows beliefs about this change is a good and positive thing for employees and the organisation (Kirrane et al., 2016; Bouckenooghe, 2010). When employees understand that change is essential to continue the organisation's existence, readiness is consisting of with the positive perceptions of employees (Weiner, Amick & Lee, 2008, By, 2007; Rafferty & Simon, 2006; Madsen, Miller & John, 2005; Barrett et al., 2005; Hailey & Balogun, 2002; Chonko et al., 2002; Dahlan et al., 2002; Eby, Adams, Russell & Gaby, 2000; Joshi & Lauer, 1999; Simon, 1996; Armenikas, Harris & Mossholder,1993)

According to Bouckenooghe and colleagues (2009) readiness is divided into three dimensions as emotional, cognitive and intentional. Emotional readiness defines people's feelings about how change is introduced. Employee's feelings about the change plans in the organisation also take place in emotional readiness. On the other hand, cognitive readiness focuses on beliefs and attitudes towards to the change outcomes. Intentional readiness is also referring to employees' willingness about change process and change implementation (Kirrane et al., 2016). In addition to that, intentional readiness is regarded as employee's efforts and energy towards change to benefit from its impacts on their job outcomes (Zayim & Kondakci, 2015; Nikolaue et al., 2007; Oreg, 2006).

As discussed in the upper paragraphs "readiness" is described as employee's beliefs, intentions and attitudes of related changes are required for obtaining organisational success. Therefore, readiness is an important cognitive pioneer either resistance or support for change (Armenakis et al., 1993). Kotter and Schlesinger (1979) recommended some strategies like participation, support, communication, education,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

training to cope with resistance about the organisational change. Besides, effective management models have an impact on employee cooperation, coordination, perception, and readiness for implementing new practices in the organisations (Fox et al., 1988). To provide readiness of employees' it should be emphasised the importance of a change is required for organisational sustainability and well-being of employees in the message of change reasons. In this perspective, readiness message should focus on; i) the requirement for change, ii) perception about change will have positive impacts over organisational(profit) and individual (performance, abilities) work-related outcomes (Armenakis et al., 1993). If readiness is high on the employees' side, response toward change results will be seen as quickly as possible.

Bouckenooghe and colleagues (2009) summarized antecedents towards readiness for change as climate-based factors and process-based factors. Climate-based factors are related to internal elements of an organisation like how change is formulated while process based factors are correlated with how change is managed or implemented. With this approach, it is expressed that leadership can be evaluated under the climate based factors which are expected to be influential on readiness for change (Kirrane et al., 2016; Bouckenooghe, 2011).

It usually aims to increase organisational effectiveness and profitability with the "change" steps in the organisations. The intention of the organisation and employees for a change is also important for change in success (Weiner, Amick & Lee, 2008). Therefore, it is stated to prepare employees for a change process play an essential role in maintaining persistent positive advantages from change practices (McNabb & Sepic, 1995). In this context, the motivation of employees also has a significant value over individual readiness for change. If employees are not motivated about change; barriers, obstacles, and resistance may be seen as a response to the change process in the organisations (Benzer et al., 2017). Bandura (1986) explained that employees may show resistance towards to change if they believe that their abilities do not fit with the planned tasks because of the change. Besides, if staffs are not ready for change they may tend to counterproductive work behaviours across to expected proactive behaviours as a result of change outputs (Armenakis et al., 1993). That is why leaders need to encourage and influence employee's readiness about change with mentoring them. On the other hand, Lau and Woodman (1995) explained that employees who believed having control over the change process get positive and good beliefs about change and behave more beneficial for the organisational outcomes. In addition to participation and self-control, change effort, organisation condition in the marketplace, work environment, are important factors for an individual's perception about "change". In this perspective, it is seen that leadership is also a prominent factor in the readiness of employees for change applications (Armenakis et al., 1993).

The readiness of an employee is also influenced by interpersonal and social relations in the organisation. According to the Social Information Theory, an employee's readiness might be affected by a co-worker's readiness (Woodman, Sawyer & Griffin, 1993). For this reason, integration of organisational and individual's aims should fit with each other to enhance readiness success on implementation with the cumulative power (synergy) of employees. (Fox et al., 1988).

Innovative Work Behaviours

De Jong and Hartog (2007) implied that innovation is seen as a competitive power in today's business environment. Katz (1964) stated that organisations who want to be innovative should invest employees' abilities about innovativeness (p.132). It is also emphasised that innovative behaviours of employees have a great significance for achieving competitive advantage and sustainable performance (Pieterse et al., 2010).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Innovative work behaviours are identified as an application of new ideas to increase performance (West & Farr,1989). Problem recognition, idea generation, idea implementation, idea creation are sub-dimensions of innovative behaviours (Scott & Brucel,1994). The relation between innovation and performance enhances the attraction over innovative work behaviour concept in academic groups.

West and Farr (1989) expressed innovative work behaviours as; "*intentional introduction and application within a role, group or organisation of ideas, processes, products, and procedures*" (p.9). Later, Janssen (2000) stated that the restriction of innovative work behaviours as intentional efforts may not promote beneficial job outcomes. For this reason, innovative work behaviours are described as intentional, useful and profitable outputs related work behaviours. In addition to normal work-related tasks, innovative work behaviours include contextual and extra-role behaviours which are not expected to be rewarded (Janssen, 2000). Farr and Ford (1990) explained that innovative work behaviours tend to achieve an introduction for beneficial and new ideas, processes, procedures, services, and products. Built on this definition, achieving a business model which brings beneficial and profitable results for organisation and individuals is called as innovation. According to De Jong and Hartog (2007), innovative work behaviours are also described as a longitudinal concept which ranks between initiation and implementation.

Zaltman and colleagues (1973) indicated that innovation is comprised of two main steps. Initiation (production of an idea) and implementation (implementation of an idea). Later, West and Farr (1989) determined innovative work behaviours as intentional creation, introduction, and application of new ideas to increase the performance of employees, groups and organisation. Scott and Bruce (1994) stated that innovative work behaviours are forms in a multi-stage process. Janssen (2000) described this process as idea generation (production of valuable ideas), idea promotion (to find friends to support your idea-to build coalition for power) and idea realization (prototype or model application of innovation). Martins and Martins (2002) evaluated innovative work behaviour as idea generation, risk- taking, and decision making. They implied that if these norms are fitted in the working environment innovative behaviours encourage and enhance individual's abilities. Later, De Jong and Hartog (2007) mentioned innovative work behaviours under four dimensions. Opportunity exploration (identification of new opportunities), idea generation (aimed to solve problems and have sustainable performance with the formulation of new ideas), idea championing (promoting new ideas for getting followers, cooperation and collaborations with others to reveal the importance of the new idea), idea application (implementing step of ideas to understand its functionality with the expected aims) (Suhaimi & Panatik, 2016).

Passion and high energy of employees towards the work, bring the sustainable performance to the organisation (Macey et al., 2009). Flexible, open-minded employees usually tend to demonstrate innovative work behaviours. Interaction and coordination with colleagues and the flexibility of the work environment also make easier innovativeness of employees (Anderson et al., 2004). Therefore, leadership style is important for generating this flexible work environment in organisations (Yukl, 2002).

Mumford and colleagues (2002) discussed the factors which may shape the innovation as; working climate, interpersonal relations, organisational structure, strategies, and individual abilities. Besides, Agarwal and colleagues (2012) summarized the related antecedents of innovative work behaviours as; work-group relations, leadership, job tenure, and perception of support. Amabile (1988) also stated that motivational antecedents like leadership play a major role in employee's innovative work behaviours.

Innovation and creativity are generally sound like similar however they have main differences from each other. Creativity only focuses on new idea generation. Innovative work behaviour is a wide concept than creativity. It also includes commercializing creative ideas with business models, investments, imple-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

mentations, and practices. Innovative behaviour orients on to produce useful and profitable results. In creativity, it is not needed to produce a profitable benefit (De Jong & Hartog, 2007) Generally, creativity is evaluated as in the first phase of innovative work behaviours (West, 2002). In idea generation side, it is required to have creative ideas for a response to needs and problems. Work-related issues, disagreements, sustainability problems trigger the idea generation of employees (Drucker,1985). Idea generation is usually fuelled by the realization of necessaries. Creativity often takes place as the formulation of new ideas while innovation is the commercialization of creative implementations (Mumford & Gustafson,1988). Innovation is comprised of both the formulation and implementation of ideas (Reuvers et al., 2008). In this context, innovative work behaviour is regarded as a multi-stage process that includes implementation and creativity (Scott and Bruce,1994). Although there have been many descriptions of innovation and creativity, there is not a consensus about the relations between innovative work behaviour and creativity in the literature yet (Suhaimi & Panatik, 2016).

Relationships Between Strategic Leadership, Readiness for Change and Innovative Work Behaviours

Porter (1996) expressed that a leader must know what is going on outside related to the organisation and its products-services. Besides, he stressed that a strategic leader is always able to answer "how can an organisation respond to the environmental changes or customer needs"? Like Porter; Jonas III, Fry, and Srivasta (1990) advocated the new leadership roles should focus on creating new ideas, implementing them and make a balance between stability and innovation in the adaptation of environmental requirements (Crossan, Vera & Nanjad, 2008).

Ireland and Hitt (1999) also stated the significance of the relationship between strategic leadership and innovation strategy. Strategic leaders take into consideration of innovation while analysing opportunities and strategies (Elenkov, Judge & Wright, 2005) Strategic leaders formulate innovations to provide in accordance with the environmental requirements (Papadakis, Lioukas & Chambers, 1998). Selznick (1994) also underlined the importance of "change" concept in the formulation of a strategic leadership. Specifically, when it is needed a changing procedure in organisations, the strength of strategic leadership notion rises to prominence.

According to Vera and Crossan (2004) strategic leadership is defined as top management leadership style for achievement of the organisational aims with the promoting strategies in different situations (Benzer et al., 2017) Strategic leaders work for the integration of organisational and individual aims achievement to have a sustainable performance with sharing vision and improving required activities. In this perspective, change is valued as a required activity which is expected to bring fresh information to a corporation (Benzer et al., 2017). Strategic leaders like "change" activities for the purpose of making innovative strategies. Strategic leaders design a productive work environment. Employee's perception of such a positive environment may be effective on them working hard to be innovative (Avolio,1999). Nevertheless, Hurt, Joseph and Cook (1977) expressed innovative work behaviours as individual behaviours which demonstrate an employee's willingness to change. Because innovation is related and oriented to change, the relationship between them is rewarding to investigate in the literature (Spreitzer, 1995; Woodman et al., 1993).

Leadership is an essential influencing factor for motivating and mobilizing subordinates (Yukl, 2002). Leaders' efforts for organisational sustainability should also fit with employees needs and desires. Strategic leaders enhance the employees' abilities by mentoring and coaching. Strategic leaders

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

are evaluated as role models with their interest in innovations. In this regard, the impact of leadership on innovative work behaviours is also investigated in the literature (Jung, Chow & Wu, 2003; Mumford et al., 2002). Strategic leaders are generally focused on individual concerns during the change process. Strategic leaders appreciate employees' efforts for change implementation. Besides, strategic leaders create opportunities for individuals' developments. They prepare employees for change implementations with good and clear communication methods (Benzer et al., 2017). Strategic leaders influence employees as a change-setter perspective. Strategic leaders also encourage innovative behaviours in organisations by sharing their vision and motivating employees for their own and organisational well-being (Kamasak, Yozgat & Yavuz, 2017; Rhoades & Eisenberger, 2002). When strategic aims of leaders and employees are integrated, readiness towards to change is occurred easily to achieve organisational success (Klein & Knight,2005). Moreover, effective human resource management practices influence the innovation and organisational performance. For this reason, strategic leaders plan employee related practices carefully to have better financial outcomes (Zhou, Hong & Lıu;2013).

METHODOLOGY

This chapter is aimed to explain the relationship between strategic leadership and innovative work behaviours. According to the literature, it is expected to find out that strategic leadership has a positive impact on innovative work behaviours. It has also tried to reveal the role of readiness for change in this relation. For these purposes, firstly it has tried to explain the conceptual framework of the research model. In the theoretical part, strategic leadership, readiness for change and innovative work behaviours were described. Relations between variables were analysed in detailed accordance with the literature. In this section, research methodology is mentioned and statistical analyses are explained. Finally, results are evaluated with the theoretical perspective.

Figure 1. Research model

Reference to research model, hypothesis of the study is formed as:

Hypothesis One: Readiness for change has a mediator role in the relationship between strategic leadership and innovative work behaviours.

The tourism industry was chosen for this study. It is well known that tourism sector goes parallel with national and international dynamics like foreign trade, economic relations, policies of governments, country's politic structure, and security of the region. In addition to these, local problems of neighbour countries also influence the sectoral demand because of the guest's social worries. For this reason, sea-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

sonal activities of the tourism industry are considered as very volatile. Leaders and supervisors of hotel organisations not only aimed to compete with competitors but also purposed to continue the organisation's existence in this volatile times to maintain organisational performance. Besides, technological trends also have a major role in the industrial competition like economic and diplomatic dynamics. Porter (1985) expressed that innovation in technology make a great contribution on cost reduction and expansion of service differentiation. Hotel organisations need to follow technological developments to compete with others. It is an understanding thing that, technology usage both speed up the daily operations and increase the employees' self-progress. It is generally expected to increase operational and financial performance with technology usage. Innovation related investments in business model's also expand the individual's capacity. Increment of employee performance is anticipated to rise up the financial performance of organisation. Moreover, strategic emphasis on business model innovation exhibits the organisational value and profitability (Aspara, Hietanen & Tikkanen, 2009).

In this study, it is preferred to analyse a four-star hotel which takes place in Antalya. Antalya is a coastal city in the south of the Turkey. Antalya is embraced by the natural beauties and historical areas. In addition to these, there are many sandy beaches, archaeological sites, shopping malls that attract the tourists to the region. In the city, there are two international airports that have approximately 150.000 air traffic movements per year and it is stated that 11 million tourists visited Antalya between January and September in 2018. Moreover, there are more than 1000 hotels with four and five star. In the region, lodging industry works to enhance demand and the capacity to have a sustainable and profitable performance. According to March (1991) investments on technology usage expand capacity and explore new services and processes. Besides, scholars indicate that innovation oriented investments have positive impacts on the organisational outcomes like return margins, performance and profitability (Christensen 2013; Zahra 1996). Carvalho, Ribeiro, Cirani and Cintra (2015) also found that innovative companies have higher financial performance results than non-innovative companies. Under the circumstances, leaders pay attention to internal and external dynamics selectively. In this chapter, it is tried to reveal out the importance of readiness for change on technological investments in organisation. Moreover, it is expected to exhibit the relationship strategic leadership and the innovation with the better performance expectations.

In the chosen hotel, it was planned to use a new technologic system and instruments for the daily activities. For this purpose, the CEO of the hotel prepared a meeting with employees and explained his plans and investments in detail. He tried to provide user-friendly devices to maintain technological system success. In addition, he organized a training seminar for the change process. From room cleaning to accounting operations it was aimed to implement all operations in accordance with systems and technological devices. This survey was recognised after four months of these new practices were implemented in the hotel.

In this chapter it is used of Pisapia, Reyes-Guerra (2007) "Strategic Leadership Questionnaire" to measure strategic leadership. Strategic leadership questionnaire was measured with 35 items under five dimensions. Furthermore, a translation of 9 item scale of Bouckenooghe et al. (2009) was used to measure readiness for change. The scale is comprised of three dimensions and each dimension has three items. Finally, innovative work behaviours were measured by the Jong and Hartog's (2010) Innovative Work Behaviours Scale. The scale consists of four dimensions with 10 items. In the questionnaire form, sample items were rated 5 points Likert Scale ranging between 1 (completely disagree) and 5 (completely agree) in all scales. Only readiness for change questions were used with the past tense

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

form. There are also four demographic questions in the last part of the questionnaire form which does not need to respond mandatory.

The sample of this study consists of tourism establishment employees. The population of this study was generated from the sampling formulation. There are 247 workers in the whole hotel. Considering error margin and confidence interval, it was found to have suitable 151 forms were enough for statistical analyses (Barlett et al., 2001). Questionnaires were sent by e-mail to all employees. At the end of 30 days acquired and errorless 194 valid questionnaire forms were used for statistical analyses.

In this study to provide regression analysis assumptions, the normality and correlation analysis tests were investigated by IBM SPSS Statistics 21.00 Programme. In the normality tests, diagrams and Skewness-Kurtosis values; it was accepted that the data demonstrated normal distribution. In order to test relationships between strategic leadership and readiness for change, strategic leadership and innovative work behaviours, readiness for change and innovative work behaviours correlation analysis were used. Otherwise, factorial structures of the scales were analysed through LISREL 8.8 Scientific Software International Programme. Finally, with the regression model, the research hypothesis partially supported in the IBM SPSS Statistics 21 Programme tests.

RESULTS

According to the statistical analysis from IBM SPSS 21.00 Programme, means of variables were found as; strategic leadership 3.94, readiness for change 3.86 and innovative work behaviours 3.82. Besides, standard deviations of variables were also obtained as; strategic leadership 0.96, readiness for change 0.98 and innovative work behaviours 0.88. Pearson Correlation coefficients were used to evaluate the relationship between variables. The relationship between strategic leadership and readiness for change is significant and strongly positive (r=0.703). Besides, the relationship between strategic leadership and innovative work behaviour is also significant and strongly positive(r=0.712). The relationship between readiness for change and innovative work behaviour also has a significant, medium level and positive(r=0,684). Correlations between variables are significant at the level of 0.01.

Table 1. Means, correlations and standard deviations of variables

	Variables	Mean	Standard Deviation	1	2
1	Strategic Leadership	3.98	0.96		
2	Readiness for Change	3.86	0.98	0.703**	
3	Innovative Work Behaviours	3.82	0.88	0.712**	0.684**

**Correlation is significant at the 0.01 level(2-tailed)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In this study, Cronbach's Alpha method was used to test the reliabilities of scales. The reliability analyses show that all constructs possess satisfactory Cronbach's Alpha values: strategic leadership (α=0.88), readiness for change (α=0.86) and innovative work behaviour (α=0.90). Otherwise, factorial structures of the scales (Confirmatory Factor Analyses) were analysed through LISREL 8.8 Scientific Software International Programme. According to the results of the analyses, it was revealed out that scales have construct validities with good indices. Factor loadings of strategic leadership scale are ranged from .54 ($p < 0.001$) to .87 ($p < 0.001$). Factor loadings of readiness for change are range from .52 ($p < 0.001$) to .80 ($p < 0.001$). Factor loadings of innovative work behaviours are range from .68 ($p < 0.001$) to .92 ($p < 0.001$). Besides, the fit indices for the scales are ranked in Table 2. Arbuckle (2006) states that if a value of x2/df is less than 2.5 it shows a great and good model fit for the factorial structure, whereas if the value of x2/df is between 2.5 and 5 it has an acceptable model fit. Reference to Arbuckle (2006), the results of the scales are at the acceptable levels for a good fit. Moreover, a value of more than 0.95 for CFI, IFI indices; and a value less than 0.07 for RMSEA indices are good for the factorial structure of scales (De Vellis, 2016).

Table 2. Confirmatory factor analyses of scales

Variables	X^2	df	X^2/ df	RMSEA	TLI	IFI	CFI
Strategic Leadership	205.18	51	4.023	0.06	0.96	0.96	0.95
Readiness for Change	293.761	73	4.024	0.06	0.96	0.97	0.94
Innovative Work Behaviours	341.620	87	3.92	0.04	0.99	0.98	0.97

This study also aimed to find out the mediating role of readiness for change in the relationship between strategic leadership and innovative work behaviours. In this direction, to test the research model in accordance with Baron and Kenny's (1986) steps, hierarchic regression analyses were used. According to Baron and Kenny's (1986) 3 step model, it is advised to provide some assumptions to obtain the mediating role of a related variable. In the first step, it should be a significant relationship between strategic leadership and innovative work behaviours. In the second step, it is required to point out a significant relationship between strategic leadership and readiness for change. In the last step, i) readiness for change and innovative work behaviours need to be significantly related and ii) the relationship between strategic leadership and innovative work behaviours also have to decrease under the presence of readiness for change. In the last step if the model turns to meaningless ($p > 0.005$) it is called full mediating; while if model stays significant ($p < 0.005$) but the beta of the strategic leadership is declined it is evaluated as partial mediating. Reference to regression analyses, all assumptions of the mediating model was confirmed. Only in the last step, it is seen that the model is still significant but the beta of strategic leadership declined to 0.289 from 0.712(first step value). Besides, it was used Sobel, Aroian and Goodman tests via online statistical programmes. In accordance with these results, it was found that readiness for change significantly and partially mediates the relationship between strategic leadership and innovative work behaviours.

FUTURE RESEARCH DIRECTIONS

This chapter aimed to demonstrate the relationship between perceived strategic leadership and innovative work behaviours. Besides, it tried to prove the role of readiness for change in this relation. Although innovative work behaviours have a positive impact on individual outcomes, it is required to analyse relations between innovative work behaviours and financial performance indicators. Furthermore, a longitudinal research for measuring readiness for change before technological practices implementation will have better explanatory power on change process performance.

CONCLUSION

Globalisation and environmental impacts of new innovations have revealed out the necessity of new leaders to make a balance with environment and organisation. The specification of a new model leader is defined as a fit oriented with environmental changes and organisational adaptation by flexible planning and decision making (Hitt, Haynes & Serpa, 2010). In this context, Ireland and Hitt (1999) also mentioned for the importance of strategic leaders in the 21st century's business environment to get strategic competitive advantages and sustainable company performance. Lear (2012) indicated that strategic leaders can increase organisational performance or maintain organisational sustainability in turbulent and unpredictable environments with the implementation of innovative strategies. Therefore, innovative and creative decisions will provide better strategic advantages in the volatile industries.

Elenkov, Judge and Wright (2005) determine strategic leadership as; the process of generating a long-termed vision, providing a good dialogue with all employees, touching to subordinates needs and supporting employees for change practices. Specifically, in change processes, the inspiration of employees has a great value for organisational success. Besides, it is stated that employees' readiness for the change is the key factor for implementation's effectiveness (Bilgin, Bilgin & Kilinc, 2017; Eby et al., 2000). In the literature review, it was found that supportive and strategic leadership has a positive impact on innovative work behaviours of employees and readiness for change (Pieterse et al.,2010; Reuvers et al., 2008).

In this study, it was obtained that perceived strategic leadership has a positive impact on innovative work behaviours. Besides, it has been revealed that readiness for change has also a positive impact on innovative work behaviours. In this context, both strategic leadership and readiness for change are explanatory on the innovative work behaviours. But, in this sample study, readiness for change has a partial mediating impact on the relationship between strategic leadership and innovative work behaviours. It means that readiness for change increases the explanatory power of the relationship between strategic leadership and innovative work behaviours. If we take the readiness for change in the model, the impact of the strategic leadership on the innovative work behaviours cannot be strong unlike the entrance of readiness for change in the model. Accordance with the results it is stated that perceived strategic leadership has a major role in employees' innovative work behaviours. In addition to this, it also needs to have readiness for change to maintain sustainable innovative behaviours. Results show similarity with the literature findings (Carvalho, Ribeiro, Cirani & Cintra, 2015; Christensen 2013; Zahra 1996; March, 1991). It is advised to leaders and managers to prepare employees for change practices with cooperation, education, and participation. It is also recommended for managers and leaders to invest in task-employee and technology fit devices and systems to have a sustainable strategic advantage with the usage of these models.

Chapter 60
Managing and Shaping Change in International Projects

Jürgen Janssens
asUgo Consulting, Belgium

ABSTRACT

Companies are either international by nature, either their workforce is, or business dynamics and agile optimization create an extended web making it international. This obliges managers to gear up for the needs of this evolving DNA. This is especially the case in strategy critical project portfolio contexts focusing on organizational change, process transformation, or roll-out of headquarter-driven products/services. This chapter will address the required hard and soft assets: integrating the cultural essence and maturity of the ecosystem, combining experience with a pragmatic approach, and being dedicated to continuous shaping of collaborations. Additional focus will be set on managing in the digital age. To give more depth to the tangible value, different real-life cases will be integrated. Together, the theoretical insights and the empirical examples will offer a big picture view that will benefit the management of hybrid portfolios in geographically blended environments.

INTRODUCTION

In the current ecosystems, companies are all virtually international: either they are international by nature because of their locations, either their workforce has diverse backgrounds; or their business dynamics lead to global interactions, making it de facto international - even when operating from a single location. This obliges managers of permanent organizations and managers of temporary project organizations to integrate the needs of this international DNA, together with other managerial skills and capabilities.

One specific dimension concerns project portfolios focusing on organizational change, process transformation, or cross-site roll-out of headquarter-driven products. Due to their transversal nature, these types of projects tend to be larger, and are often more influenced by the international footprint of the organization than projects focusing on subject specific matters in an isolated department. In large companies, they are even key for the realization of the strategic backbone, and are fueled by hybrid, international teams.

A frequent example concerns companies that have grown across different countries (organically or through takeovers) and that want to obtain optimization benefits by standardizing the way of working of all divisions across the different countries. Despite/because of the complexity of the latter, this is often combined with the deployment of a new ERP (that will support the new way of working) and the set up of new organizational roles (to execute the new way of working).

Realizing such corporate undertakings is only possible in a structured and coordinated way. Therefore, companies have to set up temporary project organizations. Leading them well requires more one out-of-the-box solution. To lead them well, international project managers have to master a solid set of complementary hard and soft management skills.

Before unveiling this blended skill and tool set, the essence of project management will first be highlighted, including its importance in international contexts.

Secondly, the practical value of the synchronization with the site/country-specific reality will be analyzed. It will be illustrated that rather than blindly counting on past experience, managers should realize the targets, while integrating the cultural essence. In this sense, a series of tools will be explained that help in evaluating the Change Climate. Doing so will contribute to understanding the identity of local units, independent of eventual regional stereotypes or subjective extrapolations by international managers.

Thirdly, the cultural essence and the maturity of the ecosystem in which international project managers work will be analyzed. Emphasis will be set on hands-on approaches. Reality shows namely that it is more important to respect the spirit of management best practices, than sticking rigorously to the letter.

In complement, it will be stressed that moving forward in international ecosystems implies that managers should go beyond their operational perimeter. Managers have to regularly turn up their sleeves to shape the transversal dynamic, while keeping the strategy and the management philosophy in mind.

Lastly, a specific type of international project shaping will be addressed: contexts involving Digital Transformation. This is an aspect that is very important to keep in mind. The Digital Age is namely fundamentally changing the value proposition to and from the customer. The growing global pressure for companies to adapt entails several risks if the dynamic is not managed correctly. This specific kind of context will therefore be analyzed in detail.

Overall, after completing the chapter, the reader must be able to understand how to manage and shape change in international projects by building upon this blended set of tools and skills.

PROJECT MANAGEMENT: FOUNDATIONAL CONCEPTS

Project management methodologies like PMBOK and Prince 2 refer to a project as a temporary endeavor undertaken to create a unique product or service based on an agreed upon business case, and with a limited duration (Office of Government Commerce, 2010; Project Management Institute, 2013).

In agile, the definition of a project follows the same idea, as having a start and end date, focused on delivering a product and the likes. Project management as such, however, is organized differently. In some cases, the responsibility is shared between several persons.

From a macro perspective, however, the differences between agile and Waterfall driven programs are negligible. In the further discussion on project matters, the PPM definitions illustrated in Table 1 will therefore be used (Janssens, 2017).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Distinction between project management, program management and portfolio management

	Project	Program	Portfolio
Definition	The delivery of one or more outputs, contributing to a program or offering a direct strategic benefit.	A group of projects contributing to a common outcome or to one or more strategic benefits.	A significant share of the organization's total investment in the changes to meet the strategic objectives. Re groups multiple programs.
Time vision	Temporary (relatively short-term)	Temporary (can last several years)	Permanent (continually changing and aligned to the strategy)
Planning	Project level plans with focus on detailed delivery.	High level plans, supported by detailed plans.	Continuous process of prioritization and alignment to meet strategic objectives.
Scope	Narrow defined scope.	Wide scope, changing along the clarification of the requirements and solutions.	Transversal strategic perspective of the whole organization.

Source: Janssens, 2017

For a detailed understanding of traditional project management, the author refers to the aforementioned sources and methodologies. It is however essential to note that Agile and Waterfall projects alike share the need for follow-up, management and delivery – which is particularly relevant in international contexts.

Cultural differences may namely lead to longer decision-taking, reduced creativity and ability to take independent decisions, diffuse communication, additional room for positive and negative changes, adapted team dynamics, or different foundations for cooperation (Johansen, 2009).

In addition to aspects related to culturally diverse backgrounds, these environments involve also structural layers of additional complexity, like reconciling headquarter ambitions with local reality and international regulations, or balancing one structured approach with various, culturally diverging working styles.

The structuring power of project management applied by managers that have the necessary skills and tools is thus important to move from multi-national risks to the unleashed potential from international, complex environments.

INTERNATIONAL, COMPLEX ENVIRONMENTS

In international, complex environments, managers are continuously challenged to stay ahead of the curve. Communicating smoothly, defining purpose, managing globally while facilitating locally, balancing process understanding with helicopter views, anticipating spillover effects, being a strategist, a born speaker, a listener… are only some facets of the ultimate manager. In international contexts, their toolbox needs to be further enriched with soft and hard skills.

An ecosystem offering such challenges requires the management of projects, programs and portfolios. Often, the set-up of a solid project portfolio structure and mixed teams is required in international companies to realize large, organizational transformations. The final goal is to deliver the expected strategic benefits for the company, while integrating international constraints, and respecting time, quality and budget requirements.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The importance of good international project management is emphasized by the growing trend of projects taking place simultaneously at several locations. This is enabled by evolutions in digitalization (Schwab & Samans, 2016) and in outsourcing (Deloitte, 2016). It is thus important to know how to manage such mixed resource pools and their environment.

For this, research on leadership skills in very large, international projects (requiring a budget up to $5 billion) has indicated the primordial role of "the art of project leadership." This concerns soft issues, like leadership, organizational culture and behavior of project leaders and teams (Asvadurov et al., 2017). This assumes, however, the availability of project management "science", like processes and technical expertise. As this is not always present, it is thus essential to understand how the combination of both groups of skills and means – soft project art and hard project management science- make the difference in practice.

Therefore, the author wants to bring different managerial prerequisites together. Attention will be dedicated to the company culture, the organizational maturity, the integration of pragmatic solutions and the building of organizational bridges. They will be illustrated with real life cases.

To ensure that these assets remain future proof, specific awareness will be provided based on shaping in the Digital Age. Altogether, integrating these complementary components should open possibilities to work with multicultural teams in international contexts.

SOLUTIONS AND RECOMMENDATIONS

Canalizing Company Culture

Company Culture and Cultural Change

The success of managerial decisions depends on different factors. At the core, vision and managerial experience are of uttermost importance. At the same time, awareness and the ability to anticipate change appear to be at the center of the success (or failure) of many projects (Gulla, 2012).

For an efficient management of change, actions have to be taken at the beginning of the project. This will provide solid foundations for the future and avoid problems that would otherwise have grown over time. In small projects, this preparation is done by the project manager or owners of the concerned processes. For large projects, it is advised to have a dedicated change manager.

Secondly, guiding change requires a down to earth vision, as transformational matters implying human change are usually faced with resistance. Smoothing the road to acceptance is traditionally done through information and guidance, complemented by training sessions and follow-up. The final goal is to make sure that the concerned people understand, and, in the end, really own the future way of working. This should involve all stakeholders impacted by the projects, going from senior managers to final end users.

When preparing and guiding the process, managers need to take into account the impact of their words and their actions. As communicators, they need to keep in mind that others may have a totally different understanding due to their specific background or their organizational culture.

Managing the negotiations in an international project implies to take into account, for example, that Chinese and Indian employees have different expectations. Similarly, Egyptian and Israeli people value (in)direct communication differently, Norwegian and French staff have a different relation to hierarchy,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

or blended teams prefer different types of project structure (and decision taking). Specialized literature can help in depicting these specific geographical influencing factors (Johansen, 2009; Salacuse, 2004).

Company Culture and Cultural Change

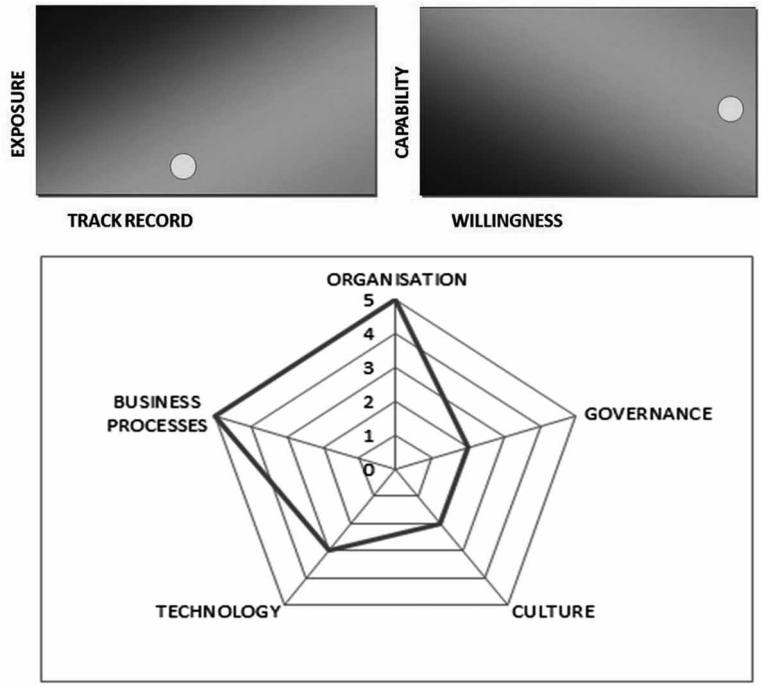
Different tools and techniques are available to grasp the essentials of the overall culture (Cameron & Quinn, 2011). They need to be used for each site that is impacted by the project. Especially in international contexts, it can be damageable to build upon generalizations, expecting that people from one site, for example, will react in the same way as people from other regions with a similar size or headcount.

The author will focus on the distillation of three dimensions: the climate for change, the mindset of the stakeholders, and the impact of the project.

- The evaluation of the Change Management Climate gives an indication of the recent exposure to change. It is influenced by aspects such as the quality of internal communication, priority setting habits, the way resistance to change is managed, the presence of change agents, and the like.
- It is built through interviews with stakeholders. The results indicate the organizational aspects requiring attention. This can range from consistent training for each project, to priority setting rigor on management level, or consistency in the decision-taking process.
- The Stakeholder Assessment evaluates the willingness to change versus the capability to change. Usually, people are interviewed in each group of stakeholders. This helps to identify change agents capable to mentor colleagues or support the project. Adversely, it might shed light on the more change-resistant departments, requiring specific guidance.
- The Project Impact assessment evaluates who will feel the biggest impact on what level. Usually, angles to explore are: organization, governance, culture, technology and business processes.

In Figure 1, the change diagnostics have been done for a company desiring the put in place new transversal processes for its different departments (Janssens, 2016). The change climate has been evaluated by the executive director of the organization through an assessment of 50 statements, to be evaluated on a scale from 1 (strongly agree) to 5 (strongly disagree). The answers result automatically in an updated graph.

The stakeholder assessment has been obtained through a (different) self-assessment, completed by the senior managers of each division, resulting each in a divisional image. The aggregated picture shows the final graph. The project impact assessment is based on the feedback of the executive director.



The combined change diagnostic illustrates a project in an environment with a limited exposure to change and a limited change track-record; a moderately positive stakeholder support; and the highest impact of the project being expected on business processes and organizational fluidity.

To take this change management climate into account, the outcome from previous projects has to be captured and good practices selected carefully. Also, focus on quick-wins is needed to reassure and involve users, and extra focus in communication, business involvement and transparent reporting.

The stakeholder assessment shows that the project will take place in an environment favorable to change management, but with a strong need to guide the latent change awareness. Based on the aggregated assessment, a part of the department appears to be able to support the initiative, if they receive additional support. As change agent, they seem appropriate to promote the project to key users or have a positive influence on the local promotion of change.

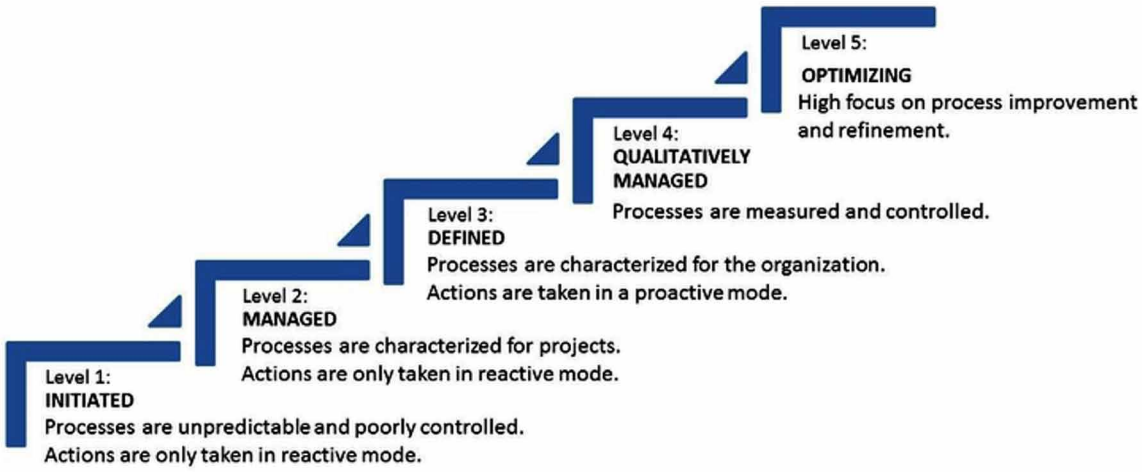
Figure 1. Change management climate, Stakeholder assessment, Project Impact assessment
Source: Janssens, 2016

As the project is likely to impact business processes and organizational fluidity, one will have to reinforce attention to these aspects – or to the expectations stakeholders have on this level. On the other hand, it is an indication that the stakeholders are realistic concerning the possibilities of the future way of working. This will make it easier to embed the technological changes.

As mentioned earlier, this change management assessment needs to be done for each site involved in the project. It can be damageable to expect that people from one regional division will react in the same way as people from other one with a similar size or headcount. Similarly, structurally performing the assessment in each site in the beginning of the international project allows managers to have an objective, non-biased understanding, regardless from subjective, personal preconceptions.

Integrating Maturity



Maturity Frameworks

Companies are constantly looking for strategic advantages and efficient delivery. To be fruitful it is important to have a sufficiently mature organization, or to manage in line with reality. Different models exist to assess the organization's current capabilities, identify where they want to be in the future and implement improvements in a structured way, with measurable results. A first useable framework is the Capability Maturity Model Integration (CMMI).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

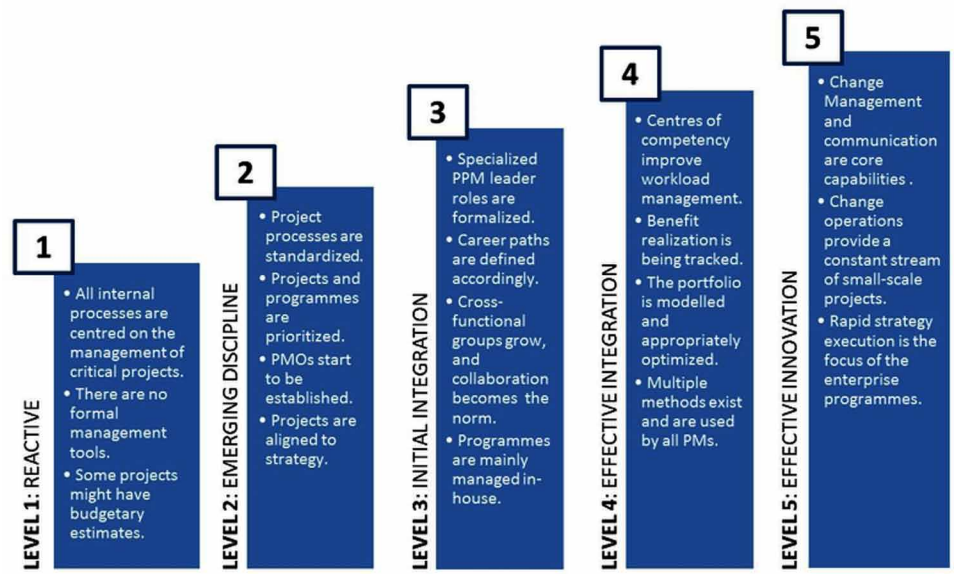
CMMI provides organizations with the fundamentals for effective process improvement. It covers a wide spectrum of industries including manufacturing, software engineering, finance, aerospace and telecommunications. CMMI covers Waterfall and agile environments (Chrissis et al., 2011; Forrester et al., 2011; McMahon, 2010). The assessment leads to five possible maturity levels that can be used as base for the development of a roadmap to improve performance (see Figure 2).

Figure 2. Maturity levels in CMMI
Source: Own elaboration

A second framework is the Portfolio, Program and Project Management Maturity Model, P3M3.

P3M3 builds upon Prince 2 and MSP. It looks across an organization at how it delivers its projects portfolios. It can be used for activities related to the (temporary) project organization as well as for activities of the permanent organization (Sowden et al., 2010).

For each maturity level, P3M3 drives progress through seven Process Perspectives: Management Control, Benefits Management, Financial Management, Stakeholder Management, Organizational Governance, Risk Management and Resource Management. When keeping cross-industry applicability and international expertise in mind, a third approach worth using is the Program and Portfolio Management Maturity Model.



The model distinguishes five dimensions (see Figure 3): Interdependence of People, Portfolio practices and processes, Project Value management, Technological Growth, and Human Relationships. The evaluation results in a specific maturity level (Mieritz et al., 2007).

This model shares the transversal expertise captured in CMMI and P3M3, but focuses more on actionable steps, that prove to be of added value in practice. Further in this publication, the maturity levels will refer to those as defined in Gartner's model.

Overall, maturity models give managers the occasion to perform a factual health check and do an assessment towards a full development plan (Sowden et al., 2010). Conversely, rather than a means to identify weaknesses and apply only 'quick wins', maturity improvement should be managed as a long-term process, involving incremental changes on different levels.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. The five maturity levels of Gartner's model
Source: Mieritz et al., 2007

By completing the maturity model with elements that are specific to the international footprint and/or workforce of the company, it is possible to provide the project managers with a foundational base that reconciles organizational understanding with international grip.

Projects, Programs, Portfolios and Maturity

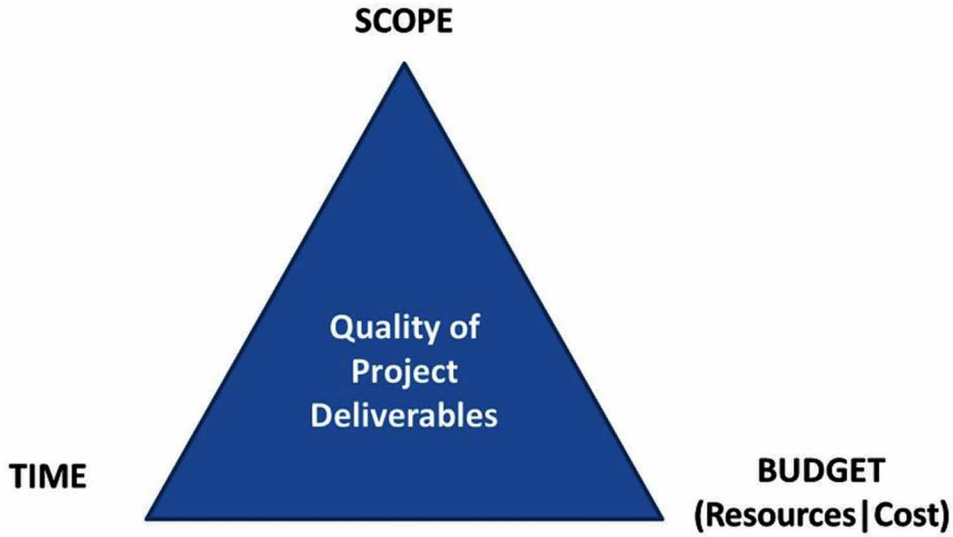
Maturity for Program and Portfolio Management

For each management team, it is essential to have grip on the maturity level. One of the challenges at level 1 and 2, for instance, is to build transversal foundations while still leaving room for focused actions.

On the one hand, an environment with a low maturity entails the risk that initiatives will not last due to poor organizational acceptance. It is therefore important to focus on the medium term by building foundations, also in environments with an internationally blended workforce.

Companies that are at the other end of the spectrum (i.e. level 5) face different challenges.

At NASA, for example, the Space Shuttle Onboard Software project had to prepare the activities prior to departure. Quality requirements were extremely high. Through continuous improvements, the project evolved into a very mature environment (Hickey et al., 2011). Executives, however, were not concerned with the teams' drive for excellence since a culture of excellence was already present. Rather, they ensured that the staff did not become complacent, and that they constantly focused on improving the process performance (Paulk et al., 2000).



Once the maturity level is defined and the roadmap established accordingly, a critical mind remains of utmost importance. Even with a clear direction being defined, the use of best practice models has to be seen as a facilitator within a larger dynamic, rather than as an omnipotent catalyst.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Maturity for Project and Resource Management

Traditionally, project fundamentals are represented by the Project Management Triangle composed by time, resources (or cost) and scope – and eventually throughput for Kanban –see Figure 4– (Steyaert, 2016). The idea is that project success is driven by a balance between different constraints.

Figure 4. The Project Management Triangle
Source: Steyaert, 2016

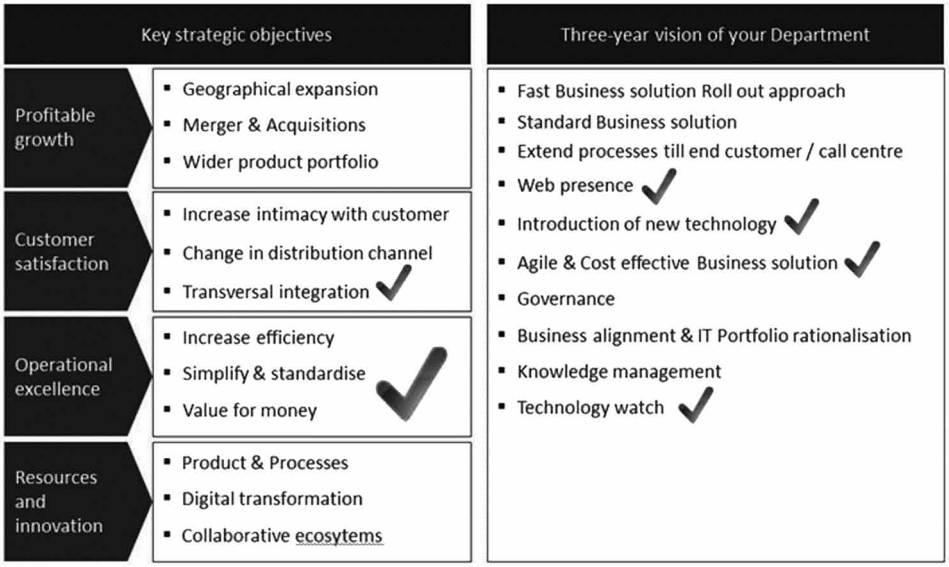
Although the concept is widespread, it is not straightforward to have project management and resource management managed optimally together in reality.

Some companies give people extra work, without taking into account other pending tasks; or they ask people to work longer to solve delays, rather than looking at the real causes (e.g. lack of prioritization). Sometimes, there is some progress coming from an increased awareness for the matter. A lack of factual information, however, tends to take away the oxygen that can turn sparks into a fire powering the engine of advancement.

The lack of appropriate tooling is a frequent reason for which resource management is not well done. This can be even more the case for teams working in different locations or subject to other cultural habits with regards to planning and resourcing.

Although (the will to improve) project and resource management maturity is not directly linked to tooling, it does play a role in practice, as well in young companies as in well-established ones (Threon, 2015). It is therefore advised to set-up a clear governance, centrally and locally, before initiating the project.

Maturity for Strategy Management



There is a strong dependency between corporate strategy management and the reality of project, resource and portfolio management. It is therefore essential to integrate the different aspects that are impacting in

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

practice: the management of the contribution to the corporate and portfolio strategy, the communication on the strategy and the management of the resources.

A first attention point is the management of the strategy contribution. As such, programs have to contribute to the realization of the corporate strategy (Axelos, 2011), no matter if they are steered centrally or locally. To do so, it has to be factualized upfront to what extent each project has to contribute to the local strategy, and to what extent to the international ambitions of the company. This will contribute to solid foundations, but also, and especially, to a better understanding across the sites and mixed teams (see Figure 5).

Figure 5. Evaluation of the strategic contribution of the project, submitted in the business case
Source: Own elaboration

A second attention point is strategy communication outside of the executive floor. Project members often state that the company has no strategy, or that the strategy is too high-level or not clear (Couto et al., 2017). Assuming that most companies have a real strategy, this can be linked to a lack of qualitative communication. Obviously, it cannot be expected that everyone understands the repercussions of a strategy. It is the duty of managers, however, to ensure that the strategic pillars are cascaded down, in all sites and teams.

By doing so, people will understand more easily what path a company is following, understand the contribution project work can offer to the realization of the strategy, and come up with proactive proposals that can help to attain it (Bushnell & Stone, 2013; Groysberg & Slind, 2012).

A third attention point for strategy is resources. As mentioned, the balance of resources must be monitored carefully across the different contributing resource pools. Otherwise, project portfolios do not always deliver their full value to the realization of the strategy. Moreover, projects that do deliver the defined scope despite resource constraints risk to do it at the detriment of time, quality or budget. This, in turn, involves a risk for the bottom line contribution to strategy.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Overall, maturity of strategy management goes thus beyond international blue oceans (Kim & Mauborgne, 2015), or deciding on top down silver linings for local realizations. As explained, strategy management needs to be seen from a systemic angle to make it fit within the corporate reality of program ecosystems that require a company to reach global targets through coordinated, multi-national delivery.

Maturity: Risk Factor or Managerial Lever?

People can react in different ways to a maturity diagnosis, especially when the maturity level is below expectations.

On the one hand, managers can, based on cultural or personal convictions, decide to neglect the low maturity, either because it is not seen as a priority, or because the potential impact is regarded as unimportant. Some might be reluctant to act as long as they don't have the mandate for it (Axelos, 2011). Similarly, it can demotivate people. Some might even get angry at key actors on managerial level in an attempt to find a guilty responsible.

Undeniably, it can be harsh to be faced with a factual indicator of a lower than expected maturity. Some cultures tend to be more sensible for matters potentially associated with "losing face." It can even trigger fear of failure, given that "over-managing" in an "under-performing" environment raises the risks of recurring failures (Gulla, 2012).

On the other hand, the fact that the maturity is below expectations can be handled as a genuine variable on which actions can be taken, at least in some regional teams. It becomes then a lever to canalize non-factual discussions and trigger an improvement roadmap in line with reality.

While waiting for the maturity roadmap to be materialized, some might start the development of tools to compensate for a low(er) maturity. A more potent approach is to use the maturity as a managerial lever for additional support. This requires more preparation because of the involved political/human dynamics, especially in culturally mixed contexts. The author refers to dedicated literature for details on stakeholder management and organizational negotiations (Axelos, 2011; Cameron & Quinn, 2011; Couto et al., 2017; Laloux, 2014; Todnem By, 2005).

The advantages, however, can be multifold on the short term: having a priority review of projects within the portfolio, obtaining additional resources or budget, obtaining the adaption of timelines, or negotiating significant reallocation of the workload of resources among regions.

In complement, managers can request more structural actions beyond the borders of the individual project portfolios to senior stakeholders.

To further inject quality, it is worth considering experience exchange with non-competing companies in an internationally comparable situation. Depending on the cultural habits of informal networks, this is done through personal or professional networks.

Case: Monnet Chocolate

Companies

To give more depth to the maturity picture, a concrete example will be shared. While illustrating real-life experience, the name and specificities of the concerned company have been adapted.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Corporate Context

Monnet Chocolate Europe is the European entity of an international chocolate manufacturing company. Throughout the 20th century, it has grown organically through acquisitions of competitors. Later on, it has been integrated in a multi-product conglomerate. Despite its group obligations, Monnet Chocolate Europe is relatively autonomous for its operational strategy.

It manages an extensive project portfolio, ranging from ERP supported transformation programs to technology projects for external business development. A marginal percentage is managed through agile.

Organizational Maturity and Strategic Support

In the beginning of the reference period, Monnet Chocolate's maturity for project and portfolio management was evaluated between 1 (Reactive) and 2 (Emerging Discipline). Internal processes were focused on the management of critical projects. All projects had a budgetary estimate. There was a growing desire to have project processes standardized. Prioritization and strategic alignment only happened in theory, however, given that all projects had to fight for resources, and struggled against conflicting deadlines within the same portfolio.

On strategy, the portfolio ecosystem faced a lack of communicational transparency. The strategy was well understood and taken into account by most senior stakeholders. Conversely, non-senior stakeholders often stated that the company had no strategy or that the strategy was not tangible enough. This was mainly due to incomplete communication, or a lack thereof. This created frustration within the projects and weighed upon the project and portfolio managers.

Resource Management, Project Management and Factual Data

One of the most impacting weaknesses was the relation between resource and project management.

Projects suffered either from a lack of resources or from resource over-allocation. Resource conflicts were managed reactively rather than structurally. Solving a bottleneck from one resource, for instance, was not a guarantee that it would not happen again shortly after.

On portfolio level, senior management did not evaluate spillover risks either. Periodically, costs and time pressure were rebalanced by involving resources from other countries. While softening peaks, it did not prevent problems from happening again as root causes remained unsolved.

No factual information was available about (non) project workload. A centralized tool supported the matching of project constraints and resource management, Planview Enterprise. However, it was not used by all programs yet, neither for all non-project work. The resulting view was thus incomplete. This reduced a part of the added value of the tool and weakened the adherence to the process.

Bottom-line, managers risked to deliver projects late or at a higher cost, while stretching resources beyond their limits. This was even at the risk of losing people, as awareness for burn-out was nonexistent in most regional pools.

Impacts

Overall, managers experienced the repercussions of the lack of maturity on several levels. Resource management conflicts impacted progress and delivery, as well as the morale of the teams. The delivery

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of priority programs was at risk, as well as the delivery of non-priority (but still scheduled) projects. Altogether, this reduced the ROI and the contribution to the strategy.

In addition, managers were faced with drastic reduction of potential levers. Using problems as an opportunity for change – or as a means for negotiation – is usually a potent management tool. But as situations lacked factual information and structure, nothing tangible was available to negotiate about.

Mitigation

To tackle the recurring problems, the CIO and the Governance Officer decided to set up a central Project Office. Its task was to factualize the portfolio reality and shape the portfolio foundations.

The initial focus was the development of a center of excellence. Existing approaches were centralized and best practice sharing was stimulated. In complement, the interaction between resource and project managers was improved by reinforcing the support for Planview usage. To do so, the fundamentals of project and resource management were re-explained, and periodic explanations were given illustrating the concrete value for managers, beyond their cultural and regional habits. In parallel, reviews worked on improving the data quality.

In a second stage, a review process on resource capacity management was started across the European resource pools, with a focus on the organizational units and/or projects that were most mature. Later, this approach was extended to other perimeters. Gradually, this unfolded into an international cross-portfolio follow-up.

To complete the 'single source of truth' – based management, a monthly review was started of portfolio KPIs. The goal was to objectivize the 'word-of-mouth' and mitigate where needed.

HR wise, project careers were embedded in development paths. As for management challenges cascading from the permanent organization to the temporary units, experience exchanges were set up between senior stakeholders and managers from other companies, as well as with reference users of specific tools.

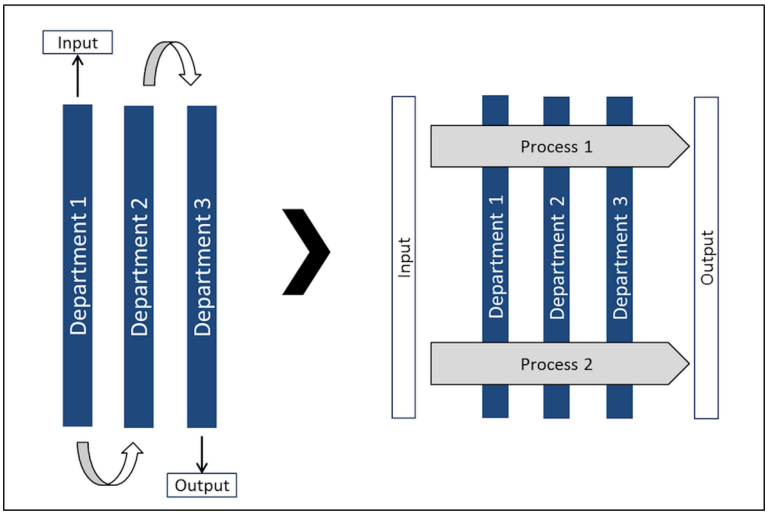
Results

After two years, Monnet Chocolate Europe's maturity rose from 1 to 2.4. Senior business and IT stakeholders, as well as the community of project managers, evaluated that the main gains were the existence (and operational use) of a portfolio follow-up on KPIs and resources, the adherence to best practices, and the evaluation of roadmap timelines.

Indirectly, the company reinforced the positive effect by creating burnout prevention groups throughout its different sites.

To attain level 3 and have real portfolio prioritization bodies that are actively linked with strategic discussions and allow managers to be in control, significant efforts are still needed. Aforementioned initiatives need to be continued to create a sustained dynamic, covering the full perimeter of the temporary and permanent organization.

Ultimately, the company has to strengthen the portfolio capabilities, to ensure that the leading roles are - or can be- managed by internal resources. This will greatly contribute to a more constructive and potent climate across the different sites for all project managers.



EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Expertise, Pragmatic Solutions, and Organizational Bridges

In addition to integrating the cultural essence and maturity of the ecosystem, managers that want to be internationally successful have to look beyond their expertise and experience. They should also invest in building organizational bridges.

As such, corporate silos are necessary (see Figure 6). They provide the structure that allows companies to function. On the other hand, they also cause structural problems potentially impacting internal or external customers, locally or globally. Some decisions need therefore to be made across silos. Managers should connect, and eliminate problems caused by silos, rather than tearing them down. As indicated by Smith & O'Connell (2012), cooperation, communication and understanding other departments' priorities are foundational to break the barriers.

Figure 6. Silos should be connected
Source: Own elaboration

Best practices exist to do so, but they should be seen as guiding inspiration, rather than as rules that provide their full value when being strictly applied (Office of Government Commerce, 2010).

To adapt approaches to the reality at stake, different types of information need to be taken into account. A first set of information is related to the change reality of the organization. This can be tuned in based on the insights obtained with the diagnostic tools explained in section 1.

A second one is related to the cultural identity of the team members. When managing large roll-out based projects, for instance, it is advised to integrate the cultural aspects in the organizational backbone.

Earlier mentioned Belgium-based Monnet Chocolate integrated specific traits of Russia (people only execute requests from their direct hierarchy), Brazil (many problems need informal fixing), Italy (human respect is key) and others, by having a local manager of each country join the executive force of their international transformation. This enabled them to combine a proven methodology with local adherence.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

When shaping transversal bridges, the perceived value has to be taken into account. This implies reconciling a sound approach with pragmatic solutions. It is namely not through the perceived complexity of a solution that people get convinced and adhere, but through its clarity and feasibility (Rad, 2017).

In Kaizen, for example, immediate realization is (to a certain extent) favored over ultimate perfection. Similarly, the software development world is opting for "good enough" solutions. This does not mean that quality should be neglected. It does reinforce, however, the need for targeted, pragmatic solutions, be it at the level of the managerial approach or for the final service/product.

To make the need for workable, transversal solutions more tangible a concrete example will be shared. While illustrating real-life experience, names and specificities of the company have been adapted.

Case: Hing-Ka

Managerial Challenge

Hing-Ka Europe is the European division of an international manufacturing company active in the aerospace industry. It was founded in the 1980's, as the European branch of a Japanese company, Hing-Ka, which itself is a subsidiary of a conglomerate.

The European division is active in the production of plane parts and the development of flight navigation solutions for the B2B market. The scope of the current case is the portfolio organization supporting flight navigation and autonomous flying projects.

The senior management team was facing a historical milestone. The products generating the major revenue share were potentially at risk, as multi-annual contracts were ending, while no new contracts were secured yet. At the same time, the historical comfort had resulted into a contented mindset amongst the employees towards the development of new opportunities. There was thus a high risk to turn virtually overnight from a stable, iconic company with steady results into a fallen, extenuated glory.

Double Dynamic

To tackle this risk, the senior management team set in motion a double dynamic, supported by the regional vice-president.

A first aspect of this dynamic consisted in changing people's mindset. It decided to move from a traditional 'project delivery' environment to an organization driven by market development, innovation and premium quality delivery. Employees were asked to come out of their comfort zone and engage actively in this new dynamic, be it locally, or across the national borders.

In parallel, a taskforce-driven project was launched, consisting of a cross-departmental audit, and the realization of the related change. Its goal was to identify the zones of improvement that had to be worked on to make the switch happen in reality. It covered the entire process, from the idea generation to final customer acceptance. The task force was a mixed team led by an internal and an external expert.

Concretely, the work was split in three phases: Firstly, team interviews captured the essence of what worked and what didn't. Secondly, mixed teams joined off-site for a detailed explanation of the company's vision and strategy, and a group review of the (anonymized) outcome of the interviews. This helped to identify the core problems for which causes and solutions were identified and shared. This offered a good view of the main action zones. Thirdly, corporate fundamentals were reviewed in detail (project portfolio, project process, project roles) and combined with earlier collected input.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The resulting actions were the base for targeted clarifications, improvements and changes, all aimed at contributing to regenerating the company from the inside to kick-start its jump forward.

Actionable Outcome

The effective impact of the approach has to be further evaluated over a long period of time. On the short term, this approach has however proven to fit to the challenges Hing-Ka's managers were facing for the internal rebirth and the development of opportunities across their pan-European portfolio.

The involvement of blended teams, for instance, set the foundation for the adherence to business acquisition focused changes and organizational shifts senior management put in motion later on. This has been particularly true for collaborations with French, German, Japanese and Belgian teams.

Similarly, the fact that the approach was hands-on and guided by expertise contributed to results that were perceived as close to reality, while still ensuring a change forward.

Transversally, business development teams and engineering teams are now more closely involved in a cross-fertilizing innovation process. This leads to a collaborative climate that favors customer and result focused innovation.

Lastly, throughout the entire project, quick wins had to be reconciled with lasting structural efforts. The resulting outcome was therefore closer to a good enough than to ultimate perfection. But, in the end, it enabled the management team to move forward significantly enough in the chosen direction, while still ensuring continued delivery in an internationally very challenging context.

Managing Internationally: The Digital Age

A specific type of shaping is expected in Digital Transformation contexts. Digital Transformation is a process in which human and corporate society is shifted to new ways of working and thinking with digital and social technologies. It involves a change in leadership, a different mindset, the encouragement of innovation and new business models, and an increased use of technology to improve the customer experience, locally and globally (Terrar, 2015).

Customer experience alone, for instance, is seen as a clarion call for CIOs, as avoiding complexity – and resulting efficiency drains – requires working on the cross-pollination across disciplines (Wharton, 2015). Doing so benefits namely the understanding of the skills and processes of the different teams. This, in turn, opens the possibility to better collaboration, cleaner solutions and increased value for the customer.

The success of Digital Transformation goes through integrating technological possibilities and dynamic customer journeys in the corporate DNA. Doing so obliges managers to mastermind a new way of functioning, new perspectives on projects and processes, and create a new dynamic that, in the end, will allow their companies to be more in the driving seat of the 'global' Fourth Industrial Revolution.

Before analyzing strategy development or actionable translations, it is important to agree on what Digital really is. For some, it is about increasing international technological strength. Others see it as collecting zealous amounts of data, being in constant communication with customers, or completely reshaping the company.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Anticipation and Adaptability

Digital is a dynamic sequencing of each of the above. It is a new way of thinking about service and product delivery, about organizing a company, about interacting with the larger ecosystem - and about creating value. Digital Transformation is thus not about technology itself, but about how companies integrate it to transform their businesses and shape the way of working.

With data collection happening through apps, for example, people can be seen as customers that use the apps' services. But as data generated by people are increasingly managed by the people themselves, consumers are, for instance in healthcare, turning into suppliers. This leads to the obligation to rethink products or develop new services (De Brouwer, 2015).

Embarking on Digital is thus about outlining and managing a dynamical way of working. With a clear strategy, skilled people and powerful data, digitally activated companies should namely get a fine-grained sense of the relations between customers and their ecosystem, take proactive decisions and, ultimately, adapt their business models to share and tune people's journey-focused experience.

Strategic Vision: Models and Methodologies

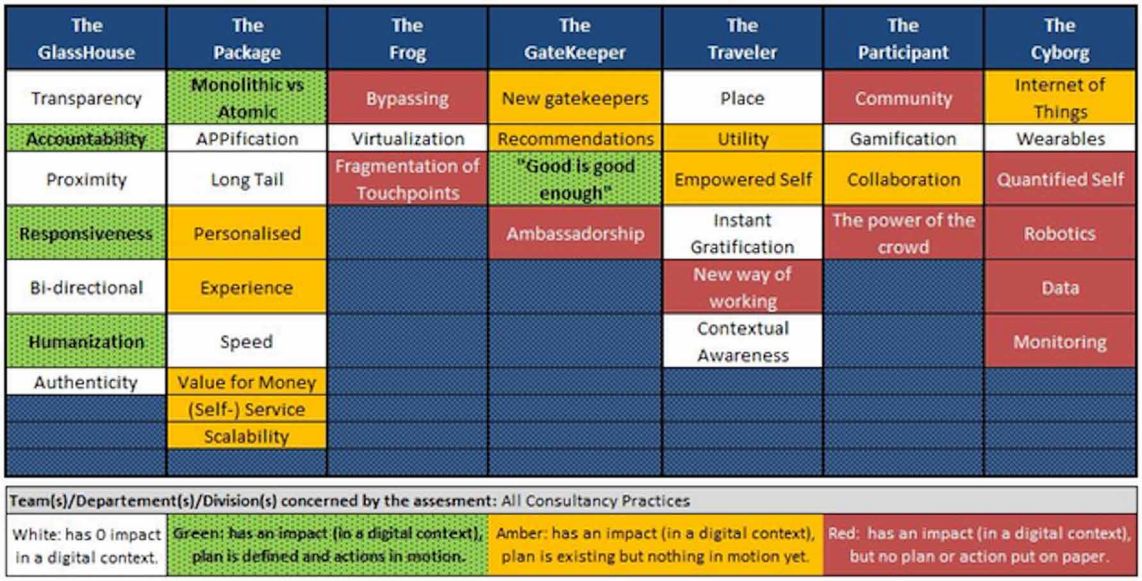
Professionals have developed tools that make this reinvention process more tangible and the outcome more actionable towards the thriving management teams.

A baseline can be built based on the Digital Quotient. This metric for the digital maturity of a company has been developed by consultancy McKinsey, based on an evaluation of 18 practices related to digital strategy, culture and capabilities, in 150 companies around the world (Catlin et al., 2015).

Companies can shape their digital road map by making choices with regards to the components of the Digital Quotient: Building a Strategic Commitment to Digital, Developing Digital Capabilities, Creating an Adaptive Culture, and keeping an Internal Coherence towards the realization of the Digital Strategy. This vision is the foundation for future actions, and the management with a clear sense of direction.

A holistic approach to structure the strategic digital thinking from conception up and until the realization has been developed by Caudron & Van Peteghem (2014). The 'Digital Transformation Modeling' methodology aims at clarifying the potential impact of Digital on an organization's activities, create future scenarios and build a plan based on these insights.

In essence, the process consists of five steps: Creating insights, Assessing potential impacts, Developing scenarios, Building Business Case(s), Staying alert through trend-watching. Figure 7 illustrates the assessment of potential impacts for an existing consultancy company. For an in-depth analysis of the framework, the author refers the reader to Caudron & Van Peteghem (2014), and Janssens (2017).



Skills and Big Data Power: Seize for Success

Healthy ambition requires that an organization gives itself the technical and human means to succeed. For the Digital journey, transversal capabilities can be developed by focusing on customer value, data experimentation, ecosystem collaboration, digital platforms, and maturity. In geographically or culturally hybrid contexts, specific attention will be needed on maximizing the blended potential.

The analysis of the different technologies is not in scope of this chapter. An element to keep in mind, however, is that technological possibilities need to be balanced with the potential budget as well as with

Team(s)/Departement(s)/Division(s) concerned by the assesment: All Consultancy Practices

White: has 0 impact in a digital context.	Green: has an impact (in a digital context), plan is defined and actions in motion.	Amber: has an impact (in a digital context), plan is existing but nothing in motion yet.	Red: has an impact (in a digital context), but no plan or action put on paper.

the company's appetite for change. By the same token, the ability of leaders to take an active role in the transformation is decisive when choosing suitable technology.

Secondly, organizations need to scale *towards* and *for* success. If the ramp-up results in high interactivity with the customers' ecosystem, for example, it is possible that data volumes will quickly skyrocket. If this sudden growth is not managed, the digital drive will be refrained, which may result in a negative cycle. Sizing for growth and success is thus essential.

Lastly, data power implies virtually always Big Data. In 2014, human and machine data was expected to reach 40ZB by 2020. In 2017, IDC expected the growth to continue further to 163ZB by 2025 - of which a quarter in real-time (Reinsel et al., 2017). Managing intelligently with the data fuel in mind is therefore vital.

Empowering Digital People

Bringing a technically prepared and data fueled company digitally onboard requires sound management and skilled people. People might have to change their way of working or the way they are organized. It might even involve the investment in talent and new skills.

People need therefore to be hired with a passionate enthusiasm about digital, a healthy level of 'functional craziness' and seasoned to think beyond the traditional silver lining.

At the same time, management of skills disruption is an urgent concern in the Digital Age, and the rate of skills change accelerates across old and new jobs (Schwab & Samans, 2016). To be compatible with this relentless skills change, companies need thus to look for people that are open to frequent change and that can adapt easily.

To ensure compatibility, managers need to create a stimulating environment. Notwithstanding periodic debates on whether quirky office layouts result in better output, it is clear that stimuli are a must.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the Silicon Valley, methods are available in spades, going from Google Ventures' techniques to more anarchic approaches (Bushnell & Stone, 2013). As such, it comes down to creating a climate and culture where thinking beyond the traditional references is stimulated.

In complement, it can be fruitful to review periodically ideas discarded early in the business process, to see if no hidden gems were thrown away. Atari, for example, listed the six worst ideas of the past period and brainstormed on how to turn them into good ones. At worst, it offered precious lessons. At best, products became a success (Bushnell & Stone, 2013). Google has been following a comparable approach.

Secondly, managers need to nurture their people for and with Digital. High performers have namely a beneficial influence on company results and potentially on other colleagues. It is thus important to think upfront about how to retain them. With predictive HR management, companies can anticipate employee expectations and identify needs for mentoring, while taking into account cultural particularities. By doing so, employee engagement will be stimulated. In turn, this will lead to increased bottom line productivity.

Thirdly, managers need to learn to talk digital. They do not need to know everything. They should be able to ask questions to their teams, however, and understand the answer. Digital teams tend to be culturally mixed, implying different human expectations. Latino workforce, for instance, has a more humility driven way of career management than American people. Nevertheless, a manager showing sincere interest creates respect among passionate people. It will reinforce faith in the company's digital culture and will cascade to other employees.

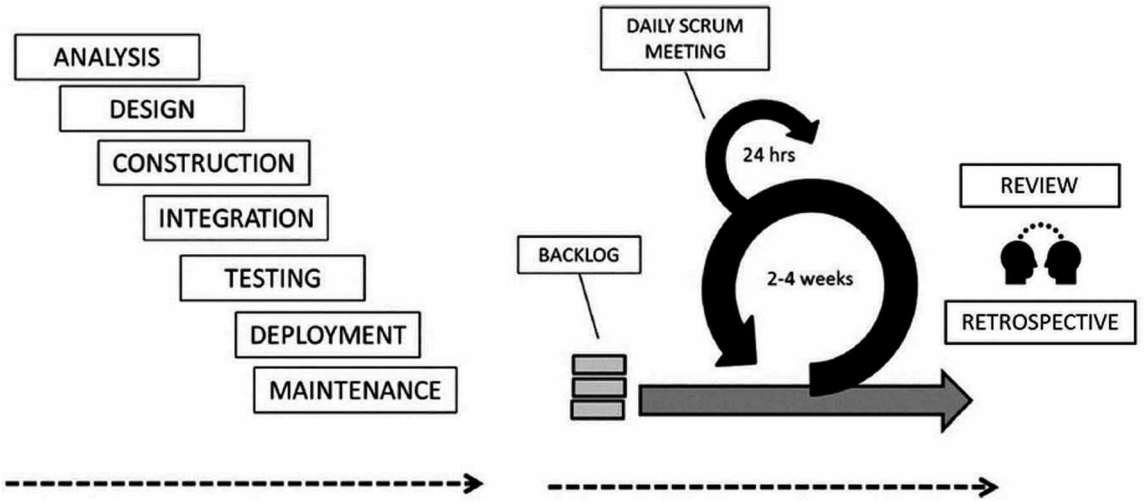
Having the appropriate human capital on board is thus one of the cornerstones to manage digitally. This implies creating an appropriate environment and culture, nurturing people, and managing them with a solid understanding of what digital means for them.

Dynamic Feedback and Agile Projects

In pre-digital times, companies were designed to gain market share. In the Digital Economy, companies need to be designed for reactivity, flexibility and agility. The challenge is therefore to build an integrated operational backbone that embraces a continuously evolving service backbone, and shape the respective capabilities, while implementing a clear, but dynamic (digital) business strategy (Ross, 2016).

A fair share of this nimble way of working is coming from agile software development: rapidly creating prototypes, testing them, and getting releases out smoothly. This philosophy is also influencing the development of business deliverables, given that data powered services are driven by software engines.

For details on agile approaches, the author refers to dedicated literature. But some attention points should be taken into account.



Firstly, the fluidity associated with agile requires discipline of the main actors. Scope control, failing fast and regular iterations are part of the core principles. The success of agile comes thus from the unconditional availability of decision takers towards rapid feedback.

Secondly, follow-up loops need to be managed carefully. No matter if they are scrum or Kanban, they need to aim at quality. Indirectly, this implies that baselines are important to fuel further improvement (see Figure 8).

Thirdly, agile perimeters might have to integrate with more traditional ecosystems. To make such hybrid contexts work, managerial compromises have to be made, despite eventual cultural tendencies to keep approaches unchanged. When agile subsets are inserted in a waterfall environment, they have to work with less autonomy and with a different time perspective. Similarly, waterfall entities will have to adapt to a flexible way of working.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 8. Combining waterfall approaches and agile might be needed
Source: Own elaboration

Also, radically simplified management theories (Laloux, 2014) have a strong potential, but need to be taken with a grain of salt. They might seem compatible with going beyond traditional ways of working. Nevertheless, Digital still needs structure and guidance. Simplification should not equal chaos (Rad, 2017). Simplification should be limited to a lean way of working, rather than going for a deconstruction of supporting governance.

Lastly, the overarching focus on agility should not become a goal on itself. In a dynamic environment where decisions have to be made based on continuously evolving insights, managers should be able to develop their quantified intuition and take decisions that make a difference. The aim of agility is therefore to be in support of the overall goal: providing appropriate solutions to customer needs and preferences.

FUTURE RESEARCH DIRECTIONS

Companies are either international by nature or global business dynamics turn them into internationally challenged players. This obliges managers to stay sharp. This is especially the case in portfolio contexts, as they are essential for the realization of the company's strategy.

In practice, this requires a combination of leadership skills and managerial means. Integrating these complementary components contributes to canalizing efforts and unveiling potential. Such environments are, however, evolutionary by nature. It is thus essential to continue to nourish the management toolbox.

A possibility is to go beyond the fine-tuning of existing models. Complementary value could be obtained by analyzing the constraints that come with increasingly hybrid portfolios. Similarly, cross-pollination of permanent and temporary organizations should be further explored.

In the same train of thought, as steady expansion of agile will lead to an increased importance of human trust, self-organization and delegated ownership (Rad, 2017), future research should analyze ways to stimulate ownership. As projects are at the cross-roads of present and future, this implies taking

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

into account the generational heterogeneity and the broad spectrum of expectations/needs inherent to culturally and/or geographically blended teams.

Lastly, attention should be paid to the influence of evolutions driven by increased automation and artificial intelligence (AI). Beyond being consequences of technology spurred business models, both evolutions shift jobs from white to blue collar, and involve requirements on technology and business for which many organizations are not necessarily mature yet in the same way in every geographical sub-area.

Further analysis of such ecosystems could provide precious insights on how to further improve portfolio management in times of increased Digital Darwinism.

Obviously, best practices will require regular revisiting as this context is in constant evolution. But the author believes that the recurring efforts will be largely compensated by the advantages in quality and outcome of the concerned managerial portfolio guidance.

CONCLUSION

Given the speed of innovation and dynamic competition, managers need to regularly sharpen their skills and competences to allow them to achieve success in international environments.

Successfully managing and shaping change within project portfolios and organizational ecosystems assumes the integration of some important variables. The chapter shed light on specific 'project management science' insights and managerial soft skills that can contribute to a sound management, if they are balanced intelligently.

Firstly, it has been explained that managers of international projects need to stay tuned with the local reality while working towards their corporate targets. Insights have been given on how to perform change diagnostics to capture the site-specific change climate, the stakeholders' feeling and the project impact. Illustrating it with a company putting in place a transformation portfolio has offered an understanding of the knowledgeable value of these insights.

Secondly, a complementary emphasis has been put on capturing and using the organizational maturity. Several frameworks were highlighted and a foundational one has been put forward to increase the understanding of the ecosystem in which international project managers work. An experience based example has shown the tangible potential before and after activating the maturity in the managerial toolbox.

Thirdly, it has been emphasized that crafting solid management implies to tune best practices to a knowledgeable approach for the full value to unfold. An equally important quality for managers desiring to have a lasting international footprint is to invest in transversal collaborations, while keeping the strategy and the management philosophy in mind.

Lastly, several elements have been combined in digital contexts, where companies face global challenges due to the changing value proposition. Essentials have been explained to shape a digital strategy and manage digital teams.

By combining theoretical insights with empirical examples, the chapter aims at offering a big picture view, and paving the way for joint exchanges between academic knowledge and field shaped expertise. Consequently, the author believes that further synergies between temporary and permanent environments will lead to bidirectional insights and best practices, that will also benefit the guidance by managers of hybrid portfolios that combine both identities in geographically blended environments.

ABSTRACT

The authors believe that the transition to Industry 4.0 will have a strong impact on the level of urbanization in Russia. The level of urbanization is influenced by many factors, which include the level of economic development of the country, migration of the population, natural and climatic conditions. The highest level of urbanization is typical for industrialized regions. This suggests that it is necessary to develop industry and move to Industry 4.0. The purpose of this chapter is to show the relationship between urbanization and Industry 4.0, as well as to increase the level of knowledge about digital production, the internet of things, the Industry 4.0, and urbanization. The chapter explains the role of Industry 4.0 in the current changing environment. The chapter deals with the most important problems and opportunities of the fourth industrial revolution.

INTRODUCTION

In this chapter the authors search for trends, which occur in the traditional sectors of the economy as a result of digitalization, and above all in the labor market, industry and agriculture, financial services and education. Modern information and communication technologies substantially change all social relations, in connection with the notes that now it's the formation of a new, information society, which is called the "digital economy". Despite the somewhat similar properties with traditional economic relations, it differs in some respects from them, which makes its relevance from the point of view of the interest of the scientific community. One of the key areas of the state development is economic. We should understand the "digital economy" as a lever of economic structure and the environment in general. Horizons are expanding, a window of opportunity is opening by the younger generation, which can realize their ambitions and knowledge, creating favorable secure social environment for our future.

BACKGROUND

Contributions to the development of the digital economy have been made by foreign researchers such as Stephen M. Mutula (2010), Ari-Veikko Anttiroiko (2008), Georgios Doukidis, Nikolaos Mylonopoulos, Nancy Pouloudi (2003), Ionica Oncioiu (2013), Elena Druicã (2017).

The use of digital economy in industries has been reflected in the science. In the world of scientific literature, this area of knowledge is presented with such authors as: Nikolaos Mylonopoulos (2003), Bob Ritchie, Clare Brindley, Pedro Isaias (2017), Di Francesco Virgilio (2017), Ionica Oncioiu (2017), Elena Druicã (2017).

However despite the large number of works devoted to digital economy, the specifics of applying it in different industries haven't been given due attention. Innovation and the impact of the digital economy on society provided the theoretical and practical approaches for its development, increasing the awareness of understanding the term "digital economy" and what advantages there are to ensure the information technologies and innovations as basic resources. The publication of Elena Druicã (2017) focuses on rethinking of classical economic theory in the context of new technologies, information and innovation that makes her publication the best research for economists and social researchers, academicians, professionals and practitioners. In the opinion of Ionica Oncioiu (2017) digital technologies support an important tool in the modern economy business. As the economy continues to change, companies are looking for solutions for the expansion and development of its organization.

In the information economy, handling and the exchange of information and knowledge are the basis of its activities. The U.S. economy, works well, because it was due to the revolutions in the field of information technology (IT), which influenced the growth, employment, inflation, and labor productivity. Fundamental factors, driving growth in these new economies include technological innovations, e-commerce and digital conversion, higher education and skills in the IT field, open trade and a balanced budget. According to Pedro Isaias, digital economy is the main driving force of change, innovation and competitiveness for different companies and entrepreneurs. Study of the development of these initiatives can be used as a basic tool for future business success (Isaias, 2017).

According to Di Francesco (2017) in the digital age, numerous technological tools are available to improve business processes. In case of effectively using, knowledge sharing and organizational success increase significantly. According to analysts of Microsoft, a key role in the further development of the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

world IT industry must be played by a mass adoption of the so-called "The technology platforms" - sets of compatible technologies, products and channels of distribution, as well as the ecosystems of their distribution and usage. The main elements of the new technology platforms are now considered: cloud computing, mobility, Internet of Things technology, big data analytics, business intelligence, and machine learning. Thanks to the cumulative effects of these advanced platform technologies there has been a gradual "transformation of products into services" and the expansion of the chains of value creation, delivery of goods and services, as well as the extension of the supply chains of human capital."(The term used by the chief economist of Microsoft Preston McAfee, 2017).

The world is constantly changing, and recently one can hear about the growing role of advanced technologies and innovations in the development of the economy. New technologies allow increasing the efficiency of production and business processes. Traditional approaches and methods of work are changing as the penetration of advanced technologies in all new industries and spheres of human activity.

The influence of digital technologies is at both the global and the local level. On the one hand, the digital economy as a collection of new industries is the fastest growing part of the world economy in the traditional sense. Recent years the development of new technologies has led to the emergence of huge markets for cellular communication, Internet services, online gaming industry and others. On the other hand, new technologies have transforming impact on some aspects of the work of the established economic entities that basically is replacing the analog working mechanisms - whether it is the means of communication or industrial machines - to digital or semidigital elements, as well as the further modernization - for example, the already existing.

The growth of the digital economy follows the growth a number of markets, directly related with digital and mobile technologies. The digital economy during at least 10-15 years will be heavily dependent on traditional one. At the current stage of technology development and the current status of the markets for digital economy should not be seen as a goal, but as a means to improve the efficiency of economic activity. In the age of computerization and high technology digital economy affects every aspect of life: health, education, Internet banking and government *(Vasin and Gamidullaeva, 2018).* Digital Economy has received stimulus in all developed countries including Russia. On the basis of foreign policy developments and global trends, Russia is solving the problem of global competitiveness and national security, and a digital economy development in the country plays a great role in this issue. Some elements of the digital economy have been already successfully operated. For today the process of making digital documents and data, the resolution of the electronic signature, the communication with the state also goes on the electronic platform.

MAIN FOCUS OF THE CHAPTER

Issues, Controversies, Problems

In 2018 there are several trends in the digital economy development in Russia:

Cyber Security

The issue of cybersecurity goes to a new level in the context of the growth of IoT and robotics, as well as the increasing cyber attacks. The budget for cybersecurity by 2017 has been raised to $19 billion, and

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

worldwide amounted to more than $80 billion. The proportion of Russian costs is more than 55 billion rubles. According to Gartner, the world market turnover of cybersecurity by 2018 will be close to $100 billion. They discuss the possibility of banks in Russian system in coding and encryption. At the conference in Munich the Head of Communications of the Russian Federation Nikolay Nikiforov proposed to develop a common regulatory framework and international standards for advanced technologies. Russian companies, leading the activities on the international market, since May of this year must comply with the updated rules for the processing of personal data according to the rules of the GDPR.

Cross-Border Cooperation

Russian companies are actively integrated in international alliances that define the technological standards in the years ahead. In May 2017, the head of the company "Russian export" Igor Chaika signed an agreement of cooperation with Alibaba, under which the Chinese trading platform will open the Russian national pavilion for the implementation of food products and household chemicals. The prospect of such undertakings is obvious. Thus in 2017 by the initiative of the Russian export center the playground "Made in Russia" (sector B2B) began to work. Requests for products from the catalog come from different parts of the world: Africa, Asia and South America. As a result long-term international partnerships with participation of Russian manufacturers develop.

The Establishment of Common IT Platforms

This allows you to synchronize the digital solutions that stimulate the emergence of associations that are interested in the qualitatively different technology solutions. So in the summer of 2017 "Sberbank" and "Yandex" agreed on the establishment of a joint platform of electronic commerce based on aggregator of goods and services "Yandex.Market". The total cost of the updated project is estimated up to 60 billion rubles *(Gamidullaeva, et al., 2019).*

Another striking example is association of the Russian "Uber" and "Yandex.Taxi" into a single site online taxi, the deal will have been closed in 2019.

The Digitalization of Public Services

Setting a course for the digitalization, the state motivates the company to develop high-tech Resource and sets a plate of IT. Within the framework of the "digital economy" Russia plans to hold the internet in remote areas of the country, place the state docs in cloud storage facilities, to ensure that by 2025 it will provide 80% of the public services in electronic format. Also there is a plan for the establishment of 50 smart cities, the launch of the 10 sectoral platforms in the figure and the transition 10 enterprises in the high-tech format. For comparison a Denmark digitalization program was adopted in 2001. Population and business interact with the State primarily through online services, due to which the country annually saves $136 million.

B2B-Marketplaces

They replace morally obsolete electronic platform where everything can be sold by everyone. Aggregators of goods and services are the trend of the past 10 years; retail consumers are already accustomed to

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

use them. Businesses also need comfortable conditions for online purchases and variability of methods of payment for goods and services category. So on the site Yorso there is convenient search for large amounts of seafood. Agro24 is a modern online platform to buy food. Such services appear increasingly, they're different in convenience and variety of search parameters of products.

In Russia, nowadays most of the issues arising in the use of information and telecommunication technologies in various spheres of activity are resolved. However, the regulatory environment has a number of disadvantages, which stop the formation of the new institutions of the digital economy, development of information and telecommunication technologies and related economic activities. The huge number of citizens of the Russian Federation recognizes the need for the possession of the digital competencies, but the level of use of personal computers and the Internet in Russia is still lower than in Europe, and there is a serious gap in digital skills between separate groups of the population.

The doubtfulness of program (mentioned above) is proved with the following:

- The successful functioning of more than 10 companies (operators of ecosystems), competitive in global markets", while maintaining focus on the export of oil and gas seems very unlikely;
- The successful functioning of more than 500 small and medium-sized enterprises in the field of digital technologies and platforms and provide digital services" is not typical for Russia, when all of the innovations come from small and medium-sized businesses.
- The number of graduates of higher education in the areas of information and telecommunications technologies is 120 thousand people per year" looks unbelievable. Now days there are 5000 students in Information Security, and 36.1 thousand students in Informatics and computer engineering. That is to achieve the target of 120 thousand we need to increase graduates in three times.

There are some advantages. How, for example, it can be that the digitalization will help accelerate the optimization of the cost of sectors of the economy, minimizing the deficit of services. More than there was a reduction of the number of hospitals and doctors. And for encouraging the patients, telemedicine is proposed for consultation, when the doctor, starting with the second reception, can give advice to the patient via the Internet. Time, money, the cost of logistics is saved, but the number of physicians can be discharged. It leads to the growth of unemployment. Similar innovations will affect and educational sector.

Risks and Problems

The following are just a few:.

- The threat of "digital sovereignty" of the country and the redefinition of the role of the State in a transboundary world of "Digital" Economy;
- Violation of privacy / potential surveillance of citizens;
- Reducing the level of data security;
- Reducing the number of employment of low and medium professional skills;
- Increasing the level of complexity of business models and patterns of interaction;
- Change in the behavior of producers and consumers;
- Need in reviewing the administrative and tax codes.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In such socio-economic conditions the development of different spheres must be implemented with the use of information and telecommunication technologies of a qualitatively new level that allows use data in digital form as a key factor of production; the information technology industry should provide the necessary platform and services. Undoubtedly the plan of development (spoken earlier) is very faithful. Indeed there are problems in industry such as: staff shortage, "brain drain", the lack of a unified environment, in which the technological leaders would unite the efforts to establish new platforms and etc. All this points are important tasks throughout the state.

Qualitatively and quantitatively opportunities to do through a computer almost everything will increase; for example, receiving a variety of services. It is cheaper and more efficient within adequate measures of protection. The digital economy is both advantage (compared with classical way), and the threat to society, because in many respects we should deal with data security. Therefore you need to plan at the same time, substantial costs, for example, to ensure the safety of money on accounts of people, their personal data. The central bank, for example, could create a special institute which would ensure the safety of financial information of physical and juridical persons. Within the framework of the Eastern Economic Forum (September 13, 2018) Experts called the problem of Russian digital economy and this is lack of normative-legal base.

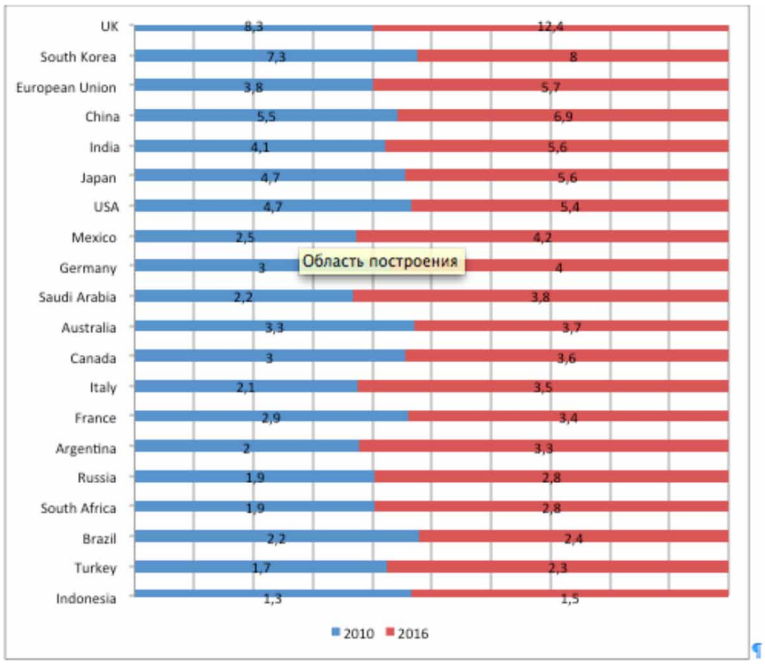
THE INFLUENCE OF DIGITAL ECONOMY ON THE LABOR MARKET

The development of the digital economy has an impact on the labor market: changing the structure of employment, new requirements for professional competence and the growing demand for IT professionals in the field of information and communication technologies (ICT). At the same time, people working in all sectors of the economy, must have a digital literacy and digital information skills, using modern telecommunication and software products.

The digital skills – they're the competence of the population in the use of personal computers, the Internet and other ICT, as well as the intention of the people to acquire relevant knowledge and experience.

Depending on the purpose of the use of ICT there are two categories of persons with digital skills:

- **A Professional:** Professional skills are necessary for the development, operation and maintenance of the information and communication systems (preparation of specification, design, development, installation, operation, support, maintenance, management, evaluation, research and development in the field of ICT).
- **A User:** The skills are necessary for the effective use of ICT skills for work, study or personal purposes.



In 2015, the number of software developers and applications, databases and networks, specialists on ICT and ICT users, support of telecommunications and broadcasting - is estimated to be 1.2 million (approximately 2%). Specialists in information and communication technologies are relatively young: 38% below the age of 30, one third - 30-39 years. The total number of staff in these age groups is 22 and 27%. A quarter of IT professionals (23%) are working in the IT industry, 10% in the communications sector, about 20% in the financial sector, trade and public administration (6-7% of the total population are ICT specialists in communication technologies).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Information and communication technologies have become a part of our lives: four fifths of the population of the world (81%) aged 15 to 72 years has used a personal computer, the same situation concerns with the Internet. The quantity of daily network users comes closer to 60%. According to The Boston Consulting Group (BCG), the share of the digital economy (also called web or internet transition) to the GDP of developed countries has grown since 2010 up to 1 point and is now 5.5%. In developing countries this figure increased from 3.6% to 4.9% of GDP.

The UK is a world leader in the proportion of the digital economy in GDP. Sector which includes the IT and telecom, online trading, government spending associated with the internet, takes the second place in the economy of the country in the wake of the real estate and telecommunications manufacturing and trade.

Figure 1.

Dissemination of digital technologies in everyday life alters the path of access to services, information and knowledge. Rapid technological changes should make maximum use of the new opportunities offered by information and communication technologies, expanding the usage of digital technology to increase the demand for new skills. At the same time the key of effective implementation is the basic skills in the use of information and communication technologies that allow a person to deal with digital activities and adapt quickly to the new and precarious work.

Over the next 30 years the technology will overcome the biological limitation of human potential. The available devices that are connected through the Internet, will be able to transfer context sensitive information, which is directly related to our emotions. Exoskeleton and prosthetics in combination with the brain can make rights stronger and return mobility of older persons and persons with disabilities. The sensors and computers, embedded in contact lenses and the permanent implants will allow you to

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

hear the whisper from the distance, give a natural night vision and allow you to immerse yourself in a virtual and supplemented by reality. Neurometabolic drugs increase the cognitive ability of the people and transform work and education.

In addition there is the evident global trend to robotizaion. Robots will be entrusted with the care of patients, procurement of supplies, the harvest, the maintenance of the company's infrastructure and providing many other services. Bots headed by the terabytes of data will be responsible for the automation of the business processes, training and the provision of services - functions and roles have traditionally been inherent in man. However, the expanding technologies are quite expensive, and those who cannot afford such upgrades, will not be able to compete in the augmented economy. Network accessories will also become an attractive target for hackers who want to control the mind and body. Robotics may lead to an increase in unemployment.

The population survey on the use of information technologies and telecommunications networks, conducted by the National Statistical Service, showed that the most common computer skills are related to the text editor (Used 42% of the respondents), transfer files between computer and peripheral devices (29%), work with tables (23%). The proportion of "advanced" users who can change the configuration of the software, is not more than 3%, the same data applies to people who have the possibility to install or reinstall your operating system. The task to write software, using the power of programming languages, is normal for only 1% of the population in this age group.

The skills to use the software for editing photos, video and audio (21% of the population), show that Russia is almost at the same level as Ireland (23%), Czech Republic (21%), Cyprus (20%). In Luxembourg, Denmark, Finland and the United Kingdom, these computer operations can perform every second. At the level of the development of the digital literacy it is possible to estimate data on the total population using the network for various purposes that require a certain skill level when you work with content, the search engines and software products.

The fact that the vast majority of Internet users has the ability to communicate over the network, demonstrates the importance of social networks (76% of the population aged 15-72 years via the Internet in the past three months). More than two fifths of the three-month Internet population (42-44%) use the network to find information about products and services, and phone calls and video, electronic letters. Nearly one-third has personal experience of the upload files to the web-sites, social networking, cloud storage for general access.

The main reason for the failure occurs from the use of the Internet, is the lack of skills. In 2017 it was registered every fourth respondent (from those who have not enjoyed the network). In comparison with the 2015 this figure had increased by 3 percentage points (from 22% to 25%).

The technology is transforming the relationship between people and their work. Freelance market increases, with access to the internet resources and tools work together. Companies are making rapid innovation technologies such as 3D-printing and application programming interface (API). In the coming years, these trends will change the structure and principles of work as a whole. For some participants, businesses reduce the barriers will bring new opportunities. On the other hand, competition in the "free earnings" will mean lower wages, lack of benefits and economic uncertainty.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

THE DIGITAL TRANSFORMATION OF AGRICULTURE

Innovative development of agriculture in the world economy has now reached a high level and sustainable growth. While there are hidden reserves, the use of which will give a new impetus to its development in the third millennium. One of them is the digital economy.

Currently each country in transition to a digital economy, depending on the level of economic development, the level of education, the readiness of the normative-legal base, technology development of state and application of information systems, focuses on the strategy of digital transformation to achieve a positive effect. Digital Economy in agriculture will be able to ensure the sustainability of agricultural development, the development of the agrarian science, agricultural education, compliance with environmental regulations.

Digital Economy in agriculture will allow the development of a model agricultural growth in developing countries, oriented at both the domestic and external markets. This will ensure the growth of the main product groups, aimed at both the export demand and for domestic consumption. Sustainable development is an organization of agricultural production, in which the new generation would have access to the resources and could lead agriculture in scale, ensuring the needs of the population for food.

To avoid global problems in the field of food and bio-safety humanity needs a new kind of agriculture, which corresponds to the model of circular economy (without the waste) and the principles of sustainable development. The heads of international organizations and national governments are increasingly devote themselves to the transition to a new economic model and "smart" agriculture as an integral part of it.

"Smart" agriculture is based on the use of automated decision-making systems of complex automation and industrial robotics, as well as the technologies of designing and modeling of ecosystems. It includes minimizing the use of external sources (fuel, fertilizers and agrochemicals) with the maximum use of local factors of production (renewable energy, biofuels, organic fertilizers, etc.).

Advanced Intelligent technology agriculture provides effective protection from pests, restoration and protection of beneficial properties of soils and groundwater and remote end-to-end monitoring compliance with the requirements of certification of organic agriculture. These technologies include the use of biopesticides to integrated pest management, Nano biotechnologically clean water and soil, integrated farm management, etc.

The Innovative Development of the agricultural sector, in turn, requires the use of information and communication technologies. They can ensure effective communication, interaction in the online mode. In the conditions of the network economy technological platform should become one of the major elements of digital ecosystems. For agrarian digital ecosystems it can become of main idea a technology platform of the food and processing industry, and complementary: space and geo-informational technology - products of global competitiveness.

The development of information systems and computerization of the opens up new opportunities for agriculture by improving the quality of work and improve performance. The important role played by the enterprise, producing agricultural machinery and equipment. At the same time this development in the field of software processes control spraying and tillage, fertilizer for the crops.

Recently the market of consulting services in the agrarian sector is gaining popularity all over the world. The reasons for this were: increased interest in the implementation of information technologies and the need for practical experience in this area. Farmers need advice because they do not pay sufficient attention to the tracking of recent advances in technological progress, since for them, the quantity and quality of manufactured goods much more important. Consulting is focused on business activities,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

focused on projects, which allows you to pursue an independent assessment of the effectiveness of new information technologies. In this case the consultant, who regularly visits the farm, and makes recommendations to improve production and introduction of innovative technologies, comes to the rescue. This support helps farmers to spend money not only on the purchase of traditional, but new information technologies. In addition, advisory, management and organizational centers are made to help agriculture through their financial and investment projects. World-wide network of new technologies is the basis for the creation of uniform information space, but new technologies are rapidly developing and implemented with high-tech developments.

In addition, there is a need for economic and legal basis for the definition of the rights and responsibilities of individuals when creating information resources and the objective of stimulating their regulators.

An example of the development of the digital economy in agriculture is a factory "Kuban". It within the program "Electronic agriculture" the integrated program implemented a powerful plant subsystem by the creative team from various industry crop NRU and cybernetics RESEARCH INSTITUTE OF AGRICULTURE on a single methodological basis has been implemented integration of knowledge of different ICS organization (offline). The requirement of integration of information, its modes of processing, as well as the requirement of functional completeness served as a basis for compiling the list of tasks and their classification (340 automation tasks), as well as to the structure of the logical database (151 type of records), common to all crop enterprises.

In modern conditions when implementing the model site for agricultural enterprises this logical structure of the database can become an integral part of all systems of precision farming, spatial monitoring of soil and other ICS from one position. This will allow realizing the standard solutions, almost for free for manufacturers of the goods. This logical structure and classification of these tasks of automation can become the basis for the standardization of the platform digital sector of agricultural crops. Such an approach for other industries, including animal husbandry, while placing certain databases in a particular cloud, for example, a powerful database system (DBMS), extends a digital platform in all sectors of agriculture. It is clear that these databases will be integrated with each other.

As shown in the domestic and international practice, with the introduction of a typical farm plot and mandatory reflection in the overall cloud statistical information, the system of statistical accounting must be substantially changed. The integration of a single information field of the agricultural knowledge with typical locations of agricultural organizations, agricultural research institutes and universities; the standard ICS and primary accounting system, implemented through Internet technology, are the basis of the digital platform, a logical structure which is ready for the future integration with various digital devices.

Digital Economy in agriculture will form a new structure of digital ecosystems of the agrarian sector. Together with the digital assets of the agricultural sector in the technology platforms there will be innovative projects. For the establishment and operation of digital the agrarian sector of the global economy of the twenty-first century requires coordinated actions of all participants, specialists, with new competencies, high financial costs, developed the IT structure, methodical and legal support.

FINANCIAL SERVICES AND E-COMMERCE

Electronic commerce is meaningful institute of digital economy, penetrates into a growing number of legal relations in the sphere of trade, and covers the entire spectrum of relations - direct interaction with

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

consumers-to-consumers (C2C), the interaction of sellers-to-consumers (B2C), the interaction between businesses (B2B), the interaction of business and the state in digital form (B2G), etc.

The Internet commerce is one of the most dynamically developing technology markets in the world. The rapid growth of the market due to, first of all, fast enough the global spread of broadband (fixed and mobile) access to the Internet. In the e-commerce the segment "m-commerce" slows down the increase (in 2016 he grew to 63.8%), but is still developing more dynamic market as a whole. The market of electronic commerce "m-commerce" is presented in Figure 2.

Figure 2.

With the development of the gadget industry the proportion of purchases that users commit by means of mobile devices gradually increases; thanks to this mobile commerce becomes a separate segment of e-commerce. According to eMarketer, sales in the segment of m-commerce in the world grew by 40.3% in 2017 up to 1 357 billion dollars, which is 6.0% of the total volume of retail sales. For comparison, in 2017 the total sales of retail e-commerce throughout the world reached 2 304 billion dollars, on the segment share of m-commerce accounted for 58.9% of online sales.

It is worth noting that the increase in the market of e-commerce (+24,8% in 2017) was markedly lower than that of sales through mobile devices. It is expected that the dynamics of growth of mobile sales will remain high, but will gradually slow down to 22.2% in 2021, when the sales volume in the segment will be at the level of 3 556 billion around the world.

"Globality" in internet is fully exposed to trading platforms in all countries. In 2017 cross-border trade is one of the main drivers for the growth of e-commerce around the world. Local giants go to foreign markets, steadily being transformed in the global players, looking for business opportunities in new regions. While the buyers are motivated with the opportunity to is guaranteed to obtain a high-quality product at the right price from anywhere in the world, internet retailers cross-border electronic commerce provides tremendous opportunities for the expansion of the market for their products and attracting new clients. The number of online purchases at foreign websites will increase from year to year. Consumers from different countries are looking at foreign sites goods unavailable in their region or price and quality which are more attractive.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Trade in the Internet is gradually becoming an integral part of the world economy. However, the development of a new direction in theaters is different pace. Asian region is situated in the absolute leaders in segment, almost twice as overtaking North America on drug Internet commerce (mainly at the expense of China). This trend is due to the strong economic growth in developing Asian countries and informatization.

However, the new market is less true and transparent in comparison with traditional retail due to the specifics of existing virtual technologies. But it is the global nature of the trade is at the same time as a powerful driver of growth and a key barrier to creating the necessary legal and financial instruments for legalization of the sector. In some cases, the emerging commodity-money relations is already becoming difficult to regulate the rules in force in the territory of one country (in particular, allowed to sell goods - for example, medicines, and ways of delivery), it becomes evident that the necessity of regulation of the internal and cross-border Internet-trade on the basis of uniform principles, regardless of jurisdiction, is needed.

However, the common practice for regulation at this point has not happened yet. While there was a clear trend related to the popularization of protectionist measures (except for the United States and several other countries where taken on the course of market self-regulation) in most developed and developing countries in the world in order to stimulate the national Internet retailers and manufacturers. The commodity structure of the e-commerce market includes a lot of various categories - from the spare parts for cars, hazard appliances to perfumes and art objects (practically all that is presented in a traditional retail).

The trend of e-commerce will be the mobile commerce. Now more and more users prefer to make purchases on their way in a convenient for them at the appropriate time. Retailers constantly improve applications for customers convenience and easy to execute orders through smartphones. According to the Statist, income from sales of mobile is growing steadily. In 2017 it amounted to $550 billion, an increase of 30% compared to 2016 year.

As expected, in 2018 this figure will increase by 20% and will reach $670 billion. Easy to pay for goods with smartphones (buying in one click), the use of new technologies (payment by fingerprint or payment authentication using selfie), as well as push notifications, showing greater efficiency compared to the e-mail broadcast, contribute to the growth of mobile transactions. So, the day of the Chinese sale of “Singles Day” (90% of sales was implemented with mobile phones, and in the United States in the popular network Starbucks coffee 10% of orders been decorated with smartphones.

The ability to directly buy goods on social platforms, a growing number of bots and services artificial intelligence, the popularity of instant messengers and IoT devices with voice operated control will promote the development of mobile commerce. Consumers prefer to use different devices when making a purchase - to search for goods and read reviews about it with smartphones, and execute the order with the desktop. It is important to monitor the sale, committed with different devices and make the transition from one to another smooth and integrated. The ability to identify the buyer allows companies to have recourse to it personally at the right time, bearing in mind the preferences and needs. The technology of the cross-tracking device can help you to explore user behavior and to understand its “path” to purchase, as well as to develop client-oriented marketing strategy at different devices.

Thus, each customer will be able to receive individual recommendations and will see the ads, based on his past purchases and preferences, geolocation and the trends of the market. According to the largest news portal Business Insider, by 2020 80% of the companies planning to introduce chat bots and other automated systems, in order to understand the intentions of users and to ensure a positive customer experience. Another trend of e-commerce is a social commerce. Recently “influencers” are gaining more

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

popularity, capable to influence its target audience and unobtrusively to promote those or other goods and services.

According to the consulting and auditing firm PwC, for 50% of the respondents social networks are the main platform, enabling them to make purchases. According to a study conducted by the company, BrightLocal specializing in CEO, 85% of users' degree of confidence to online reviews as great as to personal recommendations from friends and acquaintances. Influencers generate traffic, drawing on the target page visitors. More than 40% of the companies represented online, have the significant increase in traffic from social media. One of the problems facing e-commerce is the use of blockers of advertising.

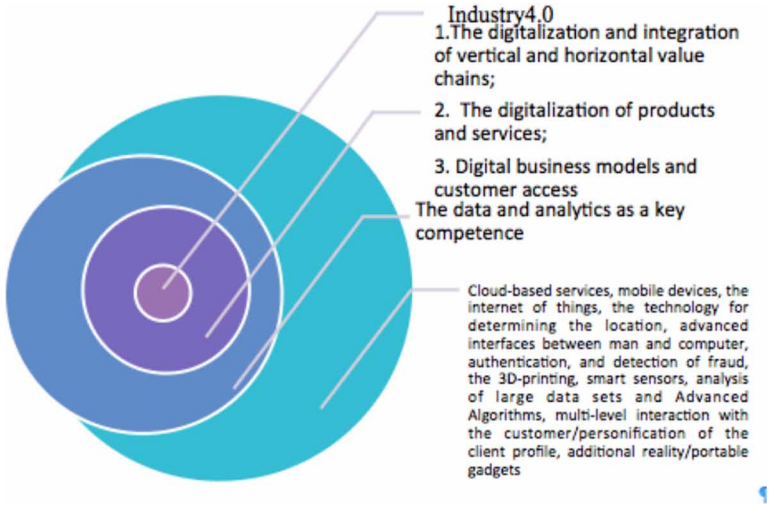
According to eMarketer, by the end of 2018, 30% of internet users will block your ads. Most ad blockers installed on the desktop and PC, but their application on mobile phones increases gradually. The USA and China will determine the trends in e-commerce. China is the undisputed leader, taking first place in the turnover and providing 40% of the world retail e-commerce. The country sets the global trends - the Chinese sale Bachelor's Day on the quantity of sales overtook the American Black Friday and Cyber Monday.

The USA, in turn, occupies a leading position in the field of technological innovation, American users have a wealth of experience of online shopping and have a high purchasing power. To understand how e-commerce will develop in the coming years, we draw our attention to these countries. The role of e-commerce in the development of the world economy, in turn, necessitates the task of the development of statistical indicators and appropriate methods of calculation and analysis.

Currently, we are witnessing rapid growth of financial services, at the same time as a stimulus for the intensive development of technological solutions for the industry. Under the Financial Technologies (hereinafter - The FinTech) we understand the application of innovative technologies in order to provide financial services. However, with a lot of technologies, used in the financial industry, boundaries of the term "branch of Financial Technologies" are blurred.

The main segments of the financial technologies at the moment are: payments and transfers, crowd-funding, asset management, the financial marketplace, the blockchain. In this regard, we see the growing trend to create a fully digital bank, which, in its activities focuses mainly on those who prefer using online banking services.

In the first half of 2017, the volume of investment around the world in this branch of economy has increased by 49% compared to the same period of the previous year and reached the level of 15 billion US dollars. Banks and large financial groups embarked on the path of technological development, the consequence of which the provision of their clients was more extensive with financial services. The consequence of the rapid development of financial technologies worldwide the number of fraudulent crimes in the area has been increasing. In this regard, the first place outside the security not only of the transaction, but also the identity management of users.



According to some estimates, currently there are many prerequisites for significant changes in the sphere of FinTech, the consequence of which we see its evolution and beyond the standard payments and credits. A new stage in the development of financial technologies is based on cloud computing technology, which gives much more opportunities for critical infrastructure changes, and the functioning of the financial sector of the economy. The widespread introduction of artificial intelligence in the area of financial technologies is having the place. Among them there are the chat bots for customer service, robotic players on the stock market, machine learning and big data for decision on the loan for the client.

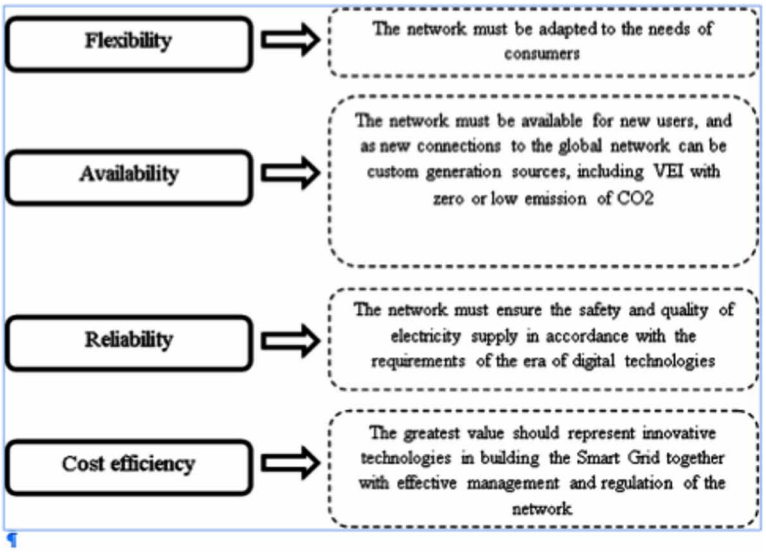
EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

THE TRANSFORMATION OF THE INDUSTRY INTO THE DIGITAL ECONOMY

The modern world business is now at an important stage of transformation - moving to the digital economy. At the same time, the steak holder queries are becoming more and more difficult, acquiring the complex and resource-intensive in nature. At the same time, political interests often have a very significant pressure, substantially limiting the ability of many entrepreneurs and corporations to fulfill the expectations of stakeholders and the realization of the principles of sustainable development at the microeconomic level. In these circumstances, the formation of new mechanisms for sustainable development of business organizations that meet the requirements of the digital economy becomes significantly important *(Gamidullaeva, et al., 2019).* The main "end-to-end technology" for business organizations is represented at the Figure 3.

Figure 3.

All of these processes are global in character, which is at the root of the transform approaches and mechanisms for sustainable development of business organizations. The world's largest producers of fossil fuels, oil and gas had limits, and it's required of new solutions to create highly integrated intelligent systems for generation and distribution of electric networks of the new generation Smart Grid.



Smart Grid has the following aspects of the functionality presented in Figure 4.

Smart Grid currently serves the concept of intellectual active adaptive network, which can be described with the following features:

- The saturation of the active network elements, allows you to modify the topological network parameters;
- A large number of sensors, which measure the current operating parameters for assessing the status of the network in different modes of operation of energy systems;
- The system of collection and processing of data (program-technical complexes), as well as check the active network elements and electrical installations of consumers;

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4.

- Availability of executive bodies and mechanisms in real time to change topology network parameters and the interaction with the neighboring energy objects;
- Tools for automated assessment of the current situation and the forecast of buildings for work in the network.

It's a high-speed control system and information exchange. Based on the above-mentioned characteristics of the network, it may be defined as a file attached to the source for the creation and installation of software and hardware for consumers, as well as for the analysis of information and management systems to ensure reliable and high-quality power transmission from the source to the receiver at the right time and in sufficient quantity.

The major technological trends in the field of digital transformation of the industry are as follows:

- The mass introduction of intelligent (quantum) sensors in equipment and production lines technology (Industrial Internet Things);
- The transition to automatic production and mass adoption of robotic technologies;
- The storage of information and the holding of calculations with your own objects on the resources made available ("cloud" technology);
- The transition to a mandatory digitized technical documentation and electronic document management ("Paperless" technology);
- Digital design and simulation of technological processes, facilities, products throughout their entire life cycle from idea to operation (the use of engineering software);
- The use of technology building materials instead of a slice ("additive technology, 3d printing);
- Use of mobile technologies for monitoring, management of processes in life and at work.

The development of digital (electronic) economy of the load on the digital infrastructure, based on the communications and telecommunications, is greatly increasing. Users need access to various platforms,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

services and services in electronic form. The very notion of "user" is fundamentally changing, because in the digital transformation in this category there are not only people, but also representatives of the "Internet of Things" (connected devices), the number of which already exceeds the number of people in the times, and will soon exceed the already and by orders of magnitude. Thus, we are talking about loads on the communications and telecommunications and their bandwidth, surpassing the existing by several orders of magnitude.

Obviously, building communication systems and telecommunications, due to such requirements, through the traditional hardware realization of network functions will lead to the exorbitant costs and networks or obstruct their surplus equipment, which is a dead-end path. To solve the problem one can use a digital transformation of the communications systems and telecommunications, the transition to a software implementation of network functions.

"Digital Logistics" emerges as a response to the global challenges of the digital economy for the traditional sector of transport and logistics, such as the rapidly changing, globalized and super competitive trading environment, the complexity of supply chains, rapid changes in customer expectations, the limited resources of the infrastructure. So, the digital economy, in particular, electronic commerce increases the availability of information on the demand and supply. However, the conclusion of the electronic trade transactions and retail sales can be hindered the logistics problems of delivery of goods, works or services. The problem of logistics in e-commerce is associated primarily with a faster pace of formation and realization of supply chains of goods compared with traditional trade. This feature of e-commerce determines the need to improve the mechanisms for Predicting demand, which should contribute to a more rational planning of the stock of goods in warehouses in different geographic regions, reducing the time the movement of goods and cost of delivery. Within the framework of the development of e-commerce, it is necessary to develop and deploy the technologies analysis of data on demand for the planning of the distribution logistics.

Perspective directions of the development of the digital logistics are also linked with the development of the Internet of Things (use of automatic order supplies and raw materials for the production and automatic delivery of finished products to the consumer, bypassing the intermediaries) and unmanned technologies in transport systems.

Education in the Digital Economy

Technology is changing education. Schools and universities currently offer online courses; the teacher online offer new ways to study the training materials; schools regularly integrate tablet computers and other technology to the class. Education, science, research, culture and the media are key areas that implement new digital backup and serve as major factors contributing to the further development and digital technologies. This means that all citizens can take advantage of the huge opportunities in these areas for learning, development and participation in economic and social life *(Potapova, et al., 2019).*

The education system should better equip people skills and knowledge to meet the needs of the digital working environment and society of knowledge. It should also increase the level of literacy in the media. It's of great need to promote wider use of digital media in education throughout life. Together with all stakeholders in the field of education, they will strive to develop a strategy for digital learning, which systematically uses, expands and realizes the possibilities of digital media to provide high-quality education. However, the problem of social adaptation of the population to the challenges of the digital economy, associated with the constant improvement of skills and the development of new skills in the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

online space of digital ecosystems remain. In this regard, especially important active labor market policies, support income, continuous training and more flexible education system *(Tolstykh, et al., 2018).*

In the system of modern education it is necessary to introduce new technologies, as required by the needs of society, to teach today that will need tomorrow. Education should contribute to the development of society, the growth of its capabilities. It is necessary to shape the identity, fostering they thought, and who can realize their creativity in a broad sense of the word. Creativity is a process of searching, adoption and implementation of the complex, complicated problems. Creativity is a process (purposeful work) turning the impossible into the possible.

In spite of the digital transformation of the educational process, changes in forms and methods of training, competencies, the classic fundamental education remains important for the formation of the modern system of professional education. The educational trajectory of today changes under the influence of the external environment, under the influence of the digital environment, taking into account the requirements to the new professions, change the value orientations of people, predominantly focus on applied science and practice. The profession appears faster than they are being developed and formed educational programs. Therefore, the system of additional professional education has a key role to provide advanced training programs or professional retraining on the popular professions that will help you to be competitive in the modern information environment. Digital economy, based on digital technologies, suggests a new way of technological production, requiring new skills and new conditions of development.

To the modern specialist a number of major requirements are produced:

1. IT literacy. In modern society, the establishment of digital competences and the use of information and communication technologies in professional activity.
2. Language and mobility. The Specialist is able to learn different foreign languages, as it requires the professional suitability.
3. The desire to learn. Motivational component in the modern world expresses the ability and readiness for teaching and training has played a leading role in the development of the personality, including self-education. High motivation is generated when the person is in search for the satisfaction of their needs for creativity. In the development of the concept of "Industry 4.0" is formed by the society of continuous learning, able to learn throughout their lives.
4. Labor migration. A person is able to master the different professions and in the retraining throughout life.

Currently, the formation of the so-called digital society, in which the interaction between subjects of the economy decided by a number of production issues. This interaction is based on three components: information, knowledge, communication. A number of difficulties related to the transformation of the state mechanisms to the Cyberspace of socio-economic systems raises in the digital era in all sectors of the economy of the country. The Russian educational system at the stage of the formation of the digital society faces a number of problems, the main of which are:

1. The transfer of knowledge, the formation of skills and abilities to own is carried out using the digital and information technologies that is associated with the need to use all the opportunities of electronic, remote and interactive learning.
2. The world economic space defines the demand for new types of competencies.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Currently, education of the future is undergoing a digital transformation that goes beyond the time frame of life, beyond the educational institutions using the unique capabilities of network and digital technologies, with involvement in the educational process all direct and indirect participants. The role of the teacher in the age of digital economy is changing; there are new forms of interaction between the teacher and the students, the so-called network interaction.

Recently, in terms of digital public relations, the leading role in the pedagogical process belongs to the electronic educational technologies. One of the most popular pedagogical trends is the formation of massive open online courses (MOOCs)for systems level and additional education. Coordinating the governing body of the education in most states now approved by the order of application of educational organizations of e-learning and distance education programs. According to this document the organizations which are carrying out educational activities, have the right to implement educational programs or their parts with the use of e-learning, distance education technologies, organizing training sessions in the form of online courses, and students who mastered the educational programs in the form of online courses, provided the appropriate document, and gives the right to allow the learner to the intermediate appraisal in other educational organization.

One of the innovative projects in education is considered to be the MOOCs, which allow solving a number of problems facing the modern education. Open Educational Resources to help in the digital pedagogy to ensure the mass education (the number of registered on different courses comes to hundreds of thousands of people), the availability of each learning in any territorial in the world and the high quality of education, as these courses are the best Russian and foreign teachers. These modern digital technologies allow you to integrate Russia into the world educational environment and shape the lives of new professions for digital organizations. One of the priority directions in the trajectory of digital pedagogy is the formation of digital educational environment in which success will be implemented MOOCs. This promising form of distance education gives you the freedom to learning, gives you the opportunity to self-select their future profession, and improves the motivation of learners in the acquisition of skills to be competitive in the digital space. MOOC removes the spatio-temporal limitations in the study of the educational course or its parts are beyond the scope of one of the educational organization.

Nowadays the largest platform for MOOCs is operated by global electronic educational services; including Coursera platform, KHAN, edX Udacity, and others. This indicates that the information educational environment is available, and the training becomes a global process using the structure of the MOOCS – including lectures-Video, training exercises, homework, and references. During the period of the digital transformation the role of the university instructor- who must use all possible techniques, methods, tools of electronic and distance learning,- is vital to the innovative growththe business communities. The teachers are the authors of the online courses that enhance students creativity to enable them to manage the processes of sustainable socio-economic development in the context of digital transformation.

RESULTS

1. It's noted that the modern digital economy is the postindustrial, characteristics of postindustrial economy are presented.
2. The definition of digital economy is submitted, its essence is revealed, the main objectives and indicators of the digital economy evaluation and development are mentioned.
3. The education in the digital economy is examined.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

4. The transformation of the industry in the digital economy is analyzed.
5. The financial services and e-commerce is considered.
6. A digital transformation of Agriculture is examined.
7. The influence of the digital economy on the labor market is considered.

FUTURE RESEARCH DIRECTIONS

To sum up our excursion into the "Digital" economy, we would like to stress once again that the total digitalization, automation and the introduction of appropriate technology is a natural process, and therefore inevitable. At the same time, today there is no picture of the future (neither the nearest, nor the distant), which means that the result of forthcoming changes isn't determined. Because of the fateful circumstances the beginning of the digitalization coincided with the end of globalization and the Global Economic Crisis.

The end of the extensive development model of capitalism will inevitably require revision of many of the fundamental tenets of contemporary world order. This means that under the auspices of the digitalization completely new world can be created; such a world which will become a staple of other than today's one, system of values, management paradigm, social norms and economic laws. Of course, such a sight already has both supporters and opponents, whose violent confrontation we will all be able to witness in the near future.

From feasibility, the intensity and the coherence of action it depends how quickly our digital future will come, what are the social, economic and other problems we face on this path, and, finally, whether our future represent digital slavery or triumph of humanism, spirit and intellect over all the difficulties and problems.

The most important phase of the upcoming struggle will be not economic or technological rivalry, but the formation of a new civilizational paradigm capable to unite humanity, give it intuitive and attractive image of the future and outline the main milestones toward its construction.

CONCLUSION

So, digital technology is rapidly changing the familiar forms and methods of economic life around the world. The business is changing not only the individual companies - are changing the industry, regions and entire states. The development of the digital economy starts to go beyond the changes in the technologies and even in business - it becomes a factor in the macroeconomic and political. Not only the engineers, scientists and entrepreneurs, but also policy, philosophers and social activists are trying to reflect the changes. Some see it as a tool of fundamental changes in public life, the others, on the contrary, hope that the digitalization of economy will become an alternative to painful reforms.

In this sense, the experience of developed states gives food for thought, first and foremost, of what can speak the macroeconomic effects of the mass use of digital technologies. It turns out that the effect of this is expressed not so much in a quantitative increase of labor productivity, but in the qualitative changes of industries, agriculture, labor market, finance, education, their manageability and flexibility. In addition, the leading foreign analysts expect that as the expansion of the presence of digital technolo-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

gies in different segments of the economy, there will be enormous transition indicators of economic efficiency of their application to a new, higher level. And now the world is on the threshold of such a leap.

The digital economy is a new type of economic relations in all sectors of the world market, which is now growing at a rapid pace and already in the near future, with the growth of high technology, can become the main type of commodity-money exchanges in the global world. The establishment and improvement of new technologies is happening so quickly that it's not possible to follow it. Therefore it is necessary to be included in the general information and technological flow of updates and try to apply them effectively.

ACKNOWLEDGMENT

KEY TERMS AND DEFINITIONS

B2B (Business-to-Business): Is a term that defines the type of information and economic interaction, classified by type of interacting actors, in this case juridical persons which deal with the other business.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

B2C (Business-to-Consumer): Is a term that refers to the commercial relationship between the business and the private, the so-called "end" consumer; also a form of electronic commerce, the purpose of which is direct sales to the consumer.

B2G (Business-to-Government): Is the relationship between business and the state. Usually the term is used for the classification of e-commerce sites. An example B2G-systems can serve as a system of electronic procurement.

C2C: Is a term that refers to the scheme of electronic commerce between final consumer (consumer) and the end-user, in which the buyer and seller are entrepreneurs in the juridical sense of the word.

Digital Economy: Is economic activities, based on the digital technologies related to e-business and e-commerce, produced and marketed their electronic goods and services. Payments for goods and services are often produced by electronic money.

E-Commerce: Is the scope of the economy which includes all the financial and trade transactions, carried out with the aid of computer networks, and business processes related to such transactions.

ICT: Is information and communication technologies.

Chapter 62
Restructuring and Globalization of Telecommunications Industry

Sasmita Mohanty
University of Aveiro, Portugal

ABSTRACT

Restructuring and globalization are very important for every technology sector. It provides key competitive advantages to the companies over their rivals. Telecommunications sector is an important strategic segment of the modern economy. Telecommunications is also an advanced technology sector and its restructuring is essential to optimize its revenues. Now it has been evolved to information and communication technologies (ICT), which is the main driving force of growth worldwide. In fact, ICT has paved the way for modern globalization. Overall, ICT and ICT-enabled sectors are among the main contributors of global economy. This sector has passed through several restructuring and evolves continuously. Its globalization is obvious as it is the main technology which promotes globalization. In this chapter, the authors provide the restructuring of telecommunications sectors since the time of its inception in the early 19th century. They also analyzed the strategic changes that promote the restructuring and globalization of this sector.

INTRODUCTION

Telecommunications industry plays several essential roles in the modern society. Telecommunications has become a basic need in the modern human life. In the business sectors, it has even more important roles. In the modern times, it has been expanded in different forms to be known as the information and communication technologies (ICTs). Due to the essence of ICT, its infrastructure is available in every corner of the world. It has been spread in the form of core, regional, metro and local networks. Most of the access areas are covered through the wireless networks and the core parts are mainly optical fibers. Along with the support of computing, ICTs change the lifestyles and business landscapes which were not possible before their conjugation. The Internet is the clear outcome of the conjugation of these two enabling technologies that has changed the world's communication and business frameworks. That is why, ICT sector is very often regarded as the nervous system of the current world.

Telecommunications sector has gone through several stages of evolutions. In the early years, it was started as a point-to-point communication enabling two individuals to communicate. Then came, the broadcasting systems in which the information was transmitted from one source to multiple destinations. Gradually, with the advances of computing, this system evolved in to software enabled multimedia systems. This is how global entertainment and news sectors came into existence. In the last three decades, ICT has disrupted the global businesses several times. First, the arrival of the Internet changed the global business landscapes. The popularity of the mobile communications further enhanced the proliferation of businesses. Mobile communication evolves every decade and it disrupts the global economy in several new ways. The other famous disruptions of the last two decades are: the proliferation of social networks, and arrival of the Internet of things (IoT). It is needless to say that this sector needs regular restructuring with the changing times. New demands propel new inventions in ICT which finally results in restructuring. In ICT, in the recent years, we have witnessed several restructuring at various levels. Some of them are at the foundation level in which the driving technologies themselves have been changed significantly. The others are mainly found at the application and management levels. The changes in the applications are either user or market driven. At the management level, the changes are due to the strategic modifications of the investors to optimize their positions in the market.

Globalization of ICT is a natural choice for the investors. They want larger markets and modern day trade rules facilitate the access to foreign markets. The services landscape in ICT is very much potent in revenue generation. ICT services have evolved in many different ways. The segments which used to generate huge revenue before two decades now have been pushed back by the new services. Globalization brought new enterprises in to the market and at the same time several existing enterprises have disappeared. Irrespective of these changes, ICT sector went up gradually to be the main driver of the global economy. Thus it is clear that restructuring and globalization of ICT sectors are very much significant in the modern world. ICT industry is the main facilitator of the growth and development. The countries which are doing great economically have excellent ICT infrastructure. It is true that the countries which are economically weak are also backward in ICT. Human development index (HDI) and the ICT growth too run in parallel. Countries which are advanced in technology and uses better ICTs have better HDI.

In this chapter, we provide restructuring trends of global telecommunications industry. Restructuring is essential for telecommunications, and we analyze the issues related to it. We show the intensities of globalization in different times and their effects on the market. We present chronological restructuring of telecommunications sector starting from its beginning until the recent years. We present the globalization of telecommunications at different times and its effect of the global trade.

The main objective of this chapter is to provide the overviews of restructuring and globalization in the telecommunications sector since its beginning. Strategic changes in this sector have forced multifaceted restructuring. Globalization is one of the main leading strategies for its expansion. Restructuring and globalization together are very much at the forefront of the telecommunications revolution around the world. We analyzed the past and contemporary literatures to find out the nature of restructuring in different era.

In this chapter, we have eight sections. In Section 2, we review the related literature for this chapter. In Section 3, we provide the methodologies used for this work. In Section 4, we analyze the strategic changes in the telecommunications sector in the last few decades that had motivated the major restructuring in the sector. In Section 5, we show different types of commonly observed restructuring in telecommunications sector. In Section 6, we present the globalization aspects of telecommunications companies. In Section 7, we have discussed the future research directions. We have highlighted the future researches

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

which are important for the growth and restructuring prospects of the ICT sector. Finally, we conclude in Section 8 with the main points.

LITERATURE REVIEW

Telecommunications is a well-researched area. A large number of research activities are being carried on telecommunications management. Its restructuring is very much common since the days of its inception. However, since the beginning of liberalization in the late 1970s and 1980s, restructuring became a key strategic requirement. Based on the strategic changes over the decades, several literatures are available. Since the invention of the telephone, expansion of cross-border telecommunications services continues. Ericsson started its manufacturing of telephone sets and other telecom equipments as early as 1878. Similarly, the cable and wireless started their manufacturing in the 1860s. All these companies globalized their businesses. In the liberalization era, globalization became a key strategic move and become a priority for the leading players of telecommunications operation and equipment vending.

Bruce (1989) studied the restructuring of telecommunications sector in developing countries. Restructuring in developing countries is more important than in the developed countries. In the developing countries, the demand is lower compared to the developed countries and the markets in the developing countries are less exploited. The opportunities for the operators are more in the developing countries as the market is not saturated. However, the prices and other sensitive issues must be planned according to the market dynamics. The costs for infrastructure building and network deployment are costly and the returns may take a long time. Therefore these aspects must be addressed at the planning phase to avoid revenue blackouts. The author has shown the cases of several developing countries where the governmental assistance has been provided and regulatory changes have been passed in favor of restructuring for ICT developments. Bell (1990) analyzed the effects of monopoly in the pre-1980s era and the compared the new scenarios of liberalization and completion. In 1984, AT&T was broken down to 19 smaller companies. British Telecommunications in the UK was privatized in the same year. Similarly, the Japanese telecommunications company NTT was privatized in the 1980s. These are the structural reforms in the telecommunications companies in the 1980s. In some way, these steps removed monopoly from the telecommunications market and introduced competition and liberalization through privatization. The author compared the state of research and development in the two different scenarios. Due to these changes business strategies too were restructured for coping with the new initiatives. Hudson (1991) analyzed the roles of ITU in the development and technical cooperation for the adoption of new technologies in telecommunications. In this work the author focuses the cases of Africa. Traditionally, Africa does not have advanced infrastructure for global communications. There are several reasons behind this such as economical difficulties and lack of political intent. Therefore, international organizations such as ITU have important roles to promote the development in telecommunications in these countries. In fact, ITU is showing increased focus for these developing countries. In many cases it has taken initiative to build networks and motivated for modern restructuring.

Bagley and Hunter (1992), studied different aspects of restructuring in commonly observed industries. According to their findings, restructuring is inevitable in every sector. It is one of the basic needs for the survival of a company. In their study, they analyzed the education system in the US. They suggested that technology plays a key role in the modern restructuring across all the sectors including primary and higher education. Stagliano (1994) presents the roles played by ITU in the regulation, technology

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

adoption and liberalization of the telecommunications industry. ITU as a global organization for the telecommunications standardization and expansion has taken several positive initiatives over the years. It also makes sure that fundamental telecommunications services are available in every country. It played the main role in the telecommunications revolution of 1980s and 1990s. It works as an advisory board for the member countries and explain them about the overall benefits of restructuring. Wellenius and Stern (1994) went through the implementation of reforms in the telecommunications sector for several countries. In their World Bank sponsored documentation they brought forward all the relevant factors of the reforms around the world. According to them the structural reforms for the ICT sectors started in the 1980s. All the developed countries and majority of the developing countries started the structural changes in telecommunications. Both, ICT and information technology (IT) sectors started to grow very fast in those countries. Reforms were implemented as a policy of the government in these countries. These reforms were facilitated by the joint collaboration of the World Bank, the International Telecommunication Union (ITU) and the Commonwealth Telecommunications Organization (CTO). In 1991, these organizations came together and discussed about the roadmap for the reforms in the ICT sector and became very successful. More than forty countries agreed for the reforms and that was a big change in the telecommunications policy changes. In this study, the authors have analyzed the practical aspects of the reforms of Latin America, Asia, Europe and Australia. They included the realities about the investment in ICT sectors, their regulation issues and final implementation in the countries which took part in the initiatives of the World Bank, ITU and CTO.

Levi-Faur (1998), studied the restructuring and globalization of telecommunications in Egypt. In his study he analyzed the case of Etisalat and went through the changes performed over several years. He found that radical changes have been carried on strategically to restructure its businesses across North Africa and the Middle East. He also compared these strategic changes with other sectors. He discovered that no such deeper and broader changes are observed in other technology sectors in the regions where Etisalat provides its services. This study also analyzed the economic impact of the restructuring on the national economy. The impact was clearly positive. The regulations in fact, work as an indirect control over the telecommunications companies. It is also true that the regulations helped in the broader restructuring of the telecommunications businesses. Based on the different regulations of the telecommunications sectors, this work shows that there are normally two types of effects. One is the regulation of the competition and the other is the regulation for the competition. Cogburn (1998) studied the globalization in telecommunications industry of South Africa. This work analyzed the telecommunications industry of South Africa of the 1980s and 1990s. The state of the industry during this time was very much unorganized. South Africa's political restructuring also took place during this time. It was expected that the changed politics would bring new positive aspects to the telecommunications sector. However, the author observed that the politics was playing a hindrance for the changes. In this work, the author proposed several restructuring for the telecom industry. He suggested it is a complex process and needs a changed mindset in the policy making. Graham (1999) studied the modern restructuring of cities around the world. In almost all the countries, cities are pushed for better infrastructure and better quality of life. Telecommunications is one of the prime sectors which play key roles in the modernization of the cities. In fact, ICT has the very basic necessities for several aspects of the city restructuring. Dependence of other sectors on ICT is termed as tele-reliance by the author. Due to the increasing demand on ICT, this sector itself undergoes several restructuring.

Lal, Pitt and Beloucif (2001) studied the European telecommunications market and short listed the major factors responsible for the recent changes. The authors observed that before the 1980s, telecom-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

munications companies used to be very much dormant and their operations used to be limited to only one country. However, the liberalization facilitated globalization and telecommunications became a market-oriented sector. The authors credited the US and the governments of Europe for this liberalization and globalization. European telecommunications markets led strategic changes in the ICT sectors and it was followed by other leading markets. The factors were identified from the European markets and highlighted for this study. These factors were utilized to model the emerging markets.

Chan-Olistad and Jamison (2001) studied the fierce competition in the telecommunications sector that was mainly started after the 1980s. In the developed countries and some select developing countries where several companies operate saw fierce competition among the rivals. This was the first time in the history of telecommunications that such tough completion came to the markets in several countries. The strategic changes were very much focused towards future growth and survival. The authors studied the qualitative aspects of the telecommunications markets considering the new strategic changes observed during the above mentions time period. They studied several strategic factors for these markets and also considered the political economy for the overall restructuring of the ICT sector. One of the most interesting factors they observed was that the companies try all kinds of solutions, including alliances with the rivals. It is remarkable that rivalry through alliances was found to be very much rewarding in the long term. Sakai (2002), studied extensively the global industrial restructuring. The main motivating factor is expansion for long term survival. Revenue increase for innovation is also essential for the company to stay active in the market. Revenues can be increased in several ways. One of them is internationalization. With time, restructuring is inevitable. Without it a company loses its competitive edge over the rivals and over time it moves towards its demise. Bartlett et al. (2002) studied several national telecommunications companies in twenty five different countries. The companies considered in their study were privatized to some extent through public share holdings. They studied the companies' financial and operational status both before and after the privatization process. They observed that post-privatization performances were better than the pre-privatization performances. They further fine tuned the studies to identify the improvement in the performances. They found that regulation and changes in the government policies had significant roles in the performance improvements. Public companies are directly affected by the governmental decisions and normally are slow in restructuring what is decided by the policy makers.

Jin (2005) studied the reforms and restructuring in the ICT sectors in the 1990s and the early twenty-first century. He observed several companies failed despite following the reforms. Then those companies started following different types of restructuring. In the most recent restructuring, the companies took several bold steps which were very much new to the sector. They started to focus on new markets where they did not have presence before failure. This is what the authors called neoliberal globalization. This neoliberal globalization was very much rewarding for several companies. In addition to the strategic changes of the existing companies new startups and spin-offs were the new entrants in the ICT market. Their presence disrupted the ICT market to a large extent. Some of those startups went on to become game changers in the sector. Considering their importance, some of the successful startups were acquired by the big companies of the sector. Similarly several mergers and acquisitions resulted from the fierce competition in the sector. Overall, the restructuring of telecommunications sector became vibrant. It was also found that a few companies could not stand firm in front of the tough competition and failed. In a few cases the companies were finished forever. According to the author, all these effects are due to the neoliberal globalization across the major markets. Jin (2008) presents the extreme liberalization observed in the telecommunications industry in the early twenty-first century. He started the analysis from the late twentieth century. In the late 1980s, the telecommunications industry saw dramatic changes.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

New dimensions were established for its rapid expansion. Companies restructured their businesses in many different ways. Globalization was a preferred means of expansion during this period. Internet based services opened new opportunities for both the vendors and operators. Mergers and acquisitions in telecommunications became very common. Some of the mergers and acquisitions were in fact a kind of facilitation of globalization. Foreign direct investment (FDI) in telecommunications increased very fast since the 1990s. It is the effect of globalization on this industry.

Mohanty and Moreira (2014) stressed on the essence of sustainability in global telecommunications. In this study, the authors went through the basics of the current needs of sustainability. They analyzed sector-wise carbon emission at the global scale. They showed that telecommunications is one of the fastest growing sectors in the world. Due to this growth, energy consumption of this sector has grown up very fast. This sector is going to use around 10% of the total power in the next decade. This is huge amount of power, and due to this the carbon footprint from this sector is going to be really huge. In 2014, the telecommunications sector was responsible for almost 2% of the net global carbon emission and has an increasing trend. Green solutions are expected to be followed in the future. In fact, the authors have shown several energy efficient initiatives already in place in current practices in ICT. However, there is a need of deepen the use of green technologies in this sector. Cogburn (2017) studied the modern restructuring of ICT sectors around the world. The authors mention that a new world order has come into existence due to the major changes in the ICT sectors. It has given rise to a new knowledge world. These changes have not happened overnight. Rather continuous restructuring of the ICT sector over the last few decades has contributed to it. The authors have also highlighted the flip sides of these changes and show that several value systems have been degraded due these changes.

He et al. (2017) studied the internationalization of innovation by the global corporations. The authors started with the essence of innovation in the modern businesses. Then they pointed that innovation has become more important due to the globalization of the economy. Chinese firms have been studied in this work. Several Chinese companies have successfully globalized their ventures. They are also using the innovation as one of the driving forces for their growth and restructuring. Like the big global companies, these Chinese companies have also started their innovations bases at overseas destinations. These new initiatives provide positive business perceptions about the Chinese companies and they become popular at overseas destinations. This is one of the most effective ways of making the globalization a success.

Yu (2017) emphasized on the digital transformation for large scale restructuring and globalization. Globalization is a rapid process of fulfilling client demands at very far off places. In order to carry it on successfully digitalization is essential. The author has studied the digital transformation of Chinese economy. He showed that the telecommunications sector in China has changed its digital landscape. That is a really significant achievement for China and that helped the country to progress in its manufacturing and expansion of its economy. Czarnecki and Dietze (2017) analyzed the modern telecommunications industry for the reforms and restructuring points of views. The authors started with the notion that in order to restructure the telecom industry the strategists must understand it clearly. In this article, the authors presented several conceptual and strategic aspects which must be understood properly before applying any kind of restructuring. The value chain in the telecommunications market now has evolved into complex value networks. The restructurings must be done only after understanding the current status and how the new changes will fit into them. Otherwise, the outcomes may not be as expected.

Mohanty and Routray (2017) presented the recent trends of global telecommunications. These trends are mainly motivated by the demand from global population. Consumer electronics plays the main role of driving these demands straight to the customers. The resources such as bandwidth are scarce. There

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

are new bands being introduced for the emerging services. Recent trends show the global bandwidth demand is growing faster than the previous years. Globally, mobile communication is very popular with the total number of subscriptions is about to exceed the global population. However, some parts of the developing world are still not fully connected. In the next decade, it may cover these untouched territories in Africa and elsewhere. Hong (2017) analyzed the post-2008 restructuring in China's online businesses. They started the Internet Plus policy according to which their digital economy got priority over the traditional business platforms. It has developed world class vendor companies such as Huawei and ZTE. It seems that China's plans for a digital restructuring for the future dominance over the online businesses are getting pace. Agur (2018) studied the telecommunications restructuring of independent India. He started his study from 1947 the year in which India achieved its independence and started its own infrastructure. The author has divided the whole period from 1947 until 2018 into three parts: 1947 until 1984, 1984 until 1991 and finally from 1991 until 2018. In the first period from 1947 until 1984 the restructuring was very much slow and dependent on the government policies. In the second period, several initiatives were taken by the government to bring changes in the ICT sector but they were not successful immediately. In the third period, India witnessed the biggest changes in its ICT sector. The liberalization introduced by the government in 1991 brought fruits. The emergence of the private sector in telecommunications was remarkable. These changes were the main driving forces of India's modern telecommunications market which is now very much competitive. Restructuring and globalization over the years have made Indian ICT sector very much matured, forward looking and globally recognized.

Li (2018) presented several positive and revolutionary changes in the global telecommunications sector. Due to the advances in new technologies the Internet of Things (IoT) has arrived. This is termed as the fourth revolution industrialization known as Industry 4.0. In this article, the author has predicted similar changes in the telecommunications sector which is named as Telecommunications 4.0. In this study it has been shown that the analog communication was started more than 100 years back and it was the telecommunications 1.0. With the digital communication the second version came into the industry and the Internet brought the third version. In the current fourth version, with technologies like IoT and 5G many new changes are about to come in the global telecommunications sector. Several new dimensions will be added to the ICT services. There will be several new challenges for the companies in the new landscape. Sapolsky et al. (2018) presented a detailed study of telecommunications revolution in the past, present and also predicted the future trends. It shows the global restructuring of the telecommunications sector over the last several decades. In the past the telecommunications used to be a public service and was controlled by the governments. Regulations were changed due to the competition and this sector too witnessed the LPG transformations. The new technologies in the sector forced several restructuring which were pivotal in the overall changes. Gao (2018) studied the effects of the 2008 world economic recession on the emerging industries including the telecommunications sector. Due to the financial crises in 2008, the global value chain was restructured to cope with the future challenges. As a strategic move global industry relocation was carried out in several sectors. Based on the global supply and demand industry relocations happened to high demand markets. In fact, before the relocations the companies assessed the markets using different measurement tools. It is well known that the global relocation follows the Pareto Principle. Similarly other tools were used for strategic relocation of industries in the post 2008 era.

Lewis (2018) studied the Internet based businesses in China. There are several new opportunities in the online markets in China. Initially, China did not allow the multi-national online giants in China. That is very much according to the Chinese communist principle of maintaining secrecy. However, later they

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

allowed partial openness to the international companies. The controversy with Google China reopened the Chinese policy of hiding information from the public. It was a boon for the domestic Internet-based companies of China. Now several big companies exist in China those do Internet-based businesses. China has even bigger plans for the future. It is clearly visible from the current restructuring in those companies. The recent plans such as Belt and Road Initiatives and Internet Plus clearly show China's ambition to be a superpower in this sector. China engages with ASEAN countries with a special focus in this direction.

METHODOLOGY

In this study, we analyze several telecommunications companies from their beginning till 2018. Several of the old companies have become obsolete now. Some of the companies have been merged with their successful rivals (Mohanty, 2012). We started the analysis from the beginning of the Telegraph era which started in 1831. However, major restructuring in telecommunications was started in the 1980s. Both restructuring and globalization became strategies for long term goals in the 1980s and since then they play key roles in telecommunications planning (Czarnecki & Dietze, 2017). We also analyzed the chronological restructuring and strategic changes in the telecommunications sector. We present all these significant chronological changes in this chapter. We classified the major reasons for restructuring, and found that changing telecommunications technology is the main reason for the restructuring. Technological changes in telecommunications have disrupted the global markets in several ways time and again (Mohanty & Routray, 2017). Especially the mobile communications since the 1990s have changed the global markets and human lives to a large extent (Mohanty & Routray, 2017). We emphasized these disruptions and studied the restructuring of telecommunications companies due to the impact of the mobile technologies. We also studied the future impacts of ICT on the society. For the future research directions we analyzed the technology foresight papers on ICT. Of course we focused the future research directions only for the next decade.

STRATEGIC CHANGES IN TELECOMMUNICATIONS

Telecommunications is one of the largest technology sectors in the world. It has big roles in the day to day lives of people. Revenue wise, it is one of the largest contributing sectors to the global gross domestic product (GDP). It is estimated to be around 5% of the global GDP is from the ICT sector (Mohanty, 2012). This sector is also considered as the backbone of the modern business. All the online commercial activities are dependent on this sector. Due to its importance, its up-gradation is always a priority for government as well as for private companies. Restructuring is always considered a strategic move. However, depending on the contexts it has different goals. For some companies restructuring is required to expand their markets, for some it is essential to survive in the market, for some sustainability is not possible without restructuring. Depending on the contexts, companies restructure their businesses to remain active in the market. In fact modern strategic changes in the telecommunications sector were started in the 1980s, in both Europe and North America. The privatization of British Telecom (BT) and other European telecommunications operators were the beginning of the modern restructuring in a large scale (From & Eliassen, 2007). Similar restructuring was kicked off in the USA through the division of AT&T.

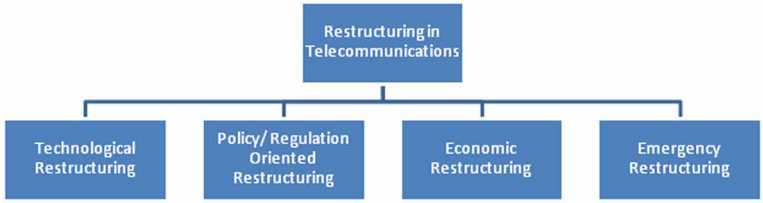
Strategic changes in telecommunications are quite contrasting in the developed countries when compared with the developing countries. Strategically, there are several changes in the telecommunications market of the developed countries. Some of the companies in these developed countries have grown rapidly. Now several of them lead the global communication in the technology and management frontiers. However, some of them have struggled badly to keep their positions intact. Majority of the companies have expanded their coverage areas of services. However, a few of them have done the reverse (Mohanty, 2012). Overall these moves and restructuring are strategy driven to remain competitive in the market. Several big companies have also changed their marketing and cultural aspects of their strategies to compete better. Restructuring in brand building and advertisement too have changed over the last couple of decades in the developed countries. In contrast to the companies in the developed countries, the telecom markets in the developing countries are very much young and unsaturated. The growth rates in several developing countries are in the double digits (Mohanty, 2012). However, large markets in the developing countries are quite versatile with a variety of service providers, operators and customers. The tele-densities of rural and urban areas differ by large margin. That is an attraction for both the domestic and international operators. The growth potentials in the developing countries are still very attractive. However, in developed countries ICT sector is always looking for new innovations to expand the market.

RESTRUCTURING OF TELECOMMUNICATIONS SECTOR

Restructuring of telecommunications is the process or combination of processes to change the technological, management and market related aspects of the telecommunications industry to remain competitive. Restructuring is always a strategic step in the growth and sustainability of a business. Restructuring has several motivating factors. Strategic restructurings are well planned, based on the position of the company in the market. Planned restructuring is done over a period of several years and its main goal is to make the telecom services more attractive and competitive. Intense competition and the intention to provide better services than the competitors may force frequent restructurings (Mohanty, 2012). Some of the restructuring may not be planned. For instance, during the natural disasters, telecom infrastructures are badly affected. The post-disaster restructuring is essential to bring the services back.



Restructuring in telecommunications can be classified in to several types (Ulset, 2007). Here we classify restructuring on the basis of their driving forces. Telecommunications is a technology driven sector. Thus new innovations in ICTs always bring new frontiers and dimensions for this sector. Technology driven restructuring is a continuous process and it happens gradually with every passing year. It is noteworthy that politics and economics also important roles in the restructuring of telecommunications sector. Politics is all about the policy making at the upper level for the approval of the services to the public. Economics is the price decider in the market. If there is only one service provider then the monopoly would keep the prices high, if there is no policy on the price control. On the other hand, competition among multiple service providers normally brings down the price which is very much customer oriented.

Types of Restructuring in Telecommunications

Restructuring is a gradual process. It is an absolute fact that a sector remains competitive as long as the timely restructurings are on course. For telecommunications sector, there are some key motivating factors for restructuring. Normally, the motivating factors are market driven. The three main factors for the

Figure 1. Restructuring in telecommunications

restructuring of telecommunication are: technology, telecommunications policy/ regulations, and the economics of the market. However, emergency related events also initiate restructuring. Based on these main factors, we classify telecommunications restructuring in to the following types.

Technological Restructuring

Technology is always the main driving force behind any kind of meaningful restructuring in telecommunications. Technology frames the form and scopes of restructuring. In general, any telecommunications system needs three basic resources: transmitted power, bandwidth and telecom infrastructure. Technology is associated with each of these resources. Transmitted power is needed for every communication and its efficient use is always a benefit for the operators. Therefore in every periodic restructuring, power efficiency is considered for the up-gradation of the telecommunications systems. Bandwidth is a very limited resource. It belongs to the government of the country, and normally, it is auctioned publicly for the allocation to different operators. Presence of many operators makes the spectrum expensive and the services may also become costly. However, it is also noteworthy that large numbers of operators bring healthy competition to the market. Infrastructure is the built environment and the equipment required for the telecommunications operations. Sustainability of the businesses is an essential aspect in the modern world (Mohanty & Moreira, 2014). It is possible only through appropriate restructuring in line with the innovations on resource conservation. Green communications and sustainability issues are really important for the long term success of a telecom company (Routray & Sharmila, 2017). Thus technological restructuring is always a strategic step to remain effective in the telecommunications business.

Policy Oriented Restructuring

In every country, policies are made by the governments. For the telecommunications sector too, the policies are made by the political class. From time to time, governments change the policies on the services, and tariffs of telecommunications sector. Power levels in communications, maximum permissible bandwidth per person, and infrastructural guidelines are prepared by the country's regulators and finally converted in to regulations for implementation by the governments. The governments auction the resources such as the available bandwidth to the existing operators. Governments also set the policies on the data rates and other performance related aspects. All these proposed changes from the governments are mandatorily implemented by the telecom operators of the country. These are the policy related restructuring. These restructurings are binding and the operators cannot opt out of it.

Economic Restructuring

Economics is the real force behind several restructuring. Economics decides the price through the supply and demand in the market. In case of monopolistic market, the operators can dictate their own terms in the market. This type of monopoly was observed during the pre-liberalization era. However, the presence of multiple operators makes the business very competitive. All the aspects such as tariffs, quality of services, and service maintenances are subject to the competition in the market. All these aspects demand restructuring in telecommunications business to stay relevant in the market. Thus economic restructuring is associated with the market dynamics which is decided by the competition in the market.

Emergency Related Restructuring

Telecom networks are vulnerable to the natural disasters and also suffer from aging related malfunction. An active network cannot be kept out of service for a long time. The malfunctions have to be repaired on time as an emergency. In fact, a normal repairing may not be considered as restructuring. In case of restructuring, the network deployment techniques are altered from the previous ones to improve the robustness of the networks. The main aim is to avoid such damages when a similar disaster strikes. These types of rebuilding services come under the emergency restructuring. Depending on the scale of the disaster, this restructuring can be minor or major. For instance, providing better protection to optical fibers along a coast line for a few kilometers is a minor restructuring. However, rebuilding a network with robust techniques in one or more states after a hurricane or cyclone is a major restructuring. In terms of revenue, a major restructuring is an expensive move. However, emergency restructurings are essential to bring the services back and to resume the day to day operations. A delay in these restructuring may result in revenue loss and customers may switch to the rivals.

Telecommunications Restructuring Until 1950
