Library of Congress Cataloging-in-Publication Data

Names: Information Resources Management Association, editor.
Title: Research anthology on digital transformation, organizational change, and the impact of remote work / Information Resources Management Association, editor
Description: Hershey : Information Science Reference, 2020. | Includes bibliographical references and index. | Summary: "In understanding digital transformation in the workplace there needs to be advanced research on technology, organizational change, and the impacts of remote work on the business, the employees, and day-to-day work practices. This advancement to a digital work culture and remote work is rapidly undergoing major advancements, and research in this book is needed to keep up with both the positives and negatives to this transformation"-- Provided by publisher.

Daidj, Nabyla / Institut Mines-Télécom Business School, France 1737
Daniel, Harold / University of Maine, USA 1678
Dash, Amar Ranjan / Berhampur University, India 374
De Wet, Lizette / University of the Free State, Bloemfontein, South Africa 1385
Denis, Constance / Université de Sherbrooke, Canada 1060
Di Guardo, Maria Chiara / University of Cagliari, Italy 761
Doore, Brian / University of Maine, USA 1678
Edoh, Thierry O. C. / Technical University of Munich, Germany 1533
Efimova, Yulia A. / Financial University Under the Government of the Russian Federation – Kursk, Russia 1223
Egbuta, Iheanyi Chuku / University of South Wales Business School, UK 332
Elhussein, Mariam Ahmed / University of Dammam, Saudi Arabia 590
Ernst van Aken, Joan / Design Science Research institute, The Netherlands 225
Eryılmaz, Mehmet / Uludağ University, Department of Business Administration, Bursa, Turkey 1889
Esteves, Francisco Madeira / Instituto Politécnico de Setúbal, Portugal 116
Fernandes da Anunciação, Pedro / Instituto Politécnico de Setúbal, Portugal 116
Ferrari, Filippo / Bologna University, Italy 41, 742
Ferreira, Ronaldo da Silva / Universidade de Aveiro, Portugal 501
Fichter, Rachel / Teachers College, Columbia University, New York City, NY, USA 23
Fiermonte, Francesco / Politecnico di Torino, Italy 311
Finogeev, Alexey G. / Penza State University, Russia 560
Firth, Janet / University of Wolverhampton, UK 1427
Fischer, Anne / Chemnitz University of Technology, Germany 700
Franck, Edwiygh / The Greatest You Yet!, USA 2011
Furda, Robert / Department of Information Systems, Faculty of Management, Comenius University, Bratislava, Slovakia 1704
Gajardo, Pablo Alfonso / University of Lleida, Lleida, Chile 886
Galli, Brian J. / Assistant Professor and Graduate Program Director, Master of Science in Engineering Management Industrial Engineering, Hofstra University, USA 1692, 1901
Gamidullaeva, Leyla A. / Penza State University, Russia 560, 1223
Garnero, Gabriele / Università degli Studi di Torino, Italy 311
Gavrilova, Olga / Petrozavodsk State University, Russia 1138
Glahn, Christian / Leiden-Delft-Erasmus Center for Education and Learning, Switzerland 908
Gloet, Marianne / University of Melbourne, Australia 1119
Gökmen, Aytaç / Çankaya University, Turkey 1340
Gonçalves, Ramiro / INESC TEC and University of Trás-os-Montes and Alto Douro, Portugal 70
Goyal, Praveen / Department of Management, Birla Institute of Technology & Science, Pilani, India 1005
Graham, Christian / University of Maine, USA 1678
Gregus, Michal / Department of Information Systems, Faculty of Management, Comenius University, Bratislava, Slovakia 1704
Güçlü, Burçin / BES La Salle, Universitat Romon Llull, Barcelona, Spain 415
Guerreschi, Paola / Università degli Studi di Torino, Italy 311
Gupta, Manish / IBS, IFHE University, India 1998
Hambley, Laura A. / Work EvOHlution, Canada 279
Hamlin, Robert G. / University of Wolverhampton, UK 1792

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Hannibal, Claire / Manchester Metropolitan University, UK 1427
Hrustek, Nikolina Žajdela / University of Zagreb, Zagreb, Croatia 540
Imanaka, Jessica L. / Seattle University, USA 1081
Ioffe, Anastasiia / Petrozavodsk State University, Russia 1138
Iqbal, Qaisar / Universiti Sains Malaysia, Malaysia 1578
Jääskeläinen, Pia / South-Eastern Finland University of Applied Sciences, Finland 2033
Jamil, George Leal / FUMEC University, Brazil 1834
Janssens, Jürgen / asUgo Consulting, Belgium 1199
Jones, Jenni / University of Wolverhampton, UK 1427
Justinek, Gorazd / Graduate School of Government and European Studies, Slovenia 432
Kamboj, Shampy / Department of Management Studies, Indian Institute of Technology, Roorkee, India 1005
Kanarev, Sergey / Penza State University, Russia 560
Kapondera, Sellina Khumbo / Mzuzu University, Mzuzu, Malawi & Royal Holloway University of London, London, UK 1720
Kerse, Gökhan / Karamanoğlu Mehmetbey University, Turkey 1
Kesim, Mehmet / Anadolu University, Turkey 1037
Khoury, Grace / Birzeit Univeristy, Palestine 1451
Kim, Hyojeong / Department of Hospitality Management, Kyung Hee University, Seoul, South Korea 1821
Kim, Junghwan / University of Oklahoma, USA 723
Kirche, Elias T. / Department of Information Systems and Operations Management, Lutgert College of Business, Florida Gulf Coast University, Fort Myers, USA 1300
Kofuji, Sergio Takeo / Universidade de Sao Paulo, Brazil 838
Konak, Abdullah / Penn State Berks, Reading, USA 1660
Kondratieva, Zoya A. / Financial University Under the Government of the Russian Federation – Kursk, Russia 1223
Kryachkova, Ludmila I. / Financial University Under the Government of the Russian Federation – Kursk, Russia 1223
Kuhn, Jane M. / University of Minnesota, USA 823
Kulturel-Konak, Sadan / Penn State Berks, Reading, USA 1660
La Paz, Ariel I. / University of Chile, Lleida, Chile 886
La Riccia, Luigi / Politecnico di Torino, Italy 311
Laitano, María Inés / LabSic, Université Paris 13, Villetaneuse, France 191
Larios-Hernandez, Guillermo J. / Universidad Anahuac Mexico, Mexico 1100
Lee, James J. / Seattle University, USA 1081
Levy, Moria / Bar Ilan University, Israel 990
Lim, Doo Hun / University of Oklahoma, USA 723
Lima, Ana / Polytechnic of Porto, Portugal 1916
Lima, Ana Carolina Oliveira / University of Aveiro, Portugal 501
Lison, Christelle / Université de Sherbrooke, Canada 1060
Loi, Michela / University of Cagliari, Italy 761
Loko, Laura Y. / National University of Sciences, Technology, Engineering and Mathematics, Benin 1533
Major, Debra A. / Old Dominion University, Norfolk, USA 614
Mândricel, Diana Andreea / Titu Maiorescu University, Romania 952

Table of Contents

Preface xxiv

Section 1
Fundamental Concepts and Theories

Chapter 1
Change and Change Management in Organizations 1
Gökhan Kerse, Karamanoğlu Mehmetbey University, Turkey

Chapter 2
From Doing Digital to Being Digital: Exploring Workplace Adoption of Technology in the Age of Digital Disruption 23
Donna Murdoch, Teachers College, Columbia University, New York City, NY, USA
Rachel Fichter, Teachers College, Columbia University, New York City, NY, USA

Chapter 3
Everything Must Change Because Nothing Changes: A History of Organizational Change in the Italian Banking Sector 41
Filippo Ferrari, Bologna University, Italy

Chapter 4
Capability Demands of Digital Service Innovation 49
Jo Coldwell-Neilson, Deakin University, Australia
Trudi Cooper, Edith Cowan University, Australia
Nick Patterson, Deakin University, Australia

Section 2
Development and Design Methodologies

Chapter 5
A Multi-Perspective Theoretical Analysis to Web Accessibility 70
Carlos Peixoto, INESC TEC and University of Trás-os-Montes and Alto Douro, Portugal
Frederico Branco, INESC TEC and University of Trás-os-Montes and Alto Douro, Portugal
José Martins, INESC TEC and University of Trás-os-Montes and Alto Douro, Portugal
Ramiro Gonçalves, INESC TEC and University of Trás-os-Montes and Alto Douro, Portugal

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 6
Rethinking the Contribution of Organizational Change to the Teaching and Learning of Organizational Behaviour and Human Resource Management: The Quest for Balance 93
John Mendy, University of Lincoln, UK

Chapter 7
Challenges to Business Models in the Digital Transformation Context 116
Pedro Fernandes da Anunciação, Instituto Politécnico de Setúbal, Portugal
Francisco Madeira Esteves, Instituto Politécnico de Setúbal, Portugal

Chapter 8
Predictive Model of the Influence of Leadership Styles on Attitudes Towards Organizational Change Among Secondary School Teachers in Selangor 130
Yuen Fook Chan, Universiti Teknologi MARA, Malaysia
Nusrah Ahmad Mukhtar, Universiti Teknologi MARA, Malaysia
Norsidah Mohammed Noordin, Universiti Teknologi MARA, Malaysia

Chapter 9
Developing Project Management Maturity as an Organizational Change Process 152
Gilbert Silvius, LOI University of Applied Sciences, The Netherlands & University of Johannesburg, South Africa

Chapter 10
Leveraging Enterprise Resource Planning Systems to Digitize Business Functions 165
Jessy Nair, PES University, India
D. Bhanu Sree Reddy, VIT University, India

Chapter 11
Developing a Participatory Approach to Accessible Design 191
María Inés Laitano, LabSic, Université Paris 13, Villetaneuse, France

Chapter 12
Structural Change Management for Sustainable SME Development: Applying Classical Management Tools 202
Robert M. Molnar, Technical College of Applied Sciences in Zrenjanin, Serbia

Chapter 13
Design Science Research to Produce Instrumental Knowledge for Evidence-Based Practice in OCD 225
Joan Ernst van Aken, Design Science Research institute, The Netherlands

Chapter 14
Integration of ICTs in Radio Programs (II-RP) for Environmental Awareness for Peasant Farmers of Rural Zambia 243
Tracy Chisanga, Copperbelt University, Zambia
Jameson Mbale, Copperbelt University, Zambia

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 15
The Conceptual Framework for The Examination of a Successful Digital Entrepreneurship in 21st Century 263
Bilal Ahmad Ali Al-khateeb, Al Imam Mohammad Ibn Saud Islamic University, Saudi Arabia

Chapter 16
Leading Anywhere Workers: A Scientific and Practical Framework 279
Christianne T. Varty, Wilfrid Laurier University, Canada
Thomas A. O'Neill, University of Calgary, Canada
Laura A. Hambley, Work EvOHlution, Canada

Chapter 17
The Walkability of the Cities: Improving It Through the Reuse of Available Data and Raster Analyses 311
Luigi La Riccia, Politecnico di Torino, Italy
Antonio Cittadino, Università degli Studi di Torino, Italy
Francesco Fiermonte, Politecnico di Torino, Italy
Gabriele Garnero, Università degli Studi di Torino, Italy
Paola Guerreschi, Università degli Studi di Torino, Italy
Franco Vico, Politecnico di Torino, Italy

Chapter 18
Teleworking and a Green Computing Environment: A Conceptual Model 332
Iheanyi Chuku Egbuta, University of South Wales Business School, UK
Brychan Thomas, University of South Wales Business School, UK
Said Al-Hasan, University of South Wales Business School, UK

Section 3
Tools and Technologies

Chapter 19
Accessibility Compliance for E-Government Websites: Laws, Standards, and Evaluation Technology 354
Lourdes Moreno, Advanced Databases Group, Department of Computer Science, Universidad Carlos III de Madrid, Madrid, Spain
Paloma Martínez, Department of Computer Science, Universidad Carlos III de Madrid, Madrid, Spain

Chapter 20
Ensuring Quality of Web Portals Through Accessibility Analysis 374
Amar Ranjan Dash, Berhampur University, India
Manas Ranjan Patra, Berhampur University, India

Chapter 21
The Destructive Effect of Complex Analytics on Innovativeness 415
Burçin Güçlü, BES La Salle, Universitat Romon Llull, Barcelona, Spain
Miguel-Ángel Canela, IESE Business School, University of Navarra, Barcelona, Spain

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 22
Effective Tools for Improving Employee Feedback during Organizational Change 432
Tanja Sedej, Graduate School of Government and European Studies, Slovenia
Gorazd Justinek, Graduate School of Government and European Studies, Slovenia

Chapter 23
Accessible and Inclusive Content and Applications 449
Tom Brunet, IBM, USA
P. G. Ramachandran, IBM, USA

Chapter 24
How Internet of Things Is Transforming Project Management 463
Marisa Analía Sanchez, Universidad Nacional del Sur, Argentina

Chapter 25
Graph Tools for Social Network Analysis 485
Nadeem Akhtar, Aligarh Muslim University, India
Mohd Vasim Ahamad, Aligarh Muslim University, India

Chapter 26
Impact of Evaluating the Usability of Assisted Technology Oriented by Protocol 501
Ana Carolina Oliveira Lima, University of Aveiro, Portugal
Maria de Fatima Queiroz Vieira, Federal University of Campina Grande, Brazil
Ana Isabel Martins, Institute of Electronics and Informatics Engineering of Aveiro, Portugal
Nelson Pacheco Rocha, University of Aveiro, Portugal
Joana Catarina Mendes, Instituto de Telecomunicações Campus Universitário de Santiago, Portugal
Ronaldo da Silva Ferreira, Universidade de Aveiro, Portugal

Chapter 27
Collaborative Systems for Design-Based Learning 523
Joycelyn Streator, Georgia Institute of Technology, USA

Chapter 28
Developing and Validating Measurement Instrument for Various Aspects of Digital economy: e-Commerce, e-Banking, e-Work and e-Employment 540
Nikolina Žajdela Hrustek, University of Zagreb, Zagreb, Croatia
Renata Mekovec, University of Zagreb, Zagreb, Croatia
Igor Pihir, University of Zagreb, Zagreb, Croatia

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 29
Emergence of Industry 4.0 Technologies: Leapfrogging Opportunity for the Russian Federation 560
Leyla A. Gamidullaeva, Penza State University, Russia
Sergey M. Vasin, Penza State University, Russia
Elena V. Shkarupeta, Voronezh State Technical University, Russia
Tatyana O. Tolstykh, NUST MISIS, Russia
Alexey G. Finogeev, Penza State University, Russia
Galina V. Surovitskaya, K. G. Razumovsky Moscow State University of Technologies and Management, Russia
Sergey Kanarev, Penza State University, Russia

Chapter 30
Design Solutions Guided by User Behavior: A Practical Inquiry Approach 590
Mariam Ahmed Elhussein, University of Dammam, Saudi Arabia

Chapter 31
Women in STEM Workplaces and Computer-Mediated Communication: Obstacle or Advantage? . 614
Seterra D. Burleson, Old Dominion University, Norfolk, USA
Whitney A. Tyler, Old Dominion University, Norfolk, USA
Debra A. Major, Old Dominion University, Norfolk, USA
Katelyn R. Reynoldson, Old Dominion University, Norfolk, USA

Chapter 32
Mastering Change Management for Successful Digital Supply Chain Transformations 640
Ehap Sabri, KPMG LLP, USA & University of Texas at Dallas, USA

Chapter 33
An Analysis of Web-based Document Management and Communication Tools Usage Among Project Managers..... 662
Tomislav Rozman, DOBA Faculty of Applied Business and Social Studies, Maribor, Slovenia
Tanja Kocjan Stjepanovič, DOBA Faculty of Applied Business and Social Studies, Maribor, Slovenia
Andrej Raspor, DOBA Faculty of Applied Business and Social Studies, Maribor, Slovenia

Chapter 34
Evaluating Wireless Network Accessibility Performance via Clustering-Based Model: An Analytic Methodology 687
Yan Wang, Xidian University, China
Zhensen Wu, Xidian University, China

Chapter 35
Digitization and Sustainability: Threats, Opportunities, and Trade-Offs 700
Marlen Gabriele Arnold, Chemnitz University of Technology, Germany
Anne Fischer, Chemnitz University of Technology, Germany

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Section 4
Utilization and Applications

Chapter 36
Organizational Learning and Change: Strategic Interventions to Deal with Resistance 723
Jieun You, Ohio State University, USA
Junghwan Kim, University of Oklahoma, USA
Doo Hun Lim, University of Oklahoma, USA

Chapter 37
Facing Organizational Change: An Italian Perspective on Six Challenges for Organizational Change Practitioners 742
Filippo Ferrari, University of Bologna, Italy

Chapter 38
Mapping Innovation in the Digital Transformation Era: The Role of Technology Convergence..... 761
Elona Marku, University of Cagliari, Italy
Manuel Castriotta, University of Cagliari, Italy
Maria Chiara Di Guardo, University of Cagliari, Italy
Michela Loi, University of Cagliari, Italy

Chapter 39
The Accessibility, Usability, Quality and Readability of Turkish State and Local Government Websites an Exploratory Study 780
Yakup Akgül, Alanya Alaaddin Keykubat University, Alanya, Turkey

Chapter 40
Transformational Leadership and Attitude Toward Enterprise Resource Planning System: A Perspective of Organizational Change 803
Paul Chou, Department of Business Administration, Minghsin University of Science and Technology, Xinfeng, Taiwan

Chapter 41
Organization-Wide Culture Change in a Large Healthcare Organization: A Case History..... 823
Louis Neumann Quast, University of Minnesota, USA
Jane M. Kuhn, University of Minnesota, USA

Chapter 42
Digital Transformation in the Utilities Industry: Industry 4.0 and the Smart Network Water 838
Marcelo Teixeira de Azevedo, Universidade de São Paulo, Brazil
Alaide Barbosa Martins, Universidade de Sao Paulo, Brazil
Sergio Takeo Kofuji, Universidade de Sao Paulo, Brazil

Chapter 43
The Transformation of the Public Administration in the Multi-Level Governance Era 866
Elif Yucebas, Dokuz Eylul University, Turkey

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 44
Measuring Business-IT Alignment in a Digitally Revolutionized Economy 886
Pablo Alfonso Gajardo, University of Lleida, Lleida, Chile
Ariel I. La Paz, University of Chile, Lleida, Chile

Chapter 45
Measuring the Digital Transformation of Education and Teaching..... 908
Christian Glahn, Leiden-Delft-Erasmus Center for Education and Learning, Switzerland

Chapter 46
Transformative Organizational Communication Practices 931
Philip J. Salem, Texas State University, USA

Chapter 47
Reflections on the Effect of Organizational Restructuring: Evidence From Albania..... 952
Ionica Oncioiu, Titu Maiorescu University, Romania
Diana Andreea Mândricel, Titu Maiorescu University, Romania

Chapter 48
Knowledge of Management Tools and Systems in SMEs: Knowledge Transfer in Management..... 966
Adam Pawliczek, Technical University of Ostrava, Czech Republic & Moravian University College Olomouc, Czech Republic
Miroslav Rössler, Moravian University College Olomouc, Czech Republic

Chapter 49
Change Management Serving Knowledge Management and Organizational Development: Reflections and Review..... 990
Moria Levy, Bar Ilan University, Israel

Chapter 50
Impact of Social CRM Capabilities on Firm Performance: Examining the Mediating Role of Co-Created Customer Experience..... 1005
Shampy Kamboj, Department of Management Studies, Indian Institute of Technology, Roorkee, India
Mayank Yadav, Department of Management Studies, Indian Institute of Technology, Roorkee, India
Zillur Rahman, Department of Management Studies, Indian Institute of Technology, Roorkee, India
Praveen Goyal, Department of Management, Birla Institute of Technology & Science, Pilani, India

Chapter 51
Policies Information Literacy, Equality, and Gender: The Case of Spanish Prisons..... 1022
María Antonia Agúndez-Soriano, Colegio Universitario de Estudios Financieros, Spain
Aurora Cuevas-Cerveró, Universidad Complutense de Madrid, Spain

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 52
Culture, Technology, and Education in the Digital Age: A Conceptual Framework..... 1037
Mehmet Kesim, Anadolu University, Turkey

Chapter 53
Digital and Collaborative Work: Winning Couple?..... 1060
Christelle Lison, Université de Sherbrooke, Canada
Constance Denis, Université de Sherbrooke, Canada

Chapter 54
Theorizing Virtuality in Enterprise Social Systems 1081
James J. Lee, Seattle University, USA
Jessica L. Imanaka, Seattle University, USA

Chapter 55
Coworking Spaces and the Transcendence of Social Innovation Knowledge in the Smart Territory 1100
Guillermo J. Larios-Hernandez, Universidad Anahuac Mexico, Mexico
Alberto Borbolla-Albores, Universidad Anahuac Mexico, Mexico

Chapter 56
Telework and People with Disabilities: Perspectives of Managers and Employees from Australia. 1119
Rachelle Bosua, University of Melbourne, Australia
Marianne Gloet, University of Melbourne, Australia

Chapter 57
The Cross-Cultural Analysis of Australia and Russia: Cultures, Small Businesses, and Crossing the Barriers..... 1138
Vardan Mkrttchian, HHH University, Australia
Svetlana Veretekhina, Russian State Social University, Russia
Olga Gavrilova, Petrozavodsk State University, Russia
Anastasiia Ioffe, Petrozavodsk State University, Russia
Svetlana Markosyan, HHH University, Australia
Serge V. Chernyshenko, Open University for the Humanities and Economics, Russia

Chapter 58
The Flexibility of the Workplace and Working Time: Analysis of Employees' Preferences in Poland 1159
Beata Skowron-Mielnik, Poznan University of Economics and Business, Poland
Grzegorz Wojtkowiak, Poznan University of Economics and Business, Poland

Chapter 59
Strategic Leadership, Readiness for Change, and Innovative Work Behavior: A Field Study From Turkey 1177
Meltem Akca, Istanbul University, Turkey

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 60
Managing and Shaping Change in International Projects 1199
Jürgen Janssens, asUgo Consulting, Belgium

Chapter 61
Emerging Trends and Opportunities for Industry Development at the Sub-National Level in Russia 1223
Leyla A. Gamidullaeva, Penza State University, Russia
Natalia S. Merkulova, Kursk State University, Russia
Ludmila I. Kryachkova, Financial University Under the Government of the Russian Federation – Kursk, Russia
Zoya A. Kondratieva, Financial University Under the Government of the Russian Federation – Kursk, Russia
Yulia A. Efimova, Financial University Under the Government of the Russian Federation – Kursk, Russia
Sergey V. Matukin, Penza State University, Russia

Chapter 62
Restructuring and Globalization of Telecommunications Industry 1245
Sasmita Mohanty, University of Aveiro, Portugal

Chapter 63
The Significance of Trust to the Adoption of E-Working Practices Within Local Government 1266
Hazel Beadle, University of Chichester, Bognor Regis, UK

Chapter 64
The Knowledge Management Culture: An Exploratory Study in Academic Context 1282
Marcello Chedid, University of Aveiro, Portugal
Leonor Teixeira, University of Aveiro, Portugal

Chapter 65
ERP On-Premise or On-Demand 1300
Fan Zhao, Department of Information Systems and Operations Management, Lutgert College of Business, Florida Gulf Coast University, Fort Myers, USA
Elias T. Kirche, Department of Information Systems and Operations Management, Lutgert College of Business, Florida Gulf Coast University, Fort Myers, USA

Chapter 66
Online Organization: A Flexible, Agile and Adaptable Organizational Instrument 1317
Carlos Páscoa, Portuguese Air Force Academy, Pêro Pinheiro, Portugal
Ana Telha, Portuguese Air Force Academy, Pêro Pinheiro, Portugal
Tiago Santos, Portuguese Air Force Academy, Pêro Pinheiro, Portugal

Preface

As technology advances and becomes increasingly integrated in the workplace, digital transformation research has been brought to the forefront of modern investigations on organizational success and business modeling. The continual improvement and utilization of technology, especially in a world that is relying more heavily on remote work, has led to innovation and change in virtually all types of workplace atmospheres. Understanding how to adapt to these changes, implement technology, and successfully navigate these new uncharted advancements is essential to successful business management in the changing work environment. Examining current research, case studies, and applications can lead to a greater understanding of the technological, economic, and social implications; advancements; and issues related to digital transformation, organizational change, and remote work.

Staying informed of the most up-to-date research trends and findings is of the utmost importance. That is why IGI Global is pleased to offer this four-volume reference collection of reprinted IGI Global book chapters and journal articles that have been handpicked by senior editorial staff. This collection will shed light on critical issues related to the trends, techniques, and uses of various applications by providing both broad and detailed perspectives on cutting-edge theories and developments. This collection is designed to act as a single reference source on conceptual, methodological, technical, and managerial issues, as well as to provide insight into emerging trends and future opportunities within the field.

The *Research Anthology on Digital Transformation, Organizational Change, and the Impact of Remote Work* is organized into seven distinct sections that provide comprehensive coverage of important topics. The sections are:

1. Fundamental Concepts and Theories;
2. Development and Design Methodologies;
3. Tools and Technologies;
4. Utilization and Applications;
5. Organizational and Social Implications;
6. Managerial Impact;
7. Critical Issues and Challenges; and
8. Emerging Trends.

The following paragraphs provide a summary of what to expect from this invaluable reference tool.

Section 1, "Fundamental Concepts and Theories," serves as a foundation for this extensive reference tool by addressing crucial examples essential to the understanding of how change, innovation, and the digitalization of businesses are transforming the modern workplace. This section opens with the chapter "Change and Change Management in Organizations" written by Prof. Gökhan Kerse of Karamanoğlu

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Mehmetbey University, Turkey, which introduces the concept of change and offers some suggestions on change management, resistance to change, and leadership through change culture with applicable examples. Closing this section is, "Capability Demands of Digital Service Innovation," by Profs. Jo Coldwell-Neilson and Nick Patterson of Deakin University, Australia and Prof. Trudi Cooper of Edith Cowan University, Australia, which explores the demands that digital service innovation places on those stakeholders who use the digital service through three lenses: workers and workplace, digital literacy, and finally, digital education.

Section 2, "Development and Design Methodologies," presents in-depth coverage of the ways in which businesses are creating new models of operation and accessible design for the use of technology in the workplace. Opening this section is the chapter "A Multi-Perspective Theoretical Analysis to Web Accessibility" by Profs. Carlos Peixoto, Frederico Branco, José Martins, and Ramiro Gonçalves of INESC TEC and University of Trás-os-Montes and Alto Douro, Portugal, which presents accessibility in information technology, accessibility problems and methods and chance mentalities in web accessibility implementation. Ending the section is the chapter "Teleworking and a Green Computing Environment: A Conceptual Model," authored by Profs. Iheanyi Chuku Egbuta, Brychan Thomas, and Said Al-Hasan of the University of South Wales Business School, UK, which considers strategic green issues of teleworking in terms of the environment, transport, location, office space, and resource use for modern organizations and business sectors and formulates a conceptual model of the processes involved.

Section 3, "Tools and Technologies," explores the various tools and technologies used to assist the online workplace and advance the performance of various aspects in digitalized business procedures. The chapter "Accessibility Compliance for E-Government Websites: Laws, Standards, and Evaluation Technology" by Profs. Lourdes Moreno and Paloma Martínez of Universidad Carlos III de Madrid, Madrid, Spain, opens this section by presenting the regulatory framework regarding accessibility, a survey of the technology, and a proposal of good practices concerning technology which evaluates accessibility as a support resource. To conclude this section, the chapter "Digitization and Sustainability: Threats, Opportunities, and Trade-Offs," written by Profs. Marlen Gabriele Arnold and Anne Fischer of Chemnitz University of Technology, Germany, provides a review of the literature on digitization and sustainability and compiles a SWOT table and a concept map for visualizing key topics in light of digitization and sustainability.

Section 4, "Utilization and Applications," describes how technology is being used and applied throughout various types of organizations and businesses in diverse fields of work. The opening chapter, "Organizational Learning and Change Strategic Interventions to Deal With Resistance," by Profs. Doo Hun Lim and Junghwan Kim of University of Oklahoma, USA and Prof. Jieun You of Ohio State University, USA, suggests that HR/HRD should play a role in building the learning organization and facilitating organizational learning for change as a change agent. The concluding chapter, "Online Organization: A Flexible, Agile, and Adaptable Organizational Instrument," by Profs. Carlos Páscoa, Ana Telha, and Tiago Santos of the Portuguese Air Force Academy, Pêro Pinheiro, Portugal, studies an online organization model that represents the concepts of organizational entities, job positions, resource management, and human resource management through competency management to predict future improved effectiveness and efficiency.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Section 5, "Organizational and Social Implications," includes chapters discussing the organizational and social impact of the implementation of change management and digital transformation into workplaces all around the world. This section starts with the chapter "Contemporary Change Management and Leadership in Local and International Businesses" by Prof. Aytaç Gökmen of Çankaya University, Turkey, which discusses the process of effective change and how this change process affects the organizations at a structural, managerial, and individual basis. The final chapter in this section, "Domestication of Telecentres by Malawian Rural Women," by Prof. Wallace Chigona of University of Cape Town, South Africa and Prof. Sellina Khumbo Kapondera of Mzuzu University, Malawi & Royal Holloway University of London, UK, uses domestication theory to explain the processes through which women in rural Malawi encounter technologies, deal with them, and integrate them into their lives.

Section 6, "Managerial Impact," discusses the impact of organizational change and digital transformation on organization management, managerial decisions, and leadership. The chapter "Strategic and Business-IT Alignment Under Digital Transformation: Towards New Insights?" by Prof. Nabyla Daidj of Institut Mines-Télécom Business School, France starts off this section by analyzing how digital transformation could affect strategic fit and IT-business alignment in modern companies. To conclude the section, "The Information and the Strategy Business" by Prof. George Leal Jamil of FUMEC University, Brazil explores business and information strategies and how managers and companies can adapt to the digital transformation overtaking society.

Section 7, "Critical Issues and Challenges," presents coverage of academic and research perspectives on challenges of technology implementation in the workplace and proposed models for improvement. Opening this section is the chapter "The Use of Software Tools in Linked Data Publication and Consumption: A Systematic Literature Review" by Profs. Armando Barbosa, Ig Ibert Bittencourt, Rafael de Amorim Silva, and Ivo Calado of Federal University of Alagoas, Brazil and Prof. Sean Wolfgand Matsui Siqueira of Federal University of the State of Rio de Janeiro (UNIRIO), Brazil, which investigates the use of software tools in Linked Data publication and consumption processes and explores how these software tools are related to process of publication or consumption of linked data. Concluding this section is the chapter "Continuous Improvement Maturity Models: How to View Them Effectively" by Prof. Brian J. Galli of Hofstra University, USA, which analyzes the need for continuous improvement maturity models in a company, the techniques and practice of these models, and the benefits of their implementation.

Section 8, "Emerging Trends," highlights areas for future research within this field. The final section of this resource work opens with the chapter "New Trends and Tools for Customer Relationship: Challenges in Digital Transformation" by Profs. Ana Lima and Jorge Pacheco of the Polytechnic of Porto, Portugal, which explores how digital transformation effects customer interaction and collaboration and recommends new technology and tools for customer support. Closing this reference book is the chapter "What Does the Future Hold for Innovation Management Education?" by Prof. Klemen Širok of the University of Primorska, Slovenia and Prof. Pia Jääskeläinen of South-Eastern Finland University of Applied Sciences, Finland, which aims to identify and describe emerging trends that will most likely put additional pressures on innovation management education and presents a concept of a future-oriented innovation management course.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Although the primary organization of the contents in this multi-volume work is based on its seven sections, offering a progression of coverage of the important concepts, methodologies, technologies, applications, social issues, and emerging trends, the reader can also identify specific contents by utilizing the extensive indexing system listed at the end of each volume. As a comprehensive collection of research on the latest findings related to the intersection of technology and business, the *Research Anthology on Digital Transformation, Organizational Change, and the Impact of Remote Work* provides researchers, administrators, engineers, academicians, managers, business professionals, and academicians with a complete understanding of the impact of digital transformation and organizational change in remote work and business settings. Given the current technological advancements taking place in organizations across all fields of work throughout the world, *Research Anthology on Digital Transformation, Organizational Change, and the Impact of Remote Work* encompasses the most pertinent research in technologies, change, and innovation being employed to improve workplace culture, business processes, and organizational success.

Chapter 1
Change and Change Management in Organizations

Gökhan Kerse
Karamanoğlu Mehmetbey University, Turkey

ABSTRACT

The aim of this chapter is to make it easier to understand the concept of change and offer some suggestions on how the change should be managed. In this direction, change, change management, and its importance have been dealt with, and a conceptual framework has been established through examples. Then, the types of change are discussed by explaining what environmental factors bring about the change. The process of managing change is reviewed; the resistance to change and the sources that reveal this resistance are examined, as well as how to overcome the resistance. Finally, the role of the leader in change management and creating change culture has been discussed.

INTRODUCTION

Modern organizations are open systems that take the input they obtain from their environment into a certain process and offer them back to the environment as output, with a relationship with environmental factors. These organizations analyze the variables and parameters around them, collect sufficient data about those variables and parameters and try to keep up with the changing environmental conditions in line with those data. This is because the phenomenon of "change" is gaining importance in modern organizations, in contrast to classical organizations which prioritize protecting their current status and avoiding risks. It is also emphasized that change at both individual and organizational levels is essential (Şimşek, Akgemci & Çelik, 2008, p. 415). Therefore, modern organizations perceive and understand the change emerging in the environment and try to adapt to the change and protect their balance.

In daily life, the concept of change means that something is transformed into something else in a planned or unplanned way in time. Change as mentioned in the management literature involves the change process that generally occurs in a planned way. Planned change aims to develop the organization's adaptive skills towards the developments in the environment and to change the employee behaviors (Robbins & Judge, 2013, p. 580). Thus, planned change requires managerial abilities. Management and change

are intertwined concepts that complete each other. In the journey of change, your purpose, destination, whom you will take with you on the journey and whom you will leave behind are determined in advance. Hence, activities such as planning, evaluation, implementation and control are carried out before and during the journey and change is tried to be managed.

It is possible to see many examples of businesses that demonstrate the importance of seeing changes in the environment in a timely manner, and managing it in order to gain competitive advantage. For example, Nokia, the leading player in the mobile industry for some time, did not follow the trend change and tried to hold on to the market with its traditional mobile devices while its competitors developed themselves according to changing trends and the result is clear… For this reason, change and change management for organizations is vital.

CHANGE AND ORGANIZATIONAL CHANGE

Think about your life for the last 5 years. What has changed in your life? Where were you five years ago and what business were you doing? Did the products you used change? Has your form of access to information and speed changed? Did the people in your life get diversified?

If you are a business owner, think about what has changed in your business so far from the days you have started it. Has your business provided product range? Have you experienced product, market or technology differentiation? Has the number and profile of your employees changed? Has customer expectation and applications of order delivery changed? Has the number of competitors increased or decreased? If you answer is "yes" to one or more of these questions, we can say that you are experiencing the change. What is the concept of "change", which is a fact of business life as well as private life?

Change in daily life refers to the fact that things alter and do not stay the same, they turn into something else. This transformation includes the change of both the places of people and objects and personal knowledge, ability, etc. to a different situation than its current situation. In the organizational context, change means that the organization comes to a different situation in terms of its activities (van de Ven & Poole, 1995, p. 512). Organizational change is to enter a new field and play the game according to the new rules (Ragsdell, 2000, p. 104). Organizational change is the alteration of the organization's strategy, structure and culture as a consequence of the shift occurring in the organization's environment, structure or technology (Passenheim, 2010, p. 7). This alteration and transformation can be performed in a planned way, or it can be unplanned as well.

In organizations, every work, technology, process and procedure is constantly changing (Nordin, Md Deros, Wahab & Rahman, 2012, p. 106). Constant change includes continuously differentiating and changing any aspect or situation of individuals or organizations (Çetin, 2008, p. 109). Organizations are constantly in the process of producing goods or services that are "cheaper, better quality and quicker" and, in doing so, they have to keep pace with the change. This effort of the organizations reminds the slogan of the Olympic Games known as "citius (quicker), altius (higher), fortius (stronger)" (Şimsek et al., 2008, p. 415). It is necessary for members of the organization to adapt to that kind of life in such an environment where there is a constant change. Because, as in the well-known expression, "the only thing that has not changed in organizations has become the change itself". The speed to respond to customer needs which is a fundamental dimension in today's management approach and stipulated by total quality management has become a demonstration of change in organizations. In today's economic conditions,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

organizations' living in and changing through innovation are seen as an important "life principle" (Koçel, 2011, p. 667-668).

The change has become the norm in most organizations (Quick & Nelson, 2011, p. 588). This norm suggests that there is a wide variation rather than stability and organizations must be "evolutionary organizations" depending on this norm. Otherwise, organizations can hit the glaciers as victims of the "Titanic Syndrome". Because an organization manager who is a victim of Titanic Syndrome cannot respond to environmental conditions just like administrators of the Titanic. These managers have the idea that the ship can sink, but they cannot see the ship sinking slowly by crashing into the glaciers that are seen (Naktiyok, 2004, p. 216). For this reason, it is necessary for organizations and organizational managers to know that the change is a fundamental characteristic of contemporary organizations.

CHANGE MANAGEMENT AND ITS IMPORTANCE

Organizational change is that an organization moves away from its current position and moves towards a desirable situation to increase its effectiveness. The future situation might include a new strategy, changes in organizational culture, a new technological transition, and so on (Champoux, 2011, p. 455). Well, why does an organization need to turn to a situation different from its current state? The answer to this question is that the business environment is constantly changing and the organization must adapt to changing environmental conditions in order to achieve competitive advantage and survive (George & Jones, 2012, p. 533).

Organizations operate in a climate of rapid environmental change, a global economy and intense national and international competition. In such an environment, they form strategies to achieve organizational goals and competitive advantage. These established strategies need to be shaped according to the needs of the environment. That is, organizational strategies should be formed and the change should be managed according to environmental changes and competition factors. Entropy arises if the organization does not adapt the constant change in the environment or if it is against the change (Naktiyok, 2004, p. 215). Therefore, the organization gradually acquires a bureaucratic character and eventually disappears. For this reason, achieving a competitive advantage and sustaining life takes place when organizations manage the change.

Change management is a process of constantly revising the direction, structure and capabilities of an organization in order to serve its ever-changing internal and external customer needs. (Moran & Brightman, 2000, p. 66). Change management is the structuring operation that is carried out so that the organization can renew itself, analyze the opportunities for change, utilize the potential and determine and use the most appropriate strategy in order to survive and outperform their competitors in an environment of constant change (Tunçer, 2013, p. 379). However, change management is not a structure that can come as a "fait accompli" since customer expectations, market status, technology, government regulations, economy, organizational strategies and the workforce structure are constantly changing in the organizational environment. Organizations operating in such an environment of constant change have to obtain new information, absorb this information and be dynamic and flexible at all times. Organizations that are dynamic and flexible towards their environment and meet their need for change in a timely manner continue to exist, whereas those that cannot keep up are faced with "Rigor Mortis". "Rigor mortis" in business is when organizations cannot change and fail to perform the process of change and transformation at the right time, in the appropriate manner with ease (Koçel, 2013, p. 671). An organization

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

down with this sickness will have difficulty in adapting to environmental changes. It will not be able to perform changes that emerge in products, services, technology, ways of doing business and managerial style, which in turn results in loss of competitive power and destruction. It is possible to see examples of firms that failed to realize the change process or couldn't fully complete the process or were too late for the change to occur and thus lost their competitive advantage among firms of both past and present.

For instance, the laptop computer that we use today was first produced by Osborne Computer, however, the company declared bankrupt two years after the official launch of the product in January 1981. Although the sales were satisfying during first 2 years, the technological advancements led companies such as IBM and Apple Computers to enter the market. Companies such as IBM and Apple Computers used the change in the market and the product range in an effective way and modified their organizational structure accordingly, whereas Osborne failed to implement this change. Therefore, one of the reasons that caused the bankruptcy of Osborne was that they lacked plans appropriate for crisis situations that occurred under conditions of uncontrolled change (Şimşek et. al, 2008, p. 416-417).

According to some authors, the phenomenon of change is a feature that defines contemporary organizations. For this reason, it is a key factor to implement and manage the change in the success of all organizations, whether in the private or public sector. On the other hand, today's change has a higher acceleration than previous changes. Hence, people no longer only talk about the change, but at the same time they feel it (Çetin, 2008, p. 109). For this reason, by becoming ordinary, the notion of change has become a part of both daily and business life.

FACTORS THAT BRING THE CHANGE

Factors that force organizations to change can be handled in two groups as internal and external factors. These factors are explained below:

Internal Factors

The internal factors that force organizations to change are related to events or situations within organizational boundaries. A crises arising in the organization might require the change. Strike or boycotts of employees in the organization may lead managers to change their wage structure (Quick & Nelson, 2011, p. 592). As a result of changing the administrators in the decision-making position of the organization, it might be necessary to make changes appropriate to the working habits, the field of expertise, the supervisory ability of the newcomers (Sabuncuoğlu & Vergiliel Tüz, 2005, p. 249). Emerging changes in employee expectations can trigger the change, because the expectations of today's young people are different from the expectations of older workers. The level of education of the workforce is another factor that elicits change. Although an educated workforce is advantageous for an organization, the demands of these workers from their employers are higher than those of low-educated workers (Quick & Nelson, 2011, p. 592). Like the level of job satisfaction, employee attitudes may also produce positive or negative consequences for change. The dissatisfaction of employees in the organization can increase the level of absenteeism, which can lead to changes in staff management or practices (Passenheim, 2010, p. 9). Low

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

productivity in the organization, decrease in sales, low morale and motivation levels, conflicts between individuals or groups are other factors that reveal organizational change (Koçel, 2011, p. 675).

External Factors

External factors that force organizations to change are elements outside the organizational context. When the organizations are dealt with from a system approach point of view; they transform the inputs they receive from the outside through a process with the help of specific information and technology, and presents them to the outside environment as output (Cummings & Worley, 2009, p. 89). The more formal and systematic the flow of this process in the organization, the higher the likelihood of success and achievement of the organization. On the other hand, this flow in the process will change itself according to elements outside the boundaries of the organization. If opportunities in the external environment are perceived, the organization will make changes to benefit from these new opportunities; if the external environment creates a threat or danger instead of an opportunity, it will make changes to reduce or eliminate those threats. Therefore, organizational changes are made according to factors outside the organization. These non-organizational factors that force organizations to change include (Passenheim, 2010, p. 7; Quick ve Nelson, 2011, p. 589; Özkalp & Kırel, 2013, pp. 435-436): customer expectations, technological changes, changes in economic conditions, globalization of the market and change in competition, changes in labor force diversity, legal regulations, social, cultural and demographic structure.

- **Customer Expectations:** Customer preferences and ratings have an important place in organizational change. As the customers' expectations for more and more quality and cheaper goods and service increase every day, they are looking for the opportunity to reach these goods and services and to receive after sales service whenever they want. This situation brings to the agenda the necessity of making changes in order for organizations to quickly adapt to changing customer demands and expectations.
- **Technological Changes:** New machinery, tools and equipment emerging from the technologies in production, communication, transportation, distribution, marketing, information and so on force the organizations to change to use this technology and equipment. These changes improve the quality of the product / service, increase the productivity and provide maintaining the organizational life. For example; if we had seen something called "e-commerce" 20-30 years ago, we would probably think it was a word mistake. But nowadays many businesses such as Amazon.com, Alibaba.com, JD.com, Hepsiburada.com, Markafoni.com, Yemeksepeti.com and so on are dealing with electronic sales activities.
- **Economic Conditions:** Situations such as changes in supply and demand related to goods and services, increases in inflation and interest rate, fluctuations in oil prices, appreciation and depreciation of stocks, recession and crisis events, etc. are other factors that put pressure on the change of organizations.

For example, in October 1987, stocks in the exchange stocks began to depreciate rapidly, which allowed businesses to make changes in their financial and investment plans. Many Wall Street financial institutions have had to implement a restructuring or merger strategy in order to survive (Özkalp & Kırel, 2013, p. 435-436).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Globalization and Competition:** With the globalization, the boundaries between the countries have been removed and the world has become a single market, which has led many local and international enterprises to contribute to the production and sale of goods/services. This situation has required organizational changes such as differing from competitors and improving goods / services, organizational structure and personnel quality, changing the sector, and merging or negotiating with competitors.
- **Labor Force Diversity:** The differentiation of the labor force structure compared to the past years has brought about the necessity of making some changes in the organization. Today's workforce is more flexible than the past, spending more time with family and friends, preferring short-term work, desiring to be rewarded immediately for success, and less workaholic and more utilitarian generations (Özkalp & Kırel, 2013, p. 431; Kicheva, 2017, pp. 108-109). Making organizational changes in line with the expectation of this workforce will ensure that qualified individuals apply for the employment and that the current workers will continue to be an organization member. On the other hand, compared to the past, it is seen that women are more active in business life today. This situation has brought about the necessity of organizational changes according to the needs of the working husbands and wives (the existence of kindergartens in the enterprise, the transfer between the branches, etc.).
- **Legal Arrangements:** Government legislations and regulations have great influence both on public and private businesses. For example, to reduce the harmful effects of smoking, regulations and taxes on tobacco products have put a lot of pressure on some large-scale organizations. These organizations now have to change in order to survive (Passenheim, 2010, p. 8).
- **Social, Cultural and Demographic Structure:** The increase in the number of universities, in the rate of higher education graduates, in the number of female students, the increase in the marriage-divorce rates, the changes in consumption preferences as well as social trends, population growth mobility, demographic trends are among the factors affecting the changes in organizations (Özkalp & Kırel, 2013, p. 436-438).

TYPES OF CHANGE

It is possible to make various classifications of the change. Some of these classifications are explained below.

Planned Change: Unplanned Change

The planned realization of change is related to the pre-determined and implemented phases of the change process (van der Voet, Groeneveld & Kuipers, 2014, p. 173). In the planned change, it is essential to change activities consciously and purposefully (Robbins & Judge, 2013, p. 581). This change is a systematic management effort in the transition to a new state of an organization or subsystem. Therefore, it includes consciously changing the organization design, technology, tasks, people, information systems and so on (Champoux, 2011, p. 456).

Unplanned change is the change whose purpose, orientation and the phases in the processes are not considered before and there is no other way but adapting it (Taşlıyan & Karayılan, 2011, p. 257). This change occurs when the oppression at the point of change is over the resistance to change. In fact, the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

management does not have such an expectation of change (Champoux, 2011, p. 456). But for example, there is no choice but to take precautions and decisions that s/he does not think of in order to overcome a crisis or to survive it. The phrase "Difficult breaks the game" in our language can be used for organizations that make unplanned change (Koçel, 2011, p. 673).

Evolutionary Change: Revolutionary Change

Evolutionary and revolutionary change take place on opposite poles of planned organizational change. Evolutionary change is a gradual change that takes place over time in order to adapt organizational design and processes to changes in the external environment. The evolutionary model of organizational change suggests that activity of change must take place in small steps that contribute to the total amount of change. In revolutionary change, big activities of change are carried out in a stable period, and these activities influence many parts of the organization. After a major change has taken place, another steady turn is passed (Champoux, 2011, p. 457-458). Therefore, there is an attempt to completely change the existing situation in revolutionary change. While evolutionary change takes place slowly and progressively; revolutionary change takes place swiftly, and it affects the all parts at the organization at same time (Greenwood & Hinings, 1996, p. 1024). Total quality management or kaizen are applications of evolutionary change while process development (reengineering), restructuring and innovation are the applications of revolutionary change (George & Jones, 2012, p. 540-546).

Macro Change: Micro Change

Macro and micro change are related to the number of issues that are subject to change in the organization. While the organization changes as a whole in macro change, there is a change about any topic at the lower or upper level in the organization in micro-change (Taşlıyan & Karayılan, 2011, p. 257-258). For example, organizing any phase of workflow or supply process in an organization is a micro change.

Proactive Change: Reactive Change

Proactive change is changing the work, activities and procedures in the organization by estimating the environmental conditions; so that when the estimated environmental conditions are met, the organization would be ready for this situation. Reactive change, on the other hand, is the change in order to adapt to actual conditions rather than change according to the predicted ones (Uçkun, 2002, p. 106). In reactive change, it is essential to react according to the conditions encountered. For example, in the economic crisis that began in the USA in 2008 and spread all over the world, some businesses were relatively prepared (proactive) through the restructure measures taken in the previous years (1999-2001), while some businesses had some reactive measures (stop producing, dismissal, etc.) to reduce the effects of the crisis (Koçel, 2011, p. 673-674).

Active Change: Passive Change

Active change is that the organization influences and changes its external environment by innovating. Passive change, on the other hand, is a change in organization's own structure in order to adapt to the conditions that occur in the external environment. For example, an enterprise that is striving to keep up

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

with technological changes is in a passive change. An enterprise that has developed and started to use a new technology is in an active change (Koçel, 2011, pp. 673-674).

CHANGE MANAGEMENT PROCESS (MODEL)

When the subject is the change in the management literature, it is often understood the change that takes place in a planned way. Planned change is intended to improve the ability of the organization to adapt to developments in its environment and to change employee behavior in the organization (Robbins & Judge, 2013, p. 580). In the literature, various change management models seem to be put forward to successfully manage and place the change. Some of these planned change models are (Sanrı, 2014, p. 50-54, Özkalp & Kırel, 2013, p. 452-458): Lewin's Three-Stage Change Model; Lippitt, Watson and Wesley's Five-Stage Change Model; Galakin's Change Management Wheel Model; Armenakis, Harris and Field Binary Change Model; Extended Process Model and Action Research Model. Below is a description of Lewin's Three-Stage Change Model and Action Research Model, which are seemed to be used more widely than the other models.

Lewin's Three-Step Change Model

Many of the models developed in the context of change processes and management in the literature are based on the change model developed by Lewin. According to this model, change refers to the difference between the previous state and the state that is followed and to be reached (Lewin, 1947, p. 151). According to Lewin, change is a process whose success depends on the application of three steps. These are: unfreezing, moving, refreezing (Quick & Nelson, 2011, p. 602). Lewin's change model is shown in Figure 1.

Figure 1. Lewin's change model
Source: (Quick & Nelson, 2011, p. 603).

Source: (Quick & Nelson, 2011, p. 603).

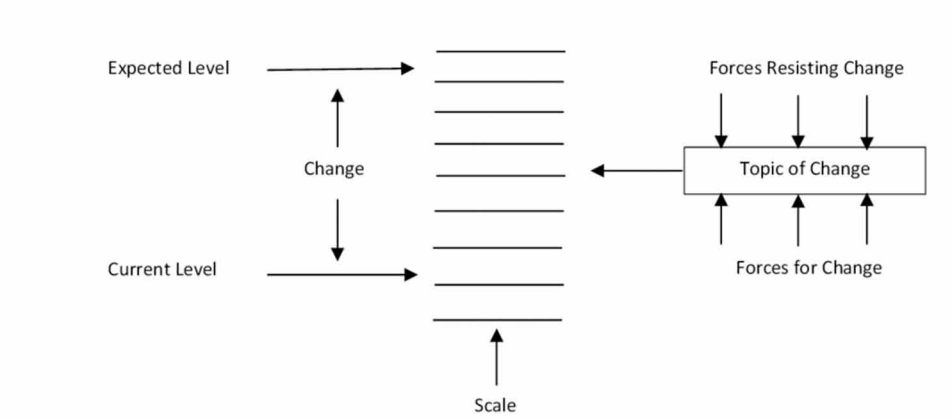
Unfreezing is the phase of "dissolving the ice" in the organization (Şimşek et al., 2008, p. 436). Unfreezing involves encouraging the individual to get rid of their old behavior by re-organizing the state of equilibrium that provides the continuation of the present situation (Quick & Nelson, 2011, p. 602). In this step, employees are informed about the situation to be changed. It is explained to the employees why the change is necessary, how the new situation will be when the change is realized, how the employees

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

will be affected by the change, and which positive outputs will be obtained as a result of it. Therefore, with these explanations, employees who are likely to resist the change are persuaded at this stage and they are made aware of the need for it.

Moving / change is the phase in which old attitudes, values and behaviors are replaced by the new ones (Quick & Nelson, 2011, p. 603). In this phase, action is taken for change and a new situation that is different from the current one is achieved in the organization. This may be related to a new operating system, the use of a new technology, or a new performance appraisal system.

The last phase of the change process, refreezing change, is the "hardening" or "freezing" of the new state to ensure the continuity of it (Cummings & Worley, 2009, p. 24). Therefore, all relations and procedures in the organization start to process based on this new situation. That is why, at this stage, it is important for organizational managers to encourage and reward behavior related to the new situation and punish the behavior related to the old situation (Quick & Nelson, 2011, p. 603-604). For example, an employee is sent to a course to learn a new computer program. After completing the course, if s/he continues to use the old program instead of the new one because it is familiar and easy to use, the freezing process does not take place (Özkalp & Kırel, 2013, p. 453-454). For this reason, the employee who learns the program should be encouraged to use the program s/he has learned by rewarding or punishing in different ways.



When the above-mentioned steps of change are taken as a whole (Koçel, 2011, p 676); firstly, the variables that are to be replaced are resolved from their current values and the current state is broken (unfreezing), then these variables that have been solved and softened are given the new form (moving / change), and finally these reshaped variables are re-frosted (refreezing). Therefore, the employees are prepared for change in the unfreezing step; the intended change is implemented in the change step; and the permanency of the change is provided in the refreezing step (Chadha, 2017, p. 17).

Another model that can be used in the realization and management of change is the Force Field Analysis model developed again by Lewin. According to Lewin, social systems are usually seeking a balance and want to maintain it at a certain equilibrium (Hellriegel & Slocum Jr., 2011, pp. 525-526; Stroh, Northcraft & Neale, 2002, pp. 432-433). This equilibrium refers to a constant state between the forces for change and the forces against the change (Yeniçeri, 2002, p. 193). Forces for change characterize the forces that put forward the change must take place; and the resistance forces characterize the "resistance to change" that is against the change. In organizations, the success of change activities depends on the dominance of the forces that encourage / force the change over those that resist it. The situation related to the model is presented in Figure2.

According to Figure 2, the internal or external forces that force to change must be determined first. Then, the possible resistance forces that would prevent the change should be estimated. Later, the intended change must be realized with the necessary measures that reduce the resistance to change and increase the intensities of the forces for change. This point of view of the model evokes the phenomenon of movement in the physics. The expression "the objects tend to stop" in physics means that the object desired to move needs to be subjected to more inverse force than the resistance that blocks the motion of it. If the force to move the object does not beat the resistance that prevents the movement of it, the object does not move (Koçel, 2011, p. 678).

Action Research Model

The action research provides a scientific methodology for managing planned change. Action research is the systematic collection, analysis and implementation of change activity according to the results of the analysis (Robbins & Judge, 2013, p. 587). This research can be done to explain an existing or possible future problem in the organization, increase the organizational success or improve the knowledge of the organization. The investigator and the agent of change are responsible for conducting the action research. The investigator is the individual who is assigned to carry out the organizational research by the organization (Yeniceri, 2002, p. 207). The change agent is the person or group that undertakes the task of managing change in an organization (Quick & Nelson, 2011, p. 593). The change agent is therefore the person or group who manages and implements the change.

The action research process consists of five steps. These are (Robbins & Judge, 2013, p. 587; Özkalp & Kırel, 2013, p. 457) diagnosis, analysis, feedback, action, and evaluation.

The diagnostic stage is similar to the doctor asking his patient questions and making a diagnosis. At this stage, the change agent collects information about the issue or problem and identifies the changing viewpoints of the members of the organization. Information can be collected by revising the records or face-to-face interviews with employees.

The analysis phase is the synthesizing of the information obtained during the diagnostic phase. The problems in the organization, people related to those problems and the sources of the problems are determined and the possible actions are planned.

Feedback is the phase in which the findings from the first two steps are shared with employees. At this stage, employees are assisted by the change agent and develop action plans in line with the change activity needed.

At the stage of the action, the employees and the change agent perform the actions they specify in order to implement the change activity.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Finally, it is assessed how successful the action plan and change are in the evaluation phase.

The action research activity described above has two main benefits. The first of these is that the change agent investigates the problems objectively and determines which change action should be used according to the problem. The second is that the resistance to change is decreased as employees are involved in the process in action research (Robbins & Judge, 2013, p. 587).

RESISTANCE TO CHANGE

One of the most important problems encountered in carrying out the change activity is that the resistance to change is high in the organizations. Resistance to change is the unwillingness to change within the organization and the behavior to prevent it (Tuncer, 2013, p. 383). Although the goal of change in organizations is about the design of the organization, the work in the organization or the technology used, it also affects the social systems in the organization. When the change affects the social networks, it might create a strong resistance by the employees. Resistance can be in the form of lack of co-operation in change activity, intentional sabotage of change activity, or increased levels of conflict (Champoux, 2011, pp. 459-460).

Change is inevitable no matter if it is individual or organizational, and showing resistance to change at the individual or organizational level is a known fact. Moreover, the issue of resistance to change is not a current problem, but a problem that even tribal leaders encountered in ancient times (Şimşek et al., 2008, p. 420). Researches in the literature also show that resistance to change is common in organizations. For example; in their study carried out in Australia, Eisen et al. (1992) found that resistance to change is a major obstacle in adopting modern quality management practices. In the research by Bostan and Köse Ünal (2016), health care workers in private hospitals were found to show resistance to health transformation program practices in Turkey. The findings of these researches show that there is resistance to change in today's organizations because of various reasons.

Change activity is seen as an uncomfortable event for reasons such as deterioration and dismissal of the status quo, and anticipation of giving up the habits. The resistance to change can be explained by the friction phenomenon in physics. As it is necessary to apply more force than the friction to move an object, it is necessary to apply a kind of force (mental, physical or spiritual) in order to realize the change activity (Koçel, 2011, p. 679). But in doing so, it is necessary to explain to the employees why the change is needed and how it will be realized. Otherwise, even if the change is realized, it does not reach its original purpose and resistance can come out again after a certain period of time. Sezgin et al. (2016) found out that the change is perceived as utopian especially for public institutions and it has been determined that the perception of the change in the lower level employees are very different from those planned in the upper levels. It has been suggested that changes that are not based on a valid cause and imposed only as fashion reinforce resistance behavior. In addition, it is stated that especially in the imposed change activities, the resistance may be seen at every level of the organization and this resistance may become ossified after a while.

The resistance to change does not always come in a standard. Sometimes it can be seen as overt or covert, sometimes suddenly or delayed. From the point of view of the organization managers, it is easy to overcome a clear and sudden emergence of resistance, such as a complaint, a slowdown of work or a threat of strike. However, it is more difficult to overcome the resistance that emerges as covert or delayed. The loss of loyalty or motivation and increase in mistakes and absenteeism are examples of such resistance

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Robbins & Judge, 2013, p. 581). Likewise, negative reactions such as disengagement, misidentification, disenchantment and disorientation can be considered within this type of resistance (Quick & Nelson, 2011, p. 600). In addition to these forms of resistance, suppressed behaviors can also be seen as a form of resistance. This form of resistance does not occur immediately; it can be seen weeks, months or years later. The changes made up to that point cause an accumulation in the employees, and as a result they show a great reaction to a very small change effort (Özkalp & Kırel, 2013, p.445).

One of the negative sides of the resistance to change is its preventing adaptation to environmental changes and organizational development. However, it is possible that the resistance to change at organizational level, provided that it is not either big or at an important level, may accelerate organizational change. Such a change can help to reveal some problems that cannot be seen by change managers and to take the necessary precautions (Tuncer, 2013, p. 384). Although resistance to organizational change is not desirable, this situation can be transformed into a functional conflict. In other words, the resistance to change in terms of use of a new technology, transition to new production methods, adoption of new wage systems, differentiation in a new product or service group, and so on can lead to a better discussion environment and better decisions.

Causes of Resistance to Change

Why do employees show resistance to change at the organizational level? This question may have different answers. Some people think that the change activity will cause to lose something they value. For example, the social status of an individual or group may decrease as a result of the change. If an individual or group values their current status, they are more likely to resist to change. The resistance to change may also emerge if change is believed to bring inequity in rewards in the future. Misunderstanding or not completely explaining the purpose of the change and the lack of confidence towards the agent of change regarding the realization of the change are also important reasons for resistance actions (Champoux, 2011, p. 460). Indeed, Sezgin et al. (2016) explain that the thoughts by employees that the managers do not fulfill the promises they have made and that they do not have sufficient qualifications for change are among the reasons for the resistance to change.

There can be many reasons for resistance to change in addition to the reasons mentioned above. The causes of resistance to change are discussed in four groups. These are job-related reasons, personal reasons, social reasons and organizational reasons.

- **Job-Related Reasons:** Job-related reasons are related to the work that the individual does and will do in the organization as a result of the change activity. These reasons may cause employees to occasionally resist to change, be unwilling for the change, or exhibit negative attitudes after the change. Resistance resources arising from job-related reasons are (Koçel, 2011, p.680):
  - Fear of technological unemployment,
  - Fear of increased workload,
  - Fear of lack of technical knowledge and skills,
  - Fear of change in the relation of work-wage-prize,
  - Perceiving change as technically impossible,
  - Fear of change in business conditions,
  - High costs.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Personal Reasons:** There may be some psychological (personal) reasons for counteracting change and trying to prevent change activities. These reasons are (Koçel, 2011, p. 680, Robbins & Judge, 2013, p. 582):
  - Not being able give up habits,
  - Security needs,
  - Fear of unknown,
  - Economic concerns (loss of interest, loss of wages),
  - Inadequacy of information about the change,
  - Believing in the failure,
  - Difficulty in learning new things,
  - Illiberality,
  - Personal experiences,
  - Lack of self-confidence,
  - Disruption of the comfort brought by familiarity,
  - Selective information processing (hearing what you want to hear).

Although some of the above reasons are related to each other, in general, the fact that individuals do not have knowledge of the subject of change, they are excluded from the phenomenon of change, and the fear of unknown are the main reasons for resistance to change (Bovey & Hede, 2001, pp. 534-535; Champoux, 2011, p. 460; D'Ortenzio, 2012, pp. 62-63). As previously stated, the changes that do not have a valid cause and are only an act of fashion and imposed on the workers reinforce their resistance behavior; this resistance becomes ossified after a while (Sezgin et al., 2016).

- **Social Reasons:** Another cause of resistance in organizations may be related to social relations. These causes are as follows (Şimşek et al., 2008, p. 423):
  - Differences between objectives of change and group norms and objectives,
  - Negative attitude and lack of trust to those who make the change,
  - Negative attitude to change of the close environment or group to which the employee belongs,
  - The desire not to give up on existing social relations,
  - Thought of staying outside the change activities,
  - Dislike from being led by outer forces,
  - Thinking that change will only serve the interests of a particular group.

Apart from the above mentioned reasons, the reason for resistance to change may also be the fear of what others will think. It is possible for an individual to show negative attitudes and resist to change in the organizations in which the group norms are the frontline and the group exhibits negative attitudes to change even if s/he accepts it (Özkalp & Kırel, 2013, p.474).

- **Organizational Reasons:** The sources of the resistance to change may also be rooted in the structure or functioning of the organization. The organizational reasons of resistance to change are (Şimşek et al., 2008, p. 423; Robbins & Judge, 2013, p. 582):
  - A non-functional organization structure,
  - Structural stability in the organization (built-in mechanisms that provide equilibrium),
  - Limited focus on the change (limited change in subsystems),

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The existence of groups that are not organized for a purpose
- The absence of team work,
- Previous failed attempts to change,
- Perception of threat to expertise (seeing long-term power relations as a threat, with redistribution of decision-making authority).

Strategies Used to Overcome the Resistance to Change

It is not easy to realize the phenomenon of change, which has become part of everyday or business life. Because "resistance to change" is common as well as "change" phenomenon. The reasons for resistance to change are explained above. Now let's explain what can be done to overcome the resistance to change in the organizations. The methods (strategies) that can be used to remove the resistance are described below.

- **Participation:** Participation of those that will be affected by the change in the planning and implementation phases of it reduces the resistance to change (Wagner III & Hollenbeck, 2010, p. 289). What is important here is that the participants feel that they are not excluded from the event of change that will affect them rather than that their ideas are accepted. On the other hand, one thing to keep in mind is that the participation process can take a lot of time. For this reason, the individuals who support and oppose the change should be identified. When the individuals who are opposed to the change are brought to the decision-making positions, it will enable them to participate more because of the responsibility (Özkalp & Kırel, 2013, p. 450).
- **Communication and Training:** Many of the problems that arise in organizations stem from lack of communication. It can be useful in removing resistance to change if the communication which is defined as the transfer of data, information, thoughts and emotions between individuals and institutions is well-managed, and the employees are ready for the change (by training) (Şimşek et al., 2008, p. 425). Explaining employees why they will make changes, asking what their concerns are, telling when and how changes will take place and what will change and what will not change will facilitate the acceptance of change activity. Because people's not knowing the details cause them to show the tendency of assuming the worst result. Therefore, it is necessary to share the details of the change and to be prepare for the change by creating training classes (Chadha, 2017, p. 18-19).
- **Discussion and Compromise:** It is useful to use the method of discussion and negotiation if the groups or employees lose something important that they value as a result the activities of change and have a strong power to resist (such as a union). Discussing before the change helps the change activity to develop in a soft way (Özkalp & Kırel, 2013, p. 451). On the other hand, forming a connection between the change and other topics that individuals are interested in to increase the perception of the need for change will facilitate compromise. For example, business security may reduce the likelihood of accepting the change as a threat and may be a tool for change (Chadha, 2017, p. 18).
- **Manipulation and Cooptation:** Manipulation is introducing an event to the others by altering it, showing the event different from how really it is and providing people to understand it differently (Simşek et al., 2008, p. 426). It can be considered as manipulation to make the facts attractive by distorting them, to withhold knowledge and to spread false truths (rumors) to workers in order the change to be accepted. For example, if an organization is threatening its workers who resist a

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

nationwide salary deduction to shut down the production facility (even though it will not be), there is manipulation in this organization (Robbins & Judge, 2013, p. 583).

Cooptation, on the other hand, is to make individuals who are opposed to a particular subject a part of the problem and solution (Şimşek et al., 2008, p. 426). Cooptation is a concept that combines manipulation and participation. It is an example of the cooptation to propose an important position to the leader of a group that is opposed to change and bribe him/her. Although manipulation and cooption are cost-free strategies for gaining support from the other side, the strategy can cause a backlash when individuals understand that they are deceived or used (Robbins & Judge, 2013, p. 583).

- **Choosing the Right Time:** Timing is very important in the change activity. The implementation of major changes in organizations at one time and very quickly increases the likelihood that employees will resist it (Chadha, 2017, p. 19). For this reason, it will be beneficial for some changes to be done slowly and gradually. As well as reducing the resistance, the changes carried out in this way can provide workers to work productively.
- **Fair Implementation of Change:** It may also be beneficial for the organization to ensure that the change activity will be carried out in a fair way to reduce negative effects of change (Robbins & Judge, 2013, p. 583). When employees perceive decisions and implementation of change as fair, it reduces their resistance to change (Oreg & van Dam, 2009, p. 129-131). Visser (2013) has found that the perception of justice reduces resistance to change.
- **Using Force:** Using force, which lies at the end of the strategy list that can be used, is to directly threaten and apply force on individuals who resist to change (Robbins & Judge, 2013, p. 584). Employees may be exposed to threats such as reducing wages, being fired or transferred elsewhere, and writing a bad reference letter (Özkalp & Kırel, 2013, p. 451-452). This strategy can be used when other strategies do not fully meet expectations. Because it might cause an adverse effect on the employees.

THE ROLE OF LEADER IN MANAGING CHANGE AND CREATING CHANGE CULTURE

It is inevitable that changes and new formations will emerge in today's organizations. Because organizations are faced with the pressure of change, both from their own structures and environment. In the face of this pressure, the organization must initiate the change without losing time and maintain it successfully. But the change is not to remove the old in the evening and bring something new in the morning. On the contrary, change takes place as a result of pursuing better ways to do the targeted work, distributing the execution of the process at a certain time, and operating the processes properly to achieve the predetermined goals by following a leader (Ceylan & Summak, 1999, p. 521). So the role of leader and guidance is great in the success of the change process. I has been found out that about 70% of the change efforts in enterprises have failed, and one of the main reasons for these failures is the lack of guidance for the intended targets (Kang, 2015, p. 28).

The decision makers of the initiation and implementation of the change activity are undoubtedly top managers. For this reason, the top management makes decisions such as what the change will consist of, how the change process will go on and who will play an active role in the change. Therefore, the success

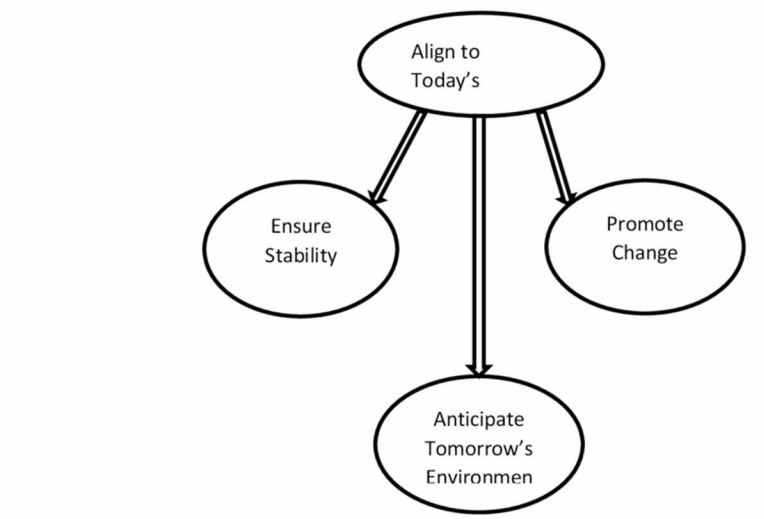
EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of the change activity and the adoption of the change culture in the organization depend primarily on the managers' (or leaders') believing in the change movement, convincing the workers that the change will be successful (reassuring the employees) and supporting the change. It is possible to find examples showing that the leader has an active role in the success (or failure) of the change activity. Some of these examples are explained below (Chadha, 2017, p. 12-16):

After the World War-II, the Japanese automobile market loses its competitive power against American Ford and General Motors enterprises. As an engineer at Toyota, Taiichi Ohno suggests that success in keeping up with American competitors can be provided through his "just-in-time" approach, a new and exclusive practice in production. According to Ohno, rather than ordering and storing too much material and machinery, the purchase of the materials when they are needed will save space, time, money or energy, and will allow the use of available money for other emerging opportunities. Ohno's approach is applied even if it does not happen overnight. The approach leads to a transformation in Japanese automobile production and brings Ohno to an executive position.

Jack Welch is appointed to the top position of General Electric (GE) in 1981 and takes over the management of a company with a market value of $ 12 billion. In 1995, Welch thinks that the company needs revision in all its content and decides to implement Six Sigma, a method aimed at reducing errors and flaws in the process. Five years after that, GE will earn $ 10 billion. The market value reaches 280 billion dollars. Thus, Welch transforms GE into a very strong international company by creating a good team that manages change and managing them right.

When Amazon, the Seattle-based company, launches its first website activity, it only deals with book sales. Founder Jeff Bezos and his team expands the field of activity with things like CDs and DVDs in the following years. As the years go on, Amazon continues to change its product range and becomes a business that sells more than 200 million products to customers worldwide today. Bezos explains that Amazon will not confine with these and soon be delivering packages via drones. Bezos and his team constantly change and develop. They got three Oscars in 2017.



The above examples clearly demonstrate the role of leaders in implementing the change successfully in enterprises. The change leader responsible for the change activity encourages the change to prepare the organization for the tomorrow's environment, in addition to harmonizing it with today's environment. The change leader provides stability in the organization and gives employees confidence. On the other hand, they have a difficult task of encouraging the change in the periods when employees adopt stability. This situation is described as leadership paradox and is shown in Figure 3 (Moran & Brightman, 2000, p. 68).

The change activity within the organization can start with the leader forming (or changing) his own mind map, and creating a hand-held, accessible in time and impressive vision. On the other hand, values and missions, which are complementary elements of the vision, should be taken into consideration in this process. In the absence of a concrete and impressive vision, the final point to be reached will not be known, so the process will turn into chaos before it begins (Ceylan & Summak, 1999, p. 532).

It is necessary for leaders that can manage the change and create a culture of change in the organization (by encouraging innovation culture and creating a learning organization) to communicate with their followers through approaches different from traditional leadership approaches and leadership characteristics. The two main types of leadership that can be used in the process of change and creating culture

Figure 3. Leadership paradox
Source: (Moran & Brightman 2000, p. 68).

Source: (Moran & Brightman 2000, p. 68).

are transactional and transformational leadership. In the transactional leadership, the leader rewards employees with the award they value when they perform what they are expected to do by the leader. Therefore, the relationship between leader and employee (follower) involves interdependence. In the transformational leadership, the leader enables organizational goals to overcome employees' personal expectations by deeply affecting them and increasing their self-confidence (Bass, 1990, p. 20-21; Ali, Jangga, Ismail, Kamal & Ali, 2015, p. 168). According to Burns, the transformational leader is aware of the material and physical needs of the employees that are fulfilled by the transactional leader (Bass, 1985, p. 14), and enables them to use their full potential by meeting their high-level needs in the Maslow hierarchy (Bass, 1985, p. 14; Jandaghi, Matin Farjami, 2009, pp. 275-276).

In change activities, transactional leaders promise employees that they will be awarded the prizes they deserve when the change is realized. They tell the employees that they should not resist to change and adopt change activities so that they can receive awards. Therefore, mutual bargaining is done for the change activity. For this reason, the expected benefit may not be achieved in the realization of organizational change.

It is the transformational leadership that facilitates the realization of change and transformation within the organization. Transformational leaders create a vision for the future during the renewal process of the organization and ensure that followers are involved in the change process. They have charisma or idealized influence, intellectual stimulation, and individualized consideration (Eisenbach, Watson & Pillai, 1999, p. 83-85). These features are very effective in the realization of change activity and reduction of resistance to change. Transformational leaders provide the successful realization of the change by creating a vision of change and gaining employee confidence (idealized impact), providing the employee's finding solutions to the problems that arise in change activity and thinking creatively (intellectual stimulation) and taking into account each employee's demands and needs (individualized thinking).

CONCLUSION

Change is an experience that we live both in daily life and in business life both individually and organizationally. It is not possible for mankind and organizations created by mankind to escape from this experience. Resisting change and ignoring mean that putting individual and organizational life in danger. Because, the World we see enormously in distance has shrunk. In the today, increased global competition and e-commerce, organizations established and managed thousands of miles away are now as close as their door neighbors. For this reason, organizations have to constantly change their products, services, skills, Technologies, structures and direction in a planned manner; that is, organizations have to manage change.

Managing change is planning the change activity and implementing these activities in a systematic way. The implementation of the planned change improves competitiveness, effectiveness and performance of the organization. But, "implementing change" is not as easy as it is said. Because some people –the genius- do not like change and transformation. For this reason, the change is resistant. It is the responsibility of the leaders to reduce this resistance that emerges in organizations. Organization leaders can make employees part of change by using different leadership styles and resistance reduction strategies. In this way, the employee adopts the change activity and it is easy to make the change. Organizations gain competitive advantage and maintain their lives when the change is realized.

FUTURE RESEARCH DIRECTIONS

In this study, the concept of change management, which is crucial for companies to gain competitive advantage, has been dealt with and only a conceptual framework has been established. For this reason, this study does not include an empirical research on change management. In the future studies, the concept of change management can be considered in the sectoral basis and the importance of the competitive advantage of change management can be supported by empirical studies. In addition, leadership in change management is important. Future studies should focus on leadership that is important for change; and taking into consideration the cultural structure, it can be examined which leadership style will reduce the resistance and facilitate the change activity.

KEY TERMS AND DEFINITIONS

Action Research: The action research is to collect data related to a problem existing in the organization or a possible problem to occur, to analyze the data and to carry out the change activity according to the analysis results.

Change: It means that something is transformed into something else in a planned or unplanned way in time.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Change Agent: It is the individual who undertakes the task of carrying out change activities within the organization.

Change Management: It is to harmonize the organization and organizational structure with changing environmental conditions.

Change Process: The change activity generally occurs as a result of unfreezing, moving, refreezing stages.

Organizational Change: It refers to a different situation from an existing situation in the organization's activities, strategy, structure, and culture.

Planned Change: It is the conscious act of change activity; that is, each step is planned and implemented in advance.

Resistance to Change: The change that is desired to be realized is reluctance and conscious change prevention activity.

Chapter 2
From Doing Digital to Being Digital:
Exploring Workplace Adoption of Technology in the Age of Digital Disruption

Donna Murdoch
Teachers College, Columbia University, New York City, NY, USA

Rachel Fichter
Teachers College, Columbia University, New York City, NY, USA

ABSTRACT

In this article, it is explored how digital transformation is reshaping existing conceptions of technology adoption in the workplace and, as part of this, why the adoption of enterprise technology often lags behind consumer technology. The effect of business intractability towards technological advancement is examined. Also, the inability to quickly disseminate new information about technological changes puts additional stress on adoption by employees. This article then continues into suggestions to improve adoption of technology based on changes in the workplace in attitude and culture, promoting digital literacy and the establishment of new programs to facilitate them.

INTRODUCTION

At the heart of much recent dialogue about digital transformation in the workplace is the assumption that inconsistencies in technology adoption across organizations can be attributed to asymmetries in the technical knowledge of employees (Corbett, 2007). These asymmetries are often attributed to differences in the generations and manifestations of their immersion in digital culture. While we do not disagree with this proposition, we argue that digital transformation in organizations is change for everyone, regardless of technical prowess. Learning how to use workplace technology in the age of digital transformation is

less about the development of the knowledge and skills required to perform specific technology-enabled tasks and increasingly more about reshaping the learner's mindset to navigate the uncharted waters of technological and digital culture successfully. Indeed, it is our perspective that individuals with a continuous learning mindset are proactively able to identify and utilize relevant learning to adapt to and grow or evolve with their work. This view is in line with Friedman (2017), who commented that "when the pace of change gets this fast, the only way to retain a lifelong working capacity is to engage in lifelong learning" (Loc. 506). To do this, learning and work must also be fully integrated so that individual employees can readily locate necessary knowledge and gain requisite skills to achieve performance goals.

Several factors are involved in developing a digital mindset. On an instrumental level (e.g., Mezirow, 1975), to facilitate the adoption of new technologies, organizations should be mindful of the current state of consumer technology and be prepared to emulate its design, interface, and seamless interactions. Because digital natives (i.e., those who grew up in the digital world) and digital immigrants (i.e., those who learned to use digital tools at some point during their adult lives) have, to a large degree, embraced consumer technology, it will be easier for them to adopt workplace technology if it is similar to what they use in their personal lives. But that is not enough. Organizations must also identify and address cultural barriers to digital transformation. Leaders should ask themselves and other organizational members what is inhibiting learning and adoption. In our experience, this is often due to insecurity around the broader change at hand, which results in actions that, while well-intentioned, actually hinder the desired outcomes.

As scholars and practitioners of adult learning and leadership in the corporate world, our goal is to invigorate a broader discussion about the impact of technological and digital transformation on resistance to and engagement in workplace learning. To accomplish this, we question the relevance of current—and what we consider to be instrumental—models of technology adoption in this age of continuous transformation. Broader theories that promote communicative learning are preferable, such as Argyris and Schön's (1974) theory of action and Pietersen's (2002, 2004) model of strategic learning.

We begin with an overview of the current business environment, which is being dramatically transformed by technological advancements. We discuss impediments to learning in the digital workplace, noting how discrepancies between consumer and enterprise technology contribute to learning resistance. Next, we review models of technology adoption and outline their limitations with respect to technological and digital transformation. For the purposes of this paper, we define digital transformation as "the use of technology to radically improve performance or reach of enterprises" (Westerman, Bonnet, & McAfee, 2014, p. 153). We argue that existing approaches reinforce an artificial separation between the organization and the individual, which can lead to frustration and resistance. We then move to a discussion of the theory of action (Argyris & Schön, 1974), a social constructivist view of how individuals interact on an ongoing basis to shape and evolve individual and organizational knowledge. Unlike models of technology adoption, we posit that Argyris's theory-in-use model offers a robust framework for understanding resistance to and engagement in the adoption of a digital mindset (what we refer to as being digital). We also look to Pietersen's (2002, 2004) model of strategic learning for additional insights into the challenges of learning and change, which have historically often been (mis)treated as one-time events that simply get "you stuck in a new place" (p. 2).

Next, using our practitioner lens, we apply our understanding of these theories to a hypothetical case of technology change. It is here that we see the emergence of a paradox of learning to be digital: As technological change becomes increasingly pervasive in the workplace, the adoption of a digital mindset is more critical than ever. However, anxiety around technology translates into individual and organizational defensive routines that contribute to learning resistance and prevent the being digital mindset from taking

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

hold. Clearly, we are only scratching at the surface of a very important topic that is evolving almost as quickly as the technologies that are forcing the conversation in the first place.

DIGITAL TRANSFORMATION IN CONTEXT

A few years ago, the term digital disruption was virtually nonexistent; in today's workplace, it is practically ubiquitous. Moreover, according to the strategy consulting firm McKinsey, when it comes to digitization, "You ain't seen nothing yet" (Bughin, 2017). Although the long-term impact of technological disruption on whole industries remains unclear, what we do know is that many industry incumbents are increasingly being attacked—successfully so—by so-called "digital entrants" (e.g., Bughin, 2017). Examples of technological disruption abound: Self-driving cars and trucks are transforming the transportation industry, artificial intelligence is upending manufacturing, and blockchain technology is revolutionizing the world of finance, to name just a few. Of course, disruption is not always digital, but digital technologies are—with increasing frequency—driving industry disruption. Take, for example, business model innovation. In a 2014 *Harvard Business Review* article (Christensen & Van Bever, 2014), innovation expert Clayton Christensen wrote about how digital platforms were disrupting the consulting and law industries to match freelance consultants with clients or identify potential customers. Without a digital infrastructure, an organization will undoubtedly be at a significant disadvantage when competing with new entrants whose businesses are premised on a digital foundation.

Digitization is the manifestation of a fundamental transformation of society known as the fourth industrial revolution (Bloem, Van Doorn, Duivestein, Excoffier, Maas, & Van Ommeren, 2014). It is fueled by generations sometimes called "digital natives" (including Generation Y, born between 1982 and 2000, and Generation Z, born starting in 2000), for which digital technologies are embedded in their daily practice (e.g., Persican, 2013) and deeply engrained in their culture. As great consumers of technology, these generations are essentially forcing companies to change their business models radically or develop completely new ones (Berman & Bell, 2016). Nowadays, consumer technology is generally far more sophisticated and user-friendly (i.e., using principles of "design thinking" [Kelly & Amburgey, 1991]) than enterprise technology, which is often a patchwork of legacy systems built over decades. Developed to serve the enterprise and not the individual employee, adoption of new technologies at work is often much less appealing. There is a significant gap between how a person interacts with technology in her personal life—for example, by tapping on an online banking app or quickly looking up the weather—and how she interacts with a mix of new and outdated technologies in the office.

Lured to the technology by its sleek design and user-focused experience, individuals from all generations are increasingly participating in all aspects of digital culture. Regardless of generation, people post photos of their children on social media sites and communicate via instant messaging. In fact, 67% of senior adults use the Internet and Smartphones daily (Anderson & Perrin, 2017). While virtually all individuals may use sophisticated social media platforms and interact with seamless digital technologies at home, adoption is likely to be more elusive when technology is not as ubiquitous and transparent, such as in the workplace (Westerman, Calméjane, Bonnet, Ferraris, & McAfee, 2011).

This transformation, led by technology innovators, is of crucial strategic importance to traditional companies because it forces them to scan the industry constantly for potential market disruption and learn to adapt in a fast and personalized way. As they race to develop digital strategies to maintain an industry position, company leaders appear to neglect what we argue is the single-most important limiting

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

or enabling factor—the individual employee. As Friedman (2017) noted, accelerations in technology "are causing an increase in the pace of change that is challenging the ability of human beings to adapt" (Loc. 426). Well-established change management models (often used by industry incumbents to drive major change) are no longer sufficient in a world where change is a never-ending phenomenon. In their most recent book, William Bridges and Susan Bridges (2017) acknowledged the limitations of their widely-acclaimed transition model in an era of "simultaneous changes" (Loc. 2137). Also gone are the days of John Kotter's (1996) eight-step process for driving successful change—because there is no longer an end game. Pietersen (2004) commented on the limitations of this approach well over a decade ago, writing that instead of focusing on one-time change, organizations must develop a "built-in ability to sense and rapidly adapt to changes in the environment…on a continuous basis" (p. 2).

In terms of digital disruption, change is not simply about getting hundreds or thousands of employees on board to execute a digital strategy (i.e., as a discrete event or project); rather, it is about nurturing the growth of a digital mindset in each and every employee and weaving it into the fabric of the organization. According to Friedman (2017), "the only way to release us from the society-wide anxiety around tech" (Loc. 506) is by focusing on the ability of our society to adapt. In other words, digital transformation is not about doing digital but about being digital. The implications of digital transformation in terms of learning—both at the individual and organizational levels—are nothing less than profound.

IMPEDIMENTS TO LEARNING IN THE DIGITAL WORKPLACE

Digital transformation is not easy; impediments abound. Many large organizations block access to digital media (Vodanovich, Sundarum, & Myers, 2010) such as Facebook, Reddit, and YouTube. Although these decisions appear to address legitimate security concerns, they are also often motivated by deeply embedded cultural norms (Vodanovich, et al., 2010) and perpetuated by a leadership team comprised of digital immigrants who are skeptical of the value that these tools bring. Consider the case of a company's rollout of a state-of-the-art enterprise platform that integrates traditional workplace applications such as email and file storage with newer team collaboration, social media, and organizational network analysis tools. That company's IT department blocked access to the less familiar applications, citing compliance and other security risks. Restricting digital media is likely to be ineffective and counterproductive in the longer term as it removes an important opportunity to innovate, collaborate, and learn (Vodanovich et al., 2010)—all of which are key to successful digital transformation. In other words, organizational leaders are restricting the very tools that are so needed to evolve a being digital mindset.

This defensive organizational pattern is challenging for digital natives and digital immigrants alike, albeit for different reasons. Digital natives struggle with this kind of dis-integration because being connected is not merely part of their daily lives; rather, they are hardwired for it. At home, millennials get information they need or solve problems by watching YouTube videos, searching the Internet or interacting with others on social media. Most are familiar with at least one coding language and many contribute to "open source" software development projects on the Internet. They engage collaboratively with their peers in interactive environments and consider the digital world to be "part of their personalities" (Vodanovich et al., 2010, p. 720). When the use of collaboration platforms is prohibited and personal learning tools are not available, the adoption of enterprise systems becomes difficult—even among the most tech-savvy employees.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

While digital immigrants also engage with social media at home, they often use it in a disjointed way, targeting applications for specific purposes (e.g., using LinkedIn for professional networking). Since they are generally less digitally literate than their millennial counterparts, they need to be brought along in a supportive and compassionate way. Organizational leaders must demonstrate how the new technology is going to improve an individual worker's life and answer the "why bother" question. Even more importantly, leadership must be willing to listen to and address the concerns of the digital immigrant population, as a way of establishing an empathic connection that will support trust building and pave the way for a mindset shift. However, leaders (many of whom are digital immigrants themselves) are also often overwhelmed by the changes and are therefore unable to provide the necessary support to their followers.

Another impediment to digital transformation in the workplace is the focus on how the new technology supports the execution of specific work tasks within the context of larger technology transformation projects and voluntary adoption by the individual employee. According to *MIT Sloan Business Review* (Kane, Palmer, Phillips, & Kiron, 2015):

Less digitally mature organizations tend to focus on individual technologies and have strategies that are decidedly operational in focus. Digital strategies in the most mature organizations are developed with an eye on transforming the business. (p. 38)

Since businesses organize their activities primarily on a project basis (e.g., Sydow, Lindkvist, & DeFillippi, 2004), technology initiatives are often designed as strategic change projects aligned with existing core business functions and focusing on operational improvement. This "business-centered" design approach reinforces an artificial separation between the technology and its user, and is likely to result in a missed opportunity for meaningful learning. It is also counterintuitive for employees who are accustomed to "human-centered" principles adhered to by the designers of consumer technology, and thus can lead to frustration and resistance.

Absorbing complex, transformative technology in the workplace requires much more than adoption and mastery of functional tasks; it often means a complete reengineering of organizational practices and procedures (e.g., Johnson & Rice, 1987). This advice—already 30 years old—remains elusive to this day. As Friedman (2017) said:

There is a mismatch between the change in the pace of change and our ability to develop the learning systems, training systems, management systems, social safety nets, and government regulations that would enable citizens to get the most out of these accelerations and cushion their worst impacts. (Loc. 416)

Once again, we are faced with the more fundamental question of what is preventing organizations from aligning their actions to match the desired outcomes.

TECHNOLOGY ADOPTION THEORY

To understand why traditional theories of technology adoption are of limited practical value in this new technological era, it is useful to review existing research. Well-known models, such as Rogers's (2003) "innovation decision process" (p. 41) and Davis's (1985) "technology adoption model," were developed

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to illustrate the technology adoption process and behaviors. Rogers (2003) proposed a five-stage "innovation decision process" in which individuals (a) collect necessary information about the innovation, (b) form a judgment of its value, (c) decide to accept or reject the innovation, (d) take first steps toward implementation, and (e) validate their initial views of the innovation. Rogers noted that an individual may reverse an earlier decision "if exposed to conflicting messages about it" (p. 41).

Several limitations are evident in Rogers's process when applied in the current environment. One is its linear approach to decision making, which implies that technology adoption is a relatively clean and universal (i.e., context-free) process (albeit with a feedback loop between phases three and five). While that might have worked 15 years ago, at the current pace of innovation, employees might experience multiple innovation decision processes at once. From there, one can postulate that an individual, feeling anxious and overwhelmed, would be generally more inclined to resist the adoption of new technologies (i.e., stop at Rogers's third phase), preferring to maintain the status quo. Another limitation of Rogers's theory is that it does not consider the vast discrepancy that has emerged between how people use technology at home and how they use it at work. Individuals often hold preconceived—but varying—notions of how technology should work for them and what connotes ease of use. Even those (e.g., digital natives) who embrace the use of technology at the early end of Rogers's curve may find workplace technology to be entirely different and therefore insufficient (Persico & Pozzi, 2014). This might cause them to stop adoption as early as Rogers's second stage, since they have already decided that their personal technology—with its seamless interfaces—works best. Put another way, task-based enterprise systems are complicated and often emphasize functionality over user interface (UI) or user experience (UX). Moreover, companies and their IT departments rarely take into consideration the digital habits of individual organizational members. Developing enterprise technology without considering the current state of consumer technology can cause even the most tech-savvy users to resist adoption. If the organization does not have a sound technology eco-system and a being digital mindset, proprietary systems will undoubtedly face resistance.

As an adaptation of Fishbein and Ajzen's theory of reasoned action, Davis's (1985) technology adoption model (TAM) was designed to assess and predict user acceptance of technology. Starting with external variables such as system design and training, the TAM proposed that an individual's adoption was the result of behavioral intention. This was, in turn, determined by two perceptions: (a) usefulness, or the extent to which an individual believes that using the system will improve his or her job performance; and (b) ease of use, or the extent to which an individual believes that using the system will be free of effort. While these perceptions provide meaningful insight into adoption, they only explain part of the story as it relates to digital transformation. The TAM, which was developed long before the age of digital disruption, neglects to consider the impact of seamless consumer-oriented technology on usefulness and ease-of-use perceptions. Consumer technology has shifted baseline assumptions and raised expectations far beyond the tools and technologies that most companies are offering their employees. More fundamentally, the TAM does not sufficiently consider the organizational assumptions—sometimes reinforced over many years—that underlie decisions regarding external variables and might enable or prevent usage.

ALTERNATIVE APPROACHES TO TECHNOLOGY ADOPTION

Theory of Action

Argyris and Schön's (1974) theory of action offers an alternative way of understanding resistance to learning in the digital workplace. It might come as a surprise that a theory, developed almost a half a century before the age of digital disruption, could be so relevant. The applicability is not around the adoption of a technology; rather, it is centered on the organizational defensive routines that prevent individuals and entire organizations from continuous learning, a key driver of being digital. Argyris and Schön (1974) identified espoused theories and theories-in-use as the two main components of their theory of action, a social constructivist view of how individuals interact on an ongoing basis to shape and evolve individual and organizational knowledge. At the individual level, espoused theories consist of explanations or justifications for a person's actions or patterns of activity, while theories-in-use are inferred from observed actions, which reflect their values, action strategies, and assumptions, and may or may not be in alignment with espoused theories. At the organizational level, members acting as agents of an entity interact with each other to negotiate new knowledge, which becomes part of the fabric of the organization. Here, espoused theories are concerned with strategies and other artifacts often created by organizational leaders and members, whereas theories-in-use are derived from the observed actions undertaken by individuals representing the organization.

Argyris and Schön (1996) created the theory-in-use model as a process that begins with a set of "governing variables" (Argyris, Putnam, & Smith, 1987, p. 84) or goals related to a problem to be solved (problem solving in this context is synonymous with learning). In this case problem definition is interactive because it affects both action and re-action (hyphenated to emphasize the interactivity). In other words, reflexivity impacts learning at the individual and organizational levels in both positive and negative ways. Individuals then consider a range of action strategies to produce consequences they believe will match their intentions. When the selected action produces a mismatch, the individual might test alternative strategies or question the governing variables. Single-loop learning occurs when an individual responds to a mismatch by trying out alternative action strategies until finding one that leads to a match. Individuals who question the underlying premise of the action (i.e., the governing variables) engage in double-loop learning, with new knowledge forming as the result of the mismatch (thus doubling the learning loop). Single- and double-loop learning are often nested; therefore, what is perceived as double-loop learning in one situation might be considered single-loop learning in another.

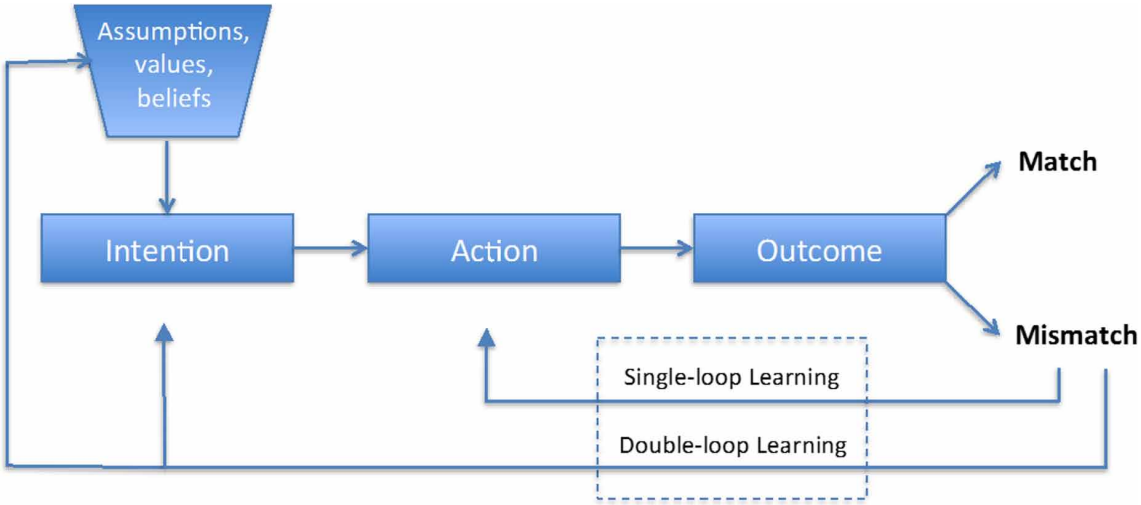

Figure 1. Argyris and Schön's theory-in-use model

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Marsick (unpublished) adapted Argyris and Schön's theory-in-use model as a process that begins with an individual's assumptions, values, and beliefs, which are the result of knowledge that has mainly been acquired unconsciously over many years (e.g., Mezirow, 1994). This tacit knowledge feeds into the governing variables, described by Marsick as intentions or goals related to a specific problem (in this case, the adoption of technology). Individuals then consider a range of action strategies to produce an outcome they believe will match their intentions. When the chosen action does not produce a match, the individual might test alternative strategies (i.e., engage in single-loop learning) or question the intention or the underlying assumptions, values, and beliefs (i.e., engage in double-loop learning).

Figure 2. Marsick's (unpublished) adaptation of the theory-in-use model (reprinted with permission by Victoria Marsick)

Marsick's adaptation of the theory-in-use model is particularly relevant to the discussion of technology adoption because of the distinction it makes between underlying assumptions and intentions. This approach, grounded in transformative learning theory (e.g., Mezirow, 1994), adds depth to the discussion. As will be highlighted in the case example later on, the creation of a being digital mindset is dependent on a double-loop learning approach in which intentions and assumptions, values, and beliefs are under constant scrutiny. These are necessarily different from the more superficial intentions or goals that one might have. The ensuing dialogue can help to surface organizational defensive routines that prevent adoption and mindset change.

Strategic Learning

A second alternative to traditional models of technology adoption that can help to explain the process of moving from doing digital to being digital was developed by Willie Pietersen, former CEO and professor of practice of management at Columbia Business School. Under the banner of "strategic learning," Pietersen (2004) laid out the case for a continuous learning approach that can help organizations to enjoy sustained success in a "world of unpredictable change" (p. 2). Strategic learning is grounded in

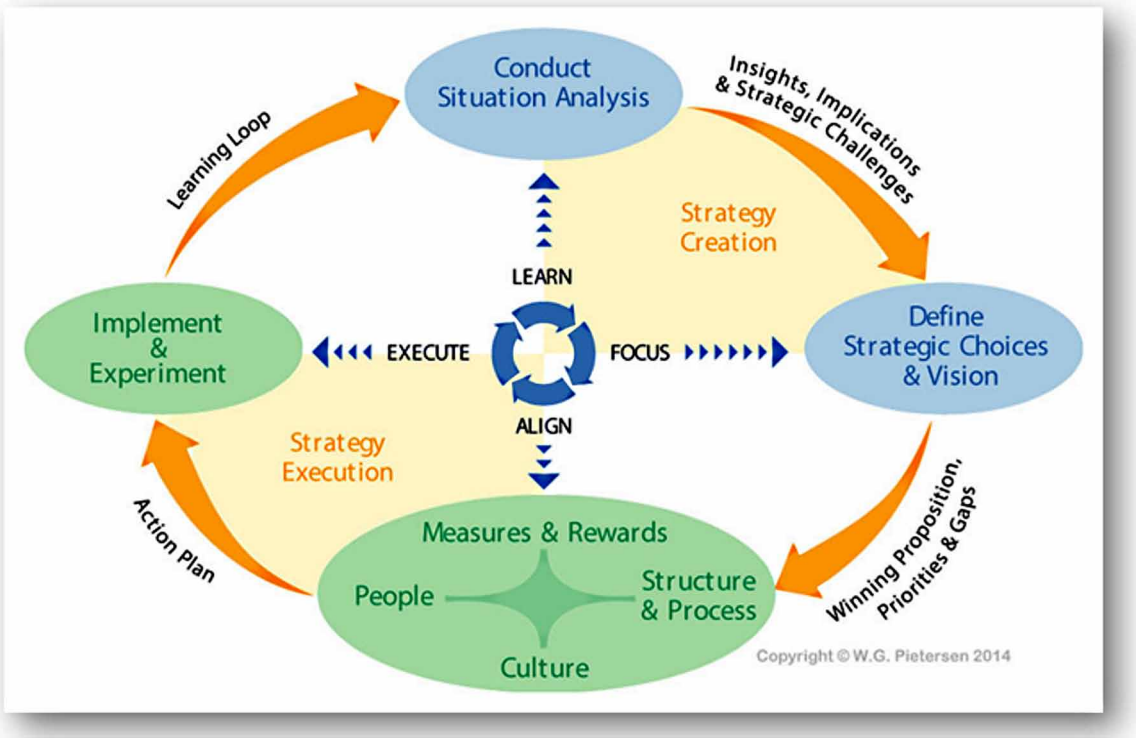
EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

experiential learning, an adult learning theory that emphasizes the role of experience in the construction of new knowledge and integrates "experience, perception, cognition and behavior" (Kolb, 1984, p. 21).

Pietersen defined strategic learning as "a practical leadership process for creating an adaptive enterprise by mobilizing a dynamic cycle of four steps: learn, focus, align, and execute" (p. 2). First, an outside-in situation analysis allows leaders to gain deep insights (i.e., to learn) about the business environment as the basis for making strategic choices. The second step is about strategic focus—creating a vision and making strategic choices based on the situation analysis. The next step is preparing for implementation. This is done through the alignment of all aspects of the organization's ecosystem—including measures and rewards, structure and process, people, and culture—with the strategy. The fourth step is executing through continuous experimentation and learning. Key is that those experiments fuel deeper insights, which then serve to update the situation analysis and adjust the strategic focus. In other words, the four-step cycle is dynamic and constantly evolving as learning happens.

Pietersen looked to nature and its "massive and ceaseless set of experiments" (p. 3) to develop his model, comparing the survival strategies of individual organisms to the business world: "As in nature, the rules of survival in the marketplace are essentially Darwinian. Never sit still. Continuously generate favorable variations—those that create competitive advantage—or run the risk of extinction" (p. 3). Unlike nature, however, he argued that people can think and learn, which allows them to adapt more effectively.

In addition to the four steps in the leadership process, Pietersen identified five "killer competencies" (p. 7) that individual leaders must purposefully develop in order to adapt: insight (the ability to interpret important signals in the environment), focus (prioritization on the right activities), alignment (the ability of the organization to rally around the priorities), execution (the ability to get things done quickly), and renewal (the ability to repeat the first four competencies on a continuous basis). While the first four competencies are output-oriented (i.e., designed to produce and implement business strategy), renewal is the "ultimate competency" (p. 8). Here, organizations live or die. As they go through cycles of action and reflection to develop and execute business strategy, organizational leaders must consciously integrate renewal in a deliberate and systematic way.



Strategic learning helps to elucidate the concept of being digital in several ways. Unlike the technology adoption frameworks described above, its holistic approach emphasizes the importance of learning as an integral part of organizational life, not as something one does when management orders a change. For instance, if an "outside-in" situation analysis leads to an understanding of digital disruption on the horizon and a strategic choice to transform the organization, the alignment of internal processes (e.g., measures, rewards, structure, people, culture, etc.) will enable the development of a digital mindset and make the adoption of new technology more palatable. In conjunction with Pietersen's killer competencies, leaders can use the strategic learning process to foster an environment of safety, which counteracts the insecurity and fear that prevent people from challenging their assumptions and intentions.

CASE STUDY

Companies fail to achieve digital transformation goals because they are unable to develop the capabilities that allow them to think and work differently (e.g., Chesterman, Castelle, & Shauger, 2016). As organizational leaders continue to develop technology to make process improvements and drive efficiency, they often neglect to foster the digital capabilities that employees need to reimagine the underlying processes completely. In other words, these companies inhibit their people (consciously or not) from challenging

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Pietersen's (2004) strategic learning model

existing assumptions, values, and beliefs around the value of technology. This, in turn, prevents them from learning how to drive real transformation. In the quest to remain relevant and competitive, leadership may make large investments in proprietary technology projects that perpetuate the status quo even as they genuinely try to find ways to innovate. Even organizations that were once widely acknowledged as innovative and disruptive can lose their competitive edge—and market share—if they do not promote learning as part of daily work and nurture a continuous mindset throughout the organization.

This is the case with Fulcrum University, a fictitious organization loosely based on the experience of one of the world's largest online universities. Widely acknowledged for being innovative and brimming with creative energy, Fulcrum was one of the first academic institutions to offer online degrees for working adults. A disruptor in its time, Fulcrum grew rapidly and thrived for over 30 years. However, in the early 2000s, several traditional universities began to challenge Fulcrum's supremacy by offering online degrees with slicker user interfaces, better learning design, and lower prices. By 2009, facing significant enrollment declines, Mark, the CEO of Fulcrum's parent company, presented a proposal to his board of directors to develop a state-of-the-art online learning management system (LMS), which he believed would help Fulcrum win back its market share and reaffirm its leadership position. Mark left the board meeting with a mandate to disrupt the market and develop "the best LMS ever." The goals were twofold: (a) create a high-quality, personalized learning experience for its several hundred thousand students based on the concepts of mass customization and adaptive learning, and (b) improve the institution's operational efficiency by streamlining faculty interaction with students, thus increasing retention. Mark also received approval to establish an educational consulting services division that would sell the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

new LMS to market entrants to generate additional revenues. With Fulcrum's reputation as the leading innovator in online adult learning, this strategic initiative would surely reinforce its leadership position and meet increasingly demanding market expectations.

In making his decision to move forward with the new LMS, Mark relied heavily on research sponsored by Joe, Fulcrum's President, to understand the challenges and opportunities in the industry. The results, which spanned more than two decades, showed how disorienting online learning was for many adults and stressed the need for a more intuitive learner support system. Over years, Fulcrum had developed a systematic and rigorous approach to providing student support through hands-on engagement with administration and faculty. But that came with a hefty price tag, and stakeholders were complaining about the lack of efficiency. The idea behind the new platform was to integrate student support into the learning experience and personalize it through the use of artificial intelligence (AI). This would improve learner engagement and reduce the need for live teacher-student interaction. Moreover, with so many new AI tools available in the marketplace, Fulcrum was extremely well positioned to link them to a new LMS and leapfrog the competition.

With responsibility for the design of the new platform, Dave, Fulcrum's CIO, hired designers from Disney and Google—technologists who he believed would know what "best ever" meant in terms of functionality and user interface. Dave came from a traditional IT background and had been with Fulcrum almost from the beginning. His long-term success was based primarily on his deep knowledge of the institution's internally developed legacy systems and his rock-solid relationship with Joe, his boss. The new LMS was not Dave's idea, but it was not his job to strategize. He was supposed to make it happen, although he was privately concerned about how his team members would manage such an ambitious project because they were all what Dave considered to be "old school" IT developers. That was why he had decided to bring in the very best designers from the outside. However, Dave made it clear to the designers from the beginning that, unlike high-tech companies, academic institutions needed customizable systems to meet unique faculty and course design requirements. After all, his clients were the teachers, not the students. He therefore strongly opposed the use of a "one size fits all" consumer-oriented cloud-based system, preferring an on-premise solution that would meet the needs of the university's faculty and administration.

As the development of the new platform progressed, Mark hired an entire marketing team from a technology company that had recently been sold. The idea was to begin socializing the capabilities of the new LMS with educational institutions that were expanding their online learning presence. Work on the new platform was slow, so the marketing team used screenshots and demos to generate interest in a product that they described as "coming soon." The team came back with positive feedback from the market, but sat idle for over a year waiting for the new LMS to be finished.

Diane, the Head of Marketing, wondered why the development process was so secretive. She had tried to get involved when she first arrived, but there was a lack of dialogue between the marketing and IT departments. That was not how digital companies worked—they were generally much more collaborative and cross-functionally oriented. As a new hire, Diane also noticed a discrepancy between the way the market perceived Fulcrum as "bleeding edge" (this is why she had been excited to join the company) and her own evolving view, which was that innovation at Fulcrum was more a myth than a reality. Perhaps it had been innovative at some point in the past. Diane's perception was validated when she finally got access to the actual platform. Despite its adaptive learning bells and whistles, one could hardly call it state-of-the-art because it was not cloud-based. Her experience told her that it would be extremely chal-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

lenging to sell an on-premise platform, no matter how good the system was. Indeed, it would be out of date by the time it was implemented! She wished that someone had asked for her opinion.

Over the next few years, Mark attempted to manage stakeholder expectations by generating excitement for the LMS and other innovative initiatives. Although the LMS was up and running, it was extremely complex and few institutions were willing to invest in an internally hosted platform, despite its sophistication. By 2015, it was clear that the new LMS had not met the market's expectations, and Fulcrum's one-billion-dollar investment in digital disruption had soured. Student enrollment at Fulcrum is currently a fraction of what it was when the project launched.

ANALYSIS OF FULCRUM

What follows is an analysis of Fulcrum's key decision makers using Marsick's adaptation of Argyris and Schön's theory of action and Pietersen's model of strategic learning (see Table 1 for a summary). In combination, these two theoretical perspectives offer valuable insights into cultural barriers to digital transformation, which can inhibit learning and adoption of new technology.

Assumptions, Values, and Beliefs

Marsick's adaptation of the theory-in-use model begins with the assumptions, values, and beliefs that underpin a course of action. While these assumptions drive individual decision making, they are often held by many individuals in an organization and, over time, become embedded as organizational knowledge. In the case of Fulcrum, assumptions around innovation, industry leadership, and technology contributed to organizational defensive routines that prevented any of the individuals from challenging them.

Mark, the CEO of Fulcrum's parent company, firmly believed that Fulcrum was the leading innovator in the online education industry. This view was not only perpetuated by individuals within the organization, but also by the external marketplace and even other universities. Similarly, Joe's assumptions were rooted in his unwavering belief that Fulcrum, with its decades of experience and success, was unique in its ability to understand the online education industry. He was certain that Fulcrum's research on adult online learning would provide accurate insights into future needs of the industry. The data—collected over several decades—convinced Joe that the new LMS, with its adaptive learning capability, could help any educational institution overcome obstacles to course completion. He also assumed that other universities with less experience would automatically look to Fulcrum, as the market leader, for expertise and would jump at the chance to use the new LMS.

Dave, the CIO, was not certain that the LMS was the right strategy, but trusted that Joe, Mark, and the Board knew what was best for the company. Since he did not believe he had the right in-house talent to execute, he hired designers and developers from well-known high-tech companies who he assumed would have the capabilities needed to design the "best LMS ever." However, Dave was constrained by his own experience in IT and mistakenly advised the team to develop an on-premise product—as had always been done at Fulcrum. He also believed that the primary function of IT in an academic institution was to provide on-site customer service for a full range of proprietary systems. In his opinion, technology should always be subservient to course design and did not need to be oriented toward the student.

Diane, the Head of Marketing, joined Fulcrum based on its history of innovation and overall leadership position in the industry. She was certain it would have a blockbuster product, and looked forward

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to be the first to market it to the university community. She brought in former colleagues based on the assumption that the software would be state-of-the-art, and that Fulcrum had done ample research to determine that the need for such a product existed beyond their own organization.

Intentions

The second step in Marsick's model suggests that individual intentions are manifestations of assumptions, and that intentions, or goals, are precursors to action which, in turn, lead to outcomes. Therefore, there is a strong relationship between intention and outcome. Mark's goals were to maintain the confidence of the board of directors, community, employees, and other key stakeholders. His responsibility was to convince them that despite declining enrollments, the LMS strategy, which was rooted in hard research, would reinforce their supremacy in the marketplace. Joe's short-term intentions were to stop the enrollment decline and maintain operations. In the long term, his goal was to build out an infrastructure that would increase the number of students who graduated and expand the overall student population.

Dave planned to lead the development of the "best LMS ever" with a world-class team of designers and developers. As Head of Marketing, Diane intended to enter the nascent LMS market with a new product that would be remarkably more advanced than the three major incumbents. She put together a rock-star marketing team who would be able to put the right product in front of the right people at the perfect time—when demand for online education was increasing and their current platforms were no longer meeting consumer demands. The more she researched other products in the same category, the more she realized that existing systems were designed with administrators in mind. Diane's goal was to put out a learner-centric system that would work intuitively for a less tech-savvy user.

Actions

Most of the actions taken by the leadership were the result of three basic assumptions about the institution: (a) it was truly innovative, (b) it had unique insight into the market through its decades-long research on adult online education, and (c) technology in academic institutions was fundamentally different. These beliefs underpinned the intention to produce an outcome that would disrupt the online education market and strengthen the organization's leadership position. Mark's and Joe's beliefs about innovation and research underpinned their convictions about the LMS and led them to deny that the initiative was struggling until it was too late. Dave's actions were driven by his loyalty to Joe and, although he understood some of the limitations of the IT department which led him to hire outsiders, his assumptions about how IT works in an academic institution created insurmountable constraints for the new designers. Diane's decision to join Fulcrum and bring a team with her was based on the assumption of innovation propagated by the external market, as was her willingness to show an unfinished product.

Outcomes

It should come as no surprise that the outcomes were overwhelmingly negative. Enrollments continued to decline, the development of the LMS became a serious financial drain on the organization, layoffs became necessary, and key stakeholders were very unhappy. In fact, the outcome was exactly the opposite of what was intended. While Dave was satisified with the look and feel of the new LMS, he was in denial about the commercial viability of an in-house system in the era of cloud-based computing. They

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

had built a beautiful LMS that nobody wanted to buy. Dave had to lay off his design and development team, and Diane, who was unable to sell the LMS, disbanded her team and left Fulcrum.

Single- and Double-Loop Learning

Mark, Joe, and Dave demonstrated single-loop learning. Their actions led to the very outcomes they were trying to avoid, but they never questioned the assumptions or intentions that underpinned them. While Diane did challenge her initial assumption of innovation, she did not alter her intention (to sell an LMS), nor did she surface her concerns. Not only were her actions the result of the organizational defensive routines, but they also served to perpetuate them.

Table 1. Application of theory-in-use model by individual

Actor	Assumptions, Values, Beliefs	Intention	Action	Outcome
CEO (Mark)	Fulcrum as market leader and innovator; accurate and sufficient research	Increase revenues and market share; keep board happy; reassure key stakeholders	Convince board to approve strategy; deflect performance concerns by generating enthusiasm about future	Board approval; high-quality product that does not meet client needs; declining enrollments and revenues; 1 billion-dollar loss
University President (Joe)	Accuracy of Fulcrum's data on student challenges and outcomes; supremacy of institution	Help more students complete degrees and increase enrollment; maintain the university's integrity and reinforce standing as academic institution	Provide research results to Mark; link data to LMS and adaptive learning platform	Unanticipated faculty and administration layoffs with significant impact to local community; declining enrollments
CIO (Dave)	Designers from high-tech companies would develop the best LMS ever; continued relevance of in-house custom systems; technology as support, not driver for innovation	Meet the needs of CEO and President	Hire team of best-in-class designers and developers to produce an LMS that matches Fulcrum's reputation as an innovator	Beautiful LMS but not commercially viable
Marketing Head (Diane)	Reputation in the marketplace was real; Fulcrum would build blockbuster product	To be part of an innovative institution; to sell the new LMS to institutions offering online courses or considering entering the market	Joined the university and brought a team with her; marketed the platform with screenshots and short demos; brought back word of interest in the "coming soon" product	Was unable to get any clients for the LMS

Strategic Learning

Pietersen's strategic learning framework offers additional insights into what went wrong at Fulcrum. According to Pietersen (2002, 2004), the key to embedding strategic learning in an organization successfully is to acknowledge that deep learning is a habit that encourages individuals to become cognizant of their learning through cycles of reflection and action. This did not occur at Fulcrum University. Beginning with a situation analysis that was flawed because of its internal focus, Fulcrum's leaders were blind to

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

what was going on outside the institution. As the result of their assumptions of innovation and industry leadership, they relied solely on their own data (i.e., what they already knew) to make strategic choices and create a vision, neglecting to consider broader trends in higher education and advances in technology. In an example of doing digital (as opposed to being digital), it never occurred to Dave to build a system from the point of view of the end consumer (i.e., the student). His own experience left him unaware of how technology was evolving toward a design thinking approach, and while he was probably using consumer technology in his private life, the connection was not apparent to him. Nor did he invite the new team members to contribute their own experiences and insights, preferring to maintain the status quo and stay within his comfort zone (and what his assumptions told him was right).

Preparation for implementation was limited to the LMS itself, and did not address broader issues of alignment, which served to rally the organization around the strategic choice. In particular, there was a lack of interest in reshaping organizational culture, which resulted in ongoing mismatches between intention and outcome. Moreover, the secretive nature of the initiative led to a lack of experimentation and learning, and the strategic learning cycle was stopped before it could really get started.

Mark and Joe, Fulcrum's leaders, did not demonstrate the "killer competences"—the behaviors necessary to support a being digital mindset. Lacking insight into the broader environment, they chose to focus on the wrong activities. While Mark spent considerable time and energy rallying the university's external stakeholders around the LMS, he and Joe did little to engage their people and did not attempt to integrate the new and existing employees. Execution of the new LMS suffered and renewal was stopped in its tracks.

RECOMMENDATIONS

This article explored the adoption of new technology in the age of digital disruption through the lens of two distinct, yet complementary, adult learning theories. Outlined below are five recommendations grounded in theory and practice that organizational leaders can use as they seek to transform themselves and move from doing digital to being digital:

1. Adopt a holistic view of technology change. Organizational leaders must acknowledge that training on new technologies is not enough to drive adoption. They should start by "looking under the hood" and examining the assumptions that underpin intentions and actions. By challenging their own core beliefs and those of their employees, leaders can begin to articulate what might be preventing adoption and establish a foundation for a being digital culture.
2. Embed a culture of continuous learning. Once leaders have identified the fears and insecurities associated with digital transformation, they should use the process of double loop learning to address them—on an ongoing basis. Leaders should also be relentless about developing their own "killer competencies" to provide a supportive environment in which continuous learning can thrive.
3. Promote digital literacy by launching and sustaining a digital literacies program. Share bite-sized pieces of content with leadership and primary stakeholders each morning. This communication can be sent via email or by using a handheld platform that enables custom sharing of content so they can access this learning anywhere, any time. Video, articles, and other multimedia nuggets can share glimpses of digital culture. Some of the content should be broad-based, others should align with the business itself. For instance, one day a short video talk by a well-known digital thought

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

leader can be shared. The next day, share a screencast with a high-level demonstration of a new digital tool they might use at work.

4. Establish a clear link between consumer and enterprise technologies. Employees must learn how to connect their practices at home and the way they use consumer technology and tools to the way they work. Organizational and individual learning should be encouraged and purposefully enabled by collaborative, familiar practices and knowledge creation systems that promote inquiry, discovery, and exploration to build collective success and workplace potential. Within this empowering context, individuals can work cross-functionally, solve problems collaboratively, and develop initiatives collectively with the shared goal of accelerating the discovery, acquisition, and application of new knowledge.
5. Establish and execute a reverse mentoring program within the organization. Pair "digital natives" who are technology-savvy with established employees to share and assist with contextually appropriate tools. This relationship can be reciprocal—the mentee can learn about established practices, and the younger mentor can reflect on how the practice can be reimagined using newer digital tools and processes. That reflection can be shared, and in this way the tools are relevant to established objectives.

CONCLUSION

Technology is reaching into every corner of the business world. Digital entrants are constantly creating new playing fields and disrupting industry incumbents and forcing increasingly compressed business cycles. Characterized by a continuous learning mindset, being digital is key to an organization's success. Future research should build on what the ideas presented in this article to come up with a more robust definition of the term being digital and to understand more deeply the challenges associated with digital disruption. There is not a single organization in the world today that can afford not to make this topic a priority.

Chapter 3
Everything Must Change Because Nothing Changes:
A History of Organizational Change in the Italian Banking Sector

Filippo Ferrari
Bologna University, Italy

ABSTRACT

This reflective case history describes an intervention conducted by the author within an Italian bank. Involved in an organizational change at the bottom level, the author faced many difficulties both related to organizational dynamics (changes in work organization and in the skills of the operators) and to relational aspects (power dynamics and resistance to change of some employees). This reflective case history describes the followed organizational analysis and evaluation process and the implemented organizational change strategy. Finally, it presents the adopted reflective method of intervention and the obtained results.

INTRODUCTION

Background to the Organization and Change Setting

The Italian banking system has for many years been characterized by mergers, to meet the criteria of solvency and reliability required by European legislation. In Italy, however, many small businesses belonging to the so called 'cooperative credit' system (i.e. originally established by a small group of people on an equalitarian base) have in fact retained their own autonomy, taking root in their territory. For a couple of years, Italian legislation has forced cooperative banks to abandon this model of governance and be listed on a stock exchange (if adequately sized) or, alternatively, to merge.

The level of managerial and strategic skills expressed by these small credit institutions has always been criticized. For instance, the governance has often shown a lack of strategy, following *cronysm* log-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ics in the provision of credit to companies. These logics often generated scandals and financial losses such that the Bank of Italy took over some institutions to the point of involving people who were close to prominent political figures of the Government. However, *cronysm* has also always affected the hiring and staffing process, eventually leading to a widespread skill shortage at the middle and bottom levels of the organization. Hence, in this continuously developing and changing sector, these specific criticisms at the human resources level could potentially lead to obstacles in achieving positive change outcomes. Given this scenario, proper preparation, training, and involvement of the human resource function in organizational change (OC) initiatives becomes a strategic purpose for all involved as the change agents.

The 'XYZ' Bank[1] was founded in 1908 by the initiative of sixty founders who each owned 1489 shares worth 20 *lire* (the Italian currency before the Euro). Just reading the Company Statute leads to a clear understanding of what the intentions were of its first shareholders. Article 2.1 states: "The Company's purpose is the collection of savings and the exercise of credit, both in respect of its Members and non-Members, and is inspired by the principles of mutuality; it also proposes to support and promote the development of all productive activities with particular regard to the smaller ones". For almost eighty years the bank's activities were concentrated in a mountain province of Northern Italy. Then, starting from the early 1990s, the 'XYZ' Bank committed itself to growing beyond its original geographical area: first in Milan and Sicily, then in Marche, and finally in Lazio. In a few years it became one of the leading Italian banking groups, and in 1994 was listed on the stock exchange. In 2016, on the Italian Government's impulse, it became a public company.

The banking group 'XYZ' has since then been made up of 4 different subsidiaries. The human resources division of the group consists of a central HRM service, at the head quarter, and a responsible HRM for each region. Operationally, all four subsidiaries consist of small branches in various parts of the four respective territories, whose human management policies are coordinated at the regional level. Each local branch has a branch manager and some operators. In this intervention, my direct interlocutor was the HRM coordinator for the Emilia-Romagna Region, where my affiliation (the University of Bologna) is based. Operationally, I also interfaced with the board of branch managers, which coordinates operations at the level of a single branch in the territory.

The Triggers and Drivers of the OC Initiative

In that period, 'XYZ' Bank aimed to achieve a new 'customer care model' in which the bank's operators would present a wide-ranging skills portfolio to face and address all customers' needs/demands. This implied there was a need for an extensive re-organization of personal skills, and development of a more flexible and life-long learning-oriented workforce, especially at the bottom levels of the organization. Therefore, creating readiness to change throughout the bank and employee adaptability became strategic issues for the human resource management function.

The Organizational Sponsors (Clients) and Stakeholders

The 'XYZ' Bank had never been involved in scandals. However, I had followed all the events of this bank: the decision to be listed on the stock exchange, the evaluation process by the Bank of Italy, the debate on all the major Italian newspapers. The opportunity for an OC consultancy collaboration with 'XYZ' Bank arose from a discussion of a Master thesis being carried out by a student of mine who was a young employee of the company. My student's manager (who belongs to the local branches coordina-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tors board) had been appointed as Project Manager of a staff development plan aimed at contributing to the change management process taking place. However, this manager from the beginning found some difficulties in involving people (especially middle management) in the project, and these difficulties were undermining the development of my student's thesis. It was an opportunity to make an appointment and meet the Project Manager.

THE ORGANIZATIONAL CHANGE INITIATIVE

My first meeting with the bank therefore takes place informally, during a meeting that had the aim of agreeing on the development of my student's degree thesis. So I did not have any role in the formulation of the change strategy, nor in the choice of the methodologies to be adopted. Soon, however, discussing the difficulties my student was encountering in collecting data, the project manager shares some of his perplexities and difficulties with me, and asks me for a private meeting, without the student. The process of change had already started, the bank's top management had approved the general strategy and funded the project, of which my interlocutor (who was not a top manager, but a local branch coordinator belonging to the regional board of coordinators) was the Project Manager. He had defined in partial autonomy the detailed operational plan that was to implement the strategy, but soon some problems with the local branch managers had arisen. At that point, I asked and got to see what had been done up to that point, trying to understand to what extent the company's strategic objectives were achievable with the planned strategy.

As argued in Chapter 1 of this book and in the author's contributed chapter in Section 2, engaging in 'critically reflective' as well as 'evidence-based' practice should become an essential feature of managing/facilitating OC programs. Senior (2002) suggests that management of an organizational change should be *strategic*, that it ought to be based on the ability to identify the type of change (rate of occurrence: continuous/discontinuous), how it comes about (planned/emergent), and the scale (level of impact: fine-tuning/corporate transformation). In fact, change processes are not all equal, and literature suggests that the type of change resistance depends on the type of change (By, 2005) and OC strategy. Hence, as Hamlin and Russ-Eft argue in Chapter 2 of this book, gaining a better understanding of an organization through sound organizational analysis prior to formulating a change strategy, and then critically evaluating the effectiveness of the change processes and change agency are of crucial importance.

Organizational Analysis and Evaluation

Many organizational change processes fail because the involved people are not adequately prepared for the specific type of change (Bovey & Hede, 2001). Following Senior's (2002) taxonomy, the 'XYZ' Bank case seemed discontinuous, planned, and with a wide impact on the corporate body. Thus, it appeared to me to be a somewhat simple case with favourable characteristics: an official project with a specific budget, well defined desired and formalized outcomes, and clear deadlines. At first glance, everything should have gone smoothly, or so I thought. But I was wrong.

The problem that I immediately identified was not at the level of middle line managers, but those in the HRM Department. To favour change, the HRM staff wanted to provide formal courses based on non-empirically validated methodologies- Neuro-Linguistic-Programming in particular-supposedly to 'convince employees that the change would be useful and effective'. A similar problem emerged during

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

various meetings with other consultants and trainers involved in the project, all of whom were practitioners without any OC related academic background: they too emphasized the usefulness of direct lecturer only methods to facilitate organizational change.

A considerable number of courses were therefore being delivered, but their effectiveness was scarcely being evaluated. This was because the courses had already been established by the HRM staff based on their personal beliefs, and I could not modify them. Despite and as a consequence of the HRM staff beliefs, middle managers considered the courses they attended to be a complete waste of time. This scenario was consistent with what has been available to read in the literature since the seminal study of Rynes et al. (2002) which revealed that research on effective HRM practices has not readily been adopted by HRM practitioners. More recent literature provides evidence of a significant research-practice gap between the beliefs of HRM professionals about human resources management practices, and the empirical evidence provided by the scientific literature (Carless et al, 2009; Sanders, et al 2008; Tenhiala et al., 2016).

In addition to this lack of an evidence-based methodological approach, my evaluation of the 'XYZ' Bank case unfortunately revealed other critical problematic issues, and mainly at the level of the informal relationships between various sections of the workforce.

The bank is organized on a regional basis, with at least one branch in each provincial capital. Each branch has a manager and 4 to 12 operators with different experience, skill levels, and often also with different areas of expertise. My student was working as an operator, thus at a very bottom level, where real relational problems arose. In fact, if on a formal level the objective of the OC initiative was to get the entire organizational bottom-level population to change, it soon became clear to me that a further problem was being generated by the fact that older employees were considered by the younger employees to be less competent, less up-to-date and less flexible in facing the new organizational situation. However, they often had some unique specialist skill and above all, their long tenure ensured them a high status in their branch. My problem was therefore activating and conducting an effective evidence-based OC intervention, but without causing conflict either with the beliefs and convictions of staff within the HRM Department, or by undermining the status of existing interpersonal relationships within the subsidiaries.

The OC Strategy Adopted and Implemented

The bank's management also had another problem due to the previously adopted OC strategy. In addition to investing in training activities to bring about change, and to raise the level of productivity and stimulate individual work motivation in the new business model, top management had begun to implement a performance appraisal system based on the goal setting technique (Locke & Latham, 2000) and on Management by Objectives (MbO) (Drucker, 1954). In doing so, the HRM staff followed the available empirical evidence. In fact, aiming to make the intervention more effective, the managers of local branches of 'XYZ' Bank had been stimulated to construct MbO plans strictly calibrated on the expected results (in terms of their subsidiary's output) and applied to each worker. However, within a few months, productivity had not taken off. Instead the rate of complaints from middle managers of the local branches had risen.

During a meeting with the Regional HR Manager, I was asked to intervene immediately. The HRM Department staff asked me particularly to design a new performance appraisal system urgently that would be better fitted for their desired strategic organizational change. Eventually, I tried a more reflective approach following Schein's *process consultation* view on Organization Development (OD) (Schein 1999). If I had supported my client I would have activated the *patient-doctor pattern*, and this would

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

have offered me immediate benefits. My perception, however, was that the management did not need an evaluation system, or rather that that was not the solution to the real problems that were causing the failures in implementing the OC strategy. Thus, following Schein's approach, I began an *open consultation process* through which I suggested they first take a diagnostic moment to understand better the attitude of the personnel involved in the change in progress.

The first approach was therefore 'traditional': I asked to meet in a confidential way some 'special witnesses'. It was very difficult for me to understand that the main problem in the 'new business model' was not the *elderly workers*, but the lower level of pay and the lower contractual protection of the *younger workers*. In this scenario, the 'new business model' would potentially penalize the younger staff. The 'model' required elderly workers with higher wage levels, more protection contractually and being very expert in specific areas but less prepared in general, to work together with younger staff with skills closer to those required by the 'model', but with lower levels of remuneration and trade union protection. Furthermore, I came to realize that the middle managers' goal was not to accomplish the change, but to *pretend* to accomplish it. In other words, the change project had to formally respect what top management had indicated, but without affecting the habits and skills of the involved people. Before my intervention, the front-office of each local branch was divided into several specific areas/positions in which the employees carried out tasks according with their specific skills. The 'new business model' required all front office employees to become fully-interchangeable. Therefore, the only possible strategy I could suggest was 'a promotion' of the older workers to move them from direct contact with the public/customers, leaving only the youngest (and most eclectic) workers at the front office. Formally, the 'new business model' was fully implemented with each branch re-organized to provide all-round advice to the customer. However, the reality was everything remaining as before: young employees provided the first level of care, and then passed the customer to the oldest colleague in the back office according to their higher level of competence. Of course, I had failed to implement a fully evidence-based intervention. However, I saved the relational system, and in addition I fostered the skills exploitation of the younger employees. It was a makeshift solution, but I avoided the collapse of the relational context. In the end, rather than training for change, it was a matter of moving people. As the ancient Italian saying asserts: 'everything must change, because nothing really changes ...'

Fortunately, there is a happy ending. To stop a succession of acquisitions that since 2010 had led the 'XYZ' Bank to lose € 1.1 billions, and also because in 2015 the stock market had collapsed by 90%, in December 2017 the extraordinary shareholders' meeting approved the robust capital increase of € 700 million, an amount six times higher than the bank's market value. In the first semester of 2017, the bank shares lost 12.78% marking the worst performance of the entire Milan list and closing at € 8.926. Today, 16th of February 2018, the announcement of the conditions of the € 700 million maxi capital increase has boosted the 'XYZ' Bank's share price at Piazza Affari (the Milan Stock Exchange). During the preceding six months, 'XYZ' Bank had renewed the employment contracts to more than four hundred people, especially the younger ones with fixed-term contracts, thus preserving the employment level. The HRM staff said to me that this outcome was considered by some in the bank to be due mainly to the better and growing performance of the youngest employees within the local branches all around Italy…

In a cultural context that is very traditional and relation-based as in Italy, the avoidance of conflict, the fact of considering 'untouchable' certain employees just because of the long time they had served in the company, and/or of their greater seniority perpetuates an organizational cultural model built on belonging rather than on merit.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

I was able to find the organizational mechanisms to lead the senior employees towards taking on a new job/position, but undoubtedly the potential of the branches remained partly unrealized due to the low productivity of the seniors involved. However, in the specific context of 'XYZ' Bank, this compromise was the only goal to be pursued, regardless of the Evidence Based Management that suggests that goal-setting is the most important factor providing the basis for excellent performance. In fact, as Rynes, Brown and Colbert (2002) claim, "this is one of the most robust findings in all of industrial/organizational psychology" (p.152) (see also Locke & Latham, 1990).

CONCLUDING REFLECTIONS

On reflection, maybe it was not correct of me to negatively emphasize so strongly the 'research-beliefs gap' in the field of HRM, as widely reported in the management literature. Regarding this research-beliefs gap, indeed a weakness in current approach to research is to identify evidence-based knowledge with empirical evidence. For instance, an evidence-based approach grounded only on empirical, quantitative literature would have suggested the implementation of a strongly goal-oriented management system applied to front-office operators. But this approach, in this specific context, resulted in negative outcomes. Because of the difficult in relationships between the local branch managers and their respective older operators I turned to boycotting such goal-based performance management systems.

The Italian bank sector is characterized by a shared perception of distributive justice based on an equality criterion rather than on meritocracy. People appraisal procedures that are outcome-based are not widespread at low hierarchical levels. Thus, evidence-based managerial procedures should pay attention to the specific context, considering both formal and 'informal' aspects. For instance, the 'XYZ' Bank case indicates that a more broadly based scientific approach should have been adopted that derived its evidence-based knowledge from other sources of information. This reflective case history indeed suggests that to make the most effective OC decisions, it is necessary to consider at least four different sources of information: empirical evidence derived from good qualitative as well as quantitative research, organizational evidence derived from good internal organizational analysis and evaluation, personal experience-based evidence, and finally stakeholders' experience-based evidence (Barends, Rousseau & Briner, 2014; Pfeffer & Sutton, 2006a; 2006b). Of course, considering these four sources of information at the same time makes the action of the change agent very complex, and above all requires a professional who has at the same time academic training (such as research methodology, literature analysis skills, participation in international networks) and a solid background of field experience as a consultant. However, professionals should be particularly cautious in paying attention to personal experience, especially as a source of evidence. Cognitive sciences warn that experience could become a trap, eliciting fallible shortcuts in decision-making processes. In other words, among these four potential sources of 'best evidence', past experiences could become a trap in change agent action. Thus, a more effective source of experiential information to inform and shape change management processes could be drawn from a change agent's personal characteristics including his or her *attitude of wisdom* (Ferrari, 2014). Wisdom is knowing without excessive certainty and without excessive caution. Understanding the role of wisdom (Bigelow, 1992) as a source of resilience is a Socratic kind of knowledge (the operator knows he doesn't know), a kind of knowledge which is free of presumption on the one hand and of excessive caution on the other. As an attitude, wisdom resides in individuals, and it has been conceptualized in at least two distinct (but not mutually exclusive) domains: a cognitive domain and a constellation of personal

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

attributes. The Max-Planck model (Baltes & Smith, 1990; Dittmann, Kohli & Baltes, 1990; for a review see Kramer, 2000) posits five specific criteria of wisdom: 1) rich factual knowledge about the matters of life; 2) procedural knowledge about ways of dealing with life problems; 3) life-span contextualism and, more relevant to the aims of this case history; 4) uncertainty in problem definition and finally; and 5) relativism regarding problem solving. Using a combination of these sources of 'best evidence' to inform the formulation and implementation of OC initiatives ensures a more appropriate and better context-situated decision-making process (Olivas-Luján, 2008). Perhaps, after all, a reflective change agent is 'simply' a *wise* professional who ensures a good integration between academic skills and field experience. At the end, this is my lesson learned, and the basis for future more reflective evidence-based organizational change projects.

Chapter 4
Capability Demands of Digital Service Innovation

ABSTRACT

This chapter explores the demands that digital service innovation places on those stakeholders who use the digital service through three lenses: workers and workplace, digital literacy, and, finally, digital education. The chapter includes an overview of digital service innovation. The impact of digital services generally is explored from the perspective of the workforce and the future of work developing an argument for the need for ongoing upskilling in the digital space. The skills required in the age of digital disruption are explored, and a definition and general understanding of what digital literacy entails is presented. Finally, the opportunities for education in digital environments are explored through three vignettes which illustrate different opportunities for upskilling and retraining. The chapter highlights adaptations required in socio-political environments, education and training, and curricula to allow digital service innovations to achieve the expected benefits.

INTRODUCTION

Digital service innovation is emerging in diverse sectors in the economy, including, retail, education, tourism, hospitality, social services, and distribution. This chapter synthesises findings from three different research projects to address questions about how digital service innovation is changing work; what

types of change will be socially beneficial; what digital skills will be required by the future workforce; and how education and training can meet these needs. This chapter will explore four questions:

- how is digital service innovation changing work and workplaces?
- what are the potential socio-cultural benefits and pitfalls of digital service innovation?
- what are the implications of these changes for digital literacy? and
- how is education and training being developed to meet various digital literacy needs of the future?

RESEARCH METHODS

The research presented here builds on a recent research project on digital skill acquisition conducted by Coldwell-Neilson (2016) combined with digital discernment research by Cooper (2019) and with Patterson's extensive experience designing, building and teaching in online and MOOC environments. Three vignettes are presented which illustrate contrasting education and training skills that can be used to develop of various digital service skills.

Central to this chapter is the research conducted by the Coldwell-Neilson (2016) on future digital literacy requirements. A twenty-first century perspective of digital literacy was developed through an extensive literature review, which included a scan of existing digital literacy definitions and frameworks, as well as a review of industry expectations of the impact of digital service innovation on skills and capabilities. This was validated through a series of workshops with academics from higher education as well as through conference presentations. This led to an updated understanding of digital literacy as presented in the following sections.

Cooper conducted a research project to integrate digital discernment skills into an undergraduate degree, reported in vignette 3. Barnett and Coate's (2005) curriculum framework with Threshold Concepts (Meyer, Land & Bailie, 2010) was used to develop an initial curriculum for digital discernment for youth work and community work students. An action-learning methodology was used to fine-tune curriculum implementation changes through four iterations, as reported in (Cooper & Scriven, 2017). A cyclical inquiry process of dialogical questioning, planning, observation, information gathering, reflection and re-questioning, learning and re-planning was used as a reflexive research method to document and theorise process, and to improve delivery strategies. Digital discernment problems were identified and strategies to address each of these were developed and trialled.

BACKGROUND

Digital Service Innovation is driven by the need to deliver new solutions rapidly to a wide audience through digital technology. Digital Service Innovation is often assumed to be motivated by the pursuit of economic efficiency and the use of ICT to reduce workforce cost (Green, 2017) producing savings that are passed on to consumers as lower prices, or through increasing profit. Nylén and Holmström (2015) contend that better user experience is at least as important as price competition.

Digital Service Innovation brings about digital disruption. This has both positive and negative outcomes. Digital services, the electronic delivery of information and data over the internet, provides many benefits to employees, employers and consumers if it provides easier access to such services. Digital

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

technology has enabled flexible working, including working from home and, in some industries, flexible work hours so that work can be better balanced with other life commitments or constraints. This flexibility enables some people who were previously excluded from the labour market to participate, such as those with disabilities or people who live in remote locations or where there are few local employment opportunities (Green, 2017). Claims have been made that the automation of more tedious jobs allows workers to have greater autonomy and creativity in their working lives (Vom Brocke et al., 2018). New forms of work, such as 'e-lancing', crowdsourcing and social media influencing, have enabled individuals to directly access their markets digitally (Green, 2017).

Less positively, some digital service innovation has had negative outcomes for some groups in society. For example, digital service innovation has increased automation in clerical, retail and warehousing sectors, resulting in the loss of low skill, full-time, entry level jobs (Green, 2017). Remaining low-skill work has become casualised, and the precariat, the social class characterised by precarious employment, has emerged as a new class of workers (Standing, 2011). Services that are 'digital by default' at first point of contact (Green, 2017) where the user does not interact with another person, have not always delivered the positive user experience that Nylén and Holmström (2015) have suggested is necessary. This is especially problematic where the service is offered by an entity that the customer cannot avoid interactions with, for example, government services such as Centrelink. To avoid inequity, those using digital services need to have access to appropriate technology as well as the skills and capabilities to use them efficiently, effectively and safely (Compaine, 2001).

Technical and human barriers to digital service innovation have been researched by others, (for example, Green, 2017) and the effects of digital services innovation on employee experiences of work have also been explored (for example, Gregg, 2011). However, there is a consensus that more research is required into digital skills in the workplace (Gekara, Snell, Molla, Karanasios & Thomas, 2019). Concern is also widely expressed in the literature about the inadequacy of digital skills education and training (Gekara et al., 2019). Green (2017) contends that rapidly changing digital technologies have placed greater responsibility on individuals to maintain their skills to ensure employability. He contends that the shortening life cycle of digital skills makes this onerous because it necessitates ongoing learning and upskilling. Green found that businesses were not good at articulating the digital skills required and did not put resources into upskilling or training in digital literacy for employees (Green, 2017). This was affirmed by Gekara et al. (2019), who claim that late technology adopters expect employees to have digital skills and resist investing in upskilling their staff. However, they found that early adopters appreciated that continuous upskilling is necessary, and they were more likely to provide training (Gekara et al., 2019).

DIGITAL SERVICE INNOVATION AND THE FUTURE OF WORK

The impact of automation and digital technologies on the future of work is mediated by the socio-political systems in which technologies develop. Futurists and novelists have been making predictions about automation, the future of work, and social change, since the first industrial revolution, with varying degrees of success. Some futurists have assumed that the low-regulation free-market neo-liberal socio-political system that is dominant in many Western liberal democracies will be unchanged by the introduction of technologies. For example, Tyler et al. (2019) assert that space tourism will be a future job, without considering how mass space tourism might be affected by other policy considerations such as the climate crisis and the need to limit carbon emissions. Others have assumed that technological change will

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

have profound social and political impacts that may be dystopian. Science fiction writers (for example, Brunner, 1968) have explored potential social and political consequences of unregulated technology. Other futurists, such as Bill Gates, Elon Musk, and Stephen Hawkins have focused upon what regulation and policies are needed to prevent adverse socio-politico-cultural outcomes of technology and to ensure that technology meets human needs rather than being driven by economic needs. This section addresses digital service innovation and the future of work. The authors begin from the premises argued in the recent ACOLA report (Walsh et al., 2019), that:

- adoption of digital innovations will have social, political and cultural consequences;
- political choice can be made about implementation of technologies that affect the future of work; and
- these choices ought to be informed by social and ethical values rather than economic gain for the few.

If this occurs, regulation will modify how technologies are adopted and also how the socio-economic system operates, at least to some extent. The following example illustrates some important aspects of this position.

In 1930, Keynes, the economist, wrote about the future of work. He was writing just after the 1929 Wall Street stock market crash and at the beginning of the Great Depression. The Great Depression occurred during the second industrial revolution (Coldwell-Neilson & Cooper, 2019) when mass production had increased output and productivity. The economic recession caused mass unemployment in Europe and the USA, and positive feedback loops meant this was ended only by the Second World War. In 1930, Keynes had this to say about work in 2030:

…for the first time since his creation man will be faced with his real, his permanent problem-how to use his freedom from pressing economic cares, how to occupy the leisure, which science and compound interest will have won for him, to live wisely and agreeably and well…Yet there is no country and no people, I think, who can look forward to the age of leisure and of abundance without a dread. For we have been trained too long to strive and not to enjoy …For many ages to come, the old Adam will be so strong in us that everybody will need to do some work if he is to be contented. We shall do more things for ourselves than is usual with the rich to-day, only too glad to have small duties and tasks and routines. But beyond this, we shall endeavour to spread the bread thin on the butter-to make what work there is still to be done to be as widely shared as possible. Three-hour shifts or a fifteen-hour week may put off the problem for a great while. For three hours a day is quite enough to satisfy the old Adam in most of us! (Keynes, 1930).

Keynes contended that people have been encultured to need work, suggesting for the next hundred years from the time he wrote that this would continue to be the situation. By 2030, he predicted that the standards of living for ordinary people would have increased eightfold (this is probably an underestimate based upon Piketty & Goldhammer, 2015). After this time, he predicted an age of leisure, and a change of socio-cultural values away from a focus on making money and towards a focus on how to live well. Meanwhile, he suggested work should be shared to ensure that everyone had access to the sense of purpose that work provided. At the time of writing, eleven years remain before Keynes' 'age of leisure'.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The quotation illustrates that the social impacts of automation and digital technologies in part depend upon socio-politico-cultural decisions. The standard working week has reduced slightly from a 45-hour working week common in 1930s Britain, to 37.5 hours in contemporary Australia, and most other developed economies. A four-day week (30-hour worked but paid the same as 37.5 hours) was recently trialled by Perpetual Guardian in NZ. Against expectations the evaluation found that output did not decline and workers reported less stress and an improved work-life balance. A key to gaining these results was involving the workforce in the job redesign to enable a four-day week (Coulthard Barnes & Perpetual Guardian, 2018). A similar trial was run at Microsoft in Japan. Paul (2019) reported that Microsoft saw a 40% jump in productivity. There have been various trial projects of Universal Basic Income (UBI) schemes that guarantee people a weekly payment irrespective whether or not they work to address wage loss from automation (Piketty, 2015). UBI has been proposed as a policy response to structural unemployment caused by automation and digital technology (Weller, 2017) that would provide income to displaced workers. The preliminary evaluation of such a program implemented in Finland indicates that participants experienced less stress and better health, but their economic participation was no different from the control group (Charlton, 2019). If there is structural unemployment, the lack of improvement in economic participation might be expected. Apart from this, there is little evidence that changes to socio-cultural values needed for an age of leisure have occurred. There is no evidence that political and economic systems have adapted to ensure that those with little or no work have an adequate standard of living. Keynes's account was premised upon the assumption that the benefits of automation would be shared across the population, but in Australia there has been no increase in the real value of the Newstart allowance for 25 years for example (Lewis, 2019), so this has not occurred for those who are unemployed.

More recently, technology entrepreneurs Bill Gates and Elon Musk predicted that ultimately robots will replace humans in all work (as reported in Ghosh, 2018). Gates suggested this could be addressed by taxing robots, with the income generated used to fund more jobs for people working in education and social services, meeting currently unmet social and human needs. Musk supports payment of UBI to workers displaced by robots. They both predict that unless the socio-economic system adapts there will be greater wealth inequalities (Ghosh, 2018). A declining middle class in the USA (and growing inequalities) provides some evidence that this is already occurring (Pew Research Centre, 2016).

According to a recent OECD policy report (OECD, 2018), based only upon existing technologies, one in seven (14% of existing jobs) "are highly automatable and a further 32% could face substantial change" (p. 1). Manufacturing jobs, agricultural jobs and routine jobs with low skills are at most risk. Service sector jobs at risk include jobs in courier and postal services, land transport and food services (Nedelkoska & Quintini, 2018). The OECD report also identified that young workers were more at risk than middle-aged workers who have established careers, because automation will primarily affect entry level positions (OECD, 2018). According to Nedelkoska and Quintini (2018), older workers' jobs were affected, but less so than young workers.

The relationship between automation and age is U-shaped, but the peak in automatability among youth jobs is far more pronounced than the peak among senior workers. (Nedelkoska & Quintini, 2018, p. 8)

They conclude that under-employment is currently most likely to manifest as youth unemployment, and to a lesser extent unemployment of older workers, who effectively move into earlier retirement, albeit on a lower income. It should be noted, however, that recent policy in many OECD countries has

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

progressively raised the retirement age to save the cost of pension payments, so these effects pull in opposing directions. The OECD policy report also concluded that risks to employment from automation varied considerably between countries, depending upon their economic structures.

Many jobs will change rather than disappear. Technology will replace discrete tasks, and humans will augment technology (Business Council of Australia, 2017). Other jobs have changed substantially but use similar core skills. For example, in media and communications, the number of jobs in traditional print media journalism has declined, but social media analyst positions have emerged. Least at risk were professional jobs and social work/social care. However, even in aged care, digital service innovation is using technology to facilitate people to 'age in place' by remaining in their home rather than entering institutional care (Yang, Miao & Shen, 2015; Rantz, Skubic, Miller & Krampe, 2008). In this context, digital technologies change where and how services are delivered rather than displacing workers. This potentially contributes to increased social well-being, the goal suggested by Keynes and Gates. Yang et al. (2015) concluded that for digital service innovation in aging-in-place to succeed, implementation would have to consider many different factors including "technical, economic, organizational, societal and user readiness aspects" (p. 572). This is confirmed by the ACOLA report (Walsh et al., 2019).

The OECD policy report (2018) conceded that not all jobs that could be automated would be, and that other jobs would emerge. The report stated there was considerable uncertainty about the likely rate of change and whether jobs created would compensate for jobs lost. According to Price Waterhouse Cooper (PwC) (as reported by Ghosh, 2018) many jobs will be lost to automation within the next 10 years, but artificial intelligence will create more jobs than it will displace. The PwC report further suggests that healthcare and education will be growth sectors, as will professional scientific and technical, information and communications, and hospitality (Ghosh, 2018). However, it also predicts that more jobs will be lost than created in manufacturing, retail, transport, public service and construction. In the longer term the OECD policy report also concluded that there would be a diminishing number of job-types that in future could not be completed by robots (OECD, 2018). The ACOLA report (Walsh et al., 2019) suggested that priority for automation should be given to jobs that are "dirty, dull, or dangerous and difficult" (p. 31).

Workplace training will be essential to ensure that the workforce re-trains so that workplace skills align with employment vacancies (Nedelkoska & Quintini, 2018). However, this will require more targeted training than is currently occurring as Nedelkoska and Quintini (2018) found that workers whose jobs were most at risk from automation were least likely to receive training:

Workers in fully automatable jobs are more than three times less likely to have participated in on-the-job training, over a 12-months period, than workers in non-automatable jobs. (p. 9)

Policies that support adult learning will be essential for re-training and up-skilling workers whose jobs have been automated (Nedelkoska & Quintini, 2018).

IMPACT OF DIGITAL SERVICE INNOVATION ON SKILLS

In 2015, the OECD estimated that improving written communication, maths, problem solving and digital literacy could increase productivity by up to 7% in countries such Australia (OECD, 2015). More recently, the Foundation for Young Australians (FYA, 2017) have suggested that "traditional, linear

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

career trajectories are rapidly becoming an antiquated notion" (p. 3) and that most will experience a portfolio of careers in their working lives. FYA go on to suggest that by 2030 workers will spend more time: learning skills on the job; and on creative and critical thinking, with a need to use more maths and science skills. Workers will need highly developed communication and interpersonal skills and develop an entrepreneurial mindset. These predictions have significant implications for young people entering the workforce, but they also have ramifications for those already in the workforce. Reinforcing the OECD's 2015 expectations, skills currently in high demand are for digital literacy, critical thinking, creativity and presentation skills (FYA, 2017, p. 21).

In a post in the Adobe Blog, Gay (2019) suggests that digital literacy is "fast becoming an important job skill at all levels of an organization". Gay further suggests that 57% of executives are calling for workers to have 'soft' digital skills as well as the more common 'hard' skills, distinguishing here between the skills that make up digitally literacy and those that are specific to a profession. In his blog post, Gay makes the distinction that "digital literacy is not to be confused with a digital lifestyle, which refers to passive use of digital platforms". He brings our attention to work undertaken by the International Society for Technology in Education (https://www.iste.org/standards/for-students), who have identified seven attributes that contribute to digital literacy. These are:

1. Empowered learner
2. Digital citizen
3. Knowledge constructor
4. Innovative designer
5. Computational thinker
6. Creative communicator, and
7. Global collaborator.

These attributes align well with the skill set that the FYA (2017) have suggested will be essential skills for young people. However, as automation and digital service innovation in particular, continue to infiltrate into the workplace, what are the implications for our current workforce?

Meeting the changing demands of workplace skills requires action at a number of levels. Employers need to take at least some responsibility for upskilling their workforce, particularly for those who are most likely to be impacted negatively by automation. Employees need to be proactive in maintaining their skill set, particularly digital literacy, as these are the skills required to interact with automation. Education providers at all levels are not exempt. They have a responsibility to ensure that students and graduates have appropriate skills to be effective contributors to the workforce.

Digital literacy skills have become an essential skillset, alongside language and numeracy. But the question is often asked, and rarely answered, what is digital literacy? Employers expect it of their employees and those stepping into the workforce often think they are digitally literate. Unfortunately, there is a history of evidence to suggest that this is not the case if the evidence from studies of higher education students is to be believed (for example Kennedy, Judd, Dalgarno & Waycott, 2010; Nataraj, 2014; Martin & Roberts, 2015; Coldwell-Neilson, 2018). Without a universal understanding of what we mean by digital literacy it is difficult to understand how anyone can adequately prepare for a job of the future. We have presented one view of digital literacy above, from the International Society for Technology in Education. There are many other interpretations of what digital literacy entails, many relating to skills that need to be developed within an education context. The earliest definition was coined by

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Paul Gilster (1997) who described digital literacy as "the ability to understand and use information in multiple formats from a wide range of sources when it is presented via computers" (Gilster, 1997, p. 1). This understanding of digital literacy has evolved, but the information literacy focus has persisted for more than 20 years, particularly in higher education, despite digital technologies developing rapidly and becoming ubiquitous. Digital technologies have moved from being a 'closed shop' where large installations where kept behind closed doors that only the computer staff could access, to the majority having more computing power in their pockets in the guise of mobile phones. The activities of daily living are regularly facilitated through mobile digital devices but, as mentioned earlier, this does not imply that those using the devices are digitally literate.

Coldwell-Neilson (2018) has defined digital literacy as the ability to identify and use technology confidently, creatively and critically to effectively meet the demands and challenges of living, learning and working in a digital society. Being digitally literate is recognising that the evolution of technology and digital media is not static, that the associated skill set needs to be as flexible and expanding, as well as transferable across technologies and disciplinary boundaries, to meet the demands of this dynamic environment. Digital literacy is a mindset and an attitude, not just a skill set. This definition recognises that our digital literacy skills are evolving over time and that different sets of overlapping skills, capabilities and understanding are required in the various aspects of our lives. Ensuring our digital literacy skills continue to be relevant entails an exercise in lifelong learning.

Drawing on the work of JISC (2014), the European Commission (2006) and others, Coldwell-Neilson (2018) has developed a framework of digital literacy that underpins the definition stated above. Digital literacy incorporates seven elements that all contribute to the seven attributes of a digital literate as suggested by the International Society for Technology in Education:

1. ICT proficiency
2. Information and media literacy
3. Information and data management
4. Creation and innovation
5. Communication, collaboration and participation
6. Security and privacy, and
7. Digital identity and wellbeing

Each of these elements provide the foundation to: develop an understanding of how digital technologies work and build confidence in using them; develop the agility and flexibility to engage with, and manoeuvre a rapidly changing digital environment; actively develop skills to understand the modern media world to enable critical engagement with the environment; develop the skills to be able to recognize when information may not be reliable at best or fake at worst; develop the skills and capabilities to be a responsible digital global citizen; and develop the skills and capabilities to harness the power of digital technology for the betterment of yourself, your community and more broadly, the world we live in.

There has been, and continues to be, a significant increase in the number of roles that will require higher levels of digital skills beyond digital literacy. A useful four-band classification of the digital skills required in our workforce has emerged as part of the UK Digital Skills Taskforce (Select Committee on Digital Skills, 2015). This report indicates that in the context of the workforce approximately 7% of workers will not require any digital skills (the report refers to these workers as digital muggles). Digital citizens will make up 37% of the workforce. These workers will need to be able to use digital technol-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ogy purposefully and confidently to communicate, find information, purchase goods and services and interact with government services. Digital workers, making up 46% of the workforce, will need the ability to evaluate, configure and use complex digital systems. Elementary programming skills such as scripting will be required for these types of activities. Finally, digital makers will need skills sufficient to build the digital technologies that digital workers and citizens will be using. This group will make up 10% of the workforce. This classification suggests that the majority of the workforce of the future will required quite sophisticated digital skills, underpinned by a strong foundation of advanced digital literacy skills and capabilities.

DIGITAL SERVICE INNOVATION AND TRAINING

A recent Digital Pulse report (Deloitte Access Economics, 2019) indicates that the "highest policy priority for the digital economy is skills development" (p. 3). The report also suggests that increased investment is required to develop workers' foundational literacy, numeracy and digital skills supported by flexible learning programs that target mastery-based learning; and recognition of short courses as formal credentials. This finding is supported by McKinsey's report, which indicates that approximately 14% of the global workforce may need to change occupational categories due to digitization, automation and advances in artificial intelligence in the workplace (Illanes, Lund, Mourshed, Rutherford & Tyreman, 2019).

With the advent of new digital services, the requirements and needs for professionals to be digitally literate has increased and will continue to increase as the workplace evolves technologically. It is suggested that without the skills required to use digital tools, individuals will be left behind not only in their work lives but also possibly in their social lives (Chase & Laufenberg, 2011). Higher education is a key stakeholder in upskilling the workforce and its success or failure may be integral to, and a powerful indicator of, the knowledge-producing and talent-attracting capacity of the country (Hazelkorn, 2018). This section will focus on the training that will be required to meet the demands of the digital workforce. Who should be responsible for upskilling the workforce? What are effective ways of delivering training to and for individuals in the workforce? Two vignettes are presented which demonstrate the effective use of free online education; the first aims to upskill digital literacy skills and the second provides opportunities to gain micro-credentials that measure and certify skills developed within the workforce.

Technology is shaping the future of work, for example, through the proliferation of websites and mobile applications that change the ways people interact with services:

- providing digital access to large, global organisations such as Uber and Amazon;
- Australia Post's Keypass identity card for those who do not have a suitable way to identify themselves online;
- cloud storage solutions such as Dropbox and Google Drive; and
- activities associated with daily life such as making appointments, online banking applications or accessing government services.

These innovations have potential benefits for some businesses, and sometimes for service users and for society, however, not all technology has had beneficial social effects. Technology in everyday life, provides entertainment and opportunities to connect to others through social media such as Instagram

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and Facebook, and through dating applications. However, it has also enabled 24 hour a day access to gambling (Cherry, 2015), which may have adverse social consequences for some people.

In the work context, the digital era has seen a significant change in the way work is organised, for example, academic work in universities. Academics now routinely use digital devices such as computers, laptops, tablets and mobile phones, and also other digital technologies and software packages to support our research and teaching, for example:

- audio visual equipment is used in the classroom to support face-to-face teaching, including projectors and computers; presentation software such as Microsoft PowerPoint is used and lectures are recorded for students to access;
- delivery of learning resources to students is via a learning management system which also supports online discussions, provision of class lists, submission of assignments and notification of feedback and grades;
- Microsoft Outlook, Teams, Skype, Zoom and virtual meeting points are used for communication with colleagues across multiple locations;
- virtual private networks to access secure institutional intranet when working off-site;
- word processors to prepare electronic documents;
- project management tools such as Trello, Teams and Project to manage work activities and for student group work;
- Microsoft SharePoint and wikis to gain access to policies and procedures, curriculum documents, or to simply share documents with colleagues;
- other web applications for uploading student final grades, uploading exam scripts, managing tutorial and seminar groups;
- searching internal and external library databases to source information;
- online databases for research funding opportunities; and
- using reference management tools to curate all the information collected.

Capacity building to effectively use these technologies is often just-in-time, by trial and error, or relies on informal peer supported learning or the autodidactic capabilities of individuals, which often rely on digital resources. Strategies employed by staff vary according to circumstances. These approaches are sometimes formally supplemented by courses or by individual support, provided on an 'on-call' basis (helplines or mobile expert staff).

As suggested in the previous section, building flexible digital skills provides a starting point for training. Learning to use a specific tool or package may be adequate in the short term, but sometimes an in-depth transferable understanding can be useful in the longer term. In depth digital skill development can help people to transfer skills between technologies. In conjunction with Coldwell-Neilson's (2018) definition of digital literacy, awareness is required of the context in which digital skills are applied. Jones and Hafner (2012) suggest that although digital literacy relates to operating digital technology, it also relates to the ability to transfer affordances and constraints of the technology to different circumstances and contexts. However, training to use digital technologies is often dependent on the context and discipline or profession. Further, the skills associated with digital literacy may change as digital technologies advance (Coldwell-Neilson, 2017). Therefore, digital skills development needs to be addressed through lifelong learning. Coldwell-Neilson (2019) suggests that digital literacy is a mindset and attitude, not just a skill

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

set. Providing individuals with the ability to elastically adapt from one technology to another without a steep learning curve will help them to adapt to all the requirements in the workplace of the future.

Digital literacy and digital education could be developed progressively from primary school through to high school and into tertiary education. Hulten and Ramey (2018) indicate that education provides the foundational infrastructure of literacy, numeracy and general information which contributes towards the functioning of an advanced society as well as its economy. In Europe the European Commission identified digital competence as one of eight key competencies for lifelong learning (European Commission, 2006). More recently the Australian Government developed a national policy through the National Science and Innovation Agenda (Australian Government, 2015) which was implemented by ACARA (2015).

Although these initiatives are aimed at addressing the digital literacy capabilities of young people, the workplace of the present and future will require almost everyone to have digital literacy skills. One approach to improving digital literacy skills more broadly is for digital literacy education to be provided free or at an affordable price through tools such as Massive Open Online Courses (MOOCs), where the reach can be global through simple delivery mechanisms such as smart phones. One example is 'Becoming Career Smart', which is offered on the FutureLearn™ educational platform. It has reached over 36,000 people in over 40 countries. It is estimated that 5 billion people have a smart device and over half of these are smart phones, making options such as this kind of education much more feasible. Taylor and Silver (2019) found that a relative high percentage of adults in emerging economies report owning a smart phone; for example, in South Africa 60% of adults own a smart phone, in Brazil it is also 60%, in Mexico 52% and Nigeria 39%.

MOOCs are not the only solution. There are problems, for example, high attrition when learners join courses and do not complete. There are a number of factors which contribute to this including work and life commitments, or the fact that it is free results in learners not committing fully to completing the course (Koller, 2013). The low completion rates in MOOCs is termed the 'retention funnel' and can be concerning in traditional academic environments when the completion rate may be only 5% (Koller et al., 2013). If the content is not being utilised in a 'free' educational opportunity, is this wasteful? Further research by Bralić and Divjak (2016) shows that as a tool learners were fairly satisfied with this kind of approach, but they did have difficulties such as the language barrier, needing prior knowledge or the required workload in their life to complete it. The learners also appreciated the fact that MOOCs were self-paced and provided the opportunity to assess their knowledge on a regular basis (Bralić & Divjak, 2016). The following vignette illustrates an example of a collaboration between Deakin University and Australia Post that utilised a MOOC to deliver basic digital literacy education to the general public.

Vignette 1: Australia Post Massive Open Online Courses

Massive Open Online Courses have a variety of forms and purposes. Short, introductory courses are often used as 'tasters' to entice the student to go further and complete a formal qualification. Alternatively, they deliver a specific learning opportunity to fill a perceived need. Here we present one particular MOOC which was designed to benefit the general community by increasing awareness of digital business tools, provide an opportunity for the general public to gain the skills to enable access and use of the business tools with the aim of increasing access to and adoption of the digital services. This is a relatively new approach to educating a community about a service and providing them the means to build the skills to use it. However, it also presents an insight into the potential for failure when education is not the core business of, and the target audience is external to, the organisation.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

During 2018, Deakin University and Australia Post (the Australian national postal service) entered into a commissioned project to develop two courses in the MOOC to boost the general public's digital literacy understanding and capabilities. This was driven by Australia Post's implementation of a suite of digital services that the general public could access. In order to take full advantage of these services, Australia Post realised that users would need some basic digital literacy competencies which were likely to be beyond the capabilities of many of their customers.

Information about the 'Digital Discovery' program was advertised on Australia Post's website and the courses were delivered via the FutureLearn™ platform. The courses are centred around the vision of 'building your confidence online' and covered topics such as web browsing, social media, shopping online, using digital tools and cyber safety. The two courses were delivered to the public for free and each ran for a period of 2 weeks.

Participants were guided through the learning, which consisted of short readings and videos which explained the concepts and provided instruction of how to implement them in commonly used digital devices such as mobile phones and tablets. The participants were able to post questions in a discussion board, providing a means of peer support. They also completed a short quiz at the end of each week to allow them to assess their progress and a final test at the end of the course which was designed to provide Australia Post with some indication of how successful the course was at achieving its aims. The delivery platform for the project centres around social learning (where peers communicate and help each other to learn, not purely through the lead educator), so feedback could be collected from the learners' postings in the online discussion boards; comments highlighted elements the learners were doing right which they were commended on, and identified what they were doing wrong, which then provided an opportunity for further learning.

Individuals and community groups were encouraged to participate in the program by mentoring the learners or providing supported environments for the learners by delivering the program in libraries, community centres or other environments where there is a need of improved digital skills and confidence. Guides to support mentors and community organisations were made available via the Digital Discovery page.

No formal evaluation of the courses has been undertaken to date, but evidence has been collated from the discussion boards at each stage of the course which indicate that throughout the courses the participants are learning about important elements of digital literacy including: the basics of digital literacy; using digital services for solving problems in their daily life; becoming braver when using the internet and associated technologies; and coming to the realisation they know more than they thought they did. In essence, building their confidence in the digital world.

Although this approach of free digital education to help increase the capabilities of business customers is well founded, Australia Post's initiative did not live beyond the first offering of each of the two courses. This was due to a number of factors. Australia Post had difficulty in proving a return on investment for the MOOC. As FutureLearn™ owned the student data, there was no information to justify how many of the participants were in the course out of curiosity compared to the number who were there to gain digital literacy skills. There was no indication of how many of the participants in the first course went on to complete the second one. Australia Post engaged with some public libraries to run the courses as a community offering, thus allowing them to gain some real insights in the value of the courses. However, the courses were designed for wholly online delivery and were not best suited to a blended style of delivery. Overall, Australia Post was unable to justify the cost of running an advertising campaign to increase the awareness of, and participation in, the courses by their customer base.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The training and education space with respect to digital service innovation and digital skills is a rapidly evolving and useful area as we will see through the second vignette which study illustrates how certification of skills developed in the workplace, through professional credentials, have benefits for the learner.

Vignette 2: Deakin Professional Practice Credentials

Training and education are changing, particularly at the postgraduate level. How we certify or measure someone's skills in the workforce is also changing, with greater recognition that learning does not only take place in the classroom but does so to a large extent in the workplace. For many employees, their professional learning has occurred on-the-job, with no formal recognition of their capabilities. This situation is not uncommon in the ICT industry for example.

Deakin University has developed an innovative method of credentialing an individual's skills and knowledge that have been gained through work and experience. Credentials provide an authenticated and validated method for an individual to gain formal recognition of their capabilities, enabling these to be warranted to employers. Credentials do not require any formal learning but provide the means for capabilities to be formally assessed and recognised.

Credentials are offered at a number of levels aligned with Australian Qualifications Framework (AQF) levels 7 (Bachelor's level), 8 (Gradate Certificate/Diploma level) and 9 (Master's level), and focus on what are generally termed professional (or soft) skills. The skills that can be credentialed currently include (see Deakin University, 2018):

- Employability skills such as communication, digital literacy and team work;
- Technical knowledge such digital marketing, data analytics and risk management; and
- Leadership such as adaptive mindsets and leading and developing people.

The credentials have been developed in consultation with industry experts and professional bodies to ensure they are recognised in the workforce. These are benchmarked against industry skill frameworks and AQF. The ICT related credentials for example have been developed in collaboration with ICT industry experts, the Australian Computer Society, and with reference to the Skill Framework for the Information Age (SFIA).

Having selected the relevant credential, the applicant is guided through the development of a portfolio addressing the credential's assessment criteria:

1. Selecting examples and evidence that "demonstrate the criteria and dimensions of autonomy, influence and complexity of the credential" (Deakin University, 2018);
2. Prepare a reflective testimony that brings together the examples and evidence into a narrative which addresses the credential's assessment criteria; and
3. Undertake a video testimony where the applicant has to answer a series of questions relating to the portfolio and the skill being assessed. The questions are designed to validate the evidence and authenticate the individual as the person claiming the experience.

The outcomes of each stage of the process are collated and sent to two assessors – one academic and one industry based - who determine if the evidence justifies the award of the credential. This approach is an Australian-first and allows individuals to measure their professional skills but also achieve a micro-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

credential that is recognised and can be used towards academic certification. The micro-credentials can be used towards recognition for prior learning towards a number of Master-level degrees offered by Deakin University for example, shortening the study period considerably.

Vignette 3: Digital Discernment for Youth Work and Community Work Students

Digital discernment skills are required in youth work and in many other social service professions. These skills enable youth work students to conduct good quality research during their university studies and are also valuable after students graduate. A role of youth work is to support young people's participation in democratic institutions. To do this, youth workers need to be able to recognise propaganda and disinformation disseminated through social media and to help young people to develop an awareness of how false information may be propagated. Information discernment skills are also necessary for youth workers so that they can support young people to recognise financial and romantic internet scams in daily life. Digital media have also become an integral part of young people's social world, and, in response, digital youth work has become blended with face to face youth services, (Cooper, Tierney, Brooker & Sutcliffe, forthcoming). This means that youth workers need various types of digital knowledge and skills to use platforms ethically, effectively and appropriately.

Based upon prior teaching experience staff identified five components of information literacy and discernment problems that needed to be addressed:

1. insufficient information retrieval/search strategies,
2. misapprehensions about the purposes of university education,
3. limited strategies to evaluate information critically,
4. uncritical trust in personal experience, and
5. attitudinal resistance of some students to examining materials challenged their existing beliefs (Cooper, 2019).

The first component required students to gain information retrieval skills. This was relatively easily taught in collaboration with the university subject librarian. The second component required students to accept that a purpose of university education is to enhance their capacity for critical thinking, problem-solving and self-directed life-long learning. This concept of education was made explicit but was resisted by some students (Cooper, 2019). The last three components required students to engage with different aspects of digital discernment and critical thinking skills. These skills were the most difficult to teach because they required students to develop judgement about the quality of information from internet sources and in everyday life, the relative validity of different forms of evidence, and how language and argument can be used fallaciously to mislead. The process of teaching information discernment was embedded in disciplinary knowledge and developed and reinforced across the whole degree. The author argues that digital discernment skills should be an embedded and integral part of academic education for all graduates irrespective of discipline (Cooper, 2019).

This third vignette illustrates the importance of digital literacy and digital discernment in a non-technical profession.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

SOLUTIONS AND RECOMMENDATIONS

It is clear that digital literacy is now a foundation skill in an environment of increasing digital service innovation. Education at all levels has a responsibility to ensure students are adequately prepared to engage with the digital environments and have the capability to develop their digital literacy skills to maintain relevance to future technology developments. However, not all responsibility lies with education. Employers have a responsibility to ensure they understand what digital literacy skills are required in their domain of influence and to support their employees to gain and extend their digital literacy skills aligned with these requirements. Opportunities for retraining will be an ongoing requirement as digital disruption continues to impact jobs of the future.

FUTURE RESEARCH DIRECTIONS

The three vignettes presented in this chapter demonstrate a few of the ways educational opportunities can be delivered to an audience. Further work is required to explore their relevance and reach and to ensure the opportunities meet the needs of the stakeholders. The dynamic nature of digital technology innovation and use suggests that developing an understanding of digital literacy and the associated skills and capabilities is a moving target that also requires ongoing exploration.

CONCLUSION

The introduction of digital service innovation is occurring in many fields. Digital literacy skills are becoming necessary in all professions and in everyday life. If Keynes, Musk, Gates and others are even partly correct, increased automation will have significant social impacts, including the possible replacements of full-time secure employment, for example in the public service, by less well-paid casual employment in the private sector (for example in the aged care sector). There is a strong likelihood that there will be a mismatch between some displaced workers' aspirations, their skills, and the jobs available. There is likely to be an increase in leisure-time (voluntary or involuntary) for many. How socio-political systems respond to this will have an impact on the types of work available, and whether displaced workers are able to fill the new roles. Appropriate social policy is needed to ensure that all workers, and in particular displaced workers, receive adequate support to retrain and that job creation occurs in locations that are accessible to displaced workers, or that support is provided for people to re-locate. A reduction in working hours may also need to be facilitated, to better distribute available work. Young people in particular will need extra support to gain employment, and older workers need policy that recognises that, for some, retraining for a new job may not be an option. Increased automation will ultimately change how people see the place of work in their lives, for example telecommuting and flexible work hours are becoming more common and boundaries between home and work are becoming less clear cut, as was the case prior to the first industrial revolution. Policy is also required to ensure wealth from automation is shared. Broader socio-culture values need to change to ensure that those who are displaced by automation and cannot retrain or cannot find work, have socially useful work or other ways to find purpose and gain respect (Walsh et al., 2019).

The increasing capability demands of digital service innovation will result in:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The need for socio-political dialogue and decision-making about how to prioritise the roll-out and uptake of automation (for example, 'dirty, dangerous, dull and difficult' tasks); how to share the benefit of automation, and how to compensate those who have less work than they would like.
- Employers having a responsibility to provide opportunities for their workforce to upskill and retrain;
- Individuals having a responsibility to ensure their skills and capabilities are aligned with the current and future demands of the workplace;
- Changes to curricula in higher education across all disciplines; and
- Education institutions having an increase focus on providing appropriate learning opportunities to enable graduates to maintain and improve their hard and soft skills, through flexible, adaptable and innovative learning opportunities.

ABSTRACT

Accessibility has become increasingly important in information technology, particularly due to legislation pressure to make affordable public services to all. Being end-users and software companies those who have direct contact with accessibility problems, other stakeholders are committed to defining methods and change mentalities in Web accessibility implementation. In addition to a conceptual definition, this chapter presents entities views with responsibilities in the area, taking into account their work done in the past and the prospects for future. The understanding of the interaction between all these perspectives will help to realize the way it will go, which carries with it great challenges and opportunities, widely explored in this work.

INTRODUCTION

Information and Communication Technologies (ICT) represent a good opportunity to reduce the exclusion of people with some sort of disability. As a result, the Web can be viewed as leverage for increasing communication possibilities and users' autonomy. On the other hand, Internet is making the world more connected and globalized. Organizations, in this context, are present not only in their own national territory but in the entire world.

Continuous change in how users make use of Web applications is an irreversible fact, perceivable in the increasingly complexity associated with the available content and the existing needs for it to be dynamic and personalized. By merging this reality with the need to make the referred content more accessible to all, one can clearly understand that entities and organizations, such as development agencies, education institutions and governments, have a very important role in this process.

With the above in mind, from our point of view, a broader analysis to the Web accessibility topic is need in order to understand how the various entities and organizations perspective the topic. This is even critical when the scientific and professional communities, with common interests in Web accessibility, have difficulties in interacting, find consensus and sharing information and solutions.

The purpose of this study is to try to clarify the perspectives of the various relevant stakeholders associated with Web accessibility, and doing so by performing an extensive literature review. During the research project a set of perspectives was achieved and considered the most relevant to the topic:

1. End users;
2. Organizations;
3. Governmental entities;
4. Education institutions; and
5. Associative entities.

This paper was organized into six sections. Section 1 is the introduction and the second section provides the main theoretical concepts. Web accessibility according to the various aforementioned perspectives is characterized in Section 3. Section 4 contains a set of challenges and opportunities in the context of Web accessibility. Finally, the last section of the chapter presents the achieved conclusions, limitations and future work.

WEB ACCESSIBILITY: CONCEPTS AND PERSPECTIVES

Internet has been growing in size and complexity since its inception. Some arguments explain that this is because of its decentralized property, where anyone can contribute without there being a central authority to dictate what can and cannot be published (Lopes, Gomes & Sedge, 2010). With the integration of the Web in people's daily lives cannot be ignored potential accessibility barriers, as these barriers make this important resource inaccessible to a certain set of users (Van der Geest & Velleman, 2014).

WHO (2014) stated a disabled person covers impairment, limited activity or restricted participation. Still, according to data collected by the same organization there are over one billion people with type of disability, which amounts to 15% of the world population. At the European level, according to data collected by the European Union, there are more than 80 million citizens in the same context (EU-FRA, 2015).

The exclusion in the use of IT is not a single issue only of those people with disabilities. There is another group of users who have constant difficulties in interacting with the Web, the elderly (Arch, 2008). As society ages there is a serious probability of people suffering from some sort of disability, whether temporary or not (Díaz-Bossini & Moreno, 2014). This is even more relevant when considering that in 2050 the number of people with more than 60 years old is going to triple (United Nations, 2008).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Despite the various definitions associated with the term, accessibility is assumed as the ability of a person with disabilities have access to a particular service / product or perform a certain activity in the same way that a person without a disability would do. Accessibility is a topic that can be applied to various areas, and the area of ICT, an area in which this concept has been more debated and publicized (Gonçalves, Martins, Branco & Barroso, 2013).

In the technological context, the term accessibility means 'people with disabilities should perceive, understand, navigate and interact with the Web and that should contribute to the Web' (W3C, 2005). This concept evaluates how easily different sets of users, regardless of their constraints whether physical or on the surrounding environment, can access the content on a website (Mankoff, Fait, & Tran, 2005).

In the same context Iwata, Kobayashi, Tachibana, Shirogane, and Fukazawa (2013) says Web accessibility refers to the construction of a website, where all users can access to their information, regardless of their age and physical limitations, they can easily navigate in their site. In contrast, Aizpurua, Arrue, and Vigo (2015) report that a website can follow all the recommended standards in order to gain better understanding and yet this effort is not sufficient because developers can consider the site accessible and users hold a different perception about the accessibility the site. The same authors also claim that a Web site designed to be compatible with the appropriate standards can fail if users do not experience this accessibility.

Henry, Abou-Zahra, and Brewer (2014) studied the role of accessibility in the universal web and affirm the fundamental project of Web has the potential to be worked by all people, taking into account, their hardware, software, language, culture, location or physical and mental capacity. To achieve these goals there are different disciplines that focus on specific technical aspects, such as multi-modality, internationalization and accessibility for people with disabilities.

Today, Web accessibility, or lack of it, can be a serious obstacle to integration into society and not only with regard to individual interactions. Organizations are very powerful modern institutions that enjoy many of the legal rights of human beings, so it is only permissible for corporate web sites are accessible to everyone, even to those who are in the minority (Gonçalves, Martins, Pereira, Oliveira & Ferreira, 2013). In contrast, Web accessibility can also be very advantageous for companies because the number of users who visit the site will increase, which in the business aspect can result in an increase in sales effect for the organization (Noh Jeong, You, Moon, & Kang, 2015).

Martínez, De Andres, and García (2014) say Web accessibility is a technological innovation able to improve the relationship between an organization and all its stakeholders, not just those with disabilities. This happens because one of the key principles is to design websites and software flexible enough to meet different user needs, preferences and situations. The same perspective is approached by Sanchez-Gordón and Moreno (2014) when they stated that accessible technologies are technologies that users can adapt to suit their visual, auditory, cognitive deficiencies, dexterity and also their interaction preferences.

In addition, Web accessibility will also benefit people who use the Internet in special conditions, such as whom using text-only devices, which are in places where the network quality is relatively poor, or users connecting to the Internet through smart phones, tablets or Web-TV and using the same in a context where their eyes, ears or hands are interfered with by factors such as walking, driving or traveling in a quite difficult (Rau, Zhou, Sun, & Zhong, 2014). Web accessibility will improve the Internet user experience in all these conditions which will be beneficial not only for people but also for the Web service providers (Gonçalves, Martins, Pereira, Santos & Cota, 2013). These efforts have resulted in a number of different solutions, the most relevant being the regulations and recommendations that have

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

been published and which provided development tools, evaluation and appropriate Web content classification (Gonçalves, Martins, & Branco, 2014).

In the 1990s, there were already information regarding Web accessibility and were available in companies like IBM and organizations such as the Trace Research and Development Centre (Henry, 2002). However, the organization stood out most in this area was the World Wide Web Consortium (W3C), which is managed through the voluntary participation of members of the industry and universities and is basically oriented on two primary principles:

- "Web for all" and
- "Web on everything" (W3C, 2015).

In 1997, the W3C established the Web Accessibility Initiative to promote a corporate environment with Web content accessible to people with disabilities (WAI, 2005). Later, in May 1999 the WCAG 1.0 (Web Content Accessibility Guidelines 1.0) became the recommendation developed by WAI as a global standard for accessibility and design of Web content (W3C, 1999). This recommendation is a set of 14 guidelines, each containing clear key points about HTML form a total of 65 checklists, divided into three levels based on their importance and scope (Kuzma, 2009). However, implementation of this set of guidelines the W3C / WAI has received extensive comments since represented the first time that there was an international standard for Web accessibility, and this feedback reflected the need to update the recommendation (Brewer, 2004). Subsequently, in December 2008 the second version was created, the most current WCAG guidelines, WCAG 2.0 (Wentz et al., 2014).

The current version of the referred guidelines was defined according to several layers of conceptualization, including:

- Principles,
- General strategies,
- A set of techniques to promote web accessibility and
- Complex documentation set with all accessibility flaws and potential errors (W3C, 2008).

There are some studies in which the goal passes to deepen the process of migrating from one version to the other and even demonstrate the main differences between them (Bradbard & Peters, 2010; Li Yen Lu, & Lin, 2012).

In parallel, ISO (International Organization for Standardization) also introduced some regulations regarding Web accessibility, such as ISO TS-16071, ISO 9241-111 (ISO 2003, 2006), and the most relevant standard is the ISO 9241 -171 (ISO 2008) which was achieved through the development and evolution of the previous and aims not only the implementation of a set of rules that must be met, but also help the public and organizations create content accessible on its Web platforms (Gonçalves et al., 2015).

As these guidelines used by most countries, even so there are some who choose to create their own rules and methods. An example of these countries is the USA who created the "Section 508". In particular, this policy has served as an impetus for public libraries to facilitate the use of its websites and electronic resources. However, there are two issues at stake:

- One is the lack of perception and the other is the limited budget (Yi, 2015).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

There are also studies for other countries that seek to demonstrate the laws and regulations regarding Web accessibility will follow the same (Leitner & Strauss, 2008; Sánchez-Gordón & Moreno, 2014).

A MULTI-PERSPECTIVE VISION OF WEB ACCESSIBILITY

In a field in constant evolution, the understanding between different stakeholders engaged on this subject can be tricky and complex. As a result, there is an increase difficulty for the inherent community in sharing knowledge and reaching agreements and understandings, which makes it even more difficult for people outside the community to realize what is at stake in terms of requirements, legislation and activities. With this in mind, an attempt to analyse the Web accessibility topic from the perspective of the various stakeholders was made. The chosen perspectives were drawn from Gonçalves, Martins, Pereira, Santos, et al. (2013), and are the following:

1. Governmental perspective;
2. Educational perspective;
3. Business Perspective;
4. Institutional perspective; and
5. End users' perspective.

Governmental Perspective

Government authorities have the capacity and the obligation to create laws and regulations, while taking the task of monitoring the implementation of laws and act accordingly on their practice. Therefore, the area of Web accessibility is no exception and has to be adequate rules that must be exercised by those in charge, and the government is the entity that has the duty to manage the whole process and above all to be an example in their sites web. Many countries have demonstrating evident interest in finding laws and policies that work in Web accessibility area. In America Section 508 was established as the standard mostly followed in other continents is the W3C WCAG 2.0 guidelines. However, there is still a lack of legislation or irregular adoption of the same, and there are communities that are trying to fill this gap, setting standards and promoting their implementation. In this perspective Andreasson and Snaprud (2014) discuss the efforts of a community called European Internet Inclusion Initiative (EIII) in order to support greater digital inclusion in the public sector.

Policy issues related to fragilities in the laws regarding the government's electronic services are a problem where discrimination exists in relation to the on line environment is huge and attitudes taken by the responsible authorities are not necessary (Jaeger, 2004). To achieve adequate levels of accessibility is necessary for the government to establish formal laws and appropriate guidelines to the local context and then adapt existing and force by law enforcement or other additional mechanisms monitoring these guidelines (Al-Khalifa, 2012).

In some research the concern of the authors is to understand whether government agencies are developing their web presence affordable to all the people and at the same time realize that they are being established standards that can be followed by other organizations or public, or private (White, Goette, & Young, 2015).USA is a country that has developed great efforts in this field, where several projects have

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

been developed in order to understand how they behave different states as concerns the accessibility of their government websites. (Lazar et al., 2010).

The provision of government services via mobile applications (m-government) has had a significant growth in recent years. In this context, it is also crucial that the applications are accessible to all people. Sierra, Carvalho, Ferreira, Vaz, and Freire (2015) present a case study with the evaluation of four government mobile applications in Brazil. The article discusses the methodological adaptations of WCAG 2.0 in the context of mobile and its limitations. The results showed many basic accessibility problems, which highlights the importance of promoting research accessibility in mobile applications.

Karkin and Janssen (2014) conducted a study which evaluate government websites in Turkey for the municipalities, not a common perspective of values as the content, privacy, usability and quality, but from a perspective of public values such as:

- Accessibility,
- Transparency,
- Openness,
- Dialogue and
- Balancing of interest.

The evaluation showed that websites perform better with regard to common values than the public values, justified by the fact that websites are built on providing functionality instead of holding public values.

Certain approaches to Web sites reviews have shown that there are other ways of perceiving their evolution. Hanson and Richards (2013) developed a study where the aim was to understand the changes of accessibility indicators over a period of 14 years in order to understand whether there was progress in this period. The conclusion is that the sites have a low level of compliance with WCAG 2.0 standards, although improvements are evident, at least in some success criteria, which can be a side effect of good coding practices and will improve the accessibility of Web sites.

Government websites are one of the main sources of information for people. Parmanto and Yu (2011) evaluated a set of US government websites and compared with the federal government sites and random e-commerce sites. The results showed that though the US government and the federal government provide the service more accessible, yet the barriers are huge and it is very difficult for a person with some kind of trouble navigating the 3 groups.

Nietzio, Olsen, Eibegger, and Snaprud (2010) a different concept presented with the aim of improving the development process of governmental sites. This project called eGovMon aims to bridge the gap between high levels of benchmarking and accessibility improvements that are implemented in isolation. This concept is based on several pillars:

- An on-line scanner that provides reviews,
- A community that serves to help managers of sites and finally,
- Regular and updated publication of benchmarking for managing the progress and improvements over time.

Some studies make a comprehensive analysis, the government websites in various groups of countries, such as the European Union (Goodwin, Susar, Nietzio, Snaprud, & Jensen, 2011). These studies

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

used various terms of comparison to developed countries and developing countries (Kuzma, 2010), continents (Kuzma, Yen, & Oestreicher, 2009) or even sets of comparison between countries a particular continent (Costa et al., 2013). Mostly these researches reveal that there are serious issues of accessibility in e-government sites, even those whose governments claim compliance with international accessibility standards.

Completed a bibliographic review you can see that there is a serious gap in the whole system when we talk on Web accessibility theme. It is easy to see that government institutions are not to assign the required value that the subject requires and the problem increases exponentially every day and every created Web site. It is extremely important that the responsible entities look to your web presence responsibly and judiciously with accessibility concerns. Only then, after resolving its internal problem can act careful way in other sectors.

Educational Perspective

Educational institutions, where universities and polytechnic institutes have a leading role, have a very important part in the continuous improvement of mission of the Web accessibility levels. These institutions are the ones with the knowledge and skills needed to develop, transmit and stimulate the best practices and techniques on the topic in question.

Van Rooij and Zirkle (2016) developed a work which describe the results of a collaborative case study that addresses one hand, the design and development of on-line educational experiences and other accessibility thereof. These issues are discussed simultaneously with the development of an on-line course and are taken a few lessons, particularly from the perspective of students in the same. Finally, the authors share their experience in order to sustainable collaborative processes are created for successful on-line initiatives.

There is a problem when two areas like Web accessibility and education intersect, is to realize what are the challenges and directions that have to take and above all who is working to implement the entire system. Linder, Fontaine-Rainen, and Behling (2015) also presented a study, performed in the United States, on the current institutional practices, structures, resources and policies that are necessary to ensure on-line accessibility for all students, with the key finding better articulate who is responsible for the process of on-line accessibility initiatives.

Education is a social process and consequently before moving any content learning to students is absolutely critical that teachers have accurate knowledge of what they convey. As the Web a recent area accessibility is necessary to train teachers on the content they are teaching, an example of such initiatives is presented by Santarosa, Comfort, and Neves (2015) promoting a course where the areas of accessibility and usability are part of the curriculum of training.

Despite laws and policies imposed it is still difficult to educational institutions recognize the rights for equal benefit of persons with disabilities on their Web sites. With this in mind it is urgent that these institutions adopt good accessibility practices in its on-line platforms, which has not been the case (Zap & Montgomerie, 2013). Failure by the university Web designers to use these guidelines reveals the unwillingness of institutions to follow in accordance with a universal Web.

In order to achieve organizational changes necessary to ensure that the accessibility challenges are effectively fulfilled, it requires a cultural change in educational institutions. Cooper (2013) reflected on the process of promoting this cultural change within an Open University and found that the importance of being clear about the roles and responsibilities in promoting accessibility for educators is huge. At

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the same time, educators must be provided with the necessary support to enable them to assume that responsibility.

In order to better understand the depth state of accessibility in education, a study was conducted by Ringlaben, Bray, and Packard (2014) where the sample were not public universities but to assess the websites of special education university departments, or institutions where their audience is none other than the disabled people. The results were catastrophic and showed that 97% of the pages have many problems of accessibility in which 39% of which are serious.

Distance education has grown significantly in recent decades and in parallel the need to meet the standards of accessibility of on-line courses increases. Several studies have focused their interest in this subject in order to determine if students with disabilities are satisfied with the respective institutions and the courses act in accordance with their capabilities in order to understand if these learning environments can be academically well- successful (Roberts, Crittenden, & Crittenden, 2011).

Wijayaratne and Singh (2010) explored the level of accessibility of Web sites of the Association of Asian Open Universities and realized that on-line learning tools are behind compared to Western countries. The purpose of this study is to highlight the importance of accessibility to educational institutions, which are to despise a wide range of users with large barriers in their platforms. Some countries have specified laws that legally oblige the institutions of higher education to have their Web sites accessible, as is the case of the US with the Americans with Disabilities Act (ADA). With this in mind are developed studies designed to assess the extent and effectiveness of the implementation of these accessibility policies in universities (Bradbard, Peters, & Caneva, 2010). The results show that while most universities apply these laws, they have serious deficiencies. In the case of ADA authors report that probably many schools are in breach and run the risk a judicial process by a disabled person.

In Portugal, the Web accessibility in educational institutions has also been the focus of many researchers. Gonçalves, Martins, Pereira, Santos et al. (2013) assessed the compliance of all high schools in the country with the WCAG 2.0 standard and found that there are serious problems that limit the availability of the mentioned sites and their content promoting serious implications in the educational context of students. Through these results the authors created a model that aims to improve the accessibility levels within the Portuguese spectrum.

Although all problems, research suggests some possible solutions. One can go through the potential generic pedagogical tools such as the theories of learning and learning projects can help teachers to develop materials and activities accessible. Seale and Cooper (2010) analysed these tools and argue that they can have potential, but its influence and too general and abstract. The authors also argue that the key is the teachers learn to use design tools because its potential is more concrete and influence the content of the design process is much higher.

Reviewed literature summary, we conclude that education and Web accessibility are two areas where it is critical that there is communion to achieve the objectives, not only related to educational institutions, as well as the future of all other sectors. It is essential that education to work as a sustainable basis for all Web accessibility implementation system and is through education that begins the process of learning an area that requires effective and robust training. That said, it is urgent that educational intuitions change their stance regarding this issue, with a profound change in their culture, their way of acting, in their curriculum programs and the platforms they manage.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Business Perspective

In this set of perspectives, we identified the companies as a major actor in the mission to improve Web accessibility levels. As business entities to express corporate social responsibility (CSR), Web accessibility is an integral part of this obligation in order to demonstrate the commitment to provide the same equal opportunities. In our view the business outlook should be divided into two distinct areas:

- The non-technological companies and
- Enterprises of information technology in which fits the perspective of programmers.

Even though, there is a highlight of the Internet in people's lives, most of the Web presence of organizations in the private sector does not yet meet the contemporary accessibility standards. Leitner, Strauss, and Stummer (2015) conducted a case study in order to find the motivations of organizations to implement or reject the accessibility standards. The authors realized that motivation varies according to several factors such as:

- The size and complexity of the business,
- The organizational sector,
- Corporate culture and
- The degree of complexity of web presence.

In the daily activity of a company there is a key element: employees. Providingh Web accessibility can be an important element in the CSR to demonstrate and employees can play a vital role in this process. Oh and Chen (2014) proposes a model which shall examine the intention of the employees to exert pressure, as concerns the accessibility is influenced by three psychological needs:

- The need for belonging,
- Control, and
- Meaningful existence.

In some sectors of activity, the importance of the Internet takes on a large scale. One of these sectors is the bank which has developed some research with the focus of this very Web accessibility. According to Martínez et al. (2014) three factors are associated with Web Accessibility adoption in banks:

- Operating factors,
- Size, and
- The organization's CSR strategy.

After a case study the authors conclude that both operating factors, such as database size, does not seem to influence the Web Accessibility adoption. On the other hand, the commitment to CSR, the results indicate significant influence on the adoption of accessibility.

As is evident, companies have a social citizenship behaviour that should take into account, with the leaders of organizations to fulfil this role. The world's largest companies to be a good example by setting standards to be followed by smaller companies. Gonçalves, Martins, Pereira, and Oliveira et al. (2013)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

evaluated the websites of the 250 largest companies in the Forbes list and found a considerable number of accessibility errors on all sites of the chosen group, demonstrating a level of compliance with the decidedly down guidelines.

Web accessibility in business is not just an ethical dimension issue or equal opportunities, but also an economic dimension as it excludes a group of consumers with economic potential. Rocha, Bessa, Gonçalves, Peres, and Magalhães (2012) focused on characterizing the economic value of people with disabilities so that companies realize what they are losing monetarily when their Web presences are inaccessible to a number of people. With specific data that used the authors demonstrated a very high amount of money that companies are losing.

Lorca, Andrees, and Martínez (2012) conducted a study on Web accessibility levels of a sample of 600 European companies. The researchers' findings are that both the size of the company and the culture of the country in which it operates have a considerable effect associated. A fact that proves this argument is that large British companies are likely to have the highest levels of Web accessibility and this comes from the fact that English law has high levels of individualism, low power distance and low uncertainty avoidance, and all these issues promote innovation (such as Web accessibility).

Organizations of information technologies, which include developers also have an important role to play in this process. While there are numerous regulations and standards for accessibility for the development of appropriate interfaces, it is still quite difficult to achieve, and more to maintain high levels of quality in the development process. This difficulty is due to several factors such as the lack of adequate development of methods, tools used and the professional's training of development (Miñón, Moreno Martínez, & Abascal, 2014).

In order to be included in accessibility is vital development process that developers acquire habits of developing accessible Web sites, more precisely in the techniques and methods used by them. In spite of the literature review show that Web accessibility is important in the work of these people, it happens that the actions are somewhat limited, either due to their own causes of the individual as their limited perception on the subject, his empathy, and especially the lack of related to the Web accessibility experience, whether due to external reasons, mainly relating to firms in which they operate, where the main reason is due to the fact that developers have lack of control / power in relation to positive or negative ramifications of Web accessibility (Putnam et al., 2012).

Web accessibility is increasingly desired by customers, where many development companies listed the same as one of the techniques offered in their services. As such, evaluation studies to the websites of these companies are carried out in order to see if these companies have accessibility as a service to incorporate in your on-line presence. These studies demonstrate that despite the homepage these websites contain the compliance icon with the guidelines, it has no impact on actual accessibility of the homepage and also does not reflect the current state of the entire site, as it may have been modified several times since the validation happened (Gilbertson & Machin, 2012).

Lopes, Van Isacker, and Sedge (2010) effected an investigation to try to understand the motivations, concerns and difficulties of web developers when the topic is Web accessibility. The answers showed that in half of the people surveyed the topic has effect on his work, recognizing some awareness of the guidelines and standards accessibility, but only a more theoretical format. Overall the majority expressed the need for greater knowledge about the functional limitations of the disabled as well as assistive devices. However, the largest proportion (85%) was attributed by those who indicated the need for advanced training in Web accessibility area.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Still in the same direction, a similar study to the previous with the difference being only specific to a group of programmers from a recognized software development company was analysed. The conclusions were that the design, testing and find appropriate technology, are the hardest aspects in producing an accessible application. Although programmers have access to information and training, testing and technological solutions are time-consuming to implement, and the lack of time is a limiting factor in the development of projects (Trewin, Cragun, Swart, Brezin, & Richards, 2010).

In light of the knowledge gained through the existing literature, it is clear that organizations, despite being aware that Web accessibility has assumed increasing importance globally, does not give it the proper value. Although all ethical and cultural values that arise, it should be noted that individuals with some kind of trouble have a high economic value and it is absolutely imperative that companies understand that they are losing that amount to devalue this set of people.

Institutional Perspective

Associations are organizations whose mission is achieving a common goal of all participants thereof. In the case of web accessibility, this setting is no exception, and associations related to the theme, which may or may not have been created under that system, must have the ability to not only sensitize the world to the subject and must also submit active participation in the discovery of information and knowledge.

One of the associations that have made more efforts in this area is the Web Accessibility in Mind (WebAIM), which has helped build a large community of programmers, specialized people in the Web, people with disabilities and others who share the goal of making the Web more accessible. The major contribution of this community based on sharing resources and information on-line ensuring the knowledge, technical skills, tools and leadership strategies that enable organizations to make their own content accessible to people with disabilities (WebAIM, 2015).

As already discussed in this chapter, the professionals who develop their work in Web accessibility of the area are very important parts in the process. Thus one of the associations that have had great impact is the International Association of Accessibility Professionals (IAAP), which is to end the association of individuals and organizations with a focus on accessibility or in the process of building their skills and strategies. The purpose of this association is to help accessibility professionals to develop and advance their careers in order to help organizations integrate accessibility into their products and infrastructure (IAAP, 2015).

By another hand, there are assistive technologies that are very important tools in providing help to people with particular needs. Thus was created the Assistive Technology Industry Association (ATIA) that represents the common interests of business, government, education and agencies. Their mission is to serve as the collective voice of the assistive technology industry to best products are delivered to people with disabilities (ATIA, 2015).

There are also associations not being created exclusively for the purpose of Web accessibility, begin to focus their attention on the subject. The US Public Policy Council of ACM (USACM) is an association that unites the US government, the computing community and the entire American public, which in recent years has been looking at Web accessibility as a major theme. Aims of the council are:

- To increase awareness,
- Develop tools, and
- Extend the accessibility standards minimizing the regulatory burden (USACM, 2015).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Another country that has shown interest in the subject through their associations is Australia. The Web Australian Industry Association (AWIA) representing all the Web industry, both from an ethical point of view and professional, regularly organizes events related to Web accessibility where the topic is discussed thoroughly in order to find the best solutions, for both for the industry and for end users (AWIA, 2015).

According to what has already been reported, education and Web accessibility are two fields that to work properly necessarily have to cooperate among themselves. With this in mind, there are also associations for educational purposes that do not discard the Web accessibility. An example is the Association for the Advancement of Computing in Education (AACE) which has the mission to advance information technology in education and e- learning in its practical application. For this Web accessibility functions as a central pillar for the association in your research (AACE, 2015).

We verified the existence of a considerable number of associations approaching Web accessibility, some of them created exclusively for this purpose and others who realized the increasingly urgent necessity of the theme and the need to adapt. It is good to realize that within the associations the path already begun, however there is still much to go and it is essential that not only appear more entities concerned, as well as those that already exist, to make themselves heard more impactful to be successful in the goals that propose to achieve.

End Users Perspective

The last perspective to be analysed is the end users. We attribute great importance and emphasis to this group because obviously the whole scope of this work and Web accessibility in global revolves around these individuals, who may benefit if the objectives are achieved. As such it cannot exclude these people from intervening in the process of achieving better levels of accessibility, it is essential to acquire all the feedback and experience that they gather and use this valuable knowledge when developing new platforms.

Internet users are a highly heterogeneous entity, with different needs and requirements, where individuals with a disability may have many problems. With this in mind are created adaptive software systems to facilitate the interaction of people with all the information around them. The possibilities for exploring new methods and accessibility techniques to make adaptive Web for these users is a key point, since recent studies indicate that even when the guidelines are implemented, there is little evidence that people with disabilities gain better accessibility indexes (Raufi, Ferati, Zenuni, Ajdari, & Ismaili, 2015).

Research on inclusive design has contributed to a rich and wide range of publications and initiatives, forming an emerging knowledge base in this area. Understanding the needs and characteristics of the knowledge of the users, added a new dimension to the research task. For this purpose, there are works that focus on knowledge of inclusive design, involving the end users, in order to help the developers in their work. Research programs are used to illustrate the understanding of these needs and developed tools in order to evaluate its effectiveness (Dong, McGinley, Nickpour, & Cifter, 2015).

Factors such as the physical constraints, experience of using and accessibility barriers that websites have, are very important when observing users' behaviour on a particular Web site. This process of adaptation has been much investigated in recent times and the findings show that will as the interaction progresses the user gets higher completion rates of tasks, developing more techniques of exploitation, which makes them more qualified, independent and autonomous. These metrics can be considered learning indicators to be explored in order to intervene appropriately in the interface (Vigo & Harper, 2014).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Blind users are the most affected by this exclusion and is a challenge for them to seek information effectively on the Web. Xie, Babu, Jeong, Joo, and Fuller (2014) effected a case study with blind people in digital libraries in order to find possible solutions help in the interaction. The authors concluded that the keyboard focus location advertising, shortcut keys to exit out the current location of the cursor and descriptive summaries in relation to the overall site structure can be incorporated into digital libraries in order to improve the accessibility levels.

Ferati, Raufi, Kurti, and Vogel (2014) conducted a study which grouped people with different levels of visual impairment in different countries to compare their needs. The results showed that the cultural dimension of their country of origin and the context of use plays a crucial role in making the content accessible, and WCAG guidelines alone are often insufficient. Furthermore, it is necessary to evaluate the visual impairment level of the user before applying any technical adaptation.

Blind users interact with sites in different ways and it is necessary to analyse each case in particular to understand how they can eliminate these barriers. Pascual, Ribera, Granollers, and Coiduras (2014) performed an evaluation at two sites with similar content but different accessibility levels in three groups of users with different vision impairment. It was noted that all users showed better mood when interacting with the site accessible. An interesting fact is that the blind users when interact with the site inaccessible, complained much less than the low vision individuals and those without any difficulty. One possible explanation for this phenomenon is the daily interaction that blind users are always using the Web.

The evaluation of a website respect of its availability is an essential part of the whole process. Automatic ratings are the most common and which has higher utilization rate, however there are some barriers that are only detected with the participation of users. So it is important to study the behavior of these people in order to identify features and develop protocols that assessors and experts should consider in the performance of expert assessment (Capra, Ferreira, Silveira, & Ferreira, 2012).

Power, Freire, Petrie, and Swallow (2012) conducted an empirical study in collaboration with blind users and came to the conclusion that even though the developers correctly implement the current guidelines WCAG, there is little evidence that people with disabilities may have fewer problems. These results indicate that it is time to change the Web accessibility paradigm and define a much wider set of principles, in addition to the guidelines, which is based on users and knowledge that can be transmitted by them and used as valuable feedback by developers.

The question of accessibility on the Internet is not just for blind people, older users also have an important role in the information society. Yao, Qiu Huang, Du and Ma (2011) investigated the technological accessibility problems of this group and concluded that the reason for these difficulties is linked to:

- The lack of promotion by government entities enabling environments,
- Lack of involvement of the rest of the community,
- Lack of support the newest members of the family, and
- Little capacity autonomous learning of the elderly.

With older people as the focus of research Sayago and Blat (2009) effected an ethnographic study of daily interactions over a period of three years, concluded that the greatest barriers these people face are the difficulty in memorizing the steps, understanding the terms used on the Web and use of the computer by the mouse, despite the will to use it. Regardless of these limitations the inclusion and independence are two conditions desired by these users.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Audits and evaluations the Web is becoming ever more complicated and time consuming due to the increasing number of compliance criteria to be tested. As a consequence, Yesilada, Brajnik, and Harper (2011) tested 61 common barriers with different groups of users to try to reduce the compliance criteria and showed that 58% of them are common among users of mobile applications and users with disabilities. Another interesting aspect is that the most serious barriers are similar for users with low vision and users with motor disabilities.

Lopes, Van Isacker, et al. (2010) conducted a questionnaire to users who deal daily with accessibility problems either people with disabilities or elderly people, and realized that they all claim that increasingly Web and mobile applications are raising severe obstacles in their tasks. Even so, they continue to use your computer or smartphone on a daily basis, relying often with dependence on friends to help them. The group has explicitly stated that the main improvement that they desire is the better compatibility between assistive technologies and websites.

As result of this research, we can see how it is absolutely essential we include in this work the perspective and knowledge of end users can assign. End user are relevant throughout Web Accessibility process as their feedback is what makes work of programmers more focused to the needs of those will use. Thus all are benefited and are not wasted later features in practice does not serve as useful.

CHALLENGES AND OPPORTUNITIES

The demand for sophisticated Web interfaces, able to interact with everyone without any exceptions, using autonomous reactions, and meeting the needs of different users, has produced high expectations from ICT. Progressing towards understanding and modelling these computational tools is crucial in the behaviour of Human-Computer Interaction-systems in order to achieve social and economic benefits.

Laws and Regulations

Web accessibility depends on the combined efforts of several components, such as software development tools, developers and the content itself, and this interaction can sometimes be complicated. There are several organizations that recognize these difficulties and provide technical and functional indications directed to each of these elements, even though not always consensual and accepted transversally. In the case WCAG 2.0 it means that the automated validation and correction, preferred by programmers, cannot be considered as the only (or main) form to validate content and web platforms developed.

Based on previously explained, and after an analysis and reflection on the existing literature, we can see that there is a set of technical / functional regulations or indications homogeneously accepted by all and that programmers can easily follow. Such limitation brings a huge challenge to organizations and scientific community who wish to focus in this context, whereas its impact is immense, forcing the need to make a previous work of cross-examination before we even be able to think of technological developments or new solutions (Harper & Chen, 2012).

Current mass acceptance of mobile devices has also been creating a new set of issues to the already immensely complex problem of Web accessibility. This stems from the fact that most of the regulations and technical and operational indications are not directed at the development of content and platforms for mobile devices. Presented this fact, from our point of view it will be necessary to provide further clarification and regulations on how best to develop mobile applications accessible to all.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Web Accessibility in Education

After reviewing the existing literature Web accessibility in education it is possible to verify that there is a considerable gap in terms of know-how lack of progress in terms of different areas. This view is reinforced by arguments of several researchers (Seale, 2013), whereby an update to the teaching support systems and a thematic implementation of "Web accessibility" in study programmer focused and comprehensive manner.

Online learning has the ability to open the door of education to those who have the technology to participate. However, when it comes to inclusion rise up some barriers. These problems need to be solved quickly, but it is necessary to investigate the real needs of these students and their interaction with these platforms in order to achieve concrete objectives and to really improve your experience (Burgstahler, 2015).

Education is considered one of the main actions to improve integration of people with functional diversity in society, more accurately through the higher education institutions. Both the administrations of higher education institutions, as their teachers need to understand concepts in Web accessibility issues in order to carry out a more inclusive learning and quality. In fact, today's students will be professionals in the future, and when we invest now in their education about Web accessibility, we invested in an improvement of inclusion levels of long-term Web platforms.

Restrepo, Benavidez, and Gutiérrez (2012), present the idea to include lectures on the subject in educational institutions or even change the curriculum in the most appropriate courses, thematic instilling applying Web accessibility techniques, and thus teach students the techniques and methodologies appropriate to the creation of accessible Web content, may be the best option. Although there are some studies in this regard (Fuertes, González, & Martinez, 2012), is plenty of space for research in this area, as there are great challenges, both on the content being taught or about the most appropriate way of teaching.

Web Accessibility in Companies

We have seen, in recent years, some positive signs of how companies look at Web accessibility, however in light of the research we conducted, the adoption of Web accessibility by organizations (either when they are developing their own web content, either when they are developing Web content and platforms for others) is still very scarce (Gilbertson & Machin, 2012).

For many companies, websites are priority in the services they provide, then improve the accessibility levels of the same is urgent. Even so the challenges do not exhaust here and there are much deeper issues that need a comprehensive investigation. The challenges are immense, ranging from realizing that the reasons why organizations use this technology to analyse and try to change the perception that these are the social and economic value inherent in Web accessibility.

Nevertheless, for organizations are absolutely crucial to inform all the potential that Web accessibility can bring them in order to make themselves understood to companies that Web accessibility should not be an obligation, but a way to reach new audiences and reach more quality to those who are already loyal.

Collaborative Accessibility Web

Web content is under the control of the owners of Web sites and therefore are those who have the responsibility to make your content accessible. Given this basic assumption of accessibility, users should be able to demonstrate their discontent and even contribute with knowledge and help the owners of websites.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

So some windows of opportunities and challenges open, whereas are very few platforms where users can report problems of interaction and navigation, and those that implement this feature have very slow registration process and low success rate.

purpose to connect users and owners through platforms creating a social network so that these groups can share their experiences, report problems in real time and even serve as a platform to attract new users through the services affordably, it may be one way. However other directions may be taken into account, and the researchers are of utmost importance in this context, as it is necessary to realize a conceptual point of view of how it can integrate users and owners of websites so that they can collaborate.

Web Accessibility in Mobile Applications

The growing use of mobile devices has been overwhelming and today this type of systems has become one of the means most used by people to access services and information on-line. In this context it is extremely important that these resources are accessible to the entire community. Focused on this thought, it is possible to say that there is much work to be done in this area to achieve satisfactory levels of accessibility.

As argued by Leitner, Strauss, and Stummer (2015) the research possibilities in the framework of accessibility in mobile applications are varied. The challenges start right in designing accessible applications, where many problems still exist, as Although we already have some regulations of support do not yet exist any firm base to serve as a support to the developers of these platforms. On the other hand, the evaluation as to the accessibility of mobile applications already on the market is still an open challenge as a result of lack of regulation and technologies and support tools.

Researchers can also go through the studies with users with limitations, with the objective of analyse the problems arising from the use of mobile platforms in order to adjust and define recommendations for mobile accessibility based not only on assumptions, but on evidence empirical. This work has enormous relief, for it is through the results of this research that mobile application developers can direct their focus and work on developing truly accessible applications.

CONCLUSION

Web accessibility is an increasingly important topic both from a technological and from a more human perspective. This relevance is largely drawn from current Web users needs and the necessity to develop (Web) software and platforms that allow for a universal access and use.

Although most of the accessibility problems can be anticipated by users or programmers, there is another set of questions that can only be identified during the development stages. Nevertheless, it is increasingly accepted that the Web accessibility is also a critical topic for all organizations, including those who produce and provide Web content.

Social agencies with responsibility in education, associations or in government activities, should also help in triggering an accessible Web. This can be done from various perspectives: the development of regulations; the creation of a moral and social mindset towards the Web accessibility topic, and so many others. Besides these more direct actions, these entities can also help shape positive perceptions on stakeholders and web developers in order to increase the perception on the topic and the awareness on the necessity.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Despite the existing amount of scientific and technical work on the Web accessibility topic, perceivable through a literature analysis, it is still possible to identify a knowledge gap on the subject that should be analysed and aimed.

This chapter intends to document a multi-perspective vision on the Web accessibility topic and with this try to help creating a global perception on the subject and, in parallel, help both the scientific community and the organization to better understand the related issues and how to contribute to an overall improvement on websites accessibility levels, hence transforming this technology into an inclusive one.

KEY TERMS AND DEFINITIONS

Challenges: A demanding or stimulating task.

Characterization: A characteristics and peculiarities description.

Disability: A disadvantage or deficiency, especially a physical or mental impairment that interferes with or prevents normal achievement in a particular task.

Guidelines: A rule or instruction that shows or tells how something should be done.

Multi-Perspective: Relative to more than one perspective.

Opportunities: A chance for advancement or progress.

Web Accessibility: Use of Web environments, products and services by anyone, regardless of their limitations.

This research was previously published in Research Paradigms and Contemporary Perspectives on Human-Technology Interaction; pages 117-139, copyright year 2017 by Information Science Reference (an imprint of IGI Global).

Chapter 6
Rethinking the Contribution of Organizational Change to the Teaching and Learning of Organizational Behaviour and Human Resource Management:
The Quest for Balance

John Mendy
University of Lincoln, UK

ABSTRACT

One of the great attributes of acting as a Human Resource Manager is being reasonable. One may not know what is best for a company but one should be able to identify, reasonably, when in-house fighting and resistance on the shop floor are disadvantageous. While agreeing with the law one must also be aware, again reasonably, that it may be in conflict with itself. One's job is to resolve difficulties to the benefit of all parties – once more reasonably – even when one's emotions are on the side of one of the parties. In short, there is a job to do, but there is a difficulty: doing so successfully depends on being reasonable as well as developing expertise. However, being reasonable is precisely what the scientific method does not support although being an expert could be a desirable attribute. It excludes anything that contributes to a bias, including the bias that trust, fairness and team spirit introduce (Huczynski & Buchanan, 2013). The result is well known: the scientific method tends to support commodification, objectification and reification and elicits resistance (Pitsakis & Kuin, 2012; Mahadevan, 2012) even on phenomenon-driven change (Schwarz & Stensaker, 2014). HRM officers do not seem to have done too badly however – albeit without the support of the scientific method (Ford, Ford, & D'Amelio, 2008). This does not mean that support would be wasted or impossible. The aim of the present chapter is to explore what it might look like. The result is a series of recommendations, based on a study showing how some

employees proved able to contribute as experts to their companies even after they had been threatened of being fired due to heavy economic weather. This finding serves as an important lesson, i.e. that there are ways other than the scientific method to turn personal motivations and objectives into resources. These ways include creating an HRM/OB platform for change that helps to link people. They make it possible to create structures that help individuals to achieve 'expert presence', i.e. expertise to deal with difficulties in the workplace in the here and now.

INTRODUCTION

HR Managers need to deal with a variety of practical problems as a result of the implementation of organisational change. Different ways have been adopted in the treatment of the topic in the academic literature and in education. In most studies the authors claim to apply the scientific method. Piderit (2000) for example identified staff attitudes, as positive and negative responses to organizational change, Lewin (1947) proposed the Force-Field Model and Kotter (2008; Kotter & Cohen, 2012) gave us an eight-stage guide. These examples present efforts to elaborate on the way Buchanan and Huczynski (2010) and Huczynski and Buchanan (2013) have looked at the subject. Other approaches include those of Burnes (2004) who advocated behavioural change and Schwarz and Stensaker (2014) who called for greater concentration on the change phenomenon rather than theory-driven change. Romanelli and Tushman (1994) focus on external influences on the way organizations function. Johnson et al. (2006) look closer at the role of culture in determining the successful or unsuccessful change outcomes. Agnew (2005) advocated changing the environment. Paton and McCalman (2008) and Rees and French (2013) focus on the cultural dynamics in the management of change. Additional material can be found in Kanter (2012) who called for organizations (and their managers) to become more competent. Buchanan and Badham (1999) and Pettigrew and McNulty (1995) focus on the important role people, power and politics play in the outcomes of the change management process.

A common characteristic from these literatures is that the debate is one-sided in terms of the addressees and the recipients, i.e., of those implementing change (i.e. organizations/employers/managers/change-agents on the Organizational Behaviour side) and those on the receiving side of the activities and actions (i.e. employees/staff on the HRM side). Usually only one point of view is explored (e.g., Ford et al.., 2008), who looked at the 'change-agent centric' viewpoint). Some researchers advocate for greater focus on change as a phenomenon and what practical forms of knowledge and understanding it could generate (Schwarz and Stensaker, 2014; Eisenhardt et al., 2007) whilst others propound theory generation or reframing (Burke, 2010; Suddaby, 2011; Hodgkinson, 2011). Golembiewski et al. (1976) examined the treatment of the subject from what has been referred to as 'technical' or, if one wills, scientific procedures that tend to objectify participants in the implementation and management of change. Kanter (2012) emphasises the centrality of employee learning, competency and skills acquisition. Other authors (Buchanan and Badham, 1999) focus on power and politicking as mediating variables between success and failure. Finally Piderit (2000) calls for 'ambivalence' in people's attitudes to organizational change.

Piderit (ibid) suggests that a different kind of treatment of organizational change is needed that goes beyond the rather simplified dichotomization of change agents and change recipients. This chapter takes a more complex view of organizational change to see what support is needed. An example would be the work of Kotter (2008) and Lewin (1947) who wish to treat managers as individuals. The type of support

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

developed in this chapter links technical/scientific and non-technical/non-scientific procedures. Adopting such an approach is expected to provide HRM professionals and OB specialists with an HRM platform that takes people's objectives and motivations into account to produce a different type of competence to what Kanter (2012) and Future Work Skills 2020 and their proponents advocated for as well as a different type of understanding as claimed by Schwarz and Stensaker (2014).

The chapter is firmly rooted in Human Resource Management and Organizational Behaviour education but a departure from Buchanan's and Huczynski's (2010; 2013) tradition. It explores the debates or 'old theories' in organizational change (see Hassard, 2013) and suggests that HRM and OB education and the literature could benefit by focusing on something missing; i.e. employees' motivations and objectives and what these could practically and theoretically contribute to the technical/scientific approach. It is also opined that doing so will help HR Managers become experts in their practical roles and that academic staff will develop greater expertise in research and teaching.

The above theoretical and educational debates frame the objectives of this chapter, which translate into research questions as follows:

1. Do employees play an active (or even expert) role in the implementation of organizational change practices?
2. What impact (if any) do organizational change practices have on the daily lives of employees?
3. What recommendations are there for researchers, student-learners and practitioners who investigate and want to develop their understanding and expertise of organizational change?

These questions form the basis for the investigative inquiry. In the next section the literature is explored that underpins the study reported in the next two sections. In the third section the research methodology, data collection and analytical processes are summarized, whilst the fourth section presents and analyzes the research/investigation's findings. The latter leads to the introduction of the concept of 'expert presence' and recommendations made on the basis of the experimental findings. The concept of 'expert presence' not only surfaces both the positives and negatives of organizational change as part of developing our understanding of the phenomenon but it also suggests what organizations, HR Managers and employees can do when personal objectives and motivations are taken into account. Concluding statements, including future research travel, are projected in the final section.

LITERATURE REVIEW

Technical Approaches to Organizational Change

This section explores and critiques technical approaches to organizational change with the view to see what has been missing in the debates and discussions. The most commonly cited examples of standard, technical/scientific models of organizational change are Lewin's (1947) Force-Field Model, Kotter's (2008; Kotter and Cohen, 2012) eight steps, Burnes's (2004) behavioural change or personal transitions that may be required to adapt to new procedures. All these authors and their followers were interested in looking at why change fails and what steps could be taken to resolve the difficulties. Some examples of major change failure over the years include Betamax, Pan Am, Swissair, Washington Mutual and Enron, to name but a few. Such academic and practical interests on the topic remain as current as they

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

were seventy years ago, at the time Lewin was making his proposals felt. The fact that these once-great organizations failed signalled that there was something fundamentally missing in the way they understood and managed their change practices. Below are three examples – the first two focus on technical/scientific approaches, examples of which are drawn from Lewin and Kotter and the final one looks at phenomenological resistance as an alternative (i.e. non-technical/non-scientific) approach given the limitations of the previous two. The differences between the approaches will be highlighted to see what support could be provided from the practical experimental findings to resolve part of the theoretical limitations.

Example One: Lewin

The first of three examples taken from Organizational Behaviour and HRM texts looks at Lewin's contribution as he is one of the key authorities on the topic area. In 1947 he came up with what he referred to as the 'Force-Field Model', one that can be used to analyze a society's or organization's readiness for change. The model is broken down into a three-stage procedure and discussed alongside what other academics and scholars have commented on the topic to see what is missing.

Lewin identified his first step as one where an organization needs to 'unfreeze' its members' behaviours and attitudes. He identified characteristics such as members having to unlearn or destabilize their old beliefs, attitudes, behaviours and an organization's culture needs to be rebalanced to new ways of doing things. He recognized that for an organization or society to bring about successful change there needs to be a rationale for change, providing organizational or societal members with information and employing people with the requisite skills to carry out the required tasks. He cited that this would entail a period of emotional disturbance and disequilibrium as members adapt to the requirements of new practices. To a certain extent, organizational or societal members could be experiencing shock to their system as leaders seek to communicate urgency and effect the new culture as part of the new practices.

Lewin claims in his second stage that the organization starts to transition or move onto the change phase as management try different procedures and implement the practices required. At the same time, management are also advised to take into account what is happening in their external organizational settings, note the approaches needed and evaluate chances of success. Whether they do might be another issue despite being targeted. Doing such groundwork is expected will facilitate organizations and their members to have the appropriate behaviours and ensure success. However, these actions need constant work and effort for the required behaviors to be embedded and for success to follow.

This is what Lewin refers to as the 'refreezing' stage when the change behaviors and attitudes are reinforced and stabilized. These become part of the institutional fabric. When this happens it could be claimed that the organization has a new way of doing things or a new order. This newness reflects the organization's culture, new practices, new values and norms. Cummings and Hues (1989) regard such transformation as pivotal to success.

Lewin and his followers emphasized the role the organization, the manager or society plays at the higher level. They deviated from the scientific procedure in focussing on interventions, but didn't specifically focus on individual contributions – such as motivations, objectives and preferences. What is needed is to explore what the role of individuals, i.e. their motivations and objectives could practically contribute in reversing the organizational change failure trend and rebalance the notions of resistance and cooperation in the theoretical debates.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Example Two: Kotter

In the second example, Kotter (2008) found an increase in the frequency and scale of change. Kotter proposed the eight-Step Model, which is designed to recognize the interlocking nature of the steps and the ways these are managed to deliver success. It is interesting to note that Kotter ruled out human emotion as part of his model although Richardson and Denton (1996) differ. This appears mainly attributable to the fact that both Kotter and Lewin used elements of the scientific approach. Their adaptations indicate that they were aware of some difficulties in doing so.

Step one of the procedure centres on management building a sense of urgency. Keeping the momentum, fostering collaboration and cooperation characterize this stage. It is assumed that data are available, that they are reliable and management can act on these to effect the changes. However, perennial organizational difficulties continue to wreak havoc on efforts. There are costs, dwindling material and non-material resources and the need to do more for and with less. In some management's quest to subvert what they term operational dysfunctionalities the anticipated change and the successes promised may come to naught. Although Romanelli and Tushman (1994) claim that external turbulence compels organizations to change, the scale and gravity of these on the internal organizational operations are not accounted for. Nor are people's reactions as part of the process. Alternative strategies such as research and development, performance management and leveraging these against competitors are recommended. However, the role that organizational members play in these dynamics are left out (Paton and McCalman, 2008; Hassard et al., 2013; Rees and French, 2013). Although the important role of culture is underlined, the grassroots' influence on outcomes is bizarrely left out by Johnson et al.. (2006). Studies seem to over-emphasize either the resistance or cooperation aspect in what scholars have acknowledged as inter-relational elements. Therefore a more holistic and more complex picture is required.

Realising the potential damages from resistance Kotter (2008) adds a second step. Building a coalition to implement the change is included. Kotter assumes that the group's formation will galvanize talent and create an appealing vision to employees and stakeholders (including customers or service users). Obstacles posed to change are overcome as management communicate the organization's new vision using a step procedure. Whilst Kotter proposes skills development, Kanter (2012) advocates that organizations (as entities) learn to become competent in change whilst Schwarz and Stensaker (2014) call for greater focus on the change phenomenon itself to see what it could offer. The extent to which individual employees at the lower level play a role in the new developments is downplayed at best or not commented on. Paradoxically, those who fear the changes should be empowered to carry the vision through as part of the next step. Significant omissions in this include the roles of culture, power and members' reactions (not to forget negative resistance), the very obstacles Kotter was poised to overcome by using elements of the scientific approach. Perhaps, the lack of tangible and measurable data in this area and the approach adopted could have accounted for his omission. Buchanan and Badham (1999) and Pettigrew and McNulty (1995) uphold the centrality of people, power and politics. Others still see the arguments as one-sided (Ford et al.., 2008) and therefore not representative of the complexities involved.

In relation to the chapter's topic it is important to highlight and recognize the contribution of different individuals. The four organizations studied show the need to talk about people, their motivations and objectives. Although the latter were constrained by conditions such as their employment, an economic downturn and the anxieties of future dismissal, they contributed to reshaping their organization's culture and its fortunes. The motivations and objectives of people need to be included in Kotter's, Lewin's and their followers' scientific and resistance-centric approach.

Other Approaches to Organizational Change

Example Three: Resistance

In the third example, Piderit (2000) reminds us in her seminal work of the role attitudes play to organizational change as a departure from the scientific approach and its teachings (also see Bouckenooghe, 2010; Procter and Randall, 2015). She highlights the complexity of the topic area and a shift from reifying people and what they could contribute. However, she also bemoans the over-emphasis scholars have placed on the role of resistance. Dent and Goldberg (1999) are an additional case in point. Researchers and practitioners who treat resistance as negative have reinforced the tradition started by Lewin (1947) although we have been reminded of its limitations. We are also aware of the potential limitations of an over-emphasis on theoretical postulations (Hodgkinson, 2011; Hassard, 2013). Finding alternatives means looking at different ways of reconceptualising resistance and whether this could be beneficial. When resistance is not perceived negatively, it offers possibilities. For example, Schultz et al. (2002), Nemeth et al. (2001) and Knowles and Linn (2004b, 2004c) have reminded us of the way resistance can be used as a resource to create awareness as part of the necessary support needed for change.

Scholars who treat resistance negatively view employees as barriers to change. People are reported as uncooperative and therefore need to be managed (see Watson, 1982; Bovey and Hede, 2001). However, other studies have revealed a different source for the difficulties. Management are perceived as the source of employees' resistance by treating employees initially as resistors to the change plans (see Merron, 1993). It is assumed that those with less power will try to oppose those with official power (i.e. management or 'change agent-centric' individuals (see Ford et al., 2008). Whether this happens in most cases as reported is yet to be concluded. Research into why people resist organizational change has also revealed that this could be explained by people's ethical beliefs rather than their own individual interests (see Milgram's 1965 experiments). Contrary to Lewin and his followers' claims, studies have recently demonstrated that resistance can draw management's attention to practical things that employees (as implementers of change), want to see addressed (Dutton et al., 1997). Whether the resultant actions benefit the organization and develops our understanding of the phenomenon is another thing (Schwarz and Stensaker, 2014). However, the assumption is that when not addressed, this creates further difficulties for HR Managers and OB specialists and others who seek to understand and address the complexities. A different type of support is therefore needed for HRM and OB specialists.

In their studies Brower and Abolafia (1995) and Spreitzer and Quinn (1996) emphasized the role that employees' inaction and management's leadership behaviors could play in creating resistance. This is contrary to Lewin and his followers' notion that people's uncooperative actions are conceptualised as resistance. Even when employees act against management's change initiatives these are perceived as impatience and emotional frustrations (see Coch and French, 1948 for earlier renditions). Piderit (2000) combined three approaches: the cognitive, the emotional and the intentional to study people's attitudes and report what she perceives as a more dynamic (and therefore complex) view. The cognitive element refers to people's beliefs or what they think about the change. The emotional pays attention to how people react to/feel about the change and the intentional centres on people's judgements and what they wish/wished to achieve. Given that people may show more than one attitude, Piderit proposed 'ambivalent attitudes'. By so doing, she combined positive and negative attitudes and signals a shift in the topic. However, she did not indicate the type of support needed or even whether these could count as resources.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Earlier studies tended to separate the approaches to attitudes and treated resistance to change negatively (see Eagly and Chaiken, 1998; Morrison and Phelps, 1999).

Ford et al. (2008) claim that resistance should be perceived by scholars and practitioners as something of value and that it creates a new conversation. However, others who are more sympathetic to the technical/scientific approach see it as a challenge (Kanter, 2002; Barrett et al., 1995). When new conversations arise they take the forms of complaints and criticisms (Carruth et al., 1985) or communicative behaviour (Skinner, 1991). It is assumed these help in highlighting the issues faced by members. To ensure commitment and success, members' freedoms should be ensured as they become part of their organization's decision-making processes. When there is a clash between members' personal values and those of their organization, engagement with the change processes is perceived to be expressed (Dirks et al., 1996). Elsewhere these are seen as conflicts that organizations ought to avert through appropriate communication and relationship-building mechanisms (Kotter and Schlesinger, 1979). Even when the initiatives are resisted by employees, it is averred that resistance assumes a value that could prove useful in developing the necessary resources.

Contrary to Piderit's (2000) and Dent and Goldberg's (1999) proposal to relegate resistance into the scrapheap, the author proposes that HRM and OB should value resistance and note its theoretical and practical contribution in highlighting people's objectives and motivations and the type of support needed in organizational change. Although Lewin and Kotter faced resistance in their treatment of change, they addressed it as something negative that needed to be resolved by using elements of a scientific, mechanistic or technical procedure. Developing something different means looking at three things: the contributions of management (as change implementers), the negative portrayal of employees as resistors to change and the contributions, the objectives and motivations of both employees and management as change agents and recipients. Doing so, shifts the emphasis from the dichotomised presentation of both groups of participants as either 'implementers' or 'recipients' and highlights additional issues that HR Managers and scholars need to (re-) focus their attention on. It is anticipated doing so will add to the much needed resources in managing change more effectively. Managers and employees would now be viewed as active participants to the organizational change and change management process (different from the one-sided recipient-presentation by Bartuneck et al. (2006) earlier)). The first two have been overly examined in the literature (see Lewin, 1947; Kotter, 2008; Piderit, 2000, and Ford et al., 2008 amongst others), the latter notion of 'active participants' has not benefited from such attention. What people contribute to organizational change, including their motivation to resist, need to be included in the scientific approach already developed by Lewin, Kotter, Dent and Goldberg and their followers.

The author reports below on his own investigation on constraints faced by employees and the ways they reacted to the difficulties caused by the scientific approach, elements of which managers used to try to resolve constraints to working practices. The author proposes to use findings from four case studies to explore what the third element can contribute to creating the necessary support (see the fourth section for the findings' contribution to the organizational change) for managers, student-learners and academic staff. This adds to the emerging literature on change recipients' development of capabilities as part of the support needed (see Lopez-Cabrales et al., 2006, for example). Whilst Meyer and Stensaker (2006) and Stensaker and Meyer (2011) looked at the attitudes, experiences and reactions of employees to multiple organizational changes, the current chapter examines the motivations and objectives of employees as they collectively contribute to liberate themselves from the constraints and bring about successful organizational change. Building on from the earlier work of Meyer and Stensaker (ibid), the chapter identifies both the positive as well as the negative reactions of employees and combined these with em-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ployees' motivations and objectives in a concept referred to as 'expert presence'. It appears important in bringing about collective organizational change in a way that is different from previous studies that have examined the subject in dichotomized terms of change agents/implementers (i.e. management) and change recipients/resistors (i.e. employees) by using either technical/scientific procedures, by perceiving resistant employees as a problem or, in other words, a drain on necessary resources or by focusing solely on theory generation (Burke, 2010; Suddaby, 2011; Hassard, 2013) or practical relevance (Eisenhardt et al., 2007; Schwarz and Stensaker, 2014). When this happens what drives people to contribute (i.e. their capability to be a resource) becomes lost. The findings and the concept of 'expert presence' are intended to help HR Managers become experts in identifying when conflicts and resistance are becoming destructive and what needs to be done to reverse the damage. It is also anticipated that academic staff become experts in the evolving research and teaching issues of organizational change. The methodology that informs the current chapter is examined next.

METHODOLOGY

The author conducted interviews with employees and managers whose organizations were experiencing difficulties and undergoing change in the UK. Managers were tasked with implementing the necessary changes and therefore fitted the predominant theoretical description of 'change agents' (see Ford et al., 2008). Two data collection points were carried out, the first in 2004/2005 and the second in 2011 to address part of the shortcomings of data sufficiency in this area as well as check the impact of the change phenomenon (see Schwarz and Stensaker, 2014) on potential theoretical generation (Burke, 2010; Suddaby, 2011). In the first set, that is prior to the banking crisis of 2008, the author asked participants what changes were introduced, by whom, what was the nature of the changes, how they were introduced (e.g. by 'change agents') and reacted upon (e.g. by 'change recipients'). Four organizations that had to respond to market pressures, satisfy customer demands and government legislative changes to the delivery of services such as care and housing agreed to provide materials for the case studies. Participants were distinguished as managers and employees to provide clarity in their roles, to identify what they contributed to the new requirements, and to see whether they fitted descriptions from the literature (Lewin, 1947; Kotter and Cohen, 2012) or whether additions are required in line with Burke (2010), Hodgkinson (2011), and Hassard (2013). Sixty-eight interviews were conducted in the first round, seventeen in the second. The second set of interviews asked what each organization did subsequently, what the nature of the working relationships were between the two groups, what the objectives were and how these influenced the changes. In 2004/2005, seventeen interviewees were conducted on average per organization with the following breakdown: Bakkavor-Lauren's Patisserie - ten employees and seven managers, Longhurst Housing - ten employees and seven managers, Eden Housing - ten employees and seven managers and Lagat -ten employees and seven managers. Participants and their companies relinquished anonymity. Each participant was given the opportunity to elucidate on their objectives to see whether these added anything. Some did others chose not to via their statements. The responses/statements were treated as ways people saw the changes, the constraints imposed and what they articulated as their objectives. These had the benefit of providing rich data, insightful knowledge on each of the four organizations' working practices, how people responded to the demands and enhancing the emergence of potentially new ways of understanding and managing change (see also Tavana, 1998). Generalising the findings to other cases could be problematic as contextual variables may apply.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

With the assistance of two other researchers the author wrote down all the themes from both datasets, checked these with the two assisting researchers, agreed what themes were dominant based on their recurrence and named each of the categories in stages as reported hereafter. The categories fitted and were then reported in six stages. These were narrated and their narrative followed a story-like format. Each stage of the narrative showed the development of how participants responded to constraints as a result of the technical approach and the reification used. The technique via which the themes were derived has been referred to in the literature as recursive abstraction following the hermeneutics tradition (Alvesson and Skoldberg, 2000). The findings demonstrate the differences in the ways employees and managers reacted to their reification and to people's motivations and objectives in shaping change.

Empirical Data From Four Organizational Cases

The specific organizational-type difficulties and changes in the four companies were as follows. In 2004/2005 Longhurst was coming under intense pressure from government to improve its housing stock and facilities, to provide more affordable homes and to comply with UK housing legislation. They introduced more one-to-one staff supervisions as well as encouraged team and mobile-working. By 2011 supervisors were conducting appraisals and using measurements to closely monitor performance.

During the first interview round, Lagat's services of providing guidance and counselling to young adults were increasing. This was at a time when the human resources to deliver such services were thinly stretched out. Employees were having to work long hours thereby increasing their workload. The organization set up additional skills training to cope with the new demands and identified areas for further development. In 2011 staff were additionally stretched as workforce numbers had gone down owing to a merger and redundancies for acquired Connexions staff. The parent company, Lagat faced additional pressures such as government's funding cuts, lack of business opportunities and covering a wider geographic area. They responded by asking staff to embrace digital working and closer scrutiny.

In 2004/2005 Eden Supported Housing was run as a family-business. Management and staff worked cordially and patients with learning and physical disabilities were supported. They were responding to providing affordable care to those within as well as off their premises. The level of care quality was also scrutinized closely. On the author's return in 2011, the organization had been bought by a business firm whose priority was to streamline operations and maximize profits from existing and new business ventures. Managers were tasked by the parent company to be more business-like in their service-delivery and monitoring. This included having to monitor patient numbers and welfare according the Care and Quality Commission guidelines.

When the author initially visited Laurens-Patisserie in 2004/2005 it was family-owned. The company made and sold cakes to local supermarkets and families for over two decades. Increasingly, the company had to work hard at integrating different ethnicities and nationalities including Iraqis, Afghans, Africans and other people from Eastern Europe and South Asia. There was also an increasing demand from local supermarkets to slash costs. By 2011 supermarkets wanted nutrition labelling on all products. The organization responded by training additional staff for Health and Safety, increased health inspections, introduced an additional shift of workers and monitored production and quality. The organization has also been bought by Bakkavor, an Icelandic-based company, whose emphasis shifted to profit maximisation, an increase in managers and employees' responsibilities and contributions. All were expected to cut down on waste and create shareholder value.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Whereas Lewin (1947) introduced three stages and Kotter (2008) proposed eight the author identifies six stages (from the experiential data or, if one wills, from the phenomenon as proposed by Schwarz and Stensaker, 2014). Developments from each of the practical settings highlight employees' 'expert presence' as part of a demonstration of what happens when people's objectives and motivations are taken into account. When combined the stages tell a story of the complexity of ways that employees and managers adopted their 'expert presence'. The latter's characteristics are argued to be a necessary addition to the technical or scientific approach propounded by Lewin and Kotter and helped in reframing the theoretical debates in the area (Hodgkinson, 2011; Suddaby, 2011). The technical methods adopted were found to reify what people did as the phenomenon evolved in each of the six stages. The notion of 'expert presence', generated from people's contributions, describes a variety of employees' subjective experiences and objectives to the technical/scientific procedures managers thought would alleviate the constraints of change. The concept is different from the traditional observational and representational form of research in which people's feelings and subjective perceptions are represented as objective/reified entities (similar to the technical/scientific approach). 'Expert presence' makes it possible to feature people's objectives in a six-stage process (see next section) and provides an outlet for current and future HR Managers and student-learners to identify when conflicts and resistance become destructive thereby triggering practical action.

Stage 1

This stage saw managers in each of the four organizations recognizing the need to address the constraints. They started to introduce new customs, new ways of working and demanded that employees adhered to the requirements. Managers realized from early on that they ought to begin to ask employees to be disciplined and to meet the challenges if they were to continue in jobs in the longer term. Managers also started asking their staff to work in teams in order to carry out what employees saw as an increase in their workload as tasks became more diversified and monitored compared to prior to the organizational changes. A breakdown of what each job role did, in which of the four participating organizations and at what point in the data collection stage (2004/2005 or 2011) is reported to show contextual differences, the techniques used and levels of or lack of support as follows.

In 2011 a senior manager at Lagat said: 'management put up an away day to break barriers between teams; we also arrange weekly then monthly meetings for people to see what others are doing...' Another manager in the same company added 'I also develop programs as government funding and opportunities arise, working in partnership with organization s to maximise opportunities (with our collaborators such as Lincoln College, Action for Employment (A4e), Jobcentre Plus etc).' The Business Advisor said '… we used to work independently whereas everybody has talents we can pool together in a team.' A Senior Training Officer mentioned 'we…have Lagat Days and we talk about the company training plan... All new staff are encouraged to do the key skills they require.'

At Eden the HR Manager remarked 'we are working with people with more complex needs, we are growing geographically with an ambitious growth plan while managing the cost plan, so doing more with less resources, introducing new projects in certain strategic places; each of those projects is multi-tasked, for example the Health Care Manager and Team Managers are managing staff and delivering frontline support…a lot of managers are having to work round the clock, regional managers have to pick up one-to-one (i.e., supervision) with staff, changes will ensure we are leaner and more efficient…'

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

An employee at Lagat remarked 'there's a lot of cross working, a lot of cross function work that goes on in departments around disciplinary issues...'

The Head of Construction at Longhurst said 'there is a policy for every manager to meet staff once every month; it's a download session really, they talk about jobs on site, with end users, how they are working, if it doesn't work we think of alternatives, to get the best solution…' The Quality and Information Manager at Longhurst noted 'in the next three-five years…there will be more conflating of work… We try to be more effective. Previously…the last two companies (Friendship Care and Spire Homes) had 2 IT systems…there will be better returns on investments…' An employee said 'until recently we have been financially stable but there's increasing recognition we have to compete, to be cost effective and to be able to grow. Government grant aid has been cut, so the only way to grow is to be leaner and meaner so that we can borrow more and build more...'

The Systems Manager at Bakkavor noted the following changes in working practices: 'The change was driven by becoming leaner, to measure ourselves, train personnel and a need to drive down labour costs to make maximum profits… The previous management team has been scrapped. In a similar vein, the way we quantify all the processes have changed. For example information and manufacturing processes have changed, technical staff [Technical Assistants] have been increased, factory operatives have decreased, but there has been more management staff, more quality assistants, more health and safety staff…'

Stage 2

Managers started to inject more disciplinary measures into their organizations having realized that previous efforts to use the scientific approach had failed. Employees did two things simultaneously: they showed signs of being disciplined by reporting and leaving work on time, carrying out their responsibilities whilst finding additional ways not to be cowed by the technical measures. They did so by occasionally reporting late for work or sometimes failing to do so and providing countless reasons for their tardiness. Managers began to despair at the ways employees were talking to each other and bringing in unofficial methods to get their work done. HRM and Health and Safety procedures and policies were being side-lined as employees interpreted the rules managers had put in place to suit their own work and personal circumstances. They started to find more intelligent ways to work round the proposed organizational changes.

In 2004/2005 employees at Eden talked about 'making work arrangements less strict' or if one wills, less scientific/technical and 'erasing job boundaries'. Staff at Longhurst noted that jobs were given 'verbally to a team in the ICT Department…This is informal as opposed to laid-down (HRM) policies and procedures… Staff devised their own ways of conducting daily operations.' In a similar vein, Lagat (formerly Prospects) staff at their Lincoln office talked about adopting 'working practices which were at odds with their London counterparts.'

Stage 3

Managers started to identify what they termed 'new strategies' to engage their employees more as they realized the resistance generated from their earlier draconian, scientific measures was damaging progress. Employees saw these measures as 'hard'. Managers identified values such as organizational effectiveness, value for organizational gain, sustainability, organizational survival and so on which they thought employees could easily assimilate into. However, employees felt they have been treated in a disrespectful and objectified way. They started to develop their own communication methods as a way not to talk to

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

their managers thereby creating a two-tier communication system. To make matters worse, managers insisted that employees should report their actions (or inactions) to their Line Managers/Supervisors. Failure to do so was judged by management as acts of sabotage and that employees were not wanting to cooperate. Employees began to explore additional ways of institutionalising structures that work in the organization's favour and interests. Managers tried to reinstate 'hard' procedures, measures and structures.

Some employees talked about 'undergoing a lot of pressure and job stress' simply because they were having to be compelled by managers to 'meet the daily targets' and to bow to shareholder demands of boosting profitability because 'shareholders have the power' in Laurens.

Stage 4

Employees increasingly engaged other employees to fight against the 'harsh' management strategies. They began to take up additional roles whilst managers emphasized that employees needed to stick with their official responsibilities. This they thought would facilitate monitoring and supervision of staff outputs. When employees sought to be more entrepreneurial, managers introduced what they saw as further bottlenecks in the work of Dispatch, Health and Safety, Cleaning and Production staff. When the latter failed to comply managers became despondent and increased the monitoring mechanisms. Employees began to feel that they have discovered a new sense of personal dignity outside of the technical procedures. Managers introduced quality checks and increased the number of and heightened the role and responsibilities of quality teams and customer services. Managers thought their implementation will boost the cooperation between the parties. The counter-effect was achieved in Eden as employees viewed such a move with cynicism and full of technical elements.

In the 2011, the Quality Manager at Longhurst remarked 'We have residents' scrutiny panels who look at our customer service. Residents are engaged and quite involved in retendering contracts and that has been good' (i.e. in improving our services). Another said 'we have always had housing officers who engage with the local community…the expectation to engage with people…'

At Laurens and Eden employees started to seek for a second point of view different from what was going on in Longhurst who engaged with their local communities for such second viewpoints. One employee remarked 'people would say: 'we used to do this and that together' as employees) whilst it was becoming practice for 'junior support staff at Eden to confide to trainers' for a second opinion different from managers' technical ways.

Stage 5

Employees initiated the development of sub-cultural groups which they thought would provide the necessary support for other employees affected by managers' strategies and desires. Employees began to identify tasks which they were collectively good at and started to work more closely with others in other departments to make their effect and employment power on management more pronounced. They increasingly would not report their actions to managers but to each other. They began to stimulate each other to be more productive and effective in dealing with management's 'harsh' strategies. Managers started to backtrack on some of their actions and emphasized their personal power as a cushion against the backlash.

In 2004/2005 an employee at Laurens said 'managers and the proprietor of the business have a lot of power here. The proprietor owns the land.' Employees observed that managers' responses in resolv-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ing the change implementation issues were not sustainable and they started to question management's competence in managing the change process in the longer term. Lagat employees doubted whether their managers' could see the sustainability of providing educational and counselling services to younger adults in the future whilst Eden employees viewed with cynicism managers' sudden drive to increase value for money in every service.

In 2011, an employee at Bakkavor said 'I want to have responsibility... I manage my function and I get on with it… I would like to…develop towards a broader role…and then have a more strategic role… in another Bakkavor site…' Others mentioned 'learning to appreciate the work demands on each other's role through support for each other…'

An employee at Eden remarked 'it's about developing a positive attitude, enhance team working across departments and develop…'a very 'can do' approach. There's a lot of cross working, a lot of cross function work that goes on…Cross departmental working is appropriate…'

Along similar lines, another employee at Eden remarked 'more is expected; managers are less visible, because they have more work to do…as an employee I used to go to people and say 'can I help with something'…'

Stage 6

By stage 6, employees were increasingly behaving as if they were influencing their organizational change. They were putting what they thought were the appropriate strategies to respond to the constraints and successfully. They were cognisant of their value and in what they could do. They started to encourage others to be more supportive and to be competent. One employee made the following comment 'we at Laurens are self-supportive' whilst another said 'I think more communication is required at Laurens because of the high turnover rates' whilst another said 'management at Lagat need to be talking to staff informally.' This stage witnessed employees' growing confidence in their abilities to make their motivations and objectives felt when managers were trying to fight off their resistance by using technical procedures. Paradoxically, managers realized that employees were becoming more competent in their roles as change implementers and said that 'jobs are allocated based on responsibilities at Eden'.

The story of these six stages has shown that when managers were implementing wide-scale organizational changes as 'change agents', employees were increasingly showing signs that were akin to positive and active participants. Their actions suggested a reversal of roles as they took the role of 'change agents' as they displayed behaviour that suggested they had the welfare of their organizations to heart. They demonstrated that they could be innovative even when they came across management barriers and power that incited resistance. Such developments are composed of people who come together in a collective effort to defy the constraints that included treating staff as objects of change. This type of development is what has been referred to as people having 'expert presence'. Its contribution to the literature, its practical benefits and how it was developed from the six stages are discussed in the next section.

DISCUSSIONS

'Expert presence' highlights six steps that help in including individual objectives, something that is not mentioned in the type of cooperation that Lewin's three or Kotter's eight steps, the resistance literature from Dent and Goldberg (1999) or the competency and cross-cultural frameworks that Kanter (2012)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and the Future Work Skills 2020 intended to achieve. Employees showed that they can channel what they wanted done in a stage-by-stage process that provided the practical support needed for organizational members. The author therefore challenges the interpretation of (societal and organizational) change as initiated by people in leading roles, e.g. managers (including Chief Executive Officers), democratically-elected or self-imposed individuals and so on. This view is particularly inherent in some of the well-known proponents and scholars of social change (Lewin, Kotter) and also in that of people who may avail themselves the opportunity to use the results of applying the technical/scientific method. In the author's view, it is advantageous and even responsible to stimulate those implementing social and organizational change to not only contribute to the formulation of the objectives but equally importantly to the identification and appropriate use of the resources needed for the specific type of change. This is fundamental especially in paradigmatic-type change similar to the ones described in the four case studies here. The data from the cases show that employees of organizations that had to change as they faced situations that posed serious threats to their existence contributed in terms of identifying the necessary resources to avoid their organization's demise. This type of contribution is referred to as having 'expert presence'. It will be beneficial for future HR Managers and the HRM and OB student-learners to be able to recognize characteristics of such expertise and to develop similar attributes so as to help their future organizations manage change successfully and responsibly.

In addition to the literature the story that emerged from the responses seems to balance the notions of resistance (see Piderit, 2000; Dent and Goldberg, 1999) as well as cooperation by showing a variety of other ways managers have identified what was needed and how they reacted to the changes. Lessons for scholars, student-learners and practitioners are derived from reflections and discussions on the findings and include the following. Employees cannot simply be viewed as passive recipients as shown with the traditional technical/scientific approach whereby resistance to change is identified, reified and dealt with through standard HR and OB procedures. The emerging story shows the springing up of new organizational heroes and heroines who are different from those advocated by Lewin, Kotter, Buchanan and Huczynski. Teaching change management in the traditional sense in HRM and Organizational Behaviour has been shown in the four cases to have woefully failed in motivating and inspiring their employees at the grassroots. The latter had to innovate and create working practices that not only helped in making the organizational changes to stick but to enhance their organizations' continuous survival (Argyris and Schon, 1996). The findings show that HR Managers and student-learners need to become aware of the complexities involved in identifying objectives when they instantiate organizational change processes and procedures. The findings from the four cases also show that employees, students as well as managers need to be aware of the potential pitfalls and develop capacities to manage these.

The six stages demonstrate that individual motivations do matter in successful organizational change. When managers isolated themselves as part of their fightback to resistance (see stages three and four), this tactic seemed to have worsened resistance. Employees showed they were additionally strengthened as they identified the need to build sub-culture groups and strategize to 'save' their organizations from elements of the scientific approach used by the managers as originally designed by Lewin (1947). If employees had resisted (see stage five) and not shown expertise (see stage six) this could have led to organizational failure. The case has therefore been argued, using the data and the literature for people's motivations to be part of change management procedures (technical, non-technical, resistance and 'expert presence'). The chapter has successfully made the argument for rebalancing the notions of resistance and cooperation in the teaching of Organizational Change within HRM and OB.

An additional lesson for student-learners is that resistance has to be researched and taught by academic staff not as something negative that HR Managers need to deal with/manage in line with traditional management literature but as part of the resources that people contribute to organizational change. This marks a significant departure from its earlier treatment (see Lewin, 1947; Coch and French, 1948; Armenakis et al.., 1993; Kotter, 2008). In other words, employees' exhibition of a range of reactions and motivations should provide the platform for HR Managers to learn about the nature of the constraints, its sources (e.g. clients, patients, suppliers) and how to deal with these in a responsible way (i.e. in a way that serves the collective good). Employees were responding to pressures externally (Romanelli and Tushman, 1994) as they simultaneously were changing their behaviours based on the internal change phenomenon (see Schwarz and Stensaker, 2014). Therefore the teaching and researching of organizational change should not be dichotomized by academic staff as presented by Ford et al.. (2008) or treated as 'ambivalent' (Piderit, 2000). This answers the first research question on whether employees do play a role in change.

The results from the six stages have shown that when HR Managers are faced with the responsibility of balancing their personal and official power with staff, they tended to fall back to the traditional, technical approach to deal with staff (French and Raven, 1959; Agnew, 2005). The lesson for student-learners here is that HR Managers need to be aware of when their power can be used irresponsibly at their organization's detriment and to avoid destructive conflicts and resistance from the shop-floor. HR Managers should listen to people as they drive change with staff. Employees have shown they can upskill themselves, take on additional workloads and adapt to internal and external pressures. This has answered the second research issue on the impact of organizational change on the daily lives of employees. The notion of 'expert presence' responds to the third research question on investigating other approaches to organizational change other than the predominant technical approaches in the tradition of Lewin (1947) and Kotter (2012). This type of organization is different from the upskilling, the organizational competence claimed by Kanter (2012) and the cross-cultural competence propounded by the Future Work Skills 2020. What the four cases demonstrate is that teaching, researching and learning about change should recognize a more bottom-up approach to organizational change, referred to fittingly as 'expert presence'. When all parties develop expertise in this area, it limits the practical destruction that would have been caused had elements of the scientific approach continued to be used. The notion is informed by the change phenomenon as advocated for by Schwarz and Stensaker (2014) and still satisfies the quest for rethinking and reframing emerging notions in the area (Burke, 2010; Suddaby, 2011; Hodgkinson, 2011; Hassard, 2013).

From 'expert presence' employees showed that resistance could be treated by HR Managers as a positive development contrary to earlier claims by Dent and Goldberg (1999) or Coch and French (1948). It shows employees are prepared to work round impositions and control from their managers (Felstead et al.., 2003) by becoming more active in identifying groups, structures and practices that bring about successful change. Managers should learn ways of using buffer positions created by staff to increase the value of their contributions as 'change agents' and 'change resistors'. 'Expert presence' made it possible to surface (via the six stages) and refer to the idea that staff may contribute individually and collectively by trying to become 'expert' at what they do and to do so by being present (i.e. being there (at the time and place of the change). The latter may be contrasted with the position of an external researcher who acquires knowledge or, if one wills expertise, without being there and hence is unable to include personal objectives and experiences in the knowledge and expertise acquired. It is envisaged that 'expert presence' enables managers and researchers to deal with the inadequacies of the scientific/technical procedures by capturing the increasingly complex nature of organisational change. 'Expert Presence' has made it

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

possible to allow for the identification of complex and, sometimes, difficult behaviors as well as how better to respond to the difficulties and complexities. HR Managers should learn that an increase in command and control structures using the scientific approach might serve to create unintended consequences of staff resilience and destructive conflict and resistance to organizational change. It behoves of management to deal with change issues more sensitively and responsibly and to develop managerial expertise in stimulating 'expert presence' contrary to earlier claims by Dent and Goldberg (1999) and Golembiewski et al. (1973). Such 'expert presence' is achieved when managers are supported to understand the limitations and potential pitfalls of using the outcomes of the technical/scientific method. The findings demonstrate that both managers and employees need to work together to formulate objectives and collectively identify the organisational resources needed to bring about effective change.

However, the question needs to be asked 'what happens when all employees develop 'expert presence'?' What the findings demonstrate is that some employees have identified the appropriate resources that helped in building their 'expert presence' which they then used to facilitate their organization's successful change. Some might argue that this initial expert group could be used to develop or enhance the expertise of all employees so that organizational change failure becomes a thing of the past. This could then cut down drastically on an organization's costs of having to hire change management experts/consultants, having to deal with resistant employees, resolving conflicts with trade union representatives and so on. Others might argue that paradigm shifting types of change as the ones captured in the four organizations need to celebrate the complexities and varieties of interactions involved. These include the cooperation, the resistance, the conflicts and the varieties of activities and behaviours such that current and future HR Managers and student-learners can deepen their understanding and knowledge of the shifting contours of the change phenomenon and be equipped to do something practical about it. Total 'expert presence' might stifle such kaleidoscopic presentation and the need to reframe and rethink the debates over time. Whatever the case, some 'expert presence' may help towards resolving some, if not all, of the resistance, the conflicts and unintended consequences that these might bring had the notion and its benefits not been surfaced and explained.

RECOMMENDATIONS

This section provides recommendations for HR Managers, academics and student-learners based on the findings and the lessons from the previous section as follows. It is recommended that current and future HR Managers take a more complex and comprehensive view and understanding of what employees do when challenged to adopt new ways of working rather than be restricted by and to the adoption of the scientific approach. As observed from the findings, doing so will wreak more havoc and destruction to change efforts and expertise. Based on the principal research outcome of 'expert presence', HR Managers, OB specialists and student-learners ought to recognize early signs of resistance and conflict and to guard against their negative consequences among shop-floor and others. Taking greater responsibility of management's actions is a starting point towards such change in managerial attitude and behaviour. This can be done by current and future HR Managers developing the capability to identify various stages of staff resilience as well as being able to act responsibly and at an early stage. When they do, they can utilize these apparently negative elements as knowledge from the grassroots to effectively deal with negativity within change environments. Additionally, it is recommended that HR Managers develop

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the capacity to identify those objectives that motivate staff to be resistant and what inspires them to be creative as a bottom up approach to enhance individual and collective expertise to change.

It is recommended that HRM and OB students recognize from the data that organizational change is instantiated by multiple members, not just solely by 'change agents' or 'change recipients' as portrayed in the extant literature. It is recommended that students view top management not distinctively as 'change centric' people who are out to 'save' their organizations but as participants in a process of developing expertise for everyone. The findings show that sometimes their actions might be as counter-productive as the change resistors they had initially intended to deal with. It is recommended that students are aware when destructive elements need to be treated more responsibly as upcoming HR Managers.

Academic staff could use the case study approach as one way to bring out the richness of change management issues in a complex and holistic manner in contrast to the rather simplified renditions of the topic from the technical/scientific or non-technical approach. Doing so will help to rebalance the debates and discussions on organizational change by portraying the and to show expertise in the process of teaching and researching its elements. The initial findings have shown that employees took charge as 'change agents' and made the required changes in working practices happen successfully. Referred to as 'expert presence' it is recommended that participants recognize each member and their objectives and motivations as a resource that could be pooled together for organizational benefit. When this happens, academics will be seen to be allowing for the identification and theorizing of a more complex and varied set of people's attitudes, motivations and objectives especially in environments that are controlled, constraining and difficult to manage. It is recommended that HR Managers see their role as one that enhances a more liberating environment where everyone is willing and capable to contribute to. It is also argued to be mindful of some of the potential pitfalls of trying to make all employees have 'expert presence'.

We (academics, non-academics, society) should recognize the limits of using the technical/scientific approach to organizational change and be prepared to explore less mechanistic procedures that enhance innovation and creativity from the bottom up. Resistance or elements therein could then be used to develop the capacity and expertise to change for the better. 'Expert presence' made it possible for people's points of view to be made to count in ways that they thought are more liberating than the scientific approach that sought to objectify what they did.

CONCLUSION AND FUTURE RESEARCH STUDY

In conclusion, the chapter has looked at two different approaches – the technical/scientific and the non-technical/non-scientific approach to organizational change. It is opined that both approaches have informed and been informed by HRM and OB education and literature over the past seventy years, especially since Lewin (1947) proposed his Force Field Model. It has also been shown that HR Managers make use of the predominantly technical approach when they implement and manage organizational change although with limited success as this has been shown from the literature and the findings to constrain what people want to do. When the procedures reported in Example One are noted to result in the reification of people's motivations, employees are blamed for being 'anxious', uncooperative and resistant (see Dent and Goldberg, 1999). These characteristics are perceived as negative 'barriers' or 'resistors' to change and Kotter (2008) proposed that Managers adopt the eight steps to deal with the problems caused. When employees still fail to cooperate tougher measures from the scientific approach are recommended as shown in Example Two.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Over the past seventy years, HRM and OB education and its literature have paid much attention on two principal actors dichotomized as 'change recipient'- employees who derail change efforts and 'change-centric' managers who are perceived as having the requisite competence to deliver successful outcomes (Golembiewski, 1976). The past decades have also witnessed the polarization of the debates between theory generation and phenomenon-informed change (Kotter and Schlesinger, 1979; Piderit, 2000; Eisenhardt et al., 2007; Burke, 2010; Schwarz and Stensaker, 2014). When the procedures of the scientific approach fail, others have proposed additional measures such as dealing with organizational politicking and using managerial power (French and Raven, 1959; Agnew, 2005). It is assumed these would quell employees' resistance and enhance what people contribute (Buchanan and Badham, 1999). Research results still show that organizational change fails as resistance or identity-affiliated resistance continues (Mahadevan, 2012) thereby shifting the contours of the phenomenological experience and how it is managed (Stensaker and Meyer, 2011). This has ushered in Example Three. To resolve the problem of resistance that HRM and OB education and literature might have benefited from Schwarz and Stensaker's (2014) call for 'straightening' the tightness of the proverbial theoretical 'jacket'. However, this does not guarantee that the anticipated organizational success will follow or that all employees will have 'expert presence'. In other words, it is not a guarantee that managers will convert resistant employees into overnight cooperating individuals with 'competence' to deliver successful change (Kanter, 2012). Or even that managers are aware of the destructive nature of their resistance-fuelling technical procedures. The imbalance between cooperation and resistance and sometimes lack of theoretical development has continued in HRM and OB for longer than is necessary.

What the six stages from the findings have shown is that HRM and OB education and its literature need to embrace something new, something that balances the notions of cooperation and resistance, serving both as a lesson and a set of practical recommendations. This is 'expert presence'. In terms of its operationalization, it would firstly be beneficial for academics and practitioners to recognize and incorporate in their teaching and practice that employees also have objectives just as organizations and their managers have objectives. Managers need to recognize and work with employees' objectives if they want to effect successful change. Using their power and influence alone (French and Raven, 1959) and falling back onto technical/scientific procedures have been shown not to provide the answers to bring about the required outcomes. Managers, future HR Managers and student-learners can use the six stage-story as one way that will help them to see how employees who found themselves in difficult organizational situations that had been brought about by the need for their organizations to change have channelled their objectives (including their motivation to resist) to provide support to each other in difficult change situations. Employees have demonstrated that they could re-develop their contributions contrary to parts of the technical and resistance approaches. These motivations and objectives have been played out by using the six stages and the arrangement produced 'expert presence'. The notion highlights what individuals and collectives can do as they resist imposition and mitigate against the negative impacts on their physical, emotional and mental wellbeing/wellness at work. The literature is vocal on employees' attitudes and reactions to change but silent on what motivates people to develop objectives perceived as resistant behaviours. The empirical data demonstrate employees took up active roles, adapted their objectives and made change work. This is a grassroots perspective different from the higher up/managerial, organization or societal-wide perspective.

The benefits of 'expert presence' are that it makes it possible to talk about and theorize instances where and when people are able to identify certain inappropriate interactions, constraints to their psychological and emotional development and to fight against/resist the predominant extant literature's

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

notions of employee frustration (Coch and French, 1948) or their 'discontent' (Graham, 1995: 220) or their anxiety (Argyris and Schon, 1978) or their 'un-readiness' (Armenakis et al.., 1993). It is recommended that managers use employees' objectives to support each other and to effect positive change. The operationalization of the concept via the story has also helped to answer the second as well as the third research question on 'the impact of change on employees' lives' by showing that even though there was a negative environment employees transitioned the negativity into something positive, proactive and supportive.

Academics should recognize that through research employees' actions and behaviours, HRM systems and the workplace can be combined and their combination via a series of steps/stages can produce a platform. Such a combination gave rise to 'expert presence'. This has demonstrated the potential of using experimental material from the findings to forge a more complex understanding of the issues raised and the objectives of people within various organizational change environments compared to the limited possibilities provided by the technical and resistance approaches. The findings show that the models proposed by Lewin and Kotter and the propositions made by Schwarz and Stensaker (2014) and their followers need further revisions and applications in order to provide the necessary expertise for successful and liberating change. The first step in doing so has been proposed through the recognition and contribution of 'expert presence' which serves to highlight the ways employees adapt their motivations and objectives to bring about a practical supportive structure and environment that could enhance successful change. A further study could look at how 'expert presence' might be resisted in other similar SMEs, what the nature of that resistance might look like, the nature and characteristics of developing total 'expert presence', any potential resistance to this and ways how these emerging characteristics and issues could be used to inform HR Managers and employees of other possibilities of change implementation and management. From such further research additional recommendations can be made to HR Managers, academics and students on alternative approaches of implementing and managing change…

Chapter 7
Challenges to Business Models in the Digital Transformation Context

Pedro Fernandes da Anunciação
Instituto Politécnico de Setúbal, Portugal

Francisco Madeira Esteves
Instituto Politécnico de Setúbal, Portugal

ABSTRACT

The digital transformation of the economy and society itself is pushing the economic organizations to processes. Multiple digital technologies like data analytics, enterprise mobility, social networks, cloud computing, robotics, block chain, and internet of things (IOT) are pushing radical changes in the ways of working (WoW). People with strong technological skills are demanding changes to organizations towards two-way business interaction in order to meet the needs and expectations. But consumers who are technology users expect new information and knowledge products and services based on technological potential. It remains to the organizations to define strategies for this transformation, seeking to adapt their organizational and information systems to this new paradigm of digital transformation.

INTRODUCTION

The economic and social environment is permanently challenged by technological innovation. The resources, structures and dynamics established in the economy and society are increasingly dependent on technological capabilities. This dependence also expresses greater vulnerability of people and organizations regarding the technological context of society and of the economy itself. As we move towards greater integration of the digital dimension into the lives of consumers and organizations, the collective responsibility of the various actors that ensure the availability and operation of infrastructure increases. It is this collective responsibility of the various stakeholders that depends on the quality of the transac-

tions carried out, the satisfaction of the products and services marketed, as well as the general social relations carried out through the technologies.

In this context, issues, like privacy or security, are permanently present in the activities of economic organizations, in the lives of technology users and in the new technological dimension of ethics, a concept rooted in ancient philosophy, reflects on the new human condition in the context of the digital economy and society (Anunciação, Esteves & Santos, 2014) (Anunciação, 2012) (Anunciação, 2008) (Anunciação & Santos, 2007). The lightening of the set of values and principles that, in the past, guided human practices, now, need adaptation, or perhaps not.

We live in a spiral difficult to control and even manage. Society and the digital economy constitute movements of society that have no return. The adhesion of consumers and citizens to information and communication technologies put pressure on economic and social organizations to adopt new working paradigms closely aligned with technological factors. ICT challenges business and organizations to adopt new models fully attuned to the technological potential, in any economic sector. If digital transformation in any large organization is tough - breaking down silos, overcoming legal barriers, fixed mindsets and internal conventions - negotiating technological change on the scale of the federal government is nightmarishly difficult (Gray & Parce, 2017).

Management requires responses in timings that are too short to adapt organizations and their operations to the market, modifying structures and adapting crystallized cultures. The setting is a permanent investment and managers are required net profits in the process of digital transformation of economic activities. And since many companies are not, and do not have, specialists in all technological areas, they will have to frame their activities in partnerships with specialists, focusing on their core business in order to frame their competitiveness.

The context associated with the process of economic and social transformation can be better evidenced through the analysis of the evolution of the digital economy in Portugal is presented in Tables 1-4 (IDC2015).

Table 1. Evolution of internet users

Online Population	2011	2012	2013	2014	2015
Evolution of users (millions)	6,1	6,7	6,7	7,0	7,4

Table 2. Evolution of the number of online buyers

Shopping Population Online	2011	2012	2013	2014	2015
Evolution of online purchases (millions)	1,9	2,3	2,5	2,7	3,1

There are several technologies that mark this digital era. Cloud computing, social networks, IoT (Internet of Things) and artificial intelligence, among others, are examples of new paradigms that are emerging and consolidating in the economy and society. Some of them have been breaking traditional paradigms associated with concepts fully assumed in the field of business sciences, such as cloud

Table 3. Activities on the internet

Activities on the Internet	Email	Search	Social Networks	Read News	Chat	Listen to Music
Personal computers	83%	67%	59%	55%	31%	30%
Tablet, smartphones	56%	39%	49%	35%	30%	19%

Table 4. Business presence on the internet

Activities on the Internet	All Companies	Public Administration	Banking and Insurance	Distribution and Retail	Industry	Services
Companies with own website	29%	89%	100%	28%	30%	29%
With page in business directory	7%	11%	30%	8%	8%	4%
With page in social networks	20%	39%	80%	19%	18%	24%
Selling on own website	10%	0%	70%	19%	3%	13%
Online sales in third-party site	3%	0%	30%	5%	6%	5%
Company with mobile APP	8%	11%	90%	6%	2%	9%

computing or data centers. The concept of Information System, traditionally framed and administered in the internal context of economic organizations, is now outsourced, providing remote access to users wherever they are. This feature is one of the biggest advantages of cloud computing, access to information anytime, anywhere. Take the health area as an example, and analyze the advantages of access to medical imaging and the possibility of clinics and hospitals accessing the patient's data, with just one computer or tablet and internet access.

This possibility is a new reality for management, in general, and for information systems managers, in particular. And, in this sense, it is important that management understands the various dimensions associated with the digital transformation as an impact on the organization and business. And in this sense, it is important to analyze the surrounding environment and understand, among other aspects, why traditional companies are failing at digital and how they can succeed; how to overcome strategic, operational, technical and market related causes of failure; how to benchmark, envision, roadmap and build a successful digital strategy, and why preparing for the future, near and far, ensures their readiness for the next decade's technology revolutions.

At the ubiquity (Anunciação & Zorrinho, 2006) must match the security of data / information and the respective treatments, and associated services and the scalability of the systems should match the suitability of providers. The management is, thus, responsible for a secure outsourcing of the information system, safeguarding core and core aspects such as service levels, operations and information backup or technical support, among other aspects.

With regard to social networks, their importance is not only due to the great ease of communication they provide, by allowing multiple connections between a significant diversity of people / users, but especially the exceptional source of data that originates and makes available. In social networks, people / consumers exchange opinions, evaluate products, dictate trends, judge behaviors and, above all, define

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

themselves as citizens and as consumers. Networks are currently the main communication channel, constituting excellent commercial channels of enormous competitive potential.

IoT (internet of things) is a new reality. Based on a network of billions of digitally connected devices, from homes to household appliances, from cars to clothing, global data collection and transmission are possible. In this domain, information and information systems governance is challenged by enhancing the digital world of economic organizations with the possibility of connecting a multiplicity of devices and objects that communicate and act according to certain parameters or instructions, given not only by people, but the machines themselves. This extension of information systems to the diverse needs of people, not only professional or social but also functional support to their life (appliances, housing, transport, etc.), challenges and will continue to challenge architecture or organizational urbanism (Anunciação & Zorrinho, 2006) (Anunciação, 2016) (Anunciação, 2015) of the economy and society itself. Not only will be required, new technological, treatment and storage, connectivity or interoperability capacities, but, above all, new instruments and models will be required to facilitate the management of a new context where the limits are difficult to identify.

While there were updates on familiar themes from prior years, such as the Internet of Things (IoT) and cloud computing, the major shift this year has been a central focus on Artificial Intelligence (AI) across industries, and a need for an even more aggressive approach to digital transformation in order to compete (Tiersky, 2017). The Artificial Intelligence has perhaps associated the most radical change, in that it provides a new relationship between the human person and the technologies, devaluing several dimensions that realize the human being.

Eventually, we are faced with a new challenge for the human being if he comes to rethinking himself, his role in the economy and his framework in society itself. Since the industrial revolution that seeks to overcome human limitations and increase their capacities. With artificial intelligence, he walks to the possibility of overcoming not only physical limitations but his own intellectual capacities. Some social researchers are currently questioning whether, in the future, people will be driven by machines or even if some "digital people" on social networks are real.

In the economic context, artificial intelligence, in addition to enabling smarter choices, provides the possibility of predictive analytics development, linking work environments, personal life, leisure, health, etc., conditioning options and choices. If the virtue of the advantage of having an instrument that can increase our capacity for action is clear, it is also evident the perspective of a greater conditioning, and control of what we are and what we do which, in economic terms, can have significant repercussions.

As we consolidate these changes, many of the foundations (principles, values, models, instruments, etc.) that have so far oriented the functioning and development of economic organizations, and even of the theory itself, have been questioned in society and in economic management. The traditional principles of business science are difficult to fit into the new reality. It is important to understand the new requirements associated with the functioning of economic institutions in a framework that tends to be completely technological and to be able to define a matrix for the desired development in view of the organizational and economic sustainability.

Most business leaders agree that digital transformation - a wave of business innovation fueled by technology - is disrupting their business or soon will be, but fewer than half have enacted a digital strategy, according to a new report by Harvard Business Review Analytic Services (Olavsrud, 2017). But, according Westerman (2018), technology doesn't provide value to a business. It never has (except for technology in products). Instead, technology's value comes from doing business differently because technology makes it possible. E-commerce is not about the internet — it's about selling differently. Analytics is not about

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

databases and machine language algorithms — it's about understanding customers better, or optimizing maintenance processes, or helping doctors diagnose cancer more accurately. IoT is not about RFID tags — it's about radically synchronizing operations or changing business models (Westerman, 2018).

If it is true that technologies continue and will continue to dictate the meaning of economic and social development, managers need to understand how this development tends to take place. If, in the past, the adoption of technologies was carried out essentially from a one-to-one or individual perspective, where the main objective was productivity and efficiency gains or the improvement of the functioning of the operational structures, the development now fits into a two ways perspective, relational or collaborative, whose benefit depends on the degree of depth of relations, service and value to the parties involved.

Although the centrality lies in technological innovation, its focus is associated with the relationship between technology service providers and customers / citizens / users in general. Citizens/users, while tending to be more and more active in the technologies, will seek players who provide services capable of meeting their permanent information needs. It is not only a question of satisfying a specific commercial need, but of a whole set of complementary or associated needs. Thus, emerges, as a competitive paradigm, the "360º" vision of the client/citizen.

It is in this context that organizations must evolve and transform themselves. They should identify the critical dimensions for this evolution, from structure to technology integration, from partners to customers. Ismail (2014) characterizes the organizations in this context as Exponential Organizations, considering that these have to be better, faster and cheaper than the competitors. The economy and competition do not, in this field, leave a great alternative. Organizations are, in general, pressured to increasingly provide technology-based services. It is precisely in the capacity to complement the tangible dimension of services with the digital dimension and, above all, in the evolutionary capacity to complement supply and demand for digital products and services that will face the greatest challenge of digital transformation.

This is a movement that has no return and that fits a new scenario for the economic sustainability of organizations. Make digital transformation core to your business strategy (Albanese & Manning, 2016). Adaptation to it is a management imperative, depending on the managers' ability to give their organizations a strategic look at digital transformation.

WHAT IS DIGITAL TRANSFORMATION?

The change in the needs of the business has not happened overnight. Business needs have been gradually evolving throughout the internet and mobile computing eras where technology became more accessible, vendor offering matured products and services and the rest of the business became more tech savvy. The disruptive technologies and trends, such as social, mobile and cloud, did not create the gap; they have widened it to the point where it cannot be ignored (Shrivastava, 2017) (Cox, 2014).

In this sense, we can consider digital transformation as the set of disruptive changes that institutions must make in business, organizations, structures and forms of operation and development of the respective activities based on the digital paradigm. It is not just a substitution of people or activities for technologies, but a new economic view of the institutions and their activity through ICT and, above all, the generation of new value for customers or citizens / users in relation to the products marketed or services provided.

The digital transformation market size is estimated to grow from USD 148.04 billion in 2015 to USD 392.15 billion by 2021, at a Compound Annual Growth Rate (CAGR) of 18.7% (Newswire, 2016) (Wire, 2016). Companies are seeking ways to increase revenue and reduce expenses, as the global market

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

competition continues to shrink profit margins. Organizations of all sizes are focusing more on analyzing sales and market saturation in specific territories and identifying gaps. However, the lack of awareness regarding the benefits of digitalization is a restraining factor for the digital transformation market. (Wire, 2016). In the Portuguese case, for example, according to the Marktest Telecommunications Barometer study, smartphone usage and the penetration rate have registered an upward trend over the last few years, rising from 40.4% in 2013 to 71.6% in July 2017 (Marktest, 2017). It is, therefore, natural for customers to expect benefits in terms of mobility, access to information and services when they need them, whatever the channel (smartphone, for example). These challenge is not only to provide instruments, means and services that meet customers' needs and expectations, but also the possibility of collecting data on them and on the operations carried out, in order to allow a better understanding of them big data, analytics, for example). These tools enable the opportunity to develop deeper knowledge about customers, seeking to improve their experience, regardless of the device used in access to information.

There are several relevant and central domains presented in the scope of digital transformation by various authors. Tiersky (2017), for example, mentions that this shift breaks into five interrelated insights: customer expectations continue to rise, speed is more important than ever, customer insight continues to be essential, artificial intelligence is front and center and digital transformation means business transformation. On the other hand, Evans (2017) considers that digital transformation is a broad subject that requires competency across strategy and vision, people and culture, process and governance, and technology and capabilities. Strategy is before technology (Schwertner, 2017) (Westerman, 2017). In the area of the strategy and vision pillar, this author refers to the existence of some of the key elements that include digital transformation strategy, digital transformation focus and investments. The digital strategy must be understood as a process from strategy to execution. It's important for the digital strategy to set the stake in the ground in terms of target business outcomes. Digital focus is important to establish a customer-centric perspective that drives transformation journeys and continuously adjusts based on changing customer demands. And Investment specifically allocated to digital transformation as a critical factor to fund the large-scale transformational change that's essential across business models, business processes, products and services.

With regard to the second pillar, people & culture, some of the key elements include leadership, culture and digital skills. Leadership as a digital transformation necessity, to enforce behaviors, and to keep programs chartered and aligned with the external perspective front of mind. Culture because digital transformation initiatives require re-inventing and re-designing traditional business models, processes and ways of working, it necessitates an innovative and collaborative culture to enable tolerance and receptivity to risk, to embrace and empower change, and to encourage innovation and experimentation. And digital skills because digital transformation initiatives require new technologies, capabilities and approaches, so it takes strong digital skills embedded in all strategic areas across the organization to do the heavy lifting with a completely new set of tools and techniques.

Concerning the third pillar, process & governance, some of the key elements include innovation management, change management and governance. Digital innovation leading practices in corporate innovation, and they are important to identify and accelerate digital transformation initiatives from idea to execution and to provide a mechanism for continuous and collaborative innovation across internal and external constituencies. Change management because digital transformation initiatives typically have a broader and deeper change impact than traditional ones, change management programs need to take a more holistic view across a wider range of stakeholders with a richer, ongoing engagement model. And Governance because digital transformation initiatives span traditional business units and silos, affecting

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

all parts of the organization. As a result, effective digital governance is important to promote the right levels of coordination and sharing to minimize risk and cost and to ensure close and continual alignment with strategic priorities.

As regards the fourth pillar, technology & capabilities, some of the key elements include disruptive technologies, platform business models and digital services mastery. Disruptive technologies because, when building the next wave of digital applications, disruptive technologies can be applied in powerful combinations – first, as digital experience essentials (with technologies such as social, mobile, analytics and cloud) and, then, as digital experience enhancers (intelligent automation, IoT and next generation cyber security) - to create unique new value propositions for customers. Platform business models because they convert traditional, linear value chains into multi-dimensional value networks. They convert the pipeline business model, where value creation is one-way and subject to bottlenecks throughout the supply chain, into a platform business model where value creation is two-way and continuous. Digital services mastery because the next step for IT is to consider the "how" as well as the "what". It's no longer sufficient to have an innovative set of products or services (the "what"). You have to be a master of how you design, develop, deploy, manage and continually evolve your digital services (the "how") as well.

Rogers (2016), on the other hand, presents five more concrete domains: customers, competitors, data, innovation and value, specifying the nature of the transformation to be carried out, according to Table 5.

Among other aspects, we can point out as critical the following aspects:

Table 5. Changes in strategic assumptions from the analog to the digital age

	From	To
Customers	Customers as mass market Communications are broadcast to customers Firm is the key influencer Marketing to persuade purchase One-way value flows Economies of (firm) scale	Customers as dynamic network Communications are two-way Customers are the key influencer Marketing to inspire purchase, loyalty, advocacy Reciprocal value flows Economies of (customer) value
Competition	Competition within defined industries Clear distinctions between partners and rivals Competition is a zero-sum game Key assets are held inside the firm Products with unique features and benefits A few dominant competitors per category	Competition across fluid industries Blurred distinctions between partners and rivals Competitors cooperate in key areas Key assets reside in outside networks Platforms with partners who exchange value Winner-takes-all due to network effects
Data	Data is expensive to generate in firm Challenge of data is storing and managing it Firms make use only of structured data Data is managed in operational silos Data is a tool for optimizing processes	Data is continuously generated everywhere Challenge of data is turning it into valuable information Unstructured data is increasingly usable and valuable Value of data is in connecting it across silos Data is a key intangible asset for value creation
Innovation	Decisions made based on intuition and seniority Testing ideas is expensive, slow and difficult Experiments conducted infrequently by experts Challenge of innovation is to find the right solution Failure is avoided at all cost Focus is on the "finished" product	Decisions made based on testing and validating Testing ideas is cheap, fast and easy Experiments conducted constantly, by everyone Challenge of innovation is to solve the right problem Failures are learned from, early and cheaply Focus is on minimum viable prototypes and iteration after launch
Value	Value proposition defined by industry Execute your current value proposition Optimize your business model as long as possible Judge change by how it impacts your current business Market success allows for complacency	Value proposition defined by changing customer needs Uncover the next opportunity for customer value Evolve before you must, to stay ahead of the curve Judge change by how it could create your next business "Only the paranoid survive"

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The traditional one-way business relationship (supplier → customer) tends to be replaced by a two-way economic relationship (supplier ←→ customer);
- Commercial relations tend to be dictated more by the service than by the product, more by the value they provide and not by the associated price;
- Technologies tend to be adopted and framed more by their potential and strategic value than by the productivity gains and efficiency they can provide;
- Systems tend to be evaluated more for perceived quality, output quality and reliability relative to the operations performed, no longer being considered from the perspective of production;
- Customer loyalty tends to be associated more with the value generated by the system and with the opportunity of the services it provides.

Although we can consider that, due to the great adhesion of the majority of people to information and communication technologies, digital transformation is occurring naturally among companies and citizens, it cannot be passively classified by managers and organizations. The assumption of the centrality of the digital transformation should not only result in a reaction to the market or to competition as a result forced by the need for survival, or even a result of the cost reduction demand. The digital transformation must be understood as a strategic decision, which must correspond, on the part of the management, a process of immersion in the technological potential and the inclusion of the technologies in the diverse organizational dimensions, in view of a concrete response to the digital context. It is not only a matter of generating value through productivity or organizational efficiency, but also because of the strategic dimension of competitiveness, fully in line with market requirements. Technological innovation must be reflected in the innovation of activities, products and services, structures, relationships and knowledge.

Technological innovation opens up windows of opportunity insofar as it is possible to identify, know, make and reach in relation to the exterior. It should be noted that the concept of digital transformation has associated two dimensions that give meaning to the depth of its meaning. The first refers to the concept of transformation. A process of transformation presupposes, as the expression itself indicates, a change of a certain status quo and the transition to a different, higher value state. This transition, from a management perspective, must be a thoughtful, reflective and planned act, with well defined objectives and expected results. The second dimension concerns the inductive and central element of transformation, the digital dimension. This digital transformation is now an imperative of economic survival, and it is closely related to the way citizens and consumers are being increasingly supported in digital technologies. Opportunities provided by technological connectivity, ubiquity of services, business opportunities, among other examples, encourage users to demand appropriate business responses from service providers regarding the provision of products or services.

Many companies in sectors such as financial, distribution or health are making significant investments in this field in the expectation of generating competitive differentials. These competitive differentials between companies will depend on the knowledge they generate and have about their customers, the ability to interact with them and the ability to provide them with value. The central question lies in the relationship they achieve between these three dimensions, that is, in the capacity to meet their expectations, in the timing adequacy, in the innovation in services and products and in the quality of the technological platform that supports them.

An investment in technology that does not emerge its value in organizational structures and dynamics does not provide significant competitive and economic improvements. Salesforce's State of IT survey found that digitally transforming companies are 3.7 times more likely to adopt technology trends vis-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

à-vis competitors, invest 1.8 times more in software and customer interface technology (for example in sales apps, marketing and customer service applications), and are more likely to adopt digital channels (4.8 times more) for customer loyalty.

The benefits of digital transformation will only be noticeable if the organizational vision integrates IS / IT and its managers understand the benefits of the economic innovation of technologies. It is true that cloud computing, for example, allows the release of resources associated with the management and maintenance of the technological infrastructure of organizations. However, it will be in the ability to overcome the legacy of technologies and the destruction of information silos that will be the critical success factor of digital transformation. Associated with this generation of knowledge are also the set of functionalities and channels of access to customers through, for example, increasing the availability of apps to customers and employees, improving the quality of business functions, customer loyalty, security, etc.

The management vision of IS / IT will have to change radically. These will have to cease to be seen as cost centers and should be classified as revenue centers. This change should put IS / IT leaders in a position of great responsibility and enormous opportunity.

CRITICAL AREAS IN DIGITAL TRANSFORMATION

There may be several drivers associated with digital transformation that can support management in the development of strategies in this domain. For example, Hess *et al*. (2016) consider that there are four key dimensions to any digital transformation endeavor: the use of technologies, that must reflect a firm`s approach and capability to explore and exploit new digital technologies; change in value creation, that must reflects the influence of digital transformation on a firm`s value creation; structural changes, that must reflect the modifications in organizational structures, processes and skill sets that are necessary to cope with and exploit new technologies; and the financial aspects, that must relates to both a firm`s need for action in response to a struggling core business, as well as its ability to finance a digital transformation endeavor.

However, the existence of some questions regarding this transformation can help economic agents focus the objectives of this transformation, for example, what is the vision for improving the lives of customers? How do you want to put your vision into action? What are your digital capabilities? And how will you urbanize and re-architect the business and the organization? (Moore, w.d.).

We propose the analysis in three main central axes of this process of transformation:

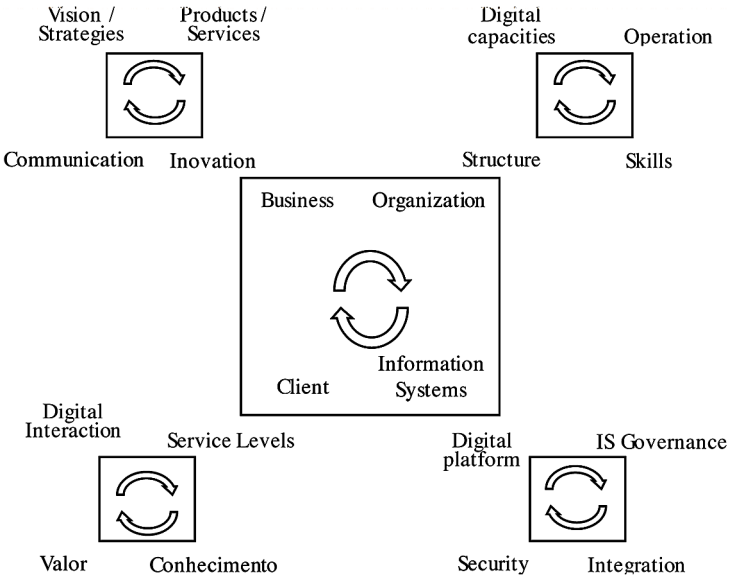
- Business (change in business);
- Knowledge (about the activity and about the client);
- Value (generated for the customer).

It is true that other factors could be enunciated, however, we consider these as central and specific axes associated with this matter.

The change in the business must make evident how the organization and the managers can adopt innovation and the digital dimension in the organizational functioning, and the economic activities developed. It is important to analyze whether technological innovation has provided an opportunity for innovation at the business level and whether technologies, in addition to promoting productivity and organizational efficiency, have provided new ways of developing activities and greater reach in com-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

mercial actions. As mentioned previously, opportunities are not only achievable with the acquisition and introduction of technologies. The adoption of technologies must necessarily be analyzed and managed in order to provide the organization with new dynamics, both internal and external. In addition to the reflection on the improvement of the institutional image, in its brands, among other examples, there is a broad spectrum of opportunities in the approach to digital markets, such as the possibility of providing a wide range of new services and the possibility of customization or simulation, commercial advice or post-sale monitoring. These may be new requirements that, in digital markets, greatly contribute to the increase of customer loyalty.



The transformation of the business presupposes, as has been shown previously, organizational adaptation. Traditional functions, such as sales, marketing, service, finance, will have to be redefined appropriate to the digital potential, but above all the boundaries traditionally delimited by hierarchical structures will have to be re-equated.

In this context, in order to understand and size the digital transformation of organizations in the aforementioned axes, we consider the following as domains or analysis strands the most relevant (Figure 1): business, organization, information systems and the customer.

In business domain, it is important to analyze, among others, the following aspects:

- **Business:**

Figure 1. Digital transformation domains

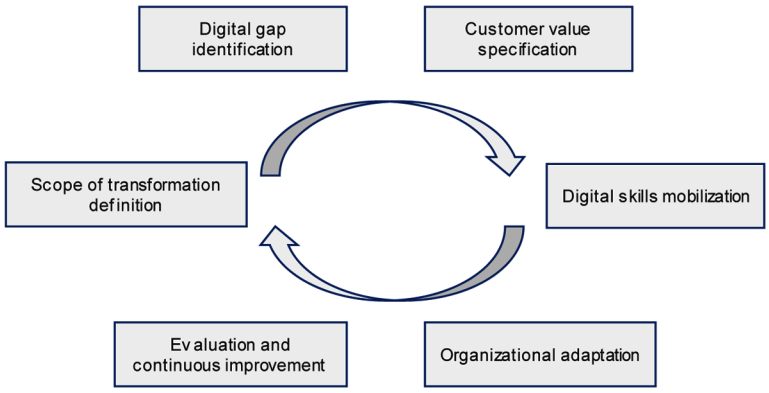
  - **Vision / Strategies:** What strategies are defined and assumed that specifically aim at the digital transformation of the business, activities, organization, products or services?
  - **Products / Services:** What digital products or services have been developed, are they developing or are they expected to be developed? How will these be complemented by the traditional offer?

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

    - **Innovation:** What digital initiatives, within the scope of organizational innovation or of products and services, are being developed or are expected to be developed by the institution?
    - **Communication:** What degree of digital communication is there and what is the expected increase in digital transformation?
- **Organization:**
    - **Digital Capabilities:** How deep is the digital dimension of processes, activities, products and services?
    - **Operation -** What changes have been or are expected to be recorded in organizational operation with a view to digital transformation?
    - **Competencies:** Are existing skills both internally and at the customer level sufficient to support digital transformation strategies?
    - **Structure:** Who takes responsibility for digital transformation?
- **Information Systems:**
    - **Digital Platform:** What is the scope of the digital platform in the framework of the activities carried out? What technological paradigms do they support (IoT, AI, etc.)?
    - **Information Systems Governance:** What policies exist in relation to systems, technologies and information (architecture, urban planning, security, investments, etc.)?
    - **Integration:** What level of integration is there in information systems? And what level is expected or desired?
    - **Security:** What policies and procedures exist in the area of information security and digital systems?
- **Client:**
    - **Digital Interaction:** What level of digital interaction exists or is expected to be generated with customers by virtue of the inclusion of digital technologies?
    - **Service Levels:** What increases our levels of service have been achieved or are expected to be achieved with the introduction of the digital dimension in organizational operation?
    - **Knowledge:** What level of knowledge is there and expected to have on customers? What technologies enhance this knowledge (for example, Business Intelligence)?
    - **Value:** What metrics are being adopted, are they adopted or will be adopted to measure the value generated for the client?

In addition to understanding the dimensions presented above, it is important that management defines a roadmap for a progressive and coherent transition to digital operation. According Weill & Woerner (2018), there are four different pathways that for a digital economy:

- **Standardize First:** Building a platform mindset with API (application programming interface) enabled business services that can be accessed across the enterprise and also externally;
- **Improve Customer Experience First:** Improve the customer experience across the whole enterprise, attempt to do several things at once: develop new attractive offers, build mobile apps and websites, improve call centers, and empower relationship managers;
- **Take Stair Steps:** Alternating their focus from improving customer experience to improving operations and then back again, shifting the focus back and forth as needed;
- **Create a New Organization:** Transform their existing organization.



EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

However, we propose a life cycle for the digital transformation process. This integrates a roadmap that, in our view, clarifies and facilitates management intervention and organizational adaptation. Thus, we suggest:

- **Scope of Transformation Definition:** Clear and objective identification of the transformation to be undertaken (vision, strategy, processes, products, services, value, etc.);
- **Digital Gap Identification:** Survey of the current information system and identification of the developments and investments to be made necessary for a transition to a digital operation;
- **Customer Value Specification:** Identification of the needs and services offered in the digital context, highlighting the experience and value provided;
- **Digital Skills Mobilization:** Increase of internal and external knowledge and skills for the adoption of digital products and services, highlighting the value provided;
- **Organizational Adaptation:** Flexibility in the structure and organizational functioning to ensure continuous operation, in tune with the needs of clients and according to the timings provided by the technologies;
- **Evaluation and Continuous Improvement:** Identification of technological developments and their potential as well as customer adherence to them, assessing the current status quo and innovating.

CONCLUSION

Figure 2. Life cycle for digital transformation

As Cox (2014) points out, the paradigm of digital transformation decrees a disruptive change that implies a strategy for the transition. This transition must be clearly assumed and fulfilled. It must go through the definition of the scope of transformation, identification of the digital gap, specification of customer value, mobilization for digital competencies, organizational adaptation and evaluation and continuous improvement.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

It is not a process that begins with the introduction of information and communication technologies or ends with its entry into production. As Evans (2017) points out, we must consider that the digital transformation is clearly a journey, not a destination. This is a permanent journey that begins with the auscultation of the Market in general and of the customers in particular.

As previously mentioned, the challenge is not only to provide instruments, means and services that meet customers' needs and expectations. Essentially, the focus of digital transformation is to generate knowledge through access to customer data, to their expectations and to adjust operations, products and services, in order to allow for better understanding and satisfaction. Therefore, it will be vital to use analytical tools that address the potential associated with the big data and that provide economic value to the organization. These tools enable the opportunity to develop deeper knowledge about customers, seeking to improve their experience, regardless of the device used in access to information.

All these challenges will necessarily have to be framed within a governance perspective, which provides a starting point for the information systems and the organization, in full harmony with the challenges of the market and in close relation with the organizational capacities.

Chapter 8
Predictive Model of the Influence of Leadership Styles on Attitudes Towards Organizational Change Among Secondary School Teachers in Selangor

Yuen Fook Chan
Universiti Teknologi MARA, Malaysia

Nusrah Ahmad Mukhtar
Universiti Teknologi MARA, Malaysia

Norsidah Mohammed Noordin
Universiti Teknologi MARA, Malaysia

ABSTRACT

The chapter aimed to examine the relationship of leadership styles and attitude towards organizational change among 360 secondary school teachers in Selangor. Statistical analysis techniques, namely, mean and standard deviation, Pearson product moment correlation, and multiple regression analysis, were used. Findings indicated that although teachers perceived the leadership styles of their principals were only at the moderate level, teachers showed a high level of positive attitude towards organizational change. There were positive relationships between principals' leadership styles and teachers' attitudes towards organizational change. The results also revealed that 11.8% of the variance of attitude towards organizational change is explained by transformational leadership style. Hence, transformational leadership style has an influence on the teachers' attitudes towards organizational change. The practical implications of these findings were discussed to provide insights for the improvement on leadership practices towards organizational change in the secondary schools in Malaysia.

INTRODUCTION

Globalization, liberalization and information technology are three important change drivers that urge private and public organizations to endure a future constant change (Benn, Dunphy & Griffith, 2014; Osborne & Brown, 2013). Even though the goals of organizational change are varied, however, the common goals of most organizations are bettering the firm, and minimizing cost, crisis and intervention, and overcoming competition. In general, organizational change is a process to optimize performance in order to reach its ideal state. Hence, an organization that is able to deal with change will gain a competitive advantage (Chaston, 2012).

In today's rapid changing environment, it is unavoidable for any organization to undergo constant changes (Mossholder, Settoon, Armenankis & Harris 2000). Therefore, in view of the pressure from external environment such as globalization, internationalization, advancement of ICT and many others challenges, education system in Malaysia has undergone structural changes to face the challenge. In fact, Malaysian education system has entered an intensive phase of change with the introduction of the Malaysian Education Blueprint 2013-2025. (MOE, 2013). This policy was introduced in the context of rising international education standards and to uphold the Government's aspiration to better prepare Malaysia's children for the needs of the 21st century, and increase public and parental expectations of education policy. Hence, quality education has become the ultimate goal of transformation of Malaysian education for human capital development. Among the 11 strategies and operational shifts stated in the Malaysian Education Blueprint, there are two shifts (Shift 4 and 5) that are relevant to this study. The fourth shift is transforming teaching into a profession of choice, and the fifth shift is to ensure high-performing school leaders in every school. These two shifts have highlighted the roles of both the teachers and school head in school and in the transformation process of the Malaysian education system.

Since most educational changes happen in the classroom under the responsibility of teachers, hence teachers' attitude has become one of the crucial and critical factors in the process of organizational change (Wiboonuppatum, 2002). In fact, earlier, the Malaysian Ministry of Education has introduced Education Development Master Plan 2006 to 2010, with its six core agendas, that emphasis on commitment of the teaching workforce to increase the quality and efficiency of the educational system (Utusan Online, 2007). Nijhof, Jong and Beukhof (1998) and Wiboonuppatum (2002) have pointed out that teachers are main contributors to school success and quality. They deliver curriculum in bright, shiny new boxes and by the end of the academic year, students are expected to succeed (Loucks and Pratt, 1979). Undeniably, teachers are the ultimate key players in school organization and have the authority to make a difference in students' capital development. The teachers have the responsibilities to enhance the quality standard because all the actual education reform processes happen in the classroom. Hence, in this context, Nordin, Darmawan and Keeves (2009) agreed that teachers' dedication and commitment are vital in quality education. In this sense, teacher commitment has been identified as one of the most critical factors for the success of education and schools (Huberman, 1993).

To date, there are many issues and challenges emerged among school teachers after the Malaysian Education Blueprint has been implemented. These issues and challenges have great impacts on the teachers' attitudes towards the organizational change (Cheah, 2010; Noor & Sahip, 2010; Tan, 2010), and their reactions can range from quite positive and supportive to quite negative and very resistant. (Dunham, Grube, Gardner, Cummings & Pierce, 1989). In the second decade of the 21st century, teachers are likely to play the role as facilitators to provide scaffolding to students in developing their own personal ways of learning (Darling-Hammond, 2006). Teachers are no more like a sage talking in the front while

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

students are sitting and listening to the teachers. Teachers in 21st century learning are being more likely as a facilitator to invent active learning among students in the learning process. Thus, we visualize the aim of 21st century teaching as the development of knowledge, higher-order skills (such as the 4Cs of creativity, critical thinking, communication, collaboration), and character, as well as the establishment of lifelong learning habits and an ability to learn how-to-learn with technology as the central roles in the new picture of teacher effectiveness (Darling-Hammond, 2006).

As stated by KurÇunoğlu (2006), when attitudes of employees in an organization toward change have been identified, relevant preventive measures can be taken and right decisions can be adopted for change process and focus on change strategies. This is also applicable to teachers. It seems possible to take preventive actions and give right decisions about determining, planning, implementing and evaluating any type of change when attitudes of teachers toward change are exactly known. Teachers may either be willing to change or resisting change. Hence, Benveniste and McEwan (2000) suggested that adoption of educational changes such as new pedagogies can be attributed to the teachers 'willingness (motivation and commitment) to change.

For example, while schools are receiving intensive change, if the teachers, who are the front-line change implementers in schools, do not buy-in or apply the organizational change into practice, education transformation will only be adopted superficially or even fails. However, if teachers demonstrate positive attitude towards organizational change, they will cooperate and collaborate to make change happens. As according to Burke (2008) some organizational members are able to readily embrace the organizational change and they are moving towards it. Apparently, positive attitude towards organizational change has shown to be a crucial variable in accomplishing organizational aims and also succeeding the change programs (Eby, Adams, Russell & Gaby, 2000).

According to Lewin (1947), a successful change program should involve three stages namely unfreezing, movement and refreezing. The Kurt Lewin model provides guidance on how to make changes in an organization, with minimal disruption of the structure's operations, and making sure that the change adopted is permanent. Unfreezing stage is the most crucial stage as at this stage, the old attitude will be changed to the new one in order to prepare the employee to be ready for change and to overcome the resistance towards organizational change.

Movement stage, or sometimes known as implementation stage, is when the employees have open up their minds and becoming more ready to accept changes in the organization. Basically, movement stage is related to the development of new behaviors, values, and attitudes, through organizational structure and process changes and development techniques (Schein, 1996). During this implementation stage, there will be confusion as people move from the old ways of doing things to the new. Hence, it needs motivation to identify a specific outcome from planned change and it is not easy because of the complexity of the forces concerned. Instead, the leader should be proactive to look into all the forces at work to identify causes and to evaluate effectiveness.

Once the employees have already accepted the changes made in the organization, the last stage will take place; refreezing stage. Refreezing seeks to stabilize the group at a new quasi-stationary equilibrium in order to ensure that the new behaviors are able to sustain. The new behavior must be, to some extent, congruent with the rest of the behavior, personality and environment of the learner or it will simply lead to a new round of disconfirmation (Schein, 1996). This is why Lewin noticed that successful change is related group activity. Without the transform of the group norms and routines, changes to individual behavior will not be sustained. In organizational terms, refreezing often requires changes to organizational culture, norms, policies and practices (Cummings and Huse, 1989). Changes made in

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the organization will reach its full effects only if it is made permanent. In this stage, every effort must be made to "cement" the change implemented earlier and thus making sure the organization becomes more standard. It has been argued that the reason for so many change efforts run into resistance is usually directly traceable to the lack of unfreezing process before attempting a change process (Armenakis & Bedeian, 1999). However, it is much easier to overcome resistance if there is a leadership key role in motivating the employees to accept change and creating a vision (Waddel, Cummings and Worley, 2004).

On one hand, leadership has been defined by Northouse (2004) as a process by which some individual influences a group of individuals to achieve common goals. Apparently, a leader who is able to deal with workers in change and shape them accordingly to follow the plan in order to achieve change is considered as an efficient leader (Kotter, 2012). Leader has a power to influence the employees to achieve target during that period (Brattianu & Anagnoste, 2011; Lussier & Achua, 2007). On the other hand, teachers' attitude towards organizational change has an important impact on the successful change process in schools if the school principal plays an important role in influencing teacher's attitudes toward organizational change. Previous research on education has shown that the ability of school leaders to manage change could give impact on school effectiveness (Fullan, 2007; Hallinger & Leithwood, 1996). Hence, principals have been identified as the important contributors to make the school innovation successful (Fullan,2001; Dixon, 1991). As mentioned in Malaysian Education Blueprint (2013-2015), shift 5 is to ensure high-performing school leaders in every school. International research on school leadership also shows that an outstanding principal who is focused on instructional and not administrative leadership can raise teacher quality and student outcomes (MOE, 2013). This shows that the factors of effective and influential leadership, which is the principals themselves, as well as teacher's attitude towards the transformation takes up a vital role in order for a particular transformation in schools to be implemented successfully.

ATTITUDE TOWARDS ORGANIZATIONAL CHANGE

Attitude towards organizational change is the internal factor that influences employee's selections of personal action, or a reaction tendency towards the change. It refers to the employees overall evaluative judgement, either positively or negatively, of an organizational change initiative implemented by organization (Lines, 2005). Attitude towards organizational change consists of three dimensions namely cognitive, affective and behavioral tendency (Dunham et al, 1989). The first dimension which is cognitive reaction towards change, refers to the beliefs about the need for change, the significance of change, the favorability of outcomes and the knowledge required to handle the change. The second dimension which is affective reaction towards change, refers to emotional state or feelings about the change ranging from positive emotions like pleasantness, excitement, enthusiasm and happiness to strong, negative emotions such as anger, resentment, frustration, anxiety, stress or fear. The third dimension is behavioral tendency towards change, refers to the extent to which employees would take action to support or initiate change, which means whether they want to move towards change or to go against change.

Readiness for change is a multifaceted concept, and involvement in the change process relates positively to emotional and intentional readiness for change (Bouckenooghe, et al., 2009). In scrutinizing the research on attitude towards organizational change, there are several terms appeared representing attitude such as readiness for change, commitment to change, openness to change and acceptance to change in regards to the positive term of attitude (Bernerth 2004; Chawla & Kelloway, 2004; Armenakis & Bede-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ian, 1999). On the other hand, terms like resistance to change, cynicism to change refers to the negative attitude towards change. (Bovey & Hede, 2001; Wanous, Reichers & Austin, 2000). Basically, all the terms are used interchangeably. These terms are having overlapping concept, and these attitude-related concepts, generally constrained to two constructs namely readiness to change and resistance to change (Bouckenooghe, 2009). Thus, it could be concluded that resistance to change is a negative attitude toward change, whereas readiness to change is a positive attitude toward change.

LEADERSHIP STYLES

Leaders succumb to various styles of leadership. Lussier and Achua (2007) stated that leadership style is the mixture of skills, traits and behaviors that used by leaders when they interact with followers. Studies exhibited that leadership styles are powerful influencing factors on subordinates' behavior and the use of different styles produce different outcomes (Hayes, 2013; Lynch, 2012; Klandermans & Roggebands, 2009). If employees are involved only at the implementation level of the change process, the role of the leader becomes even more important (Jones, Watson, Hobman, Bordia, Gallois & Callan, 2008). For example, the school principal is the most dominant factor in achieving the school's goals (Watts, 1980). The success of implementing any change or initiative in school depends very much on the school principal's leadership and ability to adapt to different situations (Friedman and Horowitz, 1998; Friedman, 1993; Fox, 1995). Undeniably, strong leaders are needed not only to create policies and procedures but also to push followers to perform beyond expectations and subsequently to achieve levels of excellence, sustain a positive culture, and motivate followers to become good leaders themselves.

The underpinning theory of this study is relating to the transactional leadership and transformational leadership styles advocated by Bass and Avolio (1993) that best fit into an organizational change. The style of transactional leadership is characterized by the circumstance when leader plays a role as a representative of change and supports the employees through fundamental change procedures that can enhance productivity. Whereas the style of transformational leadership infers that the leader authorizes the employees to assume the vision of the organization and is reflected into the enhancement of productivity, work satisfaction, employees' motivation and individual performance.

The transformational leadership style is represented by five dimensions; namely, idealized influence (attribute), idealized influence (behavior), inspirational motivation, intellectual stimulation and individualized consideration. On the other hand, there are also four dimensions of transactional leadership; namely contingent reward, active management by exception, passive management by exception and laissez-faire (Avolio & Bass, 2001). Among these two leadership styles, transformational leadership has been defined as "leader behaviors that transform and inspire followers to perform beyond expectations while transcending self-interest for the good of the organization" (Avolio et al., 2009, p. 423). Hence, transformational leadership has become the most frequently researched theory over the past two decades (Avolio, Walumbwa, & Weber, 2009; Judge & Bono, 2000) due to its dominant influence on followers' positive attitudes, behaviors, and levels of performance. It has extended other leadership theories through its focus on important behaviors that include motivating followers to commit to challenging goals, providing them with the confidence needed to perform beyond expectations, being role models for the organization, communicating and enthusiastic vision for the future, challenging the status quo, and developing their followers to meet their full potential (Bass & Avolio, 1990).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

To date, numerous studies have shown that followers' commitment, loyalty, satisfaction, and performance are related to transformational leadership (Judge & Piccolo, 2004). This kind of leadership emphasizes how exceptionally effective leaders interact with followers in a manner that inspires them to higher levels of performance and commitment to their organizations (Bass, B. M. & Bass, R., 2009). This interaction is mainly realized through building trust, strong beliefs, values and vision of communication. Besides, leaders will express individual consideration about employees' development needs and encourage them to think out of the box to solve problem using intellectual stimulation (Bass & Avolio, 1994).

On the other hand, transactional leadership suggests leaders to approach followers with the intent of exchanging a reward for compliance (Burns, 1978). Since, the transactional leader's primary means of influence is through compliance, thus, a contractual type of agreement exists between the followers and leader by which duties and activities are accomplished for rewards. The rewards can be in terms of a follower's needs, including: economic, security, affiliation, or esteem. Normally, transactional leadership focuses on behaviors related to basic administrative and management tasks required for groups or organizations to function well in the short term. These behaviors include ensuring followers have the knowledge, skills, and resources required to accomplish their tasks. These behaviors lead to the creation of equitable reward systems, based on clear and explicit goals and performance expectations, and the delivery of rewards when performance is realized and goals are achieved (Rosenbach, Sashkin, & Harberg, 1996). On that note, transactional leadership also showed a positive influence on job satisfaction and organizational identification (Zhu, Sosik, Riggio & Yang 2012; Emery & Barker, 2007).

Hence, the combination of transformational and transactional leadership styles can be the most effective leadership styles in order to motivate employees by influencing their behaviors and attitudes, and improving their performance (Avolio & Bass, 2001). Transformational and transactional leadership styles, specifically the transformational leadership style, has been validated in numerous settings, yet there is no conclusion to be made on which standard leadership style is to be applied on standard setting. Different settings and cultures could make the leadership style being perceived differently (Bhagat & Steers, 2009). Apart from determining the relationship between the leadership styles and attitude towards organizational change, this study would like to see whether transformational or transactional leadership style, or both collectively, are applicable for the school setting. Furthermore, this study will help the principal to know how their teachers perceived their leadership styles.

RELATIONSHIP BETWEEN LEADERSHIP STYLES AND ATTITUDE TOWARDS ORGANIZATIONAL CHANGE

The past findings have clearly showed that leaders who were able to overcome resistance by making the employees ready for organizational change were considered as effective leaders (Armenakis & Bedeian, 1999; Armenakis & Harris, 2002; Foster, 2010; Holt, Armenakis, Field & Harris, 2007). Apparently, the role of leadership in an organization is critical in the organizational change process, particularly in creating readiness toward the change (Aarons, Sommerfeld, & Willging, 2011; Hammond, Gresch, & Vitale, 2011; Armenakis & Harris, 2009; Boga & Ensari, 2009; Choi, 2011; Gilley, Gilley, & Mcmillan, 2009).

Transformational and transactional leadership styles have been studied as the most important factor for leading certain types of change (Eisenbach, Watson & Pillai, 1999). However, transformational leadership style is widely known as an important leadership style for organizational change (Avolio & Bass, 2001). A study in mental health teams found that employees attitude towards innovative practice

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

showed positive relationship with transformational leadership style (Aarons & Sawitzky, 2006). Furthermore, attitude towards organizational change was also proven of having positive relationship with transformational leadership style during the first stage of downsizing initiative in Scandinavian study in team leadership (Svensen, Neset, & Eriksen, 2007).

Bass & Avolio (2003) found that there is a positive correlation between the transformational leadership style and high organizational performance. This is due to transformational leadership showed a positive influence on self-efficacy, motivation, creativity of the employee, and in return, directly influence the organizational performance (Pillai & Williams, 2004; Shin & Zhu, 2003). Besides that, there was a study showed that transformational leadership style has negative relationship with employees' cynicism towards organizational change in three Midwestern private companies (Bommer, Rich, & Rubin, 2005). Another study also found negative relationship between transformational leadership style and cynicism among the employees in a large organization in China (Wu, Neubert, & Yi, 2007). On the other hand, however, findings revealed that the relationship between transactional leadership styles and attitude towards organizational change were very scarce. There was one study showing a relationship between transactional leadership and readiness towards organizational change by Nordin (2011).

Obviously, arguments for the relevance of transformational leadership and attitude towards organizational change can be found extensively in the literature of transformational leadership. Empirical evidence supporting the theoretical assumptions on the positive impact of transformational leadership are available in various researches. However, the circumstances that may encourage transactional leadership on teacher's attitude towards organizational change were not sufficiently addressed in existing literature.

OBJECTIVES OF THE STUDY

1. To examine the attitude towards organizational change among secondary teachers in Selangor;
2. To identify the perceived leadership styles of the principal among secondary school teachers in Selangor;
3. To examine the influence of leadership styles on attitude towards organizational change among secondary school teachers in Selangor;
4. To identify the best principal leadership style for positive attitude of organizational change as perceived by secondary school teachers.

METHODOLOGY

This study was based on the adapted model from the Three-Stage planned change theory by Kurt Lewin (1947). This descriptive-correlational research study aims to examine, in an educational setting, the influence of leadership styles on attitude towards organizational change. This study employed the state cluster sampling design. The samples were drawn from secondary school teachers from nine districts in Selangor. By using G*power (Faul, Erdfelder, Lang & Buchner, 2007) analysis program and sample size recommended by Krejcie and Morgan (1970), a sample size of 360 was chosen. Hence, the respondents in this study are 360 teachers from daily secondary schools in Selangor. Teachers from secondary school was chosen in this study because most 15-year-old secondary school Malaysian students are involved in the international exams; namely, Trend in Mathematics and Science Study (TIMSS) and Programme for

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

International Student Assessment (PISA). The Organization for Economic Co-operation and Development (OECD) launched the triennial survey of 15-year-old students around the world. PISA assesses the extent to which 15-year-old students, near the end of their compulsory education, have acquired key knowledge and skills that are essential for full participation in modern societies. The assessment focuses on the core school subjects of science, reading and mathematics. Students' proficiency in an innovative domain of collaborative problem solving is also assessed (OECD, 2018). Both TIMSS and PISA tests indicated the quality of educational outcomes at the global state (Blueprint, 2013). This proves that it is crucial to use secondary school level as a benchmark of the Malaysian education quality.

Two self-rating questionnaires have been used as the research instrument to collect data from respondents. First, the inventory of attitude towards change developed by Dunham et al (1989) was used to determine teachers' attitudes towards organizational change. This instrument contains 18 items and 3 dimensions towards change. The reliability coefficient of the instrument was 0.925. Second, Multifactor Leadership Style Questionnaire (MLQ-5x form), developed by Bass and Avolio (2001) has been used to measure transformational and transactional leadership styles. This instrument contains 36 items and the reliability coefficient of the instrument was 0.967 for transformational leadership and 0.785 for transactional leadership.

All the items are rated on a Likert type scale ranging from 7 (strongly agree) to 1 (strongly disagree). Both descriptive and inferential statistics were used in the analysis. Descriptive statistics such as mean and standard deviation, and frequency and percent were used to describe the research variables. Pearson's Product Moment Correlation Coefficient (r) was used to examine the relationship between each of the independent variable with the dependent variable. Meanwhile, multiple regression analysis was used as a tool to identify the contribution of each of the significant independents variables towards the variance of attitude towards organizational change.

FINDINGS

This section presents the level of the attitude towards organizational change as the dependent variable. This discussion addresses the first research objective of the study that is: 'To examine the attitude towards organizational change among secondary school teachers in Selangor."

For descriptive data analyses purposes, three arbitrary levels were employed to ease the interpretation of the attitude towards organizational change frequency levels amongst teachers in the Selangor districts. Classification was derived by subtracting the lowest value from the highest value. The resulting value was then, divided proportionately into three parts to form the range values among the three categories that are high, moderate and low. Besides that, the descriptive statistics (namely, means, standard deviation, range frequency distribution and percentages) were computed on the dependent variable. A total of eighteen items with seven-point Likert scale ranging from; 1 = Strongly Disagree to 7 = Strongly Disagree, was used to measure all the three components under the attitude towards organizational change.

The following are the results and description of the teachers' attitude towards organizational change based on the total scores for the overall components.

The results in Table 1 indicates that for the composite construct of Attitude towards Organizational Change overall, the majority of the teachers (100%) reported a moderate (33.1%) to high level (66.9%). Indeed, none of the teachers showed low attitude towards organizational change score. The small standard deviation observed, indicated that most of the scores were bunching around the mean value. The

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. The mean level of overall attitude towards organizational change

Level	Frequency	Percentage
Low (1.00 – 2.99)	-	-
Moderate (3.00 – 4.99)	119	33.1
High (5.00 - 7.00)	241	66.9
Total	360	100

Note: Mean = 5.38, Min = 3.28, Max = 6.78, SD = 0.79

Table 2. Components of attitude towards organizational change mean scores

Component	Mean	Standard Deviation
Cognitive Reaction	5.73 (High)	0.81
Affective Reaction	5.37 (High)	1.28
Behavioral Reaction	5.04 (High)	0.95

Mean indicator: 1.00 – 2.99 (Low), 3.00 – 4.99 (Moderate), 5.00 – 7.00 (High)

mean value for the total score of attitude towards organizational change was 5.38. This seems to signal that overall, the teachers felt themselves to be having a highly positive attitude towards organizational change. Further analysis was conducted to examine each of the components in the attitude towards organizational change in Table 2.

Table 2 displays the mean and standard deviation scores of the three components of attitude towards organizational change. The mean scores were arranged in descending order and the result depicted that the mean scores of all the three domains range from 5.73 to 5.04 and the level of all components were high. Teachers showed the highest mean score of 5.73 in cognitive reaction component, followed by affective reaction component with a mean score of 5.37 and 5.04 mean score for behavioral reaction component.

The next section presents the level of the leadership styles as the independent variable to address the second research objective of the study that is: 'To identify the nature of principal leadership styles as perceived by secondary school teachers in Selangor. The Multifactor Leadership Style Questionnaire (MLQ-5X form) was used to assess the teachers' perceptions of principal's transformational and transactional leadership styles. Transformational leadership was assessed with five dimensions; namely of idealized influence (attribute), idealized influence (behavior), inspirational motivation, intellectual stimulation, and individual consideration. Transactional leadership style was assessed with four dimensions; namely, contingent reward, active management by exception, passive management by exception and laissez-faire. Teachers were asked to judge the extent to which their principals engaged in specific styles measured by the MLQ. Each style was rated on a 7-point scale ranging from 1 = strongly disagree, to 7 = strongly disagree. Table 3 presented the description of the school teachers' perceptions on transformational leadership style towards their principals based on total scores for the overall dimension.

Table 3. The mean level of overall transformational leadership style score

Level	Frequency	Percentage
Low (1.00 – 2.99)	20	5.6
Moderate (3.00 – 4.99)	196	54.4
High (5.00 - 7.00)	144	40
Total	360	100

Note: Mean = 4.66, Min = 2.3, Max = 6.20, SD = 0.94

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The results in Table 3 indicated that for the construct of transformational leadership style score. Based on the Likert scale used in the survey instrument that was 1 to 7, the results showed that the minimum rating was 2.30 and the maximum was 6.20 with a range of 3.90. The mean value for the total score was 4.66. This seems to signal that at overall; the teachers felt their principals were practicing moderate transformational leadership style such as in inspiring or motivating the teachers. Further analysis was conducted to examine each of the dimensions in transformational leadership style as presented in Table 4.

Table 4. The dimension of transformational leadership style

Dimensions	Mean	SD
Inspirational motivation	5.04	0.98
Idealized influence (Behavior)	4.87	1.03
Intellectual stimulations	4.61	1.02
Idealized influence (Attribute)	4.40	1.20
Individual considerations	4.39	1.06

Mean indicator: 1.00 – 2.99 (Low) 3.00 – 4.99 (Moderate) 5.00 – 7.00 (High)

Table 4 reports the mean and standard deviation scores for five dimensions associated with transformational leadership style. The mean scores for each transformational leadership style were arranged in descending order to rank them from the most to the least exhibited dimension of transformational leadership behavior. The daily secondary school teachers in the districts of Selangor perceived their principals' transformational leadership style as having highest score of inspirational motivation with 5.04 mean score. Meanwhile, the teachers perceived that their principals were moderately practiced the four transformational leadership style dimensions namely idealized influence (behavior), intellectual stimulation, idealized influence (attribute) and individualized consideration which were rated with 4.87, 4.61, 4.40 and 4.39 mean scores respectively.

Table 5 shows the results and description of the school teachers' perceptions on transactional leadership style towards their principals based on the total scores for the overall dimension.

Table 5. The mean level of overall transactional leadership style score

Level	Frequency	Percentage
Low (1.00 – 2.99)	20	5.6
Moderate (3.00 – 4.99)	314	87.2
High (5.00 - 7.00)	26	7.2
Total	360	100

Note: Mean = 4.30, Min = 2.25, Max = 5.88, SD = 0.64

Based on the Likert scale used in the survey instrument that was from 1 to 7, the results showed that the minimum rating was 2.25 and the maximum was 5.88 with a range of 3.63. The mean value for the total score was 4.30. This seems to signal that overall; the teachers felt their principals were practicing moderate transactional leadership style such as in rewarding or monitoring the teachers. Further analysis was conducted to examine each of the dimensions in transactional leadership style (Table 6).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 6. Transactional leadership style dimensions mean scores

Dimensions	Mean	SD	Indicator
Contingent reward	4.94 (moderate)	0.98	Moderate
Management by exception (Active)	4.76 (moderate)	1.03	Moderate
Laissez-faire	3.78 (moderate)	1.02	Moderate
Management by exception (Passive)	3.71 (moderate)	1.20	Moderate

Mean indicator: 1.00 – 2.99 (Low), 3.00 – 4.99 (Moderate), 5.00 – 7.00 (High)

Table 6 indicates the mean scores of the transactional leadership dimensions. The results revealed that all the dimensions in the transactional components mean scores were moderate. Ranked from the highest to the lowest, they are contingent reward, management by exception (active), laissez faire and management by exception (passive) means scores of 4.94. 4.76, 3.78 and 3.71 respectively.

Table 7 covers the findings pertaining to the relationship between the dependent variable and the independent variables. The purpose was to address the third objective that is: 'To examine the influence of leadership styles on attitude towards organizational change among secondary school teachers in Selangor. The results of the correlation between attitude towards organizational change and leadership style of the principal in daily secondary school were summarized in Table 7. The correlation coefficients showed each domain was individually compared to attitude towards organizational change and the result depicted that the domains showed positive to negative linear. The relationship strength also was varied from strong to weak. The elements of transformational leadership; idealized influence (behavior) (r=0.358, p=0.000), inspirational motivation (r=0.478, p=0.000) and intellectual stimulation (r=0.313, p=0.000) were found to have a moderate and positive linear relationship. The remaining elements namely idealized influence (attribute) (r=0.226, p= 0.000) and individualized consideration (r=0.190, p=0.000) showed weak but positive relationship.

As for transactional leadership domains, contingent reward and active management by exception showed moderate and positive (r=0.328, p=0.000) and (r=0.303, p=0.000) linear relationship. However, passive management by exception and laissez-faire correlates negatively with attitude towards organizational change with correlation coefficient values of (r=-0.107, p=0.042) and (r=-0.060, p=0.260) respectively.

Table 7. Correlation coefficient between leadership style and attitude towards organizational change

Dimensions	Attitude Towards Organizational Change
Overall transformational leadership	**0.348****
Idealized influence (attribute)	0.226**
Idealized influence (behavior)	0.358**
Inspirational motivation	0.478**
Intellectual stimulation	0.313**
Individualized consideration	0.190**
Overall transactional leadership	**0.185****
Contingent reward	0.328**
Management by exception (active)	0.303**
Management by exception (passive)	-0.107**
Laissez-faire	-0.060**

** Correlation is significant at 0.01 level

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 8 presented the analysis on the contribution of each of the significant predictors' variables towards the variance of the criterion variables. Based on the ENTER method, as shown in Table 8, the findings reveal that, out of two variables that were regressed, only one predictor variable was found to be significant. The predictor variable was transformational leadership style with its t and p values ($t = 6.021$, $p = 0.000$). Besides, Table 8 also indicates the coefficient of determination, that is, R squared. It is the value which indicates the percentage of total variation of the dependent variable explained by the independent variables.

Table 8. Multiple regression analysis on attitude towards organizational change

Dimensions	Un-Std. Coefficient		Std Coefficient	t	Sig.
	B	Std. Error	Beta		
Constant	3.828	0.279		13.708	0.000
Transformational	0.272	0.045	0.326	6.021	0.000
Transactional	0.066	0.066	0.054	1.004	0.316

Note: F Statistic = 25.128, $R^2 = 0.123$, Adjusted R = 0.118, sig. < 0.05

Therefore, as shown in Table 8, the total amount of variance of the criterion variable that was predictable from the predictor was 12.3%, and the adjusted R square change of 11.8%. Since the adjusted R square could give a better estimation of the true population value, the contribution of the predictor variable towards the variance in the criterion variable in this study was reported based on the adjusted R-square value. Therefore, the overall regression model was successful in explaining approximately 11.8% of the adjusted variance in attitude towards organizational change. A further analysis was carried out on the nine dimensions of transformational and transactional leadership styles to examine which of these components could be identified as the significant predictors of attitude towards organizational change. The purpose was to address the fourth objective that is: 'To identify the best principal leadership style for positive attitude towards organizational change as perceived by school teachers in Selangor.

Table 9. Multiple regression analysis on attitude towards organizational change with the nine dimensions of transformational and transactional leadership styles

Dimensions	Un-Std. Coefficient		Std. Coefficient	t	Sig.
	B	Std. Error	Beta		
Constant	*3.626*	*0.294*		*12.319*	*0.000*
Idealized influence (attribute)	0.049	0.054	0.075	0.908	0.364
Idealized influence (behavior)	-0.026	0.119	-0.034	-0.215	0.830
Inspirational motivation	0.675	0.085	0.848	7.938	0.000
Intellectual stimulation	-0.026	0.100	-0.034	-0.263	0.792
Individualized consideration	-0.204	0.064	-0.277	-3.192	0.002
Contingent reward	-0.059	0.075	-0.082	-0.792	0.429
Active management by exception	-0.083	0.073	-0.117	-1.138	0.256
Passive management by exception	-0.009	0.064	-0.013	-0.136	0.892
Laissez-faire	-0.001	0.049	0.002	0.018	0.986

Note: F Statistic = 15.567, R2 = 0.286, Adjusted R = 0.438 sig. < 0.05

The findings in Table 9 revealed that two out of nine transformational and transactional leadership styles predictors had significant relationship ($p < 0.05$) with the overall attitude towards organizational change score. For these data, all the two dimensions namely inspirational motivation and individualized consideration which both from the transformational leadership style were the significant predictor of the attitude towards organizational change ($t = 7.983$, $p = 0.000$) and ($t = -3.192$, $p = 0.002$) respectively.

DISCUSSION

At recent times, we notice that the world is changing fast. The changes, that is, transitions occurred in all aspects of the world may be self-directed and are usually triggered by external environment. Tekeli (2003) argued that changes from an industrial society to a knowledge society, alterations from nation-states to global world and from modern to postmodern way of thinking have a tremendous impact on educational systems of many countries. On that note, the attitude of the teachers towards organizational change and the influence of the leadership styles of the school principal have become key issues to be discussed in this study.

Obviously, there were positive cognitive reactions portrayed by the teachers in this survey. According to Bouckenooghe (2009), cognitive reaction to change refers to beliefs of people about the need for organizational change, the significance of it and the favorability of the outcomes from the organizational change. Thus, it could be inferred as the mindset of the teachers showing that they are ready to accept change as according to Dunham et al (1989), those who have positive cognitive reaction towards change are looking forward to organizational change and support it and they think that people in the organization will get benefit from the organizational change as well.

Meanwhile, the affective reaction to change in this survey also showed a positive sign. However, there was no negative affective reaction towards change showed by the teachers because those who are having negative affective reaction will resist new ideas, do not like the organizational change, they also feel frustrated and irritated by the organizational change (Dunham et al, 1989).

The last dimension, behavioral tendency to change, which refers to the actions for or against change also received an encouraging response from the teachers. They showed positive behavioral tendency meaning that the organizational change would help them to perform better by stimulating them, improve unsatisfactory situation at their organization and they intend to do whatever possible to support organizational change (Dunham et al, 1989). The leader's daily activities and decisions reflect the pervasive focus and style of the school's leadership (Noonan & Walker, 2008). School administrators who build school capacity through an effective leadership style may influence student achievement through teachers (Christie, Thompson, & Whiteley, 2009). Hence, the school leader must develop the capacity to work with teachers to focus on curriculum, instruction and student learning gains (Fullen, 2001). Undeniably, a teacher-focused leader who works toward the development of school capacity will builds upon positive teacher capacity with the end results of increasing students' academic achievement.

The findings showed that the teachers in this study already possessed positive attitude towards organizational change in terms of cognitive reaction, affective reaction and behavioral reaction. Hence, the organizational change to be specific, the Malaysian Education Blueprint that has been introduced by the government could be positively accepted by the teachers. Referring to Eby et al (2000) positive attitude towards organizational change was found to be crucial in accomplishing organizational aims and also in succeeding the change programs. What is expected from education is no longer to enable individuals

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to compete with others. On the contrary, societies should be educated to compete with each other to challenge with the changing concepts of the world (Dülger, 2002).

Based on the findings on the leadership styles, when the teachers rank inspirational motivation with a prominent mean score, it can be concluded that teachers perceived their principals articulate a compelling vision for the team's future and able to motivate them whereas leaders with inspirational motivation could induce positive attitude among employees (Avolio and Bass, 2001). The actions of school leader's impact on school capacity may enhance student achievement. School capacity is defined as the collective power of a teacher to raise student achievement (King & Youngs, 2002). An effective educational leader is one who has the ability to develop a school's capacity to enhance student learning through the motivation of teachers, staff and students (Daley, Guarino & Santibanez, 2006). Such leadership is determined by the followers, not the leaders (Bhindi, Hansen, Rall, Riley, & Smith, 2008). Therefore, it may be claimed that student achievement is affected by the teacher's perception of school leadership.

The data analysis suggested that most of the principals exercised the four transformational leadership dimensions moderately as perceived by the teachers. It can be inferred that they have adequately become a trusted role model in behavior or attribute and adequately engaged teachers in dealing with problems in new ways in their work and adequately pay attention to each employee's needs and goals. As a whole, it could be said that the respondents perceived their principals also exhibited adequate transformational leadership behavior.

When portraying transactional leadership style as falling along a continuum scale, Bass (1995) displayed contingent reward as the highest level while laissez-faire at the lower end of the continuum. Based on the results, the majority of the teachers perceived that their principals succumb ranked contingent reward dimension the highest for transactional leadership. It can be inferred that the principals adequately set out clear goals and expectations and rewards teachers for working toward them. Referring to Peters and Waterman (1982) research, they found that contingent rewards among top rated companies were frequently used to provide reinforcement for task completion. Followed by active management by exception which explained the principals adequately monitor teachers for mistakes and try to correct them.

The finding also revealed that some principals exhibited laissez faire characteristics as they avoid making decisions and were typically absent when needed. Passive management by exception was ranked the lowest moderate level portraying that principals seldom wait for mistakes to occur before acting to correct them. As a whole, it could be said that the respondents perceived their principals exhibited adequate transactional leadership style, and rare of laissez faire leadership style.

According to Burns (1978) and Avolio (1999), leaders who embrace the elements of transformational leadership behavior inspire, motivate and facilitate strategic renewal by empowering their staff members to question old assumptions. On the other hand, the transactional leadership styles are based on assignment and task-oriented. Task completion and employee compliance are mandated and enforced by organizational rewards and punishments designed to influence both compliance and performance (Burn, 1978).

The findings suggested, the majority of the respondents perceived their principals as showing a moderately transformational and transactional leadership styles. However, the data revealed that the mean score of transformational leadership style was higher than the mean score of transactional leadership style indicating that secondary school teachers in Selangor perceived that their principals exhibited a transformational leadership style rather than transactional leadership style.

For discussion on the relationship between transformational and transactional leadership styles and attitude towards organizational change, the finding was also in line with the previous literatures in the change context that stated transformational leaders were positively related to attitude towards

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

organizational change (Svensen, Neset & Eriksen, 2007; Aarons & Sawitzky, 2006). Therefore, this study provides empirical evidence that the transformational leadership styles where principals provide inspiration, intellectual stimulation, individualized consideration and idealized influence are able to create positive attitude towards organizational change among their teachers in the organization. Apart from transformational leadership, the results also showed that the transactional style of leadership that provides rewards when employees demonstrate performance also influences attitude towards organizational change. As mentioned by Kotter (2012) and Tichy and Devanna (1986), a leader has to create readiness for change. Transactional leadership occurs when leaders reward or discipline the followers depending on the adequacy of their performance, and depends on contingent reinforcement, either positive contingent reward or negative forms of management (Bass, 1998). Hence, leaders must prepare people for an ongoing change to provide long term growth and stability. Effective principals have to create a constructive change process, getting teachers involved in the change process so that resistance to change can give way to new developments.

The significant predictors of the transformational and transactional leadership styles on the attitude towards organizational change results also mirrored that different leadership styles were significantly related to the attitude towards organizational change. Inspirational motivation and individualized consideration were predicting attitude towards organizational change. Transformational leadership style with inspirational motivation is about the way leaders motivate their followers by optimistically looking at the future, emphasizing ambitious goals, projecting an idealized vision and communicating to followers that the vision is attainable (Bass & Avolio, 1993).

Furthermore, the fact that teachers attitude towards organizational change was predicted by inspirational motivation is congruent with Lewin's (1947) three-stage planned theory. During the unfreezing stage, the key leadership role is to motivate and to create a vision in order to make the employees to accept the organizational change. The second predictor was the leaders with individualized consideration who signify organizational mentors as they show a high concern towards employees and treat them as an important mechanism of an organization (Barbuto, 2005). Therefore, principals who motivate teachers and show concern are able to influence attitude towards the organizational change of the teachers.

In sum, transformational leadership style was found to be positively linked attitude towards organizational change at a significant level of 0.05. Thus, indicated that attitude towards organizational change could occur in situations where teachers showed positive attitude towards organizational change if principals showed transformational leadership style.

RECOMMENDATION

In order to make teachers ready to perform new task, school principals should be able to motivate and support them. According to Burke (2008), employees resist to change or to perform new task is due to the fear of the unknown. Professional development programs could be introduced to prepare the teachers to face the organizational change. Resistance towards organizational change could be overcome if teachers think that they have adequate knowledge and skills. Furthermore, school principals should equip themselves with transformational leadership style so as to be able to analyze the organizational change results and its limitations to ensure that the implemented change is at the desired state.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

Teachers' attitude towards organizational change is greatly influenced by the transformational leadership style. Positive attitude towards organizational change becomes the critical factor which leads teachers to accept change. The envisage transformation planned change by the Malaysian government needs teachers as the key players and with the help of principal leadership styles as a complementary role.

Chapter 9
Developing Project Management Maturity as an Organizational Change Process

Gilbert Silvius
LOI University of Applied Sciences, The Netherlands & University of Johannesburg, South Africa

ABSTRACT

The entanglement of project management and the management of organizational change is not reflected in the literature on and standards of project management maturity. Studies on maturity concentrate on identifying the components that determine an organization's maturity, the levels in which this maturity can be expressed, and the effects of maturity. However, the process of changing from one level to another level is hardly or not addressed. By taking an organizational change perspective on developing maturity, this chapter develops a framework that provides guidance for the development of maturity. For every transition, from one level to another, a set of interventions is provided that addresses both the hard and the soft dimensions of organizational change. Successful project management maturity development requires that equal attention is being paid to both the hard and the soft dimensions of organizational change. The framework developed in this chapter provide guidance for this.

INTRODUCTION

The ability or competence of an organization to successfully perform projects, often addressed as Project Management Maturity, is considered of strategic importance for the success of that organization (Srivannaboon, 2006). In today's dynamic business environment, organizations need to constantly anticipate or react on developments in their markets (Doppler et al., 2008). And projects are temporary organizations that are instrumental in realizing these changes in organizations (Silvius et al., 2012). Projects and organizational change are therefore concepts that are inseparable, with as a logical consequence the integration of aspects of change management into the discipline of project management (Pollack & Algeo, 2014).

This entanglement of project management and the management of organizational change is not reflected in the literature on project management maturity. Studies on maturity seem to concentrate on identifying the components that determine an organization's maturity, and the levels in which this maturity can be expressed (Batenburg et al., 2014). The resulting maturity models therefore quite often result in a matrix of components and levels, that for each component provides descriptions of the defining characteristics of each level. Following the capability maturity model (CMM), most maturity models recognize four or five levels (Pöppelbuß & Röglinger, 2011). However, the process of changing from one level to another level is hardly or not addressed. The descriptions of the different levels for each component provide a certain amount of direction for this change, but it would be underestimating the complexity of organizational change to assume that this suffices for the change of developing maturity. Project management maturity models focus on the 'What?' of developing project management maturity, not on the 'How?'.

It is this observation that forms the inspiration for this chapter. In this chapter we plan to discuss the process of developing project management maturity from an organizational change perspective. What approaches can be derived from the theory of organizational change, in order to develop project management maturity in an organization? And factors impact the effectiveness of the approach?

In order to answer these questions, this chapter is structured as follows. After the introduction, the following paragraph will discuss the approaches to organizational change and the evolving insights on this. In the paragraph following this one, we will discuss the concept of project management maturity and the main standards for maturity. We will then apply the insights from organizational change to the concepts of project management maturity in the development of a framework for the development of maturity.

A CONTINGENCY APPROACH TO ORGANIZATIONAL CHANGE

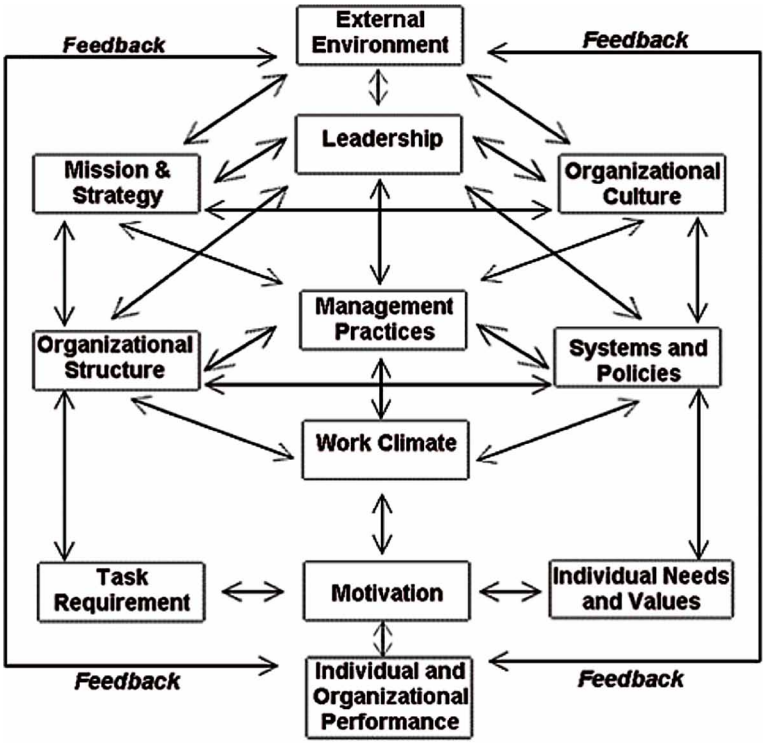
While there appears to be consensus about that organizations are subject to frequent, and perhaps even continuous, change, the management of these changes remains an area of debate. Traditional models of organizational change depict organizational change as a linear and planned process. An example of such a model is Lewin's well-known model that depicts the change process as three-stages (Lewin, 1947):

- **Unfreezing:** Ensuring that employees are ready for change;
- **Change:** Executing the intended change;
- **Re-Freezing:** Ensuring that the change becomes permanent.

Also Kotter (1995), in his article on change management, suggests that change develops in a series of phases and that it requires a considerable length of time (Kotter, 1995). This series of phases can be summarized as:

- Establishing a sense of urgency;
- Forming a powerful guiding coalition;
- Creating a vision;
- Sharing the vision;
- Empowering others to act on the vision;
- Planning for and creating short-term wins;
- Consolidating improvements and producing still more change;

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use



- Institutionalizing the new approaches.

Despite the contribution that these seminal process models made to the understanding of organizational change, the critique on these models pointed out that the practice of change is much more chaotic, with frequent change to react to or anticipate on an equally rapidly changing environment (Gleick, 1987). Also the assumption of a planned and controlled change, that is inherent to the process models, is contested, as change often creates resistance that makes control of the change impossible.

Later authors, such as Homan (2005) and de Caluwé and Vermaak (2004), therefore describe organizational change as a much more continuous process, that only to a limited degree can be controlled. Homan adds to this the insight that different actors in the change process often create their own vision of the change. According to him, organizational change is not the outcome of a univocal centrally planned process, but a multivocal decentrally emerging reality.

Burke and Litwin (1992) built upon the view of organizational change as a rather chaotic process in their model of transactional factors effecting organizational performance and change (Figure 1).

Figure 1. Overview of the transaction factors of organizational performance and change
Burke & Litwin, 1992.

The Burke and Litwin model shows that changing an aspect within an organization, for example the organizational structure or a work process, cannot be considered in isolation. An "organization' constitutes of several interconnected dimensions or elements and changing one dimension will effect also

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

other aspects of the organization. This perspective can also be found in the McKinsey 7S model, that received wide attention with the 1982 bestselling book "In search of Excellence" (Peters and Waterman, 1982). The 7S model shows 7 interconnected dimensions of an organization (Table 1). Of the different dimensions, 'Strategy', 'Structure', 'Systems' and 'Staff' are considered the 'hard' dimensions of an organization, as described in regulations, documents, quality handbooks, procedures, standards, etc. The dimensions 'Style/Culture', 'Skills' and 'Shared values' are more intangible in nature and are considered the 'soft' dimensions of the organization.

Table 1. The 7 organizational dimensions from the 7S model

Dimension	Description
Strategy	Actions a company plans in response to changes in its external environment.
Structure	Basis of specialization and co-ordination influenced primarily by strategy, size, and diversity of organization.
Systems	Formal and informal procedures that support the strategy and structure.
Style/Culture	Consisting of two components as below: Organizational culture: the dominant values, beliefs, and norms which develop over time and become relatively enduring features of organizational life. Management style: more a matter of what managers do than what they say; how do company managers spend their time; what are they focusing on.
Staff	The people/human resource management- processes used to develop managers, socialization processes, and ways of introducing young recruits to the company.
Skills	The distinctive competences- what the company does best.
Shared Values	Guiding concepts, fundamental ideas around which a business is built.

The different views on organizational change effect the approach to the management of this change. Based on a study of 75 successful organizational change cases, Reitsma and van Empel (2004) identify four distinct approaches to the management of organizational change: Directing, Tell/Sell, Interacting and Developing. These four approaches are briefly discussed in the following section.

- **Directing:** In the Directing approach, the content of the change is predetermined. During the process of change there is little or none degree of freedom and the management of the change is focused on controlling the progress towards the predetermined outcome. The locus of power is the top of the organization and the information flow about the change is dominantly top-down, informing the rest of the organization about the content of the change.
- **Tell/Sell:** The Tell/Sell approach resembles the Directing approach in the sense that the content of the change is also predetermined and communicated top-down. However, in this approach, the communication aims to 'sell' the change, by making it attractive to the rest of the organization. This means that in the communication about the change there is room for some bottom-up input, however, this input does not always change the change.
- **Interacting:** In the Interacting approach, the content of the change is more open and not predetermined by the leadership of the organization. The change is discussed with a limited number of key-players, that, within boundaries, co-decide about the change. The communication about the change is therefore interactive and open.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Developing:** In the Developing approach, the content of the change is largely left open, allowing the participants in the change to co-design the exact change in the cause of the change process. Power is shared by a large number of actors involved, that together shape the change. The management of the change is focused on controlling the process of change, and not its content.

Table 2 provides an overview of the main characteristics of the four approaches.

The four approaches are not only distinctive in their approach, but also in their effectiveness in managing different changes. This effectiveness is influenced by the characteristics of the change. The approach needs to 'fit' the characteristics of the change in order to be effective. Intuitively this makes a lot of sense, but the practice of how changes are managed in organizations does not always show these contingencies.

Table 2. Characteristics of the four change management approaches

Characteristics of the Approach	Change Management Approach			
	Directing	**Tell/Sell**	**Interacting**	**Developing**
Vision of the future and goals	Clear	Clear	Reasonable clear	Not clear
Degree of freedom with regards to the content of the change	None	Low	Within boundaries	A lot
Role of the change owner	Dictating	Selling	Boundary setter	Co-creator
Character of the interaction about the change	Informing	Explaining	Co-deciding	Designing

Reitsma & van Empel, 2004.

A factors that influence the effectiveness of a change management approach is logically the object of change. That is to say, that one approach is more effective in the change of certain aspects of an organization, whereas another approach is more effective in the change of other aspects. According to Reitsma and van Empel (2004), a more top-down approach, such as the Directing or Tell/Sell approaches, may be effective for changing the 'hard' aspects of an organization, such as organizational structures, procedures and systems. However, for a change of 'softer' aspects of the organization, such as behavior and culture, a more developing approach is expected to me most effective. Also the urgency of the change, and the perceived urgency, are factors of influence. As a developing approach will take more time for the change to unfold, this may not be effective in a very urgently needed change.

Another contingency factor is the expected resistance to the change. When the expected resistance is high, a directive and top-down oriented approach to the change will not create the acceptance needed for effectuating the change. In such a case, a more developing approach might be more effective. Other situational factors influencing the effectiveness of the change approach are organizational culture and prior experience with change within the organization.

Table 3 shows the situational characteristics and their fit with the four change management approaches.

The model of change management approaches of Reitsma and van Empel, puts emphasize on the contingent factors influencing the effectiveness of a change management approach. The management of organizational change is not a 'one size fits all' concept. An effective approach takes into account several factors, such as the (objective and perceived) urgency of the change, the objects of change, the culture of the organization that 'hosts' the change and the expected resistance and prior experiences with change within the organization.

PROJECT MANAGEMENT MATURITY

The Oxford English Dictionary (Stevenson, 2010) defines maturity as "*the state, fact, or period of being reached in the most advanced stage in a process*". In the 1970's, publications such as Gibson and Nolan (1974) and Crosby (1979), first applied the term maturity to indicate organizational capabilities. The popularity of the concept of organizational maturity was especially intensified by the introduction of the Capability Maturity Model (CMM, later CMMI), in the late 1980's (Paulk et al. 1993).

Following the success of this model, its five maturity level architecture also served as inspiration for the development of several project management maturity models, for example the Project Management Process Maturity $(PM)^2$ model by Ibbs and Kwak (1997) and the Project Management Maturity Model (PMMM) by Kerzner (2001). Project Management Maturity in this context may be defined as being prepared (as an organization) for effectively and efficiently implementing a portfolio of projects (Cooke-Davies, 2002). The issuers of the most influential project management standards, the Project Management Body of Knowledge (PMBoK) by the Project Management Institute (PMI) and PRojects In Controlled Environments (PRINCE2) by the Office of the Government Crown (OGC) and later Axelos, also contributed to the development of project management maturity standards with their standards Organizational Project Management Maturity Model (OPM3) (Project Management Institute, 2004; 2013) and Project, Programme and Portfolio Management Maturity Model (P3M3) (Office of the Government Crown, 2006; Axelos, 2015).

Despite this widespread development and use of these maturity models, they also remain subject to severe criticism.

A first line of critique on the nature of organizational maturity models in general is that they are not well theorized (Kohlegger et al., 2009) and that they "*lack a clear definition and contextualization.*" (Mettler and Rohner, 2009). Also project management maturity models have been criticized for lacking foundation (Cooke-Davies, 2004; Jugdev and Thomas, 2002; Mullaly, 2006).Following this lack of foundation, researchers also seem to lack agreement on what comprises the project management maturity

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

construct (Ibbs and Kwak, 2000; Pasian et al., 2014).The third line of criticism concerns the lack of evidence of the relationship of maturity and perceived outcomes (Besner and Hobbs, 2006; Mullaly, 2014).

As this chapter is focusing on developing maturity from an organizational change perspective, the second line of criticism, the antecedents of project management maturity, is most relevant for our discussion. Most models of organizational project maturity, for example $(PM)^2$ (Ibbs and Kwak, 2000), OPM3 (Project Management Institute, 2004) and P3M3 (Office of the Government Commerce, 2006), define this maturity in levels of controlled structures and processes. These levels are expressed in terms such as 'Defined', 'Managed' and 'Optimized'. And although the wording of the different models differ somewhat, the shared intention of the models is to provide a comprehensive description of each level that expresses an increased level of control. Table 3 provides a brief overview of the descriptions of the five levels in the models $(PM)^2$, CMMI, OPM3 and P3M3.

From Table 4 it appears that the elements that define project management maturity are primarily identified as "processes", "standards", "systems", "data", "methods", "procedures" and "technologies". According to the earlier discussed 7S model of organizational dimensions, these may all be considered as 'hard' elements within an organization. The project management maturity models seem to neglect the 'soft' aspects of an organization. A criticism of the models above, and also the general understanding of project management maturity in practice, is therefore that they lack attention for intangible assets (Jugdev and Thomas, 2002), and "human factors" (Pasian et al., 2014), such as culture and attitude (Jiang et al., 2004). The authors mentioned also consider these 'soft' factors in an organization relevant in the development of organizational maturity.

DEVELOPING PROJECT MANAGEMENT MATURITY

The project management maturity models discussed in the previous paragraph consider maturity as a measurable status in or of an organization. For the development of maturity, the moving from one level to another, however, this static perspective does not provide much support. The descriptions of the different levels may provide a 'snapshot' of the desired state, however, for the organizational change to this desired state, a more dynamic perspective is required. A perspective for which the theories of organizational change may provide useful.

From the discussion on project management maturity, the conclusion arose that the constituting elements of maturity cover both the 'hard' elements within the organization (processes, standards, systems, data, methods, procedures, structures, knowledge, technologies, etc.) and the 'soft' elements within the organization (experience, culture, attitude, trust, values, vision, etc.).

Following the contingency approach to the management of organizational change that Reitsma and van Empel (2004) suggest, these elements require different change approaches. And although reality always presents more diversity than that models or typologies can capture, a basic distinction can be made between an effective approach for the change of hard and mostly tangible elements and an effective approach for changing the soft and intangible elements. Table 5 shows this distinction. For the hard elements a more Directive or Tell/Sell approach may work well, However, the soft elements, such as values, attitude and trust, cannot be changed 'on demand'. These elements of maturity require a much more Developing approach.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 4. Overview of the maturity levels of selected project management maturity models

	(PM)²	CMMI	OPM3	P3M3
Level 1	• No project management processes or practices are consistently available • No project management data are consistently collected or analyzed	*Initial:* Processes are unpredictable, poorly controlled and reactive	*Ad Hoc:* No formal standards, processes, methods, procedures, or staff to constitute a project management discipline. Standard technologies and reporting are sporadic.	*Initial:* • The organization recognizes projects and runs them differently from its ongoing business? • Projects may be run informally with no standard process or tracking system.
Level 2	• Informal project management processes are defined • Informal project management problems are identified • Informal project management data are collected	*Managed:* Processes are defined for the project and are often reactive	*Planned:* Project management standards, processes, methods, procedures, and staff exist in the organization, but are not considered to be an organizational standard. Basic documentation exists, inconsistent management support rarely/occasionally applied.	*Repeatable* • The organization ensures that each project is run with its own processes and procedures to a minimum specified standard? • There may be limited consistency or co-ordination between projects.
Level 3	• Formal project planning and control systems are managed • Formal project management data are managed	*Defined:* Processes are defined for the organization and are often reactive	*Managed:* • All project management standards, processes, methods, procedures, and staff are in place as organizational standards. • Formal documentation exists, consistent management support, execution irregularly/inconsistently applied.	*Defined:* • The organization has its own centrally controlled project processes. Individual projects can flex within these processes to suit the particular project.
Level 4	• Project management data and processes are integrated • Project management processes data are quantitatively analyzed, measured, and stored • Multiple project management processes are recognized (program management)	*Quantitatively Managed:* Processes are measured and controlled	*Integrated:* • More refined project management standards, processes, methods, procedures, and staff are in place. • More refined documentation, consistent management support, consistent execution, and efficiency exist across all projects. • Metrics are in place to collect performance data across all projects.	*Managed:* The organization obtains and retains specific measurements on its project management performance and runs a quality management organization to better predict future performance.
Level 5	• Project management processes are continuously improved • Project management processes are fully understood • Project management data are optimized and sustained	*Optimized:* Processes are continuously improved	*Sustained:* Lessons learned and best practices are applied to continuously improve existing standards, processes, methods, procedures, and staff. Metrics are collected and applied at the project, portfolio, and organizational levels. The organization is in a position to evaluate future decisions based on past performance and maximize its competitive advantage in the industry.	*Optimized:* The organization continuously improves its processes with proactive problem and technology management for projects, in order to improve its ability to depict performance over time and optimize processes.

Table 5. Illustration of different constituting elements of organizational maturity and their matching change management approaches

	Constituting Elements of Organizational Maturity	
	'Hard' Elements	**'Soft' Elements**
Objects of Change	processes, standards, systems, data, methods, procedures, structures, knowledge, technologies	experience, culture, attitude, trust, values, vision
Matching Change Management Approach	Directing / Tell/Sell	Interacting / Developing

The conclusion from this analytical mapping of elements of maturity and change management approaches is that developing project management maturity requires a holistic approach in which both hard and soft elements are effectively addressed. As the industry standards for project management maturity, such as OPM3 and P3M3, are biased towards the hard elements of an organization, their implementation should be accompanied by a change process that puts equal emphasis on developing the vision, culture experience, attitude, trust and values around projects. The approach of this change process will need to reflect a much more developing approach in order to be effective.

Developing the soft elements of project management maturity therefore may take much more time, and will involve many more stakeholders, compared to the implementation of a standards such as OPM3 or P3M3. These standards lay the practical and necessary foundation on which maturity can develop. However, the development of project management maturity may be hindered by inflated expectations of the implementation of these standards and the following disappointment.

This final section of this chapter develops a framework for the development of project management maturity within an organization. The framework is based on two pillars: The maturity models discussed earlier and the 7S model of organizational dimension. However, the framework demonstrates a more dynamic view on the maturity levels. Instead of describing the status of the organizational components that define project management maturity, the framework describes the transitions between the levels. The 7S model of organizational dimensions is consequently used as a model to describe these transitions. As the 7S model covers both the hard elements in the organization and the soft elements, the framework summarizes most of the insights developed in the previous paragraphs.

Tables 6 and 7 presents this framework, with a first identification of transition interventions filled in in the different cells of the model.

The framework presented in Tables 6 and 7 provides guidance for organizations that aim to develop their organizational maturity in performing projects. For obvious reasons the framework only describes the transitions to a higher level of maturity, and not to a lower level.

The framework may be especially helpful in creating a better vision of the 'How?' of developing maturity. However, Kotter (1995) pointed out that every change starts with establishing a 'sense of urgency'. An insight that many that have been involved in organizational change projects will acknowledge. The sense of urgency relates to the 'Why?' of developing project management maturity. Questions such as *Which problem is experienced? Who experiences this problem?* and *How important is this problem?* need to be answered before the development of project management maturity can have the managerial support this change needs in order to be successful.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 6. Framework for the organizational development of project management maturity (hard dimensions)

	Strategy	Structure	Systems	Staff
Transition from level 1 to level 2	Formulating in all project proposal, the contribution of the project to the strategy of the organization.	Explicitly formulating project team roles in project plans.	• Implementing a structured project management process in all projects. • Implementing identifiers for project related work and costs in the organization's administrative systems.	Creating temporary project management jobs.
Transition from level 2 to level 3	Translating organizational goals in programs and projects.	Establishing a Project Management Office for support and coordination of projects.	• Implementing organization-wide processes and standards for project management. • Implementation of project management and collaboration tooling. • Implementing time registration.	Creating permanent project management positions.
Transition from level 3 to level 4	Translating organizational strategy in programs of projects and drive realization of that strategy through project, program and portfolio management.	• Establishing board-level leadership of projects and programs. • Establishing a portfolio management office.	• Implementing portfolio management processes. • Contributing to professional project management development.	• Developing project management career paths. • Introducing project responsibilities in general management career paths.

Table 7. Framework for the organizational development of project management maturity (soft dimensions)

	Style/ Culture	Skills	Shared Values
Transition from level 1 to level 2	Development of a task-oriented culture in projects.	Investing in project management competence by training or external support.	Establishing the shared view that projects are a relevant to the organization.
Transition from level 2 to level 3	Creating acceptance for cultural differences between the permanent part of the organization and projects.	Investing in organization-wide competence development in projects and project management.	Establishing the shared view that projects are not an incident, but that they are a regular activity within the organization that contributes to the realization of the strategy.
Transition from level 3 to level 4	Creating project 'heroes' and success stories.	Investing in organization-wide project management maturity.	Establishing the shared view that projects are essential for the innovation, success and survival of the organization.

FUTURE RESEARCH DIRECTIONS

As most research into project management maturity focusses on the effects of maturity on project success and/or the constituting elements of maturity, the dynamics of developing organizational project management maturity is an underdeveloped field of study. The perspective of developing maturity as an organizational change process, promises to be a useful perspective. However, the framework developed in this chapter should be considered as a first exploration of this perspective. Future research may therefore expand the framework with more insights from the developing theory on organizational change, in which also the contingency view is further developed. For example the relationship between

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

interventions to develop project management maturity and organizational culture is an interesting topic for further study, as temporary organizations, such as projects and programs, tend to interfere with the hierarchical structures of the permanent organization.

Another direction for future research is the empirical testing and development of the framework developed in this chapter. Especially the further development and testing of interventions to develop maturity would deepen the insights provided.

CONCLUSION

This chapter started from the observation that most models and industry standards of project management maturity focus on measuring a current level or 'state' of maturity. By doing this, the models implicitly take a static perspective on maturity, whereas the aim of the models is to help organizations develop maturity in order to improve the success rates of projects. However, the process of changing from one level to another level is hardly or not addressed. Project management maturity models focus on the 'What?' of developing project management maturity, not on the 'how?'.

By taking an organizational change perspective on developing maturity, this chapter developed a more dynamic framework, aimed at providing guidance for the development of maturity, detailed in the transitions from one level to another. For every transition, a set of interventions is listed, as an example, that addresses both the hard and the soft dimensions of organizational change. As the industry standards for project management maturity, such as OPM3 and P3M3, are biased towards the hard elements of an organization, the implementation of these models will not be sufficient for the transition to a higher level of project management maturity. Successful project management maturity development requires that equal attention is being paid to the soft dimensions of organizational change, such as sense of urgency, shared vision, culture experience, attitude, trust and values around projects. The framework developed in this chapter may provide guidance for this, with as recommendation for future research, the empirical validation of the framework and the development of successful interventions.

PES University, India

D. Bhanu Sree Reddy
VIT University, India

ABSTRACT

The successful implementation of Enterprise Resource Planning (ERP) system is a challenge to many organizations. Though an intervention, ERP brings in large scale tangible and intangible benefits to an organization. It poses significant intervention on firm level endogenous dimensions; internal stakeholders, internal organization, business processes and technology. Though literature recognizes that ERP intervention brings about technological change during ERP implementation, hardly any article has conceptualized these interventions in evaluating its performance. Drawing on the Socio Technical system perspective the objective of this article is to conceptualize the ERP intervention on the endogenous dimensions of the organization and develop a comprehensive conceptual model to assess the success or failure of ERP system implementation. The conceptual model, Process-Variance and Adapted Socio-Technical (PVAST), proposed in this article will enable decision makers and practitioners to measure ERP project performance at every stage of its life cycle in a coherent method and adopt corrective measures.

INTRODUCTION

Information Systems (IS) of organizations have evolved from disjointed business processes to a boundaryless and cross functional structure by transforming functional enterprises and organizing their independent functions into process value chains. ERP system software, an Information Technology (IT) driven initiative enables a value chain (Shehab, Sharp, Supramaniam & Spedding, 2004) based organization

structure by allowing seamless flow of real time information across functional processes of the organization and empowering organizational stakeholders with precise decision making (Arnold, 2006). External indicators like globalization of markets and operations (Gunasekaran, 2005) and competitive pressure; internal indicators such as increasing costs in inventory, administration and so forth, resulted in Hammer & Stanton (1999) claiming that organizations have to inevitably restructure into process enterprises by strategically orienting themselves in this manner to stay competitive. Henderson and Mitchell (2007) emphasize that while organizations develop their strategy and align resources for implementing strategy it is very pertinent that decision makers identify key dimensions internal to the organization. They further state that this will enable the organizations to develop organizational capabilities and the capabilities can be leveraged to shape the environment and match the organizational performance necessitated by the competitive business environment. A technological resource such as ERP is a strategic tool that results in organizational change while bringing about tangible and in-tangible benefits to the organization. Hence successful ERP intervention is therefore an outcome of high investments and organizations have achieved operational efficiencies, yet a large group of organizations have been unable to translate ERP implementations into a success (Nwankpa, 2015).

ERP as an application software is distinguished from other general software due to the tangible and intangible benefits it can bring about by its organizational impact. Review of literature of over a decade clearly points that even though ERP is an application software its implementation should not only consider technical perspective but interactions with social factors in an organizational context (see Figure 1).Therefore, organization stakeholders can consider internal factors like organizational context, stakeholders, culture, processes and external factors like globalization, competitiveness and customer requirements for successful implementation of ERP. Organizational change that occurs with ERP project necessitates organization stakeholders to implement ERP successfully and evaluate its performance. ERP intervention requires managing change brought about by implementing IS and the mutual interaction it has with the organization's socio-technical context, which is intertwined of technology, people (Davis & Olson, 1985), organizational context and processes (Uzoka, Abiola & Nyangeresi, 2008).

ERP systems are vendor developed software applications necessitating enormous monetary investment by the organizations for its implementation. Costs of ERP project constitute a larger amount (Janssens, Kusters, & Heemstra, 2008) which many organizations find difficult to estimate compared to the ERP software itself. Symons (2006) claims organizations are under increasing pressure from top management to demonstrate and improve the business value of their investments made for IT. The risk associated (Grant & Tu, 2005) with the intervention of ERP system monetarily as well as the organizational changes it brings about, implies that practice of only *post facto* performance evaluation in itself is inadequate. Emphasizing importance of evaluating IS, Beynon-Davies, Owens, & Williams (2004) claim organizations need to evaluate the IS during the life cycle of the IS development process and develop a framework to accommodate the evaluation process during every stage of development. Though the author's research question is contextual to IS development, this question is valid for ERP systems as well. Contemporary literature categorizes ERP implementation as either a process approach; performance of the system is evaluated through a series of phases or variance approach; identifies *a priori* Critical Success Factors (CSF) essential for success of ERP project. ERP implementation frameworks based on either approach defeats the purpose of mitigating risk because the former approach necessitates rigor in evaluation as ERP project transitions from antecedent to consequent phase. In the latter perspective, a CSF based framework is insufficient in addressing the performance of ERP implementation in each phase and taking appropriate corrective measures. The objective of the research is to address this conceptual gap in

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Evolution of ERP definition from technical to socio technical perspective

twofold: first, by developing an integrated framework of process and variance perspectives to identify CSF for each phase of ERP implementation and second, to categorize CSF into four dimensions; internal stakeholders, internal organization, business processes and technology. This will give a better perspective for stakeholders to take up corrective actions at each phase of ERP implementation. This research contributes to development of theory to measure the performance of ERP system implementation and develop associated concepts to evaluate the success or failure of ERP project. Theory development in this article sets a foundation for an empirical study with statement of propositions which are relationships between units observed or approximated in the empirical world, contains concepts, definitions and propositions (Bacharach; 1989; Kerlinger; 1988 Pawar; 2009). Hence the following research questions arise:

1. What theoretical perspectives can be deliberated upon to conceptualize the dimensions to evaluate ERP success or failure?
2. Can these dimensions be based on sociotechnical organizational change perspective since ERP is a technological intervention on the organization?

The article is organized as follows. The first section sets forth the foundation and elucidates the gaps in analysing ERP implementation by comprehensively reviewing theoretical facets of ERP implementation methods based on process, variance and sociotechnical perspectives. Process perspective as pertinent to ERP projects describes implementation from an organizational change standpoint, factor perspective lists causal factors to be deliberated upon for ERP project and sociotechnical perspective describes ERP as an intervention on an organization that causes synergy in the social and technical endogenous environment. The subsequent section explains the merit of integrating process, variance and sociotechnical perspectives to develop an integrated conceptual framework that assists in measuring the performance of ERP system thereby reducing the risk associated with ERP implementation. Then we delineate the

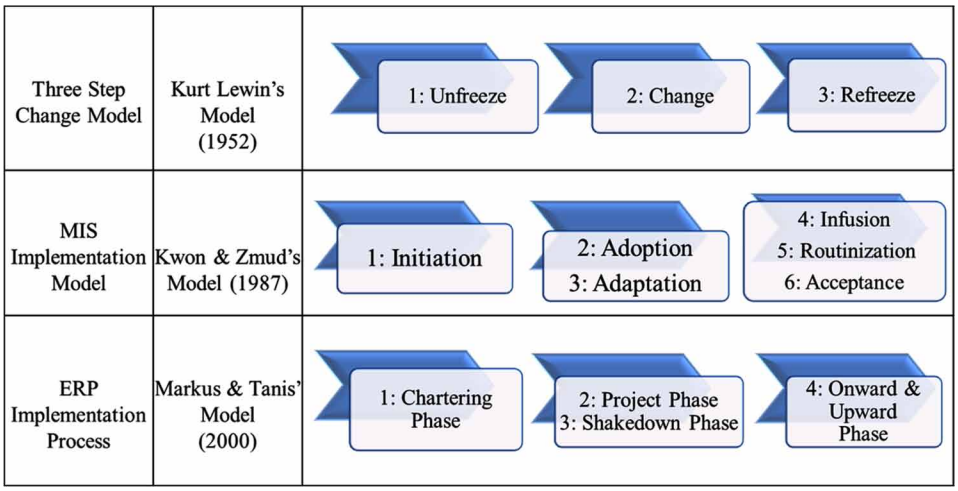
EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

theoretical constructs and operationalize them to state the propositions associated with the study. The section that follows develops the proposed PVAST model explaining its elements and discussing the model's applications for practitioners and organization's decision makers. Finally we draw up conclusions, state the implications and explain the further scope of this research.

BACKGROUND: A COMPREHENSIVE STUDY OF ERP IMPLEMENTATION METHODS FROM A CHANGE PERSPECTIVE

Premise One: Process Approach to ERP Implementation- An Organizational Change Perspective

ERP restructures organization as value chain enabling information integration and the decision to implement such a technological artifact brings in both tangible and intangible benefits. This indicates the need to go beyond traditional project management principles (Holland & Light, 1999) as there is an inherent need to reengineer the organizations business processes which is accompanied by organizational change on core elements of organization. Stewart, Milford, Jewels, Hunter & Hunter (2000) refer to ERP as an intervention and change agent and recommend that organizations have a planned change management program that accommodates not only change of technology but also business processes, personnel and organization context to realize the benefits of ERP. Therefore it will be practical to consider Kurt Lewin's (1952) three step change management process model as it is profoundly used to theorize and institutionalize change in organizations. "It is a truly elegant and infinitely practical guide to the host of complex and sometimes baffling issues inherent in the change process" (Levasseur, 2001, pp. 71) where the change process in this model consists of three stages; first-unfreeze enables organizations to unlearn legacy processes and systems being practiced in the organization, second-transition is when the enterprise adopts new work practices and readies standards, systems and employees for the change and finally-refreeze the organization adapts to the new changes brought about in the organization by freezing the new ways of work and skills. Strong parallels can be drawn between Kwon & Zmud's (1987) stage model for IS and Markus & Tanis' (2000) emergent process model for ERP implementation with Lewin's generic model for change to manage technological intervention. Lewin's model can be used as a baseline and a practical guide to evaluate the success of ERP, since as a system it has to diffuse and evolve during the phases of the project.



Mapping Change Models

Figure 2 summarizes Kwon & Zmud's (1987) stage model and Markus & Tanis' (2000) ERP emergent process model with Kurt Lewin's (1952) change model for ERP implementation. The two models are mapped to Lewin's (1952) three step change management model to appreciate that IS implementation stage models are based upon organizational change. To assist organizations in the change process (Hawking, Stein & Foster, 2004) it befits to deliberate on a framework based on organizational change to successfully implement ERP. Kwon & Zmud's (1987) stage model for IT implementation follows six stages: initiation, adoption, adaptation, acceptance, routinization and infusion. This IT implementation research model is founded on Lewin's (1952) change model (Cooper & Zmud, 1990). The initiation stage is related to unfreeze stage, adoption and adaptation are linked to change stage and the acceptance,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

routinization and infusion stages are correlated to the refreeze stage in Lewin's change management model. This model was applied to study implementation of Materials Requirement Planning (MRP) system by Cooper and Zmud (1990). MRP systems are specifically oriented towards the functional view of organizations where organizational changes were restricted to functional departments thereby being technically specific rather than organizational specific and therefore did not necessitate large scale process reengineering and change management. Markus & Tanis' (2000) model of ERP implementation consists of four phases namely; chartering: decisions regarding the business case and solution constraints; project: getting the system and end users started; shakedown: stabilizing, eliminating bugs, getting to normal operations; onward and upward: systems, supporting users, get results, upgrading system extensions. This model posits the necessary actions to be deliberated by decision makers in each phase of the ERP project where actions in each phase are mentioned *a priori*.

Figure 2. Mapping ERP implementation process with other implementation process

The above paragraphs illustrate IS implementation as an organizational change process while associating it to Kurt Lewin's change management model. This is referred to as process perspective and it helps us understand how ERP implementation efforts have happened and it therefore gives a moving picture about how we got from time 1 to time 2 (Aladwani, 2001). Several researchers fragment the implementation process into *a priori* stages or phases (Sabherwal & Robey, 1993). A synthesis of IS literature illustrated in Table 1 indicates that the number of stages or phases varies from at least three to six. Hence process approach seeks to understand outcomes by observing how events occur over time and in ERP transitions, processes may be conceived as sequence of events that occur over time (Boudreau & Robey, 1999) and though these events begin in a particular phase they may continue to overlap one another while another stage begins (Janssens, Kusters, & Heemstra, 2008). Boudreau & Robey (1999) affirm that an organization implementing ERP at any moment in time is influenced by conditions beyond its control and can achieve motivated behavior by way of plans and actions. As a result phase models are limited because they portray only one possible sequence of events through which all organizations

are expected to progress. In the case of ERP implementation, the organization cannot risk the project by monitoring the success or failure *post facto.*

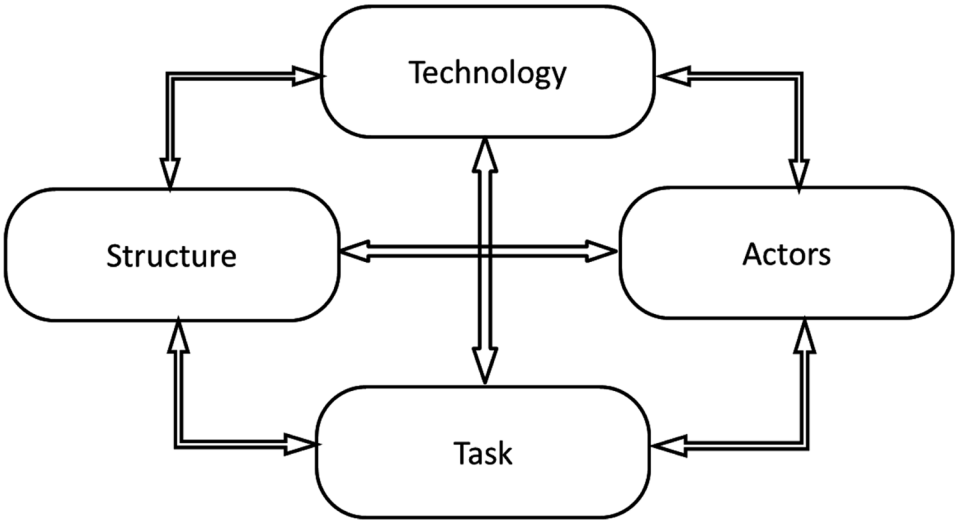
Premise Two: Variance Perspective to ERP Implementation- Assessing Change Perspective Through *a priori* Factors

Literature points to majority of articles which identify requisite conditions or factors *a priori* to analyze the performance for successful ERP implementation. CSF are widely used in the information systems arena (Rockart, 1979) and within the context of ERP implementation context CSF are defined as factors needed to ensure a successful ERP project (Gibson, Holland, & Light, 1999; Parr & Shanks, 2000). An implicit goal of variance research is to establish the conditions necessary to bring about an outcome (Van de Ven & Poole, 2005) and is the focus of much of the research published in IS literature (March & Storey, 2008). Consequently, this article will interchangeably use the terms variance or factor perspective in the context of CSF. A review of literature confirms that the conditions necessary to evaluate the performance of ERP project are listed by way of "a laundry list of causal factors" (Richmond, 1993, pp.117). A majority of literature related ERP research is dedicated to listing CSF (Farzaneh, Vanani, & Sohrabi, 2013; Finney & Corbett 2007; Jarrar, Al-Mudimigh & Zairi, 2000; Markus & Tanis, 2000; Motwani, Subramanian, & Gopalakrishna, 2005; Nah, Lau, & Kuang, 2001; Soja 2006; Somers & Nelson, 2001; Toni & Klara, 2001; Zhang, Lee, Zhang, & Banerjee, 2002). Kini & Basaviah (2013) found CSF for large organizations and Small and Medium Businesses (SMB) similar.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Somers and Nelson (2001) argue that organizations must learn to identify the critical issues that affect the implementation process and know when in the process to address them effectively to ensure that the promised benefits can be realized and potential failures avoided. Rockart (1979) states that CSF are limited number of areas in which satisfactory results will ensure successful competitive performance for the individual, department or organization. While CSF identified *a priori* facilitates planning resources for successful ERP implementation, it adopts a rather static view, which limits its adequacy in explaining the dynamics of the implementation process (Aladwani, 2001) and it is unclear how these CSF interrelate (Akkermans & van Helden, 2002), affirming this Esteves & Pastor (2001) report there is practical evidence that CSF do not have the same importance along the various phases of a SAP [Systems, Applications, and Products in Data Processing] implementation project. This is emphasized by Nah, Lau, & Kuang (2001) while developing a conceptual model for successful ERP project by listing eleven CSF across the phases of Markus & Tanis' model where they identified through an exploratory study, CSF that influences ERP implementation in various phases of ERP life cycle. A cumulative list of CSF clustered for each phase may not remain static over the life cycle of all ERP projects and also claim that organizations are influenced by exogenous factors that are beyond its control (Markus & Tanis, 2000). Tavana (2011) affirms this while describing the significance of considering an organization adapting to the ERP project through change and system in-built flexibility, organizations are influenced by dynamic environment and becomes essential to consider progressive changes that occur during the life cycle of ERP due to intervention of technology on people and organization. Hence it may be appropriate if CSF can be clustered into an integrated process variance framework where we can cluster CSF based on a model of organization that will enable the organization stakeholders identify and consider a plan of action to implement ERP.

Premise Three: SocioTechnical System Perspective to ERP Implementation – A Technological Intervention for Organizational Change



Conceptualizing ERP project as an organizational intervention creating change we draw Socio Technical (ST) system perspective to identify and define key constructs to analyse the performance of ERP system. ST system perspective began with the purpose of improving the Quality of Work Life (QWL) of workers on the production line (Mumford, 2006), the theory gradually found its application in design and implementation of new technologies (Dillon, 2000), clinical workplace (Wears & Berg, 2005), healthcare systems (Coiera, 2006) and computer information systems (Palvia, Sharma & Conrath, 2001). Recognizing significance of technological change in organization Appelbaum (1997) points to technology as an intervention and appraises the ST system theory to practitioners since this approach accommodates both social and technical elements of organization whereas Mumford (2006) considers ST system theory as a means for optimizing the intelligence and skills of human beings. ERP implementation is considered to rely on behavioural processes and actions (Al-Mudimigh, Zairi, & Al-Mashari, 2001) hence ST system can be a change perspective to examine interaction between social relationships of people with their environment explicitly organization and technical system using methods and materials.

ST system perspective is a synergy of social and technical subsystems and offers a standpoint to analyse performance of ERP implementation. We draw upon Leavitt's (1965) diamond model of organizational change and uncertainty due to its appeal and simplistic nature (Lyytinen, Mathiassen & Ropponen, 1996) to describe an organization as a social structure. Leavitt (1965) categorizes an organization as four distinct elements- task, actor, structure and technology interdependent to each other. Task refers to

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

expected outcomes in terms of goals and deliverables (Lyytinen, Mathiassen & Ropponen, 1998), structure implies a means of communication, systems of authority and systems of work flow, actors refer to those participants involved that carry out tasks and technology is defined as any technical means, know-how and tools to carry out tasks (Lyytinen, Mathiassen & Ropponen, 1996). Grant & Mergen (1996) applied modified Leavitt's model to study the relation between task, technology, organization structure, people and an additional element of communication within a large corporation to reduce the cycle time of its products to keep up with the competition. Their evaluation of other organization frameworks reveals that Leavitt's ST system model was most appropriate since it is simple and explicit to stakeholders from diverse background in the organization. Leavitt's model is as illustrated in Figure 3. Here each element is interdependent on the other and any change in one element causes effects on other elements; in this case implementation of ERP involves changing the organization's technology component which automatically triggers changes in other components of the organization (Sarker, 2000).

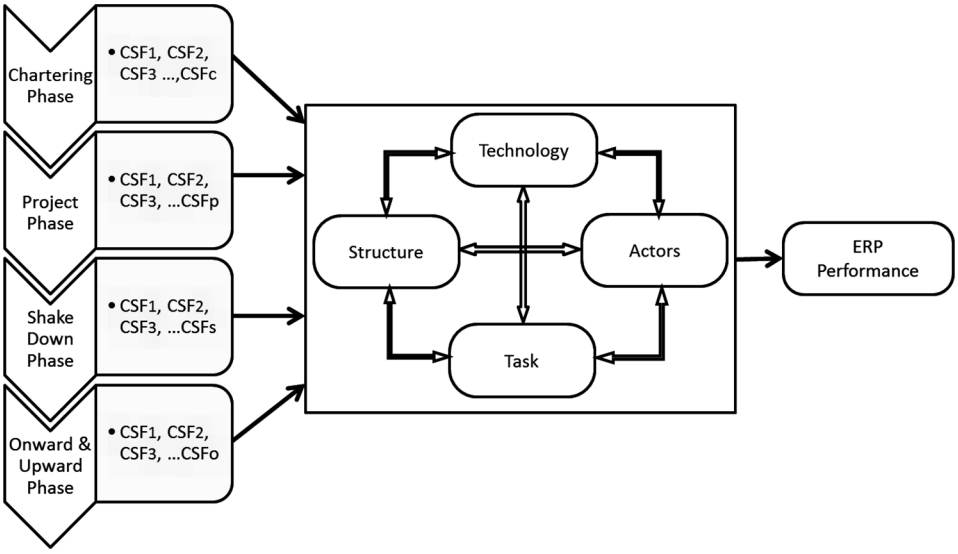
Figure 3. Leavitt's diamond model for sociotechnical change

To summarize, in premise one and two we compare and contrast the process and variance theoretical perspectives to explain why any one of the perspectives used in isolation may not serve the purpose of evaluating the performance of ERP implementation from an organizational change viewpoint. Since ERP is a technological intervention on the social structure of the organization it may be appropriate to leverage Leavitt's model to evaluate ERP performance through CSF. Integrating process-variance perspective with ST system based on Leavitt's diamond model is an attempt to monitor ERP performance and pinpoint areas where corrective actions need to be taken up during the ERP life cycle. DiMaggio (1995) argued that "many of the best theories are hybrids, combining the best qualities" (p. 392) of these approaches. This research article attempts to fulfil this gap in the literature. The following section discusses the research approach to evaluate performance of ERP implementation by integrating process and variance perspectives with ST system perspective.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

RESEARCH APPROACH

The article is an exploratory study to conceptualize the performance of ERP implementation from process, variance and ST system perspectives. To review literature based on these perspectives we adopted grounded theory approach. According to Wolfswinkel, Furtmueller, & Wilderom (2011) grounded theory approach enables to identify the key concepts to surface, instead of being deductively derived beforehand; the concepts emerge during the analytical process of substantive inquiry. With vast ERP implementation literature available Allan (2003) recommends a form of content analysis in grounded theory called coding to conceptualise the underlying issues amongst the 'noise' of the data. Key steps of this approach are: *open coding*- adopted to break down the data into distinct units of meaning called categories or concepts, *axial coding*- used to appreciate concepts in terms of their dynamic interrelationships which should form the basis for the construction of the theory and *selective coding*- adopted to identify and develop relations between the main categories (Goulding, 1999; Wolfswinkel, Furtmueller & Wilderom, 2011).



Integrated Conceptual Framework to Evaluate ERP Performance

In this section, we detail and develop an initial conceptual framework by integrating process and variance (PV) perspectives with sociotechnical (ST) perspective as described in the above premises. Literature review indicates that there have been significant efforts to group factors into dimensions and integrate under different frameworks to get a better understanding to analyse ERP implementation. Belassi and Tukel's (1996) empirical study to identify the factors for success or failure of projects highlights the significance of grouping factors based on criteria such as project elements, factors concerning project manager and team members, organization elements and external environmental elements to enable project managers understand the relationship between the grouped factors. Therefore, if CSF can be organized into dimensions, it will enable stakeholders to gain a better perspective of ERP project. ERP literature attempts to list such dimensions, another empirical study by Hanafizadeh and Ravasan (2011) chose to assess the first stage of ERP project-called ERP readiness assessment by leveraging McKinsey 7S framework by classifying the dimensions as hard and soft elements where the framework can be considered comprehensive and provides a specific list of factors for each of the elements: strategy, structure, systems, style, staff, skills and shared values for the readiness phase of ERP life cycle.

According to Sabherwal and Robey (1993) either phases or CSF approach during ERP project may not be conclusive to measure the performance of ERP implementation and they state that such a context as "cooking with a list of ingredients but without the recipe" (p. 449). Figure 3 shows the integrated conceptual framework proposed in this paper by integrating PV and ST perspectives. The left side of the schematic is an integrated PV framework (Nah, Lau & Kuang, 2001) leveraged from literature and the right side of this schematic is the ST framework. Nah, Lau and Kuang (2001) have identified CSF for each phases of ERP implementation and integrated the CSF with the process approach of Markus and Tanis' (2000). Collating PV perspectives with a generic model such as Leavitt's diamond model which is based on ST perspective will enable organizations to consider temporal nature of ERP implementation. It will enable in clustering and classifying CSF along the phases of ERP life cycle model. This will enable in adapting to the dynamic changes of business environment and simultaneously monitoring the ERP project. Next we deliberate on grounded theory methodology of coding the literature to identify constructs in an attempt to develop a research model based on the conceptual research framework, Figure 4.

Adapted SocioTechnical (AST) System Model to Evaluate ERP Implementation

Literature search with appropriate keywords was conducted to identify articles in peer reviewed journals that analyse ERP implementation. This review is focused on two areas:

1. Articles associated to ERP implementation.
2. Articles that listed CSF for each phase of lifecycle model of ERP.

Initially, the articles that related to ERP implementation were analysed and summarised. Adopting the grounded theory approach, articles were reviewed for themes that emerged from the researchers' interpretation. A representative sample of reviewed articles and its summary is illustrated in Table 2. The emerging themes observed while reviewing the literature are stakeholders, organization, processes and technology. These themes are categorized and called concepts or constructs and this content analysis process of grounded theory is called open coding and the outcome of this open coding process resulted in four constructs.

For the next step, articles that list CSF for different phases (Dawson & Owens, 2008; Kronbichler, Ostermann & Staudinger, 2009; Motwani, Subramanian & Gopalakrishna, 2005; Nah, Lau & Kuang, 2001; Somers & Nelson, 2001) of ERP life cycle are considered for consolidating CSF. Table 3 summarises a list of 36 CSF obtained from the literature. To provide clarity and meaning to the four constructs, stakeholders, organization, processes and technology the CSF obtained through literature were clustered on the basis of their interrelationships and attributes using the process of axial coding. In the final step applying selective coding to data illustrated in Table 4, we observe an interrelationship between the constructs stakeholders and organization which is collated as social factors likewise we group processes and technology as technical factors and this defines a new SocioTechnical (ST) framework for ERP implementation. These four constructs can be mapped to equivalent dimensions of Leavitt's ST change

model. The modified Leavitt's model with the new SocioTechnical (ST) framework is referred as Adapted SocioTechnical (AST) model (Figure 5) for assessment of ERP implementation. In the following section we discuss the conceptualization of constructs which are enablers of ERP performance and set forth the propositions for the proposed model. Setting limits to research in a conceptual paper by emphasizing theory (Schultz, Ginzberg & Lucas, 1994) answers what (constructs) and how (conceptual framework) (Whetten, 1989; Pawar, 2009) by setting directions to develop the propositions for the research article.

DELINEATING THE THEORETICAL CONSTRUCTS AND STATEMENT OF PROPOSITIONS

This section discusses and defines the five constructs of conceptual framework. The dependent variable is ERP performance which is a surrogate measure used to evaluate ERP success and independent variables are stakeholders, organization, processes and technology influencing the ERP performance. The constructs for the study is operationalized as shown in Table 5 and propositions are stated as a guide to enable in developing the research model.

Figure 5. Leavitt's diamond model and Adapted SocioTechnical (AST) constructs for ERP implementation

Social Factors (Stakeholder and Organization) and Technical Factors (Process and Technology)

AST framework developed in Table 4 displays CSF classified as social and technical dimensions. This emergent reaction between the social setting and technology is a phenomenon (Lee, 2000) that cannot be considered in isolation. As they interact with each other, it reinforces the need to look beyond technological perspective and study IT/IS implementation impact on humans and organizations and contribution of these interdependent elements by way of change on various contextual factors impacting the organization (Sarmento, 2005). Literature is opinionated with technology imperative which proposes that ERP technology being standardized software imposes organizations to adapt even though it is developed and implemented by humans to develop better explanations of human and machine interactions in organizations (Rose, Jones & Truex, 2005). However social imperative points out that new technology referred to as technical system has an effect on "users, the organisation, and work processes" and cannot be independent from the humans (Karsh, 2004). Hence by adopting a humane perspective to ERP project and relating it to "child rearing", managers who affiliate to technical side and the others who orient to human side of technology should communicate and co-ordinate as one unit to bring about successful organizational change (Tavana, 2011) and a symbiosis of social system and technical system will achieve the goals set if the combined systems is regularly monitored and controlled (Lee, 2004). In this research article we define the social dimension as consisting of two sub-systems- stakeholders and organization and the technical sub-system comprises of business processes and technology and evaluates ERP implementation through its performance grounded on the following statement:

The technical system is concerned with the processes, tasks, and technology needed to transform inputs to outputs. The social system is concerned with the attributes of people (e.g., attitudes, skills, values), the relationships among people, reward systems, and authority structures. It is assumed that the outputs

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of the work system are the result of joint interactions between these two systems. (Bostrom & Heinen, 1977, p.17)

Stakeholders to Internal Stakeholders

Stakeholders also referred to as actors (Keen, 1981; Leavitt, 1965) are group of people in an organization who share a pool of values that define what the desirable features of an IS are, and how they should be obtained (Beynon-Davies, Owens & Williams, 2004). Stakeholders are critical resource and necessitate a dedicated support (Orlikowski & Hofman, 1997; Zhang, Lee, Zhang & Banerjee, 2003). Employee's perception of the usefulness of the new system and acceptance of the new way of doing business (Beheshti & Beheshti, 2010) is modified by the attitudes of others to these behaviours (Coiera, 2006) and presence of the surrounding stakeholders, i.e. top management, project management, project champion, software vendor and consultants were identified as the root causes driving performance (Akkermans & van Helden, 2002). Boonstra (2011), for example has illustrated the impact of various stakeholders in each phase of ERP project life cycle so that their initiatives for the project can be planned by decision makers and defines stakeholders as "... any person or group who can affect or is affected by the EIS [Enterprise Information System] is a stakeholder (p.160)".

ERP project consultant and vendors are external players and their involvement begins well before pre-implementation stage by partnering with client in enabling them plan the type of implementation, modules of ERP system, business processes to be modified, training needs to adapt to new system and resources required for the project. They play a significant role by being part of ERP project which is referred by Markus, Axline, Petrie & Tanis (2000) as socially complex activities and they continue to assist organizations to assimilate the new systems. Therefore this study assumes consultant team and ERP vendors as internal stakeholders of a particular organization implementing ERP. It encompasses their perception towards project, usage of ERP system and attitude towards project stakeholders. Hence we rename our construct in AST model from stakeholders to internal stakeholders.

Proposition 1: Success of ERP implementation is related to performance of ERP and is positively related to the social perspective of internal stakeholders of an organization to ERP project.

Organization to Internal Organization

Lyttinen & Newmann (2008) argue that identifying business environment as a dimension can bring forward key elements that influence change in IS systems. Though the article calls upon consideration of internal and external organizational environment, this article deliberates on the internal organization context since it forms the controllable component and the decision makers are able to plan the resources to leverage the performance of ERP project. This is supported by Table 3 an exhibit of CSF represents endogenous organizational context. Organization strategies, mechanisms to communicate about ERP project and change management methods are made conducive to enable internal stakeholders adapt to ERP project. Duncan (1972) defines internal environment as consisting of those relevant physical and social factors within the boundaries of the organization.

An often overlooked aspect of ERP implementations is the effect that the new system will have on employees (Okrent & Vokurka, 2004) as a result, appropriate change methods and techniques that help individuals and groups make the best use of available technology are needed (Appelbaum, 1997). This

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

is consistent with (Geels, 2004) that sociotechnical systems do not function autonomously, but are the outcome of activities of human actors and organizations. Another important aspect that effectively brings about change in organizations is culture (Grabski, Leech & Schmidt, 2011; Orlikowski & Hofman, 1997). Culture is used as a means to understand organizations (Robey & Boudreau, 1999) and in the context of ERP implementation, culture signifies a mechanism of sharing values, believes and ideas among organizational stakeholders. Hence internal organization is defined as the endogenous organizational context planned for ERP implementation.

Proposition 2: ERP implementation success is related to ERP performance and is positively related to the internal organization from a social perspective.

Process to Business Processes

Implementing ERP application software (Rashid, Hossain, & Patrick, 2001) force companies to reengineer their business processes to accommodate the logic of the software modules for streamlining data flow throughout the organization. ERP system causes mutual interactions between IT and organization by pointing to the requirement that organizations must reengineer its business processes to fit the processes that the ERP software was programmed to manage (Lee, 2004). The Business Process Reengineering (BPR) paradigm is an enabler to bring about changes in business process. ERP deployment requires extensive effort (Al-Mudimigh, Zairi & Al-Mashari, 2001) to transform the business processes, bring about radical organizational change (Kwahk, 2006) and a thorough strategic thinking that allows companies to gain better understanding of their business processes (Ehie & Madsen, 2005). A business process in the context of ERP deployment can be defined as a method of identifying as-is business processes and configuring the ERP software for the new to-be business processes. Therefore, in this study we redefine processes in AST model as business processes.

Proposition 3: ERP implementation success is related to its performance and is positively related to processes from a technical perspective.

Technology

ERP implementations are usually large, complex projects, involving large groups of people and other resources, working together under considerable time pressure and facing many unforeseen developments (Akkermans & van Helden, 2002). The enterprise has its own thoughts, but the software of ERP has also certain thoughts, therefore, how to synthesize them is a critical work (Jing & Qiu, 2007). In this regard to bring about change effectively another key organizational context dimension is technology (Orlikowski & Hofman, 1997). The technical infrastructure is unlike other software systems where organization has to pay special attention to the existing technology, generically known as legacy systems and will be a good indicator of the nature and scale of potential problems (Finney & Corbett, 2007; Karsh, 2004).

Another issue faced by organizations relates to ERP customizations. Since ERP is vendor developed application software developed based on best practices of organizations worldwide while implementing ERP, nearly most organizations reengineer their processes and standardize them to meet the needs of ERP software rather than customizing the software to the requirements of the organization processes. Though ERP has the rich potential for customizing that distinguishes it from other packages (Klaus, Rosemann

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

& Gable, 2000), while implementing ERP the objective of customization is to achieve a fit between the ERP system and the process that the system supports. This calls for decision makers to collaborate as a team with the top management and consultants to draw consensus while establishing a fit between the processes and technology (Parthasarathy & Anbazhagan, 2007). Hence we observe that technical systems cannot be stand-alone systems but must align with environment and involve sub-systems such as humans (Lee, 2000). This article defines organization's technology as the combination of hardware-software infrastructure (Whitworth, 2009) and software architecture framework.

Proposition 4: ERP implementation success is related to its performance and positively related to the technology from a technical perspective.

Table 5. Operational definition of conceptualized constructs to evaluate ERP performance

Constructs	Working / Operational Definition of Proposed PVAST Model
Independent Variables	
Internal Stakeholders	Defined as the attitude and perception of the members (top management, project team members, end users, vendors and consultants) who are part of the ERP project towards ERP deployment in the organization.
Internal Organization	The endogenous environment of organization is defined as a context where appropriate strategic planning process, effective communication tools, tools for decision making and change management methods and techniques is undertaken for ERP implementation.
Business Processes	Defined as the process of analysing as-is state of the organization and plan for the to-be processes on account of ERP implementation.
Technology	Tools (ERP system) required, its associated hardware, network, communication and software architecture framework for the organization to fulfil its objectives and end user to carry out their tasks.
Dependent Variable	
ERP Performance	The dependent variable. ERP success is measured with a surrogate measure, ERP performance. This surrogate measure is represented with three items to incorporate tangible (the cost of ERP did not outweigh the benefits), intangible benefits (ERP implementation has significant positive effectiveness for the business) and the organization gains with ERP implementation (improved overall business efficiency).

ERP Implementation Performance

ERP success or failure is a concern for organizations due to the risk associated with the project by way of investments made by the organization, acceptance of software by stakeholders, reengineering business processes, unlearning old practices and adapting to new systems. IS implementation can be defined in terms of management change and improvement (Schultz, Ginzberg & Lucas, 1998). This is consistent to the three theoretical premises based on change in this study. Therefore it is significant for IS professionals to understand how the implementation of such IS can bring about firm value through their performance (March & Storey, 2008).The full benefits of productivity improvement measures are realised when productivity is examined from two perspectives: operational efficiency of an *individual*

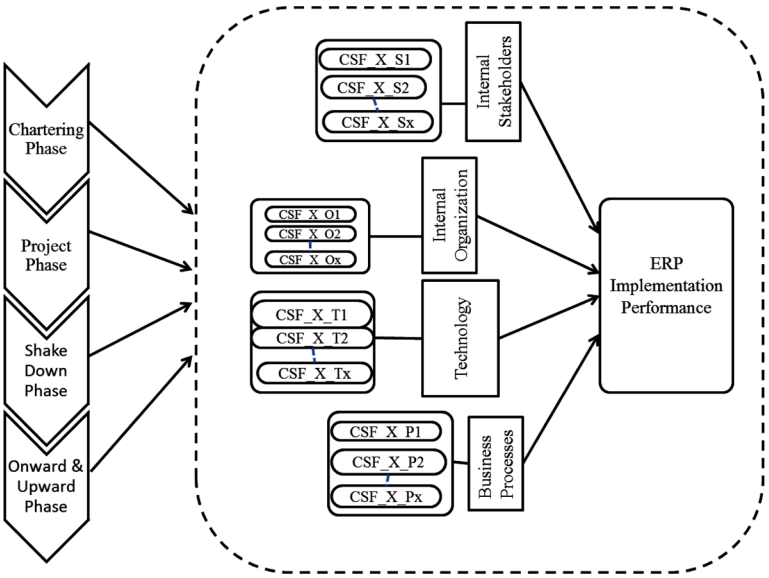
EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

worker or a *business unit* and effectiveness through *system performance* (Beheshti & Beheshti, 2010). Hence ERP implementation is viewed from the perspective of *internal stakeholder's* at all hierarchical level of the organization and *business unit* which is *represented by constructs* of AST Leavitt's model in this study. ERP success during implementation is measured through *ERP performance* by evaluating the social and technical factors.

Proposition 5: ERP implementations success is related to ERP performance assessed through social and technical dimensions of organization.

THEORETICAL MODEL DEVELOPMENT AND DISCUSSIONS

In this section we propose a theoretical model that shows the relationship among the constructs. The proposed Process Variance and Adapted SocioTechnical (PVAST) model is illustrated in Figure 6. This PVAST model is an assimilation of three theoretical perspectives: process, variance and adapted sociotechnical. PVAST model is based on five constructs; one dependent variable: ERP implementation performance which enables in evaluating the success or failure of ERP implementation; four independent variables: internal stakeholders, internal organization, business processes and technology. The key for our research model is based on:



…the lessons that emerge in the interactive system effects between the technological [technical] and the organizational [social], where these lessons pertain to the management of information technology and the uses of information technology for managerial and organizational purposes. (Lee, 2000, p.vii)

The PVAST model is developed in two stages; firstly, integration of variance perspective under AST as illustrated in Table 4; and secondly, four instances of the above integrated model are generated for each phase namely chartering, project, shakedown and onward-upward. *CSF_X_Sx, CSF_X_Ox, CSF_X_Px* and *CSF_X_Tx* represent the CSF associated with internal stakeholders, internal organization, business processes and technology respectively, where *X* represents phases of implementation and *x* is number of CSF in the phase X. To illustrate this (see Figure 5), *CSF_C_S1* and *CSF_O_P6* represent the first CSF under internal stakeholder construct in chartering phase and sixth CSF under the business processes construct in the onward and upward phase respectively. This proposed model will facilitate to evaluate the performance of ERP project. This process of monitoring will also enable stakeholders of the project plan their resources based on temporal conditions of time and account for changes in CSF due to the dynamic competitive environment before the next stage of ERP project.

Uniqueness of PVAST model for ERP implementation is that it enables organization decision makers leverage simplicity of AST Leavitt's change model which can be understood easily by members with diverse backgrounds and frames of reference (Grant & Mergen, 1996). This is consistent with Alter's (2010, p. 3) view "a model that fosters better communication between business and IT professionals should consist of terms that are understandable to typical business professionals". Though the integrative model of Somers, Nelson, & Ragowsky (2000) is based on ST perspective view of organizations consisting of domains- actors, structure, technology, tasks and data, accounts for the external and internal environment of the organization, and is based on software life cycle model but it does not explain how the organization can apply the model to evaluate ERP implementation.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 6. Proposed conceptual PVAST model for ERP implementation assessment based on Adapted SocioTechnical framework

The proposed PVAST conceptual model allows an organization to gain perspective on the performance of ERP implementation can be powerful means of providing focus and improving the effectiveness of the systems efforts and will enable organization to diminish the risk associated with the technological interventions; nevertheless organizing CSF along the phases from a sociotechnical perspective enables stakeholders in conceptualizing ERP performance based on organization elements. This is consistent with Beheshti & Beheshti's (2010) call upon organizations if it wants to meet the challenges of the dynamic environment to consider ERP system as contained with people, management, strategic goals, business processes, the hardware and the ERP software. These components are the constructs of PVAST model and hence measuring ERP success with this model will enable organizations evaluate its performance.

CONCLUSION AND IMPLICATIONS

The objective of this research has been to develop a rich theoretical background to evaluate the success of ERP systems. An integrated PVAST conceptual model that associates process and variance perspectives with sociotechnical perspective in conjunction with an adapted Leavitt's change model has been theorized. The conceptual model draws on the synergy of social and technical dimensions of the organization to represent it as a social structure in Leavitt's adapted change model. The key constructs identified from this model are internal stakeholders, internal organization, business processes and technology. The article operationalizes the constructs by adopting the grounded theory approach and develops propositions for the study. The four instances of the PVAST model across the implementation phases (chartering, project, shakedown and onward-upward) enable decision makers to evaluate the success of ERP during its life cycle.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

From an academic perspective this research has developed a novel integrated framework grounded on process, variance and sociotechnical perspectives to evaluate the success of ERP through its life cycle. The PVAST model enables practitioners to identify CSF for each phase in ERP life cycle model and cluster them under the adapted Leavitt's model and provides them a better standpoint to underpin areas where corrective measures are essential during planning, implementation and up-gradation of ERP system. The proposed model is developed by rigorously reviewing literature based on the grounded theory approach and further empirical study can be carried out to validate the proposed model. Future studies can extend the organization environment to take account of exogenous context to include concepts such as customers and suppliers as stakeholders.

ACKNOWLEDGMENT

The authors wish to thank anonymous reviewers for their valuable feedback on earlier versions of this research article. The feedback received from the reviewers has enabled us to improve this article substantially. The authors would also like to acknowledge the support received from the editor during this process. This chapter is a revised version of the research article "Conceptualizing Dimensions of Enterprise Resource Planning Systems Success: A SocioTechnical Perspective" published in the International Journal of Enterprise Information Systems, 10(1), 53-75.

KEY TERMS AND DEFINITIONS

Critical Success Factors: Critical Success Factors (CSF) are defined as factors needed to ensure a successful ERP project.

ERP Implementation: The intervention of ERP application system on the social and technical factors of an organization.

Process Perspective: The process perspective posits the necessary actions to be deliberated by decision makers in each phase of the ERP project where actions in each phase are mentioned *a priori*.

SocioTechnical Perspective: SocioTechnical perspective is a synergy of social and technical subsystems of an organization.

Variance Perspective: The process of establishing conditions necessary for the success of a project.

Chapter 11
Developing a Participatory Approach to Accessible Design

María Inés Laitano
LabSic, Université Paris 13, Villetaneuse, France

ABSTRACT

This article describes how accessibility to ICTs is understood as conformity to standards, which usually ends in designs that do not consider the singularities of people. This article delves into a participatory approach to accessible design, as an alternative to design guided simply by standards. It first defines a relevant network of stakeholders for accessible participatory design, based on the expertise that each of them can provide. It then discusses the issue of consensus among stakeholders, necessary to make design decisions when there are conflicting views. Finally, it addresses the question of non-technological outcomes and methodological concerns of Participatory Design that should inspire the accessible design agenda.

INTRODUCTION

Although accessibility to Information and Communication Technologies (ICTs) has been promoted for more than ten years as a fundamental human right of people with disabilities (United Nations, 2006), as an unprecedented opportunity for communication and autonomy, many communities remain excluded. The reasons for this situation of relegation are many and diverse (economic, technical, cultural, political, geographical, etc.) but a major cause is the standardized design of mainstream ICTs. Standardized or normalized design implies certain norms, like young, white, male, heterosexual, Western, middle-class, non-disabled, and marginalizes individual identities (Lewthwaite, 2014). As postulated by the social model of disability (World Health Organization, 2001), exclusion is generated by the environment in which the person lives, by the normalized design of mainstream technologies, and not by their personal attributes.

In the accessibility arena itself, there is a generalized understanding of accessibility to ICTs as conformity with norms. Several countries granted law status to Web Content Accessibility Guidelines (W3C, 2008), promoting web design projects based exclusively on accessibility standards. These guidelines are lists of verification criteria, designed more to evaluate existing websites than to address new design projects. It was shown empirically, by user test, that accessibility guidelines do not cover all the problems

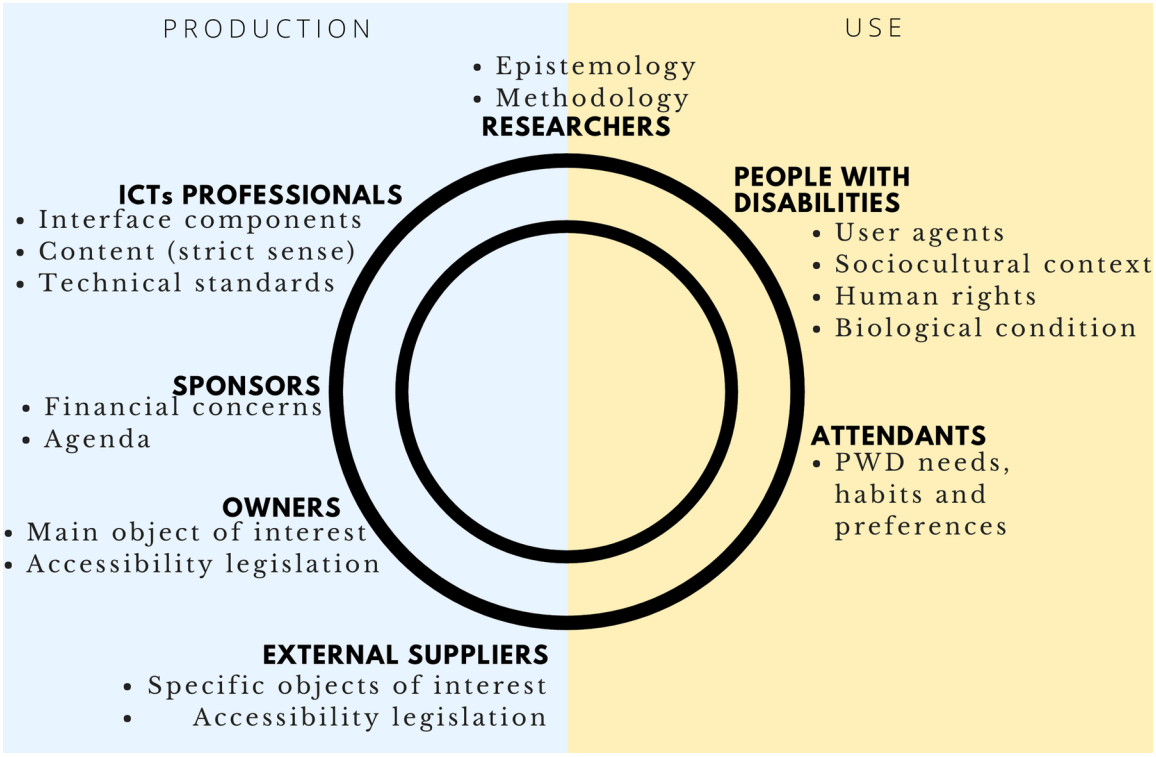
encountered by people with disabilities when they browse the Web (Power, Freire, Petrie, & Swallow, 2012; Rømen & Svanæs, 2011). Guidelines define accessibility as a property of the digital content and not as a property of the relationship between the user and the content in a context of use (Cooper, Sloan, Kelly, & Lewthwaite, 2012), as a property of the user experience. The W3C Accessibility Guidelines Working Group, aware of these limitations, is currently working on a next major version for 2020 that hopes to expand the scope beyond content and beyond the Web (Lauriat & Spellman, 2017). One of the goals in this elaboration process is to involve more stakeholders by doing user research with people who use the standard.

This paper delves into a participatory approach to accessible design, as an alternative to design guided simply by standards. Participatory design calls for democratization and stakeholder involvement in the design process, for empower relevant stakeholders rather than being restrict them to a prescribed way of interacting (Fischer, 2002), for emancipate specially "groups of people whose views, opinions and needs might be the most ignored by mainstream society." (Vines, Clarke, Wright, McCarthy, & Olivier, 2013). At least two rationales, one moral and one pragmatic, support participatory design. The first is that the people most directly affected by the design result have the right to judge that result. The pragmatic reason is that directly including users will increase the chances of a successful design result because they are the ones who will need to adopt and to adapt to the design result (Carroll & Rosson, 2007).

The three main goals of the participatory design philosophy—sharing expertise, sharing control and inspiring change (Vines et al., 2013)—are explored in the context of accessible design. The author outlines opinions developed through experience and loosely guided by these three goals. She took part as a researcher/designer in a series of technology design projects for social inclusion carried out in the city of Rosario (Argentina), the majority of them within a public program of accessible tourism.

Thus, the objectives of the article are three. First, to identify who are the relevant stakeholders, based on the expertise needed to design an accessible artifact. Second, to discuss the issue of consensus among stakeholders, necessary to make design decisions when there are conflicting views. Thirdly, to address the question of the outcome of an accessible participatory design project and the outcome aspects that should concern the accessibility research agenda.



The contributions are not intended to be a formal or reproducible methodology for the accessible design of ICTs. The socio-technical systems "involving humans and technology contain far too much variability to be reproducible in any straightforward way" (Brown, Reeves, & Sherwood, 2011). The proposed suggestions are only intended to motivate and inspire more reflections on accessible participatory design. It is up to each designer or researcher to adapt, via re-signification and non-mechanical dissemination (Thomas, Juarez, & Picabea, 2015), these proposals to other local contexts.

SHARING VIEWS ON ACCESSIBLE DESIGN

Participatory design conceives design as a process of inscribing knowledge in material forms (Karasti, 2014). This knowledge is not owned by a single person but possessed by different stakeholders in an asymmetric and often controversial way (Fischer, 2000). Relevant stakeholders for accessible participatory design are all those people with some knowledge of accessibility, capable of share their points of view and produce new ideas and artifacts. This definition extends the classic triad developers-content-users of the W3C's Web Accessibility Initiative (Chisholm & Henry, 2005) to a wider network conformed by: ICTs professionals, sponsors, owners and external suppliers on the production side; people with

Figure 1. Stakeholders and their expertise for accessible participatory design (Source: Laitano, 2017)

disabilities and attendants on the use side; as well as researchers. Figure 1 synthesizes the stakeholders' network proposed for accessible participatory design and the expertise contributed by each of them. Names in uppercase define the stakeholders. Expertise of each stakeholder appear in bullets. The light blue background identifies the production side while the orange background identifies the use side.

People with disabilities –or end users– consult and interact with the content through user agents: web browsers, media players and assistive technologies[1]. They have different levels of competence in the use of user agents and configure them in very different ways. For example, an expert screen reader user knows multiple keyboard shortcuts that a novice user may not know. But user agents represent only one –the technological one– of the multiple dimensions that make up the disabled experience (Frauenberger, 2015) and from which people with disabilities can give testimony. There is knowledge derived from biological condition. For instance, within the collective of people with visual impairments, blindness is not the same as low vision nor blind deafness, birth blindness is not the same as acquired blindness. There is knowledge intrinsically cultural. For example, sign language is the language of a deaf culture. Contemporary conceptualizations of disability, which go beyond the dichotomy between the biological model and the social model, give the pattern of multiple knowledge that people with disabilities can contribute to accessible design (Frauenberger, 2015).

Attendants of people with disabilities (family, colleagues, teachers, caregivers and others) are also key informants in accessible participatory design. As outlined in the "Support and relationships" chapter of the International Classification of Functioning, Disability and Health (World Health Organization, 2001), people with disabilities receive practical physical and emotional support from their attendants as

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

well as support in various aspects of their daily activities. Because of this, their attendants have a deep knowledge about the disabled experience, about their needs, their habits and their preferences. Attendants are not only informants but can also play the role of mediators. As mediators they can, for example, take part as interpreters of deaf people whose native language is the sign language.

By delving into the common definition of content[2], it can be seen as the conjunction of three elements belonging to different stakeholder's expertise of the production side: interface components, content (in the strict sense) and objects of interest. The difference between interface and content is a classic distinction in computer science: an interface component is a part of the artifact that is perceived by users as a single control for a distinct function while a content is an information or a sensory experience communicated to users with a certain structure and presentation format (W3C, 2008). Participatory Design has already pointed out that the design of interface components and the design of the content are intertwined. (Fischer & Herrmann, 2011) and this is especially true in accessible design where a barrier in either of the two makes inaccessible the whole. Whether a button does not support operation by keyboard (interface) as if important information is only in non-textual format (content) the entire artifact is inaccessible.

The object of interest is a concept that derives from the Activity Theory applied to the Human Computer Interaction. The interaction between people and technological artifacts occurs in the broader context of a human activity (Rabardel, 1995). People does not interact with technological artifacts but with an object of the world through technology. The technological artifact only mediates the relationship between the human and this object of the world that interests him (Bødker, 2011). For example, when someone looks up an accessible sightseeing tour on the Web, his attention is not placed on the format of the content but on the tour sights and its accessibility features. So, if tour sights are not accessible or if nothing is said about accessibility features, even if the interface and the content are accessible, the technological artifact does not fulfill its mission, the experience as a whole is inaccessible.

Developers –who can be named more generally as ICT professionals because they include designers, QA professionals and others– are experts in the design of interface components and content in the strict sense. They use –and are experts in the use of– authoring tools such as development environments, content management systems, blog applications, etc. and evaluation tools to check the content syntax and accessibility.

In addition, there are "owners" of the design solution, i.e. those who initiate, promote, edit and keep alive the design solution over time (Laitano, 2016). To illustrate, if the Tourist Office turned to the University to design a tourism solution accessible to tourists with disabilities, the Tourist Office fulfills the role of the owners of the design solution and the University fulfills the role of the ICT professionals. Owners are experts in the purpose or main service of the designed artifact that in the example would be the tourist offer of the city and that can be named as main object of interest.

There are also those stakeholders who are referred to in the content but who are not owners, their role is rather that of external suppliers of content. Local hoteliers and gastronomes are external suppliers in the case of a tourism design solution. External providers have knowledge about the specific services they provide (specific objects of interest) and are responsible for their accessibility. Also on the production side there are sponsors, stakeholders who understand the financial aspect of the project and normally control the project's agenda. Sponsors may or may not coincide with owners. In the case of a tourism design solution, the municipal government or the tourism ministry can be the sponsors of the project.

All production stakeholders have –or should have– knowledge about the standards that an accessible design solution will have to respect. As proposed by Kelly et al. (2009), the extent to which artifacts are accessible will be influenced by how all the production stakeholders respond to these external drivers

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

for accessibility which are the standards. Developers know technical standards on digital accessibility, standards that establish how to show audiovisual content, among others. Owners and external providers know the legislation on accessibility and disability that applies to their own service or domain of expertise.

Researchers are also relevant stakeholders for an accessible participatory design project, located in a meta-position that encompasses both production and use (see Figure 1). This does not mean that they control the process from outside but 'inside the loop' (Brown et al., 2011). The knowledge provided by the researchers is above all methodological and epistemological. Methodological because researchers establish ways for shared, communicated and embodied the stakeholders' knowledge (Vines et al., 2013). Epistemological because they observe, analyze and transform a process in which they themselves take part. Recognizing the researcher as part of the design process is recognizing that the designed artifact is also linked to the researcher's culture[3].

LOOKING FOR CONSENSUS AMONG STAKEHOLDERS

Co-design a socio-technological solution is a complex challenge in which multiple points of view can take place. Stakeholders are not homogeneous and the particular characteristics and singularity of participants can lead to very different design process. Different process, run in different ways, can end up with very different outcomes even if the technological artifact that is being built is exactly the same (Brown et al., 2011). Moreover, this suggests that the idea of recruiting representative stakeholders (Newell, Gregor, Morgan, Pullin, & Macaulay, 2011) is quite a while idealistic. Finding the point of consensus is therefore a topic of interest in the Participatory Design literature. Some authors propose a participatory result "as one that shows evidence of democratic ideals by increasing the agency of its users and giving them a voice in matters they did not have before." (Bratteteig & Wagner, 2016). Participatory design insists on the tolerance of different perspectives, on the passionate commitment that brings together the stakeholders, on transform conflict between enemies into constructive controversies among adversaries who have opposing interests but are capable of legitimizing visions different from their own (Björgvinsson, Ehn, & Hillgren, 2010).

In the case of accessible design, controversies appear at multiple levels. Just to mention a few:

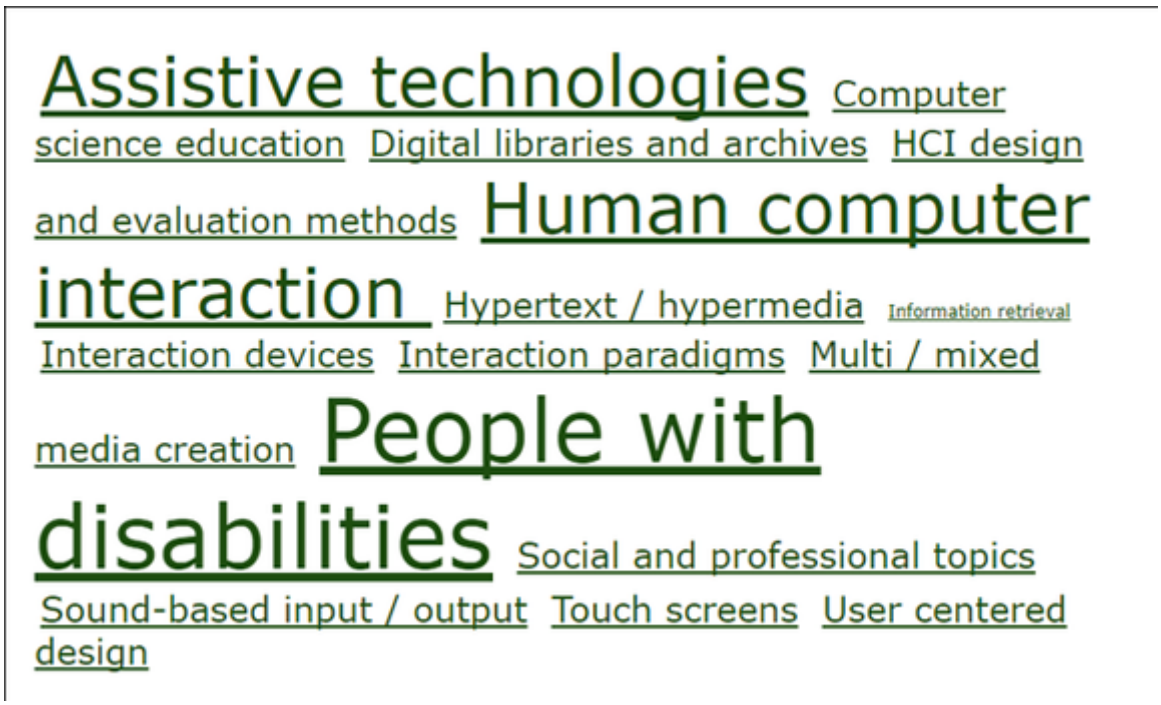
- Within the same collective of users: essential features for one user with low vision may not be important for another. Many of them use the browser zoom to read the Web while others navigate with screen reader to avoid visual fatigue. For the former, a good color contrast is essential, while for the latter, a well-written HTML is more important.
- Between different collectives of users: People in the deaf community prefer that the size of the sign language interpreter in a video be very large while people who do not understand sign language will tend to prefer a small size.
- Between ICTs professionals and users: In surveys to screen reader users (WebAIM, 2009), when users are consulted about web images that seek to generate some emotion or sensation, most indicate that they prefer images described by their screen reader. This result is clearly opposed to the accessibility guideline that recommends not describing decorative images and therefore opposed to what any ICTs professional would tend to do.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

How to deal with these conflicting preferences is a subject still little explored in the field of accessible design. Accessibility standards are not normative in terms of participation and involvement of stakeholders, although the Website Accessibility Conformance Evaluation Methodology (W3C, 2014) indicates the intervention of people with disabilities as an *optional* requirement. Scientific works on Participatory Design with people with disabilities developed so far (Brock et al., 2010; Metatla, Bryan-Kinns, Stockman, & Martin, 2015) are more focused on the forms of communication between producers and users (accessible scenarios, accessible prototypes, etc.) and less in the forms of agreement. There is, on the other hand, a widespread idea of design for all or universal design that has implied dangerous implications such as thinking that a design could satisfy the preferences or views of any individual. If it is already difficult enough to find consensus among the members of a participatory design project, "it can become impossible if the characteristics for which one is designing, in terms of physical, sensory, motor and cognitive abilities, to say nothing of culture, knowledge and motivation, are suggested to include those of the whole population" (Newell et al., 2011).

If the disadvantages of the standards-guided design exposed at the beginning of this paper are considered, a path of possible agreement for an accessible participatory design would be to prioritize the voices that come from the experience of stakeholders over the voices that are based on the accessibility standards. In this way, singularities of the people directly involved will be prioritized over the norm, which is ultimately established by people unconnected to the project. Likewise, a path of possible agreement is to take advantage of the creative potential that has bringing different points of view together and trying to create a shared understanding among all stakeholders (Fischer, 2000) to imagine solutions that solve apparently opposite needs. This last idea approaches that of Bødker and Zander (2015) for whom it is about identifying win-win situations. That is, instead of simply respecting the voice of the majority, redouble the creative effort to arrive at solutions that respond to heterogeneous needs.

INSPIRING THE ACCESSIBLE DESIGN AGENDA



The balance between the technological concern and the methodological concern is another point of discussion in the field of Participatory Design. Participatory Design mainly focuses its efforts on identifying "novel ways of deploying existing technologies in ways that are useful to users" (Dunckley, Camara, Abdelnour-Nocera, & Waema, 2009) and in designing "improvements over existing technologies as they are more sensitive to the needs and desires of specific user groups" (Vines et al., 2013). These reuses and adaptations of existing technologies put the focus on design processes and methods, and are usually accompanied by a lack of interest in the technological research concern. Korsgaard, Klokmose and Bødker (2016) consider that the cause of this technological conservatism is the stability of mainstream technologies and draw attention to the risk for Participatory Design. The perpetuation of operating systems like Windows, Mac, iOS or Android, and applications that has matured for decades (Microsoft Word, Excel, etc.) has led to a standardization of both the design of user interfaces and the training of researchers and practitioners in the field of software design. "If technologies are chosen based on the researchers' (and users') taken-for-grantedness, familiarity and/or convenience, and later result in recommendations for, or, a finished system, it must be implicitly assumed that our current technologies are adequate for local practices." (Korsgaard, Klokmose and Bødker, 2016, p. 73).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The opposite seems to happen in the field of Accessibility. The scientific community has a predilection for the technological research concern, as illustrated by the prominent subjects in the Accessibility and Computing literature (Figure 2): while only two themes make reference to design processes and methods –user centered design, HCI design and evaluation methods–, several topics are related to technologies –assistive technologies, interaction devices, interaction paradigms, sound based I/O, touch screens, etc. Following the same reasoning as before, the inclination for the technological concern may be a consequence of a certain platform instability, of the existence of many and heterogeneous toolkits and platforms. Assistive technologies vary completely from one disability situation to the other as well as within the same disability situation. For instance, assistive technology for visually impairment include screen readers, screen magnifiers, Braille embossers, voice recognition, navigation assistance, wearable technology, among many others. But addressing only the technological aspect also involves a risk, already mentioned above: assuming that a technology can be a universal solution, which can satisfy any subject with a certain disability.

Integrating the methodological concerns of Participatory Design into the accessible design agenda could then lead to a better balance between methodological and technological aspects, to a socio-technical approach of accessible design and to a real socio-technical outcome. Integrating the methodological concerns means starting from the local knowledge of people with disabilities and other stakeholders for questioning the conditions under which technologies are designed and introduced.

Figure 2. Prominent subjects in the Accessibility and Computing literature (Source: Special Interest Group on Accessibility and Computing https://dl.acm.org/sig.cfm?id=SP1530)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Finally, the technological artifact is not the only outcome in a participatory design project. New knowledge and competencies, new collaborations and networks are other possible outcomes of the collaborative work among stakeholders (Bratteteig & Wagner, 2016). The knowledge about the disability experience is usually very asymmetric in an accessible design project, very limited in the case of the production stakeholders. Producers are probably the ones who take the most in terms of new knowledge and competencies. For their part, people with disabilities encounter daily so many barriers in ICTs that they are particularly motivated to exchange in design processes. They accept the challenge because the problems addressed are personally meaningful problems (Fischer, 2002) for them. Mutual learning, exchange and joint work to produce something new generate trust and bonds between stakeholders that endure over time. Accessible design research should value this knowledge as scientific knowledge, should transmit the skills acquired and can take advantage of collaborations and networks in future projects.

CONCLUSION

This paper delves into a participatory approach to accessible design, as an alternative to design guided simply by standards. It analyzes three essential issues of participatory design in relation to accessibility: sharing expertise, sharing power and inspiring change in the accessible design agenda. In the first place, it defines a relevant network of stakeholders for accessible participatory design based on the expertise that each of them can provide. On the production side are the ICTs professionals, the owners, the sponsors and the external suppliers of the design solution. On the use side are the people with disabilities and their attendants. In a meta-position between production and use are the researchers. The article then raises the issue of consensus among stakeholders and proposes two possible scenarios for resolving controversies. The first is to prioritize the voices that come from the experience of stakeholders over the voices that are based on the accessibility standards. The second scenario consists in transforming controversies into creative potential, in redoubling the creative effort to arrive at solutions that respond to heterogeneous needs. Finally, the author exposes two qualities of Participatory Design of which the accessible design agenda could be inspired: to probe more deeply into the methodological concerns and to take advantage of the non-technological outcomes of the process, such as new knowledge, new competencies and new stakeholders' networks.

Bringing together the right stakeholders, prioritizing their knowledge over accessibility standards, attending to the methodology and to the non-technological outcomes of the process are some of the challenges for accessible design. More reflections and more designs in this sense remain to be carried out to take advantage of the communicative and emancipatory potential of ICTs for people with disabilities.

ACKNOWLEDGMENT

The author's research was funded by the Université Paris 13 (France) and the Consejo Nacional de Investigaciones Científicas y Técnicas (Argentina). The design projects that inspired this article were funded by Ministerio de Ciencia, Tecnología e Innovación productiva, Universidad Nacional de Rosario, Universidad Abierta Interamericana, Ente de Turismo Rosario, Secretaría de Turismo de la Municipalidad de Rosario, and supported by many stakeholders from Servicio de Lectura Accesible de la Biblioteca Municipal Argentina "Juan Álvarez", Asociación Rosarina de Deportes para Ciegos, Centro de Rehabili-

ENDNOTES

1. Assistive technologies are specific programs or peripherals that people with disabilities use to improve their interaction with the Web. For example, screen readers normally used by people with blindness are assistive technology.
2. The Web Accessibility Initiative defines the content as "the information that forms Web sites and Web applications: the code and markup that define the structure, presentation, and interaction, as well as text, images, and sounds that convey information to the end-user." (Chisholm & Henry, 2005, p. 32)
3. It is also to inscribe participatory design as a practice of complex thinking and as a second-order epistemology. The concept of the meta-point of view of Morin (2005) is relevant to deepen this aspect.

Chapter 12
Structural Change Management for Sustainable SME Development:
Applying Classical Management Tools

Robert M. Molnar
Technical College of Applied Sciences in Zrenjanin, Serbia

ABSTRACT

This chapter addresses several approaches in investigation of the SME life cycles, particularly in respect to the structure, functions and behavior of these businesses. Once SMEs have been established they start to change both their structure and behavior. In fact, it could be stated that SMEs operate in a permanently changing environment. There are a lot of factors which influence these changes and optimizing their management is a great challenge for most SMEs. As a result of these factors and suboptimal SME management practices survival rate of new established SMEs is low. For researchers and practitioners it is therefore crucial to discover how to increase long-term survival chances of SMEs through relevant structural change. In order to contribute to this goal the chapter will consider the conceptual and research framework of the structure and practical management behavior of SMEs in change management processes. The chapter also provides suggestions on how to use practical management tools such as the PEST, SWOT and TOWS matrices and ways of their analysis.

INTRODUCTION

Structural changes inevitably occur with the development of human society, both on a personal and on a global level. These structural changes are being reflected in value systems and put small, flexible organizations in a more favourable position compared to larger ones in terms of adaptability. Market competition between companies also forces small and medium size enterprises (hereinafter: SMEs) to be both innovative and productive. Speed of changes that take place in human society, even in markets, increased the competitive advantage of innovative and flexible companies, so they put at a disadvantage

those companies which are weighed down by large structures and bureaucracy. With this in mind, perhaps it is not surprising that the share of small enterprises in the total number of companies is in constant increase. In addition to their number, small companies have a significant role in employment generation which is higher when compared with large ones and what is also very important, small companies could be the driving force for local economic development, particularly out of urban areas (Birch, 1981).

However, a small number and scope of their business functions result in the fact that SMEs individually have little impact on their environment and the power to modify it according to their needs. But, for the same reasons SMEs have an ability to react quickly to the changes happening in their environment. Conversely, large enterprises strive to establish stability in their operations, as well as keep up their structure, opening the door for the development of a structured bureaucratic organization. This inevitably hinders their flexibility and innovation which are prerequisites for success in market competition (Molnar, 2010).

In the second half of the twentieth century, large enterprises and multinational companies were the main factor of economic growth and development. However, at the same time in both developed and developing economies, SMEs became an increasingly important economic and social factor. With their innovations and willingness to take a risk, entrepreneurs in these SMEs emerged as a potential force that changes the existing situation and contributes to overall progress. The willingness of societies to support such individuals often predetermined their own overall progress (Penezić & Jakopin, 2002).

Enterprise growth eventually develops and changes its organizational structure and its goals, as well as ways of achieving them. The initial phase in the life cycle of SMEs is often chaotic, uncertain and risky period in their lives (Stanković, 1998). Those companies which survive this period in many cases avoid re-exposure to risks and uncertainties with which they are faced. They sustain their businesses in a smaller framework, not only relating to the number of employees, but also to other business factors. In this way, owners of SMEs themselves become a limiting factor in their own SME life cycle.

Nevertheless, the number and rate of creation of "small" companies among the overall business entities are increasing day by day. SMEs emerge on a daily basis, but they also disappear on a daily basis. Whether this is due to their inability to overcome all the "children's diseases" on their development path or simply the law of the market in overall economic environment remains for further research. This is definitely a question that requires an answer. There are many ways in which small businesses are trying to survive, but modest overall resources that are at their disposal, are certainly one of the limiting factors of their survival and eventual further development.

In terms of ruthless struggle for market survival, the problems faced by SMEs are not just problems of individuals - entrepreneurs and managers. But rather, these problems have a wider social-economic dimension. An SME as an open organizational system is in intensive relationship with the environment, and its dependence on stakeholders is at an extremely high level. Since an SME does not have the power to change the environment, the only strategy is to adjust to it (Molnar, 2010).

As a result, and strongly dependent on success of SME management, numerous statistical evidence shows that less than a half of established SMEs survive for more than five years (EUROSTAT, 2016). Evidence seems more favorable in developed countries mostly due to their entrepreneurial culture level as well as organized systemic support provided by institutions of financial and non-financial SME support (SBA, 2014; Australian Government, 2013). Statistical SME performance data also reveals that failure to secure the survival is one of the most fundamental SME problems as well as opportunities.

For researchers and practitioners it is therefore crucial to discover how to increase long-term survival chances of SMEs. In order to contribute to this goal this chapter will implement the conceptual research framework on the structure and practical behavior of SMEs. Many researches have been conducted in

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

area of business failure. Some of them emphasize problems with finances (Hagen, 2009), while others report non-financial problems such as poor marketing, bad business planning, lack of skills, poor leadership as crucial ones (Molnar, 2010; Wagner, 2013). But, somehow *unmet need for structural changes* in an SME has never been listed among most frequent reasons for unsuccessful business or finally for its failure. This is the main research gap and one of the intentions of this chapter is an attempt to go beyond it.

METHODOLOGY IMPLEMENTED

This chapter presents a conceptual framework of structural change management in sustainable SME development. The main result of this chapter is presented as a model of an *SME growth in order to achieve sustainable development*. This model has been developed as a synthesis of previously developed models and concepts in the relevant field that have been analyzed by broad literature research. High level of abstraction has been implemented as well in order to develop the model as it is. The literature sources for this research could be divided in two groups:

1. Primary, where researches in relevant field has been conducted on a broad SME base, and
2. Secondary, where relevant concepts has been developed.

BACKGROUND WITH LITERATURE REVIEW

Once SMEs have been established they start to change both their own structure and behavior. So, it could be highlighted that SMEs operate in permanent changes which originate both internally and externally. There are a lot of factors which influence these changes and optimizing their management is a great challenge for most SMEs.

The life cycle curve determination is one of the important tasks in investigating SME durability (Adižes, 1994). There are behavioral similarities among SMEs behaviour in respect to the position on the life cycle curve. At the same time, management approach and practice in how to achieve business goals has strong inluence on SME future determination in terms of success. Once an SME starts to grow, it undergoes permanent changes. Sound management should be able to deal with problems that arise due to change. Some of them can be foreseen, but some not. In dealing with problems solving different conflicts arises. The causes of conlifct have a complex nature that is as complex as SME business operation itself. But conflicts are expected and have to be carrefully managed in order to keep or turn them into the constructive ones (Adizes, 1992). A proper SME management tries to optimize together different interests of various stakeholders into an SME (partners, management, employees, to mention just a few) with the goals and strategic interest of the SME as a business.

The author would like to point out several other life cycle issues. For example, what is truly the driving force for an SME in its life cycle adventure? Is proper management enough to ensure a bright business future for an SME? One of the very important factors which shouldn't be neglected is *innovation*. It could be described as a specific objective of entrepreneurs to use change as an opportunity for the realization of various production and service activities. Therefore, entrepreneurs look at change as something desirable and healthy. They even look for them and use them as opportunities for practicing a pro-active approach in their everyday business (Drucker, 1991).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Following an SME on its life-cycle "travel" and bearing in mind previous remarks a question arises. Is it possible to develop/change an SME without changing its elements, particularly people within it? This question is tightly related with entrepreneur and SME management structure as well. Learning organization is an imperative in modern management. By an SME development there have been numerous changes undertaken, not just in "material" world but in "psychological" one too. If it is not achieved, that will be a big obstacle for SME future development (Sengi, 2003). According to this theory, there are 5 features of a learning organization:

1. Systems thinking,
2. Shared vision,
3. Challenging of mental models,
4. Team learning, and
5. Personal mastery, all of which are of tremendous importance for SMEs.

Besides the life cycle approach there are other theories the author has used extensively in his SME research (Molnar, 2010). First, the *system approach* which should be implemented in all efforts to achieve long term survival of an SME. The theory suggests that different physical, biological as well as social/organizational and other systems have certain similarities in their behaviors and have some common characteristics on higher levels of abstraction. The fact that an SME is an organizational system means that it performs and behaves on the highest level of complexity among all other known systems such as technical and biological ones (Boulding, 1956). Consequently, SME management efforts include more or less mistakes before a concrete activity even started. The other fact that is also important for this chapter relates to the behavior of a system, where it is not a sum of the behaviour of its parts, but rather it a product of their interactions (Ackoff, 1999). Beside these, any man made system can be classified as purposeful one. Relating to SMEs which are organizational systems, their members are purposeful individuals who intentionally formulate their objectives (Ackoff & Emery, 1972).

The second major theory closest to the author's views is implementation of laws of physics in the organization. This approach was previously called "Organizational Physics" (Sisney, 2013). This comprehensive approach incorporated in itself most of the previously developed approaches/theories, mentioned before with well known laws of physics. In this theory there are classified "Six Laws of Organizational Physics" which deal with an organization performance and can help to improve it. For an entrepreneur or manager, it is crucial to understand implications of each law. The first one, states that "An organization is a complex adaptive system", originates from systems theory and suggests that in every analysis, intervention and reaction, the organization should be considered in its totality. The second law, states that "An organization is subject to the first law of thermodynamics" suggesting that every organization has a finite amount of energy and if it strives to increase then it must obtain it from the outside". The third law states that "An organization is subject to the second law of thermodynamics" where due to entropy every system falls apart over time. So, organization first uses its energy to manage and counter disintegrating forces, and survival could be used to drive integration with its environment. The fourth law, states that "An organization must shape and respond to its environment and act as a whole system, including its parts and sub-parts". This implies that every organization is like a chaotic system which has patterns or forces throughout it. The fifth law states that "An organization is subject to the conditions of its environment" which is the driving principle of evolution suggesting that not the strongest or most intelligent companies will survive but those which are best adapted to the environment. Finally, the sixth law states

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

that "An organization is subject to the laws of motion" putting into correlation Newton's laws of motion (inertia, acceleration and action-reaction) with the principles of organizational change and momentum.

One of the latest researches in the field of organizational change implies that uncertainty may not have an inevitable negative influence on organizational development (Zhang, 2016). In this study, a co-evolutionary model of organizational change has been developed. This model also emphasizes the interaction between institutional-level factors and organizational-level change as bridged by top management perceptions of organizational uncertainty where its dynamics affects organizational change.

Highlights of Types of Change Management

But, what is really the driving force behind the attained structural changes in SMEs? There are some processes which should be properly managed in order to achieve certain levels of change. Changes in an SME could be treated on two levels by two types of management programs (Bourda, 2013):

1. Systematic organization implying a wide change initiative that involves an organization through a wide transformation effort, particularly changes in its structures, and
2. Specific internal change management or change control program that involves providing tools and processes to control daily operational or project - specific changes, including the people side of change.

As a result of highlighted changes in structure, people and relationships, the behavior of SME naturally evolves and changes as well.

It is crucial for managers to identify change, modify or adapt it and consequently use a model for SME transformation to help an SME survive or even develop. There are at least two leading models in change management practice which the author would like to highlight.

One of the first developed and applied change management models for understanding organizational development refers to the three-stage process of change, namely the *Unfreeze–Change–Freeze* stages (Lewin, 1947). This model takes into the consideration psychological aspects of behavior modification in these three different stages. In the *Unfreezing* stage there is low level of resistance to change, mostly because of recognizing and accepting the need for change. It is reasonable to expect uncertainty. In the next stage named *Change* it is necessary to develop new attitudes to encourage behavior necessary for change to occur. In this stage, people and employees need to understand the benefits of change. In the final stage of change, named *Freezing,* processes should stabilize and there is a need for supporting and reinforcing new change conditions. It is important to acknowledge people's efforts that will reinforce their belief in future changes.

The next major model widened the stages that should be taken into consideration when dealing with change management. The eight-stage change model describes change process for managing change in organizations, mostly in large ones (Kotter, 2012), from which SMEs can learn. The eight steps are as follows:

1. **Establishing a Sense of Urgency:** People have to see the need to change;
2. **Creating a Guiding Coalition:** Create a group with authority and credibility to lead the change efforts;

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

3. **Developing a Vision and Strategy:** Create a vision and develop strategies with clear aim and way forward;
4. **Communicating the Change Vision:** Promote understanding and commitment in order to accept vision and strategy;
5. **Empowering Broad-Based Action:** Enable people to act and overcome barriers by changing the structures that could undermine the vision and strategy;
6. **Generating Short-Term Wins:** There is a need for visible achievements in order to motivate and ensure further support;
7. **Consolidating Gains and Produce More Change:** Introducing broad range of changes related to systems, structures and policies and maintains change momentum; and
8. **Anchoring New Approaches in the Culture:** Articulate and communicate new values, attitudes and behaviors.

However, besides many change management models developed SMEs have to reckon with a number of forces that resist change and support the status quo within an organization. These forces are both internal and external. An effective change management tries to minimize these forces by satisfying following criteria which affect stakeholders (French, Rayner, Rees, & Rumbles, 2015):

- **Benefit:** The change should have a clear relative advantage for the individuals being asked to change;
- **Compatibility:** The change should be as compatible as possible with the existing values and experiences of the people being asked to change;
- **Complexity:** The change should be no more complex than necessary. It must be as easy as possible to understand and use; and
- **Triability:** The change should be something that people can try on a step-by-step basis and make adjustments throughout the process.

In order to produce changes in people's and SME behavior as well, SME management needs to be very active during change phases in order to implement reinforcement tactics. Verbal reinforcement is a cost free method. For implementation it is important to articulate and permanently repeat desirable behavior that fits into organizational change. As a result, old behaviors become "extinguished" over time, and will be replaced with new (desired) behavior. It is crucial that some sort of reinforcement is necessary for change to take root in the individual. Beside the verbal method, an SME can change its structure and policy in a very formal way, by writing new rules and procedures. In this case, without informal reinforcement, employees in most cases are not going to change quite as easily. So, in organizational changes reinforcement comes in as a vital part of it (Pryor, Taneja, Humphreys, Anderson & Singleton, 2008).

Main Components and Characteristics of Change Management in Sustainable SME Development

As it has been stated previously, SMEs operate in very dynamic environment where uncertainty and particularly changes are among the most important characteristics. Hence, for this chapter, *change* and its management in an SME development is the main theme.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

But, how do changes really affect an SME and organization in general? Any change generates one or more problems because permanent structures and (organizational) system need new parameters and actions in order to keep outputs within planned framework. So, managing changes is a permanent/daily activity performed by managers, and can potentially be one of the business functions in an SME as well as in any other organization. If it is not the case, SME will be negatively affected both externally and internally.

The main components of change management could be identified as: change, problems and solutions/management/problem solving (Adizes, 1992). It is very important to mention that these components create a cycle, so, every solution creates another change, and so on. But, it is very important to underline that initial change, marked as "$change_1$" which created "$problem_1$" after reaction of "$management_1$" causes "$change_2$" which differs from "$change_1$", as it presented below:

$change_1 \rightarrow problem(s)_1 \rightarrow solutions_1/management_1/(problem\ solving_1) \rightarrow change_2 \rightarrow \ldots$

Change can be minor or major problem, affecting less or more important components and structures in an SME. Depending on this, the problem(s) created by change will be minor or complex one(s). Minor problems could be solved and managed immediately, while complex ones need much more time, effort and knowledge.

Conflicts are side products of organizational changes and have to be taken into consideration in the change management process. There are both constructive and destructive conflicts, depending on mutual trust and respect between relevant people within an organization. If, there is mutual respect then people may learn from their differences. Also, people then may work together and decisions made will be better and their implementation will be less questionable (Adizes, 1992).

The next very important issue in change management is timing. In order to find out the most appropriate time to implement changes within an SME, so called push and pull factors have to be taken into consideration. If push factors are dominant then SME is forced to be changed in an opposite way it wants to change. It could be crucial to determine why an SME is implementing changes within it. The reason for change determines the strategy that will be implemented.

In case of huge, strategic changes a strategic plan should be developed or at least a new vision or mission statement. There are some proposed factors which may be considered as triggers for change (Rees & Hall, 2013):

- Challenges of growth, especially global markets;
- Challenges of economic downturns and tougher trading conditions;
- Changes in strategy;
- Technological changes;
- Competitive pressures, including mergers and acquisitions;
- Customer pressure, particularly shifting markets;
- Pressures to learn new organization behavior and skills; and
- Government legislation/initiatives.

Additionally, it is crucial to recognize the signs suggesting that some organizational structure isn't working and needs to be changed. When inertia starts to dominate in majority of business processes of an organization or SME, it is time for structural changes. If management neglects this sign and keeps the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

current structure operational, negative impact on the organization performaces will cause its „death" over time. According to the approach mentioned before (Sisney, 2013) there are five rules of organizational structure in change management process:

1. When the strategy changes, change the structure;
2. Don't allow functions focused on efficiency to control functions focused on effectiveness;
3. Don't allow functions focused on short-range results to control functions focused on long-range development;
4. Balance the need for autonomy with the need for control; and
5. Put the right people in the right functions.

Some authors suggest that change management process could be considered as a project with four parts of its implementation plan (Burton, Obel & Håkonsson, 2015). They are:

1. *What*. The tasks as projects and sub-projects have to be defined;
2. *Who*. There is a need to allocate human resources in order to assign responsibilities;
3. *When*. Decide on milestones and deadlines;
4. *Follow up on milestones*.

More recent researches suggest that organizational infrastructure may have a profound impact on organizational behavior. In process of changing organizational routines there will be influence of not only people's sense-making and behavior but also of the technology and infrastructure with which people interact (Langstrand, 2016).

However, bearing in mind the objective of this chapter which emphasizes sustainable SME development the most desirable change which should be implemented is related to the SME structures and its functions that develop new organizational systems ensuring a higher level and rate of SME survival.

A CONCEPTUAL FRAMEWORK OF STRUCTURAL CHANGE MANAGEMENT IN SUSTAINABLE SME DEVELOPMENT

From the very beginning of its operation every organizational system seems to be forever in reorganization (Drucker & Maciaiello, 2008). There are many reasons for that but spontaneous development of disorder, frictions and underperformance are most important ones that force an organization to change its own structure. It has to be noted that good organization structure doesn't guarantee good performance. But, in opposite, an inappropriate organization structure impedes performance and seriously affects survival of an organization and an SME as well.

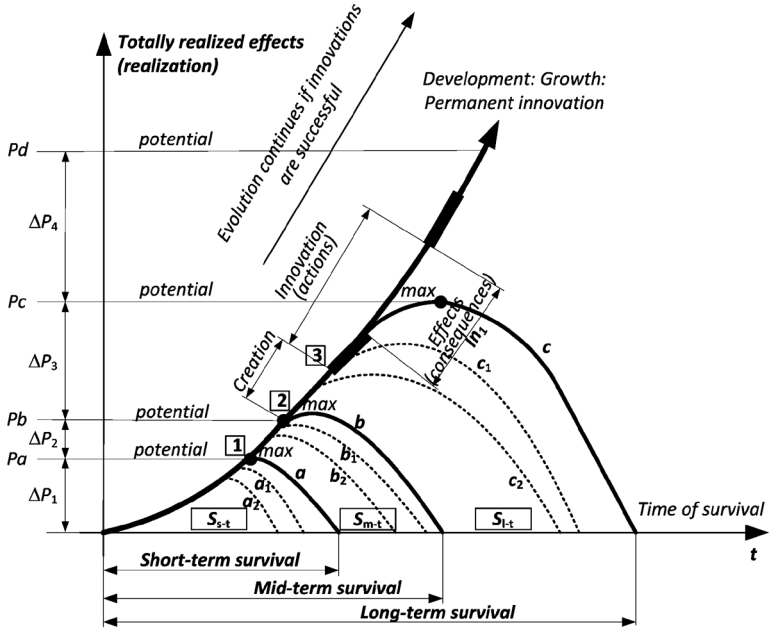
As noted earlier, SMEs, like living beings, have their life cycle with characteristic phases they pass through. All of these phases have their own behavioral patterns and need a specific structure for SME operations. Therefore, structures in different phases differ and need to change as SME behavior as well. However, unlike living beings, SMEs, at least theoretically, could escape death as a final step in their life cycle. This is achievable only if the SME management practices proper approach to changes (Adižes, 1994).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

By researching SME life cycle phases, it is possible to find some answers relating to SME survival and development. For example, emotional potential and other personal characteristics of the entrepreneurs are very important internal factors in early stage of structuring SMEs. But, good personal characteristics are not enough as a potential to structure successful SMEs in later stages of their development. Obviously, some needs in the market environment could be met by satisfying the demand for SME goods and services. If the needs are more intensive and offer is more attractive then SMEs have a higher potential to create added value. This potential is based on active intelectual potential and knowledge potential as one of the resources in SMEs. Knowledge potential is a multidimensional one because it is related to the product (knowing WHAT to produce), to the technology (HOW to produce) and finally to the organizational system (production management). But, this chapter will show that this resource is still not enough to create a functional SME capable for sustainable development. In addition, several other resources can't be neglected in optimizing the SME management system: machinery, supplies, finance, human capital are among the most important. Maintaining the potential of all of these resources at a certain potential level is a precondition of SMEs ***short–term survival.*** These resources can't be renewed by themselves, so „somebody" should take care of that. In early stage it is an entrepreneur but later on when the SME spreads out he/she is forced to involve others into the SME, and then its structure optimization actually starts (Černiček & Molnar, 1998). When the first cycle of an SME is completed it has three group of functions:

1. Functions for continuity assurance;
2. Functions for operative management; and
3. The servicing functions.

The SME which incorporated in itself all of these group of functions could be marked as $\boldsymbol{S_{s\text{-}t}}$**.** All of these groups have some specific functions inside of them and have certain relations between themselves.



An SME evolution, from short-term to long-term survival is followed by some significant changes in its functional structure. This change, as a result, causes other ones, like quality and quantity of resources managed, and particularly SME behaviors expressed internally and externally as well. Relevant for all structures is that every of them is flexible, adaptable and changable at the beggining, but with time they become more inflexible and rigid. So, there is also a moment when none of the structures can respond to changes which happened externally and are not able to perform their main role. This is the final moment when SME has to implement change management in order to create appropriate changes within it. If it is not case, then the SME starts to get organizationally old. There are numerous factors which contribute to SME aging such as changes in individual and social needs, life cycle of the needs, development of science and technology, scarcity of natural resources and growing competition.

During its existance an SME permanently solves problems caused by changes and creates some effects. Figure 1 visualizes effects of an SME growth in order to achieve its sustainable development.

The curves presented in Figure 1 are a synthesis of all internal and external factors that affect an SME. Only one curve, the thickest one, represents successful change management. So, very few SMEs are capable to create the thickest curve in their life cycle. Most of them, turn aside of it with unsucsessful tries in order to realize own potential which is due to poor change management. However, as Figure 1 also suggests, innovation lies behind all successful SME development, not just in products or services but also in structures and management as well[1].

Figure 1. SME growth in the function of sustainable development
Source: *Adapted by author from Černiček & Molnar, 2000, p.232*

The most dominant feature of SME life cycle is its functional structure development. Every level of it, allows effectiveness up to a certain level (potential). When an SME evolves untill the level of short-term survival, then realized effects permenently increse until point 1 and after that SME starts to decrese its realized effectiveness. Maximum potential of this structure is denoted as ΔP_1, which is same as total potential denoted as P_a. When SME exploits available potential then it reaches a curve marked as „*a*", and if it is not the case then curves „a_1" and „a_2" are reached and are obviously behind curve „*a*" (See Figure 1).

There are four basic functions which assure SMEs continuity/short-term survival, such as: financial, sales, manufacturing (technical) and procurement functions (Černiček & Molnar, 1998). These functions properly interrelated should enable the reproduction cycle in an SME. If some of them fail then SME existance is seriously endangered. However, a question arises about the period of time in which this functional structure is able to ensure SME survival. It strongly depends on potential generated between the SME supply and demand created on the market. Finally, it is limited by the product life cycle which could be reached only by most successful firms. All potentials created this way definitelly vanish at the end of the product life cycle in any case. But, if an SME didn't create new potential it vanishes too.

When an SME reaches potential for longer survival, then realized effects increse until point 2 and after that SME starts to decrese its realized effects. Maximum potential of this structure is P_b, which is higher then P_a for ΔP_2, that originates from newly evolved part of the structure. This part of the structure should focus mostly on new products and/or services, meaning their quality and quantity in general and their market penetration. Additionaly, permanent development of products and/or services should be assured as well, which implies changes in management structure too. If SME exploits available potential then this is observable on a curve marked as „*b*", if it is not the case then curves „b_1" and „b_2" have been created behind curve „*b*".

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

For those SMEs untouched by negative statistics associated with „life expectancy", during the first „survival" phase, new potential can be created. This is only possible if SME develops new specialised functions, namely, the *SME passes through new structural changes*. Besides financial resources needed for creating the new system it is necessary to choose a certain segment of market environment with new potential. This is followed by creating attractive offers, development of SME processes which will realize the offer and finally the organizational system development with potential to realize all these factors. The research suggests that this system could be a system for *integrative management and development* and it has its own interrelated functions as well as functions previously developed (Zgodavova & Bober, 2012). As such it assures *mid-term survival* of an SME. The SME which successfully incorporates in itself all of these functions is an optimal mid–term SME and could be denoted as $\boldsymbol{S_{m\text{-}t}}$**.** However, numerous researches on business failures suggests that SME managers neglect or just not able to recognize importance of structural changes of organization they run (Hagen, 2009; Molnar, 2010; Wagner, 2013).

In a situation of strategic development, continuous and accelerated growth could be experienced by an SME due to approaching point 3. Maximum potential of this structure is P_c, which is higher then P_b for the difference denoted as ΔP_3, that originates from newly evolved part of the organizational structure. If SME exploits available potential that is observed on a curve marked as „*c*", and if it is not the case then curves „c_1" and „c_2", have been created which are behind curve „*c*".

In the third phase of SME structure development there are numerous sub-systems incorporated which realize SME potential on the market as well as numerous sub-systems which develop new potential. All of them are in different stages of their life cycle or in different stages of future development of their potential. The main challenge for the SME new functional structure is to measure its own potential and choose the optimal option(s) in combining already developed systems. The new functions developed in this phase are: *strategic management function* and *strategic management servicing function*. The SME which incorporated in itself these functions as well as those developed in previous phases have sustainability potential and could be marked as $\boldsymbol{S_{l\text{-}t}}$. Dominant characteristic of this kind of SMEs is its ***long-term existence***. When SME achieved its highest, strategic level, then it is able to successfully fight against „aging" in order to stay flexible, vital and „young", applying real-time replacememt of its inadequate sub-systems, components and structures with new ones. At this level of survival, an SME has very strong ties with its environment, particularly with the market, and it is quite well integrated with it. On the other hand, this SME developed its own structure in way that it is capable to innovate itself. If an SME (or any other organization) is capable to innovate itself then new potential has been created, such as ΔP_3 and so on[2]. All of these innovations suggest that in first step it is necessary to innovate the system for strategic management in which an SME realizes innovations later on. Every successfuly realized systemic innovation creates new potential for an SME.

After all of these statements, at least one question arises: How long can an SME be vital, flexible and „young"? The answer is very simple, but hard to implement in practice and it is: until SME change management is capable successfuly solving the strategic tasks.

The concept presented above leans on the basic princple of organizational structure that form follows function. Aditionally, there is an approach that describes what really gives an organization its „shape" and controls how it performs (Sisney, 2013). Those are the three main aspects:

1. The functions it performs;
2. The location of each function; and
3. The authority of each function within its domain.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

First two of three aspects are completely in line with the concept presented by the author in Figure 1. The "authority" aspect isn't embraced by this research.

This section of the chapter conveys to the readers that every SME or organization in general, is a unique organizational system with its systemic characteristics such as: environment, inputs-outputs, components, processes/functions, structures and behaviors. Because of that, every SME has to have its own strategy of structural change management in its sustainable development which is addressed in the next section.

OPPORTUNITIES AND STRATEGIES OF STRUCTURAL CHANGE MANAGEMENT IN SUSTAINABLE SME DEVELOPMENT

Once opportunities within SME environment have been taken into the consideration then a situational analysis should be implemented. One of the most often used instruments of the situational analysis is PEST analysis which deals with political, economic, social and technological factors from the environment or the so called external drivers. There are also variations, or broader PEST analyses which include other external factors that affect an SME, such as legal and environmental ones when PEST is transformed into PESTLE analysis, as well as STEEPLED where ethical and demographic factors should be added (Rothaermel, 2012). Commonly, PEST analysis starts with a 2x2 matrix as illustrated in Table 1. In case, a PESTLE or a STEEPLED analysis is being performed, then the matrix changes its structure according to the numbers of external factors analysed.

Table 1. Toolbox for a PEST Matrix

Political factors	**Economic factors**
• Factor 1 • Factor 2 ...	• Factor 1 • Factor 2 ...
Social factors	**Technological factors**
• Factor 1 • Factor 2 ...	• Factor 1 • Factor 2 ...

Source: Compiled by author on the grounds of own research.

After fulfilling the PEST matrix, or some of its numerous variations, it is necessary to carry out an evaluation of specific factors. This can be carried out by using an instrument illustrated by Table 2.

There are differences among the identified factors or drivers in their impact on an SME. Because of that, they could be ranked on the basis of their importance. This can be done in several ways, such as by introducing a three-star scale. In this way, an economic factor, for example, "Levels of government spending" (which is estimated to have a major impact on the subject of analysis in Table 1), could be marked as "Levels of government spending ***". On the other hand, some factor with a lower impact could be marked as for example "Intellectual property *".

In the SME *short-term survival period* external factors analysed in PEST matrix have major influence on its future potential. For example, if "Intellectual property" issue has been neglected it surely

will negatively affect an SME in the future, when large companies "borrow" its idea or innovation and start a large scale production under own name.

In order to prepare a relevant strategy for optimizing structural change management in sustainable SME development it should be implemented with another instrument of strategic planning which is SWOT analysis. This instrument combines external factors which affect an SME with internal ones. Internal factors are treated as *Strengths* and *Weaknesses* (Fine, 2009). Analysing internal factors, mostly resources of an SME, are evaluated. This can be done by analyzing each factor individually (expert approach) or using some of the methods such as: Brainstorming, Brainwalking, surveys and others. These approaches could be implemented in PEST analysis as well. The external factors/drivers identified and evaluated in PEST analysis could be used in SWOT analysis as *Opportunities* and *Threats*, depending on the character of their influence.

In the process of SWOT analysis, numerous visions are being considered. One should be selected which best illustrates the real situation. In the case of only one vision being considered in the process of SWOT analysis, it is being confronted with reality and may be redefined.

Commonly, SWOT analysis starts with a matrix 2x2 as it is illustrated by Table 3.

Table 3. Toolbox for a SWOT matrix

Strengths	Weaknesses
• Factor 1 • Factor 2 ...	• Factor 1 • Factor 2 ...
Opportunities	**Threats**
• Factor 1 • Factor 2 ...	• Factor 1 • Factor 2 ...

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Strengths are all SME resources which create positive external and internal influences.

Weaknesses are primarily all SME resources that can't achieve the intended SME goals, because of their quality, but also because of their quantity.

Opportunities are all external resources that are identified in the environment that can be used in order to improve an SME structure or behaviour. The quality and quantity of these resources can't be influenced by an SME, but they can take advantage of them.

Threats for an SME are all systems, phenomena and events in the environment that exert or may exert a negative influence.

It is important to note that SWOT analysis does not boil down to a fulfilled matrix as shown by Table 3, but also the activities which follow it. After completion of the SWOT matrix it is necessary to identify key factors among those listed in *strengths* and *weaknesses* and propose actions which could improve an SME resource as well as its position in the environment. The proposed actions should lean on *opportunities* from environment and should also take into consideration *threats* that could negatively interfere in actions as well as on SME as an organisational system. For example, if "Lack of skills" has been identified as a weakness of an SME, and there is an opportunity in the environment identified as "Government subsidies for capacity building in business sector" then SME management could propose an action such as "Documentation submission for governmental subsidies in the business sector". Because of the lack of resources that an SME manages it is crucial to identify actions with their costs which will produce maximum positive effects for an SME as a whole. This process of selection of key factors with actions proposal is the quest for a strategy creation.

SWOT analysis becomes more powerful when after a certain time it is being repeated and actions proposed and undertaken made change resources and the SME as a whole. Then, the effects of the actions undertaken can be measured in more realistic way. For example, if proposed action "Documentation submission for governmental subsidies in business sector" has been undertaken, in next SWOT matrix a weakness previously identified as "Lack of skills" could simply vanish. This means that undertaken action resulted positively on the weakness identified previously. More preferably, this weakness could be converted into the strength "Highly skilled employees" if the action undertaken had deeper impact on weaker resource.

It should be noted that, in addition to internal factors which were the subject of actions, there are also those which could be neglected during time and in this way are being converted from strengths to weaknesses. This is often the case with equipment as well as with skilled people. Also, environmental factors could significantly change over a period of time due to some broader social or natural processes, and can be analyzed. Their impact on internal factors can be more or less significant.

Unlike "ordinary" SWOT analysis, the so-called "advanced" SWOT analysis evaluates identified factors listed in the SWOT matrix and prioritizes them in relation to their impact on the subject of SWOT analysis as well as SME (David, 2009). For this purpose, previously presented SWOT matrix has been modified, while the numbers in following Table 4 being are fictitious for easier explanation.

In the Table 4, where internal characteristics have been analysed, the reader should pay attention to three columns on the right side.

- In the column "Importance", the *significance* of the specific internal factor has been assessed. Every strength and weakness has been assessed by numbers in range of 0,01 (insignificant) to 1,00 (most significant). The sum of all assessed factors has to be equal to 1,00.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 4. Toolbox for an advanced SWOT matrix

	Importance	Rank	Result
Strengths			
• Factor 1 • Factor 2 ...	0,04 0,30 ...	1 2 ...	0,04 0,60 ...
Weaknesses			
• Factor 1 • Factor 2 ...	0,06 0,01 ...	2 1 ...	0,12 0,01 ...
	Importance	**Possibility**	**Result**
Opportunities			
• Factor 1 • Factor 2 ...	0,03 0,01 ...	1 2 ...	0,03 0,02 ...
Threats			
• Factor 1 • Factor 2 ...	0,03 0,15 ...	1 2 ...	0,03 0,30 ...

Source: Compiled by author on the grounds of own research.

- Column "Rank" is determined in the range of 1 (minor) to 3 (main) in order to indicate the strength or weakness for the subject of analysis, and SME as well.
- Column "Result" represents the product of two columns "Importance" and "Rank". It allows prioritization of strengths and weaknesses. An SME has to rely on the most important strengths (the highest score) and should try to convert weaknesses into strengths or to defend its weak points.

In the lower part of Table 4, the external factors should be assessed, with a little modification compared to the internal ones.

- Column "Importance" shows the extent to which external factors can influence the object of analysis. Every opportunity and threat has been assessed by numbers in range of 0,01 (insignificant) to 1,00 (most significant). The sum of all assessed factors has to be equal to 1,00.
- Column "Probability" is determined by the likelihood of outside influence and is expressed by whole numbers in certain range (e.g. 1 to 3, which corresponds to the values of "small", "medium" and "large").
- Column "Result" represents the product of two columns "Importance" and "Probability". It allows the prioritization of opportunities and threats. It must rely on the most important external factors (the highest score), and ignore those who are unlikely to affect SME.

SWOT analysis could show its major relevance in the later period of an SME survival, particularly in the *mid-term survival period*. Actually, at the beginning of this period, when first signs of inertia in business processes have been recognized, it is high time to investigate internal characteristics of SME and put them in correlation with the external ones.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Unlike to PEST and SWOT analysis where the main task is to identify external and internal factors that affect an organisational system such as SME, the TOWS analysis deals with 4 different strategies that the subject of analysis could implement. Methodology of TOWS analysis suggests that external factors should be identified first, and after that internal ones. The results given then should be compared among themselves in order to find the best strategy for the subject of analysis and SME.

The TOWS analysis tries to give answers to the following questions:

- **Comparing Strengths and Opportunities**: How can existing strengths assist in capitalizing opportunities?
- **Comparing Strengths and Threats**: How can existing strengths assist in identifying and avoidance of existing and potential threats?
- **Comparing Weaknesses and Chances**: How existing weaknesses could be overcome using opportunities from the environment?
- **Comparing Weaknesses and Threats**: How could be reduced these weaknesses and to avoided existing and potential threats on the best way?

Answers to these questions are obtained by direct comparison of the factors identified in the TOWS matrix and are the concrete strategy for the subject of analysis, namely (Weihrich, 1982):

1. **MAXI-MAXI. Strategy of Strengths and Opportunities (SO):** Every organization would like to be in position to implement this strategy. However, just some of them are in a position to choose this strategy. For some organisations the option could be, previously convert main weaknesses into the strengths and after that implement this strategy, using the opportunities that come from the environment.
2. **MAXI-mini. Strategy of Strengths and Threats (ST):** In this case, it is relatively easy to counteract threats from the environment, because SME has significant strengths. However, depending on the specific situation, care should be taken about how to use own strengths, which should be usually used with a dose of restraint and discretion.
3. **mini -MAXI. Strategy of Weaknesses and Opportunities (WO):** This strategy seeks to minimize the weaknesses and maximize opportunities. It hides potentially attractive options. In case, that there have been identified some attractive opportunities in the environment but weaknesses are to significant, then should be worked on overcoming own weaknesses and then take advantage from the opportunities.
4. **mini-mini. Strategy Weaknesses and Threats (WT):** This strategy bears potentially high risks. Weaknesses from inside and threats from the outside should be minimized. The situation is unenviable and leads to a real battle for survival.

Table 5 shows position of each main strategy in TOWS matrix.

There are numerous challenges how to maximize strengths, utilize available opportunities, and address threats and weaknesses by turning them into opportunities.

The TOWS analysis could show its major relevance particularly at the beginning of *long-term survival period*, when some strategic decisions have to made. If strategy, roughly articulated by the TOWS analysis becomes right, SME could count on survival in a long term perspective.

Table 5. Example of a TOWS matrix

Subject of Analysis (SME)	**Strengths**	**Weaknesses**
	• Factor 1 (Experienced engineers' staff) • Factor 2 (Well equipped R&D sector) • ...	• Factor 1 (Declining profitability) • Factor 2 (Basic production equipment is out of date) • ...
Opportunities • Factor 1 (Government subsidies related to SME sector) • Factor 2 (Growing market for SME products) • ...	**MAXI-MAXI (SO)**	**mini –MAXI (WO)**
Threats • Factor 1 (Rising transportation costs) • Factor 2 (Increasing foreign competition) • ...	**MAXI-mini (ST)**	**mini-mini (WT)**

Source: Adapted by author from Weihrich (1982, p. 63.)

It is relevant to mention that organizational structure follows strategy, not oppositely. Good organizational structure is just a means for achieving the objectives and goals of an SME (Drucker & Maciaiello, 2008).

However, even the best strategy developed for structural change management in SME sustainable development will face[3] with resistance to change. Only the strategy developed that foresees resistance to change, individual and/or group ones, which is implemented by managers who are able to overcome these internal processes could be characterized as promising

FUTURE RESEARCH DIRECTIONS

Many authors, theorists and practitioners too, have developed their own or upgraded existing models which deal with change management. But the fact is that majority of them have limited space of implementation, mostly because of SME complexity, dynamic and turbulent changes in environment.

Future researches in this field may focus on quantification of parameters given by the author in Figure 1, particularly on measurement of SME potential needed for its transition from short-term to mid-term survival as well as from mid-term to long term survival which may happen later on if an SME is a successful one. After these quantifications and mathematical computations the next level in developing the concept presented in this chapter could be a computer simulation which will show, based on quantified parameters, where an SME is in its life cycle depicted in Figure 1.

Change management as a function within SME needs highly educated and skilled staff and managers. Their education and training, in order to be capable in the future to deal with change management issues, should be one of the subjects of future researches too.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In addition, empirical researches should be undertaken, particularly in the field of human resource management aimed at recruitment, training and conditions for employees within an SME who will ultimately be its driving change force as innovators and managers.

CONCLUSION

This chapter dealt with structural changes in SME emphasizing change management as a tool for implementing changes within an organizational system.

In summarizing this chapter it can be pointed out that there are three distinct phases from high entrepreneurial drive until a fully fledged developed SME. In the first one, continuity of SME survival has to be achieved. In the second one, this existence potentially lasts and finally in the third phase long-term existence conditions have to be assured. Each of these phases has been completed by certain functional structure with clearly defined functions. From start-up to maturity, in each phase, the management system of an SME is being developed as a driving force of its development.

The conclusions based on presented material could be summarized as bellow:

- SMEs without strategic and development capabilities are able to survive for only a few years;
- There are three different levels of functional management and other structures in the SME life cycle. Each of them supports a certain kind of behavior and capabilities;
- SMEs with short-term existence potential could only develop the first level of functional structure;
- SMEs with mid-term existence potential are able to develop the first and the second level of functional structure;
- SMEs with all three levels of functional structures have potential to achieve long-term existence.

SMEs which strive to achieve long-term survival must have innovative potential in every phase of their growth. Otherwise they become ordinary economic entities with lesser chances for long-term survival.

Consequently, SME managers who react rapidly on both external and internal factors could be successful. Indeed, those SME managers who are able to anticipate the future and prepare their SMEs for new circumstances are really successful. It may also be concluded that SMEs which do not survive are those who fail to anticipate the future or even adapt to changes that affect them both externally and internally.

Change management should lean on results of environmental assesment implementing instrruments of strategic planing such as PEST, SWOT and TOWS analyses. After that, an SME oriented for sustainable development will be able to produce a viable strategy, taking into consideration all resources it manages. The strategy should include certain criteria for measuring success of an SME which are related to its sustainable development.

Finally, every SME can enhance its chance for a long business life involving both survival and development if it develops and optimizes its own strategic capabilities. It can be reasoned out that structural change management in sustainable SME development results is in the function of long-term survival as a strategic goal for an SME.

KEY TERMS AND DEFINITIONS

Change Management: A systematic approach to dealing with change both from the perspective of an organization and the individual as well.

Entrepreneur: An active subject in the entrepreneurship process. He/she creates something new that differs from other goods available on the market creating new value.

Entrepreneurship: A social phenomenon where somebody (entrepreneur) moves available resources from low productivity sectors to the high productivity ones, bearing risk and expecting a profit for those efforts.

Innovation: A means that enriches a resource with new capacities for wealth creation.

Management: A business function which deals with processes of planning, organizing, commanding, coordinating and controlling.

SME (Small and Medium Sized Enterprise): An economic entity defined by legal documents which differ from country to country. The three main criteria used to define an SME are number of employees, annual turnover and average value of assets.

SME Development: Every SME as an organizational system has its life cycle and passing through it SME changes its elements, structures and behavior.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Systems Theory: An independent scientific discipline that contributes to the development of scientific research and science in general. Instead of analytical and linear methods, its focus is on the totality, on global characteristics, structures and behavior of the researched system.

ENDNOTES

1 Editors' note: See chapter 17, and compare with the concept and principles of open innovation.

2 Editors' note: For the more mathematically minded, the rate of change denoted as ΔP_n is a process of finding the derived function. The derivative of the function, $\Delta P/\Delta t$, is the limit (if it exists) of this expression as Δt approaches zero.

3 Editors' note: A further and comprehensive discussion on sustainability is given in chapter 13.

This research was previously published in Optimal Management Strategies in Small and Medium Enterprises; pages 348-369, copyright year 2017 by Business Science Reference (an imprint of IGI Global).

Chapter 13
Design Science Research to Produce Instrumental Knowledge for Evidence-Based Practice in OCD

Joan Ernst van Aken
Design Science Research institute, The Netherlands

ABSTRACT

Evidence-based practice (EBP) is a promising approach to improve professional action. EBP is the use of the best available knowledge in professional problem-solving, in particular the best available knowledge produced by research. EBP has much promise for organizational change and development (OCD). However, for successful EBP, one needs a well-developed knowledge base of instrumental knowledge (i.e., knowledge-to-act). Unfortunately, academic OCD research is strong in developing conceptual knowledge (i.e., knowledge-to-understand) but rather weak in instrumental knowledge. In this chapter, design science research (DSR) is discussed: a research strategy to develop instrumental knowledge in the form of designs for effective interventions, processes, or systems to improve present practices. These designs are developed through experiential learning by executing a number of problem-solving projects in the messy "swamp of practice," often executed in partnerships with professionals. Embedded-in-action theories can be powerful inputs for EBP, thus improving the practice of OCD.

INTRODUCTION

Planned organizational change and in particular large scale planned organizational change and development (OCD) is a difficult to manage process. These processes do not always meet expectations (see e.g. Beer & Nohria, 2000; Stanford, 2016; chapter 1 of this book). Many feel that managers and OCD-professionals should be able to do better. Evidence-Based Practice (EBP) is a powerful and proven approach to improve professional actions in many disciplines. Its development started in Medicine as Evidence-Based Medicine (Hamer & Collinson 1999; Sackett et al., 1996; Trinder & Reynolds 2000).

Subsequently this approach has been transferred successfully to other disciplines in the social sciences, such as education, social policy and criminal justice under the name of Evidence-Based Practice (Davies, Nutley & Smith, 2000; Young et al. 2002). In the meantime, it has also been recognized as a promising approach in management (Briner, Denyer & Rousseau, 2009; Rousseau, 2012).

Essentially EBP means the conscientious use of the best available knowledge in professional problem-solving, particularly the best available knowledge produced by research (Sackett et al., 1996). An important contribution of using the EBP-approach is to compensate the bias, always present in personal professional experience, by complementing this experience with valid up to date knowledge produced by research. The key input for EBP is 'knowledge-to-act' to be used in solving field problems. In this chapter I use the distinction, made by Pelz (1978), between instrumental and conceptual knowledge; instrumental knowledge is 'knowledge-to-act', whereas conceptual knowledge is 'knowledge-to-understand'. Academic management research is strong in developing conceptual knowledge, but, unfortunately, rather weak in developing instrumental knowledge. The objective of this chapter is to discuss design science research (DSR), a discipline-independent research strategy aiming to develop instrumental knowledge to be used in EBP.

DSR is a family of research strategies, showing some variations across the various disciplines where it is used. But all family members share the objective of developing designs for interventions, and processes or systems to be used to improve present practices. In this chapter I will discuss DSR for OCD. In DSR for OCD, effective designs are developed, often in partnerships with professionals, on the basis of experiential learning through a number of problem-solving projects in the messy 'swamp of practice'.

In the next section EBP and its key input of instrumental knowledge will be discussed. Section 3 gives an account of three important barriers facing management researchers (including OCD-researchers), desiring to develop instrumental knowledge. These are paradigmatic convictions, institutional pressures and methodological problems. In section 4 I discuss systematic experiential learning as an effective approach for dealing with these methodological problems.

The academic literature may be weak in presenting instrumental knowledge, but there is a lot of instrumental knowledge for OCD to be found in the non-academic management literature on planned change (see e.g. Cameron & Green, 2015; Gibbons, 2015; Grenny et al., 2013; Kotter, 2012). It is a type of literature looked down on by many management researchers, often because of the limited evidence given to support its recommendations. However, this literature can give an idea of the character of instrumental knowledge relevant for the 'swamp of practice.' Section 5 is a plea to develop evidence-based versions of non-academic management literature using the DSR-strategy. Then, finally, section 6 gives an account of DSR for OCD and section 7 a number of OCD-issues relating to research using the DSR strategy plus some pointers on how to do this. Section 8 gives conclusions.

INSTRUMENTAL KNOWLEDGE AS KEY INPUT FOR EBP

In discussions of EBP with change agents often one gets the impression that they tend to consider EBP as a hype or as a strange idea devised by some academics. However, EBP is rather to be regarded as a millennia old core demand to *any* professional (see on professionals e.g. Freidson, 1973, Klegon, 1978; Schön, 1983). The core process of professionals, like medical doctors, engineers and lawyers, is knowledge-intensive problem-solving in their domain of expertise. The additional 'knowledge-intensive' aspect of such occupational roles distinguishes the professional from the craftsman. The founding fathers of EBP

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

in medicine defined this approach as 'the conscientious, explicit, and judicious use of the current best evidence in making decisions about the care of individual patients' (Sackett, 1996, p71). This is a very natural demand; clients (patients in medicine) expect no less than that the professional services they get are *always* based on the best available knowledge (which includes the expectation that these services are in line with the current insights of the profession).

Furthermore, one can say that every professional education is a training in EBP: at professional school one acquires the valid and relevant knowledge of one's field of expertise and subsequently is given 'clinical training' to learn to use this knowledge from the 'high ground of theory' in the 'swamp of practice'. This metaphor, coined by Schön (1983), distinguishing the high ground and the swamp, nicely illustrates the challenges of EBP: using knowledge from the well-organized and firm high ground in the messy and slippery swamp.

As is well-known, there are four sources of knowledge to be used in EBP (see e.g. Rycroft-Malone, 2004): one's own professional experience, knowledge on the client's problems (in one's field of expertise), knowledge of the client's preferences with respect to the kind of solutions to be designed, and last but not least, valid generic knowledge on the kind of problem to be addressed produced by research. The EBP-movement, starting in the 1990s in medicine (Sacket et al. 1996), aimed to promote the use of the fourth source to compensate for the bias of personal experience, without, however, downplaying its importance (as well as not downplaying the importance of the other two).

Both conceptual and instrumental knowledge are important for professionals. Conceptual knowledge plays a central role in the education of professionals: it is used to teach students to understand their profession and the type of issues and problems they have to deal with. However, using an EBP-approach to professional problem-solving particularly needs instrumental knowledge. Instrumental knowledge can be defined as knowledge that can be used in a specific and direct way to design interventions, processes or systems producing desired outcomes in the real world. This type of knowledge provides answers to the question of what one can *do* to improve present reality. Insight into (usually context-dependent) action-outcome relations is the key element of instrumental knowledge. For instance, EBP in medicine involves the use of conceptual knowledge on the nature and causes of e.g. cholera or heart failures. But even more important for effective EBP is instrumental knowledge, i.e. knowledge on how to act. In medicine instrumental knowledge refers to knowledge on alternative treatments, like e.g. treatments for cholera or heart failure and on the expected effectiveness of these various treatments. Instrumental knowledge in OCD for instance is knowledge on how to deal with conflicts between departments or how, after a merger, to deal with cultural differences between the constituents of the new company.

BARRIERS TO DEVELOPING GENERIC INSTRUMENTAL KNOWLEDGE FOR OCD

There are several barriers impeding the development of instrumental knowledge for OCD (and in other management fields) by academic research. These include paradigmatic convictions on the mission and nature of research, institutional pressures and methodological problems.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Paradigmatic Convictions

Drawing on ideas of Kuhn (1962) and Lakatos (1991), a research paradigm can be described as a set of convictions on the type of research questions to be answered, the acceptable research methods to use, the acceptable kinds of evidence to use in justifying these answers and the nature of the research products pursued. Main stream management research, including OCD research, is based on the paradigm of *explanatory research*, the iconic example of which is physics. Many researchers consider research in physics as the mother of *all* academic research. When using this research paradigm, the mission of research is to describe and explain the past from the perspective of a detached observer. Research according to this approach is a quest for truth. As in physics, one prefers objective observations (e.g. by using surveys) and logical deduction of conclusions from observations. The iconic research product is the quantitative variance model, explaining some phenomenon based on some explanatory variables (like the laws of Newton explain attraction power in terms of mass and distance).

Design science research uses another research paradigm. The idea to distinguish between explanatory and design science paradigms draws on Simon's *The Sciences of the Artificial* (Simon, 1969; 1996)[1]. This seminal book celebrates the power of design in transcending the present by designing what can be, enabling the preferred. The mission of research, on the basis of the design paradigm is to develop instrumental knowledge to address field problems, i.e. problems on material or social reality that, according to stakeholders, need to be addressed. Its research products are interventions or solutions, often presented in terms of process models. In the design science paradigm research is a quest for effectiveness, the effectiveness of these interventions and solutions. Explanations are primarily based on logical deductions from observations, while designs primarily are based on abduction, a creative leap (abduction) from observations, analyses and requirements to a design (see Pierce, 1923, on the logic of abduction or e.g. Samuels, 2000).

Paradigmatic convictions can be an important barrier for developing instrumental knowledge. Researchers, educated in the tradition of the explanatory research paradigm, tend to dismiss the development of instrumental knowledge as something for practitioners, and not as a respectable objective for academic research. This disdain may be related to a belief that it is not possible to develop instrumental knowledge in a rigorous way. This is true so long as one believes that physics is the mother of *all* rigorous research.

The permanency of the dominance of the explanatory paradigm may be understood by considering the history of social science research, combined with the history of management research. These two histories can be analyzed using Volkan's theory of transgenerational trauma (Volkan, 2001). A transgenerational trauma is a very traumatic experience of a group of people, passed along from generation to generation and in this way becoming a defining component of the group identity. Examples are the destruction of the second Temple of the Jews in 70 CE and the (lost) battle of Kosovo in 1389 by the Serbians. These examples show the power and permanence of transgenerational trauma's.

The transgenerational trauma for the social sciences originated on July 3, 1946, when the US-Senate voted to exclude the social sciences from the new National Science Foundation on grounds that their 'scientific merits' were unclear, thus depriving these disciplines from federal funding (Lyons, 1969, p 126). Only much later, after demonstrating the 'scientific merits' of social science research to Vannevar Bush, the 'father' of the Foundation, did the social sciences get access to NSF-funding (Stokes, 1997). This demonstration of merits was realized by using quantitative 'objective' measurements and statistics to build quantitative causal models on the basis of these measurements. Quantitative explanatory research still tends to be regarded as the highest form of social science research.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The transgenerational trauma of management research was caused by the publication of the Ford and Carnegie Foundation reports on American Business Schools (Gordon & Howell, 1959; Pierson & Others, 1959). These reports castigated business schools, because these were like trade schools, too much practice oriented and not enough research minded. In present terms, one might – justly – say that the business schools did not train their students in EBP. Many of the then present teachers, often experienced managers, were fired (a traumatic experience) and replaced by experienced social scientists, bringing along their own traumatic experience. Paradigmatic convictions concerning the importance of quantitative research and a focus on explanation rather than improvement might be traced back to these traumatic experiences. The double traumatic experiences are facts, the impact of them on present attitudes are, of course, a matter of debate.

Institutional Pressures

Reward systems for research discourage the development of instrumental knowledge for various reasons. The dominance of the explanatory paradigm is a major cause in this. This can include the idea that instrumental knowledge (or normative or prescriptive knowledge) does not belong to the mission of academic research (see the paradigmatic convictions above) or that it cannot be done in a methodologically rigorous way. Ideas like these induce the present scarcity of instrumental knowledge in the academic management literature.

Methodological Problems

In former days instrumental knowledge was also called normative or prescriptive knowledge. This is a relic of the past in which management research was a quest after the Holy Grail of the best way of organizing. The (often only implicit) idea was that researchers could *prescribe* best practices to practitioners, like medical doctors do, once they had discovered this best way. Many decades ago this quest was (rightly) abandoned by academic management researchers as being impossible, and with this the idea of prescribing actions based on research. Along with these new insights, the still advocated prescriptions in the non-academic management literature were dismissed by academia because of the limited evidence given for them. Regrettably, no alternatives for the low evidence non-academic management literature were developed, possibly because of the methodological problem in developing instrumental knowledge for the social domain.

Instrumental knowledge is knowledge on how to realize desired outcomes. So, developing such knowledge is dealing with a desired, under determined future, as opposed to explaining a fixed past. Gathering evidence on statements concerning the under determined future is the key methodological problem in research aiming at instrumental knowledge.

The core scientific claim of instrumental knowledge is that the proposed intervention will produce the desired outcomes. The core issue in gathering evidence for this claim refers to the *prediction* of outcomes of interventions. The gold standard for gathering evidence on these predictions is field-testing. If one has, for instance, developed a new design for car brakes or a new design for securing a car park one can use field-testing to assess its effectiveness.

In principle this gathering of evidence through field-testing is relatively unproblematic in the material domain but is demanding in the social domain. In the material domain, field-testing can be as limited as a single trial. Field-testing does not pose specific methodological problems different from those encoun-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tered in the development of valid explanations on the past. This is because in the material domain there are *invariant, universal, determining mechanisms*, making that the near future equals the recent past. These mechanisms are constant over time, do not vary over context and they also determine individual behavior. A machine developed, assembled and tested in Stockholm will work in just the same way next week in Amsterdam. These mechanisms shall be called strong ones. They make that the results of field tests on one instantiation of a given research product can be generalized to other times and places.

In the intangible, fluid and indeterminate social domain, where human agency and human relations play a key role, relations between interventions and outcomes are under determined. Certain interventions in organizational change may be effective in some cases, but less so in others. Even within cases some interventions may be effective today, but not tomorrow. It is therefore a challenge to establish effectivity claims in the social domain. In this domain there are no universal, invariant mechanisms that determine *individual* behavior. Therefore, the prediction of outcomes in the social domain is difficult: the evaluation of a single application of a designed intervention cannot simply be generalized to other times and places. This is the core methodological problem of DSR in the social domain. It is due to the influence of human agency and the fact that human agency is strongly context-dependent, as it is contingent on the network of social relations within which it operates.

Although 'social mechanisms' or 'generative mechanisms' do exist (Davis, 2006: Pajunen, 2008: Hedström & Ylikoski, 2010; Pawson & Tilley, 1997), they are neither invariant nor universal, and do not determine *individual* behavior. As Numagami (1998) says, there cannot be invariant laws in the social domain. Such mechanisms will be called weak mechanisms in this chapter.

Nevertheless, social mechanisms are strong enough to produce regularities and patterns in social behavior. In other words, they permit the existence of context-dependent-outcome relations, provided that a certain amount of uncertainty is allowed. Knowledge of these relations enables purposeful action to realize desired outcomes in the social domain. These relations are different in nature from the determining action-outcome relations in the material domain.

DEVELOPING INSTRUMENTAL KNOWLEDGE BY EXPERIENTIAL LEARNING

Social mechanisms allow the prediction (within certain ranges) of the behavior of others in response to one's own behavior. In fact, the ability to predict social behavior is an almost universal human competence, without which purposeful social behavior would be impossible. This competence is developed by personal social experiential learning, that is, learning from personal experience (Kolb, 1984). It is subsequently applied through case-based reasoning in which the present setting is compared (typically subconscious) with similar prior experiences and a line of action is designed based on the outcomes of these previous actions. Hence, this mode of learning is limited by the scope of one's personal experience, beyond which one is much less able to predict the behavior of others, as may be seen when acting in an alien culture.

Personal experiential social learning is typically the basis of teaching in trade schools. Teachers explain how the craft should be exercised, implying that their students just need to imitate their behavior to be successful. However, experiential learning can also be done in a rigorous scholarly mode: *systematic, methodical and transparent experiential social learning.* Through this research strategy one can learn what the outcomes of certain types of actions in various social settings can be.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

When doing research as experiential learning, researchers learn through cross-case analyses of sets of rigorous in-depth case-studies in dealing with a type of field problem. These case studies provide detailed descriptions and analyses of the problem, its context, and the actions and outcomes involved, giving insight into these elements and their interrelations. 'Thick' descriptions, as opposed to the more reductionist models used in quantitative research, are needed to turn these case-studies into real social experiences. Effective interventions are designed, based on cross-case analyses and subsequent field-testing.

INSTRUMENTAL KNOWLEDGE IN NON-ACADEMIC MANAGEMENT LITERATURE

There is little instrumental knowledge to be found in the academic management literature. However, the non-academic management literature, sometimes patronizingly called 'Heathrow literature' (Burrell, 1989), gives a lot of instrumental knowledge on how to deal with management and organizational problems. This literature can give an impression of how instrumental knowledge for management might look like.

Non-academic management literature is largely written by experienced managers or management consultants (some of them called 'management gurus', nomen est omen), based on their *personal* experiential learning (e.g. Fayol, 1984; Drucker, 1993). In the medical domain this type of knowledge is called clinical knowledge. Although in this discipline clinical knowledge is regarded as knowledge with a low position in the hierarchy of 'best evidence' (because of the inevitable bias in personal experience), it is abundantly used as input for text books and guidelines. It is also used as input for EBP in medical practice, following the adage to use *the best available* evidence. For many complex or rare medical problems clinical evidence is the best available instrumental knowledge, so this knowledge can be used in EBP. Similarly, as there is not much instrumental knowledge on OCD, in many cases the best available evidence is provided by non-academic management literature, based on (biased) personal experience. This means that management literature can be used in EBP for OCD by professional change agents, provided, of course, that one always is aware of the weak evidence on the effectiveness of the promoted action strategies and, maybe even more importantly, aware of a possible bias caused by personal interests in making the knowledge in question credible. These weaknesses are to be compensated by the conscientious use of one of the four inputs to EBP (see above), i.e. one's own personal professional experience: what can I, as an experienced professional, believe from these accounts?

However, a much more effective approach for the OCD-discipline is to develop a rich knowledge base of validated instrumental knowledge, compensated for by the various sources of bias, as an alternative for (or maybe just complementing) the instrumental knowledge provided by the non-academic management literature.

DESIGN SCIENCE RESEARCH FOR OCD

Design science research (DSR) is a research strategy, not a research method. Research methods are instructions for gathering or analyzing data. However, DSR is not an approach for gathering and analyzing data, but is, as any strategy, defined by its objectives and the main lines of action to realize these objectives[2]. DSR is driven by field problems. Field problems are situations in reality that, according to their stakeholders, can or should be improved. The objective of DSR is to develop generic instrumental

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

knowledge, knowledge-to-act, to deal with types of field problems such as performance problems in certain operational systems or cost problems in product development by SMEs or less than successful organizational change programs. DSR aims at developing instrumental knowledge to improve present practices.

More precisely, the objective of a DSR-project is to develop a generic design of an intervention, process or system to address a given type of field problem. This generic design is then to be used as input for EBP (see e.g. Van Aken & Romme, 2012). In EBP professionals use this generic design to design a context-specific version of it when dealing with an instantiation of the type of field problem for which the generic design has been developed. The main line of action for developing these generic designs is learning from several problem-solving projects on a type of field problem in the messy 'swamp of practice'.

DSR differs from other research strategies in its objective to improve (by applying effective designs), as opposed to more conventional research strategies, which have the objective to understand by describing and explaining. However, in DSR the methods for data gathering and analysis can be – but may not need to be - conventional.

The development of design science research is inspired by Herbert Simon's *The Sciences of the Artificial* (Simon, 1969;1996). Nowadays the DSR strategy for addressing field problems is used in a number of management disciplines, like Information Systems (see e.g. Hevner, March & Park, 2004; Wieringa, 2014), Operations Management (see e.g. Holmström, Ketokivi & Hameri 2009: Van Aken, Chandrasekaran & Halman, 2016; Kaipia et al., 2017), Management and Organization (see e.g. Boland & Collopy, 2004, Van Aken, 2004, Bate, 2007), and Accounting (Labro & Tuomela, 2003). The operationalization of DSR research strategies shows some variations across these disciplines. Therefore, one may regard DSR as a family of research strategies. Nevertheless, these strategies share a focus on developing designs to be applied to improve present practices.

In DSR for OCD designs for effective interventions, processes or systems are developed through learning from several comparable problem-solving projects in the 'swamp of practice'. These projects are not executed by researchers in detached expert roles, but as 'engaged scholars' (Van de Ven, 2007). Professional-researcher partnerships are a powerful way to organize design science research projects. In OCD, researchers contribute their expertise in OCD interventions and processes, but operate in problem-solving in close partnership with the professionals in the 'local' context, which can result in co-production of knowledge.

The designs are developed through experiential learning in a number of cycles of designing, implementing, and subsequent learning from the outcomes. However, as Stouten et al. (2018) remark, 'experiential learning in a management discipline is more difficult than, say, learning to play a musical instrument'. Playing a musical instrument is a discrete and repeatable activity, the outcome of which can be immediately known. Experiential learning in management, on the other hand, is learning from protracted divergent processes, the outcomes of which are only clear after a delay. Therefore, the problem-solving projects from which one wants to learn need to be comparable and the causal chain linking intervention and outcome should be fairly short. Projects trying to establish effective practices to create a long-term, complex outcome, like an excellent company (see e.g. *In Search of Excellence*, Peters & Waterman, 1982), are seldom successful.

Designs are made 'transferable' by learning from problem-solving projects that are comparable with respect to the type of context and the type of field problem. Conscientious cross-case analyses give insight in the effectiveness of the design and of the context-dependency of it. Insight in the context-dependency of a design can be used for its contextualization in a new but comparable context. These insights make

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the design transferable, which for instrumental knowledge development is the equivalent of the concept of generalization in explanatory research.

The outcomes of the various applications of the design produce input to the body of evidence to be used in validating the design. Claims with respect to the effectiveness of a design can never be proven like in mathematics and in physics but are to be supported by an as strong as possible body of evidence.

A design on itself has only limited practical value. It must be embedded in an *action theory*. With 'action theory' I do not mean theory describing and understanding human actions (like in Parsons, Shils & Smelser, 1965), but rather theory like action theory as used in Argyris and Schön (1974). They discuss the competence of professionals as being based on their ability to develop theories (action theories) on what to do in new situations. A design can be embedded in an action theory by using the so called CIMO-logic (Denyer, Transfield & Van Aken, 2008). This logic gives the following key elements of an action theory:

- The problem-in-***C***ontext for which the design has been made
- The essence of the ***I***ntervention
- The ***O***utcomes one may expect from using this intervention in the given context (both desired and possibly less desired collateral outcomes) and finally, but most importantly,
- The ***M***echanisms producing these outcomes in the given context.

So, presenting an action theory in a DSR-publication can consist of an account of a validated and transferable design, embedded in an argument, giving the problem-in-Context to be addressed, the Intervention (the application of the design), the Outcomes to be expected and an understanding of why this intervention produces in this context these outcomes (the Mechanisms).

A simple example (taken from Pawson & Tilley, 1997, p 78-82) may illustrate this CIMO-logic.

*The problem-in-***C***ontext is thefts from cars, parked in a carpark. The* **I***ntervention is the introduction of a closed-circuit television (CCTV) system, the* **M***echanisms producing the desired* **O***utcome of less theft are deterrence of criminals, allocation of personnel to suspicious situations and less careless behavior of parkers.*

The action theory presented in a DSR-publication is expected to be applied as input of EBP (which uses it in problem solving together with the three other sources of knowledge for EBP). Application of action theory in a new situation involves the contextualization of it. The insights in the context-dependency of the effectiveness of the action theory are a key input for this contextualization.

See further Van Aken, Chandrasekaran and Halman (2016) for information on how to conduct DSR.

DESIGN SCIENCE RESEARCH FOR FIELD PROBLEMS IN OCD

There are many problems in OCD that can fruitfully be addressed through DSR, producing instrumental knowledge, subsequently to be applied through EBP. For instance, the design objectives (the DSR counterpart of the research question in explanatory research) of DSR-projects in OCD can be like the following.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Design change processes which can effectively be used for inherent painful changes. Not painful because of irresponsive or disrespectful interventions by the change agents (resulting in avoidable pain), but painful because of e.g. layoffs or significant loss of status or remuneration by the recipients of change. Common interventions like explaining the reasons for this change or participative approaches only show even more to them the pain they may have to endure. Change agents may even have to deal with resistance to change by internal or external coalitions against the change, built by the recipients of change.
- Design action strategies that can be used for situations in which the principal is part of the problem: the change agent expects that the change process will fail so long as this person is in charge, or, at least, so long as this person does not change fundamentally his/her behavior. An interesting part of this type of problem is the grey area where the client seems to be ineffective, but not 'ineffective enough' to justify removal. The issue, then, is how to deal with his/her limitations.
- Design change processes to use when the objective of the change seems to be clear, but in reality, is not. It may be that the problem mess in question is so large, or so complicated, or comprises so many urgent issues that the client cannot or does not want to choose what components of the problem mess to address and defines an unrealistic large set of objectives for the change process. Or the client has defined a clear objective, but this objective only addresses a symptom and not the underlying root cause of the disappointing performance. Or the client has some generic idea to be introduced (like 'lean' or self-organization) but does not fully understand its implications.

Design science research is driven by (types of) field problems. The usual research design is to conduct several rigorous problem-solving case-studies on a type of field problem in organizations that share the interest of the researchers in this type of field problem. These case studies are used to develop action theories for dealing with this field problem based on the learning that takes place. Researchers involve as much as possible the 'local' stakeholders in the production of knowledge but keep firm control of the project to produce sound instrumental knowledge, as well as an as strong as possible body of evidence to validate this knowledge. These case-studies can be made in retrospective mode, analyzing in CIMO-terms what has been done in the past to deal with the problem and learning from the outcomes of these actions. They can also be executed in prospective mode, solving with the partner organizations instantiations of the field problem and again learning from them. Case studies in retrospective mode have the advantage that it may be easier to find enough comparable projects to learn from; but they have the disadvantage that much detailed knowledge has evaporated in the meantime. The prospective project may produce more insightful and innovative designs because the actual course of a past project may hide many possible alternative courses; in hindsight, occurred outcomes may give an impression of being unavoidable outcomes.

The results of these problem-solving projects can be published in academic journals where reviewers and editors do not harbor prejudices against instrumental knowledge. But DSR should also serve the professional OCD-community; so, publications in professional journals are also important (even if the university reward system does not reward this).

DSR can also be executed in a real professional-researcher partnership by using the following research design (which is a design I presently use in The Netherlands together with management consultants and the Ooa, the Dutch Order of Management Consultants). In this design, researchers relinquish to some extent control over the project and with this part of the rigor in gathering evidence to validate its results. The research is executed through a series of workshops on a certain field problem. In each workshop a

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

small number (say five to seven) of researchers and professionals analyze and develop action theories using past projects dealing with the field problem in question. At least one of the professionals must have been an actor in the project to be analyzed to develop really deep insights through questions and answers. The group makes an integral analysis of the project: the client organization, the agreed problem-definition for the assignment (plus the possible shifts in it during the execution of the project), its context and history. Subsequently the group zooms in on the actions which the various actors in the project have used in dealing with the problem. The CIMO-logic is a powerful instrument to analyze these actions. First, tentative in-case action theories are developed based on what has worked, or what has not or has worked less; later these are made generic/transferable on the basis of cross-case analyses of cases.

The more limited rigor of these series of workshops can make it difficult to publish the results in academic journals. However, publications in professional journals can produce important contributions to the development of the OCD-profession. This is important and will continue to be so for as long as universities put only limited effort in the development of instrumental knowledge.

The development of psychotherapy might be an example for the OCD-community. Over the past decades this discipline has dramatically improved the effectiveness of its therapies. These improvements are largely realized by developing and field-testing new approaches to psychotherapy by professionals and by sharing their experiential knowledge with other professionals through professional publications, study meetings and conferences. Apart from important contributions by research on drugs, the role of university research in these important developments has been limited. As in OCD, it is difficult if not impossible in psychotherapy to develop effective instrumental knowledge by traditional academic research methods. Hence, the professionals have taken the lead in improving the effectiveness of their therapies by developing, testing and sharing experiential knowledge. It is an example that the OCD-community might follow[3].

Of all the types of field problems in OCD to address through DSR, the most interesting and important one may be the failed change process. Failing change processes are a major reason to promote EBP and to publish this book (see chapter 1). Failed change processes are discussed in non-academic management literature, usually presenting little evidence for their conclusions. They are also amply discussed in the academic literature, providing more evidence for its findings but often giving few specifics and/or giving not much instrumental knowledge to be used to avoid failure. DSR can add insights to this literature on failing change processes.

There are several interesting issues and research questions of direct relevance for DSR-for-EBP-in-OCD, including the following four.

- What *is* failure of an organizational change process?
- What causes can failure have and how to limit their impact?
- What can be the contributions of the various stakeholders to failure and how to deal with these to avoid failure?
- How to adapt a running change process in response to changing circumstances and impending failure?

There are many more interesting and important issues with respect to failure of organizational change processes that require being explored; these four are presented to give an impression of the type of research questions and design objectives one can have for this subject area.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The basic set-up for developing fine grained insights in failed OCD-projects and effective action theories can be similar to the retrospective analysis of the OCD-project discussed above. For the failed-project program the first issue is to get a deep and detailed insight into the very concept and causes of failing organizational change processes. Virtually no change process realizes its objectives as stated at its start. This is not only impossible, but also undesirable. For a very limited change to be realized in a few weeks or months it may be possible to meet these beforehand stated objectives. But for large scale change processes taking a year or extending over several years, this is impossible. Large scale organizational change is to be realized in a setting of constant flux: clients, competitors, regulating agencies, all produce changing challenges to the organization-in-change, as do internal changes triggered by outside changes as well as internal ones (changing insights and in particular, changing key actors). Clinging to original objectives can produce disaster, so one must adapt the objectives of the change processes. Therefore, not meeting initial objectives cannot be a good indication of failure for large scale change processes. So, research can produce nuanced understanding of failed organizational change processes and, with this, possible action theories to deal with impending failure (or, alternatively, to secure a soft landing of the project). Research can focus, for example, on the following issues

- How can we define failure of change processes? Is it useful to differentiate in success and failure on various dimensions of success/failure?
- Is it useful to develop a typology of failed change processes, maybe based on the causes of failure, or on the degree or nature of failure?
- What is the role of the various stakeholders in rating the finished process as failed or successful (there might be important differences of opinion among the various stakeholders and recipients of change in their valuation of the results of the change)?
- What are the consequences of failing? Successful change may be a matter of life or death for an organization. How do the various stakeholders deal with the consequences of failure?

These questions (and other ones) on failure are interesting enough to be answered from the perspective of academic interest. However, in the context of DSR-for-EBP-in-OCD the professional relevance is even more important. This leads to certain nuances in the research. For instance: What is the professional relevance of a definition of failure. Can we define failure in a way that professionals can use it to see failure coming and to design action theories to avoid it (to change the original change strategy, which now seems to lead to failure) or to design a 'soft landing'?

The second issue to explore is the detailed analysis of the most common causes of failure. This involves not only the identification of these common causes, but also more detailed how a cause impacts the change process and what change agents can do to counteract this impact. A main cause can be the role and behavior of the principal of the change process. Chapter 1 suggests that misunderstanding by managers of the complexities of large scale organizational change is a major cause of failure. This may well be, but the next step is to investigate how such misunderstandings impact their behavior, as well as analyzing possible strategies by professional change agents to deal with such misunderstandings. Another problem can be the fact that managers typically have other agendas next to realizing the present change process. These may range from personal concerns regarding their own position and the position of the department they run, to concerns beyond the present change process such as what to do after the change or concerns due to becoming aware of new threats and opportunities. They may not always share such

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

additional concerns with others, including the professional change agents supporting the present change process, which then can look to them like misunderstanding of complexities.

This brings us to the third issue, the roles that the various stakeholders in the change process can play in failure. These stakeholders include various internal persons and parties (among whom, of course, are the recipients of change) as well as external parties like shareholders, trade unions, regulating agencies and, last but not least, the media. Each type of stakeholder may need a different strategy to deal with it, which is especially important in times of stress caused by a critical stage in the change process or an impending failure. Professionals can learn a lot from the experience of colleagues in dealing with these issues, analyzed and presented in an objective and insightful way through DSR.

Finally, and possibly the most important issue in avoiding failure (also important in every change process), is how to adapt the change process *and* its objectives to changing circumstances as already mentioned in the discussion of the first issue. Typically, organizational change processes can be characterized as punctuated equilibrium processes (see e.g. Gersick, 1991, for the punctuated equilibrium model). Organizations are constantly developing and changing through learning processes and though the influence of changing environments. But from time to time these (largely spontaneous) adaptation processes are no longer sufficient, thus causing influential stakeholders to initiate a planned change process. After successfully concluding this process, the organization is again in the equilibrium of spontaneous adaptations.

Many descriptions of planned change processes give the impression that these are, or should be, processes separated from the ongoing daily operating processes, starting with unfreezing and subsequently managed as a project with well-defined objectives like a project for building a bridge. The change project then may be regarded as one to be managed according to the standard project management criteria of quality, cost and time. Towards the end of the project the organization has to be 'refreezed'.

Some say that organizational change is like changing the tires of a driven car. Organization change is to be introduced while the organization is in constant flux, the daily operations have to go on and customers need to remain satisfied. And, even more importantly, if the duration of the project is more than some months, its environment, its objectives and maybe even major actors and stakeholders start to shift. Hence, a major issue to explore by fine-grained DSR for OCD is to observe and analyze how change agents deal with these challenges and how in particular this is done (or not done) in failed projects.

Possibly a key factor in successful adaptation of a running change project to changes is that the change agents have intimate knowledge of the problems the change is to solve and the business strategy the change needs to support. The best way to get this intimate knowledge may be to involve the change agents, if only as observers, in the design of the change and of the business strategy the change must support. Adaptation of the project to external changes is very difficult for change agents who are only involved in the project after its objectives and the relevant business strategy have been defined. Thus, one could analyze in various failed change projects how involving change agents in strategy and design can support effective adaptations (or how a lack of involvement may impede successful adaptation).

This discussion of DSR-research on failed change processes illustrates the fine-grained interest of DSR in actual practices in order to be able to improve them. This interest is much more detailed than often is the case in academic research from the perspective of the detached observer. A general understanding of situations and processes may all he/she wishes to develop. As partner of professionals, sharing their perspective of the actor, a DSR-researcher is not satisfied with generalities.

DSR on change projects and failed change projects produces as starting material a set of narratives on these projects, as objectively as possible observed and described. This material then is analyzed to

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

find patterns and regularities and to develop possible action theories to deal with the various key issues in OCD, subsequently to be field-tested.

The reader may think that this looks much like management literature. *It does*. But the differences include

- That evidence is given for the conclusions and action theories, enabling the professional reader and journal editors to judge their validity and relevance
- That action theories are presented, using CIMO-logic to understand their effectiveness and particularly the mechanisms producing the desired results
- That insight is given in the context-dependency of the effectiveness of the action theories instead of the often one-size-fits-all approach used in non-academic management literature
- That these action theories are to be used as input for EBP, so as one of the inputs for the design of context-specific change plans and change organizations, not as recipes to be followed as given
- That, as academic research, the extant literature is well-used and, finally,
- That these results are not written from the perspective of one person, aiming to 'sell' his/her road to success, but from the more objective perspective of the OCD-discipline as a whole.

So DSR-publications may be regarded as valid and objective 'management literature', or as the academic version of this non-academic management literature.

CONCLUSION

This book is published on the premise that the conscientious use of the best available evidence will contribute to a much higher level of effectiveness of OCD processes than presently is realized. This chapter is written on the belief that this is a challenge to both academia and the community of professional change agents. Design science research can produce valid and relevant instrumental knowledge to be used as input to EBP-in-OCD. Developing professional-research partnerships is a sound way to execute such DSR. It may be even more important to include this idea of partnership in the mission of management research, like it is in all other professional schools including engineering schools and medical schools. If so, the relevance of management research for management practice will be the key objective of research, which consequently makes research also relevant for teaching to aspiring professionals and for EBP.

ENDNOTES

1. Interestingly enough Simon did not distinguish the explanatory and design science paradigms. He stayed firmly within the explanatory paradigm, while recognizing the differences in the origination of natural and artificial things (Pandza and Thorpe, 2009). His own research was research *on* design to be used by observers to understand, as opposed to research *for* design to be used by professionals to improve their work (see Cross, 2001, for this distinction). It was his celebration of the power of design to create the preferred, that inspired people like me to develop DSR for the social domain (within engineering DSR has always been the main stream research strategy).
2. There are many definitions of strategy, but their key elements always include objectives and lines of action to achieve these objectives. A well-known definition in the military domain is given in Liddell Hart (1967, p 321): strategy is the art of distributing and applying military means to fulfil the ends of policy. In the business domain a well-known definition is given in Chandler (1962): Strategy is the determination of the basic long-term goals of an enterprise, and the adoption of courses of action and the allocation of resources necessary for carrying out these goals.
3. This account of the impressive development of psychotherapy is not always recognized by professional psychotherapists. Only on second sight, discussing the contributions of great men and women in the discipline and the various important approaches in therapy, does one recognize that the growth of the discipline is largely based on developing and sharing experiential knowledge by and among professionals. This reluctance is understandable. Many outsiders to the discipline still have the—mistaken—idea that the effectiveness of psychotherapy is not proven, so academic respectability is important.

Chapter 14
Integration of ICTs in Radio Programs (II-RP) for Environmental Awareness for Peasant Farmers of Rural Zambia

Tracy Chisanga
Copperbelt University, Zambia

Jameson Mbale
Copperbelt University, Zambia

ABSTRACT

The radio was the most and only reliable media capable of disseminating remedial information for methods of curing and preventing the outbreak of animal and crop diseases. However, this mode of media faced the challenges of majority of peasant farmers not owning radios, and as a result, they did not access such services. In addition, the distance among the peasant farmers hindered people sharing such resources. Nevertheless, the mushrooming owning of mobile phones by the majority of peasant farmers made information sharing possible. It was in view of that that the integration of ICTs on radio programs, in this work abbreviated as II-RP, was envisaged to disseminate remedial information to peasant farmers in remote areas of Zambia. The II-RP, a mobile built system, allowed farmers and agriculture officers to share the awareness information and sensitization of methods of farming.

INTRODUCTION

The Integration of ICT's on Radio Programmes, in this work abbreviated as II-RP is envisaged to disseminate remedial information to peasant farmers in remote areas of Zambia. Such information is vital to alert farmers and to quickly apply necessary technology for preventive measures. The II-RP architecture

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

is demonstrated in Figure 1 and it has the following functional components: SMS Service Provider, Mass Media, NAIS Core, Commuter, and Wireless.

Currently the Radio, Television, Newspaper and Newsletter are media channels used by National Agriculture Information Service (NAIS) to disseminate information to farmers. The Radio is the mostly used media channel to disseminate information to framers. Existing wireless cellular networks that have been installed by Mobile Service Providers are utilized by the Mobile System. The major mobile service providers in Zambia are Airtel, Mobile Telecommunications (MTN) and Zambia Telecommunications (ZAMTEL).

Statement of the Problem

The major problems that affect the rural farming industry are as follows: first the outbreak of animal and crop diseases; second, the plague of insects that cause a lot of damage to the crops; third, lack of farming skills; and fourth, lack of information on the rainfall patterns. From these outlined problems, the peasant farmers do not have remedial and preventive information to combat such hazardous circumstances. They have very little means of communicating to the National Agriculture Information Service (NAIS), an organization which has farming experts such as the District and Provincial Agriculture Information Officers (DAIO/PAIO, respectively). These trained officers are employed to give peasant farmers valuable information across all kinds of farming activities. However, the major communication means which is through radio is not very effective to reach out majority of the rural community who cannot utilize such facilities due to inadequate radio frequencies and coverage. Only a few remote areas can access radio coverage and be able to listen to the agriculture programmes where farmers are educated on how to manage animal husbandry, and crop growing. In this way, farmers do respond by filling-in the forms to give there reports, in form of feedback, about the problems they are experiencing them. Thereafter they send these reports to NAIS through Post Office and it takes weeks or some months to reach the intended offices. The whole communication process becomes cumbersome as this in-turn the feedback from NAIS reaches the farmers after a long time. However, these days, the Internet Service Providers (ISPs) have installed towers even across some rural sectors. In that way they have provided adequate mobile coverage to the rural community. In addition, the majority of the rural community own mobile phones. This is supported by Furuholt and Matotay (2011) who pointed out that these days even the poorest peasant farmers own mobile phones. Therefore, developing an agriculture mobile application would be beneficial as many peasant farmers are going access the system for they own mobile phones. Such applications can be integrated into radio systems that would aid an effective communication to the NAIS workforce. It is in view of this, the Integration of ICT's on Radio Programmes (II-RP) was envisaged to build a mobile system which would be available and accessible to remote peasant farmers. As discussed earlier, this was necessitated by the fact that the Government had installed mobile networks coverage in most parts of remote areas. In that way the II-RP would integrate the mobile and radio technologies to develop a system which would be accessed with those on remote areas.

The Objectives of the II-RP

The II_RP model was developed in accordance with the following objectives:

- Design and build the II_RP functional system.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- To determine how best ICTs can be used to enhance information dissemination to farmers.
- To explore all the possible ways ICTs can be used to attain at least ninety percent (90%) feedback from farmers.
- To give farmers an ICT platform that will encourage them to come together and share information.
- Design and develop mobile programmes for the II-RP system.
- Train peasant farmers on how to operate the II-RP system.

Research Questions

This wok tends to answer the following research question. How can Information and Communication Technology (ICT) be used for effective communication between NAIS and the farmers so as to increase their production and productivity? The research question is further subdivided into three parts as:

- What role can ICT play to enhance information dissemination to farmers in Rural areas?
- What mobile technologies are required for the effective feedback communication of information to NAIS?
- What use can mobile technology be in improving information exchange among farmers?

Significance of the Study

The II-RP would enhance information dissemination to farmers in remote rural communities. It would also solve the problem of information feedback communication between peasant farmers and NAIS. In addition, the II-RP would provide an ICT platform which could encourage farmers to come together and share information and improve their farming methods.

BACKGROUND

This section provides key concepts giving the overall background on the Integration of ICT's on Radio Programmes for fomenting social change to peasant farmers of rural Zambia. The section highlights the importance of agriculture health awareness campaigns through various media to disseminate remedial information to farming methods and hazardous livestock and crop epidemic diseases.

Agriculture Health Awareness

The concept of agriculture health awareness posed a threat to the Zambian peasant farmers living in the remote rural setup. The outbreak of epidemic diseases caused a lot of damage to the crop and livestock. The poor peasant farmers are caught unaware to such outbreaks and have no knowledge and solution to neither prevent nor cure such deadly diseases.

Animal Diseases

The outbreak of epidemic diseases has killed a lot of livestock especially in the rural farms. According to Muma et al., (2013) and Mweene et al., (1996), they identified some of notorious animal diseases

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

such as the foot and mouth, rabies, bovine tuberculosis and brucellosis. Whereas, Muma et al., (2013) and Mweene et al., (1996) emphasised that animals die in large numbers from the listed diseases. In fact from the discussed information, the peasant farmers have no vital information on how to control such an epidemic. They do not have knowledge of the useful drug to cure such diseases. Lack of agriculture health awareness as discussed earlier, has put a peasant farmer in a helpless situation of failing to prevent the diseases from spreading and affecting their livestock.

Crop Diseases

In the South African region insects and pests had been attacking and destroying crops. According to Zambia Agriculture Research Institute Report (2013), identified the following insects that attacked crops: aphids (aphididae), army –worm (spodoptera sp.), caterpillars, bean fly or bean stem maggot (ophiomyia phaseoli), beetles, yellow transverse bands, bugs, cutworms (agritos sp.), grass hoppers (acridoidea), leaf hoppers (cicadellidae jassidae), mites (tetranychidae), spider mites, nematodes or eel worms (meloidogyne sp., heterodera sp., phatylenchus sp.), stem- or stalk borers (busseola fusca, sesamia, calamistris, chilo partellus), thrips (thripidae), and white fly (bemisia tabaci). There are also dangerous viruses that have attacked crops. Kaitisha (2003) described the cassava mosaic virus which cause cassava mosaic disease (CMD), the maize streak virus which cause maize streak disease, the maize dwarf mosaic virus which affect both maize and sorghum and bean common mosaic virus which affect beans.

Rainfall Patterns

In recent years, there are some gradual climatic change which has drastically affected rainfall patterns. In some years the rainfall starts very late and stops early causing some dry spell in other areas of the country. This has affected the peasant farmers who could have purchased enough farm inputs in form of seed maize, and planted large portion of hectors but the germinated maize withered. All this loss is because the peasant farmers could not get the information from the Meteorological Station(s) who aired on the Radio Programme that they won't be enough rainfall in that particular rain season. In some cases, there is too much rainfall at the end of season and end damage the crop which had reached maturity. All this is because the farmers did not have information to alert them plant either early or late maturity seed maize.

National Agriculture Information Service (NAIS)

To alleviate the above identified agriculture health problems, the Zambian Government introduced and setup the National Agriculture Information Service (NAIS), a Department of the Ministry of Agriculture and Livestock. The NAIS is responsible for dissemination of remedial agricultural information through the mass media to relevant parties, mostly the peasant farmers from remote areas. The Department is in constant communication with farmers to provide information about better farming methods, expected rainfall patterns, crop and animal diseases and warning of disease outbreak. Despite of such efforts, the sentience information never reached majority of the farmers as they leave in remote areas where the radio facilities are not accessible. Many peasant farmers could not afford to buy radios, and the distant among themselves deprived them to reach the homes of others who have such facilities.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Media Channels

NAIS is using Media Channels to disseminate information and reach out the remote areas. Some of the widely used Media Channels are the Radio, Television, Newspaper and Newsletter. From these media, the Radio Stations 1 and 2 are the most commonly used channels to disseminate information to peasant farmers. The Radio Station 1 relays agriculture programmes transmitted at least in all major Zambian languages that include: Chitonga, chilozi, Chikaonde, Chiluvale, Chibemba, and Chinyanja. In this way, the local people are confidently able to listen from the languages they are conversant with, that are their mother tongue. Hence the majority if not all, are able to listen and participate in the programme by giving the feedback which will be discussed in the later Sections. Whilst, Radio 2 transmits farming programmes in English, which is an official language for Zambia. However, majority of peasant farmers has a problem with this channel, for they do not understand English. Only those from commercial farms make use of this channel as many of then attained education and some of them are Agricultural Managers.

In view of the above, the Radio media does not reach the majority of the peasant farmers. Even those who manage to listen do not have effective technology that would enable give an instance feedback to reach out the NAIS.

Information Communication Technologies (ICTs)

Information Communication Technologies (ICTs) does not only refer to Computers, it also includes radios, television, mobile phones, tablets, smart phones, scanners, printers, projectors, routers, switches, hubs, bridges, but to name a few. Developing a mobile application would make majority of peasant farmers have access to such a system. This is so because these days many people from the rural communities own at least one or two mobile phones. Hence, integrating ICTs with or into radio application would easy accessibility of information to unreachable remote areas. Acquiring Android phones these days is no longer a problem as these gadgets are all over the markets at an affordable price. Since technology has also expanded, the question would be to engage IT industry to develop Mobile Programming systems that will be integrated with radio programmes. This is possible because the mobile service providers such Airtel, Mobile Telecommunications (MTN) and Zambia Telecommunications (ZAMTEL) have extended their infrastructure to some near rural sectors. As such there is at least enough network coverage in many remote areas.

Agriculture Information Officers

The District and Provincial Agriculture Information Officers (DAIO/PAIO, respectively) are the trained personnel who have various skills in farming methods. The DAIO are stationed in each district in a province and they are responsible for overseeing the Radio Framer's groups that have been created in that area. Since NAIS has no established electronic media channels to relay information to Radio Farmer Groups, the DAIO act as the medium. They monitor and provide information to farmers and at the same time get information from farmers and submit it to PAIO. The PAIO is responsible for coordinating the work in the province and monitoring the operation of the DAIO. They are also responsible for relaying information collected from farmers by the DAIO to the Central Office in Lusaka. The Senior/Chief Agriculture Information Officer oversees all the operations in the country.

LITERATURE REVIEW

In recent years the organization has made efforts in trying to integrate mobile SMS technology in information dissemination.

NAISSMS: Platform

During the 85th Agricultural and Commercial Show, NAIS show cased a mobile phone based platform which it developed. According to the Report (National Agriculture Information Service, 2013), the application was to allow farmers to ask questions and get answers in all the seven local languages including English.

How it worked: In the message pad farmers were required to type the following:

```
NAIS, language code, and type the question, then
Send to
3009
```

NAIS Technical personnel (personal communication, January 13, 2016), reviewed that the mobile phone-based platform was hosted by Zambia Telecommunication (ZAMTEL) and Zambia Information and Communication Technology Authority (ZICTA) was involved for the Domain. Farmers owning a mobile phone with any Sim Card from any mobile service provider in Zambia were able to send in questions but for a fee. However the application was not fully utilized and has not been successful. The cost of running it proved to be too much for NAIS. To run the application required the yearly payment for the code (3009) to ZICTA and ZAMTEL for hosting. Furthermore, all responses to questions sent in required an operator to always be present. If the operator was out of the office meant that the messages won't be attended to. To make matters worse it never had a notification subsystem to inform the operator that they are pending messages when they were out of the office. Also the operators were overwhelmed as the application lacked the automation of well know solutions to well know problems.

Text to Change (TTC)

TTC is a program that was launched at NAIS Exhibition from July 30th to August 4th 2014 (National Agriculture Information Service, 2014). It is a text messaging platform called Vusion that has been designed by TTC Mobile which is interactive, scalable, flexible, cost-effective and easy-to-use (TTC Mobile, 2016).

The operation of TTC was based on the Push-and-pull of information service for farmers (National Agriculture Information Service, 2014). Push messages included alerts, announcements and tips of good farming practices. Pull messages gave farmers the ability to ask pressing questions. To ask a question, farmers were required to send the language keyword with their question to 8448. ENG for English, BEM for Bemba, NYA for Nyanja, TON for Tonga, LOZ for Lozi, LUN for Lunda, LUV for Luvale, and KAO for Kaonde.

NAIS Technical personnel (personal communication, January 13, 2016), reviewed that the program was based on cloud computing and utilized google services which meant access to the SMS Dashboard required the operators to have a smart phone and internet connection. With the current internet connec-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tion speeds in the country this proved to be a challenge. Furthermore, NAIS never had full control of the application; the access privileges were limited. Sadly the program only lasted for a year (2014-2015).

Existing Similar Systems

SMS Trade/Market Information System

The SMS market and trade information system was developed in 2006 by Zambia National Farmers' Union (ZNFU). The platform serves as a price discovery type of tool built to help farmers access actionable up-to-date market prices on their own, within their vicinity, and allows them to have a better negotiating position (Pandor, 2014). The system gives a farmer access to comparative market data and the best price for their produce without going through the daunting task of going out of their way to look for a market.

This price information system is linked to a website and is only available on the Airtel network. To access the service all the farmer needs is the most basic simple cell phone. According to (Pandor, 2014), to find out the market price of a commodity, all one needs to do is type the first four letters of the commodity and send to 4455.For example, to find the current price for wheat, you type 'whea' and send to 4455.Once the SMS is sent, within seconds, the system will reply to inform the farmer of who is buying and at what price they are buying. The cost of an SMS is 50 ngwee.

Commodity prices that are accessible on the platform are: maize, soybeans, sunflower, sorghum, cassava, beans, rice, jatropha, popcorn, honey, groundnuts, wheat, beef, sheep, goats and bran.

According to Tibone Moyo (ZNFU'S Market Information Economist), every week the platform is updated with the latest prices. There are 160 companies from milling companies to traders who are registered with the service as of 2014. The registered companies are called to find out how much they are buying a particular commodity for in that week or if there is a change in the price they are offering (Pandor, 2014).

As can be seen the Application focuses on providing a platform for farmers and buyers to meet and do business at a competitive price. Furthermore the service is only available on the Airtel network which means farmers subscribed to other networks don't have access. The cost of a SMS is also higher than the ordinary charge (which is about K0.25 – K0.30/text message).

The application does not provide information on how to grow crops, keep livestock or address the problems that farmers encounter daily. The proposed system focuses on helping farmers grow better crops and keep health livestock animals.

iCow

iCow is an Agriculture information platform accessed primarily via mobile phone that delivers information and different services to farmers (Su Kahumbu. S, 2012). It was developed in Kenya by Green Dreams TECH Ltd and was lunch in June 2011 (USAID, 2011). During a presentation on Mobile tech spreads seeds of information to farmers, Su Kahumbu (2013) stated that iCow is more like a pipeline in which on one end are farmers and the other end are the agriculture stakeholders (Government, NGO's, Research Institutions, Vets, Input providers, Processors etc). She further explained that iCow is not only used to deliver information and services to farmers, but also help agriculture stakeholders to evaluate their projects and increase their efficiency using information that is coming back from farmers. iCow features include:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. **Cow Calendar:** Farmers register their cows and their insemination date by SMS short code, and then receive periodic SMS prompts timed with vital days during the gestation period (USAID, 2011). Information sent to farmers include; when the cow is due to come on heat, when to serve it, when to see if in fact it is pregnant and when to stop milking it.
2. **Linkage to Experts:** This service enables farmers to locate the nearest veterinarian or artificial insemination specialist via SMS or through the iCow website. A farmer simply sends vet to iCow short code and then receives an SMS with the telephone numbers of the vets or the artificial inseminators.
3. **Information:** The service sends weekly SMS messages to subscribers with information and tips on breeding, nutrition, milk production efficiency, and other best dairy practices (USAID, 2011).
4. **iCow Soko:** iCow established iCow Soko in August 2011, which enables farmers to trade livestock and livestock byproducts via mobile phone (USAID, 2011). iCow Soko enables consumers purchase their livestock and livestock by products directly from their producers, enabling a healthier agri ecosystem all round (icow, 2015).
5. **iCow Sauti**.

According to Su Kahumbu (2011), the area of focus for icow is providing Livestock information therefore its implementation by NAIS would not be beneficial to all Zambian farmers. Zambian peasant farmers need a system that is not only able to provide information concerning livestock but also growing of different crops. They need to be equipped with the knowledge of growing different crops and how to prevent some crop/livestock diseases if possible. Furthermore, they need a system that is accessible at any time and is not restricted to any mobile service provider.

Thailand: 1677 Farmer Information Highway

Is a Corporate Social Responsibility (CSR) project by telecom operator Telenor. Subscribers receive free information on market trends, commercial crops (rice, vegetable and fruit), livestock and fisheries, important news updates and warnings on weather conditions through their mobile phones (mAgriculture, 2010). 4-6 messages per day are forwarded to subscribers. The content format has been upgraded in phase II of the project and includes MMS and Video Clip, no longer SMS only ("using mobile to improve farming skills", 2010). The project is also linked to Happy Radio of the Telenor group and a farmers_help center, where subscribers network with successful farmers and experts.

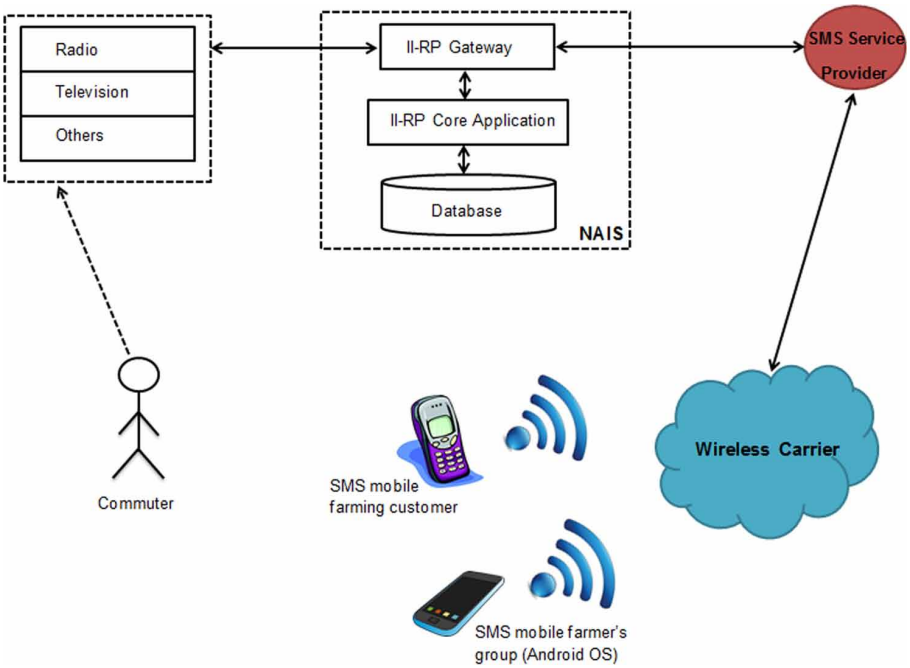
As it can be observed, 1677 Farmer Information Highway is a project undertaken with the aim of providing adequate and timely information to farmers. The project attracts much attention as it seems to have much of the features desired by NAIS. However, the cost of implementation and operation are very high. To fully operate the System, the government of Thailand contributes to the cost of the service (mAgriculture, 2010). NAIS cannot afford to implement this system as early seen; it has failed to fund the NAISSMS –Platform and Text To Change (TTC).

Avaaj Otalo

Avaaj Otalo (literally, "voice stop") is a system for farmers to access relevant and timely agricultural information over the phone (Patel et al., 2010). The system was designed in 2008 through collaboration between IBM India Research Laboratory and Development Support Center (DSC), an NGO in Gujarat

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(mAgriculture, 2010). By dialing a phone number and navigating through simple audio prompts, farmers can record questions, review and respond to others, or access content published by agricultural experts and institutions. In addition to the Q&A forum, Avaaj Otalo includes an announcements board of headline-like snippets updated regularly by DSC staff, and a radio archive to listen to past episodes of DSC's popular weekly radio program (Avaaj Otalo, 2010).



The system has mostly utilized audio technology which requires heavy investment in state of the art mobile communication technology which currently cannot be implemented by NAIS due to financial constraints. Furthermore, if ever NAIS managed to implement such a system the peasant farmers cannot afford to access its services. This would mean that all operational cost will be handled by the organization. The proposed Mobile Application system is feasible as access to the services costs farmers the same amount they spent on an ordinary text message and has no mobile service provider restrictions.

In conclusion, there are many mobile applications available and each has its own area of focus. Mobile systems that are affordable lack the services that the organization needs and Mobile systems that seem to have the desired services are very expensive for the organization to implement. The best solution is to develop a system that considers the cost of operation on the organization's part and farmer's financial ability to access the services. The proposed system meets these demands.

THE II-RP ARCHITECTURE

The II-RP architecture is presented in Figure 1. The architecture has the following functional components: Mass Media, NAIS Core, SMS Service Provider, Commuter and Wireless Carrier. The system is developed using Java programming language.

Figure 1. II-RP architecture

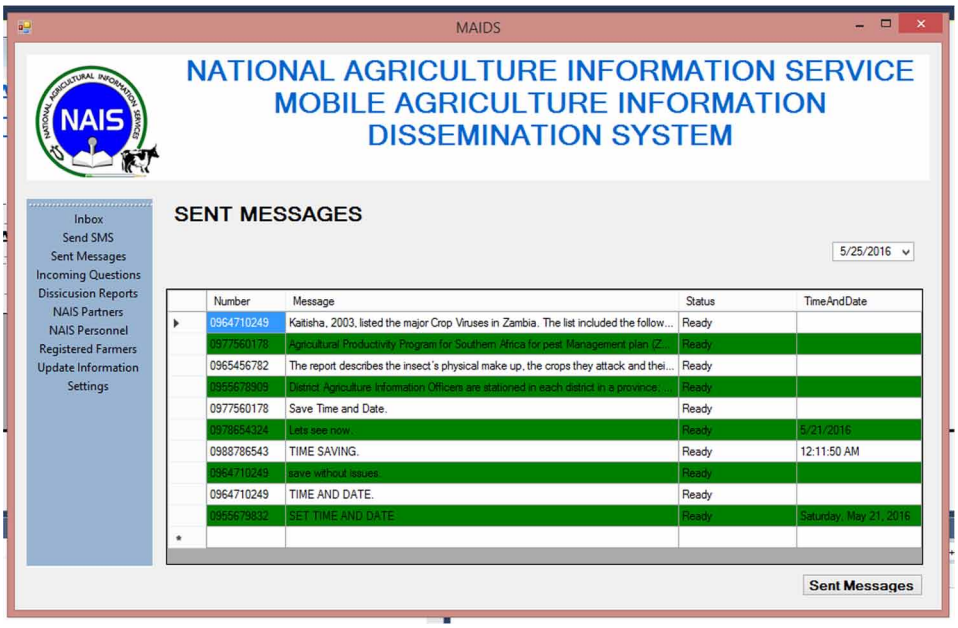
EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The farmers, in the architecture referred to as Commuters form groups. The groups listen in to the programmes run by NAIS through the Radio and sends feedback through mobile phones/Tablets running Android operating system distributed to them by NAIS. The mobile phones/tablets have an application and offline database installed. The application contains a form that farmers fill in after a meeting or listening to a Radio Programme and sends it to NAIS, this replaces the Dialogue Forms which farmers fill in and mail it through the Zambia Post Office. The database contains information that is helpful to farmers such as where to buy medicine for crops and animals, vets contacts and a list of members with their contacts. This is to reduce the load on the main system and lower cost for farmers. The mobile phones/tablets are also used to access other services provided by NAIS via SMS. Services provided by NAIS are available to any farmer with a mobile phone via SMS except the above explained Feedback System which is only available to the mobile phones/tablet distributed by NAIS. The cost for the text message is the same as an ordinary SMS.

NAIS maintains a central database which contains a pool of information. Staff personal information and their responsibilities, Clients and their relationship to NAIS and Partners with their involvement are stored in database tables respectively. Information about the media channels used in information dissemination is stored for easy access and collaboration.

The database also contains personal details of registered farmers, all known crop diseases and their cure, marketing information, Livestock information and Livestock expert contact details of Vets and artificial insemination officers. Marketing information includes; where to buy seeds, fertilizer, insecticide, pesticide, etc. livestock information includes; different animal diseases and their cure, animal dibbing and De-worming, etc.

The Application is built from scratch. Its interface with the stakeholders is through the II-RP Gateway. The Application monitors in-coming messages; any received SMS is placed in the assigned table and displayed on the screen. Messages are retrieved from the table in the order they arrived and processed. If a reply is needed, the required information is retrieved from the database or provided by the operator then wrapped up in a Text message (SMS) and sent to the farmer through the II-RP Gateway. The II-RP Gateway is a device that connects NAIS to the general public. A 4G Mobile Broadband Modem is to be used for small scale implementation. For full scale implementation, a SMS gateway is to be used.



ENVISAGED OR PLANNED MOBILE APPLICATION

The Mobile Application has many modules/subsystems. Among these include the basic components that are expected in a mobile application such as the Send Message subsystem and the Inbox subsystem. These two subsystems have been programmed to store any message sent or received to permanent storage (Database) for the purpose of aiding in identifying the problems that farmers are facing most and for future reference.

The Send Message module allows Agriculture Information Officers to send SMS messages to a single farmer or group. Incoming questions are immediately displayed as demonstrated in Figure 2 and the operator attends to them. However, not all queries are attended by an operator. All the enquires sent by farmers except for the messages proceeded with the short code word "question" are automatically served by the application. When a message is received, it is broken down and the application searches for the requested information in the database. When found it is wrapped up in a text message and sent to the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. The II-RP interface

farmer. The ability to serve queries without an officer is what makes this application ideal for the organization because it saves time and lessens the number of officers required to attend to farmers' enquires.

Other subsystems include Discussion Report, Farmer Registration, Information Update, which stores data into the database, Agriculture Information Officers component, Organization's Partners and the Media Channels used by the organization.

The Discussion Report component focuses on the collection of feedback from farmers. After farmers listen to a programme aired on the Radio, they fill in a discussion report form on the Android phones and this information also as discussed above is wrapped up into a text message which is sent as SMS to the Mobile Application. The information received is stored in the database and accessed at any time. Once the farmer's groups send the message, all the processing that follows is handled by the system.

The registration process of farmers is served by the Farmer Registration subsystem. Farmers send a text message proceeded with the short code word "Register" to the Mobile Application and the subsystem automatically extracts the farmer's number, name and district name supplied in the text message and saves this information to the database. It further informs the farmer if the registration is successful or not.

Information pertaining to animal and crop diseases/pests, their causes, cure and prevention is managed by the updating subsystem. Other information managed by this subsystem are; rainfall patterns, growing weather condition for different crops and crop/livestock experts contact details.

DISCUSSIONS AND FINDINGS

In this section, data analysis methods, study results and a discussion of the findings have been presented. Findings from this study indicate that most media channels used to disseminate information are not very effective. Their effectiveness is slight around half with the exception of the use of radio. The feedback

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

channels used to receive feedback are not effective. This confirms that NAIS has difficulties in collecting feedback from farmers as was stated in the problem statement. The findings also confirm that NAIS would welcome the development of a mobile information system as it will not only give farmers the platform to communicate with the organization but also will enable NAIS to disseminate information in a timely manner.

During the process of data collection, a questionnaire was prepared and addressed to two categories of the targeted sample size, that was, Provincial/Senior and District Agriculture Information officers. Out of the 20 questionnaires distributed only 15 were returned indicated 75% response rate. Lusaka and the Copperbelt provinces made the sample size. From Lusaka Province six questionnaires were returned and from Copperbelt Province nine questionnaires were returned. Copperbelt included the following districts: Mpongwe, Lufyamama, Luanshya, Kalulushi, Ndola and Kitwe. From this sample, five (5) questionnaires were not answered nor returned representing twenty-five percent (25%) non-response rate. This non-response rate was because the respondents were busy with other commitments.

The questionnaire comprised of three (3) sections and data generated was presented as follows:

- Media channels used to disseminate information, their effectiveness and challenges.
- Feedback channels used, their effectiveness and challenges.
- The need for a mobile information system and its perceived benefits.

Descriptive statistical analysis was used to analyze the data that was collected from the questionnaires. Not all respondents answered all of the questions therefore numbers reported correspond to the total number of respondents who answered the individual questions.

Media Channels Used to Disseminate Information

Figure 3 shows the media channels used in disseminating information to farmers. The mostly used media channel to disseminate information was the Radio, followed by the Times of Zambia Newspaper. Television and Newsletters were also used but their usage was mostly in urban and pre-urban areas. Newsletters were only used to produce information for a specified period of time.

The II-RP Effectiveness of the Media Channels

Table 1 shows the effectiveness of the media channels presented in Figure 3. Users perceived the use of the radio as the most effective media channel (about 80%). Although the newspaper is highly used its effectiveness is low (about 51%). Newsletters are the least effective (45%). This could be because limited number of copies are produced and in a few languages.

Challenges in Disseminating Information of II-RP

Table 2 provided the challenges that were faced by NAIS in disseminating information. The major challenge was the lack of financial and communication resources. The challenge of farmers initiating communication varies significantly between urban, peri-urban and rural areas. In urban and pre-urban areas farmers were able to access NAIS offices easily through personal phone calls and SMS. However, farmers in rural areas only rely on the dialogue form/ discussion report for relaying information to NAIS. Although it appeared to be least of the challenges, it is a major challenge faced by farmers in rural areas.

Feedback Channels Used

Figure 4 shows the media channels used in getting feedback from farmers. The most commonly used feedback channel is dialogue forms/discussion reports. Phone calls and short message service (SMS) are also used. However, these phone calls and SMSs are not addressed to an established system but to personal lines.

Figure 4. Feedback media channels

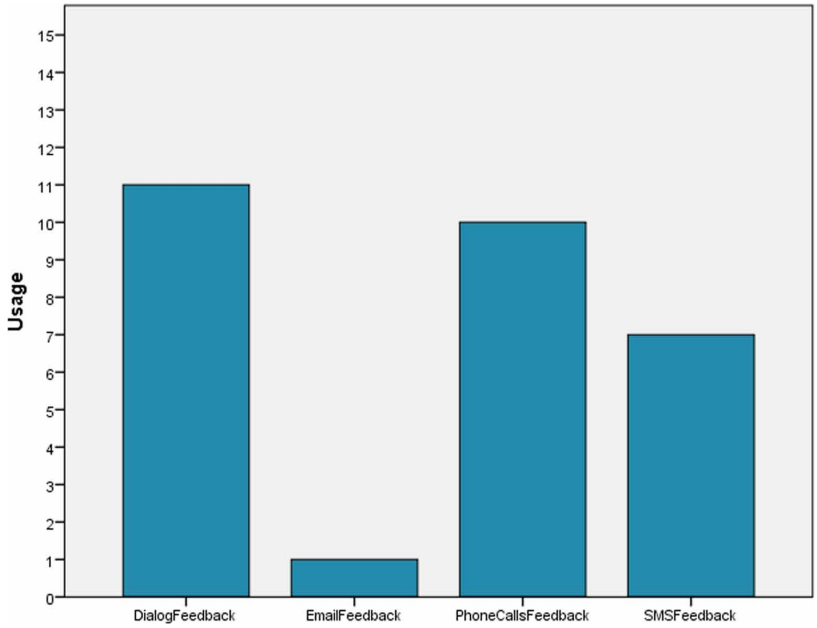

Figure 5 shows the effectiveness of Dialog Form/ Discussion Report in getting feedback. As stated earlier, this is the main feedback channel which is supposed to be used. This is evident in Figure 4 (that is, 11 respondents out of 15 are using this channel). As it can be seen from the chart, a slight majority of users mostly from rural areas feel this channel is highly effective as it is the only channel available to them. However, if we consider the numbers of those who feel that the channel has a low effectiveness with those who do not use the channel, it is clearly evident that this channel has not provided the organisation with the response needed.

Email Effectiveness Figure 6 shows how effective the email channel is in getting feedback. It is clear that farmers do not use this channel. A few who use this channel feel its effectiveness is low.

Phone call effectiveness Figure 7 shows the effectiveness of phone calls. Slightly above half of those who are using this channel feel it is highly effective. An equal number of people are not using this channel. This is because, there is no established phone system to respond to farmers' enquiries as stated earlier.

SMS Effectiveness Figure 8 shows the effectiveness of this channel. As it can be seen from the table, the SMS technology is underutilised as only about half of the respondents are using it. This is because the organisation has not established a formal SMS system. The fact that about half of the respondents are using the channel is evidence enough to indicate the willingness of farmers to use the technology.

Figure 8. SMS effectiveness

Challenges With Feedback Channels Used

The respondents outlined the challenges faced by the organization with the feedback channels that are currently in use. The challenge that stood out was the difficulties in getting rapid responses from the primary audience (the small-scale farmers). They stated that response is not effective and the dialogue forms/discussion reports do not even reach the office most of the time. This was attributed to the location of the farmers and transportation. On the organization's part, the respondents reviewed that there are no resources and the funding they receive is inadequate. With inadequate funding the organization faces the challenge of providing dialogue forms/discussion reports to farmers as getting stationery is also a challenge. Furthermore, because of limited resources it is difficulty for District Information Officers to carry out their field work. All this has led to communication breakdown.

District Information Officers operating in rural areas stated that they are poor Radio signal or reception and poor mobile network. This makes it difficult for farmers to listen in to radio programmes. Furthermore, they pointed out that airtime may not be readily available and maybe out of reach to some people. So even if the officer gives them his/her mobile number, the farmers rarely communicate.

On social grounds, the respondents complained on the farmers being rigid sometimes. They stated that some farmers have a negative attitude towards them and the help the organization tries to offer.

The Need for a II-RP Mobile Information System

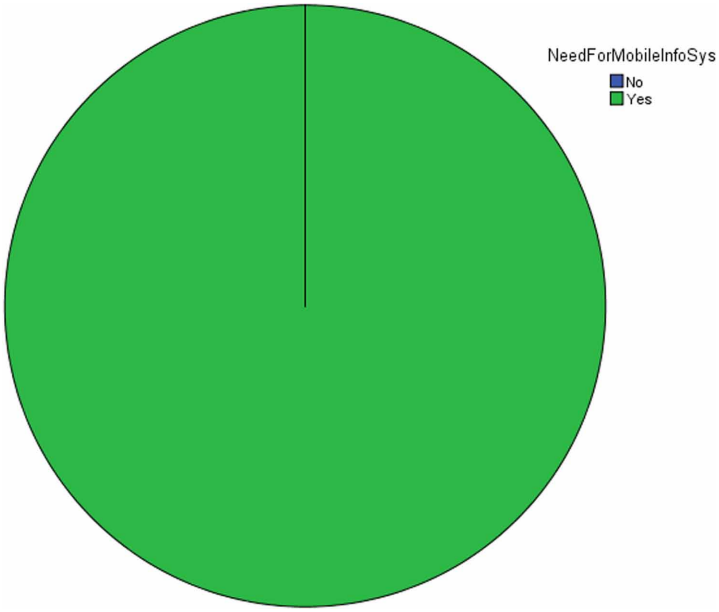

Figure 9 clearly shows that NAIS officers identify the need for a mobile information system which will help them to be in touch with the farmers.

The following are the perceived benefits by the respondents:

- A Mobile system would be helpful as it will mean going closer to the farmer's location. It will enable direct contact with the farmer and so enhance participation, reach hard to reach areas and feedback will be instant. This will help in the monitoring of radio farmer forums.
- Fast response to farmer's questions and concerns thus making them aware about new farming trends.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 9. Need for a mobile information system

- Since most farmers have cellphones, it will be easy for them to access the agriculture information on their phones.
- Timely feedback would resolve urgent response challenge. Most farmers listen to radio as individuals and the culture of using the Post box is low and mail takes so long to reach recipients.
- Through the use of the SMS Toll free especially on factors that are critical to the sector such as outbreak of diseases/pests and serious weather changes affecting their agriculture activities, a mobile system will be very helpful to both the farmers and the organization.
- Most farmers have mobile phones despite poor Network. Farmers are able to communicate with fellow farmers on issues affecting them. A Mobile System will further encourage them to share information.

CONCLUSION AND RECOMMENDATIONS

From the districts that were sampled, 93% of the respondents stated that the radio is the most effective media channel used to disseminate information to farmers as it covers a large portion of the country. Findings from this study also indicated that most media channels used to disseminate information were not very effective. Their effectiveness was slight around fifty percent with the exception of the use of radio. Never the less, all respondents, representing a 100% feedback (Figure 9) reviewed that the use of a Mobile System to disseminate information would be far much better as it will not only give farmers the platform to communicate with the organization but also enable the organization to disseminate information in a timely manner.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Dialogue Form/ Discussion Report was the most used feedback channel as 73% of the sample size stated so. However, its effectiveness was rated at 40%. The other feedback channels used were also not effective. This confirmed that the organization had difficulties in collecting feedback from farmers.

The challenges encountered in disseminating information and collecting feedback were common among the sampled districts. Respondents agreed that the implementation of the Mobile Agriculture Information Dissemination System will help to overcome almost all the challenges they faced.

It was evident that the Mobile Application would be of great help to both the peasant farmers and the organization. With the system, the farmers would be able to enquire on any issues affecting their crops or livestock and get immediate feedback. This would not only make them the initiators of communication but will give them full access to the System as there are no time restrictions. As stated early, parts of the Mobile Application are automated to respond to enquires without a human operator.

On the organization's side, the system will not only enable it to disseminate information to farmers on time but will also reduce the cost of operation. The resources that are used in printing dialogue forms/ Discussion Reports will be eliminated, Communication costs will be reduced and fuel expenses will also reduce as the movements taken by Agriculture Information Officers will be brought to a minimum.

District Agriculture Information Officers together with the Senior/Provincial Officers will be trained on how to use the system at the same appointed time. District Agriculture Information Officers in turn will train the peasant farmers in the Farmer's Groups that have been established. Furthermore, the Mobile Application has a component that provides information to farmers on the short code words to use when enquiring on specific issues.

Recommendations

In order for NAIS to effectively train its Officers and farmers there is a need to open training centres in rural areas. This would encourage farmers to participate and remove the negative attitude some farmers have about seeking help from other parties. It would also give a chance to Agriculture Information Officers to gain key interest in the affairs of the farmers as they would not only train them but give them a platform to air out their views and concerns.

Currently, Android phones are provided only to Farmer's groups. Each group uses this phone to send updates (views) to NAIS on the programmes that are aired. Farmers not part of any group and too poor to afford a phone need to be provided with one, if possible have one given to them as a loan. This would ensure that every farmer in the Country has access to the Mobile Application and participate in the programmes that are aired on the Radio.

KEY TERMS AND DEFINITIONS

Channel: A physical transmission medium such as a wire, or a logical connection over a multiplexed medium such as a radio channel.

Gateway: Point of exit or a network point which interfaces with another network that uses different protocols.

Media: The collective communication outlets or tools that are used to store and deliver information or data.

Meteorological Station(s): The site where instruments for conducting meteorological observations on the ground are installed.

Mobile Phone: A wireless handheld device that allows users to make calls and send text messages, among other features. Today's mobile phones, however, are packed with many additional features, such as web browsers, games, cameras, video players, and even navigational systems.

Mobile Programming: Developing applications using handheld devices such as cellular phones.

Radio: The technology of using radio waves to carry information, such as sound, by systematically modulating some property of electromagnetic energy waves transmitted through space, such as their amplitude, frequency, phase, or pulse width.

SMS: Small message system.

Chapter 15
The Conceptual Framework for The Examination of a Successful Digital Entrepreneurship in 21st Century

Bilal Ahmad Ali Al-khateeb
Al Imam Mohammad Ibn Saud Islamic University, Saudi Arabia

ABSTRACT

There is still lack of a clear conceptual framework to examine a successful digital entrepreneurship within the developing and emerging contexts despite calls by previous scholars. Also, recent studies shown that majority of the digital enterprises studies available today are mostly from the Western world. Thus, there are only few studies on digital enterprises studies emanating from the developing and emerging countries in the Middle-East and Africa continents. Based on the evidence from the literature, this paper provides an overview of digital entrepreneurship, identifies key variables that determine a successful digital entrepreneurship and then provides a conceptual model to guide the understanding of a successful digital entrepreneurship development within the context of developing and emerging economies. The paper offered some implications for digital entrepreneurs, policy makers and some other people in the business of digital entrepreneurship in Saudi Arabia.

INTRODUCTION

There have been several attempts by both practitioners and academics to link entrepreneurship to the digital world. However, prior to this time, both empirical and practical evidence suggest the rise of a new category of entrepreneurship, that is, the concept of digital entrepreneurship which is believed to be an emerging trend.

Digital entrepreneurship affects every task, activity and process within a company (Conigliaro, 2017). Therefore, companies must disrupt their own traditional business model before competitors do. In essence, the time to build a digital company is now. Digital transformation is not only about changing technology but also about changing the way companies do business, and no company is left out of this.

The importance of digital entrepreneurship cannot be undermined. For instance, it attracts talent all over the world. It increases employee's productivity, satisfaction, retention, engagement and improves communication within the organization and equally reduces operating costs for the organization. It equally promotes digital marketing by helping companies to collect valuable information about customers and competitors, particularly in real time. In doing so, it becomes an engine for economic development and growth. Thus, digitalization of the economy is the fundamental mechanism of innovation, competition and growth in today's world, which in turn requires a process of adaptation and transformation. According to Nambisan (2016) and Nambisan (2017) digital entrepreneurship helps in transforming the nature of uncertainty inherent in entrepreneurial processes and outcomes, as well as the ways of dealing with such uncertainty.

Despite the many benefits of digital entrepreneurship as highlighted above, and with the recent increase in the number of digital entrepreneurs across the globe, particularly in the Western world, the academic approach to digital entrepreneurship in the 21st century still needs to be explored. Unfortunately, it is yet to be explored and accorded the needed attention and also treated as one of the areas of entrepreneurship study. Additionally, Ngoasong (2017) recently acknowledged that majority of the digital enterprises studies available today are mostly from the Western world. The author argued that the nature of online reach has made this possible for them. The above suggests that there are few studies on digital enterprises studies emanating from the developing and emerging countries, particularly those from the Middle-East and Africa continent.

Practically, digital entrepreneurship seems strong, but the outlook seems theoretically weak in terms of model development. Thus, digital entrepreneurship appears to lack clear models to advance its understanding, particularly in developing countries such as Middle-East and Africa. Also, it appears that the early writers on digital entrepreneurship sound more of practical than academic, and therefore, may not have found a need for models to advance the knowledge in digital entrepreneurship domain. It is on the basis of this that authors such as Archer, Hull, Soukup, Mayer, Athanasiou, Sevdalis & Darzi (2017) and Nambisan (2016) clamored for theoretical frameworks to guide the understanding of digital entrepreneurship and the relevant factors that affect it. The study noted that only limited efforts have been made by previous studies to provide theories and theoretical framework for the examination of digital entrepreneurship. However, some attempts have been made by few to provide theoretical models. On the contrary, these attempts appear to be ineffective as the key variables were not considered, while on the other hand, majority of the frameworks are perceived to be Western based. For example, the theoretical model provided by Ngoasong (2017) seems to have neglected the relevant factors that actually determine successful digital entrepreneurship as the study only focused on digital entrepreneurial competencies, institutional context, local context and technological context, without consideration to variables such as digital knowledge-based, digital business environment, digital skill, digital mindset and digital infrastructure. Also, Giones & Brem (2017) model is only concerned itself with digital technology entrepreneurship. In 2016, Leong, Pan & Liu (2016) advanced another model which they called digital entrepreneurship of born digital and grown digital firms but failed to include the key variables highlighted above. Authors such as Aldrich (2014); Forrester (2017); Nambisan (2016); Ngoasong (2017) claimed that variables such as digital infrastructures, digital knowledge-based, digital business environment, digital skill and

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

digital mindset, cannot be ignored in an attempt to develop successful digital entrepreneurship. In view of this unfolding reality which forms the basis for this study, this paper provides an overview of digital entrepreneurship, identify key variables that determine a successful digital entrepreneurship and then provide a conceptual framework to guide the understanding of successful digital entrepreneurship development in the 21st century.

CONCEPTUALIZATION OF DIGITAL ENTREPRENEURSHIP

Attempts to describe digital entrepreneurship have led to many contributions from different authors and researchers. While some of the descriptions are contextual, others are general in nature. For example, Davidson & Vaast (2010) described digital entrepreneurship as the practice of pursuing "new venture opportunities through new media and internet technologies. They noted that digital entrepreneurship is like, or related to, the traditional entrepreneurship which tends to pursue entrepreneurial opportunities by creating new enterprises or commercializing products and services. On the other hand, digital entrepreneurship is different from traditional entrepreneurship because some or all of the entrepreneurial ventures take place digitally, instead of traditional formats. Therefore, one can describe digital entrepreneurship is that type of entrepreneurship which manifests in existing businesses through the introduction of new digital technologies, or through the novel use of technologies that change business models or revolutionize products or services (Prodanov, 2018; Tumbas, Berente, Seidel & Brocke, 2015). However, Santana (2017) states that the most acceptable definition of digital entrepreneurship across the world should be that which covers all new enterprises and existing companies, that have been "transformed" or converted, and that create economic and social value through digital technologies. These firms are distinguished by high intensity in the use of new digital technologies, (particularly solutions for the social sphere, big data, mobile phone technology and cloud technology), for the purpose of enhancing business operations, inventing new business models, improving business intelligence and dealing with clients and partners. It depends on five pillars namely; digital knowledge based and ICT market; digital business friendly environment, access to finance, digital skills and e-leadership; and an entrepreneurial culture (Santana, 2017). Also, digital entrepreneurship is conceptualized as the embracing of new ventures and the transformation of existing businesses by creating and using novel digital technologies (Zhao & Collier, 2016).

Consequently, these digital businesses possess certain features such as high intensity of new digital technologies utilization (which are mainly social, mobile, analytic and cloud solutions), in order to increase business actions, invent new (digital) business models, sharpen business intelligence, and engage customers and stakeholders through new (digital) channels. It is equally a term used in referring to the methods of creating a new or novel internet enabled/delivered business, product or service. This description is comprised of not just startups-bringing a new digital product or service to market-but also the digital transformation of an existing business activity inside a firm or the public sector. Accordingly, Vasilchenko & Morrish (2011) view digital entrepreneurship as businesses that provide online accounting, software development, social computing and digital platforms for cataloguing, e-commerce (Javalgi, Todd, Johnston & Granot (2012) and multi-media businesses that sell digitized products and services (Hair, Wetsch, Hull, Perotti & Hung, 2012; Onetti, Zucchella, Jones & McDougall-Covin, 2012). Thus, a digital entrepreneur is an individual who creates and delivers key business activities and functions, such as production, marketing, distribution and stakeholder management, using information and communication technologies (ICTs).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ROLES OF DIGITAL ENTREPRENEURS IN 21ST CENTURY

It is actually very difficult to say precisely when digital aspect of entrepreneurship emerged. However, Leadem (2018) observed that an important landmark in digital revolution can be traced down to 1994 when Amazon was founded, while another landmark can be linked to the first iPhone, which was released in 2007. He noted that these remarkable events not only marked the beginning of the life-changing Smartphone frenzy, but gave room for more major digital revolution, including social media and mobile apps, to surface. It is at this point that company like Netflix's streaming was launched in 2007, the birth of Bitcoin in 2009 and the release of Google Drive collaboration software. All these set the stage for a digital revolution which has given birth to digital entrepreneurship, now ruling the world.

As to the role digital entrepreneurship, it would be very difficult to undermine this, particularly in the 21st century. The reason is that digital entrepreneurship is traceable to every aspect of the business sector. For example, digital entrepreneurs help customers and companies to get the most accurate data from the most authoritative sources. Digital entrepreneurs are regarded as professionals who provide context for maps, info cards and specific answers to customers and companies in need of information, in a professional way. With digital entrepreneurship, this information is provided in an intelligent way (Forrester, 2017).

Digital entrepreneurship promotes digital marketing. In the 21st century, businesses cannot afford to ignore digital marketing, because doing so would amount to opening a business, but not telling anyone (Conigliaro, 2017). It also helps businesses to engage users online and help brands in connecting with customers. Digital entrepreneurship, through digital technologies, has broken down communication barriers, thereby improving employee's experience in the workplaces across the world.

Furthermore, digital entrepreneurs also provide digitalization concepts to ensure sustainable growth for both the government and businesses around the world (Denison, 2017). It equally provides the basis for future-oriented jobs, greater resource efficiency, and responsible economic activity. They engage in smart regulation and focus investment in education, research, and entrepreneurship, and these are considered very crucial for the world economy.

According to Nambisan (2016), digital entrepreneurship tends to balance the playing field in some specific sectors such as ICT and entrepreneurship, thereby providing opportunities to work from remote places at different hours, from the home, or on the go. One can also see the role of digital entrepreneurship in the promotion of gender equality, social and economic inclusion, which stimulate local development, and contributing to sustainable development, particularly when new technologies are joined with the availability of open and public data in cases where data for example on climate/weather, crops and soil, or road and traffic conditions, are used to develop services and apps that alleviate local problems, be it the optimization of agricultural production, emergency and disaster relief response, road safety and accident avoidance, or reducing traffic congestion and parking difficulties. Simple price information of products and services can also greatly improve economic opportunities for local suppliers; also, the bringing together or matching of supply and demand for labor, goods and services by digital technologies, tends to improve economic efficiency, productivity and income opportunities.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

CHARACTERISTICS OF DIGITAL ENTREPRENEURSHIP

Psychological theory or model of entrepreneurship, which is equally called hereditary or trait theory by McClelland, Lynn & Schrage (1961), emphasized on the need for entrepreneurs to possess certain characteristics or personalities to enable them become successful entrepreneurs. Based on this, Digital Skills Academy (2017) asserts that there are several skills required by the digital entrepreneurs to effectively function in their business area. These qualities are far more different from those of the conventional entrepreneurs, such as economic entrepreneurs, social entrepreneurs, technopreneurs etc. (Lucky, Rahman & Minai, 2013). Because of the nature of the digital task that digital entrepreneurs engage in; they are forced to possess certain characteristics or skills that are more specific to their tasks. Hence, the abilities and characteristics of the digital entrepreneur become their most important assets.

According to Digital Skills Academy (2017), there are ten key unique qualities often used to qualify digital entrepreneurs in the 21st century. They are as follows:

- **Democratization:** It is one of the mo**st** interesting effects of the digital revolution in the present business world. New entrepreneurs in the digital world can gradually build businesses from the ground up without capital and business connection like before, when conventional entrepreneurs may not be able to do so without capital and business connections.
- **Visionary:** It is not just having a plan, but a clear vision of what your business will do, how your business will do it, and the business goals and objectives. This keeps the digital entrepreneurs focused and helps them to move on the right track.
- **Communicator:** Digital entrepreneurs get others off the ground by clearly articulating their business ideas, and it is this skill also needed in order for co-workers and clients to work with digital entrepreneurs efficiently. This can be achieved through strong and effective communication skills.
- **Motivated:** Digital entrepreneurs are motivators as they drive and propel others to really do what they are doing; and what they want them to do. They possess the motivational skill to always keep going on the road to success so as to reach the end. Therefore, with the support of clear vision and goals, motivation can be attained.
- **Nous:** This is human intellect that is necessary for understanding what is true and real. It is a know-how, ability, knowledge, skill or acumen to understand how the system and operation works. With this skill, digital entrepreneurs are able to work regardless whether they are functioning in their area of expertise, other related areas or wider structural systems, such as legislative frameworks or the economy, it is important to know how to manage them and how they can affect your business.
- **Opportunist:** A skill to always see or recognize business opportunities within the environment, whenever they arise, is one of the most valuable traits an entrepreneur can have. The skill equally assists digital entrepreneurs to create their own opportunities. For example, it is this skill that assisted Patrick and John Collison to see a gap in the market, that later made them billionaires.
- **Technologist**: It is important, if not compulsory, for any digital entrepreneur to possess this skill. This requires that one must be more than just a tech entrepreneur, because one needs to understand not only the technology he is developing, but the wider technology ecosystem, having the ability to see where technologies will develop and where they will provide opportunities.
- **Explorer:** Digital entrepreneurs should possess the ability to explore avenues as they arise, because it allows the discovery of new areas of possibility. It will also provide a situation where

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

what was initially the core of your business could become just a branch of a much wider and more lucrative business concept.

- **Adaptable:** This is the quality needed to overcome a number of bumps which are inevitable on the way to success. It helps digital entrepreneurs to remain on track especially when the inevitable and the unforeseen knock them off course. Adaptability allows the digital entrepreneurs to deal with any of these inevitable and unforeseen bumps.
- **Tenacity:** Digital entrepreneurs must be persistent and determined in such a way that they should not allow any challenge they face get on top of them. A tenacious entrepreneur is one that is inspired when they come up against a wall, excited by the prospect of finding a way over or around it, rather than being frustrated by it. Tenacious entrepreneurs do not give up because they don't know how to give up (Digital Skills Academy, 2017).
- **Learn From Mistakes:** Mistakes are an inevitable part of running a digital business. Digital entrepreneurs must learn how to deal with both valuable mistakes and costly mistakes. This skill should help digital entrepreneurs to spend their energy in analyzing mistakes, rather than regretting those mistakes. They should learn from the differences between valuable mistakes and costly mistakes.

DETERMINANTS OF SUCCESSFUL DIGITAL ENTREPRENEURSHIP

This paper identified five major determinants that are believed to promote successful digital entrepreneurship. These determinants include digital knowledge-based, digital business environment, digital skill, digital mindset and digital infrastructures. These determinants therefore form the basis for further discussion below.

- **Digital Knowledge-Based:** Forrester (2017) noted that digital knowledge-based management has recently emerged as one of the digital entrepreneurs with the most important responsibilities. Digital knowledge - based becomes imperative due to the fact that it is almost appearing impracticable to manage or upgrade all of this information content manually. The concept is not a passive responsibility but rather encompasses far more than just local listings management. Digital knowledge base consists of facts about your organization's people, products, and locations. It also includes the public information concerning your business, like your name, address, and phone number (NAP data), which then improves content, such as photos, descriptions, and menu items-information that is dynamic and changes often. Digital knowledge management vendors provide businesses with solutions to effectively manage all of the digital information about their business. If an entrepreneur is serious about making sure customers get accurate information about his/her brand, when and where they need it, then such an entrepreneur is actively managing his/her digital knowledge. Thus, digital knowledge management is concerned with the use of data a company has, to determine what data it needs to solve problems and drive strategy. Therefore, an effective knowledge management solution should support internal social networks that people can use to connect with each other. If business improvement is the ultimate goal of digital transformation, effective knowledge management is what' is going to pave the way there.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Digital entrepreneurs are people who have the ability to track down all the authoritative sources of knowledge about a brand, people, products, events and locations from within your organization. This could be an easy job at a small company, but it could become a huge undertaking for large corporations. It would likely require conversations with departments such as Marketing, IT, Legal, Facilities, Store Operations and others. It is no small feat to identify and find all the public facts about a business that is relevant to customers. Digital knowledge management saves time which is worth the investment. At the same time, it equally puts the company's brand in a position that would address new information needs and opportunities, as they arise. An organization such as Yext is already into digital knowledge based. For example, Yext, through its digital knowledge based, discovered in 2006 alone that its customers generated 334 million phone calls and 622 million requests for driving directions from third-party resources. Customers are not just looking for up driving directions by chance, but it is believed that they have strong intent in searching for how to get to your business; they have strong intent to go, and you want them to be able to find you. Thus, correct information everywhere is therefore needed to drive customers to your business, and ultimately improves your bottom line. From the above, it becomes crystal clear that digital entrepreneurship is greatly affected by the quality of digital knowledge based available to them. The better the quality of the digital knowledge based, the higher the success of the digital entrepreneurship.

- **Digital Business Environment:** From entrepreneurship perspectives, environment refers to external and internal conditions that affect the business. It is a condition, situation, or factors in the surrounding that affect or influence entrepreneurs. Entrepreneurs interact with the environment all the time. Therefore, digital business environment is best described as those technological factors and supports that tend to influence and support digital entrepreneurship. Environment changes from time to time; therefore, environment is full of uncertainties. However, it provides opportunities as well as threats to an entrepreneur's business. So, digital entrepreneurs must always analyze and understand the environment he/she is operating in, and by analyzing and understanding the environment, an entrepreneur will also be able to know his/her business's strengths and weaknesses. Technological factor is one of the aspects of the business environment. It is actually required to increase process efficiency, minimize cost, invent new designs, innovate and effectively use resources. For example, with ICT, digital entrepreneurs can have access to new knowledge, new processes of production, new and faster information flow and new strategy and better decision making.
- **Digital Skill:** Generally, skill is described as the capacity or ability to do something. It is the focus for analytical research (Green, 2011). It is seen as the ability one possesses or acquires mostly from training which enables him to perform his task. Therefore, skill is ability, and ability is a skill. Skill is the expertise in doing something or expertise needed to perform a task. According to European Union (EU) Skills Panorama 2014 (2015), entrepreneurship is an individual's ability to turn ideas into action. It includes creativity, innovation and risk- taking, as well as the ability to plan and manage projects in order to achieve the stated objectives. It is seen as vital to promoting innovation, competitiveness and economic growth. Fostering entrepreneurial spirit supports the creation of new firms and business growth. Basically, the OECD did identify three fundamental skills entrepreneurs needed for effective functioning. These skills include:
    - **Technical:** Communication, environment monitoring, problem solving, technology implementation and use, interpersonal and organizational skills.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Business Management:** Planning and goal setting, decision making, human resources management, marketing, finance, accounting, customer relations, quality control, negotiation, business launch, growth management and compliance with regulations skills.
- **Personal Entrepreneurial:** Self-control and discipline, risk management, innovation, persistence, leadership, change management, network building, and strategic thinking.

From the above, it is very clear that the type of entrepreneurial skills needed by the digital entrepreneurs is that of technical skill, which they required to perform the core operations in digital organization. It entails the use of technological tools, techniques and procedures, to function in their digital field. For example, internet skill, computer repair skill, innovative and creative skills etc. The quality of these entrepreneurial skills possessed by the digital entrepreneurs goes a long way to determine the type of success the entrepreneur would achieve.

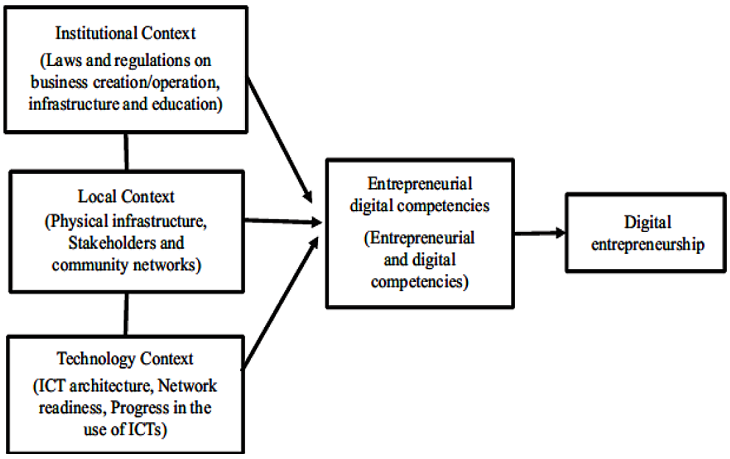
- **Digital Mindset:** Entrepreneurial mindset refers to a specific state of mind, which orientates human conduct towards entrepreneurial activities and outcomes. Individuals with entrepreneurial mindsets are often drawn to opportunities, innovation and new value creation. Practically, entrepreneurs are all different with different mindsets that contribute to their success. These mindsets have to do with their individual personalities or characteristics, in relation to the field in which they have chosen to work. As pointed out by Hessinger (2018), entrepreneurs have about ten mindsets that actually make then successful in the areas of their endeavours. For example, they have the mindset on reaching out to customers first, finding a new market for an existing product, using networking to build their business, giving without expecting a return, keep control of their vision, understand the power of brand, focus their energy on what is good for their businesses, always maintain quality control, set their product apart and take ownership. Therefore, digital entrepreneurs should strive for those entrepreneurial mindsets that could make them successful in their digital field of business.
- **Digital Infrastructure:** the study by Nambisan (2016) pointed out that one factor that affects digital entrepreneurship in the 21st century is the digital infrastructures. This suggests that digital infrastructures are strongly associated with successful digital entrepreneurship. The author described digital entrepreneurship as digital technology tools and systems (e.g., cloud computing, data analytics, online communities, social media, 3D printing, digital makerspaces, etc.) that offer communication, collaboration, and/or computing capabilities to support innovation and entrepreneurship. Aldrich (2014) and Delacroix, Parguel & Benoit-Moreau (2018) asserts that digital infrastructures such as cloud computing, data analytics, online communities, social media, 3D printing, and digital makerspaces have significantly affected entrepreneurship in the form of democratization of entrepreneurship. Accordingly, Hatch (2013) affirmed that cloud computing, digital makerspaces, and data analytics have made it possible for new ventures to cost- effectively construct and test novel concepts, involving a larger set of potential customers, thereby showing the capability to support end-to-end entrepreneurial activities. A good infrastructure for incubators and corporate accelerators, funding programs for start-ups, and targeted investment in research and development, are the prerequisites for pioneering new developments (Denison, 2017). Finally, good digital infrastructures would bring about successful entrepreneurship.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Empirical Review

Authors have argued that digital entrepreneurship is driven or determined by certain key variables. However, these variables are yet to be properly identified. It is one of the main objectives of this present study to properly and effectively identify these variables, and then link them with digital entrepreneurship, while explaining how these variables affect successful digital entrepreneurship. With respect to this, Forrester (2017); Nambisan (2016); Ngoasong (2017) have made frantic attempts to determine what kind of variables predict a successful digital entrepreneurship. For example, Nambisan (2016) claimed that local context in the form of physical infrastructure affect digital entrepreneurship. However, the study failed to be specific about digital infrastructures. Also, Aldrich (2014) asserts that digital infrastructures such as cloud computing, data analytics, online communities, social media, 3D printing, and digital makerspaces have significantly affected entrepreneurship in the form of democratization of entrepreneurship. In another related development, Hatch (2013) affirmed that cloud computing, digital makerspaces, and data analytics have made it possible for new ventures to cost effectively construct and test novel concepts involving a larger set of potential customers, thereby showing the capability to support end-to-end entrepreneurial activities.

Ngoasong (2017) emphasized on entrepreneurial digital competencies. He argued that small digital businesses require digital competencies to be successful. Thus, digital competencies are referred to as digital skills, and are believed to be strongly related to a successful digital entrepreneurship. Finally, Conigliaro (2017), in his presentation, reported that digital knowledge base, digital business environment, digital skill and digital mindset, are the core pillars that can foster successful digital entrepreneurship. This has been highlighted by the digital entrepreneurship scoreboard in 2015. Hence, this paper proposed a strong relationship between digital knowledge-based, digital business environment, digital skill, digital mindset, digital infrastructure and successful digital entrepreneurship.



MODELS OF DIGITAL ENTREPRENEURSHIP

Ngoasong Model (2017)

In order to explain digital entrepreneurship, Ngoasong (2017) developed a model called entrepreneurial digital competencies. The major aim of the model is to demonstrate the importance of digital competence in the development of digital entrepreneurship. The model depicts the link between context, competencies and outcomes. The research framework suggests that the influence of context on digital entrepreneurship is mediated by entrepreneurial digital competencies (EDCs). Also, the framework is applied to examine how digital entrepreneurs use EDCs to either discover or create entrepreneurial opportunities and make entry choices and post-entry decisions, to overcome context-specific challenges, using Cameroon as an empirical setting. However, this model failed to take cognizance of key factors such as digital knowledge-based, digital business environment, digital skill, digital mindset and digital infrastructure in the development of successful digital entrepreneurship. It should be stressed that these factors are very crucial and must not be excluded in any entrepreneurship study of this nature. For example, Obeng (2010) observed that the need to create an enabling environment that promotes and encourages entrepreneurial activities is a crucial one. While Lucky (2013) argued that studies in entrepreneurship development that failed to consider environment, should be regarded as incomplete.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

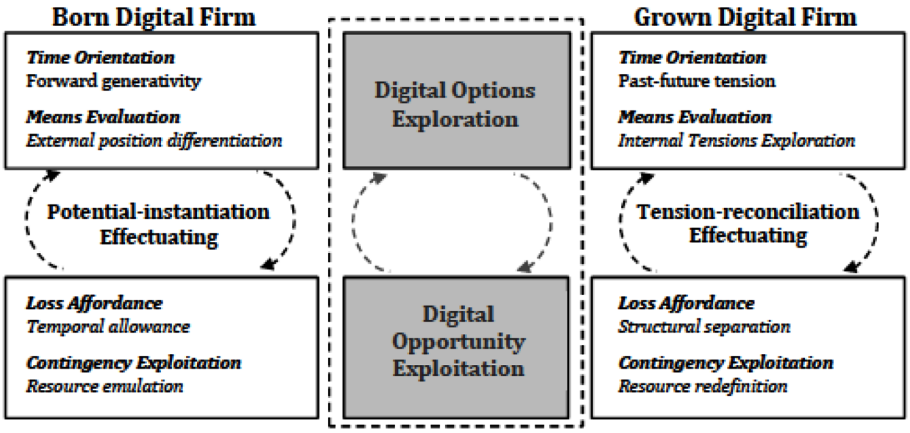


Figure 1. Ngoasong, (2017)

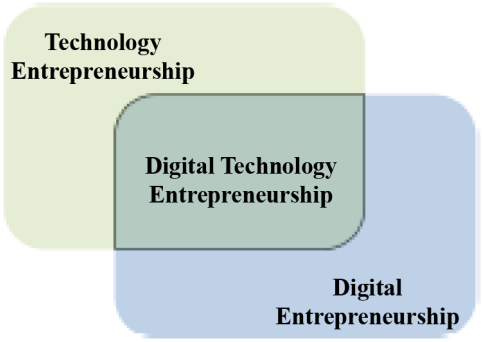
Leong, Pan and Liu Model (2016)

To also understand the concept of digital entrepreneurship, Leong, Pan & Liu (2016) developed a digital entrepreneurship model called digital entrepreneurship of born digital and grown digital firms. The model tends to differentiate between born digital firm and grown digital firm. They claimed that born digital firms are forward generative, while grown digital firms are past-future tension. At the middle of their relationship are digital options exploration and digital opportunity exploitation which affect each other accordingly. There are equally potential-instantiation effectuating and tension-reconciliation effectuating which revolve round to affect both born digital firm and grown digital firm accordingly. Effectuation describes a process of entrepreneurial actions based on the logic of entrepreneurial expertise and a dynamic and interactive process of creating new artifacts in the world (Sarasvathy 2008). However, Leong, Pan & Liu (2016) appear to be silent about the key factors such as digital knowledge-based, digital business environment, digital skill, digital mindset and digital infrastructure in the development of a successful digital entrepreneurship.

Figure 2. Digital Entrepreneurship of born digital and grown digital firms



EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Giones and Brem Model (2017)

Giones & Brem (2017) developed a model of digital entrepreneurship which they described as a conceptual representation of a new type of technology entrepreneurship: digital technology entrepreneurship. The author's model describes the change in the meaning of "technology" as a continuum between the extremes represented by the commercialization of the latest scientific breakthroughs (e.g., a new material like graphene) and the latest application for smartphones (e.g., a new food delivery app). The conceptual model demonstrates the overlap between technology entrepreneurship and digital entrepreneurship. The overlap is caused by digital entrepreneurship. They argued that the concept of digital technology entrepreneurship is a combination of elements of technology and digital entrepreneurship. It is on this basis that the authors described technology entrepreneurship to include specific aspects related to this specific form of entrepreneurship: digital technology entrepreneurship is focused on the identification and exploitation of opportunities based on scientific or technological knowledge, through the creation of digital artifacts. Digital technology entrepreneurs build firms based on technologies on one hand, and on services on the other hand. Just like the previous model, this model was silent about the key factors such as digital knowledge-based, digital business environment, digital skill, digital mindset and digital infrastructure, in the development of successful digital entrepreneurship.

Figure 3. Conceptual representation of a new type of technology entrepreneurship-Digital technology entrepreneurship

THEORETICAL FRAMEWORKS

One of the most important and relevant theories that can guide the understanding of digital entrepreneurship is knowledge-based theory. This theory is one of the theories associated with the Resource-Based View of the firm (RBV) initially promoted by Penrose (1959). Knowledge-based theory became popular due to the belief that resource-based view of the firm (RBV) does not go far enough to explain and differentiate knowledge. For instance, Resource-Based View of the firm (RBV) failed to distinguish between different types of knowledge-based capabilities; rather it only recognizes the important role of knowledge in firms. Accordingly, RBV only specifically treats knowledge as a generic resource, rather than having special characteristics. Unfortunately, this is not enough to explain the understanding of digital entrepreneurship. It is believed that Knowledge-Based View (KBV) of the firm is a recent extension

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of the RBV of the firm. It is accepted to be adequate to the present economic context of digital world. According to Curado (2006), KBV of the firm has attracted great interest, as it reflects that academia recognizes the fundamental economic changes resulting from cumulative and availability of knowledge in the past two decades.

In order to effectively guide the understanding of digital entrepreneurship, an emerging theory such as Knowledge-Based theory is required. Digital entrepreneurship is part of the Information and Communication Technology (ICT) that is shaping the world. Information technologies plays a crucial role in the knowledge-based view of the firm, in that information systems can be used to synthesize, enhance, and expedite large-scale intra- and inter-firm knowledge management (Alavi & Leidner 2001). Also, it is believed that heterogeneous knowledge bases and capabilities among firms are the major determinants of sustained competitive advantage and superior corporate performance, instead of RBV. The sustainability of digital entrepreneurship is determined by the amount of knowledge the digital entrepreneurs possess. Apart from that, disseminating the information equally depends on the knowledge of the person. Knowledge-Based theory is a theory that is relevant in linking knowledge to digitalization.

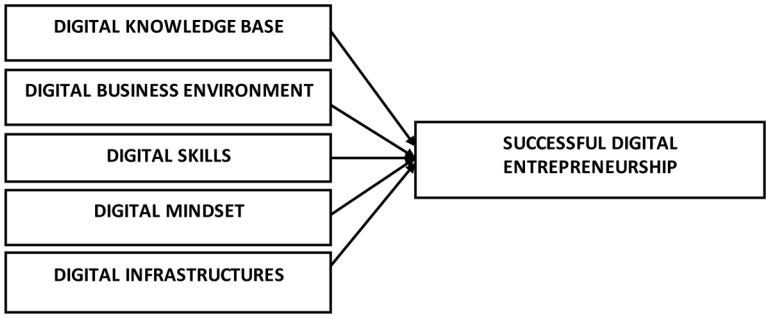
KBV posits that knowledge is the most strategically significant resource of the firm and that knowledge is embedded and carried through multiple entities, including organizational culture and identity, policies, routines, documents, systems, and employees. In the digital entrepreneurship field, knowledge is the most important and relevant resource as well as the only service they offer to their clients. Therefore, knowledge would help the digital entrepreneurs to grow, expand and sustain their business in the 21st century.

Digital Entrepreneurship and Developing/Emerging Economies

The conceptual framework was developed based on the peculiar nature of the developing countries which include Saudi Arabia. According to Ngoasong (2017), advancements in digitization, and the development of ICTs is creating opportunities for new type of entrepreneurial activities in emerging economies. Unfortunately, there are very few international business studies with theoretical models to understand and guide the nature of digital entrepreneurship in developing/emerging economies. Thus, the proposed conceptual model of this present study becomes very relevant in this respect.

Developing/emerging economies are often characterized by slow economic growth, low human capital index, low standard of living, low or middle per capita income, less developed industrial base, lack of rapid development in terms of industrialization and infrastructures etc. Saudi Arabia may not be excluded from this. There are countries that have not achieved a significant degree of industrialization relative to their populations, and have, in most cases, a medium to low standard of living. There is a strong association between low income and high population growth. Developing countries differ from the developed countries, because they still rely primarily on agriculture, have made less impressive gains in infrastructure and industrial growth, and are experiencing low or middle incomes and slow economic growth (Reynolds, 2017).

One greater focus of digital entrepreneurship is the creation of new enterprises. It presents and provides huge opportunities for potential young entrepreneurs through the creation of new ventures. The new enterprises created by digital entrepreneurship covers all new enterprises and existing firms that have been "transformed" or converted, and that create economic and social value through digital technologies. The industry has a very huge capacity to absorb a large and huge population of young people who are ready to become entrepreneurs. This is in line with the crucial and pressing need of many developing countries; which is to provide employment for their many unemployed youths, who have among them



EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

those that are graduates from their various tertiary institutions (Lucky, 2015). These young entrepreneurs would in time create new businesses that would hire employees. They create jobs and these economic opportunities uplift and support communities by increasing the quality of life and overall standard of living (Sappin, 2016). Achieving this objective requires that these emerging/developing economies take into account the variables presented by the conceptual model in figure 1. It implies that variables such as digital knowledge based, digital business environment, digital skill, digital mindset and digital infrastructures should be considered for successful digital entrepreneurship in emerging/developing economies.

Secondly, the model provided in this paper would boost development by promoting commerce and regional economic integration. You may ask how? It is very possible because of technology which digital entrepreneurship depends on. Digital entrepreneurship is the creation of new venture opportunities presented by new media and internet technologies; with digital entrepreneurship, small entrepreneur-led businesses in developing countries would have opportunities to expand into regional and global markets. According to (Sappin, 2016), whenever these new digital businesses export goods and services to other regions or countries, they contribute directly to a region's productivity and earnings. There is no doubt, this increase in revenue strengthens an economy and promotes the overall welfare of its population. It has been observed that economies that trade with one another are economically better off. Also, digital entrepreneurship is an easy way to engage in regional and international trade, which in turn promotes investment in regional transportation and infrastructure, and then strengthens economies. Countries such as the United States, China etc. are greatly benefiting from this. Foreign trade, according to some estimates, is responsible for over 90 percent of the world economic growth.

Finally, the conceptual framework emphasizes on factors such as digital knowledge base, digital business environment, digital skill, digital mindset and digital infrastructure. Unfortunately, many developing countries lack all these factors needed for the development of successful digital entrepreneurship. There is no doubt, digital entrepreneurs bring new ideas to life in a digital way; however, their flourishing condition depends on key factors aforementioned above. For example, digital entrepreneurs need education and training to enable them possess the required digital skills for the jobs. The government can play a major role in this aspect, by providing them with training and by so doing, they can raise the human capital index of their countries.

Figure 4. Developing a conceptual framework to examine and guide the understanding of a successful digital entrepreneurship development in the 21st century.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

This paper examined digital entrepreneurship with particular attention to developing/emerging economies. It identified and discussed the key variables needed to develop and promote successful digital entrepreneurship. Therefore, variables such as digital knowledge - based, digital business environment, digital skill, digital mindset and digital infrastructures, were identified and the extent and how they contribute to the development of a successful digital entrepreneurship in developing/emerging economies was equally discussed. Evidence from the previous studies (Giones & Brem, 2017; Leong, Pan & Liu, 2016; Ngoasong, 2017; Sappin, 2016) helped to establish a strong correlation between identified factors and their contributions to the successful development of a digital entrepreneurship particularly in developing/emerging economies.

From the ongoing, this paper provided two major contributions to practice and research in the area of digital entrepreneurship. First and foremost, this paper documented the relevance of digital entrepreneurship as an area of inquiry within entrepreneurship and elucidated the potential implications of such research for innovators and entrepreneurs in industries across the digital spectrum.

Secondly, the paper provided a conceptual framework for better understanding and the relationships that exist between different dimensions and components that determine successful digital entrepreneurship in this 21st century. These variables arguably greatly influence successful digital entrepreneurship. In so doing, practitioners and academia will not neglect the relevant factors or variables in their study of digital entrepreneurship. Conclusively, digital entrepreneurship, as an emerging area of entrepreneurship discipline, is creating opportunities for new types of entrepreneurial activities in developing/emerging economies; it however lacks a theoretical model to guide its understanding in the developing/emerging economies. This is therefore being taken care of in this present paper.

Chapter 16
Leading Anywhere Workers:
A Scientific and Practical Framework

Christianne T. Varty

Thomas A. O'Neill
University of Calgary, Canada

Laura A. Hambley
Work EvOHlution, Canada

ABSTRACT

As organizations continue to adopt anywhere working, it remains critical to address the leadership and management challenges of leading anywhere workers. Through interviews with experienced anywhere leaders from several different organizations, this chapter clarifies how leaders meet and overcome those challenges. Building on existing behaviorally-based models of leadership, the authors propose a hierarchical taxonomy of anywhere leadership effectiveness behaviors. The taxonomy is composed of four metacategories (Relationships, Flexibility, Productivity, Culture) and fourteen subcategories, which detail the behavioral capabilities necessary for anywhere leadership. In doing so, this chapter provides a common framework for understanding anywhere leadership, lays the foundation for the assessment and development of anywhere leaders, and is a starting point for further research.

INTRODUCTION

The globalization of work coupled with rapid technological advancements have contributed to the rise of anywhere working, also known as telework, mobile, agile, or distributed work. Increasingly, organizations also leverage diverse expertise across geographies by utilizing virtual teams – physically and temporally dispersed work teams that communicate primarily through electronic media (Minton-Eversole, 2012). These various arrangements mean that employees are no longer tied to the traditional office or assigned workstations, which brings benefits such as freedom from the restrictions of a nine-to-five workday and

reduced costs and time associated with commuting, travel, and relocation (Cascio & Shurygailo, 2003). However, this shift also raises complex challenges for organizations, particularly for the leadership and management of people (Biermeier-Hanson, Liu, & Dickson, 2015).

Leadership is a foundational cornerstone of an effective modern workforce, but recent research has indicated that traditional leadership is more difficult from a distance and the leadership challenges are more extensive (e.g., Hambley, O'Neill, & Kline, 2007a; Purvanova & Bono, 2009). Mainstream models of leadership were not designed with anywhere workers in mind and many of the key behaviors (e.g., motivating employees, setting a vision) may be driven by, or rely on, face-to-face contact (Avolio, Kahai, & Dodge, 2000). At the same time, research into the management capabilities necessary for anywhere work is lacking (Blount, 2015). Inefficiencies in typical uses of e-mail, videoconferencing, text messaging, and other communication media draw from an organization's bottom line due to mismanaged time, frustration, isolation, and turnover. Increasing reliance on these modes of communication requires managers find ways to effectively organize and direct employees, delegate tasks, and manage workflow.

The current chapter reports on recent research examining the behavioral capabilities necessary for effectively leading anywhere workers. Specifically, the authors develop and propose a taxonomy of leadership and management behaviors. Past research has distinguished between leadership behaviors (e.g., change processes such as developing a vision and empowering employees to support that vision) and management behaviors (e.g., behaviors focused on daily operations including planning, organizing, and coordinating others; Kotter, 1987; Lunenburg, 2011). Instead of focusing on this distinction, the current research uses the term *anywhere leadership* to refer to the range of leadership and management behaviors. In doing so, the authors do not aim to propose a new *type* of leadership but use this term to refer to capture the broad set of behaviors that fall under the umbrella term anywhere leadership. Moreover, the authors suggest that successfully leading anywhere workers will depend on the integration of leadership and management behaviors adapted to the anywhere working context. Accordingly, the terms leadership and anywhere leadership are used throughout the chapter.

The usefulness of this proposed taxonomy is threefold. First, a working taxonomy provides a common framework for understanding anywhere leadership. Second, the taxonomy is based on a large and diverse database of effectiveness behaviors, which practitioners and organizations can leverage to inform leadership development. Third, the taxonomy provides a starting point for the assessment and development of leaders in organizations. Overall, the objective of this chapter is to advance existing understanding of the behavioral capabilities necessary for leading the anywhere workforce and providing scholars, organizations, policy makers, and leaders with a framework and best practices.

BACKGROUND

As technology has developed and the employment of knowledge workers has grown, many employees have gained the ability to work anytime and from anywhere (Blount, 2015). This chapter uses the term anywhere work to describe this flexibility. Also known as teleworking or distributed work, anywhere workers can do their jobs away from the conventional office while communicating with colleagues and accessing organizational resources through computer-based technology (Nilles, 1994). The recent trend towards virtual teams dispersed across locations, time zones, and cultural boundaries (Bell & Kozlowski, 2002) constitutes another type of anywhere work. To manage the challenges of dispersion, team members must leverage electronic communication technologies to work collaboratively from anywhere. A final

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

type of anywhere work refers to an individual's job characteristics. Employees increasingly depend on distributed contacts (e.g., colleagues, clients, suppliers, freelancers) and rely on electronic communication regardless of whether their organizations are formally utilizing virtual teams or telework arrangements (Orhan, 2014). In fact, recent estimates indicate that approximately 30% of college-educated professional employees in the United States engage in anywhere working (see Noonan & Glass, 2012), and over half of multinational organizations use virtual teams (Minton-Eversole, 2012). Other studies assert that many employees are away from their desks up to half of the time (Global Workplace Analytics, 2016), due to meetings, travel, use of satellite offices, or remote work (e.g., home, coffee shops, client spaces). These findings show that working from anywhere is a key feature of the modern workplace.

Organizations have responded to these changes by increasingly designing workplaces compatible with anywhere work, as well as implementing communication and collaborative technologies. Despite these adaptations, both organizations and researchers have largely overlooked whether the behavioral capabilities have shifted. This is both surprising and concerning given the prevalence of these ways of working and the leader's role in facilitating the success of the anywhere workforce (e.g., Bell & Kozlowski, 2002; Gajendran & Joshi, 2012; Golden & Veiga, 2008; Hambley et al., 2007a). Moreover, it appears that leadership depends on the specific context and characteristics of the virtual or anywhere work (Gajendran & Joshi, 2012; Golden & Veiga, 2008; Hoch & Kozlowski, 2014; Joshi, Lazarova, & Liao, 2009; Kahai, Huang, & Jestice, 2012). This highlights the need for a stronger understanding of how leaders currently manage the challenges of anywhere work while continuing to perform important roles such as motivating and developing employees, coordinating efforts, and managing cross-cultural differences (O'Neill, Lewis, & Hambley, 2008).

Leaders face numerous challenges when it comes to anywhere work. First, the lack of in-person exchanges between anywhere team members and leaders complicate the development of a seamless and coherent work unit. Leaders must also help employees overcome feelings of isolation or disconnectedness from colleagues (Gibson & Gibbs, 2006, Kirkman, Rosen, Gibson, Tesluk, & McPherson, 2002). Second, anywhere work is characterized by ambiguity. Leaders face the challenge of effectively communicating with different individuals from a distance (Mukherjee, Lahiri, Mukherjee, & Billing, 2012) and adapting to new technology (Qureshi & Vogel, 2001). Third, monitoring anywhere workers' performance requires new methods that do not involve face-to-face contact (Blackburn, Furst, & Rosen, 2003; Hertel, Geister, & Konradt, 2005). As such, leaders must learn to effectively manage by objectives instead of presenteeism (Konradt, Hertel, & Schmook, 2003). Moreover, minimizing process losses inherent in the use of electronic communication media remains one of the leader's fundamental challenges (Connaughton & Daly, 2004). Fourth, spanning multiple geographic boundaries raises new challenges (e.g., time zone management, cultural diversity), which increase the difficulty of becoming an efficient and cohesive work team (Armstrong & Cole, 2002). Across cultural boundaries, for example, it is more likely that self-regulation methods, power distance, uncertainty avoidance, collectivistic orientation, and assertiveness will differ. (Bell & Kozlowski, 2002; Javidan, Dorfman, de Luque, & House, 2006). Accordingly, anywhere leaders must manage these differences, and translate them into process gains (through complementary knowledge sharing). Fifth, the inherent reliance on technology in anywhere work presents an overarching challenge; the leader's ability to appropriately match the communication media to the task (Riopelle et al., 2003) is foundational to managing the other challenges of anywhere work. In fact, according to one perspective, research has failed to keep up with the organizational use of electronic technologies and little is known about the impact on leadership (Avolio, Sosik, Kahai, & Baker, 2014). For example, maintaining employee engagement and focus from a distance poses a seri-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ous challenge. Distractions from the Internet and other applications have led to an increased prevalence of cyberslacking, or using the Internet for non-work purposes while being paid (Lim, 2002), although some personality traits are more strongly associated with cyberslacking than others (O'Neill, Hambley, & Bercovich, 2014; O'Neill, Hambley, & Chatellier, 2014).

To understand how leaders can manage the litany of challenges, studies have attempted to apply current knowledge of traditional hierarchical leadership to the distributed context (e.g., Avolio & Kahai, 2003; Hambley, O'Neill, & Kline, 2007b; Zigurs, 2003). In particular, there has been a strong focus on transactional and transformational leadership (Hambley et al., 2007b; Hoch & Kozlowski, 2014; Howell, Neufeld, & Avolio, 2005; Kahai & Avolio, 2008; Purvanova & Bono, 2009). Transactional leadership involves the exchange of rewards or punishment for desired behavior, whereas transformational leadership is focused on inspiring and motivating followers to achieve higher performance (Bass & Avolio, 1993). Substantial research has supported the effectiveness of both leadership styles in face-to-face work groups (Judge & Piccolo, 2004), but transformational leadership, in particular, has been linked to stronger performance (Lim & Ployhart, 2004) and enhanced group cohesion (Jung & Sosik, 2002). However, studies suggest that transformational leadership requires greater effort and is more difficult from a distance (Purvanova & Bono, 2009). Moreover, the effects of transformational leadership are attenuated by increases in virtuality (Hambley et al., 2007b; Hoch & Kozlowski, 2014; Howell et al., 2005). One study found that a related concept referred to as shared leadership – decision-making characterized by collaboration and shared responsibility (Day, Gronn, & Salas, 2004) – positively influenced performance, independent of virtuality (Hoch & Kozlowski, 2014). This led those authors to conclude that shared team leadership may be an effective alternative to traditional hierarchical leadership for managing in environments characterized by geographic dispersion, cultural diversity, and reliance on electronic communication. However, Avolio and colleagues (2014) have noted that "the shift in locus from individual to a shared or collective leadership in most organizations remains a stretch goal as opposed to reality" (p. 126). This is because modern organizations are still organized by hierarchies according to business function or service, and therefore the sharing of leadership authority runs counter to the organization's design. Thus, it remains necessary to understand how existing formal leaders meet and overcome the challenges of anywhere work.

A second line of research has studied the role of leader-member exchange (Graen & Scandura, 1987; Graen & Uhl-Bien, 1995). Leader-member exchange (LMX) considers the relationship between managers and subordinates and posits that both possess resources the other desires. For example, managers possess social support, consideration, and information, whereas employees can offer extra effort, goal commitment, or loyalty. High quality relationships are characterized by the reciprocal exchange of these resources (Liden, Sparrowe, & Wayne, 1997). Researchers have recently begun to consider the effects of LMX within anywhere working relationships and outcomes such as job performance, satisfaction, and organizational commitment. One study found that employees whose work was extensively virtual demonstrated the highest levels of performance, satisfaction, and commitment when they reported high-quality relationships with their leaders (Golden & Veiga, 2008). Another showed that high-quality LMX was most important for those employees who relied heavily on electronic communication (Hill et al., 2014). In a field study of 40 globally distributed teams, Gajendran and Joshi (2012) observed that the teams only successfully leveraged diverse expertise and achieved innovative problem solving when virtual team members were willing to contribute and offer their perspectives. That study also showed that high-quality LMX relationships positively influenced innovation, suggesting that leadership offers a way to overcome the challenges of virtual teamwork.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

While this is an important finding, it is still unclear exactly *how* leaders develop high quality relationships with their subordinates. For example, how do leaders establish personal connections, develop trust, or even effectively delegate from a distance? The majority of existing research is not well positioned to provide a clear answer to these questions, because most scholars have not taken a behavioral approach to understanding leadership of anywhere workers. Instead, researchers have largely focused on mapping existing theories to anywhere work without explicitly considering the differences between anywhere work and more conventional forms of work. Arguably, anywhere leadership constructs and their measurement should incorporate relevant new terms and concepts, especially related to electronic communication use. However, before assessments can be tailored to this type of leadership, it is critical to clarify the behaviors through interviews with anywhere leaders who have experience leading and managing employees who telework, work in virtual teams, and otherwise work away from the office. Without an understanding of what these leaders actually *do* (i.e., behaviors) to be effective, it is very difficult to provide guidance, training, and coaching.

This chapter aims to identify and classify leadership and management behaviors that experienced leaders view as fundamental to leading anywhere workers. In doing so, this chapter goes beyond describing the challenges of anywhere work (e.g., Kirkman et al., 2002) or comparing anywhere and face-to-face leadership (e.g., Rosen, Furst, & Blackburn, 2006; Zimmerman, Wit, & Gill, 2008). Although these are important first steps, they are unlikely to be very helpful for organizations or leaders (O'Neill et al., 2008). Instead, the current research proposes a taxonomy of effectiveness behaviors. This is in line with the long history (Halpin & Winer, 1957; Kahn & Katz, 1952; Stogdill & Coons, 1957) and ongoing perspective that behaviors are the key mechanism for transmitting leadership. Eberly, Johnson, Hernandez, and Avolio (2013) recently argued that the leader's traits, affect, cognition, and behaviors are each mechanisms of leadership that interact to exert influence. Behaviors, though, are the primary mechanism because they can be *observed by others* and provide interpersonal cues about the leader's traits, affect, and cognition. That is, "behaviors are the primary carrier of leadership between the loci and therefore drive interactions that shape leadership" (p. 438).

Some researchers have offered contributions through a behavioral approach to virtual team leadership (e.g., Hambley et al., 2007a; Malhotra, Majchrzak, & Rosen, 2007). Hambley et al. (2007a) interviewed existing virtual team leaders and members to identify four overarching themes: leadership critical in virtual teams, virtual team meeting effectiveness, personalizing virtual teamwork, and learning to effectively use different media. Perhaps more importantly, those authors presented specific behavioral examples from the interviews (e.g., "leader must establish acceptable ground rules for use of e-mail"), which provide insight into how leaders manage the daily challenges of leading from a distance. In another field study on the effective practices of virtual team leaders, Malhotra et.al. (2007) collected interview and survey data from globally distributed team leaders and members who were part of short-term project teams. They identified six leadership practices (establish and maintain trust through the use of communication technology; ensure diversity in the team is understood, appreciated, and leveraged; manage virtual work-cycle and meetings; monitor team progress through the use of technology; enhance external visibility of the team and its members; and ensure individuals benefit from participating in virtual teams). They also presented specific behavioral examples to explain how leaders enacted these practices (e.g., "use check-ins during meetings to ensure everyone is engaged and heard").

These studies laid the groundwork for behaviorally-focused research of leadership in distributed contexts; however, they have several limitations. Both studies were focused specifically on virtual team leadership effectiveness, whereas the current research aims to incorporate the wider discipline of

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

anywhere leadership. This is a broader, all-encompassing concept suggested by the authors of the current chapter that includes virtual team leadership as well as leadership of any mobile or dispersed team member. In addition, Hambley et al. (2007a) only interviewed nine leaders and Malhotra et al. (2007) focused on short-term project teams, thereby raising questions regarding the generalizability to other leaders and other types of anywhere work. Finally, the concept of anywhere work has continued to evolve over the last decade. In particular, significant technological advancements (e.g., social media platforms, smartphones, integrated collaborative software programs) mean it is critical to revisit the behavioral capabilities of anywhere leadership.

Behaviorally-based models of leadership have a long history in the literature. Notably, studies from Ohio State University and the University of Michigan identified two categories of behaviors as central to effective leadership: task and relationship (Halpin & Winer, 1957; Kahn & Katz, 1952; Stogdill & Coons, 1957). Also known as Initiating Structure and Consideration, or Concern for Production and Concern for People (Blake & Mouton, 1982), this two-dimensional framework once dominated leadership research (Yukl, Gordon, & Taber, 2002). Initiating Structure or task-oriented behaviors are those used by the leader to help employees do their jobs, such as clarifying roles or establishing processes. Consideration, or relationship-focused behaviors are those actions that center on enhancing employee well-being, such as expressing appreciation or demonstrating support. Although mixed evidence led researchers to question the efficacy of these leadership dimensions, a recent meta-analysis from Judge, Piccolo, and Ilies (2004) supported the validity of these behavioral categories. Building on this work, Yukl and colleagues (2002) attempted to integrate the vast literature of behavioral leadership taxonomies (see Bass & Stogdill, 1990) to develop a "meaningful conceptual framework" (p. 15). Their proposed hierarchical taxonomy of leadership behavior contained three meta categories: task behavior, relations behavior, and change behavior. The former two categories encompassed the behaviors discussed above whereas the latter category, change behavior, was a new addition. This category captured behaviors centered on promoting growth, utilizing and encouraging creative problem-solving, and monitoring changes in the environment in preparation to adapt. Yukl and colleagues (2002) distinguished the categories based on the primary objective of the specific leadership behavior. That is, while leadership behaviors serve multiple purposes they are driven by a primary goal. For example, the objective of task behaviors is mainly to improve outcomes like performance and efficiency, the objective of relation behaviors is to develop commitment to the group and build trust, and the objective of change behaviors is to facilitate innovation and adapt to change. This categorization approach is useful for providing outcome-focused best practices for managers.

One relevant meta category of behaviors missing from the hierarchy is that of culture (e.g., Malhotra et al., 2007). Past research has shown that behaviors aimed at managing cultural differences and leveraging diverse perspectives are pertinent to leading anywhere workers for several reasons. Anywhere working enables the use of globally distributed team structures, often associated with innovation (Gibson & Gibbs, 2006). At the same time, the modern workforce is becoming increasingly diverse, and a strong business case is building for the inclusion of diverse perspectives (e.g., Hunt, Layton, & Prince, 2015). While crossing cultural boundaries and accessing diverse expertise is often cited as a key advantage of anywhere working, managing cultural differences requires additional leadership behaviors (Javidan et al., 2006). Diverse workers bring differing cultural values, assumptions, and perspectives on appropriate behaviors, which can complicate team functioning and performance (Armstrong & Cole, 2002; Cramton, 2001). The leader plays a key role in translating diversity into improvements in performance, decision making, and innovative thinking (Ang et al., 2007; Caligiuri & Tarique, 2012; Gajendran & Joshi, 2012).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

This requires behaviors such as adjusting one's communication style during and after cross-cultural interactions (Earley & Ang, 2003; Ang et al., 2007) and adapting to different cultural practices (Shaffer, Harrison, Gregersen, Black, & Ferzandi, 2006).

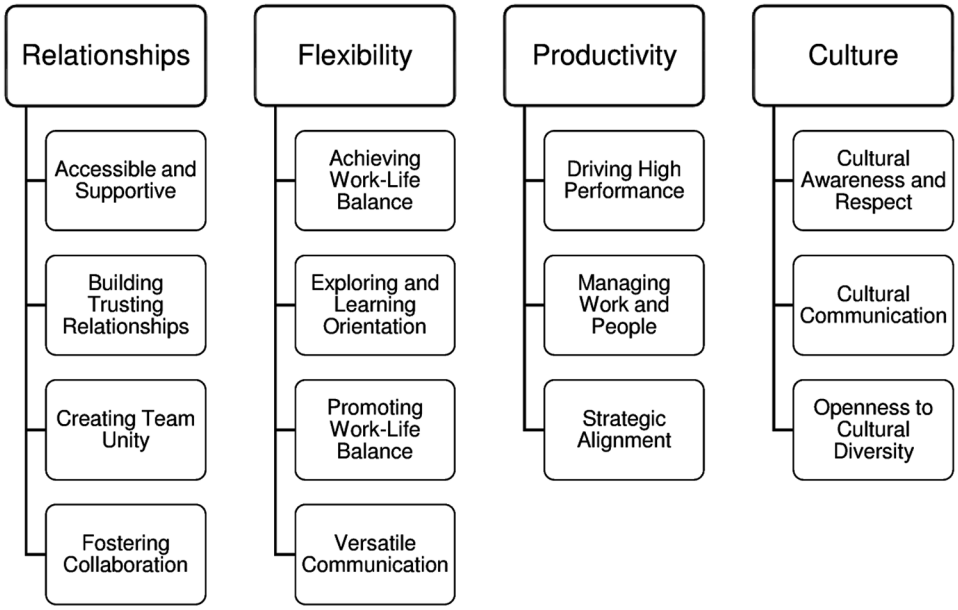
The current chapter incorporates Yukl and colleagues' (2002) leadership taxonomy and research on cross-cultural leadership capabilities (e.g., Earley & Ang, 2003; Caligiuri & Tarique, 2012) to propose a taxonomy of effectiveness behaviors. This extends work on virtual team leadership (Hambley et al., 2007a; Malhotra et al., 2007) to the broader range of anywhere workers, including teleworkers, part-time remote workers, employees working in mobile and campus environments, and virtual team members. Since the taxonomy is modeled after existing research, significant differences at the metacategory level were not expected, whereas differences were anticipated at the more granular levels of behavioral clusters and specific behaviors. For example, promoting a vision is a key behavior for all leaders (Yukl et al., 2002) but *how* a leader effectively communicates that vision via electronic communication media may not be captured in existing models. Without a taxonomy of specific behaviors needed for success, we are left with a limited theoretical understanding of the anywhere leadership performance domain. Moreover, to optimally train and develop leaders in the modern workplace, specific leadership and management behaviors must be catalogued, classified, and understood. The authors aim to address these issues in this chapter.

MAIN FOCUS OF THE CHAPTER

Research Method

The researchers interviewed 34 leaders from North America and Europe who had experience leading anywhere workers. This included leading employees working in different cities or countries, or working remotely from the same city. The leaders were recruited purposively through the networks of the research team and references from other participants. In an effort to capture the diverse experiences of leading anywhere workers, interviewees were drawn from 12 different organizations in a range of industries including energy, engineering, information/communication technology, financial services, and pharmaceuticals. All participants were currently leading anywhere employees or teams, with the exception of one participant who had recently returned to an individual contributor role but who had significant previous leadership experience and was therefore deemed suitable for participation. Leaders spanned a variety of roles and levels, i.e., the sample include front-line managers, middle managers, and senior leaders (e.g., vice presidents). The majority of leaders had led anywhere workers in multiple roles (65.0%) and had an average of 8.25 years of experiences ($SD = 5.61$). Twenty-nine leaders were based in Canada, four in the United Kingdom, and one in the Netherlands, and the majority (55.9%) were male. Interviews were conducted over the phone and typically ranged from 45-60 minutes. Detailed notes were taken during each interview, and interviews were recorded and transcribed.

Leaders were interviewed using the Critical Incident Technique (CIT; Flanagan, 1954). The CIT is an interview technique where individuals are asked to provide instances of high and low performance. Specifically, participants were asked to outline different situations in which they effectively and ineffectively led anywhere workers, describe the behaviors and actions taken in each situation, and specify the outcome (e.g., O'Neill, Goffin, & Gellatly, 2010). This method allows the researcher to observe differences in behaviors associated with different levels of performance. In addition to asking CIT ques-



EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tions, the researchers drew questions from a past interview study of virtual team leaders (Hambley et al., 2007a) and asked leaders to outright list and describe the behaviors and actions necessary for success when leading/managing anywhere workers.

Proposed Taxonomy and Framework

The authors developed the behavioral taxonomy by identifying and classifying behavioral statements from the interviews. First, a member of the research team extracted behavioral statements from the interview transcripts and notes to create a database of 680 unique statements. Two researchers then independently classified the first 200 behavioral statements by thematically organizing them into behavioral clusters. The researchers discussed their themes and decided on the number, name, and definition of the clusters that captured the statements (cf. Bownas & Bernardin, 1988) and then classified the remaining 480 statements into those clusters. They discussed all disagreements and made adjustments to the definitions in order to capture the nature of additional statements that were included. Finally, the researchers categorized the fourteen behavioral clusters into the four meta categories (Relationships, Flexibility, Productivity, Culture) to arrive at a preliminary hierarchical framework of effectiveness behaviors (see Figure 1). These procedures are in accordance with modern applications of the CIT (e.g., O'Neill et al., 2010). Below the findings are considered with respect to the meta categories, behavioral clusters, marker behaviors, and relevant past research.

Figure 1. Preliminary hierarchal framework of anywhere leadership effectiveness behaviors

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Relationships

The Relationships meta category captures relations-focused behaviors (Yukl et al., 2002) aimed at overcoming the challenges of limited face-to-face interactions. This meta category was defined by four behavioral clusters: Accessible and Supportive, Building Trusting Relationships, Creating Team Unity, and Fostering Collaboration. Each cluster is defined and discussed in connection with relevant past research. See Table 1 for key behaviors that leaders can implement to develop these capabilities.

- **Accessible and Supportive:** Makes him/herself accessible by being easy to get a hold of and retrieve information. Remains approachable, such that employees feel comfortable reaching out with questions and concerns. Is responsive, communicates regularly, and gets to know employees.

One major challenge associated with anywhere work is limited face-to-face interactions. This can slow communication and information flow and leave employees feeling isolated from their team, leader, or organization. The key to overcoming these challenges was conveying constant availability through a virtual "open-door policy" by keeping the "available" light turned on in collaborative software programs, using instant messaging, and responding to e-mails promptly. Consistent with previous research, leaders maintained constant communication via various communication media (Brake, 2006; Kayworth & Leidner, 2002). To prevent isolation and lessen the impacts of distance, they incorporated communication on a personal level through IM, "virtual coffee," and pausing to allow for a few minutes of personal conversation/personal moments.

- **Building Trusting Relationships:** Forms strong relationships with employees that are built on trust and rapport. Makes people feel important and valued. Communicates in a fair and consistent manner to all employees and is present and focused on interactions.

Research on the challenges of anywhere work has repeatedly stressed the importance, and difficulty, of building trust from a distance (Kirkman et al., 2002; Brahm & Kunze, 2012). This was reiterated by leaders in the current study. They described communicating with honesty and transparency, and tried to provide consistent messages to different people. These communication techniques have been emphasized in previous research (Clark, Clark, & Crossley, 2010; Malhotra et al., 2007), and building trust is a key leadership function that is heavily dependent upon frequency of communication (Staples & Cameron, 2004). Punctuality in virtual meetings and remaining focused during virtual communications were other approaches used to convey respect and build strong relationships. Finally, it is noteworthy that every interviewee stressed the importance of trying to meet employees face-to-face to establish a personal connection and build trust, especially with newly formed workgroups (cf. Hambley et al., 2007a). Though it is optimal for organizations to equip leaders for success by providing resources for some face-to-face interactions, at other times closely approximating face-to-face through video and integrated collaborative software was identified as an effective alternative.

- **Creating Team Unity:** Cultivates a powerful sense of team unity by learning the team's history and integrating new members. Builds strong social and emotional bonds among employees, recognizes individuals and shows appreciation, and makes it fun to be on the team.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

This behavioral cluster captures the leader's broader efforts to meet the challenge of developing a healthy distributed team environment. Leaders leveraged rich communication media (e.g., face-to-face or one-on-one video conference) to learn about existing relationships or team conflicts. This was a critical behavior since the electronic communication media relied on in anywhere work can facilitate misunderstanding and exacerbate team conflicts (Furst, Reeves, Rosen, & Blackburn, 2004). Leaders also created opportunities for team members to connect and work together on a semi-regular basis to prevent feelings of isolation from the work group. One leader expressed that setting up face-to-face working opportunities for her anywhere workers was valuable because individuals used the time to problem solve and to build personal connections which enhanced their long-term working relationships. This is consistent with Gibson and Manuel's (2003) recommendation that managers develop interdependencies among anywhere workers, and that they do so explicitly. Interdependency fosters team spirit (O'Neill et al., 2008) because members are accountable and dependent on each other. However, conflicts and performance issues must be addressed swiftly for this structure to enable strong team unity.

- **Fostering Collaboration:** Supports idea sharing and cooperation across locations, including with other teams or leaders. Identifies common ground among people in and outside of the team to accomplish goals. Builds alliances and connects employees in cross-department collaborations.

Paradoxically, although the ability to collaborate across geographies is cited as a key benefit of anywhere working (Peters & Manz, 2007), leaders described challenges with technology, time lags, and cultural differences that *hindered* effective distributed teamwork. To address some of these issues, leaders promoted collaboration by establishing processes for effective technology use (e.g., require meeting materials 24-hours in advance), preparing backup communication options, and facilitating schedule-sharing to help workers connect and reduce the impact of time zone delays. Leaders also took other actions such as virtually introducing employees to others in the organization, and organizing workspaces for closely located individuals to meet and solve problems in person. Regarding managing the impact of culture on collaboration, leaders discouraged the formation of sub-groups and "us versus them" attitudes especially for globally distributed workers. Although there is limited research on sub-groups within anywhere working teams (Gilson, Maynard, Young, Vartiainen, & Hakonen, 2015), the available literature does suggest that fault lines are readily developed across geographical boundaries (O'Leary & Mortensen, 2010). Leaders need to make sure these sub-groups identify with the team and its objectives rather than the sub-team. Indeed, according to Shapiro and colleagues, the salience of identification with the global team is the primary determinant of members' willingness to sacrifice and work hard for the group (Shapiro, Furst, Spreitzer, & Von Glinow, 2002).

Flexibility

The Flexibility meta category captures change-focused behaviors (Yukl et al., 2002) aimed at managing and embracing the dynamic and ambiguous nature of anywhere work. This meta category was defined by four behavioral clusters: Achieving Work-Life Balance, Exploring and Learning Orientation, Promoting Work-Life Balance, and Versatile Communication. Each cluster is defined and discussed in connection with relevant past research. See Table 2 for key behaviors that leaders can implement to develop these capabilities.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Marker behaviors of the Relationships meta category

Relationships **Accessible and Supportive**
Schedule "virtual coffee" to chat between formal meetings and check-ins.
Take a moment to allow for personal conversation or time to "catch up" during formal communications.
Communicate a virtual open-door policy by staying online in instant messaging software, responding to e-mails quickly, and reiterating your accessibility.
Communicate your accessibility by making your schedule available online to team members or by letting workers know the best time/way to contact you.
Respond to communications quickly to prevent feelings of isolation (i.e., acknowledge the receipt of e-mails even if you're still working on an answer).
Building Trusting Relationships
Be careful not to constantly miss or reschedule meetings with those at a distance, or anywhere workers may feel they are a lower priority than those who are in closer proximity or face-to-face.
Use communication media that approximate face-to-face as much as possible (i.e., videoconference), especially for difficult or important conversations.
Turn off your phone, e-mail, and instant message notifications during phone calls/video conference and pay attention. Do not multitask on distance calls.
Try to meet every employee face-to-face at least once to start building a relationship. Use this opportunity to begin to understand his/her body language and nuances in communication, which will be less obvious via electronic communication.
Record personal information that individuals share with you (birthdays, work anniversaries, other personal details) and deliberately bring up to help personalize conversation and prevent people from feeling forgotten.
Creating Team Unity
When visiting workers at other locations/when workers visit your location, plan activities outside of work (e.g., lunch, dinner, teambuilding activities) to help individuals connect with you and each other on a personal level.
Use technology to recognize anywhere workers and their contributions (e.g., on a team conference call, on the organization's social media page).
To prevent employees from disengaging during virtual meetings be enthusiastic, request contributions from each individual by name, and use interactive activities (e.g., prizes, games, online polling).
Take time to learn about and understand existing relationships between your staff members (anywhere and collocated). Accomplish this by interacting with both individuals and groups of workers at different locations via different media (face-to-face, conference call, videoconference).
When new team members join the work group, try to give them the opportunity to meet with others face-to-face. If face-to-face is not feasible, make sure to encourage both formal introductions and informal virtual meetings.
Fostering Collaboration
Introduce and connect likeminded groups/disciplines within the organization to help anywhere workers get to know and leverage the expertise available.
When trying to facilitate large-group virtual collaboration, first connect with and update workers individually and then pull into group meetings. Providing the opportunity for questions and understanding one-on-one can help everyone get up to speed quickly and smooth subsequent workflow.
Encourage and expect individuals to communicate with each other so you are not always relied upon as the "middle person" for communication.
If you lead people who largely work at other company locations, build relationships and alliances with leaders at those locations. Engage those leaders to help monitor and support your workers – and do the same for theirs.
Pay attention to "us versus them" attitudes that may develop between employees in different locations, or anywhere workers and those who mostly work in the office. Demonstrate and reinforce the value that all workers add in your everyday behavior and language to prevent sub-groups from developing and disrupting collaboration.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Achieving Work-Life Balance:** Maintains a healthy balance between work and life commitments.

Although anywhere work is often cited as a way to enhance balance, the impact of electronic media on work-life boundaries has come under recent scrutiny (Demerouti, Derks, Lieke, & Bakker, 2014; Gerdenitsch, Kubicek, & Korunka, 2015). This is relevant to leaders because electronic communication technology underpins anywhere work. Several interviewees described endless workdays in which a constant stream of e-mail and requests kept them tethered to their computer long after standard work hours. To overcome this, leaders intentionally scheduled non-work time in which they "signed off" from working remotely by shutting the home-office door and turning off work phones and computers. Leaders managing globally distributed workers experienced the added complication of 24/7 work across time zones. One leader's approach to managing this was to carve out specific times during the day to attend to e-mails or other communications. He explained this process to his staff to ensure they did not feel isolated or ignored. Lastly, leaders repeatedly pointed out that managing anywhere workers requires more work than traditional face-to-face leadership (Purvanova & Bono, 2009). One aspect of ensuring sufficient time and energy for success involved diligently managing the boundaries between work and life activities with the strategies described.

- **Exploring and Learning Orientation:** Open to a distributed work environment and willing to learn how to succeed in it. Is open to and accepting of change.

Anywhere working represents a massive shift regarding how and where work is done, as well as how it is evaluated. Leaders emphasized that success depended on remaining open to this dynamic nature, investing significant effort into learning how to adapt and embracing constant shifts in technology. For example, leaders must be open and willing to evaluate employees on the quality of deliverables, instead of on time spent. As well, leaders constantly reevaluated processes and consulted with others when seeking solutions for problems with communication or workflow. In fact, developing and maintaining a network of mentors and peers who understand the context was cited as critical. Regarding technology, leaders agreed that electronic media underpins successful anywhere work (Blount, 2015). They often revisited whether their current technology was adequate, reported constantly searching for new applications to support workers, and strived to provide workers with different options for communication (Workman, Kahnweiler, & Bommer, 2003). Further, leaders considered it their responsibility to train employees to effectively utilize different communication media (Maruping & Agarwal, 2004).

- **Promoting Work-Life Balance:** Encourages employees to seek a healthy work-life balance. Supports the use of strategies to achieve balance.

As described, leaders experienced substantial challenges managing their work-life balance. Unsurprisingly, leaders also expressed that the use of electronic media and constant access to communication via smartphones, for example, has blurred work-life boundaries for their employees. This is supported by research showing that virtual and anywhere work arrangements do not necessarily equate to improved work-life balance (Allen, Johnson, Kiburz, & Shockley, 2013). Leaders attended to this challenge by modeling and promoting work-life balance norms such as taking a lunch break or not sending e-mails late at night. One leader committed to using the delayed send feature for any e-mails after 7:00 p.m., so as not to set the expectation that she required a response at night. Although working outside of standard work hours was not always avoided, leaders employed different strategies to manage this. For example,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

they flexed their workdays instead of always expecting others to accommodate the leader's work hours and encouraged employees to delay the start of their workday on days where they were working later to accommodate those in another time zone.

- **Versatile Communication:** Knows and understands that employees' preferences for how to communicate from a distance will differ. Is willing and able to adjust personal style to others' preferences.

A recent review suggested member consideration and recognition of individual needs were important capabilities for managing anywhere workers (Mukherjee et al., 2012). Leaders echoed this finding, noting that adapting to individual communication preferences was more important in the distributed context. Leaders mentioned that relying on e-mail for communications with employees whom they saw face-to-face every day was effective because the low richness of e-mail was supplemented with face-to-face interactions. For anywhere workers, however, leaders tried to use communication methods better suited to the individual. For example, some employees were fine with text-based media like e-mail or instant messaging, whereas others preferred phone or video calls. This depended on individual preference, as well as the worker's relationship with the leader. Leaders also reported adjusting the content of their messages; some members preferred directive and concise communications, whereas others also desired personal interaction and social support. To accommodate the latter group, leaders would schedule "virtual coffee," and initiate or be available for informal contact. These behaviors can be understood as specific examples of high-quality leader-member exchange (Graen & Uhl-Bien, 1995; Golden & Veiga, 2008).

Productivity

The Productivity meta category captures task-focused behaviors (Yukl et al., 2002) aimed at managing the daily work environment and enabling performance. This meta category was defined by three behavioral clusters: Driving High Performance, Managing Work and People, and Strategic Alignment. Each cluster is defined and discussed in connection with relevant past research. Table 3 contains key behaviors that leaders can implement to develop these capabilities.

- **Driving High Performance:** Sets high standards for the team, communicates the standards and expectations clearly, and holds him/herself and others accountable. Is outcome and objective focused.

Leaders consistently emphasized that their role was to drive and facilitate high performance, regardless of the work arrangement. As such leaders were required to explicitly set, communicate, and document expectations. Leaders also moved away from managing time on tasks and instead focused on managing by objectives. This was accomplished by providing clear directions and deadlines, and then encouraging employees to work where and when they were most effective. Leaders spoke to incorporating this results-focused approach into performance appraisals by primarily evaluating the quality of deliverables. This behavioral cluster also contains behaviors related to the transformational leadership facet of inspirational motivation (Avolio, Bass, & Jung, 1999). One leader articulated this as "using every conversation to leverage passion for the work." She pointed out that motivating performance and inspiring enthusiasm was much more difficult from a distance. Her approach to overcoming this challenge was to be energetic and positive and use every conversation to boost and engage employees.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Marker behaviors of the Flexibility meta category

Flexibility **Achieving Work-Life Balance**
Set your own boundaries of availability and communicate those boundaries. However, ensure that employees can access other leaders/managers/resources during periods of unavailability.
When not working, make sure to limit your access to work demands and tasks by turning off your company phone, powering down your laptop, or pausing email notifications.
If you lead workers across multiple time zones, be careful to avoid literally working around the clock. Instead of trying to answer as messages come in, set specific times for responding to e-mails and requests.
It is more work to support and develop employees from a distance, so monitor yourself for symptoms of stress and burnout and ask for help if you need it.
Take breaks. Don't be afraid of others thinking you are not working hard just because you cannot see each other.
Exploring and Learning Orientation
Research and experiment with new ways of communicating instead of relying on e-mail. Try instant messaging, videoconferencing, or integrated communication platforms.
Constantly and deliberately ask your staff for feedback on various processes. You cannot see what is and is not working for others, so make sure to ask.
Seek out other leaders who have experience managing anywhere workers. Ask questions and share your successes and failures in order to learn from their experiences.
Ask your employees a lot of questions about their daily experiences so that you are better able to support them (e.g., what resources do they use, who do they consistently communicate with, what communication media do they rely on).
Demonstrate your buy in to the concept of anywhere working and remain open to constantly learning and adapting.
Promoting Work-Life Balance
Try to ensure that meetings across time zones fall within work hours. If that is not possible, then rotate who starts early/late; if meetings fall over lunch hours, then encourage workers to bring a meal to the meetings. "Share the pain."
Demonstrate and model the behaviors that you expect such as not working through the lunch hour, taking breaks, and not replying to e-mails late at night.
Respect others' boundaries. For example, only contact people outside of their typical working hours when necessary and set this as a standard of behavior among the entire team or work group.
Encourage people to be flexible with how they manage their time. For example, if someone has to work late to accommodate those in another time zone, encourage that individual to start their workday later or take a longer break during the day.
Discuss work-life balance with your people. Help them to re-create the boundaries that can be blurred with anywhere working.
Versatile Communication
Ask your employees how they prefer to be communicated with and periodically revisit this. People vary in their preference for various communication media.
Take time to understand the needs of your workers and adjust your behavior accordingly. Some will require more regular check-ins or support, whereas others may prefer to work more independently – this depends on individual personality, confidence, and competence.
Pay attention to workers' social needs. Some workers may desire and need more social interactions. Make time for personal conversation during formal communications, or schedule "virtual coffee."
Try to ensure that communications are engaging, interactive, and not one-way by varying the communication media, or by alternating who leads meetings/communications.
Demonstrate and encourage the use of different communication media for different tasks to help employees learn how to best utilize various communication media with each other.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Managing Work and People:** Manages the flow of work among employees in an effective, efficient, and detailed manner. Provides frequent feedback.

This cluster provides a detailed understanding of the behaviors related to task-structure and efficiency, which are consistent across research in this domain (Bell & Kozlowski, 2002; O'Neill et al., 2008). In particular, the effective management of technology and work processes is critical to ensuring smooth workflow (King & Majchrzak, 2003). Leaders set up communication guidelines and expectations for meeting preparation. For example, in one distributed engineering team, the leader mandated all on-site engineering problems between on-site engineers and engineers located in company headquarters be discussed via video conference. This facilitated quicker and clearer communication by allowing the headquartered engineers to see the issues instead of relying on an oral description. Other leaders strictly enforced rules such as requiring meeting materials be accessible ahead of the meeting or preventing employees from introducing any new materials during meetings. Leaders also used project management software and checklists to follow up on tasks and people. In a traditional office, follow-up and feedback often take place during informal physical encounters (Kirkman et al., 2002). Since anywhere work limits those opportunities for contact, leaders recorded and delivered feedback during regular check-ins.

- **Strategic Alignment:** Communicates a vision, provides direction, and establishes strategic plans. Engages both the team and individual employees to overcome feelings of isolation from objectives.

As pointed out, the nature of anywhere work limits opportunities for informal communication and clarification. This meant leaders worried about employees veering from objectives or struggling to understand the relevance of their role to broader team and organizational objectives. One mitigation strategy involved articulating a vision and providing strategic plans that clearly linked an individual's work to the broader goals. Promoting a vision is considered central to many leadership models (e.g., Bass & Avolio, 1993; Harvey, Novicevic, & Garrison, 2005), and leaders felt that anywhere work was no different. The behaviors used to accomplish this were not fundamentally different than those that occur in face-to-face environments, but leaders structured them more formally and delivered them more regularly (through various communication media) to be effective. For example, one leader described how her former manager included all team members in the development of strategic plans, regardless of distance. Since face-to-face planning meetings were not feasible, he pulled together individual ideas and contributions from one-on-one meetings and then communicated the plan back out to the group. This approach resulted in stronger identification with and knowledge of the objectives.

Culture

The Culture meta category captures cross-cultural leadership behaviors (e.g., Earley & Ang, 2003) aimed at leveraging diversity and overcoming challenges related to cultural differences. This meta category was defined by three behavioral clusters: Cultural Awareness and Respect, Cultural Communication, and Openness to Cultural Diversity. Each cluster is defined and discussed in terms of relevant research. Table 4 contains key behaviors that leaders can implement to develop these capabilities.

- **Cultural Awareness and Respect:** Conscious and respectful of cultural differences among employees. Considers the impact of cultural diversity on the team's interactions.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Marker behaviors of the Productivity meta category

Productivity **Driving High Performance**
Be enthusiastic and positive in every conversation you have with your employees to create and motivate passion for the work.
Manage by results. Clearly outline deliverables and deadlines and then allow team members to manage their own time within those parameters.
Set, document, and display clear expectations for all employees to have constant access to (e.g., in a collaborative software program).
Emphasize that anywhere working depends on individuals taking responsibility for themselves. Be clear that workers are accountable for results, but make yourself available to answer questions, alleviate concerns, and remove obstacles.
Model and exceed the behaviors that you expect from others, especially those which are critical to facilitating success (e.g., adhering to communication or workflow processes, demonstrating enthusiasm, using the correct communication media for the task).
Managing Work and People
Plan ahead and be sensitive to time frames and deadlines as much as possible. It is more difficult to execute "need it now" work.
Establish explicit policies and guidelines around communication to streamline workflow (e.g., meeting materials must be made available 24 hours before the start of a meeting).
Facilitate schedule sharing among your entire team or work group to prevent inefficiencies in communication due to differing work hours, time zones, or preferences.
Beware of "out of sight, out of mind." Take detailed notes during meetings and immediately create and share a list of items for follow up.
Opportunities for more informal feedback will be limited, so establish a culture of deliberate, ongoing feedback.
Strategic Alignment
Consult employees in the development of strategic plans. Integrate input from your employees as much as possible and then communicate the plan back to the group for feedback.
To overcome the lack of casual check-ins that happen more informally when collocated, use regularly schedule touch points for adjustment and to ensure workers are headed in the right direction.
Workers at a distance may struggle to understand organizational or team norms. Explicitly communicate norms or aspects of the team/organizational culture (e.g., what is most important to the group, how work gets done).
Meet with other managers or stakeholders (e.g., clients) outside of your team/work group to get a better sense of whether your staff's actions and behaviors are aligned with objectives.
When you receive notice of organizational decisions/changes, quickly communicate this information to your employees. This prevents them slowly hearing news through the grapevine and feeling that they are the last to be informed.

Leaders identified developing self-awareness as a key first step to effectively managing cultural diversity. Leaders accomplished this by examining their cultural assumptions and biases (Brislin, Worthley, & MacNab, 2006; Triandis, 2006) and by seeking the advice of other leaders with experience managing culturally diverse teams. One leader described a situation in which one of his employees was consistently late, even to local client meetings. While this aggravated the leader, he recognized that punctuality is a culturally-bound expectation and in the employee's context, it was normal to arrive late. The leader recognized his assumptions and had a collaborative discussion with the employee about expectations, demonstrating an ability to go beyond acknowledging differences and adapt to the context (e.g., Wang, Feng, Freeman, Fan, & Zhu, 2014). In addition to recognizing individual cultural differences, leaders also paid attention to the broader cultural context of their staff. For example, in some cultures, anywhere working is less accepted and leaders had to support employees through additional challenges (e.g., family resistance to working outside of standard work hours). Finally, leaders paid close attention to how cultural differences impacted team interactions. During the interviews, several North American-based leaders

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

noted key differences in work-life balance between those in Canada and those in the United States. For instance, expectations of availability differed across regions, so leaders helped clarify expectations to ensure that frustrations such as receiving e-mails on vacation or being unavailable during evenings did not prevent communication or collaboration.

- **Cultural Communication:** Capable of adjusting verbal and nonverbal behaviors during cross-cultural interactions. Uses communication to create an inclusive working environment.

Cultural distribution presents an added obstacle to achieving the smooth, effective communication necessary to anywhere work success. For example, differing social cues may increase the chance for misunderstandings (Shaw & Barrett-Power, 1998). One leader described how she misinterpreted an employee's silence during conference calls as an unwillingness to contribute, whereas the behavior was tied to the individual's cultural beliefs about speaking when more senior employees (e.g., leaders) were present. Upon becoming aware of this, the leader made sure to invite the individual to speak – a simple, but effective, behavioral adjustment. Other leaders emphasized taking time to clarify whether their message was understood when managing workers whose first language was not English. Although these businesses largely operated in English and all employees were fluent in English, leaders took extra time with those individuals to limit opportunities for miscommunication and to ensure language barriers did damage outcomes such as trust (Tenzer, Pudelko, & Harzing, 2014).

- **Openness to Cultural Diversity:** Open attitude towards diverse backgrounds. Enjoys learning about and interacting with people from different cultures.

Leaders identified a third set of behaviors centered on demonstrating openness towards cultural diversity. They acknowledged that it was paramount to communicate their willingness to engage with individuals across cultural boundaries (Deci & Ryan, 1985). Leaders served as role models for other employees in the business, and it was critical that they demonstrated both willingness and confidence when working cross-culturally (Bandura, 2002). Effective leaders showed an intrinsic belief in the value of diversity and made an effort to get to know and understand their workers' personal and cultural backgrounds. Moreover, they encouraged employees to share this information with each other and provided opportunities during team interactions for members to discuss and get to know one another's histories.

DISCUSSION

The current chapter extends Yukl and colleagues' (2002) hierarchical leadership taxonomy to the anywhere working context. Further, this research incorporates work on cross-cultural leadership capabilities (e.g., Early & Ang, 2003; Caligiuri & Tarique, 2012; Malhotra et al., 2007) by adding a Culture meta category to the framework. In doing so, the authors clarify the theoretical understanding of the anywhere leadership performance domain. This helps to address the "criterion problem" as it is related to anywhere leadership by identifying the criterion space and facilitating the identification of variables that may be important predictors of effectiveness. This taxonomy also provides specific behaviors to guide item development for future measures of the leadership facets (e.g., behavioral clusters). Thus,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 4. Marker behaviors of the Culture meta category

Culture **Cultural Awareness and Respect**
Facilitate activities (e.g., personality assessment, personal history sharing) to help you and your workers build self-awareness about cultural assumptions and biases.
Seek the advice of leaders who have worked with culturally diverse or globally distributed teams in order to learn from their experiences. Consider inviting experienced leaders to a team meeting to lead a discussion about cultural awareness and respect.
Constantly revisit whether your expectations of employees are culturally bound. Do not assume that your way is the only, or "right," way.
Pay attention to how an individual's local context and culture could impact his/her work and be prepared to support him/her through additional challenges (e.g., is anywhere working an accepted practice in his/her location?)
Watch for cultural differences among employees that may impede communication or collaboration (e.g., different expectations about work hours, availability on vacation).
Cultural Communication
Some individuals may feel uncomfortable speaking in meetings with more senior employees present. Deliberately invite those people to contribute or solicit input in different ways (e.g., in writing, pre/post meetings).
If you lead employees who speak a different first language, take extra time to clarify your message and ask probing questions to ensure you are understood.
To gain insight into how culture may influence your employees, question them on the decisions they make and their reasoning for those decisions. Take the time to get to know the culture of all your staff and be sensitive to it.
Pay attention to differences in nonverbal communication (e.g., eye contact, nodding) and be prepared to adjust your habits.
Do not assume that you are understood: always recap or summarize the main points of your message and encourage and reward clarification and questions.
Openness to Cultural Diversity
Regularly emphasize and demonstrate the importance and value of cultural diversity to your staff through your language and behavior.
Get to know and understand your employees' personal and cultural backgrounds by asking questions and encouraging them to share their stories with you and each other. Don't feel like you can't talk about each other's backgrounds.
Try to visit individuals at their locations. If this is not possible, consider attending cultural events in your own city/location in an effort to immerse yourself and gain more understanding of your workers' cultures.
Display an open, inquisitive, and respectful attitude towards others and expect the same behaviors from all of your employees. Encourage team members to maintain their cultural identity.
Don't just try to help employees fit in. Instead, also consider what they can teach you and use this to broaden your ability to fit in with them.

the main contribution of this research is in laying the foundation for a program of research on leadership effectiveness of the anywhere workforce.

This taxonomy also extends existing behavioral research focused on virtual team leader effectiveness (Hambley et al., 2007a; Malhotra et al., 2007). There are several similarities, and also important differences, between current and past research. Several of the main themes are strikingly similar. For example, Malhotra et al. (2007) identified the importance of establishing and maintaining trust and acknowledging and leveraging cultural diversity, which corresponds with Building Trusting Relationships and the Culture meta category, respectively. Hambley et al., (2007a) considered personalizing virtual teamwork a key capability, which corresponds to Creating Team Unity. Both Malhotra et al. (2007) and Hambley et al. (2007a) recognized the role of facilitating effective team meetings, which was reflected in the Managing Work and People behavioral cluster. Malhotra et al. (2007) identified two categories (enhance external visibility of the team and its members; ensure individuals benefit from participating in virtual

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

teams) which did not constitute major themes in the current study, but captured behaviors categorized under Fostering Collaboration (e.g., connect workers to others in the organization) and Creating Team Unity (e.g., acknowledge virtual/anywhere contributions). This difference in categorization may have arisen due to the nature of the interviewees in each study. Malhotra et al., (2007) focused on short-term project teams, whereas the current study examined a wider range of anywhere leadership. Thus, while the behaviors were considered important by leaders in the present study, they were identified in relation to other capabilities instead of as individual categories. One final similarity revolved around the effective use of different communication media. Hambley and colleagues (2007a) defined this as a capability in and of itself, Malhotra et al. (2007) linked the effective use of technology to monitoring team progress, and leaders in the current study stressed the importance of utilizing technology and communication media when discussing several behavioral clusters.

There are also important differences. One major difference is the number and specificity of the behavioral categories in the present taxonomy. The authors took a bottom-up approach to developing the behavioral clusters to capture the breadth of experiences described by interviewees. This resulted in the three-level hierarchical taxonomy presented. This difference is best illustrated by comparing Malhotra and colleagues' (2007) category Ensuring Diversity is Understood, Appreciated, and Leveraged to the Culture meta category. The three behavioral clusters (Cultural Awareness and Respect, Cultural Communication, and Openness to Cultural Diversity) correspond to Malhotra et al.'s (2007) category, but breaking the concept into several clusters serves two specific purposes. First, it adds specificity to the vaguely defined domain of anywhere leadership. Second, this approach highlights the complexity and depth of leading anywhere workers, which serves to make the taxonomy more applicable and useful for organizations and leaders who must navigate that complexity daily. Another key difference in this taxonomy is the presence of the work-life balance clusters (Achieving Work-Life Balance, Promoting Work-Life Balance). Previous taxonomies have not systematically defined these behavioral capabilities for leaders of virtual teams, teleworkers, or other types of anywhere workers. The recent emergence of research on the impacts of electronically mediated communication on the work-life interface (e.g., Allen et al., 2013) may partly explain this discrepancy. Moreover, the ongoing development of technology and the way humans leverage technology for work has continued to evolve over the last decade (e.g., social media, smartphones). This has contributed to the blurring of work-life boundaries (e.g., Nam, 2014) and has drawn attention to the role of organizational leadership in navigating these challenges (Fonner & Stache, 2012). While certain behavioral capabilities of anywhere leaders have remained constant over the past decade of research, the discipline has continued to develop, and ongoing research is warranted.

Practical Implications

This proposed taxonomy could be useful to organizations and leaders. First, this research offers a starting point for assessing the behavioral capabilities for leading anywhere workers. Given the lack of assessment tools focused on leadership in the anywhere working domain, this is a key practical contribution. Leadership assessment can offer individual leaders and organizations valuable insight into strengths and areas for development. However, a lack of tools addressing relevant leadership criteria could leave leaders and organizations unable to recognize or address the key issues regarding anywhere leadership training and development. By clarifying what constitutes effective leadership behavior, this taxonomy lays the groundwork for accurate and comprehensive leadership assessment. For example, leaders could incorporate these tips and strategies into their daily practices, and organizations could integrate the con-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

cepts into existing training and development resources. Thus, this taxonomy could be practically applied to guide anywhere leadership assessment and development.

Development of a Preliminary Assessment and Results from the Workplace

Using the marker behaviors, the authors developed a preliminary assessment of anywhere leadership effectiveness in conjunction with the consulting firm Work EvOHlution. The researchers developed a Likert-type scale with multiple items per behavioral cluster (e.g., I have regularly scheduled contact with my anywhere workers; I ask each anywhere worker how to best communicate with him/her). Individual item responses were averaged across the behavioral clusters and meta categories to obtain overall dimension scores on each behavioral cluster and leadership meta category. To illustrate the potential utility of anywhere leadership assessment, the researchers collected preliminary data comparing leader self-assessments to direct report assessments on the fourteen behavioral clusters. Fifty leaders of two large, multinational organizations self-rated their effectiveness on each behavioral cluster. Leaders were from the information and communication technology industry or the insurance and financial services industry and were based in North America or Europe. Individual ratings were averaged across the behavioral clusters in each organization. The clusters were rank ordered and compared to the rank ordering of direct report ratings. Interestingly, in both organizations leaders self-rated Strategic Alignment and Creating Team relatively high, while direct reports ranked these clusters near the bottom (see Table 5). Although this is an exploratory comparison, it provided the participating organizations with valuable information about potential blind spots within their leadership. The finding suggests that the leaders may need to adjust their behaviors focused on developing Strategic Alignment and Creating Team Unity. More broadly, this result highlights the diagnostic potential of individual leader assessment in the anywhere leadership domain.

Leader assessment also lends itself to organizational benchmarking. Benchmarking is a useful way for organizations to gain insight into current areas of success and areas of opportunity (Drew, 1997). The information can help leaders and decision makers better allocate resources and direct development investments. Using the same pilot assessment described above, the authors obtained self-ratings from 200 leaders across five different organizations in the energy sector, information and communication technology, and insurance and financial services. The individual assessments were aggregated by organization, and comparisons were made between the participating members. Examples are presented in Figures 2 and 3. Figure 2 shows the Flexibility meta category results from a large oil and gas organization based in Canada. That organization's leaders scored significantly higher on Achieving Work-Life Balance and significantly lower on Versatile Communication, compared to leaders from the other participating organizations. Discussion with stakeholders at the target organization revealed that anywhere working was only recently adopted by the organization and previously collocated teams were now distributed across North America. The results of this assessment provided valuable information to human resource leaders on where to focus their development efforts, namely, improving leaders' capability to adjust their communication styles to workers' preferences. Figure 3 shows the Relationships meta category results from a mid-size North American engineering firm. That organization's leaders scored significantly lower on all four behavioral clusters of the meta category. Human resource leaders in this organization were not surprised with the assessment results but were able to use the data to make a stronger case to senior management about the need to address these specific deficits of anywhere leaders. These two examples provide further evidence for the usefulness of assessing leaders tasked with the challenge of leading

anywhere workers. As a whole, this exercise demonstrates some applications of this taxonomy and its potential value as the basis of an assessment tool.

Implications for Organizational Policy and Processes

Historically, significant attention has been paid to the technology and facility issues of anywhere work (see Blount, 2015). This chapter draws attention to the *human elements* of anywhere work and suggests that it is important to consider the human factors of effective anywhere leadership. In fact, research has shown that leadership/managerial resistance remains a key obstacle to widespread anywhere and flexible work adoption (e.g., Blount, 2015; Hegewisch, 2009; Lee & Hong, 2011). This means it is critical to ensure that leaders are equipped with the requisite leadership and management behavioral capabilities and that the proficiency levels of anywhere leaders are addressed and supported. Based on the current research, the authors recommend that organizations formally acknowledge the demands of these forms of leadership by supplementing their current talent management and human resources processes with leadership selection, training and development, performance appraisal, and succession planning processes

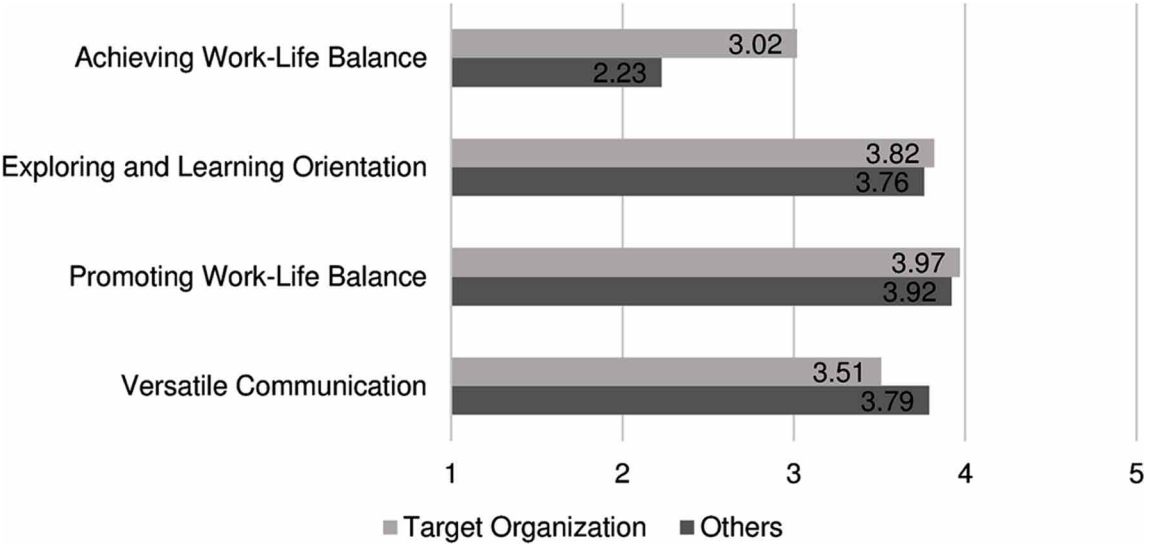
Figure 2. Organizational benchmarking results on the Flexibility meta category



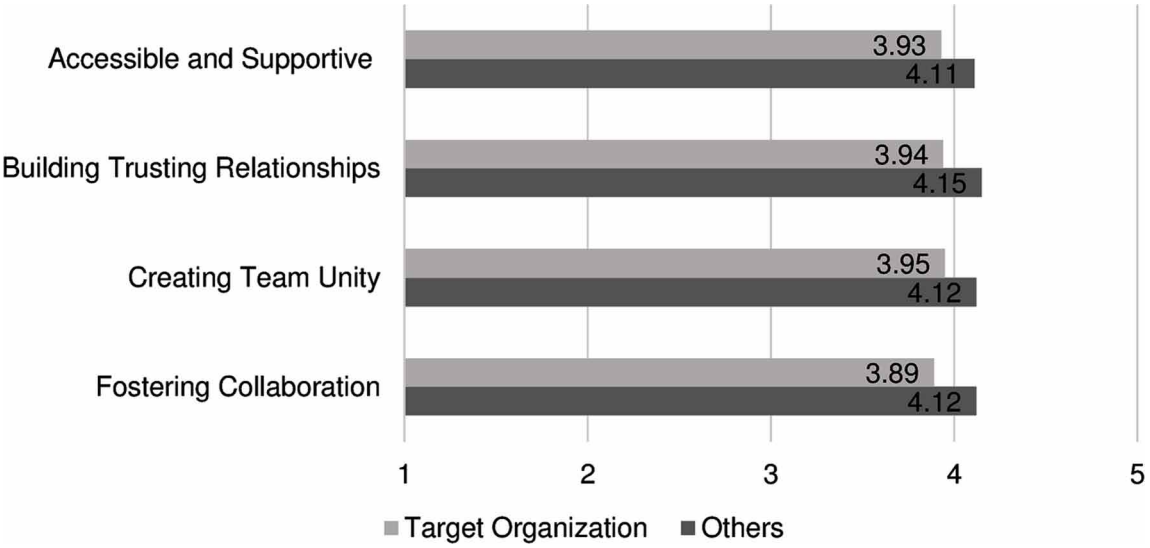


Figure 3. Organizational benchmarking results on the Relationships meta category

targeted towards leading the anywhere workforce. During the interviews, leaders repeatedly emphasized that leading from a distance was more difficult than face-to-face leadership.

Poor leadership, in general, can result in employee turnover, raise employee stress levels, and diminish employee confidence (Erickson, Shaw, & Zha, 2007). The added demands of anywhere leadership mean selecting leaders with the right skills and attributes to perform the critical behaviors is paramount. For example, a leader who lacks technology savvy may be able to lead somewhat effectively in face-to-face arrangements but could become completely ineffective when required to lead workers from a distance. Without explicitly considering the behavioral capabilities specific to leading anywhere workers during

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

leadership selection processes, an organization may mistakenly move a leader into a position where he/she is likely to fail – a costly, yet avoidable error. Following selection of the behaviors, skills, and attributes needed for effective anywhere leadership, the training and development, performance appraisal, and succession planning processes should also be carefully aligned with the requirements of this type of leadership.

Integrating specific behavioral capabilities into leadership development and performance appraisal processes is particularly important. Many organizations already assess, train, and develop their leaders, but it is less clear whether they consider the full range of leadership capabilities necessary for anywhere leadership. Leading anywhere workers requires similar yet nuanced, as well as additional, leadership and management behaviors. Using assessments designed for and validated with face-to-face leaders is thus insufficient and could leave organizations unable to accurately address leadership deficiencies and leverage key strengths. Moreover, failing to adequately appraise the range of leadership and management behaviors necessary for anywhere leadership success means organizations are without accurate data on the performance of leaders. This could mean that key performance issues inherent in this context are overlooked or ignored, or that leaders who are effectively handling the challenges are inadequately acknowledged for their contributions.

Finally, it is important to consider policy around succession planning. Effective succession planning is key to ongoing organizational effectiveness as it prepares the organization to meet future leadership demands. Without incorporating the leadership and management capabilities specific to anywhere leadership, organizations may be overlooking a critical factor when attempting to identify and develop future leaders. Leaders in the current study pointed out that a key source of their knowledge and learning about leading anywhere workers came from experienced colleagues, mentors, or supervisors. This informal learning may be useful, but policy and systems should be in place to formally integrate knowledge of anywhere leadership directly into succession management practices. This would allow organizations to leverage this expertise more formally when developing the next generation of leaders. Moreover, this is relevant to successfully training and supporting those currently in leadership positions. As the nature of work continues to evolve, the acknowledgment of the human success elements of anywhere work by human resource and organizational policymakers is a key step to developing a culture that acknowledges, promotes, and leverages anywhere work.

FUTURE RESEARCH DIRECTIONS

The current chapter serves as a starting point for future research into the behavioral capabilities necessary for effectively leading anywhere workers. A key first step is the empirical validation of this model. This is dependent on the development of reliable measures of the behavioral clusters and meta categories. One approach could be to use the database of behavioral markers to guide the development of survey items, which was the method used by the authors when developing the preliminary assessment previously described. Second, upon the development a reliable and valid measurement instrument, confirmatory factor analyses can be used to test the robustness of the hierarchical categorization proposed. Third, future research should investigate the relationships involving leadership and individual, team, and organizational outcomes, such as individual and business unit performance, employee engagement, and job satisfaction. Fourth, researchers should examine how feedback, training, and development specific to anywhere leadership may impact leader proficiency and individual, team, and organizational outcomes. Fifth, the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

behavioral interviews also provided insight into the skills and personality attributes that leaders rely on for success. Future research should endeavor to systematically identify individual differences (e.g., skills, attributes, general mental ability) that predict anywhere leadership effectiveness. Understanding the predictors of effective leadership in this context is foundational to the accurate assessment and development of leaders. Lastly, it will be important to compare the anywhere working specific assessment of leadership effectiveness to other leadership constructs and models. This is a critical research phase for determining the utility and value of assessing leadership in this domain. For example, researchers could examine whether there are differences in the prediction of employee outcomes, or if the antecedents of effective anywhere leadership differ from other leadership constructs. Thus, this taxonomy forms the basis for a program of future research into leading anywhere workers.

CONCLUSION

Anywhere working is a fundamental evolution in the nature of work from a place (e.g., "I am going to work") to an activity (e.g., "I am working"). While this shift is driven by factors including the desire for flexibility, the globalization of work, and rapidly improving technological infrastructure, it continues to be limited by an inadequate understanding of the management challenges of anywhere work (Blount, 2015). This chapter is a step forward in addressing that gap. Through behavioral interviews with leaders who lead anywhere workers, the authors detailed the behavioral capabilities required for effectiveness and provided insight into overcoming the daily challenges of anywhere work. The proposed taxonomy extends existing leadership taxonomies (Hambley et al., 2007; Malhotra et al., 2007; Yukl et al., 2002) and brings clarity to the performance domain of leading the anywhere workforce. Hopefully, by extending prior research, suggesting future research directions, and demonstrating potential applications for leaders and organizations, this chapter will serve as a resource for researchers, practitioners, and leaders who seek to understand and address what it takes to lead anywhere workers.

KEY TERMS AND DEFINITIONS

Anywhere Leadership: Managing one or more workers from a distance at least part of the time; includes employees working in different cities or countries, and mobile employees working remotely from the same city.

Behavioral Cluster: A subcategory of a leadership metacategory; composed of a set of related behaviors identified by leaders as fundamental to effective anywhere leadership.

Behaviorally-Based Leadership: An approach to leadership focused on understanding and enacting effectiveness behaviors.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Behavioral Taxonomy: The classification of a set of related behaviors.

Marker Behavior: Specific behaviors identified by leaders as fundamental to effective anywhere leadership and classified as representative of a behavioral cluster.

Metacategory: An overarching category or leadership dimension containing three to four subcategories (behavioral clusters).

Virtual Team: Organizational work teams dispersed across geographic, temporal, and/or cultural boundaries.

ABSTRACT

The issue of city walkability is nowadays a theme in evidence. The chapter proposes a two-level reasoning. At the city level, the goal is to recognize the parts where actions aimed at improving walkability can be more effective. The second level is more detailed: lacking pedestrian paths' specific graphs, the urban space is modeled through a raster with 1x1 m. cells. Considering a series of criteria, an impedance has been assigned to each cell (i.e., the cost of travelling the cell on foot). This approach is applied to the city of Torino (Italy), but it is largely generalizable. To calculate this impedance, inter alia, the Torino geo-topographic database was used. The elaborations described in this chapter are seen as an aid to stakeholders to reason on city walkability and to compare different points of view in an explicit and articulated way.

INTRODUCTION

The walkability of the city has been the subject of consideration for at least fifteen years, but today it is certainly in evidence. In February 2018 the small volume *Pedestrians First* (ITDP 2018) was published, that was inspiring in particular for two reasons: it was conceived in a context and with a vision absolutely global; it has a clear operational objective, to support the different subjects (policy and decision makers,

planners and technicians, pro-active subjects at a local level, etc.) involved in the promotion and planning of the increase of the city's walkability, as a factor of sustainability and growth of the its livability.

The city's walkability theme intersects several relevant current themes. The reasons reported in the literature to deal with it are surprisingly varied, ranging from the sustainability of urban mobility, from soft mobility (recovery of walking as a solution to the problems of transport over short distances), to the health of people (contrast of obesity (Agampatian 2014) prevention of cardiovascular diseases, osteoporosis (Eynard, Melis and Tabasso 2017). In the middle there is a wide range of motivations concerning the livability of the city, security, pollution, urban densification. Some analyzed researches often describe a path that led to the construction of walkability indices, taking into consideration, along with other aspects, such as the physical form of the city and its way of functioning, that is population, building density and the mix of urban activities and functions (which, together, lead to multiplication of possible origins and destinations of movements), security (which concerns both the intersections between pedestrian paths and vehicular routes, that anthropic safety), the pleasantness of the environment (quality of the sidewalks, presence of shops and other activities along the pedestrian paths, presence of green, low level of pollution and noise, etc.).

For people, to decide to get walking a little more, instead (specifically in Italy) to use their car, involves reviewing their own habits and building new mental maps of their city.

If the ultimate goal is to provide views of the walkability of the city, useful for people to reconsider the possibility of walking different areas of the city, and the accessibility of different interest points on foot, the specific objective of this chapter is to demonstrate the possibility of constructing effective views of city's walkability, using existing data, extensible (more or less easily) to the entire urban or metropolitan area, bypassing the lack of specific networks related to foot mobility, which allow municipal technicians and policy-makers to focus on critical points of pedestrian paths, considering all the factors that influence the walkability.

BACKGROUND

Definitions of Walkability

Walkability and accessibility with alternative mobility are conditions for the development of the quality of urban and territorial life, as well as a way to deal concretely with the great issues of the "right to the city" (Lefebvre 1968; Harvey 2008) and the relationship between city and welfare.

In literature, there are many definitions of "walkability". For Abley (2005) *walkability* or *walkable* is "the extent to which the built environment is walking friendly": this definition enables the opportunity for a subjective or qualitative assessment against specific criteria. These criteria may be characteristics such as the "5 Cs": connected, convivial, conspicuous, comfortable and convenient, or other criteria specific to a particular user.

For Seilo (2004), walkability "is a measure of the urban form and the quality and availability of pedestrian infrastructure contained within a defined area. Pedestrian infrastructure includes amenities developed to promote pedestrian efficiency and safety such [as] sidewalks, trails, [and] pedestrian bridges".

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Walkability for a More Livable City

In the policy "Walking action plan. Making London the world's most walkable city" (Mayor of London and Transport for London 2018), walking is considered "(…), in many ways, the mode of travel that is most important to the aims of the strategy. It makes efficient use of street space. It is good for individuals' health. It produces no emissions or noise. It is safe and encourages interaction, which improves lives. It is good for business".

Then, USA's Walkable Communities Inc. website defines walkable communities "those who put urban environments back on a scale for sustainability of resources (both natural and economic) and lead to more social interaction, physical fitness and diminished crime and other social problems".

The concept of walkability is a way of looking beyond the presence, distribution, and accessibility of urban facilities: spatial quality and the ability to accommodate and promote the pedestrian mobility of the urban environment and in particular of the road influence the way in which people perceive and use the city.

In this regard, many studies show how the psychophysical wellbeing of individuals, as well as urban studies, corroborates the thesis that better urban quality is given by the walkability and the development of the possibilities of action of the individual in urban space. Planning strategies need to be built through empirical research that identifies correlates of walking behavior.

While socio-demographic (i.e. ethnicity, income, age) correlates of walking have been widely probed in the literature (Saelens et al. 2003), physical environmental variables have been studied with much less rigor. However; the limited number of studies on the link between the built environment and walkability demonstrate that physical environmental variables are significantly associated with walking behavior controlling for socio-demographic factors (Jacobs 1961; Handy and Clifton 2001). Walking activity promotes also social life and public participation by providing opportunities for face-to-face contact and casual interaction, all of which subsequently are proven to improve mental health and well-being (Robertson et al. 2012). A vibrant, economically viable and safe community needs people on streets and in public places. A walkable environment can also provide significant health benefits and independence to specific groups such as children and third age people who rely more on their local neighborhoods (Berke et al. 2007).

There are also numerous case studies of public policies and projects that have shown how the quality of the city and the urban environment improve considerably in case of walkable friendly environments or soft mobility policies. In particular, several attempts are being refined and disseminated to make the concept of urban walkability operative in terms of physical well-being and improvement of the urban quality of life. These researches are aimed at systematize and simplify procedures for the formal assessment of the concept and the possibility of using walkability in a more rigorous way as a tool to support decision making, urban planning and mobility planning (Saelens and Handy 2008, Talen and Koshinsky 2013).

Measuring Walkability

Effectively understanding and measuring the complexity of walkability has proven challenging for many organizations and governments, given the various levels of policy-making and implementation involved. With a better understanding of walkability, and more consistent and frequent measurement of the walkability of urban environments, decision-makers could be empowered to push policies that create more walkable urban areas.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Over the last two decades, there has been in literature considerable progress regarding measuring walkability, various different measurable features of the built environment have been incorporated to models, and different approaches have been developed.

A first method is based on interviews or questionnaires. Questionnaires can potentially reveal the extent to which individuals perceive various elements of the built environment and how a person experiences a neighborhood. This method is considered as "subjective" because two unique individuals may perceive the same environment differently. The most commonly assessed measurable environmental features of perception are land use, traffic, aesthetics, and neighborhood safety from crime (Tomalty et al. 2009).

A second approach uses built environment characteristics obtained by systematic observations or audits that quantify the environmental attributes of an area, including the presence or absence of features hypothesized to affect physical activity. Audit tools are used for measuring and assessing physical features through direct observation, and include one or more measurable characteristics, such as: land use (i.e. commercial space), streets and traffic (i.e. crosswalks), sidewalks (i.e. presence, width, and continuity of sidewalks), public space and amenities (i.e. presence of benches), architecture and building characteristics (i.e. height), parking (i.e. presence of parking lots), maintenance (i.e. presence of litter), and other indicators related to safety (i.e. presence of graffiti) (Brownson et al. 2009; Pelletier 2009; Gauvin et al. 2005).

Finally, another method uses geospatial databases and Geographic Information Systems (GIS) in order to assess or develop relevant indicators that measure walkability. A GIS "is a facility for preparing, presenting, and interpreting facts that pertain to the surface of the earth. This is a broad definition… a considerably narrower definition, however, is more often employed. In common parlance, a Geographic Information System or GIS is a configuration of computer hardware and software specifically designed for the acquisition, maintenance, and use of cartographic data" (Tomlin 1990). The increasing use of Geographic Information Systems (GIS) has made them an essential part of urban planning research. Nowadays, GIS techniques are being utilized more frequently also by the public health sector. In particular, GIS has been used to assess potential associations between a number of built environment characteristics and walking (Butler et al. 2011), taking into account the physical location of areas, boundaries, people, and services, as well as types of land use and natural features, and facilitating researchers by providing them the ability to create maps, measure distances and travel times, as well as define the extent and nature of spatial relationships.

One of the latest advancements in GIS methods and techniques that are used to measure walkability is the employment of composite indices (WalkScore 2011). These indices are expected to measure the degree to which an area provides opportunities to walk to various destinations (Manaugh et al. 2011). This is achieved by measuring both form and content of neighborhoods, which eventually captures the interrelation of various built environment characteristics, minimizes the effect of spatial collinearity and facilitates the communications of results. Understanding the potential impact of the built environment on walkability requires relevant, easy-to-comprehend, and reliable measurable features (Brownson et al. 2009, Hollenstein and Bleisch 2016). These measurable characteristics can assist in determining how much the built environment affects the people. These measures can also provide indirectly evidence of the state of population health for the area under study. Composite measures of walkability are also expected to provide more consistent predictors of walking behavior than single component measures (Vargo et al. 2011).

Many attempts to measure walkability fail to capture all of its nuances in an urban context. Other attempts to measure walkability involve complicated indices that leave the user with a score, but with little

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

understanding of how that score was calculated, or how to improve it, or how it relates to walkability. Although conventional approaches to the assessment of quality of life usually measure the distribution, density and distances of different opportunities in space, other studies take into account the quality of accessibility and urban opportunities (Blečić et al. 2014). Besides the mere distance, it matters a great deal if a place can be reached also by foot or by bicycle, if the pedestrian route is pleasant and spatially integrated with the surrounding by good urban design, if it is brim-full of urban activities, if it is well maintained and (perceived as) secure, if it is not submissive and surrendering to the car traffic whether by design or by predominant social practices of use of that space. At the same time, it is important to go beyond the simple presence of urban services, to understand their characteristics, if they are able to serve different categories of individuals, if their relevance is on the neighborhood, urban or metropolitan/regional level, if there are possibilities of choice between two or more relevant places.

Walkability suffers from the metrics problem: that is the subject to be measured is influenced by a large number of factors. For this reason, a simplified tool is preferable and metrics must not be overly resource and time consuming, but must also capture the elements of a city that are most important to the basic building blocks of walkability. Meanwhile, they have to be easy to measure with as reliable and objective as possible data.

The already mentioned ITDP's *Pedestrians First* (2018), aiming to improve understanding and measuring walkability, defines a set of criteria and tools, based on the following key concepts:

- Data inputs that are relatively quick and inexpensive to collect;
- Metrics that are easy to understand and are designed to avoid hidden biases;
- An understanding of walkability at multiple levels (citywide, neighborhood, single stretch of street).

In following paragraphs, we explain in what these concepts influenced our work.

A DIFFERENT APPROACH: OVERVIEW

Walkability is typically "the forgotten mode of transport" (ITDP 2018): consequently, few analytical techniques are available to help practitioners identify low standard walking environments. But walkability is a crucial first step in creating sustainable mobility in an urban environment and the basis in creating sustainable city. Improving it means support a green type of mobility which except crowding reduction and also has low level of environmental influence, energy conserving without any air and noise pollution. It can be more than a purely useful type of travel to shopping, school and work: also have both social and recreational importance. For this reason, our approach proposed in the chapter takes on the theme of walkability as a fundamental piece of more sustainable urban mobility.

A Raster Model of Urban Walkable Space

The approach proposed here is applied to the case of Torino (Italy)[1], but it is largely generalizable given some conditions that are however widespread. It allows, first of all, to get around the obstacle of the lack of pedestrian paths' specific graph. The urban space is modeled through a raster with 1x1 meter cells, a rather small cell in order to obtain a high level of detail. An impedance is assigned to each cell, that

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

is a *cost* to be traveled on foot, more or less pleasantly and safely. Cells that cannot be traveled because they are included in areas destined to vehicular traffic or because they are non-public, are excluded. This raster is often named *cost raster*.

Reuse of Torino Large-Scale Geo-Topographic Data Base

The second distinguishing feature of proposed approach is that, in order to build the cost raster, the information contained in the Torino municipal large-scale digital map was used above all. A technical map is normally seen and used as a representation of the forms of the territory, often materialized as a printed map or saved as a PDF file. In the case of Torino, this topographic map is at high level of detail and is structured according to the national specifications for geo-topographic databases. Territorial objects (*features*) are organized into classes (very numerous); each feature has attributes… a lot of information. The explicit and implicit information of this cartographic database were used to characterize the location of each walkable area, their context, the level of separation with respect to the areas dedicated to vehicular traffic, the type of paving, etc. In no case, in the literature, we found cases of such extensive use of cartographic information.

Reuse of Some Alphanumeric Data-Set

Various other data-sets of different types have been used: population, commercial activities, noise, etc. All of them contain georeferenced information. Most of them were available as *open data*. However, it was not easy to use them for the reasons that will be explained later.

On one side, having in mind the criteria to be taken into consideration to evaluate the walkability, and, on the other, the information obtainable from the municipal geo-topographic database and from the data-sets actually available and usable, a series of indices have been built. These indices have been reported, in different ways, to the grid of 1x1 meter cells, producing a series of rasters whose weighted sum (the map algebra was used) led to the final construction of the cost raster.

This cost raster is a view of the walkability of the city: it is an exploitable result in the evaluation of walkability per se, as well as being a fundamental information for the next step.

Accessibility Computed as Cost Distance

Almost always in researches on walkability there is an analysis of accessibility, expressed as walking distance to certain services. This distance is usually computed on the center street lines, using data and tools developed for vehicular traffic. This is obviously due to the unavailability of pedestrian paths' graphs. But in this way significant distortions are introduced.

Moreover, if the analysis stops calculating a distance, the distance is taken into account but not the quality of paths. Walkability and accessibility are related but walkability means more.

The cost raster plays a fundamental role in calculating accessibility to some destinations of urban mobility on foot. Accessibility has to take into consideration also the quality of walking paths, that is has to be calculated as cumulative distance weighted on the base of cost raster. The result is an overlapping raster with the same properties as the cost raster: it is often called *cost distance*.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Using this procedure, various raster accessibility maps were produced, referred to different possible destinations. They can be added, using the map algebra, as weighted sum, obtaining synthetic views of the walkability that include the accessibility to different groups of activities and points of interest.

Is this Approach Really Different?

In the analyzed literature on walkability we found some papers in which raster analyses are used. For example: Holbrow (2010) generates network distance buffers around various destination points, measured on street centerlines (i.e. calculates the *service areas* using ESRI ArcGIS Network Analyst), and converts distance buffers in raster to make possible a weighed sum of them: in this way a walkability raster surface is produced (cell size 5 meter). Eynard, Melis and Tabasso (2017) follow the same approach (but the cell size is 50 meter).

Hollenstein and Bleisch (2016) apply the concepts of cost raster and cost distance, but the cost raster is very simplified, taking into consideration only the presence of sidewalks, the car speed, the presence of crossings.

A single case of a more substantial use of cost raster and cost distances was found. It is the website *Walkshed find your walkable way through the urban jungle* (http://www.walkshed.org/; Ogle, undated) that allows you to build your own personal walkability maps, varying the weight attributed to different criteria. The term walkshed echoes watershed. It is a very interesting case, precisely because it allows to build your own maps. But it seems that the grain at which the analyzes are conducted, too wide, and the excessive simplifications make the result less significant. However, this evaluation of *Walkshed* is provisional, because, if the key passage is the production of the cost raster, it is not enough documented how the impedances are calculated.

EVALUATION OF WALKABILITY AT THE NEIGHBORHOOD LEVEL

As mentioned, in *Pedestrian first* (IDT 2018) more levels of analysis / intervention are suggested: this is very reasonable. The first is the entire city/metropolitan area. The second one is the neighborhood level[2]: what has been described in the previous paragraph on cost raster and cost distance, applies to this second level.

For reasons of better exposure, analyzes on the neighborhood level are presented first.

For neighborhood level ITDP 2018 (page 31) suggests 1 km^2 areas, but this is merely to avoid too large and expensive data collections.

In our case, the analyzes could potentially be extended to the entire city of Torino, as all data-sets used cover the entire municipal area. With the exception of one, the pedestrian crossings data-set which is completely missing. In order to model the pedestrian circulation areas, pedestrian crossings are essential to generate the continuity of the pedestrian paths when these intersect the areas of vehicle circulation.

Incidentally, we have adopted a narrow definition of pedestrian circulation areas, not providing the possibility that pedestrians cross vehicular traffic areas outside pedestrian crossings. In other research (Hollenstein and Bleisch 2016), this possibility has been considered, which, on the other hand, corresponds to real pedestrian behavior in the roads covered by low-speed vehicles.

Lacking the pedestrian crossing data-set, it was therefore necessary to digitize them ad hoc. For this practical reason, the analysis of walkability is limited, for the moment, to a test area, San Salvario district,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of 193 Ha. It is a rather central area, which has various socio-economic and environmental characteristics: we do not consider San Salvario as a representative area of the entire city, but just a test area.

In identifying the criteria at the neighborhood level, the starting point was the *Walkability Hierarchy of Needs Pyramid* (ITDP 2018, pages 13-14). The 6 criteria proposed were compacted in 3 macro-criteria: practicability (physical possibility of moving on foot), safety (physical safety and anthropic safety), comfort/pleasure.

On the base of available data-sets 15 indices were identified. Some alphanumeric georeferenced data-sets were punctual: data have been spatialized using the Kernel Density Estimation (KDE) which, given the value of a phenomenon in one point, represents its diffusion and attenuation in a circular neighborhood, with a radius defined appropriately in relation to the phenomenon represented[3]. The 3 macro-indices were calculated as weighted sum of indices. The cost raster is the weighted sum of these macro-indices. Since indices and macro-indices have different values, mean, deviations, they have been normalized, which was done using the 0-100 scale. High values of macro-indices mean high practicability, high security, high pleasure, while the cost raster values represent a cost, an obstacle to walk the cell. Then the cost-raster values were calculated as the complement to 100 of the normalized sum of the macro-indices. Table 1 displays the complete process, from criteria, to indices, to macro-indices.

In addition to the criteria considered, listed in Table 1, it would be reasonable (and likely possible) to consider other criteria that at the moment have not been implemented because the necessary data were not available. We list some of them: presence of traffic calming areas and protected intersections with vehicular traffic, muggings and other street crimes, lighting levels, presence of dehors, presence of artworks.

Figure 1 shows the cost raster for a portion of the test area. On the right a part of the large urban park of Valentino stands out, with its pathways. On the right the urban fabric made up of more or less regular blocks. [To make the map more readable a dotted buffer line is drawn inside the blocks at 5 meters from the buildings' front line (same for the maps in Figure 2 and 3).]

Figure 2 is a zoom in of the map of previous figure. The 1x1 meter cells become visible. You can see the sidewalks, with variable costs; pedestrian crossings, with a higher cost; a tram platform, raised but inside the vehicular traffic area, which took the maximum cost value...

NEIGHBORHOOD LEVEL: ACCESSIBILITY OF POINTS OF INTEREST

The overall evaluation of walkability has to consider the accessibility to attractive activities and to points of interest, present within a walking distance. The cost distance represents the cumulative cost of the movement, where the *cost* is given by the value of the cost raster cell. Therefore, the cost distances calculate a weighted accessibility, which, in our case, takes into account distance, practicability, safety and pleasantness of walking. A value of accessibility to a certain activity or point of interest is attributed to each 1x1 meter walkable cell. Using cost distance algorithm, the accessibility to some attractive activities and significant intermodal points in urban mobility was calculated. The weighed sum of various cost distances can lead to synthetic views of accessibility. It should be noted that at this point the computation of accessibility is simple and it is easy to explore different aspects of the matter.

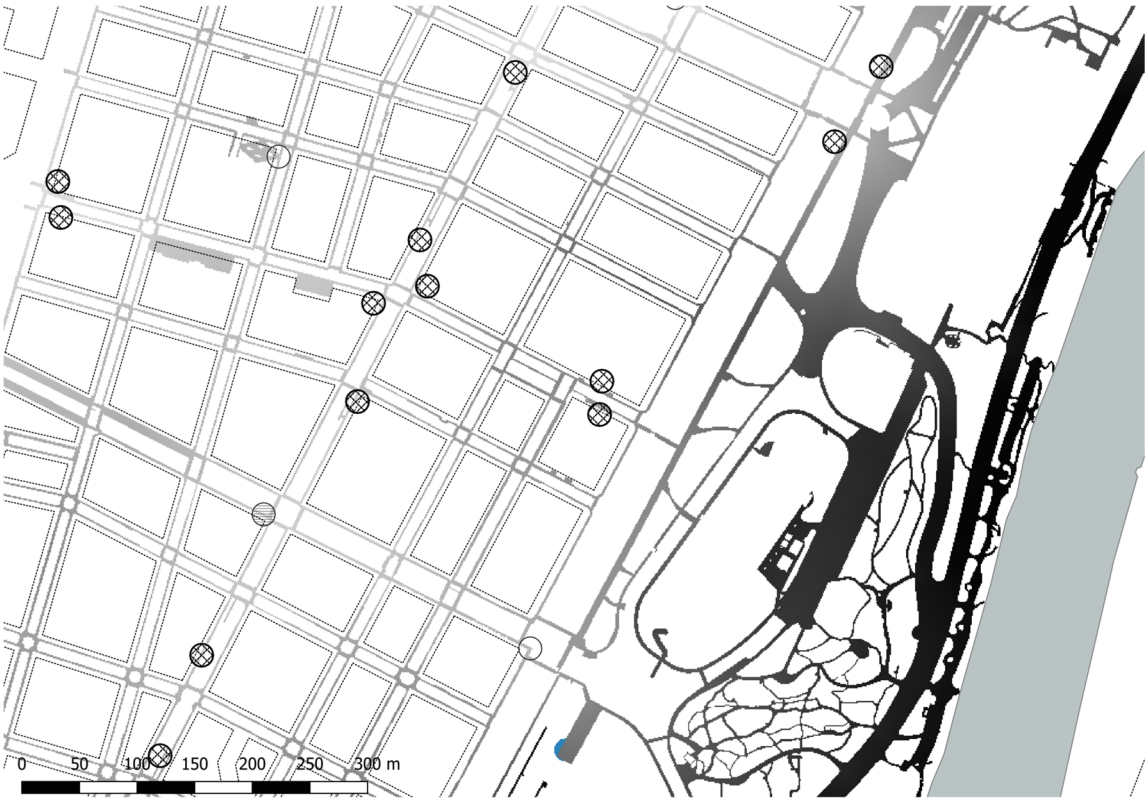
Table 2 lists some cost distances that were calculated, within the San Salvario test area, and displays how the overall accessibility to intermodal points in urban mobility and to 3-14 years old schools was calculated as weighted sum of several cost distances. As previously the cost distances were normalized using the scale 0-100 before being summed.

Table 2. Neighborhood level: accessibility to attractive activities and points of interest. Calculated cost distances, accessibility indices and macro-indices, weights assigned in weighed sums.



Accessibility Indices		**Macro-Indices of Accessibility**		**Summary Index**
Cost/Distance Relative to Points of Interest	**Weight Attributed to the Weighted Sum**		**Weight Attributed to the Weighted Sum**	
Childhood schools	20%	Accessibility to 3-14 years old schools		
Elementary and middle schools	80%			
Metro stops	30%	Accessibility to intermodal points in urban mobility		
Main Torino transports stops	30%			
Bike sharing stations	20%			
Car sharing stations	5%			
Taxi stations	5%			
Train stations	10%			
High schools	100%			
Universities	100%			
Hospitals	100%			
Catholic churches	80%	Accessibility to religious facilities		
Other places of worship	20%			
Cinemas	50%	Accessibility to leisure facilities		
Theaters	20%			
Museums	30%			

Figure 3 shows the cost distance to intermodality points in urban mobility for a portion of the test area (the same as in Figure 1) as weighted sum of the 6 related cost distances. Weights assigned in the weighted sum are shown in table 2.

An overall summary accessibility can be computed, as weighed sums of all cost distance rasters: however, at this stage we preferred to stop and compute summary accessibilities only for groups of activities or points of interest.

Figure 3. Neighborhood level: cost distance to intermodal points in urban mobility

COST RASTER AND COST DISTANCE ALGORITHMS: SOME ADDITIONAL CONSIDERATIONS

All processings were done in the QGIS environment (various releases from 2.18 to 3.4). The choice of a *Free and Open Source Software* (FOSS) is not casual and should be seen together with the choice of using open data (ex post we must say, only predominantly). It should also be remembered that QGIS is promoted by City of Torino and adopted in its technical offices for all GIS elaborations. The guiding idea is that the overall elaboration path had to be easily repeatable and generalizable.

While we used QGIS we took into consideration the similar algorithms in ESRI ArcGIS, well known and widespread proprietary SW. This is not the place to introduce a comparison between the different implemented algorithms. Anyway in this chapter we decided to use the widely enforced terms *cost raster* and *cost distance* (used also by ArcGIS) rather than the various corresponding terms used in QGIS, that are cost surface, local cost, unit cost layer, cumulative cost, accumulated cost and may be others.

Cost Raster does not refer to a specific algorithm or sw tool: it is in fact a concept and does not necessarily imply financial cost. In general, this raster is the result of a multi-criteria approach: it is the weighted sum of several rasters whose cells values represent various aspects of cost, i.e. of impedance or friction in traveling the cell. In previous paragraphs the considered aspects of cost are listed. By the way, the slope is a cost aspect often considered in building cost raster, but we did not because the test area is basically flat.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In building the cost raster the raster layer of macro index I_NPER (see table 1), which contains only the pedestrian circulation areas, was the first one. All cells not included in these areas became "null cells". In the following sums with the rasters relative to the other indices, these null cells are left out, so it is not necessary to introduce any kind of masking.

As far as *Cost Density*, generally speaking, it works this way: starting from target points or cells it is calculated the cost of moving to the 8 neighboring cells, as average cost, two by two. This value is multiplied by the cell size (in our case 1 meter) or, if the cell is traveled diagonally, by 1 * 1,41. This computation is repeated in all directions and costs are added up, choosing the least cost increment at each step. This process is propagated on the whole cost raster (de Smith, Goodchild and Longley 2018).

We used the QGIS/GRASS algorithm *r.cost.* Various options are available (e.g. different movement rules from cell to cell, how null cells have to be dealt…), none of these has been used. Incidentally we have to report that some problems of SW instability occurred updating the sw from one release to the next one.

An interesting optional output of the cost distance algorithm is *allocation*, that is the identification of the area of influence of each activity: the result can be usefully interpreted if referred to destinations of the same kind. Some allocations have been calculated, together with the cost distances, but they are not shown and discussed here.

EVALUATION OF WALKABILITY AT CITY LEVEL

As mentioned, the first levels of analysis/intervention suggested in *Pedestrian first* (IDT 2018) is the entire city/ metropolitan area. The goal (there and here) is to recognize the parts of the city where actions aimed at improving walkability can be relatively easier and more effective. With this in mind, criteria to be considered were focused and indices to make them operable were developed. For reasons of easier data availability, the reference area is only the Municipality of Torino, but it makes sense and it would be possible to extend the analysis to the entire Torino metropolitan area[4].

The walkability analyzes developed at the city level are relatively more common.

Also for this level the approach has been raster. Some useful data-sets are referred to the statistical areas (average area 138 Ha), others to the census track (e.g. population, economic activities, employed: average area 3.3 Ha), others are punctual data. Data referring to statistical zones and census track have been rasterized, with a 20×20 meter cell (therefore much larger than the one used for the neighborhood level). In this way, the fact that the data do not refer to a single type of areas becomes irrelevant. Furthermore, these data are referred to predefined statistical areas, that is they are affected by a distortion related to their dependence on the delimitation of the areas themselves, defined a priori with respect to the analysis (areal dependence of data). The raster approach attenuates this distortion.

Several used data-sets were referred to points: they have been spatialized using the Kernel Density Estimation algorithm (see before). In this case radius has been assigned considering the area of influence of each activity, setting a maximum limit (1200 meter) corresponding to 20 minutes walking. The cell size was the same, 20×20 m.

Ultimately, all produced maps are raster and all with the same cell size.

The various rasters have been then simply summed giving to each one an appropriate weight, using the map algebra. Having used only weighed sums, avoiding more complex statistical algorithms, here and also for the neighborhood level, is functional to maintain a certain control on the meaning of the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

results: this is very appropriate because these results derive from a procedure which contains several debatable steps. To make indices and macro-indices comparable and summable they were normalized on a 0-100 scale. Table 3 and Table 4 list produced indices and display the complete process.

Figure 4 shows the result of the weighted sum of each Kernel Density Estimation related to the attractiveness index at the city level. The individual indicators, shown in Table 4, which make up this index concern three basic categories: services, leisure, intermodality.

Figure 5 shows the result of the weighted sum of all the indices at the city level (see Table 3). The darker areas are those that are best suited to walkability. Note that they are identifying some semi-peripheral areas with respect to the central ones, where the weighted walkability index is higher.

SOLUTIONS AND RECOMMENDATIONS

For the development of this research, the involvement of some officials of the City of Torino and of some staff members of the City of Torino Authority for Urban Mobility was fundamental. It took place within the *Framework Agreement... of collaboration between the City of Torino and the Politecnico of Torino to promote the culture and dissemination of geographical information among the institutions,* signed in September 2017. This involvement was helpful for the retrieval of various data-sets, for their correct use, and also for the identification of the criteria to be considered and the definition of the weights to be attributed to indices. This involvement will be obviously fundamental also for the desired future developments.

Despite this privileged conditions in which the collaboration with the City of Turin allowed us to operate, despite the current presence of European and national standards regarding metadata and interoperability of geographical data, despite the principle of *open by default* established by Italian law with regard to public property data, we had some difficulty in accessing data and in their (re)use. We had problems of absence or insufficient meta-documentation (e.g. code-list lacking, unexplained coding rules...), but also of inconsistencies in coding, as well as missing data.

In conclusion, the easy retrieval and reuse of data is still an unearned goal.

In addition to integrating missing data, making consistent enumerations etc., in the spirit of INSPIRE, of multiple use of information resources, it would make sense to revisit some existing data sets, also thinking of possible wider uses than those for which they were originally produced. An example can clarify. We used intensively Torino Geo-Topographic Data Base: the *forms* of the various objects and portions of the territory are represented, but other important aspects are not included, for example "pedestrian circulation areas" are not distinguished between "in public areas" or "in private areas". Another example: the areas that still retain the shape of vehicular road are classified as "vehicular circulation areas" even if a municipal deliberation has declared them only pedestrian. We understand the reasons (non-trivial) behind considering only the physical form, but this weakens the usability of the resource.

The views on walkability presented in this chapter (Figures 1-5) have been commented little or nothing at all because we think that their reading on paper is difficult and above all that it is not very stimulating. It is better to analyze these views, on a monitor, in a GIS environment that allows turning on and off layers, zooming, querying etc.

Table 4. City level: indices related to the attractive activities (I_ATTATT) divided by "services", "leisure", "intermodality"

Service Activities	Leisure Activities	Intermodality Activities
Local health companies Public bathrooms Libraries Churches Other places of worship Counseling Pharmacies Local markets Hospitals Carabinieri Finance guard Municipal police Civil protection Police stations Fire fighters Childhood schools Primary schools Secondary schools Administrative offices Registry offices Post offices Social-assistance structures Fiscal Assistance Centers Italian National Institute for Insurance against Accidents at Work offices Italian National Social Security Institution bisogna che si capisca che non sono ulteriori elementi della lista Universities	Cinemas Sport centers Thematic markets Museums Touristic offices Theaters	Taxi parking lots areas Car sharing stations Bike sharing stations Suburban bus stations Parking lots for disabled people Parking lots Metro stops

This statement is also based on some partial experiences we made: the views were presented and discussed, in a GIS environment, with some of municipal officials involved in the research. They obviously know the city well. These views are *objective* and depend on the data used, and may differ from the people's perceptions of the walkability. So, in front of these views, many questions arose, to understand how and why the analysis got those evaluations.

We think this is exactly the usefulness of our research: looking at walkability from multiple, partly new, points of view.

FUTURE RESEARCH DIRECTIONS

In fact, we think that the elaborations described in this chapter have to be seen as an aid to the various stakeholders to compare different points of view in an explicit and articulated way. Many steps of elaborations are questionable, in the sense that they imply choices, evaluations: it makes sense therefore, precisely, to use these elaborations to discuss on it.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Among the desirable developments (the chapter describes a work that is still ongoing) there is a certain automation of (at least) parts of the procedures, so that they can be used *live*, in operational contexts or in communication and participation situations. Some automation is also essential to produce sensitivity tests on the various indices and weights used, tests that help to focus on what is really important.

From the point of view of the Torino municipal mobility sector, the key point to the future development of walkability is not only to improve and increase the space for pedestrians but also that people take into consideration the possibility of walking on short distances, that is, they have to review their habits and build new mental maps of neighboring urban spaces. In 2015 the Municipality distributed a map named *Walk To* (where *To* stands for Torino), which contains some suggestions: some circumferences centered on the city center are drawn with the indication of the distances and the time to move on foot, but calculated as the crow flies, not significant and not very useful.

More stimulating information is required, for example, indications on what is the most pleasant and/or safe route and some highlights on the urban opportunities that can be encountered along the pedestrian paths. With this in mind we are thinking of making accessible meaningful parts of information that was elaborated and displayed in this research, producing an app for smartphone. Very important, this app shall allow also those who walk to provide some feedback to the Municipality.

CONCLUSION

The cost raster seems to be, and partly proved to be, a flexible and effective tool for reasoning, in detail, on the walkability of the city: it can be useful at neighborhood level, in discussion groups of interested people who know the places. The approach is objective, in the sense that the views of walkability are based on data, but we know that they depend to a large extent on implemented indices and weights. We think that people can be led to reconsider their perceptions of urban spaces and their urban mobility habits, also by varying the considered these indices and weights: questions and suggestions can arise. Perhaps even more questions and suggestions can arise when looking at the cost distances. It is with this process in mind that we avoided to use complex statistical algorithms that is we put it into practice the concept of IDTP 2018 *metrics ... easy to understand.*

Another concept of IDTP 2018 is *data… relatively inexpensive and quick to collect*. Hence the idea of using above all open data and of extracting thoroughly the information contained. If the San Salvario test area is limited, the extension of the survey to the whole city, and also to the urbanized parts of the metropolitan area, is feasible, not without costs but with sustainable costs.

ACKNOWLEDGMENT

We thank our colleagues Giuseppe Chiantera, Stefano Cianchini, Gabriele Del Carlo, Filippo Orsini, Rocco Picerno, Gianfranco Pirrello from Municipality of Turin who provided insight and expertise that greatly assisted the research.

ENDNOTES

1. Torino is a city in the North-West of Italy, in the past it was a typical one company town (car industry), in profound transformation since the 90s. It currently has almost 900,000 inhabitants. It was discovered as a tourist destination after the 2006 Winter Olympics Games.
2. *Pedestrian First* (IDT 2018) suggests also a third level of analysis/intervention, named *street level*, that concerns the redesign of urban space: this level is beyond our competences and the purpose of this work.
3. For example, shops, bars and restaurants overlooking the sidewalk, which can be seen both as pleasure and security factor (social control), in this context are not considered as a destination of movement and has been given to them a radius of 50 meters.
4. Various Torino metropolitan area definitions have been given over time. In the context of this chapter it makes sense to refer to the urbanized continuum area that includes Torino and 14 neighboring municipalities: this area currently has about 1,3 million inhabitants.

This research was previously published in Spatial Planning in the Big Data Revolution; pages 113-137, copyright year 2019 by Engineering Science Reference (an imprint of IGI Global).

Chapter 18
Teleworking and a Green Computing Environment: A Conceptual Model

Iheanyi Chuku Egbuta
University of South Wales Business School, UK

Brychan Thomas
University of South Wales Business School, UK

Said Al-Hasan
University of South Wales Business School, UK

ABSTRACT

This paper considers strategic green issues of teleworking in terms of the environment, transport, location, office space and resource use for modern organisations and business sectors and formulates a conceptual model of the processes involved. Teleworking technologies are variously implemented for green computing initiatives and many advantages include lower greenhouse gas emissions related to travel, greater worker satisfaction and, as a result of lower overhead office costs, increased profit margins. The paper initially investigates the appropriateness of a working definition of teleworking with regard to green computing and explores the benefits, and barriers, of teleworking in a green computing environment. Theoretical frameworks and models of teleworking are considered and a conceptual model of the contribution of teleworking to green computing is formulated. The application of the model is considered in terms of teleworking concepts, the organisational environment and driving forces. It is the intention of the paper to identify, and articulate, those teleworking concepts that will be useful to academicians, scientists, business entrepreneurs, practitioners, managers and policy makers, and to indicate future directions for research scholars and students with similar interests.

INTRODUCTION

The aim of the paper is to consider the strategic green issues of teleworking in terms of the environment, transport, location, office space and resource use (Goodman et al., 2004) for modern organisations and business sectors. The research has attempted to understand factors and processes through which organisations have adopted teleworking in relation to green computing. The study has surveyed and built upon the body of knowledge concerning teleworking and green computing, including applications and practice in the business research literature. In these terms the key benefits and barriers of "green teleworking" in contemporary organisations have been considered and the definitions and models of teleworking and green computing have been analysed. A review of the processes and dynamics of green teleworking as an innovative practice in modern organisations has been undertaken. Preliminary research questions for this study which arise out of the literature include:

- How do organisations overcome the barriers to adopting green teleworking?
- To what extent does teleworking, and specifically green telework, contribute towards a green computing environment?

In many respects, green teleworking is emblematic of recent changes in our ideas of work and the workplace (Bailey & Kurland, 2002). Information technology has facilitated the rapid growth of teleworking in recent times because modern telecommunication and computer technology allows workers to perform their duties at home or in remote locations instead of requiring them to travel to and from far-away workplaces (Ndubisi, 2003).

Most studies have attempted to reveal why the practice and application of telework has been slow among organisations and the main finding is that the interests among managers is low. According to Huws et al. (1990) in their survey of a poll of 4,000 European managers, reached the conclusion that telework 'is still very much a minority interest' among European managers. The research results showed that managers gave two major reasons for their disinterest in telework and these are: the lack of interest in the need for change, and the organisation and secondly, that the implementation of such programmes is difficult. The managers in large firms expressed concerns about controlling staff who work away from the conventional office environment. The smaller firms anticipated costs of managing and implementing telework programmes as a greater managerial issue (Bailey and Kurland, 2002).

Changes in order to organise work from different and remote locations with the use of hardware such as home and mobile computer, mobile phones and fax machines and software technologies such as the use of e-mails and group ware is what teleworking is about (Perez et al., 2004). Perez et al. (2004) believe that teleworking is not an all or nothing activity because only a small percentage of employees may be involved in teleworking. In addition, it can be viewed as a work pattern that can be imbibed in degrees ranging from less than one work day per week to all five work days per week.

Following identification of contemporary benefits and barriers of the adoption of green teleworking (Matthews & Williams, 2012), a model that highlights the importance of the factors for organisations has been developed to highlight the processes involved. Teleworking technologies are variously implemented for green computing initiatives and the many advantages include lower greenhouse gas emissions related to travel, greater worker satisfaction and, as a result of lower overhead office costs, increased profit margins. The paper initially investigates the appropriateness of a working definition of teleworking (USOPM, 2013) with regard to green computing and explores the benefits, and barriers,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of teleworking in relation to a green computing environment. Theoretical frameworks and models of teleworking are considered and a conceptual model of the contribution of teleworking to green computing is formulated. It is the intention of the paper to identify, and articulate, those teleworking concepts useful to academicians, scientists, business entrepreneurs, practitioners, managers and policy makers, and to indicate future directions for research scholars and students with similar interests.

The research methodology involved an extensive literature review into the fields of Teleworking and Green Telework. The literature review has identified journals, articles and documents that define, describe, test and analyse the concepts of Teleworking and Green Telework. Various definitions of Teleworking have been analysed from research papers and articles in contemporary journals and a definition of Green Telework has been given. The review has illustrated various trends and research gaps and has assisted in the formulation of a conceptual model of the contribution of Teleworking towards Green Computing. The research design has involved a logical sequence from the thematic literature review to the study's research questions, theoretical frameworks and models of Teleworking. This has been followed by formulation of the conceptual model, discussion of the usefulness of the model, future research directions and conclusions (Yin, 2012).

BACKGROUND

Teleworking Definitions

The definition of telework proposed by the European Commission reads as follows: "Telework is a form of organising work, using information technology, in the context of an employment contract/relationship, where work, which could also be performed at the employer's premises, is carried out away from those premises on a regular basis" (Krzyskow, 2006). The role of technology (Ellison, 2004) is reinforced by the definition used in the Polish legislations labour code which defines telework as:

…work done on a regular basis from the workplace, using means of electronic communication, i.e. technical solutions, including information technology devices and appropriate software tools, which enable individual communication over a distance while transferring data between information technology systems. A teleworker is a person who performs telework and passes the result of their work to the employer by means of electronic communication, especially by means of e-mail (Krzyskow, 2007).

The Australian Telework Advisory Committee (2005) adopted a working definition of telework to include work undertaken, either on a full-time, part-time or occasional basis, by an employee or self-employed person, which is performed away from the traditional office environment. This includes working from home, and which is enabled by ICT, such as mobile telephony or the internet. Australian Telework Advisory Committee (2006) research findings show that owing to the lack of a consistent definition of telework, it is difficult to assemble authoritative data when measuring the uptake of telework across industry sectors and between countries. Notwithstanding the difficulties in assembling comparable statistics, there is a surprising level of consistency in the conclusions of researchers who have studied telework, including the capacity of these arrangements to support business productivity and efficiency improvements, and their ability to broaden workforce participation. Daniels et al. (2001) define mobile telework as multi-location or nomadic telework as a brand of work that usually involves travel and/or

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

spending time on the customer's work location with the teleworker probably utilising laptop computers and mobile phones to support their mobile work. Mobile telework is classed as a form of working where those carrying out this work pattern work at a range of locations, spending a considerable amount of time away from home and office locations.

In an analysis of Daniel's definition of mobile teleworking, Hislop & Axtell (2007) suggest that the technology element of the definition leaves out jobs such as lorry driving, which involves considerable amounts of mobility however in some way necessitates minimal use to be made of information and communication technologies. Perez et al. (2004) views teleworking as the organisation of work through the utilisation of communication and information technologies that facilitate managers and employees to access their work activities (Golden & Fromen, 2011) from distant locations (Morganson et al., 2010) including hotels, airports and other remote locations (mobile teleworking), managers and employees' homes (home-based teleworking) and branch offices set up solely for the intention of lightening the employee's daily commute (telecentres or teleworking centres).

Niles' (1994) definition of teleworking concurs with the work of Perez et al. (2004), by defining telework as working outside the conventional work place and communicating with it by way of telecommunications or computer-based technology. Sullivan & Lewis (2001) encapsulate most of the above definitions of telework in a brief definition which states that telework is work practice that takes place anywhere and anytime. Ndubisi and Kahraman (2005) define teleworking as 'an information and communication technology aided work arrangement concerned with the use of personal computers, dedicated word processors or terminals, telephone, fax, e-mail, modem, etc., for work-related purposes from the employee's home, a satellite or neighbourhood work centre or any flexible work location outside the traditional work place will be adopted'. Building upon these definitions we define green teleworking as 'work undertaken away from the conventional office location using computer and telecommunications technologies involving green considerations of the environment, transport, location, office space and resource use'.

Benefits of Teleworking

Teleworking nowadays is considered as a flexible way to organize work and no longer as a technological innovation (Bridoux & Taskin, 2005). Teleworking represents an alternative work arrangement facilitated by information and communication technologies that allow the employee to work physically outside the conventional workplace, and, therefore, brings work to the worker (Fairweather, 1999) (Lake, 2013). This includes working away from the company premises (e.g. at home, in travel, in tele-centres), and is buttressed by the works of Watad and DiSanzo, 2000; Nilles, 1992; Olsen, 1983; that view telework as the inclusion of opportunities that employees are given to work from home rather than reporting to a centralised office site. Flexible, and in most cases unregulated, work time is another trait of teleworking which, according to Feldman and Gainey (1997), involves many workers making use of telecommunications technology to extend the workday after they arrive home, which in conventional terms will be classed as after office hours' time.

Scott and Timmerman (1999) evaluated issues concerned with teleworking including communication technologies options and their role on virtual work and assorted workplace classification. The conclusion of the evaluation was that telephone is the most used technology and they further discovered that there are a number of differences between the telecommunication technologies teleworkers used for communication and interface with a range of other parties (Scott and Timmerman, 1999).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Work involving processing data such as text, graphics, video, etc., (ENTER, 2007) are active teleworking mediums and these technologies are the backbone of any telecommuting programme and managing them is critical in the support of all teleworking programmes and initiatives (Siha et al., 2006). Byrd and Gulbro (1998) examined the significance of e-mail as a distributor and disseminator of information. However, they caution that e-mail should not be used to resolve employee crisis or to convey disapproval and they advise, that guidelines should be offered so that employees know when they should use face-to-face or telephone interactions (Byrd & Gulbro, 1998, Golden et al., 2008). Gornall et al. (1999) highlighted the need for video conferencing and its unique benefits over emails and phone conversations in organisations which can be very beneficial to the Green Teleworking concept.

Telework allows employees flexibility and control over their schedules (Strum, 2001; Hill et al., 1998). There have been different definitions of teleworking, however, summarizing all dimensions and conceptual criteria used by different authors, and admitting Qvortrup's (1998) claims that there is no reason to believe that an ambiguous and restrictive definition can be established for such a diverse phenomenon as teleworking. Huws et al. (1990) argue that three components are mandatory to recognize somebody as a teleworker: working in a remote location from employer or contractors' premises; use of IT technologies to complete work; and use of communications technologies to communicate for work purposes (with employer, colleagues, clients, etc.). According to Kamerade and Burchell (2004), there are three basic dimensions along with the different types of telework that can vary in addition to the three mandatory components: the location of remote work (Lim and Teo, 2000), combining home and traditional office, in satellite offices, telecentres (Bussing, 1998); the proportion of working time spent on remote working (Daniels et al., 2001); permanent or occasional work at home (Bussing, 1998); and employment status e.g. freelancer, employed, self-employed etc. (Daniels et al., 2001). There can be a wider variety of different types of teleworkers flexible enough to meet diverse analytical purposes and to concentrate on the teleworking specifics in different contexts (Kamerade & Burchell, 2004).

Another empirical study primarily associated with work that is repetitive, measurable and structured performed by DuBrin (1991), showed an increase in telework work-at-home by practicing employees. Chevron and Primeau (1996) examined teleworkers' behaviour and workers' attitude and found that teleworkers appreciate the freedom and feel more efficient; however, they miss the socialisation aspect of the typical work arrangement. The average capacity utilisation for the centre is about 54 percent based on regular users (Alcott, 2001). Programmes can be designed to train and educate people with disabilities for work in knowledge-based sectors which may assist in overcoming limitations to employment possibilities for people with disabilities (Baker et al., 2006).

Ndubisi and Kahraman (2005) have chronicled a list of these potential benefits and these are the balance between work, family and leisure is an advantage that teleworking offers to individuals. The flexibility issue, of caring for young children or an elderly family member while working from home, is addressed in conjunction with the balance issue in the family (Siha et al., 2006). There are many flexible life scheduling methods to accommodate new tasks. Hill et al. (1998) discussed the results of an empirical study where the influence of the virtual office was examined and it was found that it has a great positive influence on productivity and flexibility.

Less commute travel and more effective use of work time which translates to increased productivity results from eliminating the wasted time that a real commute requires and as a benefit of teleworking that is highlighted in studies by Davies (1995), Hill et al. (1998) and Angove et al. (2007). A study by DuBrin (1991) showed an increase in productivity of work-at-home employees, this was primarily associated with work that is structured, repetitive and measurable.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Bailey and Kurland (2002) conclude that work/life balance is indeed a benefit of telework but that the effect is primarily a benefit for "dual-career" families. Tietze (2002) reviewed a series of case studies of the UK teleworker that provided additional support for the benefits of dual-career spouses. One male spouse was able to take on more family duties including 'child rearing tasks' as a result of telework opportunities. Work–life balance has become increasingly important for a number of social and economic reasons which are making organisations think about how they work, government think about how people balance paid and unpaid work and care (USOPM, 2009; US Gov, 2010), and individuals think about the role work has and will have at different stages of their life. Broadly, this shift is influenced by changes in markets, ways of working, the labour market and expectations of work (Miller et al., 2008).

Hopkinson and James (2001) evaluated self-completion questionnaires from British Telecom (BT) employees who were in the process of registering for the BT options 2000 teleworking programme (a programme by BT to enable staff telework and reduce organisational cost). It was discovered that some employees were already working at home an average of 1.9 days a week and, considering overall, respondents anticipated that in future they will operate from home an average of 3.6 days per week (average car mileage saved by pre-existing teleworking was 95 miles per week per teleworker) (Hopkinson & James, 2001).

Internal research by Hewlett-Packard Ireland showed that teleworking can increase productivity by 25%. Relevant factors include reduced distractions and interruptions among teleworkers, as well as fewer commuting problems and a reduction in absenteeism (Sweeny, 1998). Productivity improves due to increased work efficiency in their work environment and the Telefutures report quoted figures of up to 50% reduction in sick leave (Bertin & O'Neill, 1996).

At an economic level, teleworking assists in the reduction of operational overheads especially accommodation and can provide a possible solution to the problems of rising office overheads, office expansion or situations where a high proportion of office desks are empty at any one time (National Advisory Council on Teleworking, 1999).

Barriers of Teleworking

The Sensis Report (2005) suggests that some businesses that did not have employees teleworking said that the main barrier was a belief that it was not suitable for their type of work. Also, in the Sensis report, 13 per cent of teleworkers report a negative impact of having to work longer hours (Sensis Report, 2005). Teleworkers may also think that their profession is being hampered by a lack of social contact with their contemporaries and managers and by being absent from the office (Australian Telework Advisory Committee, 2006).

In February 2005, the UK government announced a public consultation on extending the British flexible working laws that were introduced in April 2003 (DTI, 2005). In 2003, parents of children under six and disabled children under eighteen were given the right to request flexible working patterns, which included part-time working, variations in working hours and home working (DTI, 2005). Since employers have a duty to consider such requests seriously a government survey estimated that thirteen per cent of employees requested a change to working patterns in the first year of this law and eighty-six percent of those requests were wholly or partially accepted, meaning that around 80,000 people had new flexible working patterns (DTI, 2004). Ten per cent of those requests concerned working from home on a regular basis (DTI, 2004). If the home working ratio seen in the first year is a reliable predictor, this means perhaps 100,000 further people will be working from home on a regular basis (DTI, 2005).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

While the more formal aspects of teleworking are the subject of widely available advice concerning legal health and safety and some technology and work organization aspects (DTI, 2003), there are deeper unaddressed issues. These issues, as highlighted by Gundry and Slater (2005), are trust, work management, information management, social and team aspects, visibility and development, communications and time management and isolation (Angove et al., 2007). Technology is viewed as the backbone for any teleworking programme and managing it is critical in the sustainability and support of teleworking and technology is the enabler of teleworking (Siha et al., 2006).

There are several technology options to help implement telework and according to Viack Corporation (2005) the inherent technology needs for a teleworker are: a computer, internet connectivity, e-mail program, telephone and fax machine. The highest concern expressed from managements in organizations has been the fear of having less control over employees who work from home, ensuring that they remain productive and efficient. This particular concern can be addressed by introducing a richer medium for continuous communications, such as an online communication collaboration tool suite. By equipping teleworkers with high speed internet, a web camera, headset and an online communications solution, managers will be in touch with teleworkers at all times. An effective and useful tool, it should include such features as real-time video, telephone-quality audio and presence detection systems to allow better interaction between the main office and teleworkers. Using a combination of communication methods, such as online meetings, e-mail, fax and phone, will provide a comprehensive telework program.

In order to ensure that the basic elements of a successful teleworking scheme are in place, AT&T (2004) recommends that companies need to apply certain strategies to make it work. Positive outcomes such as improved productivity, organizational loyalty and belonging, job satisfaction, and employee retention and attraction often top lists of the advantages of teleworking (Bailey & Kurland, 2002) but an increasing number of people are teleworking to a large extent as an ordinary element of their job. In contemporary times it is unrepresentative of the true picture to study telework along any single factor or element, but rather in relation to varying working practices in general.

Theoretical Frameworks and Models of Teleworking

Research has shown that not all studies have supported teleworking. Von Glinow and Metzger (1988) attempted to offer an even-handed view by highlighting the problems experienced as a result of teleworking as a mode of work. Such problems highlighted are: social isolation, the presence of children, scarcity of non-financial incentives, career progression option, control mechanisms for efficient direction and governance, loyalty and commitment (Von Glinow & Metzger, 1988; Workman et al., 2003; Golden, 2006). Gainey et al. (1999) and Davenport and Pearlson (1998) also agree that social isolation is a problem in the teleworking work pattern in their research. Venkatesh & Vitalari (1992) cited teleworking inside the wider context of a non-synergised organisational structure. In their research, they consign to additional work done at home, in addition to the usual office based work. A focal input of Venkatesh and Vitalari's model is the merging of the three factors of the organisation work factor, the technology work factor and the household factor with emphasis on home-work relations.

There are several representations of teleworking however, according to an Australian telework advisory committee consultation paper (2002), telework has eight models and they are satellite centres, time-shifting, home-based telework, home shoring, mobile workers, virtual working, home-based self-employment and off-shoring. Different conceptual models for the adoption of telework and its uses have been proposed by many researchers and these are evidenced in the literature.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

There are several models worth exploring to develop a deeper appreciation of teleworking. For instance, the work of Gray (1997) adopted the supply/demand approach of telework; the relationship between different telework practices and organisational outcomes (Matthews & Williams, 2012) by Belanger and Collins (1998). The Siha and Monroe (2006) research model follows a top–down viewpoint that starts with a tactical organisational element controlled by the regulatory and competitive environment within which an organisation operates. The Siha and Monroe model advocates government regulation and competition because they present the momentum for organisations to consider telework work patterns (Siha & Monroe, 2006).

A CONCEPTUAL MODEL OF GREEN TELEWORKING

The conceptual model of green teleworking developed for the research is central to the research questions, methodology and survey work. It has been fashioned as a model that depicts the organisational adoption process of green teleworking and has been developed taking into consideration important stakeholders and defining the main concepts. The principal concepts concerning Green Teleworking identified in the literature are: 1) Environment, 2) Transport/travel, 3) Location of work, 4) Office space, and 5) Resource use (Goodman et al., 2004), and these are described below.

1. **Telework and the Environment:** Reduced environmental impacts is a major benefit of teleworking and according to the Department of the Environment and the Environmental Protection Agency in Ireland, motor vehicles are a significant source of greenhouse gases, air pollution, noise, and deterioration of the urban environment and health problems. This has led to their acknowledgement of the environmental benefits of teleworking such as reduced commuting that will lead to less gas consumption and less emissions, possible saving in energy usage in modern buildings, and reduced traffic congestion. Additional benefits to the teleworker include a reduction in commuting time and the increase in leisure/family time, health benefits, a reduction in stress levels and possible cleaner environment benefits and financial savings (National Advisory Council On Teleworking, 1999). Even though local air pollution has declined with the advent of catalytic converters and cleaner fuels, improvement in fuel efficiency for individual vehicles has been balanced by the growth in the volume of traffic (Department of Transport, 2002). Sometimes alternatively called 'telecommuting', teleworking has been presented as an answer to the inconvenience of traffic congestion and pollution with the supposition that travel will be reduced because of the eradication of commuting trips (Baines, 2002; Pyoria, 2003).
2. **Transport/Travel:** Teleworking using mobile networking devices could promote a general shift away from passenger car travel (Goodman et al., 2004) and recent European Commission research has underscored a scenario of simultaneously increasing road congestion and rapidly improving mobile computing. Since public transportation is more open and adaptable to mobile computing than the private car i.e. with wireless internet now frequently available on trains, the research envisages the prospect of a movement from the car to the bus, tram and train (Ndubuisi, 2012) (Erdmann et al., 2004). A study by Mitchell and Trodd (1994) observed the travel behaviour of a small sample of practicing UK teleworkers and found an average reduction in commute of 113 miles per week (even after creating allowances for remaining travel to work and additional non-work trips). A study by Flexibility Ltd (2000) and Angove et al. (2007), also support this, reporting that time wasted

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

in traffic jams can represent a significant loss to the economy, as evidenced in the estimated net public loss to the UK economy at £20 billion. Environmental benefits from increased telework through reduced traffic congestion and carbon emissions will assist to address air quality and the quality of life in metropolitan areas (Lake, 2013) and business savings can be realized by providing flexible telework arrangements which improve worker productivity, efficiency and organizational effectiveness and reduce staff turnover and absenteeism (Sensis, 2005). Organizations that have established business cases and invested in telework, are reaping the benefits because they outweigh the costs (Sensis, 2005).

3. **Location of Work:** Improved flexibility and work-life balance is often mentioned in relation to teleworking (Wilks & Billsberry, 2007). Kurland and Bailey (1999) and Gurstein (2001) mention the supposition that doing work from home allows a more beneficial work-life balance even though Gurstein (2001) questions if it is truly the case. Tietze and Musson (2005) advise that the boundaries and discourses of work and home blur when people telework while it is suggested by Wilson and Greenhill (2005) that gendered identities and roles will be renegotiated because of the promised flexibility of telework. Tietze and Musson (2005) found that working from home was not an interruption-free method of work, however they found out from the teleworkers interviewed that they were able to make out time to benefit their families and themselves and these moments were much appreciated. Business productivity and cost savings advantages are evidence that indicate the positive consequences and cost of teleworking to employers (Jackson and van der Wielen, 1998; MITEL, 1998). Teleworking is viewed as an attractive working arrangement among employees generally, as increased flexibility of working hours and location of work can be used to meet the changing needs of people throughout their lives, and during human and natural disasters, the ability to work in a decentralized manner, away from central business locations, can allow businesses and governments to provide ongoing services (ATAC, 2006).
4. **Office Space:** Cost savings in office space are a major advantage of teleworking because people who telework do not use office space and do not create overheads and this advantage even covers part-time teleworking hot-desking because they still generate space savings (Baruch, 2001). Companies are now reducing office work space and streamlining work activities on the basis of room-sharing and remote working and traditional workplaces and central offices are going through fragmentations and shrinking in order to reduce office overheads and cost of facilities (Morelli, 2001).
5. **Resource Use:** Since the mid-1990s traditional 'nine-to-five' offices were replaced by flexible working solutions for employees such as virtual offices, hot desking, motelling, hotelling and campus-style organisations (Wood, 1997). Several studies especially those from Baruch and Nicholson, 1997; Hill et al., 1998; Leonard, 2000, and Lake, 2013 have highlighted employees' improved efficiency and effectiveness and even increased morale and satisfaction as some intangible benefits of teleworking. There is definitely a positive impact of telworking on individual performance (Golden et al., 2008), wellbeing and effectiveness (Atkinson, 1985; Baruch, 2000; Di Martino and Wirth, 1990). Increased workforce participation in teleworking and remote working is becoming more of an option for employers of labour because according to Hart (2008):

…employing staff to work from home gives employers access to staff with the skills they need, no matter where they may be based. And while our country's network has room for improvement, it does offer

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

many people the facilities to log onto company networks – just as though they were sitting at a desk on-site. And once the concept of staff working remotely has been accepted, it opens up the possibility of employing people with the skills a company needs no matter where in the world they may be.

Empirical studies indicate that in organisations the human resources department's flexible practices such as flextime; part-time work, compressed work week etc., contribute a great deal and positively impact on firm performance (Konrad & Mangel, 2000; Perry-Smith & Blum, 2000; Eaton, 2003; Watad & Jenkins, 2010).

Figure 1. A conceptual model of the contribution of Teleworking towards Green Computing (based on Goodman et al., 2004 and Egbuta, 2016)

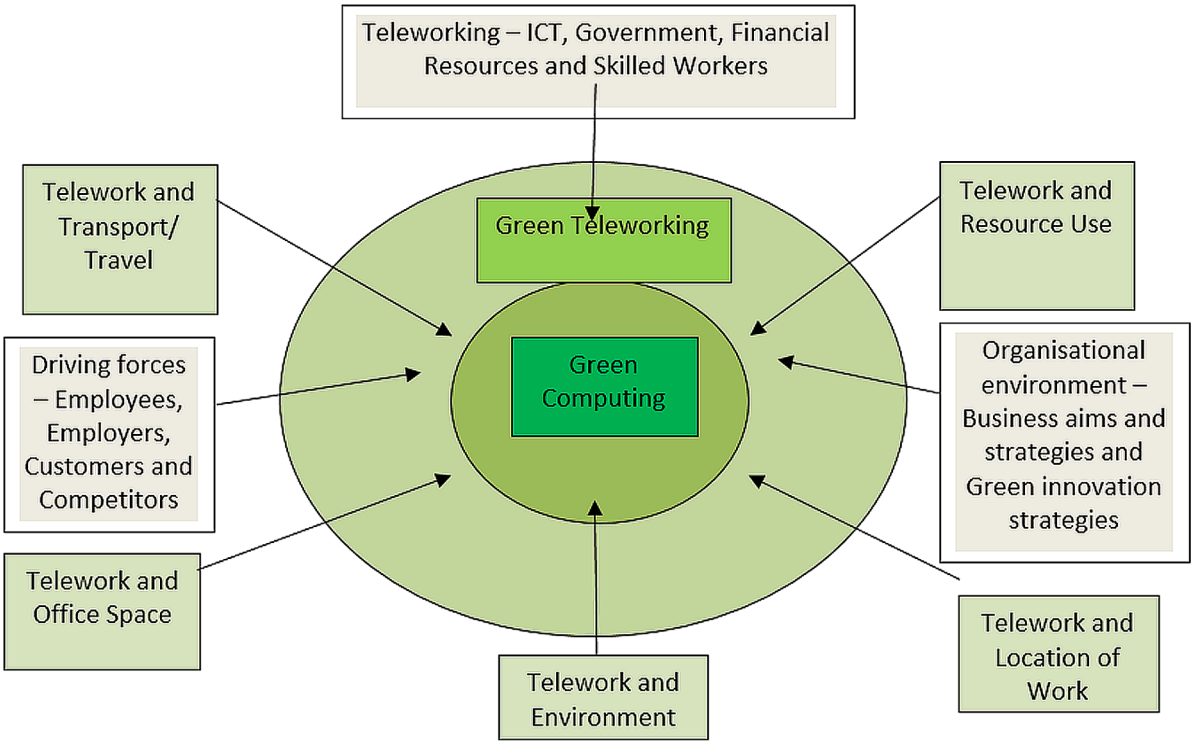

Figure 1 illustrates the conceptual model of the contribution of Teleworking towards Green Computing according to the main concepts (Goodman et al., 2004).

APPLYING THE MODEL

The application of the model can be through the ICT infrastructure, government, skilled workers and the green computing environment (Egbuta, 2016), and these are discussed below.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Teleworking

Information and Communications Technology (ICT)

ICT infrastructure refers to the facilities and networks employed to transmit and receive information by electrical or electronic means. For every country, the level of telecommunication infrastructure provided is different. Organisations need to know what telecommunication infrastructure is available in their area to have a better understanding of the type of teleworking that they can have access to and can make their business more efficient.

There are various types of teleworking through ICT infrastructure connection that is offered to organisations depending on the availability. Some examples of common ICT connections are Digital Subscriber Line (DSL), Wireless Internet Service Provider or Mobile Broadband. Each of the connections offers a different type of Internet speed and price. If the users have a reliable telephone connection, considering the DSL might be the best (most expensive). However, mobile broadband has the advantage that the users can use it to access the Internet anywhere (dependent on whether the users have access to the 3G, 4G and in recent times 5G network).

The other alternative to access the Internet is from a public access point, such as a tele-centre, places, Wi-fi zones that offer the Wi-fi or Internet cafés. These can be commonly found in nascent times on trains, buses, shops, hotels, holiday resorts, ships, boats, clubs, schools, and in diverse places where business takes place. This alternative is a common option for rural areas organisation users to get connected to the Internet in order for them to effectively have teleworking as a workplace practice.

Government

The government is the agency that can provide many kinds of support programmes and incentives to assist organisations in the adoption of teleworking. For example, government can introduce some major components of support programmes, which cover infrastructure, financing, advisory services and information, health and safety, technology, and human capital. These are some components created to assist and enhance the growth of teleworking in organisations.

These support programmes and incentives provide greater opportunities for organisations to gain an advantage. For instance, organisations may seek advice on adopting and using teleworking. In addition, organisations may consider the incentives offered by the government such as grants offered and given to start new businesses with little or no taxes paid on ICT equipment and workplace developmental programmes, skills growth and management skills development, which supports the adoption of teleworking. Government incentives, support bodies and business growth intervention programmes in some countries, these types of support programmes will not exist. Organisations can refer to business councils or chambers of commerce to identify what support programmes and incentives are being offered by the council or in their cities.

Financial Resources

The cost of the adoption of teleworking as an innovative work practice can be an issue for organisations. It will result in start-up costs that have to be borne by the organisations; however, in the long-run the adoption of teleworking will reduce operational costs drastically. For example, through teleworking

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

as an innovative workplace practice, organisations can reduce the cost of printing of materials (letters, brochures, pamphlets or forms), manage customer orders systematically remotely and from any location, and be able to answer any response from customers promptly (replying to e-mails). Below are a few recommendations that organisations could consider to reduce the cost of adopting teleworking as a workplace practice:

- Organisations practicing teleworking may utilize free services, like free website templates to design the website, free e-commerce checkout tools for payment facilities, free software for managing website content and free hosting packages. These free services allow organisations to create a business website with minimal cost. Organisations can slowly replace the website with high quality for-pay services as teleworking applications and practices, reduce the cost of business overheads and grows and generate profits.
- Organisations can adopt the use of skype, go to meetings, face time (i-phone facility), yahoo messenger, msn messenger which are all free services in order to reduce costs however still able to view clients, employees and customers through video conferencing regardless of location. This is one of the benefits of teleworking.
- Organisations could consider using collecting deals with telecommunication firms by using a bulk collective contract on phones, on internet and on online portals, the chances of reducing costs are higher as such deals most times, come at discounted rates thereby saving organisations valuable resources and ploughing it back into expanding the telework practice for better business.

For organisations in rural areas, collaborating in developing a superior joint teleworking portal or site can be an advantage for organisations (sharing the resources). Through this portal, organisations can work together to promote their business as they do not have to pay to promote themselves individually. This is an innovative way of enhancing teleworking and supporting each other.

Skilled Workers

There are certain issues to be considered before hiring skilled workers for teleworking to be practiced. Among these issues are:

- The cost of hiring skilled workers is expensive. Does it affect your organisation's expenses?
- Can hiring one skilled worker be an asset to the organisation as he/she would be able to train others in teleworking methods and application, thereby saving the organisation's resources?
- For rural areas, there is a possible shortage of skilled workers. Thus, it diminishes the option of the skilled workers to be selected.

Organisational Environment

Business Aims and Strategies

It is important to have appropriate business aims and strategies for each organisation. The business aims and strategies will determine the direction of the organisation and determine if the organisation is

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

driven by positive innovation thereby applying teleworking as a workplace practice. The aims guide the business in what to do and the strategies indicate how the business will do it.

Green Innovation Strategies

Green innovation strategies involve the process of promoting new ideas, products and services in a green computing environment, which allows the organization to increase sales and profits with limited available resources. It may also be seen to be the conversion of new knowledge into products or services thereby, creating value, increasing efficiency, and therefore growing a business.

Teleworking even though not very new can be classed as a green innovation strategy for organisations as it was formerly perceived to be just for technology enhanced organisations. Without innovation, new products, new ways of carrying out business and new service delivery plans for employees and customers would never materialise, making organisations remain entrenched doing things the same way without positive environment friendly change.

Driving Forces

Employees

Employees are the back bone of any organisation and most especially the employees that make up environment friendly enterprises. If the employees of an organisation are not happy with their conditions of service, work environment, direction of the business, innovative ideas for future business development, this will definitely affect the progress of such a business. Hence, the need for work practices such as teleworking to be implemented and sustained to ensure that working conditions are favourable as well as having the right workplace balance for healthy family life which if not managed properly will affect performance.

Employers

Employers employ labour and have the full power to transform the direction of their businesses and transform the innovative direction of their businesses completely. Teleworking is advocated and employers embracing this workplace practice will do a lot to boost employee satisfaction, customer happiness because of the bespoke nature and pro-customer and pro-business outlook of teleworking.

Customers

Every customer might have different needs. Every organisation has a target audience and once that audience called customers are not catered for, the business will begin to see problems that can affect its existence. This scenario needs to be considered by organisations as innovation through teleworking allows for flexibility with customers' needs in order to select an appropriate approach for the target market.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Competitors

It is important for organisations to identify their competitors in the market especially in an ever-changing world where needs and desires change every second and businesses and customers continue to seek better alternatives. The adoption of teleworking as a business practice can give an organisation a positive advantage over its competitors.

DISCUSSION OF THE USEFULNESS OF THE MODEL AND FUTURE RESEARCH DIRECTIONS

With regard to the usefulness of the conceptual model, the benefits include the provision of a framework that clearly specifies the main concepts associated with the adoption of a Green Telework approach by organisations and companies. The general nature of the model enables its use for a broad spectrum of organisational situations and through this it will be possible to evaluate the consequences of the adoption of a Green Telework approach. Further to the development of the model it will be possible to provide a clear direction for future research into Green Telework. This will address some of the existing gaps in the literature and provide an agenda for future research. A key success factor in terms of how well an organisation performs in terms of Green Teleworking is whether there is a positive environmental impact (Campbell & McDonald, 2009). One measure will be whether there is a significant reduction in travel leading to less pollution and congestion. Future research is therefore required to investigate this. Existing research into Teleworking, and specifically Green Teleworking, has tended to examine advantages and disadvantages. There is therefore a need to investigate the deeper issues of the various groups involved. Finally, with the development of the latest laptops and netbooks these will have a much smaller environmental impact buttressing the need for a more universal Green Computing environment and a future research strand could be to quantify the benefits of these.

CONCLUSION

The paper has considered the strategic green issues of teleworking in terms of the environment, transport, location, office space and resource use for modern organisations and business sectors and has formulated a conceptual model of the processes involved. This study contributes to the body of knowledge in respect of the use of teleworking in a green computing environment. It has been observed that more attention is needed to support organisations in adopting teleworking as a workplace practice (Egbuta, 2016). Many previous studies have focused on the use of teleworking on a larger scale, and ICT in general, by larger enterprises in developed countries. This study has involved the development of a conceptual model for the use of teleworking as an innovative tool and workplace practice in a green computing environment. The study has made an empirical contribution through providing greater insight to organisations in adopting teleworking as an innovative work practice in their business. The model offers benefits to researchers, development consultants, and policy makers. There are many ways to apply this model. From the perspective of organisations, this model can be applied to evaluate the performance of the adoption of teleworking. Organisations can revise their business aims and strategies, and innovation strategies if the adoption of green teleworking in the workplace does not contribute to the outcomes expected. The

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

model will provide better insights to professional consultants or development for assisting adopter and non-adopter organisations to focus on areas they need to concentrate on if any complexities arise. This model can be presented as an instructive manual for environmental policy makers. Through this model policy makers can determine the areas of teleworking innovation in a green computing environment that require support.

It has been found that teleworking technologies are variously implemented for green computing initiatives and the many advantages include lower greenhouse gas emissions related to travel, greater worker satisfaction and, as a result of lower overhead office costs, increased profit margins. The paper has investigated the appropriateness of a working definition of teleworking with regards to green computing and has explored the benefits, and barriers, of teleworking in a green computing environment. In relation to the research questions posited it has been found that organisations can overcome the barriers to the adoption of green teleworking by taking an informed approach to enable competitive advantage and cost savings. In these terms teleworking, and specifically green telework, can make a positive contribution towards a green computing environment. Following consideration of the theoretical frameworks and models of teleworking a conceptual model of the contribution of teleworking to green computing has been formulated. This has identified and articulated those teleworking concepts that are useful to both academics and practitioners and from this the future directions for research have been identified.

Chapter 19
Accessibility Compliance for E-Government Websites: Laws, Standards, and Evaluation Technology

Lourdes Moreno
Advanced Databases Group, Department of Computer Science, Universidad Carlos III de Madrid, Madrid, Spain

Paloma Martínez
Department of Computer Science, Universidad Carlos III de Madrid, Madrid, Spain

ABSTRACT

Barriers to web accessibility exist that deny the rights of people with disabilities to access content on public sector websites even though equal access is mandatory on e-government websites in most countries. In order to achieve web accessibility, specific standards and technology are essential for ensuring compliance with accessibility laws. In order to support the implementation of accessibility standards facilitating compliance with laws and methodological approaches exist which can play an important role in making e-government websites more accessible. The purpose of this article is to present the regulatory framework regarding accessibility, a survey of the technology and a proposal of good practices concerning technology which evaluates accessibility as a support resource. Recently, standards have been updated which make compliance with accessibility standards mandatory in the upcoming years. Faced with this situation, this work provides support resources to this new regulatory framework such as approaches to accessibility monitoring and evaluation technology.

INTRODUCTION

We continually use information and communications technology (ICT) for everyday tasks. Through the Internet, individuals can access an ever-increasing number of services. A digital society can only be complete when all citizens have access; this access must include persons with disabilities (PWDs).

There is a wide range of PWDs, including blindness, low vision, deafness, hearing loss, learning disabilities, cognitive limitations, limited movement, speech disabilities and combinations of these. Moreover, some people may have disabilities due to an illness or they may develop impairments with age. Given this situation, we must all face the fact that, at some point in our lives, we all may be forced to deal with either a temporary or permanent disability. One billion people, or, in other words, 15% of the world's population, experience some form of disability (WHO, 2011). Furthermore, the population in Europe is becoming increasingly older, and the proportion of senior citizens who need assistance in their daily life will continue to rise in the coming years. Between 2016 and 2080, the elderly will account for an increasing percentage of the total population. Those aged 65 years or older will account for 29.1% of the EU-28's population by 2080, compared with just 19.2% in 2016 (Eurostat, 2017).

PWDs configure standard software and hardware according to their needs, and use assistive technologies that help them perform tasks. Assistive technologies include screen readers that read webpages aloud for blind, screen magnifiers for people with certain types of low vision and selection switches for people who cannot use a keyboard or mouse. Using technology in a way that supports accessibility means that it works with assistive technologies. This condition is satisfied if accessibility standards are followed (W3C WAI, 2017). Therefore, in order to prevent the exclusion of PWDs, it is essential that public government websites be accessible. They must follow accessibility standards so that any citizen, with our without disabilities, can access a website. These standards are referenced in the laws and regulatory framework regarding accessibility in the different countries. In most cases, it is mandatory for all e-government websites. Despite numerous efforts made by various governments, the Internet is not completely accessible. Studies indicate that there are many websites which continue to present accessibility barriers (Olsen, 2010) (Moreno, 2018). Currently, there are still research challenges which must be overcome.

Several factors positively influence compliance with web accessibility. Some of these are the integration of accessibility requirements into website development processes and the definition of accessibility policies for the organizations (De Andres et al., 2010). During all stages of web development, accessibility must be taken into consideration. In addition, the accessibility integrated into the development processes must be sustainable throughout the life cycle of the application, something that is difficult to achieve. The research has identified occasions in which the incorporation of accessibility has been possible via its integration into User-Centered Design processes (Baguma et al., 2009; ISO, 2010; Rusu et al., 2015), web engineering approaches (Moreno et al., 2013), design tools (Xiong et al., 2007), authoring tools (Power et al., 2007), evaluation tools (Abascal et al., 2004) and monitoring tools (Mirri et al., 2011).

Assessment technology is fundamental for creating accessible products as it is essential for developers to evaluate their web prototypes as soon as possible in the development process. Due to the fact that problems with web accessibility may arise during any stage of development, continuous support for accessibility testing is needed (Trewin et al., 2010). Evaluation methodologies and automatic validators play a key role in ensuring the accessibility of e-government public administration websites. Public policies for web accessibility should take such tools into account, regulating and promoting their use (Paternò and Schiavone, 2015).

For this purpose, an exploratory study has been carried out to detect the existing weaknesses found in the implementation of accessibility in policies in both the organization and development processes. To this end, a study of the regulatory framework regarding accessibility has been carried out, indicating which standards must be met and if there are guides and support on how to apply these standards. Subsequently, a study is presented in which accessibility assessment technology is analyzed as this evaluation technology is an essential element affecting compliance with accessibility standards process.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Additionally, a proposal of accessibility assessment tools is presented. This technology is analyzed to determine whether it provides sufficient support, or, on the other hand, if it may be the reason for the existing challenges related to non-compliance with accessibility standards. Finally, a discussion is presented in which some of the best practices in evaluation technology advancing accessibility development processes are provided.

The structure of the paper is as follows. Section 2 presents an overview of the legislative framework and standards for public policies on web accessibility, as well as several studies regarding the accessibility of e-governments websites and services. Methodological approaches on accessibility assessment technology which is essential to ensuring compliance with the legislative framework concerning accessibility are presented in Section 3. Additionally, a survey of automated accessibility tools is presented as a support resource for choosing an accessibility assessment tool. Finally, some conclusions are presented in Section 4.

BACKGROUND

Laws and standards regarding accessibility and studies of the accessibility level of e-governmental websites are presented in this section.

Accessibility Laws for ICTS

Since the late 1990s, several countries began to enact laws adopting computer system accessibility for technology supported or provided by the government. One of the first countries was the U.S. with the Section 508 of the Rehabilitation Act of 1973 modified in 1998, (Access-board, 2017). Many other countries have also passed similar legislation (Putnam et al., 2012) as the Disability Discrimination Act (DDA) of U.K.

The European Council also began to address the issue with several action plans such as eEurope 2000, eEurope 2002, eEurope 2005 and Europe 2020 strategy. The "United Nations Convention on the Rights of Persons with Disabilities was ratified by the European Union and its Member States in 2010 (United Nations, 2006). It recognizes that disability is an outcome of the interaction between the person and the physical, technological and economic barriers, as well as other aspects that prevent their participation in society. Several countries began to enact national laws on the accessibility of information systems as Germany with the BITV in 2002, Italy with the Stanca Act in 2004, etc. A lot of these laws have updated and referenced standards as is shown in Table 1.

In January 2017, the US Access Board released their latest proposal to update (ICT) Standards and Guidelines related to Section 508 called "The Refresh" (Access-board, 2017 b). These updates also contain revised guidelines for Section 255 of the Communications Act that apply to manufacturers of telecommunications products and services. In October 2016, a European Directive on Web Accessibility for Public Sector Websites by European Parliament has been approved. This new situation means that PWDs will have better access to the Websites and mobile applications of public services (European Commission, 2016).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Accessibility Guidelines and Standards for ICTs

In order to achieve compliance with the legislation, numerous initiatives and standards exist which identify accessibility problems and suggest new accessible designs. As regards accessibility standards, special mention must be made of the World Wide Web Consortium (W3C) with the Web Accessibility Initiative (WAI).

The WAI has been working since 1997 on accessibility guidelines. The most relevant guidelines are the Web Content Accessibility Guidelines (WCAG), first published as version 1.0 in 1999, then updated to version 2.0 in 2008 (W3C WAI, 2008) and it was recently updated to WCAG 2.1 (W3C WAI, 2018). WCAG is internationally recognized as the reference standard for Web accessibility and is referenced in the regulations of several countries that mandate accessibility of public Websites such as is indicated in Table 1. Since 2012 the WCAG 2.0 is an international standard through standard ISO/IEC 40500:2012 (Information technology -- W3C Web Content Accessibility Guidelines (WCAG) 2.0).

WCAG 2.0 covers a broad range of recommendations for making Web content more accessible. Regarding its structure, WCAG 2.0 contains three main layers of guidance: principles, guidelines and success criteria that provide the basic goals that Web designers should work toward in order to make content more accessible for PWDs. These criteria allow WCAG 2.0 to be used where requirements and conformance testing are necessary, such as in design specification, purchasing, regulation and contractual agreements. To meet the needs of different groups and different situations, three levels of conformance are defined: A (lowest), AA, and AAA (highest). In general terms, one of the levels of conformance is met in full on a Web Page. In most regulatory frameworks that have adopted the WCAG 2.0, it is mandatory conformance level AA. In order to comply with WCAG 2.0, it is essential that evaluation technology is provided to developers such as is presented in Section "Evaluation technology in the context of accessibility standards".

WCAG 2.0 is mandatory in many countries for public Websites and, in some cases, even for privately owned sites. Apart from that, there are other relevant standards, very similar to WCAG 2.0, which are entirely or partly related to Web accessibility, such as guidelines and technical standards such as shows Table 1.

Accessibility Standards for ICTs Development Process

Organizations must address the needs of PWDs throughout the ICTs development processes holistically in the organization. There are accessibility-related standards that offer a guide to integrating accessibility into the process by the Organizations. These standards are best practices to implementing accessibility for the organizations and public policies. However, only these standards can be followed if there is a support of technology from the technical and methodological point of view.

In the United States, an example is The Twenty-First Century Communications, and Video Accessibility Act (CVAA) (Federal Communications Commission, 2011) which indicates that 'Manufacturers and service providers must consider performance objectives at the design stage as early as possible and must implement such performance goals, to the extent that they are achievable'.

Likewise, according to Section 508 Refresh, product developers are required to incorporate accessibility throughout the entire design and development stages. Other standards are aimed to the standard process of accessible technology. It is the case of BS 8878 that was launched in the UK in 2010 (British Standards Institute, 2010). While technical, design or testing aspects of accessibility are focused on by

Table 1. Regulatory framework on web accessibility

Country	Standards and Guidelines	Legislation/Directives
Australia	WCAG 2 AA	Disability Discrimination Act
Canada	WCAG 2 AA (implemented as the Standard on Web Accessibility)	Human Rights Act 1977
EU	WCAG 1 AA (on going WCAG 2 AA)	European Parliament Resolution (2002) Ongoing new European Directive
France	RGAA 3 (based on WCAG 2.0 AA)	Law No 2005-102, Article 47
Germany	BITV 2 (based on WCAG 2 AA, but not identical.)	Federal Disabled Equalization Law (BGG)
Ireland	Universal Design Guidance for Online Public Services 2.10 (Included WCAG 2.0)	The Disability Act 2005
Italy	Technical Rules of Law 4/2004 (updated to WCAG 2 in September 2013)	Law No. 4/2004 (Stanca Law)
Japan	X 8341-3:2016 (Identical to WCAG 2.0) AA	Government Directive
Netherlands	Guidelines, which include WCAG 2.0 AA.	Government Directive
New Zealand	New Zealand Government Web Standards 2.0 (Identical WCAG 2.0 AA)	Human Rights Amendment Act 2001
Norway	WCAG 2 AA (with exceptions)	LOV 2008-06-20 nr 42
Ontario	SGQRI 008 (based on WCAG 2.0 AA)	Ontarians with Disabilities Act (AODA)
Spain	Standard UNE 139803:2012 (Identical WCAG 2 AA)	Law 34/2002, Law 51/2003, Royal Decree 1/2013
United Kingdom	WCAG 2 AA	Equality Act 2010
USA	Section 508 Refresh references WCAG 2.0 Level AA	Section 508 of Rehabilitation Act. (Refresh)

the WAI web accessibility standards, this standard specifies commissioning and implementing procedures for accessible websites regardless of whether said websites are developed for internal use by an organization or are subcontracted and focused more on users (Cooper et al., 2012).

In Europe, the European Commission published in 2005 a Mandate, M/376, to the three European Standard Organizations CEN, CENELEC, and ETSI to work on the development of functional accessibility requirements to be used in public procurement of ICT products and services. The result is the European standard EN 301 549 with the functional accessibility requirements, accompanied by guidance material and an online toolkit supporting the work of public procurers (see Figure 1).

With the aim of providing support for the implementation of accessibility standards, ISO launched in 2015 the standard ISO/IEC Guide 71 (Guide for Addressing Accessibility in Standards) that contains approaches to addressing accessibility in standards to fit with the different social policy models in different countries.

WAI has a documentation to help companies realize the benefits outlined for integrating accessibility into their development. Within it, guides which help to integrate accessibility throughout the Web production process have been developed (W3C WAI, 2016) and developing Organizational Accessibility Policies (W3C WAI, 2018b).

As previously stated, these standards are more focused on the processes that help organizations in their attempt to adopt holistic support resulting in an accessible user experience in addition to building in accessibility from the earliest stages. By keeping PWD's specific user experiences in mind through-

Figure 1. Screenshot of the online toolkit of the European standard EN 301 549 (http://mandate376.standards.eu/)

out the entire process, it will be easier to achieve the established requirements and better processes and products will be produced, improving the resulting outcome for everyone (Horton and Sloan, 2014).

Such as it has been observed, there is a lack of consensus on accessibility standards. This situation is not conducive to compliance with the accessibility standards. Currently, there is a trend for harmonization consisting of standards and guidelines as Section 508 Refresh and the Europe standard EN 301-549 with the WCAG 2.0.

After reviewing laws and standards on accessibility for e-government Websites, it is essential as is shown in Section "Evaluation technology in the context of accessibility standards" that technology be aligned with the needs presented by these regulatory frameworks in accessibility.

Studies of the Evaluation of E-Governmental Websites With Regards to Accessibility

The existence of legislation shows that web accessibility is a global issue. Despite these legislative efforts, many public organizations' websites present accessibility barriers (Paternò and Schiavone, 2015). Access to e-government services must be a priority due to the fact that access to services can give PWDs equal access to the vast potential job market, information and services in addition to promoting their social inclusion in the digital society (Carter and Markel, 2001; Bonacin et al., 2010; Moreno et al, 2018).

To date, several studies on web accessibility, at both the national and international level, have already been carried out. Several studies have revealed issues with accessibility to government websites around the world. They indicated that government websites do not comply with current laws. Some examples of these studies are the Government Website Accessibility in Australia and China (Shi, 2006), Alabama (Potter, 2002; Bridgett, 2016), Italy (Gambino, 2016) or Dubai (Kamoun, 2014) or Africa (Formunyuy & De Wet, 2017). A study of the accessibility issues of the UK e-government sites revealed that the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

websites display similar non-compliance issues with regards to the guidelines included in accessibility laws (Kuzma, 2010). Several papers have pointed out that compliance with the Section 508 law in the US remains low among Federal government websites regardless of the fact that the law has been in effect for nearly ten years (Jaeger, 2006; Lazar and Olalere, 2011). In all of these research works, evaluation technology has been used. However, the majority of the studies only evaluate websites by considering the compliance of their home pages with WCAG 2.0 (Youngblood, 2014; Shi, 2006; Potter, 2002; Kuzma, 2010). They do not provide support to evaluate a large-scale website or to monitor accessibility throughout the entire life cycle of the website.

Some of these are dedicated to using national and/or international guidelines in order to assess, identify and monitor the level of accessibility found on a variety of websites (governmental, public administration). These studies are mostly based the evaluation of activities carried out by human operators which monitor accessibility with the help of both automatic and semi-automated evaluation tools. There has been a number of large-scale geospatial assessment activities carried out, such as the "DG Information Society and Media", which focused on a variety of regions. Another example is the "Measuring progress in e-Inclusion Riga Dashboard" which studied a total of 34 European countries. A small sample of websites was used in the evaluations so that they could be manually checked (European Commission, 2007). The "United Nations Global Audit of Web Accessibility" was commissioned by the United Nations in 2006 (Nomensa, 2006). According to their report, just a mere 3% of the websites studied, all of which belonged to the European Public Sector, actually met WCAG 1.0 Level A standards. The "Assessment of the Status of eAccessibility in Europe", a subsequent study commissioned by the European Community, was done in 2007 (Cullen et al., 2007). Furthermore, the primary objective of the MeAC (Measuring progress of eAccessibility in Europe) is to track research that was previously carried out in addition to assisting the development of European policies on eAccessibility in the future. In order to do this, websites from different areas (newspapers, library websites, bank website and government websites, among others) were chosen from all EU member states, in addition to sites from the USA, Canada, and Australia, in order to have a representative sample. A total of 336 websites, from both the public and private sectors, were evaluated with automated and manual testing methods in order to ensure their compliance with WCAG 1.0 Level A standards. 25 pages were gathered from each website using an automated method. They were then analysed with both automatic and manual procedures. There were only a few countries in which the majority of the public websites analysed met these standards. On the other hand, in most of the countries investigated, none of the websites evaluated were found to be in compliance with these standards.

In 2008, the European Internet Accessibility Observatory (EIAO), an implementation of the Unified Web Evaluation Methodology's automated monitoring application scenario (Wabcluster, 2007), carried out an additional study to monitor European websites (Bühler et al., 2008). This study set out a comparison of both the EIAO and MeAC results. It found that there was an overall upward trend in the levels of accessibility found on e-governmental websites in Europe, although the general level was still considered to be quite poor.

A study was also done in 2009 in order to assess WCAG 2.0 compliance as far as web accessibility is concerned in European countries (Cullen et al., 2009). This study reported that absolutely none of the evaluated websites was in full compliance with the WCAG 2.0 standards. Even more troubling was the fact that these websites did not even fully comply with the WCAG 1.0 standards. Both automatic and manual testing methods were considered in this assessment.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Going above and beyond any type of regulation, institutions have to ensure that they have access to the appropriate tools which allow for the control and support of accessibility when, as is typically the case, they are faced with large amounts of both content and resources (Mirri et al., 2011). As previously stated, the research shows that evaluation technology is essential no matter if the studies are of government websites that provide public services, large-scale evaluations or monitoring activities. Governments should more actively promote both their use and the procedures regarding how to use.

There are tools which can assist the compliance with accessibility laws and standards. However, these laws do not make explicit reference to such tools or describe how the tools should be utilized in implementing public policies. A few examples of governments and public organisations that have successfully adopted automated testing are found in Sweden (Gulliksen et al., 2010) and the US. Nevertheless, guidance and best practices for the proper use of the automated validators are essential (Lazar & Olalere, 2011). Standards such as EN 301-549 and BS 8878 have taken these best practices into account. Some countries have created guidelines such as the e-Government Service Design Manual in the UK which recommends the use of automated validators in implementing accessibility in online e-Government and public services (Gov. of UK, 2016).

DISCUSSION

A review of accessibility standards has been made, including which standards are needed to comply with regulations such as WCAG 2.0 for web content and standard EN 301-549 for all types of ICT. Furthermore, a review of related works in which the level of accessibility of e-government websites is analysed has also been carried out. They show that government websites do not know how to implement accessibility because they do not fully comply with standards. While evaluation tools are used on all of them, it has been observed that, in the majority of cases, only the home page is evaluated. They do not follow the methodologies established to evaluate the accessibility of a complete website. In addition, works where accessibility monitoring is done have not been found. This exploratory study reveals challenges as it does not know how to carry out processes for the evaluation of accessibility successfully. In this respect, evaluation methodologies, as well as a proposal of evaluation tools, are shown in the following sections.

Evaluation Technology in the Context of Accessibility Standards

In all the studies seen concerning monitoring technology, automated tools, and manual evaluation support tools are necessary. Faced with the demand for technology as a support for the implementation of accessibility in public policies, this Section presents evaluation technology as seen within the context of accessibility standards.

Methodological Approaches for Assessing Accessibility

In accordance with the W3C Web Accessibility Initiative (WAI), the evaluation must "validate accessibility with automated tools and human review. Automated methods are rapid and convenient but cannot identify all accessibility issues. The human review can help ensure clarity of language and ease of navigation". In this way, web accessibility can be evaluated using different methods.

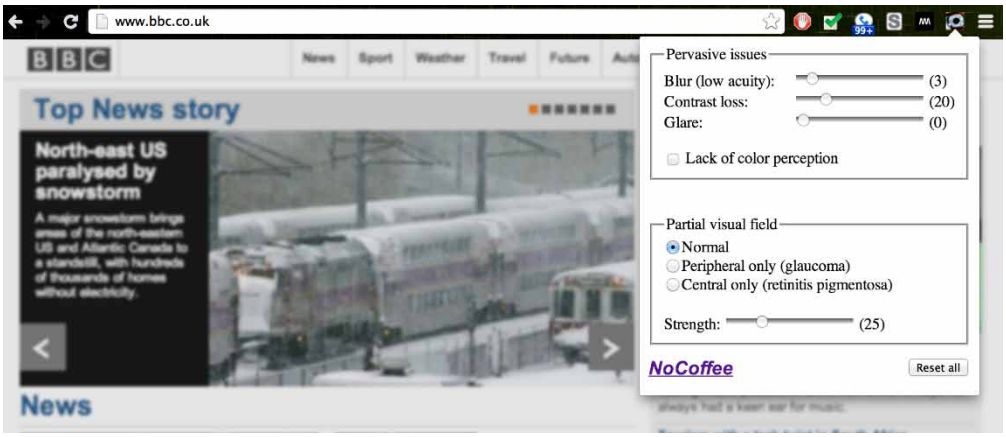
EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Roughly more than half of the provisions found in most of the accessibility standards make it mandatory for human judgment to be involved in the evaluation of compliance (King et al., 2005). Despite these inherent limitations, automated tools still play a significant role in ensuring the accessibility of websites (Paternò and Schiavone, 2015).

There are different accessibility evaluation methods which verify web accessibility guidelines. These are categorised using both qualitative methods such as standards review (Abou-Zahra, 2008), user testing (Lawton, 2007), barrier walkthrough (Brajnik, 2008), among others, and quantitative methods such as metrics (Vigo et al., 2007). A single method alone is not enough to guarantee full accessibility. Many studies combine these qualitative and quantitative methods in order to ensure better results.

In response to the demand, according to the regulatory framework, methodologies exist for assessing accessibility based on the WCAG such as the UWEM (Unified Web Evaluation Methodology) (wabcluster, 2007). The UWEM describes methods for gathering evaluation samples, testing processes in accordance to WCAG 1.0 level AA requirements and several different reporting alternatives. Another methodological approach is provided by the WAI which establishes the Accessibility Conformance Evaluation Methodology (WCAG-EM) and offers a methodological approach for determining how well a website conforms to WCAG 2.0 (W3C WAI, 2014) standards. PWDs must be taken into consideration in the accessibility evaluation processes of all web development stages, following user-centred design approaches such as those recommended by the WAI (W3C WAI, 2010).

To support the new European directive, a study monitoring methodologies for web accessibility in the European Union (SMART 2014-0061) has been launched (European Commission, 2016b; Funka, 2016). This study is aimed at providing an up-to-date description of the situation of web accessibility monitoring in the corresponding countries, validating the monitoring methodologies used to verify compliance with national provisions on web accessibility and presenting a recommended monitoring methodology for the proposal for a Directive on the accessibility of public sector entities' websites. This study has analysed different European methodologies: the "State of Affairs in the Kingdom" (Status i riket) in Norway, "Mapping of web accessibility on public websites" in Denmark, "Acessibilidade dos Conteúdos Web na Administração Pública Central (Web Content Accessibility in the Central Public Administration)" in Portugal, "Simply Accessible (Gewoon toegankelijk)" in the Netherlands and the "Web Accessibility Observatory" in Spain. To validate this set of existing national monitoring methodologies and verify how they actually measure web accessibility, a comparison with the WCAG-EM has been carried out. The results have shown that the most comprehensive initiative with regards to both quantity and quality of the analysed methods is that from Norway. In the implementation of these methodologies, the combined use of both automatic and manual assessment methods is seen most frequently.



Automated Web Accessibility Evaluation Tools

In order to adhere to accessibility standards and evaluation methods, a variety of automated tools may be used. WAI maintains a comprehensive list of automated tools which help designers, developers, and testers create accessible websites and applications and makes this list available to all interested parties (W3C WAI, 2016 b). This list of web accessibility evaluation tools may also be searched and sorted.

A wide range of accessibility evaluation tools can be found: from specialised browser add-ons to sites that evaluate a particular element, such as colour contrast. In this example, the colour contrast can be evaluated using a tool (Colour Contrast Analyser [1]) or a colour blindness simulator (Color Oracle [2]). This simulator shows how webpages might be viewed by users who are blind, colour blind or have

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Screenshot NoCoffee vision simulator tool

are visually impaired (IBM aDesigner [3], NoCoffee Vision Simulator [4] (see Figure 2)). Identification of seizure risks via Photosensitive Epilepsy Analysis of their web content and software (Photosensitive Epilepsy Analysis Tool [5]) may be carried out or tools that can be helpful in determining how readable content is (Juicy Studio Readability Tests [6]) may also be used.

In order to analyse, detect, repair and monitor accessibility issues, several automatic and semiautomatic tools exist called accessibility validators. These include online services or software that offer support to determine if a website meets accessibility criteria and are usually encoded with accessibility guidelines such as the WCAG, required by most countries' regulatory frameworks.

Table 2 shows a survey of accessibility validators that offer assistance in complying with current standards such as WCAG. Distinctive factors of the various accessibility validators have been taken into consideration in order to provide a resource which helps developers who need to select a tool to evaluate the accessibility of a website. Some of these factors include whether the tool has been designed and implemented to ascertain the accessibility level of websites according to different guidelines and regulations; if it can only evaluate a single web page or website or if it permits the monitoring of a website with large-scale evaluations; if it is an online checker, desktop software or web service and the guidelines and standards used to carry out the checks, etc.

Additionally, it is also necessary to distinguish between the support and assistance that is provided. The support tools can provide an evaluation, but it is also possible to modify the layout of webpages in order to show how the content can meet the success criteria of the guidelines or display information (errors, alerts) within webpages, as shown in Figure 3. As assistance and guided support, the tools can be used to provide large-scale evaluations when one or more websites must be managed simultaneously.

A few automated validators that evaluate dynamic websites and WAI-ARIA, such as FAE, MAUVE or WAVE (see Table 2), have been found. On the other hand, there are accessibility developer tools such as browser extensions that can be used as a complement to automatic validators in order to provide the accessibility evaluation of dynamic webpages. Some examples are the Firefox Accessibility Extension[7] and ARIA Validator[8]. These tools access the content and show the changes that take place during the interaction as well as how this information is transmitted to users via their assistive technology.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Screenshot displaying information (error, alerts, features, etc.) within webpage from wave tool

Most of the tools analysed allow for the validation of a single web page or, in fewer cases, a single website. There are a few automated validators that evaluate dynamic websites. While these tools are useful, it would be helpful to have more tools available that evaluate the accessibility of groups of websites or large-scale websites and that monitor or track the evolution of their accessibility over time such as a Siteimprove Accessibility tool and Compliance tool. Accessibility policies and new guidelines on web accessibility require constant monitoring of many details across many pages. Accessibility monitoring technology is necessary for e-government websites to be able to comply with the regulatory framework.

CONCLUSION

The exploratory study shown in this article identifies critical information that identifies future directions for research.

There is an extensive legislative framework for web accessibility and the right of PWDs to access the Internet. However, studies indicate that e-government websites do not fully comply with these regulations. These laws reference standards to which are to be followed. Some of them are more oriented to meeting success criteria with regards to web content, such as is the case of WCAG 2.0 which is the mandatory standard in most countries. On the other hand, new standards have appeared that provide guidance in implementing accessibility which understands it as a process in an organization. One example of this is to guide the process used in public procurement of ICT products and services by public administrations as the European standard EN 301 549.

As support for the implementation of these standards, different technologies have been presented. Among these, tools oriented at evaluation are essential. As has been shown, while there are many evaluation tools, they are insufficient due to the fact that they can be used to evaluate a page or a group of pages but not to monitor the accessibility of one or more websites. Moreover, the technology should minimize human intervention in the evaluation process. There is a demand for this type of technology and is needed by the websites of public administrations due to the recent European Directive. The public administrations have the duty to provide support to all citizens, giving everyone the same quality of services.

As a contribution to the research, the following best practices are proposed for evaluation tools:

- The tool should cover the widest possible scope of accessibility guidelines and regulation requirements. Moreover, upgradeability must be considered with regards to the accessibility guidelines that are checked;
- The tool should be able to support technological diversity and be aligned with the latest technology. For example, there may be specific versions of each site for various kinds of devices (mobile and desktop versions) or a single version of the site that adapts its user interface according to the resolution of the device (responsive design);
- The tool should be able to check dynamic websites that can change both the web page's user interface and content automatically or in response to user interaction;
- The tool should be able to maximize the number of checks which may be automatically conducted;
- The tool should facilitate a more in-depth manual evaluation. An application for monitoring a website's accessibility must be extremely effective in such a context since it provides significant assistance to human evaluators when evaluating a huge number of webpages;
- The tool should be able to check a large set of URLs, provide an in-depth evaluation of a single website and carry out comparisons from the different perspectives;
- The tool should provide the ability to effectively perform monitoring activities. An automatic monitoring technology must provide support for several factors such as adapting the verifications to groups of URLs, a variety of classification criteria that must be controlled, different guidelines and accessibility requirements, the frequency of reports on evaluation processes and analysis of results;
- The tool should integrate tests to monitor guidelines related to language in order to enhance legibility and understandability issues;
- The tool should be able to generate effective and versatile reports. These reports must provide clear information clear specifying the main problems and how to address them. Additionally, they must be able to be understood by a variety of people in different positions such as developers, designers, public officers, etc.

Public policy stakeholders should consider both the progress that has been made and shortcomings which have been identified in this area of research. Future work should move in this direction, in the definition of methodological approaches according to standards that support the correct implementation of accessibility and the use of automated evaluation and monitoring tools. This technology plays an important role in making public websites more accessible.

ACKNOWLEDGMENT

Chapter 20
Ensuring Quality of Web Portals Through Accessibility Analysis

Amar Ranjan Dash
Berhampur University, India

Manas Ranjan Patra
Berhampur University, India

ABSTRACT

With the increase in number of electronic services being delivered through web portals, a lot of emphasis is being given to ensure the quality of web portals in terms of contents and associated design aspects. This has led to studies investigating various requirements of web users and to guidelines for quality enhancement in order to make web portals accessible to all irrespective of one's age, physical challenges, ethnicity, and level of literacy. In this chapter, the authors address the accessibility issues of web portals based on ongoing research. They analyze the accessibility in three levels (i.e., at the levels of authoring tool, web component, and user-agent). The contents of this chapter can throw light on the design aspects of web portals, web browsers, and media players to make them more suitable for users in general.

INTRODUCTION

Over the last couple of years, web portals are being considered as excellent means of information dissemination and visibility. At the initial stages web portals were used as a source of information but with the passage of time organizations have begun to extend a plethora of services electronically. Analysis reveals that due to inadequacies in the content, presentation, and online assistance available in those web sites, users are not very much attracted towards web portals. Therefore, we need to understand user requirements to make web portals accessible for all, irrespective of their age, physical challenges, ethnicity, and levels of literacy. The World Wide Web consortium has recommended WCAG 2.0, UAAG 2.0, and ATAG 2.0 guidelines to analyze web portals at web component, user-agent, and authoring tool levels.

Since 1997, the initializations of web accessibility initiatives, the web technology researchers have been carried out some studies to evaluate the accessibility of web portals and user agents. Abanumy, Al-Badi and Mayhew (2005) evaluated the accessibility of the government web portals of Saudi Arabia and Oman, using WCAG 1.0 guidelines and Multiweb, Lynx, and W3C Validation as software tools to find error percentages. They have used Assistive technologies and haptic devices for users having problems like total blindness and mobility. But, they have not addressed the issue of persons with color blindness. Ceaparu and Shneiderman, (2002) analyzed the home pages of 50 US state Web sites. The analysis was done manually and initial recommendations were made with 10 rules which did not include any recommendation for disable people.

Kuzma, Yen and Oestreicher, (2009) examined the accessibility of government web portals from different continent that is European Union, Asia, and Africa with respect to the guidelines of WCAG 1.0 using TAW as software tool. Similarly, Al-Radaideh, Nurser and Wahbeh, (2011) have evaluated 25 Government websites of jordan by considering TAW with respect to WCAG 1.0 Guideline. Similarly, Malaysian researchers, Latif and Masrek, (2010) have used WCAG 1.0 priority 1 and Bobby as automatic tool, to evaluate 9 websites. They have provided only the number of errors of different portals instead of computing the percentage of error. Thus, it doesn't give an exact picture of the overall error percentage which can be used as a comparative measure among different web portals. Carter and Markel, (2001) classify disable peoples into four categories and demonstrate tools made for them by different company.

Kamoun, Mourad and Bataineh, (2013) have made a comparative analysis of web sites in Dubai using both WCAG 1.0 and WCAG 2.0; and recommend the use of WCAG 2.0 for e-Governments. In [Patra, Dash, Mishra, 2014, IJCSEA], the accessibility features of fifteen Indian web portals have been analyzed with respect to the WCAG 2.0 guideline. Accessibility of these web portals have been checked both manually and with the help of some tools. This work has been further extended to analyzing fifteen government web portals of Asian countries in Patra, Dash, Mishra, (2014) ICEGOV. In that work, the accessibility of four embedded media players also have been analyzed using UAAG 2.0.

Ismail and Kuppusamy, (2015) evaluate the accessibility of 302 Indian universities using ACHEKER on the basis of WCAG 2.0. Ismailova and Inal, (2016) analyses the accessibility of government websites of four countries viz, Kyrgyzstan, Azerbaijan, Kazakhstan and Turkey. In Baazeem and Al-Khalifa, (2015) authors investigate 23 accessibility evaluation studies. They analyze different type of methodology and tools used during last five years for analyzing the accessibility of web components.

Till 2004 in most research works the researchers have looked into the accessibility of web components. Then in 2005, Chisholm and Henry, (2005) have classified the web accessibility guidelines into three categories, viz., WCAG (Web Content Accessibility Guideline), ATAG (Authoring Tool Accessibility Guideline), UAAG (User Agent Accessibility Guideline) and describe how these three guidelines can control three different aspects of a web portal. After that the researchers also focus on the accessibility features of the user agents and authoring tools. Gonzalez et al. (2011) and Moreno et al., (2011) have analyzed the accessibility requirements of YouTube, BBC iplayer and CCplayer based on UAAG 2.0 guideline.

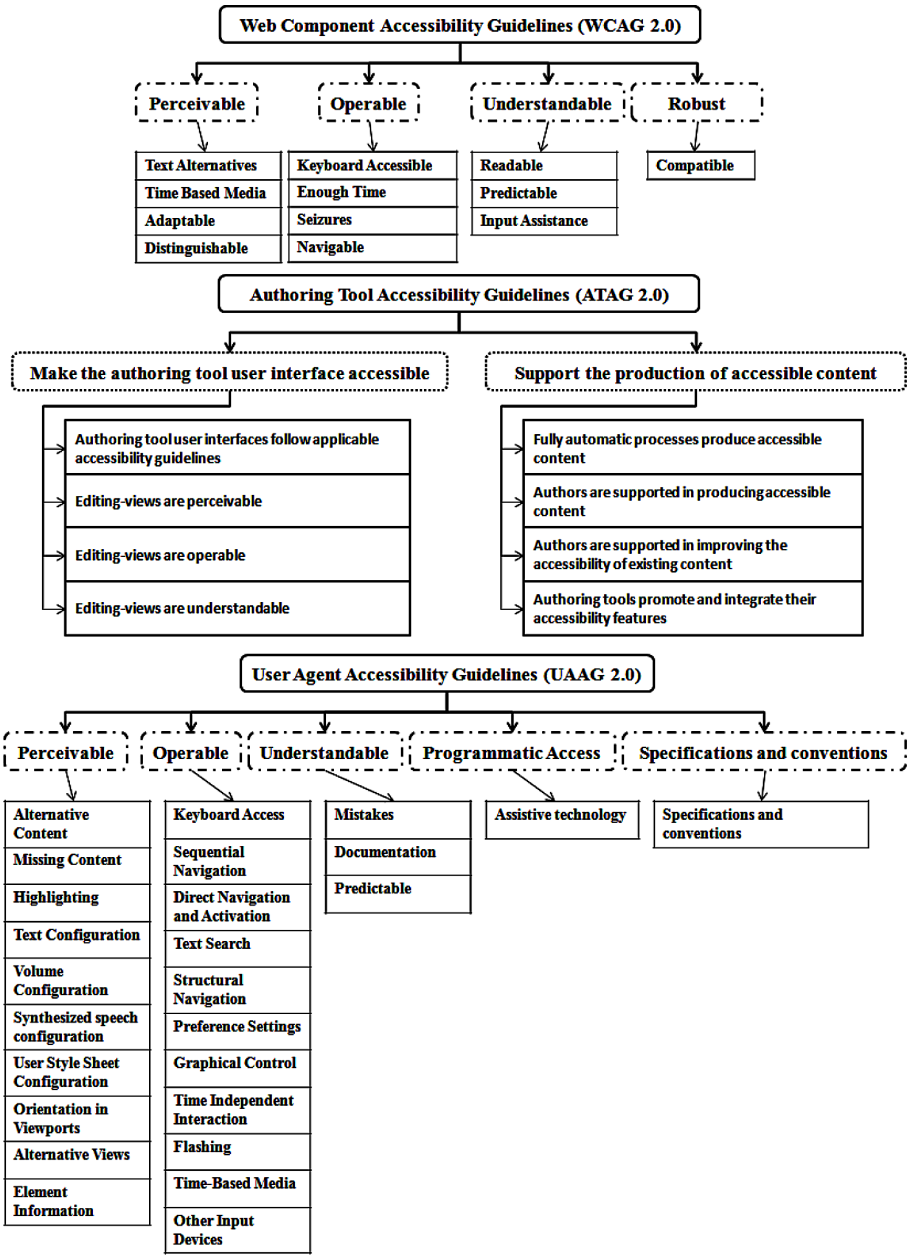
Souley and Sambo (2014) analyze Mozilla Firefox, Internet Explorer, Netscape and Opera based on their Performance, Usability, Accessibility and Security. Babu and Sekharaiahm, (2014) have described different types of assistive software and their integration with user agents to make them more accessible for physically challenged people. They have also classified the types of disabilities causing problem in accessing websites. Patra and Dash, (2017) have evaluated accessibility of 10 PC web browsers based on UAAG 2.0. Mahmud, Borodin, and Ramakrishnan, (2007) designed a context driven non-visual web

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

browser "CSurf". Borodin, Mahmud, Ramakrishnan, and Stent, (2007) designed HearSay, a non-visual web browser with cognitive directed browsing with extensible Voice XML dialog. Patra and Dash, (2017) have evaluated accessibility of 15 web browsers used in android mobiles based on UAAG 2.0.

GUIDELINES

Today web portals are major sources of information for varieties of electronic services. Thus, it is necessary that, those should be accessible to all types of users, irrespective of age, level of literacy, physical disability in persons, etc. Accessibility to web portals refers to the degree to which it is available to as many people as possible. In order to achieve this, the World Wide Web Consortium (W3C) has launched Web Accessibility Initiative (WAI) in April 1997. The Web Accessibility Initiatives consist of several working groups (Authoring Tool Accessibility Guide-lines Working Group [ATAG WG, 2015], User Agent Accessibility Guidelines Working Group [UAWG, 2015], Web Content Accessibility Guidelines Working Group [WCAG WG, 2015], etc.) each with their specific focus. The working groups have introduced three standardizations to ensure accessibility of web portals at three levels.



Web Component Accessibility Guideline [WCAG, 2008] has been recommended by the WCAG working group to verify accessibility of web contents. WCAG is an international standard for maintaining and verifying accessibility of the contents of a web portal. The first version of WCAG came out in the form of WCAG 1.0 on 5th May 1999. Subsequently, by adding new features (guidelines needed to be technology-neutral and guidelines needed to be worded as testable) a new version, WCAG 2.0 was recommended by W3C on 11 December 2008. Now, WCAG has been approved by ISO as an international standard (ISO/IEC40500:2012) on October 2012. WCAG 2.0 recommends twelve guidelines based on four basic principles, viz., perceivable, operable, understandable, and robust. A comparative study of WCAG 1.0 and WCAG 2.0 has been done by Termens et al., (2009).

Authoring Tool Accessibility Guideline [ATAG, 2015] has been recommended by the ATAG working group to ensure accessibility of authoring tools. ATAG is an international standard for maintaining and verifying accessibility of authoring tools. The first version of ATAG came out in the form of ATAG 1.0 on 3rd February 2000 and later by adding extra features and removing some of the limitations, a new version of ATAG, ATAG 2.0, was recommended by W3C on 24th September 2015.

User Agent Accessibility Guideline [UAAG, 2013] has been recommended by the UAAG working group to verify accessibility of user agents and assistive technologies. UAAG is an international standard for maintaining and verifying accessibility of different user agents (like web browsers, media players) and assistive technologies (like text to speech synthesizer). The first version of UAAG came out in the form of UAAG 1.0 on 17th December 2002 and later by adding extra features and removing some of the limitations a new version is underway. The last working draft of UAAG (UAAG 2.0) was published by W3C on 15th December 2015 which has 26 guidelines based on five principles, namely, perceivable, operable, understandable, programmatic access, specifications and conventions. A schematic representation of the guidelines included in WCAG 2.0, ATAG 2.0, and UAAG 2.0 is presented in Figure 1.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. A schematic representation of WCAG 2.0, ATAG 2.0, UAAG 2.0

ACCESSIBILITY OF WEB COMPONENTS

WCAG (Web Component Accessibility Guideline) is an international standard for maintaining accessibility of different web portals. The latest version of WCAG, WCAG 2.0 was recommended by W3C on 11 December 2008.WCAG defines some features to evaluate and maintain the accessibility of different components of websites, considering different disable persons.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- As WCAG defines some colour contrast features for colour blind peoples.
- WCAG describe the text alternative and caption related features in case of the audio or video files available in websites for deaf persons.
- WCAG point out some restriction in case of flash files to avoid causing seizerus in users.
- WCAG prescribe that every web page, frame, and table should have proper title and headers for better usability.
- WCAG prescribe "maintenance of location", "maintenance of identical web frame", and "different navigational alternatives" for easier navigation of user within website.

A schematic representation of the guidelines included in WCAG 2.0 is presented in Figure 2 which in short describes the following:

- Web portals should provide text alternatives for all non text contents.
- Reading and navigation order should be logical and intuitive.
- Text and images of text should have a contrast ratio more than the value prescribed by WCAG 2.0.
- Web portals should provide image alternatives wherever text contents are hard to understand.
- All functionality of website should be available through keyboard.
- Web portals should not contain flashes/flickering that can cause seizures.
- While filling a form proper error messages should be prompted whenever there is an error.

Evaluation of Indian Web Portals

Methodology

In Patra, Dash, Mishra, (2014, IJCSEA), we have considered three different categories of websites for evaluating their accessibility. Under each category we have selected five web portals which are frequently used by the public, thus a total of 15 websites are used in our study. The testing parameters are based on WCAG 2.0 guidelines. The accessibility parameters are checked both manually and by using some tools. Figure 3 indicates the adopted methodology.

Table 1 shows some of the tools used in the measurement of different accessibility parameters in the websites. For checking the colour contrast of links we used "Check my colour". For checking the colour contrast of text and images of text we used two tools. In order to obtain the hexadecimal colour code we used "Colour Scheme studio" and then the colour contrast was checked with the help of the online tool "Colour Contrast Check". Different web browsers like Aurora, Comodo Dragon, and Google Chrome were used for accessing the web sites. We also used the "AChecker" tool for checking some of the parameters as per the WCAG 2.0 Guidelines.

Evaluation

This research is intended to provide an accessibility evaluation of 15 Indian websites based on WCAG 2.0. The data taken for our analysis is gathered during the period 15th Sep 2013 to 9th Oct 2013. Table 2 contains list of Indian web portals selected for evaluation.

www.passportindia.gov.in	www.dheorissa.in	www.makemytrip.com

Figure 4(a) describes the overall average percentage violation per rule as provided in WCAG 2.0. In the following graph we analyze each accessibility issue for the Indian Government websites. The guideline where the % is 0 it means that either the web component which deals with that guideline is absent or there is no error for that web component.

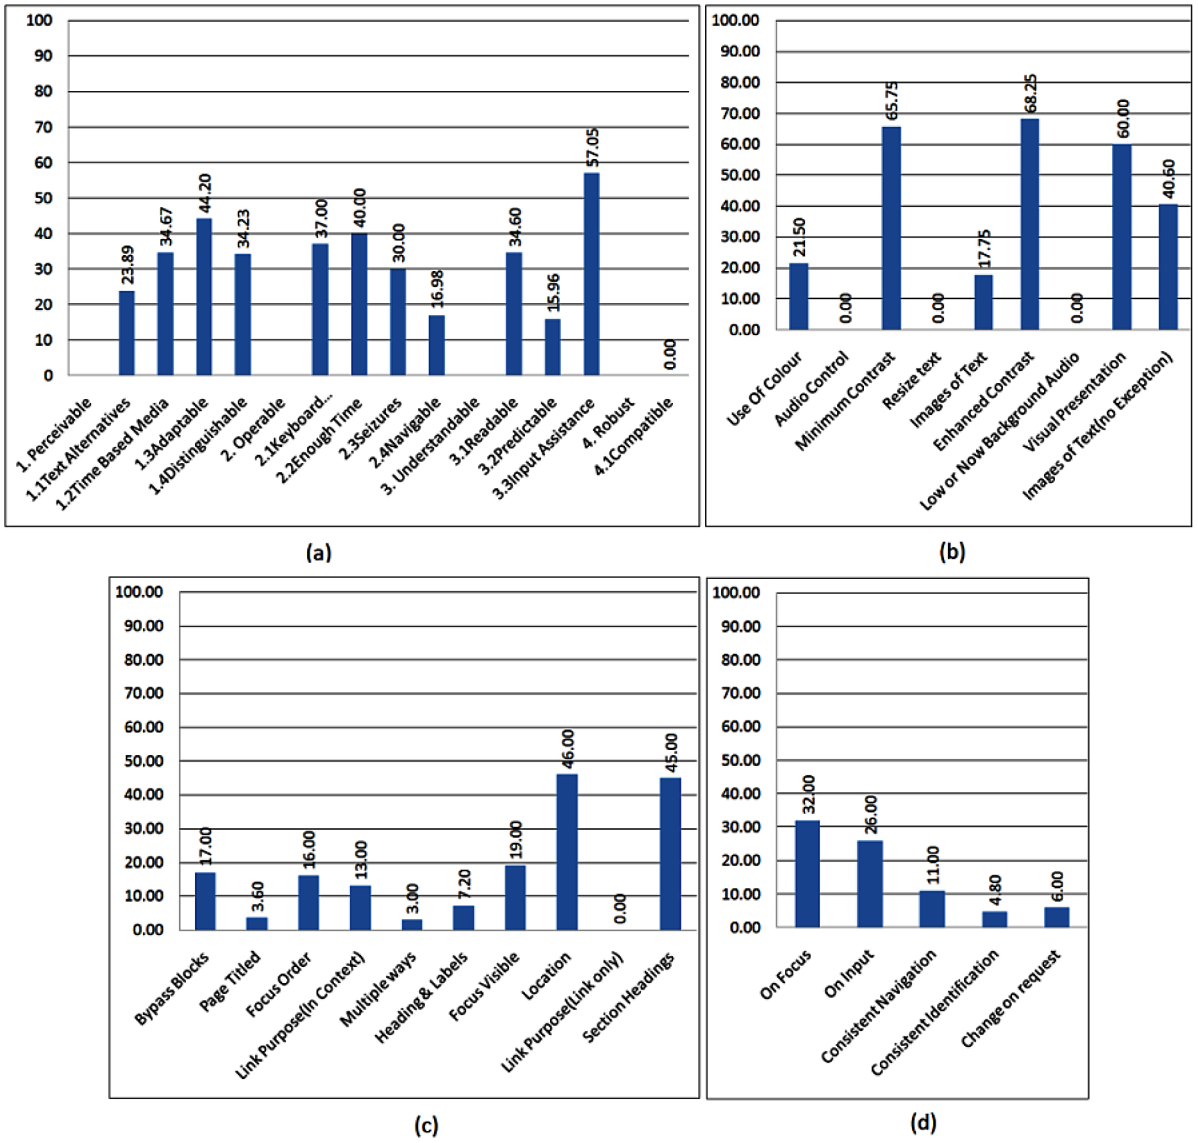
While analyzing the Perceivable features of the government websites, it is found that the maximum violated guideline is guideline 1.3 (Adaptable) in which government websites indicate 44.20% violation. Violations with respect to guideline 1.1 (Text Alternative), guideline 1.2 (Time Based Media), and guideline 1.4 (Distinguishable) were found to be 23.89%, 34.67%, and 34.23% respectively. Although the percentage is little less but this rule is violated by approximately all websites, so we provide a separate point by point graphical analysis in Figure 4(b).

While evaluating for the Operable principles, the maximum violated guideline is guideline 2.2 (Enough Time) in which government websites indicate 40.00% violation. But, for guideline 2.1 (Keyboard Accessible), guideline 2.3 (Seizures), and guideline 2.4 (Navigable) the violation percentages are 37.00%, 30.00%, and 16.98% respectively. Although the percentage is less but this rule is violated by approximately all websites, so we give a separate point by point graphical analysis in Figure 4(c).

With respect to Understandable principle in government websites, the maximum violated guideline is guideline 3.3 (Input Assistance) with 57.05% violation. Government websites indicate 34.60% and 15.96% violation in guideline 3.1 (Readable) and Guideline 3.2 (Predictable) respectively. This rule is violated by approximately all websites, so we give a separate point by point graphical analysis in Figure 4(d). According to our analysis the Indian Government Websites does not contain Robust error.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Overall average percentage violation done by selected Indian Government websites with respect to (a) WCAG 2.0, (b) Perceivable principle of WCAG, (c) Operable principle of WCAG, (d) Understandable Principle of WCAG



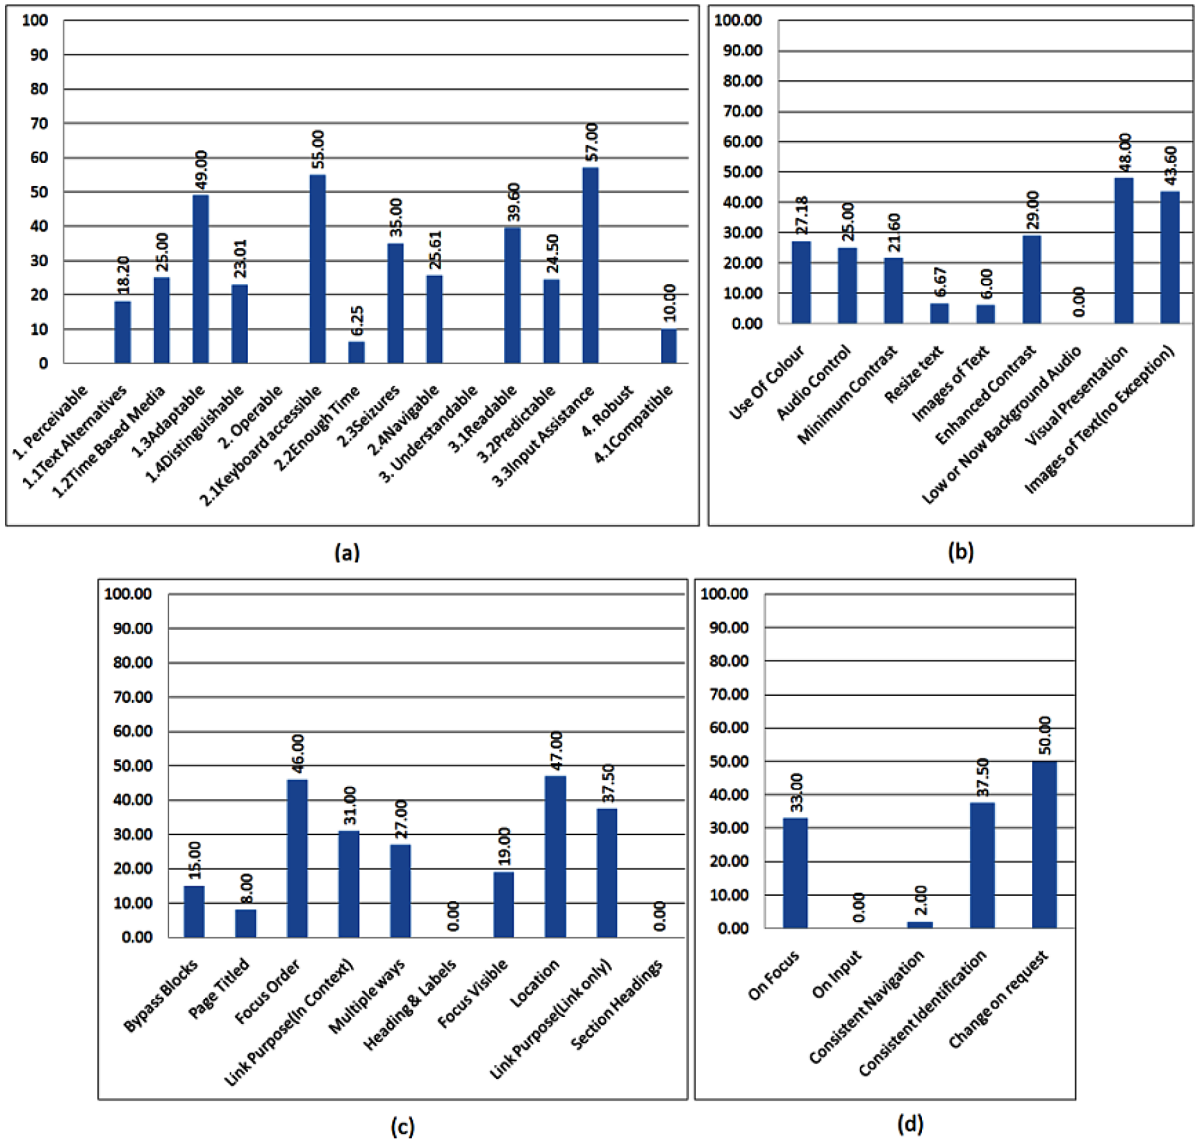


Figure 5(a) describes the overall average percentage violation results per each rule of WCAG 2.0. In the following Graph we analyze each accessibility principle in Indian Educational websites. In respect of Perceivable principle in educational websites, the maximum violated guideline is guideline 1.3 (Adaptable) in which educational websites indicate 49.00% violation. Educational websites indicate 18.20%, 25.00%, and 23.01% violation in respect of guideline 1.1 (Text Alternative), guideline 1.2 (Time Based Media), and guideline 1.4 (Distinguishable) respectively. We represent a separate point by point graphical analysis in Figure 5(b).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. Overall average percentage violation done by selected Indian Educational websites with respect to (a) WCAG 2.0, (b) Perceivable principle of WCAG, (c) Operable principle of WCAG, (d) Understandable Principle of WCAG

While considering Operable principle in educational websites, the maximum violated guideline is guideline 2.1 (Keyboard accessible) in which educational websites indicate 55.00% violation. Educational websites show 6.25%, 35.00%, and 25.61% violation in guideline 2.2 (Enough Time), guideline 2.3 (Seizures), and guideline 2.4 (Navigable) respectively. We represent a point by point graphical analysis in Figure 5(c).

While considering Understandable principle in educational websites, the maximum violated guideline is guideline 3.3 (Input Assistance) in which educational websites indicate 57.00% violation. Educational websites show 39.60% and 24.50% violation in guideline 3.1 (Readable) and Guideline 3.2 (Predict-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

able) respectively. We give a separate point by point graphical analysis in Figure 5(d). According to our analysis the In Indian Educational Websites Guideline 4 (Robust) gives 10.00% violation.

Figure 6(a) describes the overall average percentage violation results for each rule of WCAG 2.0, when applied to some of the Indian Commercial websites. With respect to the Perceivable principle in case of commercial websites, the maximum violated guideline is guideline 1.2 (Time Based Media) in which commercial websites show 72.00% violation. Commercial websites indicate 36.00%, 43.20%, and 24.73% violation in guideline 1.1 (Text Alternative), guideline 1.3 (Adaptable), and guideline 1.4 (Distinguishable) respectively. We represent a separate point by point graphical analysis in Figure 6(b).

In case of Operable principle for commercial websites, the maximum violated guideline is guideline 2.1 (Keyboard accessible) in which commercial websites show 70.00% violation. Commercial websites indicate 45.75%, 50.00%, and 34.86% violation in guideline 2.2 (Enough Time), guideline 2.3 (Seizures), and guideline 2.4 (Navigable) respectively. We introduce a separate point by point graphical analysis in Figure 6(c).

While considering the Understandable principle in commercial websites, the maximum violated guideline is guideline 3.3 (Input Assistance) in which commercial websites show 71.00% violation. Commercial websites indicate 52.80% and 36.52% violation in guideline 3.1 (Readable) and Guideline 3.2 (Predictable) respectively. We represent a separate point by point graphical analysis in Figure 6(d). The Indian Commercial Websites considered in our study indicated 30.00% violation in case of Guideline 4 (Robust).

Result Analysis

A comparative view of the violations with respect to the guidelines on Perceivable, Operable, Understandable, Robust for the three different categories of web portals considered in our study, namely, Government, Educational & commercial is presented in the pie charts of Figure 7.

Evaluation of Asian Government Websites

Methodology

The objective of Patra, Dash, Mishra, (2014, ICEGOV) is to study the accessibility of government web portals of some Asian countries. For our analysis, we have considered three different categories of web portals and five sample portals under each category. Facilities provided by each of the websites are checked both manually and by using certain tools based on the testing parameters as per the WCAG 2.0 guidelines. More or less the same methodology and tools, as described above, have been used for evaluating accessibility of selected government websites.

Evaluation

This research is intended to provide an accessibility evaluation of 15 Asian websites based on WCAG 2.0. Table 3 contains list of Government web portals selected for evaluation. The analysis is based on the data available during 1st May 2014 to 21st June2014.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 6. Overall average percentage violation done by selected Indian Commercial websites with respect to (a) WCAG 2.0, (b) Perceivable principle of WCAG, (c) Operable principle of WCAG, (d) Understandable Principle of WCAG

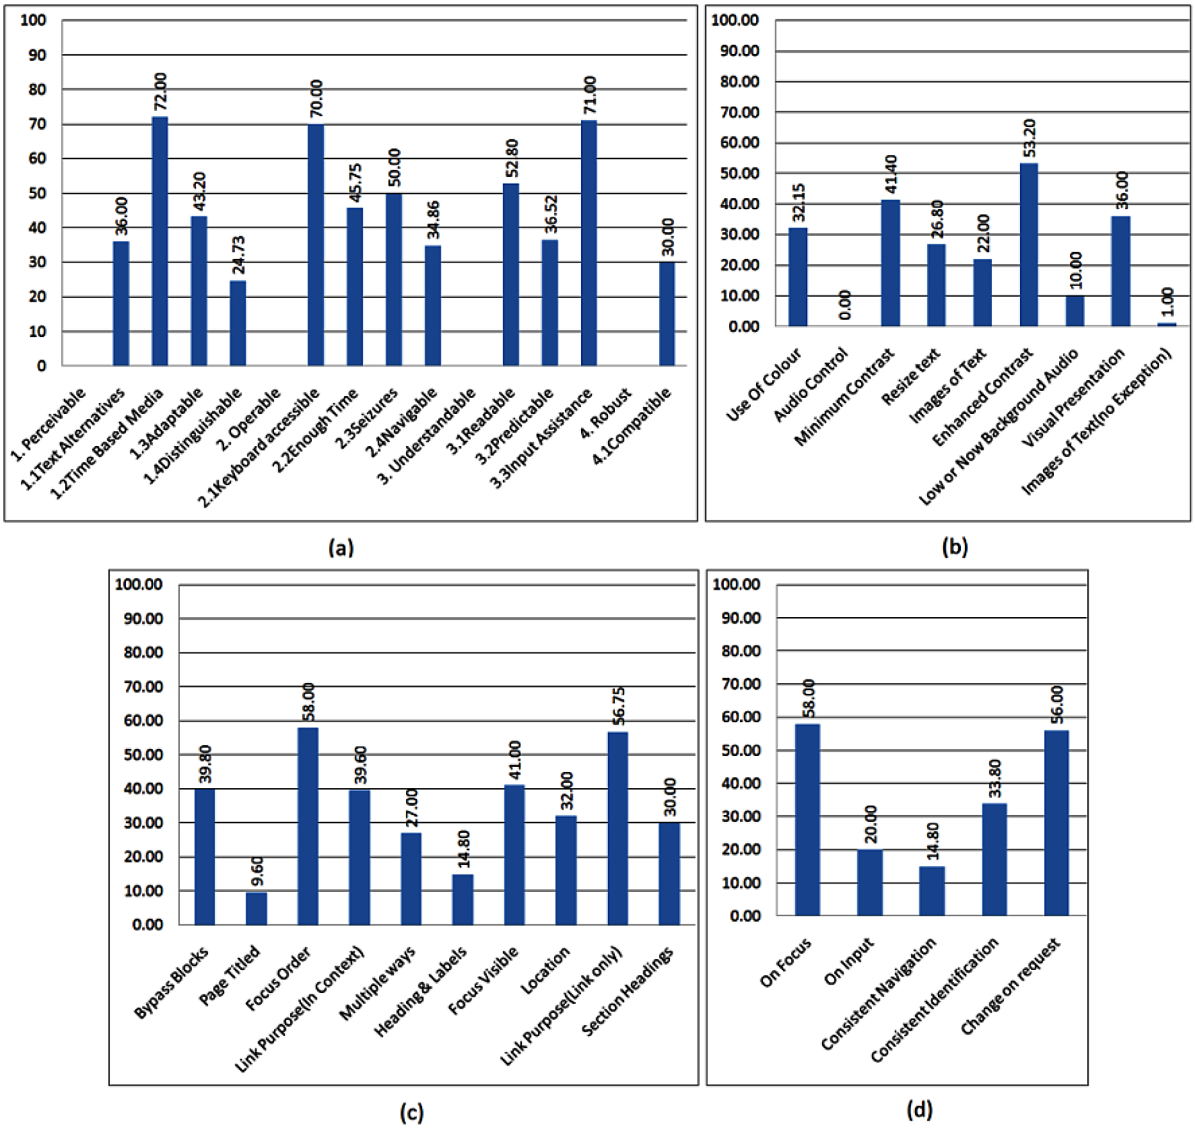

Figure 9 describes the average percentage of WCAG 2.0 guideline violation in Government websites of highly populated Asian countries. The Perceivable principle states that Web contents should be made available to the senses. While analyzing the Perceivable features of the web portals of this category, it is observed that the maximum violated guideline is guideline 1.3 in which web portals indicates 40% violation. Violations with respect to guideline 1.1, 1.2, and 1.4 were found to be 24.1%, 13.33%, and 30.04% respectively.

Figure 9. Violation of guideline in government web portals of highly populated Asian countries

The Operable principle states that the interface forms, controls, and navigation should be easily operable. While evaluating the Operable principles, the most violated guidelines are guideline 2.1and 2.3both with 40% violation. But, for guideline 2.2and 2.4 the violation percentages are 6.67% and 18.44% respectively. The Understandable principle requires that Content and interface of web portals are easy to understand by all. With respect to the Understandable principle web portals of this category, we found that the maximum violated guideline is guideline 3.3 with 75.95% violation. Further, the violations in case of guideline 3.1 and 3.2 are16.67% and 9.4% respectively.

The Robust principle requires that content of a web portal can be used reliably by a wide variety of user agents. Our analysis shows that there is 30% violation of guideline 4 is found in web portals of this category. In Figure 10 wherever the web component dealing with a particular guideline is absent in the web site, it is indicated by "-" in the corresponding column and when there is no violation, it is indicated by"0.00%".

Figure 11 shows the average percentage of WCAG 2.0 guidelines violations in Government web portals of less populated Asian countries. While analyzing the Perceivable features of the web portals of this category, it is observed that the maximum violated guideline is guideline 1.3 in which web portals indicates 33.33% violation. Violations with respect to guideline 1.1, 1.2, and 1.4 were found to be 30.82%, 27.78%, and 25.25% respectively.

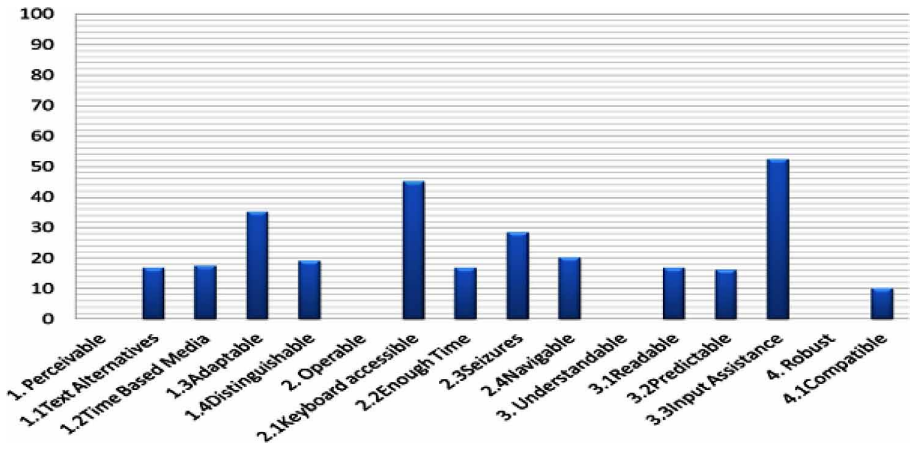
EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

While evaluating the Operable principles, the maximum violated guideline is guideline 2.3 in which these websites indicate 40.00% violation. But, for guideline 2.1, 2.2, and 2.4 the violation percentages are 30%, 12.22%, and 12.47% respectively.



With respect to Understandable principle in these websites, the maximum violated guideline is guideline 3.2 with 24% violation, whereas guideline 3.1 and 3.3 indicate 23.33% and 19.05% violation respectively. According to our analysis we found 20% violations according to guideline 4(Robust) in these government websites.

Figure 13 describes the average percentage of WCAG 2.0 guideline violation in websites pertaining to rural development. While analyzing the Perceivable features of the web portals of this category, it is observed that the maximum violated guideline is guideline 1.3 in which rural websites indicates 35% violation. Violations with respect to guideline 1.1, 1.2, and 1.4 were found to be 16.67%, 17.41%, and 18.99% respectively.

While evaluating the Operable principles, the maximum violated guideline is guideline 2.1 in which rural websites indicate 45% violation. But, for guideline 2.2, 2.3, and 2.4 the violation percentages are 16.67%, 28.33%, and 20.11% respectively.

With respect to Understandable principle in rural websites, the maximum violated guideline is guideline 3.3 with 52.37% violation. Further, rural websites indicate 16.67% and 16% violation in guideline 3.1 and 3.2 respectively. Our analysis shows that the Asian rural websites violate guideline 4 by almost 10%.

Figure 13. Violation of guideline in government web portals of rural countries

Result Analysis

Figure 15 and 16 provides a comparative view of guideline violations in case of perceivable, operable, understandable, and robustness with respect to the three categories of websites.

While evaluating the chosen 15 websites of Asia we observe that there is an urgent need to improve the web portals in order to make them really accessible. However, countries like Japan and Saudi Arabia have already taken initiatives to improve their web sites. The Japanese government has begun its mission since last five years, whereas the Saudi Arabian government has already obtained WAI-A certification (certificate of conformance level A) from W3C (World Wide Web Consortium).

ACCESSIBILITY OF USER AGENTS

Evaluation of PC Web Browsers

According to UAAG, user agents are tools used to access websites (from the client side). Media players and web browsers are examples of such user agents which are widely used to access websites. Besides this, UAAG also provides accessibility guidelines for assistive technologies (like text to speech synthesizers). This research is intended to evaluate the accessibility feature of web browser.

By using an effective web browser we can improve the accessibility of web. When we click by typing an URL of a website in the address bar of the web browser, it only gets the source code of that website from the server, and represents it in its own way taking into account the size of the display and by using DOM (Document Object Model). Thus, a website can be represented in different ways in different web browsers. The following features of a web browser can be evaluated by using UAAG:

- **Colour Contrast:** The colour of the text, link and background can be decided during the creation of a web portal using its source code. But if the colour is not mentioned for text, link and background then it uses the default colour provided by the web browser. Thus, we can control the colour contrast by controlling the colour provided in the web browser.
- **Default Navigation:** Web browser should allow direct and sequential navigation between its elements. A web browser should allow all keyboard accessibility features. It should also allow the hierarchical and structural navigation. User must be able to reverse navigation between web addresses.
- **Controlling and Customizing the Shortcuts:** Web browser should provide the list of keyboard and mouse shortcuts used in it. It should allow customization of shortcuts (except conventional shortcuts).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Control Focus:** Web browsers should be able to control and restrict the unpredictable change of focus (like pop-up and adware).
- **Controlling the Viewports and Top-Level Viewports:** The websites are represented in the viewports of a web browser. Web browser should allow easy navigation between the view ports (tab) or top-level viewports (window). Web browser should able to control the zooming percentage of the viewport. Viewports should maintain the point of regard of its elements during resizing of the viewport or changing the zoom. Viewport should be able to indicate the position of view and should be able to provide scrollbar. When clicking on a link user should be able to choose whether to open the new link in new viewport or in top-level viewport or in the same viewport. Web browser should be able to control the change of focus during creation of a new viewport or top-level viewport. Viewports should be resizable.
- **Controlling the View:** Web browser should be able to provide the outline view, source view of a web portal. Web browser should be able to show the related element and the element hierarchy in the source code of a website.
- **Default Alternative Contents:** Web browser should be able to provide the alternative text content provided by the source code of the website for respective non-text content (image, video etc). Web browser should also be able to indicate the absence of alternative text.
- **Highlight:** Web browser should be able to differentiate mouse focus, keyboard focus, and activated element. Web browser should be able to customize their highlighting method (by controlling the size, blink rate, and controlling the foreground, back ground colour).Web browser should be able to differentiate the highlighted viewports among other. The web browser should be able to control different methods of highlighting (by colour contrast of highlighted viewport with others, size, specific borders, by any blink rate).
- **Making the Form Usable and Predictable:** Web browser should be able to make the form usable and predictable. Web browser should be able to provide the spelling assistance for editable text. User should be able to reverse recognized navigation between forms (unless there is any authentication). Web browser must be able to store the local version of a website. User should be able to specify whether or not recognized form submissions must be confirmed. Web browser should be able to provide auto fill option for some repeatedly used harmless data.
- **Retrieval Progress:** Web browser should be able to show the state of content retrieval activity.
- **Controlling the Input Devices and Input Methods:** Web browser should be able to interact with any input device, which is able to interact with the platform (the Operating System of the device). Web browser must be able to access and activate different input methods.
- **Controlling the Configuration Settings:** Web browser should be able to confirm or reverse the configuration setting. Settings must be applicable to all viewports.
- **Good Documentation:** A good documentation can help the user to understand the features provided by the web browser. The documentation of the web browser should also contain the assistive features of the web browser. It should contain the version-wise additional features provided by the web browser.
- **Transferable Preferences: Web** browser should allow the user to construct multiple preferences. Web browser should be able to transfer the preference setting between the devices.
- **Controlling the Style Sheets:** Web browser should be able to control and customize different style-sheets.

Methodology

UAAG 2.0 contains the accessibility features for the user agents (media-players and web browsers) and the assistive technologies. The objective of this section is to study the accessibility of web browsers. First of all, we classify the UAAG 2.0 guidelines and choose the accessibility guidelines that are applicable to web browsers. For our analysis, we have considered top ten web browsers commonly used across the world. Facilities provided by each of the web browsers are checked manually based on the testing parameters as specified in the UAAG 2.0 guidelines. We have checked the features of web browsers with the help of 20 top websites that satisfy most of the accessible criteria as per WCAG 2.0. A schematic representation of the methodology adopted in our work is depicted in Figure 19. Table 4 shows the guidelines, which are extracted from UAAG2.0, for accessibility analysis of web-browsers.

Figure 19. Methodology for accessibility analysis of web browsers

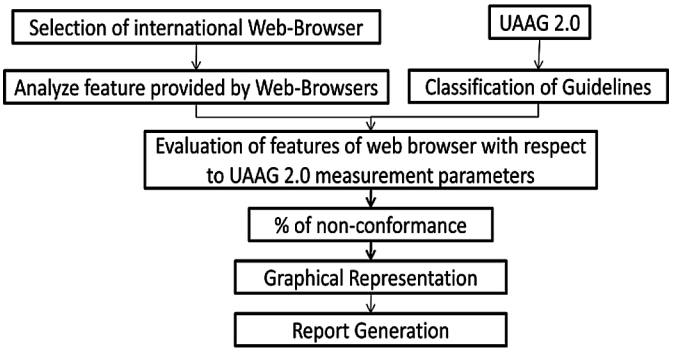

Table 4. Selected guidelines of UAAG 2.0 that are used for accessibility analysis of web-browsers

Guidelines Applicable to Web-Browsers			
1.1.1	Render Alternative Content	2.2.2	Sequential Navigation Between Viewports
1.1.2	Indicate Unrendered Alternative Content	2.2.3	Default Navigation Order
1.1.3	Replace Non-Text Content	2.2.4	Options for Wrapping in Navigation
1.1.4	Provide Configurable Alternative Content Defaults	2.3.1	Allow Direct Navigation to Enabled Elements
1.2.1	Support Repair by Assistive Technologies	2.3.2	Allow Direct Activation of Enabled Elements
1.2.2	Repair Missing Structure	2.3.3	Present Direct Commands from Rendered Content
1.3.1	Highlighted Items	2.3.4	Present Direct Commands in user interface
1.3.2	Highlighting Options	2.3.5	Allow Customized Keyboard Commands
1.4.1	Basic text formatting (Globally)	2.4.1	Text Search
1.4.2	Basic text formatting (by Element)	2.4.2	Search Direction
1.4.3	Blocks of text (Globally)	2.4.3	Match Found
1.4.4	Configured and Reflowed Text Printing	2.4.4	Alert on Wrap or No Match
1.4.5	Advanced text formatting (Globally)	2.4.5	Alternative Content Search
1.7.1	Support User Stylesheets	2.5.1	Show Location in Hierarchy

Table 4. Continued

Guidelines Applicable to Web-Browsers			
1.7.2	Apply User Stylesheets	2.5.2	Provide Structural navigation by heading and Within Tables
1.7.3	Disable Author Stylesheets	2.5.3	Configure Structural navigation and Views
1.7.4	Save copies of Stylesheets	2.6.1	Allow Access and activation of input Methods
1.8.1	Highlight Viewport	2.7.1	Allow Persistent Accessibility Settings
1.8.2	Move Viewport to Selection and Focus	2.7.2	Allow Restore All to Default
1.8.3	Provide Viewport Scrollbars	2.7.3	Allow Multiple Sets of Preference Settings
1.8.4	Indicate Viewport position	2.7.4	Allow Preference Changes from outside the user Interface
1.8.5	Allow Zoom	2.7.5	Make Preference Settings Transferable
1.8.6	Maintain Point of Regard	2.8.1	Customize Display of controls for User Interface Commands, Functions, and Extensions
1.8.7	Customize Viewport Highlighting	2.9.1	Adjustable Time Limits
1.8.8	Allow Viewport Resize	2.12.1	Platform Text Input Devices
1.8.9	Provide Viewport History	2.12.2	Operation With Any Devices
1.8.10	Allow Top-Level Viewport Open on Request	2.12.3	Text Input With Any Device
1.8.11	Allow Top-Level Viewport Focus Control	3.1.1	Text Entry Undo
1.8.12	Allow Same User Interface	3.1.2	Settings Changes can be Reversed or confirmed
1.8.13	Multi-Column Text Reflow	3.1.3	Retrieval Progress
1.8.14	Ignore Absolute Layout Dimensions	3.1.4	Spell Check
1.8.15	Linearize Content	3.1.5	Back Button
1.8.16	Provide Web Page Bookmarks	3.1.6	Form Submission Confirm
1.9.1	Outline View	3.1.7	Form Auto-Fill
1.9.2	Source View	3.1.8	Save Form Entries
1.10.1	Show Related Elements	3.2.1	Accessible Documentation
1.10.2	Show Element Hierarchy	3.2.2	Describe Accessibility Features
2.1.1	Provide Full Keyboard Functionality	3.2.3	Document All Features
2.1.2	Show Keyboard Focus	3.2.4	Changes Between Versions
2.1.3	Avoid keyboard Traps	3.2.5	Centralized View
2.1.4	Separate Selection from Activation	3.3.1	Avoid Unpredictable Focus
2.1.5	Follow Text Keyboard Conventions	5.1.1	comply With WCAG
2.1.6	Make Keyboard Access Efficient	5.1.2	Implement Accessibility Features of content Specifications
2.2.1	Sequential Navigation Between Elements	5.1.6	Enable Reporting of user Agent Accessibility Faults

Evaluation

This research is intended to provide an accessibility evaluation of 10 Web browsers based on UAAG 2.0. For our analysis, we have considered the latest version of top 10 web browsers, as shown in Table 5. These browsers are the mostly widely used web browsers across the world. The data taken for our analysis is gathered during the period 1st November 2014 to 21st July 2015.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Maxthon 4.4	http://maxthon-cloud-browser.software.informer.com/4.4

In order to measure all the dictum of UAAG 2.0 for different web browsers, first we check all the elements and features provided by the web browsers. Next, we evaluate the web browsers by browsing varieties of web-sites with different peculiarities (Assistive facilities). We have documented our findings in a tabular form by indicating '✓' when a web browser passes the test, and '✗' when a web browser fails the test. Based on this, we have calculated the error percentage which is a ratio of the number of failed features to the total number of features. The guidelines marked with red colour are violated by all tested web browsers. Similarly, the guidelines marked with green colour are regarded by all tested web browsers.

Table 6(a) provides the result of accessibility evaluation of web browsers with respect to the Perceivable guidelines of UAAG 2.0. According to Perceivable principle of UAAG, a web browser should be able to make its component and websites component available to human senses. During analysis of the perceivable feature, we test the web browser's ability to control text formatting. Web browsers can regulate the text-formatting by operating on text colour, text size, and font of the text. We observe that web browsers are able to control text formatting of rendered text and links, but unable to control it for block of text. Mozilla-Firefox, Flock, and SeaMonkey provide the best text formatting mechanism.

We checked whether the web browsers are able to differentiate between the elements selected by keyboard or mouse and activated element through its highlighting features. We also analyzed the methods provided by the web browsers to customize the highlighting feature. These two accessibility features are well organized by Mozilla-Firefox, Internet-explorer, Flock, and SeaMonkey. Web browser should be able to provide the outline view, source view, and off-line view of a website. This accessibility feature is properly managed by all the web browsers.

We analyzed all features of viewport and top-level viewport of a web browser. The viewports of a web browser should be resizable and contain the zooming and scrolling features. Web browser should be able to control the bookmark features. We also evaluated the web browser's ability for text reflow. All these viewport and top-level viewport related accessibility features are mostly confirmed by Google-Chrome, Opera, and Avant web browsers. We tested the ability of web browsers to control the text alternative for all non-text web components. Web browsers should also be able to find the absence of text alternatives.

We analyzed the facilities provided by different web browsers for creating and using user style sheet and also to save copies of author style sheet.

Table 6(b) provides the result of accessibility evaluation of web browsers with respect to the Operable guidelines of UAAG 2.0. According to Operable principle of UAAG, web browsers should be able to make their components and websites components easily operable by users. During analysis of the Operable feature we tested whether web browsers support all functionality of keyboard or not. There should not be any keyboard traps, or loss of keyboard focus.

We analyzed the shortcuts available in web browsers for forward and backward sequential navigation. A web browser should alert the user during wrapping of navigation. We analyzed the commands present in web browser for direct navigation and the method to customize them. We also tested the forward and backward text search. Web browsers should show all match found and should alert on wrap. We also analyzed the navigation of web browsers through different structures of websites. The navigation related accessibility features are mostly confirmed by Mozilla-firefox. We tested different processes provided by web browsers to access and activate input methods. A web browser should be compatible with all input devices appropriate to its platform. We analyzed the configuration setting of all web browsers and also the persistence and reversibility of web browsers' configuration. We verified whether a web browser al-

Table 7. Result of accessibility evaluation of web browsers with respect to Guideline 3 (Understandable) and Guideline 5 (Specification and conventions)

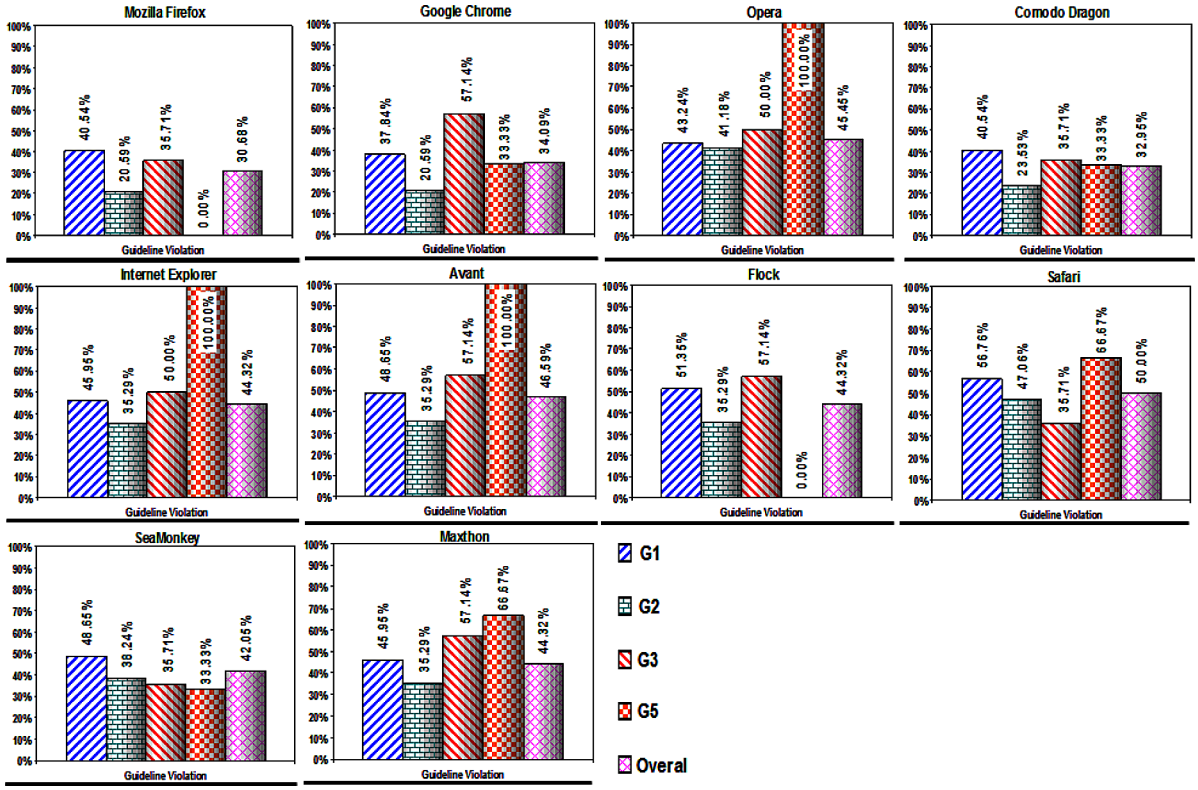
5.1.6	✓	✓	✗	✓	✗	✗	✓	✓	✗	✓



EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

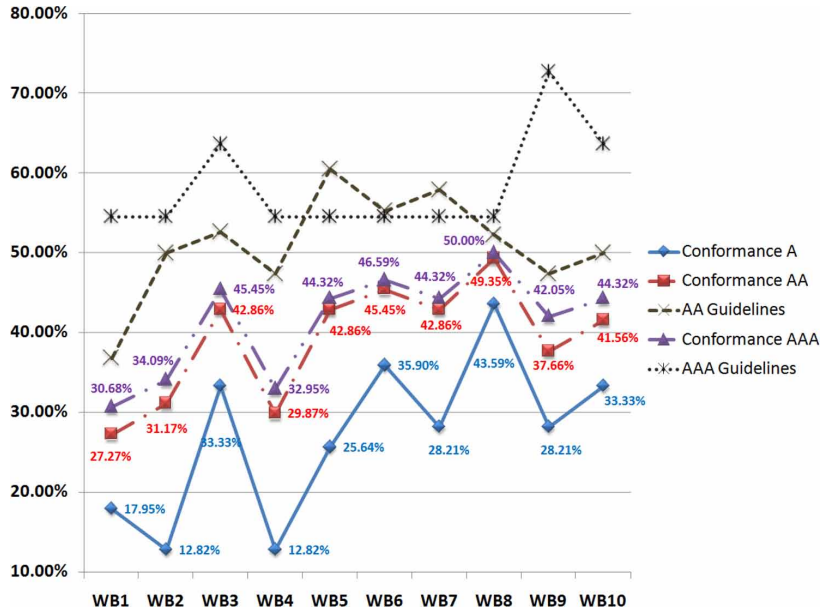
lows creating multiple preference settings. The preference settings should be transferable from one device to another. We also analyzed the customize display of controls over the user interface of web browsers.

Table 7 provides the result of accessibility evaluation of web browsers with respect to the Guideline 3 (Understandable) and Guideline 5 (specifications and conventions) of UAAG 2.0. According to Understandable principle of UAAG, web browser should be able to make its contents, interface, documentation, and websites component easily understood by users. We analyzed the effect of web browsers on the form of websites to make it understandable as web browsers can't totally control the forms of websites, but can control and customize specific features. Web browser should provide auto-fill mechanism for specific common fields. Web browsers should be capable to save local versions of web contents. It was found that form related accessibility features are mostly confirmed by Mozilla-Firefox, Comodo-Dragon, and Safari web browsers.

We scrutinized the accessibility of the documentations of web browsers. The document should provide the features of the websites, accessibility features, and the changes between versions. We also tested the web browsers capability to avoid unpredictable focus changes. We also analyzed the feedback features of the web browsers.

Figure 20. Accessibility evaluation of individual web browsers with respect to the "Perceivable", "Operable", "Understandable", and "Specifications and conventions" principles of UAAG2.0 guideline

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use



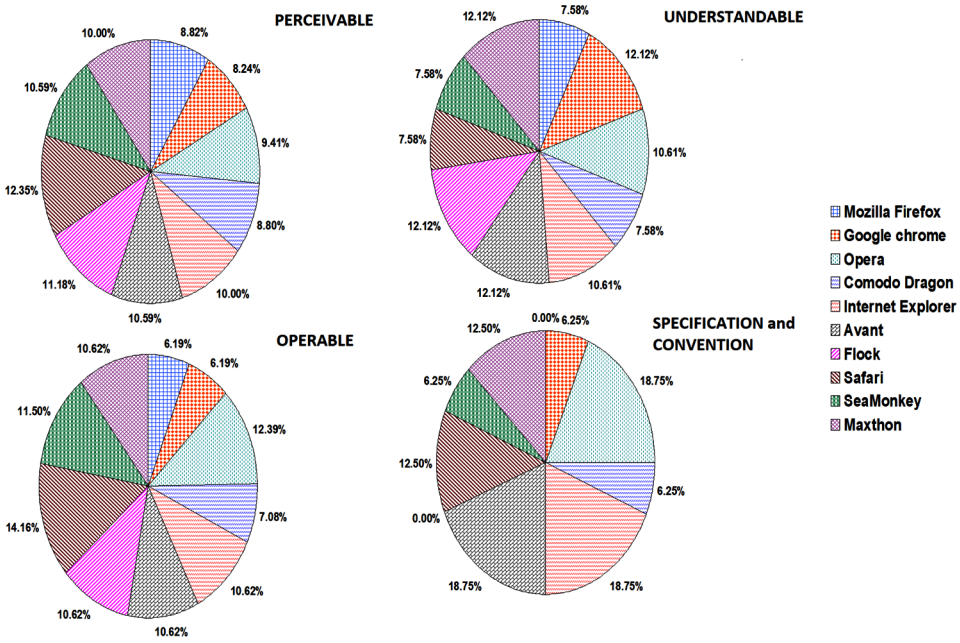
Result Analysis

Figure 20 provides the result of accessibility evaluation of individual web browsers with respect to the "perceivable", "operable", "understandable", and "specifications & conventions" principles.

It was observed that the most two accessible web browsers of all are "Mozilla Firefox" and "Comodo Dragon" with an overall violation of 30.68% and 32.95% respectively. Two web browsers that are less accessible among all are "Safari" and "Avant" with an overall violation of 50.00% and 46.59% respectively. The overall accessibility violation of "Google Chrome", "Opera", "Internet Explorer", "Flock", "SeaMonkey", and "Maxthon" are 34.09%, 45.45%, 44.32%, 44.32%, 42.05%, and 44.32% respectively.

Figure 21 represents the Accessibility Evaluation of individual web browsers with respect to different conformance like Conformance A, AA, and AAA. As per the conformance level A, least accessible web browsers is "Safari" with 43.59% violation, similarly most accessible web browsers are "Google Chrome" and "Chomodo Dragon" both with 12.82% violation. According to the conformance level AA

Figure 21. Accessibility evaluation of individual web browsers with respect to three conformance level



least accessible web browsers is "Safari" with 49.35% violation, similarly most accessible web browser is "Mozilla Firefox" with 27.27% violation. As per the conformance level AAA least accessible web browsers is "Safari" with 50.00% violation, similarly most accessible web browser is "Mozilla Firefox" with 30.68% violation.

Figure 22 provides a comparative view of guideline violations in case of perceivable, operable, understandable, and robust with respect to different web browsers. During our analysis we observed that most of the web browsers violated the fifth principle of UAAG 2.0 (specifications & conventions) with an average of 53.33% violation. The principle which is less violated by all web browsers is "Operable" with an average of 33.24% violation.

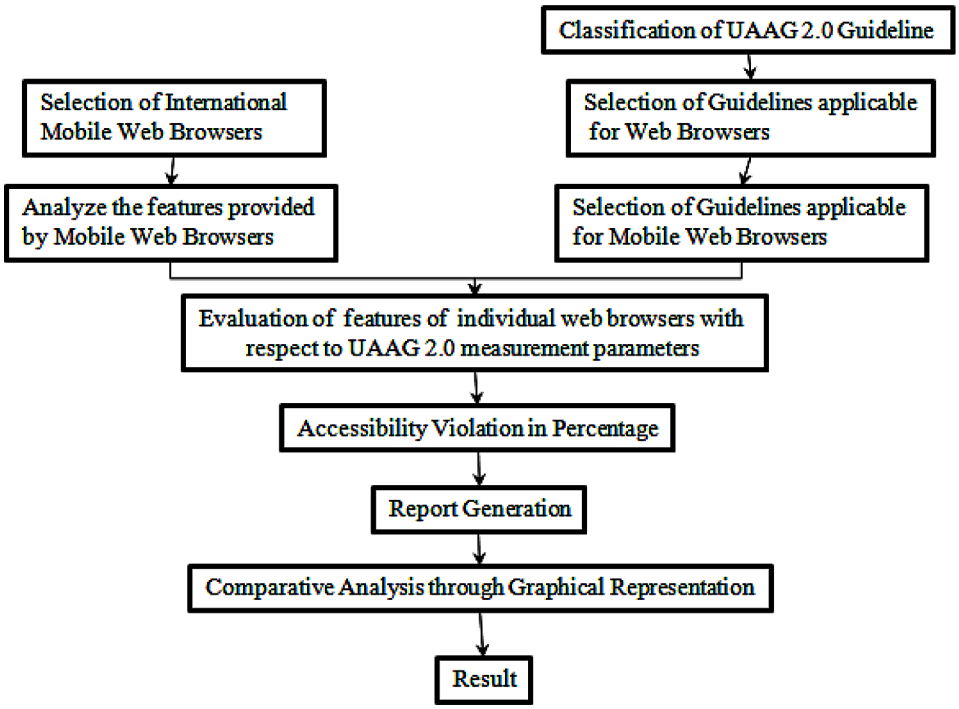
Figure 22. Accessibility violation of principles of UAAG 2.0 with respect to the web browsers

Evaluation of Web Browsers of Android Mobile

Methodology

The objective of this research is to study the accessibility of web browsers available for android mobile phones. The operating environment of mobile phones and personal computers (PC) are different, such as use of keyboard, mouse, touch screens and navigation features. Thus, the applicability of accessibility guidelines on web browsers for PCs differs from that of web browsers meant for mobile phones. First, we classify the UAAG 2.0 guidelines and choose the accessibility guidelines that are applicable to web browsers. Then, we select guidelines that are applicable to web browsers of mobile phones. Figure 23 represents the methodology adopted for evaluating web browsers of android mobiles. Table 8 shows the guidelines, which are extracted from UAAG2.0, for accessibility analysis of web-browsers.



Evaluation

This research is intended to provide an accessibility evaluation of 15 Web browsers, commonly used in android mobiles, based on UAAG 2.0. For our analysis, we have considered the latest version of top 15 web browsers available for android mobiles. The data taken for our analysis is gathered during the period 1st February 2016 to 21st August 2016. Figure 24 represents the list of selected web browsers.

Figure 25(a) depicts the result of accessibility evaluation of web browsers with respect to the Perceivable guidelines of UAAG 2.0. During analysis of the perceivable feature, we tested the web browser's ability to control text formatting. Web browsers can regulate the text-formatting by operating on text colour, text size, and font of the text. We observe that all web browsers are unable to control text format-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 23. Methodology adopted to analyze the accessibility of web browsers of android mobiles

ting of either rendered text, links or block of text. We also analyzed the methods provided by the web browsers to customize the highlighting feature. This accessibility feature is well organized in case of "Puffin" and "Mercury" web browsers. Web browsers should be able to provide the outline view, source view, and off-line view of a website. This accessibility feature is well-managed by "Mozilla Firefox", "Google Chrome", "Blue Safari", "Pale Moon", "Flash Fox", "Fire Phoenix", and "Puffin" web browsers.

We analyzed all features of viewport and top-level viewport of a web browser. The viewports of a web browser should contain the zooming and scrolling features. Web browser should be able to control the bookmark features. We also evaluated the web browsers' ability for text reflow. All these viewport and top-level viewport related accessibility features are mostly confirmed by "Maxthon", "Dolphin", and "Puffin and Mercury" web browsers. We tested the ability of web browsers to control the text alternative for all non-text web components. Web browsers should also be able to indicate the absence of text alternatives.

Figure 25(b) provides the result of accessibility evaluation of web browsers of mobile phones with respect to the Operable guidelines of UAAG 2.0. A web browser should alert the user during wrapping of navigation. We analyzed the commands present in web browsers for direct navigation and the method to customize them. We also tested the forward and backward text search. Web browsers should show all match found and should alert on wrap. We also analyzed the navigation of web browsers through different structures of websites. The search and navigation related accessibility features are mostly confirmed by "Puffin" web browser. We analyzed the configuration setting of all web browsers and also the persistence and reversibility of web browsers configuration. We verified whether a web browser allows creating multiple preference settings. The preference settings should be transferable from one device to another. We also analyzed the customize display of controls over the user interface of web browsers.

Table 8. Result of accessibility evaluation of web browsers with respect to guideline 3 (understandable) and guideline 5 (specification and conventions)

Guidelines Applicable to Web-Browsers of Mobile			
1.1.1	Render Alternative Content	1.10.2	Show Element Hierarchy
1.1.2	Indicate un-rendered Alternative Content	2.3.1	Allow Direct Navigation to Enabled Elements
1.1.3	Replace Non-Text Content	2.3.2	Allow Direct Activation of Enabled Elements
1.1.5	Provide Configurable Alternative Content Defaults	2.4.1	Text Search
1.3.1	Distinguishable Highlighting	2.4.2	Search Direction
1.3.2	Highlighting Options	2.4.3	Match Found
1.3.4	Distinguishing Enabled Elements from disabled elements	2.4.4	Alert on Wrap or No Match
1.3.5	Distinguishing Visited links from Unvisited links	2.4.5	Alternative Content Search
1.4.1	Basic text formatting (Globally)	2.5.1	Provide Structural navigation by heading and Within Tables
1.4.2	Basic text formatting (By Element)	2.6.1	Allow Persistent Accessibility Settings
1.4.3	Blocks of text (Globally)	2.6.2	Allow Restore All to Default
1.4.4	Configured and Reflowed Text Printing	2.6.3	Allow Multiple Sets of Preference Settings
1.4.5	Default to Platform text strings	2.6.4	Allow Preference Changes from outside the user Interface
1.4.6	Advanced text formatting	2.6.5	Make Preference Settings Transferable
1.8.1	Highlight Viewport	2.7.1	Customize Display of controls for User Interface Commands, Functions, and Add-ons
1.8.2	Move Viewport to Selection and Focus	2.8.1	Adjustable Time Limits
1.8.3	Provide Viewport Scrollbars	3.1.1	Text Entry Undo
1.8.4	Indicate Viewport position	3.1.2	Settings Changes can be Reversed or confirmed
1.8.5	Allow Zoom	3.1.3	Retrieval Progress
1.8.6	Maintain Point of Regard	3.1.4	Spell Check
1.8.7	Customize Viewport Highlighting	3.1.5	Back Button
1.8.9	Provide Viewport History	3.1.6	Form Submission Confirm
1.8.10	Allow Top-Level Viewport Open on Request	3.1.7	Form Auto-Fill
1.8.11	Allow Top-Level Viewport Focus Control	3.1.8	Save Form Entries
1.8.12	Allow Same User Interface	3.2.1	Accessible Documentation
1.8.13	Multi-Column Text Reflow	3.2.2	Describe Accessibility Features
1.8.14	Ignore Fixed Unit Dimensions	3.2.3	Document All Features
1.8.15	Linearize Content	3.2.4	Changes Between Versions
1.8.16	Provide Web Page Bookmarks	3.2.5	Centralized View
1.9.1	Outline View	3.3.1	Avoid Unpredictable Focus
1.9.2	Source View	5.1.6	Enable Reporting of user Agent Accessibility Faults
1.10.1	Show Related Elements

(c)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 25(c) depicts the result of accessibility evaluation of web browsers of mobile phones with respect to Guideline 3 (Understandable) and Guideline 5 (specifications and conventions) of UAAG 2.0. We analyzed the effect of web browsers on the form of websites to make it understandable as web browsers can't totally control the forms of websites, but can control and customize specific features. Web browsers should provide auto-fill mechanism for specific common fields. Web browsers should be capable to save local versions of web contents. It was found that form related accessibility features are mostly confirmed by all web browsers except "Maxthon" and "Internet Explorer". We verified the accessibility of the documentations of web browsers. A document should provide all the features of a web browser, accessibility features, and the changes between versions. We tested the web browsers' capability to avoid unpredictable focus changes. We also analyzed the feedback features of the web browsers.

Result Analysis

Figure 26 provides the result of accessibility evaluation of individual web browsers of mobile phones with respect to the "perceivable", "operable", "understandable", and "specifications and conventions" principles.

It was observed that the most accessible web browser is "Puffin Web browser" with an overall violation of 41.27%. Similarly, least accessible web browser is "Internet Web Explorer" with an overall violation of 63.49%. The overall accessibility violation of "Mozilla Firefox", "Google Chrome", "Opera", "Maxthon", "Blue Safari", "Pale Moon", "Flash Fox", "Fire Phoenix", "Web Browser & Web Explorer", "Web Browser & Explorer", "UC Browser", "Dolphin", and "Mercury" are 42.86%, 46.03%, 50.79%, 46.03%, 61.90%, 52.38%, 49.21%, 47.62%, 53.97%, 53.97%, 49.21%, 42.86% and 47.62% respectively.

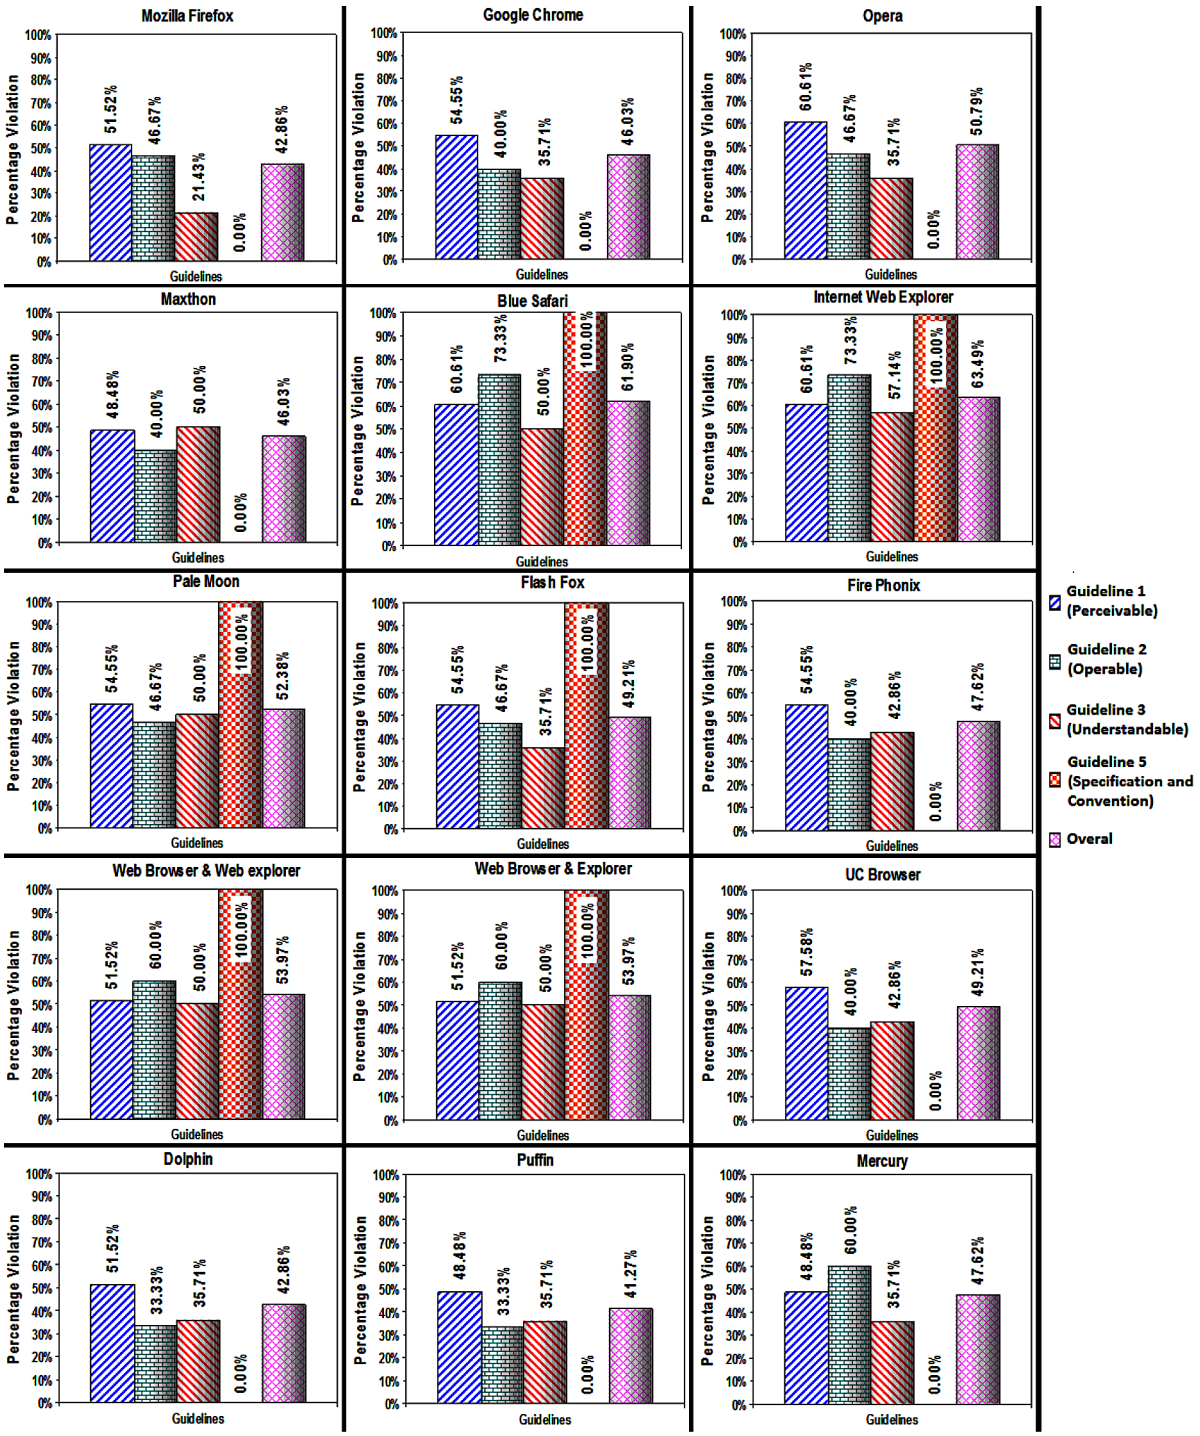

Figure 27 represents the Accessibility Evaluation of individual web browsers with respect to different conformance like Conformance A, AA, and AAA. As per the conformance level A, least accessible web browsers is "Internet Web Explorer" with 62.50% violation, similarly most accessible web browsers are "Maxthon" and "Dolphin" both with 25.00% violation. According to the conformance level AA, least accessible web browsers is "Internet Web Explorer" with 60.00% violation, similarly most accessible web browser are "Dolphin" and "Puffin" both with 38.18% violation. As per the conformance level AAA least accessible web browsers is "Internet Web Explorer" with 63.49% violation, similarly most accessible web browser is "Puffin" with 41.27% violation.

Figure 28 provides a comparative view of guideline violations in case of perceivable, operable, understandable, and robustness with respect to different web browsers of mobile phones. During our analysis we observed that most of the web browsers violated the "Perceivable" principle of UAAG 2.0 with an average of 53.94% violation. The principle which is less violated by all web browsers is "specifications & conventions" with an average of 40.00% violation.

In case of Perceivable guideline, the web browsers which cause most accessibility violation are "Opera", "Blue Safari", and "Internet Web Explorer" each with 7.49% violation. For Operable guideline, the web browsers which cause most accessibility violation are "Blue Safari" and "Internet Web Explorer" each with 9.91% violation. With respect to Understandable guideline, the web browser which causes most accessibility violation is "Internet Web Explorer" with 9.09% violation. As per the "specifications and conventions" guideline, the web browsers which cause most accessibility violation are "Blue Safari", "Internet Web Explorer", "Pale Moon", "Flash Fox", "Web Browser and Web Explorer", and "Web Browser & Explorer" all with 16.67% violation. While evaluating the 15 chosen web browsers it was observed that there is an urgent need to improve the web browsers of mobile phones in order to make them effective for accessing web sites.

Figure 29. Workflow for accessibility analysis of embedded media players

Evaluation of Embedded Media Players

Methodology

Here we have considered four media players. Features of each media players are minutely verified. First we extract the set of guideline, which are dealing with the accessibility of media players, form UAAG 2.0 then check each media players. All the features are checked minutely, but the important points are

- Configurable alternative contents (audio description, caption, sign language),
- Resizable View Ports,
- Play, Stop, Resume features,
- Zoom in and Zoom out features,
- Local and Global volume control,
- Point of regard of icons,
- History and bookmark features,
- Controllability of top level view port,
- Keyboard functionality,
- Focus order and Focus visible,
- Sequential navigation,
- Time based navigation.

To measure all the dictum of UAAG 2.0 in each media players first we check all the elements and feature provided by them. Then we evaluate by playing large variety of video with different peculiarity (Assistive facilities). We documented the result in a table with '✓' (for pass) and '✗' symbol (for fail). Then we calculated the error percentage by calculating no. of failed features with total no. of features.

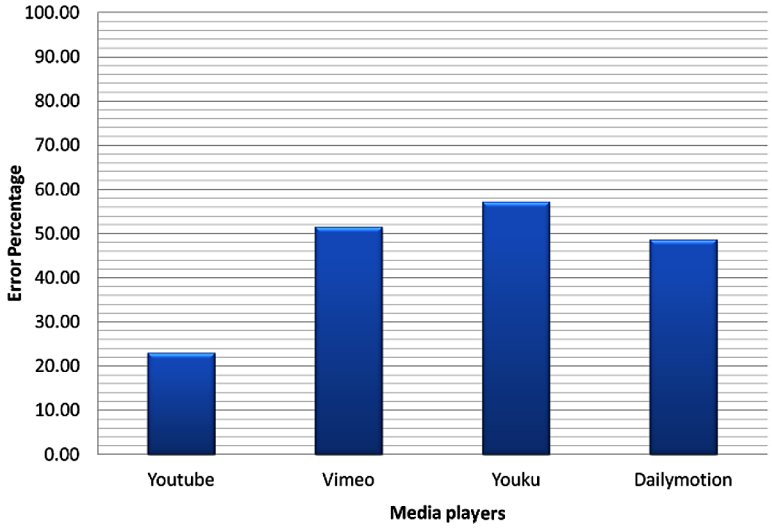
Evaluation



This research is intended to provide an accessibility evaluation of 4 Asian Media Players based on UAAG 2.0. The data taken for our analysis is gathered during the period 1st May 2014 to 21st June 2014.

While analyzing the media players we observe that, maximum guideline violation found in Youku with 57.14% violation, and the least violation found in Youtube with 22.86% violation. The violation with respect to Vimeo and Dailymotion were found to be 51.43%. Figure 30 represents the result of analysis.

During the evaluation we detect that the guidelines, which are not violated by all player are Guideline 1.8.9, Guideline 1.8.12, Guideline 1.8.13, Guideline 1.8.14, Guideline 2.9.1, Guideline 2.11.2, and Guideline 2.11.5. The guidelines, which are violated by all players are Guideline 1.1.6, Guideline 1.3.2, Guideline 1.6.1, Guideline 1.6.3, Guideline 2.2.2, and Guideline 2.11.8.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 31. Percentage of guideline violation in each embedded Media Player

We studied that in Youku media player when the zooming in reaches more than 300% the elements are not working properly. We studied that in daily motion media player the keyboard functionality are not working properly. Figure 31represents the percentage of guideline violated by each media player. According to the figure Youtube media player has less guideline violation. So Youtube is most accessible than others.

ACCESSIBILITY OF AUTHORING TOOLS

ATAG (Authoring Tool Accessibility Guideline) is an international standard for maintaining and evaluating the accessibility of different authoring tools. Authoring tools are the software used to develop different websites. The latest version of ATAG, ATAG 2.0 was recommended by W3C on 24th September 2015. Following features describe the guidelines of ATAG in short:

- The user interface of authoring tool should be accessible,
- The online user interface of the authoring tool should follow WCAG 2.0 Accessibility features,
- The offline user interface of the authoring tool should follow Platform specific Accessibility features,
- Alternative content should be available for each graphical element of the interface.
- The presentation of editing view should be programmatically determined,
- All keyboard related features should be available in user interface,
- The preview window should be as accessible as accessible as user agents.
- The user interface should help authors in avoiding and correcting mistakes
- A well accessible document, of user interface, should be available including all necessary features of user interface,
- The authoring tool should support programmers in development of accessible web content,

- The authoring tools should support the authors in producing and improving the accessibility of web contents.

RECOMMENDATIONS

Based on our study the following recommendations are made with respect to the design of web portals: text alternatives should be provided for all non-text web content, headers are to be included for each page, section, and table. There should be provision for controlling color contrasts. All keyboard functionalities need to be supported, and all the forms must be well structured and interactive.

On the basis of our analysis the following recommendations are made with respect to the design of web browsers: Web browsers should provide mechanisms to customize different highlighted options, users should be allowed to control the focus during creation of new viewports or top level viewports, the position of view should be indicated in the viewport, text formatting should be provided for blocks of text, wrapping of navigation should be allowed but with a message after completion of one round, customization of keyboard commands should be allowed, alternative content search should be allowed, mechanism should be provided to support and apply user style sheets, there should be mechanisms to activate new input methods, web browsers should provide mechanisms to choose and customize alternative contents, and there should be provision to create and transfer multiple preference settings. These features must be incorporated in web browsers so that web portals can be accessed effectively.

Similarly, the media players should allow resizing and repositioning of media alternatives provided in videos, highlight the options (like foreground and background colors, and resize the indicator when it is an image), allow a user to adjust all speech characteristics provided by the speech synthesizer, allow sequential navigation between viewports, and allow the users to adjust the contrast and brightness of visual time-based media.

CONCLUSION

With the growing number of web portals worldwide, accessibility issues have emerged as a serious concern for web designers. In this chapter we have analyzed the accessibility of web components based on WCAG 2.0 and accessibility of user agents, such as web browsers and media players based on UAAG 2.0. We also describe important features of ATAG. The issues dealt in this chapter can help web developers for effective design of web portals, web browsers, and media players by adhering to the recommendations.

Chapter 21
The Destructive Effect of Complex Analytics on Innovativeness

Burçin Güçlü
BES La Salle, Universitat Romon Llull, Barcelona, Spain

Miguel-Ángel Canela
IESE Business School, University of Navarra, Barcelona, Spain

ABSTRACT

Several studies have raised a common concern in the field of management, the lack of innovation. However, they either attribute this phenomenon to the inefficiency of marketing analytics, or to managerial despair in evaluating innovation projects. In this article, the authors propose and empirically test cognitive effort spent on marketing analytics which can lead to the lack of innovativeness, due to the negative impact of high cognitive effort on the managers' mood. In a longitudinal experiment, where manipulating the complexity of the decision context through marketing analytics, the authors demonstrate that managers employing simple marketing analytics expect their competitors to launch more products, compared to managers using complex marketing analytics. They also demonstrate that firms employing simple marketing analytics behave venturesome by embarking upon innovative activities. At the same time, firms using complex marketing analytics take more deliberative actions by innovating less and amplifying short-term gains with high priced products.

INTRODUCTION

In the last decade there has been a gradual data expansion that drives managers to seek for the development and employment of sophisticated tools that will help them make sense of the large datasets. Even though there have been significant improvements in terms of managerial tools, a lot of them fail to deliver useful information. In a recent interview, many executives stated that they did not trust the quality of the insight coming from many management tools. Particularly, nine out of ten executives admitted that their

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tools usually fail to meet their expectations, and only 23 percent of the executives interviewed stated that their tools were driven by some business strategy (Cruickshank, 2010). Recently, Ahuja and Novelli (2017) stressed out the importance of the behavioral factors that affect the evaluation of entrepreneurial efforts and the persistence of the evaluation methods providing little strategic value.

This paper focuses on the strategic choices of firms that vary with respect to the complexity of management tools, and the perceived risk of competition. In the model proposed, a firm's adoption of a strategy is dependent upon the perceived opportunities and threats in the decision context nesting risk of competition. Although firms acquire same information through market research tools, the complexity of market research tools alters their risk perception and consequently the strategies they pursue as they understand that opportunities and threats that are not identical. Consequently, firms who infer opportunities from market information follow bolder strategies, such as product launch and upgrades, while those who infer threats, pursue safer strategies such as pricing already existing products high and boosting earnings.

We conduct a longitudinal field experiment using StratSim (Deighan, James & Kinnear, 2006), a management simulation game, in which the availability of market research tools was manipulated for observation purposes such as the market information that are disclosed in different levels of complexity, and the degree to which restrictions alter strategic choices concerning innovation and pricing.

This paper is organized as follows. First, we provide a focused literature review and a behavioral theory of tool-aided decision making. Second, we present two studies conducted at individual- and group-level respectively. Finally, we discuss our findings and conclude with final remarks.

LITERATURE OVERVIEW AND THEORY

Many contemporary studies indicate mixed results for the effective applications of management tools and that highlights the ongoing dilemma regarding the usefulness of such tools (Little, 2004; Natter, Mild, Wagner & Taudes, 2008; Schilling & Schulze-Cleven, 2009). Christensen, Kaufman, and Shih (2008) raise an important concern of the last decade referring to the lack of innovativeness. They attribute this problem to management tools like financial metrics and methods employed in evaluating research and development (R&D) projects.

A study on the effect of decision making compares the attitude of two different profiles of people; the first person enrolls in fast and frugal decision making which requires less cognitive effort, whereas the second person conducts rigorous analyses when making a decision which requires more cognitive effort. As argued by Schwartz and colleagues (2002) the first person is found to be more optimistic with higher self-esteem compared to those who conduct rigorous analyses who outstand in depression, perfectionism, regret, and self-blame. These attitudes are attributed to a negative correlation of cognitive effort and mood, stating that the higher the cognitive effort required for a decision the lowest the mood and vise versa. Optimistic individuals show confidence in their self-capabilities and it is their optimistic attitude that encourages them to consistently approach challenges (Scheier, Carver & Bridges, 1994). This indicates that pessimistic managers are more likely to overestimate the risk of failure compared to optimistic managers who foresee more opportunities. In all cases, whether managers behave in an optimistic or a pessimist way, their attitude is what creates a shared understanding of the competitive environment not to mention what shapes their expectancies in terms of behavior.

Moreover, lack of optimism is linked to the tendency to lack entrepreneurial motivation as pessimistic views drive managers to downgrade their self-capabilities (Kruger, 1999) and to overweight risks and the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

probability of failure (Hmieleski & Baron, 2009). As argued by Benarjee and Newman (1991) those managers tend to avoid the bothersome situations by steering to "safer" strategies, defined as strategies with low-risk profile whose expected return is more foreseeable. Significantly, one such strategy is "Milking the cash cow" (Caves, Fortunato & Ghemawat, 1984; Zhang & Gimeno, 2007), in which firms strive to exploit their current assets to generate short-term gains that allow managers to please investors by meeting the forecasted financial numbers. This attitude minimizes the risk in operational activities and boosts short-term gains but it does so at the expense of getting crushed by dynamic firms with the technological advancement to respond to customer needs and the constantly changing business environment (Drucker, 1992).

We propose that the underlying behavioral pattern in this context is as follows: In line with Schwartz and colleagues (2002), managers who employ simple market research tools are more likely to need less cognitive effort to understand their decision environment and in this way they become optimistic perceiving less risk and more opportunities in their decision context. On the other hand, managers who employ complex market research tools are more likely to need more cognitive effort to understand their decision environment and hence become pessimistic, perceiving their decisions as risky and see more threats than the optimistic managers. Consequently, the use of simple market research tools fosters "entrepreneurial optimism" (Lovallo & Kahneman, 2003), in which managers overestimate their understanding of their decision environment and downgrade the risk of their strategic choices. On the contrary, the use of complex market research tools fosters the opposite scenario, in which managers assume that failure is more likely to occur, due to the lack of motivation in assessing the risk in their environment.

METHOD AND MATERIALS

Method

We examined how the use of market research tools impacts the firm strategy within StratSim (Deighan, James & Kinnear, 2006) in order to replicate the natural process of managerial decision making in marketing[1]. Bearing in mind that studying managerial decision making in marketing as it occurs in the field would hardly be feasible, StratSim provides a realistic setting, where participants (i.e. managers) enroll in management team debates and make strategic decisions in the face of risk.

In particular, StratSim by Interpretive Software, Inc. is a simulation game, specifically based on marketing decisions in the automotive industry. The participants are assigned to teams representing different companies and the team performance is evaluated with respect to three dimensions — team, their competitors, and the industry evolution — at each round corresponding to a yearly decision. Through the game, teams make decisions concerning product development, marketing, manufacturing, distribution, and financing using tools provided by the simulation. The input into the game was industry reports and market analyses to provide information for decision makers.

As with the automobile industry, product development in StratSim is expensive, time consuming, and risky. However, the reward of having the leading vehicle within a product class is often well worth the investment. Each firm has a limited number of product development centers that affects its ability to work on multiple development projects concurrently. Building and funding new centers can increase a firm's ability to develop more products at the same time. This investment corresponds to hiring more product development engineers and expanding the R&D facilities as it will allow firms to work on new vehicles or upgrades.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Sample

Empirical studies took place in the Erasmus School of Economics, Erasmus University Rotterdam, in the Netherlands, where StratSim is used as a significant part of FEM11028 Seminar in Marketing Strategy, accounting for 12 ECTS out of the Master's total 60 ECTS. 114 full-time master students, who had already completed a credible amount of courses in marketing, were candidates to participate in our research. Among 114 full-time master students, 77 participants were randomly assigned to 10 teams of about six to seven people, with every five teams comprising a StratSim (automotive) industry that developed uniquely based on the competitors' interactions with the introduction of new products and the way they were supported.

Experimental Conditions

We modified the normal game procedure by altering the availability of the market research tools (see Table 1).

Table 1. Experimental manipulations

Round	Industry 1	Industry 2
R1	Simple Tools Only	Complex Tools Only
R2	Simple Tools Only	Complex Tools Only
R3	Simple Tools Only	Complex Tools Only
R4	Simple Tools Only	Complex Tools Only
R5	All Tools	All Tools
R6	All Tools	All Tools
R7	All Tools	All Tools
R8	All Tools	All Tools

As presented in Table 1, firms could either access a) only simple market research tools (concept test and focus group), or b) only complex market research tools (perceptual maps and conjoint analysis) and c), or a combination of simple and complex market research tools.

STUDY 1

In Study 1 which was conducted at the beginning of the experiment, we observed the participants' expectancies regarding competitors' actions in the next round in comparing the round that preceded with the one that followed in terms of innovative activities (product launch, minor upgrades, and major upgrades) and pricing. The purpose of this study was to demonstrate that the aforementioned behavioral processes that lead to the lack of innovation are grounded at the individual-level.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Hypotheses

Drawing on the argumentation on theory, in the context of innovation, we provide our hypotheses as follows. First, we expect that the managers who employ simple market research tools will expect their competitors to undertake more innovative activities, compared to those who use the available complex market research tools. We expect managers employing only simple market research tools to be more optimistic regarding their entrepreneurial skills and to believe that their competitors will also follow this entrepreneurial stream. On the contrary, managers employing all the market research tools that are available are expected to be pessimistic regarding their entrepreneurial skills, to discard innovative opportunities and to expect their competitors to behave in line with their own behavior.

Second, we expect that managers employing only simple market research tools will downgrade their competitors' increase in prices, compared to managers employing all market research tools available. This is expected to happen as the managers employing simple market research tools will feel lower short-term earnings pressure, compared to the managers employing complex market research tools. The hypotheses are presented in Table 2.

Table 2. Study 1 hypotheses

Hypothesis	Description
H1a	Managers with simple tools availability will expect their competitors to launch more products, compared to firms with complex tools availability.
H1b	Managers with simple tools availability will expect their competitors to make more minor upgrades, compared to firms with complex tools availability.
H1c	Managers with simple tools availability will expect their competitors to make more minor upgrades, compared to firms with complex tools availability.
H2	Firms with simple tools availability are expected to have less expectation that their competitors will price their products higher, compared to firms with complex tools availability.

Procedure

We conducted surveys among the participants at the end of the first round of the game. In the first round of the game, the participants were called to make managerial decisions using market research tools for the first time. Thus, this initial round intended to reveal the complexity of the impact the required managerial decisions had on their mood and the difference between their beliefs about their competitors' actions and their degree of optimism. In addition to that, the survey conducted in this round was the first encounter the participants had with the survey questions which ensured the highest accuracy of the results.

The purpose of these surveys was to measure the participants' beliefs about their competitors' actions. Each survey was delivered once the participants submitted their decisions to the simulation, and was collected after the completion of every round. There was no time restriction for the surveys and most of them were completed in a reasonable time interval of around ten minutes.

We followed a conventional pretesting procedure; an initial draft of the survey was prepared one week prior to the experimental sessions, and the teaching team (i.e. the course instructor and three teaching

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

assistants) revised the draft over the week. We eliminated unnecessary questions, added clarification sentences, and changed the wording of some questions to avoid confusion.

We did not allow the participants to communicate with each other while completing the survey as we wanted to ensure the credibility of the answers and to ensure that each participant was expressing his/her personal opinion. Only the aforementioned teaching team was allowed to resolve any doubts from the participants' end. The surveys were circulated in print and the answers were recorded to an Excel sheet after the first round.

Three participants were missing in this round, which yielded 74 participants for the survey. We achieved a high response rate from the participants. Particularly, 74 participants out of 74 answered the question regarding competitors' innovative behavior, while 73 participants out of 74 answered the question regarding competitors' pricing behavior. The subjects were fairly incentivized to complete the surveys because the surveys constituted 10% of their overall grade.

For the sake of our theory, we were mainly interested in the participants' expectancy regarding the competitors' behavior, in terms of innovativeness (product launch, minor upgrades and major upgrades) and pricing. Specifically, participants were expected to have different expectations on these aforementioned matters with respect to the experimental conditions. Thus, in the first round of the survey, the participants were asked about their beliefs on competitors on a scale of -2 to 2 with -2 standing for the expectation that the competitors will spend less and 2 for the expectation that the competitors will spend more. Also, they were called to predict the competitors' behavior in the next round compared to the current round and "launching new vehicles," "minor upgrades" and "major upgrades" were listed.

Modeling

In each condition, we mainly looked at the differences in group means regarding the expected increase in the competitors' innovation (launch, major upgrade, minor upgrade) and pricing activities. The group means are presented in Table 3.

Table 3. Group means

Group Mean	Description
MEAN_SIMPLE_H1a	Mean value of the expected change in the competitors' product launch in the simple tools availability condition
MEAN_COMPLEX_H1a	Mean value of the expected change in the competitors' product launch in the complex tools availability condition
MEAN_SIMPLE_H1b	Mean value of the expected change in the competitors' product upgrade (minor) in the simple tools availability condition
MEAN_COMPLEX_H1b	Mean value of the expected increase in the competitors' product upgrade (minor) in the complex tools availability condition
MEAN_SIMPLE_H1c	Mean value of the expected increase in the competitors' product upgrade (major) in the simple tools availability condition
MEAN_COMPLEX_H1c	Mean value of the expected increase in the competitors' product upgrade (major) in the complex tools availability condition
MEAN_SIMPLE_H2	Mean value of the expected increase in the competitors' pricing in the simple tools availability condition
MEAN_COMPLEX_H2	Mean value of the expected increase in the competitors' pricing in the complex tools availability condition

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

We tested the significance of the differences in group means using two-sample, one-sided *t* tests with unequal variances. The null hypotheses were:

MEAN_SIMPLE_H1a < MEAN_COMPLEX_H1a

MEAN_SIMPLE_H1b < MEAN_COMPLEX_H1b

MEAN_SIMPLE_H1c < MEAN_COMPLEX_H1c

MEAN_SIMPLE_H2 < MEAN_COMPLEX_H2

Results

The results of the survey study are summarized in Table 4. In the first round of the game, we measured the expected change in the competitors' innovation activities with respect to the aforementioned scale. The mean response from 74 participants was 0.419 for launching new vehicles, 0.932 for minor upgrades and 0.865 for major upgrades, indicating an expected increase in competitors' innovative activities overall. As for launching new vehicles, the mean response in the simple tools only condition was 0.800 from a sample of 35 participants, while the mean response in the complex tools availability condition was 0.077 from a sample of 39 participants, indicating gradual differences in the expected increases in the competitors' product launching. The corresponding *t* test indicated that the difference in group means was significant (one-sided p=0.002). Concerning the minor upgrades, the mean response in the simple tools only condition was 0.971 from a sample of 35 participants, while the mean response in the complex tools availability condition was 0.897 from a sample of 39 participants, indicating differences in expected increases in the competitors' minor upgrades. However, the corresponding *t* test indicated that the difference in group means was insignificant (one-sided p=0.352). Concerning major upgrades, the mean response from 35 participants in the simple tools only condition was 0.914, while the mean response from 39 participants in the complex tools availability condition was 0.821, indicating differences in expected increases in competitors' product launching. However, the corresponding *t* test indicated that the difference in group means was insignificant (one-sided p=0.330).

In addition to that, we also measured the participants' beliefs regarding the competitors' expectations of product pricing in the next round. Participants selected the answer that best fitted their expectation and then assessed a value for this answer on the aforementioned scale. The mean response from a sample of 73 participants was 0.041, indicating an expected increase in the competitors' prices. The mean response from a sample of 34 participants in the simple tools only condition was 0.000, while the mean response from a sample of 39 participants in the complex tools availability condition was 0.077, indicating differences in the expected increases in the competitors' prices. However, the corresponding *t* test indicated that the difference in the group means was not significant (one-sided p=0.351).

STUDY 2

In Study 2 which was conducted over the simulation game, we looked at the decision outcome concerning innovative activities (product launch, minor upgrades, and major upgrades) and pricing. As demonstrated in the previous study, the behavioral processes that lead to the lack of innovativeness and to short-term earnings orientation were grounded in an individual-level. The purpose of the current study was to demonstrate that these behavioral tendencies had group-level (i.e. firm-level) consequences in the long-run.

Hypotheses

In this study, we hypothesized that firms employing complex market research tools are likely to dispose the lack of entrepreneurial courage and adopt the milking the cash cow strategy by undertaking less innovative activities and setting their unit margins higher. To be more specific, they are expected to innovate less due to a high risk-aversion, perceived lack of entrepreneurial skills and high expectancy of a negative outcome which result from the employment of complex market research tools that require higher cognitive effort. Thus, firms that use only complex market research tools will undertake fewer future-value generating activities, such as product launches and upgrades.

In addition to that, these firms will also price their unit margins higher to generate higher short-term earnings. This behavioral tendency would be the outcome of the investors' expectations to meet the financial forecasts, resulting in myopic, short-term gain orientation and finally leading to a vicious cycle in which firms plagued with short-term gain orientation in the previous rounds reemphasize this behavior by taking prior financial performances as a benchmark. Table 5 summarizes the hypotheses of Study 2.

Table 5. Study 2 hypotheses

Hypothesis	Description
H3a	Firms using only complex market research tools will tend to launch fewer products compared to those with only simple tools availability.
H3b	Firms using only complex market research tools will tend to upgrade products less often compared to those with only simple tools availability.
H4	Firms using only complex market research tools will tend to set their unit margins higher compared to those with only simple tools availability.

When all the market research tools are presented in one shot, we presume to find mixed results due to different findings in the field of cognitive science. Epfstein (1994) suggests that there are two modes of thought; the experiential and the analytical. The former refers to "heuristic decision making," in which individuals simplify their decision context by relying on fewer, recallable cues to reduce the cognitive effort in the decision making process (Shah & Oppenheimer, 2008), while the latter refers to elaborative, rational thinking by integrating all cues available in the decision context. Taking into account that our theory was in accordance with an experiential mode of thinking, we did not anticipate the effect of all the tools available for strategic choices (i.e. more/less innovative activities, lower/higher pricing) compared to the restricted availability of market research tools and waited for the results of the experiment.

Procedures

The two StratSim industries shared the same parameter setting; they were identical at the beginning of the simulation and then they were run independently in the different sessions. The game was played over nine rounds (i.e. one practice round and eight real rounds), and the team decisions were made after analyzing the previous period's results, as well as using market research tools in the current period. Firms were managed by participants in a marketing strategy course whose grades depended on their firms' profit at the end of all nine rounds. To maximize their profits, each firm needed to collect market information using the available market research tools and making key marketing (e.g. pricing and advertising spending) and innovation (new product launching, upgrading, entering into new markets) decisions based on market information.

To guarantee that the participants had the sufficient knowledge about the game, we applied the procedures presented in Table 6.

Table 6. Additional procedures

Additional Procedure	Purpose
Two compulsory three-hour sessions	Participants were debriefed about the purpose of the game, which was to expose them to the vital importance of marketing intelligence in strategic marketing decisions.
One practice round	Participants got used to the simulation procedure and software. They were told that the practice round was designed to be identical to the first real round, meaning that all firms would have access to the exact same market research tools they would have in the first real round and that they were free to use the same information in the first real round.
Essay writing	Participants were required to deliver one short essay for each tool, once every two weeks, where they specified how they defined the focal market research tool, what advantages/disadvantages they had. These essays were regularly examined and graded.

Modeling

In this section, we explain how we measure independent and dependent variables and control variables. Regarding dependent variables, we observed firms' decisions concerning innovative activities (product launch and upgrade) and pricing. At every round, the participants made a product launch and took upgrade and pricing decisions simultaneously based on the market information they gathered through the market research tools. We modeled these decisions using the following variables:

$LAUNCH_{i,t}$: Number of launches by firm *i* at time *t*.
$UPGRADE_{i,t}$: Number of upgrades by firm *i* at time *t*.
$MARGIN_{i,t}$: Profit divided by selling price of each vehicle sold by firm *i* at time *t*, in percentage.

Regarding independent variables, we explained the dependent variables using tool manipulations:

$COMPLEX_{i,t}$: Dummy variable equal to 1 if firm *i* employed complex market research tools at time *t* and 0 otherwise.
$SIMPLE_{i,t}$: Dummy variable equal to 1 if firm *i* employed simple market research tools at time *t* and 0 otherwise.

Table 7 provides the control variables with corresponding literature.

Table 8 provides the descriptive statistics overall.

The descriptive statistics concerning the dependent variables within each experimental condition are presented in Table 9.

Table 7. Control variables

Control Variables	Description	Reason
ROUND	Variable to capture the linear time trend;	Kalwani, Yim, Rinne & Sugita, 1990; Messinger & Narasimhan, 1997; Miller & Friesen, 1984
ROUNDSQ	Variable to capture the quadratic time trend;	Manchanda, Xie & Youn, 2008
$FGROWTH_{i,t}$	Percent growth in unit sales of firm *i* from t-1 to t at time *t*;	Hauser, Tellis & Griffin, 2006
$STOCKPRICE_{i,t-1}$	Firm *i*'s stock price in dollars at *t-1*	Hauser, Tellis & Griffin, 2006
$COMPETITION_{i,t-1}$	Herfindahl index in firm *i*'s industry at time *t-1*;	Anderson & Sullivan, 1993; Lee & Grewal, 2004
$MARGIN_{i,t-1}$	Profit (selling price minus cost of goods sold) divided by the selling price of each vehicle sold by firm *i* at time *t-1*, in percentage;	Yang, Chen & Allenby, 2003
$BLAUNCH_{i,t}$	Dummy variable equal to 1 if there is launch by firm *i* at time *t* and 0 if not;	To represent innovative activities that precede each other
$BUPGRADE_{i,t}$	Dummy variable equal to 1 if there is more than one upgrade by firm *i* at time *t* and 0 if not.	To represent innovative activities that precede each other

We fitted the following models to measure the impact of market research tools on innovative activities and pricing. We set all-tools availability as our baseline condition. Models (1), (2) and (3) were fixed-effects Poisson regression models because the dependent variables are count variables. Model (4) was a fixed-effects model because the dependent variable is metric. Within subjects effects represent the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

variability of the dependent variables of interest for each firm. To be more specific, they are a measure of how firms tend to change over time, controlling for unobserved effects driven from the heterogeneity of the firms:

$$\ln[E(LAUNCH_{i,t})] = \delta_1 * COMPLEX_{i,t} + \delta_2 * SIMPLE_{i,t} + \delta_3 * ROUND + \delta_4 * ROUNDSQ + \delta_5 * FGROWTH_{i,t} + \delta_6 * STOCKPRICE_{i,t-1} + \delta_7 * COMPETITION_{i,t-1} + \delta_8 * BUPGRADE_{i,t} + \nu_i$$

$$\ln[E(UPGRADE_{i,t})] = \beta_1 * COMPLEX_{i,t} + \beta_2 * SIMPLE_{i,t} + \beta_3 * ROUND + \beta_4 * ROUNDSQ + \beta_5 * FGROWTH_{i,t} + \beta_6 * STOCKPRICE_{i,t-1} + \beta_7 * COMPETITION_{i,t-1} + \beta_8 * BLAUNCH_{i,t} + \nu_i$$

$$\ln[E(UPGRADE_{i,t})] = \varphi_1 * COMPLEX_{i,t} + \varphi_2 * ROUND + \varphi_3 * FGROWTH_{i,t} + \varphi_4 * STOCKPRICE_{i,t-1} + \varphi_5 * COMPETITION_{i,t-1} + \varphi_6 * BLAUNCH_{i,t} + \nu_i$$

$$MARGIN_{i,t} = \gamma_0 + \gamma_1 * COMPLEX_{i,t} + \gamma_2 * SIMPLE_{i,t} + \gamma_3 * MARGIN_{i,t-1} + \gamma_4 * ROUND + \gamma_5 * ROUNDSQ + \gamma_6 * FGROWTH_{i,t} + \gamma_7 * STOCKPRICE_{i,t-1} + \gamma_8 * COMPETITION_{i,t-1} + \nu_i + \varepsilon_{i,t}$$

Results

The results of this study are summarized in Table 10. In Model (1), we found evidence that firms employing only complex market research tools launch new products less often (p=0.038) than those firms employing only simple market research tools, compared to when firms have all the tools available. That is, controlling for other factors, the mean number of launches in the complex tools availability condition is 0.07 units less than the mean number of launches in the all tools availability condition, while the mean number of launches in the simple tools availability condition is not significantly different from the mean number of launches in the all tools availability condition.

In Model (2), we failed to find evidence that firms employing only complex market research tools upgrade their products less often (p=0.308) than those firms employing only simple market research tools, compared to when firms have all the tools available. Nevertheless, when we replicated the same analysis in Model (3) by excluding insignificant variables $SIMPLE_{i,t}$ and ROUNDSQ from the estimation, we found evidence that firms employing only complex market research tools, upgrade their products less often (p=0.090) compared to when firms have all the tools available. That is, controlling for other factors, the mean number of upgrades in the complex tools availability condition is 0.49 units less than the mean number of upgrades in the all tools availability condition.

In Model (4), we found evidence that firms tend to set their product margins higher (p=0.002) when they only employ simple market research tools, as well as when they employ only complex market research tools (p=0.000), compared to when they have all the tools available. However, the coefficient of $COMPLEX_{i,t}$ is larger than the coefficient of $SIMPLE_{i,t}$, meaning that the difference between the complex- and the all-tools availability is larger than the difference between the simple- and the all-tools availability. This suggests that firms set their margins higher when they only have complex market research tools than when they only have simple market research tools. That is, controlling for other factors, firms using only simple market research tools set their margins 2.92 units in a percentage higher than when they have the all tools availability condition, while firms using only complex market research tools set their margins 3.96 units in a percentage higher than when they have the all tools availability condition.

DISCUSSION AND CONCLUSION

This study aimed at proposing a behavioral model of the variations in strategic choices with respect to the way information is presented while validating the underlying theory that predicts the several variances in strategic choices. This model advances a central hypothesis that the cognitive effort required in a decision environment is negatively related to optimism and self-esteem (Schwartz et al., 2002). Specifically, we tested whether changes in the mood due to the cognitive effort required in the deci-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

sion context lead to changes in strategic choices. Consequently, the use of simple market research tools fosters "entrepreneurial optimism" (Lovallo & Kahneman, 2003) in which managers overestimate their understanding of decision environment and downgrade the risk of their strategic choices. However, the use of complex market research tools fosters the opposite scenario in which managers assume that failure is more likely to occur, due to lack of motivation and confidence in their managerial skills in assessing the risk in their environment. The results of this longitudinal experiment confirmed that firms steer to bolder strategies when their (hypothetical) managers employ simple market research tools alone since the low degree of cognitive effort in the decision making process enhances an entrepreneurial spirit accompanied with innovativeness. The findings also confirmed the opposite scenario in which firms steer to the "milking the cash cow" strategy when their (hypothetical) managers only employ complex market research tools due to the high degree of cognitive effort required in the decision making process which wipes away their enthusiasm and leaves them with myopic, risk-averse tendencies to boost earnings by pricing their products higher.

A key aspect of the experiment was that the decision making process was observed within the firm through the survey study that followed the managers' expectancies. From that perspective, Study 1 has an impactful contribution to the studies on managerial decision making as it provides essential information regarding the participants' early beliefs about their competitors and those beliefs are examined in various phases over the simulation game. Particularly, in Study 1, the participants' beliefs about their competitors are shaped from the very beginning of the simulation game, as the participants' beliefs about their competitors' product launching reflects what happens over the simulation: The participants in the simple tools availability condition have an optimistic view about their competitors, believing that their competitors are in a good mood to undertake more product launches, while those in the complex tools availability condition have the opposite view, believing that their competitors do not possess adequate entrepreneurial skills to undertake more product launches. The entrepreneurial optimism is more evident in the product launching decisions than in the product upgrade decisions because product launching is a more long-term investment decision, whose financial outcome is evident in two or three periods after launching, depending on whether the new vehicle is launched in an already-existing class or in a new class, while the financial impact of product upgrading can be observed in one or two periods after implementation, depending on whether the upgrade is minor or major.

The results from Study 2 further substantiated our theoretical predictions. Significantly, the results provided evidence that firms employing only complex market research tools embark upon innovative activities less often than those firms employing simple market research tools, compared when firms have all the tools available. In addition to that, firms employing only complex market research tools are more prone to price their products higher than those firms employing only simple market research tools, compared when firms have all the tools available. As suggested, the product upgrades can be perceived as less innovative due to their shorter time horizon compared to product launches, and we are not surprised to find weaker support for the impact of complexity on product upgrade decisions in Study 2.

This study concludes that managers use management tools that provide little strategic value because they employ management tools that do not account for human cognition. As emphasized in this study, human cognition benefits from simplicity. Reducing the cognitive effort required in the decision making process ensures a positive mood, enhances entrepreneurial optimism, and contributes to the firm value in the long run. For this reason, we believe that businesses need to consider their managers' cognitive limitations when it comes to combining managerial decision making and the benefits of decision support systems.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

This study provides necessary information to several disciplines as it delves into the issue of the lack of innovation and proposes a solution by examining the root of the problem that lies in the way market information is presented. As suggested, academics in the field of management should further integrate behavioral consequences of employing decision support systems in solving complex, ill-structured problems in their decision environment.

Also, this study addresses a common issue in the practitioners' world referring to the consequence of using management tools that destroy firm value. However, as concluded in this study, management tools per se do not destroy firm value. It is the tool characteristics that foster different moods in managers and thus create problems for the firm value. As proposed in this study, practitioners are advised to revise their decision-making protocols, especially those that require the employment of management tools.

Last, this study encourages further work on simplicity outperforming complexity in the context of decision support systems. It acknowledges that the last decade has been very promising on this matter, but stresses that the impact of complexity on managers' mood in the context of business analytics requires further examination.

Chapter 22
Effective Tools for Improving Employee Feedback during Organizational Change

Tanja Sedej
Graduate School of Government and European Studies, Slovenia

Gorazd Justinek
Graduate School of Government and European Studies, Slovenia

ABSTRACT

Feedback is the fastest and most effective way for organizations to make improvements or get things back on track. Prompt and constructive feedback is strongly linked to employee satisfaction and productivity, and can increase both. During times of change when employees want to be heard and feel involved, it is even more important that the optimal internal communication tools for managing employee feedback are selected. This article tackles these questions and provides fresh empirical data on the selection of internal communication tools in general, with focus then devoted to managing feedback during change from the perspective of a professional communicator. The data evaluated and analyzed was gathered on the basis of research carried out in 2014 among 105 professional communicators of large and medium-sized companies, and was then compared with the results of similar research conducted in 2012.

INTRODUCTION

The general consensus is that organizational changes are becoming increasingly frequent, and so must be planned and managed with great care (Barrett, 2002; D'Aprix, 2008; Kitchen, 2002; Kotter, 1996; Luecke, 2003; Sedej & Mumel, 2013). Sedej and Mumel (2013, p. 25) argue that implementing change often takes longer than planned, whereas Balogun and Hope Hailey (2004) report that approximately 70 percent of changes implemented within organizations fail to achieve their set objectives.

Therefore, a critical factor to be taken into account during an organizational change is internal communications. It is widely accepted that internal communications play a key role in the successful implementation of change (Goodman & Truss, 2004; Kalla, 2005; Kotter, 1996; Proctor & Doukakis, 2003; Young & Post, 1993). Communicating effectively within organization is not something that is nice to have. Indeed, internal communication is essential for the smooth running of every organization. Justinek and Sedej (2011) argue that internal communications represent a key performance and productivity issue, especially for international companies. It is therefore vital to ensure that employees have an optimal range of internal communication tools in general and for giving and receiving feedback. Rapidly changing circumstances require internal communication tools to be continuously improved and revised.

Particularly, when change has a significant impact on employees, organizations need to provide a broad range of options for employees to communicate, ask questions, vent anxieties and express opinions. Working without feedback during a change process is akin to setting off on an important journey without a map. Relying only on sense of direction is not sufficient and of itself to make improvements or keep things on the right track.

The number of ways to communicate in organizations has rapidly increased over the last two decades (Lengel & Daft, 1998; Lydon, 2005; Richardson & Denton, 1996; Wojtecki & Peters, 2000). It is therefore crucial that this area is comprehensively understood in order to achieve best results for setting a feedback system using internal communication tools.

There is a lack of understanding about the link between the effectiveness of internal communications, internal communication tools and feedback during change. Each internal communication tool has features that make it suitable and appropriate in certain situations, but entirely inadequate in others. This chapter therefore explores which internal communication tools are the most appropriate during change generally, as well as in terms of achieving overall business success and facilitating feedback.

The purpose of this chapter is therefore to present not only a critical review of the theories and approaches currently presented regarding internal communications and the facilitation of feedback through internal communication tools, but also the results of an empirical study that will encourage further research into the nature of organizational change, change communications, and internal communication tools and setting feedback system in order to create a more pragmatic framework in which to operate.

This chapter begins with a conceptual analysis of the meaning of organizational change and change management, internal communications and the internal communication tools which are used in this regard. It then concludes with an investigation of the understanding of feedback and its power to enhance the change process.

The results of research conducted on the selection of tools for improving employee feedback in internal communication during change are also presented. The topic was first researched in 2012, but was repeated in 2014. The analysis however reveals that there has been a gradual shift in the use of internal communication tools generally and, more specifically, for exchanging feedback.

THEORETICAL BACKGROUND

Change Management and Internal Communications

Technological development, fierce competition and globalization are just some of the critical elements that force organizations to transform or adjust to new business conditions. Organizational changes are

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

a fact of everyday life and vital for survival. They must therefore be successfully planned and managed (Balogun & Hope Hailey, 2004; Beshtawi & Jaaron, 2014; Ćirić & Raković, 2010; D'Aprix, 2008; Koonce, 1991; Kitchen & Daly, 2002; Kotter, 1996; Luecke, 2003). Kitchen and Daly (2002, p. 46) argue that twenty-first century organizations are preoccupied with the concept of change. Ćirić and Raković (2010, p. 24) explain that changes are difficult to predict, and tend to occur with growing frequency. Therefore, change management is becoming an increasingly significant issue in the business world.

As change management garners increasing attention, many definitions of the concept have emerged. For example, Moran and Brightman (2000, p. 66) define change management as the process of continually renewing an organization's direction, structure, and ability to serve the ever-changing needs of its external and internal customers. Kitchen (2002, p. 48) explains that change management implies an attempt to understand the dynamics in the business environment, as well as the organization's own internal dynamics. Beshtawi and Jaaron (2014, p. 128) argue that the main intention behind a change management framework is to help all employees, even managers, to move successfully from the current state to a future state while achieving the business results desired.

The keystone of organizational change lies in internal communications, and employee communication is a pivotal element in achieving business success (Elving, 2005; Frahm & Brown, 2007; Goodman & Truss, 2004; Kitchen & Daly, 2002; Koivula, 2009; Lydon, 2006; Richardson & Denton, 1996). Goodman and Truss (2004, p. 217) believe that appropriate communication helps employees understand the need for change and its direct impact. Sande (2008, p. 29) considers communication to be real only when it is two-way. Elving (2005, p. 131) states that one of the main purposes of change communication can be to prevent, or at least reduce, resistance to change. Goodman and Truss (2004, p. 226) listed some examples of potential purposes for internal communication: getting buy-in, securing commitment to change, minimizing resistance, reducing personal anxiety, ensuring clarity of objectives, sharing information, setting out the vision, challenging the status quo, increasing clarity and mitigating uncertainty.

Organizational change can be both invigorating and intimidating (Sedej & Mumel, 2013, p. 23). Once employees are encouraged to carry out their jobs differently, the whole organization begins to change. Effective internal communication is therefore essential for addressing organizational concerns. Goodman and Truss (2004, p. 226) listed some examples of potential purposes for internal communication: getting buy-in, securing commitment to change, minimizing resistance, reducing personal anxiety, ensuring clarity of objectives, sharing information, setting out the vision, challenging the status quo, increasing clarity and mitigating uncertainty.

Despite the growing attention of the presented field, numerous errors in change management are directly linked to the collapse of internal communications (Elving, 2005; Gilsdorf, 1998; Kotter, 1996). Newton (2007, p. 186) also believes that it is necessary to take into account how much damage is sustained through too little or too much communication when considering the level of communication intensity in the context of change management. Sedej and Mumel (2015, p. 9) explain that employees always want to be kept abreast of what is happening in an organization and how the changes implemented will affect their work life.

The above observations highlight the huge importance of internal communications during the change process. It draws attention in particular to the importance of careful planning and change management. Justinek and Sedej (2011, p. 230) emphasize that internal communications must be sufficiently flexible to adapt smoothly to business needs.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Internal Communication Tools during Change

The immense significance of internal communications during change is therefore noted, but there remain some specific areas which have not been adequately investigated in this regard. Few studies have investigated internal communication tools in detail. The results of those studies usually highlight the importance of giving sufficient thought to tool selection (Goodman & Truss, 2004; Merrell, 2012; Richardson & Denton, 1996; Young & Post, 1993).

Indeed, internal communication tools need to be chosen carefully, especially during times of change. Appropriate tool selection helps employees adapt more smoothly to organizational changes and new business needs. Austin and Currie (2003, p. 236) believe that managers should use a variety of the tools available to them, find innovative ways to strengthen employee relations, and disseminate information as soon as it is known. Lydon (2006) agrees that organizations need to use communication tools that have been proven to work.

Buckingham (2008) argues that if the internal communication tools used do not fit the true culture of the organization, then only few individuals will truly take heed of the internal information flows. Sedej and Mumel (2013, p. 23) believe that unsuitable internal communication approaches are frequently employed during change; mistakes occur as unclear goals are set, inappropriate messages are relayed and inappropriate communication tools and channels are selected, which all too often result in poor communication results. It is therefore clear that the selection of appropriate internal communication tools represents a challenge.

It is crucial that internal communication tools, which should include both personal and impersonal modes of internal communications, are selected with due thought and consideration (Mumel, 2008; Ranken, 2007; Richardson & Denton, 1996). Barrett (2002, p. 221) states that effective employee communication uses all the tools available in order to reach its audience, but relies more on direct communication (verbal or face-to-face) than indirect communication (written and electronic tools).

Face-to-face communication is generally considered more efficient than other forms (Holtz, 2004; Mumel, 2008; Richardson & Denton, 1996), but is time-consuming and costly for widely dispersed organizations. Richardson and Denton (1996, p. 215) add that if personal (verbal) communication is limited, it is necessary to consider interactive tools, particularly video and telephone conferencing. Holtz (2005, p. 22) underlines that innovations in web-based technology have generated a wide range of exciting new tools in internal communications.

Handling change electronically is sometimes more convenient and efficient, but can be counterproductive when dealing with complex issues. Wojtecki and Peters (2000, p. 1) believe that many managers use e-mail, intranets, and other innovative technological tools to communicate and see them as effective internal communication solutions that meet the high demand for communicating during times of change.

Many authors divide internal communication tools according to the mode of transmission (Bratton & Gold, 1994; Klein, 1996; Mumel, 2008). In this context, organizations have a wide range of written (printed), verbal (oral), and electronic internal communication tools available.

Sedej and Mumel (2005, p. 12) explain and clarify verbal, written and electronic internal communication tools as mode of transmission. In general, verbal (personal face-to-face) communication ranges from informal conversations between two employees to formal large meetings with directors. The key feature of this mode of communications is that the information is sent from the sender directly; the information is also expressed through tone of voice and non-verbal communication such as hand gestures and facial expressions, which enrich the interpretation and contribute to a better understanding of the message.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Written communications vary from monthly reports to annual reports and corporate brochures. Electronic communications encompass the commonly used e-mails up to modern video content.

In Table 1, the internal communication tools are divided as mentioned above into three categories (verbal, written and electronic). Some of the tools in the table are classified into several subcategories. If the information is transmitted via electronic equipment, this equipment will hereinafter be regarded only as electronic internal communication tools.

Feedback Tools in Internal Communication during Change

Especially during process of change internal communications and the tools represent an underutilized way to get closer to employees' expectations and opinions by simply listening and responding to them. The systematic gathering of feedback within any organization is crucial for its smooth and normal functioning.

Many authors (Kreps, 1990; Theaker, 2004; Russ, 2007; Parker, 2009; Sande, 2009) underline the significance of feedback in internal communications. Hattie and Timperley (2007, p. 81) define feedback as information that is provided by an agent regarding aspects of one's performance or understanding. Kotter and Cohen (2003, p. 101), on the other hand, define feedback as one of the most important forms of information required to achieve success in an organization.

It is vital to have a clear understanding of the concept throughout the organization. As feedback is a critical business component Hattie and Timperley (2007, p. 81) describe it as a consequence of performance.

Indeed, all good communications consist of not only effectively delivering information, but also actively listening. Even Sande (2009, p. 29) emphasizes that internal communications require an active sender, active receiver and a healthy feedback loop.

It is a mistake to expect that only increasing the frequency of messages through different internal communication tools and the introduction of new tools will be sufficient to encourage feedback information flows. The methods for obtaining feedback are becoming increasingly diverse and innovative (Holtz, 2005; Sedej & Mumel, 2005). In addition to the most commonly used questionnaires and suggestion boxes, the use of quizzes, games, forums and blog are establishing a foothold in internal communications. Russ (2007, p. 8) clarifies that feedback can be obtained using multiple internal communication tools, verbal (within large or small groups and interpersonal communication) and nonverbal (written) feedback.

Especially in a process of change it is important to regularly facilitate and acquire feedback. Organizations need to clarify ambiguities through internal communications and gain the support and cooperation of their employees. Parker (2009, p. 25) firmly believes that if employees have the opportunity to express their personal fears, only then can progress in the process of change be made.

In order for organizations to promote open communication with all their employees, i.e. from those who are more vocal to those less willing to speak up, it is vital that there are several ways to obtain feedback. As a result, organizations often offer employees the option to provide feedback anonymously through research projects or suggestion boxes, through which employees and executives exchange opinions. Harris (2007, p. 12) argues that it is important to provide an opportunity for personal feedback communication, but it is also important to provide some channels that allow adequate anonymity because employees are often wary of expressing their real opinion, but this is largely dependent on the culture of the organization.

RESEARCH

There is no longer any doubt that employees are the most important part of the success of any organization. The employee communication process, together with internal communication tools for an effective feedback system, has undergone fundamental change, as technology has become an important part of the business world. It is imperative to have a comprehensive overview of what resonates with employees in internal communications as well as a solid understanding of the most appropriate internal communication tools for giving and receiving feedback.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Therefore, a question that addresses this chapter is in place: What are the most appropriate internal communication tools to facilitate communication and consequently employee feedback?

Methods

To begin, theoretical and background information was gathered on the concepts of change management in internal communications generally and more detailed internal communication tools for facilitating employee feedback. The existing research and literature on change processes and internal communications were used to construct the research framework.

The theoretical framework was then verified empirically with a structured questionnaire on internal communications during organizational change, in which the main focus was on internal communication tools in general and in detail for facilitating feedback during process of change.

Similar research was first conducted in 2012, with a follow-up project conducted two years later in 2014, thereby allowing the two sets of data to be compared.

Design of Research

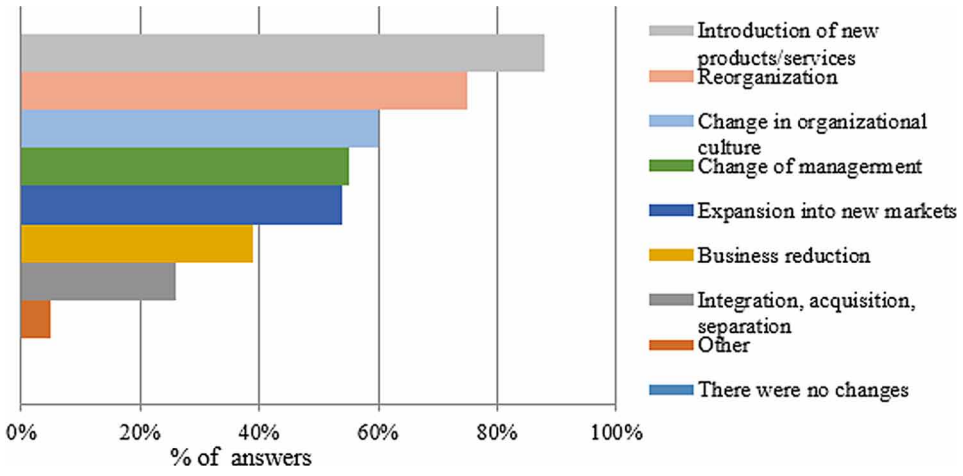
The questionnaires were designed solely for internal communication experts who have adequate knowledge and appropriate access to this kind of information. The focus was on experts who operate in large and medium-sized companies, where the high number of employees requires not only systematically planned and thoughtful internal communications but also a carefully managed system for feedback. The questionnaire was available to communication experts to complete for approximately three months in 2012 and again in 2014.

In 2012 a total of 71 internal communication experts participated in the research, of whom 48 (68%) represented large companies and 23 (32%) medium-sized companies.[1] The youngest company participating in the research was only 2 years old, with the oldest having been established for 137 years; the average duration of incorporation for all the participating companies was 21.5 years. The key share represents companies that have been established for 2 to 30 years (87%). In terms of NACE,[2] the structure of the participating companies reveals that most operate in the manufacturing sector (15%), with second and third place shared by information and communication (14%) and financial and insurance activities (14%). The following activities are also well represented: other services activities, wholesale and retail trade, repair of motor vehicles and motorcycles, administrative and support service activities, and education.

In 2014, a total of 105 internal communication experts participated in the research, of whom 63 (60%) represented large companies and 42 (40%) medium-sized companies. The youngest company participating in the research was only 3 years old, the oldest 139; the average of all participating companies in terms of number of years of existence was 20.5 years. The key share represents companies that have operated from 3 to 30 years (89%). The structure of the participating companies in terms of NACE shows that most operate in the manufacturing sector (17%); the second place belongs to information and communication sector (16%) and the third place to financial and insurance activities sector (13%). The following activities also have an essential share: wholesale and retail trade, other services activities, repair of motor vehicles and motorcycles, education, administrative and support service activities.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Results



As presented earlier in the chapter, the organizations today have a wide range of internal communication tools at their disposal and thereby numerous of possibilities to receive and give feedback to their employees. Especially during the process of change it is important to communicate openly and frequently to prevent or at least reduce employee resistance. Their concerns should be discovered in the early phase and addressed as soon as possible. In this manner all internal communications have to be cautiously planned and managed. Bellow results of the research tackle comprehensively the mentioned issues.

Frequency and Types of Organizational Change

Organizations face changes relatively often; this was also verified by the research conducted in both 2012 and 2014.

In 2012 the experts estimated that an average of 4 major organizational changes had occurred in the previous three years. After more detailed analysis, the types of changes were also established (Figure 1). In the last three years, the organizations had to deal most frequently with the introduction of new products and services (79%) and reorganization (72%), followed by expansion into new markets and changes to the management and organizational culture. The last three listed changes were identified by approximately every second organization that participated in the research.

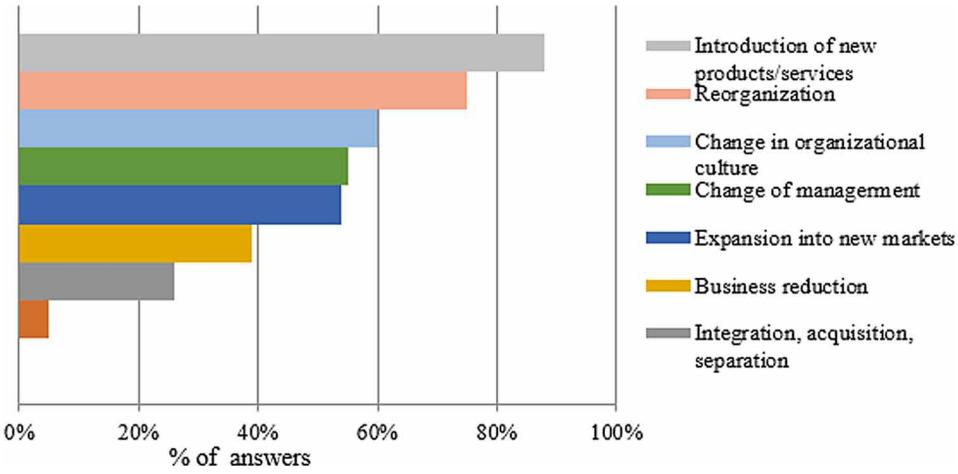


Figure 1. Type of organizational changes 2009-2011 (as a percentage)

Two years later, in 2014 the experts estimated that in the last three years on average 4.5 major organizational changes had occurred (Figure 2). Analysis also shows that in the last three years, the organizations had to deal most frequently with the introduction of new products and services (81%) and reorganization (75%), followed by change in organizational culture, expansion into new markets and change of management (approx. 50–60%).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

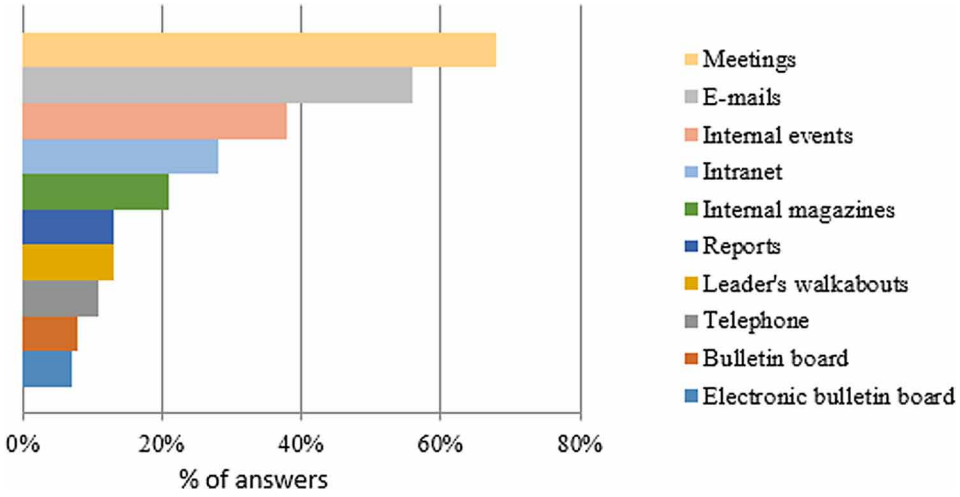
Figure 2. Type of organizational changes 2011-2013 (as a percentage)

Internal Communication Tools Used during Change in General

The right frequency and combination of internal communication tools are also vital, especially during change processes, a time when employee anxiety increases. Consequently, a series of questions related to internal communication tools was established.

In the research carried out in 2012 and 2014, the experts were required to choose exactly three key internal communication tools that are used most often in times of change in general. They could choose from among the 25 most commonly used internal communication tools. Also, three options to record alternative internal communication tools were available. Based on the experts' selection, a list of the 10 most frequently used internal communication tools during times of change was conceived.

In 2012 the first place on the list of internal communication tools was taken by meetings, which was partially expected as personal internal communication during change is usually the most preferred mode of communication within organizations (Figure 3). Other internal communication tools ranked as follows in terms of being the most appropriate: e-mails, internal events, intranet, internal magazines, leader's walkabout, reports, telephone, bulletin boards, and electronic bulletin boards.



Of the 10 key internal communication tools listed, electronic and verbal communication tools dominate. Written tools are also well represented, but are mainly ranked in the lower half of the top ten list.

Among the verbal communication tools available, the most important are meetings, closely followed by internal events and management walkabouts. Of the electronic communication tools available, the most important are e-mails, which ranked the second most important tool on the list. The next most important electronic tool is the intranet, placing third among all the tools listed. Telephone communication and electronic news also feature. Reports, bulletin boards and internal magazines feature among the written communication tools, which are all ranked in the lower half of the list of all tools.

In 2014, meetings and e-mails remained in first and second place respectively on the list of internal communication tools (Figure 4). Interestingly, the intranet placed third on this occasion. Other internal communication tools ranked as follows in terms of being the most appropriate: internal events, electronic internal magazines, reports, leader's walkabout, telephone and internal research.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

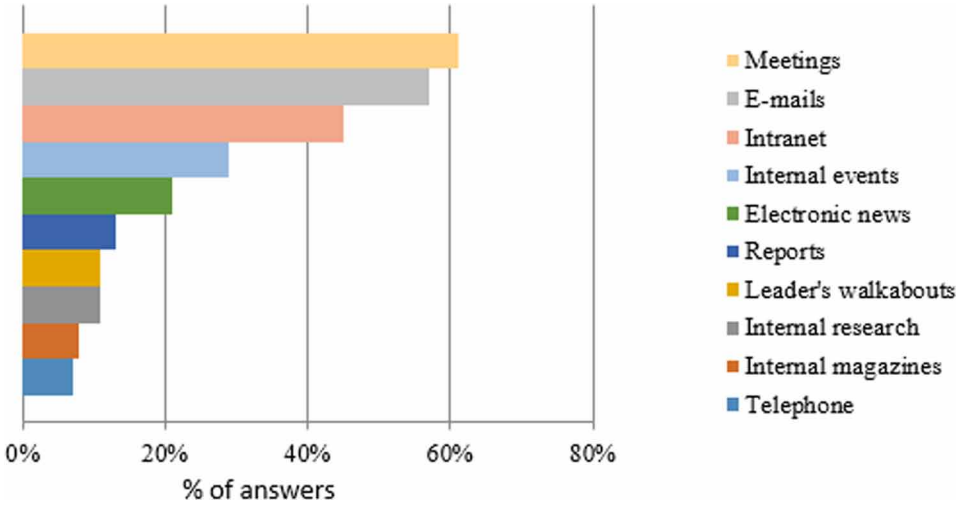


Figure 3. Key internal communication tools used during change in general 2012 (as a percentage)

Of the 10 key internal communication tools listed, electronic and verbal communication tools dominate. The share of written tools is the smallest and ranked in the lower half of the list.

Among verbal communication tools, the most important are meetings, followed by internal events and management walkabouts. Of the electronic communication tools available, the most important are e-mails, which ranked the second most important tool on the list. The next most important electronic tool is the intranet, placing third among all the tools listed. Telephone communication and e-news also feature. Reports and internal research as the written communication tools are all ranked in the lower half of the list of all tools.

Figure 4. Key internal communication tools used during change in general 2014 (as a percentage)

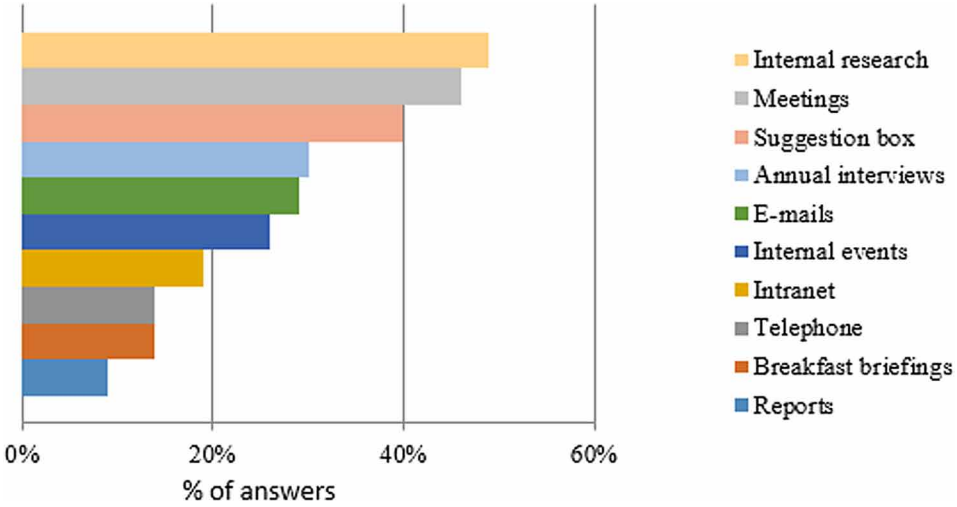
Internal Communication Tools Used during Change for Facilitating Feedback



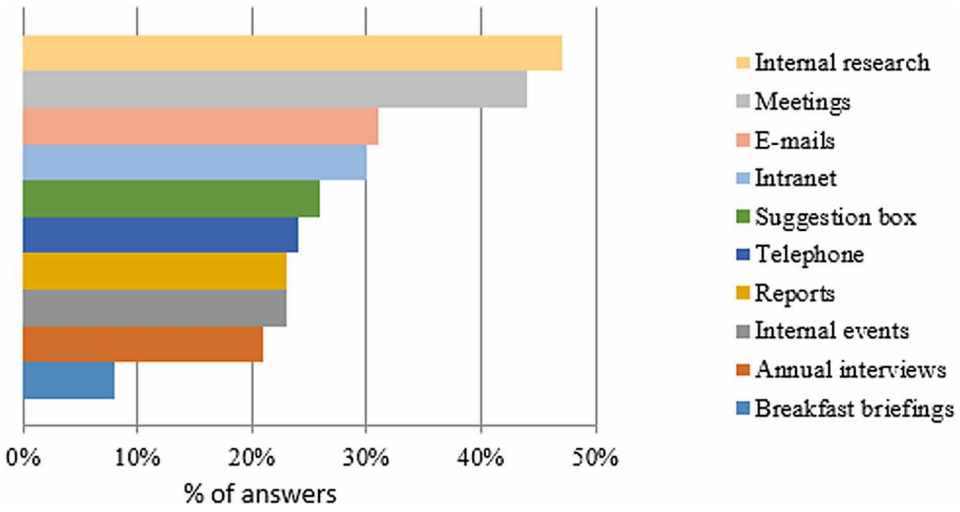
In the research carried out in 2012 and 2014, the experts were required to choose the three key internal communication tools for facilitating feedback that are used most often in times of change.

In 2012, internal research ranked first on the list of internal communication tools for facilitating feedback (Figure 5), with meetings placing second. Other internal communication tools ranked as follows in terms of being the most appropriate: suggestion box, annual interviews, e-mails, internal events, intranet, telephone, breakfast briefings and reports.

The list of ten key internal communication tools shows the importance of all types of internal communication tools, whether they are written, verbal or electronic. Written tools are considered the most important, however, since they ranked first and third on the top ten list.

Among the various written communication tools available, the most important is internal research. A suggestion box also ranks highly in third place on the list, with reports placing last. Among verbal communication tools meetings are in the foreground, followed by the annual interviews, internal events and breakfast briefings. Despite e-mails being the most important electronic tool, they nevertheless ranked only in fifth place, followed by intranet and telephone.

Figure 5. Key internal communication tools used during change for feedback 2012 (as a percentage)



In 2014, internal research once again took first place on the list of the most popular internal communication tools (Figure 6), with meetings ranking second. Other internal communication tools ranked as follows in terms of being the most appropriate: e-mails, intranet, suggestion box, reports, telephone, internal events, annual interviews and breakfast briefings.

The list of ten key internal communication tools shows the importance of all types of internal communication tools, whether they are written, verbal or electronic.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Among the various written communication tools available, the most important is internal research. A suggestion box and reports also have a significant role, ranking fifth and sixth on the list respectively. Among the verbal communication tools, meetings placed first, followed by internal events, annual interviews and breakfast briefings. Despite e-mail being the most important electronic tool, it nevertheless ranked only third, followed by intranet and telephone.

Figure 6. Key internal communication tools used during change for feedback 2014 (as a percentage)

DISCUSSION

The business environment within which organizations operate has undergone rapid development, and organizations are required to cope with change more frequently than ever. Internal communications represent a key element in the success of organizational change (Goodman & Truss, 2004; Kalla, 2005; Kotter, 1996; Proctor & Doukakis, 2003; Young & Post, 1993) and this is the main reason why organizations must give more thought to internal communication tools (Merrell, 2012; Richardson & Denton, 1996; Wojtecki & Peters, 2000; Young & Post, 1993).

The research we have conducted in past years shows that the pace of change has not slowed down. Analysis conducted on research data gathered in 2012 and 2014 suggests that it has even slightly increased.

In the process of change, internal communications should not be underestimated or even neglected. Just because a message is delivered, this does not mean that it was delivered successfully. The mission of internal change communications is complete only when the receiver has understood and successfully integrated the message relayed.

In order to get the best results in communicating change, it is often necessary to deliver the message several times using different internal communication tools. The adequate combination of verbal, electronic and written internal communication tools is therefore essential in order to ensure that the communication process is being carried out effectively.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

After each internal communication especially during process of change, it is necessary to ensure a relevant follow up with possibilities for feedback to verify the employee's level of awareness, understanding as well as their emotional reactions and commitment to include it daily work. In fact, our research proves that in order to communicate change effectively in general meetings and e-mails are still the most important tools, although the difference between them is getting smaller. It can be noted that the position of electronic tools in internal communications is growing even stronger, when comparing the data for 2014 and 2012. Three electronic tools in fact rank among the first five places. In line with expectations, the role of written tools is less prominent in 2014 than was the case in 2012, as they are all ranked only in the lower half of the top ten list.

A comprehensive picture for facilitating feedback with internal communication tools during change shows another perspective. When experts have in their mind facilitating feedback, they ranked the importance of the internal communication tools entirely differently. At the top of the scale for the research conducted in 2012 and 2014 is internal research that represents written internal communication tools, while second place belongs to meetings. In addition to verbal and electronic internal communication tools, written tools have a significant role to play during change in this regard.

CONCLUSION

All organizations, regardless of their size, are required to change significantly in order to develop or survive in a new business environment. The way in which employees are kept informed and engaged in the workplace is also changing radically.

The research conducted confirms that the number of changes faced by organizations is increasing every year. The foundation of organizational success therefore lies in planning all the phases in the change process well, especially the ability to communicate change properly and provide the best and most appropriate range of internal communication tools.

When planning internal communications during change, it is important for experts to bear in mind how the feedback is exchanged. Previous research demonstrates that written internal communication tools should not be neglected, especially during periods of change. Despite the new media and tools at our disposal, it is vital to remember that change communications are not effective when a message is simply delivered; only when the message has been heard, understood and applied in practice can it be deemed a success.

Research shows that a healthy feedback system which comprises written, electronic and verbal internal communication tools is a viable approach for communicating change in organizations. It suggests that sensible planning and managing internal communication tools for facilitating feedback can improve the implementation of changes in organizations.

ACKNOWLEDGMENT

The authors would like to thank the anonymous reviewers and the editor for their insightful comments and suggestions.

KEY TERMS AND DEFINITIONS

Change Management: A process, approach or method that increases the likelihood that employees will successfully manage through a change process.

Internal Communications: Represent a function responsible for effective communications among employees within organizations.

Internal Communication Tools: Through internal communication tools with informing, creating dialogue and relationship among employee's communication objectives can be achieved.

Feedback in Internal Communications: Feedback in internal communications is a system where the reaction or response of the receiver after he has interpreted the message reaches the sender through one or more internal communication tools.

Organisational Change: An organizational transition from its current state to a desired future state.

Chapter 23
Accessible and Inclusive Content and Applications

Tom Brunet
IBM, USA

P. G. Ramachandran
IBM, USA

ABSTRACT

As devices have become smaller and more pervasive, usage scenarios that have historically been common for people with disabilities are finding more general application for all users. Overall, the consideration of accessibility improves the usability of applications for all users. This chapter will discuss standards for accessibility, inclusive design, and topics related to the development of accessible mobile content and applications. The discussion will apply to mobile content, such as EPUB documents, and topics related to Web, native, and hybrid applications.

INTRODUCTION

The field of Accessibility is focused on ensuring that every person is able to access information and perform tasks regardless of that person's physical or cognitive capabilities at any given time. Practitioners in this field consider a wide range of capability types and impairment severities, including not only severe physical or cognitive disabilities, but also contextual limitations such as noisy environments.

The history of accessibility in the technology industry dates back to at least 1914, when IBM® hired its first employee with a disability. IBM® also led the evolution of assistive technologies with a Braille printer in 1975, a talking typewriter in 1980, and the IBM® Screen Reader product in the early 1980's (IBM, 2015). While this level of inclusion has been ingrained in companies like IBM®, legislation in this area is fairly recent - the Americans with Disabilities Act (ADA) was passed in 1990 and the Section 508 amendment to the Rehabilitation Act was passed in 1998.

For physical access, most local governments did not build accessible sidewalks and pathways until they were mandated by the ADA. In many cases, the need for these features was not immediately obvious since they do not impact everyone on a day-to-day basis. However, when the need arises, retrofitting can be difficult and costly. Due to cost, historical preservation, and other issues, retrofitting is still occurring for many buildings.

Technology access has been a different environment. Due to the rapid turnover of hardware and software, and the relative ease of modification, accessibility has evolved much faster than in the physical space. Additionally, relatively recent technologies, such as the World Wide Web, have improved access to information like never before.

The power of the Web is in its universality. Access by everyone regardless of disability is an essential aspect. (Tim Berners-Lee, 1997)

Now that mobile devices are commonplace, the universality of access has been unshackled. It is no longer available only from the desktop in your home, it is also available from the phone in your pocket.

This mobile evolution has brought two areas of Accessibility closer together. People who rely on assistive technologies are able to participate in ways that have been historically unavailable to them. On the other hand, as people are performing more tasks on devices that are smaller and using them in situations where they may not be able to look at or hear the device, these individuals require assistive technologies that have traditionally focused on people with severe disabilities.

In a less-obvious manner, our perception and abilities have not evolved, but we are using devices that are smaller than ever before. Therefore, there is a strong desire from all users for day-to-day interactions with their devices to become personal, aware, and cognitive. When outdoors, our displays need to be brighter, and when in noisy environments, the sound may need to be louder or captions may need to be provided.

Technology should adapt to humans, not the other way around. Multimodal interactions provide another interaction pattern to consider. If the same operation can be performed via various modalities, users have more flexibility and choice in how they perform the operation. During multi modal interactions, the systems also need to prioritize and be selective about how to respond to and process interactions in order to avoid accidental input. Humans are easily able to switch and prioritize. Devices will have to be smarter about processing. To some extent, multimodal interaction is already available. However, the means to enable these interactions needs to be further simplified. Development tends to prefer simplicity, so the means to enable accessibility will have to be simplified to the extent that this blends in with new development paradigms.

Wearable devices present another technology that can improve access for the general population and also for people with disabilities. Early wearable devices are similar to wristwatches and add abilities to provide feedback via vibrations and provide input via tap. Some companies are already building devices that can be woven into fabric, allowing for the integration of sensors and feedback in clothing, shoes, jewelry, glasses, etc. Each of these provides new opportunities for a user to interact with devices.

While the possibilities are endless, it is up to the technical community to prioritize simplification and enablement of accessibility. Sometimes more gadgets is not the answer; simplifying the existing ones and investing the time to understand the usage patterns can yield good results.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Many of the technologies that have enabled the mobile evolution have their roots in accessibility. Those with vision impairments leverage magnifiers and zoom technologies. Text-to-speech technology has provided additional information channels for those who are blind or have visual or cognitive impairments. Speech recognition has provided an input mechanism for those who cannot type, such as people with physical impairments.

In this chapter, we will discuss the importance of accessibility considerations throughout the content and application lifecycles, and applicable standards, techniques, and tools.

MOBILE ACCESSIBILITY

Business Imperative

In the 2010 US Census, 56.7 million people (19%) reported a disability, and more than half of these reported a severe disability (US Census Bureau, 2012). 40 million individuals were over the age of 65, and that number is expected to increase to 72 million by 2030. It is estimated that 1 billion people worldwide have a disability (WHO and World Bank, 2011).

In past decades, accessibility was largely a niche market, focused on by a handful of companies and advocacy groups. As world demographics shift to older populations and as more companies are sued to improve access to retail, services, and other offerings beyond brick-and-mortar locations, accessibility has shifted into a more visible mainstream role.

Recognition of the business imperative began with companies that were doing business with government entities, starting with the passage of the Section 508 Amendment to the US Rehabilitation Act of 1973. This amendment added accessibility considerations for US federal procurement, requiring that any company selling assets to the US government report their compliance. Many states followed suit, with similar requirements for sales to government entities at many levels. Therefore, companies that sold to US government entities were the first to develop accessibility practices, whereas other industries, such as retail, lagged behind. Other governments passed related legislation, such as the Ontarians with the Disabilities Act in 2005, and more recently due to the UN Convention on the Rights of Persons with Disabilities.

For retail entities, compliance was often deprioritized, with arguments that brick-and-mortar locations offered equivalent facilitation. This argument was used to deflect application of the Americans with Disabilities Act to Websites and other digital offerings. However, that changed with class-action lawsuits, such as National Federation of the Blind (NFB) v. Target® Corporation in 2006. These lawsuits aimed to highlight that the convenience of online shopping and discounts in online-only deals should not be available only to a subset of the population – brick-and-mortar locations are not suitable alternatives.

As more companies have reviewed their design and development processes to consider accessibility issues, these companies have recognized that design for accessibility also forces their design teams to create more organized and thoughtful user experiences. This provides critical impact for people with severe disabilities, major impacts for people with minor disabilities, and improved user experiences for all users.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Standards

There are multiple guidelines and standards that apply to the interface design of a mobile application. Individual device platforms provide basic recommendations, such as the iOS Human Interface Guidelines and the Android™ Guidelines. Following these guidelines can improve the usability and accessibility of an application, but they do not cover all aspects of accessibility.

The World Wide Web Consortium (W3C®) provides the current overriding standard for accessibility. When the W3C® started on the Web Content Accessibility Guidelines (WCAG) v2.0 (W3C, 2008), they set a goal to create a set of standards that was not focused on any particular technology and therefore would not become obsolete as technology evolved. This approach has been evident in that other standards have moved to align with WCAG 2.0 after it became a W3C® Recommendation in 2008. These standards focus on four key principles:

Principle 1 – Perceivable: Information and user-interface components must be presentable to users in ways they can perceive.
Principle 2 – Operable: User-interface components and navigation must be operable.
Principle 3 – Understandable: Information and the operation of user interface must be understandable.
Principle 4 – Robust: Content must be robust enough that it can be interpreted reliably by a wide variety of user agents, including assistive technologies.

When the checkpoints and guidelines of these principles are satisfied, applications and content can be consumed and interacted with reliably by people with a broad range of abilities to perceive and operate content.

In addition to platform guidelines, specific legislation may also apply for a given application or audience. Examples include the US Americans with Disabilities Act (ADA), Section 508 of the US Rehabilitation Act (US Access Board, 2000), Accessibility for Ontarians with Disabilities Act (AODA), EU Mandate 376, UK Disability Discrimination Act of 1995, and others. Generally speaking, following the WCAG guidelines will help you meet the content and applications components of this legislation, but often the legislation also comes with a reporting component that is specific to each.

Accessibility Starts with Design

Accessibility is a consideration of every stage of the application and content lifecycle, affecting design, development, test, and deployment.

For many development teams, their first introduction to accessibility starts with an audit, lawsuit, or other notification of accessibility issues in a released application. The common reaction to these events is remediation, which triggers a QA-driven process of identifying issues and sending them back to development to be fixed. Meanwhile, this expensive process is making changes without revisiting them in the context of the original design.

It is important that these teams take a step back and look at the larger development process. Accessibility, like all user experience and user interaction specification, starts with design. Designers should consider the user experience for a broad range of personas. Designers may already have training to consider personas in different job roles and with different lifestyles, but they also have to consider personas

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

that prefer different interaction styles. Inclusive Design refers to a design process that includes all of these personas.

When Inclusive Design is practiced, accessibility issues are considered at design time, and developers and testers include accessibility as part of the regular process of implementing the design.

There are a number of issues that designers should consider. The following list is not complete, but provides a significant review of issues that a designer might consider:

- **Alternatives for Non-Text Content:** All non-text content (for example, images) must have appropriate text alternatives. In some cases, images are used to supplement existing text, and therefore an empty alternative is appropriate to avoid redundancy. Additionally, for videos, captions must be provided.
- **Text Contrast and Color:** Ensure that text provides enough contrast to be readable per WCAG 2.0 1.4.3 and that links or hotspots are distinguishable from the surrounding text by color contrast or other formatting. Also, do not use color alone to convey information.
- **Multi-Device Access:** Different users may utilize a variety of different input devices or styles: mouse, keyboard, touch, voice, or sip/puff switch. Often, starting with basic mouse and keyboard access will assist with the other input methods, with additional fine-tuning for a specific device as desired.
- **Container Sizes:** Designs are often created for specific sizes or amounts of content. When content is altered by translation, zoom, or altered by a particular device, content may grow or shrink in unexpected ways. Designers must consider how content containers respond in these situations.
- **Semantics and Labels:** UI frameworks often provide ways to specify the semantics and labels for content. For example, in HTML, h1, h2, and other elements specify headings, ARIA landmarks mark important regions on the page, label elements help label form elements, and more. When content and applications choose elements based on semantics rather than default look and feel, the user interface and assistive technologies can use these semantics to provide a robust and consistent user experience across applications. For example, if a framework provides a checkbox widget, focus on making that checkbox adopt your look and feel rather than re-creating a partial checkbox behavior with a set of changing image widgets.
- **Form Flow and Guidance:** Ensure that there are instructions on how to fill out forms, that there are error messages when input is not properly specified, and that there are mechanisms to review or reverse submissions to avoid accidental submissions.

Mobile Application Development

An accessible mobile solution involves multiple components, consisting of at least an app, the operating system (OS) (for example, iOS, Android™), and assistive technologies (ATs) (for example, VoiceOver, Siri, TalkBack). In order to ensure that the app is accessible, the developers must ensure that the app communicates necessary information with the OS and ATs through the platform APIs. In this section, we will outline many of the significant platform APIs that affect accessibility.

iOS Native Applications

iOS provides a variety of properties that affect how VoiceOver reads content. Basic properties include:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **isAccessibilityElement:** VoiceOver will only read elements when this property is set to true. The default value is true for standard UIKit controls and false otherwise. Usually, this value should be set to true. However, some exceptions are outlined below.
- **UIAccessibilityContainer:** If a widget is a container of accessible controls (for example, a table containing rows), it should implement UIAccessibilityContainer. In this case, isAccessibility-Element should be set to false on the container and true for the enclosed elements. This allows VoiceOver users to visit the elements of the container.
- **accessibilityLabel:** The accessibilityLabel is spoken by VoiceOver for controls. For UIKit controls, this label is derived from the title value. In the case of a labelled input control, you may wish to set isAccessibilityElement to false on the related text element and specify the equivalent text as the accessibilityLabel of the input control.
- **accessibilityValue:** The accessibilityValue is used with elements with dynamic values, such as sliders and switches. For example, a switch that toggles visibility might use the following:

```
visibilitySwitch.accessibilityValue = bIsOn ? "Visible": "Invisible"
```

- **accessibilityTraits:** accessibilityTraits is a function that indicates the roles that a user interface elements implements, such as a button, static text, a search field, and more.
- **accessibilityHint:** accessibilityHint is used when the label is not descriptive enough and should be a brief phrase that starts with a verb. A button with the label "Add" probably does not need a hint. In a list of songs, the label might be the song name and the hint might be "Play the song".

There are also properties for how interfaces respond to user settings:

- **UIAccessibilityIsBoldTextEnabled:** Returns whether or not the user preference for bold text is set. For example it can be used as follows:

```
return UIAccessibilityIsBoldTextEnabled() ? "Avenir-Medium": "Avenir-Light"
```

- **UIAccessibilityIsReduceTransparencyEnabled:** Returns the setting for preferences regarding transparency. For example:

```
return UIAccessibilityIsReduceTransparencyEnabled() ? UIColor.whiteColor():
UIColor(white:1.0, alpha:0.8)
```

- **UIAccessibilityDarkerSystemColorsEnabled:** Determines if the user has asked for darker system colors.

```
return UIAccessibilityDarkerSystemColorsEnabled() ? UIColor.blackColor():
UIColor.grayColor()
```

- **UIAccessibilityIsReduceMotionEnabled:** Determines if the user has asked to reduce motion. If this is set, avoid using animations or other moving user interfaces that may be distracting to the user.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In addition to these basic properties, there are some more advanced characteristics for interacting with VoiceOver. Applications should avoid using these mechanisms for the purpose of providing a separate user interface for VoiceOver users, since some users may just be using VoiceOver as a cognitive assistant, or they may be seeking help from another user who is not using VoiceOver. These additional properties are:

- **UIAccessibilityIsVoiceOverRunning:** Determines if VoiceOver is turned on.
- **UIAccessibilityPostNotification(UIAccessibilityScreenChangedNotification, self.searchText):** Sends a notification for VoiceOver, which can be useful for elements that appear or disappear.
- **accessibilityElements:** Can be used to specify the order VoiceOver should read through elements if the default order is not working as desired.
- NSNotificationCenter.defaultCenter().addObserver(self, selector: "onVoiceOverStatusChanged", name: UIAccessibilityVoiceOverStatusChanged, object: nil): **This provides a mechanism to detect when VoiceOver is turned on and off.**

This listing is a sampling of the accessibility capabilities that iOS provides. For additional documentation and properties, see the UIAccessibility Protocol Reference in the UIKit Framework Reference (Apple, 2016).

Android™ Native Applications

The default screen reader for Android™ is TalkBack. Android™ supports third-party screen-reader applications, which can be found in the Play Store. Similar to iOS, Android™ provides applications with an API in order to interact with these assistive technologies. Basic properties include:

- **importantForAccessibility:** This property tells screen readers whether the given element should be read. It can have one of four values: IMPORTANT_FOR_ACCESSIBILITY_AUTO (0), IMPORTANT_FOR_ACCESSIBILITY_YES (1), IMPORTANT_FOR_ACCESSIBILITY_NO (2), or IMPORTANT_FOR_ACCESSIBILITY_NO_HIDE_DESCENDANTS (4). noHideDescendants means that both the current element and all of its descendants are not important.
- **android:focusable:** Sets whether or not the element is focusable. Focused elements have a number of related properties which are defined below.
- **nextFocusUp, nextFocusDown, nextFocusLeft, nextFocusRight:** Provides ways to indicate which element should receive focus if the user requests to move from the current element in the indicated direction. Some devices provide directional pads that can take advantage of all of these options, or they can be exercised via the keyboard.
- **requestFocus:** A view can request to gain focus. In some cases, this request can be blocked if the element is unable to gain focus.
- **android:contentDescription:** The contentDescription is spoken by TalkBack when the user interacts with controls. For labels that will not change, the label can be defined in the XML layout:

```
android:contentDescription="@string/prev"
```

Otherwise, the setContentDescription method can be used to set the label.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **android:labelFor:** This allows TextViews to indicate that they act as a label for other controls. For example:

```
<TextView android:id="@+id/user_nicklabel" android:labelFor="@+id/user_nick"
android:text="@string/txt_nickname"></TextView >
<EditText android:id="@+id/user_nick "></EditText>
```

- **android:hint:** User hints will display and will be conveyed to TalkBack when a field is empty. This can provide additional information to the user to help them understand the purpose of the field.

Web Applications

When discussing mobile applications, many people think of native applications, but disregard the many Web applications that are designed for mobile devices. With responsive design techniques via CSS media queries, user interface designers are finding ways to ensure that their applications work well across different device formats: desktop, tablet, and phone.

This section will highlight some significant techniques that can improve accessibility, but only covers a subset. WCAG 2.0 provides hundreds of techniques that can be found at http://www.w3.org/TR/WCAG20-TECHS/. Note that some of these techniques are noted as Advisory in the checkpoints, meaning that they are not required for compliance with WCAG, but can improve accessibility nonetheless.

Additionally, it is important to follow the HTML specification where possible. While Web browsers allow developers to deviate from the specification, they also provide default behaviors when the most appropriate elements are utilized to develop Web content and applications. When the most appropriate elements are used, and used properly, developers will get a variety of behaviors 'for free.' For example, when using a select element, the widget is styled based on the OS preferences specified by the user. This widget has a variety of keyboard behaviors: it can be reached by pressing the Tab key, it changes value with the up and down arrows, etc. In addition, JavaScript can respond to onchange events. When defining a custom version of a widget, it must consider these features that may be used by some users, but may not be obvious to the developer.

The following properties and techniques, in addition to issues addressed in the design, will help you to make your mobile applications accessible:

- **img/@alt:** The alt attribute is intended to be an inline replacement of the image, meaning that if the image is unable to load, the text provides a meaningful replacement of that image. If the image is decorative or redundant, the alt text should be empty. For example:

```
<a href="..."><img alt="Site Map" src="..."></a>
<a href="..."><img alt="" src="...">Site Map</a>
```

- **label/@for:** The for attribute of the label element is an id reference, which allows you to specify that this label is associated with the indicated input element. For example:

```
<label for="email">E-Mail:</label><input id="email">
```

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **th@scope/td@headers:** The scope attribute of a table header may be set to a value of 'row' or 'col'. This indicates whether the header cell applies to elements in this row or column, respectively. In more complex tables, developers may need to use the headers attribute of a table cell, which takes a space-separated list of ids that act as headers for the specified cell. These techniques help assistive technologies understand the relationships between data table headers and data cells.
- **@role:** The role attribute is a mechanism provided by ARIA 1.0 to override the default semantics of an element. This is particularly helpful for conveying the behaviors of custom made widgets that may be created with a combination of div/span tags, CSS, and JavaScript. For example, role='checkbox' on a div would indicate that the div acts like a checkbox. The role attribute can also be used to indicate landmarks, such as main, navigation, and search. These landmarks help users of assistive technologies find key areas of a website without having to wade through large amounts of repetitive information. For a complete list of ARIA roles, see http://www.w3.org/TR/wai-aria/roles.

Hybrid Applications

Hybrid applications are native applications with embedded Web applications. For these types of applications, both the native and Web application sections above may apply.

Mobile Content Development

There are a variety of formats that content developers can use for electronic publications. Typically, for mobile content, developers require that the format support reflowable documents, so that the content will fill the screen, potentially using multiple columns, while not requiring scrolling on smaller devices. They also need the content to be viewable on a wide range of devices. The two most common formats for electronic publications that meet these needs are tagged PDF and EPUB®.

EPUB® is a free and open standard published by the International Digital Publishing Forum (IDPF). It has a number of characteristics that make it attractive for accessible mobile content development, many of which it inherits because it is based on HTML5:

- **Reflowable:** Aside from HTML being reflowable by default, EPUB® documents can leverage CSS media queries to precisely control the layout of content based on the width of the document. For example, decorative images might be hidden for smaller formats. This behavior not only assists with readers on mobile devices, but can also provide accessibility for users who need to zoom content.
- **Variety of Readers and Editors:** EPUB® documents utilize standard formats, so they are essentially a zip file of HTML documents with an XML description. Content developers can utilize any editor they prefer to modify the content. Additionally, there are various readers for EPUB® documents, so users can use the reader that works best for them.
- **Accessibility Standards and Documentation:** Since EPUB® is based on HTML, it is straightforward to apply WCAG 2.0 techniques to EPUB® documents.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

There is also a W3C® Working Draft, which defines roles, states, and properties specific to the digital publishing industry. The latest version can be found at http://www.w3.org/TR/dpub-aria-1.0/. For example, this chapter of the book in an EPUB® representation might be wrapped with:

```
<body role="doc-chapter">Accessible and Inclusive Content and Applications</
body>
```

Tools

There are a variety of tools to aid in the detection of accessibility issues. The capabilities and the level of automation provided depend on the platform of the application that is being tested. For some accessibility issues, tools are unable to automate detection because they are unable to infer intent. For example:

If an input error is automatically detected and suggestions for correction are known, then the suggestions are provided to the user, unless it would jeopardize the security or purpose of the content. (WCAG 2.0 3.3.3, 2008)

In this situation, the tools may be able to prompt a tester to assess whether a suggestion for correction is known or whether the correction would jeopardize the security or purpose of the content, but it is unlikely to be able to determine this automatically. Due to this range of complexity, some testing tools are just assistive technologies, or provide more assistance for performing manual analysis, while others provide full automation for some subset of the issues that need to be tested.

When assessing a tool, it is important to consider the role of the tool user, and the usage of the tool in the overall development lifecycle. Many tools are built by auditing teams who are performing post-deployment audits. These tools may provide wider coverage, but they also tend to have a higher false-positive rate because the results are reviewed by an expert who can further filter the list. Other tools are intended for developers and focus on high-impact issues with high reliability. These tools may not flag everything since quality assurance teams are expected to do a more thorough deep dive. These tools ensure that developers are considering accessibility issues and providing a solid foundation, and reduce the noise that may need to be sifted through as compared to other tools. In general, it is difficult to determine a "percent coverage" that can be reliably automated by a given tool since the set of possible user interfaces and situations that can cause accessibility issues is unbounded.

In this section, we will highlight some of the tools the authors have found helpful while developing mobile applications, with a short description of the ideal situation in which the tool provides value.

Screen Readers

The catchall test for any application is to perform a complete test of the application as an end user would experience it, whether without any additional assistive technologies or with assistive technologies such as screen readers.

For iOS, the built-in screen reader is called VoiceOver. If you are not primarily a VoiceOver user, it is useful to change in the Settings under the General, Accessibility section "Triple-click Home" to VoiceOver. With this setting in place, you can press the home button three times to toggle VoiceOver.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Without this setting enabled, it can be difficult for novice VoiceOver users to turn VoiceOver off again. For more information about VoiceOver, refer to VoiceOver for iOS (Apple, 2016).

For Android™, the built-in screen reader is called TalkBack. The settings for enabling and disabling Talkback are in the Accessibility, Vision section. The Accessibility Shortcut section explains methods for toggling TalkBack so that it can be quickly enabled when needed. For more information on TalkBack, refer to Google TalkBack (Google, 2016)

For mobile Web applications, desktop screen readers, such as JAWS or NVDA, can also provide some assistance, but may not accurately reflect the mobile screen-reader environment.

Accessibility Inspector (iOS)

The Accessibility Inspector is available in the iOS Simulator (Apple, 2013). When the Accessibility Inspector is turned on, the user can click on elements of the interface and see a pop-up with a listing of significant accessibility information. This will show event notifications and accessibility-related attributes such as label, traits, frame, etc.

Since VoiceOver is not available in the iOS Simulator, the Accessibility Inspector can help developers who are working in the iOS Simulator determine how VoiceOver might behave, or determine why VoiceOver is behaving a certain way on an actual device.

Lint (Android™)

The Android™ SDK includes a static code analysis tool called lint (Google, 2016). When you compile your program, these checks run, but you can also run them manually via Analyze, Inspect Code. The lint tool, in addition to checking items for correctness, will check for some issues related to security, performance, usability, accessibility, and internationalization.

Only three rules are categorized as accessibility: ClickableViewAccessibility, ContentDescription, and LabelFor. However, there are various other rules that improve the accessibility of applications, such as those categorized as Usability. These rules may not provide significant coverage of accessibility standards, but provide quick feedback to Android™ developers so that accessibility issues are detected early.

Accessibility Scanner (Android™)

The Accessibility Scanner is an app provided by Google® that is available in the Google Play™ store (Google, 2016). This app provides a button that allows the user to scan apps on their mobile device. It will report common accessibility issues such as color contrast, small buttons, and missing labels.

The Accessibility Scanner is useful for checking individual states of an app, such as when testing a specific page or UI element. This tool requires the user to push the button to obtain a report, so it is not ideal for large scale automated testing.

AMP for Mobile

SSB Bart's Accessibility Management Platform (AMP) for Mobile uses a component that is built into an iOS or Android™ native or hybrid application (SSB Bart Group, 2015). The component just needs to be linked with your app and does not require any code changes. With the component linked with an

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

app, the app can be used and tested normally. Each time the user interface changes, the user interface is evaluated in the background and the results are sent back to the AMP server.

AMP for Mobile is useful for developers and testers since it can be run in both a simulated environment or on an actual device.

The AMP for Mobile solution relies on technology from the IBM® Mobile Accessibility Checker, which provides the instrumentation, rules, and scanning of the mobile applications. AMP then provides the reporting and business process related to that data.

IBM® Automated Accessibility Tester

The IBM® Automated Accessibility Tester is a service available from IBM® Bluemix™(IBM, 2015). The Automated Accessibility Tester wraps the Selenium WebDriver, which is a browser-automation framework. Using Selenium, you can programmatically drive your mobile Web applications in standard Web browsers, such as Firefox® and Chrome™. During the automated testing process, accessibility checks can be run and the results are returned to the Automated Accessibility Tester.

This service can be used for testing at various stages in the development process, such as for unit testing or system testing. It is primarily focused on usage in a continuous integration process. In these continuous integration processes, after a developer checks in a change, the application is automatically rebuilt and deployed to a test or stage environment. Once deployed, tests, which can include the Automated Accessibility Tester, can be automatically run. In these scenarios, the functionality and accessibility can be tested together with every change that a developer commits.

This service provides good coverage of mobile Web applications, but is unable to test mobile native and hybrid applications.

Table 1. Summary of available tools

Tool	Target	Test Usage
VoiceOver	iOS Device	• Learn VoiceOver specific user interactions • Learn expected behavior of VoiceOver • Manually interact with applications and identify unexpected behaviors
Accessibility Inspector	iOS Simulator	• Learn expected API values • Manually interact with applications and identify unexpected API values
TalkBack	Android	• Learn TalkBack specific user interactions • Learn expected behavior of TalkBack • Manually interact with applications and identify unexpected behaviors
Lint	Android, Compile Time	• Review results of static analysis • Note: Coverage is relatively small
Accessibility Scanner	Android	Push button and review report
AMP for Mobile	iOS or Android	• Interact with application normally – reports gathered automatically • Review report after interacting with the application
Automated Accessibility Tester	Mobile Web Applications	• Create a test script to automatically interact with application • Run automated script • Review report after automated script runs
Digital Content Checker	EPUB and static HTML content	• Submit content manually or via API • Review report of results

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

IBM® Digital Content Checker

The IBM® Digital Content Checker is also a service available from Bluemix™, and is focused on accessibility checking of digital publications (IBM, 2015). It supports HTML and EPUB® formats. The service can be used by submitting an individual file to the service, or by utilizing the available API.

Using the API, accessibility testing of EPUB® documents can be included in a variety of publishing processes. For example, an extension can be built for rich-text editors such as CKEditor™, allowing content authors to check their content as they develop it. In an automated workflow, an accessibility check might be performed as an automated review process. In other cases, teams may have a build process that pulls in content from a repository and builds an EPUB® document. In this case, the build process can submit the document to the API and include the results of the check in the build logs.

FUTURE OF ACCESSIBILITY TESTING

Accessibility incorporated into design of software is the best approach that is going to yield exceptional results. Retrofitting software after testing is not only time consuming but also prone to delayed release schedules. As it evolves some of the tools will be embedded into design and how each user with a unique perspective can have a delightful experience. Software projects are becoming more and more about composing and reusing rather than building from scratch, the need for prolonged regression testing is less. Pretty soon the big difference between mediocre software and exceptional software will be based on how much accessibility and usability is built in during design rather than the length and extensiveness of test cycles.

Chapter 24
How Internet of Things Is Transforming Project Management

Marisa Analía Sanchez
Universidad Nacional del Sur, Argentina

ABSTRACT

Organizations are experiencing a transformation as a consequence of digital technologies such as social, mobile, big data, cloud computing, and internet of things. The transformation presents challenges at several levels, and project management is not an exception. There are changes in the project environment, the power structures, capabilities, skills, and standard practices, just to name a few. Considering the eventual obsolescence of many project portfolio management practices, the aim of this chapter is to discuss the influence of internet of things in this discipline. The analysis departs from rethinking project management insights and describes the impact of smart and connected products considering many dimensions. Recommendations for each PPM stage are developed, followed by a brief discussion of future research directions.

INTRODUCTION

The most profound technologies are those that disappear. They weave themselves into the fabric of everyday life until they are indistinguishable from it. (Weiser, 1991)

Organizations are experiencing a transformation as a consequence of digital technologies such as social, mobile, big data, cloud computing, and Internet of Things (IoT). The impact of information technology is important even in sectors that are not information intensive such as the agricultural or mining. The digital transformation presents challenges at several levels, namely in leadership, management of markets, management of processes, in how to integrate technologies to transform the organization, and project management. Organizations that do not adapt to this new context will probably lose markets and

will vanish. Weill and Woerner (2015) point out that organizations not only fail to take the opportunities given by the digitization but fail to adapt their business models to reflect the economic characteristics and underlying mechanisms of digitization.

Porter and Heppelmann (2014) indicate that Information Technology (IT) is becoming an integral part of the product itself. Embedded sensors, processor, software, and connectivity in products, coupled with a product cloud in which product data is stored and analyzed and some applications are run, are driven dramatic improvements in product functionality and performance.

The evolution to smart, connected products requires a traditional manufacturer to build what is essentially an internal software company (Porter & Heppelmann, 2015). Building software related characteristics is not usually part of the traditional product engineering process. Slama *et al.* (2015) indicate the IoT involves a clash between two worlds in which those in the machine camp and those in the Internet camp will be required to work together to create products that combine physical products with Internet-based application services. Regarding Project Management (PM), the IoT changes the project environment, the power structures, capabilities, skills and standard practices, just to name a few.

Considering the eventual obsolescence of many Project Portfolio Management practices, the aim of this chapter is to discuss the impact and influence of IoT in this discipline. The work is divided in five sections. First, a background on digital transformation helps to put in context the topic of the chapter and explain the influences affecting organizations. Second, the main focus of the chapter is introduced describing how IoT impacts PPM. Then, taking into account the challenges posed by IoT, a discussion for each PPM stage is developed. Future research directions are briefly described. Finally, a conclusion stressing the main challenges for current leaders closes the chapter.

BACKGROUND

Digital Transformation

The corporate strategy is the input to the creation of initiatives, comprising any number of portfolios of programs and projects, which are the vehicles for executing the organization´s strategy. The nature of IoT projects, immersed in a dynamic environment, characterized by a rapid technological change, and part of a digital ecosystem, require looking at projects in a more strategic way. Hence, it is necessary to give an overview of the influence of information technology from a strategic perspective.

In the past, most information technologies adopted by organizations were a means to lower operational costs and increase productivity. Hence, the broad strategic view was that IT strategy must be aligned with the firm's business strategy (Henderson & Venkatraman, 1993). In the last years, the digital infrastructure of organizations and society has radically changed and both researchers and managers have acknowledged that the role of IT has undergone a transformation (Oestreicher-Singer & Zalmanson, 2013). El Sawy (2003) was one of the first to refer to the IT fusion model in which technology is fused in the business environment.

Porter and Heppelmann (2014) provide an historic view to the analysis of the influence of technology, and describe three "waves" as follows:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **The First Wave of IT (1960s – 1970s):** Automated individual activities in the value chain. The productivity of activities increased because huge amounts of new data could be captured and analyzed in each activity.
- **The Second Wave (1980s – 1990s):** Given by the rise of Internet with its inexpensive and ubiquitous connectivity. This enabled coordination and integration across individual activities, with outside suppliers, channels, and customers; and across geography.
- **The Third Wave (Now):** Of IT is becoming an integral part of the product itself. Embedded sensors, processor, software, and connectivity in products, coupled with a product cloud in which product data is stored and analyzed and some applications are run, are driven dramatic improvements in product functionality and performance.

Porter and Heppelmann (2014) argue that although the IoT shows a new set of technological opportunities, the rules of competence and competitive advantage remain the same. The authors analyze IoT impact on industry structure and the limits of industry to understand the effects of intelligent and connected products. They also describe some strategic options. In a more recent article, the authors analyze the internal implications, such as how the nature of intelligent and connected products redefine the work in each function (product development, IT, manufacturing, logistics, marketing, sales and post-sales service) (Porter & Heppelmann, 2015).

Loebbecke and Picot (2015) use the term "digitization" to refer to changes of established patterns caused by the digital transformation and complementary innovations in economy and society. Digitization penetrates all areas of life and creates new ways of working, communicating and cooperating. Shirky (as cited in (Loebbecke & Picot, 2015)) mentions that connecting individuals, enterprises, devices and governments enables easier transactions, collaboration and social interaction and results in enormous accessible data sources. The interaction between objects adds a multitude of data sources throughout organizations and society. The focus on connected sensors and appliances defines challenges to data flow management. More connections are required with a broad spectrum of organizations and this depends on an adequate management of new relations with stakeholders such as customers, suppliers and rivals.

The improvements in business models that derive from digitization aim to optimize existing processes to increase global efficiency and services and products quality. Digitization enables and makes easier data collection, communication and control activities and in that way reduces transaction costs. However the standardization and massive adoption of these solutions are not sufficient to get a sustainable competitive advantage (Markus & Loebbecke, 2013).

The MIT Sloan Management Review and Deloitte conducted a research and the authors highlight that strategy, not technology, drives digital transformation. Maturing digital businesses are focused on integrating digital technologies, such as social, mobile, analytics and cloud, in the service of transforming how their businesses work (Kane, Palmer, Phillips, Kiron, & Buckley, 2015). The findings of this research show that organizations where digital has transformed processes, talent engagement and business models have a clear and coherent digital strategy. Also, digitally maturing organizations are more comfortable taking risks than their less digitally mature peers.

More recently, a research on designing digital organizations also emphasizes the importance of developing a business strategy that takes advantage of digital technologies (Ross, Sebastian, & Beath, 2016). The authors distinguish two kinds of strategies: a customer engagement strategy which targets to superior, personalized experiences that engender customer loyalty; and a digitized solutions strategy

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

aimed at information enriched products and services that deliver new value for customers. In addition, the research observes that operational excellence is the minimum requirement for doing business digitally.

Internet of Things

In this technology-rich scenario, real world components interact with cyberspace via sensing, computing and communication elements, thus driving towards what is called the Cyber-Physical World (CPW) (Conti et al., 2012). The CPW is characterized by a large number of mobile devices that the users bring around or that are spread into the environment. This scenario enables the automatic observation and measurement of human behavior and the data captured in this way supports data-driven dynamic adaptation of systems in response to observed user habits, preferences and routines.

Various concepts have been coined and promoted by different scholars and technologist. Olson *et al.* present a collective of concepts that are used in depicting future visions of society as affordable by technology (Olson, Nolin, & Nelhans, 2015). In this section, concepts closer to the purpose of the chapter are included: ubiquitous and pervasive computing, and IoT. Ubiquitous computing refers to a society in which human computer interaction is seamlessly and unnoticeably integrated into everyday life. Weiser (1991) describes this concept based on ideas arising from anthropological studies of work practices. Later, IBM coined the term pervasive computing which has a focus more on technological issues. According to Orwat et al. (2008) pervasive computing is associated with the further spreading of miniaturized mobile or embedded information and communication technologies (as cited in Olson, Nolin, & Nelhans, 2015). IoT was introduced by Kevin Ashton in 1999 (Ashton, 2009). Ashton visualized that a physical world can be connected to the internet via sensors and actuators which are capable of providing real time information and hence benefit our lives. With time, this notion has been considerable broadened (Olson, Nolin, & Nelhans, 2015). Gubbi *et al.* (2013) defined IoT as the interconnection of sensing and actuating devices providing the ability to share information across platforms through a unified framework, developing a common operating picture for enabling innovative applications.

Current application domains of IoT include home and personal (control of home equipment, smart sensors in healthcare), enterprise (RFID in retail, industrial ecosystems), utilities (smart grid and household metering), transport (smart traffic, automatic driven vehicles, and intelligent logistics).

Role of Platforms

While considering IoT, it is unavoidable to discuss the role of platforms. Information technology (Internet, mobile, cloud computing, social) has reduced the need to own physical infrastructure and assets giving raise to platform businesses such as Amazon, Uber, Airbnb or eBay. A platform provides the infrastructure and rules for a marketplace that brings together producers and consumers. Platforms comprise four types of players enabling value-creating interactions. The owners of the platforms control their intellectual property and governance (Google owns Android). Providers serve as the platforms' interface with users (mobile devices are providers on Android). Producers create their offerings (for example, apps on Android), and consumers use those offerings (Van Alstyne, Parker, & Choudary, 2016). This shift from pipeline business models to platforms has profound consequences in enterprises. Parker, Van Alstyne and Choudary (2016) have extensively discussed the rise of the platform as a business and organizational model. With the advent of IoT, the concept extends to the "Internet of Things as Platform" to handle device connections and allow users to specify the meaning of the device interactions. For

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

example, smart cities (Wang, He, Huang, & Zhang, 2014), energy grids (Tanoto & Setiabudi, 2016), manufacturing (Woo, Jung, Euitack, Lee, Kwon, & Kim, 2016) or healthcare (Ishii, Kimino, Aljehani, Ohe, & Inoue, 2016) as platforms.

MAIN FOCUS OF THE CHAPTER

Classical Project Management is highly institutionalized and strongly supported by "de facto standards" or "best practices", like PMBok (Project Management Institute, Inc., 2008). On the other hand, the Rethinking Project Management (RPM) concept understands project management as a holistic discipline for achieving organizational efficiency, effectiveness and innovation (Jugdev, Thomas, & Delisle, 2001). RPM perspective adopts a broader conceptualization of projects as being multidisciplinary, having multiple purposes, not always pre-defined, but permeable, contestable and open to renegotiation throughout (Winter, Smith, Morris, & Cicmil, 2006). Svejvig and Andersen (2015) present the results of a structured review of the rethinking project management literature. Through the analysis the authors identified global topics and then categorized each contribution within one of six overarching categories: contextualization, social and political aspects, rethinking practice, complexity and uncertainty, actuality of projects and broader conceptualization. This section aims to highlight a perspective on issues related to project management in the context of IoT. The organization of the presentation is based on the categories identified by Svejvig and Andersen. These categories are rather broad and emerged from the analysis of RPM literature whose concerns are more close to the challenges posed by smart and connected products development.

Contextualization

Contextualization describes how projects need to expand beyond the narrow goals of isolated projects and encourage thinking about projects in a broader context by focusing in the management of multiple projects, the organizational strategy and the project environment (Svejvig & Andersen, 2015).

Management of Multiple Projects

The standard documents of project management currently issued by international project management organizations represent an excellent overview of what the management of a single project includes in its application area (Artto & Kujala, 2008). One limitation of this view is that it does not take into account project interdependencies. In addition, for the case of IoT, several firms participate in projects. Then, the management of a project network or of a business network framework may be more adequate.

Organizational and Ecosystem Strategy

RPM view encourages thinking in organizational strategy, IoT projects need to expand to an ecosystem strategy. For the case of organizations attempting to create value from IoT innovations, the role of stakeholders is essential. In order to define a value proposition, the abilities, knowledge and collaboration of different stakeholders is required. Stakeholders may be defined as individuals, groups and organizations that are affected by or can affect a decision or action (Freeman, 1983). Stakeholder theory recognizes

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

that organizations have obligations not only to shareholders but also to other interest groups such as customers, employees, suppliers and the wider community; amongst many others (Asif, Searcy, Zutshi, & Fisscher, 2013). Addressing the needs of internal and external stakeholders has been identified as a key element of successful product development (Majava, Harkonen, & Haapasalo, 2015). The role of partnerships has also been addressed more thoroughly by digital ecosystem research (Iansiti & Levien, 2004, 2004a). The digital ecosystem theory is adequate to analyse the role of IT in organizations that operate in complex networks and has its origins in complexity theory (Stacey, 1995) and organizational ecology (Hannan & Freeman, 1977). Business ecosystems are networks of organizations that are held together through formal contracting and mutual dependency. The entities of a business ecosystem are structured around core firms, whose centrality is established on the basis of control over the dominant technological architecture or brand that structures value in the ecosystem, or other factors such as product characteristics or geography (Teece, 2007). To summarize, organizations are part of a digital ecosystems, and project success depend on the success of the ecosystem strategy.

Products Part of Broader Systems

IoT-enabled products are part of broader systems. They are composed of components and delivered services depend on other systems. This has been the challenge for Systems Engineering field for many years. Software systems are deployed as part of a large set of components and hence software practitioners are comfortable with a systems thinking approach during all the development processes. For example, during design software teams are aware of issues regarding compatibility and safe integration among software components. These issues are also present during implementation, testing, and deployment. There is a body of experience, methods and tools to cope with systems development. And the challenge for a non-IT organization is to learn from that experience.

Social and Political Aspects

The category social and political aspects include literature with a focus on how social and political processes shape projects, *e.g.* power structures, emotionality and identities (Svejvig & Andersen, 2015). IoT-enabled products offer the opportunity to create new value with data and organizations should have data analytics capabilities. Organizations require expertise at working with large volume of data and also capability of helping leaders reformulate their challenges in ways that big data can tackle. It is also necessary to increase cooperation between the people who understand the problems and the ones who master problem-solving techniques and can generate value from data. Successful information technology organizations will train and recruit people with a new set of skills who can integrate analytic capabilities into their production environments (Davenport, Barth, & Bean, 2012). On the other hand, a data-driven decision making poses managerial challenges related with how decisions are made and who gets to make them (Klotz, 2016). Regarding leadership, Bennis (2013) argues that information-driven transparency will change the way that power is delivered by top leaders, and that leaders need to embrace that transparency.

Another implication of the digital ecosystem environment is that companies can co-create business with people. Co-creation refers to the scenario in which individuals or consumer communities produce marketable value in voluntary activities conducted independently of any established organization, although they may be using platforms provided by such organizations (Karhu, Botero, Vihavainen, Tang, & Hämäläinen, 2011). The management of such platforms needs to address social issues.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Rethinking Practice

Rethinking practice encompasses literature that suggests alternative methods, perspective and approaches to rethink the ways in which practitioners work with projects. Regarding IoT, there are several issues that emerge and have implications on project management: the shift to a product-as-a-service business model; the focus on customer success; and data analytics as a source of value creation.

Product-As-A-Service Business Model

Companies in search of growth are working on integrating products and services. Reim *et al.* (2015) provides a literature review to understand implementation of product-service systems business models and tactical practices. IoT-enabled products which can track customer usage and satisfaction represents an opportunity for manufacturers to leverage technology to create new business models that shift focus from standalone products to service-based offerings. As described by Porter and Heppelman (2015) the new data available to companies, together with new configurations and capabilities of smart, connected products, is restructuring the traditional functions of business and this transformation started with product development.

Focus on Customer Success

Users are at the center of intelligent environments, in that respect this area overlap with the efforts of the scientific community focused on Person-Centric Computing (Augusto, Callaghan, Cook, Kameas, & Satoh, 2013). The introduction of technology has to be sensitive to the user and abide to the principle that the human is the master and the computer the slave and no the other way round (Dertouzos, 2001) cited in (Augusto, Callaghan, Cook, Kameas, & Satoh, 2013)). Smart, connected products capture usage data that allows segmenting customers, customizing products, setting prices to better capture value, and extending value-added services (Porter & Heppelmann, 2014). Organizations that focus on customer success and experience are more prepared to enhance differentiation.

Analytics as a Competitive Advantage

Project managers should integrate data analytics as a core capability since it supports many activities from design, production and even innovation. The creation of new value with data requires data capabilities. Social networks, mobile and IoT products generate huge amount of data that may be used to improve product or services design and support a differentiation strategy. Hence, organizations must add talent in data analytics area. Software companies providing e-commerce solutions have long understand the power of data analytics in generating customer value (Porter & Heppelmann, 2015). For the case of Big Data, Davenport (2012) describes several ways it can be used to enhance a business, such as making routine business decisions faster, supporting new decisions and developing new product and services. Any of these applications may contribute to cost savings or improve differentiation. Progress in data storage and processing technology led to more data-driven decision making. Brynjolfsson *et al.* (2016) found that between 2005 and 2010, the share of manufacturing plants that adopted data-driven decision-making early tripled to 30 percent but the rapid diffusion is uneven. McAfee and Brynjolfsson describe

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

five management challenges related with Big Data that are related with leadership, talent management, technology, decision making and culture (McAfee & Brynjolfsson, 2012).

Complexity and Uncertainty

The category complexity and uncertainty consists of contributions that deal with the increasing uncertainty and complexity in projects and project environments (Svejvig & Andersen, 2015). Shenhar and Dvir (2007) have proposed a framework known as the "Diamond of Innovation" which provides a framework for project classification. Each one of its dimensions of novelty, technology, complexity and pace consists of four possible project categories, and by selecting a category in each dimension, one creates a specific diamond-shaped view for each project. Once a classification is selected, the model helps identify the unique impact of each dimension, and provides recommendations for a preferred style of management for increasing the likelihood of the project's success. Novelty refers to how new is the product to the market, users, and customers. Technology innovation describes how much new technology is used and it impacts product design, development, testing, and the required technical skill. Complexity represents the complexity of the product or the organization and impacts the degree of formality and coordination needed to effectively manage the project. Pace denotes the urgency of the innovation and impacts the time management and autonomy of the project management team. Table 1 summarizes the values that each dimension may assume. The dimensions proposed by the framework take into account not only the organizational readiness to develop the project but also the external issues related to suppliers, subcontractors or the market. Then, it results in an adequate framework to support the analysis of projects developed in an ecosystem environment. In what follows, there is a discussion about complexity and uncertainty based on the "Diamond of Innovation" dimensions.

Table 1. Dimensions of the Diamond of Innovation Model

Dimension	Categories in Each Dimension
Complexity	Assembly: subsystem, performing a single function. System: collection of subsystems, multiple functions. Array: widely dispersed collection of systems with common mission.
Technology	Low-tech: no new technology is used. Medium-tech: some new technology. High-tech: all or mostly new, but existing technologies. Super high-tech: necessary technologies do not exist at project initiation.
Pace	Regular: delay not critical. Fast-competitive: time to market is important for the business. Time-critical: competition time is crucial for success-window of opportunity. Blitz: crisis project-immediate solution is necessary.
Novelty	Derivative: improvement of an existing product. Platform: a new generation of existing product line. Breakthrough: a new-to-the world product.

Novelty of Innovation

Even digital technologies pose some opportunities, there are uncertainties about the market needs and hence which is the right value proposition to develop. There are no clear rules about how to proceed. Slama *et a*l. (2015) suggest building a minimum viable product and get to market fast. Hence, firms have first-mover advantages by collecting and accumulating product data and using it to improve product and services. Companies that aim to produce smart products require getting new products to market quickly and responding fast to customer need. A first-mover strategy may imply shorter development cycles and the requirement to optimize development. And this drives to the next dimension of the diamond, the pace of innovation.

Pace of Innovation

The pace measurement captures the urgency of time in the success of the project (Shenhar, Holzman, Melaned, & Zhao, 2016). The pace of digital improvement is making strategy complex. In general, IoT-enabled solutions are time-critical since the failure to meet the project milestone deadlines can result in project failure because a window to opportunity will close. For many years, the software industry had evolved software development methods from the traditional waterfall model to agile product development process. The software industry was motivated not only by the need to shorten development cycles but to develop solutions that satisfy the customer requirements. Agile product-development processes emphasize daily collaboration between developers and marketers, weekly delivery of enhancements, continual course corrections, and ongoing testing of customer satisfaction. While this is quite incorporated in any software team, IoT's project team are integrated by people from different backgrounds (engineers, software developers) and cultures so the adoption of agile techniques may not necessarily occurs in the short term. Agile requires training, behavioral change and is not adequate for all innovation types or organizations (Conforto, Salum, Amaral, da Silva, & Magnanini de Almeida, 2014). For example, public agencies and governmental organizations have been slow in adopting agile practices (Nuottila, Aaltonen, & Kujala, 2016). Also, agile methods are not recommended for system critical projects such as those related with nuclear facilities and power grids.

Technology Innovation

Most IoT developments involve new technology (*e.g.* smart homes) and even critical technologies that do not exist (*e.g.* energy grids).

Complexity

The amount of complexity is given by how complex is the product. Smart and connected products may range from discrete components (for example, a thermostat) or an array of widely dispersed collection of systems (for example, smart grid).

The Actuality of Projects

the actuality of projects covers literature that underlines the need for empirical studies of projects as its own point of departure (Svejvig & Andersen, 2015). To review this topic a retrieval of literature related with project management and IoT is analyzed.

The review aims to analyze contributions that have emerged as a result of challenges posed by IoT projects. For this reason, the key terms are based on Svejvig and Andersen (2015) review of Rethinking Project Management literature with the addition of the theme "internet of things". Considering the novelty of these topics, the search strings include "project management" and "internet of things" (Sevjvig and Andersen do not consider the term "project management" as a unique term). Also, given that some proposals may be included in digital transformation literature; both "internet of things" and "digital transformation" search strings were considered. Tables 2, 3 and 4 depict a summary of the publications search in Scopus for the last five years (2012-May 2017). The search strings included in Table 5 provided zero results.

Papers are categorized according to their type (descriptive, prescriptive, conceptual, theory, other) (Ahlemann, El Arbi, Kaiser, & Heck, 2013). Descriptive research answers the questions regarding what and how as well as Yes/No questions. Prescriptive research seeks to help people solve practical problems by developing and testing artifacts (method, model, framework, ontology, reference model, system). Conceptual papers present assumptions, premises, axioms, assertions without empirical work. A theory should fulfill three criteria: (1) a theory must have clear constructs; (2) the relationships between the constructs must be defined; and (3) a theory must be testable. Finally, a category referred to as Other includes Literature analysis, editorials, reports, book reviews, and calls for papers/abstracts/participation. Table 6 depicts the result of the categorization. Only 7 contributions were classified as descriptive (empirical).

TITLE-ABS-KEY ("internet of things") AND TITLE-ABS-KEY ("conventional project management")	-	-	-	1	-	-	1

Broader Conceptualization

Broader conceptualization deals with contributions that offer alternative perspectives on, for example, projects, project management and project success, outline how the field is broadening beyond is current limits or describe the existing perspectives within the field. Prescriptive, conceptual and review categories in Table 6 may offer a broader conceptualization (36 papers). These papers refer to specific issues but none of them cover the impact of IoT in PM.

SOLUTIONS AND RECOMMENDATIONS

In this section, an overview of each Portfolio Project Management phase is provided with a discussion about IoT impact. The framework proposed by Bible and Bivins (2011) is used because it takes into account a strategic and portfolio management perspective. In addition, an operations and maintenance phase is considered. The assumption underlying the portfolio management project is that products are released and after-sales support requires fewer resources than those required during development. That is, the need of resources tends to decline in traditional projects. However, IoT-enabled products may require additional resources after deployment. Therefore, a solution operation and maintenance phase is included.

As mentioned earlier in this chapter, the nature of IoT projects, immersed in a dynamic environment, characterized by a rapid technological change, and part of a digital ecosystem, require looking at projects in a more strategic way. In order to support this vision, Shenhar and Dvir's "Diamond of Innovation" (Shenhar & Dvir, 2007) appears as necessary framework to classify a project and recommend a managerial style. The classification depends on the project and the organization. A project may represent a high technology level for an organization but a low level for another. For example, Shenhar and Dvir (2016) describe that the technology used in Boeing's Deamliner project represented a "next generation in an existing line of projects" for Boeing but for subcontractors, it was new. Hence, it is not possible to define a generic innovation diamond. However, for the sake of illustrative purposes, Table 7 briefly describes four projects and Figure 1 depicts the innovation diamonds for each case. The classification of projects early at this stage provides clues to a recommended style of management, activities and resources required by the project.

Figure 1. Projects classification based on the Diamond of Innovation Model

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 7. Brief description of illustrative projects

Smart learning thermostat. A connected thermostat that can be controlled through an Internet connection and is able to learn when each room of a house is normally occupied and automatically schedule the heating for that room appropriately.
Smart parking solution for smart cities to allow citizens to find available parking spots. Assume the solution should be available promptly.
Smart metering project aims to provide accurate, near real-time consumption information to end consumers; the potential for users to save money and reduce emissions using consumption management tools and more highly differentiated tariffs. The project is owned by the government and it is immersed in a complex ecosystem including multiple smart meter manufacturers, communication service providers, data service providers, electricity suppliers, and meter operators.
Cross-energy management project aims to build the IT architecture for energy supply optimizing multiple heterogeneous energy resources and consumers. The ecosystem is integrated by company and private consumers, electricity suppliers and grid operators.

Strategic Phase

During the strategic phase the organization establishes or revises its strategic plan, including mission, vision, goals, and objectives. This phase provides the foundation for effective PPM as the strategic plan establishes the goals and objectives to which project portfolios contribute. The organization should define the strategic importance of connected products in the context of the strategy. The IoT may contribute to define new business or to improve internal process. Also, at this stage CEOs should work on partnerships.

According to Ron Adner (Klotz, 2016), given the relevance of partnerships in a IoT development, the CEO-level should establish partner relationships for the project to be feasible. The answer to this question depends on to the extent that the project depends on collaborating in a new ways with other partners. If the answer is very much then management of co-innovations is an issue (Klotz, 2016). The transition to a successful digital enterprise requires expertise in using digital technologies such as cloud, social, mobile and analytics. In the case of smart products building software related characteristics is not usually part of the traditional product engineering process.

The partnerships concept may go further when the organization becomes part of an ecosystem. In that case, CEOs should define an ecosystem strategy that takes into account expectations, requirements, and capabilities of all the partners across the ecosystem. For each partner there should be a definition of what connected things will develop, and which information and services will deliver.

Screening Phase

The screening phase begins the process of soliciting proposals for potential projects with a reasonable expectation of contributing to goals and objectives. Potential projects that support strategic goals and objectives and seem to be feasible are included in the list of candidate projects that will be evaluated during the selection phase (Bible & Bivins, 2011). In a portfolio approach to project management, projects that are already in progress will be assessed as well to determine whether they continue or should be postponed or cancelled. Also, mandatory projects that arise as a government requirement are included in the pool of candidate projects. The screening phase provides the opportunity to create and analyze the business case (also known as project proposal) for each project against the criteria and assumptions.

Given the requirement of shorter development cycles, this poses restrictions to all project development phases. In particular, during selection phase when projects are prioritized, managers should derive

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

a prioritized list of projects. For the case of IoT products, the window opportunity is shorter and hence they might start as soon as possible.

Screening criteria represent factors against which the pool of potential projects is evaluated to determine whether a business case is sufficient to include the project in the candidate project pool. Screening criteria and assumptions provide a scenario under which the project portfolio will be selected.

Each organization may choose the most convenient tools to develop a project specification according to the organizational available tools, expertise or preferences. However, the Business Model Canvas proposed by Osterwalder and Pigneour (2010) has proven its effectiveness on the preliminary definition of projects. It is a tool to describe the way value is created and delivered in an organization. Consisting in nine building blocks arranged in a template, the model offers a visual representation that allows a better comprehension of business and its dynamics. In the center of the template there is the value proposition which describes the products or services provided by the company to satisfy the needs of one or several customer segments. By designing different channels, the company reaches and communicates with its customers, delivering value. Customer relationships describe particular relationships the company wants to establish with their customers and the means to do so. The complete interaction between these four blocks results in revenue streams which take into consideration the cash that customers generate when paying for the value that is being offered.

The Innovation Canvas (Ahmed, et al., 2014) is a framework that guides teams to develop integrated product designs and business models. There are some different templates to guide the value proposition development (Canvanizer 2.0, 2017; Willness & Bruni-Bossio, 2017). The canvas itself supports a number of design tools, methods, and approaches (Kline et al., 2013). The Innovation Canvas incorporates all the themes of the business Model Canvas in the Market quadrant. The Explore, Ideate and Design quadrants have been added to include the key themes of a meta-model of a system and are described as follows:

- **The Explore Section:** Provides a detailed description of the project goals, collect stakeholder and voice of the customer input, clarify benefits and values of a product and provide context for the project.
- **The Ideate Section:** Describes what the product will do and the external systems that the product interacts with.
- **The Design Section:** Includes a formal requirements analysis, key components or modules, critical success factors of the product, and critical risks of product failure that require special attention.
- **The Market Section:** Includes the nine constructs from the Business Model Canvas (Osterwalder & Pigneur, 2010).

Selection Phase

Each project contributes to the realization of different goals, and some projects may contribute better than others. The objective of the selection phase is to derive a portfolio of projects providing maximum benefit subject to resource constraints and other limitations imposed by the organization. The challenges in PPM selection are how to assess contribution to strategic goals, the one-time portfolio implementation costs (infrastructure, labor, services), the future operational (and maintenance) expenditures entailed (the costs that the organization will incur after closing a project), and environmental and social impacts. In what follows, there is a brief description of how different methods tackle these issues.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

There are many possible methodologies that can be used in selecting a portfolio and evaluating projects. A detailed description of methods is out of the scope of this chapter. Methodologies range from easy to use ones that require little information but fail to assess a portfolio of projects, to more sophisticated techniques which limitation may be amount of data required to generate a prioritized list of projects.

Whatever the business case definition approach used by an organization, there are some challenges that arise for IoT products. In order to define the cost structure it is necessary to calculate costs across all parties in the network. Hence, access to information and confidence among partners is required in order to calculate accurate costs. In addition, IoT-enabled connected products require a backend infrastructure that generates operating costs on an ongoing basis (Slama, Puhlmann, Morrish, & Bhatnagar, 2015).

Implementation Phase

The implementation phase transitions the approved project portfolio into execution. Projects are monitored in order to track their development (updating costs and benefits estimates to detect deviations) and re-prioritize them when strategic goals (or their target values) change or new initiatives appear.

As mentioned earlier in the chapter, smart products are dominated by shorter development cycles. Sting *et al.* (2015) address the problem of accelerating product cycles by prioritizing project delivery. The authors mention two characteristics that make optimal delivery times elusive: uncertainty (for example, they develop a new product function whose feasibility has not been established); and the workers have information about the status of their project tasks that is not observable to anyone but themselves, which many don´t share. The authors describe a management innovation at Roto Frank, a German company that produces hardware for industrial and residential window and doors. While this is not a case of IoT-enabled products the difficulties of project planning and execution referred to by authors are valid for smart product development. The management innovation is based on establishing psychological safety and encouraging cooperative behavior by emphasizing interdependence among workers. The control chart was relocated from the meeting room to each project desk where the engineer's critical tasks for every day of the week would be clearly written. In addition, engineers were asked to put up a red flag whenever a critical task was becoming late enough to affect other tasks. Management promised that anyone who raised a red card would not be criticized, and would receive help within 30 minutes. This innovation enabled the organization to react more rapidly to problems.

Evaluation Phase

Projects are monitored in order to track their development (updating costs and benefit estimates to detect deviations) and re-prioritize them when strategic goals (or their target values) change, new initiatives appear, or projects are finished. The purpose of the evaluation phase is to re-prioritize projects and decide whether to cancel, postpone, delay or add projects.

Project managers measure project performance through the triple constraints of scope, cost, and schedule and make adjustments if performance is outside of tolerances. At the same time, the organizational strategy is in constant update as new goals are set or existing goals are dismissed as a result of changes in organizational strategy. Hence, some projects may become obsolete; or newly defined goals may not be supported by any project. Also, newly defined goals may not be supported by any project. Both of these situations reveal that some projects are not creating business value and provide the basis for determining modifications during the evaluation phase. While project managers report on the indi-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

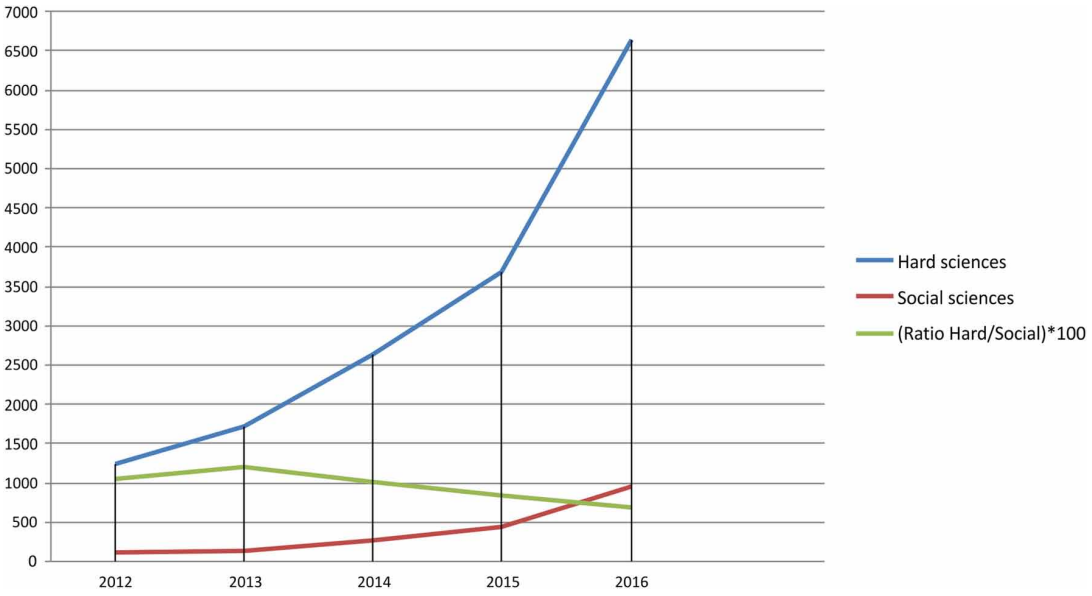
vidual performance of projects, portfolio managers, analyze the overall performance to determine areas of concern and gather information to support decision taking during the evaluation phase.

Operations and Maintenance Phase

The Close Project Phase, as described in the PMIBook is the process of finalizing all activities across all of the Project Management Process Groups to formally complete the project. The key benefit of this process is that it provides lessons learned, the formal ending of project work, and the release of organization resources to pursue new endeavors (Project Management Institute, Inc., 2008). While this process is necessary, smart products lifecycle is different and requires more resources after deployment. In the context of a software development, maintenance is required to fix defects, adapt to changes in the environment, and meet new or changed user requirements. Software cost estimation techniques are based on source lines of code as the software size input measure, due to high correlation with effort; and function points as a measure of software size by functions or modifications to functions. On the other hand, IoT relevant activities are operating the IoT platform; collecting data from the product and end-user behaviour in real time; analyze large volumes of data, and share it with other stakeholders. Costs related with these activities are not adequately estimated using software approaches. More research is required to answer the question of which are appropriate approaches and techniques to support cost calculations.

FUTURE RESEARCH DIRECTIONS

As mentioned previously in this chapter, strategy, not technology, drives digital transformation (Kane, Palmer, Phillips, Kiron, & Buckley, 2015). Also, forecasts suggest that technology will evolve, software will be cheaper an even free (*e.g.* open-source solutions). Therefore, the challenges seem to lay in having the capabilities to get value from technology. In what follows, there is a list of firm specific capabilities that can be a source of advantage, and studies that will expand both the scientific and practice-oriented foundations of these themes are encouraged:



- **Leadership:** The digital transformation context requires new ways of leading. Companies need leaders who can spot a great opportunity, understand how a market is developing, think creatively and propose truly novel offerings, articulate a compelling vision, persuade people to embrace it and work hard to realize it, and deal effectively with all stake holders (Davenport, Barth, & Bean, 2012). Research on new models for understanding and practicing leadership in a complex world is suggested.
- **Collaborative Culture:** IoT developments are knowledge intensive projects, sometimes agile methodologies are used, or they involve co-production. In any of these scenarios, collaboration is a critical success factor. As summarized by Lloyd-Walker *et at.* (2014), relationships are generally enhanced and reinforced through collaborative problem-solving that increases absorptive capacity and generates new knowledge about the project context. This begs the question on how to foster collaboration among groups.
- **Partnerships:** Can be a source for new organizational learning and can enable firms to bring new strategic assets into the firm from external sources. Closely related to collaborative projects, partnership focus on external actors. Gama *et al.* (2017) considers inter-organizational technology

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

development is problematic because firms lack sufficient partner understanding and struggle with aligning their project management practices with those of their partners. The authors identify PM practices of coordination and control to fit the contingencies of each type of partner collaboration and set the stage for future research.

- **Management of a Project Network and the Management of a Business Network:** As discussed earlier in this chapter, these approaches would help to think about projects in a broader context. Examples of themes from existing literature are found in (Artto & Kujala, 2008).
- **Data Analytics:** One of the most critical resources today is the availability of qualified data scientists capable to apply statistical and data mining techniques, cooperate with the people who understand the problems and create new value from data. Data flowing to and from products provides a picture of product use, which features customers prefer and identify the reason for failure. PM should adapt to integrate these insights in their practices. Research on adequate team organization, how decisions are taken.

Figure 2. Number of articles retrieved in a Scopus search using the term "Internet of Things". Contributions are classified according to the subject area of interest (Hard and Social sciences), and the ratio series illustrates the relationship between the number of articles in each area

CONCLUSION

The rapid diffusion of IoT technology is reflected by the offering of new services, new opportunities for innovation based on usage and customer behavior data, and the emergence of disruptive business models even before any academic conceptualization. At the same time, PM has long been belatedly in adapting to a broader context. The digital transformation accentuates the need to update best practices. The literature review provides a small number of contributions on the intersection of project management and IoT (in the academic world). On the other hand, there is an increasing interest in IoT within

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

social sciences subject area. Figure 2 shows the number of retrieves articles in a Scopus search using the term "Internet of Things", including the period from 2012 to 2016. The series "Hard sciences" groups contributions in engineering and computer science areas; the series "Social sciences" includes papers in social sciences, business, management and economy. The trend of the ratio over time shows IoT topic is becoming of interest in both research areas. This observation is consistent with the fact that a common theme along the chapter was the increasing relevance of managerial and cultural aspects. This is not surprising since technology evolves much faster than an organization ability to adapt to it. Leaders need to reframe the way strategy is formulated and define the key steps to leverage the entire organization behind a well-defined vision.

KEY TERMS AND DEFINITIONS

Collaborative Culture: It is teamwork based on trust, communication, and a shared vision or purpose.

Competitive Advantage: Competitive advantage results from a firm's ability to perform the required activities at a collectively lower cost than rivals, or perform some activities in unique ways that create buyer value.

Data Analytics: A process that uses quantitative and qualitative techniques to uncover knowledge from raw data with the aim of generating value.

Diamond of Innovation: A framework for project classification based on novelty of the product, extent of new technology to the organization used by the project, complexity of the product, and project urgency.

Digital Ecosystem: An ecosystem is composed of consumers, producers, and competitors, and as a result of their interactions over a platform driven by the ecosystem leader, innovations (planned or not anticipated) emerge.

Digital Transformation: A digitization resulting from the combination of mobile, cloud computing, social, big data, and internet of things technologies with impact on organizations and society.

Management of a Business Network: The management of network including several firms, where the firms engage from time to time in mutual projects.

Management of a Project Network: The management of a network including several firms that are participating in a project.

Portfolio Project Management: The belief that family is central to wellbeing and that family members and family issues taking precedence over other aspects of life.

Product-as-a-Service Business Model: Product-as-a-service blends physical products, accompanying services, and monitoring software where the buyer may no longer own a physical thing.

Chapter 25
Graph Tools for Social Network Analysis

Nadeem Akhtar
Aligarh Muslim University, India

Mohd Vasim Ahamad
Aligarh Muslim University, India

ABSTRACT

A social network can be defined as a complex graph, which is a collection of nodes connected via edges. Nodes represent individual actors or people in the network, whereas edges define relationships among those actors. Most popular social networks are Facebook, Twitter, and Google+. To analyze these social networks, one needs specialized tools for analysis. This chapter presents a comparative study of such tools based on the general graph aspects as well as the social network mining aspects. While considering the general graph aspects, this chapter presents a comparative study of four social network analysis tools—NetworkX, Gephi, Pajek, and IGraph—based on the platform, execution time, graph types, algorithm complexity, input file format, and graph features. On the basis of the social network mining aspects, the chapter provides a comparative study on five specialized tools—Weka, NetMiner 4, RapidMiner, KNIME, and R—with respect to the supported mining tasks, main functionality, acceptable input formats, output formats, and platform used.

1. INTRODUCTION

In present era, social networks are the fastest growing applications over the web. It has become the main interaction medium among people around the world. A social network can be considered as a graph having nodes and edges, where nodes represents actor or people and edges connect actors in communication (Alan Mislove, 2007). Social networks and the techniques to analyze them existed since decades (Carrington, 2011). In earlier decades, social networks are analyzed to understand the behavior and evolution of human networks (J. Scott., 1994; S. Wasserman, 1994). A social network can be an email network, a telephone network or a collaborative network. But nowadays, most popular and most visited social

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

networks are Facebook, Twitter, LinkedIn, Myspace and Google+ which have acquired huge number of users. Facebook is said to have about 1.71 billion monthly active users, as of second quarter of 2016.

The structure of social networks and their analysis has evolved from graph theory, statistics and sociology. Social network analysis is used in several other fields like information science, business application, communication, economy etc. Since, social network mimics the structure of graphs, analyzing a social network is quite similar to the analysis of a graph. There are a number of tools for graph analysis that are in existence from decades. But they are not able to analyze a social network graph because of its huge size and complex properties. It may contain millions of nodes and edges. Social networks are dynamic i.e. there is continuous evolution and expansion. In a social network, a node or actor usually has several attributes. There can be small and large communities within social networks. Because of the complex structure and very large size of the social networks, old graph analysis tools are not designed to analyze social networks.

In this chapter, we present a comparative study of such tools based on the general graph aspects as well as the social network mining aspect. While considering the general graph aspects, we present the comparative study of some social network analysis tools based on the platform, execution time, Graph types, algorithm complexity, input file format, graph features. Under the social network mining aspect, we are dedicated to provide a comparison study of some specialized tools with respect to the supported mining tasks, main functionality, acceptable input formats, output formats, and platform used.

2. SOCIAL NETWORK ANALYSIS

The internet has revolutionized the sharing of information through number of information sharing systems, including the Web. As of July 2015, number of internet users are 3.17 billion. Out of them, 2.3 billion users are active on social media having an average of 5.54 social media accounts. As of April 2016, Instagram has over 400 million users, and LinkedIn has over 450 million users. Facebook is said to have about 1.71 billion monthly active users, as of second quarter of 2016. These numbers significantly shows how popular social networks are.

Social network analysis (SNA) is the methodical analysis of social networks through the use of network structure and graph theories. Social network analysis views social relationships in terms of network theory, consisting of nodes (representing individual actors within the network) and ties (which represent relationships between the individuals, such as friendship, kinship, organizational position, social relationships, etc.) (Monclar, 2011).

Analysis tasks of social networks includes following:

- Discovering the structure of social network
- Finding various attribute values for the network- Ex. radius, diameter, centrality, betweenness, shortest paths, density etc.
- Finding communities in the social network
- Visualizing the whole or part of the social network

Several works has been done on various social networks to analyze and discover various kinds of relationships and information (N. Akhtar, 2013; Zelenkauskaite, 2012; Li, 2010; Alan E. Mislove, 2009).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

2.1 Kinds of Network Analysis

There are two basic kinds of social network analysis, ego network analysis, and complete network analysis. Ego network analysis is concerned with analysis of individual nodes. A network can have as many egos as nodes in the graph. Egos can be persons, organizations or whole society. In ego network analysis, individual behavior and its variation is mined and described. Complete network analysis is concerned with the analysis of all the relationships among a set of nodes. Techniques such as subgroup analysis, equivalence analysis and measures like centrality (closeness, degree, and betweenness) all require complete networks (NextMEDIA, 2010).

2.2 Applications of Social Network Analysis

Following are some applications of social network analysis: (BASNA, 2013; INSNA, 2016)

- Identify new scientific trends becoming commercially viable, e.g. RFID, Genome sequencing, tissue engineering.
- Analyze expert network, Co-authorship networks, cocitation networks, patent networks.
- Measurement of success.
- Ranking of trends, of authors, of companies commercializing trend.
- Analyzing page importance Page Rank (Related to recursive in-degree computation), Authorities/ Hubs.
- Discovering Communities: Finding near-cliques.
- Analyzing Trust: Propagating Trust.
- Using propagated trust to fight spam: In Email, In Web page ranking.

3. SOCIAL NETWORK ANALYSIS TOOLS

Social network analysis tools are used to identify, analyze, visualize or simulate nodes (organizations, or knowledge) and edges (relationship or interaction) from various types of input data including mathematical models of social networks. There are several tools available for analysis of social networks. The International Network for Social Network Analysis (INSNA) maintains a large list of software packages and libraries.

We have selected four analysis tools for comparison namely Gephi, Networkx, IGraph and Pajek. The selection is based on several facts. All four selected software are freely available for use and they can handle large graph size. Network analysis tools are either GUI based or packages/libraries which can be used in a programming language. Gephi and Pajek are GUI based network tools whereas Networkx and IGraph are packages based tools. Following are the brief detail about each of these four tools-

- **Networkx:** Is a Python language software package for the creation, manipulation and the study of structure and functions of the complex networks. With this tool you can load and store networks in standard data formats, can generate many types of random and classic networks, analyze network structure, build network models, draw networks, and much more. Networkx has many features like language data structures for graphs, dIGraphs, and multIGraphs. Nodes can be "anything"

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(e.g. text, images), Edges can hold arbitrary data (e.g. weights, time-series), Standard graph algorithms, Network structure and analysis measures etc.

- **Gephi:** Is an interactive visualization and exploration platform for all kinds of networks, dynamic and hierarchical graphs. Runs on Windows, Linux and Mac OS X. Gephi are a tool for people that have to explore and understand graphs. Like Photoshop but for data, the user interacts with the representation; manipulate the structures, shapes and colors to reveal hidden properties.
- **Pajek**: A widely used Software for drawing networks, Pajek also has analytical capabilities, and can be used to compute most centrality measures, identify structural holes, blockmodel, and so on.
- **IGraph:** Is a free software package for creating and manipulating graphs. It includes implementations for classic graph theory problems like minimum spanning trees and network flow, and also implements algorithms like community structure search. The efficient implementation of IGraph allows it to handle graphs with millions of nodes and edges. IGraph can be installed as libraries for C, R, Python and Ruby. Above four tools are compared on the following six criterion- platform, Graph types, algorithm time complexity, graph layout, graph input file format, graph features
- **Dataset for SNA Tools Comparisons:** We have used Slashdot dataset (J. Scott, 1994). It contains 77317 nodes and 982787 edges (Directed). Slashdot is a technology-related news website features user-submitted and evaluated news stories about science and technology related topics.

4. SOCIAL NETWORK SOFTWARE TOOLS COMPARISON

In this section, we have compared the four selected social networking analysis tools on the basis of various criterion. Following sub-sections describes each of the selected criterion and comparison of the tools.

4.1 Comparison Based on Platform

Social network analysis tools Pajek and Gephi are standalone software, Networkx and IGraph are libraries. Pajek/gephi runs on windows platforms and Networkx use python library and IGraph use python/r/c library for social network analysis. Networkx, IGraph or Pajek can handle more than one million nodes and Gephi can handle up to 150000 nodes.

Table 1. General Comparison of Tools

Software	NETWORKX	IGRAPH	GEPHI	PAJEK
Type	Library	Library	Stand Alone	Stand Alone
Platform	Python	Python\R\C Library	Windows	Windows
Computational Time	Fast	Fast	Fast	Medium
No. Of Nodes	1 Million	1 Million	0.15 Million	1 Million

4.2 Comparison Based on Network Types

In social network Analysis there are four types of network Graph (Monclar, 2011).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In a one-mode network, each vertex can be related to each other vertex. In one mode network we have only one set of nodes and ties are connected to these nodes. In a two-mode network, vertices are divided into two sets and vertices can only be related to vertices in the other set.

Two mode network Graph are a particular type of networks with two sets of nodes and ties are only established between nodes belonging to different sets. Techniques for analyzing one-mode networks cannot always be applied to two-mode networks without modification or change of meaning. Special techniques for two-mode networks are very complicated. We can create two one-mode networks from a two-mode network

In Multi relational network there will be multiple kinds of relations between nodes. Nodes may be closely-linked in one relational network, but distant in another.

In temporal networks (dynamic graphs) networks can change over time. The lines and vertices in a temporal network should satisfy the consistency condition: if a line is active in time t then also its end-vertices are active in time t. For one mode or two mode network analysis we can use any of software tools but for multi relational network graph we have only Pajek software tools .for temporarily network graph we have Networkx and Pajek tools.

Table 2. Comparison Based on the Network Types Supported by Tools

Graph Type	NETWORKX	IGRAPH	GEPHI	PAJEK
1-Mode Network	Yes	Yes	Yes	Yes
2-Mode Network	Yes	Yes	Yes	Yes
Multi Relational Network Graph	No	No	No	Yes
Temporarily Network Graph	Yes	No	No	Yes

4.3 Comparison Based on Graph Layout

In social network analysis we have many layout algorithms. IGraph or Pajek have most famous and recent layout algorithms Fruchterman Reingold or Kamanda Kawai. All of them software have circular or spring layout. Gephi provide user friendly layout capability for user. Gephi provide capability like Photoshop where users have many additional facilities. Force layout is another famous layout algorithm given by Gephi software. For user friendly visualization we can use Gephi software but it cannot handle large or complex graphs. For large and complex network we can use either Networkx or IGraph. IGraph or Networkx provide support for many other tools for visualization. For small dataset we can use stand-alone software (Gephi, Pajek) because we can handle standalone software easily.

4.4 Comparison Based on Algorithm and Running Time Complexity

For analyzing large graphs, processing time is very critical. We compared the selected four tools on the basis of algorithmic as well as running time complexities of available features.

Table 4 shows the comparison among the four tools on the basis of algorithmic time complexities. To find the time complexities of various algorithms, we first found the algorithm for the feature and

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Comparison Based on Graph Layout Supported by Tools

Layout	NETWORKX	IGRAPH	GEPHI	PAJEK
Circular Layout	Yes	Yes	Yes	Yes
Random Layout	Yes	Yes	Yes	No
Spectral Layout	Yes	No	No	No

Force Atlas Layout	No	No	Yes	No

then searched for the literature associated with the algorithm. After studying the literature, we found the algorithmic complexity of the feature. We are unable to find the algorithmic complexity for some of the features. These are shown as NA (Not Available) in the Table.

Table 5 shows the comparison among the running time of listed features of graph tools. A computer with normal configuration is used for performing all the experiments. Based on algorithms running time, we can say that IGraph is more useful software compare to other. IGraph provide efficient algorithms for page rank, all types of centrality, density, MST and shortest path. Networkx is comparatively too slow for large graphs.

Table 4. Algorithmic Time Complexities

4.5 Comparison Based on Graph Features and Input File Formats

Social network analysis tools has many algorithms for graph features. We compare these tools on the basis of availability of these graph features. We have selected only a few important graph features for comparison due to space problem. Table 6 lists these important graph features and their availability in the four graph mining tools. IGraph, Gephi and Networkx have algorithms for maximum number of features. Pajek lags in supporting several of the main graph features like flow, cohesion, clique and isomorphism.

A graph can be stored in a variety of file formats. Supporting multiple file formats allows flexibility. Table 7 summarizes the various file formats supported by the graph tools. Networkx and IGraph supports almost all the available graph file formats. Pajek supports only .Net and .Dat file formats, besides supporting its own format.

5. SOCIAL NETWORK MINING TOOLS

Recently, social networks are the fastest growing applications over the web. It has become the main interaction medium among people around the world. Easy access of social network sites such as Twitter, Facebook and LinkedIn making them more and more popular. Users are accessing social networks for news updates, trending topics information, collecting opinion of other users on some topics, connecting to a community, etc. The usage list of social networks are endless nowadays, that's why it is generating massive data which are dynamic and sometimes noisy. Due to the dynamic and noisy nature of the huge data coming from social networks, it is almost impossible to analyze it manually. Data mining is a set of techniques for extracting useful information from massive datasets coming from the social media.

The primary objective of data mining is to process huge dataset and extract meaningful, actionable information. Very huge amount of valuable and actionable information is hidden in various social networks. This valuable information can be sentiment analysis data, trust analysis data of actors in the social network, friend recommendation, actor relationship analysis data, etc. This is the primary cause which provides us opportunities to use specialized social network analysis tools to mine the above mentioned information. In social network analysis, text data is heavily involved. It is a challenging task to choose the best social network analysis tool for mining text data. Social networks also have very complex relationship among its actors and hence it is very difficult to find required relationship information such as friend recommendation from the social network.

Under the social network mining aspect, we are dedicated to provide a comparison study of five specialized tools - Weka, NetMiner, RapidMiner, KNIME and R.

- **Weka:** Is an open source, free data mining tool consists of machine learning algorithms for different data mining tasks. It is java based data mining tool which supports data pre-processing, classification, regression, clustering, association rules mining, and data visualization. It also includes advanced text mining features.
- **NetMiner:** Is a data mining tool for data analysis and data visualization of large network data. It analyzes the social network data interactively and provides visual representation of that data, also detects patterns and structures of social networks. NetMiner supports different social analysis tasks such as data transformation, network analysis, statistics, data visualization, etc. It is based on the Python programming language and provides following features in support to social network analysis:
  - Network analysis of more than a million of nodes in a network
  - Data visualization and interactive network analysis
  - Provides facilities for data management, etc
- **RapidMiner:** A data mining tool that is based on client-server model with the server offers its services as SaaS. It supports integrated environments for machine learning, data mining, text data mining, predictive & business analytics, recommendations, etc. It supports all steps of the data mining task and applicable in all areas like business, academic researches & training, prototyping & application development.
- **KNIME** (Konstanz Information Miner): Is another open source tool that supports all data mining steps. KNIME is based on the Eclipse platform and it can be easily integrated with Weka tool and R.
- **R:** Is an open source tool for statistical analysis as well as a programming language. The R language is widely used for developing statistical data analysis.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

5.1 Comparison Based on Functionality, Supported File Format, Language and Platform

In table 8, comparison among the five social networks mining tools is shown on the basis of functionality, input file supported, output file supported, platform, programming language and database supported, open source and community support.

Table 8 shows that Weka, RapidMiner, KNIME and R are open source and supported by windows, Linux and Mac based operating systems. NetMiner is not an open source software and supported by windows operating system only. All of the above social media mining tools supports .txt and .csv file formats in addition to other formats supported by different tools separately. Each of the above mentioned tool have database support associated with them. Weka, KNIME and R supports MySQL, Postgre SQL & Microsoft SQL whereas other tools only support SQL Server in addition to tool specific database supports. RapidMiner and R tools are best for machine learning, statistical analysis and data visualization, whereas, NetMiner can be used at its best for network analysis and data visualization. Weka, RapidMiner and R support very large number of users in comparison to NetMiner and KNIME.

5.2 Comparison Based on Different Data Mining Tasks

Table 9, shows comparisons among the above mentioned social networks mining tools on the basis of different data mining tasks.

Data mining over social media can be done by using a number of methods & machine learning algorithms and data mining. Machine learning algorithms for data mining can be categorized into supervised, unsupervised, and semi-supervised machine learning algorithms. Classification is an example of supervised machine learning approach, whereas, clustering is an example of unsupervised machine learning approach. Data mining also includes other approaches for data analysis such as association rule mining, instance based learning, and data visualization. All of the above mentioned tools supports CART and Naïve Bayes classification algorithms under supervised learning approach. In unsupervised machine learning, all of them support k-means clustering, DBSCAN and EM clustering (Except NetMiner). Weka, RapideMiner and KNIME support FP-Growth algorithm under association rule mining, whereas NetMIner and R support frequent subgraph and Apriori algorithms respectively. To visualize data, all of them support histograms, whereas RapidMiner, KNIME and R also support scatterplots.

6. TEXT MINING IN SOCIAL NETWORKS

A social network can be considered as a graph having nodes and edges, where nodes represents actor or people and edges connect actors in communication. Social networks allow users to communicate with other users in the network having different moral and social values, and different goals for generating information. Social networks can take any form such as, an email network, a telephone network or a collaborative network. But nowadays, Facebook, Twitter and LinkedIn are most popular and most visited social networks, acquiring large number of users. Facebook is said to have about 1.71 billion monthly active users, as of second quarter of 2016. The social network provides a way for communication among different users which enables them to share valuable information.

Data visualization Techniques	histograms	NA	histograms scatterplots	histograms scatterplots	histograms scatterplots

Text mining in social networks can be considered as the process of extracting the high-quality information from text generated from social network interactions. From past few years, text mining in social networks has gained high popularity because users are sharing textual data in abundance. Textual data, generated in social networks, can be characterized by its unstructured nature. Text mining is basically the analysis of data to produce previously unknown pattern (Hearst, 1999). Generally, text mining consists of different tasks such as text pre-processing, text categorization, text clustering, concept/feature extraction, etc. Applications of text mining in social networks include Topic Modeling, Sentiment & Opinion Analysis, Recommendations, Summarization of text documents, etc.

6.1 Topic Modeling

In social networks, the amount of the text information generated every day is far away from currently available processing capacity. Topic modeling provides insights analytics in order to understand huge repository of unstructured text documents. Topic modelling employs different techniques to extract hidden topics behind textual documents shared as a part of social network communications (Youngchul Cha, 2012). Topic Modeling is used as text mining approach and can be used extracting the latent topics from a collection of text documents generated in social networks. If a document is given about a particular topic, one would expect particular words to appear in the document more or less frequently such as “lion” and “roar” will appear more often in documents about lions.

6.2 Sentiment Analysis and Opinion Mining

Sentiment analysis, sometimes also referred as opinion mining, is the collection of natural language processing and text mining approaches, to analyze the textual information from social networks. The basic aim of sentiment analysis is to determine the attitude of a user in social network towards a topic or emotional reaction to a document, interaction, or event.

6.3 Recommendations in Social Networks

Recommender system is a subclass of information retrieval and filtering system that recommends the “rating” or “preference” that a user would give to a particular topic, item or text document (Francesco Ricci, 2011). Recommendation in social networks is based on the fact that users who connected in a social network have greater possibility to share the similar interests, and can be easily influenced by the friends in that network (Pritam Gundecha, 2012). Recommender systems have become increasingly popular in a variety of areas such as research articles, search queries, social tags and recommender systems for experts, (H. Chen, 2015) & Twitter pages (Pankaj Gupta, 2013).

6.4 Automatic Text Summarization

Automatic summarization (which is a part of machine learning and text data mining) is the process of reducing a text document to create a summary automatically, that consists of the most important points of the input text document. The idea behind automatic text summarization is to extract a representative summary of the data, which contains the information of the entire set of documents.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 10 shows that, RapidMiner provides Edda (Extensions for Binominal Text Classification for Topic Modeling. The text analysis extension in RapdMiner AYLIEN extracts insight from textual data such as news articles, social comments, tweets and reviews. RecSys framework is used as recommendation extension in RapidMiner for recommendations, which consists of item rating prediction and item ranking recommendation.

In R, topicmodels and TraMineR packages are used to perform topic modeling over text documents. "topicmodels" package provides an interface to LDA (Latent Dirichlet Allocation) algorithm and Correlated Topics Models (CTM) for topic modeling. TraMineR is an R package for text data mining, which describes and visualizes the sequence data. The "sentiment" package is the most general package for sentiment analysis with machine learning in R. RTextTools is an R package for automatic text classification by using the classification algorithms: svm, slda, boosting, bagging, random forests, glmnet, decision trees, neural networks and maximum entropy. The "recomederlab" R package provides an interface to test and develop recommender algorithms. The "genericSummary" package selects sentences from a text that best describe its topic. Package 'lexRankr' is used for automatic summarization of text data.

Table 10. Comparison based on text mining tasks

	Topic Modeling	**Sentiment Analysis & Opinion Mining**	**Recommendations**	**Text Summarization**
RapidMiner	Edda - Extensions for Binominal Text Classification	AYLIEN – Text Analysis Extension	RecSys (RapidMiner Recommender Extension)	--
R	topicmodels, tm, TraMineR	twitterR, tm, sentimentR, RTextTools	recommenderlab, tm	genericSummary, tm, lexRankr

7. CONCLUSION

In this chapter, we have compared and summarized four network analysis tools Networkx, Pajek, Gephi and IGraph on the basis of their general graph features. We also compared and summarized five social network mining tools Weka, NetMiner, RapidMiner, KNIME and R on the basis of their general functionality, data mining and text mining tasks. In the following paragraphs, we summed up our conclusions:

Stand-alone software is very useful for graph Visualization (up to a maximum of few thousands of nodes), data format conversion. IGraph is fastest tools that provide most of graph features and handle large and complex network. Libraries (Networkx or IGraph) are more useful for tasks involving millions of nodes and for operations such as the union and the difference between sets of nodes or for the clustering. Stand-alone software are easy to use and easy to learn so for beginner Pajek and Gephi is suitable software. For complex dataset and research purpose we can use Networkx and IGraph software.

For one mode or two mode network analysis we can use any of software tools but for multi-relational network graph, we have only Pajek software tools. For temporarily network graph we have Networkx and Pajek tools. All of the software can handle .Net file format. But mostly data are present in .txt format. We can easily understand or handle .txt format or many websites provides data set in .txt format so we can use IGraph or Networkx software tools. We have many file format conversion software they can

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

convert .txt file format into .Net file format but these software can handle only small size file. So for large size data set we use IGraph or Networkx software tools.

IGraph provides mostly graph features and it also handle large and complex network. All of them software can compute centrality, clustering coefficient, network diameter, page rank, density. But if we want to compute some specific feature we choose different software. If we want to compute Cohesion, we can Use Networkx or IGraph tools. If we want to compute Bridge and dyad, we can use Networkx, IGraph and Pajek software tools. Gephi does not provide the facilities for dyad or bridge computation. IGraph and Pajek are faster software Tools compare to others. But Pajek does not provide all graph features. So if we want to analyse all graph features we can use IGraph software. IGraph gives fastest result to almost all graph features. Load time is minimum for Pajek software. Execution time for centrality, page rank, graph degree and cliques is minimum in IGraph software. So based on execution time IGraph is better software.

The primary objective of data mining is to process large amount of data and extract meaningful, actionable information. In social network analysis, text data is heavily involved. It is a challenging task to choose the best social network analysis tool for mining text data. Social networks also have very complex relationship among its actors and hence it is very difficult to find required relationship information such as friend recommendation from the social network. There are huge number of Social Network Mining tools available which can be used to mine social network data to extract meaningful information. Every tool has its own pros and cons. Among all tools, Weka, NetMIner 4, RapidMiner, KNIME and R are most of the desired characteristics for a fully-functional DM platform and therefore their use can be recommended for most of the DM tasks.

Weka, RapidMiner, KNIME and R are open source and supported by windows, Linux and Mac based operating systems. NetMiner is not an open source software and supported by windows operating system only. All of the above social media mining tools supports .txt and .csv file formats in addition to other formats supported by different tools separately. Each of the above mentioned tool have database support associated with them. Weka, KNIME and R supports MySQL, Postgre SQL & Microsoft SQL whereas other tools only support SQL Server in addition to tool specific database supports. RapidMiner and R tools are best for machine learning, statistical analysis and data visualization, whereas, NetMiner can be used at its best for network analysis and data visualization. Weka, RapidMiner and R support very large number of users in comparison to NetMiner and KNIME.

Weka, RapidMiner, NetMiner, KNIME and R supports CART and Naïve Bayes classification algorithms under supervised learning approach. In unsupervised machine learning, all of them support k-means clustering, DBSCAN and EM clustering (Except NetMiner). Weka, RapideMiner and KNIME support FP-Growth algorithm under association rule mining, whereas NetMIner and R support Frequent subgraph and Apriori algorithms respectively. To visualize data, all of them support histograms, whereas RapidMiner, KNIME and R also support scatterplots.

Text mining in social networks, can be considered as the process of extracting the high-quality information from text generated from social network interactions, having applications in social networks include Topic Modeling, Sentiment & Opinion Analysis, Recommendations, Summarization of text documents, etc. RapidMiner provides Edda (Extensions for Binominal Text Classification for Topic Modeling, AYLIEN extension for text analysis and RecSys framework is used as recommendation extension. In R, topicmodels and TraMineR packages are used to perform topic modeling over text documents. TraMineR is an R package for mining, describing and visualizing sequences of states or events, and more generally discrete sequence data. The "sentiment" package is the most general package for sentiment analysis with

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

machine learning in R. RTextTools is a machine learning package for automatic text classification. The "recomederlab" R package used for providing recommendations. The "genericSummary" and 'lexRankr' packages are used for automatic summarization of text data.

ABSTRACT

The main objective of this research is to provide a procedure set, oriented by a clear and rigorous protocol that allows the replication of results regarding the accessibility claims of products and systems available for the blind community, thus validating their robustness. The goal during the experiment was to compare user preferences and effectiveness when performing tasks with the voice synthesizers JAWS and DOSVOX and a braille keyboard. The adopted evaluation protocol includes the following methods: usability testing, focus group, and user satisfaction survey. The study developed with the proposed protocol investigates assistive technology adequacy to target users. The tasks performed by 30 users were categorized as activities of entertainment, learning, and social inclusion. It is considered that the main contribution of this chapter is to provide the protocol and methodology, adapted for use in evaluations of accessibility products and devices.

INTRODUCTION

Accessibility has become a major concern of computer system developers. However, unlike its counterpart usability, there is no established protocol that can be used to evaluate the quality of products and systems developed for particular users or communities.

For many interactive software systems, a large part of the interaction between user and technology depends on the use of visually presented material (ISO, 2008). In particular, the individuals typically use the keyboard, mouse, or other pointing devices to provide information and various screen types as output devices. On the other hand, blind or visually impaired users employ their auditory and tactile senses as visual sense. In this case, the typical non-visual forms of interface used in interactive software are auditory or tactile (Sodnik, Grega & Tomazic, 2011). Screen readers, the software tool most commonly used by visually impaired users, are based on speech synthesizers that read the contents of the computer screen using synthesized artificial speech (Chen & Raman, 2008).

Although the scientific literature presents several studies evaluating the accessibility and usability of assistive technologies for blind people (e.g. (Sanchez & Hassler, 2017; Pascual, Ribera, Granollers & Coiduras, 2014; Ferreira, Silveira, Capra & Ferreira, 2012)), a general experimental protocol able to be instantiated for the evaluation of different devices and systems is still lacking. Targeting to overcome this issue, the present chapter presents an experimental protocol that provides a script with procedures that is aided by documents that guide the evaluator during experiments planning and conduct.

Successfully designing universally accessible interfaces requires technical and cultural changes and strategic commitment: Usability and accessibility must be an objective of system development (Queirós, Silva, Alvarelhão, Rocha & Teixeira, 2015).

In a general way, there are some examples of how Human Computer Interaction has been shaping the new demands of market, social, economic and user specificities, which is very clear in several studies (Smith-jacksonb & Hartsona, 2009; Jokinen, 2015; Findlater & McGrenere, 2010).

In terms of accessibility: software should be as accessible as possible so that it can be used by as many individuals as possible, including people with physical, mental or sensory disabilities.

Some people cannot see clearly or distinguish certain colors, and some cannot operate a normal keyboard or mouse. Access to sites of the future by people with physical disabilities requires new forms of interaction based on the use of, for example, voice.

Software should be inclusive and universal, so it favors not only the disabled people, as well as all others, whether they have a limitation or not.

The evaluation of usability applied to the universal project brings impacts in different areas, among which are:

- Multicultural interfaces: these are factors to be analyzed in the new conceptions of interfaces. Creating a solution that is usable by people in many different countries and cultures is a great challenge. The reader should be led to understand that creating a version for a specific group of users based on language or location could be important, just as colors and icons have different representations for different cultures (Miah, 2004).
- Multiplatform software: which is a technological challenge for programmers to adapt their software to be used by different software platforms. It is noted that in many cases, the newly developed software needs to run on several platforms and integrate with each one of them. The main problem

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

with cross-platform software is consistency and lack of interoperability (Dias, Martins, Queirós & Rocha, 2018).

- Multimedia Interfaces: graphics and text are not the only ways to provide information, it is currently possible to use sound and, in some cases, tactile feedback to convey information. The issue of discussion is how use these output devices to produce a good quality user interface in the future (Sangiorg, 2014).

Originally designed to evaluate the interactive products and systems usability, this protocol was adapted to evaluate the usability level of accessibility resources available to the visually impaired, thus evaluating the accessibility level from the utilitarian point of view. Help resources can consist of specific systems and components designed to increase accessibility levels, such as hardware, software, or input / output devices. The protocol was conceived, formalized and adopted over the years in research and products usability evaluation in the Laboratory of Human Machine Interfaces (LIHM) of the Federal University of Campina Grande (UFCG) (Aguiar & Vieira, 2009), (Lima, Vieira & Aguiar, 2010).

The suitability of the adapted protocol to evaluate screen readers accessibility level and Braille keyboard, when used by blind and visually impaired people, was validated. Moreover, factors that can lead to a prediction of the impact a certain assistive technology can have on the target population were also analyzed.

BACKGROUND

Ideally, the usability evaluation should be present at all stages of development, and should be iterative, allowing a continuous evolution of the product quality. The literature describes several methods and tools to ensure the usability of a product or service.

The evaluation can be done in the laboratory, but since the context of use is very important, whenever possible it should be carried out under real conditions of use (Simes-Marques & Nunes, 2012).

Some methods use user data, while others rely on usability experts. There are usability assessment techniques for all phases of design and development, from product definition to the latest changes in the final product (Hanington & Martin, 2012). Many of the methods and techniques are suitable for a specific developmental stage (Simes-Marques & Nunes, 2012).

Usability evaluation methods can be analytical (based on expert analysis of an interactive system and / or potential interactions) or empirical (based on actual user data). Usability evaluation methods are usually specified in a rather incomplete way, which makes it difficult to apply them consistently. For this reason, the usability assessment can be expected to involve a combination of several methods that, together, can contribute to the understanding of potential users (Hanington & Martin, 2012).

The usability assessment methods mainly used are test methods, inquiry and inspection.

Test methods are user-centered methods that involve observation while the user performs tasks with a particular product or service (Nielsen, 1993). Usability testing methods aim at observing and measuring the interaction of the user with the interface and consist of collecting mostly quantitative data (Afonso, Lima, & Cota, 2013). These methods focus on people and their tasks and look for empirical evidence on how to improve the usability of an interface (Hanington & Martin, 2012). Testing usability usually involves systematic observation under controlled conditions to determine how well participants can use the product or service. The focus of usability testing focuses on what the user does, rather than on what

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the user says, and therefore the focus is on the behavior (Mitchell, 2007). Within the test methods, the most frequently used techniques are: rapid prototyping, performance evaluation, observation, think-aloud, remote usability testing and simulation (Martins, Queirós, Silva & Rocha, 2014).

Moreover, inspection methods involve the participation of experts to evaluate the different aspects of user interaction with a given product or service. The inspection methods are mainly based on heuristic evaluation technique, cognitive walkthrough techniques and task analysis (Martins, Queirós, Silva & Rocha, 2015).

Finally, inquiry methods involve the collection of qualitative user data. Although the data collected is subjective, it provides valuable insight about what users want. The questionnaires are the most frequent of the inquiry methods, followed by the interview focus group and diary study methods (Martins et al., 2015).

To optimize the usability assessment, the use of a combination of methods is a common practice, especially a combination of test and inquiry methods (Martins, Queirós, Silva & Rocha, 2016). Usability evaluation is a complex task even when it comes to assessing the usability of relatively simple systems. Given the complexity of new assistive products and services it is clear that the use of only one method may not be sufficiently comprehensive to thoroughly assess all relevant issues associated with a given product or service.

The combination of methods allows a comprehensive assessment of the various characteristics of a product or service. Hanington & Martin (2012) suggest that the combination of various methods for usability assessment is required because the specifications of the different methods is too incomplete to allow for a consistent and systematic use. In addition, the various methods have different capabilities and limitations, and provide information of different types, so their combination is very important (Hanington & Martin, 2012).

Concerning the evaluation of usability and accessibility features, few studies have been found mentioning the adoption of a protocol during the evaluation of devices usability and of resources for accessibility.

The research cited in (Sanchez & Hassler, 2017) reports an evaluation of speech synthesizers. However, these assessments were qualitative in nature, e.g. based on user opinion and focused exclusively on screen readers and speech synthesizers used to access Internet sites. The evaluation experiments cited did not mention the support of an experimental protocol and were limited to a small number of participants. Samples of users with fewer than ten participants were not significant to support the reported inferences. In addition, the mechanisms used for data collection and analysis were only superficially addressed. In the researched literature, few reports of usability tests applied to evaluate the accessibility of devices for visually impaired users were found. Here follows a brief presentation of the relevant work found on this subject.

Pascual et al., (2014) evaluate the mood of disabled users while interacting with two websites with parallel content, but opposite accessibility characteristics (A-website, an accessible website, and NA-website, a non-accessible website). The authors used a JAWS screen reader to do the survey. The results confirm that the A-website had better results than the NA-website in terms of efficiency, effectiveness and user satisfaction.

The research described in (Ferreira et al., 2012) analyzes two observation methods involving people with totally impaired vision in order to develop a protocol with recommendations that can assist professionals in the identification of characteristics and problems, which can be solved or minimized during the interface's evaluations thus facilitating the process of system access focusing on users with totally impaired vision. The usability test was performed with fifteen participants: four blind, two with low

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

vision, three with learning disabilities, two deaf, two deaf-blind and two without any type of disability. Despite its contribution, this protocol is focused on evaluating a screen reader when accessing the Internet and is not comprehensive enough to be used in the evaluation of other resource types. The need of specific participants during the tests (such as human assistants to act as interpreters) is not mentioned.

In (Sánchez & Hassler, 2017), a protocol to evaluate the usability of AUDIOMUD, a virtual reality software game for blind users, is described. The game goal is to place the player in the human body in order to cure diseases, based on the listed symptoms, changing the conditions to which the body is subjected. The interaction with this virtual environment is based on a text reader (synthesizer) that guides the player along the navigation allowing interactions with other players, through a system of chat.

It is important to note that in most of the cited publications the experiments were designed to evaluate a specific device or help resource designed to improve the accessibility of web browsing activity.

Gahlawat and co-workers (Gahlawat, Malik & Bansal, 2014) discuss an approach to develop a natural sound speech synthesizer. Five parameters (naturalness, intelligibility, usability, localization awareness and expressions) were considered for analysis of the speech synthesizer (Gahlawat et al., 2014).

From the review, it was clear that in rare cases where an experimental protocol is described, this is too shallow to answer the questions raised regarding the conditions under which the tests were performed. In addition, the sample size was too small to support the conclusions drawn. Hence the need to propose an experimental protocol to support the evaluation of usability devices and systems designed to support the accessibility, as well as the accessibility level achieved. Therefore, the authors adopted an experimental protocol was adopted to provide a set of procedures and related documents to guide the evaluator during experiments planning and conduction.

MATERIALS AND METHODS

The experiment consisted in evaluating the usability of three accessibility aid features: a Braille keyboard and two voice synthesizers (DOSVOX and JAWS) for blind users. DOSVOX software was developed for Portuguese language and is available for free for blind people. The software tools evaluated were: text editor, screen reader and e-mail. JAWS is marketed by Freedom Scientific and the features tested were the screen reader and the internet browser. The version chosen for tests was the most recent one at the time of the test preparation (version 4.1), with a platform developed for DOS environment instead of Windows. The JAWS version was 12.0, also the latest available at the time. JAWS and DOSVOX, as well as the Braille keyboard, were chosen because of their popularity amongst users of the Institute for Blind People.

An experimental usability protocol consists of a set of interrelated steps, processes and activities to guide an evaluation team during the phases: planning, conducting, collecting data, analyzing and reporting the results. These steps are presented in (Aguiar & Vieira, 2009). The adapted protocol supported the planning and evaluation phases of usability assessment experiences during which people with visual impairment performed tasks to demonstrate the suitability of specific accessibility features. As the protocol proposed by (Aguiar & Vieira, 2009) has a comprehensive and modular structure, the adaptation required to accommodate the usability assessment of the accessibility of systems and devices resulted in small changes in the steps and processes, without changes in the structure. Its application is to verify that a visual support, under evaluation, conforms to an adequate technical standard of accessibility. The adequacy requirements are presented in (Lima et al., 2010) and (Lima et al., 2018).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Inference of the User's Help Towards Performance and Motivation Levels

The protocol used during the experiment, aimed to investigate the hypothesis that the users' performance and motivation level can be affected by the particular usability tool used to perform a certain task. In order to achieve this goal, the protocol included activities that can be classified in the categories learning, leisure and social inclusion.

Before starting the activities, users were asked to express their preferences by choosing the keyboard type (Braille or conventional keyboard) and the desired media on which they wanted to read the script describing the tasks (Ledor, JAWS or DOSVOX system or printed Braille). Likewise, users had different possibilities to answer the questions at the end of each task: writing in Braille, typing on the keyboard, or having their voice responses recorded. The tasks to be performed consisted of:

- **Task 1 (task category: learning):** The user alone or, when needed, with the help of a team member expert, was asked to read and understand a predefined text using speech synthesizer support. The user had to choose between three texts, in different themes (1- World Cup, 2- Brazilian dance festival and 3- explanations on how to apply for jobs in the public sector). After reading, the user was asked to answer related questions.
- **Task 2 (task category: fun, entertainment):** The user alone or, when needed, with the help of a team member expert, was asked (i) to access a news site, (ii) to elect and read news and (iii) to highlight (orally or in writing) the aspects considered most relevant and interesting.
- **Task 3 (task category: social inclusion):** The user alone or, when needed, with the help of a team member expert, was requested to access a specific financial website (http://www.caixa.gov.br), which is the financial agent from the Brazilian government's program that offers loans to low-income families to buy houses, and to simulate the application for a loan, filling out the necessary forms.

User Group Recruitment

Recruitment of participants (users) was carried out through interviews based on the profile of the individuals and their availability and interest in participating in the research; the selected user group consisted of thirty-two people that perceived the relevance and potential impact the tool to be tested would have on their community. The group of participants consisted of 30 individuals, aged between 18 and 60, both genders, with blindness or acquired blindness, from a generalized background (teachers and students of a school for blind people).

This study focused on participant's computing skills and familiarity with screen readers. According to their abilities they were classified as inexperienced (rarely used computers and had poor screen reader skills), intermediate (were learning to use screen readers) and experienced (highly skilled in using screen readers and computers) users. Ten participants were identified as inexperienced, ten as intermediate and ten as experienced users of JAWS and DOSVOX screen readers; it should be noted that these resources offer similar features.

Group Performance: Testing Criteria

The groups were compared in performance using the ANOVA test with classification criteria and with the Tukey test, to evaluate the conditions of normality and homogeneity necessary for the tests validation. The system used for analysis was Minitab 15 (Minitab - 2012). The ANOVA and Tukey (Box, Hunter & Hunter, 1978; Hoaglin, Mosteller & Tukey, 2009) tests were chosen to compare the averages among the three groups of users, depending on the characteristics in the sampling universe (size and homogeneity) and the significance criterion for the two tests. In order to support this analysis, the following metrics were considered: total number of errors, time spent on the task, number of times help was requested, number of errors due to interpretation of the text, number of times participants reported difficulty understanding audio and number of incorrect actions.

Group Performance Testing

The usability test followed the steps of the experimental protocol, with preparation of materials followed by a pilot test to validate the adequacy of resources and materials directed to the data collection and analysis of variables of interest. The experiments were carried out at the Laboratory of Human Machine Interfaces (LIHM) of the Federal University of Campina Grande (UFCG), and at the Institute of blinds in Campina Grande (Brazil). Users and usability specialists followed the procedures specified in the experimental protocol, duly adapted to the specific context of working with visually impaired people.

As specified in the protocol, participants were invited to sign an agreement stating the purpose of the experiment and the rules of participation, including their right to anonymity. The right to stop participation at any time during the test was highlighted. Conditions accepted, participants were also asked to state otherwise if they agreed to the recording of video images. All participants agreed to video recording. At the beginning of the session, participants received the test script containing a description of each task to be performed. The script was available in Braille printed form and in electronic format, which could be read using a screen reader.

After introducing the participants to the test, they were asked to perform the tasks specified in the script. Inexperienced users were previously given a brief training. The participants were filmed during the test and data were pooled for further analysis.

User Satisfaction

The satisfaction of the 30 participants was evaluated by means of a quiz following the standards adopted by LIHM - WebQuest (Queiroz, 2001); the satisfaction index was calculated from the collected data using the model in (Bailey & Pearson, 1983). The quiz is composed by ten questions associating a three-level relevance indicator to each researched characteristic. The model followed by quiz was adapted from the model proposed in (Bailey & Pearson, 1983) and is described in the following paragraphs:

1. The scale used to measure the participants reactions has three levels (-1, 0 and 1), instead of the seven levels between -3 and 3 adopted by the LIHM.
2. Only one semantic scale was associated with the quiz questions, instead of the four differential semantic scale of the original model.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

3. The importance of the items was evaluated using a three point scale with values comprised between 0.1 and 1.0 and a gap of 0.5; on the other side, the original scale has seven points and the values lie between 0.1 and 1.0 with a gap of 0.15.
4. An importance index was associated with each question of the quiz, as suggested by Bailey and Pearson.

The equations of the original model by Bailey and Pearson were modified accordingly to the changes made.

Equation (1) is originally used in a scenario where each factor is characterized with four adjectives; in the current case only one adjective is used. The modified equation used in the current study is the following:

$$R_{ij} = \sum_{j=1}^{n} I_{ijk} \tag{1}$$

where R_{ij} is the reaction of a user and I_{ijk} is a numerical response of the user to the adjective k of the factor j.

Similarly, only one adjective term, instead of four, was used for Equation (2):

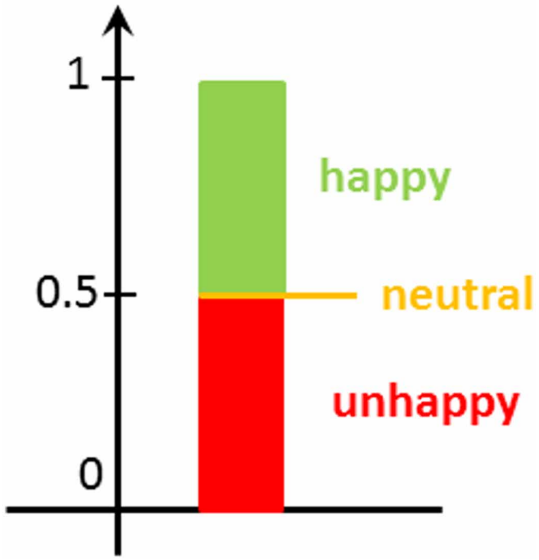
$$S_i = \sum_{j=1}^{n} \frac{w_{ij}}{j=1} I_{ijk} \tag{2}$$

where S_i is the survey satisfaction index and w_{ij} is the importance given to factor j by user i.

In Equation (3), the modification consisted of using the value one as the maximum level instead of the value three:

$$NS_i = \frac{S_i}{F_i} \tag{3}$$

where NS_i is the normalized satisfaction index for each user i, and F_i is the number of significant factors.



The three-point scale and the normalized satisfaction levels are depicted in Figure 1; values between 0 and 0.49 are associated with a positive response from the participant, 0.5 reflects a neutral reaction and values between 0.5 and 1 translate a negative reaction from the participant.

Focus Group

The focus group is a qualitative data collection technique involving a small number of participants in an informal discussion group, focused on a specific subject (Bevan & Bruval, 2003). A moderator introduces topics and guides the discussion. The objective is to extract perceptions, feelings, attitudes and ideas from the participants on a certain subject. This technique is often used in the design and development of new products or services (Wilkinson, 2015).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Levels used for the satisfaction index

The usability of a tool, when assessed from the point of view of the user, includes a component that reflects the subjectivity related with the individual differences and goals of the different users. To overcome this issue, it was decided to introduce a focus group evaluation; the users were required to give their opinion about the strong and weak points of the accessibility resources and were encouraged to give suggestions for improvements. The focus group was composed by 16 individuals, 15 of them were blind and 1 was visually impaired. Only 2 out of the 16 individuals of the focus group did not participate in the usability text. The procedure that was followed is described in the following paragraphs.

At the beginning of the session, the moderator presented the goal of the discussion and encouraged the participants to identify themselves in a quick presentation. The moderator guided the discussion and motivated the participants with previously chosen topics of interest; the chosen topics were related with the issues detected during the usability tests and aimed at evaluating the ease of learning and use of the following resources: Braille keyboard and *JAWS* and *DOSVOX* screen readers. The session took place on the Instituto of the Blind in Campina Grande, taking advantage of the familiarity of the participants with the place, and lasted for two hours. The session was divided in three parts dedicated to the three accessibility resources. The discussion was organized around the following topics:

1. General opinion about the resource;
2. General feeling about the resource;
3. Suggestions for the improvements required to facilitate the interaction with a computer;
4. Description of the characteristics of an ideal resource to facilitate the interaction with a computer.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

RESULTS

Performance Indicators

In order to calculate the performance indicators, each task was considered to be performed (i) successfully, (ii) with help or (iii) incompletely; in case the task was not successfully concluded, it was considered that the participant (iv) failed to perform the task. Table 1 shows the performance indicators for the three tasks, based on the type of participant.

Table 1. Performance levels (% of participants) versus nature of tasks

Task name	Task 1 learning			Task 2 fun			Task 3 social inclusion		
	Experienced	Intermediate	Beginner	Experienced	Intermediate	Beginner	Experienced	Intermediate	Beginner
Performed successfully	0	0	13	0	0	19	0	0	40
Performed with help	36	32	0	0	0	0	0	0	0
Incomplete	0	0	0	43	0	0	0	0	0
Failed	0	0	19	9	0	29	0	0	60

Only Task 1 was finished by all the participants, and in most cases help from the evaluation team was required. These results reflect the participants' generalized lack of knowledge about the tools. On the other hand, the group of experienced users was able to complete Tasks 1, 2 and 3, although some of them with errors. The participants familiar with JAWS and DOSVOX systems were, as expected, more successful in performing the tasks, irrespectively of their nature.

Parametric Tests

In order to take into account the different backgrounds of the participants, the results of the groups were compared using parametric tests. The performance of the groups was compared using the ANOVA test, with classification criteria and the Tukey test. The normality and homogeneity conditions required for the validation of the tests were accepted. The results of the statistical test are shown in Table 2.

Regarding the number of requests for assistance and incorrect actions, the p-value obtained and used was lower than the criterion of significance adopted for the ANOVA test described in section *Group Performance: Testing Criteria*, which allowed rejection of their respective null hypothesis. Thus, Tukey's test was applied, resulting in statistically significant differences between the averages of the two groups (experienced and intermediate) and (experienced and inexperienced). Therefore, since the value zero does not belong to the confidence interval, it follows that the group of experienced users shows better performance.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

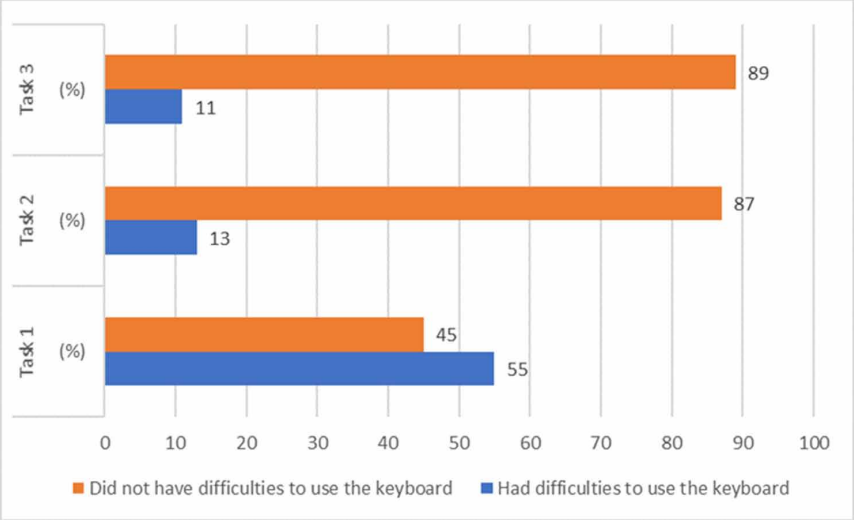
Regarding incorrect actions, differences can be found between the average results of experienced and inexperienced participants with inexperienced users exhibiting better performances (section *Group Performance: Testing Criteria*). This result could be explained by considering that inexperienced users were submitted to a brief training (section *Group Performance Testing*) and being less experienced were more careful in performing their tasks, thus reducing the errors incidence.

Table 2. Results and relevance of ANOVA and Tukey tests for the adopted metrics

Metric	Average			ANOVA (p)	TUKEY
	Experienced	Intermediate	Beginner		
Total task time	14.6	14.2	14.5	0.98	
Total number of errors	2.4	4.9	3.8	0.9	
Number of help requests	0.01	4.6	4.2	0.0	Group3= Group2 (0,9 a 1,7) Group1 ≠ Group3 (3,1 a 5,8) Group1 ≠ Group2 (2,7 a 5,4)
Text interpretation error	2.9	2.9	2.4	0.08	
Difficulty to understand audio	0.2	0.9	0.9	0.05	
Number of incorrect actions	0.5	0.4	0.0	0.03	Group3= Group2 (0 a 0,8) Group1 = Group3 (0,5 a 0,3) Group1 ≠ Group2 (0,9 a 0,2)

Thus, with the presented inferences, the previous experience of participant with the resource did not interfere with the performance level of Task 1. The analysis of the usability results based on the nature of the task was performed only for the group of participants enabled in the Using the JAWS and DOS-VOX systems, since this was the only group able to perform all tasks, considering the null hypothesis for the ANOVA test.

There were no significant differences between the averages of the groups nor in the total number of errors incurred in performing Tasks 1, 2 and 3. This suggests that the number of errors is reduced when the participant is highly motivated to accomplish the task.



For the ANOVA test, the average of the total number of errors decreased in the following order: the highest was obtained for Task 2 ($T_2 = 7.7$) followed by Task 1 ($T_1 = 2.4$) and finally by Task 3 ($T_3 = 1,2$). The value of the significance criterion p ($p = 0.01$) was lower than the level of significance adopted for the hypothesis test, therefore, the null hypothesis was rejected. The Tukey test suggests that:

- The average of total number of errors incurred during Task 1 and Task 3 is the same, since the confidence interval does not exclude zero (-3.9 to 6.3);
- The average of total number of errors incurred during Task 3 and Task 2 is different, since the confidence interval excludes zero (1.3 to 11.6), meaning that the participants achieved a better performance during Task 3;
- The average of total number of errors identified during Task 1 and Task 2 is different because the confidence interval excludes zero (0.1 to 10.4), meaning that the participants achieved a better performance during Task 3.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The usability of Braille keyboard was evaluated considering the difficulty felt by the participant in locating characters during the evaluation test (Figure 2). As none of the participants had prior experience with the Braille keyboard, the predominant feature during the analysis was the participant's previous knowledge about Braille, rather than previous experiences with the keyboard itself. Among the 30 participants in the test, the clear majority (27 out of 30) opted for Braille.

Figure 2. Ability to use the Braille keyboard during the test

Regarding Task 1, 45% of the participants did not have any difficulties in using the Braille keyboard; on the other hand, for Task 2, only 13% of the users had difficulties in using the Braille keyboard. During this task, all participants reported some kind of difficulty in using the keyboard. Finally, the majority of participants were able to perform Task 3; thanks to the familiarity obtained during the execution of the previous tasks, the reported level of difficulty was low.

Group Performance Testing

Given the experimental protocol modularity, the changes that were made in order to adapt it to accessibility assessment consisted of small adjustments in some steps, processes and activities; these consisted mainly in planning the stages of the experiment in order to adapt the test environment to the specific needs of the group of participants.

The protocol described in section *Group Performance Testing* proved to be adequate for the purpose of supporting the usability evaluation of the accessibility resources, promoting an appropriate ethical treatment to the participants of the experiment. Given the metrics: total task time, total number of errors and errors in text interpretation due to the difficulty in understanding the audio produced by the synthesizer, the results obtained from usability point of view, indicate that previous experience with specific help resources does not directly influence the performance of the user. According to the results, it was verified that the inexperienced users, in some tasks, presented better performance than experienced

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

users, which can be explained by the introductory training session, as well as by their behavior: being less confident and therefore less experienced, these participants asked for help more often than experienced participants. This result is evidenced by the fact that only the experienced participants completed Tasks 1 and 2. It is important to mention that, despite the experience of experienced participants with computer systems and accessibility aids, difficulties were observed in the group, which prevented them from performing tasks more efficiently.

On the other hand, without the help of the evaluation team, inexperienced users would not have been able to participate in the experiment. Regarding the Braille keyboard usage, according to results, the difficulties observed in Tasks 1, 2 and 3 were higher among participants who did not know the Braille method. During the last step of the experiment, participants were encouraged to discuss their experience; at this stage the participant's educational background impact on the expectations and opinions on the accessibility aids evaluated was highlighted.

The participants incurred in some errors when performing the different tasks. According to the LIHM experimental protocol, errors can be classified as:

- **Serious:** errors that cause discomfort and seriously compromise the regular action flow, preventing the user from reaching the desired goal;
- **Moderate:** errors that cause some discomfort and force a change in the regular action flow but don't prevent the user from reaching the desired goal;
- **Light:** errors that cause some discomfort and required the user do adapt his/her actions but don't compromise him/her from reaching the desired goal.

Table 3 lists the errors incurred by the participants while performing the different tasks.

Table 3. Participant knowledge about Braille versus ability to use the Braille keyboard during the test

Task	Error type	Error name	Error description	# Occurrences
1	Serious	JAWS1	Time-out control mechanisms are missing	26
		JAWS3	Information related with interface elements is missing	28
		JAWS3	Spelling checker is missing	15
	Moderate	JAWS4	Explicit and implicit information related with commands is missing	45
2	Serious	DOSVOX1	Names of interface elements are inappropriate and don't follow the conventions of the platform	20
		DOSVOX2	"Undo" or "confirm" buttons are missing	21
	Moderate	DOSVOX3	Explicit and implicit information related with commands is missing	45
		DOSVOX4	Mechanisms that redirect the user to the error location are missing	40
	Light	DOSVOX5	Mechanisms that allow for the reduction of the number of steps required to perform a task are missing	40
		DOSVOX6	The aesthetic appearance of the interface is not minimalist	21
3	Serious	JAWS5	Alternative access to relevant audio and video tasks is missing	12

User Satisfaction

Table 4 lists the results of DOSVOX and JAWS user satisfaction quiz. The satisfaction indexes attributed by the users are described in Figure 1. The general satisfaction of the DOSVOX users was, for most items of the quiz, quite good. All the satisfaction indexes were higher than 0.51 with the exception of "Browsing simplicity", for which both inexperienced and experienced users revealed a neutral position (index of 0.5).

Table 4. Satisfaction indexes for DOSVOX and JAWS systems

Quiz questions	DOSVOX				JAWS			
	Experienced	Intermediate	Beginner	All	Experienced	Intermediate	Beginner	All
Ease of use	1.0	0.9	0.7	0.8	0.9	0.7	0.3	0.6
Required learning time	0.9	0.9	0.7	0.8	1.0	0.7	0.7	0.8
Initial learning difficulty	1.0	0.7	0.7	0.8	0.8	0.9	0.5	0.7
Voice quality	0.6	0.8	0.7	0.7	0.9	0.8	0.6	0.8
Help	0.9	0.9	0.8	0.9	0.9	0.7	0.8	0.7
Browsing simplicity	0.5	0.6	0.5	0.6	0.9	0.8	0.3	0.7
Arithmetic average	0.8	0.8	0.7	0.8	0.9	0.8	0.5	0.7

Relatively to JAWS system, the satisfaction indexes and the arithmetic average are, for experienced and intermediate users, much higher than 0.51 (0.9 and 0.8, respectively), revealing a generalized satisfaction with the system. However, the arithmetic average of the satisfaction indexes of inexperienced users is 0.5, revealing a neutral position. This happens because the satisfaction indexes of "Ease of use" and "Browsing simplicity" questions is lower than 0.49 (0.3 in both cases); in addition, for the question "Initial learning difficulty" the inexperienced users revealed a neutral position. Relatively to the other questions, the satisfaction of inexperienced users was also high.

Considering the arithmetic average of all the satisfaction indexes for all the users (0.8 for VOSDOX and 0.7 for JAWS), the participants evaluated both systems in a positive way.

Table 5 lists the results of Braille and conventional keyboards user satisfaction quiz. The users revealed a general satisfaction with both keyboards.

Table 5. Satisfaction indexes for Braille and conventional keyboards

Quiz questions	Braille keyboard				Conventional keyboard			
	Experienced	Intermediate	Beginner	All	Experienced	Intermediate	Beginner	All
Ease of keyboard use	0.9	1.0	0.6	0.8	0.8	0.9	0.6	0.8

Focus Group Results

In order to analyze the data related with the opinions of the users from the institute *Instituto dos Cegos,* they were organized as teachers (T) and student (S) groups. The teachers and students group were composed by 3 and 13 individuals, respectively, of the institute. Like was mentioned in the section ***Erro! A origem da referência não foi encontrada.***, only 2 out of the 16 users had not participated in the usability test.

Table 6 summarizes the opinions (A – agree, D – disagree, and N – neutral opinion) of the participants of the teachers and students' groups regarding the different q that were arisen by each group.

Table 6. System flaws identified by the Focus Group and participants opinion; A – agree; D – disagree; N – neutral opinion

Resource	Question	Source group						
			A	D	N	A	D	N
DOSVOX	Appropriate for teaching usability resources	Teachers	3	0	0	4	0	9
	Adaptable to web browsing	Teachers	3	0	0	13	0	0
	Facilitates access to text and spreadsheet editors, graphical objects and pdf documents	Teachers	3	0	0	5	1	7
	Difficulties in web browsing	Students	3	0	0	10	0	3
	Improvements in navigation mechanisms required	Students	3	0	0	9	0	4
	Good voice quality	Students	1	2	0	11	0	2
	Accessible tutorial missing	Students	3	0	0	13	0	0
JAWS	Limited screen readers	Students	3	0	0	7	0	6
	Quality of automatic voice is not good	Teachers	3	0	0	13	0	0
	Spelling checker is missing	Teachers	3	0	0	3	0	10
	Screen readers are flexible to use	Students	0	0	3	8	0	5
	Screen readers influence the learning process of formal written language	Teachers	3	0	0	2	8	3
Braille keyboard	Facilitates learning process	Teachers	3	0	0	10	3	0
	Problem with signal standards	Students	3	0	0	5	0	8
	Useful for home and teaching/learning use but not for work environment	Teachers	3	0	0	7	6	0
	Appropriate for users with low vision	Teachers	1	0	2	0	0	13
	Easy to use	Students	3	0	0	9	4	0
	For experienced users the height of the signals is confusing when compared with the height of signals in conventional keyboards	Students	0	1	2	10	3	0

Table 7 presents the total number of users that agreed, disagreed or remained neutral relatively to the questions raised during the meeting. The data show that the opinions of both groups of participants, teachers and students, were quite similar. On the other hand, the vast majority of participants (25, 24 and 21 for DOSVOX, JAWS and Braille keyboard, respectively) that did not emit an opinion belonged

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 7. Participants opinion regarding the system flaws identified by the focus group

Resource	Total number of opinions	Teachers			Students		
		Agree	Disagree	Neutral	Agree	Disagree	Neutral
DOSVOX	7	19	2	0	65	1	25
JAWS	5	12	0	3	33	8	24
Braille keyboard	6	13	1	4	41	16	21

to the students group. Regarding the resource DOSVOX, most students and teachers agreed with the questions that were arisen (65 and 19, respectively); the opposite opinions totalized 2 and 1 among the teachers and the students, respectively. The tendency observed for the resource JAWS is slightly different: 33 and 12 agreeing opinions among students and teachers, respectively, against 8 opposite opinions among the teachers (no student manifested disagreement relatively to the questions that were arisen).

The general opinions of the participants relatively to the usability of each of the tested resources are summarized in the following paragraphs.

DOSVOX:

5. **Teaching of accessibility resources in teaching institutions:** The users reported that the first contact they had with screen readers was DOSVOX and that their teaching institutions stimulate the use of DOSVOX.
6. **Can be adapted for web browsing.**
7. **Should guarantee access to text and spreadsheet editors, graphical objects and pdf documents.** The users revealed dissatisfaction relatively to the limitations of DOSVOX in the reading of images and graphical objects. The suggestion of upgrading VOSDOX to read also pdf documents was not consensual because some users believed that VOSDOX already reads this type of documents while the other users believed otherwise.
8. **Difficulties in browsing the internet.** The users suggested that DOSVOX should be used to access the web sites. However, in this case the design of the websites would have to follow the accessibility standards. This, together with the graphical contents of the websites and the help of screen readers, would solve the issues of reading web content.
9. **Browsing mechanisms need to be improved.**
10. **Good voice quality.** The users consider that DOSVOX is better than JAWS relatively to the audio quality.
11. **Missing accessibility tutorial.** The DOSVOX tutorial is available online, however the Braille or audio versions are missing.

JAWS:

12. **The use of screen readers is limited.**
13. **The quality of the robotized voice is low.**
14. **Spell checkers are missing.**
15. **The screen readers are flexible.**
16. **The use of screen readers has an impact in the learning process of formal written language.**

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Braille keyboard:

17. **The use of the Braille keyboard facilitates the learning process.**
18. **Issues with the signal standards.** The users reported that the Braille tags did not match the standard keys map.
19. **Applicability of the keyboard in home, teaching or work environments.** This was another controversial question. Some users affirm that the Braille keyboard is appropriate for home applications, while other users affirm the keyboard is more appropriate for commercial applications.
20. **Appropriate for users with low vision.** The tags are large and this facilitates the use of this resource by people with low vision.
21. **Easy to use.** This was another controversial item. Beginners approve the Braille keyboard, since it facilitates the finding of the keys. Experienced users affirm the Braille keyboard brings no added-value since they had already memorized the position of the keys in the conventional keyboards.
22. **Height of the Braille signals is confusing.** Experienced users affirm the height of the board signs in confusing in comparison with traditional keyboards.

The opinions of teachers and students regarding the discussed items differ in some aspects. However, the analysis of the objects of discrepancy points to four major disagreements relatively to the DOSVOX, JAWS and Braille keyboard resources:

- **Quality of voice:** teachers consider that the voice in DOSVOX and JAWS systems is hard to understand, while the students consider that the understanding comes after some training.
- **Access to contents and help systems:** the students consider the resources are robust, however they refer that some more experience is required before the potential of the applications can be fully exploited.
- **The use of screen readers as an alternative to Braille reading:** the teachers consider that the first may have a detrimental effect in the capacity of using the written language, however the students believe that the adaptation of spell checkers may provide the solution for this issue.
- **Use of Braille keyboard:** the students consider that the location of characters in the Braille keyboard is confusing, while the teachers consider that the Braille keyboard enriches the Braille method and can be a fundamental resource towards the inclusion of the inexperienced user in the learning and work environments.

DISCUSSION

Given the experimental protocol modularity and scope for usability evaluation, the necessary changes to adapt it to the accessibility evaluation consisted in minor adjustments in some steps, processes and activities; mainly in the planning steps of the experiment to adapt the testing environment for the specific needs of the group of participants.

The adapted protocol proved to be adequate for the purpose of supporting the assessment of the usability of accessibility features, promoting an ethical and adequate treatment to participants of the experiment.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

A multi-method data collection approach was used, implementing quantitative (performance evaluation and user satisfaction survey) and qualitative data collection methods (focus group). This ensured a more comprehensive and adequate usability evaluation (Martins et al., 2016).

The results obtained, from the usability point of view, indicate that there is no direct influence of previous experience with specific aid resources, on the user's performance, given the metrics: total task time; total number of errors; text interpretation errors due to the difficulty in understanding the audio produced by the synthesizer. According to the results, it was found that inexperienced users, in some tasks, displayed a better performance, which can be explained by an introductory training session, more numerous requests for help from the evaluation team, besides being less confident and therefore more careful than the experienced participants. This result is evidenced by the fact that only the experienced participants completed Tasks 1 and 2; with the latter being completed successfully only by this group. It is important to mention that despite the experience of the experienced participants with computer systems and accessibility aids, difficulties were observed in this group, which prevented them from performing the tasks more efficiently. On the other hand, inexperienced users were only able to use the accessibility aid products with the help of the team, without which would have been unviable the participation in experiment. Given the last step of the experiment, during which the participants were enticed to discuss their experience, it was highlighted the impact of the participant's educational background on the expectations and opinions about the evaluated accessibility aids.

The following steps in this research consist on refining the experiment materials and extending its application to an even bigger sample which allows for more inference between subgroups of participant's profiles. The availability of the protocol should facilitate the planning and performing of the usability tests, hopefully exposing the difficulties faced by the visually impaired community when using accessibility resources, as well as their acceptance levels regarding perception, comprehension and ease of interaction.

Even though the focus of this research was not to evaluate the voice synthesizers JAWS and DOSVOX, the results from the protocol application suggest that there are resources that users can benefit from the redesign of some features related to the usability problems found.

The results of the usability evaluation indicate that navigation failures have a relevant impact on the overall usability of the system. Experienced users generally tend to memorize commands to access the system, having a significant advantage over other user profiles. It is also worth mentioning that errors related to navigation and error prevention mechanisms, such as notification mechanisms and predictable navigation, would prevent experienced and inexperienced users from performing incorrect actions. This finding refers to the results presented in Table 1, in which only the group of experienced users completed tasks 1 and 2, and the latter was successfully completed only by part of this group. In the results presented in Table 2, the help request metric showed a difference between the means of the user groups, with inexperienced users presenting better performance. Although in the incorrect actions item the inexperienced users performed better, this result can be explained by the help that these users had during the accomplishment of the task, besides these users have been restricted to the execution of actions presented during the training.

In this study, the subjective satisfaction of users does not directly reflect the failures usability of the system. Actually, the literature reports that the opinion of the users, collected through the filling of generic self-reported subjective scales, does not fully reflect users' performance (Martins et al., 2016). In fact, the work developed by Bangor and colleagues examined 200 studies that evaluated the usability using the System Usability Scale and found that the results do not follow all performance spectrum (Bangor, Kortum & Miller, 2008).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The confrontation of the data obtained with the satisfaction survey with those obtained from the focus group may also differ due to the context in which the opinions were collected. The focus group is a less formal method and therefore was more favorable to the spontaneity of the users, when issuing their opinions. The focus group reflected both usability failures and suggestions for improvements.

In general, users were satisfied with the JAWS and DOSVOX system, however a difference was identified between inexperienced, intermediate and experienced users. It was noticed that the greater the time and the frequency of use, the more favorable the users' opinions tend to be.

According to the results of the evaluation trial, the reports of difficulties using the Braille keyboard, in performing Tasks 1, 2 and 3, was higher among users who did not know the Braille method.

It has been found that the *DOSVOX* system needs revisions in several aspects that are listed below:

- Provide a graphical interface associated with the audio description of all elements presented on the screen;
- Develop an electronic help system, which allows on-line access to system help information;
- Migrate to a platform that accepts graphic elements, in which it is possible to configure accessibility (Since DOSVOX was developed for the DOS environment);
- Develop of significant notification mechanisms to the user.

Regarding the JAWS system, it is suggested a re-planning of the navigation elements such as menus to access the systems and communication with other applications such as text and image editors.

It is also proposed to extend the evaluation to other accessibility features in order to classify them in terms of suitability to the context: domestic use, work environment and public environments.

Finally, it is proposed to extend the application of the methodology to evaluations of accessibility resources in general, including resources for other types of limitations: motor, cognitive, etc.

The data obtained from the experiment allowed the testing of the assumptions, leading to the conclusion that the adapted methodology and protocol are effective for the comprehensive usability evaluation, as it highlighted which methods are most effective in locating specific categories of usability problems.

CONCLUSION

It is considered that the main contribution of this paper is to provide a protocol with a set of methods and procedures, adapted for use in evaluations of accessibility products and devices, for the blind community.

The future steps of this research include refining the materials of the experiment and extend its application to an even larger sample that allows more inference between subgroups of participant profiles. The availability of the protocol should facilitate planning and usability testing, hopefully exposing the difficulties faced by the visually impaired community when using accessibility features, as well as their levels of acceptance regarding perception, understanding and ease of interaction. Although the focus of this research was not to evaluate the JAWS and DOSVOX speech synthesizers, the protocol application results suggest that resource users may benefit from the redesign of some features related to the usability problems that were found.

Chapter 27
Collaborative Systems for Design-Based Learning

Joycelyn Streator
Georgia Institute of Technology, USA

ABSTRACT

This chapter explores use of Design-based learning (DBL) and digital tools to facilitate collaborative learning through design-based projects. Design-based learning (DBL) is an educational approach that incorporates hands-own, authentic, multidisciplinary design tasks to identify problems and design solutions. With DBL, students typically work in teams and are tasked designing solutions to open-ended problems. Teams develop conceptual solutions to problems and then work through the design process to arrive at the creation of an actual artifact. This artifact may be fully functional or simply a model, prototype, or other representation of the complete system. STEM instructors and students should give careful attention to selecting the digital tools for collaboration. Some collaborative tools offer affordances and features that compliment the communication processes in one phase of the design process while another other tool may be better suited for the tasks specific to another phase.

INTRODUCTION

This chapter explores use of design-based learning (DBL) and digital tools to facilitate collaborative learning through design-based projects. Design-based learning is an educational approach that incorporates hands-on, authentic, multidisciplinary design tasks to identify problems and design solutions. As STEM educators seek new ways of incorporating inquiry-based methods, DBL provides a valuable method of bringing student-led learning to the forefront.

With DBL, students typically work in teams and are tasked with designing solutions to open-ended problems. Teams develop conceptual solutions to problems and then work through the design process to arrive at the creation of an actual artifact. There are five basic phases to the design process. In the first phase, students identify the key issue or problem to be addressed and then brainstorm potential solutions. In the early phases of the design process, students become proficient in identifying the criteria for selecting an optimal solution. This initial phase requires a high degree of collaboration and

DOI: 10.4018/978-1-7998-7297-9.ch027

Copyright © 2021, IGI Global. Copying or distributing in print or electronic forms without written permission of IGI Global is prohibited.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

one-to-many communication streams. Next, students gain experience in determining requirements for the chosen solution and documenting these requirements. These requirements serve as the blueprint for what will be accomplished during the project and what features are determined to be within its scope. In the final phases of the project, students will implement and evaluate the artifact created as a result of the process. This artifact may be fully functional or simply a model, prototype, or other representation of the complete system.

STEM instructors and students should give careful attention to selecting the digital tools for collaboration. Certain collaborative tools offer affordances and features that complement the communication processes in one phase of the design process while another other tool may be better suited for the tasks specific to another phase. The tools used during the first phase of the design process must be suitable not only for communicating, but also capturing and refining free-flowing ideas. As students endeavor to select a design project choice among competing ideas, students need collaboration tools that support a systematic and logical approach to selecting the optimal choice. The mix of collaboration tools used in the final phases should allow teams to communicate the status of the project to a larger audience and receive feedback on the resulting artifact.

Misappropriation of digital communication tools can undermine team efficiency and focus efforts on technical struggles with software applications rather the design project itself. However, when used effectively, the tools outlined in this chapter can support all phases of design-based learning in a manner that is effective yet unobtrusive to the learning process.

The design-based learning pedagogical approach has the potential to increase students' understanding of the design process through engaging in active and authentic learning projects. STEM students must have expertise in applying a systematic process to translating technological innovation to create value-added solutions.

This chapter explores electronic resources for use in design-based STEM education. Using design-based learning can improve knowledge of design processes and increase competence in problem-solving and student motivation. Specifically, this chapter discusses the use of collaborative tools for project creation, collaboration, peer assessment, and knowledge management. The discussion includes a number of technologies (e.g., email, text messaging, social media, wikis, project web sites, and blogging, among others). While specific applications may be referenced, this chapter emphasizes more salient features that are prevalent across a particular category of software applications. Given the rapid evolution of existing technologies and the disruptive nature of emerging technologies, instructors must continually reassess the value of new collaborative tools to support learning within the community of STEM students.

BACKGROUND

It has long been held that the most effective pedagogy incorporates deep (vs. surface) learning (Cope, Staehr, & Horan, 2002). With deep learning, students endeavor to understand the process by which effective solutions are identified and designed. This is in contrast to surface learning, in which students simply seek "the right answer" as expeditiously as possible. One of the biggest challenges facing STEM educators is incorporating learning experiences within an academic context that prepares students for complex, open-ended challenges found in professional work. For example, information technology (IT) education has been criticized for the disconnect between the IT curriculum and professional practice (Cohen, 2002a; Lee, Koh, Yen, & Tang, 2002; Trauth, Farwell, & Lee, 1993). Research indicates that

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

IT practitioners place a greater emphasis on creative and critical thinking than educators (Lee et al., 2002), and that the ability to plan and design strategic IT solutions is a crucial skill for IT managers (Wu, Chen, & Chang, 2007).

STEM educators must seek news ways of facilitating inquiry-based methods and bring student-led learning to the forefront. In recent years, the importance of design thinking has been emphasized in both practitioner and scholarly circles. Design thinking is characterized as the cognitive strategies and frameworks used to solve what has been termed "wicked problems" (Buchanan, 1992). Buchanan conceptualized wicked problems as that are difficult to solve due to incomplete, dynamic, and often have unknown requirements. In a practitioner space, graduates of STEM programs encounter wicked problems as a matter of course. Developing cognitive frameworks to support design thinking during the formal educational process engenders greater confidence and an organized approach when encountering complex problems.

From a pedagogical perspective, design thinking is reflected in the tangible artifacts produced by student project teams. These artifacts address various levels of cognition and awareness of problem spaces and their complexities (Leinonen & Durall-Gazulla, 2014). For example, on the most basic level, a student may develop a deeper understanding of design based on physical attributes of an artifact. With a deeper initiation into design thinking the student would consider the behavior of the artifact in differing scenarios. Going further, the student would begin to understand design from a systems perspective. That is, how does the artifact and its behavior fit within a larger system of interconnected elements. In the higher levels of design thinking the student develops a greater awareness of the user and the social implications surrounding the design. For instance, the designer of app may consider requirements related to accessibility or cultural matters. Perhaps the designer of a new gadget may consider green manufacturing techniques and re-usability of materials.

In the practitioner realm, many corporations and research firms are positioning themselves to be design leaders and seek to develop an organizational culture centered on innovation (Dunne & Martin, 2006). Hiring managers recognize the value of recruiting individuals with a capacity for design thinking. The importance of developing a pipeline of talent with who can apply creative problem solving skills is highlighted increased level of corporate sponsorship of design activities and competitions in higher education (Collins & Han, 2004).

In the past, STEM faculty typically designed curricula around applying scientific principles to defined, technological problems. However, from an industry approach, the graduates are ill-prepared for unstructured real world problems. More recently faculty are seeking pedagogical approaches to foster design thinking. This shift is seen in both STEM (Razzouk & Shute, 2012) and non-STEM disciplines (Johansson-Sköldberg, Woodilla, & Çetinkaya, 2013). In academia, there is a growing recognition of the importance of developing a strong field of graduates prepared to face wicked, real world problems.

Among the many pedagogical approaches best suited to address this gap between the academic and practitioner worlds is design-based learning. This chapter explores electronic resources for use in design-based STEM education. Using design-based learning can improve knowledge of design processes, foster greater competence in problem-solving, and enhance student motivation. Specifically, this chapter discusses the use of collaborative tools for project creation, collaboration, peer assessment, and knowledge management. While the context of the discussion is in the discipline of information technology, the same approach and tools can be used across STEM fields.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

DESIGN-BASED LEARNING

Inquiry-based STEM pedagogy encourages students to pose questions and arrive at solutions, thus creating student-centric learning paths. Design-based learning is an educational approach that incorporates hands-on, authentic, multidisciplinary design tasks (Doppelt, Mehalik, Schunn, Silk, & Krysinski, 2008; Wijnen, 2000) to identify problems and design solutions. Design-based learning is rooted in a constructivist pedagogical approach in that it relies on learning that emerges through experimentation in authentic contexts (Duffy & Jonassen, 1992; Fosnot, 1996).

With the DBL approach, students play a larger role in defining the design problem. Therefore, the resulting projects remain topical and relevant to the current class of students. In addition, DBL has the common stages of the design process to serve as a guide for students through all stages, from conceptualization to development to evaluation.

While similar in origins to problem-based learning (PBL), DBL differs from PBL approaches. Problem-based learning centers on predetermined complex problems that students are challenged with solving ((Duch, Groh, & Allen, 2001; Savery & Duffy, 1995). By contrast, design-based learning places emphasis on the integration of scientific knowledge with emergent inquiries. Learning is facilitated as interdisciplinary teams endeavor to create authentic artifacts (Gómez Puente, Van Eijck, & Jochems, 2011). By contrast, PBL has received criticism as instructor-defined problem contexts tend to become outdated and less relevant to students (Wells, Warelow, & Jackson, 2009). In addition, research has shown that students often experience anxiety and confusion over the minimal guidance inherent in the PBL process (Kirschner, Sweller, & Clark, 2006). A design-based learning approach addresses these issues. Students play a larger role in defining the design problem and, therefore, the resulting projects remain topical and relevant to the current class of students. DBL also has the general tenets of the design process to serve as a guide for students through all stages, from conceptualization to development to evaluation.

Design-based learning engages students in design activities that reflect authentic contexts and guide students through generating specifications, outcome prediction, artifact creation, evaluation, and communication. As students step through iterations of each stage, they develop reasoning and critical thinking skills needed to address open-ended design challenges in the real world. DBL incorporates open-ended design assignments, hands-on experience, real-life scenarios, and multidisciplinary content (Puente, van Eijck, & Jochems, n.d.).

Importance of Design Process Knowledge

Graduates of STEM programs, especially IT, must have expertise in applying a systematic approach to translating technological innovation into valuable, real-world solutions. In order to meet this requirement, IT curriculum guidelines suggest that IT students must develop skills in the process of designing new solutions (Topi et al., 2010). These design skills include designing and implementing solutions that provide a high-quality user experience. Indeed, students who are competent in the design process should possess a greater ability to provide solutions for dynamic, nonlinear problems and anticipate unintended consequences from interrelated system components (Moazzen et al., 2013). While these guidelines are specific to IT, problem-solving and the ability to design effective solutions in complex environments is an important aspect of all STEM fields.

Key outcomes for design-based learning include increased student motivation, greater student emphasis on deep (versus surface) learning, and the implicit instruction provided by feedback on design solutions.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Design and Peer Assessment

Traditional methods for assessing a designed solution include observation of design activities, interviews, and analysis of design documents (Moazzen et al., 2013). However, the advent of the Internet and web-based tools for providing feedback has contributed to a rise in the use of peer assessment as a tool for evaluating student work. Recently, the role of peer assessment in the work of IT students has received considerable attention (Sitthiworachart & Joy, 2003; Tsai, Lin, & Yuan, 2002; Tseng & Tsai, 2007a). Peer assessment in IT projects not only benefits the recipient of the feedback, but also creates a learning mechanism for the student providing feedback. Students develop judgments about what constitutes effective, quality design through reviewing and providing feedback to peers (van Zundert, Sluijsmans, & van Merriënboer, 2010). In addition, research indicates that the quality of peer feedback is often highly correlated with critique provided by experts (Tseng & Tsai, 2007a).

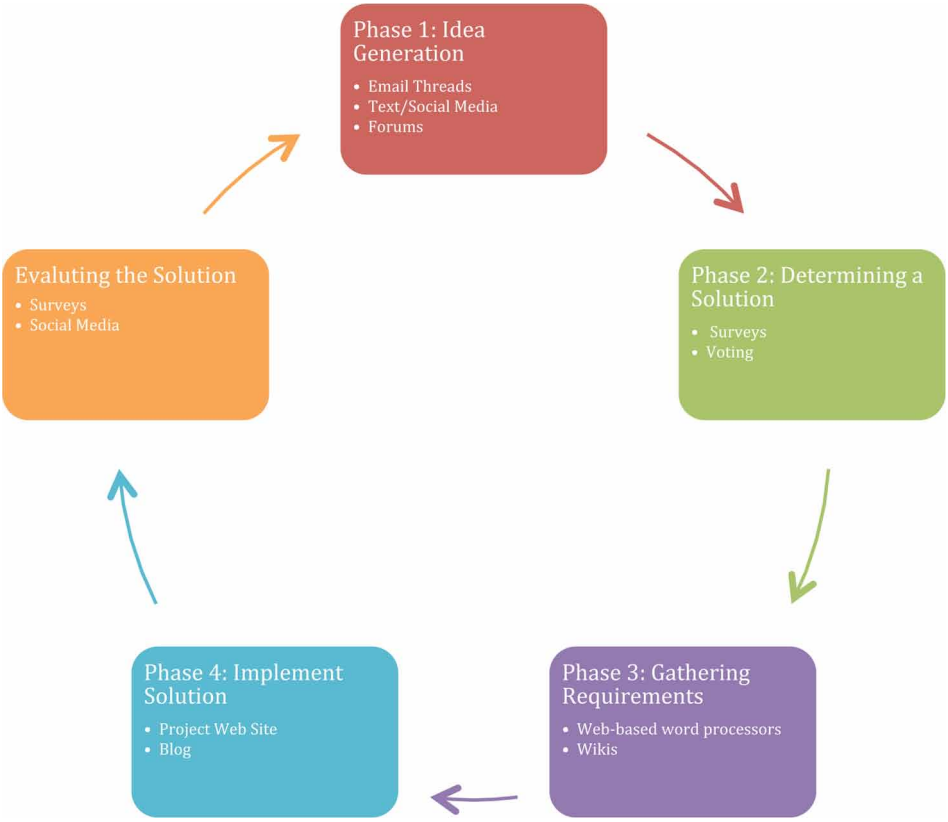
Student Motivation and Deep Learning

When students are engaged in projects that involve real-world scenarios and authentic learning, research suggests that student motivation is greatly increased (Cohen, 2002a). In addition, actively involving students in peer project evaluation has also been recognized as a factor in increasing student motivation (Tseng & Tsai, 2007a). As the level of student motivation increases, students begin to take ownership of learning, develop an intrinsic interest, and shift from surface to deep learning. When STEM students adopt a deep-learning approach, they seek a deeper understanding by developing a holistic view of the relationship between the design tasks, technology skills, and content-related concepts (Cohen, 2002a).

SOLUTIONS AND RECOMMENDATIONS

With the rapid increase in web-based tools available to students and instructors, the challenge in applying technology to STEM learning is not in finding tools, but in identifying the best tools for the learning task. There are numerous solutions available to support the design-based approach to STEM learning. With technology constantly evolving, this discussion focuses on broad categories of collaborative tools, but also includes specific software examples. Most of the basic tools are available as a standard part of learning management software or as stand-alone options.

As students apply the design process to explore unstructured problems and complex outcomes, it's beneficial to have communication structures in place to organize and gather discussions, knowledge, solutions, and results. Below is an overview of each phase of the design process and examples of supporting technologies (see Figure 1).



Phase 1 Collaborative Tools: Idea Generation

The first phase of the design process involves idea generation and brainstorming potential solutions or project topics. Brainstorming invites team members to pitch ideas loosely related to a given subject. The goals for brainstorming sessions include increasing the number ideas, building on existing ideas, and freeing participants to contribute with criticism from teammates and without regard to scope or feasibility. In this stage, students are engaging in highly unstructured communications.

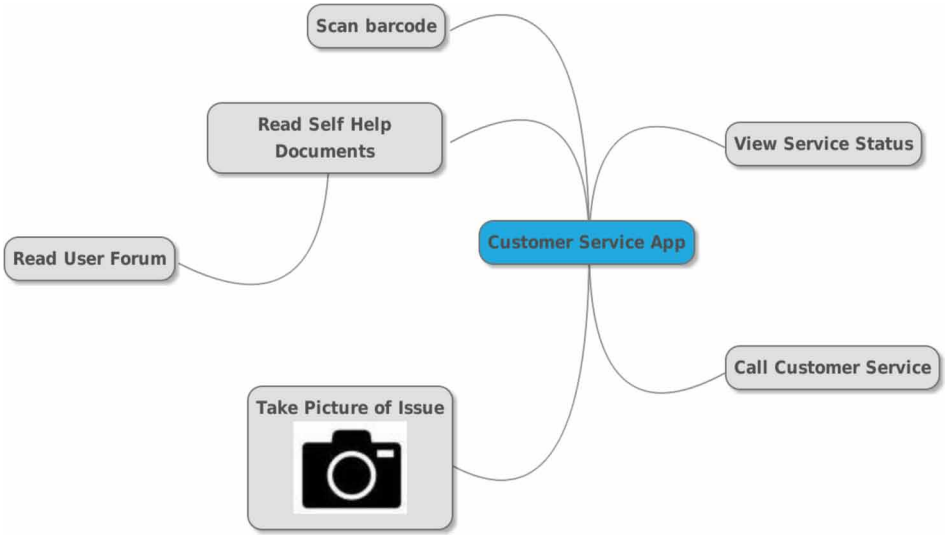
EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The benefits of using collaborative tools to facilitate brainstorming has been well documented (Dennis, Wixom, & Vandenberg, 2001). However, initiating and organizing ideas is a challenge for many learners facing ambiguous and ill-defined inquiries. The most common collaborative tool used during this phase of the design process is email. However, email threads among project team members can be difficult to track and identify when competing for the user's attention in crowded inboxes. In addition, students must be diligent in their use of email features such as "reply all" to ensure that every group member remains included in the email discussion.

Figure 1. Phases of the design process and examples of collaborative tools

Beyond email, many students use texting and social media to communicate. While these platforms are rapidly emerging, there are key disadvantages to these communication tools, particularly texting. Though texting provides instant distribution and access to communication, there can be issues with group members being inadvertently omitted from communication. Moreover, there is no central repository for archiving of student ideas.

Unlike email and text messaging, use of discussion groups or forums provides a more structured means of facilitating collaboration during the idea generation phase. Students can join the forum or discussion group or be enrolled by the instructor. After initial member enrollment, there's no longer a need to manually check to ensure that all group members are included in all conversations. Since conversa-



EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tions are organized by topic or thread within most forum and discussion group tools, students have the ability to categorize ideas and contribute thoughts in a more efficient and intelligible manner. Forums and discussion groups can also serve as a repository for documenting ideas in the brainstorming stage.

Going a step further, mind mapping tools provide another means of capturing and conveying ideas during the idea generation phase. A mind map is a radial diagram consisting of a central node that represents an idea. Branches are drawn from the central note to show subtopics or concepts related to the central idea. The branches can contain words or pictures and utilize color for categorization.

Mapping cognitive processes creates knowledge structures in the early phases of many endeavors. As students seek to refine ideas, mind mapping tools provide a means of exploring relationships among ideas and identifying conceptual gaps. Just as maps are used in literature to aid in pre-writing, natural sciences maps can be used to group related biological processes or outcomes. In the brainstorming phase of design-based learning, mind maps can be used by teams to generate ideas and cluster related concepts. As an example, if IT students were challenged with designing an application, maps aid in capturing the genesis of a potential solution and possible features (see Figure 2).

Figure 2. Mind map used to design an IT application using Mindmup (mindmup.com)

Though mind mapping techniques existed prior to the onset of the digital age, collaborative tools allow easier creation and collaboration. Many mapping tools are available via the web and allow teams to develop and share maps in real time or asynchronously. Changes made by individuals can be viewed or revised by other team members. Thus, the map can be updated as learners refine ideas. The evolution of the project can be documented via updates to the map. In most cases, web-based mapping applications store results in the cloud or can be downloaded and embedded in common formats. With mind mapping tools, teams can explore and collaborate on the potential features of several competing solutions.

The list of features and affordances associated with mind mapping software is constantly evolving. For example, some mind mapping tools allow for a richer object set. Beyond text, some systems support images, external data sources, links, and other forms of media. A valuable feature for team-based col-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

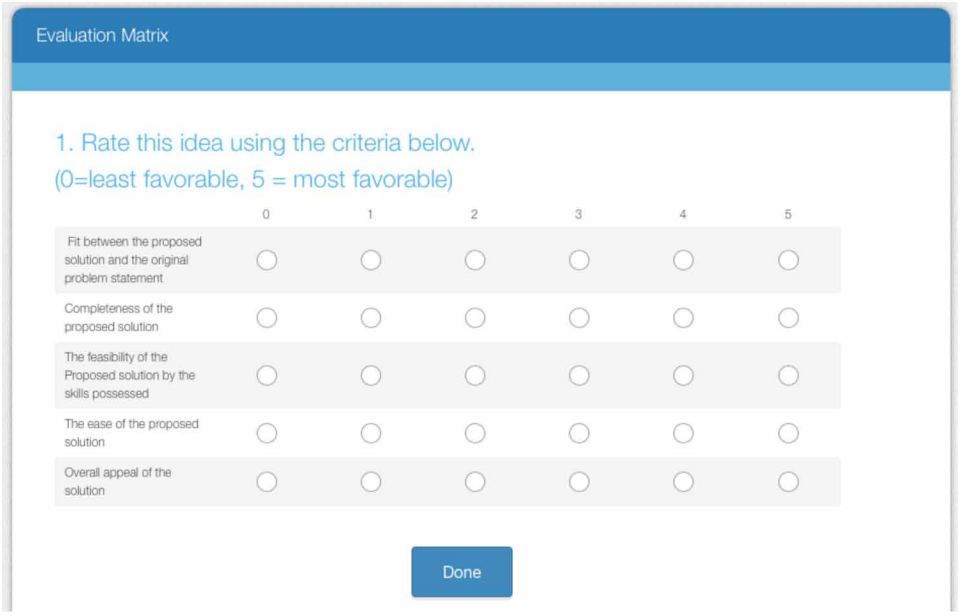
laborative projects is real-time collaboration, which allows users to modify and respond to the document from their own devices in real time. Other features that are of interest for team-based mind mapping include the ability to share documents, cloud storage, and the ability to track document history. In addition, tools that have a free version available provide a practical option for students. Table 1 contains a sampling of mind mapping tools and a summary of features.

Table 1. Examples of mind mapping tools

Tools	Features					
	Web-based	**Real-time Collaboration**	**Online Storage**	**Document History**	**Free Version**	**Additional Features**
Mindmup	X		X	X	X	• Project planning • Post to social media
Coggle	X	X		X	X	• Email change notifications • Presentation mode
Sketchboard	X	X	X		X	• Freehand drawing • Unified Modeling Language
VUE			X		X	• Import academic citations • Merge multiple maps • Supports external data sources • Presentation support
xMind	X		X	X	X	• Gantt view • Presentation mode • Create PowerPoint slides

Phase 2 Collaborative Tools: Determining the Optimal Solution

In the next stage of design-based learning, teams will need to identify the optimal solution. The method by which students assess what defines an optimal solution is specific to the discipline and topic. However, the method with which students arrive at their decision may ultimately consist of the judgment of individual group members. Some potential criteria for consideration are:



- Fit between the proposed solution and the original problem statement
- Completeness of the proposed solution
- The feasibility of the proposed solution by the skills possessed
- The ease of the proposed solution
- The overall appeal of the proposed to the design team and/or potential users.

In order to obtain the most favorable solution, students can create criteria for assessing their project. Each group member then rates potential project ideas, or the team can conduct a simple vote. Either way, surveys and questionnaires provide an ideal vehicle for rating, ranking, and voting. While there are a number of free web-based survey tools available, survey and assessment features are often built into learning management systems and web-based office productivity applications.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Approaches to evaluating potential solutions via web-based survey may include open-ended questions, closed-format questions, or a combination of both. If students poll team members or potential users with open-ended questions, the data obtained will be every rich, but highly unstructured and will take additional time to parse. Another means of evaluating ideas via web-based survey would be structuring the survey as an evaluation matrix. (See Figure 3) The survey questions would consist of an array of criteria for assessing the merits of an idea. The evaluator rates each idea (e.g., on a scale of 0-5) based on how well it meets each criterion. The results of the survey provide a criterion-by-criterion score as well as an overall score for each idea. The scores can be compared and the highest scoring idea selected.

Figure 3. Evaluation matrix created using SurveyMonkey (surveymonkey.com)

Phase 3 Collaborative Tools: Requirements Gathering

In the third phase of design-based learning, students gather requirements for implementing the chosen solution. Successful requirements gathering requires the collaborative development of a document that specifies the resources needed to complete the project. Students may work individually or in teams at this stage. Regardless, a central place where students can share and access requirements gathered by other group members is highly beneficial. Web-based word processors (e.g., Google Docs or Microsoft Office 360) are some of the simplest and most accessible tools for document collaboration. Project teams can create and simultaneously build requirements documentation with the most up-to-date version available to all team members. The main drawback to this approach is that the document is initially unstructured. Thus, team members must agree on a format and abide by that format as they make individual contributions. Since there is no embedded mechanism for capturing feedback or comments from team members, other communication tools would have to be used in parallel.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

For more complex design problems with elaborate requirements, wikis can provide a better collaborative solution. Wikis are specifically designed to allow collaborative editing and structuring of information. Wikis are particularly well suited for when a design document evolves and must be edited by multiple team members. In addition, team members can continuously review and give feedback on captured requirements.

Wiki pages can be created based on templates that reflect the nature of the project. For example, in IT projects, a wiki's pages can be pre-structured to accommodate documentation of functional requirements or use cases. Wikis also provide quick, web-based access to the latest team member contributions. As the project evolves, team members will have access to the history of not only the requirements, but also the discussion surrounding each requirement.

Beyond wikis, more advanced tools designed specifically for requirements gathering exist in the marketplace. Many of these solutions are costly and designed for corporate environments. However, a few providers offer solutions that include a free basic account suitable for student projects. Table 2 provides a sampling of requirements gathering systems.

Table 2. Examples of requirements gathering tools

Tools	Features
Wikis	Free Familiar interface, shallow learning curve
ReqView	Free version available Import documents from diverse file types Work online or offline
Gatherspace	Develop models and diagrams Report generation
iRise	Validate requirements Develop diagrams Integrate with other development environments

Phase 4 Collaborative Tools: Implementation of the Solution

In the implementation phase, students build the solution based on the requirements gathered in the previous stage. The collaborative tools used during this phase may vary greatly by discipline. However, a project web site provides an excellent means of communicating project progress during implementation. Project web sites serve as a repository for archiving and linking all aspects from each phase of the entire design project. As students review deliverables from previous phases, they reinforce their understanding of the project topic and develop a structured approach to problem-solving. The project web site provides easy access to the learning path by which they arrived at the current phase.

Within the IT discipline, the project web site can serve as point of distribution for beta versions of the artifact under design and successive releases. The website is a place for the project team to communicate the status, features, and notes regarding each new development. For users (or the instructor), the web site provides a means of gauging the project's progress and feature complexity prior to completion.

Project web sites also give instructors a view into the level of contribution from each team member. With access to a living history of the project, the instructor can assess the scope and impact of each team

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

member's contribution on an ongoing basis. In the absence of this dynamic system, it can be difficult to ascertain the amount of effort and significance of various tasks related to the final output. Also, with visibility into the project's progress, the instructor can better ascertain when to guide project teams if intervention is necessary.

For project team members, the website serves as a hub for convenient access to all phases of the project. There are a number of free web services that provide for rapid development of visually appealing and highly functional web sites. These web services provide drag-and-drop design capabilities that make creating a web site as simple as using a word processor. Thus, students no longer need to be versed in the technical details of creating web sites to harness the collaborative power of the web to support their project. STEM students can remain focused on the project domain without having to master web site development techniques, if this is outside the scope of the assignment.

For more complex projects with a greater lifespan, can place designated project resources behind password-protected web pages, effectively creating an intranet for team members. For example, access to the discussion groups/forums and survey data could be located within members-only pages. Housing project documents and communication in a project web site provides an efficient means of accessing and storing project information beyond email attachments or texting updates to team members.

Blogs are a special feature of web sites (and many learning management systems) that merit a separate discussion. Project teams can utilize blogs as part of the web site to document the stages of implementation. Blogs can also serve as electronic journals where students post pictures, links to resources, and status updates for peers and instructors.

From the instructor's standpoint, student blogs give insight into team progress and individual intellectual growth. Blogging bestows upon each student his or her own voice and opportunity to express a unique perspective on the learning challenges and accomplishments within the project space. In addition, blogs support commenting features that can be used by the instructor to provide feedback, pose additional inquiries, or give encouragement.

From the student's standpoint, blogging provides a tool for reflection and critical thinking. In writing a blog post, students apply analytical thought, reason through hypotheses, and communicate their rationale for results. When blog posts are made viewable to peers as well as the instructor, research has shown that students are more inclined to take ownership of their own ideas and the manner in which they communicate them. As students perceive that their ideas are being evaluated by their peers their level of motivation has been shown to increase (Tseng & Tsai, 2007b). As the level of student motivation increases, students began to take ownership of learning, develop an intrinsic interest, and shift from surface to deep learning. When STEM students adopt a deep-learning approach they seek a deeper understanding by developing a holistic view of the relationship between the design tasks, technology skills, and content-related concepts (Cohen, 2002b).

In addition to the deep learning that arises from blogging and peer critique, blogging also encourages communities of inquiry and knowledge sharing. As students share ideas, challenges, and successes, mutual learning occurs. Blogging can provide more personal expression and response than traditional journaling methods. As students seek sources to support their point of view, they are more inclined to find and evaluate the merits of data sources and identify scholarly work. As students focus and strengthen their discourse, their peers benefit from a plurality of well-supported, well-reasoned perspectives. Thus, students have a richer understanding of multifaceted problems and approaches as opposed to the more myopic vantage point of a single source.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Phase 5 Collaborative Tools: Feedback and Evaluation of Solution

Once the solution has been implemented, students can receive peer or expert feedback via responses posted to project blogs or surveys in which peers or experts external to the project provide both structured and unstructured comments. When utilized among peers, making feedback anonymous encourages the most constructive and honest responses.

As discussed previously, surveys can be designed to capture highly structured or unstructured feedback. The intended goal for resulting data should drive the format for the data collection. Once the project has been implemented, there are many channels for soliciting response via survey. Surveys can be emailed or embedded in a project website or the actual project deliverable if the project involved the creation of a digital artifact. Regardless, the goal is to capture the experience of the user or client and gain insight into potential opportunities for improvement. This data can then be used to refine the project via repetition of the design cycle if time or the scope of the assignment permits.

Both the student receiving feedback and the student providing feedback benefit from participating in peer assessment as part of the final phase of design-based learning projects. When considering the merits of feedback received as well formulating well-reasoned comments, students strengthen their understanding of how to arrive at a sound solution and what comprises design excellence. The prospect of receiving feedback from peers can be just as valuable in motivating self-critique and refinement of thought.

In addition to surveys, social media can be used in the evaluation phase of DBL. Social media applications vary greatly in their interface and functionality. However, there are several common features typically found in social media that are supportive of evaluating DBL projects. First, social media provides an instant form of collective communication. Apps like Twitter allow users to create uniquely identifiable channels of communication relating to a single topic. As an example, a team might use Twitter to generate discussions around a particular feature of the project. The team can then analyze the social media stream with the goal of evaluating the user response or reception to that feature.

Using social media, project teams can have many-to-many conversations and generate "buzz" or interest in their projects. Receiving live feedback and gauging the level of interest in a proposed solution provides an authentic learning experience in discovering the practical aspects of a topic and proposed solution. A team can design the most scientifically elegant solution, but if the feedback indicates that a community of potential users/clients don't perceive this solution as needed or useful then the design may require adjustment. Even in the absence of altering the solution, students still benefit from analyzing social media content as a response to team communication about the solution. In other words, students learn not only how to refine a technical solution, but also how their communication of technical or scientific information might be improved.

There are a number of collaborative tools available to support pedagogical approaches that incorporate design-based learning. Thoughtful application of these tools can foster greater collaboration, knowledge acquisition, and critical thinking. Table 3 provides an overview of the more basic tools discussed in this chapter. The table provides a starting point for applying free and commonly available tools with a relatively shallow learning curve. As instructors and teams become more acclimated to design-based learning, experimentation with some of the newer and more advanced tools discussed in this chapter may provide additional benefits.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Overview of basic collaborative tools

Digital Tool	Pros/Cons	Design Phase
Email	Pros: easily accessible and available to all Cons: email threads can be difficult to follow; individuals may be unintentionally dropped from group conversations	Idea generation – early brainstorming and idea introduction
Text Messaging	Pros: conversational quick communication Cons: Not well suited for group conversations or documenting	Idea generation – clarifying or refining ideas among dyads
Forums/Discussion Groups	Pros: easy to organize and structure communication around topics Cons: not as quickly assessable as email and text	Idea generation – refining and documenting ideas
Web-Based Word Processors/Office Productivity	Pros: easily accessible, simple to use Cons: unstructured, once document is formatted all users must maintain format; commenting is not built in(?)	Requirements gathering and documentation
Wikis	Pros: structure is predefined; commenting is built in Cons: more setup time required	Requirements gathering and documentation
Web-Based Surveys	Pros: easily distributed Cons: value of data and effort of analysis depends on how well questions are planned	Solution determination, feedback and evaluation of the solution
Project Web Site	Pros: can serve as a hub for all project documents and communication; can set up separate team member-only spaces Cons: can become outdated without ongoing effort to maintain	Implementation – documenting and communicating project milestones. Release new versions of the project artifact.
Blogging	Pros: easily accessible self-reflective tool for providing project updates and journaling Cons: students may require additional instruction on electronic communication etiquette and providing constructive feedback	Implementation
Social Media	Pros: can be used to generate buzz or interest in project; also provides project-related conversation streams for content analysis Cons: can be difficult to garner attention and attack focused conversations in noisy medium	Feedback and evaluation of the solution

FUTURE RESEARCH DIRECTIONS

The pace of change in educational technologies challenges researches to create persistent methodologies for assessing the impact of emerging technologies. To build a stronger theoretical framework and more robust empirical studies of technology application, it would be worthwhile to explore the development of salient features related to these collaborative systems. The structure for investigating new technologies could for example include affordances offered by the technology without overly focusing on the features, interface, or technical configuration.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

When students are engaged in projects that involve real-world scenarios and authentic learning, students become more motivated to engage in deep learning. Design-based learning pedagogy provides an effective way to engage STEM students in authentic learning activities that prepare them for real-world design problems. In addition, because DBL allows students to apply creativity to generate their own design plans and specifications, students have a vested interest in project outcomes and can explore complex solution spaces. At the same time, the design process provides guidance to students on how to successfully apply their technical skills to solve problems and produce functional artifacts. These artifacts can then be evaluated and refined by students to further understand the design process cycle.

A design-based learning pedagogical approach has the potential to increase students' understanding of the design process through engaging in active and authentic learning projects. In addition, student motivation, individually and collectively in teams, is a strong determinant for deep learning and perhaps the desire to engage more fully in developing knowledge of the design process. Increased knowledge and deep learning yield more favorable design outcomes.

Design-based learning places students at the center of defining design problems and taking ownership of the process. Projects reflect issues that are uniquely relevant and topical for each team. In addition, the phases of the design process guide students through an authentic means of arriving a solution. Students progress from conceptualization to development to evaluation just as they would with design solutions to problems in the "real world."

As students move through each stage of the design process and confront unstructured inquiry and uncertain outcomes, collaborative tools can be used to add structure to communication. These tools can facilitate idea sharing, serve as knowledge repositories, and communicate solutions. Given the vast and rapidly evolving digital communication and collaboration tools available, STEM instructors and students should give careful attention to deploying the tools best suited for the tasks specific to each design phase. If applied effectively, the tools outlined in this chapter can support all phases of design-based learning in a manner that is effective yet unobtrusive to the learning process. As STEM educators find novel ways of introducing inquiry-based approaches to student-led learning, technology will remain a valuable resource. As technologies evolve, instructors must continually reassess the value of existing and emerging collaborative tools to support learning within the community of STEM students.

KEY TERMS AND DEFINITIONS

Authentic Learning: A pedagogical approach that encourages students to create tangible outcomes that can be examined and critiqued using the real world as a context.

Deep Learning: An approach to learning in which learner seeks to understand the theory and broader interconnectivity between concepts.

Intrinsic Interest: A desire to engage or learn based on an internal reward system.

Many-to-Many Conversations: A feature of internet-driven communication that allows participants to converse (both transmitting and receive responses) with multiple individuals simultaneously.

Peer Assessment: A process by which students evaluate and provide feedback on each other's work using criteria provided by an instructor.

Surface Learning: An approach to learning that involves simple memorization of facts with no concern for drawing larger connections.

Unstructured Problems: A problem space in which the number of potential solutions is unknown and the connection between the solution and the outcome to be produced is nonlinear and complex.

Chapter 28
Developing and Validating Measurement Instrument for Various Aspects of Digital economy:
e-Commerce, e-Banking, e-Work and e-Employment

Nikolina Žajdela Hrustek
University of Zagreb, Zagreb, Croatia

Renata Mekovec
University of Zagreb, Zagreb, Croatia

Igor Pihir
University of Zagreb, Zagreb, Croatia

ABSTRACT

ICT-driven innovations affect all sectors of economy and society where trends like adaptability, remote workforce, augmented reality/virtual reality, internet of things, smart machines and artificial intelligence run the core of digital transformation of every aspect of a business. This article introduces the measurement instrument that was created and validated with intention of questioning certain aspects of digital economy from the user point of view. The validation of the proposed measurement instrument was conducted by applying factor analysis (Principal component analysis - PCA) which revealed critical factors affecting certain aspects of digital economy: e-commerce, e-banking, e-work (telework) and e-employment. Measurement instruments were tested on 197 respondents from two Croatian counties. To maximise the benefits that can be derived from digital transformation it is essential to overcome all barriers and force employment of opened opportunities. Business alignment with IT remains a challenge; therefore, presented results are valuable input in the discussed domain.

1. INTRODUCTION

Digital economy refers to economy based on digital technology usage and can be described as the ability of conducting business thought market ground on Internet and World Wide Web. It encompasses every aspect of modern life, such as entertainment, health, education, business, banking as well as citizens' engagement in government work (BCS, 2015). Various components of digital economy include "government, policy and regulation, internet, world wide web, telecommunication and electronic industry, e-business and e-commerce industry, digital service providers, information and knowledge management systems, intellectual property rights, human capital and knowledge workers, research and emerging technologies" (Mutula, 2010). EU and other countries around the world research and promote digital economy (EUROSTAT, 2018a) and try to measure its impact on national and global level (IMF, 2018).

The movement of traded goods, services, and finance defined image of globalization, but today's version of globalization is being characterized by flows of data that embody ideas, information, and innovation with no borders and hard to measure (Barefoot et. al., 2018), (IMF, 2018). According to McKinsey&Company (2016) 50% of the world's traded services are already digitized, 12% of the global goods trade is conducted via international e-commerce, cross-border Skype calls equal 46% of the volume of traditional international calls, from 88 to 100% of the SMEs that use eBay's platform are exporters. Globalization and rapid advancements in information technology offer unprecedented opportunities to improve lives.

ICT and the Internet allow significant consumption benefits, such as finding information, ordering and payment for services and goods and that all customers can perform in the privacy from their home. "An e-commerce transaction is the sale or purchase of goods or services, conducted over computer networks by methods specifically designed for the purpose of receiving or placing of orders. The goods or services are ordered by those methods, but the payment and the ultimate delivery of the goods or services do not have to be conducted online. One commerce transaction can be between enterprises, households, individuals, governments, and other public or private organizations" (OECD, 2011, p. 72). E-banking refers to the process or service that allows a bank customer to perform financial transactions via electronic media and is one of the most successful services in e-commerce with an increasing number of users every year.

The *e-work* indicate usage of ICT and the Internet in different aspects of employment activities like finding information about employment, sending job applications, logging on for employment mediation portals. The relevant papers that present opportunities of ICT and the Internet to support the employment policy in EU countries are: "Job opportunities in the Information Society" (1998) and "Strategies for jobs in the Information Society" (2000), i2010 - European Information Society 2010 and The Europe 2020 Strategy – "A strategy for smart, sustainable and inclusive growth" (2010). The share of respondents, which use ICT and the Internet as a tool for job seeking, indicates extent to which ICT and the Internet are exploited in job matching of the labour market.

This research aims to validate this new instrument that covers following aspects of digital economy: (i) usage of e-commerce, (ii) scope of e-commerce, (iii) usage of e-banking, (iv) usage of e-work (telework) and (v) e-employment. For this purpose, the new instrument, based on identified 5 factors or components, researched through 25 items (research questions) for monitoring certain aspects of digital economy was defined. Instrument items were defined and adjusted according to EUROSTAT (2014) and SIBIS (2003).

The rest of the paper is organized as follows: the second section of the literature review of digital economy and its current state. The third section provides the research methodology of research measure-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ment instrument, data collection, characteristics of respondents and used statistical methods. Section four represents the results of data analysis by construct validity, reliability of the measurement instrument and research findings: (1) intensity of using e-commerce, (2) scope of e commerce transaction: domestic, international, (3) intensity of using and banking, (4) perception of using e-work - telework, (5) and employment. Paper ends with conclusion and discussion as section five.

2. LITERATURE REVIEW ON DIGITAL ECONOMY

To maintain and take advantage of growing consumer interest in Internet-enabled services, online service providers are investing more in the adoption of e-commerce and are searching for new ways to attract customers to their websites, to encourage them to buy their products/services, and to enhance their loyalty (Ingham et al., 2014). On the other hand, consumers (current and potential) are leveraging and researching (with the use of Internet) prices, quality, services and delivery options, and sharing ideas and opinions to the end point of transaction/end of online shopping (Accenture 2012).

According to Commission expert group (European Commission, 2014a) it is better to characterise digital economy through key features like mobility, network effects and use of data. The US leads the world, with digital activity accounting for 33 per cent of its GDP, and in the second most advanced digital nation UK digital economy accounts for about 31 per cent of the UK's GDP (Racounter, 2016). An increasing number of customers are accepting e-commerce as an alternative to traditional shopping (Ingham et al., 2014).

When it comes to products or services purchased online, according to eMarketer (2014), e-commerce will account $1.316 trillion in 2014, or 5.9% of the retail market worldwide. By 2018, retail e-commerce reaches $2.5 trillion and share 8.8% of worldwide total retail market. Revenue driven by digital is estimated to 11.4% on global scale (research done on 2000 global companies) by Cognizant (Roehrig & Pring, 2018).

Although online sales continue to grow, the influence of web on total retail is much wider, owing this to proliferation of mobile devices, like smartphones or tablets. Forrester research estimates that web will influence 50% of total retail sales and will represent a compound annual growth rate of 7% (Sehgal, V., 2014). Western Europe UK, Germany, and France have the largest online share of retail sales, and forecast is that online retail sales will grow to compound annual growth rate of 11.5% over the next five years (O'Grady, 2014). In year, 2017 EU 28 countries had an average purchase online (in the last 3 months) by 48% of citizens (EUROSTAT, 2018b).

In 2013, eGovernment services have been used by 41% of the EU28 Population, where only 9 out of 28 countries have reached the target of half of the population by using eGovernment services (European Commission, 2014). In 2017, eGovernment services are used in average on EU 28 countries at 49% of individuals (EUROSTAT, 2018b). There are now between three and seven students per computer on average in the EU schools, interactive whiteboards are present in schools (over 100 students per interactive whiteboard), as well as data projectors. Around 50% of students attending grades 8 and 11 in general education use a desktop or a laptop during lessons at school at least weekly, 30% of students in grades 8 and 20% in grade 11 in general education use an interactive whiteboard at least weekly (European Commission, 2013).

The data on Internet banking use show dispersion amongst European countries, with over 80% of bank customers using Internet banking service in Nordic countries, while less than a third of the bank

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

customer population does so in Italy and Spain. In France, Germany, Belgium as well as the UK, adoption rates sit around 50%, while the average for the EU is 43% (Troiano, Sondergaard & Theodore, 2014). Forbes.com (Newman, 2016) predicted that in 2017 successful digital transformation that drives modern business would be encouraged with technology like augmented and virtual reality, application program interfaces, big data analytics, Internet of things, smart machines and artificial intelligence according to Forbes now in 2018 really become reality in every aspects of business (Columbus, 2018).

Adoption, use and perception of various e-services is in literature connected with different factors and possible moderators that (1) can influence overall customers' online behaviour, (2) can increase/ decrease the e-service usage, and (3) can have influence on their further global development.

Most of the literature assumes that young people are the major market for ICT, and therefore studies on online behaviours of older adults are rare. Lian and Yen (2014) presented the performance expectation and social influence as the major factors driving older adults toward online shopping, which is the same as with younger users. On the other hand, the major barriers include value, risk, and tradition, which is different from the younger. Chen et al (2015) presented results that show that gender and trust propensity influence consumers' decisions to continue using the Internet for purchases. Furthermore, the most benefit-oriented customers are men with high trust belief. Results presented by Yousafzai and Yani-de-Soriano (2012) indicate that (1) relationship between usefulness and behaviour is stronger for younger males with high levels of optimism and innovativeness and the (2) relationship between ease of use and behaviour is stronger for older females with high level of discomfort.

Ingham et al. (2014) stress that the extended version of TAM which includes trust, perceived risk and enjoyment can be used as "intermediate dispositional model" between (1) the properties of online shopping web platform, (2) the customer, (3) the e-merchant and (4) customer online purchase behaviour. Alsajjan and Dennis (2010) introduced the Internet banking acceptance model [IBAM] which includes (1) trust, (2) subjective norms, (3) perceived manageability, (4) perceived usefulness and (5) attitudinal intentions. IBAM can be used in order to predict and explain Internet banking behaviour. Loureiro (2013) reports that perceived quality and brand loyalty are more important when explaining the Internet brand equity than brand awareness and trust.

As part of digital economy measurement instrument, developed in this paper, perception of using e-work telework and e-employment were considered and authors such Laar et.al. (2017) made a systematic literature review on new digital skills at labour in digital economy that helps unemployed/employed to better perception of this "new" ways of doing business in digital economy. According to Eurostat indicator of looking for a job or sending job applications online EU 28 countries has an average of 17% of individuals seeking a job in this way (EUROSTAT, 2018b).

Challenges and opportunities of digital economy in developing countries were explored by Lazovic and Durickovic (2014), which presents an opportunity for developing countries and its classic economies to transform to digital economy, "skip" a few steps, and effectively respond to the demands of the global market. Using ICT and the Internet for conducting business activities today links two terms: telework and e-work, where e-work is the general component. "Telework occurs when paid workers carry out all, or part, of their work away from their normal places of activity, usually from home, using information and communication technologies" (Johnston, Nolan, 2001, p. 12).

The previous studies conducted differ several types of e-work. Gareis (2002) distinguishes the following types of e-work: employees working in remote back-offices, multi-locational teleworking employees, home-based teleworking employees, remote call centre in company-owned back office (outside own

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

region), employees working in telecentres, telecottages or other office premises owned by third parties, call centre employees in telecottages or telecentres.

Types of outsourced e-work include: e-lancers, e-outsourcing within own region, e-outsourcing to other region in own country, e-outsourcing to companies in other countries, outsourced call-centre, and outsourced call-centre with telecoms link. The request for labour and work is becoming more frequent due to less stability in employment relationships, dynamic changes in traditional and new sectors, diversification of career development and labour mobility. In this sense, ICT and the Internet can serve different purposes, for example offering websites for sophisticated job and candidate search engines, facilitating job-matching and job mobility for job seekers and employers, improving the functioning of labour markets, coordination and exchange of information, monitoring of local market trends, and online marketing employers and employees etc. Active labour market policies for digital economy were investigated by Bianco (2018).

The item related to e-commerce measured frequency of purchase various products and services and is of high relevance for digital economy adoption. The indicator of Internet users conducting on-line banking is also of great relevance for digital economy adoption. When the user is confident in security features that supports online banking, this most often ultimately results in a much more frequent use also other types of transactions.

The items measuring a frequency of usage ICT and Internet for communication is important because ability to communicate with others via the Internet is one of the skills of digital literacy and digital literacy is a central objective in the e-learning Action Plan in eEurope 2005 and one of priority of Digital Agenda for Europe and The Europe 2020 Strategy.

A high level of skills in communicating by using e-mail and social networks indicates a high potential for exploiting communicative potential of the Internet. An increase in the share of respondents who frequently ore very frequently use ICT and Internet for communicating with others should be interpreted as an increase in the general level of digital literacy.

3. RESEARCH METHODOLOGY

3.1. Research Measurement Instrument

With an aim to create a measurement instrument (a questionnaire) for monitoring certain aspects of digital economy: usage and scope of e-commerce, usage of e-banking, usage of e-employment and user perception regarding e-work (telework), the approach proposed by Straub et al. (2004) is adopted (Figure 1).

At the beginning of the creation of measurement instrument (questionnaire), an initial pool of 25 items presented in Table 1 was drafted based on a comprehensive overview of recent available research, outlined in previous section, adjusted according to EUROSTAT (2014) and SIBIS (2003). These 25 items were supplemented with demographic, economic and social status questions regarding participants' gender and age, household structure, place of residence, marital status, employment, family assets situation, level of income of the household in the last three years, level of education, along with questions regarding the time when respondents first started using the computer and the Internet.

Items were coded on a 5-point semantic ordinal scale. Response labels for items measuring user perception ranged from "1-strongly disagree" to "5-strongly agree", and those for measuring usage ranged from "1-not at all" to "5-very frequently".

3.2. Data Collection and Characteristics of Respondents

The research targets were people who daily use ICT and the Internet. For the purpose of this study an online questionnaire was designed. Various demographic, economic, social and cultural characteristics of the respondents are presented in Table 2.

The research was conducted in two counties in the north-western part of Croatia (Varaždin and Međimurje County) on a convenience sample using a non-parametric snowball sampling method. For more detail about this method, see Babbie (2010). For contacting potential subjects/respondents electronic mail and social network (Facebook) and an e-learning system of Faculty of organization and informatics were used. Link on online questionnaire on the social network Facebook has been sent to respondents (friends, relatives ..., 18+) with a request for filling out the questionnaire and to forward the questionnaire to other respondents (18+) with which they are connected on this or other social networks. System for e-Learning at Faculty of Organization and Informatics Varaždin, for the purpose of the pilot survey was used in a way that the link to the questionnaire was placed on forum of courses Operations Research 1 and Operations Research 2 with the request that all students who want to, voluntarily fill out a questionnaire. The data collection period via online survey lasted three months, i.e. from June to September 2014. A total of 331 respondents participated in the study, aged 18 to 74. The number of valid questionnaires was 197, remaining 134 questionnaires were incomplete and thus discarded from further analysis.

3.3. Statistical Methods

The online questionnaire was evaluated in terms of construct validity and reliability. In this research, construct validity was established through convergent and discriminating validity. For the assessment, authors used convergent and discriminating validity factor analysis as a multivariate statistical approach.

Factor analysis is a technique particularly suitable for analysing the patterns of complex, multidimensional relationships and usually is used by researchers to examine the underlying patterns or relationships for a large number of variables and to determine whether the information can be condensed or summarized in a smaller set of factors or components (Rencher, 2002). Factor analysis identified the separate dimensions of the structure first and then determined the extent to which each variable is explained by each dimension. The applied factor analysis method is ‘‘principle component analysis (PCA)’’ with orthogonal Varimax rotation method and Keiser normalization. As a criterion to determine the number of factors, Eigenvalue larger than 1 was used. Only items with factor loadings above 0.40 and cross-loadings below 0.40 were retained (Hair et al., 2009). The Kaiser-Meyer-Olkin (KMO) test of

	Q118	By using ICT and the Internet, I can, in a simpler manner, make contact with potential employer.

Source: Authors' work

sampling adequacy and Bartlett's test of sphericity were examined to check if the requirements for factor extraction were met. Kaiser-Meyer-Olkin test of sampling adequacy represents the ratio of the squared correlation between variables to the squared partial correlation between variables. Kaiser (1974) recommends accepting values greater than 0.5 as barely acceptable. Value between 0.5 and 0.7 are mediocre, values between 0.7 and 0.8 are good, values between 0.8 and 0.9 are great and values above 0.9 are the most acceptable. For more, see Hutcheson and Sofroniou (1999).

It is also necessary to measure the reliability of the measurement instrument in order to prove that its use in repeated measuring would show equal measurement indicators. To approximate the reliability of an instrument, its degree of internal consistency should be determined. This study employed Cronbach's Alpha reliability coefficient for measuring internal consistency of extracted factors. It is considered, for the instrument to have a satisfying reliability, if Cronbach's Alpha reliability coefficient is 0.70 or higher (Mejovšek, 2008).

Source: Authors' work

The goal of the research was to develop the research measurement instrument for monitoring certain aspects of digital economy: usage and scope of e-commerce, usage of e-banking, usage of e-employment and user perception regarding e-work (telework). In the first step an initial pool of 25 items was created. For the purpose of validation of the measuring instrument online questionnaire was designed and a pilot study has been conducted on people who daily use ICT and the Internet in the north-western part of Croatia (Varaždin and Međimurje County). Construct validity of measuring instrument has been tested with factor analysis method ''maximum likelihood'' with orthogonal Varimax rotation and Keiser normalization. In order to check that the requirements for factor extraction were met the Kaiser-Meyer-Olkin (KMO) test of sampling adequacy and Bartlett's test of sphericity was examined. For measuring internal consistency of extracted factors this study employed Cronbach's Alpha reliability coefficient.

In continuation the results of construct validity, the reliability and research findings are presented.

4.1. Construct Validity

In order to determine whether the partial correlation of the variables was small, the Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy and Bartlett's Chi-square test of sphericity before conducting the factor analysis was used. As depicted in Table 4, the Kaiser-Meyer-Olkin measure of sampling adequacy (KMO = 0.832) and Bartlett's test of sphericity ($\chi 2 = 2437.108$, df = 276, p = .000) both confirmed that the data satisfied the requirements for carrying out the principal component analysis (PCA).

Source: Authors' work

After the first "principle component analysis (PCA)'' with orthogonal Varimax rotation and Keiser normalization iteration, only one item did not meet the loading cut-off, thus this item was dropped. The remaining items were then subjected to another iteration and with this iteration, the meaningful factor structure was reached. The final PCA with orthogonal Varimax rotation and Keiser normalization iteration uncovered 5 distinct factors (Table 5). They accounted for 62.981% of the sample variance.

As findings show in Table 5, five factors relevant to certain aspects of digital economy were defined. The first one appeared to be the most important one because it explained the largest portion (31.631%) of the total variance after the varimax rotation. It consisted of 10 items meant for measuring Frequency of using e-commerce. The second factor explained 11.080% of the variance. It had 4 items that measure Frequency of using e-banking. The third factor accounted for 7.799% of the variance. It employed 4 items for determination of Perception of e-work - telework. The fourth factor represented 7.087% of the variance and consisted of 3 items measuring Scope of e-commerce transaction (domestic/international). The fifth factor explained 5.384% of the total variance. It was assessed with 3 items aimed for measuring the Frequency of using e-employment.

4.2. The Reliability of the Measurement Instrument

The final measurement instrument (questionnaire) consisted of 24 items distributed over 5 assessment scales that were intended to measure the following constructs: (1) Intensity of using e-commerce, (2) Intensity of using e banking, (3) Perception of e work - telework, (4) Scope of e commerce transaction: domestic, international, and (5) Intensity of using e-employment.

In order to prove that the use of an assessment scale in repeated measurements would show equal measurement indicators it is necessary to measure the reliability of such a measurement instrument. One way to approximate the reliability of an instrument is to calculate the degree of internal consistency or Cronbach's alpha coefficient for each scale or category of questions.

An instrument is considered to have satisfying reliability if Cronbach's alpha reliability coefficient is 0.70 or higher (Mejovšek, 2008). Cronbach's alpha coefficients for each part of the measurement instrument or assessment scale were found to be satisfactory for convenience sample (N=197). As can be observed from the data presented in Table 6 for the category of questions on "Intensity of usage e commerce" Cronbach's alpha coefficient was 0.905.

From the data presented in Table 7 for the category of questions on "Intensity of using e-banking", one can see that Cronbach's alpha coefficient was 0.823, which is acceptable.

For the category of questions on "Perception of e-work - telework" Cronbach's alpha coefficient was 0.798 according to the data presented in Table 8, which is also acceptable.

* Extraction Method: principal Component Analysis, Rotaton Method: Varimax with Kaiser Normalization
Source: Authors' work

For the part of measurement instrument which presented category of questions "Scope of e-commerce transaction: domestic, international" Cronbach's alpha coefficient was 0.774 (Table 9).

And finally, according to the results presented in Table 10 the category of questions on "Intensity of using e-employment" Cronbach's alpha coefficient was 0.687.

As all Cronbach coefficients α are higher than 0.7, except for factor Frequency of the use e-employment, the alpha value of which is 0.687, which is considered acceptable by certain authors (that is according to Hair et al., 2014 and Kehoe, 1995 acceptable for exploratory studies and for small component which have less than 10 - 15 items), one can rely on the measurement instrument and its measurement results.

4.3. Research Findings

Results of descriptive statistical analysis presented in Table 3 indicate that respondents who participated in the pilot study unexpectedly rarely used e-commerce services. For example, more than 65% of the respondents rarely or never used e-commerce services for purchasing shoes and clothes or to buy/book tickets for concerts, theatre, exhibitions. Likewise, more than 70% of the respondents rarely or never used e-commerce services to buy computer software/video games or computer equipment, telecommunications services and sport and recreation items. More than 80% of the survey participants are not interested in investing in investment funds or electronical purchase, household supplies, movies, music, books, magazines, newspapers or food.

With regard to the factor "Scope of the e-commerce transaction: domestic/international, respondents' purchase of products and services do not refer from the companies in their country or from the EU member states, but from companies around the world.

Results related to factor "Intensity of using e-banking" show respondents' frequency of using e-banking services and reveal that more than one third of participants frequently or very frequently use e-banking for money transfer and payment and 20.30% of them use it to find information about banking products and services, while more than 70.00% of respondents use it to find information about specific / desired products, ICT services and Internet use.

Results which presented factor (3) "The perception of the use of e-work – telework" demonstrated a positive attitude regarding the questionnaire items which were related to the use of ICT and Internet for business activities and e-work (telework). More than 40.00% of respondents believe that telework increases a sense of autonomy and labour productivity, 75.00% of them believe that, by using ICT and Internet, one can do more business activities in one day and 50.76% of them state that using ICT and Internet can easily synchronize one's private and business life.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

According to data associated with the factor "Frequency of the use of e –employment", as well as with previously analysed e-commerce, an unexpectedly small number of respondents in the pilot study use ICT and the Internet for the purpose of employment, 63.45% of respondents do not use or very rarely use ICT and Internet to send job application, while 47.72% stated that they do not use or very rarely use ICT and Internet to find information about employment. Although respondents usually do not use ICT and the Internet for the purpose of employment, it is interesting that respondents in the pilot study perceived the use of ICT and the Internet for the purpose of employment as useful because 62.44% of them agree or strongly agree with the statement "By using ICT and the Internet, I can, in a simpler manner, make contact with potential employer."

Usage of measurement instrument for research in its on the whole or by component and its results can be of great help to the creators of the national strategy in public sectors as well as researchers in the country and abroad concerning digital economy and information society, because it displays results in relation to important spectre of component as well as critical factors which have a huge influence on active participation of individuals/groups/communities in certain segments of information society. The measuring instrument is also suitable for use in large-scale research of several relevant and topical aspects of digital economy in general population of citizens according to socioeconomic characteristics and can be useful and valuable for small and large businesses in Croatia and other countries of the world for market research and ultimately for defining long-term as well as short-term decisions and strategic plans.

5. CONCLUSION AND DISCUSSION

In this paper digital economy critical factors were researched starting with extensive literature review and finishing with the empirical research of certain aspects digital economy measurement instrument validity that was finally confirmed through this research. Digital economy measurement instrument was based on five major critical factors gathered around 25 instrument items or research questions that define state of certain aspects digital economy in general population of citizens.

In section, three and four empirical research was conducted and results was discussed. Firstly, the research items were defined, then factor analysis was applied through principal component analysis – PCA, which resulted with critical factors affecting digital economy. Then, a new instrument for measuring certain aspects digital economy was tested and validated with reliability analysis on sample of 197 respondents from two of Croatia counties. Final results, were discussed through section 4.3. and findings in general population of citizens were presented and discussed. From point of view of empirical data gathered in this research, it can be concluded that citizens in Croatia (presented sample) are still mainly sceptics in major use and benefits of digital economy. Respondents are generally conservative about new possibilities of ICT and Internet in area of e-commerce, e-banking, e–employment and e-work – telework in regular manner. The results of empirical research indicate that more than 2/3 of respondents use Internet for gathering information about product and services but they buy them normally in regular manner and avoiding the use of e-commerce services for these purposes.

In comparison with the EU28 countries for 2014, on average the level of usage of e-commerce services was 41% in 2017 EU28 was 48% (EUROSTAT, 2017). Results for Croatia was 21%. Purchase in European Union is mostly used by the UK citizens 72.00% 2014 and for UK in 2017 78%. and the minimum of users 6.00% - 2014 and 11% 2017 was in Romania (calculations made by the author, based on EUROSTAT data (EUROSTAT, 2018b). Use of e-banking for money transfer and payments of bills is

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

present at 1/3 of respondents in Croatia which is same as in EUROSTAT 2017 report 33% (EUROSTAT, 2018b), unlike continuing growth in number of Internet banking users in 28 EU countries which on average in 2014 reached the level of 44.00%; in 2017 it was 56%. From the survey results, it is evident that respondents also have a positive attitude towards e-work or telework and believe that it brings more freedom and gains increase in labour productivity. Respondents, which participated in the study, also see great benefits in contacting potential employer through the use of ICT and Internet, even if a small number of them use it to find job or apply for it via the Internet in Croatia according to EUROSTAT (2018b) only 13% which is in line with empirical results and littlebit below the EU 28 average of 17% in 2017 (EUROSTAT, 2018b).

There are several limitations of the conducted and described research, which should be taken into consideration. First limitation is connected to the sample of the respondents of pilot study as well as the method used (snowball sampling method) which consists exclusively to the respondents from two very similar districts in the northwest area of Croatia (Međimurje and Varaždin district) and that in that sample, hardly accessible areas which do not have the same level of infrastructure which allows access to the Internet, were not included. Therefore, in the further researches with the existing validated measurement instrument, the intention is to conduct a research on a greater number of respondents, in such a way to encompass larger and more diverse number of areas in Croatia as well as some other countries members of the European Union, if possible. The age group of the respondents were adult citizens, which includes respondents of the younger generation of so called "digital natives". The most important reason for not including people younger than 18 years of age into the research were certain claims in which respondents were asked their opinion on activities juveniles are forbid to conduct by the law, such as claims concerning e-banking, e- employment and e-work. Generally for future research, this research results are a good starting point for large-scale research of digital economy in general population of citizens and can be of great help to both the private and public sectors in defining strategic plans and decisions. On the other hand, new measurement instrument validated through this pilot study, which comprises only certain aspects of the digital economy should be of great value for further research in this complex and current relevant but still insufficiently explored area.

ABSTRACT

Innovations in the modern world are not simply connected with the opportunities of digital technologies but also largely based on them. This is exactly why the full-fledged successive industrial sector's digitization will become a platform for qualitative changes of the economy and long-term opportunities. Thus, the transition to digital technologies is inevitable, but from another perspective, this very transition cannot be the absolute goal. In this chapter, the authors aimed at providing a better understanding for Industry 4.0 concept and its application benefits for Russia. The main problem is how the Russian Federation acts against the economically developed countries, which are the creators of Industry 4.0. This chapter mainly focuses on presenting the authors' views on how to sustain and increase competitive advantage of the Russian Federation by catching and implementing Industry 4.0. With Industry 4.0, Russian Federation gets a bigger share of the world manufacturing value chain.

INTRODUCTION

Recent trends of globalization are faced with the need to meet the constant global demand for new production technologies. To overcome this problem, the industry must ensure sustainable production. It is expected that, within the framework of the fourth stage of industrialization, a new approach in the industry 4.0 will ensure a greater integration of information and communication technologies (ICT) with industry. It leads to the intelligent and self-organized industry as well as, more flexible and efficient industrial goods.

During the first industrial revolution with the help of water and steam, the production was mechanized. The main driver of the second industrial revolution was electricity, which helped create mass production. At the center of the third revolution was electronics and information technologies that automated production. Due to the third industrial revolution there began a wide use of information technologies in the industry. The industry 4.0 is related with the development of Cyber Physical Systems.

The fourth industrial revolution is the blending of technologies of the physical, digital and biological world, which creates new opportunities and affects political, social and economic systems.

The fourth industrial revolution fundamentally transforms modern production, thanks to new technological achievements, including digitalization and robotization, artificial intelligence and the Internet of things (IoT), new materials and biotechnology. Due to these changes, production in developed countries again becomes the main source of prosperity and creation of new jobs.

In this chapter, the authors aimed at providing a better understanding for Industry 4.0 concept and its application benefits for Russia. The main problem is how the Russian Federation acts against the economically developed countries, which are the creators of Industry 4.0. This chapter mainly focuses on presenting the authors views on how to sustain and increase competitive advantage of the Russian Federation by catching and implementing Industry 4.0. With Industry 4.0, Russian Federation get a bigger share of the world manufacturing value chain.

BACKGROUND

By rapid implementation of information and communication technologies in manufacturing, the industrial processes becomes smart and enables mass customization. Many researches today are devoted to the investigation of the technologies and processes concerned with Industry 4.0 and its impact on economic development.

Industry 4.0 supposes the use of network approach that is based on the ability of creating smart products and components *(Kohlberg & Zühlke, 2015).* According to the authors *(Kohlberg & Zühlke, 2015)* Industry 4.0 enables new implementation areas through the potential of Industry 4.0 technologies such as powerful, flexible and affordable Cyber Physical Systems applications or extended applicability of Lean Production with various production types.

Bughin and Manyika *(2015)* assumed that the crucial impact factor in competition is related with the Internet of Things (IoT) which means that senior managers and company's members must act at the system level in order to be able to solve the challenges coming from the technological disruption.

Industry 4.0 technologies' application has proved their effectiveness in terms of increasing European firm's competitive advantage not only in manufacturing sectors, but also in service fields such as retail, healthcare, travel and financial services *(Piercy & Rich, 2009).*

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Further, we should consider the main approaches to the identification of milestones in the development of industrial systems.

INDUSTRIAL REVOLUTIONS: FROM INDUSTRY 1.0 TO INDUSTRY 4.0.

During the first industrial revolution with the help of water and steam, the production was mechanized. The main driver of the second industrial revolution was electricity, which helped create mass production. At the center of the third revolution was electronics and information technologies that automated production. Due to the third industrial revolution there began a wide use of information technologies in the industry.

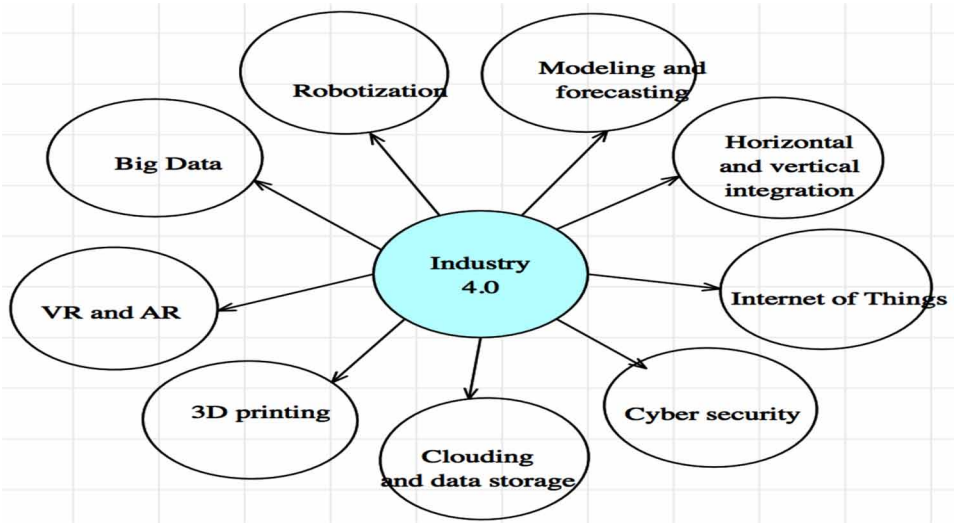
We are at the beginning of a new era, the era of artificial intelligence. But this is not only new technologies, but also cardinal changes in the very foundations of our civilization, the way of thinking of all the inhabitants of the Earth. The founder of the World Economic Forum Klaus Schwab (called it the "Fourth Industrial Revolution" *(Schwab, 2017).* Determination is inevitable and society is involved in changes regardless of the individual's desire: the decision to grant a loan in a bank or to invite to a new job takes artificial intelligence. The media was overwhelmed with a wave of reports about new successes of neural networks or investments in their creation, in amounts comparable to the budget of cities with million inhabitants.

Artificial intelligence technologies are actively being introduced in the retail and banking sectors, but the introduction of technologies into the real economy is still at an initial level. Most large enterprises still can not decide on the transition from traditional methods of managing customer or production management to technologies based on data analysis and fully automatic decision making. However, those few who have already made up their mind declare real effectiveness from the introduction.

The fourth industrial revolution seems to come out of the third, which is also called "digital" and which began in the middle of the last century. It was characterized by the merging of technologies and the blurring of the facets between the physical, digital and biological spheres.

The fourth industrial revolution is the blending of technologies of the physical, digital and biological world, which creates new opportunities and affects political, social and economic systems *(Schwab, 2017*). The fourth industrial revolution fundamentally transforms modern production, thanks to new technological achievements, including digitalization and robotization, artificial intelligence and the Internet of things, new materials and biotechnology. Due to these changes, production in developed countries again becomes the main source of prosperity and creation of new jobs. The leading developed and developing countries are now implementing their own initiatives aimed at developing the future production, and the leading foreign regions play an active role.

The features of the fourth technological revolution include the following:



- Rates of development. Development is not linear, but rather exponential. The new technology itself synthesizes more and more advanced and efficient technologies;
- Breadth and depth. It changes not only what and how we do, but also who we are;
- Systemic exposure. Integral external and internal transformations of all systems are envisaged in all countries, companies, industries and society as a whole;
- Methodological changes. The harmonization and integration of a large number of different scientific disciplines and discoveries is growing.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

With the term fourth technological revolution, the term Industry 4.0 (Industry 4.0) is associated (Figure 1).

The digital economy in industry is realized within the framework of the concept Industry 4.0, which is an element of the fourth industrial revolution. The concept Industry 4.0 was first presented at the Hanover Fair in 2011 by German scientists and politicians H. Kagerman, V.-D. Lucas, W. Valster (Kagermann, et al., 2011). In 2012, the Government of the Federal Republic of Germany within the framework of the "Strategy for High Technologies 2020" adopted an innovative development program - Industrie 4.0.

Figure 1. Large-scale trends in Industry 4.0

The basis of the program Industry 4.0 is the creation of "smart" enterprises (factories). These enterprises / factories have three types:

- Digital enterprises;
- Smart enterprises;
- Virtual enterprises.

The scale, depth and speed of the transformations that are occurring allow us to speak about the humanitarian and technological revolution (Ivanov, 2017). In this situation, technology comes to the forefront. The possession of high technologies and, especially, leadership in them means a strategic advantage in the modern world. It is technologies that become the leading variables, order parameters that determine the place of the state in the world and attract capital from countries in which there are none or insufficient (Ivanov and Malinetsky, 2017).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

TECHNOLOGICAL WAYS OF LIFE

Determining the genesis of the development of the PC is impossible without the hypothesis put forward a quarter of a century ago, according to which the long-term technical and economic development in its content represents a change in the technological structures (Lvov, 1986; Glaziev, 1993). This structuring of the process of global technical and economic development has shown its effectiveness in a number of works on measuring technological changes in the modern economy.

According to the most common point of view, the technological way is "a combination of technologies characteristic of a certain level of production development; in connection with scientific and technical and technological progress, there is a transition from lower orders to higher, progressive ones" (Glaziev, 1990).

To date, economists have identified five existing ways and talk about the onset of the sixth. In the Russian economy, there are several technological structures (Ermakova, 2013). It is conventionally assumed that the duration of the technological order is 50-60 years.

If we follow the theory of Kondratiev cycles and technological structures, then computer technologies are not related to tomorrow, but, rather, to today's and even to yesterday's day. The core of the sixth technological order, according to some scientists, may be NBIC-convergence, based on the union and synergistic enhancement nano achievements, bio-, information and cognitive technologies. The result of SCBIC-convergence will be a complete merger of these technologies into a single scientific and technological area of knowledge (Schummer 2009).

EVOLUTION OF MODELS AND CONCEPTS OF THE INNOVATION PROCESS

Modern concepts of innovation development include:

- "Open" innovations, which in 2003 proposed G. Chesbrough (2003). The model assumes that the company, when developing new technologies and products, not only relies on its own internal corporate R & D, but also actively draws innovations and competences from the outside;
- "Disruptive" innovations - K. Christensen theory (2016), which he introduced for the first time in 1997. This model can be used to describe the impact of new technologies on the functioning of a company: everything changes at a time when subversive technologies find their buyer who is ready to put up with the shortcomings of a new product and who need new properties of this product;
- Model "TAMO" and "arena of innovations" (Jansen, 2002). Model "TAMO" (T-technology, A - applied, M - marketing and logistics, O - organizational and managerial). The four components of the model - T, A, M, O - create an arena of innovation;

Theory of Constraints (Theory of Constraints, TOC) by E. Goldratt (2009). Each system has very few restrictions, and they are the key to its management.

IV. Post-industrial transition.

The transition from economy to post economy (post-industrial transition) is due to the expansion of commodification - goods become knowledge, events, impressions, attitudes, and reputation. People share knowledge and experience in networks; represent the products of their creativity in public use; participate in volunteer activities; participate in evaluation and examination. Products of intellectual

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

activity - complex, high-tech, requiring high costs (software with open source, databases, communication channels, technological solutions) are produced and provided for free on a significant scale.

MAIN FOCUS OF THE CHAPTER

Issues, Controversies, Problems

The "old economy" relied on the industrial revolution and the management of industrial branches. In an effort to reduce costs, manufacturers standardized products and aimed to continuously increase their market shares and increase efficiency from the growth of production scale. Thinking about efficiency, they copied successful processes and policies in each geographic market and managed operations, according to the hierarchy, when the chief executive instructed middle managers who in turn gave orders to employees. Standard organizational structures were developed that corresponded to the types of production, the planning system and the commercial activities associated with it. Unified methods of motivation were used, depending on the output and quality of products.

The new economy, called digital, in the already saturated consumer market is based on digital technologies and other approaches to managing information about customers, products, prices, competitors and all other aspects of the marketing environment. Information can be infinitely changed, analyzed, personalized and sent electronically to a large number of addressees in a short period of time. Having public information, for example, such as a message about the proposed price, and a feedback system with the seller, consumers and corporate customers can make more informed decisions about the purchase. Thus, the information age offers more precise levels of production, targeted communication and a balanced pricing policy.

Evolution of Types of the Economy

A.V. Babkin *(2017)* outlines the following concepts for the formation of a modern economy:

- Post-industrial,
- new,
- innovative,
- Information,
- knowledge economy,
- Competencies,
- network interaction,
- digital.

Over the past half century in Russia, several types of economies have changed from the industrial economy to the information economy, the digital economy and the knowledge economy.

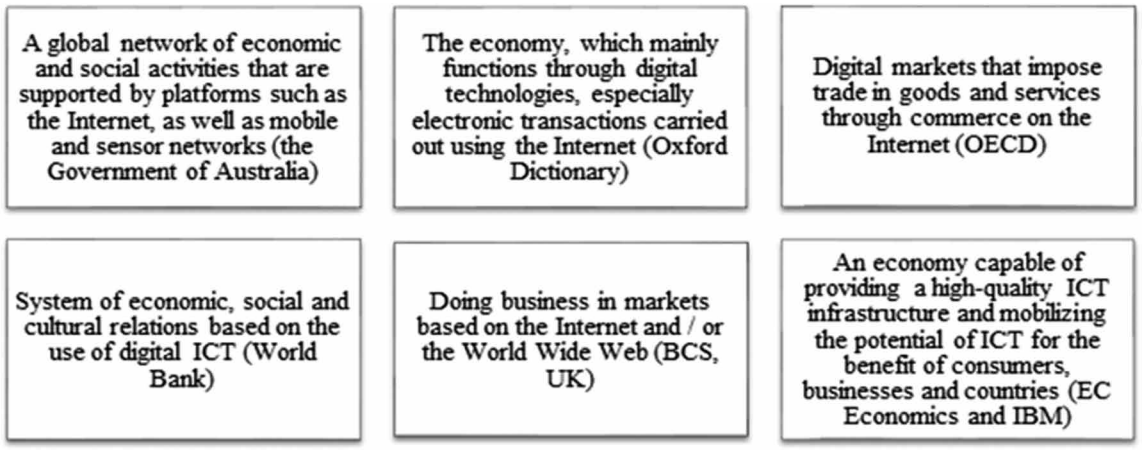
The main feature of the information economy is the ratio of the rate of development of individual subsystems of the economic system. Denoting S, T, P, I, F - respectively, the rate of development of science, technology, production (product), information sector and finance, we can write the ratio in

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the rate of dynamics of different subsystems (elements) of the economy for different historical periods *(Sukharev, 2015):*

$$\frac{\partial P}{\partial t} > \frac{\partial T}{\partial t} > \frac{\partial S}{\partial t} \tag{1.1}$$

$$\frac{\partial I}{\partial t} \geq \frac{\partial F}{\partial t} > \frac{\partial S}{\partial t} > \frac{\partial T}{\partial t} > \frac{\partial P}{\partial t} \tag{1.2}$$



The information economy can also develop without the influence of digital technologies, which has been observed so far. However, the use of digital technologies clearly expands its capabilities, as it improves the processing, storage of information, facilitates the information choice, by reducing the transaction capacity of decisions made.

Analysis of Different Views on the Concept of "Digital Economy"

The term "digital economy" was introduced by D. Tapscott *(1996).* In 2009, co-authored with E. Williams, he introduced the term "Wikinomics", implying a massive collaboration under it, which is based on such competitive principles as openness, sharing and actions at the global level *(Tapscott and Williams, 2009).*

The system of views on the concept of "digital economy" is presented in Figure 2.

Figure 2. System of views on the concept of "digital economy"

In fact, in the modern concept of "digital economy" it is a matter of changing the technological base of the economy, which will automate routine operations. G.G. Malinetsky believes that it is worth talking about the digital economy, referring to the computer economy *(Ivanov and Malinetsky, 2017).*

The Government of the Russian Federation has developed and in July 2017 approved a program for the development of the digital economy until 2024, which defines five basic areas: regulation, personnel and education, the formation of research competencies and technical facilities, information infrastructure

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and information security. This is not about a separate autonomous project, but about creating a fundamentally new way of life, a new basis for the development of the system of public administration, economy, business, the social sphere, the whole society. Obviously, these tasks can not be solved from above, it is necessary to interact with all participants in this process. In accordance with the program "Digital Economy of the Russian Federation", the digital economy is "economic activity, the key factor in the production of which is data in digital form, and contributes to the formation of an information space, taking into account the needs of citizens and society in obtaining quality and reliable information, the development of information infrastructure Russia, the creation and application of Russian ICT, as well as the formation of a new technological basis for social and economic spheres *(State program "Digital Economy in the Russian Federation", 2017).*

The digital model will increase the competitiveness of the Russian economy in global markets, provide the conditions for a gradual transition to the level of the innovation economy and knowledge economy, and improve the quality and standard of living of the population (for example, by reducing harmful emissions and improving the environmental performance of industrial production).

The digital economy has great potential to promote economic development. The Internet "explodes" the established markets for goods, services and labor, as well as the principles of the functioning of the public sector. Russia needs to take advantage of the current scientific and technological situation in the world economy in order to ensure globally competitive positions in the market *(Babkin, 2017).* Thus, the problem of managing the development of industrial companies in the context of reindustrialization and digitalization comes to the fore and becomes archival.

According to S.P. Kurdyumov (2018) under the term "digital transformation" the authors understand:

- A change of the model of economic management from program-target to program-prognostic;
- A change in the economic structure, the change in traditional markets, social relations, public administration associated with the penetration of digital technologies into them;
- A fundamental change in the main source of value added and the structure of the economy through the formation of more efficient economic processes provided by digital infrastructures;
- A transition of the function of the leading mechanism of economic development to institutions based on digital models and processes.

The notion of "digitalization" is closely related to the concept of digital economy.

In the broad sense, the process of "digitalization" is usually understood as a socio-economic transformation initiated by the massive introduction and assimilation of digital technologies, i.e. technologies of creation, processing, exchange and transfer of information.

Digitalization is also understood as the introduction of technologies needed to create new business models, processes, systems and software that will increase profits, increase competitiveness and business efficiency. Digitalization is the use of the possibilities of online and innovative digital technologies by all participants in the economic system from individuals to large companies and states. Digitalization is the most complete disclosure of the potential of digital technologies through their use in all aspects of business - processes, products and services, approaches to decision-making. It is important to emphasize that in order for the digitalization process to be complete, clearly defined business tasks and data.

Current Problems of Digitalization in Russia: Building Knowledge Economy

The movement along the way of managing the development of industrial companies requires the joint efforts of all participants. It is necessary to overcome a significant number of barriers. Only in this way the industrial complexes and the national economy of Russia as a whole will be able to move to a new stage in the development of the digital economy, to ensure the competitiveness of products of national production, both on the domestic and global markets.

Thus, the development environment under digital transformation changes its state to the "digital environment for the development of industrial companies" due to infrastructure and institutional changes.

Under the digital environment, the authors propose to understand a set of interrelated subjects of the production process and a digital infrastructure characterized by the use of information technology, high innovative activity and receptivity, operating in a favorable climate, which allows implementing scientific, technological, innovative and digital potential through proactive behavior. The digital environment for development is the most important prerequisite for scientific, technical and humanitarian progress.

The development of ICT infrastructure was noted by the Government of Russia as one of the priority directions in the construction of the digital economy. Access to high-quality ICT infrastructure positively affects GDP growth and the possibility of developing digital services. Providing broadband Internet access for small settlements, medical and educational institutions, the creation of domestic digital platforms, the deployment of 5G networks is an incomplete list of tasks planned by the Digital Economy of the Russian Federation program.

Thus, the knowledge economy is the goal of the development of the digital economy in Russia. The urgency of the formation of the knowledge economy is confirmed by the state and business. The knowledge economy is an economy in which knowledge is a market product. It is characterized by a high share of services, a high share of investment in innovation, developed information and communication sphere, building partnerships, cooperation of various companies. The economy of knowledge becomes a factor of innovative development, without which it is impossible to imagine modern society. The key characteristics of the knowledge economy are shown in Figure 3.

In Figure 4, the presence or absence of a digital economy is determined through E-Intensity, the index developed by The Boston Consulting Group, which tracks the development of the digital component of the global economy in 85 countries.

The index of the economy's digitization is calculated as the weighted average of three subindexes: infrastructure development, online costs, user activity.

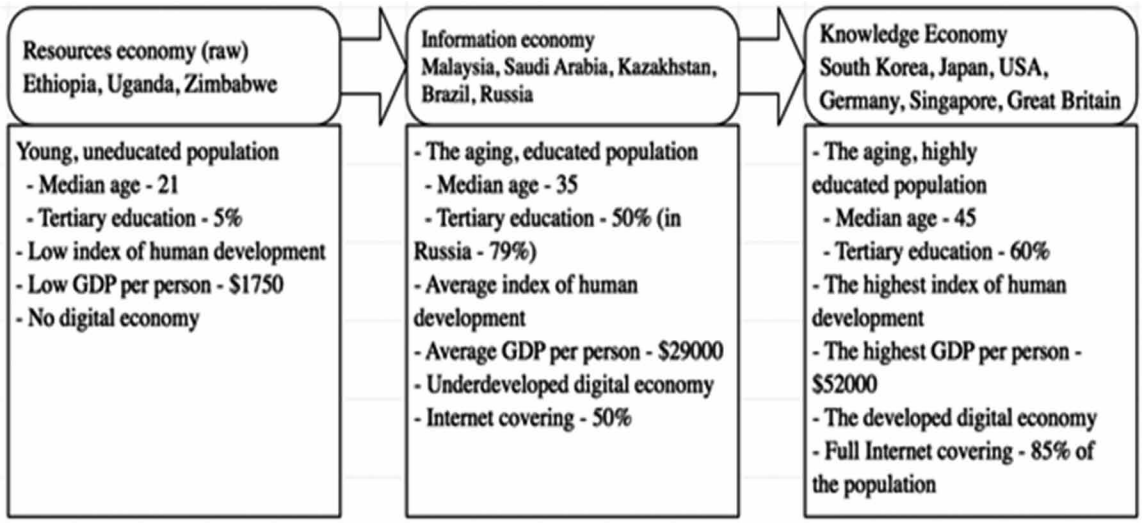
The subindex "Infrastructure Development" reflects the degree of infrastructure development and the availability and quality of Internet access (fixed and mobile). The subindex "Online costs" includes the costs of online retail and online advertising. The subindex "User activity" is calculated as a weighted average of subindexes of a lower level: the activity of companies, the activity of consumers and the activity of state institutions. All subindexes are formed from the weighted averages of several parameters underlying them.

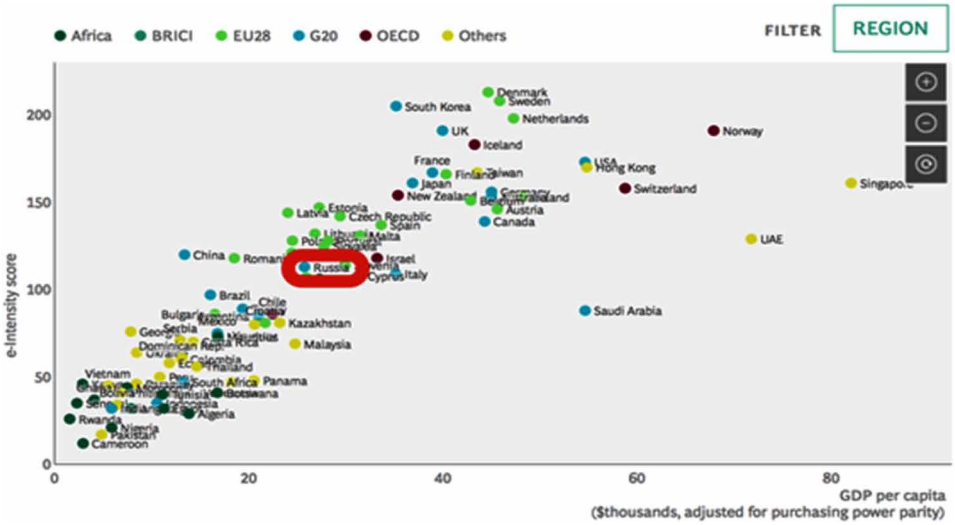
Figure 5 shows that Russia's position in the rating of BCG for the past five years has not actually changed, and the country ranks 39th out of 85 in the development of the digital economy. In 2011, it was on the 43rd place, in 2012 - on the 39th, in 2013 - on the 40th line. At the same time, the RF index (e-Intensity) grew at an average annual rate of 24% and in 2015 was 113. The leader of the rating Denmark is characterized by the value of the index of 213. The top 3 also includes Luxembourg and Sweden (212 and 208 respectively). Singapore ranks first in digital competition. However, China's indicators

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

are growing very fast, on average by 33% per year - and by 2025 it can take the first place in the ranking (URL: https://www.rbc.ru/economics/10/06/2016/5759aed19a79470d3392e05d). Technologically, China stands at the forefront of development in the most key industries, especially in the development of the Internet, applied developments, and is ahead of the US. Many institutions in Beijing do not accept cash or credit cards, they only accept aliexpress checks. It is already clear that the way Asian countries respond to global challenges, at what pace they will be set, will largely affect the further development of the world economy. However, the USA is the only digitally developed country in the world where there is no regulatory framework for digital politics.

Figure 3. Key characteristics of the knowledge economy (Adapted from: Russia 2025: from talent to cadres, 2017)





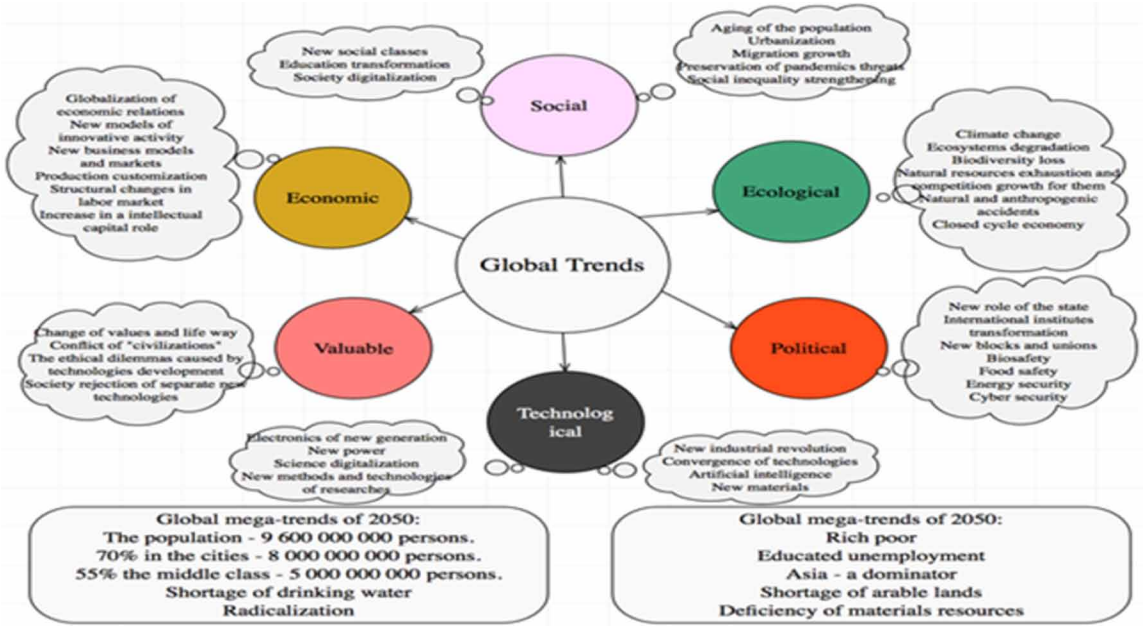


Figure 4. The index of the development of the digital economy of the countries of the world in 2015 (Boston Consulting Group, 2018)

Figure 5. Global development trends (adapted from Chulok, 2017)

The advantages that developing countries have so far demonstrated: high growth rates, cheap labor, are no longer a systemic factor that provides economic growth. Russia will need the industrial policy that will promote inclusive and smart economic growth.

Challenges and Opportunities in Leap-Frogging Strategies in Russia

According to the IMF, the growth rate of world GDP in 2017 accelerated to 3.7% against 3.1% a year earlier. Economic acceleration was global in nature and was observed in about 120 countries, both developed and developing. Support for the growth of developed countries had a soft monetary policy, the growth of developing countries - rising prices for hydrocarbons. The Russian economy emerged from the recession, but growth remains "modest". Inflation slowed sharply, the ruble strengthened, the Bank of Russia softens monetary policy. At the end of 2017, GDP growth was 1.5%, compared to a decrease of 0.2% a year earlier. The GDP grew mainly due to services, trade, mining and agriculture. The driver of growth was domestic private demand, while the growth rates of investment and consumption were at the same level. Net exports made a negative contribution due to outstripping growth in imports (*Sberbank Annual Report 2017).*

One of the central tasks of macroeconomic policy in Russia today is to reach a sustainable pace of economic growth. A steady growth rate is the dynamics of the system near a certain magnitude of its tempo. The figures of the dynamics to 2% do not satisfy many agents of the economy, because this is a rather low economic growth, and such figures can be provided by the opportunistic factors set by the dynamics of prices in foreign markets (Sukharev, 2018). G.G. Malinetsky (2015) believes that "to seriously talk about modernization and, even more so, to implement it, Russia needs to have its own big project, to master the possibilities of a new technological order and to ensure rapid economic growth (by more than 10% a year)".

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the conditions of rapid changes in society, everything is transformed - the structure of the workforce, business processes, management technologies and forms of organizations, the nature of creativity and the structure of assets, property rights. Global trends (Figure 1.6) generate big challenges for the economy, politics and society. Among the trends of technological development in the 21st century, the following (Andreeva, 2017):

- The transition from "manufacturing" as production through human physical forces to "brainfacturing" - intellectual production, or production through the human intellect;
- Transition from the concepts of "high-tech" and "low-tech" of the twentieth century to the concept of advanced and subversive (disruptive) industries in the 21st century;
- Transition from B2B, B2C to M2M - the concept of IoT ("Internet of things").

Management of industrial companies can not keep up with all global trends. In these conditions, the issue of prioritization comes first. The organization that can prioritize and concentrate efforts wins, which understands that no company can cope with all trends, it is necessary to be open to the world. The key quality of PC management in the modern world is collaboration, cooperation.

The concept and characteristics of Russia's major challenges are presented in the Strategy for Scientific and Technological Development of the Russian Federation until 2025 (Decree of the President of the Russian Federation dated 1 December 2016, No 642). In recent decades, Russia has entered a wave of deep technological and social changes, characterized by the emergence of new ones and the strengthening of the following aspects:

- The origin of the digital revolution - the massive use of digital technology, personal computers, laptops, tablets, smartphones, cameras, digital video and sound;
- Explosion of the communicative revolution - cellular communications, broadband Internet, social networks, GPS navigation;
- Manifestation of the consumption revolution - retail chains, supermarkets and shopping and entertainment centers, fitness centers, symbolic and glamorous consumption.

Further we will analyze the changes in the structure of the "old / new" technologies of Russian industry. By new technologies we mean technological innovations, under old technologies we mean the available traditional technologies. If a new production is mentioned, then it means production on new technologies, that is, when implementing technological innovations (Tatarkin, et al., 2017).

We consider the value of the costs of technological innovation as the cost of new technologies *In(t)*, and the total amount of expenditures in fixed capital - as all investments *I(t)*. Then, the difference between the value of all investments in fixed assets and the costs of technological innovation in the form of costs for old technologies, labeled *Is (t)*, is calculated in Figure 6.

As we can see, the total amount of investments in the Russian industry is growing: increase as the cost of technological innovation (investment in "new technology" (*In(t)*) in absolute terms, and their share in the structure of investments. For the period 2010-2015. the amount of investment in "new" technology has increased 2.1 times, and in "old" - 1.8 times without inflation, which is explained by the policy of stimulating innovation activities of enterprises.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 6. Dynamics of investments in "old / new" technologies of industrial complexes of the Russian Federation for 2010-2015
(Calculated by the authors on the basis of: Industrial production in Russia, 2016)

Indicator	2010	2011	2012	2013	2014	2015
Total amount of investments in industry, I(t), mln. rub.	3 290 400,0	3 969 500,0	4 713 100,0	5 136 900,0	5 415 600,0	5 970 100,0
Investments in "old technologies", Is(t), mln. rub.	2 940 636,7	3 500 057,8	4 129 439,4	4 390 121,7	4 652 825,9	5 234 342,3
Investments in "new technologies", In(t), mln. rub.	349 7 63,3	469 4 42,2	583 6 60,6	746 7 78,3	762 7 74,1	735 7 57,7
including for product innovations, mln. rub.	138 3 33,0	203 0 67,0	263 9 75,6	260 6 93,6	291 8 04,5	264 1 80,8
including for process innovations, mln. rub.	211 4 30,3	266 3 75,4	319 6 85,1	486 0 84,6	470 9 79,5	471 5 76,8
The share of investments in "new technologies" in the total amount of investment in industry, %	10,6%	11,8%	12,4%	14,5%	14,1%	12,3 %

Next, we will analyze the changes in the structure of "old / new" technologies by the number of employees in production on new and old technologies (Figure 7). The number of employed in the development will be taken as the number of employees in the "new" technologies *Ln(t)*. The difference between the number of all employed and employed in development is the number of people working on "old" technologies *Ls(t)*.

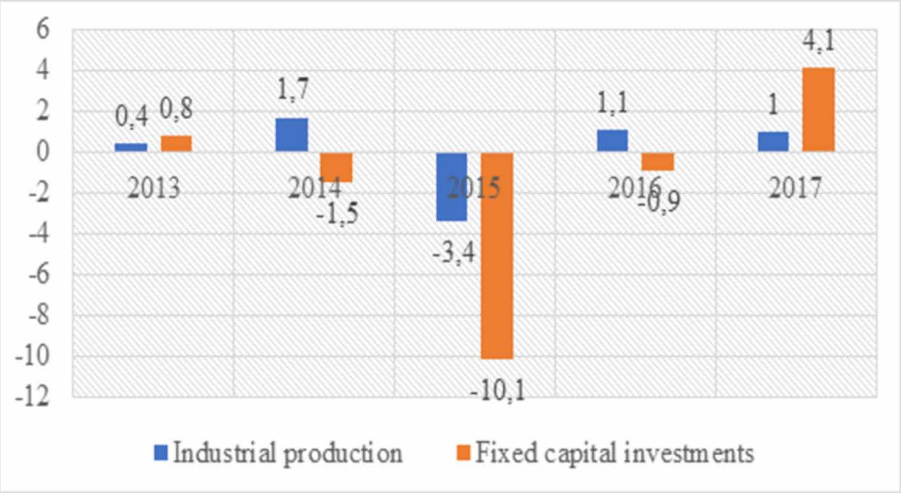
Figure 7. Number of employees in the "new / old" production in the RF and in the Central Federal District for the period from 2010 to 2016 (Calculated by the authors on the basis: Regions of Russia. Socio-economic indicators. 2017).

Indicator	2010	2011	2012	2013	2014	2015	2016
The number of employed in the industry of the Russian Federation, people.	13 25 5 200	13 23 8 500	13 19 6 800	13 07 5 400	12 84 8 800	13 38 0 100	13 35 7 500
The number of employed in the industry of the Central Federal District, people.	3 428 600	3 419 100	3 384 500	3 343 300	3 305 400	3 578 000	3 613 800
Number of employees in the "new" production of the Russian Federation, people.	736 5 40	735 2 73	726 3 18	727 0 29	732 2 74	738 8 57	722 2 91
Number of employees in the "new" production of the Central Federal District, people.	381 7 95	380 3 63	373 4 61	375 0 87	381 0 47	380 1 40	372 2 93
Number of employees in the "old" production of Russia, people.	12 51 8 660 ,0	12 50 3 227 ,0	12 47 0 482 ,0	12 34 8 371 ,0	12 11 6 526 ,0	12 64 1 243 ,0	12 63 5 209 ,0
Number of employees in the "old" production of the Central Federal District, people.	3 046 805, 0	3 038 737, 0	3 011 039, 0	2 968 213, 0	2 924 353, 0	3 197 860, 0	3 241 507, 0
The share of employed in the "new" production of the Russian Federation,%	5,56 %	5,55 %	5,50 %	5,56 %	5,70 %	5,52 %	5,41 %
The share of employed in the "new" production of the Central Federal District,%	11,14 %	11,12 %	11,03 %	11,22 %	11,53 %	10,62 %	10,30 %

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In 2015, we managed to overcome this negative trend a little: there was an increase in employed in industry, both throughout the Russian Federation and in the Central Federal District. This trend in 2016 remained only in the Central Federal District, where the increase in employed in industry amounted to a negligible amount of 35,700 people. In the Russian Federation in 2016, there was again a reduction in employed in industry. The number of employees in new and old production is also declining over the past seven years both for Russia and the Central Federal District. At the same time, the share of research and development personnel is also decreasing with a general reduction in labor productivity (as shown before).

Consequently, the key competencies for innovation development in Russia are as follows: new materials, devices, the human factor, information technologies, biotechnology.



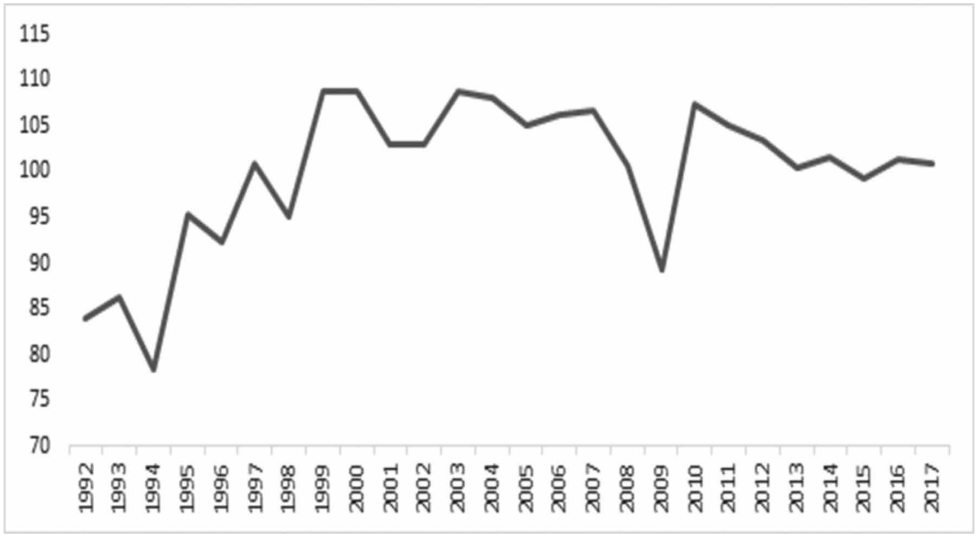
SOLUTIONS AND RECOMMENDATIONS

Lessons From De-Industrialization and Re-Industrialization

The modern condition of the Russian industry provided there was a drop of production volumes in 2015 and a slight growth in 2016 and 2017 with the cumulative deficit of fixed capital expenditures (Figure 8), is characterized by a set of attributes *(Sukharev, 2014):*

- High level of de-industrialization and technological lagging of Russian productions;
- Fragmentation of the industrial system: sectoral (branch) breaks, including vertical and horizontal links;
- Localization (spatial) of productions by regions with the emerging effect of monopolization and spatial segmentation of industrial markets;
- The effect of scouring for orders, technical solutions, sometimes personnel, as information systems of management fail to find necessary solutions and auxiliary processes (therefore sometimes import is inevitable);

Figure 8. Annual increase rates of industrial production and fixed capital investments



EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Problems with product competitiveness due to a low technological level of production;
- Underdeveloped institutions of industrial development promotion, lack of favorable development environment and organizational forms.

Let us briefly analyze the dynamics of the most significant parameters determining the Russian industrial development.

The index of industrial production (Figure 9) shows a drop in the dynamics in 2010-2014, a negative value of the rate in 2015 and a weak growth in 2016-2017.

Figure 9. The index of industrial production from 1992 till 2017, in % with resect to the previous year. The general dynamics for the last 7 years may be evaluated as descending (from 107,3% in 2010 to 101% in 2017). Changes of the financial results display extremely unstable functioning of the industry as a system due to major fluctuation from year to year. The number of employees in the industrial field (figure 1.3) was constantly decreasing from 21,3 mill. of people in 1992 to 12,8 mill. in 2015.

The yield on capital investments for the last 5 years decreased from 0,125 in 2011 to 0,117 in 2014, in 2015 there was a slight increase to 0,12 (Figure 11).

The labor and industrial productivity (Figure 12) was falling from 2009 till 2013, and in 2015 reduced critically.

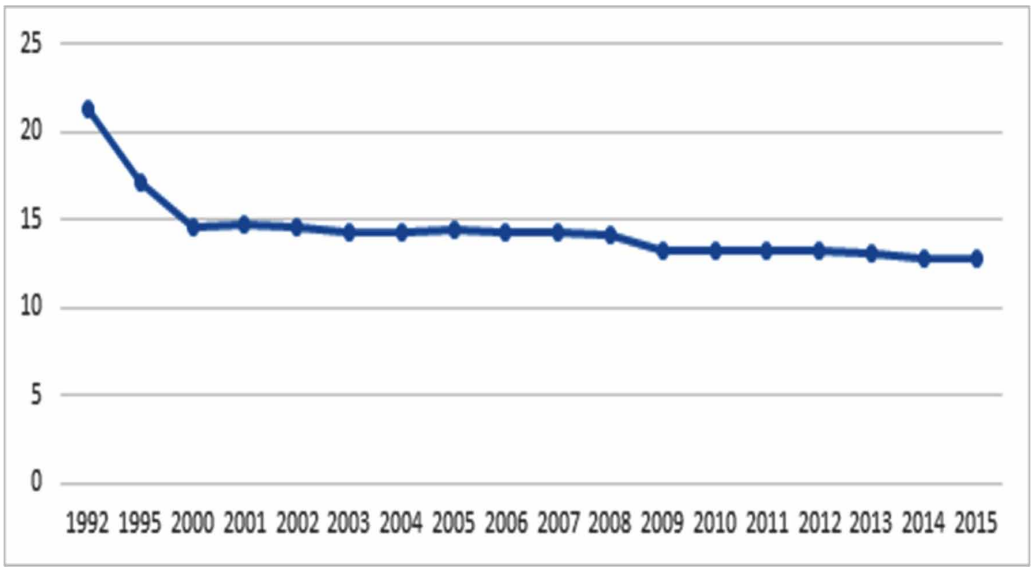
These alerting figures are the evidence of the necessity to change approaches in the industrial policy.

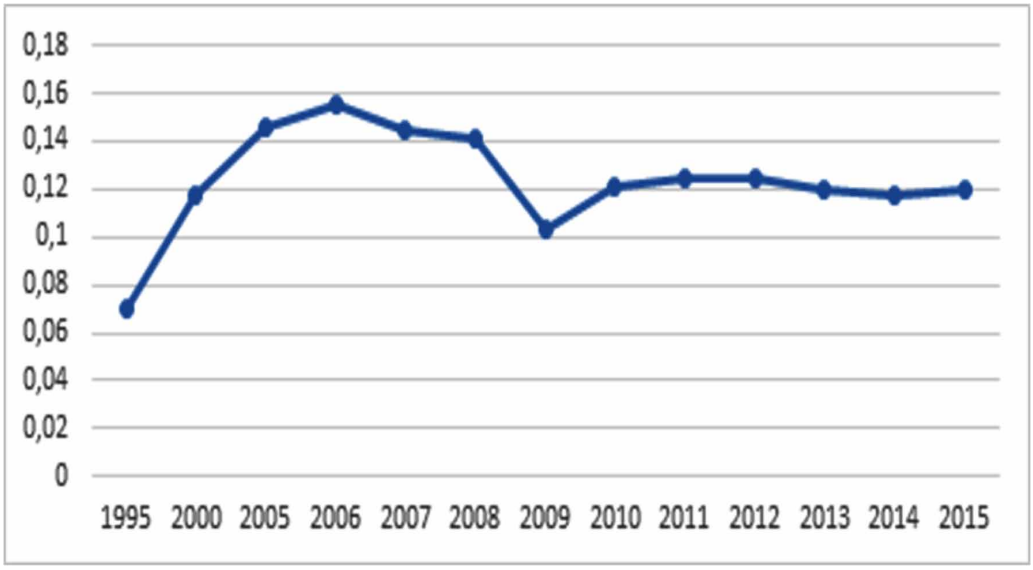
The experience of economic reforms in Russia from 2000s shows that the measures focused on Russian industry development promotion have included the following initiatives:

- Establishment of special economic zones since 2005;
- In the period of economic growth in 2005 Russia realized top priority national projects;
- Establishment of development institutions in 2006;
- Introduction of technological platforms in Russia from 2010;

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 10. The average annual number of employees in the industry from 1992 till 2015, mill. of people





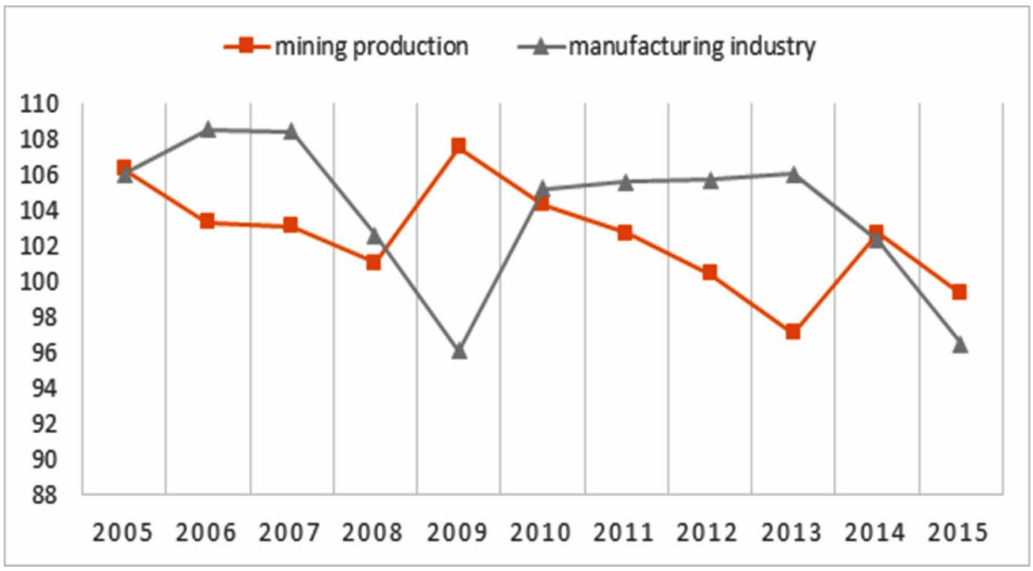


Figure 11. The yield on capital investments in the industrial production from 1995 till 2015

- From early 2012 innovation territorial clusters have been organized;
- In late 2014 the legislation fixed special forms of socioeconomic development specifically for Dalnevostochniy region (Far East region) – "territories of priority development" (TPD);
- In December 2014 in his message to the Federal Assembly the President of Russia set an objective to implement National Technological Initiatives (NTI);
- Following the changes of the geopolitical situation and some restraints on the import of certain technologies in 2014 the attention was drawn to elaboration of the Russian industrial policy;

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 12. The labor productivity in the industry from 2005 till 2015, in % with respect to the previous year

- In December 2015 the objective was set to create a national project office to support priority socioeconomic development projects;
- In 2016 there was launched the development program of the economy of new generation – digital economy;
- In 2018 12 national priority projects have been launched (demography; healthcare; education; accommodation and municipal environment; ecology; safe and high-quality highways; labor productivity and employment support; science; digital economy; culture; small and medium entrepreneurship and individual entrepreneurial initiative support; international cooperation and export).
- Some principal problems of the inefficiency of implementation of some initiatives include the following:
- Lack of feedback in the system of initiators and conductors of the said initiatives. The key condition of success in the innovation economy is the development of positive feedback. The presence of idea exchange, an innovation-receptive environment, many ambitious people coming from all over the world provides positive feedback between economic agents engaged in the knowledge-intensive field;
- Lack of coordination between initiators and conductors of the said initiatives. Cooperation and symbiosis should become more important than traditional logic of economic competition;
- Inactivity, lack of motivation and low innovation activity. It is favorable to increase the innovation activity till the level of the Soviet times (approximately 20 times). It is necessary to have a flow of ideas, projects, inventions, proposals, initiative; it is important to value the new, the original, the unusual.

Let us highlight the main problem to be resolved by the present study. To be considered the main, a problem should be of system nature for all industrial systems and have such a difficulty that it would be impossible to solve it within the existing managerial models.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

We believe that this sort of problems includes deep de- industrialization of the Russia industrial system, which has led to systemic negative socioeconomic consequences. The external factors of the socioeconomic stagnation (sanction in particular) in this case served only as a catalyst of problem aggravation. In this situation the negative effect of de-industrialization is not reduced only to absolute and relative (industrial share in GDP) reduction of industrial production volumes. According to O.S. Sukharev *(2014),* at de-industrialization the share of industrial production doesn't just reduce, it becomes more primitive; the technological level drops down, the production infrastructure collapses/curtails.

De-industrialization is a process of socioeconomic changes caused by decreased or absolutely ceased industrial activities in a region or a country, especially in heavy industry and industrial production *(The program of economic re-industrialization of Novosibirsk region).*

To describe the above-mentioned negative consequences there was defined the "two Ds effect" (de-industrialization and de-qualification), which has been later transformed into the "three Ds effect" (de-industrialization, de-qualification, dysfunction of management), as well as into the "four Ds effect"1 (from some analogy with the "four Is effect" *(Bodrunov, 2016):*

- *Disorganization* of production (decreasing organization and management of production);
- *Degradation* of technologies applied (falling technological level of production);
- *De-Qualification* of labor in production (includes not just a loss of skills and competences, but also simplification of the labor content, destruction of labor motivation etc.);
- *De-Complication* (simplification) of products.
- To our point of view this effect can be supplemented with such components as:
- *Disintegration* of production, education and science;
- *Deficiency* of investments and sanctions in the economy;
- *De-Structuring* of sectors.

At the present time the Russian economy is at the crossroads: to develop following the innovation path and to try and keep pace with the developing economies, or to lose the ability to compete with highly-developed countries forever. Thus, lagging is the main threat for Russia. It is crucial to reverse such situation and to ensure the development dynamics.

The experience of post-soviet development shows that the main problem lies not in ideas, but in their implementation. For the last quarter of the century the country has undergone a series of innovatory and bold initiatives (from creation of Special economic zones to RAS transformation), which, according to the authors' concept, are intended to provide the transition to the innovation path of development, as well as the economic development and life-quality improvement. However, in practice, such solutions haven't always led to the predicted effects. According to some scholars *(Ivanov and Malinetsky, 2017)*, such situation is to a great extent caused by application of the approach known as "innovation without science", as the bulk of such decisions have been made on the basis of common views without sufficient expert examination.

V.V. Ivanov and G.G. Malinetsky *(2017)* notice in arguments on development ways the dividing line in the following question: "Human for economy or economy for human?" If "human is for economy", than the greatest achievements are the growth of high-tech export, the number of employees in non-resource-based sectors of industry, the growth labor productivity etc. If "economy is for human", than it is natural to evaluate the quality of life in real indicators important for people: health, education quality, social protection, prosperity, food, energy etc. The authors proceed from the requirements to follow the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

"economy for human" paradigm. It is necessary to speak about the quality of people's lives, because obviously every next phase of economic development or changes of socioeconomic setups increases the role of the person. Therefore, the creation of high living standards is the key factor for the economy to change and to grow; for the best talents to remain in Russia.

Besides the person's role in the innovation economy, the preservation and restoration of the environment are the objectives of the modern world that require close attention and timely and efficient decisions both in the applied context and in the legal field. The commercial or paid approach to nature management seems to be just, and socially responsible and far-sighted industrial companies are ready to invest considerable funds into environmental events. At the present time the legislation provides for several types of compensation of negative impacts on the environment: payment for negative impacts, as well as indemnification for infliction of damage to environmental components, introduction or improvement of new technologies and holding of nature-conserving events. It is obvious that modernization of production, construction and reconstruction of treatment facilities has a great positive effect in comparison with payment of fees, and the state goal is to stimulate these and similar events. Companies holding nature-preserving events have the right to decrease fees, but the mechanism of funds offsetting has not been properly defined by laws, and in practice the balance is achieved through courts.

J. Stiglitz *(1997*), famous American economist and Nobel Prize winner, has come up with the theory of "The Great Divide". He convincingly demonstrated that the American economy had been developing for quite some time in favor of 1% of the richest US citizens, which could lead to a social catastrophe: «The top 1 percent have the best houses, the best educations, the best doctors, and the best lifestyles, but there is one thing that money doesn't seem to have bought: an understanding that their fate is bound up with how the other 99 percent live. Throughout history, this is something that the top 1 percent eventually do learn. Too late» (Stiglitz, 1997). At the present time the separation between countries and inside them is continuing to grow. Although the inequality has been acknowledged as a great threat to the world stability, nowadays the 1% of the richest control 50% of the world wealth against 43% in 2010 *(BCG).*

We believe that programs and strategies of scientific and technological development, re-industrialization of the Russian industry, the program of digital economy, as well as other state programs of modern Russia must be carried out in the interests of 99% of its population.

De-Industrialization, Re-Industrialization, and Neo-Industrialization

At the present time all developed countries are reconsidering post-industrial conceptions. Such terms as "modernization", "new industrialization" (neoindustrialization), "re-industrialization" have become permanent on the agenda. The views of researchers on the said terms are introduced below.

According to Feldman *(2001)* modernization is creation of an industrial base with structure, branches and technical equipment of the international level; establishment of mutual autonomy of social spheres (including creation of advanced systems of social protection); development of human rights protection.

In general understanding, re-industrialization is a new economic policy devoted to modernization and innovative development of the Russian economy. Economic re-industrialization presupposes establishment of new and development of existing high-tech enterprises, production of new goods and services, creation of new work places, growth of labor productivity and industrial and economic competitiveness in whole. It is reflected in accelerated technological development of the economy, in modernization of existing productions on the basis of absolutely new technologies and in establishment of new high-tech sectors and productions *(The program of economic re-industrialization of Novosibirsk region).*

Figure 13. Views on the term "industrialization"

Source	Definition
Sukharev, 2014	Industrialization is the process of switching primitive labor scarcely equipped with technology to the machine based one
Sanzharevsky, 2010	Industrialization is a process of establishment of large-scale machine production and the transition on the basis thereof from the agrarian society to the industrial one
Epishkin, 2010	Industrialization is country's industrial development; introduction of large machinery into country's national economy
Financial dictionary, Finam.	Industrialization is a period of priority development of production characterized by the establishment of large-scale machine production standard goods on the basis of the following: - complex division of labor and specialization; - utilization of various types of energy; - application of science and technology in production organization.
Black, 2000	Industrialization is a process of transferring the resources into the industrial sector.
Dictionary of business terms. Academic.ru.	Industrialization is committed development of industry, establishment of large-scale machine production in the economy or in a certain economic branch, considerable growth of the share of industrial production in the economy.
Usoltseva, 2017	Under industrialization one understands the process of transition to the industrial stage of development associated with considerable growth of the share of industry in the economy, with development of new technologies

Figure 14. Definition of "new industrialization" (neoindustrialization)

Source	Definition
Primakov, 2012	«New industrialization» (or neoindustrialization) is a policy characterized by the following features: - economic structure diversification to achieve a growing share of industrial production, - providing the said process with personnel possessing the corresponding skills; - modernization of country's financial system for the needs of re-industrialization; - establishment of "channels", "lifts" linking scientific development with industrial production; - systemic import of high technology: through acquisition of technological assets abroad; - by attracting direct investments into the Russian industry provided technology transfer

Figure 15. Views on the term "re-industrialization"

Source	Definition
Sukharev O. S. Re-industrialization of the Russian economy and technological development //National interests: priorities and security. – 2014. – №. 10.	Re-industrialization is restoration of production and technological systems, individual sectors and types of production taking place along with settlement of principal objectives concerning stock, technological and staff foundations of the industry with the general focus on creation of national qualitative values in use
	Re-industrialization is an economic policy representing a set of measures broader than in standard variants of the industrial policy. It is devoted to planned restoration (creation, change) of the industrial and technological base of the economic system by applying macroeconomic, institutional and organizational, legal, structural and investment measures effecting not just industrial organization, but the auxiliary infrastructure, financial and banking systems etc.
Re-industrialization: How can we organize industrial development? A verbatim of a direct conversation with the Chairman of the Development Party Yuri Krupnov, 3rd November, 19:10, "Govorit Moskva" radio 92FM	Re-industrialization is designing, creation of an absolutely new industrial system that would be competitive in the world and, most importantly, that would give people, the country's population (in this case, Russia's population) a sufficient number of high skill-demanding jobs
Putin V.V. On our economic problems //Bulletin. – 2012. – Vol. 30. – №. 15. – P. 5.	Re-industrialization is considered as intensive development of the Russian industry by means of large investments into development (including acquisition abroad) of new technologies and equipment for the account of reorganization of recipients of such investments — the industry in whole, its base elements and subjects
The decision of the Scientific Expert Council under the Chairman of the Council of the Federation of the Federal Assembly of Russia on the issue "Re-industrialization of Russia: opportunities and constraints" [Online resource] – URL: http://www.council.gov.ru/media/files/41d477365af565138 6f7.pdf (address date: 11.10.2016)	Re-industrialization should be interpreted as a process coordinated by authorized bodies and devoted to creation and development of the model of Russian industry, which should be implemented in the following areas: organization and development of target sectors of the country's innovation complex, in particular, bioeconomics, nano-industry, cognitive technologies; modernization of the manufacturing industry using enhanced innovation technologies; introduction of cutting-edge technologies into the development of mineral and raw-material sectors
Bodrunov S.D. Economic re-industrialization: shall we begin with import substitution? //Economic revival of Russia. – 2014. – №. 3. – P. 5-7.	Re-industrialization is a process of intensive economic growth by means of increasing the efficiency of resource utilization for the purpose of production and realization of competitive goods. These products should be developed on the basis of Russian knowledge-intensive technologies. To achieve these goals it is necessary to modernize the production and technological base of the national industry
Romanova O.A., Bukhvalov N.Y. Re-industrialization as a determinative trend of economic development of industrial areas //Fundamental research. – 2014. – №. 6-1.	Re-industrialization is a simultaneous process of creation of not just new high-tech sectors of the economy, but also efficient innovative renewal of its traditional sectors together with coordinated qualitative changes between economic, technical, social and institutional spheres, carried out by means of interactive technological, social, political and managerial alterations. As for this definition it is reasonable to highlight not just the interconnection of all sphere of public life in the country for the purpose of implementing the program of re-industrialization, but also "the functional-catalytic industrialization" as a special type of re-industrialization

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

From the point of view of O.S. Sukharev *(2014),* industrialization is a substitution of manual labor with the machine one, which leads to staff disengagement. Nowadays industrialization is reduced to *a sharp increase of production manufacturability* (the share of industrial production is subject to change, drop or even grow like in China). The comparison of the processes of industrialization and de-industrialization is shown in Figure 16.

Figure 16. Comparison of the processes of industrialization and de-industrialization

Parameters/ Process	Industrialization	de-industrialization
The share of industry in FGP (number of factories, sectors) Assets	Grows Quite rapid renewal, wear reduction, introduction of new technologies	Drops Massive wear and aging, low pace of renewal, immanent barriers to introduction of new technologies
Staff skills	Grow	Drop
Technological level (mechanization, automation, raw material processing extent)	Grows	Drops
The share of imported components, nodes, spare parts	Drops	Grows
Effective life span of developments (products)	Drops	Initially gradually rises, then sharply drops due to product wear
Technological operation complexity Development costs and time	Grows Grow (according to plan) on a short period of time and drop on a long one	Drops Considerably and quite rapidly grow blocking the appearance of new products and technologies
Development institutions (institutional conditions)	Efficient as they ensure financing (crediting) of production and emerging of new technologies	Low efficiency, short resources and reduction of the resource base for the development of new technologies and industry

D.E. Sorokin and S.A. Tolkachyov *(2015)* propose to characterize the upcoming changes of industrial foundation as neoindustrialization. From their point of view, neoindustrialization is large-scale introduction of a complex of breakthrough of NBICs (Nano-Bio-Info-Cogno-technologies) into the production process, cardinal alteration of the essence of the industrial way of production enabling as follows:

- To sharply increase labor productivity in manufacturing sectors;
- To create new markets (at the same time some traditional activities will vanish);
- To form global centers of rapid industrial growth;
- To reduce the need for low-skilled labor, thus exacerbating the global unemployment problem;
- To amplify the technological leadership of the developed countries over the rest of the world.
- D.P. Frolov and M.M. Babkin *(2016)* study the term "NBIC-convergence" as integration of nano-, bio-, information technologies and their combinations. According to these scholars, convergence of nano-, bio-, information technologies and their combinations as an objective process of development of a complex of new widely used technologies originates and develops locally within individual research centers and innovation clusters, and then spreads over the territories of other regions: from more innovatively developed to less ones. Centralized management of individual branches of NBIC-convergence creates incentives and impulses for the authorities, scientific and business communities that lead to industrial complex modernization.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

To our mind, rapid development of NBICs obliges to correct priorities. At the present time it is more appropriate to discuss another abbreviation - SCBIN (Socio-Cognito-Bio-Info-Nano) and the decisive role of social technologies, without which prominent inventions and scientific achievements won't be apprehended and implemented by the modern society.

A number of researchers and practitioners speak about the presence of digital disruption (Schmidt and Cohen, 2010) in the modern Russian economy, about so-called "digital vortex", when digital technologies destroy the existing ways of production and consumption of goods and create new ones, and digitization in various fields in inhomogeneous and resembles a vortex. Traditional companies have advantages in capital, renowned brands and accumulated client bases. New companies-destabilizers have advantages in innovations (actively utilize new technologies), maneuverable response and organizational readiness for experiments and risks.

O.V. Krivosheev *(2017)* attributes the following principles to digital disruption:

1. Everything that can be digitized should be digitized.
2. Value chains mean nothing for consumers; what matters is value consumed.

Opportunities and Threats From Digitalization of the Russian Economy

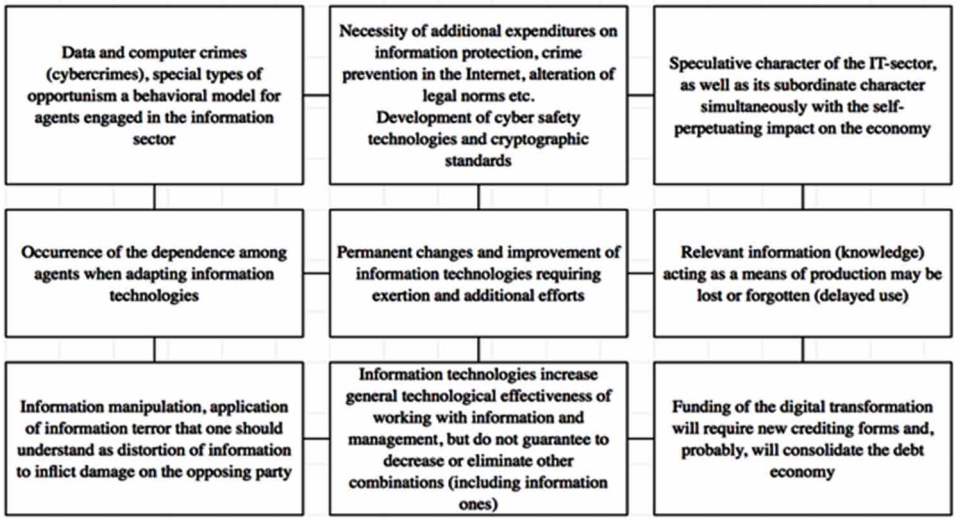
Intensive development of the society of digital economy inevitably implies solution of problems in the field of knowledge management. Information and knowledge obtained through experience are becoming the priority resources. And such competences as innovation, competence, creativity and cognitive endeavor are becoming competitive advantages in the market. Therefore, the transition from physical to digital economy requires absolutely new approaches not just in industrial sectors and productions, but in formation of the personnel potential for the digital economy: education, personnel training, development and management of innovative human resources, management of talents.

We shall characterize the depth of digital economy penetration in Russia using the statistics. In 2017 over 62% of business were registered online, 92% of patients were registered before the ambulance arrived to the E.R. due to the access to their personal data, 92% of prescriptions were issued in electronic form, the cost of tutors' services dropped by 30%: 80% of students relied on personal educational paths created on the basis of artificial intelligence. As for the financial sector, over 50% of customers do not attend offices and receive services remotely. It is the average figure in the world. Public satisfaction with the quality of state services today has exceeded 86% *(Statistical data of the Gaydar Forum)*.

Business transformation on the basis of digital models will make it possible to reach an absolutely different level of product and services creation and promotion, to provide the optimal quality of services to clients and the efficiency to companies and enterprises (Kupriyanovsky, et al., 2017). However, such transformation necessitates substitution of traditional managerial approaches, principles and values to the models with priority goals and economic system's success criteria being not the profit or short-term efficiency, but client focus, innovation, new project realization rate, cooperation with suppliers and partners.

All the above-mentioned phenomena fundamentally change the structure of the global economic system – opportunities for consumers, the structure of sectors, the role of the state (Figure 17).

Besides the benefits from digitization described in figure 1.9 transformation processes in the course of re-industrialization constitute some threats to economic and social development (Figure 18).



EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

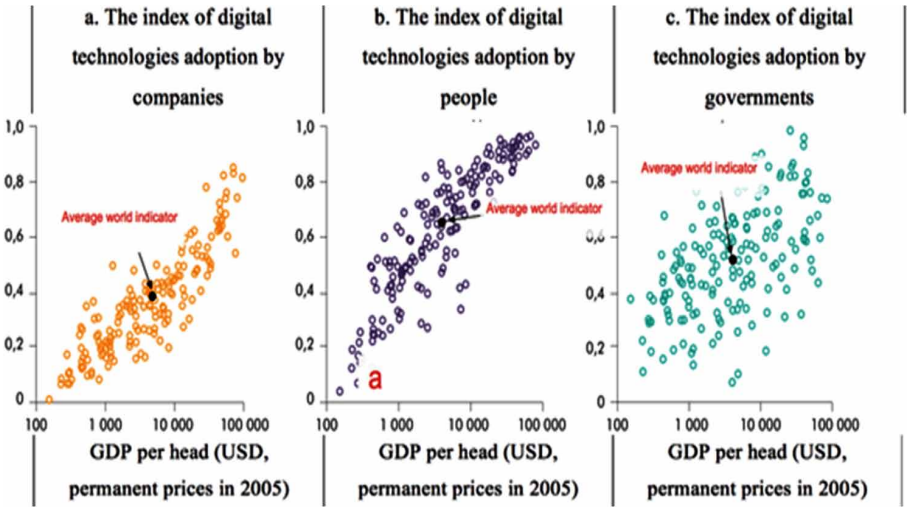
Figure 17. Sources of benefit from digitization at different levels

Benefits from digitization at macro- and meso – levels	
Effect for the country in whole	**Benefits for the public sector**
New GDP growth source	Process efficiency growth (for example, tax collection and data management)
Creation of new work places and employees' productivity growth	Reduced chance for fraud and misuse of state services
Expansion of trade, more effective use of capital and intensified competition	Identification and analysis of social trends using Big Data
Accumulation of the potential of governments and their ability to react in current situation	More effective interaction with citizens and the private sector

Benefits from digitization at the microlevel	
Benefits for economic subjects	**Benefits for consumers**
Simplified expansion to other markets – revenue growth	Opportunity to purchase better goods and services at favorable prices
Enhanced efficiency of internal prices (for example, supply chain management)	Opportunity to use products unavailable earlier (for example, through joint consumption)
Access to the best labor resources through digital communication channels	Obtainment of information on the most interesting opportunities for employment
Increased transparency and simplicity of interaction with the public sector	Simplified access to state services through digital portals

Figure 18. Threats from digitization

Thus, describing the digital economy O.S. Sukharev *(2017)* uses the term "irrational optimism". "Irrational optimism" occurs among agents not only from financial markets, but also from markets on high-tech products. They encounter a similar, but more reserved speculative effect. Such effect may provide high pace of the economic growth, however the quality can be disappointing for most agents. In the course of time it will lead to the occurrence of interconnected bubbles (technological, financial and/or mortgage) provoking an economic crisis. New technologies reproduce irrational optimism regarding



EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the granting of resources for their development and dissemination, including the very resource that is allocated by state funding programs.

The drop of efficiency is becoming inherent into the very plot of speculative human reaction (including the state level of administration as well). Standardization and unification in IT, on the one hand, will decrease development rates, and on the other - they will eliminate the impact of the speculative element in these sectors demonstrating a growing output. Probably, in this case the output growing effect may be ceased or reduced.

Thus, the progress (modernization), transformation processes in the course of re-industrialization entail not only positive effects. Despite a great number of successful examples, the impact of new technologies on the productivity across the globe and on the Russia's scale, on the broadening of opportunities for the poor and the middle class, as well as on the dissemination of the principles of administrative accountability have yet failed to meet expectations (Figure 19).

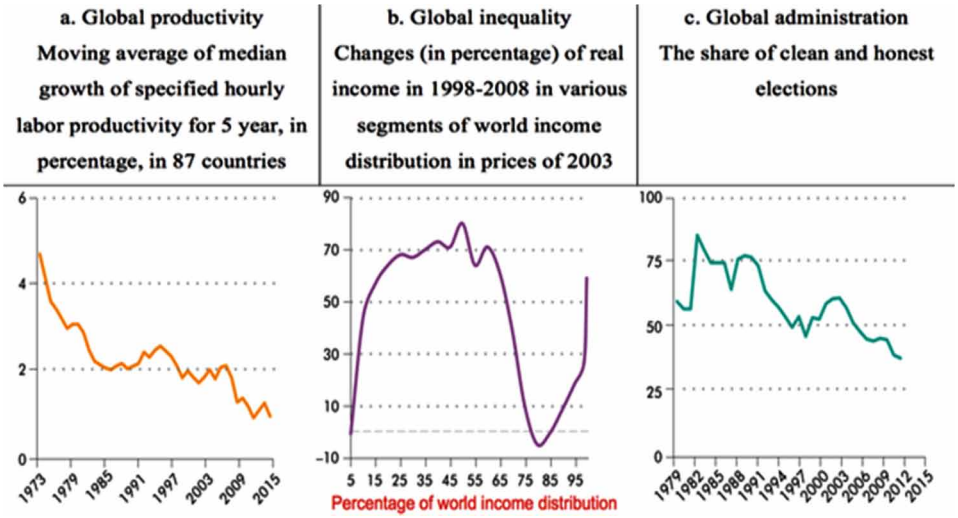
Figure 19. Pessimism caused by adoption of digital technologies in the world (The visuals display distribution of digital technologies determined by the Index of digital technologies adoption)

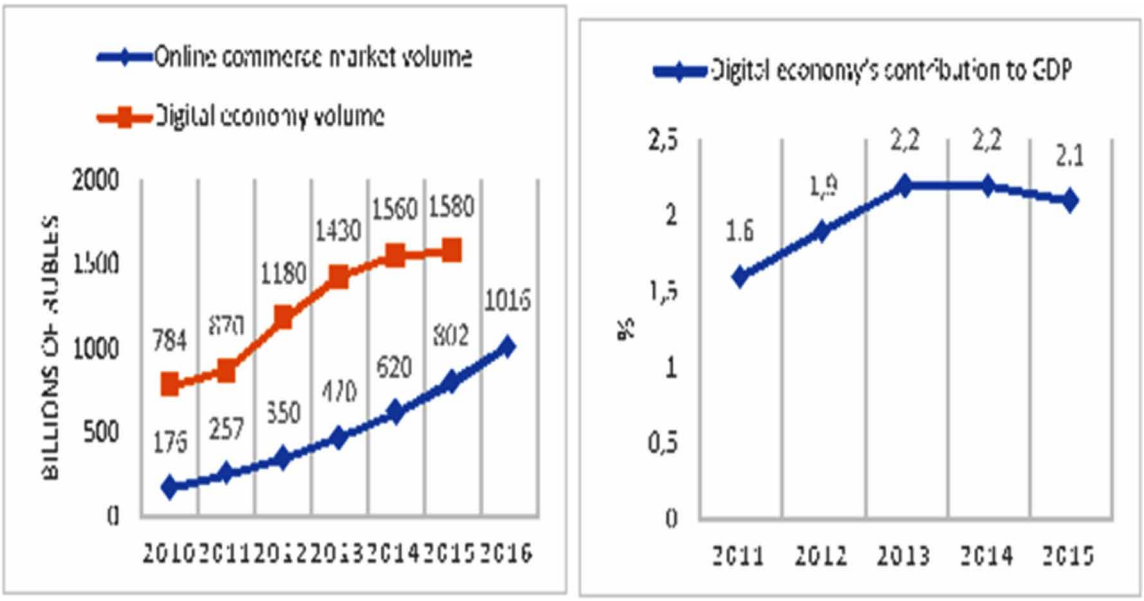
The forced introduction of computers into various spheres of life has given no considerable effect *(Ivanov and Malinetsky, 2017)*. The data on multifactor productivity (labor and capital) in the USA demonstrate that this crucial indicator was been growing for the last quarter of the century 2,5% per year only from 1958 to 1968. Such growth rate gave three explosive innovations – universal adoption of production lines, new materials (chemistry), mass use of combustion engines (and total motorization of the country). In the period from 2010 to 2015 the growth rate of multifactor productivity dropped 10 times to 0,25% per year *(Gurov and Poluni, 2017).*

In Russia the markets associated with the digital economy have grown 5,5 times from 2011 from 5 to 27,7 trillion of rubles, the volume of digital economy and online commerce market is increasing (simultaneously with digital economy share stagnation starting from 2014) (Figure 21), although the level of labor productivity is significantly lower (more than two times) than the foreign countries under consideration, especially the countries with developed economies (Figure 22).

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 20. Pessimism caused by adoption of digital technologies in the world





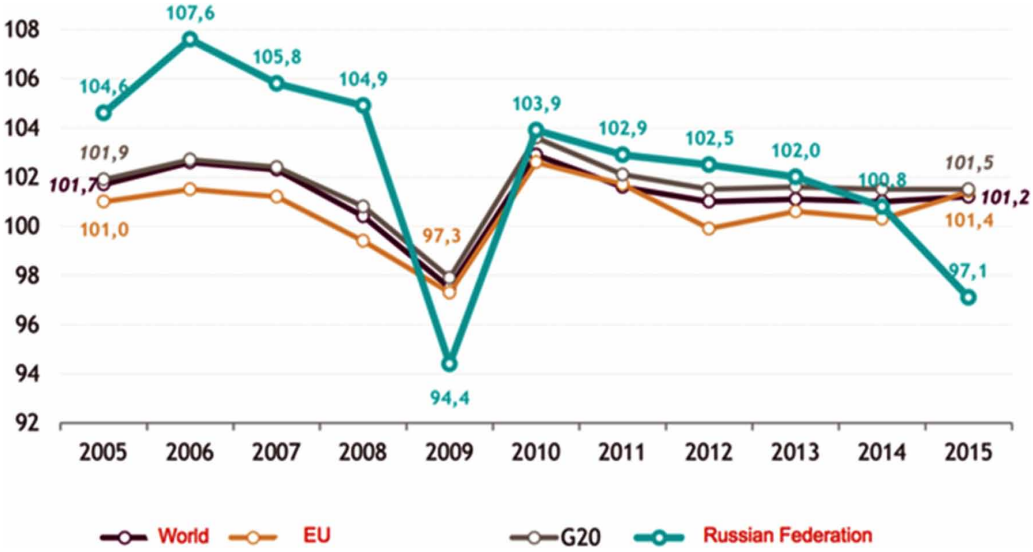


Figure 21. The volume of digital economy and online commerce market in Russia, billions of rubles; digital economy's contribution to GDP, % (BCG; https://www.insales.ru/blog/2015/09/30/ecommerce_services_report_2015/)

The observed dynamics of the labor productivity index in Russia in 2010-2015 (according to OECD) in combination with the remaining low level of labor productivity appears to be quite a dangerous phenomenon in terms of stable economic growth and digital economy formation, and from the point of view of country's social development provision, including people's life quality improvement (*Labor productivity in Russia).*

FUTURE RESEARCH DIRECTIONS

Together with the improvement of concrete systems and technologies' technical level, it is required to expand people's involvement in this infrastructure and to teach them how to use it properly. Besides, given the significance of information processing, the creation of the information is of primary importance. In other words, the digital technology itself is incapable of providing inventions in physics, chemistry or engineering sciences *(Sukharev, 2017)*.

Innovations in the modern world are not simply connected with the opportunities of digital technologies, but largely based on them. This is exactly why the full-fledged successive industrial sector's digitization will become a platform for qualitative changes of the economy and long-term opportunities. Thus, the transition to digital technologies is inevitable, but from another perspective, this very transition cannot be the absolute goal. The financing of such transition will require new crediting forms and may consolidate positions of the debt economy.

CONCLUSION

In this chapter, the authors aimed at providing a better understanding for Industry 4.0 concept and its application benefits for Russia. The main problem is how the Russian Federation acts against the economically developed countries, which are the creators of Industry 4.0. This chapter mainly focuses on presenting the authors views on how to sustain and increase competitive advantage of the Russian Federation by catching and implementing Industry 4.0. With Industry 4.0, Russian Federation get a bigger share of the world manufacturing value chain.

KEY TERMS AND DEFINITIONS

NBICs (Nano-Bio-Info-Cogno-Technologies): "Breakthrough" innovation technologies in the field of convergence of nanotechnologies, ICT, biotechnologies, and cognitive technologies. Many modern technologies are at the interface of NBIC, for example, construction of cellular and fabric structures, new information interfaces (info+cogno), bioinformatics (nano+info+bio).

Chapter 30
Design Solutions Guided by User Behavior:
A Practical Inquiry Approach

Mariam Ahmed Elhussein
University of Dammam, Saudi Arabia

ABSTRACT

Tagging systems design is often neglected despite the fact that most system designers agree on the importance of tagging. They are viewed as part of a larger system which receives most of the attention. There is no agreed method when it comes to either analyzing existing tagging systems or designing new ones. There is a need to establish a well-structured design process that can be followed to create tagging systems with a purpose. This chapter uses practical inquiry methodology to generate a general framework that can be applied to analyze tagging systems and proceeds to suggest a design process that can be followed to create new tagging systems. Existing user behavior while tagging is the main guide for the methodology.

INTRODUCTION

User-centric approach in information systems tries to discover how users' behavior is affected by the design of the system. With users in mind, user-centric design tailors how the information system is constructed according to the user group that is expected to interact with the system. This chapter introduces the concept with social tagging by following a methodology that is focused on providing solutions to specific problems. After a solution is found, the methodology suggests ways to expand it to similar problems within the domain.

Social tagging has been linked to Web 2.0 technologies. Most of the current online systems employ tagging to support retrieval, categorization or ranking of shared content. Tagging is also provided as means for self-organization and future reference. For such diverse functions, social tagging has been studied extensively. Researchers explored tagging starting from answering the question of "why do users tag?" to modeling tagging behavior.

Tagging is a low-cost attachment of metadata since it is done voluntarily by non-expert users. It is also considered to be a democratization of the classification process where people have their say on the different aspects of the content (G. Smith, 2007). The return value of tagging has two dimensions; one dimension concerns the user and the other concerns the designers of the system.

From the system designer's point of view, tagging is favored over expert indexing since the latter is expensive and time consuming. Tagging is done by far more users who will do it for free most of the time. Quality might be questioned in this case, but research conducted by Heymann and Garcia-Molina (2009) showed that 50% of the keywords used by expert indexers were also used by free-lance taggers.

Although tags are considered useful to the support of the system in many ways, it is sometimes problematic. One problem that can be associated with this freedom is that users can be unpredictable as to which type of tags they may provide (or provide tags at all). Existing online systems that allow tagging are bound to continue to support freedom of tagging and deal with the problems that arise from that such as tags used for self-reference. The designers of these systems usually state the reasons behind adding tagging in their help sections, but they do not enforce users to tag accordingly. The main issue here is to preserve users' freedom while tagging and benefit from their tags to support the web content. Attempts to solve this problem have previously all focused on working around the outcome of tagging. An immediate concern of allowing users to tag freely is that tags can be exploited in spamming. They can be used to promote products and services that are not of direct benefit to the tagged resource. Other problems were linked to tagging that was directly influenced by taggers motivations. Researchers propose three possible ways to overcome the problems that were identified with tagging; identification-based (detection), rank-based, and interface-based (prevention) (Heymann, Koutrika, & Garcia-Molina, 2007). This chapter presents a method based on interface-based (prevention) solution.

According to Liu (2000) there is always a need to incorporate methodologies that depend on the social aspects of information systems rather than the technical aspects. This need drove research into incorporating theories and methods that enable the consideration of people within the system of information. Organizational semiotics (OS) and activity theory (AT) are examples of theories that have been used in research to accommodate people as an integral part of the information system.

The questions that this chapter is based on call for changing the existing behavior of users in a certain context by understanding how they interact together. The research aims at contributing to the practice of a problem that has been developed and used. Existing tagging systems are studied in order to verify the problem and propose a solution by following practical inquiry methodology.

Background

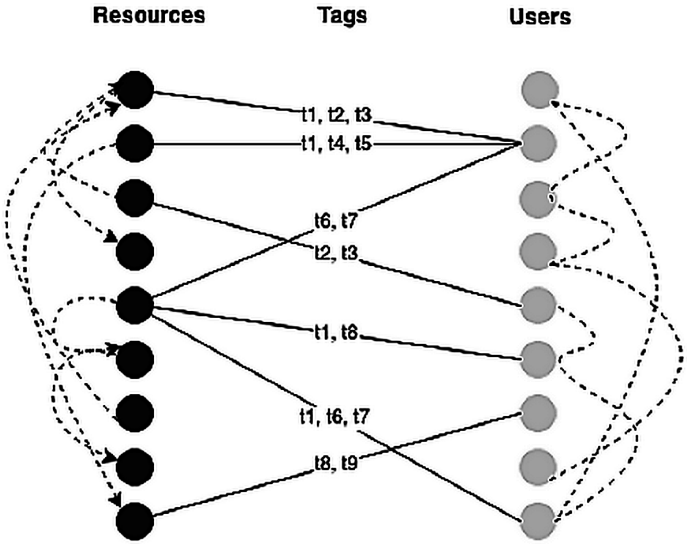
A 'tag' is defined as a user-generated keyword and "A lightweight way to enhance the description of online resources to improve their access through broader indexing." (Trant, 2009, p. 1). When tagging is conducted in a shared context, it is called 'Collaborative Tagging'. According to Golder and Huberman (2006, p. 1), "Collaborative Tagging describes the process by which many users add metadata in the form of keywords to shared content". Systems with tagging capabilities enable users to add terms that classify or describe certain content. In that way, users add different tags to the same content depending on the way they see it, which provides diverse views for the same content. One image can be tagged many times which allows it to be grouped in many categories depending on these tags. An image of a flower can be tagged as 'flower', 'spring' or 'yellow' and can be found using any of these terms. Tags can also take the form of content evaluation. Reddit.com allow their users to rank content using 'up' and 'down' tags which reduces

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

or increases its ranking and reflects how popular it is (Morrison, 2008). A visual display of tags is provided using tag-clouds, where tags that are shown in larger bolder fonts are the most popular tags.

The collection of all tags produced is called, folksonomy (Trant, 2009). The term folksonomy was derived from the words 'folks' and 'taxonomy'[1]. The 'folk' was added to reflect on the fact that the conceptual structures created were by non-professional indexers as opposed to taxonomies that are created by professional indexers (Hotho, Jäschke, Schmitz, & Stumme, 2006). There are other terms in the literature that refer to the same concept, including 'democratic indexing' (M. Smith, 2006), 'communal categorization' (Sturtz, 2004), 'collaborative tagging' (Golder & Huberman, 2006) and 'user-generated metadata' (Dye, 2006).

The main focus of research is to identify the reasons that motivate users to provide tags. This is also known as studying user tagging behavior or tagging models (Peters & Becker, 2009). The significance of these studies comes from the fact that taggers' freedom, while tagging, is supposed to be maintained. Tagging motivations are explored in order to provide systematic solutions to encourage users to provide more tags while their autonomy is preserved. In general, tags are objective depending on the purpose behind tagging which is referred to as 'tagging motivation'. Gupta, Li, Yin and Han (2010) provided a classification of users' tagging motivations as follows:



- **Future Retrieval**: This can be aimed at personal retrieval or for others to retrieve content.
- **Contribution and Sharing**: Tags are used as a way of categorizing content and group it with other similar content.
- **Attract attention**: Using popular tags, users can attract other users to view resources.
- **Play and Competition**: Some systems use incentives and competition to encourage users to tag.
- **Self-Referential Tags**: Tags are used as a mark or an identity on the content. A good example for this can be tags that start with 'my'.
- **Opinion Expression**: They can be used as a way to express opinion such as 'like'.
- **Task Organization**: Tags such as 'to read' or 'view later' are used for self-organization. The user can use tags to organize content according to tasks.
- **Social Signaling**: This is how tags are used in Facebook where users use tags to identify people in an image or signal users to view certain content.
- **Money**: Users can tag in order to receive money, sites such as Amazon pay users for tags.
- **Technological Ease**: Users sometimes tag because it is easy. Some systems make it very easy for users to add tags such as allowing tag suggestion.

Tagging takes place within tagging systems. They are the context where tagging takes place. The basic structure model of social tagging system consists of: the user, the resource, and tag(s); Figure 1 shows this structure. According to the figure users can tag each other (dotted lines between users) such as on Facebook and Twitter. Resources can also be linked to each other. The resource is the content to be tagged which can be an anything, a video, a blog or an image. The user is the tagger who will perform the tagging and the tag is the keyword that will be attached to the resource.

There are many ways to classify tagging systems. One of these is dependent on the type of content it allows its users to publish. This includes many content types such as: social bookmarking services (e.g. Delicious), e-commerce (e.g. Amazon), libraries 2.0 (e.g. PennTags), photosharing services (e.g. Flickr), videosharing services (e.g. YouTube), social networks (e.g. Facebook), blog search engines (e.g. Technochrati), and games with purpose (GWAP) (Bateman, Brooks, McCalla, & Brusilovsky, 2007).

Figure 1. A model of tagging systems (Marlow, Naaman, Boyd, & Davis, 2006)

Tagging Systems Design

Farooq et al. (2007) suggested some guidelines to be followed when designing a tagging system. They suggested three heuristics to be followed when constructing a tagging system:

1. Tagging interface is supposed to induce tag reuse
2. Recommend tags that are considered powerful from an informational point of view
3. Enhancement of tagging by showing relevant resources i.e. supporting the categorization function of tagging

Another attempt was presented by Marlow et al. (2006), who identified two areas that would affect tagging outcome. This includes:

- Tagging systems' design attributes
- User incentives to provide tagging

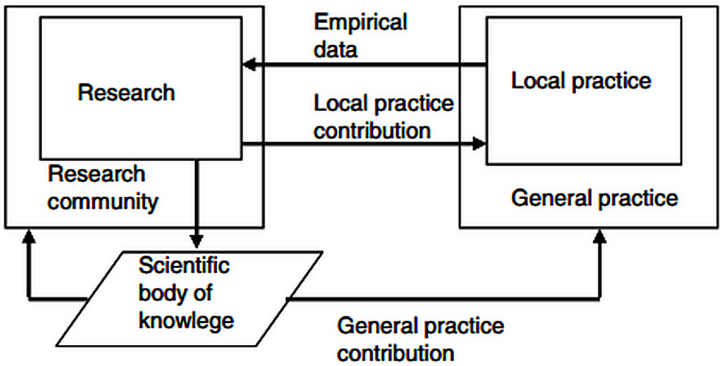
They defined seven attributes that affect design decisions when designing tagging systems. Table 1 provides a summary of these design attributes, the tagging systems types they identify and the expected impact of each of these. Despite the contribution, there is no guide on how these attributes are to be used in an arranged step-by-step process that can be followed. It might also be difficult to predict how tagging behavior would be influenced when different combinations of the attributes are applied. On another note, the design process did not explain the dynamic and interrelations that governs attributes together.

There is a need to establish concrete theoretical grounds to base the understanding of the different components of a tagging system and hence identify how they affect tag quality. The theoretical analysis of tagging systems points out the way each of its components affects the users while tagging which

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Summary of tagging systems design attributes adopted from Marlow et al. (2006)

Attribute	Tagging system types	Potential impact
Tagging Rights	Self-tagging, permission based, free-for-all	Nature and type of tags, role of tags in system
Tagging Support	Blind, suggested, viewable	Convergence on folksonomy or overweighting of tags
Aggregation Model	Bag, set	Availability of aggregation statistics
Object Type	Textual, non-textual	Nature and type of tags
Source of Material	User-contributed, system, global	Different incentives, nature and type of tags
Resource Connectivity	Links, groups, none	Convergence on similar tags for links/grouped resources
Social Connection	Links, groups, none	Convergence on the localized folksonomy



leads to supporting the system by enhancing those components. The framework can also be the basis for identifying a design process that can be followed to create new tagging systems.

PRACTICAL INQUIRY METHODOLOGY

The purpose of practical inquiry methodology is to apply "empirical study on practical matters in local practices, to contribute to general practical knowledge. This practical knowledge will be part of the scientific body of knowledge and it aims to be useful for practical affairs" (Goldkuhl, 2008, p. 1).

According to Figure 2, the methodology starts by identifying problems that are faced by practitioners in a local practice. The problem is investigated through empirical data that is researched extensively to formulate a solution. Once a solution is reached and applied to the local practice, it is generalized and becomes part of the scientific body of knowledge. The generalization of the problem is often done by the introduction of a theory. Despite the fact that the major outcome of IS research is tools and artefacts, introduction of theory in IS was inevitable since researchers are expected to produce knowledge out of their works (Gregor, 2002). Gregor (2006) believes that theory is required to understand what constitutes IS, linking the natural world, the social world and the artificial world of human constructions.

Figure 2. Practical inquiry (A research approach aiming at knowledge as a general practice contribution) Source: Goldkuhl (2008a)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Theories are used to explain or predict human or organizational behavior in order to assess existing tools or develop new ones (Hevner, March, Park, & Ram, 2004). They are used to inform researchers about the interaction between people, tools and the organization they all operate within.

In this chapter, semiotics theory and activity theory are used in order to study tagging systems as local practice, Figure 3 explains the role of theories within the methodology. Both theories were applied to different types of problems. In this chapter these are applied for specifically discover particular matter in order to discover the factors that influence tagging behavior. An empirical analysis of data from existing tagging systems is done which resulted in an understanding of the components of the tagging system. The methodology goes on to suggest a design process for tagging systems based on a framework identified using organizational semiotics and activity theory. Figure 4 shows the research process based on practical inquiry. Practical inquiry methodology consists of two stages, practice theorizing and situational inquiry (Goldkuhl, 2011).

1. The first step is practice theorizing, at this stage, practical theories are identified as guide for the inquiry process. Semiotics analysis and activity theory are shown as bases for analysis of existing tagging systems. As the process of inquiry evolves, the need for an emergent practical theory arises where a new framework based on both theories is identified. This analysis framework is considered as theoretical result of practice theorizing.
2. The second stage is the situational inquiry, where the analysis framework is used in order to analyze existing tagging systems and to identify a design process for new tagging systems. This process is considered an outcome of the first stage of practice theorizing and the framework identified from the emergent practical theory. Situational inquiry calls for empirical analysis to verify the design process. Data was collected based on the situational model (the design process) and finally the situational results are achieved. Data collection of the situational model was done by retrieving data from existing tagging systems.

The following sections explain each step of the methodology.

Practice Theorizing

Using semiotics theory, organizations are understood to have messages communicated and acted upon. A simple definition of Semiotics might be 'the study of sign' (Chandler, 2002). Semiotics theory has been linked to many disciplines including linguistics, communication, computer science, human-computer interaction, and advertising. Semiotics originated in the first works of the Swiss linguist Ferdinand de Saussure (1857-1913) (cited in Chandler 2002) who called it 'semiology' and linked it to social sciences (Eco, 1979). The work was formalized by the American philosopher Charles Sanders Peirce, who provided an early definition of semiotics as being the: "quasi-necessary, or formal doctrine of signs" (cited in Hartshorne et al. 1967, p.139). Pierce's definition of sign to cover its meaning/interpretant. In this definition, the representation is: the form which the sign takes, an interpretant is the sense made of the sign and an object is to which the sign refers. The Peircian model shows the relation between the three components. The interaction between the three is called 'semiosis' which was described as 'the process of signification' (Peirce, 1960). From this definition many branches of semiotics emerged. One branch of semiotics is 'organizational semiotics' which was started by Ronald Stamper in 1973 (Chandler, 2000). According to Liu (2000, p.19): "Organizational semiotics is the study of organizations using the

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

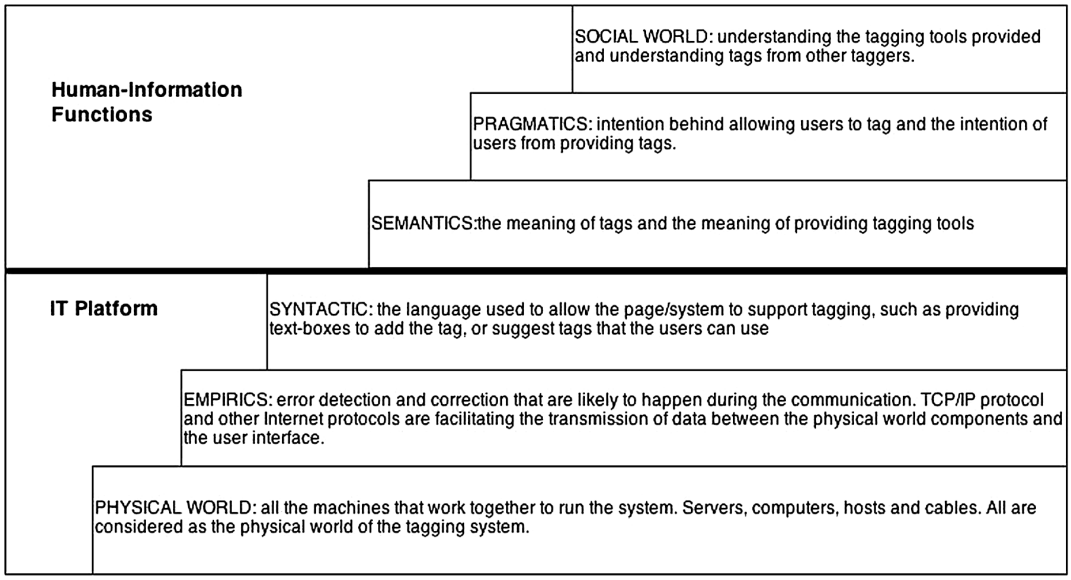
concept and methods of semiotics". This means that for the organization to function, it is important to study the communication that takes place between the people and groups within it. In order to analyze a sign to its components, the semiotics ladder was introduced. Originally it was called the sign's three dimensions which include the syntactic, semantic and pragmatic layers. These were extended later by Roland Stamper to include the physical world, the social world and empirics (Liu, 2000). The semiotic ladder is divided into two groups, the 'human-information function' and the 'IT-platform'. The human-information layers include the social world, pragmatics and semantics while the IT-platform includes the syntactic, empiric, and physical world.

According to Huang and Chuang (2009) a tag fits into Peirce's definition of a sign. It can be described using the triadic model comprising representamen, object, and interpretant. The representamen is the form the sign takes, which is the tag itself. The object is the entity to which the sign points to, which is the content to be tagged; it can be an image, a video, a book or a URL. The interpretant of the tag is the assignment of meaning the representamen is giving to the object.

Within the tagging system, the semantic layer is about the meaning of adding tagging capabilities to a system. This means that the system allows for its users to add tags to content. The pragmatic layer is about the system designers' intentions behind allowing users to tag. This means the reasons for allowing users to tag from the system designer's point of view. The social world is the user's understanding of the purpose behind adding tagging capabilities within the tagging system. Figure 5 shows the SL-based analysis of the tags tagging system while Table 2 summarizes the previous analysis of tags and tagging systems according to the semantic, pragmatic and social layers of SL.

Table 2. Tag and tagging system analysis according to SL human information functions



Layer	Tag level	Tagging System Level
Semantics	The direct meaning of the tag-content association	The direct meaning of adding tagging capabilities to the system.
Pragmatics	Intention of the user (description, categorization, self-reference, organization...)	Intention of the system designer (allowing users to categorize, facilitate retrieval, encourage imitation…)
Social	Social effect the tag has over taggers (imitation, forming an opinion, CLIR…)	Social effect of adding tagging capabilities to the system (forming groups of interest)

According to the semiotics analysis of tags and tagging systems these are viewed as messages that are conveyed from a sender to a receiver. A tag itself is a message communicated between the tagger who provided the tag and the reader who would view, interpret and act according to that tag. The tagging system is also considered to be a sign with semantic, pragmatic and social implications. When a certain system is supported by a tagging system, the system designer sends a message to the users of the system. These messages will accordingly act within the system towards the tagging facilities provided. Semiotic analysis of tags and tagging systems have allowed for an in depth view of the messages sent and their possible effects. It has also provided different dimensions of signs. However, while this analysis was useful in understanding the different layers of tags and tagging systems; it does not capture the tagging process as actions that are performed by individuals or groups. The semiotics ladder does not allow for a description of the tagging activity that takes place within the tagging system; hence activity theory (AT) is introduced here to depict tagging as an activity performed.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

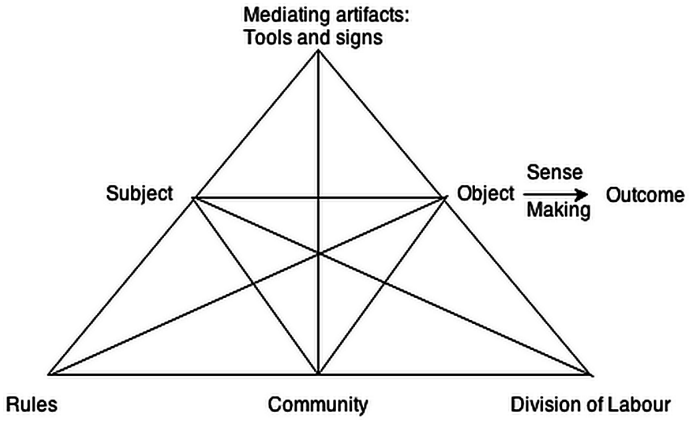
Activity theory (AT) is used to analyze the issues that comprise an activity, including cultural and social ones. It provides a language that describes people's behavior in certain context (Mwanza, 2001). AT has established presence in HCI research and has been used to analyze and improve existing systems, and constructing new ones. It became a tool for designing and analyzing in many disciplines including education, human computer interaction (HCI) and professional training (Westberry, 2009). The new development of AT by Engestrom was aimed at expanding the activity triangle defined by Vygotsky to include other components including community, rules, and division of labor. Figure 6 shows the model as realized by Engestrom. In a tagging system context, AT has not been utilized to describe tagging activity, yet it has been used to analyze social systems of a similar nature.

Figure 5. Semiotics ladder for tags and tagging systems

Kuutti (2005, p. 3) defines AT as "a school of thought on the relation and interaction between humans and the material and social environment- a kind of theory practices". The influence of activity theory on HCI research is notable in the attention it receives within the research community. AT is preserved as a tool that is used for both the design and redesign of computer tools used in systems such as BUILT-IT, a user-monitoring environment for activity systems and SupportTracker for Hewlett-Packard (Lazarou, 2011). As a theoretical framework, AT is used to analyze human practices in a form of a development process by describing both individual and social levels at the same time (Kuutti, 1995). In this context, AT is utilized to analyze tagging activity that takes place within a tagging system.

Activity theory is not a methodology, nor a predicative theory, but it provides researchers with a descriptive tool that clarifies how a goal of an activity is achieved (Westberry, 2009). The theory was built around five principles identified by Blanton et al. (2001) to include:

1. Human behaviour is social.
2. Human activity is mediated through tools.



EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

3. Centrality of communication during the activity
4. Normative expectations and rules
5. Learning and development are incorporated in the activities of the community.

Activity theory-based analysis is built around the object of the activity. The object of the activity separates one activity from the other, that is why it is said that activities are object-oriented (Kuutti, 2010).

The tagging activity which takes place within tagging systems is identified by its object. The unit of analysis is the activity directed at an object (goal). This includes the cultural (community, rule, role effects) and technical mediation (tool effect). This object is supported by the actions of the tagger who is considered to be the subject of the activity. The activity consists of goal-directed actions performed by the subject towards the object of the activity. The act of tagging performed by the subject is medicated through tools which are considered to be enabling and limiting, they enable the subject to perform the activity yet they limit what they can do (Kuutti, 1995). Tagging is considered a human behavior that is mediated through tools and conducted through communication within the tagging system. The tagger is found within a community consisting of taggers, tag consumers and the system designer. They all represent the community where the tagging activity takes place. Figure 7 shows the activity structure of a tagging activity.

Figure 6. The expanded Activity Triangle Model
Source: (Engestrom 1987, p. 78)

The subject of the activity is affected by all other components of the activity while performing the actions towards the goal. The subject represents the internalization of the activity when taggers try potential interactions in reality without performing actual actions. This includes mental stimulations, imaginings, considering alternative ways (Kuutti, 1995). In a tagging system, tools refer to the user interface components used to facilitate tagging, such as textboxes and buttons that allow users to provide tagging of contents. The rules of the activity are those set by the system designer and may take two forms, either the general terms of service of the system or other rules that govern how users of the system interact together. The latter can be rules that regulate who can tag or whether someone can tag someone else's content etc. As for the roles of taggers in a tagging system, following are the possible roles they may take

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

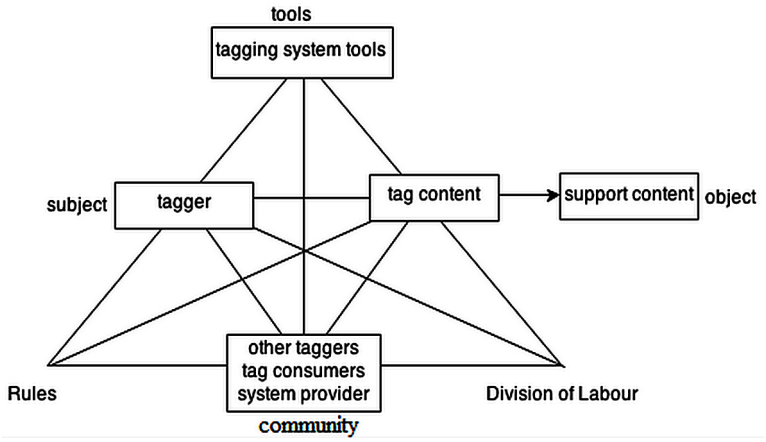
on: taggers, tag consumers and the system designers. The object of the activity is the goal that the subject is works towards achieving. The community of the tagging activity includes taggers, content publishers and moderators. In the tagging activity, the community is governed by rules. In all the publicly servicing tagging systems, there are is a set of terms that a user agrees to when s/he signs up for a username.

The outcome of the tagging activity is the goal of providing tagging support to the content (Maier, 2007). All of the abovementioned components of the activity work together to achieve this outcome. Echarte et al. (2007) found that tags can define the content, its type and/or the author among many other things. Each tag typically contributes to one or more function of tagging, which can be considered as the outcome of the tagging activity.

A Framework for Analyzing Tagging Systems

The suggested framework combines activity theory and semiotics ladder from semiotics theory.

Figure 7. Tagging activity



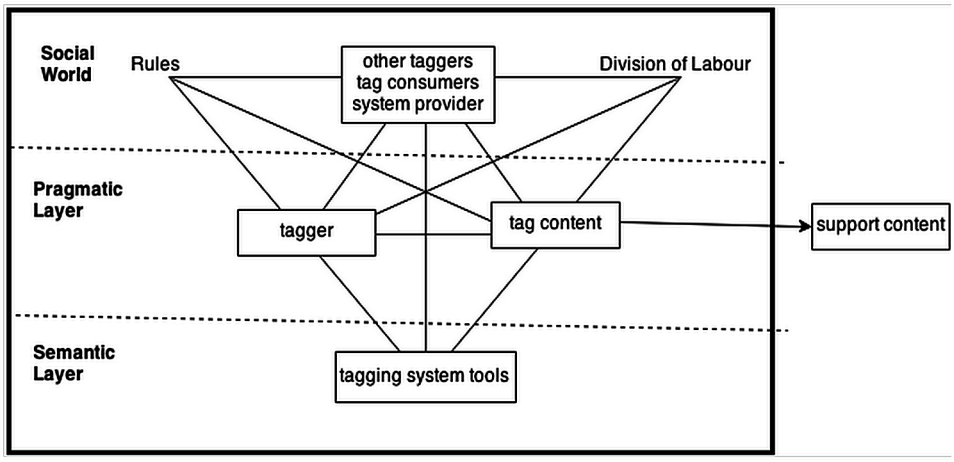


Figure 8. A framework for analyzing tagging systems (FATS)

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

It consists of the top three levels of the semiotics ladder interlacing with activity theory components (see Figure 8). AT components represent human functions within the semiotics ladder. By viewing the tagging system as a sign, the system is decomposed into three levels of sign Semantic, Pragmatic and Social world. When decomposing the tagging system into activity components, they are reflected in the three levels of the ladder. This produces three types of activity components, Social components (rules, community and roles), Pragmatic components (subject and object) and the Semantic component (tools). The social components of the tagging system represent the social effects the system has on its users including identifying who they are (community), how the work is divided between them (roles) and what governs their behavior (rules). The community of the system describes the members who are part of the tagging system and affect or affected by it. The roles of the system represent how the community members are expected to contribute towards the system. While the rules are devised to govern how the tagging system ought to perform. The pragmatic components of the system represent the intention of the doers of the activity (subject) or taggers and the intention behind creating the tagging system (object). The subject is the tagger's intention towards the tagging system i.e. using tagging for retrieval purposes, categorization, self-organizing, or even vandalism by spamming the system. The object represents the intention that stands behind allowing tagging of content within the system. It can be understood as the main purpose of the tagging system which is expected to be the motive for taggers. According to the concept of mediation from AT, the relation between pragmatic components and semantic components can be described as follows:

- Object directs the subject of the activity.
- The subject is mediated through the tools.
- Tools shape how the subject interacts with the object.

As a semantic component of the tagging system, tools reflect the direct meaning of the system. They mediate the subject towards the object i.e. reflect the intention of the taggers towards the system by allowing them to tag. Tools are also affected by the object of the system i.e. the intention of the system designers affects the types of tools used for tagging.

The social components of the tagging systems include rules, community and division of labor (roles). The community includes the group of people who are part of the system. This includes taggers, consumers of tags and system providers. The subject may affect the community of the system either in a positive or negative manner. The tagger's intention maybe encouraged if for example they receive positive feedback from the community or may be discouraged if no feedback was provided. Community members divide how tasks are performed amongst them. This division of labor identifies what each member is supposed to do within the system. Roles are set based on the object and they affect the subject of the system. They also shape the relationship between the subject and the community. The third social component here is the rules, which are influenced by the object of the tagging system. In other words, they are shaped based on the object. "Rules shape the interactions of subject and tools with the object" (Russell 2003, p. 11). Rules are also created to influence the subject within the community and to resolve conflicts that may take place within the community that is related to roles.

From the previous discussion, FATS was shown to provide a new way of looking into tagging system components using semiotics and activity theory. The next section will identify the steps that can be followed based on the framework in order to analyze existing tagging systems.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The analysis process aims at measuring performance and identifying problems in existing tagging systems if there are any. By following the proposed FATS, the analysis process starts by identifying the object of the tagging system based on the other components of the system. To provide a starting point, tools represent the direct meaning of the tagging system. If the system contains a textbox with a tag label for tagging tools, this means that it is a system that allows tagging i.e. attaching keywords to content. Starting from this point, the analysis process will be based on the tools used within the tagging system as follows:

1. Identify the tools that are used in the tagging system. This includes all visible tools in the tagging interface where users can attach tags to specific content.
2. Using the tools identified, the social components of the tagging system are described:
    a. Rules are inferred by reviewing what is allowed and what is not allowed. This can be shown from the tools.
    b. The Community component is revealed by identifying how the subject of the system is affected by the community.
    c. Division of labor (roles) are described by showing what possible roles the community members can play.
3. At the end of this analysis, the object of the system is determined.

To relate this phase of work to the practical inquiry methodology, the semiotics and activity theory framework Delicious has been selected as a practical theory that will be used in the analysis phase of inquiry. Tagging systems can be analyzed using FATS as described. The following section uses the FATS to analyze Delicious tagging system CiteULike and Flickr. The purpose of the analysis is to reveal the object of each system based on their tagging interface. The analysis is used later to show the effect of the design over the tagging behavior of the users of the system. Another advantage of the analysis is to show the different types of tagging tools used. This allows for a more comprehensive understanding of which tools to use in new tagging systems.

SAMPLE ANALYSIS

The main purpose behind the analysis of well-set up tagging systems is to identify their object according to the way they were designed. By analyzing tagging systems that are already functioning, there is an opportunity to retrieve data and examine tagging behavior from the actual users of the systems. The analysis is conducted for the system based on FATS, and then data is explored to investigate some of the users' tagging behaviors. The sample analysis is done over Delicious tagging system, one of the most extensively researched systems.

Delicious is an online bookmarking system that was created with the purpose of providing an online list of bookmarks that can be accessed from anywhere. It allows users to add URLs and provide textual descriptions and titles for them. It also allows users to optionally add tags to each URL they add. When researching social tagging, Delicious provides a rich database of bookmarks with tags. Delicious was used in the highly cited study by Golder and Huberman (2006) which described one of the earliest tagging models explaining stable patterns in tagging.

Using FATS, the analysis starts by defining each component of the Delicious tagging system.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. The semantic component of Delicious which is represented by the tools used for tagging consists of:
   a. **Tool1**: A toolbox where tags can be typed into and it is marked optional.
   b. **Tool2**: A list of suggested tags that can be used instead of creating new tags. The list was extracted from the added URL. It can be an extract from meta HTML tags of the website, or a keyword extraction of its content.
   c. **Tool3**: Title and description textboxes
   d. **Tool4**: A checkbox that says 'Make private link' i.e. the link is by default public and can be made private.
   e. **Tool5**: 'No Image' checkbox, which means that the system will provide an image from the link but the user can choose not to use an image by checking this checkbox.
2. The pragmatic components of the tagging system include the subject and the object of the tagging system. The subject of Delicious is the users' intention towards the tagging system. Every user with an account is able to sign in, add a link and tag it. Delicious has over two million users since it was launched in 2003 (Chu, Rathi, & Du, 2010). There is no special profile for users in Delicious; they can be students or lawyers whose intentions are to benefit from the tagging system by saving their bookmarks. The users can have any intention for assigning tags to a bookmark including the list of tag intentions that were listed above (categorizing, providing opinion, retrieval, personal reference, and grouping). They can also be surfers with malicious intentions that aim at abusing the system.

The object of the tagging system is the reason why was it created by the system providers of Delicious. That is, the object of the tagging system represents their intention. According to the Delicious help page, the reason for allowing tagging is to for users to categorize their links and facilitate_retrieval[2]. Nonetheless, this analysis is concerned with revealing the intention through the components of tagging system, so what is written in the help section will be overlooked. The social components of Delicious include the community, rules and roles within the system. The rules of Delicious are set by the system provider:

- When a user adds a new link, they do not have to add tags to it; it is entirely optional. This means a user can add links without providing tags to the newly added link. This rule was understood from the first tool which had the 'optional' label attached to it.
- Users are encouraged to provide tags through tag suggestions. These suggestions are related to the link and extracted from it. They have no link to a user's previous tags or community tags. This rule was deduced from the tag suggestion list.
- In Delicious, links are by default public and seen by all users along with all their attached metadata. Users are allowed to search other users' link collections. Users can choose to make a certain link private. This rule is understood according to the fourth tool that gave the option for private links.

The Community of Delicious consists of taggers, tag consumers and system providers. The community has an effect on the subject since users in Delicious can view each other's content unless it is private. This affects their intention in the sense it prevents socially unacceptable tagging behavior.

The roles the users can play in a tagging system in general is to tag their own content and/or consume tags of others. According to the tagging interface of Delicious, public tagging allows for consumers to view how others tagged. The subject is influenced by consumers as they will be using the tags provided by taggers.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

To identify the object of the tagging system, we summarize the analysis as follows:

- The user is allowed to tag freely, or not tag.
- Tagging is encouraged by providing tag suggestions that are extracted from the link.
- The subject is affected by the fact the links are public until made private. This leads to the assumption that the role of tag consumers has an effect on the subject.
- One additional influence of the object is the fact that there is a separate space for title and description. This may affect the subject to employ tags in other ways, such as categorization.

The analysis of Delicious was conducted by applying the analysis process based on activity theory and semiotics. The analysis showed the object of the tagging system as shown by the tools, rules, role and community components of the system. These components were revealed by interpreting the tagging system as a sign with semantic, pragmatic and social components. The structure of activity theory allowed for interpreting how each component was represented in the tagging system interface.

The tools used in tagging systems are limited to a small set of graphical user interface components such as textboxes and drop-down lists. In general, there are two tools used with tagging systems, tools that are used to insert tags and others that are used to provide tagging assistance. Free tagging is usually allowed using textboxes with labels that ask users to provide tags. When it comes to tagging assistance, it is in the form of suggested tags. Tag suggestion is provided is Delicious in the form of clickable buttons, each button represents a tag that can be attached to the URL.

In CiteULike tag suggestion is provided by clicking on a button that shows tags as links. When the links are clicked, tags are attached to the article being posted. In Flickr, tag suggestion is provided as a drop-down list that appears within the tagging textbox when the user types a tag. In some tagging systems, such as a system called nationbuilder[3], tag suggestion is provided in a form of checkboxes where users can check multiple tags to attach to content. In some cases, tags are provided in the form of specified list of choices from which users are supposed to select such as in the case of the priority tag list in CiteULike. Tag lists can also be optional such as in the case of Flickr's 'people tag' list, 'set' list and 'group' list. Table 3 summarizes the general guidelines to be followed when selecting tagging tools based on the analysis above.

Table 3 shows how tagging tools are selected according to the system's specification. The main issue here is the method to be followed in order to determine what the suitable type of tagging system is according to system's needs. The following sections propose a step by step process to design tagging systems. The process leads to a set of system rules that are translated into tools that form the tagging system.

Situational Inquiry

Data analysis is conducted in the photo-sharing system, Flickr, in order to explain tagging behavior using the results from the previous discussion. This will be done by comparing two version of Flickr tagging system.

Flickr introduced its new design sometime between 2007-2008. Before that time, the online photo-sharing system was using an older design. No reference was found to when the changes of the photo upload page were enforced (the interface where tagging takes place). These dates were tracked from the previous studies that discussed Flickr's tagging system (Marlow et al., 2006; Nov & Ye, 2008; Specia & Motta, 2007). The main difference between the two designs is about the metadata that are applied to

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Tagging tools selection guidelines

Type of Tagging	Description	Suggested Tools
Free and optional tagging	**Used when users are free to provide any number of tags or no tags at all.**	**Textboxes that state that tagging is optional.**
Restricted tagging list	When users are supposed to select tags from a restricted list of tags where choice must be made	A drop-down list that has a default value and no empty option is allowed
Optional tagging list	Users are provided with a tagging list to choose from with the ability to choose no tags	A drop-down list with an empty option or 'no tag' option.
Tag suggestions	Tag suggestions are provided from users previous tagging experience, the community tagging preferences or through automatic suggestion based on the content being tagged	Suggested tags can be in the form of links that can be clicked, checkboxes to choose from or can be incorporated with the free tagging textbox appearing when users attempt to type tags as a drop-down list.

the photo when uploaded. Their earlier design did not incorporate user groups as part of the uploading interface of Flickr. The older uploader systerm of Flickr is still accessible.

The following is an analysis of the older design using the analysis process supported by activity theory and semiotics analysis. The tools of the tagging system consist of:

- 'Add tags' textbox, where tags can be added optionally.
- 'Add to a Set' textbox, where a set acts like a folder that combines similar resources. There is an option to create a new set.
- 'Title' textbox, which represents the image title and is automatically extracted from the name of the file.
- 'Description' text-area, where users can write lengthy descriptions about the photo being uploaded.
- 'Privacy Settings', where content is by default public and can be made private or visible to family and/or friends.

The next step was to identify the rules of the old tagging system of Flickr:

- When content is added all values are optional and the user can proceed to upload the content without add any of the data.
- Tags are optional, users get suggestions from previously applied tags when typing a new tag.
- Users can create new sets or use existing sets to add content to.
- Content is by default public and can be set to private or viewed by family and/or friends.

The system allows for the identification of two community members, family and friends. These groups of users can be allowed to view private content and add tags to it. The roles of users are no different from those identified in the new Flickr tagging system.

From the analysis, the object of the tagging system in Flickr can be summarized as follows:

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Users can add content to sets as a way of organizing content. This influences the subject to provide tags that support the content in other ways i.e. descriptive tags which facilitate the retrieval of content.
- No tag suggestion is provided, which means that the subject is influenced to provide new tags instead of reusing existing ones.

The main difference between the two interfaces is that the new Flickr supports user groups, people tagging and sets for categorization. The system provides tag suggestions based on user's existing tags which also reduces the introduction of new tags. The old system gives more emphasis on the part tags can play in supporting the system; it provides categorization support in the form of sets which allow tags to support other types of categorization. This analysis may suggest that there will be a decrease in tags per user when comparing data from the two systems. To verify this assumption, data from Flickr was downloaded covering the tagging activity from January 2004 to September 2005 and another batch covering data from January 2010 to September 2011. The reason for the selection of these dates is to make sure that the right tagging system is being used since there is no exact date to refer to. Data retrieved contains user records consisting of, userID, contentID, date of upload, title and tags. The comparison here is based on the overall tagging behavior of users where the average number of tags per user is calculated. Table 4 provides a description of the data retrieved.

Table 4. Breakdown of tagging data from old Flick and new Flickr tagging systems

	Old Flickr	New Flickr
Number of Users	6197	9829
Number of Tags	1464542	1956568
Number of Items	230312	134906
Avg. Number of Tags/User	236	199
Avg. Number of Tags/Item (per user)	6.3	14.5
Number Untagged Items	21264	10268
Percentage of Untagged Items	9%	7%

According to the analysis, the first thing to notice is the average number of tags per user has decreased with the new Flickr tagging system. The average user in the old system applied 6.3 tags while in the new Flickr system they applied 14.5 tags. This decrease can be explained by the fact that the new system introduced multiple ways for users to tag images while the old system gave the option of free textual tagging. It is also worth noting that the percentage of untagged items decreased with the new system. The reason for that can be linked to the fact that the new tagging system provided tag suggestion, allowing users to choose from their previous list of tags.

Another analysis was conducted to extract a list of users who have records in both batches. The main reason for that was to compare tagging behavior of the same user using the two tagging systems. From the data retrieved, a total of 161 users were found to have posted images to the system within the two identified time frames i.e. having used both versions of Flickr's tagging system. The average number

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of tags applied by users who used the old Flickr was 18.7 tags per content. The same users applied an average of 12.4 tags per content using the new Flickr tagging system. This means that using the new Flickr tagging system, users reduced the number of tags applied by six tags on average. Again this can be attributed to the fact that the new design provided other options for users to annotate their images rather than textual tags.

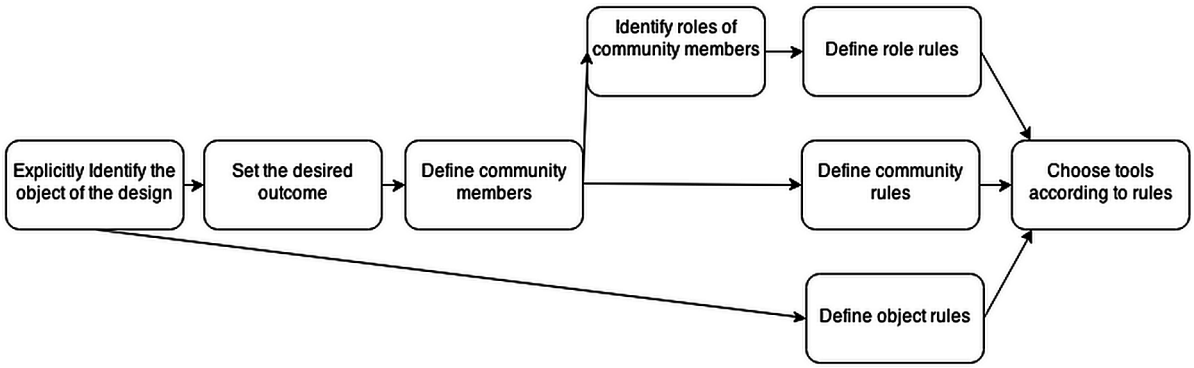
FATS that was introduced in this was used as an analytical tool to understand current tagging systems dynamics. Semiotics analysis and activity theory allowed for a new approach to comprehend tagging systems' components and the relationship between each of them. The principles of mediation and object-orientedness coming from activity theory showed how components of the tagging activity are influenced, while the view of tagging systems as a sign identified how components of the tagging system are contributing to the dynamic of delivering the message of the system. Tools represent meaning to the tagging system that was conceptualized as intentions from users and system providers. Meanings and intentions have social effects that are reflected in how the rules are set, the community is formed and the roles are divided. The analysis process is the basis of a suggested design process that can be followed to design new tagging systems. The following section will introduce design processes that were based on activity theory. This will show how the theory can be implemented as a design tool.

SITUATIONAL RESULTS: PROPOSED DESIGN PROCESS FOR DESIGNING TAGGING SYSTEMS (DPTS)

The design process that is described here is based on the principle of object-orientedness. This means that the activity is directed towards transforming the object into its outcome, hence it is described by its object. The object of the tagging system activity is identified by the intention behind creating the system which motivates the tagging system while tagging. Tagging tools are designed based on the interaction of the other components of the system would result in what the possible tools are to be used to support the tagging system towards its object. In order to identify the tagging tools, we need to identify the object, community, roles and will then be followed by identifying the rules. The reason rules are identified at the end is because they represent the other three components of the system. There are object rules, community rules and role rules. Rules represent the constraints that need to be enforced to ensure the object is transformed into the desired outcome. In the design process, rules are to be expressed following the norm representation of business rules and regulations for clarity. These rules will "determine the conditions of events and actions" (Stamper & Liu, 2000, p. 16). The description consists of a condition, state, agent, deontic operator and action. The state of the rule is optional and determines a special circumstance or situation within the condition. The agent represents the person/concept that will be affected by the condition. Deontic operator specifies how the agent is expected to behave. There are three passives values "obliged", "permitted" and "prohibited" (Stamper & Liu, 2000). The action describes the expected result from the condition. The general structure of the rules is as follows:

- whenever <condition>
- if <state>
- then <agent>
- is <deontic operator>
- to do <action>

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use



The following is an example of a rule expressed using the previous form, the rule states that taggers are supposed to provide three tags per content. (Note that the state part was not included since it is optional):

- whenever tagging for categorization
- if content is tagged
- then tagger
- is obliged
- to provide three tags per content

According to Stamper & Liu (2000), norm specifications can be translated into low-level language or a programming language. DPTS can be summarized by the following points and Figure 9:

1. Explicitly identify the object of the activity by stating the designer's intention behind allowing users to tag. This can be categorization/classification, retrieval facilitation, encourage giving opinion or feedback or description of content.
2. Setting the desired outcome: System contains few new tags and tag reuse, system provides, more new tags, etc.
3. Define the community members of the system.
4. Identify roles that the community members are playing within the system.
5. Define the rules of the system by identifying: object rules, community rules and role rules. Rules are to be expressed using norms format.
6. Choose proper tools to make sure that all rules are satisfied.

Figure 9. Design process for creating tagging systems (DPTS)

By following DPTS, a new design for tagging system can be generated based on the object i.e. the intention behind tagging. In terms of practical inquiry methodology, this is considered as a situational result that can be added to the body of knowledge. It can also be generalized and applied to similar problems as discussed in the following section.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

FUTURE RESEARCH DIRECTIONS

This section discusses the wider implications of this research that can expand its findings to cover other parts of knowledge. An area that is being considered is the application of FATS and the DPTS into other types of systems that may exhibit similar attributes to tagging systems. Such systems that are based on user collaboration can be analyzed using the analytical framework (FATS) for possible improvements and new systems can be designed by following the design process. This can be achieved since these systems are built to satisfy a goal by making the most out of user collaboration. Analysis of similar systems can be done using FATS in order to gain understanding of what influences user collaboration. The design process can be applied by setting the community component effect the roles users can play in the system. Rules and tools will emerge from the identification of the other components as applied in tagging systems within this chapter.

The future work gives the opportunity to identify other areas of strengths and weaknesses of the research. Some of the future research that can be conducted include the following:

- Design tagging systems based on DPTS and explore how the design affects the tagging behavior of the users.
- Applying DPTS by setting multiple objects for the tagging system. In some cases, the tagging system is provided to support the system in more than one way. This can be achieved by either doing this in one iteration of the design process or apply DPTS for each object at a time. When setting the first object, design rules and tools are produced. These will be built upon when the design rules and tools of the second object are identified and so forth.

CONCLUSION

Through this study, tagging systems were analyzed using an analytical framework that provided an understanding of their different components. This allowed for capturing tagging systems as interacting elements that affect each other. By applying the analytical framework, existing tagging systems could be studied to identify problems and evaluate what tagging behavior is expected from users. The research followed the practical inquiry methodology which attempts to solve problems while contributing to general knowledge. The design process that was identified can be followed to create new tagging systems based on desired tagging behavior. The design process can aid system designers in deciding about how user tagging is employed to support the entire system.

The following conclusions can be drawn from this chapter:

1. The semiotic analysis incorporated in FATS enables specification of norms for tagging system design, focusing on pragmatic components.
2. Better understanding of the effect tagging components have over tagging behavior was achieved through FATS. Although this is useful, it is sometimes hard to explain tagging behavior coming from multiple tagging interfaces e.g. Flickr taggers provide tags from the web-based system and/or the mobile based system.
3. By following DPTS, tagging systems that supports certain types of tagging behavior can be created.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

4. DPTS supports single tagging behavior which leads to directing users to this behavior. This can obstruct users from providing other types of tags that can support the system. This appears in the case of designing a system for organization, it limits the number of descriptive tags that the user can apply per content.

The overall conclusion of this chapter is that design can be guided by exploring user behavior. Following practical inquiry methodology, the design process emerged from investigating existing systems along with the support of organizational semiotics and activity theory.

KEY TERMS AND DEFINITIONS

Activity Theory: A theory that focuses on human activities from a social perspective. It has been applied in many disciplines specifically in Human-computer interaction.

Delicious: An online bookmarking system that allows users to store, tag and share their favorite bookmarks.

DPTS: Stands for Design Process for Tagging Systems. A step-by-step process that can be following to create tagging systems that directs tagging behavior.

FATS: Stands for Framework for Analyzing Tagging Systems. A framework based on Semiotics and Activity theory used for analyzing tagging systems.

Flickr: An online system for posting, tagging and sharing pictures and videos.

Organizational Semiotics: The study of the organization based on Semiotics theory.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Semiotics: A theory that studies signs.

Practical Methodology: A research methodology that investigate the problem with a system and finds solutions that can be generalized to other similar systems. It employs theories to understand the problem and generate the solution.

Tagging: Annotating objects using words that relevant to it. They are used to organize and facilitate retrieval.

Tagging System: The interface where tagging takes place.

ABSTRACT

As women have the potential to bring unique perspectives to the workplace, the under-representation of women in STEM occupations is a severe limitation to global advancement through research and innovation. Workplace utilization of computer-mediated communication (CMC) may impact common barriers faced by women in STEM, such as stereotypes, a "chilly" workplace climate, lack of social support and mentorship opportunities, and work-family conflict. As organizations shift further into the use of virtual communication, it is essential to take advantage of CMC as a way to facilitate gender equality in the workplace while simultaneously mitigating barriers workplace CMC may present for women in STEM. The potential implications of workplace virtual communication, virtual teams, e-mentoring, cyber incivility, and telecommuting for women in STEM careers are discussed.

INTRODUCTION

Globally, women remain underrepresented in science, technology, engineering, and mathematics (STEM) fields (Catalyst, 2018; Jackson, Hillard, & Schneider, 2014). Whereas women constitute 47% of those employed in the United States (U.S. Bureau of Labor Statistics, 2017), only 25% of those employed in STEM occupations are women (U.S. Department of Commerce: Economics and Statistics Administration, 2017). Women who obtain STEM jobs are significantly less likely to persist in their careers compared to those in jobs outside of STEM (Glass, Sassler, Levitte, & Michelmore, 2013), and a considerable portion of the women who leave their STEM careers behind do so to pursue other occupations, not because they are choosing to leave the labor force altogether (Glass et al., 2013). Even when women graduate with STEM degrees, they are less likely than male STEM graduates to work in STEM occupations, often opting to work in education or healthcare instead (U.S. DOC: ESA, 2017).

Considering the importance of STEM skill development in an increasingly technical and automated job market (Soergel, 2015) and the need to remain competitive at a global level in areas of innovation and research (National Science Board, 2015), increasing the participation and persistence of women in STEM has become particularly important. As reliance on computer-mediated communication (CMC) outlets (e.g., email, video-based platforms, and instant messaging) becomes increasingly commonplace in organizations, it raises concerns about how such technological advances will affect women in male-dominated STEM fields. This article explores the current status of some common barriers women face in STEM occupations, including stereotypes, a "chilly" work climate, lack of mentorship opportunities, and work-family conflict and the potential impact workplace utilization of CMC may have on these barriers. Topics discussed include virtual teams, virtual communication platforms, e-mentoring, and telecommuting.

BACKGROUND

Substantial efforts have been made to understand barriers that contribute to the underrepresentation of women in STEM to inform the development of strategic interventions designed to rectify these issues. Gender stereotypes are a key factor in the underrepresentation of women in STEM (Dasgupta & Stout, 2014). Stereotypes are commonly held beliefs about groups of people classified into categories based on associated common traits or attributes (Koch, D'Mello, & Sackett, 2015), and they tend to be activated quickly and automatically (Banaji & Hardin, 1996). In STEM, stereotypes often contribute to women's experiences of a "chilly" or unwelcoming work climate because, by choosing to work in male-dominated fields, they are perceived to be violating traditional gender role norms (Dasgupta & Stout, 2014; Hughes, 2014). The "chilly" climate experienced by women in STEM is exacerbated by problematic gender dynamics in mixed-gender mentoring relationships as well as insufficient access to same-sex mentorship opportunities (Preston, 2004). Further, work-family responsibilities and inflexible working hours have been identified as key factors in women's decisions to leave their STEM careers behind (Heilbronner, 2013).

These established barriers take on new meaning in the context of a technologically advanced workspace through the utilization of CMC. Workplace utilization of virtual teams, e-mentoring, and telecommuting policies has the potential to impact women in STEM in positive ways, such as enabling women to overcome stereotype threat in group settings (Furumo & Pearson, 2007), reducing men's perceived risk

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

in mentoring female protégés (Mertz, Welch, & Henderson, 1987), increasing opportunities for women to engage with female mentors and role models (Muller, Blake-Beard, Barison, & Wotipka, 2012), and enabling women to balance work and family roles (Golden, 2006). However, organizational utilization of CMC may have some negative ramifications. For example, women in STEM may experience mistreatment from coworkers and supervisors through CMC (Giumetti, McKibben, Hatfield, Schroeder, & Kowalski, 2012; Lim & Teo, 2009), increased feelings of social isolation (Golden, Veiga, & Dino, 2008; Morganson, Major, Oborn, Verive, & Heelan, 2010), and reduced visibility that may negatively impact their careers (Maruyama & Tietze, 2012). To effectively utilize CMC to promote the success and persistence of women in STEM, the advantages and obstacles presented by CMC must be considered.

GENDER ROLE STEREOTYPES AND STEM

There is substantial evidence that stereotypes exist in association with gender, and these stereotypes suggest there are divergent traits that generally characterize men and women (Broverman, Vogel, Broverman, Clarkson, & Rosenkrantz, 1972; Koch et al., 2015). Commonly attributed to men, *agentic* characteristics involve a tendency to behave in a way that is competitive, assertive, and confident (Eagly & Karau, 2002). Conversely, communal characteristics, involving a general concern for the welfare of others, are most commonly associated with women (Eagly & Karau, 2002). Descriptors such as helpful, socially skilled, and kind are often associated with those who display communal characteristics. Goal congruity perspective suggests that women often select out of or lose interest in pursuing STEM career paths due to perceptions that STEM careers are not aligned with communal goals (Diekman, Brown, Johnston, & Clark, 2010; Diekman, Weisgram, & Belanger, 2015). For example, STEM professions are typically not thought of as outlets through which communal goals like working with and helping others are often fulfilled (Diekman et al., 2015). However, involvement in many STEM fields, requires a great deal of collaboration and teamwork, and STEM projects often contribute to the betterment of society (Dasgupta & Stout, 2014).

When women choose career paths associated with agentic traits, they are burdened with what has been labeled a "backlash effect" (Kark & Eagly, 2010; Rudman, 1998). Paradoxically, women must display necessary agentic traits to be considered for STEM positions but, as a result, are seen as less likeable because they are deviating from female gender norms (Rudman, Moss-Racusin, Phelan, & Nauts, 2012). This contradictory expectation placed on women is likely to induce hiring discrimination, difficulty in attaining promotions, and a lack of social support, which exacerbates the harshness of the climate women encounter in STEM workplaces (Rudman et al., 2012). In addition, stereotype threat, the process whereby an individual does not perform to their best ability in a domain where there is a perceived threat of confirming a negative stereotype about a group he or she belongs to (Steele & Aronson, 1995), is a barrier women face while pursuing STEM careers (Diekman et al., 2015). In the workplace, negative stereotypes surrounding women, such as being inadequate in terms of competence or leadership capabilities in comparison to men (Koenig, Eagly, Mitchell, & Ristikari, 2011; Paustian-Underdahl, Walker, & Woehr, 2014), may cause highly competent and capable women to underperform (Kinias & Sim, 2016). Women in STEM are at particular risk for succumbing to stereotype threat due to perceptions that women do not have the competence necessary to succeed in STEM occupations relative to men (Logel et al., 2009; Schuster & Martiny, 2017). As women attempt to counter prevalent stereotypes regarding women's ability to succeed in STEM careers, they expend cognitive resources,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

normally utilized for performance, constantly monitoring their behavior (Appel, Kronberger, & Aronson, 2011; Reynoldson & Major, 2018).

Team Discrimination

STEM-related gender stereotypes may be particularly salient in team settings. For instance, men tend to display more verbal and nonverbal power-related behavior than women when engaging in masculine tasks and are more likely to assert dominance or assume leadership in group discussion (Coates, 2015; Dovidio, Brown, Heltman, Ellyson, & Keating, 1988). Women may encounter more displays of power from men in STEM, consistent with the stereotypical incompatibility of communal characteristics of women with the agentic qualities associated with STEM occupations (Carli, Alawa, Lee, Zhao, & Kim, 2016). Despite perceptions that STEM fields are more related to agentic than communal goals, teamwork is prominent in fields such as engineering and chemistry (Diekman et al., 2015). Collaboration is important in the production of scientific knowledge as well as the recruitment and retention of women in STEM (Frehill, Di Fabio, Layne, Johnson, & Hood, 2007; Wuchty, Jones, & Uzzi, 2007). An emphasis on teamwork and collaboration in STEM fields could spark women's interest in STEM careers, as women tend to be more interpersonally oriented and driven by communal goals than men (Diekman et al., 2015; Eagly & Johnson, 1990).

Moreover, promoting the inclusion of women on teams has been suggested as a way to increase the quality of team collaboration in STEM (Bear & Woolley, 2011). The proportion of women in a group is related to increased levels of group collective intelligence, which is closely related to the consistency and quality of group outputs, greater equality in participation in group conversation, and higher quality discussion that then predicts group performance (Curşeu, Chappin, & Jansen, 2018; Bear & Woolley, 2011; Woolley, Chabris, Pentland, Hashmi, & Malone, 2010). In a study of research and development teams in Spain, gender diversity was positively related to radical innovation involving drastic changes, which are key to maintaining a competitive advantage and creating novel opportunities for organizational success (Díaz-García, González-Moreno, & Sáez-Martínez, 2013).

There are, however, concerns related to gender and team dynamics relevant in a STEM context. For example, Joshi and Roh (2009) found that in gender-balanced occupations, gender diversity in teams was positively related to team performance, but in male-dominated occupations, gender diversity had a negative effect on team performance, suggesting that contextual information is important in understanding the role of gender composition in teams. In a study of engineering teams, female students in teams consisting of less than 25% women reported reduced confidence and involvement in teamwork, expressed reduced career aspirations in engineering, and participated less in group problem-solving discussion when compared to those in teams where women were the majority (Dasgupta, Scircle, & Hunsinger; 2015). Despite an emphasis on teamwork in fields such as engineering for recruitment and retention, the use of teams may lead to competitive hierarchies rather than collaboration (Frehill et al., 2007). Women in STEM have identified collaboration as being a key factor in their success (Wentling & Thomas, 2009), and competitive hierarchies may contribute to women's lack of a sense of belonging in STEM (Frehill et al., 2007). Facilitating more cooperative team environments in STEM is important, as egalitarian rather than competitive social relationships increase team effectiveness (Tonso, 2006).

Research shows that all-female groups exhibit more egalitarian behaviors than mixed-gender groups (Berdahl & Anderson, 2005). Dasgupta and colleagues (2015) found that the presence of female peers in workgroups was related to persistence, participation, and lower levels of anxiety for women in STEM,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

suggesting that women feel less threatened by gender stereotypes and more comfortable speaking up when group members are largely female. Indeed, women's level of social influence tends to be closer to that of men in groups that are gender-balanced, and men tend to resist female influence more than women do (Carli, 2001). Dasgupta and colleagues (2015) suggested that, in male-dominated fields with prevailing masculine stereotypes, attrition of women could be prevented by creating microenvironments, such as teams, where women constitute the majority or gender balance is achieved. In STEM fields, this may be difficult to accomplish, considering there may not often be a sufficient number of women to comprise 50% or more of a team.

Implications of Virtual Teams

In contrast to traditional teams, virtual teams provide a context in which demographic cues, such as age and gender, are less salient (Hoch & Kozlowski, 2014), potentially reducing the effects of stereotypes on women's success and enabling them to collaborate with others more easily, especially in male-dominated fields. Research shows that women enjoy participating in virtual teams to a greater extent than men and are more satisfied with the virtual team experience (Berdahl & Craig, 1995; Lind, 1999; Savicki, Kelley, & Lingenfelter, 1996). In comparison to their experiences in traditional teams, women are more satisfied with their virtual team experiences (Lind, 1999). Additionally, women in virtual teams perceive greater team cohesiveness, are more trusting, and feel more included than men in virtual teams (Furumo & Pearson, 2007; Lind, 1999). Stereotypes about gender and STEM aptitude may be less salient in virtual environments, as surface level characteristics may not be as apparent in the context of CMC.

A concern in traditional in-person working environments is that men tend to interrupt women in group and one-on-one verbal communication more than they interrupt other men and display more verbal and nonverbal power-related behaviors when working on masculine tasks than women (Dovidio et al., 1988; Smith-Lovin & Brody, 1989; West & Zimmerman, 1983). This concern may be mitigated by CMC because men have less opportunity to interrupt team members or engage their attention immediately in electronic communication such as e-mail and instant messaging (Furumo & Pearson, 2007). As communication in virtual teams is computer-mediated, the effects of men's nonverbal power-related behaviors may be reduced in this context. Women tend to be more reactive than their male peers to visual cues and often respond to men's interruptions and power-related behaviors by allowing them to dominate the conversation, and CMC has the potential to reduce gender discrepancies in participation by allowing all members to speak simultaneously and without interruption (Hamilton & Scandura, 2003). Therefore, asynchronous virtual communication may offer women in STEM an opportunity to compose responses in their own time with reduced stereotype threat and opportunity for interruption, leveling the playing field between women and men.

Additionally, virtual teams, in contrast to traditional teams, may provide a context in which the microenvironments of equal proportions of women and men suggested by Dasgupta et al. (2015) can be achieved more easily in a male-dominated STEM environment. Traditional teams rely on geographical proximity, which may be more of a challenge in recruiting women who constitute a smaller percentage of the STEM workforce compared to men (U.S. DOC: ESA, 2017). Comparatively, virtual teams are not constrained by geographical boundaries and can provide increased opportunities for women to form teams in organizational settings not dominated by men (Townsend, DeMarie, & Hendrickson, 1998). The use of gender-balanced or female majority microenvironments is one way to allow women to experience relief from the distraction of gender stereotypes, to focus on learning and mastery, and

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to increase their confidence and aspirations in male-dominated fields (Dasgupta et al., 2015). Overall, virtual teams provide increased opportunities for women to communicate their ideas, collaborate with fellow team members, and connect with female peers, enabling women in STEM to overcome some of the stereotypes and stereotype threat they face in traditional team settings.

CHILLY CLIMATE

Women often identify a "chilly" organizational climate characteristic of many STEM workplaces as a contributing factor to feelings that they do not belong in STEM (Hughes, 2014). This chilly climate is perpetuated through a lack of role models, stereotypes regarding gender roles, and overt and subtle discrimination. Organizational climate constitutes the collective perceptions and interpretations employees have about the policies, practices, and procedures enacted by the organization that are rewarded, supported, and expected (Reynoldson & Major, 2018; Schneider, Wheeler, & Cox, 1992). Climate is related to critical individual-level outcomes such as psychological well-being, withdrawal, and job performance through its impact on an employee job satisfaction and organizational commitment (Carr, Schmidt, Ford, & Deshon, 2003).

Inclusive organizational climates contribute to a sense of belongingness through equality in terms of organizational members' ability to be heard and to have their contributions valued by others (Major & Morganson, 2009; Reynoldson & Major, 2018). While gender diverse, highly inclusive environments are related to reduced interpersonal conflict (Nishii, 2013), exclusive work climates are associated with decreased job satisfaction, reduced organizational commitment, and increased turnover (Major, Davis, Sanchez-Hucles, German, & Mann, 2006) as well as poor psychological well-being (Brimhall, Lizano, & Barak, 2014; Reynoldson & Major, 2018). Exclusive work climates are commonplace for women in STEM occupations, partially due to the inability of women to garner sufficient support given relatively low numbers of women in these occupations (Glass et al., 2013; Hughes, 2014; Reynoldson & Major, 2018; Walton, Logel, Peach, Spencer, & Zanna, 2015). One example of the effects of chilly climates is in STEM academia. Though equally committed to their academic positions in STEM, women faculty report higher turnover intentions than men (Xu, 2008). Explanations for this include inadequate opportunities for career advancement, opinion suppression, and insufficient support from peers and mentors.

Lack of Social Support

Formal discrimination practices are decreasing for women in STEM, but interpersonal sources of discrimination remain prevalent (Robnett, 2016). Social support consists of a person's overall sense that they are cared for, are esteemed, and belong in a group or situation (Kirmeyer & Lin, 1987). For women in STEM, social support can prove particularly important in terms of retention and feelings of inclusion (Chemers, Zurbriggen, Syed, Goza, and Bearman, 2011; Rosenthal, London, Levy, and Lobel, 2011; Walton & Cohen, 2007). Robnett (2016) found that, over the course of one year, 61% of participants, comprised of women in STEM undergraduate majors and doctoral programs, experienced gender bias while pursuing a STEM education. Male peers acted as the source of gender bias more frequently than females, mentors, teachers, or professors. Furthermore, to be taken seriously, over one-third of female students felt they needed to work harder than their male peers. Women's experience of gender bias was related to lower levels of STEM self-concept, an effect buffered by peer support. When women had a

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

supportive peer network in their STEM field, their STEM self-concept remained relatively high, despite encountering gender bias.

In a study of women in engineering careers, Fouad, Singh, Cappaert, Chang, and Wan (2016) found that women who persisted in their careers did not differ from those who left in terms of self-confidence, vocational interests, or perceived workplace barriers, but they did differ in terms of their experienced workplace support, including supportive supervisors. Mohr and Wolfram (2010) demonstrated that social support is an effective tool in mitigating the impact of stress. Social support acts as a coping mechanism that can be even more effective for women than for men in promoting persistence in STEM (Morganson, Jones, & Major, 2010). For women, perceived support from others as well as one's STEM program is associated with a greater sense of belonging and motivation and less insecurity in one's STEM major (London, Rosenthal, Levy, & Lobel, 2011; Rosenthal et al., 2011).

Implications of Workplace Computer-Mediated Communication

Organizations have become heavily reliant on both internal and external CMC platforms to improve efficiency in communication between employees (Cho, Lee, & Kim, 2019). CMC takes place through many outlets in the workplace, including email, social networks, blogs, video-based platforms, and instant messaging. Services such as Slack and Skype have gained momentum as popular workplace CMC platforms developed with a purpose of increasing knowledge sharing and communication among coworkers and teams. Slack recently surpassed six million daily users including 50,000 teams engaging in its services (Konrad, 2017). Skype, though primarily used by companies within the United States, is utilized by 33,759 companies globally to facilitate communication among employees, allowing users to conduct virtual meetings, message coworkers, and make calls (iDatalabs, 2017). Due to increasing global reliance on workplace CMC, it becomes important to consider the implications of CMC for women in the workplace and, specifically, women in male-dominated STEM fields.

Organizational promotion of CMC has been proposed as a way to create a more egalitarian environment where both women and men have equal opportunities to communicate and access information (Spears & Lea, 1994). Atai and Chahkandi (2012) conducted a study utilizing professional listservs and found that men's presence was more ubiquitous, with men often writing lengthier messages than women. In a longitudinal study, Barrett and Lally (1999) demonstrated that women were hesitant early in their use of CMC, but after familiarizing themselves with the platform, women and men participated at the same rate. However, men's messages were twice as long as those of women. Overall, this suggests that women in STEM may benefit from organizational reliance on CMC through more equal participation in communication.

Surface level characteristics, such as physical appearance, are not as salient through CMC platforms as they are in face-to-face communication, but employees remain likely to make discernments of characteristics such as gender based on assumptions made when interpreting usernames or the content and style of messages (Spottswood, Walther, Holmstrom, & Ellison, 2013). For instance, messages may differ in person-centeredness (i.e., the amount a message provides emotional support; Burleson, 2003; Spottswood et al., 2013). Highly person-centered messages are considered perceptive, effective, and supportive and are often attributed to women. Low person-centered messages are characterized as being critical, dismissive, and ineffective and are typically attributed to men. Spottswood et al. (2013) found that women preferred highly person-centered CMC in general, while men preferred highly person-centered messages only when perceived to have come from a man or gender-ambiguous helper.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Particularly relevant to women in STEM, even the anticipation of working with others through CMC has been found to activate stereotypical gender biases (Heilman, Caleo, & Halim, 2010). In a study of men and women who envisioned working in a business project through CMC or face-to-face communication, gender stereotypes were activated to a greater extent when participants expected to work with others through CMC. In addition to affecting initial impressions of others, the expectation of electronic communication also motivated judgments about individuals' abilities to execute different types of work tasks. This was associated with an increased rate of task assignments which were consistent with stereotypes. As women in STEM are often working in male-dominated contexts, the activation of stereotypes in anticipation of CMC may introduce additional barriers for these women. It is important for organizations to be aware of the potential for CMC to activate traditional gender stereotypes that may lead to gender biased task assignments and differential treatment for women in STEM.

Incivility

One contributing factor to "chilly" climate and lack of social support for women in STEM is incivility. Incivility is defined as subtle, deviant behavior characterized by an ambiguous intent to harm the target (Andersson & Pearson, 1999). Examples of uncivil behavior include rolling eyes, making condescending or derogatory remarks, or excluding someone from social interactions (Andersson & Pearson, 1999). Although uncivil treatment may seem minimal, these behaviors can have substantial effects on those who experience them. A meta-analysis by Hershcovis (2011) found that experienced incivility was negatively related to job satisfaction, psychological well-being, and physical well-being. Incivility is strongly related to turnover intentions (Hershcovis, 2011), and it is also associated with job withdrawal, counterproductive work behavior, and decreased organizational commitment (Cortina, Magley, Williams, & Langhout, 2001; Penney & Spector, 2005; Spence Laschinger, Leiter, Day, & Gilin, 2009). Incivility can be quite common in the workplace. In fact, studies have shown that over 70% of employees have experienced incivility (Cortina et al., 2001) with more recent studies demonstrating that this number is closer to 90% (Lim & Lee, 2011).

Some individuals may be at increased risk for uncivil treatment (Cortina, Kabat-Farr, Magley, & Nelson, 2017). Cortina (2008) developed the theory of selective incivility, positing that uncivil treatment is actually a covert form of discrimination in the workplace disproportionately leveled at those who hold less powerful social roles (e.g., women, people of color). This theory has been supported by several research studies (e.g., Cortina, Kabat-Farr, Leskinen, Huerta, & Magley, 2013; Lim, Cortina, & Magley, 2008; Miner, Pesonen, Smittick, Seigel, & Clark, 2014). Cortina and colleagues (2002) found that women reported significantly more incivility than men, especially in male-dominated occupations. Fouad and Singh (2011) examined women in engineering, a STEM field particularly dominated by men (National Science Board, 2015), and found that women who left engineering reported experiencing more incivility than those still in the field. Moreover, women experienced higher levels of work-family conflict when working in environments in which women were generally the targets of uncivil treatment (Fouad & Singh, 2011). Miner, Diaz, and Rinn (2017) found that women in STEM experienced more gender-based incivility than men. Further, experienced incivility was related to psychological distress, and this effect was buffered by social support, further emphasizing the importance of social support for women in STEM.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Cyber Incivility

While CMC has the potential to create a more egalitarian environment for women to communicate in STEM fields (Spears & Lea, 1994), it also opens the door to new types of uncivil treatment from coworkers and supervisors. Cyber incivility, like incivility, is behavior that violates workplace norms of mutual respect, but it is distinct in that the behavior occurs through the use of CMC (Lim & Teo, 2009). Examples include behaviors such as writing in a condescending manner or making hurtful comments over email or instant messaging, excluding an individual in an email chain or group chat, or making demeaning or derogatory remarks that individuals are uncomfortable making in face-to-face communication. While Lim and Teo (2009) found that more active forms of cyber incivility are most often engaged in by men, women tended to engage in more passive forms of incivility, such as sending time-sensitive messages with short notice and choosing not to respond to emails sent by employees.

Considering the importance of perceived support for women in STEM, cyber incivility may result in particularly undesirable outcomes for women in these fields. Cyber incivility is negatively related to workplace outcomes such as job satisfaction and organizational commitment and positively related to turnover intent and counterproductive work behavior (Lim & Teo, 2009). Further, cyber incivility instigated by a supervisor predicts subordinate burnout, absenteeism, and turnover intentions (Giumetti et al., 2012). This further emphasizes the importance of preventing uncivil behavior directed towards women in STEM workplaces, suggesting that uncivil behavior can be instigated by supervisors as well as coworkers and should be dealt with at the organizational and team levels. Further Cortina and colleagues (2017) suggested that organizational use of CMC may allow uncivil treatment to permeate the barriers of regular working hours into the home lives of targets, offering little chance for relief. This has further implications for women in STEM, as these women often report difficulty in balancing work and family life as an obstacle in their success and persistence in STEM fields (Burke & Mattis, 2007; Ferriman, Lubinski, & Benbow, 2009). Cyber incivility, if left unchecked, may perpetuate women's perceptions of a lack of social support and a "chilly" climate (Hughes, 2014) in STEM fields. Therefore, it is advisable that organizations consider implementing strategies, such as putting online etiquette practices in place, to alert employees to potential miscommunication that can occur online (Giumetti et al., 2012).

Though cyber incivility is often intentional, unintentional cyber incivility can occur through misinterpretations of CMC as well. Because cues such as pitch, tone, body language, and rate of speaking are lacking in CMC platforms, there is more opportunity for individuals to misinterpret messages, and these messages may unintentionally come across as harmful to recipients (Giumetti et al., 2012). Additionally, Giumetti et al. (2012) suggested that cyber incivility may become more prevalent than face-to-face uncivil behavior, as the consequences of uncivil behavior instigated through CMC may be less immediately observable or apparent due to the lack of physical proximity and potential anonymity between the instigator and the target of the uncivil behavior. As women in male-dominated fields are at particular risk for uncivil treatment at work (Cortina et al., 2002; Fouad & Singh, 2011), it is essential for organizations to identify and prevent instances of uncivil treatment to decrease women's sense of a "chilly" workplace climate and increase their sense of belongingness in the organization and their STEM field.

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

LACK OF MENTORSHIP

Another barrier women in STEM face is a lack of opportunities to benefit from mentorship (Preston, 2004). Mentorship occurs when more experienced or senior employees provide both professional and personal assistance as well as guidance to less experienced protégés (Ghosh & Reio, 2013). Mentors experience positive outcomes, including higher levels of job satisfaction, organizational commitment, job performance, and career success (Ghosh & Reio, 2013). For protégés, mentoring is linked to increased socialization, job satisfaction, self-esteem, organizational commitment, and promotion opportunities, as well as reduced work stress and work-family conflict (Adya, 2008; Underhill, 2006). A lack of mentorship is often identified as an important factor in women's decisions to leave STEM fields (Rayman & Brett, 1995). In their review of mentoring research, McKeen and Bujaki (2007) suggest that female protégés may benefit from mentorship, as mentors can help women to navigate the masculine culture prevalent in many organizations, promote women's professional advancement, and foster a sense of belonging in their chosen field. Additionally, qualitative analysis suggests that mentorship allows women to feel connected, affirm their worth, garner support, and reduce feelings of isolation (Gibson, 2004; Langdon, 2001). This is particularly relevant for women in STEM, who identify experiencing a "chilly" climate, lack of social support as barriers to their success and persistence in STEM (Hughes, 2014).

Underhill's (2006) meta-analysis established that informal mentoring tends to produce larger effects on desired outcomes than formal mentoring. Informal mentoring occurs when individuals engage in mentoring relationships without an organizational intervention, while formal mentoring is sponsored by a program which pairs mentors with protégés (Chao, Walz, & Gardner, 1997). Mutual interests and shared characteristics drive mentors' and protégés' decisions to start informal mentoring relationships (Underhill, 2006), and gender of the protégé and the mentor may be a characteristic that influences these decisions (Mckeen & Bujaki, 2007). As women remain the minority in STEM fields, it follows that they will have less opportunity to engage in informal mentoring relationships, as many of their potential mentors are men who may be more inclined to start informal mentoring relationships with male protégés who they perceive as similar to them. It is important for women to be provided with opportunities to engage in informal mentoring relationships with male as well as female mentors. Turban, Dougherty, and Lee (2002) found the length of mentoring relationships to be more important than their gender composition, and for protégés, there are no gender differences in terms of receipt of career development (O'Brien, Biga, Kessler, & Allen, 2010). Additionally, the promotion of mixed-gender mentoring relationships has been proposed as a way to increase women's success in male-dominated organizations and occupations by enabling them to familiarize themselves with the organizational context (Scandura & Williams, 2001).

However, stereotypes may lead potential STEM mentors, especially men, to perceive women protégés as being higher risk than men with similar qualifications (Mertz et al., 1987). Stereotypes about men's aptitude in fields such as science may lead mentors to choose male protégés over women (Preston, 2004). Another source of risk may be perceptions that mixed-gender mentoring relationships can lead outside parties to make sexual insinuations about the relationship (Major & Morganson, 2009). Further, women report lower comfort levels and perceived support in mixed-gender mentoring relationships (Feldman, Folks, & Turnley, 1999; Scandura & Williams, 2001). Women who do seek male mentors may encounter societal barriers related to gender roles that make it difficult for them to engage with potential male mentors informally (O'Brien et al., 2010; Ragins & Sundstrom, 1989). For example, women often miss out on opportunities to engage in stereotypically masculine work-related leisure activities (e.g., golf;

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Schwartz, 1989), though participation in these traditionally male-dominated activities increases informal exposure to potential male mentors.

One clear benefit of same-sex mentoring relationships is that they are more strongly related to role modeling than mixed-gender mentoring relationships (Scandura & Williams, 2001). Exposure to same-sex experts (e.g., advanced peers, professionals, and professors) in academic STEM environments is predictive of stronger implicit identification with STEM, greater self-efficacy, and increased effort on STEM exams (Stout, Dasgupta, Hunsinger, & McManus, 2011). This has clear implications for women in STEM, as these women are likely to have few female role models, with whom they may identify more, due to women's underrepresentation in STEM (Jackson et al., 2014). In contrast to male mentors, female mentors may provide women in science with an opportunity to connect with the broader community of women in science (Preston, 2004). Preston (2004) suggests that as women in male-dominated fields have less opportunity to encounter female mentors organically, organizations and educational programs should consider initiating formal mentoring programs to increase women's chances of connecting with female mentors and role-models (Preston, 2004). In recent years, however, opportunities to engage with mentors outside of formal mentoring programs have been presented through the use of CMC.

Implications of E-Mentoring

One way to overcome the barriers women in STEM face in engaging with mentors, especially with female mentors (Preston, 2004), is through e-mentoring. Similar to traditional face-to-face mentoring, *e-mentoring* is characterized as relationships that are mutually beneficial between a mentor and a protégé and provide learning as well as career and emotional support, but it is distinct from traditional mentorships in that interactions occur primarily through electronic modes of communication (e.g., e-mail, instant messaging, chat rooms, social networks; Ensher & Murphy, 2007). E-mentoring relationships can be entered into both formally and informally and can be particularly advantageous for women and minorities who tend to face more obstacles in their search for effective mentoring relationships (Muller & Barsion, 2003). It has been suggested that, due to its potential to cross barriers of race, gender, geography, and class, e-mentoring may provide women opportunities to explore male-dominated occupations by providing easy access to motivated role models and advocates (Bierema & Merriam, 2002).

A key benefit to e-mentoring is that it provides women, who may have had little exposure to successful women in STEM, with opportunities to encounter successful female role models outside of traditional mentorship programs and face-to-face interactions (Muller et al., 2012). This is important, as exposure to professional women in STEM helps to break down gender barriers that women may encounter in the field (Clewell & Campbell, 2002). Schwiebert, Deck, Bradshaw, Scott, and Harper (1999) suggested that it may be necessary for women to have mentors who are men, as fewer women hold high-level positions in male-dominated fields, but e-mentoring also presents a way for women to engage with other women who they would not have otherwise been able to access. E-mentoring has the potential to provide a foundation for the creation of an online community of female STEM professionals (Muller et al., 2012), presenting new opportunities for women to gain insight and advance their careers in STEM.

Because gender is less salient in virtual interactions such as email and instant messaging, it is less likely to influence the selection of protégés in these contexts (Hoch & Kozlowski, 2014). Therefore, CMC provides women in STEM with increased opportunities to engage both formally and informally with male mentors, who might typically be drawn to male proteges due to perceived similarity to them (Mckeen & Bujaki, 2007). Additionally, e-mentoring, as it is characterized by little in-person contact,

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

may mitigate the perceived risk that comes with taking on a female protégé (Mertz et al., 1987). For example, reliance on CMC in e-mentorships may lessen the perceived risk of sexual insinuations that may arise in mixed-gender relationships as well as actual instances of sexual misconduct (Major & Morganson, 2009). Mitigating men's perceived risk could enable women to engage in mentoring relationships more easily and experience the benefits associated with having a male mentor in STEM. While gender influences the formation of mentoring relationships, perceptions of mentoring received are independent of gender in traditional mentoring relationships of long duration (Turban et al., 2002), and career development outcomes are the same for protégés regardless of the gender of their mentor (O'Brien et al., 2010). Overall, CMC presents an opportunity for women overcome societal barriers that inhibit them from encountering male mentors organically (O'Brien et al., 2010; Ragins & Sundstrom, 1989). E-mentoring has the potential to increase opportunities for women in STEM to engage with both male and female mentors and benefit from the increased socialization, professional advancement, and sense of belonging that mentorship often provides (Adya, 2008; McKeen & Bujaki, 2007).

MentorNet (www.MentorNet.net) is an example of a national program designed to help women in STEM engage with mentors through CMC, such as email, in an effort to increase the representation of women in these fields (Single, Muller, Cunningham, Single, & Carlsen, 2005). Another example of an e-mentoring program is *Career*Wise (http://careerwise.asu.edu), a free online program designed to support women in STEM through mentoring by focusing on strengthening resilience, problem solving, and coping skills to increase women's persistence in STEM programs and careers (Bernstein, 2011). Although online platforms for women in STEM to engage in e-mentoring are available publicly, organizations can facilitate formal internal e-mentoring programs to connect women entering the organization with experienced mentors. Additionally, organizations can provide employees, especially women, with resources that encourage them to seek informal e-mentoring relationships, both as mentors and protégés.

WORK-FAMILY CONFLICT

To sustain a competitive advantage, it is imperative that organizations employ interventions to promote employee work-life balance. Work-family conflict (WFC), occurs when an individual experiences pressure to participate in the work or family domain which interferes with participation in the other domain (Greenhaus & Beutell, 1985). If organizations seek to attract and retain women in STEM, measures should be taken to ensure work-family needs are met and WFC is mitigated. The consequences of WFC include decreased performance, poor job satisfaction, decreased overall life satisfaction, and emotional exhaustion (Alacorn, 2011; Nohe, Michel, & Sonntag, 2014). These detrimental experiences for employees often lead to costly turnover for organizations (Nohe & Sonntag, 2014).

A recent meta-analysis found that, overall, men and women do not differ in perceived WFC (Shockley, Shen, Denunzio, Arvan, & Knudsen, 2017). Despite experiencing equivalent levels of WFC, men are often apprehensive to discuss work-family issues, partly due to the potential of being perceived as less masculine and having more communal traits, which would be in violation of traditional gender norms (Vandello, Hettinger, Bosson, & Siddiqi, 2013). This may lead to inaccurate perceptions that women experience a greater amount of WFC. Another concern is the potential for unfavorable perceptions of employees who attempt to balance their work and family roles through the use of organizational flexibility policies. This flexibility stigmatization (Blair-Loy, 2003) is characterized by a strong belief that individuals who utilize family-friendly organizational policies and benefits (e.g., sick days, telecom-

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

muting, paternity leave) lack commitment to the organization leading to negative career implications (e.g., lost advancement opportunities; Williams, Blair-Loy, & Berdahl, 2013). Cech, Blair-Loy, Correll, Kelly, and Williams (2014) examined this flexibility stigma among STEM faculty finding that those who experience this stigmatization reported lower job satisfaction, decreased work-family balance, and lower intentions to persist in the organization and industry.

A common explanation for the underrepresentation of women in STEM is the motherhood penalty that they experience (Correll, Benard, & Paik, 2007). Mothers in STEM are even more susceptible to gender biases stemming from violating gender role norms, as these biases tend to become more salient when a woman chooses to become a mother (Correll et al., 2007). According to the U.S. Bureau of Labor Statistics (2018), there is a stark gender disparity in parental employment. Married mothers were significantly less likely to participate in the workforce (68.6%) in comparison to married fathers (92.8%). Fathers are also more likely to remain at full-time status regardless of dependent age, whereas mothers are significantly less likely to work-full time, especially when they have a child under three years old.

Considering the demanding nature of STEM professions and the desire to maintain a fulfilling family life, women frequently identify difficulty in balancing work and family obligations as an obstacle in pursuing careers in STEM (Burke & Mattis, 2007; Ferriman, et al., 2009). However, Armstrong and Riemenschneider (2014) demonstrated that WFC for women in information technology (IT) careers has become less of a barrier. The authors stated that a shifting gender role perspective in society may be one potential reason behind this. Work-family policy (Lobel & Kossek, 1996), supervisor and mentor support (Frye & Breaugh, 2004; Nielson, Carlson, & Lankau, 2001), and promotion of a family-supportive work environment (Allen, 2011) are often suggested as ways for organizations to help employees in today's diverse workforce balance work and family obligations. However, advances in CMC have enabled organizations to allow employees to successfully meet work and home demands through telecommuting.

Implications of Telecommuting

As 80-90% of employees report a desire to telecommute and 20-25% of individuals in the U.S. workforce telecommute for some portion of their work (Global Workplace Analytics, 2015), it is important to consider the ways in which telecommuting can better women's experiences in STEM workplaces. *Telecommuting* is a work arrangement that provides employees flexibility in their schedules by allowing them to work from home either part-time or full-time through the use of technology, including CMC (Nieminen, Nicklin, McClure, & Chakrabarti, 2011). Telecommuting has the potential to mitigate the difficulty in meeting work and family responsibilities women in STEM face (Ferriman et al., 2009), as it is negatively associated with work-family conflict (Golden, 2006). Telecommuting is also related to increased job satisfaction and performance as well as decreased turnover intent and role stress and is not associated with decreased quality of workplace relationships overall (Gajendran & Harrison, 2007), suggesting that incorporation of telecommuting into flexible work policy could be a step towards increasing women's persistence and success in STEM.

Work-family balance is of greater importance to the millennial generation when compared with other generations (Carless & Wintle, 2007), and women often report difficulty in in balancing work and family roles as a major obstacle in their pursuit of careers in STEM (Burke & Mattis, 2007). This suggests that as organizations seek to attract and retain women in STEM, it is important to consider the implications of telecommuting in promoting work-family balance. Golden (2006) found that employees' WFC lessened as the amount of time spent telecommuting increased. Demonstrating the mutually beneficial outcomes

EBSCOhost - printed on 2/8/2023 7:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of telecommuting, Meyer, Mukerjee, and Sestero (2001) identified a positive relationship between employee participation in telecommuting and firm profit, suggesting that telecommuting arrangements should be promoted by organizations when positions allow for it. Similarly, Bloom, Liang, Roberts, and Ying (2015) randomly assigned employees at a Chinese call-center to telecommuting positions and found that employees who telecommuted improved their productivity based on objective criteria, experienced increased job satisfaction, and had lower intentions to quit compared with the employees who worked onsite.

Though there are clear benefits associated with telecommuting, an obvious concern is the potential for telecommuters to experience social isolation. As women in STEM fields report lacking a sense of belonging and social support in STEM (Frehill et al, 2007; Hughes, 2014), it is important that organizations proceed with caution when implementing telecommuting policies. Golden and colleagues (2008) identified a positive association between employees' feelings of social isolation and amount of time spent telecommuting. Further, research has shown that employees working from the office felt greater social inclusion than employees who worked from home, client-based employees, and satellite-office workers (Morganson et al., 2010). Given that women in STEM already suffer from feelings of exclusion due to the "chilly" social climates encountered (Glass et al., 2013), it is important for organizations to consider the potential for telecommuters to experience social isolation as well as ways of making sure those who telecommute are made to feel included when seeking to implement telecommuting policies.

Due to reduced opportunity to engage in informal face-to-face interactions, there are concerns that individuals who telecommute for a large portion of the work week will have lower quality relationships with coworkers and supervisors (Gajendran & Harrison, 2007). In support of this, Gajendran and Harrison (2007) found in their meta-analysis that telecommuting more than 2.5 days in a week reduces WFC but negatively impacts relationships with coworkers. Maruyama and Tietze (2012) found that, in comparison to men in similar occupations, women who telecommute and have dependents are concerned that they will suffer from reduced visibility and will lack opportunities for career development from an inability to be noticed by their supervisors. However, meta-analytic evidence demonstrates that regardless of the time spent telecommuting, there is a positive association between telecommuting and supervisor ratings of performance as well as the quality of employees-supervisor relationships (Gajendran & Harrison, 2007). Considering the reduced visibility associated with telecommuting, organizations should develop strategies to ensure employees who telecommute are being given equal access and consideration in promotion opportunities. Additionally, organizations should reassure women that telecommuting will not negatively impact their opportunities for career development or their performance reviews, so that they feel comfortable utilizing this family-friendly policy. This has important implications for women in STEM, as dissatisfaction with pay and promotion opportunities has been identified as an explanatory factor for attrition in fields such as engineering (Hunt, 2016).

Another potential concern is that telecommuting can only be offered for positions where work can be completed from home, leaving a portion of employees without the option of telecommuting. Research has demonstrated that uneven allocation of telecommuting privileges can be perceived as unfair and may cause employees who are unable to telecommute to become less satisfied with coworkers who are given the opportunity (Golden, 2006, 2007). This is especially pertinent in STEM occupations, as certain positions may require physical attendance to perform work responsibilities. As women in STEM may already suffer from a lack of social support (Hughes, 2014), organizations should give careful consideration when implementing telecommuting policy to ensure that it combats rather than exacerbates the barriers they face in the workplace.

FUTURE RESEARCH DIRECTIONS

Research is needed to more fully understand how organizations can effectively utilize CMC to benefit women in STEM while mitigating any potentially negative implications associated with CMC. Future research should consider the differential outcomes for female majority and female minority virtual teams in STEM in terms of overall team effectiveness and women's participation in group discussion, self-efficacy, satisfaction, and perceptions of social support in the virtual team setting. The effectiveness of e-mentoring initiatives in terms of increasing women's access to mentoring opportunities, feelings of belongingness in STEM, and perceptions of promotion opportunities should be explored. Further, gender differences in experiences and instigation of cyber incivility should be examined in a STEM context, and future research should examine the effects of cyber incivility on specific outcomes relevant to women in STEM such as self-efficacy, perceived social support, and intentions to leave. It is also important to examine the utility of organizational efforts to combat workplace uncivil behavior, such as the adoption of online etiquette practices (Giumetti et al., 2012) and implementation of interventions designed to increase employee awareness of cyber incivility related to gender stereotypes. Finally, the implications of telecommuting for women should be examined in a STEM context in terms of benefits, such as reduced WFC (Meyer et al., 2001), and negative implications, such as social isolation, reduced visibility of female STEM role models, and reduced quality of relationships with supervisors (Gajendran & Harrison, 2007; Golden et al., 2008). In addition, future research should consider the effects of telecommuting on women's career advancement opportunities in STEM. Researchers should seek to determine if there is an optimal proportion of time that women in STEM should spend telecommuting in terms of career development, socialization, sense of belonging, and persistence intentions.

CONCLUSION

Women face a variety of barriers in pursuit of STEM careers. Considering the consequences in terms of economics, innovation, and research associated with the underrepresentation of women in STEM professions (National Science Board, 2015; Shapiro & Sax, 2011), the attraction and retention of women in STEM should be a global focus. CMC can have a valuable impact in terms of helping women to overcome barriers associated with stereotypes, stereotype threat, perceived lack of social support, difficulty in managing work and family life, and the "chilly" workplace climate characteristic of women's experiences in STEM fields. Conversely, there are potential negative outcomes associated with organizational focus on CMC, underscoring the importance of furthering research in this area. Inclusive work climates are associated with organizational and job commitment (Major & Morganson, 2009), feelings of inclusion, job satisfaction, and reduced intention to leave (Brimhall et al., 2014), and organizational use of CMC has a potential to contribute to organizational efforts to foster such a climate. Although there are potential downsides, research regarding women's experiences with CMC in the workplace suggests that, overall, organizational implementation of CMC has many potential benefits, including increased opportunities to connect with other women in STEM (Muller & Barison, 2003), comfortability providing input in workplace interactions (Furumo & Pearson, 2007), and the ability to effectively balance work and life roles (Golden, 2006). This underscores the importance of workplace CMC in promoting the success and persistence of women in STEM.
