For this research, the sample size is more than "sufficiently large." The minimum sample size required for PLS is usually determined by the larger one of (1) ten times the measurement scale with the largest number of formative indicators, or (2) ten times the largest number of independent latent variable impacting a dependent latent variable (Chin, 1998). Since no formative indicators are used in this study, the minimum sample size required is 70 (ten times seven independent latent variables). The sample size of 236 is more than adequate.

Measurement Model Assessment

A PLS based structural equation model (PLS-SEM) is composed of both the outer model (measurement model) and inner model (structural model). A valid measurement model is the prerequisite to any meaningful results (Hair, 1995). The validity of the measurement model was first assessed, including a number of properties such as content validity, construct reliability, convergent and discriminant validity (Nunnally & Bernstein, 1994).

Content Validity

Content validity, or face validity, is the fundamental requirement for any measurement item. Briefly, the the measurement items in an instrument should cover the major content of a construct (Churchill, 1979; Nunnally & Bernstein, 1994). Content validity of a measurement instrument is usually achieved through a comprehensive literature review and interviews with very knowledgeable practitioners and scholars. In this research, the constructs are from the extant literature. Their measurement items have been validated by previous studies. Hence content validity of the constructs is ensured.

Reliability and Validity

Next, the reliability of constructs were examined. Reliability assesses the consistency or stability of a measure and is inversely related to the degree to which a measure is contaminated by random error (O'Leary-Kelly & Vokurka, 1998). Traditionally, internal consistency reliability of a construct is assessed by Cronbach's alpha, which is estimated based on the inter-correlations of the indicators (Cronbach, 1951; Cronbach & Shavelson, 2004). For PLS-SEM studies, scholars have suggested to examine the composite reliability (CR) measure in addition to Cronbach's alpha (Shah & Goldstein, 2006). Cronbach's alpha assumes that all indicators are equally reliable, which is not the case in PLS-SEM. In PLS-SEM, indicators are prioritized based on their individual reliability (Hair, Hult, Ringle, & Sarstedt, 2014). Further, Cronbach's alpha is sensitive to the number of items in the scale, and tends to underestimate the internal consistency reliability. A scale is considered reliable if the CR value is between 0.60 and 0.70 for exploratory studies, and higher than 0.7 for confirmatory studies (Nunnally & Bernstein, 1994). Table 2 presents the reliability measures for each construct. All values exceeded the suggested 0.70 threshold. Therefore, the constructs are determined to be reliable.

Convergent validity is the extent to which an empirical indicator correlates positively with alternative indicators of the same construct. This is generally assessed by examining the item loadings on the construct as well as the average variance extracted (AVE). A high loading on the construct indicates good convergent validity. The suggested cut off value is that the standardized item loading should be 0.708 or higher, which indicates that the variance shared between the construct and its indicators would be at least 50% or higher. Items with loadings between 0.4 and 0.7 should be considered for elimination if this leads to an increase of the CR value to above 0.7 (Hair et al., 2014). All item loadings exceeded 0.708 to not cause any concern. In addition, AVE for each construct is greater than 0.60, providing strong support to convergent validity (Straub, Boudreau, & Gefen, 2004).

Discriminant validity is the extent to which a construct is truly distinct from other constructs. Discriminant validity can be assessed by examining the cross loadings of the indicators. An indicator's loading on its construct should be greater than cross loadings, i.e., loadings on other constructs (Jöreskog, 1971). However, this criterion is generally considered conservative and it is recommended to use the Fornell and Larcker (1981) test instead. To pass the test, the AVE values should be greater than the squared correlation with other constructs, with the rational being that a construct should share more variance with its indicators than with any other constructs (Hair et al., 2014).

All constructs passed the Fornell and Larcker (1981) test. As can be seen in Table 3, the values along the diagonal are square roots of AVE of each latent construct, and values off the diagonal are pair-wise correlation coefficients between latent constructs. All values along the diagonal are larger than corre-

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

sponding correlation coefficients, hence passing the Fornell and Larcker (1981) test. Each latent construct is relatively independent and demonstrates sufficient discriminant validity.

Table 3. Correlations of latent variables

	C2CT	DQ	PB	PI	PPP	PR	PSP	WSQ

WSQ	0.251	0.629	0.808	0.771	-0.221	0.154	0.697	**0.855**

Structural Model Assessment

Since the measurement model was judged to be adequate, it is appropriate to assess the structural model. The path coefficients and R^2 values for all endogenous variables were examined. They are labeled in Figure 3. A standardized path coefficient represents the strength of the relationship between two adjacent constructs. As expected, all path coefficients are positive except one (PR→C2CT), which is in line with the research hypotheses. Then the statistical significance of these path coefficients was examined. Since PLS-SEM does not make data normality assumptions, traditional statistical procedures for confidence interval construction cannot be used. Instead, a bootstrapping procedure was performed to obtain the standard error of the path coefficient estimates. The bootstrapping procedure is a nonparametric resampling approach for standard error estimation. Results show that all path coefficients are significant. No path coefficient is extremely small when compared to each other, indicating that the proposed model does not have the issue of relevance of significant relationship (Hair et al., 2014).

The other important model evaluation measure is the R^2 values for each endogenous variable. As methodologists have suggested, the level of acceptable R^2 value is research model and discipline dependent. Rules of thumb have been provided for some disciplines such as Marketing (Hair, Ringle, & Sarstedt, 2011), but not for all disciplines. In this research, the R^2 values are highly respectable. The smallest R^2 values is 35.7% (C2C Trust). The other two R^2 values are more than 60%, indicating the majority of variance can be explained by the proposed model. Therefore, the proposed model is judged to have strong predictive relevance and validity. Finally, the path coefficients are compared to see if certain factors have stronger effect as hypothesized.

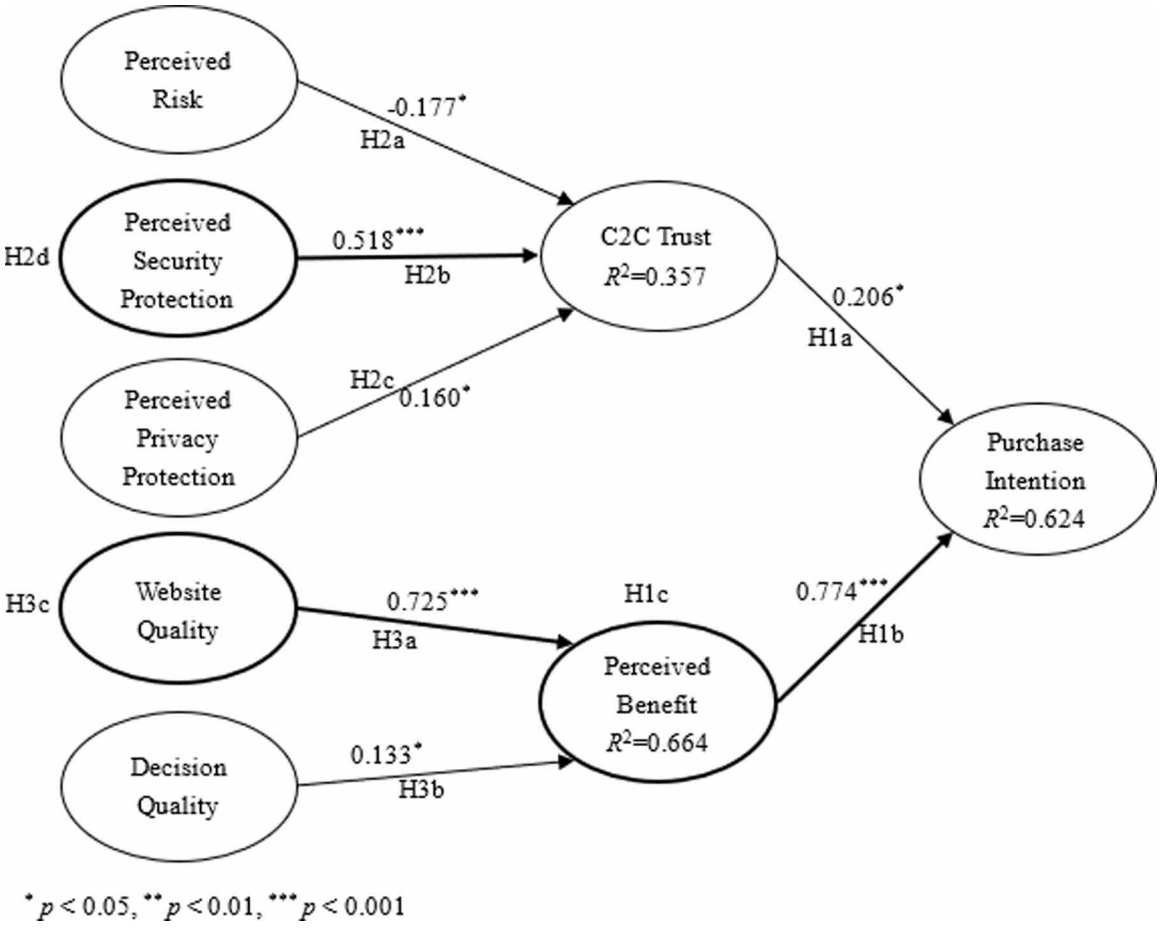
Figure 3. Empirical results



Summary of Results

Empirical results supported all research hypotheses. There is no surprise at all that both C2C Trust and Perceived Benefit have significant positive effect on Purchase Intention, supporting hypotheses H1a and H1b. The effect of C2C Trust on Purchase Intention is significant but the effect size is relatively weak (0.206). The effect of Perceived Benefit on Purchase Intention is substantially stronger at 0.774. Therefore, hypothesis H1c is supported.

The path coefficients for the three antecedents to C2C Trust are significant, in line with Hong and Cha (2013) and Kim et al. (2008). As expected, Perceived Risk negatively affects C2C Trust. Perceived Security Protection and Perceived Privacy Protection are positively associated with C2C Trust. Hypotheses H2a, H2b, and H2c are confirmed. In terms of effect size, Perceived Security Protection does have the largest effect (0.518), noticeably higher than Perceived Risk (-0.177) and Perceived Privacy Protection (0.160). Hypothesis H2d is supported.

For Perceived Benefit, the two antecedents also demonstrate a strong relationship, supporting the findings of Zha et al. (2013). Statistically significant path coefficients show that hypotheses H3a and

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

H3b are supported. The effect of Website Quality on Perceived Benefit is a much stronger 0.725 than that of Decision Quality (0.133). Hypothesis H3c is supported.

Discussion

In this study, the effect of Trust on consumers' Purchase Intention is much smaller than that of Perceived Benefit. In past studies, researchers have found that the effect of Trust on consumers' purchase intention is significantly strong in the absence of Perceived Benefit (Lim, Sia, Lee, & Benbasat, 2006; McKnight et al., 2002), but the effect of Trust reduces substantially when Perceived Benefit is included in the model (Kim et al., 2008; Li et al., 2010). It is possibly due to a substitution or interaction effect between C2C Trust and Perceived Benefit. For this study, the argument is that Trust is no longer a critical concern once trustworthiness of a C2C e-commerce website is established, particularly when consumers perceive a large amount of benefit. It is plausible to interpret the result as consumers constantly adjusting their priorities in online shopping: the importance of order winners exceeds order qualifiers.

The result also indicates that, in China, consumers' Trust to C2C website is largely dependent on how strong the website has provided security protection. This result makes complete sense in this unique context. In the past ten to twenty years, e-commerce growth is "wild" and a huge amount of security breach cases have happened. Unlike in developed countries, a strong legal system is readily available to assist consumer victims. In China, it is a nightmare for consumers to deal with such problems. Therefore, it is no surprise at all that Chinese online shoppers have placed a high priority on security protection when it comes to trust of an e-commerce website.

Empirical results suggest that Website Quality is likely the strongest factor that affects consumers' Purchase Intention because both path coefficients (Website Quality → Perceived Benefit → Purchase Intention) are high. Website Quality has a much stronger effect than Decision Quality on Perceived Benefit because Chinese online shoppers' perception of benefit is greatly influenced by how well a C2C e-commerce website is constructed. To some extent, it is a good news for C2C e-commerce service providers. Website Quality is a rather objective measure while Decision Quality can be higher subjective. C2C e-commerce websites can strive to improve quality by checking against many established metrics such as response time.

CONCLUSION AND FUTURE RESEARCH

Conclusion and Contributions

This research study proposed a model linking antecedents of Trust and Perceived Benefit to consumers' Purchase Intention based on the literature. The model development process is guided by a careful consideration of a specific context: consumer-to-consumer (C2C) e-commerce in China, the largest developing country of the world. The model was then empirically examined using data collected regarding Taobao, the leading C2C e-commerce website in China. Specifically, empirical data was collected using a survey regarding consumers' experiences and perception about Taobao. The empirical data was then analyzed using the partial least squares based structural equation modeling (PLS-SEM) method.

The findings in this research supported all research hypotheses that are derived from the extant literature. In short, Trust and Perceived Benefit have a significant positive effect on consumers' Purchase

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Intention in a (C2C) e-commerce context. The antecedents identified for C2C Trust and Perceived Benefit all have significant impact. This result supports that the theory of reasoned action (TRA) model is applicable to C2C e-commerce in a developing country context. Because characteristics of developing countries can be vastly different from that of developed countries, validating the applicability of an existing theoretical framework is a contribution by itself.

A more important contribution, though, is an exploration of effect size change in light of a developing country context. In the United States and Western European countries, business regulations are well established. E-commerce service providers have an existing legal framework that they can refer to. Meanwhile, citizens' awareness of privacy and security is at a rather high level. In contrast, the development and growth of Internet e-commerce in countries such as China follows a quite different trajectory. In many ways, government and regulatory bodies cannot provide a comprehensive framework to guide e-commerce service providers without having them trial and error first. Their feedback construes the basis for rules and regulations development. Indeed, many have characterized the growth and development of Internet commerce in China as "wild" or even "barbarian." Clearly, consumers will have very different perceptions of e-commerce, when compared to those in developed countries.

Insights about effect size change due to a different context contributes to further theory development based on TRA. The effect of Perceived Benefit on Purchase Intention is much stronger than that of Trust. Clearly, in China, consumers are willing to use a C2C e-commerce website (Taobao in this study) due to benefits such as convenience, time, or cost savings. It is a novel insight that Trust matters less than Perceived Benefit in a developing country context, though it should not be interpreted as Trust does not matter. It is also highly intuitive that Perceived Security Protection has the largest effect on Trust. In a developing country such as China, security protection is clearly not as sophisticated as in developed countries. Incidents of security breach often receive high media attention in China. Researchers hence should pay more attention to security protection in further theory development. The result that Website Quality has an effect much larger than Decision Quality is in line with the developing country context, where tangibles are often valued more than intangibles. Consumers tend to anchor their perceptions more on those tangible attributes such as how well a website is constructed, and how easy they can obtain information. In summary, these insights contribute to a more in-depth understanding of consumers' Purchase Intention in a developing country context.

These results can provide useful guidance for managers. To C2C e-commerce service providers such as Taobao, this research study suggests that their priority should be on making benefits clearly visible to consumers, because Perceived Benefit is a key driver toward consumers' Purchase Intention. Among actions a service provider can take, improving Website Quality is the top priority. Consumers in China often look at websites for easy navigation, information access. When a website provides such qualities, consumers form a strong perception regarding benefits they can reap by interacting with the website, and subsequently, conduct a purchase on the website.

Limitations and Future Research

Some limitations of this empirical study should be recognized. Since the majority of empirical data for this research was collected from college students, the findings may not be generalizable beyond this type of C2C e-commerce consumers. However, as discussed earlier, college students well represent active C2C e-commerce consumers in China. It is a reasonable sampling choice. Therefore, results are

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

valid, and generalizability of findings may be limited but the impact is likely minimal. Nevertheless, it is plausible to conduct the same empirical research in a more generic setting.

This research study can be extended in multiple ways in the future. It is conceivable that a comparative study can be conducted to further highlight the differences between the developing and developed countries. It is a plausible idea to incorporate factors such as national culture in a future study (Gefen & Heart, 2006). It is a fruitful path to investigate how other consumers' feedback affect or revise a consumer's perceptions. The current research study is a rather "static" one because no user feedback is taken into consideration. Incorporating a dynamic factor may lead to even more insights.

ABSTRACT

To understand customer repurchase intention in online stores, the present study has evolved with three variables: customer trust, loyalty, and satisfaction. A theoretical model was also developed to examine customer repurchase intention towards online shopping. The observation unit of this research is online stores and the analytical unit is the customers who have been purchasing grocery products via online. A random sampling technique was used to select the respondents and who are easily accessible. The data was collected from 645 online customers in Seoul. The data was analyzed with a structural measurement equation model by using Partial Least Square 3.0. Outcomes of study showed that, customer satisfaction and trust were the significant predictors of customer repurchase intention. The effect of customer loyalty towards repurchase intention seems to be very low. Hence, online retailers have advised to concentrate more on the activities needed to increase customer loyalty and to purchase more.

INTRODUCTION

Owing to the emergence of information and communication technology (ICT), a magic word called Internet has derived and it plays an important role in our day today lives (Pauzi et al., 2017). It connects community and communication; thus, the internet plays a predominant role in the marketing sphere. It supports marketers to reach the products to the ultimate consumers, especially for selling the novel products in online marketing (Datamonitor, 2010). Internet facilitates consumers to compare one prod-

uct with other similar products very easily and swiftly. This kind of comparison helps the consumers to have better products with the right future at the right price. As a result, today's consumers are buying a variety of products from online stores right from electronics, stationeries, cosmetics, apparel, and so on. Thus, all the products have gained popularity among the public except groceries (Grewal et al., 2004). Usually, grocery products are classified as eatable and drinkable, and that is buying on a regular basis from the departmental stores or supermarkets in larger quantities. For a long time, people used to buy the groceries in shops directly, where they have a chance to inspect the quality and other attributes of the products before making the purchase. Moreover, consumers can arrange their own transportation for the safety of fragile products (Kelin,1998). But these kinds of facilities are not available for the grocery products in online stores. All these reasons are discouraged the consumers to buy the grocery products from online stores. As a result, consumers are hesitating to adopt online grocery shopping and hence, it leaves rooms for further improvement. The modern supermarkets and online grocery stores not only deal with perishable products but also deal with durable eatables (Schuster & Sporn, 1998).

Since online grocery shopping is a new one in the online business, and absence of consumers' interest to buy the grocery products through online, it is an important area to explore. Especially, it is indispensable to analyse the factors determine consumers' purchase intention of grocery products from online stores. Attaining new consumers and maintaining existing customers is a challenging job to the online retailers, since it has more uncertainty. Hence, online retailers should made efforts to attain new customers by minimizing the mentioned risks. Also, the online shopping consumers' behavior will be differing from the consumers who are doing traditional way of shopping. As a consequence, understanding consumer behavior is a challenging task in the online business due to the cutthroat competition and the continuous changes in the online business environment. So that the online retailers should understand the determinants of consumers online purchasing and repurchasing behaviors in order to compete the online trading challenges. In this regard, numbers of studies have suggested assessing consumers' behavior towards online shopping as well as online grocery shopping (Ahn, Ryu & Han, 2004; Hanson, 2004; Lin, 2007). Though, number of earlier studies related with online purchasing and repurchasing intention available in the literature, researches that enlighten the relationship among customers trust, satisfaction and loyalty and the manifold effects of these factors on the online repurchase intention is limited, and the findings of the studies are also inadequate.

With this backdrop the present study has proposed a research model along with three factors namely customer trust, customer loyalty and customer satisfaction and it has to be tested with theoretical models by incorporating relations among all the three variables and customer online repurchase intention. The aim of the present research is to establish the evidence that the factors mostly influence South Korean consumers' repurchase intention of grocery products in online stores and the paper is organised as follows. The first part of the paper is deals with introduction. Theoretical background and research hypotheses are presented in section two. Research methodology, measurement development, data collection procedure were presented in the third part. Fourth section deals with analysis and results of the study. Discussion and conclusions were presented in the last section.

REASONS FOR THE STUDY

South Korean e-commerce market is one of the biggest markets in the world. Due to technological advancement and the development of mobile communication it has been realizing a double-digit growth in

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

the recent years. By 2021, it is also expected that the volume of online business will go up to 33 billion US dollars. According to Statista, the government transport sector in Seoul offering high-speed internet and free Wi-Fi services to the passengers (Statista, 2018). Thus, all these factors supported South Korea to be the world's best internet service provider. On the other side, South Korea is having name and fame for its internet commerce especially in grocery shopping. Out of total purchase of fast-moving consumer goods (FMCG), about 17 percent have been purchased via online shopping during 2015-16 (Korean Herald, 2018). Moreover, South Korea is also having a large number of families that purchasing FMCG products from the online market at least once a year. Due to the development of information and communication technology (ICT) online retailers in Korea offering a wide range of shopping experience to their customers. The increasing demand for fresh food supplies and less delivery period accelerate the online traders to offer best services to their customers. Thus, Koreans are enjoying the new shopping experience in their day to day transactions. In the recent years, Korea has been experiencing one-person household concept and this type of households also increasing the demand potential for online grocery products. On the other side, a lot of double-income families don't have time to purchase directly from the market, hence they prefer online stores for purchasing grocery items. Out of the total population in Korea, around 35 percent are living in one-person household lifestyle. Thus, all these factors pushed South Korea in to be the best country for online grocery shopping (Krakowiak, 2018). But still, very limited studies have concentrated on this area with different perspectives, hence the present study made an attempt to study South Korean customers' repurchase intention towards online grocery products with above mentioned attributes.

THEORETICAL BACKGROUND AND RESEARCH HYPOTHESIS

Customer Trust on Online Stores

Customers trust is described as the confidence that permits the customers to happily showing intersect on the online stores after having analyse the stores' uniqueness into the deliberation (Toufaily, Souiden, & Ladhari, 2013). However, the significance of the customer trust further stressed in the online business perspective, mainly about the products like food items and groceries (Citrin et al., 2003) since it is a critical factor that influence the success of the online grocery retail business (Toufaily, Souiden, & Ladhari, 2013). Customer trust may evolve from the subjective attitude about trust in the online sellers (Bianchi & Andrews, 2012; Toufaily, Souiden, & Ladhari, 2013) or otherwise, various attributes of the online stores may improve the customers trust during their online shopping incidents (Ogonowski et al., 2014). Once trust is instituted, automatically repurchase intention will be more likely. As such we expect a significant relationship between customer trusts and repurchase intention of online grocery stores. In accordance with we have framed a hypothesis that:

H1: Customer trust is significantly related with customer repurchase intention.

Customer satisfaction is a state of mind that derives from the consumption related feelings like contentment, revelation while shopping from particular stores (Belanche, Casalo, & Guinaliu, 2012). Customer satisfaction is an artifact conceived with both affective and cognitive experiences (Oliver, 1997). While many of the studies mentioned that customer satisfaction (Shim et al., 2001; Nesset, Nervik, & Helge-

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

sen, 2011) and trust (McCole, Ramsey, & Williams, 2010; Toufaily, Souiden, & Ladhari, 2013) are the notable antecedents of the repurchase intention in online shopping. Further, the relationship between these two antecedents have established well by (Cronin, Brady, and Hult, 2002; Ha & Perks, 2005; Ha, Janda, & Muthaly, 2010). Very specifically, in the context of online grocery shopping, customers order the perishable goods like fruits, vegetables, meat and so on, believing that the online retailers will select worthy products and have they supplied it in a stipulated time. It is therefore discussed that customers who have experienced the satisfied transaction with their online grocery purchase will have higher levels of trust. Therefore:

H2: Customer trust is significantly related with customer satisfaction.

The notion of customer loyalty is administered in the present research as customers' optimistic attitude on the repurchase of grocery products. The relationship between customers trust and customers loyalty has assessed in different ways by various researchers previously. However, some of the studies have taken these variables as antecedents of customer satisfaction (Ok et al., 2005). But, still these two factors having room for further analysis since researchers come up with different outcome. While, Ok et al. (2005) mentioned that there is no significant relationship between customer trust and customer loyalty while buying things from offline stores. On the other hand, Kim and Han (2008) have established that customer trust to have an influence on customer loyalty through the data collected from online customers. Moreover, trust is a long-term orientation and onward looking in nature, then it can be analyzed logically that the trust having an influence over customer loyalty in the online retail sector (Caceres & Paparoidamis, 2007). Hence;

H3: Customer trust is significantly related with customer loyalty.

Customer Loyalty

Customer loyalty is an important domain in marketing research (Bodet, 2008). It acts as a key driver in the success of online trading (Reichheld & Schefter, 2000). Loyal customers have a strong commitment, high fondness and more affection for their chosen retailer. They also propagate more positively through word-of-mouth endorsements, never switching to rival brands, having high tolerance even in-service failure, and ready to pay the even higher price for their retailer's products (Wien & Olsen, 2014). Thus, it shows that customer faithfulness is being the success cue for online trading and also supports to attain sustainable growth, generate profits and a valuable asset to the retailers (Zeelenberg & Pieters, 2004). Similarly, Yang and Peterson (2004) revealed that loyal customers help in attracting and attaining more customers to the firm, excuse the customer service mishaps, never mind price fluctuations and being a resource for perennial profits. Customer loyalty is optimistically influenced firms to attain profits and sustainable growth (Oyvind, 2006). Customer loyalty has influenced by two approaches such as behavioral and attitudinal (Yi & La, 2004). According to behavioral approach, loyal customers are one who continuously buys a specific brand without having any brand-related information (Brunner et al., 2008). Thus, behavioral approach defines the loyalty as buying regularity or quantity of purchase of particular brand (Tellis, 1988). Bettencourt, (1997) has criticized that since the real customer loyalty is a behavior centric, it is very difficult to distinguish between original and fake loyalty, hence, experts have added an attitudinal attribute along with the behavioral one (Bodet, 2008). As per attitudinal approach, loyal

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

customers have high psychological bonding and positive approach towards particular retailer (Rauyruen & Papassapa, 2007). In the same way, customer loyalty creates a desire to have an association with a service provider (Wieseke, Alavi, & Habel, 2014). Therefore:

H4: Customer loyalty significantly affects customer repurchase intention.
H5: Customer loyalty significantly affects customer satisfaction.

Customer Satisfaction

Satisfaction is a feeling that makes a customer happy about particular products or services after purchase, and it fulfills their expectations. State of mind of a buyer towards the goods or services purchased to fulfill his or her needs and wants. It is an outcome of positive words from the customers on to the goods or services sold by the firm and encourage them to praise or being a favor to it. If the customers not happy with goods or services, he or she will behave negatively and reduce purchase gradually. Contrary, if customer satisfied with the purchased goods or services, it will push them repurchase intentions, and increase the sales accordingly (Kahneman & Tversky, 1979). Parasutaman et al. (1985) said that customer satisfaction and post-purchase behavior have a considerable impact on repurchase intentions. Jong-Kun Jun (2003) similarly said that higher the satisfaction would turn the customers towards repurchase intentions. Online customer satisfaction is the extent to which customers have satisfied in the earlier dealings with particular online store (Anderson,2003). Hence:

H6: Customer satisfaction significantly affects the customer repurchase intention.

Repurchase Intention

Purchase intention is an outcome of a customer's justification towards the goods, bought from particular retailer (Lacey, Suh & Morgan, 2007). Prior research works have provided the evidence that customer satisfaction having a positive relationship with customers' repurchasing plan (Mittal & Kamakura, 2001; Yu Dean, 2001). Though, many researchers criticized this relationship (Seiders et al., 2005; Yi & La, 2004). Regardless of different perceptions, there are researches that explained the association betwixt customer satisfaction and re-buying plan (Magi Anne, 2003; Yi & La, 2004). In order to examining how customer satisfaction does relate to repurchase intention, a lot of possible mediating factors have been analyzed. Seiders et al., (2005) have analyzed the customer participation with different socio-economic factors. Bloemer and Ruyter (1998) have analyzed the concept called elaboration and found that it is a more useful tool for assessing the customer satisfaction after purchase. Because, elaboration path has emotional, and attitudinal aspects are influencing purchase intention.

Research Framework

Based on the review of the literature and the discussion made previously, research framework has developed and it explains the relationship between research factors. Figure 1 pictures the relationship between repurchase intention and research factors such as customer trust, customer loyalty, and customer satisfaction.

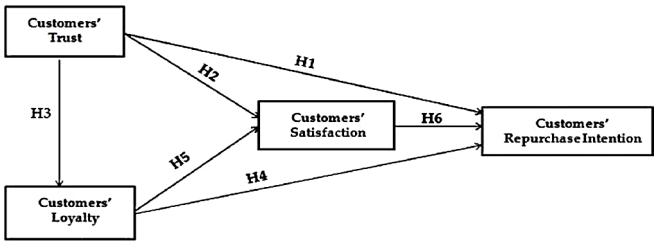
Figure 1. Research framework



RESEARCH METHODS

Measurement Development

For developing the measurement items, earlier studies were reviewed and from which measures were adapted. With a view to identify and avoid complications in the study, pilot test as well as the pre-test, was conducted with the prepared questionnaire by choosing the persons with online purchasing experience. The purpose of the pilot study is to provide information about the extent to which data collection could be anticipated to include and forecast the complicated items to be complete (Quinones et al., 1998). By using 20 university graduate students, sequence of the questions, logical consistency, the possibility of understanding and contextual coherence were assessed for refining the questionnaire. According to the results of the pilot study, the length of the questionnaire has shortened, since the longer questionnaire pressured the respondents in filling up the data and it leads to decline in the quality of data. Hence, some of the items were removed from customer trust, loyalty, satisfaction, and repurchase intention constructs.

At last, the finalized questionnaire was with 17 items under four constructs. Further, based on the comments received from the students, some of the minor modifications were made in the questionnaire. Thus, the pre-test was conducted with 117 online shopping customers in order to ensure the relevance and quality of measurement items and to establish the evidence to the proposed model. It could see from the results that, the value of factor loadings was ranged between 0.731 to 0.827, composite reliability values were ranged between 0.79 to 0.86, the values of correlation coefficient ranged between 0.43 to 0.76, and the average variance extracted value was ranged between 0.62 to 0.76. Thus, all the variables were significant, and it indicated that the finalized questionnaire was fit for formal data collection and analysis.

Thus totally 17 items were finalized under four constructs. Three items were used to measure customer trust and they adapted from Gefen (2000). Customer loyalty was measured with five items adapted from Zeithaml et al. (1996). For measuring customer satisfaction five items were developed based on Anderson and Srinivasan (2003). Finally, four items used to measure the repurchase intention of online stores and they were adapted from Kim et al. (2012) and Parasuraman et al. (2005). (Please refer the appendix for questionnaire related items). Followed by the five-point Likert scaling technique with raking ratings from strongly disagree (1) to strongly agree (5) was used to measure all constructs.

Data Collection Procedure

The survey was conducted between January 2018 and March 2018. The proposed research model was analyzed with the help of the data were collected from 645 online customers who have online shopping

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

experience in Seoul, South Korea. Data for the present study were collected by random sampling technique, through online mailing method and contacting the persons directly. To ensure and validate the responsiveness of the respondents, it was mentioned in the demographic information page that, since the study is online grocery products purchase intention oriented, consumers those who have purchased the grocery products already in online stores, only eligible for filling the questionnaire. Thus, totally 700 online customers were contacted by both methods. Out of which 682 filled questionnaires were returned to us. While checking the received questionnaires, many of them were seen as improper information or with missing information and dual marking. And such kind of invalid questionnaires were omitted, thus, 645 questionnaires were found with valid information and they have included from 682. Thus, it could see that, the study has received 94.57 percent of the respondents' responses from the survey and it showed that involvement of the respondents in this research and this encouraged us to precede further analysis.

As far as the research questionnaire is concerned; it begins with the purpose of the study and confidentiality promise that the personal details will be used only for academic research purpose. The second part of the questionnaire consist the demographic profile of the respondents and it has presented in Table 1.

Table 1. Demographic profile of the respondents

Measurement Variables	Items	Number of Respondents	Percentage
Gender	Male Female	314 331 645	48.69 51.31 100.00
Age	18-25 26-30 31-35 >36	65 108 292 180 645	10.08 16.74 45.28 27.90 100.00
Education	Upto High School Graduates Masters	124 363 158 645	19.23 56.28 24.49 100.00
Position	Student Employed Housewife	113 374 158 645	17.51 57.98 24.51 100.00
No of Times online purchase made in the past Three months	1-2 3-5 6-10 11+	121 252 149 123 645	18.75 39.06 23.13 19.06 100.00

Note: $n = 645$

With a view to validating the representativeness of the given sample, it was matchup with the sample of online customers. According to Statista's report entitled 'Online shopping penetration in South Korea 2015, by gender' (2015), the greater part of the online shopping consumers is female in South Korea (57.1percent). This result also supported by the Live Republic of Korea population (2018) that out of the total population (50.2percent) is female. Thus, the majority of the study sample was female (51.31

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

percent). Since in Korea, housewives are being the household representatives and thus they have been purchasing the grocery products more. Thus, the majority of the study sample was female (51.31) and it proved that the sample size was justifiable one in terms of gender. Moreover, infilling up the questionnaire related to shopping, women would have more willingness than men (Farag et al., 2007). Accordingly, this statement should be kept in mind while interpreting the results of this research.

ANALYSIS AND RESULTS

Data Analysis

There are three reasons have influenced this research work to use Structural Equation Model (SEM). The first reason that since SEM is multivariate analysis it estimates the multiple equations simultaneously (Hair et al., 2006). Secondly, in one step process SEM carryout both factor and regression analysis, as it is used to test the structural theory. And finally, based on its major strength, SEM analysis becomes a popular one among the social science researches. Thus, the structural equation modeling was performed by utilizing partial least squares (PLS) graph 3.0. Because, PLS is a specially recommended method for exploratory research and allows the modeling of latent constructs with both formative and reflective indicators. In addition, PLS is more appropriate when the objective is to predict and investigate relatively new phenomena (Chin, 1999; Palos-Sanchez et al., 2017). PLS examines both measurement model as well as structural model and supports to the concealed constructs to be the determining or reflective indicators. Thus, for testing the model, each and every construct were modeled as reflective.

Measurement Model

Reliability, validity and discriminant validity were evaluated in order to test the adequacy of the measurement model. With the help of composite reliability (CR) values, the reliability test was performed. It was understood from Table 2 that, the composite reliability values of each variable were more than 0.7 and this indicates that it is a commonly accepted level for performing explanatory research. According to Fornell & Larker (1981), there were two criteria have been followed to test the convergent validity of the measurement scales. The first criterion was, indicator loadings should be more than 0.7 and they should statistically significant. The second reason was each constructs' average variance extracts should be more than (0.05) the variance due to the measurement error for that constructs.

It could be seen from Table 2 that items of each constructs' CR value is more than 0.7 thus it supports to accept the items convergence. Moreover, the AVE values of each construct are more than 0.5. Thus, the convergent validity's two conditions were fulfilled.

With a view to assessing the extent to which one construct is differ from another; the discriminant validity test was administered on constructs. According to Fornell and Larker (1981), two kinds of tests were used in this process. The first one was used to assess the cross-loadings and their correlation among the measurement constructs. The second one was used to assess whether the square root of the AVE was more than the relationship between one construct to remaining other constructs of the model. According to Hanseler et al., (2009) a construct should have more variance with its measurements than with other constructs. To satisfy this condition the square root of the AVE should be larger than the square of correlation among the constructs and the remaining constructs. Thus, the condition became true for

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

all the latent variables and it will be clear from Table 3. Hence it is concluded that the constructs have shared more variance with their indicators than the other constructs (Hanseler et al., 2009) and thus discriminant validity was confirmed based on the analysis.

Table 2. Validity and reliability results of the test variables

Variables	Indicator	Validity Test		Reliability Test		
		Loading Factor	Conclusion	AVE>0.5	CR>0.7	Conclusion
Customer Trust	CT3 CT2 CT1	.796 .769 .721	Valid Valid Valid	0.581	0.824	Reliable
Customer Loyalty	CL4 CL2 CL3 CL1 CL5	.712 .723 .687 .674 .684	Valid Valid Valid Valid Valid	0.605	0.806	Reliable
Customer Satisfaction	CS1 CS4 CS3 CS5 CS2	.731 .712 .700 .695 .689	Valid Valid Valid Valid Valid	0.565	0.837	Reliable
Repurchase Intention	RPI1 RPI4 RPI2 RPI3	0.714 0.673 0.731 0.706	Valid Valid Valid Valid	0.541	0.819	Reliable

Table 3. Discriminant validity

Constructs	CT	CL	CS	RPI	Mean	STD
CT	0.610				3.26	0.89
CL	0.420	0.642			3.01	1.03
CS	0.561	0.406	0.575		3.22	1.07
RPI	0.527	0.475	0.442	0.566	2.98	0.99

CT - Customer Trust; CL - Customer Loyalty; CS – Customer Satisfaction; RPI – Repurchase Intention

Analysis of the Structural Model

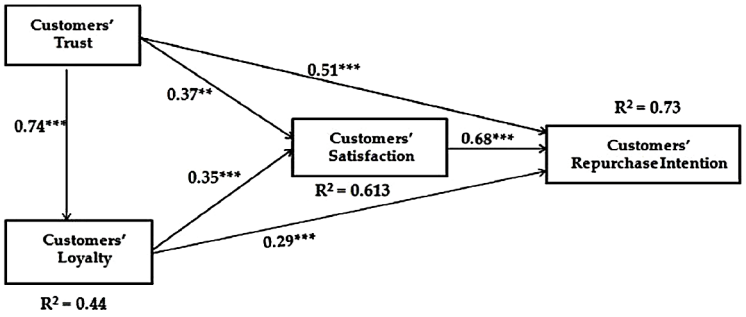
Path coefficient (β) explains the level to which predictor variables support to the internal variables' explained variance. With the multiplication value of path coefficient and the correlation coefficient of two factors, it can be measured that the variance explained in endogenous constructs by other latent variables (Falk and Miller, 1992; Palos-Sanchez et al., 2017). Chin (1998) mentioned that the path coefficient result can be accepted when the value of β is > 0.2, moreover the result will be desirable when the β value >0.3. By this way, the proposed research hypotheses were compared.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

In any case, the evaluation of standardized coefficients must be supported by some valid measurements and it should describe the statistical significance of the results and the quality of adjustments performed (Palos-Sanchez et al., 2017). With a view to measuring the quality of adjustments, the't' statistics has been used in the present study. And the study has adapted bootstrap resampling test values from Palos-Sanchez et al., (2017) and they have been used as reference for testing the statistical significance of the study results. In which t = 1.647 ensures the results as 95% of the confidence, while t=2.333 guaranteed for 99% and t = 3.106 for 99.9%. The values fall in this region along with standard regression coefficients, have been collected and presented in the Table 4. Thus, hypotheses were analyzed with proposed research model.

Chin (1998) used the R^2 values of 0.67, 0.33, and 0.19 as strong, moderate and weak respectively for assessing the predictive power of the model by way of the variance explained. Further, Falk and Miller, (1992), mentioned that, though the hypothesized relationship of the variables is statically significant, its predictive level will be very low when the R^2 values are less than 0.1. Thus, the predictive, as well as the explanatory power of the proposed model, was assessed by the percentage of total variance explained.

Figure 2. SEM analysis of the research model



It was found from the model that, when the customer trust was used to predict the loyalty of the customers towards internet shopping, it explains 47 percent of the variance. Followed by, both customer trust and customer loyalty explains 61.3 percent of the variance in customer satisfaction. At last, the R^2 obtained by repurchase intention of online stores explain 73.1 percent of total variance, since it was a dependent variable. It could be understood from the model that, the predictive power of the internal variable was moderate, while customer satisfaction was moderately strong (Chin, 1998). Since the endogenous variables' R^2 value was more than the threshold value of 0.01, it confirmed the predictive value of the model (Falk and Miller, 1992).

Path Analysis and Hypothesis Testing

Table 4 presents the summary of hypothesis testing. Structural equation model (SEM) was used to analyze the proposed research model. Results indicated that model was fit and thus t-test was performed to test the hypotheses.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 4. Summary of hypothesis testing

Hypothesis	Paths	Path Coefficient (β) p = >0.2	*t*-Value	Result
1	Customer Trust → Repurchase Intention	0.51	6.737***	Supported
2	Customer Trust →Customer Satisfaction	0.37	2.721**	Supported
3	Customer Trust → Customer Loyalty	0.74	9.473***	Supported
4	Customer loyalty → Repurchase Intention	0.29	7.921***	Supported
5	Customer loyalty → Customer Satisfaction	0.35	4.215***	Supported
6	Customer satisfaction → Repurchase Intention	0.68	3.088***	Supported

Note: *p < 0.05 = 1.647; **p < 0.01 = 2.333; ***p < 0.001 = 3.106

According to Table 4 and Figure 2, it could see that every hypothesis was supported to the study. Based on the standardized coefficient values, customer trust ($\beta = 0.37$, $t = 2.72$, $p < 0.01$) and customer loyalty ($\beta = 0.35$, $t = 4.215$, $p < 0.001$) were seems to be statistically significant and positively affect the customer satisfaction. Thus, H2 and H5 were supported to the study. On the other side, customer trust positively affects customer loyalty, while $\beta = 0.74$, $t = 9.473$, $p < 0.001$. Hence, H3 also supported the study. H1 customer trust with the path coefficients of $\beta = 0.51$, $t = 6.737$, $p < 0.01$ and H4 customer loyalty with $\beta = 0.29$, $t = 7.921$, $p < 0.001$ have a positive relationship with repurchase intention of the online store. Thus, H1 and H4 were also supported by the study. The last hypothesis, H6 found that there was a significant relationship between customer satisfaction and repurchase intention of the online store, since the $\beta = 0.68$, $t = 3.088$, $p < 0.001$.

DISCUSSION AND CONCLUSION

The present research aimed to examine the factors affecting customer repurchasing behavior of grocery products in online stores in South Korea. For this, the relationship among customer trust, loyalty and satisfaction towards the repurchase intention of online stores were analyzed with the proposed research model. Thus, the research contributes the literature with manifold effects of antecedents of online stores' repurchase intention. It was understood from the results of the research that, the targeted research variable customer satisfaction was positively influenced by both customer trust and customer loyalty. Through this study, we have empirically established that customer trust plays an important role in ensuring customer satisfaction. The same result also consistent with the earlier studies by (Ganesan, 1994; John and Reve, 1982; Johnson and Grayson, 2005) that higher customer trust leads to highest customer satisfaction. Hence, with a view to increasing customer satisfaction, online stores should take necessary steps to increase customer trust. The constructs of customer loyalty and satisfaction were connected conceptually in this study and the finding reveals that customer loyalty is an important antecedent in determining customer satisfaction. The result is validated and also supported by the previous study results of Liu (2007) and Kim et al. (2009). Therefore, with a view to satisfying the customers, online stores should be loyal to their customers by delivering on their promises.

Customer trust is positively related to customer loyalty in this study. This result is consistent with the study by (Chinomona & Dubihlela, 2014) that higher level of customer trust is leading to higher

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

level of customer loyalty. Hence, to increase the loyalty of the consumers, online retailers should first increase the customer trust. Further, customer trust and customer loyalty have a statistically significant relationship with repurchase intention of the online store. From this work, our finding implies that customer trust one of the significant factors that increase customer repurchase intention to some extent and this findings reliable with the study by (Aren, 2013) that higher level of online repurchase intention is possible, only when increasing the customer trust. Therefore, with a view to increasing customer trust, online stores should provide good quality products with the right quantity, the right price at right time. The finding of the customer loyalty is concerned, it is consistent with the study by (Eisingerich and Bell, 2007) that customer loyalty is an important and a predominant factor that determines repurchases intention of the customers. Hence, to increase the repurchase intention of the customer, online retailers should improve customer loyalty, by displaying a variety of goods to new customers and offer a lot of incentives to existing customers. Customer satisfaction has made a positive impact on repurchase intention and it understood from the result that customers who have satisfied with the services provided by the retailers, would have repurchase intention over the same retailer. Thus, the result of this study suitable to (Pleessis, 2010; Shin et al., 2013; Moosakhani et al., 2010) and mentioned that customers who are satisfied with the functioning of online stores would have a positive mindset towards repurchase intention. From the overall observation it is concluded that, though all the variables have supported to the study, customer satisfaction (0.68 percent) is strongly influence the customer repurchase intention in the study area. Followed by customer trust (0.51 percent) stood in the second position and it influence customer repurchase intention moderately. Finally, customer loyalty (0.29 percent) also influences customer repurchase intention, but it seems to be very weak compared to other two variables. Hence, the South Korean online grocery vendors should concentrate more on the activities needed to improve customer loyalty.

From the findings of the study, we have drawn some implications for practitioners. As mentioned in the model, there are three attributes namely customer trust, loyalty and satisfaction have made impact on customer repurchase intention of the online stores. As far as the repurchase intention of the online stores is concerned, customer trust is an important influencer and it influences the customer to intend online repurchase and customer loyalty is another important factor. Therefore, online retailers should first try to increase customer perceived trust as much as possible towards online stores. With a view to increase perceived trust among the customers, online retailers must concentrate on customer data safety and security; ensure the payment systems with highest security and also updating the customer privacy policies time to time. Moreover, the online retailers should concentrate more on customers support activities by keep in touch with them round the clock. Thus, the online retailers may increase the customer perceived trust. Customer loyalty is another antecedent of the repurchase intention of the online stores. Hence, online retailers should provide promotion offers, special discounts, gift vouchers, coupons to the existing customers and thus stores may intend them to repurchase. According to the study, customer satisfaction has shown as one more important antecedent of repurchase intention of online stores. With a view to satisfying the customers, online stores should offer better quality products with right quantity and price, ensuring on time delivery, free shipping if possible. By this way online retailers may satisfy and impress their customers and intend them to repurchase.

There are limitations in this study. The first one is, research data were collected from online purchasers who live in Seoul the capital of South Korea, and hence the study may not represent the views of all the online purchasers in South Korea. Since, majority of the respondents are female in this study, the findings of the study more depend on female representation. Future research may collect more data from

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

online shoppers who are living in other parts of South Korea and can conduct a cross-cultural study. Since the present study limited its coverage with three research variables, future researchers may add more variables and develop a comprehensive research model with the factors that may affect repurchase intention of online stores.

Chapter 70
Understanding Egyptian Consumers' Intentions in Online Shopping

Reham I. Elseidi
Ain Shams University, Faculty of Commerce, Business Department, Cairo, Egypt, & Badr University in Cairo, Cairo, Egypt

ABSTRACT

The purpose of this article is to investigate the factors that impact on Egyptian consumers' attitudes and intentions to use online shopping by integrating the technology acceptance models of Davis, and Fishbein and Ajzen's theory of reasoned action. In addition, other variables will be added such as trust and perceived enjoyment for its theoretical framework. A total 306 current internet users in Egypt provided usable responses. Structural equation modelling was employed to test the proposed model and research hypotheses. The findings showed that perceived usefulness, perceived ease of use, trust and perceived enjoyment were the significant predictors of attitude toward online shopping; whereas, attitude, perceived usefulness and perceived enjoyment were the most important factors affect the behavioural intention toward online shopping. The article provides some useful suggestions for the practitioners within the online shopping field.

INTRODUCTION

Internet is the rapidest growing media during the past decade. With the increase in the numbers of humans are gravitating in the direction of greater extensive use of the internet because the accessibility of era, the availability of records, and the capability to have interaction through the internet growth and evolve. Obvious abilities of the net include avenues for amassing records, purchasing a product, or rendering a carrier (Shanthi and Kannaiah, 2015). According to the Internetworldstats report (2017) internet users in Egypt has almost reached 36.5% by the end of March 2017. Over half of internet users use e-commerce service, ranging from buying products and services to paying bills online. Electronics are the most popular products purchased online followed by software, whereas website subscriptions and

airline ticket bookings are the top services paid online. The average spending per e-shopper was $641 USD in 2017 and Pay fort's report on the State of Payments in the Arab World, says that ecommerce will reach 2.7 billion USD by 2020.

Online shopping with no doubt the future trend, which is growing rapidly in Egypt; it was driven rapidly by the increase of computer accessibility and the take up of broadband. Actually, it becomes essential to understand the Egyptian consumers toward online shopping.

THEORETICAL BACKGROUND

Technology Acceptance Model

The Technology Acceptance Model (TAM) is an information systems theory which derived from the Theory of Reasoned Action (Fishbein &Ajzen, 1975) to use in the field of Information Systems (IS) in order to explain technology acceptance behaviour (Davis, 1989; Davis et al., 1989; Venkatesh et al., 2003). Technology Acceptance Model was initially introduced by Davis (1986) and tested by Davis et al., (1989) to explain computer usage behaviour and accepting a particular "Information Systems Product" in a job context. The TAM theory postulates that perceived usefulness and perceived ease of use determine the individual's intention to accept and use an information system, which in turn influences the individual's actual behaviour. In fact, this theory has been successfully applied to many research settings in explaining and exploring the factors affecting consumers' acceptance of various types of technology such as mobile settings (Lee et al., 2007; Zhou, 2011), technology based services (Wu et al., 2005; Lu et al., 2009; Lin et al., 2011), internet banking (Al Sukkar and Hasan, 2005, Celik, 2008), tourism setting (Kim et al., 2008; Metawie and Elseidi, 2015, Agag & El-Masry, 2016; Lin et al., 2010). In the e-commerce setting, numerous studies have validated the TAM model's robustness in predicting and explaining consumers' adoption and acceptance of new technology (Huang, 2008; Al Sukkar and Hasan, 2005, Li et al., 2017), including the online shopping (Lim and Ting, 2012, Yulihari et al, 2011; Lei, et al., 2002; Hassanein and Head, 2007; Lim, 2015; Lee, 2009; Albarq, 2014; Vijayasarathy, 2004; Wang, 2011; Chen et al., 2002). Although TAM model has been studied within the online shopping to understand and predict consumers' behaviour to use or purchase from a website shopping, other factors such as trust and enjoyment have been extended to the original TAM in order to explain better consumers' behaviour cross various online situations (Davis et al., 1992; Pavlou, 2003; Gefen, et al., 2003; Yu et al., 2005; Hassanein and Head, 2007; Ha and Stoel, 2009; Lim, 2015; Akroush and Al-Debei, 2015; Lee, 2009). Thus, the extended TAM model is appropriate framework for the present study.

RESEARCH MODEL AND HYPOTHESES

The main objective of this study is to examine factors influencing consumers' intention to use the online shopping. This study developed a model comprising the extended technology acceptance model TAM (Davis et al., 1992; Pavlou, 2003) and the theory of reasoned action (TRA; Fishbein and Ajzen, 1975) by incorporating trust, enjoyment and subjective norms in the development of a theoretical model to understand better the behaviour intentions for the Egyptian consumers within the context of online shopping. Figure 1 shows the model, which is based on the extended TAM constructs and postulated relationships.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

TAM and TRA

Both of the theory of Reasoned Action (TRA, Fishbein and Ajzen, 1975) and the Technology Acceptance Model (TAM, Davis, 1989), were employed as theoretical frameworks to measure beliefs and predict consumer behaviour either in general or in e-commerce. Based on TAM, an individual's attitude toward a technology is directly affected by his/her perceptions or beliefs about the system, which consists of perceived usefulness (PU) and perceived ease of use (PEOU). In turn, the individual's attitude either positive or negative will affect his/her behavioural intentions to use that technology which leads to its actual use (Davis, 1989; Davis et al., 1989). Building on TAM, Perceived usefulness (PU), defined as "the degree to which a person believes that using a particular system would enhance his or her performance", which directly influences both individual's attitudes and behavioural intentions to use that system, while Perceived ease of use (PEOU), defined as "the degree to which a person believes that using a particular system would be free of effort", which has an indirect effect through perceived usefulness and attitude on the behavioural intentions (Davis, 1989; Davis et al., 1989).

Regarding the e-commerce field, specific online shopping, numerous studies have verified the causal relationships among perceived usefulness (PU), perceived ease of use (PEOU), attitude, and behavioural intentions (Venkatesh and Davis, 2000; Moon and Kim, 2001; Wu and Ke, 2015; Lee, 2009; Lim and Ting, 2012; Chen et al., 2002; Yulihasri et al., 2011; Yu et al., 2005; Kim et al., 2009; Vijayasarathy et al., 2004; Ha and Stoel, 2009; Yaghoubi and Bahmani, 2010; Metawie and Elseidi, 2015). The findings of these studies all supported the assumptions proposed by TAM: that is, behavioural intentions would be determined by perceived usefulness and attitude, while attitude would be determined by both perceived ease of use and perceived usefulness, and perceived usefulness would be determined by perceived ease of use. Consequently, PE and PEOU are considered to be the most robust components in TAM to explaining and predicting the individuals' attitudes and behavioural intentions to use a particular technology.

Therefore, in accordance with the TAM, this study will test the relationships among these variables:

Hypothesis One: Consumers' attitudes toward online shopping has a direct and positive effect on consumers' behavioural intention to use the online shopping

Hypothesis Two: Perceived usefulness has a direct and positive effect on consumers' behavioural intention to use the online shopping

Hypothesis Three: Perceived usefulness has a direct and positive effect on consumers' attitudes toward online shopping

Hypothesis Four: Perceived ease of use has a direct and positive effect on consumers' attitudes toward online shopping.

Hypothesis Five: Perceived ease of use has a direct and positive effect on perceived usefulness.

However, the theory of Reasoned Action (TRA) underlines that both the attitude towards a particular behaviour and subjective norms have an impact on behavioural intentions, which in turn affects the actual behaviour, the original TAM model dropped the subjective norms from its model due to some theoretical concerns and psychometric problems (Davis et al., 1989; Celik, 2011). Nevertheless, several scholars have proposed modified TAM model by adding subjective norm as an antecedent of beliefs and the behavioural intentions to use a specific technology (Davis, et al., 1989; Taylor and Todd, 1995; Lucas and Spitler, 1999; Malhotra and Galletta, 1999; Karahanna and Straub, 1999; Venkatesh and Davis, 2000; Venkatesh and Morris, 2000; Yu, et al., 2005; Schepers and Wetzela, 2007; Venkatesh and Bala, 2008,

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Kim et al., 2009). For instance, Venkatesh and Davis (2000), extended the original TAM by incorporated additional constructs such as social influence which includes subjective norm, voluntariness and image and cognitive instrumental process with two moderators' variables (experiences and voluntariness) to introduced TAM2. They tested the impact of the three interrelated social factors on the user's behaviour to use or to reject a particular information system. The findings of their study showed that subjective norm had a significant direct effect on usage intention when system use was perceived to be mandatory, but not when system use was perceived to be voluntary. Additionally, they found that subjective norm had a strong significant on perceived usefulness. These results aligned with Karahanna and Straub (1999) who found a strong relationship between social influence and usefulness perceptions, but insignificant on system use. They indicated that social influence affects usage indirectly via the process of internalization by strengthening one's belief in the usefulness of the system.

Concerning the e-commerce context, the effects of subject norm on perceived usefulness and behavioural intentions have been widely studied (Bhattacherjee, 2000; Yu et al., 2005; Kim et al., 2008; Kim et al., 2009; Celik, 2011; Nasri, 2012; Abbad, 2013; Mandilas et al., 2013; Srinivasan, 2015; Kalinic and Marinkovic, 2016). They have revealed that subjective norm plays an important role in explaining and predicting behavioural intentions for technology use either direct or indirect through perceived usefulness.

Besides, Malhotra and Galletta (1999), examined the three different processes of social influence in term of compliance, Identification and internalization on users' attitudes and behavioural intentions to use and adopt a certain technology. The findings of their study, show a positive influence between two types of social influences (internalization and identification) on the users' attitude toward the acceptance and use of the new system, whereas, compliance have a negative influence on the attitude. Further, Schepers and Wetzels, (2007), underscored that when a person perceives that important referents think he or she should use the system, he or she assumes the referent's beliefs, generating a sense of belonging on the part of the user. They found the subjective norm had a significant and positive effect on attitude to use.

Within the e-commerce context, Kim et al., (2009) emphasized the effect that subjective norm has on customers' attitude to use the airline websites. On the basis of the aforementioned discussion the following hypotheses are presented as below:

Hypothesis Six: Subjective Norms has a direct and positive effect on perceived usefulness.

Hypothesis Seven: Subjective Norms has a direct and positive effect on consumers' attitudes toward online shopping.

Hypothesis Eight: Subjective Norms has a direct and positive effect on consumers' behavioural intention to use the online shopping

Trust

It is considered an essential component for all business transactions in which the complexity and uncertainty are existing (Luhmann, 1979, 1988; Pavlou, 2003; Kim, 2008). In the e-commerce context, particular the online shopping, trust has been received much attention by the scholars, due to its importance as a significant factor for dealing with an uncertainty present in the internet environment and the undesirable opportunistic behaviour of online vendors (Gefen et al., 2003; Pavlou, 2003, Wu et al., 2005). According to e-commerce literature, trust can be conceptualized as the perception of the trustworthiness of the vendor and consists of a set of specific beliefs including benevolence, ability, integrity, credibility and predictability that results in behavioural intention (McKnight et al, 1998; 2002; Pavlou, 2002, Gefen et

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

al., 2003; Kim et al, 2004, 2012). Generally, online consumers would like to feel secure and reduce risk, so they expect that the online vendor (web retailers) will act cooperatively to fulfil their expectations and needs, to keep honesty in transactions, and to be capable of delivering ordered goods and/or services as promised without exploiting its vulnerabilities. Following previous research in e-commerce (Gefen, 2002; McKnight et al., 2002; Inghan et al., 2015) this study defines trust as a set of specific beliefs about the trustworthiness of an online vendor or a website retailer.

Trust has been widely incorporated with the TAM model in investigating the acceptance of online shopping setting (Gefen et al., 2003; Wang, 2011; Hsieh and Liao, 2011; Lee, 2009; Pavlou, 2003; Chiu et al., 2009; Yu et al.,2005; Ha and Stoel, 2009). For instance, Gefen et al, (2003) incorporated trust and TAM to develop an integrated model in the online shopping setting They considered trust as a set of specific beliefs includes integrity, benevolence, ability and predictability of e-vendors website and indicated that trust is an antecedent of perceived usefulness whereas perceived ease of use is an antecedent of trust. In the e-commerce context, particularly in the online shopping, several prior studies have confirmed the positive link between trust and the perceived usefulness (Pavlou, 2003; Ha and Stoel, 2009, Lee, 2009; Chiu et al., 2009; Yan et al., 2015; Wang, 2011; Casalo et al., 2011). On the other hand, in their study, Gefen et al., (2003) argued that ease of use the e-vendor's web site is one of the most protruding aspects of appearance in an e-vendor which creating trust in the transactions and reducing the misunderstanding between the customer and the e-vendor. Further to this, Lee (2009) concluded that perceived ease to use has a positive influence on trust in online trading because the PEOU can help promote customers' favourable impressions toward the e-vendors. In the same vein, Wang (2011), found that both of perceived ease of use and privacy significantly explain 80% of the variations in trust. Such this result indicates a fact that PEOU has been well recognized as a basic requirement for system design.

In the e-commerce field, a number of studies (Grazioli et al., 2000; Lee, 2009; Wang, 2011; Casalo et al., 2011; Belanche et al., 2012; Akroush et al., 2015; Agag and El-Marsy, 2016) have underlined the positive direct effect of trust on consumer attitude to engage in behaviour toward an online service provider, because trust in a specific online service provider helps consumers to develop a favourable attitude toward showing a given behaviour. So, trust consider to be one of the most important antecedent affecting the consumers' attitude toward online shopping. Drawing on the aforementioned discussion, the following hypotheses can be proposed:

Hypothesis Nine: Perceived ease of use has a direct and positive effect on the consumers' trust in online shopping websites.

Hypothesis Ten: Consumers' trust in online shopping websites has a direct and positive effect on the perceived usefulness.

Hypothesis Eleven: Consumers' trust in online shopping websites has a direct and positive effect on consumers' attitudes toward online shopping.

Perceived Enjoyment

Davis et al. (1992) considered perceived usefulness as an extrinsic motivation factor whereas perceived enjoyment as an intrinsic motivation factor to use information systems which added to the original TAM model. They defined perceived enjoyment as "the extent to which the activity of using a technology is recognized as enjoyable in its own right, apart from any utilitarian or practical outcomes". in the online context, Childers et al., (2001) suggested that enjoyment is a reflection of hedonic value that affects a

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

consumer's intention to adopt new technology. Previous studies have indicated that perceived ease of use positively affects perceived enjoyment (Davis et al., 1992; Igbaria et al., 1995; Teo et al., 1999; Heijden, 2003; Kim et al., 2009; Agrebi and Jallais, 2015), whereas others have supported that perceived enjoyment positively and directly affects the individual's attitude and behavioural intention to use a particular technology (Davis et al., 1992; Mandilas et al., 2013; Agrebi and Jallais, 2015, Ingham et al., 2015). Heijden (2003) found support for the association of perceived ease-of-use with perceived enjoyment, the easier the system is to use, the more enjoyable it is. In addition, he found that perceived enjoyment had a significant and positive influence on the individual's attitude and intention to use a website.

Regarding the online context, Hassanein et al., (2007) and Ha et al. (2009), found that perceived enjoyment positively affects consumer attitudes to use the online shopping, whereas Ingham et al., (2015) found that perceived enjoyment had a positive and direct impact on attitude and intention toward e-shopping. Generally, a person who feel it easier to use the online shopping websites is more likely to believe that using the online shopping websites would increase his/her enjoyment and get more fun, as well as enhance his/her professional and personal life. Therefore, a person who perceives more fun and more enjoyment with using the online shopping may tend to exhibit more positive attitudes toward online shopping websites and are more willing to use it in the future. In accordance with the previous discussion and literature, the following hypotheses are proposed:

Hypothesis Twelve: Perceived ease of use has a direct and positive effect on perceived enjoyment towards online shopping

Hypothesis Thirteen: perceived enjoyment has a direct and positive effect on consumers' attitudes toward online shopping.

Hypothesis Fourteen: Perceived enjoyment has a direct and positive effect on consumers' behavioural intention to use the online shopping.

Hence, figure 1 depicts the conceptual framework which was developed based on the previous discussions.

RESEARCH METHODOLOGY

Data Collection and Sample

To accomplish the research objectives and examine the research model and hypotheses, the empirical study is based on information gathered through a structured and self-administered online survey given to the Egyptian internet users and not necessarily have much experience with online shopping. The online survey was developed using Kwiksurveys.com one of the easiest and free website to set up the questioners. An online survey is consistent with previous studies within the context of understanding the online shopping behaviour (Chiu et al., 2009; Rose et al., 2012; Wu, 2013; Albarq, 2014; Al-Debei, Akroush and Ashouri, 2015, Akroush and Al-Debei, 2015). The survey was initially prepared in English, but due to the fact that it was conducted in Egypt for the Egyptian internet users. Therefore, it was necessary that the English survey to be translated into Arabic and to ensure that both versions used equivalent meaning. A bilingual professional Arabian translator and the researchers working independently to translate the survey into Arabic. Then, the final version was translated back into English by another bilingual profes-

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

sional translator to ensure that the Arabic survey sufficiently consistent with the English version upon which it was based (Hair et al., 2010). The online survey was posted and transmitted to invite a large number of internet users in order to participate in the survey through the social media networks such as Facebook, WhatsApp, online communities, Links and e-mails. The researchers asked the participants to circulate the survey to their peers through the social media networks. It took place from June to October 2017 and it was reposted several times during this period. Nevertheless, it was difficult to identify the population frame for the internet users and online shoppers. Hence, the data for this study was collected using a convenience and snowball sampling approaches following similar procedures in previous research (Park and Kim, 2003, Al-Debei et al., 2015; Akroush et al., 2015). The unit of analysis was the Egyptian internet users who are highly experienced with the internet. A total of 306 were received and were used for analysis. About the sample, both female and male responded equally to the questionnaire (50%), and at least 41.7% of them were students. The majority of the respondents were in their twenties and thirties, and the vast majority of respondents had been using the internet for more than 6 years (58.2%)and from 4 to 6 years (29.1%) respectively, while 1.3% had been using the internet for less than one year. Most of the respondents stated that they have experienced online shopping before, as about 27.8% of the sample reported that they extremely often bought products and service on online shopping, while 24.2% have never bought any products over the internet and 17% rarely to purchase products through the online shopping websites.

Measures

All measurements items for the current study were developed from previous research in the field of online shopping behaviour. However, before the final questionnaire began, a pre-test of the survey and a pilot study were performed to make sure that the questionnaire easy to understand for the respondents and verify the instruments within the target context. The pre-test involved six experts two marketing professors from reputable Egyptian Universities, two digital marketing specialist who were familiar with the online shopping in Egypt and two online shopper who purchased goods and service over the internet through the retailers' website. Whereas, the pilot study involved 20 undergraduate and postgraduate students who are highly experienced in the internet. As a result, from the pre-test and the pilot study several items were removed and several minor modifications of the wordings and the question items sequence were made to improve the questionnaire clarity.

The formal questionnaire consisted of three parts including 34 items measuring the seven constructs. All the 34 items are scored on a seven –point Likert scale with end points of (1) Strongly Disagree and (7) Strongly agree. The first part asked general questions indicating internet users' patterns of respondents while the third part identifies demographic profile of the respondents including age, gender, education level, and occupation using a nominal scale. The second part, as a key part of the survey, elaborates the dependent variable and independent variables based on the proposed model that would be tested in this study. Ten items adopted from Gefen et al., (2003) and Venkatesh & Davis (2000) measured perceived usefulness (PU) and Perceived Ease of Use (PEOU). Trust in the online shopping website (TR) was measured by five items adopted from Gefen et al., (2003), while the constructs of attitudes toward online shopping (ATT, 4 items) and subjective norms (SN, 3 items) were assessed with measures reported by Hsu et al., (2006) and Bhattacherjee (2000). The eight items used for measuring perceived enjoyment (PE) were adopted from Yu et al., (2005). Finally, the items for the dependent variable behaviour intention to use online shopping websites (IOS) were adapted from Venkatesh and Davis (1996) using four items.

DATA ANALYSIS AND RESULTS

Measurement Model Analysis

Confirmatory factor analyses using AMOS 22 was carried out for testing the measurement model based on the maximum likelihood estimation (MLE). On this basis, a CFA was conducted for each construct, and items loading and internal consistency were examined as a test reliability. Items that had communality scores greater than 0.5 was considered acceptable, and less than that were removed (Hair et al., 2010). Thus, as a result of the of CFA and modification indices of indicator variables, 12 items were omitted from all the constructs (one item from each of the following constructs: perceived usefulness, attitude toward online shopping, subjective norm and intention to use online shopping, two items from perceived ease of use, two items from trust and four items from perceived enjoyment). Table 1 demonstrates the final results of CFA which consisted of seven factors with only 22 items that loaded significantly on their respective constructs and all the measures exceed the aforementioned value, with composite reliability values are higher than the recommended value of 0.70 and the average variance extracted (AVE) for all the constructs were greater than the minimum criterion of 0.50 (Fornell and Larcker, 1981) ranging from 0.510 to 0.641indicating high internal consistency and convergent validity (Jöreskog & Sorbom,

1993). In addition, Cronbach's alpha ranged from 0.740 to 0.815 and exceed the acceptable value of 0.70 (Nunnally, 1978) and the overall alpha value is 0.90, suggesting good internal reliability (see table 2).

Furthermore, to assess discriminant validity the study was applied Fornell and Larcker (1981) method. Thus, the square roots of AVE for each construct should be greater than the square correlation coefficients between constructs, in order to meet the requirements for satisfactory discriminant validity. Table 2 reveals that the square roots of AVEs were greater than the construct's correlation with others constructs, this implied that the constructs had sufficient discriminant validity. The results of the measurement model test, show strong statistical evidences that the current model displays adequate degree of items reliability and construct validity which suggested that it is suitable to proceed with the evaluation of the structural model.

Table 2. Discriminant and convergent validity of the measurement model

Construct	Number of Items	C.R.	AVE	Cronbach's Alpha α	PU	PEOU	ATT	SN	TR	PE	IOS

Cronbach alpha of all constructs is 0.90

Square roots of AVE are in diagonal italic bold cells.

** Correlation is significant at the 0.01 level (2-tailed).

* Correlation is significant at the 0.05 level (2-tailed).

Structural Model Assessment

Structural equation modelling (SEM) was assessed to test the hypothesized model and the squared multiple correlation (R^2) to evaluate the percentage of variance in the endogenous constructs that could be explained by others previous constructs. The model fit was examined using a variety of the most common indices between the researchers with some suggested guidelines. The results show that the chi-square (χ^2) value of 133.037 with 120 degrees of freedom, was statistically insignificant ($p = 0.196$) which should be >0.05, whereas the Normed chi-square or the chi-square to degree-of-freedom ($\chi 2/df$) was 1.109, which falls within the suggested value of 3 or below (Kline, 2005). Besides, the study had been used also others goodness-of-fit measures to assess the model fit, and the overall fit indices of the measurement model are as follows {GFI (0.96); AGFI (0.93); CFI (0.99); TLI (0.99); RMSEA (0.019); RMR (0.076); PCFI (0.63)}, indicating acceptable fit of the proposed structural model and all the indices are above the threshold levels, Table 3 illustrates the results of these indices.

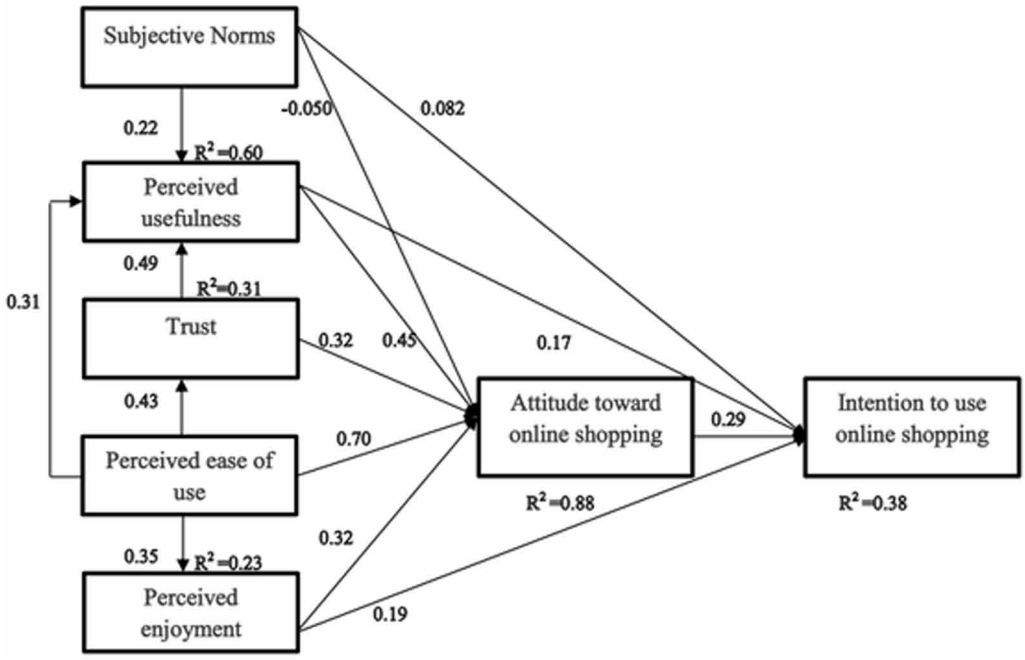
The path coefficients and variance explained (R^2) of the structural model are depicted in Figure 2 and summarized in Table 3. The structural findings disclose that twelve hypotheses out of fourteen are supported, except H7 and H8 which are not supported. Consumers' attitudes toward online shopping ($\beta = 0.290$, $t = 2.384$, $p < 0.05$), perceived usefulness ($\beta = 0.174$, $t = 2.042$, $p < 0.05$), and perceived enjoyment ($\beta = 0.190$, $t = 1.984$, $p < 0.05$), are significantly and positively influencing consumers' behavioural intention to use the online shopping. These results support hypotheses H1, H2 and H14 respectively. Moreover, the squared multiple correlation value (R^2) of 0.38 for the structural equation model indicates that three exogenous constructs (attitude, perceived usefulness and perceived enjoyment) explain 38% of the variance in the behavioural intention to use the online shopping. Meanwhile, subjective norms ($\beta = 0.471$, $t = 0.925$, $p = 0.355$) has positively but not significantly affected intention to use online shopping, providing no support for H8. Consecutively, findings disclose a high explained variance of attitude ($R^2 = 0.88$), which is obtained from the effects received from perceived usefulness ($\beta = 0.454$, $t = 4.891$, $p < 0.001$), perceived ease-of-use ($\beta = 0.695$, $t = 5.351$, $p < 0.001$), trust ($\beta = 0.319$, $t = 2.888$, $p < 0.01$), and perceived enjoyment ($\beta = 0.322$, $t = 3.888$, $p < 0.001$), providing support for the hypotheses H3, H4, H11, and H13, respectively. Whereas, subjective norm has been found negatively and insignificantly affected attitude ($\beta = -0.049$, $t = -0.692$, $p = 0.489$), so hypothesis H7 is

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

not supported. The findings reveal that trust has a stronger and positive impact ($\beta = 0.485$, $t = 5.277$, $p < 0.001$), on perceived usefulness than perceived ease-of-use ($\beta = 0.305$, $t = 3.408$, $p < 0.001$) which also moderately high variance explained ($R^2 = 0.60$). Thus, hypotheses H10, and H5 are supported. Lastly, the results also show that perceived ease–of–use ($\beta = 0.430$, $t = 4.003$, $p < 0.001$), significantly and positively influencing trust toward online shopping, while perceived ease-of-use ($\beta = 0.346$, $t = 4.168$, $p < 0.001$), has significantly and positively associated with perceived enjoyment, confirming hypotheses H9 and H12. In turn, R^2 results of 0.31 and 0.23 respectively, demonstrate that 31% of variation in trust toward online shopping is caused by the perceived ease-of- use, and 23% of variation in perceived enjoyment is determined by the perceived ease-of-use.

Figure 2. The structural model results



DISCUSSION AND IMPLICATIONS

This study aims to shed light on the factors influencing consumers' intention to use the online shopping within the context of the extended TAM. In this respect, the researcher developed a model comprising the extended technology acceptance model TAM (Davis et al., 1992; Pavlou, 2003) by including trust, enjoyment and subjective norms into the research model of this study. The findings have clearly confirmed that the attitude is important construct in influencing consumers' intention toward online shopping. This finding is consistent with those of (Chen et al., 2002; Vijayasarathy, 2004; Wu et al., 2005; Yu et al., 2005; Schepers and Wetzels, 2007; Lee, 2009; Ha and Stoel, 2009; Kim et al., 2009; Kim et al., 2009; Nour, et al., 2010; Yulihasri et al., 2011; Lim and Ting, 2012; Lim, 2015; Agag & El-Masry, 2016). Although, the previous scholars have suggested that the inclusion of attitude in TAM model is not meaningful (Davis, 1989; Davis and Bagazzi, 1989; Venkatesh et al., 2000; Albarq, 2014), however, the results of this

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

study have found otherwise. This study has underscored that attitude is predicted by perceived ease of use, perceived usefulness, trust, and perceived enjoyment respectively. These results comply with many studies within the context of e-commerce specific the online shopping (Taylor and Todd, 1995; Childers et al., 2001; Vijayasarathy, 2004; Yu et al., 2005; Wu et al., 2005; Hassanein and Head, 2007; Ha and Stoel, 2009; Lee, 2009; Kim et al., 2009; Lim and Ting, 2012; Lim, 2015; Chen et al., 2002; Yulihasri et al., 2011; Ingham et al., 2015) Thus, the researcher argue that attitude should be used and included in the current model. Besides, this study showed that perceived ease of use and perceived usefulness are the strongest predictors of consumers' attitude toward online shopping than other factors, while perceived usefulness has a direct and significant effect on behavioural intention to use online shopping and perceived ease of use has a significant effect on perceived usefulness and attitude. These results supported the current study's hypotheses related to the original TAM model, however, perceived ease of use has the most effect on attitude rather than the perceived usefulness. The later finding is inconsistent with TAM model (Davis, 1989) which highlighted the importance of perceived usefulness as a key determinant of users' acceptance of IT and different with many prior studies that studied and examined TAM model either in the information system or the online shopping context (Chilers et al., 2001; Shih, 2004; Yu et al., 2005; Schepers and Wetzels, 2007; Ha and Stoel, 2009; Wang, 2011; Yulihasri et al., 2011; Hsieh and Liao, 2011; Lim and Ting, 2012;). In the meanwhile, this finding aligned with other researchers (Chen et al., 2002; Lee, 2009; Lim, 2015) who reported that perceived ease of use related to the system design and if the internet users have perceived the online system as easy to use or friendly user, they are more likely to have favourable attitude toward this system. Contrary to the relationship implied in TRA model and with others prior studies (Yu et al., 2005; Kim et al., 2009; Schepers and Wetzels, 2007; Nour and Bahmani, 2010; Mandilas, et al., 2013; Ingham et al., 2015) subjective norm was found insignificant on consumers' intentions to use online shopping. However, this result is similar with the findings obtained from previous studies (Davis et al., 1989; Venkatesh and Davis, 2000; Lee, 2009). Venkatesh and Davis (2000), asserted that subjective norm could significantly determine intention to use in a mandatory usage context, but its impact would become insignificant while users are in a voluntary usage context. On the other side, the result of this study shows that subjective norm is an antecedent of perceived usefulness which is consistent with TAM2 (Venkatesh and Davis, 2000) and other studies' findings (Taylor and Todd, 1995; Featherman and Fuller, 2002; Kim et al., 2009; Abbad, 2013; Srinivasan, 2015; Kalinic and Marinkovic, 2016). This result can be interpreted that when a person is willing to perform an action based on strong beliefs, he/she accepts and interprets information from important referents as evidence about reality. Although, the previous finding, however the result demonstrates a negative and insignificant effect on attitude toward the online shopping which is inconsistent with that of Schepers and Wetzels (2007). This could be because attitude toward online shopping is influenced by other antecedents which have much stronger affect than subjective norm. Moreover, the results reveal profoundly the effect of perceived ease of use on trust and the effect of trust on perceived usefulness which confirmed the findings of previous studies (Gefen et al., 2003; Wang, 2011) in online shopping. The finding of this study also, coincides with the results obtained from prior studies in the e-commerce (Grazioli et al., 2000; Ha and Stoel, 2009; Lee, 2009; Kim et al., 2009; Casalo, et al., 2011; Akroush et al., 2015) which have been suggested that trust in the web sites is an important determinant of attitude. It can be concluding that trust plays a dominant role in online shopping context, because consumers are unlikely to shop online if they do not trust the online websites. Furthermore, the findings indicated positive and direct effect of perceived ease of use on perceived enjoyment, whereas, perceived enjoyment have a positive and direct effect on attitude and behavioural intention. These findings conformed the other results that have

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

highlighted the importance role of perceived enjoyment in online context (Davis et al., 1992; Teo et al., 1999; Heijden, 2003; Hassanein et al., 2007; Ha et al., 2009; Ingham et al., 2015). Such findings can be interpreted that when consumers believe that online shopping website is easy to use and do not require a lot of efforts, then, they are more like to have fun and enjoy online shopping, and more willing to exhibit more positive attitudes toward online shopping which in turn affect their behavioural intention to use.

This study has shed light on some important issues related to consumers' attitudes and intention toward online shopping which help marketers to improve the performance of the online shopping websites. First, although that perceived usefulness and perceived ease of use have a significant influence on consumers' attitude, this study reveals that perceived ease of use is more important influential factor than perceived usefulness. This result is particularly important for the marketers that they should ensure that their sites are easy to use, proper, has a good construction, include flexible features such as live customer support and chat rooms for shoppers that formulate favourable attitude towards the online shopping. Secondly, trust can play a critical role in forming consumers' enjoyment and attitude. In order to successfully increase consumers' intention to use online shopping, managers of those sites need to build online trust to creating positive attitude toward online shopping. The findings demonstrated that online shopping mangers can create confidence in their web sites by improving perceived ease of use which in turn affecting and increasing the consumers' intrinsic motivation (enjoyable) then consumers exhibit more positive attitude and have more tendency to using the online shopping.

LIMITATIONS AND FUTURE RESEARCH DIRECTIONS

The study has the following limitations. The first limitation of the current study is that most of respondents are young undergraduate and postgraduate students. Secondly, the study based on the cross sectional which represents a slice of time and does not show how consumers' attitudes and their behavioural intentions may be change over time. Another possible limitation that the study investigated the online shopping in general not a specific web site. Although the aim was to examine factors influencing consumers' intention to use the online shopping, some may not have been included. So, it would be useful for future research to study other variables such as perceived risk, security, privacy concerns, self-gratification, demographic variables and online experience to provide better understanding the factors which might be affect the behavioural intentions to use online shopping. Future research should consider longitudinal studies to investigate the changing of consumers' attitudes and behavioural intentions toward using online shopping over time. Further, cross sectional surveys present nothing more than snapshots leading to get bias results. Therefore, future research may have to test the robustness of this study by repeated regularly to provide more robust results. Future studies are highly encouraged to replicate the model in other context such as mobile commerce which allows users to interact more with others or within the online reviews or advising. Besides, future research could compare online shoppers' and nonshoppers' attitudes toward using the online shopping.

Anthony' Freeman Mensah
University of Education, Winneba, Ghana

Frederick Asare
Kumasi Technical University, Kumasi, Ghana

ABSTRACT

This article seeks to explore factors responsible for the adoption of online marketing by second hand (used) car dealers to sellers in Ghana. A conceptual framework was adopted from the extant literature using the Technology Acceptance Model as a theoretical base. This article adopts a quantitative research approach. Data for the study was obtained from 60 second hand car sellers through a self-administered questionnaire. Findings from this study revealed that factors responsible for online marketing adoption by second hand car dealers in Ghana are: perceived usefulness (marketing online, customer demand and increase productivity; ease of use (ability to upload pictures, interaction with clients, and online vehicles sales) of the platform. The study however, found no significant relationship between IT knowledge of the owner/manager, age of business and adoption of the online technology. This article highlights the importance of technology adoption in business among SMEs from technologically disadvantaged market.

INTRODUCTION

Businesses in the developing world are now harnessing the potential of the internet to position themselves in the electronic marketplace and to expand their market. This is because of the benefits brought about by the new technology. Today, because the Internet can facilitate the quick and efficient movement of

information among trading partners at a greatly reduced cost, business via the internet known severally as electronic commerce, internet marketing, online marketing or electronic marketing has become one of the principal means of doing business. According to Payne (2003) it is transacting or enabling the marketing, buying, and selling of goods and/or information through an electronic media, specifically the Internet.

Indeed, businesses everywhere need to understand the why, when and how to use electronic commerce. In some industries, businesses are learning now that this is no longer an option to consider, but a requirement for survival. As Payne (2003) puts it, businesses in developing countries will soon be affected as significantly as others in the developed economies in utilizing online technologies. In this respect, Kofi Annan former UN Secretary General opined that, the ability of developing countries to adopt e-business can be another opportunity to accelerate economic growth and development.

According to Basu and Muylle (2007), online technology has dramatically changed how companies' business processes are implemented and has also enhanced industry structure and shifted the balance of power between corporations and their suppliers and customers. According to them, companies in every industry have had to evaluate the opportunities and threats presented by the internet. By thinking strategically about online platforms, managers can select technological solutions that support the company's business strategies and create value for the company and its customers (Cote, Vezina & Sabourin, 2005).

Ghanaian businesses are today able to sell and market their products and services thanks to the proliferation of online marketplace platform. There are over a dozen online marketplace platforms in Ghana marketing and selling various items from household items to business solutions. Increasingly a significant number of people in Ghana and in Africa are accessing the Internet. This is really important for the development of the continent as the internet has the potential to spur economic growth thereby reducing poverty on a large scale. Not only are consumers visiting online retail stores to purchase, businesses are also not left out in this virtual marketing. Most businesses are creating various online platforms with incentives to entice consumers to shift to buying from these businesses. The online platform has become an additional channel for businesses to market and sell their excess products.

There has been a plethora of research on online marketing adoption. Most of these studies however are in the developed countries context. There appear to be however paucity of literature on online marketing from Africa and for that matter Ghana. Again, available literature on online marketing focused on consumer adoption of online marketing consumer-oriented research (Hoffman & Novak, 1996; Lynch & Beck, 2001; Novak, Hoffman & Yung, 2000; Wolfinbarger & Gilly, 2002; Xia, 2010); and technology use (Zhou, Dai & Zhang, 2007; Zhang & Von Dran, 2002; Liao & Cheung, 2002; Palmer, 2002; McKinney, Yoon, & Zahedi, 2002). However, there appear to be scarce research on business perspective of online marketing adoption. This study therefore is positioned to fill the gap in research. Accordingly, this study examines the factors responsible for e-marketing adoption by used or second hand car dealers in Ghana. From the foregoing, this study seeks to achieve the following objectives: to:

- Identify the factors that motivate second hand car dealers in Ghana to adopt online marketing to sell their cars
- Explore the effect of company characteristics on online marketing adoption

This paper is set out as follows: the first section of the paper focused on the introductory aspects of the paper; whilst the second section showcases the literature review and conceptual framework. The third

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

portion of the paper is the study methodology whilst the fourth section is the presentation and discussion of the study findings. The paper appropriately closes out with conclusions and recommendations.

REVIEW OF RELATED LITERATURE

Technology Acceptance Model

The innovation and emerging technology adoption literature implies that in order to adopt new technology in developing countries, firms need to be internally and externally ready (Chung et al., 2007). This readiness which is termed e-readiness can be defined as the ability of a company to successfully adopt, use, and benefit from the technology or innovation (Fathian, Akhavan, & Hoorali, 2008). Molla and Licker (2005) demonstrated that in initial adoption of electronic commerce in developing countries, internal (organizational) readiness is significant. The adoption of technology by SMEs is however dependent on two key factors, the perceived usefulness (PU) and perceived ease of use (PEU) of the technology (Dwivedi, Papazafeiropoulo, Parker & Castleman, 2009; Grandon & Pearson, 2004).

The Technology Adoption Model (TAM) proposed by Davis (1989) has been used widely by scholars in examining technology adoption in many fields (see Dennis, 2005). The TAM proposes that, attitude towards using a new technology is influenced by perceived usefulness and ease of use. The TAM is said to have been derived from the TRA (Dennis, Merrilees, Jayadwardhena & Wright, 2008). Usefulness refers to consumers' perceptions that the use of Internet will enhance the outcome of their shopping and information seeking (Chen, Gillenson, & Sherrell, 2002). In a similar model developed by Dennis, Merrilees, Jayadwardhena and Wright (2009), usefulness is incorporated into the image components of product selection, customer service and delivery or fulfillment in the role of functional attributed. Ease of use on the other hand concerns the degree to which e-shopping is perceived as involving a minimum of effort, for example in negativity and clarity (Chen et al., 2002).

PU is the degree to which a person believes that using a particular system would be better than alternative systems in enhancing his or her job performance (Davis, Bagozzi, & Warshaw, 1989). Lim (2010) also contends that the perceived marketing benefits of Internet technologies are pertinent towards the decisions by SMEs to accept and implement online marketing for their business transactions (Iddris & Ibrahim, 2015).

Online marketing adoption is also influenced by perceived ease of use (PEOU) which measures the extent to which an organization believes that investment in technology requires minimum effort (Davis et al., 1989). The complexity of the user interface reduces system evaluation and lessens the intention to adopt specific Internet technologies (Opia, 2008). PEOU has direct and positive impact on perceived usefulness of technology adoption (Venkatesh & Davis, 2000). Moreover, Awa, Nwibere, and Inyang (2010), underscore that PU and PEOU will have significant effects on the adoption of Internet technology by SMEs. As such businesses will adopt technologies that are attuned to their line of business but such technologies have to offer relative advantages (Rashid, 2001).

A noteworthy determinant of technology adoption is the owner-manager's knowledge about Internet marketing. Knowledge could be sourced from the SME operator's network of personal contacts (Elliott & Boshoff, 2007; Poon & Swatman, 1999). Ultimately the spillover of information from users to non-users can positively contribute to the adoption of Internet technologies (Hollenstein, 2004). In a developing economy (including African) context, owners/managers of small firms tend to be extremely

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

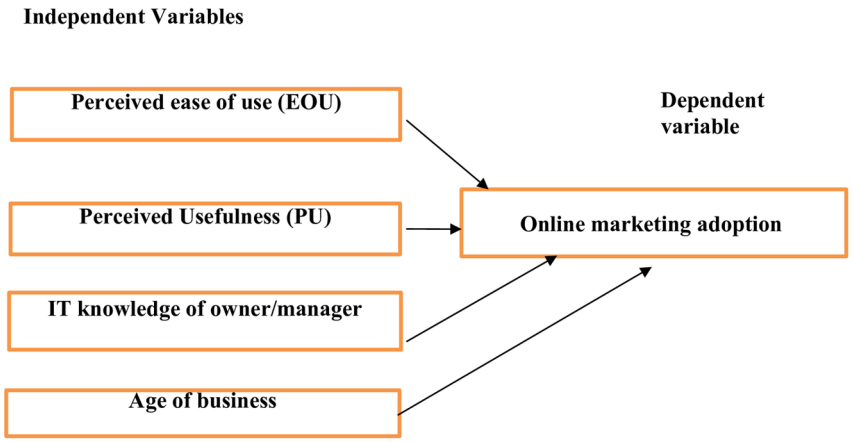
powerful in the decision to adopt/not adopt new technologies. Small business owners do not usually have sophisticated governance structures and therefore any decision that requires substantial capital outlay; usually have to be decided by the owner/manager. In certain cases, owners/managers fall on the advice of a management team.

Conceptual Framework and Model

This current study proposed a conceptual framework for the adoption of online marketing by used or second hand car dealers in Ghana. The framework consists of two main building blocks i.e. online marketing platform and online marketing adoption factors (figure 1). The online marketing platform refers to the online marketplaces that serve as vehicle for businesses to trade their products and services. There are a number of these online marketplaces including tonaton.com, cheki.com, olx.com, kaymu.com and jumia.com. These platforms serve various purposes from selling household products as well as personal products. The online marketing adoption factors according to the conceptual framework for this study are company characteristics and perception. The company characteristics include, age of the business, educational background or experience of the owner/manager, size of the business and age of the business owner/manager. The perception on the other hand refers to the perceive usage of the technology i.e. perceived usefulness and ease of use of the technology. The ease of use of the platform also relates to how easy it is to use the platform in terms of the technology usage. Usefulness of the platform on the other hand relates to how useful the platform is to the owners' businesses in terms of added advantage it gives the business (see figure 1).

Model Development

Figure 1. Conceptual model of the study



Hypothesis Development

On the basis of the dependent and independent variables, the following hypotheses have been developed:

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

H1: Ease of use of the platform would influence online marketing adoption
H2: Usefulness of the platform would influence online marketing adoption
H3: IT knowledge of owner/manager would influence online marketing adoption
H4: Age of the business would influence online marketing adoption

METHODOLOGY

The study adopts a quantitative approach in exploring the e-marketing adoption factors among second-hand car sellers in Ghana. Data for the study was collected via structured questionnaire consisting of both open-ended and close ended questions. The research adopted a cross-sectional design which allows the researcher to draw one or more samples from the population at one time period and was used to provide an in-depth investigation of the relationship between variables (Sekaran, 2000). Since it is a correlational type of design, it establishes a relationship between two variables in each case, i.e. one dependent and the other an independent variable.

Population and the Sample

A target population is any indefinable total set of elements about which the researcher wishes to make inferences (Collis & Hussey, 2009). In Ghana, businesses with employees numbering between 6 to 29 employees with investments below US$100,000 are classified as small businesses. The target population was limited to Kumasi Metropolitan Area in the Ashanti region of Ghana. Kumasi was selected as it's the largest city in terms of land size and population. Sampled for the study were selected using cluster sampling and accidental sampling techniques. First and foremost, since the Metropolis is large, it was divided into six different clusters based on the business nature of these towns. Ten sellers were then selected from each of these clusters using accidental sampling based on the availability of sellers in the area. A total of sixty (60) car sellers were thus obtained for the study. Another criterion used to select these respondents was based on the display of various billboards showing they (car sellers) use a particular online portal to sell. An accompanying cover letter was attached to the questionnaire to highlight the purpose of the study.

The data was collected within three months by the researcher and trained field researchers who were offered a day's training on interview and questionnaire administration. The rationale for selecting a quantitative study was due to its cost effectiveness and easier to administer compared to a qualitative approach (Malhotra, 2010). In addition, quantitative study was selected due to the nature of data to be collected, the time available as well as the objectives of the study that underpin the adoption of online marketing by the sampled businesses.

Instrumentation and Data Collection

The survey instrument was based mostly on scales that were already developed and tested in other markets. A self-administered questionnaire based on the adapted technology adoption scales used by Davies et al. (1989) and Chau (1996). These scales were further validated within the context of e-business adoption among firms in the studies of El-Gohary (2012) and Dwivedi et al. (2009). The questionnaire was divided into two sections, namely; A and B. Section A of the questionnaire primarily obtained demographic

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

information from the respondents. Section B requested information on the online marketing adoption factors. Section C on the other hand assessed the online marketing performance. The items in section B were scored on a 5-point Likert scale which ranged from 1 (strongly disagree) to 5 (strongly agree).

Data Quality Control

For quality control, a pre-test of the research instrument was done to test its face validity from experts and reliability. The questionnaire was checked for accuracy and completeness using the Cronbach's a (alpha) test. George and Mallery (2003) provide the following rules of thumb: "=.9 – Excellent, =.8 – Good, =.7 – Acceptable, =.6 – Questionable, =.5 – Poor, and=.4 – Unacceptable" since Likert scale measures are fundamentally at the ordinal level of measurement because responses indicate a ranking only.

For this study, Cronbach alphas of 0.7 or more were considered significant. Pre-testing was conducted with a convenient sample of five academics in the management and marketing fields in order to ensure that the questionnaire met expectations in providing accurate information, usage of appropriate wording, questioning sequence and to assess the extent to which respondents understood the questions clearly. The pretest also served to determine the anticipated questionnaire completion time. Based on feedback from the pretest, minor revisions were made to the questionnaire and a pilot study was conducted with 10 SMEs.

The questionnaire collected was compiled, sorted, edited, classified, coded into a coding sheet and analyzed using Statistical Package for Social Sciences (SPSS v22.0). The data collected was analyzed so as to have the required quality, accuracy, consistency and completeness. The analysis included correlation to establish the strength and direction of the relationship between the variables.

RESULTS OF THE STUDY

Demographic Characteristics

The results in the tables that follow show the general characteristics of the respondents who participated in the study.

Nature of Business

With regards to the nature of business performed by the sampled respondents; 45% respondents sell cars only; 16.7% buy and sell cars at the same time; 13.7% buy and sell cars; 11.7% sell cars and do car rentals; and 6.7% sell cars and spare parts as well as sell and do maintenance of cars respectively (refer to table 1). Most respondents sell cars and not much buying of cars.

Number of Employees

With respect to the number of employees currently working for these businesses, majority of the respondents (73.3%) have stuff strength of '10 to 19' employees; 13.4% have between '20 to 29' employees; and 10% have employees between '30 to 39'. This shows that few car dealers employ large number of people due to their working capital which is in adequate to employ more stuff.

Business Ownership

Most car businesses are owned by locals (88.3%); and only a handful of these businesses are foreign owned (3%). However, (8.3%) of these businesses are owned jointly by both foreigners and locals (see table 1). This is good for local content trade and business development for the local people.

Years in Business

Majority of the businesses (36.7%) have been in operation for '16 to 20 years'; followed by '11 to 15 year' (34.1%); 23% have been in business for '5 to 10 years'; whiles 18.3% have been in business less than 5 years. Very few 4 (9.3%) have operated for 20 years or more; '31 to 35 years' (1.7%) and 26 to 30 years' are 2 respondents (3.3%). This shows that perhaps most businesses in this industry fold up with increasing number of years in operation (refer to table 1). This could be due to high economic fluctuations.

From table 2, it is shown that Tonaton.com is the online marketing platform mostly used by car dealers 32 (72.72%) to market and sell their cars. This is followed by Checki.com (43.18%); Olx.com (20.45%); Myjoymarketplace.com (11.36%) and Kasoa.com (0.27%). This means that Tonaton.com receives the largest patronage by these industry players and is the most widely used.

Table 2. Online marketplace awareness and patronage

Online Marketing places	Awareness of online marketing places (n = 44)		Usage of online marketing places (n = 44)	
	Cumulative Frequency	Proportion (%)	Cumulative Frequency	Proportion (%)
Tonaton.com	32	72.72	25	56.81
Olx.com	9	20.45	5	11.36
Checki.com	19	43.18	16	36.36
Myjoymarket place	5	11.36	2	4.55
Kasoa.com	1	0.27	0	0.00

Source: (Field survey, 2017)

Marketing online is the most relevant factor for online marketing adoption with a mean score value of 4.33. This is followed by the ability to upload pictures easily (3.93%). The least factors be considered are customer demand and increased productivity with a mean score of 3.00 each. Moreover, the ease of use of the online marketing platform is very important to the car dealers with a mean score value of 3.66. The usefulness of the platform is the second to consider with a mean score value of 3.54 (see table 3)

Table 3. Reasons for online marketing adoption

Reasons for online marketing adoption	Mean
Easy to sell vehicles	3.68
Easy to interact with clients	3.83
Difficult to use	3.00
Online marketing is easy to use than offline marketing	3.48
Able to upload pictures of products easily	3.93
Easy competition	3.69
Conducting business online	3.69
Marketing online	4.33
Customer demand	3.00
Increased productivity	3.00
Ease of use of the platform	3.66
Usefulness of the platform	3.54

Source: (Field survey, 2017)

REGRESSION RESULTS

The model summary explains to what extent the independent variables together explain the dependent variable (Table 4). The R squared value of 0.365 means that together the independent variables explain about 36.5% of the online marketing adoption.

The ANOVA or analysis of variance is also a tool used to test how significant our model is in explaining the relationship between the variables (Table 5). The p value shows a significant figure (0.000) which means that our model is very strong or significant.

Equation

$$Y = \alpha + \beta_1 + \beta_2 + \beta_3 + \beta_4 + \mu$$

Y = online marketing adoption

Table 4. Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.604[a]	.365	.319	.334	.365	7.913	4	55	.000

a. Predictors: (Constant), yrs_business, tech_know, REGR factor score 3 for analysis 1, REGR factor score 2 for analysis 1
b. Dependent Variable: online_adoption

Table 5. Analysis of Variance[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	3.525	4	.881	7.913	.000[b]
	Residual	6.125	55	.111		
	Total	9.650	59			

a. Dependent Variable: Online Adoption
b. Predictors: (Constant), Years in business, IT knowledge, Perceived Usefulness, Perceived Ease of Use

Table 6. Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	.842	.147		5.732	.000
	PU	-.139	.046	-.343	-3.020	.004
	PEOU	-.166	.044	-.410	-3.776	.000
	IT_know	.061	.074	.090	.824	.413
	Yrs_business	-.006	.006	-.109	-.982	.330

1. Dependent Variable: online_adoption

Let β_1 = Ease of use; β_2 = usefulness; β_3 = IT knowledge; β_4 = Years in business

Then Y = 0.842 - 0.139 - 0.166 + 0.61 – 0.006

The *table 6* above shows the test of hypotheses of this study. Two out four hypotheses stated (Ease of use and usefulness) showed a positive relationship between the independent variables dependent variable (online marketing adoption). Perceived Ease of use had the largest score with ρ value of ($\rho = .000 < 0.05$). This is followed by Perceived Usefulness with ($\rho = .004 < 0.05$). However, the other two hypotheses; IT knowledge and Years in Business did not have significant relationship with the dependent variable. Years in business ($\rho = .330 > 0.05$); IT knowledge ($\rho = .413 > 0.05$). This means that Years in business and IT knowledge do not contribute to our understanding on online marketing adoption by used car sellers in Ghana.

The coefficients of the regressors also show the overall effect of the independent variables on the dependent variable. On the whole all the variables returned a negative coefficient score with the dependent variable. Only one variable IT knowledge had a positive Betta score ($\beta = .061$). This means IT knowledge explains about 0.6% of online marketing adoption.

DISCUSSION

This study sought to examine factors that influence e-Marketing adoption among second hand or used car dealers in Ghana. Two research objectives were stated. The first was to explore factors that influence adoption of online marketing by second hand car dealers in Ghana. Preliminary findings from this study with regards to factors for the online marketing adoption by Ghanaian car dealers are linked to the ease of use of the platform as well as the usefulness of the online platform. The usefulness factors include marketing online, customer demand and increase productivity. This finding supports earlier findings (Iddris and Ibrahim, 2015; Dhurup and Dlodlo, 2013; Qingfei, Shaobo & Gang, 2008).

Moreover, the ease of use of the online marketing platform is very important to the car dealers with a mean score value of 3.66. The ease of use factors include ability to upload pictures easily, easy to interact with clients, and also easy to sell vehicles online. This finding corroborates with earlier findings of (Iddris & Ibrahim, 2014; El-Gohary, 2012; Dhurup & Dlodlo, 2013; Venkatesh & Davis, 2000).

This study proposed and tested four research hypotheses to explore factors that influence e-marketing adoption among Ghanaian second-hand or used car dealers.

The first hypothesis which sought to state that the online marketing adoption would be influenced by perception of how easy it is to use the platform by second-hand car dealers was accepted. This means that there is a positive relationship between ease of use of the technology and online marketing adoption of car dealing business. This finding supports earlier findings (see Iddris & Ibrahim, 2014; El-Gohary, 2012; Dhurup & Dlodlo, 2013; Venkatesh & Davis, 2000).

Also, the second hypothesis which stated that usefulness of the sight would influence the adoption of online marketing was also accepted. This support earlier findings by (Iddris & Ibrahim, 2015; Dhurup & Dlodlo, 2013; Qingfei et al., 2008).

A number of studies have revealed that in SMEs, the role of CEOs (top management or owner/manager) is central to adoption of new technology (Fuller-Love, 2006; Smith, 2007). The third hypothesis which stated that educational status of the dealer or business owner would influence online marketing adoption was however found not to be significant. This means that knowledge of the owner/manager in IT would not necessarily influence their adoption of new technology in their business. This finding contradicts earlier findings which found that management's perception of and attitude on technology, support and commitment, knowledge and experiences influence the process of technology adoption in SMEs (see, Premkumar, 2003; Qureshi & York, 2008; Drew, 2003; Thong, Yap & Raman, 1993).

Also, the fourth hypothesis that stated that age of business would influence the technology adoption of the business in this study was also found not to be significant. This means that the age of the business in terms of number of years the business has been in business would not necessarily influence their adoption of new technology. This finding however, seems odd as there seems to be correlation between number of years or age of business and technology adoption.

CONCLUSION

This study focused on the factors that influence the recent adoption of e-marketing by used or second hand car dealers in Ghana. Hitherto, the second hand car dealers sold their products though middlemen and through their garage sales. However, in recent times these car dealers or sellers have taken to selling their cars through online portals in Ghana. This research has shown that smaller firm online marketing

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

adoption is influenced by number of years in business, educational level of the SME business owner, ease of use of the platform and usefulness of the platform. Exploiting online marketing adoption by SMEs is crucial to growing the smaller firm. This therefore means that SME business owners in Ghana have seen the need to adopt technology to foster growth and become more competitive in this competitive environment. This is really encouraging considering the country's low and slow rate of technology adoption. When utilized effectively, online marketing has the potential of propelling the small businesses business growth and long-term survival.

IMPLICATIONS OF THE FINDINGS

This paper has implications for both managers and future research.

Implications for Managers

SMEs in least developed countries with infrastructural challenges and constraints, first need to develop the IT infrastructure to implement any online marketing strategy. Online marketing strategies will be expensive, and returns will be slow in the short-term but may improve in the long-term. Infrastructure access may also create competitive barriers that may not be easily overcome. As such the need to keep a patience posture and not to abandon the strategy midway due to unrealised expected outcome.

Secondly, SME owners should partner with firms with strong IT knowledge and experience to be able to learn and build their capacity to utilize online marketing strategies. Smaller firms grow successfully learning and upgrading their skills. Despite the severe resource constraints for SMEs in least developed countries, training and skills development and acquisition should be their topmost priority as these capabilities can serve as a longer-term low-cost growth catalyst, much in the same way that networking, word of mouth marketing and exploiting of relationships can help the smaller firm to develop.

Implications for Future Research

The present research, based on factor analysis and correlation analysis, will provide a platform for undertaking further research in advancing theory building into SMEs adoption of technology especially from less developed countries. Future research could also exploit the effect of online marketing adoption on profitability and growth of SMEs.

This research received no specific grant from any funding agency in the public, commercial, or not-for-profit sectors.

Chapter 72
Examination of the Extent and Effects of Strategic Management on E-Commerce Companies

Zafer Adiguzel
https://orcid.org/0000-0001-8743-356X
Istanbul Medipol University, Turkey

ABSTRACT

Internet technology can be used not only in commercial applications but also in the implementation and distribution of public services like education and health, making e-commerce essential not only for the business world but also for all of society. Thus, companies can take advantage of internet opportunities in order to develop their strategies in e-commerce environment, creating working groups by bringing together employees in different geographical locations with tools such as newsgroups, communication rooms, etc., benefiting from customer suggestions. Therefore, it is important to examine and analyze the companies that have commercial activities in e-commerce environments in terms of strategic management. From a strategic point of view, the aim of companies should be to increase their activities by influencing their existing customers and continuously gaining new customers within the e-commerce environment.

INTRODUCTION

E-commerce is about the purchase and sale of products, services, and information through computer networks and is a very important phenomenon for both companies and consumers. E-commerce provides marketing platforms for products, services and information, enables customer support before and after the sale, and builds commercial communication between organizations and customers through computer networks. Furthermore, e-commerce enables instant access to information, products and services all over the world. The organisations with strong internet infrastructure can offer 24/7 e-commerce options, which eliminate 'time problems' that limit the shopping experiences of consumers/customers.

Due to ever-increasing competition and constantly evolving market conditions, society has created the concept of a new economy. When we say new economy, we think of a situation where people's mental activities have adapted along with the formation of advanced technologies. This concept of a new economy is also considered a creation of e-commerce organisations operating over the internet (Marangoz, 2014). Most importantly, e-commerce companies offer products and/or services in the internet environment to other regions, and they have to think fast and make swift strategic decisions in order to create value. In this new economic environment, the products and services of e-commerce companies depend on two different technologies (Marangoz, 2014):

- Information
- Communication

The tools of these technologies are computer software, telecommunications, and the internet. E-commerce companies benefit from the opportunities provided by the internet environment: keeping records and information on virtual platform, the ease of accessing information in an electronic environment any place and at any time without the need of another person.

Indeed, it is specifically because the Internet allows consumers to compare products/services according to their prices and quality before making decisions and purchase dependent on budgets and requirements that e-commerce companies must consider these factors before creating their strategy (Zwass, 2003). Internet technology offers access to information regardless of location and in the event of problems experienced by customers, the ability of e-commerce companies to use internet to reach information increases a company's responding to the needs of its customers (Dixon & Quinn 2004). In this way, customers value the service they received and remain as permanent customers. Thanks to ever-developing technology, the Internet provides an infrastructure for sharing data and enables the cooperation of employees. In terms of business strategies, there are two types of e-commerce companies: companies with no physical stores or those with physical stores (Erkan, 2012). At the same time, there are two types of operational dimensions within e-commerce: Narrow or Broad sense. A Narrow business strategy allows businesses to carry out their activities freely and offer their own products and services to consumers over web-based systems (Bozkurt, 2000). In the broad sense, an e-commerce business strategy is defined as the inclusion of special e-commerce systems in addition to the shopping experience of consumers/customers over the internet. In this article, the importance of e-commerce in terms of its advantages and disadvantages, as well as its effects on an organization will be examined within the framework of strategic management.

DEFINITION OF E-COMMERCE

E-commerce in the internet environment not only enables more efficient transactions, but also provides an opportunity for companies to take advantage of cost advantages and provide better service to customers. The internet provides opportunities to companies to reduce their costs while making it possible for most services to be carried out online (Lituchy & Rail, 2000). The rapid growth of the internet enables service and manufacturing companies to create a distribution channel at a low cost and to have easier access to global markets (O'Connor, 1999).

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Nowadays, the quality of customer service can be evaluated according to the services companies offer through the Internet (Heung, 2003). With the emergence of the Internet and the continuous development of Internet technology, the search and purchase behaviour of consumers has changed significantly. The service and products of companies can be compared as there are many web portals publishing evaluations, therefore it leads companies to provide products and services that are customer-oriented. The most important privilege offered by e-commerce is that customers use the opportunities offered by technology with devices such as smart phones, tablets, laptops, etc. (it may even be possible to make purchases from smart wristwatches), and they can now receive service whenever and wherever they want (Chung & Law, 2003). Customers who are interested in technology can also select parts according to their requirements and likings and create the product themselves. The opportunities provided in the e-commerce environment change the shopping habits of the customers, allowing them to order over the internet, save time, and get the products delivered to their prepared location instead of visiting stores. In this way, customers enjoy and value the shopping experience more fully.

Law (2000) explains that the internet allows direct communication with customers and suppliers by eliminating barriers. In particular, the fact that customers give more importance to the quality of service has led companies to start offering more personalized services to their customers through their website (Lituchy & Rail, 2000). Due to the faster growth of the services sector, the use of traditional indirect distribution channels has decreased and more direct channels have developed (Williams & Palmer, 1999). As consumers & customers gain more internet experience, the probability of them getting used to electronic shopping rises (Card, Chen, & Cole, 2003). Companies that understand the importance of e-commerce see their web sites as a tool that brings 80-90% of business from around the world, with the internet being the most important primary marketing tool (Eimer, 2000).

Since 1995, with the increase in internet usage, e-commerce has become more widespread and gained importance in terms of competition between companies (Wymer, & Regan 2005). During the years that the Internet was not an option or was not widespread, the companies would offer their goods and services to markets using tools such as radio, newspaper, and television. In today's world, the wide use of the Internet gradually caused an increase in virtual markets, both in terms of the number of e-commerce businesses and the number of products & services offered to customers. In terms of business strategies, there are two types of e-commerce companies:

- Companies without physical stores
- Companies with physical stores (Erkan 2012).

Narrow e-commerce refers businesses that operate freely, offering their own products and services in web-based systems (Bozkurt, 2000). Whereas, broad e-commerce is described as shopping on the internet, which includes special electronic commerce systems. Specifically, companies should consider some important elements during their decision-making process, before starting their activities in the e-commerce environment:

- Electronic Funds Transfer (EFT)
- Electronic Banking, Electronic Data Interchange (EDI)
- Electronic Message Sending and Receiving etc.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Electronic Funds Transfer (EFT)***:** The EFT system is used as a transfer of money between two banks. Today, thanks to the internet banking offered by banks, payments can be made via smart phones, tablets, and laptops at any time with EFT (Coşkun, 2004).

Electronic Data Interchange (EDI): EDI was first used in North America in the 1960s, and it is also called information exchange. The aim of the system is to reduce paper consumption, help commercial transactions between companies, and provide faster shipments (Sezgin, 2013).

Sending and Receiving Electronic Messages: From the 1970s until present, messages have been sent through the internet, and the most important tool for sending messages has been e-mail. One of the main objectives in the development of the e-mail system is to prevent the consumption of paper and to quickly communicate information (Çubukcu & Bayzan, 2013).

The New Economy: The concept of the new economy was created by businesses offering their products and services through their web pages (Marangoz, 2014). In particular, the new economy is a situation where people's' mental activities increase in pace with the development of advanced technology opportunities. Thus, the emergence of the new economy concept is to increase customer potential by reaching more consumers, while improving thinking and decision making.

In the new economy, products and services are based on two different technologies (Marangoz, 2014):

- Information (structured and formatted data)
- Communication (transfer of information from sender to recipient)

The tools needed to these two technologies are computer software, telecommunications, and the internet. One of the most obvious advantages that the Internet provides is advertisement for e-commerce companies that costs less if at all (Rogers, Bennett, & Grewal, 2007) . With the increasing number of social network users over the internet, e-commerce companies have started to display their ads on social networks primarily because smart phone users share information around their social networks, increasing ad visibility with their social media activities.

The Historical Development of E-Commerce

In 1950, the production of computers started with the advent of ARPANET, the name that represented a project between the army and university in 1969, and later became known as the Internet (Erkan, 2012). With the discovery of the Internet, people began to communicate more easily, and with the development of communication opportunities, this innovation led to the development of e-commerce (Zhu & Kraemer, 2002). And, through e-commerce, companies found new markets and started to increase their market share, starting with. the company that made the first sale over the Internet an American restaurant in central Texas. Starting in 1990, with widespread internet use, e-commerce was one of the most innovative concepts in today's world. Just a couple years later, in 1994, a Pizza Hut restaurant accepted its first order via their web page, followed by the establishment of some of the most important companies of e-commerce: Amazon.com in 1994, and Ebay.com in 1995 (Worzala et al., 2002).

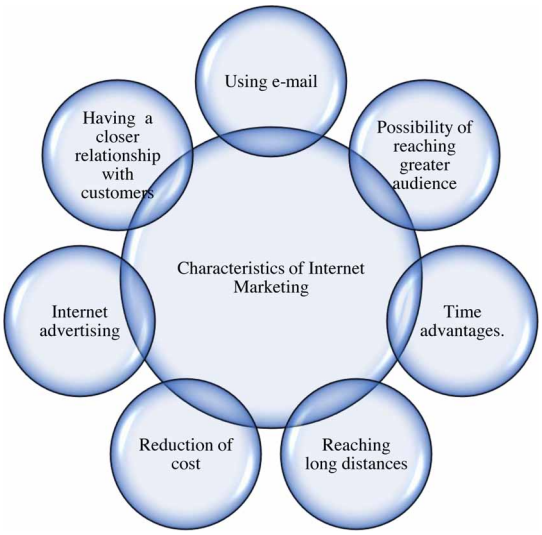
Marketing and trade have been reshaped through the development of the Internet (Yeşil, 2008), but within the e-commerce world, there are differences between concepts of marketing and trade. Trade is limited to the exchange of a product between seller and buyer; however, marketing is about providing product information, promotion, and after-sales activities. The gains achieved in trade and marketing are two important concepts in terms of strategic management, and on the Internet, trades between the

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

buyer and the seller mean more marketing. The traditional marketing is very costly and takes time to reach people; whereas, internet marketing can reach millions of people, if not billions, in seconds using an effective marketing method (Hart, Doherty, & Ellis-Chadwick, 2000). Internet marketing has many advantages compared to traditional marketing methods, including the necessity of face-to-face contact with customers in business relations, a key disadvantage in traditional marketing (Schibrowsky, Peltier, & Nill, 2007).

As a whole, the modern e-marketing methods are strategically important, as they are faster, less costly, and do not require face-to-face contact with customers. Therefore, when we look at the characteristics of the development of internet marketing (Figure 1), there are important elements of e-commerce environment.

Figure 1. Characteristics of Internet Marketing



Before the internet, some international brands were providing distant sales in a diverse ways.

Companies such as Oriflame and Avon were performing their marketing activities in traditional ways prior to e-commerce (Erkan 2012). Similarly, there were companies such as Shopping TV and Top Shop which carried out marketing activities with TV programs. Nowadays, these companies still continue their activities, showing the importance of e-commerce.

Scope of E-Commerce

Information technologies, communication, and similar concepts are parts of e-commerce (Yeşil, 2008). Each activity within the commercial sector has results on the internet that are seen as e-commerce. Businesses want to keep in close contact with their suppliers in order to respond to the expectations of their customers more efficiently. It is possible to look at e-commerce from two perspectives: the commercial and service vantage point. The commercial aspect of e-commerce depends on technology; whereas, the service aspect of e-commerce is related to providing information, payments and similar services over the

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

internet (Forman, Goldfarb, & Greenstein, 2005). In short, e-commerce is the sale of goods and services, carrying out transactions such as insurance, distribution, etc. over the internet.

When we consider e-commerce in a broader sense, there are several issues listed below that companies should give attention to in terms of strategic management and customer satisfaction (Marangoz, 2014):

Scope of E-Commerce

- Production planning and production chain creation
- Electronic exchange of goods and services
- Bank operations in a virtual environment
- Electronic bank transactions and fund transfers
- Ordering
- Sending a bill of lading via the internet
- Customs clearance
- Public procurement on the internet
- E-mail related transactions
- E-share and stock market trading
- Transfer of intellectual property rights
- Making a deal
- Production planning
- Taxation on the internet
- Creating and transferring on-site information
- Marketing to consumers
- Keeping and monitoring of trade records
- Electronic signature and electronic notary

Scope of E-Commerce Summary

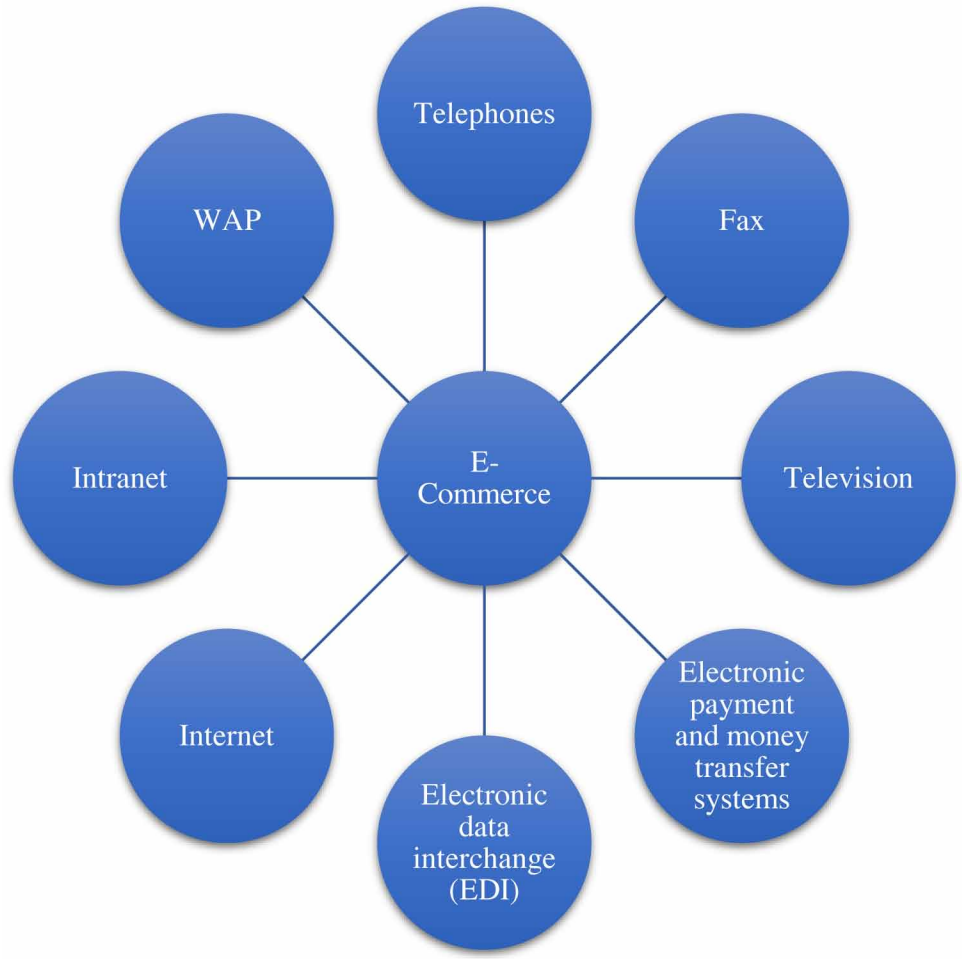
Carrying out business activities in the electronic environment is called e-commerce, which includes electronic processing and transmission of commercial transactions in text, audio, and video format. E-commerce includes all activities related to the design, production, promotion of products, commercial transactions and payments, as well as all types of activities through computer networks (King, Sen, & Xia, 2004). In summary, e-commerce covers all kinds of goods and services. In order to conduct e-commerce relations, it is necessary to have communication facilities with internet technology, and the most efficient and rapid development of the internet is definitely web pages where businesses with specialized e-commerce activities can be accessed using web search tools (Kaufmann, Cliquet, & Achabal, 2010).

Many IT companies continue their R & D activities through new e-commerce tools and environment, some of which are;

Electronic commerce has developed very rapidly because the Internet environment eliminates time and space limitations, providing low costs and commercial transactions that can be carried out by one or more people in an interactive platform. Additionally, the internet is more flexible than other e-commerce tools, resulting in the difficulties and barriers of the trading environment decreasing (Ene, 2002).

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. E-commerce Tools



The important points of e-commerce can be listed as follows: (Dolanbay, 2000)

- E-commerce is the largest business gateway to the world.
- E-commerce may require radical decisions in all working methods.
- E-commerce addresses consumers through a different culture.
- In the e-commerce system, it is almost impossible to detect the mass of consumers and the market share in advance.
- The future position of the e-commerce business will be determined by planned services.
- E-commerce requires leaving the idea of regionalism.

E-commerce activity types can be examined according to their legal status (Arıkan, 1999).

Promotion activities on the market: The buyer and seller in the e-commerce environment without face-to-face contact;

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Sellers carry out market research, product planning, and advertising the product
- The buyer determines the best product by comparing them in an e-commerce environment.

Contractual activities: At the stage of contracting in an electronic environment;

- The buyer orders the product under the terms and conditions.
- The seller can start the transaction according to the order.

Communication between the two sides about logistics operations:

- E-commerce can provide systems that show the location of the product, transfer, and delivery processes.

Activities related to the payments:

- Payment and billing are among the activities of e-commerce in an electronic environment.

E-Commerce Standards

Some of the standards that e-commerce companies must follow (Canpolat, 2001; Çakırer, 2013):

- E-commerce companies should develop the Frequently Asked Questions (FAQ) section.
- E-commerce companies should inform their customers about the amount of existing products, delivery times, and estimated delays.
- The customer should be able to see the product stock information about the product he or she wants to buy.
- E-commerce companies should inform the customers regarding the return procedures before the purchase of the product.
- The customer must be able to see all the billing information of the company before purchasing the product.
- E-commerce companies should specify the warranty conditions for each product to their customers.
- Customers must be informed about after-sales support and services.
- E-commerce companies should put "search engines" on their websites which enable their customers to easily search for products or services.
- E-commerce companies should announce that the customer information is secure and will not be shared with third parties.
- E-commerce companies cannot request information unrelated to business transactions (such as race, religion, sect) without the consent of customers, and if they get this information with the consent of their customers, they should take preventive measures to keep it confidential
- E-commerce companies should take measures to prevent brand age and protect their logo against any abuse.
- E-commerce companies are responsible for the security of all information regarding payment, financial information, and buyer identity.
- E-commerce companies should correct the missing and/or wrong information as soon as possible.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

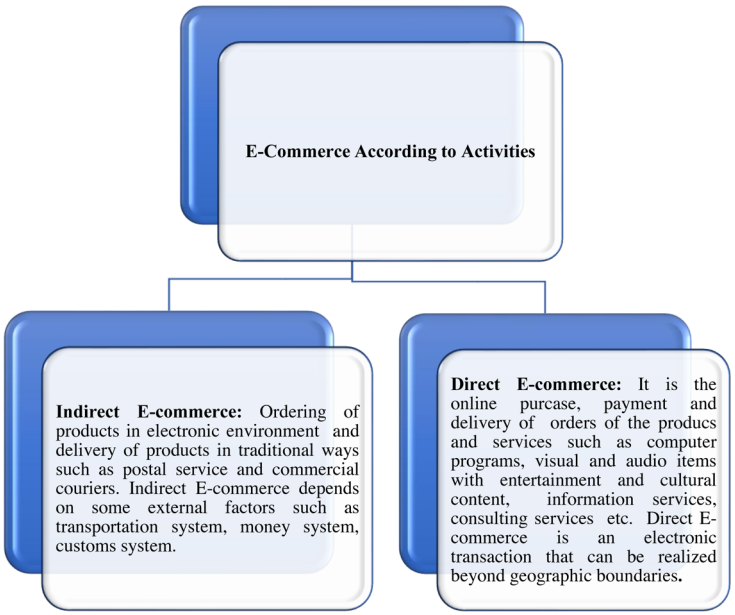
- E-commerce companies should provide payment facilities (Credit Card, Debit Card, EFT/Money Transfer etc.) for the customer who want to buy the product.
- E-commerce companies should get the payment of the product either during the online sale or when the product is delivered.
- E-commerce companies should indicate when the customer will be charged for the purchase of the products on the last transaction page.
- E-commerce companies must notify the customer in advance of the delivery date of the product.
- E-commerce companies should notify the customers about the products they ordered by e-mail, fax, sms, or through web pages.
- E-commerce companies should ask the billing information of the customer.
- The customer should see the latest status of the product with internet-based reporting.
- E-commerce companies should insure the product against any damage that may occur during delivery.
- E-commerce companies should tell the customer how long it takes for the product to reach the customer.
- E-commerce companies should provide cargo information about the product by e-mail, fax or web page.
- E-commerce companies should provide customers the right to return the product in a pre-specified period and offer refunds as soon as possible.
- E-commerce companies should provide information about the return conditions and the refund policy regarding the product.
- E-commerce companies should provide information about the last return date with the refund conditions.
- The customer should easily be able to access the return conditions on the e-commerce company's website.
- E-commerce company's web page should display a link to customer services.
- E-commerce companies should review and respond to questions and complaints about products and/or services from customers.
- E-commerce companies should provide the customer with the opportunity to contact the manufacturer if they cannot solve the problem regarding the product and/or service.
- E-commerce companies should inform the customer after supplying a product that is not in stock.
- E-commerce companies should inform the customer if it cannot supply the requested product.
- E-commerce companies should inform customers about changes in the policies of the company.
- E-commerce companies should not collect specific information for themselves and third parties by taking advantage of the naivety and inexperience of children under 12 years of age without the direct knowledge and consent of parents.
- E-commerce Companies definitely should not take orders from children without the consent of parents (Canpolat, 2001; Çakırer, 2013).

E-Commerce According to Activities

E-commerce activities can be examined in sections, according to their activities both indirect and direct (Ene 2002).

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. E-commerce activities (Ene 2002)



Indirect Parties to E-Commerce; The main indirect parties of e-commerce are buyers, sellers, manufacturers, banks, brokers, insurance companies, transport companies, non-governmental organizations, universities, customs offices, Foreign Trade Offices, and information technology companies. Networks that the parties communicate with are multiple: the Internet, Intranet and an Extranet (Özbay & Akyazı, 2004).

Effects and Benefits of E-Commerce

E-commerce has caused some economic and social changes (Arpacı & Uluçay 2012).

- Through e-commerce, economic impacts are increasing.
- Through e-commerce, competition is increasing among organisations.
- Through e-commerce, the overall costs of organisations are decreasing
- Through e-commerce, the decrease in costs is reflected in the prices of the products.
- Through e-commerce, product options are increasing.
- Through e-commerce, market power is transferred to the consumer.
- Through e-commerce, 24/7 continuous trading and shopping opportunities are offered.
- Through e-commerce, ‘transparency’ and ‘openness’ are becoming widespread.
- Through e-commerce, the importance of being geographically close to the market is disappearing.
- Through e-commerce, the efficiency of web-based marketing and online order is increasing.
- Through e-commerce, the market structure is changing.

E-commerce has different effects on companies, societies, and individuals. E-commerce companies are more adaptive to the conditions in the markets and to customer expectations, thereby gaining com-

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

petitive advantages against other companies (Ngai & Wat, 2002). With e-commerce, business processes are shortened, daily work tracking takes shorter time frames, costs decrease, and productivity increases. Thanks to e-commerce, companies can increase their product options on their web pages, the quality of the products increase as the buyers have the opportunity to make comparisons, payments can be made quickly and with different methods, and the product can be delivered faster (Molla & Licker, 2005). Furthermore, the entry of low-priced and high-quality products into the market leads to increased competition among manufacturers and reduces the cost of all business transactions. Thanks to e-commerce and the development of Internet technology this development starts from computers and goes up to the smart phones and smart wristwatches today, information provided to the customers about the products in the market from all over the world and new manufacturers are allowed to enter the world market (Wade & Nevo, 2005). It is almost impossible for us to imagine what technology will come up with in the next 10 years as it continues to develops. In fact, these developments push companies to make new strategic moves and to think with a technology-focused approach. E-commerce brings manufacturers and consumers together and eliminates commercial barriers and disadvantages: distance to the market, lack of information, and an inability to produce according to demand etc. If companies do not have any knowledge and experience in e-commerce, they are still able to use the Internet for the purpose of advertising or market research in the first stage (Becker, 2007). As they gain knowledge and experience, they can start to conduct more professional e-commerce activities. E-commerce is the best solution for companies that want to sell abroad but cannot open stores. Although the initial investment costs are high, it is still an economical alternative due to the fact that the company will have less expenses over time, in terms of location, sales services, and customer service.

The Effects of E-Commerce on Economic Life

E-commerce affects almost every field of economic life and causes great changes. However, some units of business life are more affected by this change.

Economic Life Activities Affected by E-Commerce

E-commerce activities that affect economic life (Korkmaz, 2002);

- Marketing, sales, and promotion
- Pre-sale and supply
- Financing and insurance
- Business transactions: order, delivery, and payment
- Service and maintenance
- Mutual product development and work
- Using public and private services
- Public transactions, taxes, customs etc.
- Delivery and logistics
- Public procurement
- Accounting
- Automated trading of electronic products
- Settlement of disputes.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Changes Brought by E-Commerce

Changes brought by e-commerce (Kepenek, 1999)

E-Commerce carries the marketplace from a physical place to a virtual platform. The latest reorganization of shopping activities and the maintenance of trade-related services will require the training of skilled manpower to carry out these functions.

E-Commerce has an accelerating and disseminating effect on trading and related transactions. In particular, the process of the transactions change depending on the developing technological infrastructure of the organisations.

E-Commerce increases the operating density of the economy as economic relations between businesses and consumers are reinforced by e-commerce, enabling businesses and consumers to operate on a world scale.

Businesses should be transparent towards their customers and suppliers. As a whole, the most beneficial aspect of e-commerce is that it is expected to strengthen competition, and the most disadvantageous aspect is the need to protect private information against possible attacks.

E-Commerce changes the relative importance of time since there is a principal that the economic activities are realized in a short period of time, thereby shortening the processing times.

Benefits of E-Commerce

E-commerce enables the commercial transactions & activities between the buyer and seller to be realized over the internet. Companies can engage in marketing activities about their products and/or services through the internet network, and can respond to requests and complaints from their customers, provide after-sales services, and thus, have the chance to collect significant data regarding customer satisfaction (Young, Clark, & McIntyre, 2006). The most important advantage of e-commerce is that it breaks down the traditional trade concepts and enables the buyers and sellers from all over the world to meet 24/7 (Hoffman & Novak, 2000). Thanks to the internet, companies can expand their customer portfolio by crossing borders. E-commerce is not only a matter of concern to companies, but it also concerns all consumers and customers who benefit from the opportunities and advantages of E-commerce (Gibbs & Kraemer, 2004). There are definitely positive changes through e-commerce (Afra, 2014):

- Through e-commerce, companies are growing beyond the borders and competition is increasing.
- E-commerce reduces the costs of companies.
- Through e-commerce, consumers have the opportunity to buy quality and cheap products at any time.
- E-commerce systems reduce companies' inventory costs.
- Through e-commerce, consumers have the chance to compare products and prices.
- E-commerce facilitates the planning of production, and therefore, the efficiency of production increases.
- E-commerce allows companies to provide efficient and effective customer service.
- E-commerce reduces the costs of sales, marketing, and distribution.
- Through e-commerce, companies can quickly and effectively adapt to the changes that will occur in the market as well as the introduction of products.
- Through e-commerce, trade is made easier and more efficacious.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Through e-commerce, companies develop their commercial activities and become global, gathering more shares from international trade.

Effects of E-Commerce on Management

E-commerce has a positive effect on working areas of the companies and on the speed of communication with their customers (Korkmaz, 2002). Consumers and customers are able to make purchases in the e-commerce environment at any time for the products and/or services they want to buy. Buyers have the opportunity to make comparisons between products and/or services, while companies with intranet network have access to up-to-date promotional advertisements and prices for products and/or services (Porter & Michael; ilustraciones Gibbs, 2001). With the widespread use of the internet, it is possible to reach the requested information anywhere and at any time (Forman, 2005). With the increasing use of this opportunity, the e-commerce companies have developed online customer service operating from their web pages in order to provide better quality service to their customers (Kantarcı et al., 2017). The internet not only offers advantages to buyers, but also allows business people to access information about the production and sales numbers from web pages at any time (Luo, Hongxin, Zhao, & Du, 2005). It has become even more important for buyers and sellers to reach information comfortably, and in today's world, the companies with different locations can collect data from each location and create working groups with Internet technology. Data from different locations and working groups create a platform where new strategically ideas and opinions are generated.

STRATEGIC MANAGEMENT AND ITS ELEMENTS AS A CONCEPT

When examining the concept strategy, we see the term 'strategos', which Greek means 'General'. What is the strategy in literature? It is a question that does not have a mutual or clear answer. According to Mintzberg and colleagues, one of the famous strategy theorists, the concept of strategy refers to "army" and "governing" (Mintzberg et al., 2003). The reason behind Mintzberg's thinking is that the concept of "General" is related to both the army and the concept of governance. Naturally it was difficult to explain in a single concept. When we look at the concept of strategy in terms of business management, it is explained as the process that defines business goals and policies. However, since the concept of strategy includes very different ideas and opinions, it has been considered from different perspectives and different definitions in the literature.

According to Eren (2010), it has been defined as a selection of elective decisions on how to optimize the operations of an organisation that has an important effect on the organization and general objectives of the business, helping a business to find solutions to complex business situations. Ülgen and Mirze (2010) define strategy as the whole of result-oriented and dynamic decisions, which are taken with a visionary perspective by analyzing the competitors, in order to reach the objectives of the business. In short, it can be explained as leaders and managers who analyze the external environment of the business, bring the resources together, and organise them effectively to achieve the long term aims of the organisation.

Basic Elements of Strategic Management

Strategic management begins with the strategic consciousness of an organisation. The initiation of strategic consciousness starts when the managers think about the various strategies of competitors, how they can develop counter moves against these strategies, and how they can benefit from opportunities and threats in the competitive environment (Hitt, Ireland, & Hoskisson, 2012). From this perspective, the basic elements of strategic management include important elements such as the mission and vision of the organisation, the strategic consciousness of top managers, strategic choices, and the analysis of the external environment.

Figure 4. Basic Elements of Strategic Management

If senior executives want to be successful architects and coordinators, they need to be global leaders with both intuitive and participatory aspects in analyzing and making decisions with the data they obtained (Dinçer, 2007).

Senior executives need to respond to two key questions in the strategic management process (Dinçer, 2007):

a) What is our type of business and what is the work being done?

This question is entirely related to the mission of the business and how the organisation defines itself. For this reason, organisations have to define their missions to society in a clear, understandable, and open manner.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

b) Why are we doing this?

In order to define objectives, an organisation should answer the question of why it is carrying out the work. Companies wishing to operate in the field of e-commerce should strategically determine what they want to do, why they want to operate in this field, what their objectives are. After defining the mission, vision, goals and objectives, prospective e-commerce companies should be careful in terms of analysis, finding the right direction, determination of strategies, and the final steps of evaluation and implementation (Martin & Pénard, 2005). In terms of strategic management, e-commerce companies need to identify their vision. Today, vision is one of the most misunderstood and overused words. Vision means a picture shared by all employees about the organization's future; the place where the organization wants to be in the future its horizon. In other words, the vision is a cognitive design that combines the beliefs of how to reach a desired situation, how to be at a targeted place in the future (Güçlü, 2003).

In terms of strategic management, e-commerce companies need to analyze their external environment. If this analysis is not carried out, we cannot say that the life of the companies operating in the field of e-commerce will be very long because the changes and developments of the external environment are considered one of the most decisive elements of strategic management in terms of decision-making and implementation. The continuous changes in the environment and the long time horizon of strategic management increase the uncertainty and thus highlight the importance for the organisation (Mariz-Pérez & García-Álvarez, 2009). Therefore, for the decision-making mechanisms in strategic management, it is important for e-commerce companies to identify opportunities and threats through the analysis of the external environment. The external environment analysis is important for choosing the appropriate strategy for the success and development of the company in the long term (Üzün, 2000).

Types of Strategies

The selection of appropriate strategies is the most important phase of the strategic management process. However, prior to the selection, strategies should be defined and upper and lower strategies should be defined as well. We can classify strategies into two main categories (Ülgen & Mirze, 2010);

- Basic Strategies
- Strategies according to Management Levels.

Basic Strategies

Basic Strategies about the work and activities that organisations should or should not do in the future in order to sustain their lives and gain a competitive advantage (Porter 2008).

The first of the strategies is the **Growth Strategy** and refers to the numerical and qualitative development of organisations. The organisations can go further by building their existing assets and capabilities in order to improve their activities in the sector, thereby gaining more returns.

The second basic strategy is the **Downsizing Strategy** whereby organisations can withdraw from sectors where business is inefficient and focus on attracting more efficient areas: Organisations can consciously reduce some of their activities in order to generate more revenue.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The third basic strategy is **Stable Strategies**. Organisations can choose stable strategies if competition is very intense and if other strategies will not produce gains above average, or if there is no new opportunities in the market.

Finally, businesses can use any of the basic strategies simultaneously or consecutively. While implementing a stable strategy in one sector, it may turn to growth strategies in another sector. In such cases, the companies implement '**mixed strategies**'.

Strategy According to the Management Levels

It is also necessary to classify the strategies according to responsible management levels. Strategies can be classified into three groups according to management levels, the purpose of implementation, and perspectives (Ülgen & Mirze, 2010). Corporate Governance Strategies are related to the issues that senior executives of an organisation are constantly thinking and seeking solutions to, such as what business areas to operate, how to implement activities in order to survive in the long term, and how to increase value by having a competitive advantage in the future. Therefore, this strategy is about the main areas of activity within organisations, and how they should implement their activities.

Functional Strategies are prepared and implemented at the middle or lower management levels and are functional or departmental strategies, such as marketing, production, finance, human resources, research and development, etc. which are usually dealt with at the middle management levels (Ülgen & Mirze, 2010).

The Strategic use of E-Commerce

The first thing that comes to mind about e-commerce is the strategic threats and opportunities in business life. At the beginning of the list of strategic issues lies communication formed with business partners, competitors, and potential customers. It can be said that e-commerce is a structure that provides a new and powerful information system and communication channel to consumers and organisations with the help of information and communication technologies. This allows buyers and sellers to come together in more efficient ways and to create new markets and opportunities for the re-organization of economic processes, personalization of products, re-definition of distribution approaches to products and services (Ada et al., 2008). The strategic use of the Internet is evident by the fact that there is now 24 hours of uninterrupted communication and an unlimited flow of information. Another important issue in the use of e-commerce is the innovative change in the supply chain that are mainly made by using electronic channels with digital and electronic products, forcing the restructuring of the traditional supply chain rules (Sadowski et al., 2002). One of the most important issues here is the savings on stock costs. The acceleration of orders and their provisions leads to a remarkable reduction in inventory. Reducing inventory costs, especially in times of crisis, eliminates a huge burden for organisations and transfers resources from stock costs to more efficient areas in organisations (Bozkurt, 2000).

The third important issue in the strategic use of e-commerce is the cost issue, which can be great opportunity but also an important threat. However, this cost is not the cost of investment, it is the cost of learning and managing the technological infrastructure. For companies, transitioning to e-commerce requires the right timing. The use of this infrastructure solely for the purpose of reducing commercial costs can create a lower optimization hazard (Porter, 2002).

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The effect of e-commerce on the competitiveness of companies is very robust leading to reduced costs, the elimination of barriers to access the market, ability of customers and producers to reach information easily, and more conscious consumers and changes in consumer habits causing competition to intensify (Phan, 2003). This situation forces companies to restructure and review market strategies. In addition, the fact that small, medium-sized, and large enterprises have equal conditions in terms of market entry conditions makes competition more ruthless. This point is already the most important feature that distinguishes the internet from other technological innovations. The adaptation of all economic actors to the transformation created by the internet and information technology, the development of new technologies, and the fact that everyone can reach these opportunities through less expensive technology increases everybody's chance to have a place in the global market (İşler, 2008).

The Driving Force And Scope Of E-Commerce Strategies

In previous studies, different perspectives of trade strategies have been shown. For example, many researchers have explored the ways in which the internet offers strategic opportunities as opposed to traditional trade (Levenburg, 2005; Pavitt, 1997). Another important research group examined the possible economic effects of trade on the internet and how internet-based e-commerce can affect pricing and competition (Wood et al., 2005). Furthermore, in terms of opportunities created by e-commerce, an important feature discovered was the power shift towards the consumer and the effect of changing power structures in the supply chain (Priluck, 2001). As the volume of shopping in the e-commerce environment grows, the internet has the potential to change physical retail transactions (Burt & Sparks, 2003).

The adoption of the internet among companies engaged in trade has so far varied. Although some companies are relatively aggressive, there are some aims to provide a wide range of product portfolios, to exist in the e-commerce environment, and to develop websites accordingly (Dholakia & Kshetri, 2004). Some small-scale companies that did not adopt the e-commerce environment preferred to continue their traditional trading practices and faced leaving the market. As a matter of fact, trading companies have seen the internet as a channel for reaching larger markets and have begun to invest continuously in their infrastructure on the Internet, which broadens and significantly affects trade volumes.

Success Of E-Commerce Strategies

The success of e-commerce strategies comes from the fact that it adopts a customer oriented method. In other words, the strategies identified in the e-commerce environment aim to measure the attitudes and reactions of the buyers and sellers and their strategic position in terms of various elements (Doherty, Ellis-Chadwick, & Hart, 2003). These attitudes and reactions may even cause changes in the design of web pages in the e-commerce environments of companies (Cliquet et al., 2007). The ease of use, quality of the web pages, the loyalty of the customers and their intention to continue shopping online, the perception of consumers, and the interaction and shopping pleasure are current strategic issues (Wolfinbarger & Gilly, 2003). In their study, Goode and Harris (2007) state that consumers place importance on the reputation, reliability, site design, and security provided by e-commerce companies. There are a reasonable number of studies about the success and failure of e-commerce initiatives (Lunce et al., 2006), with an important empirical study on the success of e-commerce companies having been conducted by Zhuang and Lederer (2003). However, this study only focused on the benefits of e-commerce and was not able to answer exactly what the cause of success was.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

E-Commerce Strategies

The e-commerce strategy is the adoption of long-term activities in order to achieve a competitive advantage in a changing environment through the structuring of resources and skill of the organization to meet the expectations of stakeholders (Johnson, Scholes, & Whittington, 2008). The E-commerce strategy is vital for companies and provides a framework for operational planning, enhancing organizational efficiency, and clarifying the direction of organizational activities. In addition, e-commerce helps companies to achieve long-term benefits (Chang, Jackson, & Grover, 2003).

For e-commerce strategies, companies should consider their internal environment, including strategic investment logic and internal coordination capability (McAfee & Brynjolfsson, 2008). For the implementation of e-commerce strategies, the external environment should be taken into account, including market environment, market position of the organization in the value chain, and customer participation (El Sawy, Malhotra, Gosain, & Young, 1999; Urban, Sultan, & Qualls, 2000; Venkatesan & Kumar, 2004). The business transactions, application principles, and corresponding strategies can be developed considering the business environment and product characteristics for various e-commerce activities (Lee & Whang, 2001; Chatterjee, Grewal, & Sambamurthy, 2002). In addition, companies should develop approaches to evaluate the stages of e-commerce development and the implementation of e-commerce strategies (Barua, Konana, Whinston, & Yin, 2004; Hackbarth & Kettinger, 2004). The development of e-commerce strategies and the implementation of E-commerce provide frameworks for managing organizational changes in this process (Grandon & Pearson, 2004). For the successful implementation of e-commerce strategies, important factors are the use of technology and adaptive changes in business processes and in organizational structures (Benjamin & Levinson, 1993).

The lack of knowledge in the implementation of the e-commerce strategy will limit the skills of organizations in e-commerce initiatives because insufficient organizational skills block the organizational transformation processes (Gilbert, 2005). In particular, traditional companies that are not involved in e-commerce should understand the importance of acquiring information to overcome such obstacles. In order to overcome the difficulties arising from insufficient organizational skills, a successful e-commerce strategy should be implemented (Johnson, 1988).

The rapid change and development of technology and internet has also begun to change the consumer understanding of shopping. Thanks to smart phones and smart watches of the future, consumers will be able to take advantage of time saving advantages of online shopping (Levy & Weitz, 2004). Reasons for the activity of companies to participate in e-commerce field are multiple:

- A constantly expanding e-commerce market,
- Having a widespread consumer network in the field of e-commerce,
- Having ubiquitous access without any boundaries through internet technology
- Change of consumer habits due to the Internet and technology,
- Expectations of Companies to increase their revenues as a result of e-commerce activities where they can offer online purchases on their web pages.

Companies not only offer online shopping on their web pages in terms of selling products and/or services in the e-commerce environment, but also aim to provide satisfaction and loyalty for customers who buy from the company (Tek & Orel, 2008). Because, unlike traditional shopping methods, a variety of products and services can be provided without physical shelf limitation.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The power, scope, and interaction created by the Internet is considered to provide customers with a unique opportunity to experience shopping in the e-commerce environment (Doherty & Ellis-Chadwick, 2006). In particular, e-commerce provides an extremely rich and flexible new trade channel by providing information over the internet, making customer communication easier, enabling market research activities, allowing the collection of data over the internet for more swift strategic decisions, and introducing products and services through social networks (Basu & Muylle, 2003).

From a strategic point of view, the Internet offers these opportunities to companies:

- Expansion of target markets
- Improving communication with customers
- Ensuring product diversity
- Ensuring cost efficiency
- Development of customer relations
- Offering personalized offers (Srinivasan et al., 2002).

Indeed, with the rapid growth of internet usage, there has been an increase in the volume of online shopping (Forsythe & Shi, 2003). In spite of the apparent commercial potential of the internet, many of the companies that did not have a visionary perspective and could not see that the future was technology-focused went bankrupt when the '.com' exploded in 2001. Although e-commerce provides sustainable growth for companies, technology-oriented companies that develop technological infrastructure have become dominant in their sector (Min & Wolfinbarger, 2005; Evanschitzky et al., 2004).

SOLUTIONS AND RECOMMENDATIONS

There are still a number of issues that continue to be explored for companies that have operations in the field of e-commerce. Many factors such as management support, competitive pressures and technical infrastructure continue to be strategically examined. There is too much variation between studies and therefore further studies are needed in this area in terms of identifying and adopting new strategic approaches in e-commerce. Especially, it should not be forgotten that there are differences between Western culture and Eastern culture. Valid strategic management theories may cause the emergence of new theories due to cultural differences and Strategic approaches in the field of e-commerce should take cultural differences into consideration (Venkatesan & Kumar, 2004). For example, Japan might be a technology giant, but many Japanese people still use classic mobile phones which were used before smart phones. In this case, can companies that want to operate in the field of e-commerce and develop strategies offer online shopping through smart phones? Can they implement effective strategies that need to be realized through smart phones in this country? It is important to remember that this situation consists entirely of cultural differences. In the early days of the e-commerce market, many companies made a strategic mistake lagging behind the leading companies by not creating a web page on the Internet. However, companies should also offer good and secure web pages on the Internet because when consumers & customers find the web page very simple they may think the company is not reliable or secure (Rao & Frazer, 2006). At the same time, consumers see complaint portals as important reference points showing how reliable and high quality the work of e-commerce companies is.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Within this framework, there are important determinants to be considered in terms of the success of e-commerce strategies:

- Identify different factors in the e-commerce strategies that can be implemented against competitors for the success of the organisation.
- Analyze whether the identified factors are appropriate to the organizational structure of the firm
- Examine the composition of the strategic success arising from the identified factors
- Evaluate the relationship between the scope of e-commerce strategy and its perceived success.

Opinions will always be needed regarding how e-commerce companies should approach strategy development. It is possible that today's strategies may not be valid tomorrow. When we want to criticize theoreticians in the field of strategic management, they want us to provide evidence, but the real evidence is that they forget the theories were examined in which country, in which market conditions, in which companies, in which sector. The general acceptance of a theory is determined by the extent to which it can be proven to be appropriate for every company, every sector, and every culture.

FUTURE RESEARCH DIRECTIONS

Although it is accepted that the determinants of the success of e-commerce strategies are cost and marketing, it is also strongly associated with resources. If e-commerce companies want to be successful, they should be able to distribute resources and skills to several internet transactions at the same time, and they should manage an efficient budget because the concerns over cost can have a negative impact on success. The underlying factor behind the success of e-commerce companies is the powerful management support and strategic adaptation to the e-commerce field. It is important to remember that there is a very strong and positive relationship between a visionary strategic perspective and e-commerce success. In e-commerce companies, managers must be aware of the slight differences between the determinants of success and the factors that influence the scope of a strategy. And, the management team must initiate strategic moves when they receive full organizational support in order to be successful in e-commerce. The scope and the success of e-commerce is related to a company's internet-oriented thinking, ability to carry out research activities for future use, and the steps to expand the number of users and carry out original activities.

Companies wishing to operate in the field of e-commerce should aim to benefit from sales but be cautious and adopt e-commerce models that actively involve the Web (internet) (Trice 2001). Furthermore, companies need to invest in the design, implementation, and advertising of a web site. This investment will vary according to the target audience and the organisation objectives. However, it is very important to provide a web site which generates the perception of a safe, quality, virtual environment. Investment in new technologies in the field of e-commerce will mean that the company can have more flexibility and better capacity against its competitors. The advantage of a web site is that it allows the realization of new developments and changes ahead of competitors, also forcing the organisation to rethink their business methods and processes. The most important benefit of e-commerce strategy is bringing a company ahead of competition and creating a positive impact on a firm's growth potential. Furthermore, the creation of a functional and useful web page is very important in the implementation phase. The length of time spent by consumers on the website is related to the user-friendliness and the product diversity of the web page.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

From a strategic point of view, the key factors for success are the decisive steps of senior management (however, these decisive steps must definitely be future-oriented, and the data must be very well analyzed), the realization of strategic cohesion, and the distribution of company resources and capabilities. The internet is an important, highly dynamic and global phenomenon, therefore it is important for the companies to follow their competitors, identify their weaknesses and plan counter strategic steps. In order to determine the mutual and different driving forces of e-commerce companies, it is important to analyze many factors. For example, as mentioned before, to perform similar studies in various sectors and in various countries. It is not acceptable to put forward acceptable theory from a study conducted in only one country since the theory has meaning when it is accepted by everyone. Also, the determinants of an e-commerce strategy may be related to the direction of managerial orientation or the intensity of competition. For example, companies in weak competitive markets may need greater incentives and encouragement to invest in an e-commerce strategy when the return on investment is uncertain. E-commerce companies should strategically measure the intensity of competition accurately or take into account the adoption of a specific e-commerce strategy. Therefore, in e-commerce strategy, it is useful to collect additional data about cost and performance, as well as about other multi-channel strategies (e.g. mobile commerce, social use) (Ayanso & Yoogalingam, 2009).

E-commerce companies start their activities by establishing their own websites for both communication and sales purposes. Before starting this activity, however, they should consider the multivariate concepts, such as brand value, brand image, reputation, customer satisfaction, accessibility, quality, performance, etc., which are good indicators of whether a company will stay in the market. The purpose of communication is to reach the widest audience possible and provide information about products and services. When the success of communication reflects on sales, a company starts to actively compete and take a share in the market. Finally, the companies with strong customer service may have to adopt special e-commerce strategies. Companies will have an opportunity to make comparisons between customer behaviour on the company's web site and in the store. This comparison can be related to product perceptions, shopping experiences and customer service (Jarvenpaa & Todd, 1996), customer satisfaction (Cao, Gruca, & Klemz, 2003), and behavioural loyalty (Huang, 2011). This information makes it possible to develop strategies in the e-commerce field by analyzing the reasons for different customer behaviours.

Chapter 73
Examination of Effects of Competitive Strategies on the E-Commerce Companies in Terms of Achieving Sustainable Competitive Advantage

Zafer Adiguzel
https://orcid.org/0000-0001-8743-356X
Istanbul Medipol University, Turkey

ABSTRACT

E-commerce brings companies and customers together in an exchange market environment, beyond any physical, cultural, and legal boundaries, and on an unimaginable scale, which was considered to be technically impossible before. The companies' online facilities have been improved and become accessible to everyone through smart phones, tablets, etc. as the web pages and social networks started to direct individuals towards e-commerce. E-commerce not only raises economic concerns related to competition and pricing, but also reveals new social and environmental threats that can be quite widespread and viral. Several studies have been conducted to examine the transformation of traditional business models into e-businesses, the impact of e-commerce businesses on traditional business activities, or opportunities brought by technological innovations. For this reason, the effects of the competitive strategies will be explained in terms of ensuring sustainable competitive advantage within e-commerce companies.

INTRODUCTION

E-commerce is becoming increasingly important for companies due to increasing technological opportunities. The companies that want to reach more customers and present their product range can use their web pages to conduct marketing and sales activities and share corporate information. As a result, technological and managerial strategies are becoming increasingly widespread in the political, social,

and regulatory environments of e-commerce. The growing development of e-commerce has caused an intensely competitive environment where only strong companies can survive and the weaker ones are eliminated. The power wars in a competitive environment can create new markets, increase or decrease existing legal regulations, create market entry barriers, affect prices, decrease or increase competition costs, and re-structure interactions between companies and customers (Chen, 2001). E-commerce brings companies and customers together in an exchange market environment, beyond any physical, cultural, and legal boundaries, and on an unimaginable scale, which was considered to be technically impossible before. Because of competition, consumers can make a selection by comparing products and/or services as they wish. E-commerce is defined as the transactions of financial, marketing, and human resources management or similar functional activities by means of information technologies and through web-based networks (Zhang & Gai, 2005).

E-commerce companies use IT and communication technologies to interact with their customers for commercial purposes in order to gain a competitive advantage. According to the definition of e-commerce, it includes sales activities by telephone or e-mail or through online shopping systems over the Internet. The most important factor behind the thrive of e-commerce is the accessibility of the thousands of networks by individuals around the world. E-commerce began to boom, especially after the development of the World-Wide-Web and establishments of sector networks. The companies' online facilities have been improved and become accessible to everyone through smart phones, tablets, etc. as the web pages and social networks started to direct individuals towards e-commerce. Furthermore, e-commerce companies have changed the market rules and the role of information technology (IT) in the sectors. Before, information technology was just another option within market strategy; however, in today's world, information technology has a power all its own since the Internet is accessible by everyone (Venkatraman & Henderson, 1998). Indeed, some companies established their market strategies based on information technology. When we look at today's successful e-commerce models, we see that marketing and technological activities interlock with each other in a competitive environment (Ghosh, 1998).

E-commerce not only raises economic concerns related to competition and pricing, but also reveals new social and environmental threats that can be quite widespread and viral. One of the advantages is that e-commerce reduces the cost of organising activities in every sector and this is an issue companies should give necessary importance to. In the last decade, significant studies have been carried out on e-commerce technologies and multi-dimensional applications. It is clear that ever-expanding and developing e-commerce opportunities affect the organizational management field; therefore, studies on new e-business technologies and e-business modelling have been carried out (Brynjolfsson & Hitt, 2003; Rust & Kannan, 2003; Yunus, Moingeon, & Lehmann-Ortega, 2010). Several studies have been conducted to examine the transformation of traditional business models into e-businesses, the impact of e-commerce businesses on traditional business activities, or opportunities brought by technological innovations. There are entangled applications such as Internet business models, web business models, e-commerce business models, and e-market business models (Koellinger, 2008).

The e-commerce concept can transform organisations and industries into virtual networks where customers and suppliers come together to create value-added processes, a concept that challenges long-accepted business models. Thus, it is important to analyse the transformational effects of e-commerce on the critical and fundamental processes of organizations (Fahey et al., 2001). E-business strategies, funding, and governance are considered critical issues that require efficient planning, and effective control of information technologies in private and public organizations (Gottschalk, 2006). For this reason,

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

the effects of the competitive strategies will be explained in terms of ensuring sustainable competitive advantage within e-commerce companies.

WHAT IS E-COMMERCE?

According to the world trade organization, the definition of e-commerce is the advertising, sales, and distribution of products and services through the Internet network (Ussahawanitchakit & Intakhan, 2011). E-commerce is the realization of all commercial activities through computer networks, as from the design of the products to the production and promotion. Furthermore, E-commerce is the implementation of all business activities in an electronic environment (Ramanathan, 2010) and refers to all business transactions of processing, transmission, and storage of digital information in the form of text, sound, and image either over the Internet (reached by all the individuals and institutions) or over the intranet (accessed by limited number of users) (Chaffey, 2007). E-commerce can be defined as the process of delivering products and services to the customer after payment transactions, performing after-sales support, and also providing information and search opportunities to consumers, organisations, and public institutions by means of presenting data in Internet or intranet environments (Canpolat, 2001).

Different Definitions of E-Commerce

In terms of communication; e-commerce is the promotion of products and services by telephone, fax, computer networks, Internet or similar electronic tools for the purpose of sales.

In terms of business; e-commerce uses information technologies for the work- related activities of companies (Dal & Özbek, 2006).

E-commerce is the advertising, sales, and distribution of products and services through communication networks (Canpolat, 2001).

E-commerce is the new commercial understanding of the new century where the exchange of products and services is carried out on electronic environments, a result of the rapid changes and developments of information technologies (Mucuk, 2012).

E-commerce is all kinds of transactions related to commercial activities through computer networks (Erbaşlar & Dokur, 2012).

These definitions include wide and multi-dimensional relationships between provider and the consumer and also all the possible commercial transactions. Therefore, it can be said that e-commerce covers large scopes of transactions conducted in an electronic environment for providing information, carrying out promotions, and advertising and public information activities for commercial purposes (Canpolat, 2001). E-commerce activities started with telephone, fax, telex, television sales and electronic payments and money transfer systems (EFT) but reached a point where all commercial activities can be carried out over the Internet as a result of the developments in information technologies (Coşkun, 2004).

Today, the 'Information Society' or 'Knowledge Society' is seen as post- industrial societies, with the advancement of knowledge causing significant developments in commercial activities as technological developments are used to process and manage information or resources (Marangoz, 2014). E-commerce is a concept that includes the sale and purchase of all kinds of products and services with the use of computer technology, electronic communication channels, and related technologies (smart card, electronic fund transfer EFT, POS terminals, fax, etc.) (Ersoy, 1999). E-commerce refers to the purchase

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

and sales of products and services and payment transactions over the Internet. The economy generated by e-commerce is called 'digital economy' or 'e-economy' (Erbaşlar & Dokur, 2012). Globalization makes it necessary for companies to closely follow the developments in information and communication technologies in order to obtain a permanent and firm position in competitive markets.

In a highly competitive environment, e-commerce is the most efficient and fastest way for companies to reach and communicate with their customers if they use the right tools. In particular, e-commerce enables companies to operate in global markets, easily make differentiations, reduce operational costs, expand their customer portfolio and control the risk structure, as well as having a key role in the efficient use of distribution channels. E-commerce is about the management of consumption activities between manufacturers, consumers, and the public and private organizations in an electronic environment (Erbaşlar & Dokur, 2012). E-commerce is the realisation of promotions, sales, insurance, and the distribution and payment of products and services through Internet networks.

E-commerce is the implementation of commercial transactions in an electronic environment and has three stages;

- Advertising and market research
- Order and payment
- Delivery

With the rapid expansion and development of Internet technology, e-commerce has become a new and very effective tool of commercial transactions and has emerged as a result of technological developments and the liberalization of trade.

The Actions of E-Commerce (Akgöz, 2009)

- Providing/getting information and conducting search activities in an electronic environment.
- Meeting of both parties in an electronic environment and during the transaction of payments
- Fulfilment of the commitment to the delivery of goods or services to the customer
- After-sales maintenance, support, etc.

E-commerce is about the activities carried out by the companies in an electronic environment in order to provide faster services, decrease service costs, and improve the quality of products. E-commerce enables products and services to be bought, sold, and shared over the Internet and by means of other electronic services (Görkey, 2001). E-commerce companies responds faster to customers' expectations and needs in line with the rapid changes and developments in a global world. E-commerce also offers the possibility of choosing the best supplier from widespread sales networks (Akgöz, 2009).

Common grounds of e-commerce (Erbaşlar & Dokur, 2012);

1. E-commerce can be carried out via Internet or intranet.
2. Interest holders of e-commerce including producers, consumers, public and private sector companies, and other organisations.
3. Tools of e-commerce: TV, Radio, Fax, EFT, EDI, ATM, Telephone, Internet.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

These definitions not only cover the relationships between the seller and the buyer but also cover a wide and multi-dimensional relationship, together with all possible commercial transactions. Therefore, the context of e-commerce include activities such as promotions, advertising, training, and public information (Canpolat, 2001).

E-commerce Activities are Carried out in 4 Stages (Akgöz, 2009)

- **1st Stage:** Sharing information and documents of foreign trade in the Internet. For example, standards such as BM / EDI-FACT, SWIFT must be introduced.
- **2nd Stage:** Transactions for ordering, proforma invoice, e-contract, insurance, transportation and payments should be carried out in an electronic environment.
- **3rd Stage:** Legal structures should be established such as e-signature, e-tax, customs, and exchange legislation.
- **4th Stage:** Necessary importance should be given to e-security. Internet security should be provided and foreign trade operations should be conducted over a secure electronic environment.

According to this view, the presentation of the product, supplying to customers, company searches, transportation, payments, transactions and customs operations are an inseparable part of the process (Akgöz, 2009).

The acquisition, internalization, production and efficient use of information have a key role in the success of organisations and the national economy. In the information age, digital data regarding the world economy has significant value for organizations. A new and rather large sector has been structured for knowledge ownership, information sharing, and the reshaping of information. The information has become an essential capital of organizational life and is considered raw material like any product or service or other production tool that can be obtained from suppliers if necessary (Marangoz, 2014).

The characteristics of the new world economy (also called 'digital economy' by some researchers) are briefly stated below (Fırlar, 2010):

- Knowledge is the main source of production.
- The most important resource of a knowledge-based economy is brain power, which is the tool encompassing the production of information.
- A virtual world is formed by the digitalization of knowledge, so the relationship, interaction, etc. between all beings in the real world changes accordingly.
- New management processes of organizations are shaped according to micro-partitioning and are structured on an individual basis.
- In the new economy, communication provides the transfer of the knowledge and the role and function communication changes according to the digital network.
- The communication sector is leading the way in the economies of almost all world countries.
- One of the main rules of the new economy is planned obsolescence of products and the innovation and servicing of new products.
- In the new economy, the individuals/customers can participate in the production process through the elimination of boundaries by means of new information technologies and personal-oriented products that will therefore gain importance.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Speed is another key factor in the effectiveness of organizational success and economic activity. In this respect, the importance of web-based interactive environments is increasing daily.
- In the new economy, organizations must operate in an environment that is constantly changing and developing without borders due to globalization.

The common feature of these factors is the importance of generating information, specifically because of the intense use of communication and computer technologies. Therefore, the concepts of an old or new economy do not refer to an economy as getting older or younger. These concepts are about the changes in the same economy in terms of value creation, relationships with customers and employees, methods of conduct, behaviour, and management methods, etc. (Marangoz, 2014). Increasing global competition and the formation of advanced technologies manifests itself in every aspect of the economy and the production, distribution, and consumption of goods and services are deeply affected by this processes.

Today, there are three concepts that direct the new economy (Dal & Özbek, 2006);

a) Informatics
b) Communication
c) Information.

Changes in macro factors affects the organisations and create pressure for the following reasons (Dal & Özbek, 2006);

a) Globalization
b) Rapid changes in technology
c) Increased production
d) Increased use of computers by individuals and organisations
e) Constantly up-to-date concepts of new products and services
f) Fast and short delivery of new products and services to the consumers
g) The opening of new business areas such as e-commerce, the opportunity of the seller and the buyer to meet without any intermediary and beyond the national boundaries
h) Emergence of new business opportunities
i) Expansion of value-added concepts such as communication and information exchange for the products and services
j) Intense competition
k) Focus on consumer-oriented marketing approaches
l) Investing in research and development activities

DEVELOPMENT OF E-COMMERCE

There are two important elements in the development of e-commerce.

The first is development in the IT sector. The development of new communication environments, the increasing interest in information communication technologies from all sections of society, and the increasing power of social media adds a new dimension to the concept of socialization (Vural & Bat,

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

2010). Investments in information technologies increase each year and positively affects e-commerce because, information technologies form the basis of development tools of e-commerce (Coşkun, 2004).

Second is the globalization of the markets, which accelerates the development of e-commerce or vice versa. The globalization of markets accelerates the development of e-commerce, at which point e-commerce eliminates the borders of the country leading to an ease in customs rules, and an increase in globalization (Coşkun, 2004).

History of the Development of E-commerce

According to Smith (2011), the timeline of e-commerce development:

1946: ENIAC (first computer) was structured at the University of Pennsylvania.
1957: The Soviet Union launched the first artificial satellite (Sputnik).
1958: USA established ARPA to gain the science and technological leadership and to withstand the technological superiority of the Soviet Union.
1969: ARPANET (pioneer of the Internet) was founded at UCLA, Stanford, UC-Santa Barbara and the University of Utah.
1970: Application of EDI-Electronic Information Exchange
1973: The first international communication to the ARPANET was implemented at the University College of London.
1974: BBN company announced the establishment of Telnet, the first commercial version of ARPANET.
1982: ARPA established TCP and IP.
1984: The number of Internet users exceeded 1000.
1987: The number of Internet users exceeded 10000.
1989: The number of Internet users exceeded 100000.
- In the 1990s, the development and dissemination of the World Wide Web (www) began.

1990: The ARPANET was shut down.
1992: www (world wide web) was founded in Cern.
1994: Pizza Hut started to sell its products over the Internet.
1994: The first cyber bank First Virtual was founded.
1997: B2B (Business to Business) trading activity started.
2000: The number of Internet users exceeded 360 million.
2011: The number of Internet users exceeded 2 billion.
2011: More than 200 countries connected.
2017: The number of Internet users is about 3.7 billion (Kemp 2017).

It is a fact that the number of Internet users increased almost six-times in a period of 10 years between 2000-2010. It is expected that the volume of e-commerce will continue to increase as Internet technology is more widely used (Porter, 2001). The reason for this expectation is that Internet technology will positively affect the general development of e-commerce.

The advantages of e-commerce, such as the wide range of products offered to customers, price comparison and time savings, are important factors in e-commerce development (Hamad, Elbeltagi, & El-Gohary, 2018). In the coming years, it is thought that e-commerce will continue to grow due to fac-

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

tors such as the tendency of the young population to use the Internet, the increase in the mobile device usage rate, and the growth of emerging markets.

The most significant difference of e-commerce from traditional trade is in communication and approval processes. Transactions carried out in the traditional method are not expected to be faster than any e-commerce methods, such as e-mail or other types of electronic data transmissions ((Elibol & Kesici, 2004; Erbaşlar & Dokur, 2012).

Table 1.

Traditional Trade	E-commerce
Information about the products can be obtained by talking to the companies or examining magazines, brochures, and catalogues.	The customers can easily obtain information about the products or services of companies through their web pages on the Internet.
The customers should file a request and fill in a form regarding the product or service in order to purchase.	E-mail makes it possible to perform processes easily and quickly.
The Purchasing Department starts the price survey with the approval of the form from the customer. Catalogues and price lists are reviewed and interviews are made.	The web sites of companies already provide requested information that is easily reachable.
Forms are filled, faxed, or mailed to the supplier at the time of ordering.	E-mail or electronic data exchange (EDI) methods makes the ordering process more convenient.

E-commerce has caused radical changes in the marketing methods, shopping life, and payment of purchased products as a result of the widespread use of computers, the Internet, and the high volume of commercial networks. In the Internet environment, consumers can browse the web pages of companies, order products and services from shopping sites, and then have the products and services delivered to their location (Damanpour & Damanpour 2001).

It is very easy for stakeholders (internal and external) to reach business registry and partnership data by visiting the website of the company (Marangoz, 2014).

The main objective of e-commerce is to make commercial transactions in the electronic environment easy, reliable, fast and efficient (Kiennan, 2002).

E-commerce is not a one-sided activity and provides advantages to customers and sellers.

E-Commerce Types

E-commerce is about the sales and marketing of products and services over the Internet and transmissions between two or more parties. A classification of e-commerce is made in terms of the parties of the trade who are the businesses, consumers, and the government (Doğaner, 2007). Considering this trilateral mechanism, e-commerce types are:

Companies can gain a competitive advantage by maintaining their loyal customers who are constantly shopping through their websites (Guthrie & Austin, 1996). In periods of intense competition or economic/financial problems, companies tend to establish e-commerce activities by setting up websites in order to reduce costs and survive in the market, thus they also increase the possibility of achieving sustainable competitive advantages (Morrison & King, 2002; Tse, 2003). The reason for the private property arrangement of B&B is the lack of systematic performance data caused by competition and differing

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

financial situations (Poorani & Smith, 1995). Therefore, it is necessary to pay attention to the financial performance of B&B. In short, it is important to achieve a sustainable competitive advantage in terms of organizational learning skills, as they have an impact on organizational performance in the field of e-commerce (Ruiz-Mercader, Merono-Cerdan, & Sabater-Sanchez 2006).

Selecting Definitive Partners for Strategic Alliances

Another way to succeed in competition in the field of e-commerce is building strategic alliances. The aim of strategic alliances is to eliminate or wipe out the other competitors in the market. B2B companies are rival companies that combine their power to distribute their products in bulk, and also, they have access to new geographical markets through strategic alliances (Hamad, Elbeltagi, Jones, & El-Gohary, 2015). B2B allows information to be disseminated easily and swiftly. In a competitive environment, a partner company should only leave the strategic alliance after gaining basic competencies, knowledge, and developing a stronger strategic position (Stiles, 2001).

Figure 1. Characteristics of e-commerce

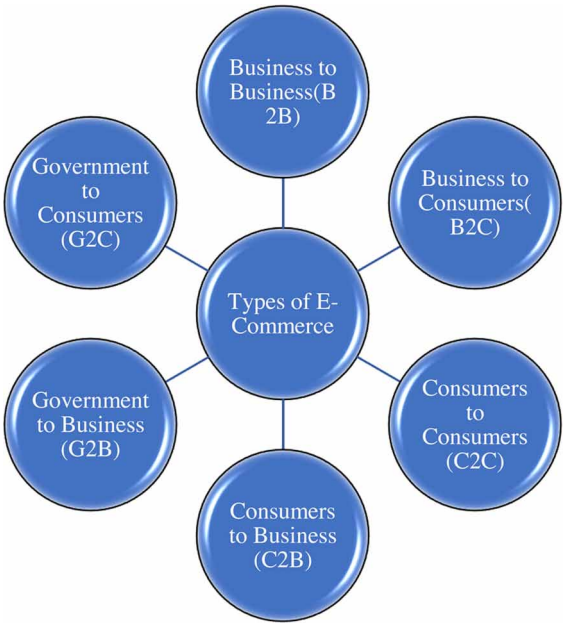
Figure 2. E-Commerce Types. Source: Doğaner, M., (2007). A study on the development of electronic commerce in Turkey and electronic trade from business to consumer. Master Thesis. Konya: Selcuk University Faculty of Economics and Administrative Sciences.



E-commerce is an important element for organisations to gain cost effectiveness against their competitors (Oum & Zhang, 2001). With B2B, partners have the opportunity to share strategic resources and capabilities that are scarce or absent in one or both companies (Gultai, 1999). Therefore, strategic alliance relations secure a wider distribution area, increase the efficiency of distribution, and facilitate the management of strategic resources, capabilities, and qualifications from a single source (Rowley, 2002). According to the findings of Stafford (1994), three strategic factors are necessary in order to be successful in competition: strategic goals, resources, and a corporate culture. Geringer (1991) explained that the collaboration, experience, and similarities in organizational culture can affect alliance performances. A strategic alliance is perhaps the most important step in forming a successful partnership in a highly competitive environment (Elmuti, & Kathawala 2001).

Achieving Expected Performance for Strategic Alliances

The growing reputation of a strategic alliance can reduce the damage caused by opportunist companies in a competitive environment. Trust is the essential factor for a strategic alliance to be successful in a competitive environment (Dale, 2003). However, inter-company diversity can lead to the opportunistic behaviour of a partner and this may adversely affect alliance performance in terms of the cost of transactions (Park & Ungson, 1997). Profit, growth, adaptability, and participation are often mentioned during the evaluation of alliance performance (Boersma & Ghauri, 1997). In strategic alliances, profit and growth are also often used as measurement elements (Hyder & Abraha, 2004). It is necessary to analyze the success of a strategic alliance by comparing alliances to competitors in a competitive environment (Tinnila, 2002). A strategic alliance provides both low transaction costs and a simultaneous tracking of

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

products or services with high added value. In a highly competitive environment, e-commerce companies are expected to increase their competitive advantages by adopting to B2B strategic alliances (Wise & Morrison, 2000). In short, the performance of strategic alliances is influenced by the industry environment, the experience of cooperation of alliance members, and by the motivation of selected partners (Harrigan, 1988; Kalakota, 2000; Chen & Tseng, 2005). At the same time, environmental characteristics affect alliance formation and motivation (Xie & Johnston, 2004). In a strategic alliance, high-quality partnerships increase performance (Lee & Lim, 2005).

Strategic Planning in E-Commerce

In the 21st century, e-commerce businesses can achieve success by integrating new job- processes into their organizations, giving importance to human resources, determining necessary skills/talents and bringing appropriate management roles and knowledge management systems (Okrent & Vokurka, 2004). Furthermore, in order to be successful in the field of e-commerce, organizations need to learn about new planning perspectives and manage innovation cycles suitable for e-commerce (Zahra & Gerard, 2002).

There is a strategically accepted fact that the Internet is now widespread throughout all countries. As a result, the e-commerce sector can be managed from even a home office environment, and this situation may have a devastating effect on companies in the normal trading environment, possibly bringing alarming change and threatening businesses. 'Alarming change' means that if companies do not conduct e-commerce activities through their web pages and continue their traditional trading activities, they may disappear from the competitive market. We know that there are 3 important strategies for achieving competitive advantage: cost leadership, differentiation, and focus strategies. It is only a matter of time before the new strategic approaches arise in the face of the change brought by e-commerce companies and their destructive impact (Lumpkin, Droege, & Dess, 2002). For example, if you look at potential customer populations and annual revenues of companies such as Amazon, Alibaba, or E-bay, which only trade over the Internet, you can better understand the impact of these potentially destructive changes of these companies.

From a strategic point of view, organizations must be able to adeptly measure, evaluate, and manage their skills. These skills are necessary for organizations to create value and to respond to the needs of customers (McAdam, & Galloway, 2005). In order to be successful in a competitive environment, the organizations need to control strategic processes (planning processes, management changes, accountability, and returns on investment) (Ho et al., 2004). In order to evaluate the assets, resources, and qualifications of the organization, e-business strategies must be aligned with organizational strategies, and the results of the implemented strategies should be related to organizational efficiency (Chang et al., 2003).

STRENGTH AND WEAKNESSES OF E-COMMERCE

Although e-commerce provides a number of advantages to businesses and individuals, there are also some questions about the reliability of e-commerce transactions as individuals have to share their personal information and credit card details on the Internet.

Strengths of E-Commerce

Advantages of e-Commerce (Budak 2010):

E-Commerce allows businesses to operate in the global market, allowing businesses to reach out to almost all countries and different cultures, and sell their products/services.

E-Commerce provides businesses not only new customers but also an opportunity to work with better suppliers and select partners, access to low-cost financing resources, and a qualified workforce.

E-Commerce businesses process, transmit, and record information in the electronic environment, instead of written paper format, reducing costs and eliminating time losses.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

E-Commerce systems use visual images and personal support services in order to enable companies to promote their products and services at the most appropriate cost.

E-commerce provides an opportunity to offer quality after-sales support services to increase customer satisfaction and loyalty.

E-Commerce allows companies to identify and respond to customer demands and needs quickly and effectively.

The Advantages of e-Commerce for Customers (Yeşil, 2008):

E-Commerce allows customers to shop at almost any place where the Internet is available.

E-Commerce provides consumers/customers with an opportunity to compare products and services, and select the reasonable priced ones.

E-Commerce companies use the complaints and suggestions of the customers for the purpose of improving customer service.

Weaknesses of E-Commerce

The web pages created by the e-commerce companies may have a number of security-related problems, which may lead to theft crime in the Internet environment.

Another security problem may arise if e-commerce companies share personal information of their customers.

In an e-commerce environment, communities should be made aware of fraudsters who use credit card copying technology on the Internet.

Customers can not try or test the products online, therefore returns and refund transactions are carried out, subsequently resulting in a loss of time and money. This is one of the issues that receives the most complaints from customers.

Tax problems that may arise due to the gains of enterprises in e-commerce,

The need for human resources in the field of e-commerce technology can be seen as a weakness as it brings extra costs to companies.

Advantages and Disadvantages Of E-Commerce

Advantages of E-Commerce

The advantages of e-commerce for businesses are as follows:

- **Customer Relationship Management:** Through e-commerce, companies are able to manage customer experiences easily, and provide solutions to any problems. Companies can create a more effective brand perception by online advertising through their e-commerce sites (Porter, 2005).
- **Reduction in Offline Store Cost:** Online stores reduce the costs of rent, office, and staff expenses. In the supply chain, it is very important to ensure accurate and fast information flow from the customer to suppliers and the delivery of correct materials from the supplier to the customer (Pavic, Koh, Simpson, & Padmore, 2007). The lack of stock requirements and the need of fewer numbers of staff can even make it possible to organise e-commerce sales from home.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Effective Use of Time:** Online, time effectiveness is an element of commercial transactions between the seller and the buyer (Porter, 2001).
- **Documentation Process***:* E-commerce activities are conducted with e-documents, which reduce stationery costs and make it possible for transactions to be carried out with minimum errors.
- **International Sales and Marketing:** Through online stores, companies have an opportunity to virtually conduct their sales and marketing activities in an international market without making any physical investments (Porter, 2001).
- **Competitive Advantage:** Online trading companies, unlike offline trading companies, provide competitive advantages by promoting their products and services more easily in the national and international arena without time and space restrictions (Lumpkin, Droege, & Dess, 2002).
- **365 Days 24 Hours Open Store:** E-commerce companies can provide uninterrupted service 365 days, 24/7 hours. If the website's software and technical infrastructure is strong, the companies can ensure uninterrupted regular services to their customers at all times (Hidayanto, Ovirza, Anggia, Budi, & Phusavat, 2017). E-commerce decreases informality in the economy and increases competition. In addition, within related sectors, it creates new employment areas through dynamic new business lines and specializations. Furthermore, it contributes to regional development, education, and social solidarity (Afra, 2014).
- **The benefits of e-commerce for the customer are as follows:** Consumers can carry out online transactions around the clock, save time, and get the product they want through the Internet. Thanks to e-commerce, consumers can easily compare different types of brand products. Furthermore, consumers can read the comments of previous buyers of products or services, gleaning different perspectives.

Disadvantages of E-Commerce

E-commerce has several disadvantages for customers and sellers.

Disadvantages of e-commerce for sellers are as follows:

- **Security Problem:** The biggest disadvantage of e-commerce is the security vulnerability, as there is a possibility that the web sites can be hacked and user information can be captured by the hackers (Baldwin & Currie, 2000).
- **E-Commerce Costs:** The databases and applications of e-commerce companies should be very well maintained. The need for serious infrastructure and the cost for effective e-commerce activity is a disadvantage for the seller.
- **Security-Reliability:** The biggest disadvantage of e-commerce for customers is that of security vulnerability, there is risk that all personal information such as identity details, home address, phone number, etc., can be served to third parties (Baldwin & Currie, 2000).
- **Quality Uncertainties:** It may not always be enough to obtain information about the product in a virtual environment. The return process of the unwanted products often creates a great time loss for customers (Corbitt, Thanasankit, & Yi, 2003).
- **Delivery Delays:** Delivery delays may occur due to weather conditions, public holidays, and a lack of product in a seller's stock. Delivery delays can cause customer dissatisfaction.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Competition Concepts and Competition Strategies

Competition has five points.

First, the goal. There must be an objective, and the existence of others might cause difficulties in the realization of this objective.

The second is rule and restrictions. In a competitive environment, the prevention of opponents into the game or their elimination by either force, abuse of the dominant position, agreement between the competitors, or cheating etc. is prohibited. If a race does not have any rules and restrictions, we cannot call it a competition. In such cases, it can be said that there is a violation in competition or unfair competition.

The third is the guarantee of fundamental freedoms and human rights. It is not enough to recognise freedom on paper. The full guarantee of freedom is possible by the existence of a well-functioning, independent, and effective justice system.

Fourth, there should be no discrimination. The position of the state in the competitive environment is very important. The state should not give privilege or priority to some players for various reasons and should not discriminate or tolerate incompliances with rules and obligations.

Fifth, the number of players should be more than one. In a competitive environment, in some cases, certain number of players are required to play, so the players can not dominate the game and can not affect the result of the game. In fact, all the players should have free access to the game, and none of the players should dominate the play on their own. In some exceptional cases, even if there is only a single player, it still may be considered a competitive environment if the entry into the race is free. However, in such special cases, the existing player should feel the competitive pressure from the potential players who want to enter the market (http://www.rekabetdernegi.org/rekabethakkinda.htm, Access: 01.02.2019).

Benefits of Competition

Competitive power is the key to the success for companies in national and international fields. Companies should give necessary importance to research and development, information, and training of employees in order to improve their technological infrastructure. In today's intense competitive environment, only robust companies can survive, whereas weaker ones are forced out of the market, both in production and service sectors. Therefore, these factors become more significant as they provide flexibility for the companies. Flexibility is an essential factor in a competitive environment because it allows companies to survive in the market by differentiating their products or services. Furthermore, the companies need to work efficiently to be successful in a competitive environment, and in this way, they can transform their savings into investments and ensure capital accumulation in a country (Su, Guo, & Sun, 2017). The companies in the e-commerce sector have flexibility, which is a significant step towards efficiency. In comparison with traditional companies, the e-commerce companies have many advantages such as reduction of costs, allowing flexibility and providing product/service diversity. Companies operating in the field of e-commerce can gain more advantages and achieve sustainability if they can open up to international economic areas and integrate with the world (Mess, 1997).

Competitive Advantage

There are other factors that may be important for the competitive advantage. One of them is the content of the web page. The Internet makes it possible for companies to display large amounts of content at a

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

very low cost. For example, REI.com is a supplier of recreation equipment and ready-to-wear clothes and has more than 78,000 items on its 45,000-page web site. However, the company could not manage its website content effectively in order to gain added value. Similarly, Garden.com had a strong start in 1999, raising tremendous venture capital but failing to create detailed and compelling content (but its name is still used by Burpee, a 125-year-old garden products supplier).

Three types of content can improve the value of a web site: customer feedback, expertise, and entertainment programming:

Customer Feedback

Buyers often rely on other buyers' comments more than a company's promise. The customer comments and customer feedback can help to improve the content of a website.

For example, if you want to buy a piece of furniture online, you can't touch, feel or try it. In this case, you can make the purchase decision by reading or evaluating the objective references of other buyers who have previously purchased the product you want to buy. Such references can create trust or play a significant role in the purchasing decision by highlighting the 'unwanted or unappreciated' sides of the product or services as experienced by the previous buyers. This can also be a competitive advantage source for the competitors because they follow each other. It is necessary for the companies to examine the responses of customers and read their experiences to understand their opinions about the products and services in order to create new product or improve services in a competitive environment (Kakalejčík, Bucko, & Vejačka, 2019).

Expertise

The Internet is a very important learning tool and it is constantly developing. Fifty percent of users regard the Internet as a kind of library, because search-oriented web pages such as Google, Yandex, etc. allow access to a vast amount of information quite quickly. As a result, users have the opportunity to improve their knowledge. Furthermore, some websites provide valuable new or objective information. At the same time, its problem-solving function often educates consumers on various options and outcomes. For example, several online web pages such as Sikayetvar.com, Sikayetim.com, or Sikayet.com can provide information about products and services, and customers can read about the problems they face before buying them. The expertise function is not limited to regions. In the case of B2B businesses, web sites share their expertise by creating communities or professional groups in the industry (Kaplan, & Sawhney, 2000).

Entertainment Programming

The Internet is used for entertainment purposes by more and more people. Technologies such as streaming media allow the Internet to send TV-like images and sound allowing computers to broadcast breaking news, offer video games and movies, and provide fun time online. In fact, we can say that TV viewing has been reduced and online activity has been increased among people with high-speed broadband service because the technology has an interactive approach, which means the viewers not only passively watch but are involved in creating art and playing a game etc. Of course, e-commerce companies noticed this trend and have started to create web content that is not only informative but also fun.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

These three types of contents-customer feedback, expertise, and entertainment programming- are sources of potential competitive advantage and can strengthen the value creation process. However, if they are used negatively, they can also reduce performance. Strategically displayed quality content enables companies to effectively differentiate their offer of product or services. This can be particularly important in an environment where differentiation strategies provide more gains compared to a low-cost strategy.

STRATEGIES TO GAIN A COMPETITIVE ADVANTAGE

There are many methods and strategies to achieve a competitive advantage. The analysis of the competitive situation of a company within the market is called competition analysis. The determination of the competitive situation of a company reveals whether the investment was successful and if it has the ability to gain above average profits (Lu & Wang, 2016). This skill increases the chance of being successful in the free market. Competitive strategies also allow companies to find the most suitable position within a competitive environment and achieve their main objectives (Porter, 2008).

There are many methods and strategies for companies to achieve a competitive advantage. Competitive strategies that can be implemented according to their sector;

1. Competitive Strategy: Porter's Model
2. Competitive Strategy: Resource-Based Model
3. Competition Strategy: Game Theory Approach

According to the Porter's competition strategy, it is necessary for companies to determine conditions affecting competition in order to ensure a competitive advantage (Porter, 2008). After that, the generic competition strategies can be implemented in every sector.

Figure 4. Competitive strategies

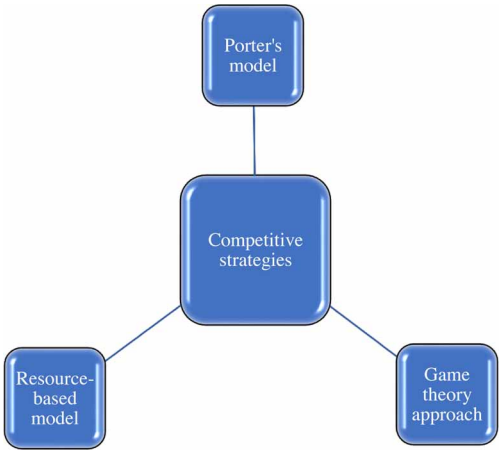

Figure 5. There are five powers that influence competition (Porter 2008)

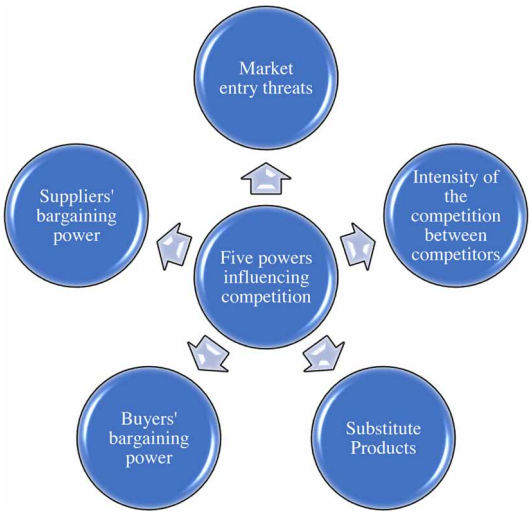


EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Main Conditions Affecting Competition

If the company(s) are entering the sector for the first time, they need to obtain a market share in order to stay in the market. From the moment they enter the competition, the companies should bring their resources. However, every company may not enter the market as they wish. This situation is called market entry barriers which is explained below (Porter, 2008):

Economies of Scale

The increase of absolute production volume per period can cause a decrease in unit costs per product. Companies may reverse their decisions for two reasons:

- They cannot take the risk of the reactions from companies already in the market.
- Or, they can't afford the cost resulting from the disadvantageous situation.

Product Differentiation

Newly entered companies may have to spend more money to create satisfaction and gain loyalty of the customers as this is a barrier for companies.

Capital Requirements

New companies in the market should spend on advertising and/or R&D activities in order to compete. This means that they should have more financial resources. For companies that are unable to handle this burden, insufficient capital is an barrier to entry.

Transition Costs

If a company does not like its supplier or does not agree with its supplier, the transition process to a new supplier may create a barrier to entry as it may be reflected in costs.

Access to Distribution Channels

When the company enters the market, it must have a good distribution channel to respond to the demand from the buyers. The need to guarantee the delivery of the product to the buyer may create a barrier to entry.

Cost Disadvantages

One of the biggest entry barriers for new entrants to the market is the position of the companies that have already taken place in the market. Their superiority gained from experience, image, reputation, or location can be a barrier to the market for possible entrants.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Government Policies

A number of state policies, restrictions, prohibitions, penalties, etc. or similar elements can be entry barriers for new entrants to the market.

Intense Competitiveness Between Competitors

From the moment of market entry, there will be competitive manoeuvres of competitors within the market. In many sectors, the competition of companies can have a significant impact on competitors in the market. In the face of these moves, opponents will tend to retaliate against their counterparts. In fact, as a result of these mutual moves, the firms become dependent on each other because they re-develop and renew themselves through retaliation.

Substitute Products

If the products of a company are also available from the competitors, and if buyers have the right to choose, this may cause a reduction in profits. The most important move of the company (s) against substitution products is to explain to consumers the difference of their products from other products in a positive way. Because, what is important for consumers is the relationship between price/performance/quality (Porter, 2008).

The Bargaining Power of Buyers

One of the most important situations for companies is that there are buyers who will benefit from competition in the market because buyers have the right to buy a product according to their budgets. The buyers gain this power as a result of competition among companies (Porter, 2008).

The Bargaining Power of Suppliers

When companies enter the market, they may see that suppliers can play with the price or decrease the quality of products and services. In this case, the suppliers can have power in the market. This power can reduce the profitability of the companies due to the cost increase caused by suppliers (Porter, 2008).

Generic Competitive Strategies

Businesses who want to be active in e-commerce should be able to satisfy their customers or consumers much better than their competitors in order to be successful in a competitive environment (Coltman, Devinney, & Midgley, 2007). The degree of satisfaction is directly proportional to loyalty. In a competitive environment, competitive analysis has a strategic importance enabling survival in the market. The two most important elements of competitive analysis is the determination of strengths and weaknesses. If senior management has ego problems, if they cannot have a result-oriented mindset, and if they are not visionaries, they might ignore weaknesses within the firm. This means that the company's life in the market will be short-lived. Status/position title can change people. Real leadership is seen in those who do not show any change in character/personality after receiving a office/title/status. Naturally,

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

during competitive analysis, companies should identify their weaknesses and turn their strengths into opportunities within the market (Tek, 1999).

The differentiation and cost-leadership strategy are parts of the Generic Competitive Strategy and also for companies operating under industry conditions. The focus strategy is for businesses with a narrow field of activity (Porter, 1985).

Industry 5.0: This means the existence of unmanned technologies in life. It is a fact that robots can do every job that people can, while also allowing artificial intelligence to communicate among themselves. The unlimited advancement of technology highlights the continuing problem of 'unemployment'. Furthermore, industries are now able to be managed by only one group of people while all other jobs can be carried out by artificial robots. The development of the capabilities of humanoid robots will push companies to generate new strategic moves. It is worthy paying attention to the question of how e-commerce companies will be affected by the attempts to bring the virtual world and the real world together. In this case, we need to ask if generic competitive strategies need a 4th strategy? Companies operating in the field of e-commerce should focus on technology-based activities in order to be ready for industry 5.0. It will be possible that new strategies will be generated as a result of this atmosphere in the competition environment.

However, Strategic Transformation should focus on;

- Reducing costs and ensuring operational efficiency; the supply chain must be functioning smoothly and technological integration, which is the pioneer of change, must be sustained successfully (Coltman et al., 2001).
- In order to have a good position in the e-commerce market, it is necessary to differentiate products and/or services and use the resources in the supply chain effectively (Chang et al., 2003).
- It is necessary to create a superior economic value that will provide a competitive advantage (Riggins, 1999).

Cost Leadership Strategy

Cost leadership strategy is about businesses gaining advantages over its competitors and obtaining above average income above in line with the reduction of costs in all activities and ensuring positive differences between costs and prices (Porter, 1985).

The cost leadership strategy has several risks (Porter, 1985);

- With the continuous development and change of technology, past investments or experiences may become invalid.
- The low cost of new entrants in the sector by imitating or investing in very good facilities,
- The fact that product or market changes may not be seen due to the company's concentration on cost.

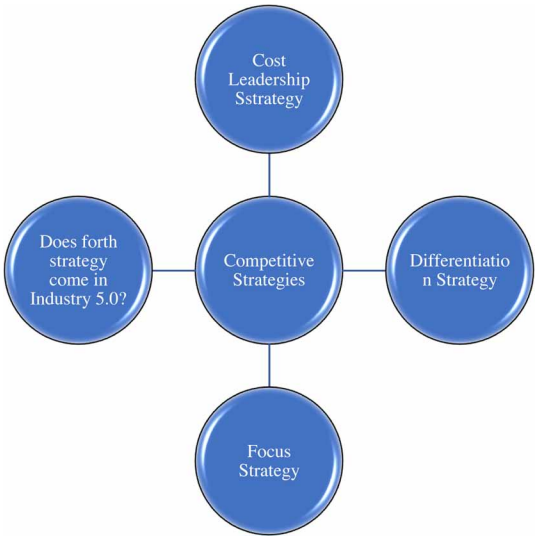
Differentiation Strategy

By differentiating product or services, businesses can create something that is considered unique by consumers and customers. Carrying out business activities the same as other companies does not allow a company to progress beyond imitation. However, the basis of the differentiation strategy is to generate

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

different applications, become distinct among competitors, and direct customer preferences to a company's products and services. Then, differentiation can be made based on the design, brand name, brand image, stores, technology, support services, customer services etc. In order for the differentiation strategy to provide a competitive advantage, the value created must exceed the cost. In addition, differentiation must be valuable for the consumer.

Figure 6. Generic Competitive Strategy (Porter 1985)



From the Technological Aspect

There are a range of outsourcing options from total outsourcing to partial outsourcing. It is possible for an organization to try to differentiate itself in the market by focusing only on one main factor. This can shift the strategic focus to an external supplier and generates additional strategic issues but does not generally lead to a comprehensive organizational culture change. However, if a comprehensive relationship in management is needed, there may be a significant gap between strategic expectations and fulfilment (Levina & Ross, 2003).

From the Products and Services Aspect

When e-branding becomes a critical issue, and when a difference occurs between brand identity and brand totality, a significant cultural change is seen (Venkatraman & Henderson, 1998). This requires all members of the organization to think 'out of the box' and distinguish between corporate customers and end consumers.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Business models, e-Positioning

At this stage, the organization regains its position in the market through e-services to a wider community. Fujitsu and Dell have been exemplary for successful differentiation through e-business. These pioneers developed their public relations and established a special relationship between suppliers and buyers. This created an organizational culture that embraces 'community culture' throughout the organization.

Focus Strategy

Businesses choose a specific part of the market. For example; it may be certain consumer populations, a specific production and distribution line, or a geographic location. With the focus strategy, a company attempts to reach a specific target, market and provide better service.

Table 2.

Advantages of Differentiation Strategy	Risks of Differentiation Strategy
- Generates customer loyalty, as well, customers become insensitive to prices and this provides protection against competition. - Customer loyalty and the uniqueness of the company, due to differentiation, creates barriers for new competitors, - Creates high margins against the power of suppliers; this also destroys the need for a low-cost market situation. - The company that differentiates itself and achieves customer loyalty is better protected than its competitors in the case of substitution products (Porter 2008).	- If the cost difference between low-cost competitors and the differentiated enterprise increase too much, differentiation cannot maintain brand loyalty, and buyers stop buying the products for certain features, services, or the image of the enterprise. -Buyers' need for the differentiating factor may decrease. This occurs when buyers become more complex. -Imitation can reduce the perceived differentiation. This situation becomes more common in widespread sectors (Porter 1985).

Resource-Based Competition Strategy

Resources of Business

The competitive strategy based on resources emerged after 1980, and started to develop in order to achieve a sustainable competitive advantage in the sector. The aim of this strategy is to determine the strengths and weaknesses of the organisation and focus on strong resources (Van Hooft & Stegwee 2001). It is a perspective based on gaining competitive advantage by focusing on a company's strong resources (Karacaoğlu, 2006). Resources (tangible assets, intangible assets, and organizational skills) are the tools for organisations to develop and implement a strategy to achieve a competitive advantage (Seviçin, 2006).

There are two basic assumptions of the Resource Based Competition Strategy:

- Businesses may have different strategic resources in the sector. In other words, the resources of similar production processes may have different characteristics compared to other enterprises. This situation may cause different productivity and efficiency levels and can lead to distinctive performance gaps. At the same time, it can generate competitive advantages.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Resource differences between businesses may be long-term. This situation indicates that the resources are specific to the enterprises and are very valuable. At the same time, it ensures a sustainable competitive advantage.

Table 3.

Advantages of Focus Strategy	Risks of Focus Strategy
- It can be considered a type of competitive strategy which reduces the threats that new entrants may create. - The threat of substitution products for businesses is very low. - The number of competitors in private and differing markets decreases and competition occurs at a different severity (lower level) (Porter, 2008).	-In the case of a wide range of products, the company with a focus strategy may lose the cost advantage of serving a narrow target. - Differences in products or services begin to decrease as a whole. -Competitors find sub-markets within the strategic target and exclude the orientation focus (Porter, 1985).

Characteristics of Resources

The characteristics of the strategic resources are:

Figure 7. The Tools for Organisations
Source: Seviçin, A. (2006). Kaynaklara Dayalı Rekabet Stratejisi Geliştirme. Dumlupınar Üniversitesi Sosyal Bilimler Dergisi, (15).

Stages of Resource-Based Competition Approach

Prahalad and Hamel, Grant and Rumelt stated that the Resource-Based Competition Strategy, carried out from internal to external dimension, and companies should use resources and skills effectively.

Hamel and Prahalad explain certain stages of competition (Köseoğlu, 2007):

- Establishing basic skills by predicting customer demands and future opportunities.
- Creating an alternative product variety to reshape the customer approach
- Creating and managing necessary coalitions for the sector
- Forcing competitors to progress styles that will be expensive and time consuming
- Ensuring suppliers have worldwide networks
- Entering key markets before competitors by identifying a suitable market positioning strategy
- Differentiating product and production processes to increase efficiency and effectiveness.

The Porter's approach and Resource-based approach are alternatives to each other, however Barca (2002) explains that these two approaches are also complementary. Barca states that 'strategy development is about associating internal resources with external environments in order to achieve a competitive long-term advantage (Barca, 2002). Barca explains that the good 'market position' and 'basic skills position' is necessary for gaining a sustainable competitive advantage (Barca, 2002).

The Effect of E-Commerce on Competitive Strategies

E-Commerce will require radical changes in our understanding of competing enterprises. When we consider Porter's Generic Competition Strategies,

Through e-commerce, businesses;

- can focus on different markets
- reduce their total costs
- can develop a wide range of services or products compared to their competitors (Porter, 2008).

If we analyse e-commerce from the recourse-based perspective, we can say that e-commerce companies should have effective and efficient approaches in using their resources. If we analyse e-commerce's competitive strategy, in terms of game theory, e-companies will affect all companies in the sector, in terms of added-value rules.

The reciprocal moves of companies operating in the field of e-commerce will also affect their strategies and naturally have an impact on the conditions of competition (Ma, Jin and Huo 2019). If companies want to turn these effects of a competitive environment into an opportunity and gain an advantage, they should ensure that their strategic moves are complementary to each other.

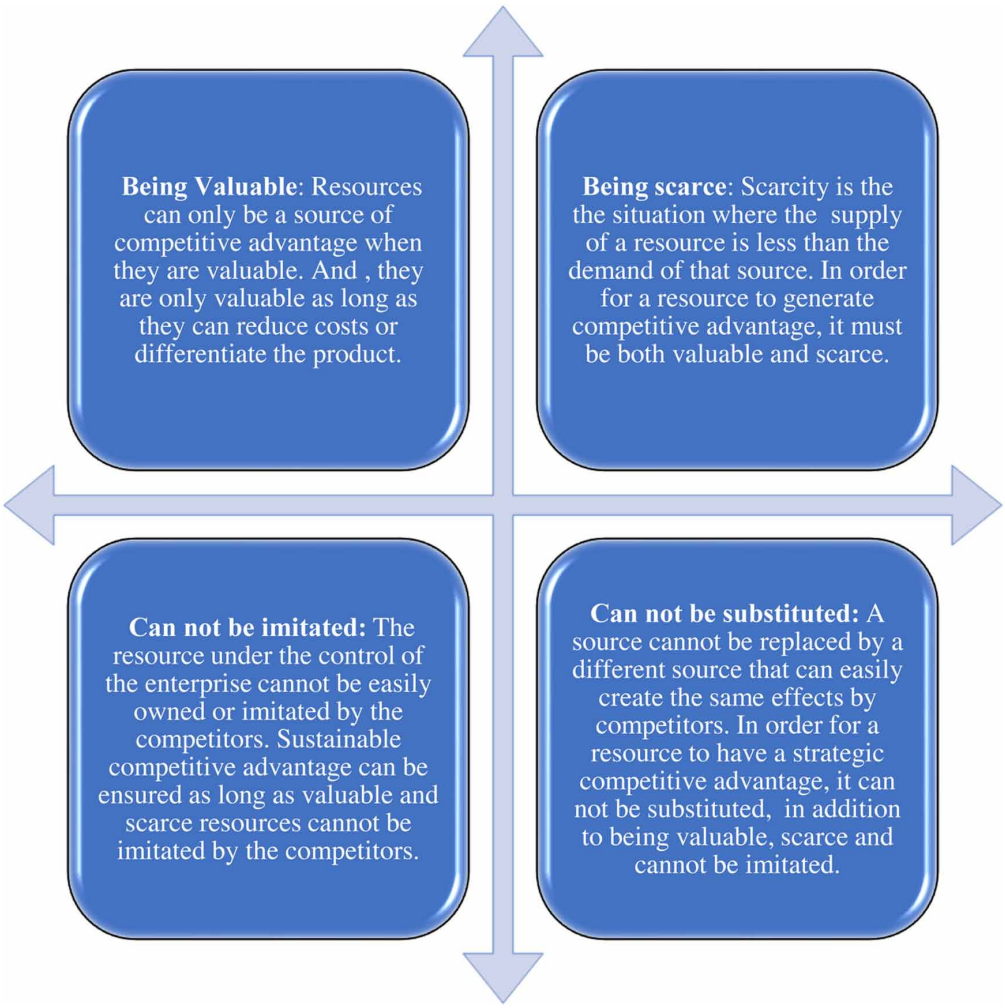
Adding Value

Companies need to collect information and data to analyse their customers and competitors in the sector. At the same time, customers need information to compare the products and/or services of companies to make a purchase. The Internet provides a great convenience both in terms of accessing and gathering

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

information. The Internet reduces search costs and brings multiple benefits. For example, we can use the Google search engine to gather information and compare products and services of several companies and then buy from the appropriate company according to our budget. Google scans 3 billion web pages in an average of 500 milliseconds and provides instant information. Imagine if you had to do the same search without the Internet; If you spend 1-minute per page, you will need to spend 5707 years to navigate 3 billion web pages. This example helps us to better understand what kind of technological invention the Internet is. Therefore, Google has become of interest for people of all ages and at all educational levels. Companies allocate significant portions of their budget to appear on the first page of Google. Because, if you want to gain a competitive advantage, you should use the technology very effectively (both in the manufacturing and in the service sector).

Figure 8. The Characteristics of The Strategic



EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

In order to achieve a sustainable competitive advantage, strong support is needed to create value in productivity and customer service because the quality of the products and/or services or customer satisfaction determines the value of the product/service offered. Customers value the product together with the service received. The value created by the service will be an advantage in a competitive environment, and a competitive advantage depends on increasing the efficiency and positive return on investments. Therefore, trainings should be provided for employees and organisational plans should be done with the utmost care. Continuous development and change will make it possible for companies to achieve their targets and reach their goals. Especially in today's business world, where there is intense competition, it is not possible for companies to be successful if they do not learn and not keep up with the changes or are slow to adopt to developments. Success in a competitive environment also depends on planning and implementing non-disruptive supply chain practices and providing innovative product and/or services compared to competitors.

SOLUTIONS AND RECOMMENDATIONS

It is accepted that 'policy' is an important factor for the new e-commerce concept. Indeed, technology and management strategy options are very much linked to the political, social, and regulatory environments of e-business. Policies can be quite complex or change regularly; therefore, their impact on e-commerce is not fully understood yet. Policies can change market conditions, increase or decrease regulations, create market entry barriers, influence prices, increase or decrease competition costs, and configure interactions between companies and customers. E-commerce companies have different options, and they can either act passively and obey the rules or become an actor in managing policy limits as a part of a company's overall strategy (Hackney, & Burn, 2001). E-commerce brings customers and traders together in a commercial, translational, cultural market beyond imagined technical boundaries.

E-businesses use computers and communication technologies for commercial purposes; therefore, they should pay attention to the automation of communication and interaction activities. E-business includes telephone, e-mail sales, or systems that support commercial activities over the Internet and exploded with the growth of the Internet (global gathering of thousands of individual networks in the world), particularly the World Wide Web. E-commerce has changed the market rules and the role of information technology (IT). Before, market strategies determined the use of IT systems; however, now, IT has power of its own (Venkatraman, & Henderson, 1998). Indeed, companies that want to be successful in e-commerce are planning their market strategies based on IT. Today's successful e-commerce models are market and technology-oriented, but at the same time, it requires the seamless integration of both marketing and technological skills (Ghosh, 1998). Tomorrow's e-business model will be technology oriented, and information technologies will be an integral part of the company strategy, in dealings with governments, interest groups, and the public. In other words, policies will be closely managed with strategy and technology options. Tomorrow's e-businesses will need to design, structure, and create relationships that allow technology and policy-driven dynamic and cost-effective options to be present.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

FUTURE RESEARCH DIRECTIONS

There is a deep concern in many circles that e-commerce may be increasing the power of traders, reducing the power of consumers, challenging the government's ability to protect local industries, and threatening the income sources of both the state and governments. E-commerce not only raises economic concerns related to competition and pricing but also reveals new social and environmental threats that can be quite widespread and viral (Kakalejčík, Bucko, & Vejačka, 2019). Moreover, the regulation of a country may need global cover rather than being limited to a sovereign state. Finally, as the Internet reduces the cost of the organization, there is an increasing number of interest groups, and their opinions about policies should be taken into consideration. These interest groups can be formed and solved in a short time and e-businesses should develop interactions with them regarding forming policy. Up until now, there has been little awareness or interest in public policies in the field of management within e-commerce. Therefore, companies that want to be successful in competition conditions should thoroughly analyze their external stakeholders before starting their activities in the field of e-commerce. Then, they need to create their own organizational culture with a better dynamic structure than their competitors. However, in doing so, the most important point is to make sure that their investment has a visionary perspective and is integrated with technology.

CONCLUSION

The most important feature of e-commerce is that it provides an opportunity for customers to evaluate and compare products and services. The customer/consumer can conduct cost and benefit analysis and purchase the most appropriate product and/or service according to his/her budget. However, it is also necessary to point out the disadvantages of e-commerce. There are some products that even if comparisons are made on the Internet, it will not be enough, and a customer will need to go and look or try. For example, textile products may not always be same as the one on the web page, and a customer may have to go to the store and try it on and purchase the goods there. Similarly, furniture may not be same as it appears on web pages. One of the indicators of success for e-business is whether the company is ready to meet the demands of customers/consumers. From a strategic point of view, the important factor is the organisation's adaptation process to technology (Spathis & Constantinides, 2003). The success of the e-business initiative also depends on having a compelling vision that radically changes the organization's performance. Another way of being successful is to have open communication between the leader and employees, and also have strong organisational participation and determination. In order to achieve this, it is necessary to establish an appropriate organizational culture (Yu, 2005). Another key point for the success of e-business is that its vision of change should be adopted by all stakeholders within the organization. In order to gain this, intra-organizational communication should be successfully implemented at all levels. A further factor of success of e-business initiative lies in the adoption of a transparent management approach, which is very important in providing trust for all internal stakeholders and external stakeholders. Managers need to use resources in line with organisational objectives and they should prepare the structure of the organization for competition in order to achieve organizational change (Huang et al., 2004; Zhao, 2004; McAdam & Galloway, 2005). A digital economy has changed the cost structures of certain sectors, as well, the applications of Internet-based technologies have already had a tremendous impact. It is clearly understood that the Internet reduces costs and speeds up processes. For

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

example, transactions between a seller and customer can be mutually agreed and implemented on E-bay.com very easily and quickly. Similarly, payments can be made between the parties through services such as Paypal, without any need of seeing each other. Amazon offers One-Click technology that enables high-speed purchases and is very successful in fulfilling orders and conducting fast and reliable transactions. These examples show that companies should focus on every detail in e-commerce, such as the variety of payment methods they offer in their web pages, in order to be successful in a competitive environment.

Chapter 74
Impact of E-Commerce on Agricultural Business Success

Carla Sofia Vicente Negrão
https://orcid.org/0000-0001-6967-7800
University of Coimbra, Portugal

ABSTRACT

In an increasingly digital and competitive environment, it is important to understand the agricultural business' success in a digital economy. E-commerce appears as a potential strategic tool. The purpose of this chapter is to analyze the impact of e-commerce on agricultural business success in Portugal. Through a quantitative approach, data were collected by survey and a sample of 372 agricultural enterprises is obtained. The empirical results suggest a negative and significant impact of e-commerce on productivity. However, there is a simultaneous relationship between the e-commerce adoption and performance, both individually and globally. This study contributes to the addition of theory on e-commerce adoption, the impact of e-commerce on performance, and other determinants of the agricultural business' success.

INTRODUCTION

In an increasingly digital and competitive environment that agricultural enterprises cross due to the technological advances into the 21st century, it is important and becomes interesting to understand their success in a digital economy. From these technological advances arose a new form of trade - e-commerce as a potential strategic tool for agricultural enterprises to become more successful in a digital economy, as more and more information and markets are available to the consumer. Although many enterprises adopt e-commerce without knowing their impact (positive, negative or potential) (Leonard and Cronan, 2002).

To clarify the possible importance of e-commerce adoption and thereby increase the agricultural business success (ABS), in a digital economy, it is proposed this study. The study therefore addresses the following research question: what is the impact of e-commerce adoption on ABS? The following general hypothesis is formulated for this investigation: e-commerce adoption has a positive impact on ABS.

This chapter aims to analyze the impact of e-commerce adoption on ABS in Portugal. For this purpose, the researcher has taken into account the potential endogeneity of e-commerce on ABS determination models. Previous studies have suggested models (e.g., Bertschek et al., 2004, 2006; Falk & Hagsten, 2015; Kubota & Milani, 2011; Liu et al., 2013). However, although e-commerce adoption may be a factor impacting the ABS, other factors may contribute to its success. In order to reach this objective, the author proposes an empirical study. In addition, this aim is achieved by performing the following specific objectives, in the context of agricultural enterprises:

- To verify possible relationships between e-commerce adoption and ABS, in multiple dimensions, in Portugal, in year 2014;
- To identify key factors that contribute to ABS in Portugal, in the period of 2014.

The present study may be relevant in a country - such as Portugal - for several reasons. Firstly, at the time of data collection, Portugal was experiencing serious economic crisis and e-commerce adoption by agricultural business could be a strategy for enterprises to grow, increasing productivity and improving performance, and, consequently, the extent of the potential economic growth. Secondly, another reason is due to the fact that Portugal is one of the European countries with the lowest intensity of e-commerce adoption by enterprises and weak business growth. This makes it interesting to analyze the impact of e-commerce in the Portuguese context. Thirdly, e-commerce in agriculture is an under-researched and scarce theme in Portugal. Finally, it may be important to discover and analyze strategies with impact on ABS, so that managers have more information available that can be useful to plan future strategies, in order to be more successful. In addition, agricultural sector is the focus of the author's interest.

This chapter can contribute to research on success, because it tests an ABS model, in various dimensions, based on a holistic approach. It can contribute to research on e-commerce, within the agricultural business in Portugal, because empirically it analyzes the impact of this technology adoption on ABS. The researcher believes that this chapter adding knowledge for development of agricultural sector for politicians, economists, managers, consultants and academic researchers, about key determinants of ABS, in particular, the e-commerce impact.

The next section contains the theoretical background and hypotheses of research. The section 3 describes the research methodology and the section 4 presents the results. The final section presents the conclusions, discusses some limitations of the research and suggests directions for future research.

THEORETICAL BACKGROUND AND HYPOTHESES

Agricultural enterprises, like the rest of the economy, have the challenge for changing their business model and practices (Henderson et al., 2000).

Success: An Overview

Success is a theme of interest in the scientific community that has allowed the development of studies over the years, and up to now, thus becoming a relevant and current theme. The research into business success covers different terms that have been used to refer to this phenomenon in different disciplines. "Success" is a broad term and therefore conceptualized in different forms. Success relates to the achieve-

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

ment of goals and objectives for any sector of human life (Chittithaworn et al., 2011; Islam et al., 2011). In addition, in business, success is "a matter of opinion and may be related to the degree to which objectives are met or exceeded, some of which may be critical for success" (Simpson et al., 2012, p. 272). However, in the field of agricultural business, success is understood as the achievement of goals and objectives of agricultural business.

In literature on success, several ways have been used to measure this phenomenon, in multiple dimensions in different disciplines. This phenomenon is measured as: survival (Headd, 2003; Schutjens & Wever, 2000), success vs. failure (Lussier & Pfeifer, 2001) and successful status at closure (Headd, 2003). Or size (Schutjens & Wever, 2000; Unger et al., 2011), growth (Lee et al., 2010; Schutjens & Wever, 2000; Unger et al., 2011; Zhou & De Wit, 2009) and profitability/ productivity (Unger et al., 2011). And still perceived organizational performance/ success (Ahmad et al., 2011; Alom et al., 2016; Chan et al., 2006; Chittithaworn et al., 2011; Hult & Ketchen, 2001; Islam et al., 2011; Lee et al., 2010; Sabherwal & Chan, 2001).

However, for the purposes of this study, the researcher decides to conceptualize success in three dimensions: growth, productivity and performance of agricultural business. Turnover growth that represents the enterprise growth. Turnover per employee that represents productivity/ profitability. In addition, the organizational performance perceived by agricultural managers. The meta-analytic review of Unger et al. (2011) uses the dimensions - growth, profitability and size, but in the present study, the size is considered an independent variable. Instead, the researcher includes the perceived performance of agricultural enterprises. These measures are chosen for two reasons. The first, because turnover and number of employees are indicators widely used in the literature. The second, because they are objective measures and easier to obtain compared to other financial measures. In addition, Zhou and De Wit (2009) suggest that future studies use sales growth as a dependent variable for growth and Combs et al. (2005) point to sales growth as the most used indicator in terms of growth. Furthermore, the researcher has selected other subjective measures of manager's perception and a more direct response, because they are easier to obtain than objectives measures and also represent organizational success.

Different researchers studying these phenomena from different perspectives and different factors influence business success. Schutjens and Wever (2000) point to large firm size right from the beginning, good preparation, have a business partner, and a few years in salaried employment increase startup firm growth. Zhou and De Wit (2009) show individual and organizational determinants of growth but environmental determinants don´t influence growth.

Ahmad et al. (2011) validate un construct for business success which include satisfaction with financial performance, satisfaction with non-financial performance, performance relative to competitors and business growth. Alom et al. (2016) point to entrepreneurial and enterprise characteristics and economic factors impact on overall performance. In perspective of Sabherwal and Chan (2001) and Chan et al. (2006), the strategic alignment improves perceived organizational performance. Chittithaworn et al. (2011) point that SMEs characteristics, customer and market, the way of doing business, resources and finance, and external environment influence business success. Based on resource-based view, Hult and Ketchen (2001) point to market orientation, entrepreneurship, innovativeness, and organizational learning have a positive effect on performance. Islam et al. (2011) show that entrepreneur characteristics affect business success, but firm characteristics are not significant. Lee et al. (2010) show gender differences on perceived business success and profit growth models.

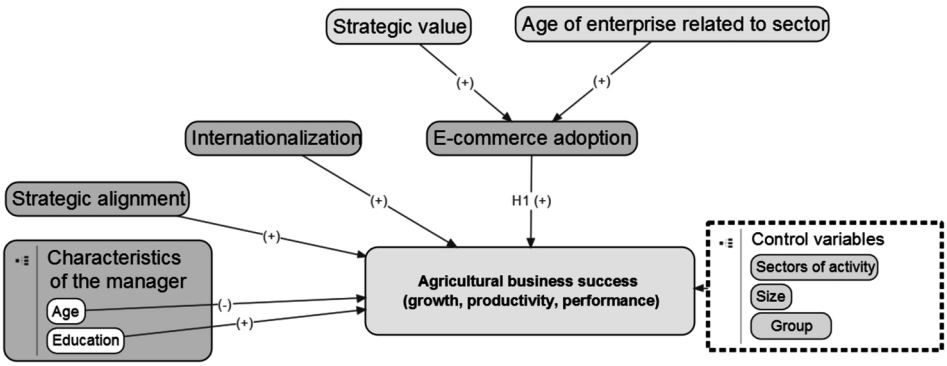
RESEARCH MODEL AND HYPOTHESES

Based on the above discussion, the researcher proposes the research model presented in Figure 1. The ABS model can be considered holistic, across knowledge of multiple disciplines, integrating several theories addressed in the literature and different theoretical models, namely in the context of entrepreneurship, strategic management, marketing and economics. ABS is measured in three dimensions: growth, productivity and agricultural enterprise performance. However, it is difficult to estimate a model with only one explanatory variable and all other factors are included in the error term. In this sense, the present investigation contains other explanatory factors/attributes and control variables on ABS model. These model aims to investigate the impact of e-commerce adoption on success of agricultural business, controlling the effect of other factors, such as internationalization, strategic alignment, and manager characteristics. On researcher's perspective, these strategies are key determinants for ABS. Because these variables are considered fundamental criteria for expansion of agricultural success business. These explanatory variables have already been used by other authors, but separately, in other areas and circumstances and it is thought that their aggregation provides a complete approach that explains ABS.

Figure 1. Research model: Agricultural business success model
Source: Own elaboration.



Over time, in addition to e-commerce, the internet does develop other technologies for enterprises and changing the traditional business to e-business. E-business also includes internal electronic exchanges, in addition to including e-commerce. Chaffey (2007, p. 13) defines e-business as "all electronically mediated information exchanges, both within an organization and with external stakeholders supporting the range of business processes". The choice of appropriate capabilities e-business for agricultural enterprises may be fundamental to success. E-business use can occur in different ways, namely by: e-sales, e-know-how, e-collaboration, e-service, e-commerce, supply chain management (SCM), customer relationship management (CRM), electric data interchange (EDI) and e-community, according to Wikipedia (2016). However, many agricultural companies continue to work without their presence in technological environments.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Impact of E-Commerce Adoption on Agricultural Business Success

The technological advances walk to the ubiquity of commerce. The rapid growth of e-commerce leads agricultural enterprises to change their business. However, most agricultural enterprises still don´t have e-commerce. Therefore, it is necessary to know what their impact on ABS.

A quick look at the literature reveals that there are many definitions of e-commerce. To Chaffey (2007), e-commerce is much more than a mere commercial exchange, it can be considered as "all electronically mediated information exchanges between an organization and its external stakeholders". Laudon and Traver (2014, p. 10) define e-commerce as the "use of the Internet, the Web, and apps to transact business. More formally, digitally enabled commercial transactions between and among organizations and individuals". These authors explain that digitally performed transactions correspond to transactions carried out through digital technologies (internet, web, mobile applications) and commercial transactions mean that they include the exchange of value for products/services between organizations and individuals.

E-Commerce B2B can allow this sources of competitive advantage: lower intermediation costs, lower purchasing costs, enhanced information gathering and processing and improved market share or development of new markets (Barnes-Vieyra & Claycomb, 2001), than B2C, enterprises more visible to consumers (Bodini & Zanoli, 2011).

In addition, over the past years, the relationship between e-commerce adoption and business success is investigated. The previous literature considers the positive impact of e-commerce on enterprises. Raymond et al. (2005) demonstrate that e-commerce and e-collaboration positively influence sales growth. Vilaseca-Requena et al. (2007) show impact of e-commerce adoption for online sales. Liu et al. (2013) show evidence that e-commerce has a positive influence on productivity. Abebe (2014) confirms the positive impact of e-commerce on performance.

However, previous studies suggest that there may be an endogeneity problem (e.g., Bertschek et al., 2004, 2006; Falk & Hagsten, 2015; Kubota & Milani, 2011; Liu et al., 2013) and several instrumental variables are used for e-commerce adoption. Bertschek et al. (2004) use the following variables: export quota, enterprise age, number of software applications and subsidiaries abroad. Subsequently, Bertschek et al. (2006) include the variables: export quota, enterprise age, number of software applications of an enterprise and the existence of production facilities or subsidiaries abroad. Several years later, the study of Kubota and Milani (2011) use the variables: % of professionals in information technology (IT), enterprise age and the existence of site. Thereafter, Liu et al. (2013) use the network effect (or network externalities) to address the problem of endogeneity of e-commerce. More recently, Falk and Hagsten (2015) test endogeneity of e-commerce (% e-sales) on productivity growth and use employees number with broadband internet access as instrument. In this chapter, the researcher decides to choose the enterprise's age and perceived strategic value as instrumental variables for e-commerce adoption of agricultural business in Portugal, as discussed in the next section.

Impact of Internationalization on Agricultural Business Success

The internationalization strategy can positively influence to increase ABS. Coad (2009, p. 126) states "expansion into new geographic markets can be an attractive opportunity for firm growth." (…), "to boost sales" (…) and offers "advantages such as scale and scope economies, more market power, diversification of revenues, and the ability of spreading fixed costs such as R&D over a larger sales base". Therrien et al. (2011) examine the impact of exports on performance (commercial success) in services

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

sector, measured by introduction of a new product and percentage of sales of this product, and through econometric models showed that to obtain more sales enterprises need to enter on the market early or introduce new products with high level of novelty. The authors suggest that exporters are more likely to have innovative products and to market them. This can happen because if an organization introduces a new product and has access to several markets it can spread its new product more efficiently.

From the same line of reasoning, agricultural enterprises that export their products are expected to have higher turnover growth and sales performance and therefore a better ABS. The impact of internationalization can be measured by intensity of exports from agricultural enterprises.

Coad et al. (2016) test the impact of exports on business growth, with growth measured through sales, productivity and employee growth, having a positive impact on all quantiles for sales growth, only for 25%, 50% and 90% quantiles, and in all quantiles except 90% and 95% for employees´ growth.

Impact of Strategic Alignment on Agricultural Business Success

According to Porter (1979, p. 143), the strategy can be understood as "building defenses against the competitive forces or as finding positions in the industry where forces are weakest." A key strategy is for enterprises to become competitive and survive in an ever-changing environment. The appropriate strategy allows a positioning of organization against the competition. The concept of alignment is a "complex, multi-dimensional construct" (Johnson & Lederer, 2010, p. 138). Strategic alignment is a process of continuous adaptation and change (Henderson & Venkatraman, 1993). In this sense, many organizations have difficulty achieve alignment (Johnson & Lederer, 2010). Due to the above, it is convenient to know that managers perceive a high level of alignment in their agricultural enterprises.

In this investigation, alignment is treated as the fit between business strategies including e-commerce/IT/IS and sales/commercial/marketing and agribusiness. In this sense, through the literature, the researcher selects antecedent factors of alignment, as shown in Table 1. Alignment is a process of continuous adjustment that agricultural enterprises use to obtain the interconnection between the strategies and objectives of e-commerce/IT/IS or sales/commercial/marketing with the strategies and objectives of the business.

Table 1. Variables for strategic alignment

Dimensions	Factors	Authors and Date	Scope
Agribusiness (factors beyond the control of the organization)	Environmental uncertainty	• Sabherwal and Kirs (1994) • Chan et al. (2006)	Environmental

Impact of Manager on Agricultural Business Success

The ABS is conditioned to the manager through their strategic decisions, so it is necessary to identify their characteristics, which appear to be relevant in success literature. Because it is intended to study the impact of these characteristics associated with the manager on ABS.

The literature presents arguments for the impact of manager's individual factors on success. Davis and Harveston (2000) find the impact of age and education on sales growth, arguing that the aging of entrepreneur decreases sales growth, and a high level of education has a positive impact on internationalization and sales growth. The results of Lussier and Pfeifer (2001) indicate that managers of enterprises successfully have significantly higher levels of education than those with failed enterprises. In a similar way, it happened with their results for owner's age. In contrast to Davis and Harveston (2000), younger owners/managers who start a business are more likely to be unsuccessful than older. This may be due to the lack of experience of owner/ manager. Baum et al. (2001) show the relevance of traits, motivation and competencies of the CEO/entrepreneur for growth. The present study has no interest in the perceptions, but in the characteristics age and education, and in a wider scope, i.e. for CEO /entrepreneur / IT/e-commerce/e-business manager or sales/marketing.

An individual approach with emphasis on manager characteristics helps to explain the ABS, through age and education. In principle, it is expected that having a manager with higher education would have a positive impact on ABS in various dimensions, because higher levels of education correspond to people with more general and technological knowledge.

Research Hypotheses

Starting from the research question and with the support of literature review, the researcher has the expectation that if an agricultural enterprise adopts e-commerce can improve its success, in terms of growth, improve their productivity and performance. In order to examine this relationship, the researcher plans to test the following formulated hypotheses.

E-commerce affects the growth of agricultural business. Growing agricultural enterprises are, therefore, successful companies, whereas, in contrast, when they are stagnant, are considered unsuccessful enterprises. Previous studies (O'Regan et al., 2006; Raymond et al., 2005) indicate that e-commerce provides growth. Abebe (2014) confirms the positive impact of e-commerce on annual sales growth rate. Hence:

H_{1a}: E-commerce adoption has a positive impact on growth.

E-commerce influences positively the productivity of agricultural business. Labour productivity of agricultural business is understood as the result of the resources that are applied. Therefore, increasing productivity is about maximizing what is achieved sell/provide maintaining the same resources. One of the reasons for companies adopt e-commerce is to generate short-term productivity gains (Karakaya & Shea, 2008). Several studies (Bertschek et al., 2004, 2006; Kubota & Milani, 2011; Liu et al., 2013) indicate that e-commerce has a positive influence on productivity. Hence:

H_{1b}: E-commerce adoption has a positive impact on productivity.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Success relates to the agricultural business sales performance. In the B2C perspective, the enterprise becomes more visible to customers with e-commerce (Bodini & Zanoli, 2011). According to Wu et al. (2003), sales performance refers to market share, sales volume increase, price change, increase of new customers and increase of existing customers. Hence:

H_{1c}: E-commerce adoption has a positive impact on sales performance.

E-commerce adoption can improve efficiency. Success can be measured by efficiency.

Customer response is faster through electronic communication Wu et al. (2003). Efficiency corresponds to the possibility of cost reduction in the transaction (Eikebrokk & Olsen, 2007, 2009). Efficiency is related to the improvement of efficiency in production and marketing, that is, the reduction of production and transaction costs, the general activities of management, coordination, marketing and acquisition of new customers Wu et al. (2003). "E-commerce provides companies with greater efficiency and reliability of business processes through the automation of transactions" (Shim et al., 2000, p. 40). B2B e-commerce is expected to reduce transaction costs, more transparent markets and the most efficient business (Bertschek & Fryges, 2002). In the case of exports and, above all, in digital products, it is expected that the reduction of transaction costs is still greater (Bertschek et al., 2004). Hence:

H_{1d}: E-commerce adoption has a positive impact on efficiency.

This measure of ABS concerns the orientation of agricultural enterprise to the domestic or international market, as well as market segmentation (Chamberlin et al., 2009), and also to improve customer service via e-commerce (Karakaya & Shea, 2008) and to the company's prestige in terms of products and markets (Karakaya & Shea, 2008). Hence:

H_{1e}: E-commerce adoption has a positive impact on products and markets.

According to Hausen et al. (2006), e-commerce improves coordination between buyers and sellers. Based on the study by Wu et al. (2003), this concept concerns the communication of agricultural enterprise with the partners and suppliers. Hence:

H_{1f}: E-commerce adoption has a positive impact on relationship development.

Customer satisfaction refers to the extent to which the company meets customer expectations.

"Customer satisfaction has always been assumed as a necessary condition for the success of organizations" (Molla and Licker, 2001: 135). A satisfied customer returns to buy again.

According to Wu et al. (2003), quantifying customer satisfaction as results of the organization covers: satisfaction with the type of commerce used, encourage others customers and increased customer loyalty. Hence:

H_{1g}: E-commerce adoption has a positive impact on customer satisfaction.

One of the two reasons for companies adopt e-commerce company's long-term competitiveness (Karakaya & Shea, 2008). Competitive advantage refers to the position of agricultural enterprise vis-à-

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

vis its competitors. This concept encompasses better financial performance, respond quickly to market changes, higher marketing performance, achieve organizational objectives more effectively and rapidity in innovation (Swilley et al., 2012). The following hypothesis is based on the study of Swilley et al. (2012) for M-commerce. Hence:

H_{1h}: E-commerce adoption has a positive impact on competitive advantages.

E-commerce adoption affects the value creation. For an agricultural company to have success must know how to contribute to add value to the client, and, therefore, defining organizational goals that meet customer needs. Overall, Amit and Zott (2001, p. 503) define value as the "total value created"… "regardless of whether it is the firm, the customer, or any other participant in the transaction who appropriates that value".

In this investigation, it is about creating value for the customer and is measured through the perception of farm manager. The creation of superior value for the client, according to Martelo et al. (2013) corresponds to the increase in the level of customer loyalty compared to competitors and compared to last year, and the increase in customer satisfaction compared to the previous year. Hence:

H_{1i}: E-commerce adoption has a positive impact on customer value creation.

E-commerce affects agricultural business performance. In addition, performance refers to more than one concept. Consequently, the following hypothesis is proposed for agricultural business performance, in global terms. Hence:

H_{1j}: E-commerce adoption has a positive impact on agricultural business performance.

RESEARCH METHODOLOGY

Based on positivist research paradigm, the research approach can be classified into a quantitative and deductive approach. In addition, this research consists of a cross-sectional study with primary data.

Sampling and Instrument

Data collect using a questionnaire. A pre-test is carried out to validate the proposed model and, therefore, to improve the clarity and comprehension of the questions. Items come from prior literature reviews, but are modified to the specific context of e-commerce and e-business in agriculture, using seven-point Likert scale, where the minimum is 1 "totally disagree" and the maximum 7 that represents "totally agree", and an option category to "don't know/ don´t answer". This option is treated as missing data.

The questionnaire was sent to two respondents in the same enterprise: a) manager/owner of the agricultural enterprises and b) responsible for commerce (e-commerce/IT/IS manager if there is e-commerce, or sales/ commercial/ marketing manager). Part of the questionnaire is intended to characterize the strategic value and performance through two groups of questions: a) for e-commerce adopters and b) for non-adopters. Other part, questions about use and type of e-business, and for 2 groups of respondents: a) use e-business and b) do not use e-business (only traditional business), to characterize strategic alignment.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

A sample is selected from agricultural enterprises in Portugal. The period of data collection takes from September 14, 2015 and run until January 24, 2016.The researcher receives responses from 418 enterprises but only one respondent per enterprise. 46 responses were rejected because they are duplicate, errors or missing dates in variables, except those that are measured on a Likert scales. The overall response rate is 11.76%, but is 10.46% when counting only usable surveys. Then, this sample consists of 372 observations. Subsamples for commerce contains 58 (15.59%) enterprises that adopt e-commerce and 314 (84.41%) that don´t adopt. Another subsamples that use e-business (n = 66; 17.74%) and use traditionally business (n = 306; 82.26%).

Measures of the Variables

Table 2 provides the description of all variables included in the model, but several variables are derived from previous studies.

Table 2. Variables of agricultural business success model: ABS

Variable	Description/Measurement	Authors and Date
Dependent Variable		
logVN1314: Turnover Growth (log)	logVN2014-logVN2013	Nunes et al. (2011), Coad and Rao (2008) e Coad et al. (2016)
logPROD14: Productivity (logarithm)	log(VN2014/EMP2014)	Bertschek et al. (2004, 2006)
FSP: Sales performance	Factorial score FSP	Adapted from Wu et al. (2003)
FEF: Efficiency	Factorial score FEF	Adapted from Wu et al. (2003)
FPM: Products and markets	Factorial score FPM	Adapted from Karakaya and Shea (2008) and Chamberlin et al. (2009)
FRD: Relationship Development	Factorial score FRD	Adapted from Wu et al. (2003)
FCS: Customer satisfaction	Factorial score FCS	Adapted from Wu et al. (2003)
FCA: Competitive advantages	Factorial score FCA	Adapted from Swilley et al. (2012)
FCV: Creating value for customer	Factorial score FCV	Adapted from Martelo et al. (2013)
AEP: Agricultural enterprise performance	Average (FSP, FEF, FPM, FRD, FCA, FCS, FCV)	
Independent Variables		
ACE	1 - if enterprise adopt e-commerce 0 – otherwise	
EXPOP: Exports	% exports	
SA: strategic alignment	Average factorial scores (SAEU: Environmental uncertainty; SAES: Environment scanning of E-business; SASU: Strategic use of E-business/ traditional business; SASD: Shared domain knowledge; SAS: Prior success; SAPS: Planning sophistication)	Adapted from Bergeron et al. (2004) and Chan et al. (2006)
AGElog: manager age	Logarithm of number of years

AGEAS: Age of enterprise related to sector where enterprises operate	Years up to 2014 relative to the industry average (Age of enterprise/ average age of sector)	Bertschek et al. (2006)

Source: Own elaboration.

Control Variables

The group was suggested as an explanatory variable by other authors, Bertschek and Fryges (2002) and Therrien et al. (2011). Generally, enterprise belongs to a group have greater financial resources and may have less risk aversion (Bertschek & Fryges, 2002). Regarding the industry effect, Zhou and De Wit (2009) suggest that firms with labor intensive may have a greater propensity for growth. Davis and Harveston (2000) show evidence significant positive effect of company size on sales growth.

Discussion of the Instruments

As one of the explanatory variables is endogenous, the researcher discusses economic arguments supporting the validity of two variables that it is used as instruments for e-commerce adoption, which are enterprise age and perceived strategic value. The expectation is that these are correlated to e-commerce adoption but not with the error of ABS model. The plausible simultaneity of e-commerce and ABS has the consequence that e-commerce is an endogenous explanatory variable on ABS determination model.

The first instrument is enterprise age[1], that is used as an instrument in several studies and through different forms. The researcher follows Bertschek et al. (2006). Enterprise age is measured in relation to average enterprises age in the same industry. For these authors, an enterprise more recent than the industry average has a relative age less than one, whereas, the enterprise's age in relation to an older enterprise exceeds the value of 1. Relative age is logarithmic due to asymmetry and the researcher add square logarithm of relative age, since the age effect on the probability of adopting e-commerce may be non-linear.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The second instrument is perceived strategic value. The researcher also considers the manager's perception of strategic value that is understood as the level at which the manager perceives the value that e-commerce can provide him. Usually, enterprises choose to invest in e-commerce due to the perceived strategic value that can be achieved (Sutanonpaiboon and Pearson, 2006). In the researched literature, although no papers have been found in Portugal or specifically in the agricultural context, several studies have focused on the relevance between the strategic value of e-commerce and e-commerce adoption in different countries and in developed and underdeveloped economies. Strategic value is measured in different ways for enterprises: organizational resources (Martelo et al., 2013), strategic value of IS (Subramanian & Nosek, 2001), strategic value of e-commerce (Grandon & Pearson, 2003, 2004; Saffu et al., 2007, 2008; Saffu et al., 2012; Seyal & Rahim, 2010).

RESULTS

In order to prevent potential problems with Common Method Bias (CMB) variation, the survey takes into account several recommendations proposed by Podsakoff et al. (2003), such as: items are written clearly and concisely, ensuring respondent anonymity to encourage participation, unknown to the respondent of conceptual model and Harman's single-factor test is performed. The researcher conducts a statistical test for common method variance with the Harman one-factor method, through a principal component analysis of all measures. Results show 14 factors with eigenvalues greater than 1, which explain 69.20% of the variance. The first factor explains 26.01% of the variance, and therefore less than 50%. This suggests that CMB isn´t a problem in this investigation and doesn´t explain alone the observed relationships among the study constructs.

Preliminary Analyses

First, the researcher checks for missing data in turnover. Are removed all data with 0, the values without coherence in turnover in 2013 and 2014, and enterprises that are established in 2014. After, all observations with missing values are removed, except for the variables measured by Likert scales. The procedure of mean substitution of items in scales is used to reduce the problem of missing data. When the missing values are less than or equal to 20%, Downey and King (1998) suggest two methods for replacing missing data: item mean and person mean. The average substitution of valid answers is one of the most used methods for missing data and maintains the sample size (Hair et al., 2010).

Subsequently, running SPSS 20 because the variables composed of several items on a Likert scale are subjected to descriptive, consistency (reliability) and factorial analysis, as shown in Table 3, Table 4 and Table 5. Besides the descriptive analyze, in order to guarantee the adequacy of the scales to the proposed variables, the researcher test reliability and validity of the constructs, through Cronbach's alpha[2] and Kaiser-Meyer-Olkin (KMO)[3]. With the consistency analyze, most of the constructs provide a certain degree of trust on scales. Factorial analyze of principal components was run to test the unidimensionality of the measurement scales and to obtain the factorial scores. The scores are exact when the extraction is performed by principal components method, while by other methods the score is only approximate (Maroco, 2007). These factor scores are estimated values of the factors to be used in the subsequent analyses.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Strategic Value Construct

As seen in Table 3, the perceived strategic value (SV) consists of the following components: SVOS, SVMP and SVDA, and all items are kept.

Table 3. Descriptive, consistency and factorial analyze of strategic value perceived

Construct	Items	Minimum	Maximum	Average	Cronbach's Alpha	KMO	Variance Explained
SVOS	SVOS1 SVOS2 SVOS3 SVOS4	1 1 1 1	7 7 7 7	4.44 4.67 4.74 4.78	0.831	0.781	66.58
SVMP	SVMP1 SVMP2 SVMP3 SVMP4	1 1 1 1	7 7 7 7	4.63 4.64 4.70 4.51	0.941	0.846	85.18
SVAD	SVDA1 SVDA2 SVDA3 SVDA4	1 1 1 1	7 7 7 7	4.62 4.69 4.60 4.66	0.942	0.837	85.45

Source: Own elaboration.

Alignment Construct

Table 4 shows analyze for strategic alignment (SA). The researcher chooses to remove item SAEU1, SAEU3, SAES1, SAES3 and SAPS.

Performance Construct

Analysis of performance is presented in Table 5 and FPM variable is removed. The dependent variables are the factorial score of each factor and one of them (AEP) is the average of all factorial scores.

In summary, the following criteria are used: all averages are higher than 4, which represents agreement; Cronbach's alpha > 0.7[4] except for SAEU (0.64) and corrected item-total correlation $> = 0.4$. Furthermore, principal components analyze method; extraction of factors with their own value superior to 1; factor weight$> = 0.5$ (if lower the variable isn´t considered relevant, then it is dropped) and orthogonal rotation method varimax. KMO> 0.6 for all factor analyses except FRD; commonalities is more than 0.5 except in FCV1; all Bartlett's sphericity tests are significant (up to 0.05) and variance explained above 60% except SAEU (but explained variance is very close to 60).

Estimation Method

Through the review of the literature on e-commerce adoption, the researcher believes that e-commerce has an impact on ABS and is endogenous. Then, it is used instrumental variables method to explain this impact. Following Wooldridge (2002, pp. 623-625), in the first stage, the researcher estimates a probit

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

regression of the probability of e-commerce adoption. As independent variables, the researcher takes all independent variables of the success model and the instrumental variables. In the second stage, the researcher predicts the fitted variable for each observation in the sample. In the third stage, the ABS model was estimated using instrumental variables method, where the researcher includes the fitted value resulting from the previous stage as an instrumental variable for e-commerce adoption. This method is appropriate when endogenous variable is binary.

Regression Results

The results of the regression analyses, using STATA, are shown in Table 6.

Model 1: Growth

The results indicate inconsistent with expectations and statistically insignificant. Isn´t possible to reject the null hypothesis. Different from previous findings of Abebe (2014).

Table 4. Descriptive, consistency, and factorial analyze of alignment

ABS is statistically different depending on managers' education. "secondary education" (-0.179) and "higher education" (-0.139) are negative and statistically significant for growth rate model (logVN1314), at 5% and 10% level, respectively. It means that enterprises with managers who have secondary and university education have lower growth rate than enterprises with managers who only complete basic education. Moreover, the average growth of enterprises included in SAE2 is lower than SAE3, on average 0.301 units. Belonging to a group have 0.134% decrease in growth, at 5% level of significance.

Model 2: Productivity

The findings point to a negative and statistically significant impact of e-commerce adoption on productivity, i.e., e-commerce adoption provides a 31.8% decrease in productivity, at 10% level of significance. Then, contrary to expectations hypothesis H1b is rejected. This result clashes with findings prior studies (Bertschek et al., 2004, 2006). While, a 1% increase in manager age provides a 0.503% decrease in productivity, at 10% level of significance. Belongs to "primary sector" has 73.1% less productivity compared to enterprise that belongs to "tertiary sector", at 1% level of significance. The enterprise included in tertiary sector allows a 1363% increases in productivity, at 1% level of significance. Belong to a business group suggests that agricultural enterprise has 69.3% more productivity, at 1% level of significance.

Model 3 to 10: Performance

E-commerce adoption has significant positive impact on sales performance ($\beta = 1.685$; $p < 0.05$), efficiency ($\beta = 2.699$, $p < 0.01$), customer satisfaction ($\beta = 4.138$, $p < 0.01$), competitive advantages ($\beta = 1.442$, $p < 0.05$) and value creation ($\beta = 1.176$, $p < 0.10$), both individually and globally ($\beta = 1.934$, $p < 0.01$), and therefore on agricultural business performance. Then, hypotheses 1c to 1j are accepted, except 1_f.

In addition, strategic alignment positively influences on sales performance ($\beta = 0.392$; $p < 0.01$), efficiency ($\beta = 0.221$, $p < 0.01$), relationship development ($\beta = 0.849$, $p < 0.01$), customer satisfaction ($\beta = 0.287$, $p < 0.05$), competitive advantages ($\beta = 0.430$, $p < 0.01$), creating value ($\beta = 0.454$, $p < 0.01$), both individually and globally ($\beta = 0.439$, $p < 0.01$), the ABS. Previous study of Chan et al. (2006) confirmed that alignment affects business success.

Moreover, it has also obtain that internationalization ($\beta = 0.00671$; $p < 0.01$) and strategic alignment ($\beta = 0.392$; $p < 0.01$) have a positive impact on sales performance. Enterprises that have managers with university education have less efficiency ($\beta = -0.424$; $p < 0.05$) and less competitive advantages ($\beta = -0.357$; $p < 0.05$), than enterprises with managers have basic education. However, enterprises that have managers with university education have a greater relationship development than enterprises with managers who have a basic education ($\beta = 0.309$; $p < 0.05$). Enterprise belongs to "secondary activity sector" SAE2 has more creating value ($\beta = 0.571$; $p < 0.05$) compared to a company that is in "tertiary activity sector" SAE3. Increasing in size of companies has a positive effect on competitive advantages ($\beta = 0.246$; $p < 0.01$). Finally, belonging to a group suggests that agricultural enterprises has less relationship development ($\beta = -0.206$; $p < 0.10$).

DISCUSSION

Econometric analyses allows, on the one hand, confirming the exogeneity of e-commerce adoption when success is measured through growth and productivity. On the other hand, endogeneity of e-commerce adoption when measuring success as perceived agricultural business performance.

However, impact of e-commerce adoption on success of agricultural enterprises isn´t significant when success is measured through growth, and, contrary to expectations, is negative when measured through productivity. In general, these results may be due to the small number of observations of enterprises adopting e-commerce or small size of enterprises. Another possible reason for these results may be non-separation between B2B and B2C.

Contrary to Bertschek et al. (2004, 2006) that point to a relationship of simultaneity between the adoption of B2B e-commerce and productivity. The present study points to exogeneity of e-commerce adoption and significance of this negative relationship. These results may be due to non-separation of B2B and B2C. In addition, prior papers use service/retail enterprises, a different context of the Portuguese agricultural sector. Perhaps this is why it has had a negative impact from e-commerce adoption on productivity. Results of Kubota and Milani (2011) show that enterprises that do not adopt e-commerce have higher productivity than a randomly chosen one.

From subsequent analyses, result a positive and significant impact of e-commerce adoption on ABS, when this is measured through agricultural business performance, as shown in Table 6. All hypotheses are corroborated except impact of e-commerce adoption on relationship management ($\beta = 0.466$; n.s.), although positive, is not significant.

In addition, the results suggest some degree of simultaneity between e-commerce adoption and performance, then enterprises that adopt e-commerce have superior performance, and enterprises with high performance are more likely to adopt e-commerce. E-Commerce adoption has a significant positive influence on performance, efficiency, customer satisfaction, competitive advantages and value creation, both individually and globally, and vice-versa.

FUTURE RESEARCH DIRECTIONS

It might be interesting: analyze the manager's perceptions before and after e-commerce adoption through a longitudinal study and use longitudinal data to analyze the dynamic effects of e-commerce adoption on ABS. It is also suggested to carry out this study with other indicators of success, conducting this study in several countries in order to compare these results with other countries or replicate in other sectors could lead to different results.

CONCLUSION

It is concluded that the decision to adopt e-commerce by agricultural enterprises is determined by perceived strategic value, but not by age enterprise in relation to activity sector.

This research provides also empirical evidence of the negative contribution of e-commerce adoption to success measured through productivity, in the context of agricultural enterprises in Portugal. There is also evidence of simultaneity relationship between e-commerce adoption and performance, both individually and globally, i.e., companies adopting e-commerce achieve higher performance and vice versa.

The study contributes to clarify the relationship between e-commerce adoption and success. A holistic view of success is obtained, with other explanatory variables that facilitate and influence ABS that can be used to predict future opportunities. Additionally, in methodological terms, endogeneity of e-commerce adoption is tested differently from previous studies. It also contributes with a new instrumental variable for e-commerce adoption - strategic value perceived.

This research presents several limitations that must be considered when interpreting the results. Sample size is a limitation of this research work, the value of responses (372) is a little lower than the recommended minimum (384) according to The Research Advisors (2006). Potential bias of non-responses is another possible limitation of this study. To estimate the magnitude of the bias, a non-response analyses could be performed to compare the responses that were obtained early and late, as suggested by Armstrong and Overton (1977). However, the researcher cannot distinguish between responses received earlier and later. In this way, the researcher cannot perform this comparison and know the potential bias due to non-responses. The variable of IT workers could be used as an instrumental variable of endogenous e-commerce adoption as Kubota and Milani (2011) study, but this question was only asked of e-commerce adopters. This limitation can be considered as a suggestion for future research. Finally, in this sample are included only agricultural enterprises because it is the focus of the author's interest, however, this limits the scope of the sample, because there are other enterprises with interest on success.

Lastly, recommendations for possible solutions are suggested, at different levels: Al level governmental, it is proposed governmental support to agricultural enterprises and individuals for continuous formation, in particular the importance of e-commerce and other business technologies and managerial

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

training initiatives. Creation and support of networks of agricultural business for enterprises to expose their products/services and to boost the agricultural market and enable internationalization of products/services. Hence, provide economic growth of this activity and economic growth of the country in general. In the organizational context, it is suggested focus on technology, for example, managerial training initiatives, for enterprises adapts in an environment increasingly digital. It is paramount that the leadership and the workers do not resist the change to these new technological environments. In an ever-changing environment, leadership will adopt methods to manage workers' resistance. As the results suggest focusing on strategic alignment for performance, plan the strategic alignment. As well the focus on internationalization. In the technological context, as this paper presents determinant factors for e-commerce adoption and impact in the ABS, the technology manufacturers have information on factors important for e-commerce adoption and the managers' needs, for the development of appropriate programs for this activity sector.

ENDNOTES

1. There is no consensus among authors about which enterprises are most likely to adopt technologies, whether the recent or the old. According to Christensen and Rosenbloom (1995) cited by Bertschek and Fryges (2002) and Bertschek et al. (2006), newer enterprises are more flexible and more likely to adopt technologies. Also, Kubota and Milani (2011) argue that more recent enterprises are more flexible to adopt innovations. However, Bertschek et al. (2006) argue that more recent firms may have more risk aversion on technology adoption because of lack of experience and financial resources.
2. Cronbach's alpha coefficient is the most used, it varies between 0 and 1 and the internal consistency is considered very good if alpha> 9; good between 0.8 and 0.9; reasonable between 0.7 and 0.8; weak between 0.6 and 0.7 and unacceptable if <0.6 (Pestana & Gageiro, 2014).
3. KMO varies between 0 and 1, between 1-0.9 points to a very good factorial analyze; 0.8-0.9 good; 0.7-0.8 mean; 0.6-0.7 reasonable; 0.5-0.6 bad and if less than 0.5 unacceptable (Pestana & Gageiro, 2014). For Bryman and Cramer (2011), the ideal value is greater than or equal to 0.8. Hair et al. (2014) consider acceptable 0.7; however this limit may be lowered to 0,6 if the research is exploratory.
4. Value recommended by Tenenhaus et al. (2005).

Chapter 75
Impact of Product Presentation on Purchase Intention:
Moderating Role of Mood in Online Shopping of Lifestyle Products

ABSTRACT

Effective visual product presentation gives consumers a sense of appropriateness and supplementary perceptible experience to lessen the degree of apparent risk, compensate the absence of sensory attributes, and offer delightful online shopping experiences. The purchase of lifestyle products has become a matter of happiness to consumers that is convincingly regulated by the mood. Mood—a direct indicator of the subjective wellbeing—plays a prominent role in consumers' purchase behavior. This chapter attempts to examine the impact of product presentation on purchase intention of lifestyle products and moderating role of mood by obtaining data from 356 Indian online shoppers. Results revealed that mood moderates the impact of product presentation on purchase intention in online shopping context. The study recommends that marketers must offer pleasant and lively virtual product experiences for creating favorable shopping atmospherics and encouraging consumers' purchase intention.

INTRODUCTION

Globalization, demanding customers, advances in information & communication technologies (ICT) and increased usage of internet have led to increased competition and brought significant promises to electronic commerce. In such dynamic business landscape, the most important asset that an organiza-

tion possesses is its customers because the ultimate measure of its success in the market is determined by what the customers think about organization's image and offerings. Therefore, every organization aims to create market offerings appropriate to fulfil the customer needs and expectations better than its competitors with an ultimate goal of creating an encouraging customer experience, delivering of services which create value for the customer, building customer loyalty and ultimately contributing to the long-term profitability of the organization. Using the extent of sensory interactions, direct and indirect experiences have been identified by researchers. In the context of product, experience of direct nature shows the intercede interaction of consumer with product, in which consumer applies all its individual sensory stimuli. The depiction of object in physically form in various media generates the form of indirect experience. ICT and internet-related technological advancements have shaped a different form of experiences. In this form of experience, usually termed as virtual experience, prospective buyers can examine a product visually with the advance facilities of object enlargement, zooming, or inspecting the product with various angles.

Product presentation is one of the important determinants of consumer buying behaviour in both online and offline format. Turley & Milliman (2000) advocated that elegantly presented product creates a favourable mood which further consequently directs to desired shopping outcome in the physical store environment. This product presentation is even more important in case of online platform. Besides attracting the customers, the well-presented product also assists consumer decision making in the lack of direct experiences with the product. Since consumers can't physically inspect the product before purchase in online environment, well-presented product plays a decisive function in encouraging purchase stimulus, shopping experiences and desired outcomes. In the age of technological revolution, e-commerce companies have begun to provide the sensory experiences to satisfy shoppers' needs by employing the technological advanced tools such as product enlargement, product rotation, three-dimensional presentation, controlled playback, functional video of the product. Use of such technology enhances understanding product features & functions, website performance and success of e-commerce organizations in this competitive marketplace.

Although the online product presentation has attracted the attention of several researchers and practitioners, it is evident the missing aesthetics product experience is still the most important hindrance in e-tailing environment (Internet Retailer, 2005). This present study also proposes that mood may be a significant attribute that facilitates sensory or aesthetics experience in product purchase. As stated by Gardner (1985), mood is a decisive and momentary construct of person's instinctively apparent emotional condition. Mood of a person can affect his behaviour with no interference with other cognitive courses of action (Clark & Isen, 1982). Addressing this concern, an attempt has been made to examine the impact of product presentation of e-commerce companies on shoppers' purchase intention and moderating role of mood in this relationship in the context on lifestyle products in India.

A study of this nature is justifiable in Indian perspective as it is the second fastest growing economy in the world, after China. Together with a population of 1.32 billion people, India is designated as the second largest emerging consumer market in the world and rapid economic transformations have led to an increase in the consumption. It is expected that e-commerce revenue of India will increase from $26 billion to $103 billion by 2020. Although lower than China, Japan and others in terms of the base, Indian E-commerce annual growth rate is quite higher. India is growing in this front at the rate of 51% and other markets are also growing (China 18%, Japan 11% and South Korea 10%) but slowly (ASSOCHAM-Forrester, 2016). Moreover, this research is interesting to be done because India occupied the significant

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

position in the usage of internet, social media and Smartphone. With more than 462 million users, India has become the second largest country by the number of internet users after China.

The outcomes of this study will be of immense value to marketers for designing appropriate product presentation strategies to arouse customers' moods and influence their purchase decision in this emerging market.

The major objectives of the research were:

- To examine the impact of online product presentation on purchase intention of lifestyle products.
- To examine the moderating role of mood in the relationship between online product presentation and purchase intention of lifestyle products.

LITERATURE REVIEW

Online Shopping

Expansion of the Internet as a user friendly technological advancement has changed the way buyers and sellers interact through online transaction channels and has transformed the social and spatial aspects of shopping for many consumers. The favourable demographics of developing economies promises a number of opportunities for e-enabled retail models and therefore, companies are exploiting the Internet as an alternative channel for reaching out to customers. Internet is fast catching up as an important media especially among Indian youth. The improvements in ICT infrastructure coupled with psychographic changes among youths are bound to influence their purchase behavior and inclination to use the electronic channels for shopping (Khare & Rakesh, 2011). Online shopping allows customers to select, inspect and purchase products over an interactive electronic medium. It also offers some unique benefits to customers in terms of increased customization, time saving shopping experience, purchase convenience, efficient and timely product delivery, easy comparison of alternatives and cost savings through lower prices. As electronic channels proliferate, it becomes important for an organization to differentiate itself from the rest. Unlike physical outlets, where marketer has a varieties of ways to differentiate, online platforms are typically constrained to the same communication channel, the same access mechanism, universally adopted technology and even the same product items. Without any reservation, a key determinant of uniqueness for an online platform is its content and the presentation of offerings.

Online Product Presentation

In the growing online shopping environment, the importance of online platform design has been highlighted. Websites that make use of responsive presentations, orderly interface & navigation, and trouble-free search options offer enjoyable and memorable shopping experience by shopping convenience (Park & Stoel, 2002). In the e-tailing environment, products are being evaluated by shoppers only through virtual product experiences rather than physical examination due to lack of aesthetics or sensory attributes. This diminishes the direct physical, social and psychological experiences of traditional shopping. Moreover, internet is unique in nature on which customer is free to move from one product to another and from one online store to another easily, it seems pertinent to persuade customers to retain and/or return at another time by offering enjoyable services and exceptional features. online product presentation is

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

emerging as a prominent strategy to gain the attention of online shoppers. The absence of sensory attributes makes it complicated to showcase the lively features of the product in e-commerce market (Jiang 2007). E-commerce companies may be able to stimulate consumer feelings, shrink consumer perceived risks and eventually encouraging their intention to buy the products, with the help of innovative multimedia visualization techniques (LaRose, 2001). Thus, effective presentation of the product has become progressively more significant in appealing consumers in e-commerce context.

Then & DeLong (1999) suggested that the consumer will be involved in the commercial exchange online, when the relevant description of the product is presented in the effective manner through the visual display by the retailer. Many e-commerce companies have displayed their product through effective manners in order to attract customers. Online retailers are avoiding the traditional forms of presentation dominated by texts and images and are now employing lively visualization techniques to augment the demonstration of products (Coyle & Thorson, 2001; Suh & Lee, 2005). Displaying product effectively minimizes uncertainties of online shopping and offers a competitive edge over traditional retailers (Elliot & Fowell, 2000). Stationary images and video devoid of commentary are less effective than moving images, virtual product experiences and commentary enabled videos in influencing consumer willingness to purchase products presented in e-commerce platform (Jiang & Benbasat, 2007). However, Kim & Lennon (2008) come across that instead of product image size; the quantity of information about the product in the form of rich text has more powerful impact on consumer willingness to purchase the product.

Product Presentation and Mood

Mood is viewed as feeling state that is subjectively perceived by individuals and as such, is a sub-category of feeling state. It is momentary and subjected to vary with time and situation (Jeon, 1990). In our day to day life, mood plays an active role in determining our beliefs and attitudes and it is instrumental in influencing our thinking, helping in decision making, and initiating actions (Gratch & Marsella, 2004). A consumer experiences a variety of subjective and/or affective status of mind during exploring, selecting or utilizing products and even interacting with marketers (Cohen & Areni, 1991; Ruth, Brunel, & Otnes, 2002). Marketers have realized that in managing human impressions and behaviours, moods (both positive and negative) play a determinant role. Social scientist explains that positive moods improve the performance of behaviours that generate to favourable consequences. Experiencing positive mood enhances the receptivity of consumers in collecting good amount of information about the product and their willingness to purchase the same even without having the direct experience. A consumer's mood is affected by visual product presentation and product presentation can be made attractive by increasing the size of product images and presenting the product from various angles and in different size may create a pleasurable shopping experience (Liao, et al., 2016). A moving object or distinct colour may also generate positive feeling and favourable attitude towards the product in online platform (Then & Delong, 1999). Further Jeandrain (2001) in his research revealed that a three-dimensional demonstration of the product encourages favourable mood of the consumer towards products and thus creates a pleasure experience of shopping.

Product Presentation and Purchase Intention

Purchase intention is considered as the major element of consumer cognitive behaviour that shows conscious plan of consumer in product purchase (Spears and Singh, 2004). Effective product presen-

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

tation may construct an emotional response, creating arousal and pleasure while making decision for purchasing a product. The attractive and interesting demonstration of the product leads to favourable customer experience which may consequently increase purchase intention. Researchers including Then & Delong (1999) and Kim & Lennon (2000) were of the opinion that consumers' willingness to buy the product can be accelerated through such product presentations which are visually appealing. Strategies such as large-sized pictures, moving product, distinct colour, three-dimensional view, human models and displayed in conjunction with similar items may be more helpful in developing favourable consumer purchase intention (Fiore, Kim & Lee, 2005; Algharabat & Abu-ElSamen, 2013).

Mood and Purchase Intention

Purchasing lifestyle products using online stores may be considered as complicated task for a number of reasons. First, lifestyle products are not purchased for functional benefits but also for psychological requirements. Thus, physical examination of products is utmost important in order to check the appropriateness, suitability and quality. Second, computer knowledge and expertise also need for online shopping purpose. Third, there are several concerns associated with online shopping such as timely delivery, product returns policy, security and privacy issues and legitimacy of merchant. These all aspects make online purchase decisions more difficult (Elliot & Fowell, 2000; Park, Lennon & Stoel, 2005). Several researches on the topic have projected that under the complex task situation, mood acts as a mean of heuristic knowledge for assisting consumer decision making (Schwartz & Clore, 1983). As a result, positive moods can be helpful in increasing purchase intentions in the case of online shopping environment. In marketing psychology, several empirical studies support the correlation between consumers' mood and purchase intention consumer. Mood states are inherent and likely to affect the purchase decision in terms of what, when and how much is purchased and even intention to repurchase the product (Babin, Dardin, & Griffin, 1994; Liao et al., 2016). Several researchers conform that when the consumers are in a favourable mood in the course of shopping, they are more keen to spend additional time in the store (online and offline both), evaluate the store more positively and consequently shop more profoundly & frequently (Park, Lennon & Stoel, 2005; Li, Sarathy & Xu, 2011; Zhang et al, 2012). Menon & Kahn (2002), Eroglu et al. (2003), Mummalaneni (2005), Rose et al. (2012) and Pappas et al. (2014) have studied the significant role of emotions or moods by means of virtual store atmospherics and advocated that online shopping cultivates different moods which trigger consumers' intention to purchase. Consumers' positive feeling generate a kind of rose-colored glasses effect, instigating products to seem more appropriate and vice-versa. Consumers' positive moods increase the likelihood that individuals will reflect behavior with positive consequences and decrease the likelihood that individuals will engross in behaviors with anticipated negative consequences (Gardner & Hill, 1988). The purchase of lifestyle product has become matter of happiness to the consumer that is convincingly regulated by the mood. Mood - a direct indicator of general subjective well-being - plays a prominent role in purchase and subsequently in post purchase behaviour of consumer.

Hypotheses of the Study

The present research work has been undertaken to investigate the importance of product presentation in online shopping environment and its impact on consumers' purchase intention of lifestyles products. Three lifestyle products namely, fashion accessories, apparels and electronic gadgets have been selected

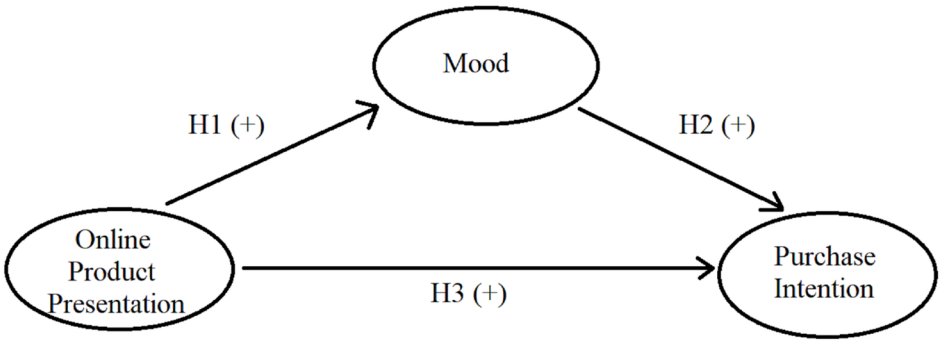
EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

to examine the association between online product presentation and purchase intention and moderating role of mood in this relationship.

By reviewing the relevant literature, the following research hypotheses were framed:

- **H1:** Online product presentation has a positive impact on purchase Intention.
- **H2:** Online product presentation positively affects mood.
- **H3:** Mood moderates the relationship between product presentation and purchase intention in online shopping context.

Figure 1. The proposed Conceptual Model



RESEARCH METHODOLOGY

Data for this study was collected from Indian consumers using an online survey developed on Google Forms in September, 2017. A well-structured questionnaire was developed and sent to consumer through emails after taking their consent for the same. The online survey is widely used research instruments as it facilitates prompt response as well as considerable advantages in terms of wide coverage and associated cost. Overall, 373 responses were received. After editing, final valid 356 questionnaires were found suitable and employed in this study, eliminating 17 incomplete and casually responded questionnaires. The existing literature helped in the preparation of the questionnaire and questions were selected based on related studies. Some questions were then modified by the researchers in order to focus on specific information.

The entire questionnaire was developed in two parts. First part consisted of questions related to respondents' demographical profile, their frequency of online shopping and product presentation modes used by online stores. The second part of the questionnaire was designed using the variables related to measurement of online product presentation, mood, and purchase intention. Respondents were instructed to indicate their opinion according to their degree of agreement with given 15 attributes related to online product presentation, mood and purchase intention in a five-point Likert-scale (where 5 designated strongly agree and 1 designated strongly disagree).

Out of 15 attributes, eight were associated with online product presentation (Webster & Ho, 1997; Menon & Soman, 2002; Park, Lennon & Stoel, 2005; Jeong, 2007), four were related to Mood (Eroglu, Machleit & Davis, 2003; Park, Lennon & Stoel, 2005) and three variables were concerned with purchase

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

intention (Jiang & Benbasat, 2007; Shukla, 2010). The validity of the construct & content, the precision of its attributes' meaning and to ensure its association with the research objectives was ensured with the panel of experts and faculty members. To check the reliability, a pilot test of 40 respondents was carried out and Cronbach's alpha test was conducted using SPSS software. The calculated value was 0.834, which indicated the reliability of the questionnaire within the acceptable threshold. After assuring reliability, a full scale survey was carried out and data thus received was analysed using SPSS 22. Descriptive statistics was calculated using SPSS 22 and structural equation modelling was carried out using AMOS 20.

RESULTS

Sample Profile

Data presented in the Table 1 show the demographical distribution of the surveyed participants. Age-wise distribution indicates that 12.92% of participants were of the age range of upto 20 years, 53.93% were of 21-30 years, 24.44% were from 31-40 years and 8.71% were above 41 years. The sample was dominated by male with almost 62 percent. The majority of participants fell into the category of students and followed by employees of private organizations. As regards to education level, 28.65% respondents were graduate, 24.44% were post-graduate, and 46.91% were professional degree holders such as MBA, B.Tech etc.

Table 1.

		F	%			F	%
Age	Upto 20 Years	46	12.92	**Occupation**	Students	197	55.34
	21-30 Years	192	53.93		Private Employees	101	28.37

Demographical Profile (N= 356)

Structural Equation Modelling (SEM)

SEM is applied in this study because it simultaneously examines the inter-relationships among several variables, both independent and dependent, and explores the causal associations among various measurement items and latent constructs (Hair et al., 2010). It is two-step approach including measurement model and structural model (Gerbing & Anderson, 1992). For the reliability and validity of the latent variables and observed variables, measurement model is intended and for showing the strength of path

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

and testing the proposed relationships among constructs, the structural model is used. Structural equation modelling was performed using AMOS 20.

Measurement Model

At the outset, using three latent constructs namely, online product presentation, mood and purchase intention, the measurement model was designed. These three constructs were measured through 12 items (3 items of online product presentation were removed because of poor fit). The maximum likelihood method was applied for parameter estimations and overall fit-indices. Using the fit indices, the fitness of measurement model was considered. Fitness indices and their threshold levels indicate the good fit of the measurement model as values of all indices was above the acceptable threshold (Table 2). Results show the model sufficiently fitted the data.

Table 2.

	χ2/df	GFI	CFI	TLI	NFI	RMESA
Calculated Values	2.856	0.959	0.920	0.916	0.920	0.056
Threshold Values	1.0 – 3.0	> 0.90	> 0.90	> 0.90	> 0.90	< 0.08

Measurement Model: Goodness-of-Fit Indices

Cronbach's α was applied to verify the reliability of items. The value of alpha ranged from 0.724 to 0.781 which was well above the minimum suggested value of 0.60 for each construct. To measure the degree to which items of a construct have a high percentage of variation, the term convergent validity suggested by Hair et al. (2010). It is measured by examining the factor loadings and their significance through critical ratio. Results show that items are significantly different from zero ($p < 0.05$ level), since all the value of the critical ratio is greater than 1.96 (Byrne, 2009). The standardized loading estimates for each item at the alpha level of 0.05 was higher than acceptable level of 0.70, signifying the convergent validity of the measurement model. Composite reliability (CR) – another reliability indicator in the measurement model – was also showed good reliability for each construct (online product presentation = 0.826, mood = 0.799, purchase intention = 0.756). Average variance extracted (AVE), which measures the overall extent of variance, was greater than the acceptable level of 0.50 for all three constructs (online product presentation = 0.534, mood = 0.515, purchase intention = 0.563). Thus, all these measures confirm convergent validity for analyzing of data.

As stated by Hair et al. (2010), discriminant validity in the model evaluates the degree to which the variance is shared between a construct and any other constructs. Discriminant validity is confirmed when AVE of a particular construct is more than the average shared variances (ASV) between the constructs. Table 3 shows that AVE of the particular constructs is more than the ASV. In particular, the results of measurement model are appropriate and possess satisfactory reliability and validity. Therefore, it is recommended to further advance to structural model.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3.

Construct and Item		Standardized Loading	Critical Ratio	Mean	SD	α
Online Product Presentation (CR = 0.826, AVE = 0.534, ASV = 0.462)						
OPP 1	OPP demonstrate all benefits of product to me in a convenient and attractive form.	0.70	9.901	4.01	0.768	**0.725**
OPP 2	It saves my time by providing images, pricing information, technical characteristics and many more relevant information.	0.76	10.779	3.94	0.718	
OPP 3	OPP enhances the personalization of the product and thus provide aesthetics value to product.	0.77	9.081	3.85	0.757	
OPP 4	Appealing visual presentation such as quality, size product image, motion & use of model accelerates me to purchase products online.	0.81	8.278	3.72	0.851	
OPP 5	Product presentation gives me a feeling of complete satisfaction, happiness and fulfillment.	0.82	9.946	3.92	0.760	
Mood (CR = 0.799, AVE = 0.515, ASV = 0.391)						
M 1	I feel pleased while shopping.	0.70	10.789	3.49	0.817	**0.781**
M 2	I feel my mood facing good influence when I shop online.	0.71	10.339	3.58	0.785	
M 3	I like the music being played in the website along with product display.	0.72	10.355	3.79	0.875	
M 4	Combinations of colour schemes in the product presentation & of website in overall make me feel refresh.	0.74	9.878	3.43	0.914	
Purchase Intention (CR = 0.756, AVE=0.563, ASV = 0.388)						
PI 1	I would think about by buying product online when it is presented effectively.	0.73	11.086	3.47	0.884	**0.724**
PI 2	I would recommend nicely presented products online to friends and family.	0.78	10.128	3.69	0.798	
PI 3	I would say favourable things about the product which is effectively presented.	0.74	9.948	3.77	0.806	

Standardized Loading, Reliability & Validity of Constructs

Structural Model

Similar to measurement model, the structural model also used various goodness of fitness statistic like CFI, GFI, NFI, TLI and RMSEA. As presented in Table 4, all the measures have calculated values more than the acceptable threshold. Review of these fitness indices proposes that proposed structural model seems to appropriately fit with the data.

Table 4.

	χ2/df	GFI	CFI	TLI	NFI	RMESA
Structural Values	2.720	0.974	0.945	0.986	0.937	0.034
Threshold Values	1.0 – 3.0	> 0.90	> 0.90	> 0.90	> 0.90	< 0.08

Structural Model: Goodness-of-Fit Indices

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The overall structural model was developed by twelve measurement items that recognized the three latent constructs (Figure 2). Among three hypothesized relationships calculated, all three were found significant at 0.05 (Table 5). The impact of online product presentation on mood (β= 0.693, p = 0.000) found significant, indicating that online product presentation helps in creating the favourable mood towards products shown in the online platform. The direct association between online product presentation and intention to purchase (β= 0.194, p = 0.026) found, indicating that online product presentation helps in encouraging purchase intention for lifestyle products. The effect of product presentation on purchase intention (β= 0.830, p = 0.000) found even more significant when mood was also involved in this relationship. This indicates that mood moderated the impact of product presentation on favourable intention of purchase in the online shopping context.

Figure 2. Hypotheses testing results

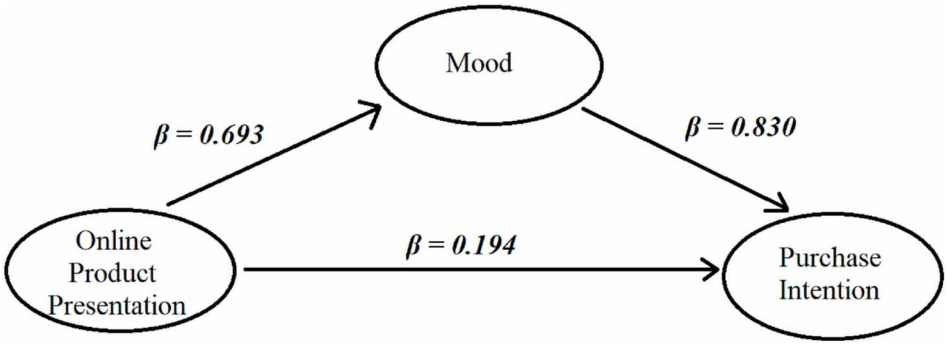

Table 5.

Independent Variable	Dependent Variable	Estimates	Standardized Error	Critical Ratio	*p*	*β*	*Hypothesis Testing Result*
Online Product Presentation	Mood	.439	.050	8.777	***	0.693	Accepted

DISCUSSION

The escalating prevalence of online shopping has changed the manner by which modern consumers explore information, assess alternatives, and make choices. With the substantial growth in e-commerce in the Indian context, there is a need for researchers and marketers to better comprehend the influence of shopping environment on consumer's willingness to purchase. Researchers attempted to explore the roles of product presentation on purchase intention of lifestyle products in online shopping landscape. This study also investigated how mood influences or moderates the relationship between the study variables - online product presentation and intention to purchase. Results of the study indicated the significant,

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

positive and statistically supported relationship between these three constructs. Product presentation significantly affects the purchase intention of lifestyle products in the online platform. Further, the impact of product presentation on mood also found significant, indicating that product presentation helps in creating the favourable mood towards products and subsequent purchase intention of lifestyle products in the online platform. The results showed that mood positively persuade the intention to purchase and also moderates the direct relationship between online product demonstration and intention to purchase. This result is consistent with previous researches of Park, Lennon & Stoel (2005), and Zhang et al. (2012) who supported the positive association among product presentation, mood and purchase intention with reference to apparels.

In online shopping environment, consumers' mood acts as an influential factor in their decision making behaviour. This has direct and instantaneous effect on consumers' willingness to search for products, amount of information needed for final purchase, product evaluations, degree of perceived risk, associated and complementary services and their intention to make the final purchase. Similar to relevant past studies, this study also indicates that innovative product presentation techniques create pleasant and inspiring shopping atmosphere which has direct and immediate influence on consumers' engagement with products and subsequent increase consumers' intention to purchase products. E-tailers should accordingly attempt focus on those aspects of product presentation which help in designing an affective and alive shopping environment. Vivacious, lively and cheerful online interfaces and demonstration of product attributes can reinforce the favourable moods of consumers and their willingness to make the product purchase. From perspective of marketers of lifestyle products in online platform, this study highlights the aspects of pleasant shopping environment which includes usage of innovative and advance presentation tools and creating favourable shopping mood of consumers. In the online platform, where shoppers inspect the product virtually rather than in its physical form, marketers must provide cheerful and lively environment for shopping in order to compensate the shortcomings of online shopping and also stimulate consumer intention to purchase. Particularly in online retailing of lifestyle products, marketers' strategies to evoke such emotions and moods using innovative presentation are obligatory owing to the absence of essential sensory experience facet.

The study also observed that product personalization, availability of rich product information, website design & interactivity, usage of music, moving objects, appealing colors enhance the positive moods of shoppers. From theoretical and practical background, the understanding of product presentation effectiveness and mood viewpoint will help scholars and practitioners in framing visually appealing strategies. In the course of development of strategies for product visualization, marketers need to consider the relevance of consumer mood and involvement. Consistent with prior research (Then & Delong, 1999; Park et al. 2005; Jeong, 2007; Li et al. 2011; Zhang et al, 2012), the present research provides empirical evidence for the significance of mood and have beneficial implications for augmenting the presentation of product online.

CONCLUSION

E-commerce is a rapidly emergent channel for purchasing lifestyle products in India. In this growing and competitive e-commerce landscape, marketers regularly add a variety of features and services to differentiate their offerings and further increase sales. Since shoppers have to imagine the product in online marketplace, marketers need to develop rich virtual product experiences attempting to imitate

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

reality. Therefore, effective product presentation has become increasingly more significant in creating arousal, pleasure and encouraging them to make purchase. As revealed in the present study, innovative multimedia product visualization techniques offer experiential value in the effective manner, which enhances the purchase intention. Findings also signify that mood moderates the direct association between product presentation and intention to purchase lifestyle products. Results highlight that indirect or virtual product experiences and favorable shopping atmospherics are important commercial stimuli in online business that can make products more touchable. In the Indian context, where numbers of internet users and online shoppers are growing rapidly, it is recommended that marketers should pay attention to effectiveness of product presentation as a significant marketing tool that influences brand image, competitiveness, and long-term success.

ABSTRACT

Millennial consumer behaviors approach purchasing or shopping things differently when compared to what earlier generations encountered. Each generational cohort shares a common technological, social, political, historical, and economic environment that shapes and distinguishes them from one another and the millennial generation is using social media as a shopping platform. Technology advancement has become far more user-friendly during millennials' lifetimes, as they are attached to the social media given that it has become a platform that is utilized to communicate and shop. The aim of the study is to look at the characteristics of consumers' behaviors as it has a huge impact on the development of new business strategies. This article provides an analytical framework of millennial consumers' behaviors based on previous studies along with data collected from a focus group discussion. The study finds that millennials are more confident compared to earlier generations, more willing to be experimented on and willing to experiment, and are fashionable trend-wise. In terms of technology adoption, millennials have adopted technology as a way of life which makes full use of its functions ranging from communication to entertainment and optimized social media presence is essential for brands that are targeting millennials.

INTRODUCTION

The world business ecosystem has undergone remarkable changes, starting from the industry 1.0 (mechanization; the age of steam), to industry 2.0 (mass production; the age of electricity), then to industry 3.0 (the age of computer and automation; the information age) and now the world is moving towards the Fourth Industrial Revolution, which is commonly known as industry 4.0, the revolution which includes cyber-physical systems (CPS), the Internet of things (IoT) and the Internet of services (IoS) (Lasi et al., 2014; Ning & Liu, 2015; Weyer et al., 2015). These technological revolutions will activate many innovative functionalities which include networking and access to the cyber world hence significantly changing human everyday lives. Moreover, the revolution will result in the creation of a new business model, work process, development methods and big data environment as the process may involve various data exchange and data storage (Jazdi, 2014).

The millennial generation is people who were born in the early time of Industry 4.0 and they are digital native groups in the society. The term 'millennials' was first coined by social historians Strauss and Howe. A generation can be defined as an "identifiable group that shares birth years, age, place, and significant life events at critical developmental stages" (Kupperschmidt, 2000). According to Zogby Analytics (Landrum, 2017), the millennial generation will take their smartphones everywhere since it has the ability to use online or to take selfies, which mean that smartphones are really important to them and hence, they must purchase it (Anshari, Alas, Sulaiman, 2019). Millennials spend more products or services online, but they have less loyalty to the brands than earlier generations (Ahad, Anshari, & Razzaq, 2017). The reasons for this low loyalty maybe because of the greater exposure to price promotions. They also look for products and brands that match their personality, lifestyle, social and community values. They use brands to create images, to represent their personality and communicate their values (Ayaydın & Baltaci, 2013). Lyons, et al. (2005) argue that some discrepancy exists in defining each generation, but Each generation shares a unique set of significant historical and social life events that shape their attitudes and beliefs, thereby creating generation gaps. Managing those generation gaps provides unique challenges and opportunities for organizations (Lancaster & Stillman, 2002).

The purpose of the study is to examine and explore the behaviors, characteristics, and values driven to consumers' millennials. The data analytics were collected from literature review and focus group discussion of the first-year undergraduate students as primary source. The research found that the consumers among the millennial generation have an unfixed preference when it comes to buying products. Millennials tend to buy anything that is currently trending in the social media, and they will move to buy something else those are newly trending.

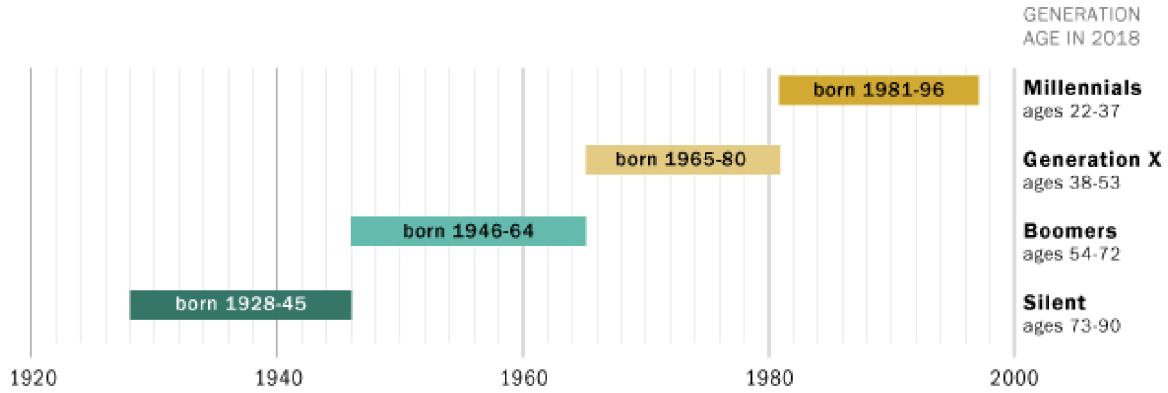
Definitions

Millennials are the demographic cohort that have grown up with the Internet and born in the range 1980s to 2000s. It is also directly followed by Generation X (Rouse, 2018). According to Rosebud (2017), both Generation Y (people born between 1980s to 1990s) and Generation Z (born between 1990s to 2000s) can be called Millennials and the primary difference between the two being technology (See Figure 1). Millennials are 13% more likely to share their purchases on social media than Gen X. This provides them with the forum for sharing and making conversations as well as a place to hear from others they trust (Woo, 2018). Generation Y grew up on personal computers, cell phones, and video game systems,

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

while Generation Z has grown up on tablets, smartphones, and apps. Yet, the common characteristics between both generations are that they have transformed and altering communication and identity globally.

Figure 1. Generation cohort (Source: Pew Research Center, 2018)



Each generational cohort shares a common social, political, historical, and economic environment that distinguishes them from one another (Williams & Page, 2011). General consensus on the boundaries are Baby Boomers (1946 – 1964), Generation X (1965-1980), Generation Y (1980-1995) and Millennials (Dimock 2018; McCrindle, 2006). The huge generation cohort of Baby Boomers will be the age of 60, transition out of the workforce, and retiring staffs. At a strategic level, there is an ongoing process of knowledge and leadership transferred to the emerging Generation X managers, the commencing Generation Y employees, and Millennials as users. Obviously, with the mixture of generations in the business landscape at all levels create differences that need to be understood. According to Ordun (2015), Gen Y buyers select and consume products that help them to define who they are, what is important to them, what they value in life and serve to express some aspect of their own personality or image. In addition, they have the desire to make the best decision on not only price and quality but give consideration to making good investments for the future. Millennial customers found great confidence and trust in the brand names of their choice. Gen Y consumers are more aware of their purchasing power and are likely to spend their cash as quickly as they acquire it, usually on consumer goods and personal services (Der Hovanesian, 1999). Gen Y demand an authentic relationship based on a deep knowledge of who they are and what makes them buy (Yarrow & O'Donnell, 2009).

Millennials Consumers' behaviors

Millennial consumers' behaviors grew up in an era of Industry 4.0. They seem to have a different decisions pattern (psychological – mental state) towards brand loyalty when compared with Baby Boomers. Ordun (2015) added that millennial use their considerable knowledge about the latest trends, images, and reputations of retailers, products, and brand names to be considered experts or leaders among peers. The millennials grew up with better offer of products and services, thus they are considered as demanding consumers who expect more selectivity, personalization and customization in their products and services (Sweeney, 2006; Anshari, Alas, & Guan, 2016).

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Millennial consumers do not get easily affected by all advertising. Only 1% of millennials in the survey said that a compelling advertisement would make them trust a brand more. Millennials believe that advertising is all spin and not authentic (Schawbel, 2015). In addition, they are mostly using multi technologies devices to purchase something. 87% of millennials use between two and three tech devices at least once on a daily basis. 39% are either very or completely likely to purchase a tablet computer in the next five years, while 30% are for wearable devices.

Other characteristics include highly educated, career-driven, and politically progressive and develop strong brand loyalty when presented with quality products and actively engaged by brands (Arabov, 2016). In terms of consumers' behaviors, millennials are solidly coming into their own. Their purchase behaviors have been shaped by their journey, wrought by social and economic trials, and clear preferences are emerging that can advise brands on the communications and connections that will have the most impact (Roesler, 2018; Anshari et.al., 2019). In addition, millennials are committed to a brand as long as it provides for their needs (DeBard, 2004).

Methodology

The study deployed an qualitative approach that were confined to data analysis from a focus group discussion and Meta analytics from literature studies of a thorough search for studies pertaining to millennials consumers' behaviors. The studies that were selected for inclusion should provide empirical data on the relationship between millennials and their consuming behaviors. This is also known as a scoping review (Torgerson, 2003). By conducting a scoping review, a preliminary assessment of the size and nature of the literature that is relevant to the research questions can be used to determine the feasibility and relevance of a full-scale systematic review (Arksey & O'Malley, 2005). Furthermore, focus group discussion was used to explore primary data from millennials group mostly first-year university students. A total of 176 respondents were contributed in defining the characteristics of millennials. The data collected either from literature reviews and focus group discussion were then extracted using text mining analytics and expressed them into data analytics visualization. Then, the results were integrated as it guided the exploration of the truth or reality behind the conversations and opinions of respondents. While there is the richness of depth in interpretive research, no generalizations are made; however, this approach is flexible in its application. As a result, the interpretive constructionist paradigm is deemed as the most suitable paradigm to meet the needs of this study.

Analysis & Discussion

Business organizations specializing in mobile commerce will get a competitive advantage by understanding millennials' behaviors. The results of data analytics confirm that millennial generation consumers show wide range of characteristics. The study discussed that most would have the same characteristics based on the respondents' opinions. Millennial generation consumers are more or less materialistic where they see that items such as clothes, phones and more are important to their lives. They have the need to purchase items that are branded and expensive. They may have a mindset where being able to purchase these items would make them "relevant" gaining attention from their followers on social media. They are however more creative than previous generation. They may in fact have a good amount of confidence in them.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

In addition, Industry 4.0 shapes the millennials consumers' attitudes toward a product, there is no holistic way of categorizing it. Influences from musical genres from K-POP to Indie Rock, athletics, movie stars, social media, and memes play a major role in what is trendy and hip. Political activism also plays a huge role in millennial preferences with the unstable political climate transition we face today, millennial use their angst to voice their opinions. This also made them more socially aware of how their product is made (Anshari & Alas, 2015).

The extent, to which the many factors involved in consumers' behaviors among millennials. It will thus be interesting to examine the characteristics of millennials from primary and secondary data sources. The following sections present findings obtained from the focus group discussions compared to the data analytics from a literature review. The findings present the most important features of millennials consumers' behaviors. It is the cirrus view from text mining analytics for the respondents' opinion on millennials consumers' behavior characterizes. The bigger the words express the level of the more important characteristics of the keywords such as social media, shopping online, trending, brands, buying a product, Instagram, technology, etc.

Figure 2. Cirrus view from respondents' opinion on millennial characteristics

The Power of Social Media

The reason of social media has repeatedly mentioned by respondents that make social media and online have become the most highlighted keywords at Cirrus visualization (see Figure 2). According to respondents, it firmly indicates that millennials consuming behaviors is that they usually use social media as the main medium for shopping information and preferences. Social media especially Instagram is the most popular social media platform for millennials in buying or selling items. Social media play a vital role

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

in their life as these mediums offer opportunities to the millennial to process new information, involve in social discussion and stay updated with any trends happening such as they would use the social media to compare the price, brands, quality and read brand's review before purchasing certain items. Since, millennial are entitled, smartphone obsessed and would have any effects on mobile commerce, they are considered as the most critical and important customer in business. As there are many social media personalities promoting products nowadays, it is easier for them to review and purchase the products. Social media has become a number one for shopping information.

They are tech-savvy shoppers and actively making a comparison of several shops online to get the best value and shopping experience. Social media has become their primary tool to search and hear about several products, special deals and shopping news. As stated by the respondent, "in my opinion, millennial generation on consumer's behavior is when young people try to develop their life experienced with similar attitudes and beliefs which they have been influenced from the al group that are currently developing especially when there is new trending." Credibility and relevance are the basis of many purchasing decisions. They rely on the content of their friends' social networks much more than on the content of the brands. They consider that trademarks must be authentic and relevant.

Millennial are certainly techno-savvy online customers. According to a study conducted by Moore (2012), millennial consumers are more active and superior adept at integrating technologies into their daily lives for marketing purposes. In fact, interviews conducted at one of America's largest shopping malls confirmed our survey findings that many members of the digital generation actually prefer visiting stores to shopping online. Online and mobile channels are important to Millennial, providing the information and insights they need to find the best products and services. Many hone their shopping skills on the Internet, checking product ratings and reviews or feedback on retailers, for example, to confirm that both product and vendor provide the best value and service, respectively, thus millennials preferred brands that use social media compared to those that do not and they want to engage with brands on social networks (Vantage, 2017).

Purchasing Behavior

Figure 3 shows sstreamgraph analytics derived from respondents' conversation on millennials' commerce behavior. They make purchases products more frequently online. It is in line with Lissitsa & Kol, (2016) that millennials more impulsively prefer to purchase goods online rather than buying goods in physical, this is because through online they could research for more details of the products or have the time to choose wisely before purchasing it. According to Woo (2018), half of millennials like to spend their cash on having experiences over material things and they certainly will pay additional for it. They make purchases based on what a friend has said about a product. Respondent made his statement that "from my perspective, in recent years, the millennial generation is more up-to-date and also more aware of what they are trying to buy. They always do thorough research first before immediately buying a product. Some even watch reviews that other experts have done to help them make their decisions. However, some are also just curious about trying out new stuff that they completely ignore the protocol and just buy whatever they think is or going to be the big trend."

Millennials do need influences when making decisions on what items to purchase or what brands to purchase, and the most influencers come from social media (see Figure 3). Millennials are also constantly exposed to social media, whereby they post or purchase products online (Murdough, n.d).

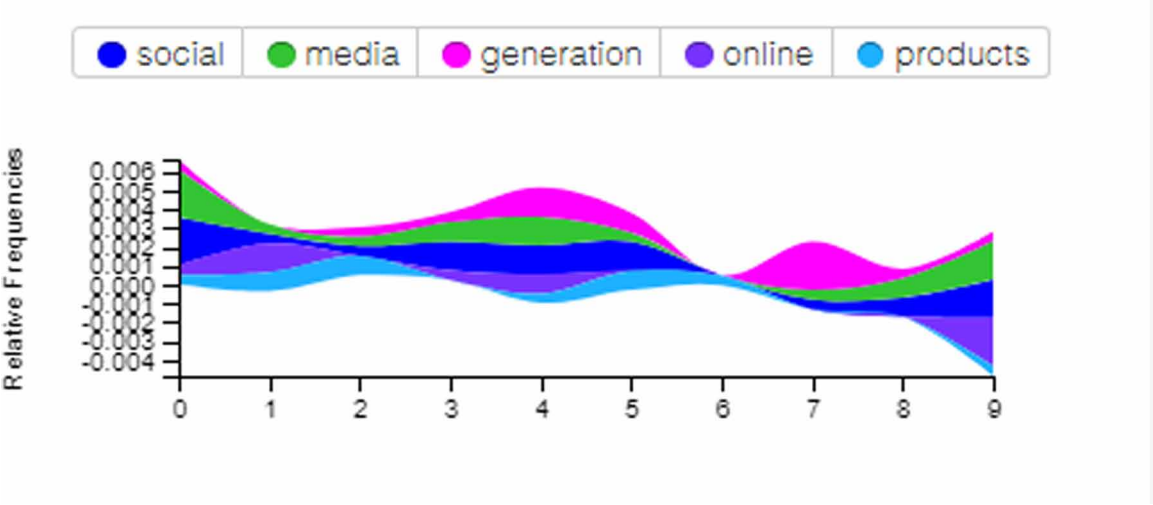
Figure 3. Streamgraph view of respondents' opinion on millennials characteristics



Furthermore, millennials make purchases based on both a logistical and an emotional need, using it as an outlet to express their personalities. Purchasing products that make them feel good about themselves. As stated by respondent, "From my opinion, their behaviors toward the things they have bought are sometimes odd in certain cases. The reason for such accusation is because from what I have experience and seen, millennials have purchased the things that are mostly trending and Instagram worthy. It does not matter whether it makes them feel happy (just saying), it only matter if they are up-to-date." In addition, millennials tend to share their purchases with peers on social media, even making purchases based on endorsements from their peers. Basing it on word of mouth rather than company-generated advertisements, this is due to millennials seeking relevance from the brands they purchase from (Woo, 2018).

Figure 4 shows millennials' consuming behaviours extracted from literature analysis of. It shows certain similarities about similar with the data analytics at Figure 3 from respondents' opinion that they are heavily use social media as a medium for shopping information and preferences. They want to purchase things that they themselves feel good about it and they like to share their purchases to others by showing/exposing them to the social media (Murdough, n.d). Since the majority of millennial consumers rely on social media (Instagram, Twitter, Facebook & etc.) or online shopping Web/Apps where they can just simply pay and preferably by their cards rather than paying face-to-face in cash. Therefore, social media plays an important role in their life because they get information about the trends around the world so that they can keep up to date alongside other people. There are a lot of influencers in the social media where they promote things for people to buy and these influencers are also mostly millennials. The millennial generation consumer's behaviours based on their characteristic, they get professional on using the social networks (Facebook, Instagram, etc.) to find information about one product they want to buy. Most millennial generations usually go through social media first to compare the price, brands and quality before purchase the items. Credibility and relevance are the basis of many purchasing decisions. They rely on the content of their social networks much more than on the content of the brands. They consider that trademarks must be authentic and relevant.

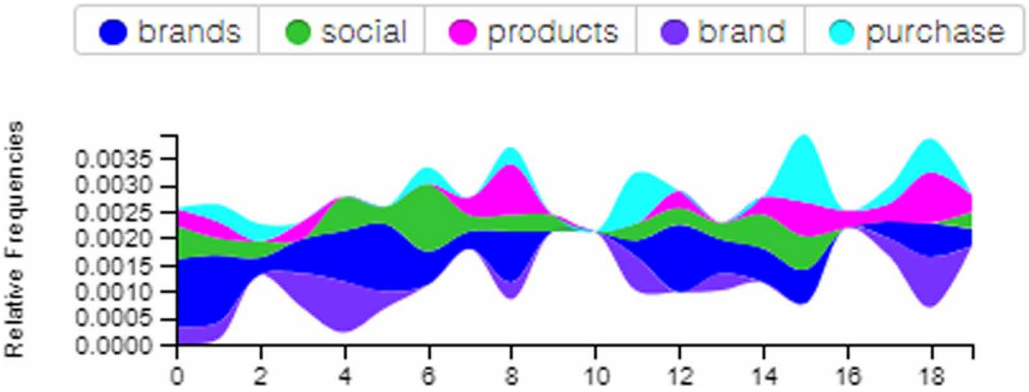
Figure 4. Streamgraph view of reference analytics on millennials characteristics



Shopping Online

Figure 5 shows Mandala visualization derived from data analytics of respondents' opinions on millennials. Some important keywords are trending, shopping, buying, product, and online. These characteristics are influenced by trends circulating in social media. It piqued their interest whenever viral items has been purchased by various people particularly close friends, family and relatives. Millennials also tend to shop online especially with the availability of shopping Web or Apps such as Amazons, Zalora, Fashion Valet, Lazada. According to Faraldo (2017) millennials like to shop online. With the aid of social media, millennials are able to get an update for their desired items. Shopping online allows millennial customers to browse items and comparing prices with ease.

They are easily influenced by the market trends not only in terms of buying power alone but also the real estate and the development of a lifestyle. According to a recent report about millennial, about 77 million people aged between 18-36 will dominate the increasing share of economy. The value of the lifestyles and purchasing power will have a direct impact to the millennials (Woo, 2018). According to Forer (2017), stating that 39% of products and brands will be reviewed by millennial. They are more likely to be connected and listen to the people like them than celebrities. While 60% of people aged between 18 to 24 are most likely to try the product as proposed by Youtube.

Respondent stated that "the millennial generation consumers' behaviors change over time. Especially in this era where new trends are rapidly growing. Take the fashion world for an example, the millennial generation would spend invest a lot to buy designer goods that are in trend." Things that are in trending, millennial would buy in no matter the cost. The reason is that sometimes having those items will make them feel blend in with the society (Chevreau, 2016). Obtaining good memories, that is what people value more, and to accomplish it, they have to experience it for themselves (Landrum, 2017).

Millennial have influence a lot especially from trending social media (Instagram, Facebook, etc.) and it varies from food to fashion with the idea to simply be keep on track with the trend. Crawble (2015) comes to conclude on how most millennial are not mostly brand loyal and are plain inaccurate. In addition to that based on surveyed conducted by Arabov (2013) on how millennial never truly influence on advertising saying it is simply a spin not authentic. They will simply review from blogs (Instagram, twitters, YouTube) before making the purchase.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. Mandala visualization from respondents' opinion on millennials

Brand Awareness

Figure 6 shows Cirrus visualization generated from literature reviews. Brands, products and social media are the highlighted keywords. Millennials are consumer brand loyal (Lodes & Megan, 2009). They are more likely to download applications to connect to retailers or brands (Moore, 2012). Brands will become bigger than ever, as millennials identify the idea of a big brand as being a return to the community. Millennials are loyal to brands whose products not only provide for the individual but also for the community as a whole (Beirne and Howe, 2008). Millennials are committed to a brand as long as it provides for their needs (DeBard, 2004). Furthermore, they spend a lot of time on social networking sites and connect themselves to retailers in social media and they are also likely to follow brands on Twitter, Facebook and Instagram. In addition, they engage in social networking to connect to retailers and brands and the engagement with the brands (either through Instagram or Facebook, etc.) will make them be a loyal customer and based on the surveyed itself they also mention how they are willing to co-create on the product as that is mainly how most the brands spreading and emerging around the world.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 6. Cirrus view from literature analytics on millennials' characteristics

Price is important but brands also matters as they are brand loyal (Schawbel, 2015). When they build a relationship and connection with the brands that they currently purchase, it is most likely that they will purchase from the same brand as they grow older or when they become an adult. According to an article posted by Vantage (2017), it stated that although 57% of millennial shopper compare prices in store with online, 60% of the population reported often being loyal towards the brands they like, price is critical, but brands matter more (Figure 1). Therefore, earning loyalty and trust of millennial is essential and important. Furthermore, millennial shopper prefers to get a direct recommendation from friends and trust the products their friend like. Thus, it is important to advertise brand products or review through influencer marketing or through creative social ads that could be part of the feed. This generation group is more active in integrating technologies into their daily lives for marketing purposes, using their mobile devices and the traditional Internet means to connect to retailers or brands (Moore, 2012). Its purchasing power and technological capacity have been crucial for minor online retailers who have benefited from this important segment of consumers. Their technological ability allows them to advertise the desired and undesired brands that they consider reliable and that also manages to generate an effective communication link with them as they continually seek to communicate. Finally, according to Oh (2018), millennials are driven by instant gratification. The rise of technology and digital has made it possible to deliver everything in real-time, which further empowers them to expect instant value from brands.

Value Driven

Millennials are highly values-driven generation especially their civic value. Their beliefs would cause them to buy products from companies that support their beliefs or the causes that they care about. For example, millennials are more likely to care if a food is organic or not when compared to non-millennials.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

A study conducted by Roesler (2018), stated that millennials use search engines to connect with brands and find information. They also expect retailers to keep prices low and to offer certain perks that were once premium extras. They would regularly skip commercials and advertisements on various websites. In addition, they review blogs before they make a purchase. This means that millennials look to social media and rely on the contents written by their peers before they make their decision to buy. Millennial consumer's behavior is unpredictable. Millennial have totally different personalities from their parents and their behavior are sometimes unpredictable. These generations tend to spend more money on technology as everyday application of technology is considered to be a commonplace and part of millennials environment and lifestyles.

In addition, millennial consumers are also demanding values as they are the key consumer to most organizations. Millennials do research and only accept relevant offers. According to a research conducted by Donnelly and Scaff (n.d.), there are approximately 80 million millennials in USA alone and they spend $600 billion each year buying goods from organisations around the world. Millennial wants instant rewards after buying products (Paddon, 2018).

Furthermore, Simoes and Gouveia (n.d.) stated that millennials are more likely to be influenced toward their family, religion and community ties. This is because they cherish their family and their status than any of other factors. Millennial does not care about others race, gender and ethnicity factors. This causes their relationship with each other to be closer. Millennials tend to search for things that are trending. They will try to be in trend to somehow look cool and in the same trend as others. In fact, they are more open to a more advanced stuff such as online shopping and making easy payment.

Techno Savvy

As they grow up in the Industry 4.0 era, millennial love automation, they crave Personalization, obsessed with easy to use technology, and they are mobile shoppers. In addition, millennials generation are able to adapt to new technologies easily more than any other generations. For instant social media (Instagram, Twitter, Facebook, etc.) play a vital role in their life as these mediums provide opportunities to the millennial to process new information, involve in social discussion and stay updated with any trends happening, such as they would use the social media to compare the price, brands, quality and read brand's review before purchasing certain items. For example, Zalora is an online shopping platform where consumer can buy shirt through online, in this case majority of millennial adapted to the uses of online shopping because of the reliability and trustworthy platform.

Even though millennials are entitled, phone-obsessed and thought would not have any effects towards the world of e-commerce, millennials today is considered as the most critical and important customer in business. When there is new technology available, millennials will be all over it. To keep brand relevant and appealing to millennials, it needs to be able to engage them on new platforms as they are released. For instance, having an application on the IWatch could be a matching long-term investment (Schawbel, 2015).

I think that the behavioral consumption of Millennials and adolescents can be simply put as techno-savvy following the mainstream trends very attentively, no matter how alien these trends are and whatsoever.

One of the traits of millennial generation as consumers is that they expect technology to work. Millennials grew up with modern and advanced technology that bundle communication, entertainment,

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

shopping, and education all in one. So business should be careful when operating their websites or their online business because the millennials expect technology to work. Millennials are different from the previous generations because they grow up in an era of modern technology and are access to unlimited amount of information (Woo, 2018). Millennial consumer has a characteristic of collaboration, they are hyper-social, they expect technology is working easy as always, and they value experiences, discoveries, and excitements (Solomon, 2018). Their technological ability allows them to advertise favorable, or unfavorable brands that they consider reliable (Moreno et al., 2017).

The millennial generation, in my opinion, has more purchases power, and technological knowledge which makes them more actives in incorporating technologies into their daily lives e.g. socializing and shopping online". As technological advances are becoming more evident, millennials tend to look for reviews of certain products or software before deciding to spend on anything.

Millennial generation consumer's behaviors are very unpredictable, millennials prefer things that are trending globally which thanks to technology, help them to see what is trending. Trending things can be music (K-pop), new games, new clothing brands and many more. Millennials would prefer branded goods than none branded goods. Millennials are the most comfortable generation in using technology. Naturally, online shopping would be a part of what brings the development of the online industry. Millennials' comfort with mobile shopping extends to stores, where they are avid Omnichannel shoppers. Nearly all have researched products online before buying in-store.

Trends & Identity

Figure 7 shows the consistency of characteristics derived from literature reviews. Millennials are trendsetters, and they are shaped by social media which is mostly which plays a major role in that revolution. However, some have started their small business at a very young age due to their relatives and for personal income. Some even turn their capabilities or passion as a side job. For instance, people who are good at taking pictures to become a photographer at wedding ceremonies or events. The millennial generations prefer things that are currently trending, and also items that are at an affordable price. Since they don't want to be left out in this world, they constantly check for any new updates that many people especially from the Western side, Korean, and Japanese side have. Moreover, advertisements and promotions can easily trigger them to buy the items. They also act on how Youtuber's review or their friends' reviews on the things that they have bought, which will further strengthen their reason for buying the things which have much more positive feedback on it. Their characteristics and preferences are solely more towards trying to constantly keep up with the 'trend' that is continuously changing. However, even though Millennial tries to keep up, they still select and purchase products that could help define who they really are, why it is important to them and how much value can this product help in their life. In order for them to know this is by knowing about the latest trends, images, and the reputations of the sellers, products and even the brand names. Hence, why, they put a lot of effort into thinking whether they should purchase such items.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 7. Mandala view of reference analytics on millennial characteristics

Impatience & Multitasking

Other characteristics that help to distinguish millennial to a degree or kind from previous generations that are impatience and multitasker (Sweeney, 2006). They have zero patience and dislike any sort of delay. They want their services to be instantly ready when they are ready as well. They need to have instant and constant feedback to know how they are progressing in terms of studies or themselves. They absolutely dislike it if there is any sort of delay, the requirement to wait in line or even having to deal with another unproductive process that could cause any delay. Millennial is known to be great multitaskers as they are able to handle different tasks at once as this is considered as more efficient and practical use of their time and also with the fact that is impatient people. Millennial does not really have a good interaction with reality. Woo (2018) stated that millennials are often characterized as unable to handle business and struggling in the real world. This is because the millennial tends to focus on the virtual world than reality. In addition, they have a problem with their work-life and do not want to try to improve their way of living because as long as they are in trend and good with their social life.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Exploratory Learners

Finally, millennial shop promiscuously, they would rather have the risk of purchasing a new product than the old well-known reliable product. Millennials behavior is depended on the environment they live in, either filled with technology, unlimited access to information or in developing low access to the internet. Woo (2016) makes a powerful statement on how reality has a definite impact on millennials psychologically and socially. Respondents mentioned that "the characteristics of the millennial generation are that they are more open-minded, confident, self-expressive with themselves, they are more upbeats and are more interested in finding new ways to live."

Millennials are savvy shoppers, and they are actively making a comparison of several shops online to get the best value and shopping experience. They make use of social media as their primary tool to search and hear about several products, special deals, and shopping news. Millennials strongly prefer learning by doing (Sweeny, 2006). They almost never read the directions; love to learn by doing, by interacting. They prefer to learn through interaction more rather than doing. Gaming, computer simulations and social medias are considerably some environments that they love and it provides them a small penalty for trial and error learning. It was known that millennials prefer being interactivity in their studies, rather than attending lectures. They are adventurous and value experiences since they travel abroad more often than non-Millennial (Solomon, 2018). Finally, the millennial generation is a group of young adults that were usually in trend with products, application or even activities and actions. This group tends to have the feelings of wanting to do something different and up to date than a regular young adult. The place where these millennial generation spend most of their times are on social media. They are usually the group of people that start the trend in the social media.

CONCLUSION

Millennials adapt quickly to technology, unlike the previous generations. It is obvious that they are tech-savvy and with that being in their identity, they have characteristics different from older generations in the sense of consuming behaviors. The millennial generation consumers' behavior is that they usually use their social media to check for any positive reviews/feedback regarding the items or brands that they seem to be interested in before they purchase. In addition, millennial consumers' behavior is more likely to be ambitious, where new trending stuff becomes a curiosity for them and build interest to know more. Since millennials tend to share most of their lives on social media, more people will know about a product once they share their stories about their purchases.

Chapter 77
Impact of Mood of the Millennial Customers on Purchase of Apparels Online

Anusha Thakur
Stellarix Consultancy Services, India

ABSTRACT

In today's scenario, the millennials are keen towards the mobile technology wherein they expect to use the best of it in all aspects of their lives. Online channels help the millennials to enhance their shopping experiences by taking a glance at the reviews, ratings, value, and pricing of the products. This can be attributed to the streamlined services coupled with the free trials and delivery, and additional discounts offered by the apps. But, at the same time, how their mood affects their decision is still a question. For instance, if the consumers are in a good mood, they are likely to shop more. However, if they are in a low mood, they might not shop for anything. This study includes the mind and mood analysis of the young millennial consumers while shopping for apparels online. The study will involve in-depth interviews of 21 customers. The analysis will be done through the Leximancer tool. Additionally, this chapter would help the retailers understand the range of mood, which the customers display while purchasing apparels online and accordingly devise their strategies.

INTRODUCTION

Online channels help the millennial to enhance their shopping experiences by taking a glance on the review and ratings, along with the value and pricing of the products. Furthermore, the individual apps for shopping stores and retailer brands are also expected to favorably impact the changing shopping trends over the forecast period. This can be attributed to the streamlined services coupled with the free trials, delivery, and additional discounts offered by the apps. The social media platforms also play an important role in this segment. Every millennial nowadays, are engaged in using any one of the social media sites for uploading and sharing their experiences with the brands that they use (Engagement, 2017).

Millennial includes the people born in between the years 1980 and 2000, i.e. the generation which truly is a digital one. This generation focuses on getting all the insights and information of the various products through different online channels in order to get the best value as well as services. They emphasize more on the shopping experience, product quality, and prices of the products (Baird, 2017). The millennial belong to the era of globalization, and numerous technological developments, which are further anticipated to enhance their behavioral pattern and mindsets. These customers are grown up with internet and smartphones, which helps suffice their needs. The convenience as well as accessibility of the mobile apps acts as a favorable factor to maintain the loyalty of these customers. Additionally, the social networking platforms which help in knowing the whereabouts and experiences of the customers, enhances their shopping trends. Furthermore, factors such as extracting all information related to the products including reviews, feedback and ratings are expected to change the perceptions and mindset of the customers.

In today's scenario, spending powers of the millennial are the maximum as compared to other generations. However, maintaining the brand loyalty of these customers is expected to be one of the challenges. The retailers need to design their strategies accordingly, to keep the millennial customers motivated and attracted towards them. Increasing innovations and developments in technologies are expected to boost the millennial shopping trends and demand. The millennial are very brand specific. This generation is more interested in the services which are much convenient, faster and easier. These people emphasize more on purchasing the products which are derived through the ethical practices and social conscious. The retailers need to lay more stress on the consumer mindset and changing preferences with time.

According to a study, the frequency of the millennial online shopping purchase in Asia, Western Europe, and North America vary from that of the purchase trends of the millennial in the regions of Middle East, Africa, and Latin America. Western Europe and North America region is expected to witness larger online sale on account of the larger disposable income as compared to the other developing economies of the world (KPMG, The truth about online consumers, 2017). E-commerce segment, specifically for the apparel is anticipated to witness significant growth. The millennial follow several brands on the online retail shopping platform. This can be attributed to the factor that they are very sensitive towards pricing and majorly, opt for the products which are on discount. For instance, online retail apps such as Zara, helps to keep the tab on the fresh arrivals, as well as filter large assortments easily. Additionally, this app also consists of a built-in barcode scanner which is engaged in offering information related to the customer in-store findings. This includes whether the store has that particular product in size or whether the product is out of stock or the users are looking for different colors. Similarly, Asos.com is a British online beauty and fashion hub which is engaged in selling nearly 850 brands along with its own range of accessories and fashionable clothing. Furthermore, this app also offers free shipping up to the orders of certain price level and can also get synchronized with the apple watch for various sale alerts.

These consumers emphasize more on the ease of payments as well as faster as well as safe delivery of the apparels. Several online apps offer at-the door delivery option, which favorably impacts the choices and preferences of the customers. Millennial are very specific about the product authenticity as well as its quality. Apart from the aforementioned factors, these consumers emphasize on the feedbacks and ratings of the products. While shopping online, one cannot feel the product quality and make their purchase decisions on the basis of the given product description. In such situations, reviews by the other customers play an important role. Hence, before making any purchase decision, the customers go through the online reviews, and recommendations of that particular product. Henceforth, product reviews act as

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

great influencer for the product purchase. If the reviews are positive or negative, the consumers make their purchase decisions accordingly (Hankin. Lisa, May 2007).

- **Identification of the Topic:** Before making a purchase decision, for in-store or online shopping, the millennial consumers focus on factors such as authenticity, shopping experience, quality, pricing and services. It has been observed that the consumers are likely to change their perceptions or preferences when they read about any product reviews, ratings and prices through different online channels. But, at the same time, how does their mood affect their decision is still a question. For instance, if the consumers are in a good mood, they are likely to change their decisions instantly after going through the feedback and purchase that particular product. However, if they are in a low mood, then it becomes difficult for them to make a decision even if the product review is good.
- **Rationale for the Topic:** This study focuses on the analysis of mindset and mood of the consumers. Data has been collected from various respondents at different locations through open-ended in-depth interviews. This study helps us to understand the changing preferences of customers for shopping online. It also focuses on the reasons why the customers tend to select any specific shopping portal online and also why they prefer shopping online rather than offline from any physical store. Additionally, this chapter focuses on the impact of mood on the purchase decisions made by the millennial customers. Further, how feelings and emotions affect the customers and their shopping patterns? This chapter discusses about the various situational mindsets and mood affecting the behavioral online shopping patterns and trends of the consumers.

The analysis of the gathered/collected information is done with the help of Leximancer tool. After the analysis, the data is presented in a detailed description format for every different mapping diagram. The study then includes different limitations, which the author came across while writing the proposed chapter, followed by the suggestions and conclusion.

Significance of the Study

The study targets the millennial customers and their impact of mood while shopping online for apparels. The shopping trend of the customer solely depends upon their mood and mindset when they shop. Mostly, the millennial customers shop in good mood or some of them shop to elevate their mood. In today's scenario, the customers prefer to shop online owing to the different factors such as:

Ease of content sharing coupled with advancements in the mobile technology is expected to propel the demand for millennial online shopping. Reposting or re-tweeting or sharing the content from one's profile to another on various social platforms, also adds value to the customer's reviews for the product.

The fact, that the millennial focus on flexibility, convenience and positive experiences while purchasing apparels online also favorably impacts the market trend. There are variety of shopping apps which provide different kinds of deals and discounts along with several other features of returning and exchange policies, as well as flexible payment systems. The aforementioned factors contribute positively to the millennial shopping trend.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Objective of the Study

The objective of this study is to understand online shopping trends of the millennial customers and the impact of their mood on their purchase decisions.

LITERATURE REVIEW

According to a study, the younger customers are more prone for shopping online than the other generation consumers (Joines J. S. C., 2003). With the ever changing cultural scenario, the tech savvy companies are just not trying to keep pace with the changing trends; a few retailers are, in fact trying to move ahead. With growing awareness of the factors which influence the consumers, the retailers connect with the shifting trends to stay relevant and gain success in the market (Global, 10 Trends Millennial Retail, 2016). For the retailers with the wherewithal to invest, there are lots of opportunities to become a leading innovator (PWC, Total Retail 2016: They say they want a revolution, February 2016)

The retail segment is expected to witness substantial growth over the forecast period which can pose to be favorable as well as unfavorable to a few retailers. This can be attributed to the changing shopping trends of the millennial and increasing digitalization. Also, factors such as inability to make adequate changes in business models and strategies with the changing preferences and behavioral patterns of the consumers might pose unfavorable to a few retailers (Nashiya, 2017).

Competition is no longer related to the presence of the physical stores. In today's scenario, the customers can shop from anywhere and anytime around the world and also from any manufacturer as well as retailer. The retailers are shifting their business strategies from shop-centric to customer-centric. With increasing lifestyle priorities, the millennial prefer shopping online rather than visiting any store (Sohi, 2016). The millennial are able to make purchase decisions by sitting at one place and do comparative analysis of the designing, authenticity, and price of that particular product. Seamless shopping experience such as customization of the product offerings by the retailers to provide enhanced services affects the online shopping trends. Additionally, factors such as transaction privacy and security, socialization, interactive control, information, economic motivation, social escapism, and non-transactional privacy are expected to boost the consumers to shop online (L. Joines, 2003).

Having a smartphone acts as an important strategy for the retailers as well as manufacturers to keep pace with this generation. Increasing technological developments in the quality of screens of the smartphones as well as easy availability of internet with hi-speed bandwidth boosts the e-commerce market demand (Deloitte, Digital Media: Rise of On-demand content, 2015). Additionally, factors such as growing access to internet coupled with the advancements in mode of payments, trust, and logistics are expected to increase the online shopping demand among the millennial. Growing rise in the digital era, coupled with the increasing online shopping trends favorably impacts the retailers as well as the product manufacturers. For the online shoppers, assurance and faster delivery play a pivotal role in their purchase decisions.

In the online shopping journey, two main factors which affect the shopping trends of the consumers majorly includes, decision of when and where to buy the product. There are various attributes which the consumers focus upon while shopping: Delivery options, pricing, availability of the products, return and exchange policy, and websites/apps through which they make purchase, and discounts being offered.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

We are in the age of value; however pricing is still the important factor for every generation, particularly for millennial. Years of fluctuating economic growth are expected to result in affordability, and value dynamics which is very important for every income bracket, across every region, and also across every particular age group (PWC, Total retail 2016: They say they want a revolution, February 2016). Price is expected to act as a vital factor over other factors such as brand, and availability of the products. This can be attributed to the cost saving behavioral pattern of the customers. Additionally, disposable income of this group can also be one of the reasons. According, to a study conducted by KPMG International (KPMG, Global Online Consumer Report: The truth about online cosnumers, 2017), pricing acts as a most significant attribute while making the purchase decisions. Pricing also creates loyalty among the customers specifically, the millennial. For instance, these customers prefer opting for apparels which are easily available online at a cheaper price than the normal physical stores. Most of the millennial are expected to shift their brand preferences if they are given certain level of discounts in the pricing of the products (Bhanot, A study of the Indian apparel market and the consumer purchase behaviour of apparel among management students in Mumbai and Navi Mumbai). Reliable delivery and affinity for any brand are the important factors which affect the shopping trends of the millennial (PWC, Total retail 2016: They say they want a revolution, February 2016).

Shopping from the websites on which the consumers trust is one of the factors affecting their purchase decision. In few regions of Asia Pacific, the consumers opt for preferred websites/mobile apps on smartphones for making their purchase decisions (Go-Globe, 2016). However, according to the global online consumer report by KPMG, the trusted websites also hold significant share of nearly 30% among the customer attributes. Secure payment gateways along with brand reputation are the factors which favorably impact the customer's online shopping criteria. As per a study, nearly 76% of the respondents return to any particular website if they have already made any purchases from it before (Editors, 2015). Furthermore, apart from brand or website reputation free shipping, delivery charges and payment convenience also contribute to the consumer satisfaction.

With the growing trends in the online shopping, the millennial customers also shop for apparels through different mobile apps. This can be due to the ease of instant connectivity and internet availability at all places. According to an article published by *RetailTech Innovation Editors*, shopping through mobiles has witnessed an increase from 31% in 2013 to 37% in 2014.

The key decision making characteristics among the millennial includes quality consciousness, information availability, and impulsiveness (Ali Alavi, 2015). Before the purchase of any product, the customers try to get all the information related to that product in order to get an idea about their choice. In today's scenario, the online shoppers also emphasize more on the faster and efficient delivery of their products. Further, flexibility in choosing the delivery date and time also motivates the millennial to shop online. For better delivery options, the e-commerce or the online retail chains need to focus more on their supply chain processes. Also, improved technology with proper landmarks and address section mentioned at the time of purchase would provide efficient delivery process. This would further enhance delivery of the product at right time by the right delivery person at right place. Better delivery options also contribute significantly, to the online consumer attributes share.

Apart from the varieties, the consumers also focus on the availability of the products. For instance, if a millennial is looking for a product on an online platform, and if the relevant size and color is not available on that app, then there is a probability, that he/she might switch to different app. Hence, the consumer preference also depends on the availability of the products. Hence, if the products are not available in the respective searched brands, it is expected that the customers might shift their preferences.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The millennial consumers make their purchase decisions on the basis of comments, reviews, feedbacks and recommendations on the various social media platforms (Rohampton, 2017). The online shoppers are always engaged in taking recommendations from the internet as well as their peers before they purchase any particular product. These shoppers particularly, emphasize on checking the online reviews and product information's. Social media platform acts as an important source to get the relevant information and deals related to the product. Also, sometimes, these millennial make their decisions on the basis of shopping experiences and stories which other people share on the social sites.

Discounts and offers play a vital role for the consumers to make purchase decisions (Shamout, January 2016). The millennial customers prefer shopping online because of the varied options and discounts that they get online in comparison to the retail outlets. This generation people are much updated and are aware of different coupons which can be used while shopping and they make the best use of it. There are several shopping apps which offer huge festive season discounts, weekend sales, end of the season sales, and seasonal discounts. The aforementioned factor acts as one of the strategy to attract and retain the customer. Also, the millennial are very brand specific. They prefer good quality, and labeled brands as their preferences for whatever products they purchase specially in the case of apparels. If they get discounts over their choice of brands online, it becomes an added advantage to them. However, there are also a few customers, for whom discounts do not play that much important role. They prefer for quality of the product, over the discounts being offered on it.

Millennial also emphasize on the latest trends and styles of clothing, which acts as a significant shopping factor. Women, particularly focus on the availability of various options, variety, and trends than men (Aswegen, 2015). For instance, Forever 21 is a well-known brand among the millennial. This brand offers more options in their collection online than in the physical stores. Similarly, there are several other online platforms, which also help in promoting the newly launched brands online at a much cheaper cost. For instance, brands like Roadster and Dress berry are launched by Myntra and its products are only available online and not in any retail stores. Advertising also plays an important role in the promotion of such apparel brands available online. This strategy focuses on the quality of the product and the offers that the different brand provides online.

According to a study, majority of the millennial look for various coupons or promotional codes before making any purchase decision. This can be seen more in the case of online shopping (which is approximately 72%) rather than in-store visits (which are nearly 52%) (Kestenbaum, This Is How Millennials Shop, 2017). This can be attributed to the factors such as ease of availability, faster and timely delivery of the products, which further contribute to the growth in the online shopping trends. The level of brand loyalty is expected to be different for the different markets. If the market is more mature, the millennial customers become less loyal (Deloiite, 2017). Majority of the millennial prefer apps or particular brands websites which are engaged in offering brand loyalty programs through personal contact numbers and email. Also, they prefer brands which reward them with free welcome vouchers or other relevant promotional offers. In comparison to the male respondents, females are more engaged in shopping online in order to get some access to these kinds of codes or various offers on different apps, to give them a better experience (PWC, Total Retail 2015: Retailers and the age of disruption, 2015). The apparel companies are engaged in providing tailored collections, various discounts and offers. Innovations in the clothing segment such as introducing the plus size clothing for the obese people is also expected to affect the apparel market demand. Also, the rising trend for the athletic and sportswear clothing on account of growing awareness for fitness among the consumers also favorably impacts the apparel sale.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

In addition to the aforementioned point, easy and varied brand availability at a discounted price is also a vital factor propelling the online sale.

However, there are certain factors which are expected to inhibit the online shopping trends. These might include the lack of touch and feel of the quality of apparel. Proper fitting might also pose barriers, however, there are brands which have very easy return and refund policies for their customers.

The retailers have to emphasize on the mood as well as mindset of their potential consumers when they shop online. Online reviews are the most influential factors responsible to favorably impact the purchase decision of the millennial. In today's scenario, the customers demand for much greater experiences from the retailers, with the ease of getting the product delivered at their desired location, and time. But at the same time, what strategies will the retailers make to retain their customers even with their changing preferences and behavioral patterns is a question. Also, how can the retailers get clarity on the mindset of the consumers?

In India, the millennial account for nearly 28% of the population, wherein they are expected to drive the online transaction usage over the forecast period. As per the statistics, online shopping among the consumers in India is expected to increase to nearly 320 Million people in 2020, as compared to over 50 Million in today's scenario (ETRetail.com, 2016). The Indian apparel industry is one of the largest contributors to the country's economy. Changing lifestyle and preferences of the young millennial consumers coupled with the entry of several global brands on a single online platform, is expected to boost the online shopping trend among the consumers. The Indian customers emphasize more towards higher degree of value orientation. They focus towards the quality of the products that they purchase (Trends of 2016: Millennial rush, 2015).

Shopping for apparels is often subjected to the emotions and sentiments of the consumers (Gopaldas A., 2014). If the consumers are uncertain about the clothing quality or authenticity, they are likely not to buy that particular product. But, at the same time, how does their mood affect their decision making process while shopping online is still a question. For instance, if a customer is in a good mood, he/she is likely to change his/her decision instantly after going through the positive feedback and purchase the apparel. However, in spite of negative feedback also, the customer might rethink over other reviews and take the decision. Furthermore, if the consumer is in a low mood, then it becomes difficult for them to make a decision even if the product review is good. The shopping trends of the millennial are very much dependent on their mood along with their mind. They have a tendency to make decisions on the basis of how they feel, and what are their preferences. Mood, cognitive functioning or time is some of the internal influences which affect the buying power of the consumers. If the millennial are in a good mood, they tend to shop a lot. Sometimes they even shop for things which are not required due to the spur of time. If the millennial are in a bad mood and mind set, it clearly affects their purchase decision. This can be further illustrated as; if the consumers are in an angry or sad or low mood, they prefer not to shop, in order to avoid taking haste decisions. However, many customers do consider shopping, as a stress buster for themselves, particularly in case of women. As per our study, there are millennial women, who shop online even in a bad mood, to elevate their mood. However, if in a good mood, the women customers might also buy some extra apparel, even if not required. Also, there a few customers for whom a specific brand can elevate their mood and make them happy. Henceforth, shopping particularly for apparels and specifically for females is expected to act as a mood buster. So, mood as well as mindset of the consumers plays a pivotal role in purchasing the product.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Knowledge Gap

There have been a lot of studies conducted on the mindset analysis of the consumers when they shop online (Lysonski S. &., 2013). However, it is very essential for the retailers to also know, how mood does impact the purchase decisions of the consumers. This would help in designing their strategies accordingly in an efficient manner and attract customers and further gain profits. There have been very few instances, wherein, the impacts of mood on the shopping trends of the customers have been discussed. And, this leads to a gap in the designing of strategies by the retailers because they are not able to understand the needs and wants of the millennial. They are not able to perceive their behavior towards various factors such as offers, discounts, reviews and other features that their websites offer. As a result, they are unable to attract them and make them loyal towards their brand.

RESEARCH QUESTIONS

1. What are specific mood of the millennial customers when they shop online for apparels?
2. What kind of strategies will help the retailers to overcome the gaps in their executions to gain benefits?

Research Design

- **Qualitative Research:** The qualitative research technique helps to understand the detailed description which is available through the various data collection approach. Conducting intensive in-depth interviews with nearly 21 millennial respondents, helped in exploring their perceptions and ideas regarding shopping online for apparels. Additionally, the process also helped in gaining information on an individual's behavioral pattern and thoughts regarding shopping.

Research Objectives

In the proposed study, target is to find the impact of mood on the customers while purchasing the apparels online. Further, the key objectives include:

- What are the main factors responsible for the changing preferences of the millennial to shop online?
- How does mood and mind of the millennial affect their purchase decisions?
- How do review, recommendations and feedback affect the shopping trends and decisions of the millennial consumers?

Target Group

- **Age Group:** 16 years to 34 years

The study focuses on gathering information from the millennial customers, specifically in the metro cities of Delhi, Bangalore, Kolkata and Pune, wherein the number of fashion conscious millennial cus-

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

tomers residing at such cities is relatively more in comparison to the other cities. Additionally, a few random in-depth interviews were also conducted across different areas of Rajasthan, specifically, in Jaipur.

METHODOLOGY

Secondary data is gathered from the different research publications and journals published till date.

Additionally, the study will also involve in-depth interviews of 21 customers of different regions and age-groups. The tool for qualitative research is discussion guide which has been attached in the annexure. Every in-depth interview is then converted into the transcript form.

The analysis of the gathered/collected data through the interview will be done through the *Leximancer tool*. *Leximancer* is a software tool for the analysts and researchers for exploring the larger text-based data, wherein coding or manual analysis might be time consuming. This includes lengthy reports, focus group transcripts/multiple interviews, and qualitative survey data. This software employs a process referred to the unsupervised semantic mapping of the qualitative data set. After the analysis, the data is then presented in a detailed description form with every respective mapping diagram. Further, the relevance percentage of different concepts in the study would also be defined. Additionally, the query results of different specific themes at the time of interviews and their respective transcripts are also described.

The results would be of practical significance to the online portals selling the apparels as it would help them understand the range of mood which the customers display while shopping and accordingly device their online communication strategies

ANALYSIS

The data was collected from 21 respondents through the in-depth interviews. Further, analysis was done through Leximancer tool. This research can help the retailers get an idea about the mindset of the millennial and design their strategies accordingly.

Objective of This Research Includes

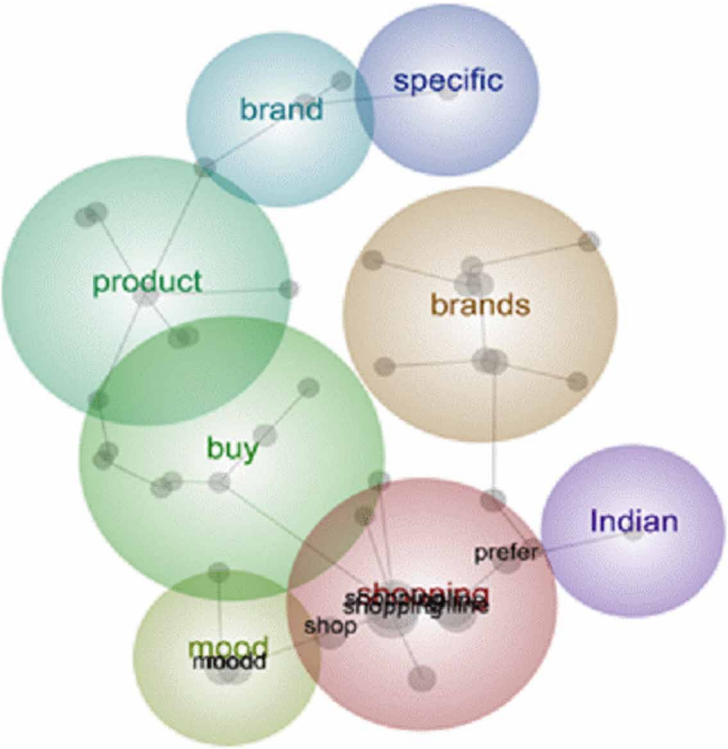
- To identify the key preferences of customers while shopping online. In today's scenario, the customers are expected to shift their preferences towards online shopping rather than visiting the physical stores. This study helps in identifying the factors which are responsible for the change in customer preferences. Additionally, it also focuses on the various factors which impact the millennial customer decision making processes such as specific brands, discounts, offers, and promotional codes.
- Understand how much is mood responsible for the customers when they shop online specifically for apparels. There are various factors which affect the purchase decision of the customers. There are a few consumers who only prefer some specific brands or there are a few customers who have a mindset of opting for the apparels which only offers discounts, thereby prioritizing discounts over brands. Further, mood also plays an important role while purchasing apparels. Many customers prefer shopping when in good mood, while a few do not prefer so. At the same time, many cus-

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

tomers do not shop in a sad or tensed mood, but for a few, shopping acts as a mood elevator. This study emphasizes on analyzing the mood and mindset of the customers when they shop online.

The analysis can be explained in Figure 1.

Figure 1. Millennial shopping trends - segments analysis



The above mentioned diagram illustrates about the different aspects in a broader perspective. For instance, what does Indian millennial prefer when they shop? Is it related to mood or is it brand specific? What kind of products do they prefer when they shop? According to our study, most of the millennial prefer shopping and buying the products on the basis of their moods. So, their mood is directly linked to their shopping trends. If they are happy, they will shop a lot. If they are sad, still they will shop. In such cases, shopping acts as a mood or stress busters. Also, there were some customers who were very specific for the apparel brands which they purchased.

Figure 2, illustrates the reasons why people prefer to shop online? How much do discounts and offers affect the shopping trends of the millennial? Is time a major constraint for today's generation? According to the information collected through the in-depth interviews, time acts as a major constraint while shopping. Nowadays, due to changing lifestyles, the consumers do not have enough time to go and look for varieties at in-store outlets. Moreover, in big cities, like Pune, or Bangalore or New Delhi, on account of traffic problems, people avoid going for offline shopping. Majority of the people prefer online shopping. This can be attributed to the factors such as availability of large number of brands on a

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

single platform. This gives the customers the ease of shopping and also, saves time. Further, in today's scenario, there are many discounts and promotional offers being offered by the different websites, which is further expected to boost the demand for shopping online among the customers. However, in some cases, in spite of discounts and offers, if he/she is in a low mood, they will not prefer to shop. And rather shop only, if they are in a happy mood.

Figure 2. Millennial shopping trend – sub-segments analysis

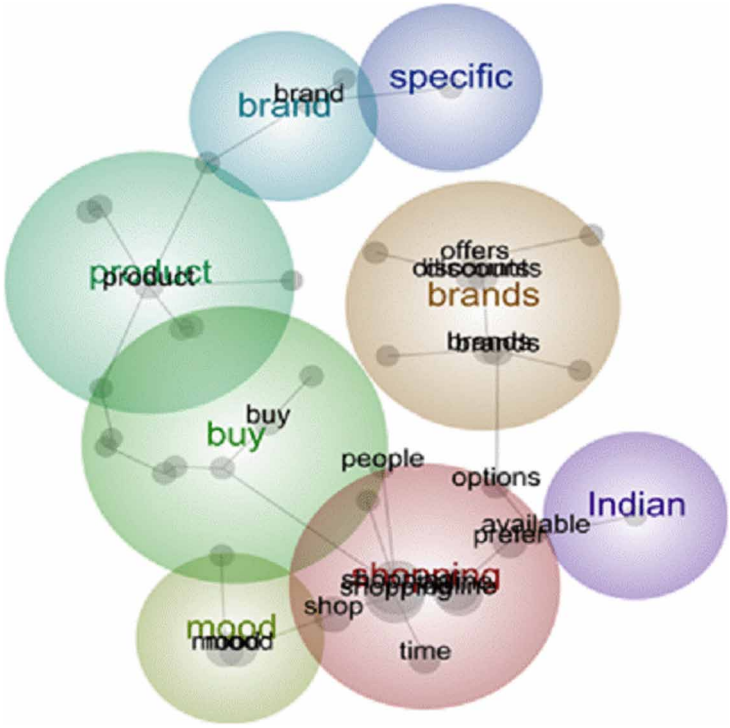


Figure 3 illustrates the further segmentation and analysis of factors such as mood, brands, product and shopping. In India, the millennial are shifting their preferences from in-store shopping to online shopping, owing to the availability of varied number of brands. In today's scenario, millennial prefer going through the reviews and feedback before making their purchase decisions. Feedbacks and reviews from one customer help the other customer to make their purchase decisions. For instance, apps such as Myntra have launched their own brands such as Dress berry and Roadster, which do not have retail outlets and are only available online. So, in such cases the consumers do go through the reviews of these brands, to get a knowhow about its product quality and its brand image. But, in case of well established brands, the people do not prefer going through the reviews. They directly purchase the products.

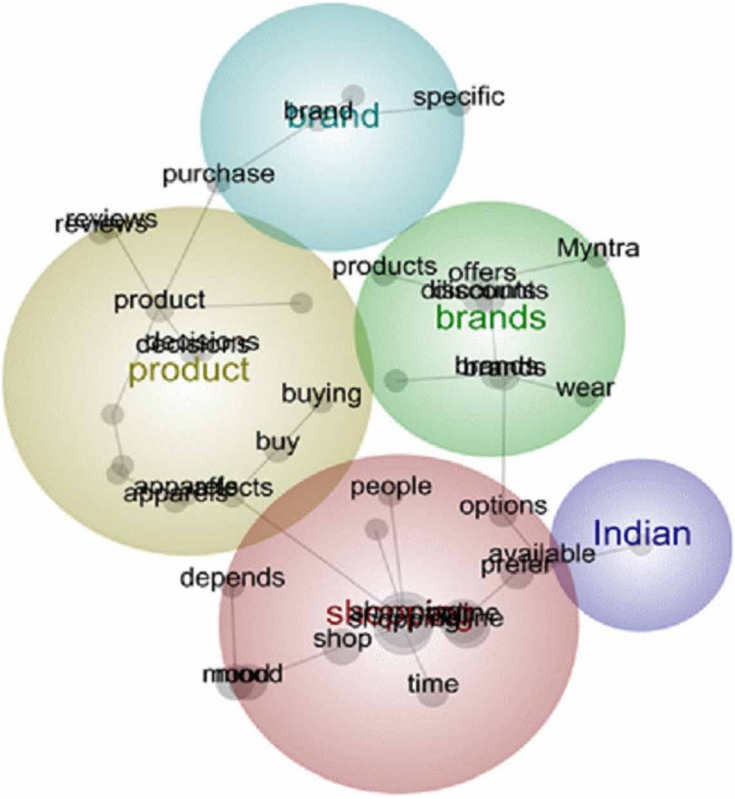
Also, mood plays a vital role in making the purchase decisions, especially in case of females, and apparels. In several instances, the females do shop online for different attires to elevate their mood. If they are in a happy mood, they tend to shop and look for more apparel products.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Millennial shopping trend analysis – detailed sub-segment analysis



In Figure 4, product and shopping are explained in a broader perspective. The shopping pattern of the millennial as compared to the previous generations has changed a lot. Firstly, this generation is a tech savvy generation, who suffice most of their shopping needs through the mobile and internet. Secondly, factors such as ease of shopping, time-constraint, and availability of more brands affect the shopping decisions of the millennial. In today's scenario, shopping online is quite easy and convenient and for professional people it is the best. Majority of the professionals prefer shopping online because it saves a lot of time. Also, shopping online is pocket friendly for the millennial customers.

Purchase of any product depends upon several factors such as reviews. Also, for apparels if some new brands are launched, then reviews help and matter a lot while purchasing the attires.

One very important thing while purchasing the clothes is quality. Quality can be checked when bought at in-stores, but it cannot be checked online. So, reviews form an important part particularly for online shopping. Furthermore, the online retailers emphasize more on designing and implementation of the exchange policies. These policies include an exchange or return period of any product, for around thirty days, wherein, the customers are given an option to exchange or return the products if they are not as per their needs.

As per our study, there are many people who are not that brand specific and prefer for those brands which offer good discounts and features. In fact, most of the people who shop online opt for options with more discounts and attractive offers for festive seasons, weekend sale or end of season sale.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Millennial shopping trend analysis on a broader perspective

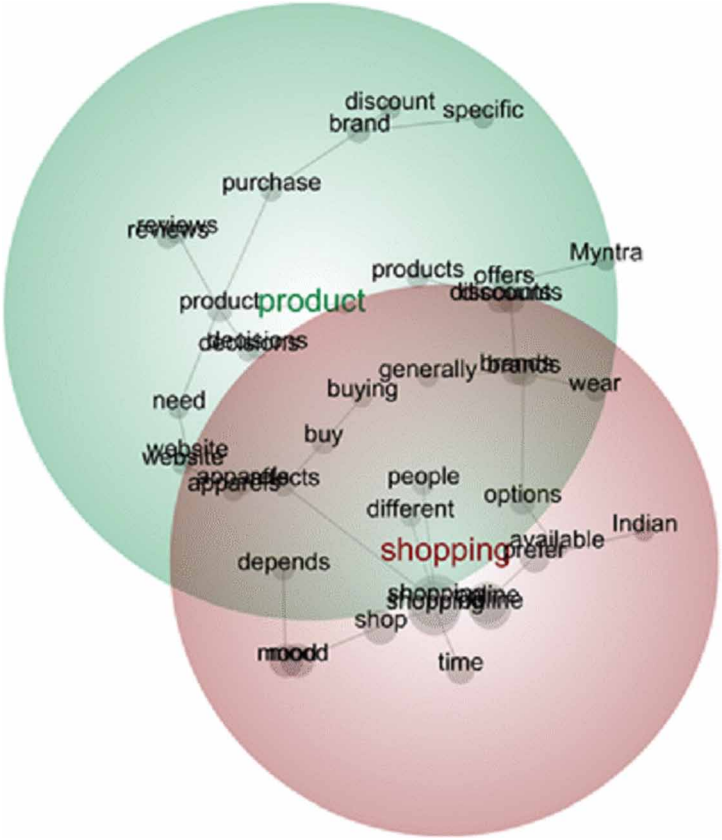


Figure 5 illustrates the linkage between shopping, products, brands and options available. Shopping depends upon the mood of the consumers and availability of time. As per the in-depth interviews conducted, millennial go for online shopping from Myntra due to the factors such as:

- Availability of varied options on one global platform
- Today's generation is tech savvy and always engages in doing comparative analysis for their shopping, which gives them valued shopping experience. What matters to them is how conveniently they get their products delivered at their door step, without any hassles of going out and looking for apparels. Myntra, is thereby one of the best options for the millennial customers.
- Return and exchange policies of Myntra also play an important factor in favorably impacting the customer choices and preferences. The company offers a window period wherein they give their customers a window period to exchange or return their products in case if the product delivered is not appropriate to their choice or is not of the relevant size.

Also, Myntra offers a lot of heavy discounts and offers on the branded as well as lesser known brands during the festive season, weekend sale, or end of season sale. This acts as a motivational factor for the customers to shop online. However, there are a few customers who are brand specific and for whom discounts do not matter much. So, in such cases, the customers prefer their choices over discounts and

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

offers. Also, few customers make their purchase decisions on reviews and recommendations of the products if they are lesser known in case of apparels. This can be attributed to the touch and feel factor, wherein, these customers cannot feel the quality of the apparels online unlike in-store outlets. So, reviews and feedbacks work the best for such kind of situations. Hence, from the aforementioned factors, it is very evident that the purchase decisions of the millennial customers depend solely on their mindset, mood, brands, discounts, reviews, and recommendations. All the factors are inter-related to each other.

Figure 5. Link between the different factors

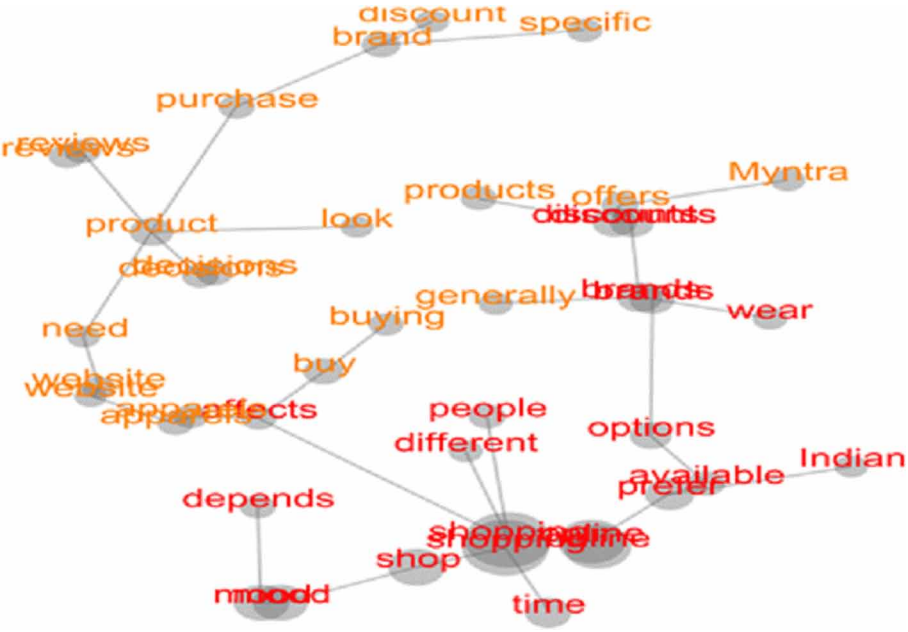

Figure 6 gives an in-depth analysis of the various attributes which affects shopping. In India, the millennial are shifting more towards shopping online and most of their preferences include shopping from the Myntra app. As discussed, shopping for apparels online majorly depends on the time constraints and mood of the customers. If the customers are in a good mood, they shop a lot. However, if the consumers are in a bad mood, a few still do shop, and a few prefer not to shop. Similarly, if time acts as a major constraint, then consumers opt for shopping online, wherein they get more options on one single platform at the same time, rather than going for shopping in-stores for different brands at different timings and different places.

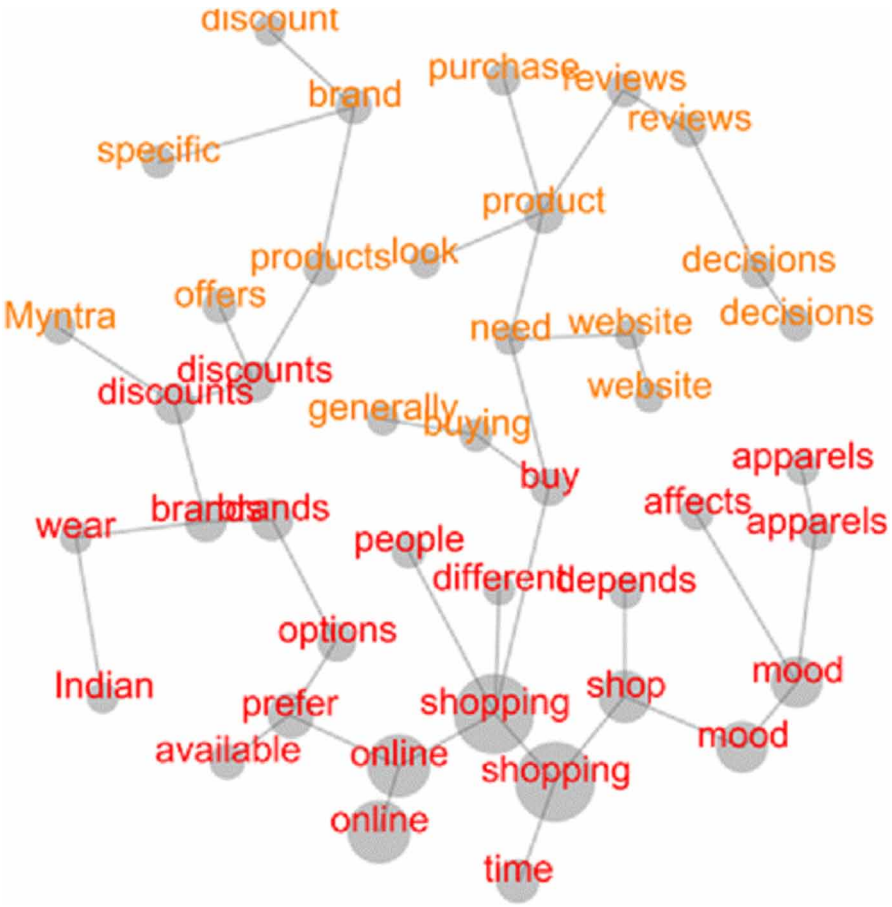
Most of the customers prefer shopping for specific brands. This can be attributed to the brand loyalty, quality, and brand image for that apparel. Also, according to our study, few of the customers prefer quality over discounts unlike others who prefer discounts whatever be the brand. The purchase decisions of the customers depend upon the needs and requirements of the customers. Additionally, the shopping trends also depend upon the various websites image, brand image, reviews, and recommendations from the present millennial who have already purchased that product.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 6. Link between the different factors – In-depth analysis



Observations

1. In today's scenario, consumers prefer shopping online owing to the factors such as availability of large number of brands and varieties on one global platform. Also, due to changing lifestyles majority of the consumers have a very hectic and busy schedule. All they want is hassle free and value for money shopping experience. However, if the consumers have enough time or need anything on urgent basis, they prefer for shopping from in-stores. So, at times, shopping depends and varies as per the needs and requirements of the consumers. Another vital factor which motivates the millennial to shop online includes the various discounts, promotional codes, offers, and deals that the websites offer to them. For a few customers, if the brands offer discounts it becomes an added advantage to shop, because at times, they don't feel the prices worth the brand. Also, a few customers prefer choosing Myntra as their preferred online shopping destination on account of the presence of features such as filters, which is thereby expected to give more options to the customers. Furthermore, online shopping apps provide the customers door to door delivery of the products, hence, saving the transportation costs and time from going for in-store shopping outlets. Online shopping can be done any time, and from anywhere. Further, factors such as easy exchange

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

and return policies are also expected to favorably impact the shopping trends of the customers. Gradually, in the last few years probability has certainly increased to get the exact product what we have ordered for. This wasn't the case a few years back because the concept was new and people were also hesitant to check whether it was correct or not. Hence, the concept of shopping online has significantly increased.

2. If the consumers are in a good mood, then they shop more. Instead of buying one product, they buy several products even if that is not required. Also, reviews and recommendations seem very positive at that time. If the consumers are in a low mood, even discounts don't matter, they tend not to shop because they think they might take decisions in haste and regret later. However, there are a few customers, for whom shopping acts as a mood buster and elevates their mood. In such situations, shopping acts as a stress buster for them and they shop a lot. During the research study, there were a few customers who change their color preferences according to their mood. For instance, if they are in happy mood, they would prefer bright colors. However, when in bad mood, they prefer dull colors.
3. Product reviews are definitely expected to affect the customer shopping trends because in case of online shopping we cannot touch and feel the quality of the apparels. Also, while purchasing for apparels online, we don't have the option to verify the product. So, in such cases, reviews and recommendations of the products play a vital role. If the reviews are not positive, the customers would not prefer buying that product.

This includes the relevancy percentage of any particular term which has been used during the interview. For instance, Myntra has the relevancy percentage of 19% to our topic. Similarly, Indian has the relevancy percentage of 14% to our topic. Shopping and apparels have 100% and 14% relevancy percentage respectively to our topic. This implies that the people in various cities of India prefer Myntra as their online shopping destination for apparels. This can be due to the factors such as the services and features that Myntra provides to its customers. Also, in India, the percentage of the consumers going for shopping has 100% relevancy percentage. Online shopping has the relevancy percentage as 60% to the topic. Several consumers are shifting their preferences from offline to online shopping with the changing time and their lifestyles coupled with ease that online shopping provides. According to our study, time plays an important role in making the purchase decisions. In today's generation, the consumers do not have time to go out and look for shopping in-stores or malls. They avoid hassle free shopping. Additionally, brands account for relevancy percentage of 29% to the topic and discounts hold relevancy percentage of 27% to the topic. Discounts are one of the important factors which boost the shopping decisions of the millennial consumer. In today's scenario, the consumers prefer discounts and offers (offers hold 16% of the relevancy percentage to our topic) for every product they purchase. This is because at times, they do not feel the worth for those brands as per their pricing. And, further, their shopping trends depend on the need and requirements of the consumer as well. Need accounts for relevancy percentage of 11%.

CONCLUSION

According to the in-depth interviews and analysis, mood along with the mindset of the consumers play a very vital role while shopping online. In today's generation millennial are shifting their preferences from offline to online shopping. This can be attributed to the ease of shopping and availability of different

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

brands with varied options in colors and sizes. Also, online shopping saves a lot of time and prevents the customers from undergoing various hassles. In India, the consumers shop for apparels from online sites depending on the range of services they offer such as door to door delivery option, payment options, ease of selecting the apparels by using various filters, availability of varied kinds of brands and options of apparels, along with the flexible rules and policies of the company.

If the customers have certain preferences for any brand, then they purchase from that particular brand. However, if they are flexible with the brands or prefer discounts over brands then they might change their decisions. Hence, mindset impacts the purchase decisions of the customers to a huge extent. Additionally, mood also plays an important factor while shopping online. It was observed that when the consumers

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

are in good mood, they shop a lot. They might even shop for double the things that they actually wanted to buy. However, if the consumers are in a bad mood, then they might not at all go for shopping. In the same case, few customers prefer to go for shopping when in angry or low or sad mood to elevate their mood and bring a smile on their faces. Additionally, the emotions and feelings also affect the shopping trends. For instance, during the festive season, consumers shop for a lot of apparels for themselves as well their family members. This is because of the festive mood and also moreover, various shopping websites offers huge discounts during the festivals to attract consumers.

SUGGESTIONS

In today's scenario, online shopping pattern has really gained importance and impacted the Indian society. The millennial from the age group of 16 years to 34 years are mainly opting for online shopping, particularly for apparels, because of the convenience, flexibility, ease, pricing and authenticity that these platforms offer. For keeping pace with today's generation customers, it is very essential for the retailers to focus on the changing needs and preferences of these millennial. The below mentioned aspects can add value to the effectiveness of the chapter. Additionally, these can also help the retailers focus on understanding their customers, thereby formulating their marketing strategies accordingly.

- Key product types or benefits which attract the customers, should be the focus strategy of the retailers. The retailers should emphasize more on the mindset of the consumers, as to what kind of products they are actually looking for?
- How far is discount or offer affecting them?
- And what more features they can add to their websites or apps to attract more millennial customers?
- What best innovations the retailers can introduce, to make their shopping experience work with their mood and make them happy.
- How to create that brick and mortar feel for the customers, when they shop online for apparels

The aforementioned factors help the online retailers to understand the mindset and mood of young millennial customers, while making their purchase decisions, in order to attract and retain them. Hence, the retailers should accordingly change their strategies and implement them to increase their profit and success rate in the market.

LIMITATIONS

Time constraint was a major factor. This interview was taken from the working millennial customers. So, for them to take out time from their busy schedule for the interview was a bit difficult.

FUTURE SCOPE OF RESEARCH

In this study, the millennial customers of only a few regions were targeted. However, the rest of the regions in India size can also be considered which would thereby help in gathering and analyzing the

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

information on a larger front. This would help to analyze the purchase decisions of the customers on a holistic front in India.

Additionally, analysis can also be done by segregating the male and female millennial consumers shopping trends, while purchasing the apparels online.

Key takeaways from the chapter include

- With the advent in technology and ease of shopping, the consumers are shifting their preferences towards online shopping.
- Along with the mindset, even mood impacts the shopping decisions of the customers across different regions.
- Reviews and feedbacks play a major role in customer shopping decisions.

APPENDIX

Discussion Guide

I am conducting an in-depth interview for the mind and mood analysis of the young millennial consumers while shopping for apparels online. First of all, I would like to thank you for giving your valuable time and views for our topic.

- May I know your name and age?
- Can you say a few lines about yourself?
- What is your profession of work?

1. In today's scenario, consumers are changing their preferences from in-store to online shopping, for example, millennial who are probably more into shopping online. What is your opinion about this? Also, what would be your preference as a millennial?
2. Which one would you prefer and why?
    a. Shopping online or
    b. Offline

Please give your views.

3. Which is the most common website from which you shop for apparels?
   Specific reasons, if any.
4. What do you usually shop for online?
    a. Indian attire
    b. Western wear
    c. Sports wear
5. Are you brand specific for clothing or your choice varies as per the pricing or discount offered by the different apparel brands or apps?
6. How any product review or feedback does affects your shopping trends?
7. How much do you think is mood responsible while we shop?
8. How your emotions and feelings are related to the purchase decisions which you make.
9. Is mood product or brand specific? I mean is there any specific brand which elevates your mood?
10. How do discounts, special offers or promotional codes affect your mood?
11. How much do you think shopping can be affected, when in angry or sad mood in comparison to when in a happy mood?

Is there anything more which you would like to add?

I'll be gathering and analyzing the information from you as well as from other respondents and further submitting it for publication.

Thank you for your valuable time and views.

Chapter 78
Components of Consumer Factor and Its Influence on Attitude of the Student Online Shopping Community:
Consumer Factor and Its Influence on Attitude

R.Rajendra Kumar
Research Scholar, Anna University, Chennai, India

ABSTRACT

This research article analyzed the impact of Consumer factors like privacy, security, time saving and convenience and its impact on the attitude of consumers of online shopping. Further, the difference between the variables such as frequency of online shopping, time spent for shopping online, products often purchased during online shopping, value of money spent during shopping, mode of payment preferred and the consumer factors were also identified to ascertain the actual relationship. The research has focused on the student's community as the data set and their views on online shopping were collected through Questionnaire.

1. INTRODUCTION

Consumer behaviour is a branch of management which gives an idea about how an individual and groups of consumers are involved in the purchasing decisions of goods or services. According to Engel et al. (1995), it is a process that include actions and decision processes executed at the time of buying goods and services for personal consumption. According to Lauden et al. (2009), it is a process in which an individual is engaging in various activities which leads to decision making related to purchasing of goods and services.

The study of behavioural aspects of consumers is centered on the process which the consumers adopt in the aspects of components of consumer factor when they make purchases. The consumers plays many roles while involving in the purchase process thus making the prediction of behavioural aspects of consumers' as difficult one. The consumer factors such as Privacy, Security, Time Saving and Convenience can be studied through consumer needs, ways to satisfy their needs, the decision related to repeated buying, information analysis, understanding of information, and formulation of plans and implementation of these plans.

The successful entry into market is based on analysis of behavioural aspects of consumer evolution and framing the marketing strategies according to it. Indian consumers are more complex than their counterparts in the other parts of world. They offer so much of hope and generates so much deception. The complication involved in the analysis of behavioural aspects of Indian consumers lies firstly in their nature which is different from the consumers of other countries. The consumers of different countries have unique characteristics in terms of history, manners, customs, culture, and mentality of its consumers.

The market codes have transformed, especially among the youth, the traditional values such as simplicity and temperance have been changed into the habit of winning, glory and heroism. These habits, which have entered the Indian way of life, shape their way of thinking, behaving and define the new criteria of the market. The understanding of behaviour of consumers in this market is very essential for the online shopping companies

2. OBJECTIVES

- To study the impact of Consumer factors on the Attitude of online shopping consumers (Table 1).
- To examine the variance between the consumer factors and various dependent variables related to online shopping.

Table 1. Factors of consumer behavior

FACTORS	VARIABLES
Consumer Factors	Privacy, Security, Time Saving and Convenience.

3. LITERATURE REVIEW

3.1. Consumer Factor

The consumer factor was suggested as important to online shopping and factors included were privacy, security, time saving, ease of use, convenience, enjoyment, previous experience, company reputation and tactility (Godwin et al., 2001). Becker (1965) indicated that the right and efficient utilization of time is an important factor for the young consumers for they do not wish to spend more time on purchasing. Further, (Alreck et al., 2002; Bellman et al., 1999; Then et al., 1999) have found from their survey, that modern day consumers consider time as a crucial factor. Apart from that, modern day consumer does not like to spend more time in brick and mortar stores (Bhatnagar et al., 2000; Alreck et al., 2002). The

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

attitude of time consciousness prevailed among modern and young consumers motivate them to use non-traditional method of buying products (Stell et al., 1999).

Kunz (1997) and Taylor et al. (1999) found in their analysis, ease of using means experiencing a positive impact of online shopping. The online shopping companies provide a technological platform for consumers to have close interaction with their product and services (Kim 2006). The product visualization technology is predominantly used to provide better shopping experience among consumers as it enables consumers to have seamless interaction with the website (Kim et al., 2004).

The convenience is the important factor that effectively determine attitude of consumer (Berkowitz et al., 1979; Shim et al., 2001). The non-traditional consumers always prefer the factor of convenience (Bellman L& Johnson, 1999). The website of online shopping companies provides more information about the product, comparative price of various products and its convenience (Butler & Peppard, 1998). The speed of the website and convenience experienced by the customer provide more satisfaction to younger consumers (Yoo et al., 2007). The excellent structure of the website and design are the important factors considered by the consumers at the time of buying the products through online shopping (Yi et al., 2003).

The online shopping companies should design the website as secured and attractive one. Also, the website should contain comprehensive details about the product, price and other related information required by the consumer (Woodside et al., 1975). Apart from that the consumers can compare different products and its prices by a simple click thus helping them not only to save money and time but also to ensure privacy of their home (Blattberg et al., 1989). The virtual marketing environment with the support from internet technology provides paperless operation for 24x7 that enables the consumers to have access with the products and services available at the technological platform (Haque et al., 2011). Easy to navigate and visual appealing are two predominant factors which are considered by shoppers when they want to involve in online shopping. Thus, Shoppers' purchasing decision depends upon the website design (Sorce et al., 2005).

The enjoyment of purchase of product through internet and this buying process is considered as the factor of enjoyment. The enjoyment can create both negative and positive impact on shopping attitude among consumers (Kunz 1997; Taylor et al., 1999; Forsythe et al., 2003). The online shopping companies are creating superior designed websites by understanding the attitude and intention of consumers to attract them (Goldsmith et.al. 2000).

The consumers who have more browsing experience adopt technology buying with a lot of ease (Bear et al., 1987; Kay, 1993; Klein, 1998; Balabanis et al., 2001; Salisbury et al., 2001). This indicates the technology adoption among consumers who have more experience on internet. Similarly, O'Keefe et al. (1998) have also stated in their analysis that, consumers who are regularly using internet have technical capability with excellent technical skills.

Srinivasan et al. (2002) disclosed in their study that, the company reputation avoids the consumer to opt for different channel buying product. In order to maintain company reputation, the company has to maintain long term relationship with consumers. Further, it stated that the company reputation can be enhanced by motivating consumers to have face to face communication with the management (Stephen et al., 1996; Schiffman et al., 2003). For the consumers who have no experience with online shopping, the reputation can be imbibed through the word of mouth thus leading to positive experience towards the company that would reduce the risk and uncertainty towards shopping online. The veracity and reliability demand in the part of consumers becomes less significant, if the online shopping companies have excellent brand awareness and good reputation (Constantinides et al., 2004). The base of reputation

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

falls on trust worthiness; it depends on how the company ensures the long-term relationship with the consumers by providing excellent technological platform for them.

The reputation can be measured through online feedback system. The feedback system of technological platform like internet is widely used by the online shopping companies to collect the views and responses from the consumers, thus leading to measure the level of reputation of companies (Marios et.al. 2004). Companies can seamlessly perform all kind of activities like collecting feedback about products, brand enhancement exercises, loyalty programme, promotion measures and after sales activities through an effectively designed in formation communication system (Emerick et al., 1996; Palmer et al., 1998; Palumbo et al., 1998).

3.2. Privacy

The privacy factor is difficult to comprehend; however, it can be defined with four components namely collection of personal information, misuse of the collected information, errors and mistakes in the information collected, wrong online transaction etc. (Segars et al., 2002). In the early stage of online shopping, the consumers are more concerned about the privacy issues. Once they gain experience, the intensity of factor of privacy is minimized to the significant level.

Further, the experience and frequent use of website are the important factors that reduce the privacy issues (Udo, 2001). Further, researchers also identified that consumers may get worried about their personal information that is being used by unauthorized person, thus creating the embracing situation for both the shopping companies and the consumers at large. Similarly, the unauthorized secondary usage of information may lead to loss of trust among consumers (Brown et al., 1996).

The consumers of online shopping companies expect the excellent social contact mechanisms thus increasing the confidence level among them. If the confidence is breached, the trust level may come down in a significant way (Teo et al., 2007) also they found that because of security issues, consumers always desired to pay through Cash on Delivery.

3.3. Security

E-Commerce provides superior opportunities to the online shopping companies. But the level of success of these companies depends upon the security mechanisms being adapted in its websites. This mechanism also ensures the flawless payment transaction through different sources (Saeed et al., 2003). Security seems to be a big concern that prevents customers from shopping online (Laudon & Traver, 2009). This is witnessed because of the involvement of the third-party services that increase the security issues thus making an entire website a complex and difficult one to operate.

The challenges towards the integration of third party with the website should be mitigated by taking effective controlling mechanisms (Premkumara et al., 2008). The online shopping companies, also take various measures to enhance the satisfaction level among the customers by reducing the security related issues. In order to provide comfort to the consumers, the online shopping companies design the well-equipped and protected websites. Furthermore, these websites have been designed with the security protocol that helps to prevent the misuse of consumer information.

The affection and loyalty towards the online shopping companies are affected by lack of trust in the consumers mind on providing their personal data and using their credit card (Whysall, 2000). Also, the consumers are worried that the online shopping companies will cheat them or misuse their credit card

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

details (Comegys et al., 2009). Consumers are always concerned about the security and safety of data when they transact online (Constantinides, 2004). The nature of trust and its implications in online shopping are not only widely recognized by the stakeholders and researchers, but are also providing extensive knowledge about its trust and its characteristics. The trust deficit to the particular online shopping website will deter consumers while making purchase decision through online shopping (Chen, 2007). The problems associated with online payment process reduce the willingness of paying money through it (Broekhuizen et al., 2009).

The payment processing system should have effective protection system which results in the prevention of misuse of credit card and other customer related information. The e- Trust certificate obtained from the authorities is a vital tool that enhances the satisfaction among the consumers (Korgaonkar et al., 1997). By obtaining this certificate, the companies can provide a safe and secured environment for the consumers.

4. RESEARCH METHODOLOGY

As per the information obtained from the Websites of Bharatiyar and Anna University, it is found that the approximately 13,500 students are undergoing their Post Graduate Programme in Arts, Science and Engineering colleges situated in and around Coimbatore. Among the entire population 7182 students are selected through the purposive sampling method. The purposive sampling method was adopted to select the students who are doing online shopping at least two times in a month.

Simple random sampling is the basic sampling technique where a sample is selected for study from a population. Each individual is chosen entirely by chance and each member of the population has an equal chance of being included in the sample. From the selected samples of 7182 students, 10.47% of the students are selected through Simple Random Sampling.

4.1. Direct-Data Survey

The behavioral aspects of online shopping consumers constitute the basic data for the study. The primary as well as the secondary data is used at large in order to derive at an accurate result (Saunders et al., 2012). The major source of the data used to carry out the analysis is primary data. In order to fulfill the objectives set out, field survey method was employed to collect the primary data from 752 selected respondents through the structured questionnaire. The Post Graduate students from different colleges in Coimbatore who shopped online at least twice in a month are taken for the study. The questionnaire is personally administered and the survey was conducted during the period 2014-2015.

The Secondary Data was collected from various indexed articles as it provides more validity to the data. (Saunders et al.2012). Databases of Sage, Emerald, Springer and Journals related to this area of research and Google scholar were accessed not only to gather comprehensive idea but also to use it as secondary data for this study.

The articles related to attitude were taken into consideration in order to collect data for the review of literature. The forgathered literature was used to formulate the appropriate questionnaire to test the relationship between the chosen factors taken for the study.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

4.2. Structure of the Questionnaire

The collection of required data was carried with the use of questionnaire. The questionnaire consists of three parts namely Demographic Data & Socio Economic data, Internet Usage & Shopping Experience, and Psychological Factor such as attitude. The third part of this research consists of questions to measure all variables selected for this research.

The research was carried out in Coimbatore city due to its nature of industrialization and use of internet for shopping and all the questions were tested through pilot study.

4.3. Instrument Validity

Before examining the hypotheses it is essential to examine the validity of the questionnaire that was used for measuring the selected factors. Validity is the degree in which variables measure accurately what they are supposed to measure (Hair et al., 2010) and consists of content validity, construct validity. The purpose of the instrument content validity is to eliminate or to correct those questions that have not accomplished their research goal (Bock & Kim., 2002). Although, the content validity is confirmed from a previous study (Lian et.al., 2002), before the beginning of the present research a discussion with stake holders of online shopping and a pilot test was made to avoid any miscomprehensions. Construct validity was accomplished by using exploratory factor analysis and reliability analysis based on the Cronbach Alpha.

4.4. Result of Reliability Tests

The result of the reliability test for the consumer factor is found to be 0.862.

5. ANALYSIS AND INTERPRETATION

The shopping behaviour of the respondents are classified based on their frequency of online shopping, time spent for shopping online, products often purchased during online shopping, value of money spent during shopping, mode of payment preferred when shopping online. These are compared with the dimensions of Consumer factors such as Privacy, Security, Time Saving and Convenience to find out the shopping attitude of the PG students. Further their shopping behaviour are analyzed through Analysis Of Variance (ANOVA).

5.1. Frequency and Attitude towards Shopping Online

H_{01}: There is no significant difference in the frequency of online shopping between the respondents based on the factors influencing the attitude (Table 2).

H_1: There is a significant difference in the frequency of online shopping between the respondents based on the factors influencing the attitude.

The level of significant difference between the frequency of online shopping and the influence of factors on attitude towards online shopping ie. Consumer Factor F(2,749)=6.708, Sig.0.001, have sig-

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

nificantly varied based on the attitude of online shopping and the shopping behaviour of the PG students, therefore the null hypothesis is rejected (Table 3).

It is inferred that the frequency of shopping online deciding the shopping behaviour of the PG students and their attitude based on the consumer factor was found to be significantly varied and the null hypothesis is rejected.

Further, to understand the most appropriate result based on the specific difference, Tukey's HSD (Honesty Significant Difference) is used to present the difference in the frequency of online shopping between the respondents based on the factors influencing attitude are presented as follows in Table 4:

Table 2. Descriptive of Frequency and Attitude towards shopping online

Factors	Frequency	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean	
						Lower Bound	Upper Bound
Consumer Factor	Very Often	193	80.18	9.497	.684	78.83	81.52
	Mostly	414	78.64	10.184	.501	77.65	79.62
	Rarely	145	76.12	10.589	.879	74.39	77.86
	Total	752	78.55	10.169	.371	77.82	79.27

Table 3. Analysis of difference on Frequency and Attitude towards shopping online

Factors	Groups	Sum of Squares	df	Mean Square	F	Sig.
Consumer Factor	Between Groups	1366.670	2	683.335	6.708	.001
	Within Groups	76299.701	749	101.869		
	Total	77666.371	751			

Table 4. Frequency of shopping and Attitude based on Consumer Factor

Frequency of Online shopping	N	Subset for alpha = .05	
		1	2
Rarely	145	76.12	
Mostly	414		78.64
Very Often	193		80.18
Sig.		1.000	.267

Tukey's post-hoc comparison with respect to frequency of shopping online among PG students in Coimbatore differed significantly across the three categories when compared with the attitude based on consumer factor and the result is significant F(2,749)=6.708, Sig.0.001 at 5% level. Tukey's post hoc compares all the three factors and the result based on the frequency of online shopping was found to be high with respect to respondents shopping very often (M=80.18, 95% CI[78.83, 81.52]) which shows

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

the significant level difference in the frequency of online shopping between the respondents based on the consumer factor influencing the attitude of respondents.

Therefore, it is concluded that the respondents who shop very frequently were found to have higher attitude based on the consumer factor leading to online shopping.

5.2. Time Spent and Attitude towards Shopping Online

H_{02}: There is no significant difference in the time spent for online shopping between the respondents based on the factors influencing the attitude (Table 5).

H_2: There is significant difference in the time spent for online shopping between the respondents based on the factors influencing the attitude.

Table 5. Descriptive of Time spent and Attitude towards shopping online

Factors	Frequency	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean	
						Lower Bound	Upper Bound
Consumer Factor	Less than 2 hours	193	76.96	10.420	.750	75.48	78.44
	2 to 4 hours	280	79.27	9.992	.597	78.10	80.45
	More than 4 hours	279	78.91	10.089	.604	77.72	80.10
	Total	752	78.55	10.169	.371	77.82	79.27

To test the variance with regard to factors influenced the attitude towards online shopping among the PG students and their shopping behaviour based on the time spent for shopping online revealed the level of significant difference between the two categories and the attitude is determined based on the three categories and their level of significance is computed ie. Consumer Factor F(2,749)=3.251, Sig.0.039, has proven to have significant variance (Table 6).

Tukey's post-hoc comparison with respect to time spent for shopping online among PG students in Coimbatore differed significantly across the three categories when compared with the attitude based on consumer factor and the result is significant F(2,749)=3.251, Sig.0.039 at 5% level (Table 7). Tukey's post hoc compares all the three factors and the result based on the time spend for online shopping was found to be high with respect to respondents spending between 2 and 4 hours for shopping (M=79.27, 95% CI[78.10, 80.45]) which shows the significant level of difference in the time spent between the respondents based on the consumer factor influencing the attitude of respondents.

Table 6. Analysis of Variance of Time spent and Attitude towards shopping online

Factors	Criteria	Sum of Squares	df	Mean Square	F	Sig.
Consumer Factor	Between Groups	668.318	2	334.159	3.251	.039
	Within Groups	76998.053	749	102.801		
	Total	77666.371	751			

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 7. Time spent and Attitude based on Consumer Factor

Time spent for shopping online	N	Subset for alpha = .05	
		1	2
Less than 2 hours	193	76.96	
More than 4 hours	279	78.91	78.91
2 to 4 hours	280		79.27
Sig.		.086	.920

Therefore, it is concluded that the respondents who spend between 2 and 4 hours were found to have higher attitude based on the consumer factor leading to online shopping.

5.3. Product often purchased and Attitude towards shopping online

H_{03}: There is no significant difference in the product often purchased during online shopping based on the factors influencing the attitude (Table 8).

H_3: There is significant difference in the product often purchased during online shopping based on the factors influencing the attitude.

Table 8. Descriptive of Product often purchased and Attitude towards shopping online

Factor	Frequency	N	Mean	Std. Deviation	Std. Err	95% Confidence Interval for Mean	
						Lower Bound	Upper Bound
Consumer Factor	Clothing / Accessories / Shoes	330	77.86	10.362	.570	76.74	78.98
	Books / DVD / CD	64	76.02	8.512	1.064	73.89	78.14
	Computer / Electronics / Software	278	78.99	10.405	.624	77.76	80.22
	Kitchen items / Gardening / Hobby items	54	82.85	8.229	1.120	80.61	85.10
	Others	26	79.81	10.068	1.974	75.74	83.87
	Total	752	78.55	10.169	.371	77.82	79.27

To test the variance with regard to factors influenced the attitude towards online shopping among the PG students and their shopping behaviour based on the products often purchased during online shopping revealed the level of significant difference between the two categories and the attitude is determined based on the three categories and their level of significance is computed ie. Consumer Factor F(4,747) = 4.089, Sig.0.003 (Table 9).

Tukey's post-hoc comparison with respect to products often purchased during shopping online among PG students in Coimbatore differed significantly across the three categories when compared with the attitude based on consumer factor (Table 10) and the result is significant F(4,747)=4.089, Sig.0.003, at 5% level. Tukey's post hoc compares all the three factors and the result based on the time spend for

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

online shopping was found to be high with respect to respondents buying Books / DVDs / CDs during shopping (M=82.85, 95% CI[80.61, 85.10]) which shows the significant level of difference in the product often purchased based on the Consumer factor influencing the attitude. Therefore, it is concluded that the respondents buying Books / DVDs / CDs during shopping were found to have higher attitude based on the consumer factor leading to online shopping.

Table 9. Analysis of difference of Product often purchased and Attitude towards shopping online

Factors	Criteria	Sum of Squares	df	Mean Square	F	Sig.

5.4. Money Spent and Attitude towards Shopping Online

H_{04}: There is no significant difference in the money spent during online shopping between the respondents based on the factors influencing the attitude (Table 11).

H_4: There is significant difference in the money spent during online shopping between the respondents based on the factors influencing the attitude.

To test the variance with regard to factors influenced the attitude towards online shopping among the PG students and their shopping behaviour in Coimbatore based on the money spent during online shopping revealed the level of significant difference between the two categories and the attitude is determined based on the three factors and their level of significance is computed viz. Consumer Factor F(2,749)=3.426, Sig.0.033 (Table 12).

Tukey's post-hoc comparison with respect to money spent during shopping online among PG students in Coimbatore differed significantly across the three categories when compared with the attitude based on consumer factor (Table 13). The result is significant F(2,749)=3.426, Sig.0.033, at 5% level. Tukey's post hoc compares all the three factors and the result based on the money spent during online shopping was

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

found to be high with respect to respondents spending more than Rs.1000 during shopping (M=79.80, 95% CI[78.52, 81.08]) which shows the significant level of difference in the money spent between the respondents based on the consumer factor influencing the attitude of respondents .

Table 11. Descriptive of Money Spent and Attitude towards shopping online

Factor	Frequency	N	Mean	Std. Deviation	Std Error	Interval for Mean	
						Lower Bound	Upper Bound
Consumer Factor	Less than Rs.500	402	77.66	10.599	.529	76.62	78.70
	Rs.500 to 1000	134	79.18	9.631	.832	77.53	80.82
	More than Rs.1000	216	79.80	9.542	.649	78.52	81.08
	Total	752	78.55	10.169	.371	77.82	79.27

Table 12. Analysis of Variance between Money Spent and Attitude towards shopping online

Sig.		.130	.537

5.5. Mode of Payment Preferred and Attitude towards Shopping Online

H_{05}: There is no significant variance in the mode of payment preferred during online shopping between the respondents based on the factors influencing the attitude (Table 14).

H_5: There is significant variance in the mode of payment preferred during online shopping between the respondents based on the factors influencing the attitude.

To test the variance with regard to factors influenced the attitude towards online shopping among the PG students and their shopping behaviour based on the mode of payment preferred during online shopping revealed the level of significant difference between the two categories and the attitude is determined

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

based on the three factors and their level of significance is computed i.e. Consumer Factor F(2,749) = 3.231, Sig.0.040, followed by Marketing Factor F(2,749) = 0.364, Sig.0.695 (Table 15).

Tukey's post-hoc comparison with respect to mode of payment preferred during shopping online among PG students in Coimbatore differed significantly across the three categories when compared with the attitude based on consumer factor and the result is significant F(2,749)=3.231, Sig.0.040, at 5% level. Tukey's post hoc compares all the three factors and the result based on the time spend for online shopping was found to be high with respect to respondents preferred Cash on Delivery payment method during online shopping (M=78.99, 95% CI[77.90, 80.07]) which shows the significant level of difference in the mode of payment based on the consumer factor influencing the attitude (Table 16).

Therefore, it is concluded that the respondents preferred Cash on Delivery method of payment during shopping online is found to have higher attitude based on the consumer factor leading to online shopping.

Table 14. Descriptive of mode of payment preferred and Attitude towards shopping online

6. FINDINGS

The frequency of shopping online deciding the shopping behaviour of the PG students and their attitude based on the consumer factor were found to be significantly varied. The respondents who shop very frequently were found to have higher attitude based on the consumer factor leading to online shopping and the respondents who spend between 2 and 4 hours were found to have higher attitude based on the consumer factor leading to online shopping. In addition, with that, the respondents buying books / DVDs / CDs during shopping were found to have higher attitude based on the consumer factor leading to online shopping and the money spent during shopping online deciding the shopping behaviour of the PG students and their attitude based on the consumer factor was found to be significantly varied. Further, the respondents spending more than Rs.1,000 during shopping were found to have higher attitude based on the consumer factor and also the significant level of difference was found between the mode of payment based on the consumer factor influencing the attitude of the online shopping consumer. The Cash on Delivery payments during shopping online were found to have higher attitude based on the consumer factor leading to online shopping. These findings are represented in Table 17.

6.1 Hypothesis Results

Results can be found in Table 17.

Table 17. Consolidated Hypothesis Results

Hypothesis	Content	Results
There is no significant difference in the frequency of online shopping between the respondents based on the consumer factors influencing the attitude	The influence of factors on attitude towards online shopping i.e. Consumer Factor F(2,749) = 6.708, Sig.0.001, have significantly varied based on the attitude of online shopping and the shopping behaviour of the PG students	The null hypothesis is rejected.
There is no significant difference in the time spent for online shopping between the respondents based on the factors influencing the attitude	The time spend for online shopping was found to be high with respect to respondents spending between 2 and 4 hours for shopping (M = 79.27, 95% CI[78.10, 80.45]) which shows the significant level of difference in the time spent between the respondents based on the consumer factor influencing the attitude of respondents	The null hypothesis is rejected
There is no significant difference in the product often purchased during online shopping based on the factors influencing the attitude	on the time spend for online shopping was found to be high with respect to respondents buying Books / DVDs / CDs during shopping (M = 82.85, 95% CI[80.61, 85.10]) which shows the significant level of difference in the product often purchased based on the Consumer factor influencing the attitude than the other two categories.	The null hypothesis is rejected.
There is no significant difference in the money spent during online shopping between the respondents based on the factors influencing the attitude	The result is significant F(2,749)=3.426, Sig.0.033, at5% level. Tukey's post hoc compares all the three factors and the result based on the money spent during online shopping was found to be high with respect to respondents spending more than Rs.1000 during shopping (M = 79.80, 95% CI[78.52, 81.08]) which shows the significant level of difference in the money spent between the respondents based on the consumer factor	The null hypothesis is rejected.
There is no significant variance in the mode of payment preferred during online shopping between the respondents based on the factors influencing the attitude	The result based on the time spend for online shopping was found to be high with respect to respondents preferred Cash on Delivery payment method during online shopping (M = 78.99, 95% CI[77.90,80.07]) which shows the significant level of difference in the mode of payment based on the consumer factor	The null hypothesis is rejected.

7. DISCUSSIONS

In the present study, it is found that there is a significant influence of privacy in the prediction of attitude as consumers always urge to ensure the protection of their data and this result is validated through the research conducted by (Guo Jun & Noor Ismawati Jaafar 2011) in which they firmly concluded that there is a significant relationship between the privacy and attitude of consumers. The current research also found relationship between time spent for online shopping and attitude as it is concluded that the respondents who spend between 2 to 3 hours were found to have higher attitude towards online shopping.

This finding got support from the research conducted by Dillon and Harry (2004) in which they stated that the students who spend more time on shopping have positive attitude towards online shopping. In the aspect of frequency of purchase, it is found in this study that the frequency of shopping influence the attitude of consumers of online shopping as it got validated through the research done by Dillon & Harry (2004).

8. CONCLUSION

The consumer factors such as Privacy, Security, Time Saving and Convenience have significantly influenced the attitude of consumers. The subcomponents of above said factors like the time spent, money spent on purchasing of products and their area of living have significantly contributed on shaping their attitude which prompted that the stake holders of industry should adopt innovative strategies to keep the youngsters in online for the longer period thus enable them to purchase products through online shopping. Further this survey also shows that the respondents living in urban area have more inclination towards online shopping Compared to the respondents of rural area which indicates that the online shopping companies have to concentrate more on urban market to enhance their market share. The overall outcome of this analysis shows a paradigm shift in the behavior of consumers in the aspects of attitude and satisfaction.

Chapter 79
Study of Emotional Factors Influencing Professionals' Adoption to E-Payment in Sri Lanka

ABSTRACT

Electronic payment is widely regarded as a fund transfer between parties electronically for commercial purposes, and it is increasingly being recognized as a key competitive tool in the present situation. While businesses are focusing more on rational factors behind consumer acceptance and adoption of e-payment, academic research is lagging in investigating the emotional factors. This chapter is providing a clear background about how businesses can emotionally influence and motivate consumers to utilize e-payment methods for their day to day transactions. A sample of 460 professionals in Sri Lanka was empirically investigated with the aim of identifying the emotional factors influencing professionals to adopt and use e-payment methods. A structured questionnaire was used to collect data and the exploratory factor analysis identified that the professionals' e-payment adoption was influenced by six different emotional factors. Based on the literature these factors are innovativeness, professional satisfaction, optimism, insecurity, skepticism, and discomfort.

INTRODUCTION

The worldwide proliferation of the Internet has given birth of Electronic payment system which is "the use of credit and debit cards on the Internet or other electronic devices to perform day to day transactions which include paying for goods and services, bill payment and transfer of money at any time of the day", mentioned Gholami et al. (2010) with Andam (2003). Simply Electronic payment systems refer to various innovative applications and approaches, including the use of credit card, debit card, Automated Teller Machine(ATM), Electronic Fund Transfer(EFT), online payment that are used to facilitate the customer's decision to pay for a product or services (Vassilious, 2004).

E-commerce can be simply described as all electronically mediated information exchanges between an organization and its external stakeholders. (Chaffy, 2009) That means e-commerce includes other activities, "such as businesses trading with other businesses and internal processes that companies use to support their buying, selling, hiring, planning, and other activities" (Schneider, 2011; Zwass, 2003). Eastin (2002) in an article entitled "The popularity of e-commerce: analysis of acceptance four e-commerce activities," mention 4 activities reviewed include online sales, online banking, online investing and electronic payment. So e-payment can be identified as a most important sub element of E-commerce.

The growth of information and communication technology (ICT) has revolutionized traditional systems of payment. Individuals can now carry out many kinds of modern methods of payment for goods and services instead of traditional methods of cash and cheques. This phenomenon of cashless payment is known as e-Payment. Electronic payment is a financial exchange that takes place online between buyers and sellers, the content of this exchange is usually some form of digital financial instruments (such as encrypted credit card numbers, electronic checks or digital cash) that is backed by a bank or an intermediary. (Ingenico, 2012) The cashless society has been predicted for decades or else we can denote as barter system and then paper-based payment instruments such as cash and checks continue to remain a dominant form of payment in Sri Lanka. But present, innovations such as e-cash, micro-payments, and smart cards which have introduced potentially powerful new technology in the banking industry have gained significant commercial adoption.

In this study researcher attempts to identify the emotional factors which affect professionals' adoption of electronic payment methods in Sri Lanka, in order to validate and to test the reliability of instruments used, the researcher went through a pilot test by taking a sample of 50 undergraduates. According to the results of the pilot test the researcher was able to identify 7 factors which affect individuals' emotions to adopt e-payment methods. This result may differ from the actual result of the research because of some inherent limitations of a pilot test.

Problem Statement

According to the World Bank report of 2015, in South Asian region only 14% ($0.3 trillion) from total of person to business payments $2.2 trillion has been done electronically. It is the lowest percentage when compared with other regions in the world. The same situation can be seen in Sri Lanka also as a country. But Payment Bulletin report issued by the Central bank of Sri Lanka (2015) emphasizes that there is an increased trend in usage of electronic cards or payment methods. It shows there is a 16.3% of increased percentage change in total financial transactions done through the internet when compared with 2014. Many researchers have provided the factors that influence individuals' adoption to electronic payment methods. Xiao et el (2015) concludes that people are more likely to use cash and less likely to

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

use card when the payment environment is unfamiliar to them and perceived as lack of trustworthiness. Hataisaree (2008) found that cash and cheques remain as popular payment modes because consumers are not convinced of the benefits of using e-payment.

According to Eastin (2002) factors influencing the adoption of e-payment were profit, previous experience, internet use, confidence and perceived convenience. Lee et al., (2003) did research, "the adoption of smart cards in the University of Singapore and Australia" and their acceptance factors based on the model of Rogers, Moore and Ben Basat and Davis, the factors were: compatibility, testability, and perceived usefulness, ease of use, relative advantage, visibility, and visible results. There it has emphasized that consumers believe that relative advantage and compatibility of the technology are two main factors of adoption of e-payment methods. However, none of the researchers have focused on factors affecting individuals' emotions towards the adoption of e-payment methods and Xiao et al., (2015) suggests future studies could further investigate this perspective by testing emotional dimensions that effect to technology readiness, the payment usage pattern/preference in specific contexts.

Positive emotions generated through system design and functionality has been shown to influence the acceptance and use of technology (Karahanna and Agarwal, 2000). As well negative emotions generated through system design adversely influences ease-of-use and thereby intentions to use a system (Davis and Venkatesh, 2000), disclosure of information (Anderson and Agarwal, 2011), technology use (Beaudry and Pinsonneault 2010, customer loyalty (Lin and Wang, 2006) and online purchasing decisions (Huang, 2003). For example, online shoppers who experience negative emotion are more likely to leave (Tax and Brown, 1998) and not return (Mulpuru et al., 2010) to e-commerce websites. With these findings the researcher concluded that individuals' emotions are playing a significant role in individuals' adoption or use of particular technology.

These witnesses guided the researcher to design the general research question as, "What are the emotional factors affecting professionals' adoption to e-payment methods in Sri Lanka?" and specific research questions as follows:

- What is the current emotional level of professionals regarding E-payment methods in Sri Lanka?
- What are the emotional factors that determine the professionals' e-payment adoption?

Research Objectives

General objective: To examine the emotional factors influencing professional's adoption to e-payment methods in Sri Lanka.

Specific research objectives

- To determine the current emotional level of professionals regarding E-payment methods in Sri Lanka.
- To identify the emotional factors that determines the professionals' e-payment adoption.
- To suggest how individuals can be emotionally influenced to adopt E-payment methods.

Significance of the Study

Safe and efficient payment systems are a major precondition for financial stability and economic prosperity in a country. A well-functioning payment system facilitates the exchange of goods, services and

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

assets, and is the foundation of today's real economy. The average bank cost of an electronic payment is one-third to one-half that of its paper-based equivalent or cash. (Humphrey, 2006) A merchant's average cost of accepting a bill payment electronically over an electronic network or at the point of sale is also lower (credit cards excepted). As well the source cost of a country's payment system may account for 1-2 percent of its Gross domestic product, it is clear that shifting from paper to electronic payments can confer social benefits. (Bolt, 2008)

Both scientific and market research shows that electronic payment methods are becoming increasingly adopted, mainly due to their advantageous characteristics such as convenience and cost saving. (Cotteleer et al.,2007; Kousaridas et al.,2008). So identification of emotional factors influencing individuals' adoption of e-payment methods is essential for business organizations in order to motivate their consumers to use e-payment methods and reduce their costs as well as to enhance their operational efficiency. Understanding those emotional factors and implementing appropriate strategies would help businesses to enhance consumer loyalty also. And the suggestions will beneficial for the government of Sri Lanka to motivate Sri Lankan citizens to adapt to e-payment system and it will help Central bank of Sri Lanka to reduce their cost of issuing cash and cheques.

LITRATURE SURVEY

Electronic Payment

Shon and Swatman (1998) define e-payment as any exchange of funds initiated via an electronic communication channel, while Gans and Scheelings (1999) define e payment as payments made through electronic signals linked directly to deposit or credit accounts. E-payment represents any kind of non-cash payment that does not involve a paper cheque (Hord, 2005). This study adopts these definitions and refers e-payment for the transfer of an electronic value of payment from a payer to the payee through an e-payment mechanism which allows customers to remotely access and manage their bank accounts and transactions, executed through an electronic network (Lim et al., 2006; Sumanjeet, 2009). E-payment requires an internet connection to work, similar to the use of other e-environments such as electronic banking (e-banking), electronic shopping (e-shopping), or electronic learning (e-learning). Since e-payment refers to financial exchange (Kalakota and Whinston, 1997; Zhang and Jasimuddin, 2012), it is one of the major functions of e-banking. It could also possibly serve as the main payment mechanism for e-shopping, but not necessarily for e-learning or some e-services where payment can also be made through other payment channels.

Adoption of E-Payment

Individual's adoption of electronic payment methods is determined by many factors. Different researchers have different characteristics to assess the e-payment systems. Schmidt and Muller (1999), discuss 3 dimensions, technical (security, reliability, scalability, and latency), economic (cost of the transaction, the exchange integral, customer base) and social (anonymity, the point-to-point). Parhonyi et al. (2005), discuss about 2 dimensions, technical (ease of use and convenience, anonymity, scalability, reliability, security, interoperability) non-technical dimension (privacy, and security coverage) and Kinberg (2002), discuss about ease of use, reliability, coverage network, transaction costs, speed up the evaluation process as a feature called micro-payment systems.

Table 1. Literature review of factors

Researcher	Research Title	Factors
Eriksson Kerem Nilsson, 2004	Customer acceptance of electronic payment in Ukrain	I. Trust II. Perceived usefulness III. Ease of use IV. Use
Results: The findings suggest that e-payment usage increases as far as customers perceive it as useful. The perceived usefulness is crucial because it determines whether the perceived ease of electronic payment use will lead to increased use of the internet bank. In other hand, a well-designed and easy to use electronic payment may not be used if it is not perceived as useful. They further suggest that model of technology acceptance should be redesigned to focus more on the role of perceived usefulness of online payment embedded in the technology.		
Researcher	**Research title**	**Factors**
Shiha Fang, 2002	The use of decomposed theory to study electronic payment in Thailand	I. Attitude II. Compatibility III. Complexity IV. Facilitating V. Behavior intention VI. Self-efficacy VII. Subjective norms VIII. Perceived advantage
Results: In the decomposed theory of planned behavior model, only complexity and relative advantage are related to attitude, not related to compatibility. In order to subjective norm, it was failed to achieve significance in the model from the path of subjective norm. It says only self-efficacy was a significant determinant of PBC.		
Researcher	**Research title**	**Factors**
KarjoMatilaPanto, 2003	Factors based on attitude formation towards electronic payment in Malaysia.	I. Prior technological experience II. Reference group influences III. Prior computer experience
Results: Among prior computer experience, prior technology experience, reference group and computer attitude the researcher says the relationship between prior technology experience and attitude were most critical.		
Researcher	**Research title**	**Factors**
Black locket WinklohoferEnnew, 2001	The adoption of internet financial service: a qualitative study	I. Relative advantage II. Compatibility III. Trainability IV. Observability V. Complexity
Results: This paper was about the innovation of delivering financial services through the Internet and evaluated the Rogers' (1983) model. Based on the usage of the Internet, the focus group members used for data gathering were selected. The strongest influencing factors which emerged for adoption of the Internet to conduct financial transactions werecompatible with a person'svalue and previous experience with the product category. As well trialability was also identified as important for future adoption.		
Researcher	**Research title**	**Factors**
Tan teo, 2000	Factors influencing the adoption of electronic payment	I. Self-efficacy II. Risk III. Complexity IV. Compatibility with values V. Relative advantages VI. Government support VII. Social norms
Results: According to the results it emphasized that perceived behavioral control and attitudinal factors play a significant role rather than social influence in influencing the adoption to electronic payment methods. Perceptions of relative advantage, trialability, risk toward using Internet and compatibility were identified to influence intention to adopt electronic payment services. Perception of government support for electronic commerce and confidence in using such services was also found to influence adoption.

Table 1. Continued

Researcher	Research title	Factors
WungwanithChakorn, 2002	Adoption intention of consumers in electronic payment methods	I. Cost II. Social value III. Income IV. Age V. Option leader VI. Product category usage VII. Perceived risk VIII. Compatibility
Results: This research also yielded a useful conclusion related to adoption of electronic payment while specially identifying age, cost saving, income and product category as significant factors.		
Researcher	**Research title**	**Factors**
Shah Hans, 2005	Effect of trust on customer acceptance of online payment	I. Trust II. Perceived usefulness III. Ease of use IV. Attitude V. Intention to use
Results: This study, the researcher found that trust is the most significant factor in explaining a customer's attitude towards using electronic methods for payment. Customer perception of the usefulness as well as ease of use also affect attitude as suggested by the technology acceptance model. At the same time, behavioral intention toward e-payment is highly related to attitude, trust and perceived usefulness. These results highlight that consumers rely on trust in the online environment which produce sensitive information.		
Researcher	**Research title**	**Factors**
NdudisiZinti, 2007	Consumer attitudes, system's characteristics an electronic payment usage in Singapore	I. Importance to e-commerce needs II. Compatibility III. Risk IV. Utilitarian orientation V. Hedonic orientation VI. Trainability
Results: From the results of this study, they emphasize that the attitudinal factors play a significant role in electronic payment adoption. As well utilitarian orientation of website has significant influence on adoption rather than hedonic orientation.		
Researcher	**Research title**	**Factors**
PikkarainenKarjaluotoPahnila, 2004	Consumer acceptance of online payment: an extension of technology acceptance model	I. Perceived usefulness II. Perceived ease of use III. Perceived enjoyment IV. Information available V. Security and privacy VI. Quality of internet connection
According to this research finding, it highlights perceived usefulness and information on online payment on the Web site was the main factors influencing electronic payment acceptance.		
Researcher	**Research title**	**Factors**
Frank, 2004	Electronic payment adoption strategies for a developing country: The case of Thailand	I. Risk and privacy II. Personal preferences III. External environment IV. Culture V. Features of the web VI. Perceived usefulness
Results: The most significant attitudinal factors that appear to encourage the adoption of electronic payment in Thailand are "Features of the website" and "Perceived usefulness", while the most significant barrier to adoption is a perceived behavioral control, namely "External environment". Other significant moderating factors are gender, educational level, income, internet experience and electronic payment experience.

Individuals' Emotions on Technology Usage

Emotion is a complex, subjective experience accompanied by biological and behavioral changes. Emotion involves feeling, thinking, and activation of the nervous system, physiological changes, and behavioral changes such as facial expressions. (Wikipedia) There are main two dimensions of emotions. As explained by "Better health channel", negative emotions can be described as any feeling which causes someone to be miserable and sad. These emotions make individuals dislike themselves and others, and take away their confidence. Emotions which can become negative are hate, anger, jealousy and sadness. As well positive emotion may be considered as any feeling where there is a lack of negativity, such that no pain or discomfort is felt. Frederickson (2009) identifies the ten most common positive emotions as joy, gratitude, serenity, interest, hope, pride, amusement, inspiration, awe and love.

Positive emotion induced through system design has been shown to influence the acceptance and use of technology (e.g., Agarwal and Karahanna 2000). In contrast, negative emotion induced through system design adversely influences ease-of-use and thereby intentions to use a system (Venkateshand Davis 2000), technology use (Beaudry and Pinsonneault2010), disclosure of information (Anderson and Agarwal, 2011), online purchasing decisions (Huang 2003), and customer loyalty (Lin and Wang 2006). For example, online shoppers who experience negative emotion are more likely to leave (Tax and Brown 1998) and not return (Mulpuru et al. 2010) to e-commerce websites.

Technology Readiness

Technology readiness(TR) construct can be viewed as an overall state of mind resulting from a gestalt of mental enablers and inhibitors that collectively determine a person's predisposition toward using new technologies (Lin, Shih, Sher, 2007). Parasuraman in 2000 found there are some characteristics that comply with the acceptance of new technologies or services resulting in interaction through technology. The term technology-readiness refers to people's propensity to embrace and use new technologies for accomplishing goals in home life and at work (Parasuraman, 2000).

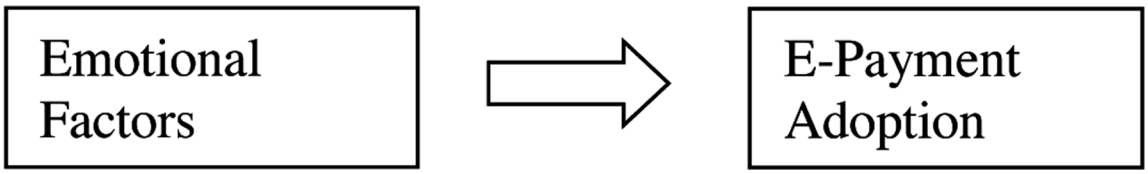
Khatri, and Montoya-Weiss (2007) stress that TR encompasses more than the degree to which an individual is relatively earlier in adopting an innovation. Parasuraman (2000) further explains it is possible for the customer to have both positive and negative feelings about technology, especially high technology products and services. The traits differ among people and therefore their beliefs about various aspects of technology differ. The relative strength of each trait indicates a person's openness to technology. TR thus reflects a set of beliefs about technology, but is not an indicator of a person's competence in using it.

Concept Indicator Model

This study thus will concentrate on establishing the factors which are affecting emotions that drive emergence and adoption of electronic payment system. These drivers are captured in the conceptual framework indicated in the diagram below.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1.



MAIN FOCUS OF THE CHAPTER

Issues, Controversies, Problems

Sample

This study mainly focuses on professionals' adoption of e-payment. Professionals can be mainly divided into 7 categories. Those are academics, cultural, medical, industry, transport, public services and science. Data will be collected from 300professionals, including all those categories by convenience sampling.

Sample Size

Gorsuch (1983) recommended that sample size should be at least 100 for a factor analysis, and Kline (1979) supported this recommendation. Guilford (1954) argued that sample size should be at least 200, and Cattell (1978) claimed the minimum desirable sample size to be 250. Comrey and Lee (1992) offered a rough rating scale for adequate sample sizes in factor analysis: 100=poor, 200=fair, 300=good, 500=very good, 1000 or more=excellent. Considering all those recommendations and study limitations, the sample size is limited to 460 professionals representing all the categories.

Sampling Method

Convenience sampling technique was used for sample selection. Convenience sampling is a non-probability sampling technique where subjects are selected because of their convenient accessibility and proximity to the researcher. Since professionals are kind of a busy people it's impossible to reach them and reserve time for them to obtain data. And it is the least expensive, least time to consume of all sampling techniques. Data will be collected by using questionnaires and there is a limitation to define the study population. Considering all conditions the researcher selected convenience sampling method for this study.

Method of Data Collection

Past research papers, literature, reports, magazines and internet are used for the study purpose as well this research heavily depends on primary data for the empirical investigation. Both primary and secondary data are considered for the study. Primary data are collected through a closed structured questionnaire.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Development of Measurements

In order to study the factors influencing professionals' adoption of electronic payment methods, researcher developed the measurement scale which consists of 50 research questions.

VALIDITY AND RELIABILITY OF INSTRUMENTS

Face Validity

To access face validity researcher developed 70 questions and the questionnaire was distributed among one academic and three undergraduates in Uva Wellassa University. According to their feedback the researcher eliminated some questions and re-modified the questionnaire to 50 questions assessed from face validity.

Pilot Survey

The pilot survey was carried out among 50 respondents in Uva WellassaUniversity who currently use electronic payment methods and those respondents are selected by convenience sampling. The unit of analysis was at the individual level. To gather primary data for pilot study, total numbers of 50 questionnaires were distributed by hand and email.

Content Validity

The questionnaire developed with an adequate coverage by comprising an adequate number of items or questions that represent the variables of interest ensuring the content validity of the instrument. Pilot survey was carried out in order to measure the content validity.

Factor Analysis

At the end of the explanatory factor analysis the researcher was able to identify 17 factors from 50 responses to the questionnaire. Out of those 17 factors only 7 factors loaded more than 0.5 of factor loading.

Convergent Validity

Convergent validity is shown when each measurement item correlates strongly with its assumed theoretical construct. In order to measure the convergent validity researcher used AVE analysis.

$$\text{AVE}= \frac{\sum\left[\lambda i \hat{} 2\right]}{\sum\left[\lambda i \hat{} 2\right]+\sum\left[Var\left(\varepsilon i\right)\right]}$$ (Fornell and Larcker, 1981)

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

λi is the loading of each measurement item on its corresponding construct and εi is the error measurement. The value of AVE for each construct should be at least 0.50 (Fornell and Larcker, 1981). Through AVE analysis researcher found 6 out of the 7 factors have AVE values less than 0.5 therefore researcher re-modified questions in order to establish convergent validity.

Discriminant Validity

Fornell and Larcker (1981) present a method for assessing the discriminant validity of two or more factors. Here, a researcher compares the AVE of each construct with the shared variance between constructs. If the AVE for each construct is greater than its shared variance with any other construct, discriminant validity is supported. Based on the inter correlation matrix it shows questionnaire consist with the discriminant validity.

Table 2. Inter correlation matrix

Column1	Column2	Factor1	Factor2	Factor3	Factor4	Factor5	Factor6	Factor7
Factor1	Pearson Correlation	0.46770	-.254	.268	-.119	0.73	-.083	.413
Factor2	Pearson Correlation	-.127	0.52179	.199	.198	-.460	.193	.315
Factor3	Pearson Correlation	.134	.099	0.4332	0.588	.256	.194	.440
Factor4	Pearson Correlation	-.059	.099	.294*	0.44772	.292	.167	0.594
Factor5	Pearson Correlation	.365**	-.230	.256	.146	0.45454	.084	.137
Factor6	Pearson	-.041	.096	.097	.083	.042	0.39480	-.115
Factor7	Pearson Correlation	.206	.158	.220	.297*	.069	-.057	0.39356

Reliability

Cronbach's Alpha was used to measure the reliability and the questionnaires' validity. The test will be significant when the alpha value results more than 0.7. It assures the reliability of questions. The formula for the standardized Cronbach's alpha:

$$\alpha = \frac{N.\overline{c}}{\overline{v} + \left(N-1\right).\overline{c}}$$ (Fornell and Larcker, 1981)

According to the below table of Cronbach's Alpha Reliability Analysis, has been proven the reliability as the alpha values are greater than the acceptable level of 0.7 alpha value.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Reliability Statistics

Case Processing Summary			
		N	%
Cases	Valid	50	100.0
	Excluded[a]	0	0.0
	Total	50	100.0
a. Listwise deletion based on all variables in the procedure.			

Table 4.

Reliability Statistics		
Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items
.785	.792	50

Source: SPSS output from field information

Composite Reliability

Composite reliability also used to measure the reliability of instruments. The test will be significant when composite reliability value results more than 0.7. It assures the reliability of questions.

Table 5. Composite reliability

Factor	1	2	3	4	5	6	7
Composite Reliability	0.7745	0.7592	0.7508	0.7054	0.7129	0.6606	0.6536

The above table shows the calculated composite reliability values for each factor. 5 out of the 7 factors are having greater than 0.7 of composite reliability value. This ensures the reliability of the questionnaire.

SOLUTIONS AND RECOMMENDATIONS

Introduction

Personal information was analyzed and presented with frequency distribution. In order to find out the underlying pattern of professionals' characteristics, cross tabulation analysis was conducted for the personal information. Then the next part is research information, which was analyzed through the exploratory factor analysis and the researcher received 300 responses from 460 questionnaires distributed. The response rate was 65.2% of the sample.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Data Analysis

There are some measures which exist in order to study on factors influence on professionals' adoption to electronic payment, but they are not well established. Therefore, in order to identify factors influencing on professionals' adoption of e-payment in Sri Lankan, Exploratory Factor analysis (EFA) method was used in the data analysis. It allows the researcher to explore the main dimensions to generate a theory.

Exploratory factor analysis (EFA) is generally used to discover the factor structure of a measure and to examine its internal reliability. EFA allows all items to load on all factors. EFA is often recommended when researchers have no hypotheses about the nature of the underlying factor structure of their measure. (Preacher &MacCallum, 2003).

Orthogonal type was used to rotation in this research study. Orthogonal means the factors are assumed to be uncorrelated with one another. This is the default setting in all statistical packages, but is rarely a logical assumption about factors in the social sciences. (Preacher &MacCallum, 2003). Under the orthogonal type this research was used Varimax rotation type.

Data Presentation

The data collected from the respondents in the sample can be presented in tables, in this connection with objectives of this study. Univariate analysis (descriptive Statistics) has been adopted by using the SPSS 21 package and Microsoft Excel 2013 software versions were used to generate the analyzed outcome.

Analysis of Reliability

The reliability of the instrument was measured using alpha analysis. It measures the internal consistency of the instrument, based on the average inter-item correlation. Cronbach's Alpha coefficient varies between 0 and 1 and the cutoff point is 0.6 (Ehlinger&Grenier, 2001). Acceptable alpha value ranges as follows,

- $\alpha \geq 0.9$ –Excellent
- $0.7 \leq \alpha \leq 0.9$ –Good
- $0.6 \leq \alpha \leq 0.7$ –Acceptable
- $0.5 \leq \alpha \leq 0.6$ –Poor
- $\alpha < 0.5$ -Unacceptable

Cronbach's alpha can be written as a function of the number of tested items and the average inter correlation among the items. Below formula shows the standardized Cronbach's alpha:

$$\alpha = \frac{N.\overline{c}}{\overline{v} + \left(N-1\right).\overline{c}}$$ (Ehlinger&Grenier, 2001)

The above table shows that the cronbach's alpha is 0.798 with respect to 50 statements, since it is greater than 0.6. Therefore, all items considered in this study are to be reliable.

Personal Information

In this section, the analysis of personal information, conducts on the information collected from 300 respondents. Data on personal profiles of each respondent were recorded during the survey. The personal profiles of the key respondents were summarized as their gender, age, occupation, bank account usage and card usage in table 7 and figures 2-4.

Table 7. Personal profile

Personal Factor	Classification	No. of Respondents	Percentage %	Total%
Gender	Male	136	45.33	100
	Female	164	54.67	
Age	18-24	116	38.67	100
	25-34	125	41.67	
	35-50	53	17.67	
	>50	6	2.00	
Occupation	Teacher	29	9.67	100
	Nurse	26	8.67	
	Doctor	22	7.33	
	Engineer	21	7.00	
	Accountant	21	7.00	
	Police officer	19	6.33	
	Lawyer	18	6.00	
	Pharmacist	15	5.00	
	Auditor	13	4.33	
	Dentist	10	3.33	
	Customs officer	10	3.33	
	Architect	8	2.67	
	Other	88	29.33	
Bank Account	Yes	300	100.00	100
	No	0	0.00	
Electronic card	Yes	300	100.00	100
	No	0	0.00	

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

As this research is based on electronic payment adoption, the researcher selected the respondents only those who use electronic payment in their day to day life to participate in the research. With this requirement the summarized data emphasize that 100% of the sample respondents are having bank account as well as electronic cards.

Factor Analysis

An initial factor analysis was done for all 50 items and 16 factors emerged. From the 50 items tested, the items with factor loadings below 0.5 were removed, since their contributions to the overall variable were low. The factor analysis was done by the Principal component methods (PCA). The rotation method was Varimax rotation type.

KMO and Bartlett's Test

Table 8 gives the results of KMO and Bartlett's test on 50 items. The high correlation value (0.720), which is higher than 0.60, shows that the results of factor analysis are reliable (Ehlinger&Grenier, 2001). And it indicates that the data are appropriate for factor analysis. In the analysis only the factors having latent roots or eigenvalue greater than 1 were considered significant.

Through Exploratory factor analysis researcher found out 16 factors from 300 responses to questionnaires.

Principal Component Analysis of Emotional Factors

The below table presents the results of exploratory component factor analysis is taken into consideration for grouping of variables. The first factor comprises of four items i.e. "I enjoy having control over others", "Others always expect me to be successful regarding online activities", "I expect to control others rather than permit them to control me when using E-payment", "My unique knowledge and abilities regarding e-payment activities are recognized by others", with factor loading values of .677, .692, .750, .560. This factor can be named as innovativeness.

Second factor shows the highest loading of three items i.e. "I feel I can do something special that makes use of my abilities regarding online shopping and e payment", "This helps me to spend my leisure time happier", "24*7 day shopping experience and payment facility makes me more satisfied", with factor loadings of .703, .697, .629. And this factor can be named as professional satisfaction.

Third factor shows the highest loading of three items i.e. "I like the idea of online shopping and e payment via computers because I'm not limited to regular business hours", "I prefer to use modern e payment methods available", "I like online shopping and e payment that allow me to tailor things to fit my own needs" with factor loadings of .658, .702, .535. This factor can be named as optimism.

Table 9. Factor groups

Question	Factor 1	Factor 2	Factor 3	Factor 4	Factor 5	Factor 6
Factor 1						
I enjoy having control over others	0.677					
Others always expect me to be successful regarding online activities	0.692					
I expect to control others rather than permit them to control me when using E-payment	0.750					
My unique knowledge and abilities regarding e-payment activities are recognized by others	0.560					
Factor 2						
I feel I can do something special that makes use of my abilities regarding online shopping and e payment		0.703				
This helps me to spend my leisure time happier		0.697				
24*7 day shopping experience and payment facility makes me more satisfied		0.629				
Factor 3						
I like the idea of online shopping and e payment via computers because I'm not limited to regular business hours			0.658			
I prefer to use modern e payment methods available			0.702			
I like online shopping and e payment that allow me to tailor things to fit my own needs			0.535			
Factor 4						
It is embarrassing when I have trouble with online transaction while people are watching				0.690		
If I provide information to a machine or over the Internet, I can never be sure it really gets to right place				0.589		
It seems my friends are learning more about online activities than me				0.566		
Factor 5						
I worry that information I send over the Internet will be seen by other people					0.555	
I do not feel confident doing business transactions with a place that can only be reached online					0.651	
When I call a business, I prefer to talk to a person rather than a machine					0.672	
Factor 6						
Descriptions about use of e payment are not helpful because they do not explain things in terms I can understand						0.511
Sometimes, I think that e payment systems are not designed for use by ordinary people						0.566
There is no such thing as a manual, guidelines about how to use modern e payment methods that is written in plain language						0.711

Source: SPSS output from field information

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Fourth factor shows the highest loading of three items i.e. "It is embarrassing when I have trouble with online transaction while people are watching", "If I provide information to a machine or over the Internet, I can never be sure it really gets to right place", "It seems my friends are learning more about online activities than me", with factor loadings of .690, .589, .566 and this factor can be named as skepticism.

Fifth factor shows the highest loading of three items i.e. "I worry that information I send over the Internet will be seen by other people", "I do not feel confident doing business transactions with a place that can only be reached online", "When I call a business, I prefer to talk to a person rather than a machine", with factor loadings of .555, .651, .672. This factor can be named as insecurity.

Sixth factor also shows the highest loadings of three items i.e. "Descriptions about use of e payment are not helpful because they do not explain things in terms I can understand", "Sometimes, I think that e payment systems are not designed for use by ordinary people", "There is no such thing as a manual, guidelines about how to use modern e payment methods that is written in plain language", with the factor loadings of .511, .566, .711. Accordingly, this factor can be named as discomfort.

From all other factors, seventh, ninth, eleventh and twelfth factors are having only two highest loadings which are greater than 0.5, so that those factors are not considered.

Rest of eighth, tenth, thirteenth, fourteenth, fifteenth and sixteenth factors are having only one highest factor loading which is greater than 0.5. With that, those factors also are not considered.

The results of principle component place 50 variables into 7 factors. Loading of meaningful grouping are given in the table 9.

Further to find out the emotional factors influencing professionals' adoption electronic payment in Sri Lanka respondents were asked to rate the questions based on five point Likert scale. Mean value of factor 1 is (M- 2.8892). In this factor 25.7 percent of respondents agreed that "I enjoy having control over others" (M-2.56)., 30.3 percent of respondents agreed that "Others always expect me to be successful regarding online activities" (M-2.77)., 38.6 percent of respondents agreed that "I expect to control others rather than permit them to control me when using E-payment" (M-3.08) and finally 41 percent of respondents agreed that "My unique knowledge and abilities regarding e-payment activities are recognized by others" (M-3.14). With that this factor was named as innovativeness.

Mean value of factor 2 is (M-3.88) Here 67 percent of respondents agreed that "I feel I can do something special that makes use of my abilities regarding online shopping and e payment" (M-3.78)., 71.3 percent of respondents agreed that "This helps me to spend my leisure time happier" (M-3.84) and 78 percent of respondents agreed that "24*7 day shopping experience and payment facility makes me more satisfied" (M-4.04). Accordingly this factor was named as professional satisfaction.

For third factor mean value is (M-3.945). In this factor 73.7 percent of respondents agreed that "I like the idea of online shopping and e payment via computers because I'm not limited to regular business hours" (M-3.91), 78 percent of respondents agreed that "I prefer to use modern e payment methods available" (M-4.00) and 75 percent of respondents agreed that "I like online shopping and e payment that allow me to tailor things to fit my own needs" (M-3.93). It emphasize that all three variables related to factor 3 have scored more than average. And this factor was named as optimism.

Fourth factor also shows the highest loadings of three items and mean value of this factor is (M-2.992). All these three factors score lower than average i.e. 42.6 percent of respondents agreed that "It is embarrassing when I have trouble with online transaction while people are watching" (M-3.08), 31.4 percent of respondents agreed that "If I provide information to a machine or over the Internet, I can never be sure it really gets to right place" (M-2.85), and 37.7 percent of respondents agreed that "It seems my friends are learning more about online activities than me" (M-3.04). This factor was named as skepticism.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Fifth factor is having a mean value of (M-3.241) and all three variables in this factor also score lower than average i.e. 49 percent of respondents agreed that "I worry that information I send over the Internet will be seen by other people" (M-3.25), 48.7 percent of respondents agreed that "I do not feel confident doing business transactions with a place that can only be reached online" (M-3.26) and 45.7 percent of respondents agreed that "When I call a business, I prefer to talk to a person rather than a machine" (M-3.21). This factor was named as insecurity.

Sixth factor also shows the highest loadings of three items. Mean value of this factor is (M-3.467) Here 2 out of 3 variables score more than average i.e. 55 percent of respondents agreed that "Descriptions about use of e payment are not helpful because they do not explain things in terms I can understand" (M-3.50), 44.4 percent of respondents agreed that "Sometimes, I think that e payment systems are not designed for use by ordinary people" (M-3.14) and 68.3 percent of respondents agreed that "There is no such thing as a manual, guidelines about how to use modern e payment methods that is written in plain language" (M-3.77). With that this factor was named as discomfort.

Hence results of this study indicate that emotional factors influencing professionals' adoption to electronic payment in Sri Lanka.

DISCUSSION

Discussion is presented in accordance to comply the objectives of the research. There were three objectives of the study and the researcher has conducted the research according to achieve those objectives.

- To determine the current emotional level of professionals regarding E-payment methods in Sri Lanka.
- To identify the emotional factors that determines the professionals' e-payment adoption.
- To suggest how individuals can be emotionally influenced to adopt E-payment methods.

Nature of the Current Emotional Level of Professionals E-Payment Adoption in Sri Lanka

One of the primary objectives of this study was to determine the current level of emotional influence on professionals' electronic payment adoption in Sri Lanka. According to Robyn Lawson (2008), male professionals as a percentage used to utilize electronic payment methods for their day to day activities rather than female professionals in the Asian region. For the present study, the researcher chose the sample respondents who currently use electronic payment since the main objective was to identify emotional factors. According to selected sample, 45% of respondents are male, while the rest of the sample is females out of 300. It emphasizes that female professionals are highly influenced to use electronic payment because of emotional factors rather than male professionals. As to the findings of Elija Sokobe (2015), electronic payment methods are highly famous among young and middle-aged people between 20 to 40 years of age. Analysis of present study emphasized that 39% of respondents were aged between 18-24 and 42% of respondents consists of age between 25-34. Since the researcher used online method for data collection that also can be a reason for this variance.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 10. Mean and standard deviations

Question	Mean	SD	Factor Mean
Innovativeness			2.889
I enjoy having control over others	2.56	1.162	
Others always expect me to be successful regarding online activities	2.77	1.09	
I expect to control others rather than permit them to control me when using E-payment	3.08	1.048	
My unique knowledge and abilities regarding e-payment activities are recognized by others	3.14	1.074	
Professional satisfaction			3.88
I feel I can do something special that makes use of my abilities regarding online shopping and e payment	3.78	0.898	
This helps me to spend my leisure time happier	3.84	1.009	
24*7 day shopping experience and payment facility makes me more satisfied	4.04	0.897	
Optimism			3.945
I like the idea of online shopping and e payment via computers because I'm not limited to regular business hours	3.91	0.821	
I prefer to use modern e payment methods available	4	0.854	
I like online shopping and e payment that allow me to tailor things to fit my own needs	3.93	0.857	
Skepticism			2.992
It is embarrassing when I have trouble with online transaction while people are watching	3.08	1.082	
If I provide information to a machine or over the Internet, I can never be sure it really gets to right place	2.85	1.103	
It seems my friends are learning more about online activities than me	3.04	0.996	
Insecurity			3.241
I worry that information I send over the Internet will be seen by other people	3.25	1.272	
I do not feel confident doing business transactions with a place that can only be reached online	3.26	1.082	
When I call a business, I prefer to talk to a person rather than a machine	3.21	1.073	
Discomfort			3.467
Descriptions about use of e payment are not helpful because they do not explain things in terms I can understand	3.5	1.062	
Sometimes, I think that e payment systems are not designed for use by ordinary people	3.14	1.113	
There is no such thing as a manual, guidelines about how to use modern e payment methods that is written in plain language	3.77	0.993	

The nature of the current emotional level of professionals can be identified from descriptive statistics of emotional factors. According to the table 10, it includes the meaning value of six factors which were identified as emotional factors. Innovativeness and skepticism which are having 2.889 and 2.992 of mean values dictate that there is a moderate level of emotional influence on professionals' electronic payment adoption. Meanwhile, other emotional factors identified by the researcher consist mean values of 3.88,

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

3.945, 3.241 and 3.467. With those finding the researcher can conclude that there is a higher level of emotional influence of electronic payment adoption of professional satisfaction, optimism, insecurity, and discomfort. Some of these factors cause positive emotions regarding electronic payments while some of them affect to generate negative emotions.

Emotional Factor Influencing Professionals' Adoption to Electronic Payment

Another objective of this study was to identify the emotional factors influencing professionals' adoption to electronic payment in Sri Lanka. The findings from this study suggested that six emotional factors for e-payment adoption as innovativeness, professional satisfaction, optimism, skepticism, insecurity, and discomfort. These factors were named as above mainly based on the literature. As discussed in problem statement technology readiness (TR) of an individual is an essential element is an acceptance and adoption of a new technology such as e-payment. This TR can be viewed as an overall mental state resulting from a gestalt of mental enablers and inhibitors that together determine a person's tendency to use new technologies and services. According to Parasuraman (2000), TR constructs consists of four emotional factors or sub-dimensions such as optimism, innovativeness, discomfort, and insecurity. Meanwhile, he has identified that optimism and innovativeness are drivers of TR and discomfort and insecurity are inhibitors. Optimism is related to the positive view of technology. And it refers to "a belief that technology offers people increased control, flexibility and efficiency in their lives". As it says optimists are more willing to use to use new technologies such as e-payment because they tend to accept their situation and are less likely to be escapist.

Innovativeness means the extent to which an individual believes he or she is at the leading edge of new technology or to be the pioneer of using new technologies or technology-based services like e-payment. Innovative consumers tend to learn about new modern technology on their own and may need less support. Meanwhile, consumers who are low on innovativeness, they beliefs may want and need more guidance, advice, and support. This factor is closely related to ease of use, but might be less concerned with ease of use, because users quite prefer and willing to figure it out themselves. The next factor, discomfort is a perception of lack of control over technology and a feeling of being overwhelmed by new technology. It consists the extent to which people have a general anxiety about technology-based service or products such as electronic payments. The previous literature has concluded that discomfort is one of two inhibitors of technology use, or simply making users reluctant to use technology. This factor can be used to measure the degree to which people have a general prejudice against technology-based services or products emotionally such as e-payment. Insecurity is another emotional factor, according to technology readiness model. The user of a new technology like e-payment needs to feel like they are in control while still having their privacy protected. This will be another inhibitor of technology use. The findings of this research or these four factors (Innovativeness, Optimism, Discomfort and Insecurity) were similar to the Nadine Guhr, Tai Loi's (2013) findings regarding mobile payment adoption in Finland, USA and Germany as well as the findings of Pinar Basgoze's (2015) study regarding integration of technology readiness for mobile shopping.

Professional satisfaction and skepticism are other two emotional factors identified by the researcher. Professional satisfaction denotes how a particular product or service meet or surpass a professional's expectations. Professional's satisfaction as a consumer is a significant drive to adopt new technology related to banking technology services. (Karthikeyan P., 2014) A higher level of consumer satisfaction leads to use a new technology again and again through creating positive emotions in consumer's mind as to

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

the conclusion of Karthik (2008), the study of the relationship between customer satisfaction and mobile banking. Alfred E. Newman (2010) has mentioned, "to gain benefits from adoption of new technology, the innovator must realize and understand the nature of skepticism that will likely to occur". When it considers the culture and perception of Asian and South Asian people, they more concern about trust and safety and seething in a skeptical attitude. (Aravind, 2001) With the research findings, the researcher can conclude skepticism regarding electronic payment and e-payment process is a significant emotional factor in professionals' e-payment adoption.

Suggestions for How Individuals Can Be Emotionally Influenced to Adopt E-Payment Methods

As to the emotional factors identified through the analysis, those six factors can be mainly divided into two parts. Innovativeness, Optimism and Professional satisfaction can be identified as motives and other factors such as Insecurity, Skepticism, and discomfort can be categorized as emotional inhibitors. As general, it can conclude that innovativeness, optimism and professional satisfaction affect to cause positive emotions regarding e-payment and other three factors affect to create negative emotions.

E-commerce businessmen and banks need to consider these factors to motivate their customers to use and adopt electronic payment methods rather than using physical cash. Through many strategies, they can improve their customer's optimism and satisfaction while reducing the level of skepticism, discomfort, and insecurity. As businessmen, they have to ensure the safety of the payments and need to build trust and belief of their customers. Simply through banks and their brand loyalty and reputation can be utilized effectively for this purpose. And they need to identify innovative consumers who adapt to their new payment systems because according to their opinions and recommendations the early and late majority consumers will gain decisions whether to adopt or not to adopt new payment methods. Simply E-businesses have to provide flexible and reliable service, enhanced control on consumers' payment, efficiency in the system functions while minimizing errors, assuring safety and guarantee in order to maximize the consumer's satisfaction. Promotional strategies can be utilized effectively to emotionally stimulate consumers and create a positive image regarding electronic payment.

Composite Reliability

In this study, all the composite reliability coefficients are greater than 0.7 indicating reliability of the factors. However, many researchers have argued that a minimum value of 0.6 is required in order to achieve composite reliability for a construct.

Table 11. Composite reliability

Factor	1	2	3	4	5	6
CR	0.763	0.717	0.667	0.647	0.659	0.625

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Convergent Validity

The value of AVE should be 0.5 or higher for this validity to achieve. Thus, retaining the low factor loading items in a model could cause the construct to fail Convergent validity. Formula for calculating AVE as follows:

$$\text{AVE}= \frac{\sum\left[\lambda i \hat{} 2\right]}{\sum\left[\lambda i \hat{} 2\right]+\sum\left[Var\left(\varepsilon i\right)\right]}$$ (Fornell and Larcker, 1981)

Through AVE analysis researcher found that 2 out of 6 factors are having AVE values greater than 0.5. They are 1st and 2nd factors and their values are 0.532 and 0.507. For other factors AVE values are 0.474, 0.461, 0.469, and 0.447 respectively for 3rd, 4th, 5th and 6th factors.

Discriminant Validity

Fornell and Larcker (1981) present a method for assessing the discriminant validity of two or more factors. Here, the researcher compares the AVE of each construct with the shared variance between constructs. If the AVE for each construct is greater than its shared variance with any other construct, discriminant validity is supported.

Table 12. Inter correlation matrix

Inter Correlation Matrix							
		Factor1	**Factor2**	**Factor3**	**Factor4**	**Factor5**	**Factor6**
factor1	Pearson Correlation	0.532	0.286	.159	0.472	0.244	.180
factor2	Pearson Correlation	.143*	0.507	0.374	.149	-.051	.218
factor3	Pearson Correlation	.080	.187**	0.474	.087	-.169	.037
factor4	Pearson Correlation	.236**	.075	.044	0.461	0.322	.182
factor5	Pearson Correlation	.122*	-.025	-.084	.161**	0.469	.040
factor6	Pearson Correlation	.090	.109	.019	.091	.020	0.447
*. Correlation is significant at the 0.05 level (2-tailed).							
**. Correlation is significant at the 0.01 level (2-tailed).

FUTURE RESEARCH DIRECTIONS

Further research may address the following important areas:

1. Identification of the relationship between emotional factors and consumer electronic payment adoption.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. Impact of these emotional factors on other e-commerce services such as e-banking and mobile payment.
3. Identification of impact of cultural factors on emotions of consumers to adopt and use electronic payment in Sri Lanka.
4. Study of emotional factors influencing shopping mall consumers as general (not limiting to professionals) to adopt and use electronic payment methods in Sri Lanka.
5. Conduct the same research in mixed method or qualitative method using interviews rather than considering only quantitative information.

CONCLUSION

Throughout the study, the researcher's attempt was to identify emotional factors influencing professionals' adoption to electronic payment in Sri Lanka. The results of this study replicate and extend earlier findings from many researchers regarding technology readiness dimensions on new technology usage and acceptance such as e-banking, online shopping, and mobile payments. Additionally, the researcher was able to add knowledge to existing literature by identifying two unique emotional factors called professional satisfaction and skepticism. Identification of these emotional factors is necessary for e-businesses to improve their sales by enhancing their target consumer base. The suggestions as explained in the third objective will help businessmen and bankers to reduce their cost of the payment system and to minimize financial frauds and errors through utilizing electronic payment methods.

As per the study results, professionals' emotions regarding e-payment are mainly driven by security, trust and comfort as well as they more concern on enhanced flexibility and control (optimism), the satisfaction they receive as well as their innovative experience to adopt electronic payment methods. Identification of these factors and designing payment structure of e-business is important to enhance and retain the consumers in order to maximize their sales.

Overall, the intention of this study is to focus on assessing the nature of emotions regarding e-payment and to determine the emotional factors influencing professionals to adopt electronic payment methods in Sri Lanka.

Assumptions and Limitations of the Research

This research also conducted under many limitations as other researchers. These limitations should be taken into account when the results of this research are interpreted. This study has been mainly focused on professionals in Sri Lanka. The results of the same, if conducted by considering another specific group of respondents may vary. The general predisposition, perceptions, and behavior of professionals may differ from other people regarding electronic payment usage. Mainly occupation, income level, geographical considerations and family background may differently affect an individual's emotions regarding new technologies. These motivations or emotional factors will need to be measured empirically considering other demographics in future research.

The same study can be expanded face to face card usage for financial transactions since the present study only focuses on the use of electronic payments for online transactions, according to the working definition of e-payment in the present study. In real-world scenario, many consumers utilize electronic

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

cards when they are physically going for shopping. Therefore the findings of this study are limited to online shopping.

Like many other empirical studies, this research might also have some limitations in reference to sampling, data collection, and generalizing of the findings. The sample drawn from the study may not be enough to generalize the study results.

Although the present study suffers certain limitations it also possesses some strong implications that give it good weight age. Firstly, this study consists of almost good sample size. Tabachnick's rule of thumb suggests there should be at least 300 cases for factor analysis. Hair et al., (2006) suggested that sample sizes should be 100or greater. A number of textbooks cite that work of Comrey and Lee in their guide to sample sizes: 100 as poor, 200 as fair, 300 as good, 500 as very good and 1000 or more as excellent therefore this study consist with 460 sample and response rate is 65.2%.

Assumptions

1. The data collected through the research were accurate and unbiased.
2. There is no change in e-commerce business policies and government ideas and regulations.
3. During the data collection, there are no any changes in electronic payment system in Sri Lanka.
4. All selected respondents in the sample will provide full - corporations for this study.
5. All the respondents will provide answers in a true and fair manner.

KEY TERMS AND DEFINITIONS

Discomfort: A perception of lack of control over technology and a feeling of being overwhelmed by new technology.

Exploratory Factor Analysis: A statistical method used to identify or discover the underlying structure of a large set of variables.

Innovativeness: The extent to which an individual believes he or she is at the leading edge of new technology or to be the pioneer of using a new technology or technology-based services like e-payment.

Insecurity: Feeling of unsafely.

Optimism: A belief that technology offers people increased control, flexibility, and efficiency in their lives.

Parasuaraman: Person who has firstly defined the term technology readiness.

Professional Satisfaction: The extent of a product or service meets or surpasses a professional's expectations.

Skepticism: Feel something in doubtful manner.

Technology Readiness: Peoples propensity to embrace or use new technology to accomplish his or her goals in home or work life.

Statement	Strongly Disagree	Disagree	Neither agree or Disagree	Agree	Strongly Agree
15. Descriptions about use of e-payment are not helpful because they do not explain things in terms I can understand.	1	2	3	4	5
16. Sometimes, I think that e-payment systems are not designed for use by ordinary people.	1	2	3	4	5
17. There is no such thing as a manual, guidelines about how to use modern e payment methods that is written in plain language.	1	2	3	4	5
18. When I get technical support from a provider (from merchant) about electronic payment, I sometimes feel as if I'm being taken advantage of by someone who knows more than I do.	1	2	3	4	5
19. It is embarrassing when I have trouble with online transaction while people are watching.	1	2	3	4	5
20. E-payment makes it too easy for governments and companies to spy on people.	1	2	3	4	5
21. E payment system always seems to fail at the worst possible time.	1	2	3	4	5
22. I do not consider it safe giving out a credit card number over a computer.	1	2	3	4	5
23. I do not consider it safe to do any kind of financial business online.	1	2	3	4	5
24. I worry that information I send over the Internet will be seen by other people.	1	2	3	4	5
25. I do not feel confident doing business transactions with a place that can only be reached online.	1	2	3	4	5
26. Any business transaction I do electronically should be confirmed later with something in writing.	1	2	3	4	5
27. Whenever something gets automated, I need to check carefully that the machine or computer is not making mistakes.	1	2	3	4	5
28. The human touch is very important when doing online transactions with a business.	1	2	3	4	5
29. When I call a business, I prefer to talk to a person rather than a machine.	1	2	3	4	5
30. If I provide information to a machine or over the Internet, I can never be sure it really gets to right place.	1	2	3	4	5
31. Other people come to me for advice on online shopping and e payment.	1	2	3	4	5
Statement	**Strongly Disagree**	**Disagree**	**Neither agree or Disagree**	**Agree**	**Strongly Agree**
32. In general, I'm among the first in my circle of friends to adopt e-payment when it appears.	1	2	3	4	5
33. I enjoy the challenge of adopting modern e shopping experience.	1	2	3	4	5
34. I find I have fewer problems than other people in online shopping and e-payment activities for me.	1	2	3	4	5
35. I feel like special when I pay using electronic card.	1	2	3	4	5
36. E-payment is used by only richer people.	1	2	3	4	5
37. Online shopping gives me chance to do different things from time to time.	1	2	3	4	5
38. I feel I can do something special that makes use of my abilities regarding online shopping and e payment.	1	2	3	4	5
39. This helps me to spend my leisure time happier.	1	2	3	4	5
40. 24*7 day shopping experience and payment facility makes me more satisfied.	1	2	3	4	5
41. My previous experiences make me use e-payment, online transactions again and again.	1	2	3	4	5
42. My friends' successes on e-payment affect me also to use e-payments.	1	2	3	4	5
43. I believe I do possess all capabilities regarding e payment transactions.	1	2	3	4	5
44. I rarely receive quality goods through e-payment transactions.	1	2	3	4	5
45. Provided information doesn't match with real product or service.	1	2	3	4	5
46. I don't believe all the information provided by merchants.	1	2	3	4	5
47. It's impossible to predict real quality of products before payment.	1	2	3	4	5
48. I often use e-payment to purchase expensive products.	1	2	3	4	5
49. I use e-payment because I can pay electronically for all my needs.	1	2	3	4	5

Thank you.

Chapter 80
A Review of Antecedents of Online Repurchase Behavior in Indian E-Commerce Paradigm Shift

Syed Habeeb
National Institute of Technology Warangal, India

K. Francis Sudhakar
National Institute of Technology Warangal, India

ABSTRACT

The purpose of this chapter is to highlight research areas of customer satisfaction and repurchase intentions and their antecedents in the Indian e-commerce industry. To retain, attract, and satisfy customers, e-retailers need to understand how and why online customers evaluate a web store. The relevant areas of consumer behavior and marketing research were derived to explain the possible gaps to study with respect to e-commerce in India. To do so, a systematic review of online consumer behavior literature is conducted. Following inclusion and exclusion criteria, a total of 109 journal articles are analyzed. The major finding of the chapter was that there is very less amount of research considering the areas of customer satisfaction, trust, loyalty along with repurchase behavior of the online customer in specific to the Indian context. Therefore, it is a need of the hour to extend the study to know the repurchase behavior of the online consumer in present time.

INTRODUCTION

India is one among the fast-moving and drastically growing countries with respect to e-commerce when compared with developed and developing countries. Now a day's internet is playing a vital role in person's life as well as for corporate houses. Because of expanding noticeable quality of e-retailing, enthusiasm among researchers and professionals have expanded towards customer perception and reception.

Researchers have attempted to speculate e-shopping regarding social brain science and data framework perspective of view to investigate its different determinants (Celik, 2016).

Nowadays, people are so involved in their way of life and they claim that it is difficult to go outside and shop. For such factors, the online stores give them countless options to peruse, including refunds that a standard store can never stand while they sit in their home. It should also be noted that if individualists unsatisfied with psychological needs in a face-to-face relationship then they would seek to satisfaction in other contexts such as the online buying (Li, Zhang et al, 2016; Li and Zhou, 2016; Ibrahim Arpaci et al, 2018). Electronic business has become immeasurably worldwide and its aggressiveness is expanding over the previous decades. The most important aspect of the business is to not only attract customers but also retain them to survive and withstand the competition. Hence repurchase from a customer is ending up increasingly noticeable for web-based shopping sites and sellers than at any other time (Jansen et al, 2008).

The number of users when compared around the world, Asia ranks the first with 50.2% internet users, Europe 17.1%, Latin America 10.3%, Africa 9.3%, the remaining percentage is shared by North America, Middle East and Australia (Internet World stats, Mar 31, 2017). Headway in the computer supported innovation and the quick development of web based apps has helped internet business drastic growth (Oh *et al*., 2012). Web based business has turned into a vital piece of the virtual space and has brought about quick development of e shopping space and online shopping websites (Alden *et al*., 2006; Kamarulzaman, 2007).

E-commerce business makes open doors for business endeavors to acquire purchasers globally (Al-Maghrabi *et al.*, 2011). It engages buyers with a broad determination, colossal item data and minimal fleeting and spatial restrictions, which urge them to buy items and services through online rather than physical stores (Wen *et al*., 2011).

The KPMG Report (2017) on E-commerce Retail Logistics India stated that the infiltration of online retail in India's aggregate retail advertise is relied upon to go up from 2.5% in 2016 to 5% by 2020. Aranca Research (March 2018), the report quantified that the online business advertising is expected to reach US$ 64 billion in 2020 from US$ 38.5 of 2017 and US$ 200 billion by the ending of 2026. With developing web infiltration, web clients in India are expected to reach 829 million by 2021 against 481 million as of December 2017 (Ibef, March 2018).

Morgan Stanley (2017) stated that India's e-commerce market will rise to 30 percent to $200 billion by 2026. This milestone will also raise market penetration to increase from 2% to 12% in coming decade and there will be an increment in new internet users from 14% in 2016 to 50% by 2026 and it will help e-commerce industry to grow (India's Digital Leap report 2018). Thus there is a vast market for new entry and as well as the existing e-retailers to grow in future. This marks that research should be done to know the mindset or new consumer's behavior.

In order to predict consumer behavior of online shopping, many models highlighting socio psychological items and informational system items have been developed which includes technology acceptance model, motivation theory, theory of planned behavior and unified theory of acceptance. These studies contributed in support to online consumer behavior, they failed to accomplish keeping online buyers retaining and repurchasing. In the Indian scenario, online shopping portals are increasing drastically. Many retailers that were only into brick and mortar business are forcing themselves to be in electronic commerce due to change in the market environment. Several multinational online shopping players also have made their existence in the Indian market as the usage of online shopping is growing among the Indian consumer

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

As the e-commerce market becomes increasingly dynamic and competitive, the marketers have to acknowledge that the best core marketing strategy is to retain existing customers by satisfying them through service in terms of delivery and service quality (Bai et al, 2008; Udo et al, 2010; Kim, 2010; Ankit keshawani et al, 2017). Indian market conditions have become more competitive than before, there is a need for a business to deliver consumer value by enchanting customers in long term relationships in order to increase greater chances of re-purchase.

Number of e-commerce players though are trying to reach out to the customers, are not successful since they could not grab the customer base. Only very few online sellers have converted themselves into giant sellers. Even though these giants provide high discounts but still fail to create loyalty to its customers and could not create repurchase intention.

Hence, in order to grab customers and take advantage of the smart Indian market, firstly the online sellers need to understand different determinants and dimensions that drive for repurchase intention from the last purchased website. Sullivan et al. (2018) repurchase intentions are influenced by website reputation and online trust. This work makes an attempt to finding out the different determinants that can cause repurchase intention.

Why Study E-Commerce in India?

The e-commerce players have come up with mobile apps or user-friendly browsers and these forces drive the consumers to taste the online experience at their convenience. Research seems to be interesting may be because of various comparisons made by the consumers like mobile versus desktop and online shop versus in-store. The state of mind or perception of consumers comparing the prices of online and in-store gives the interest to make a study of their behavior.

Indian customers are heterogeneous in nature; they like to pay online since they are found shopping online since a decade and want to have greater shopping experience in terms of fast delivery, steep discounts, replacement facility etc. The other kinds of customers are those who bargain and never mind about fast delivery, but the price of the product does matter. No loyalty is found in them when big discounts are given by the sellers.

Nowadays there are multiple competitors in online shopping such as Amazon, Flipkart, Myntra, Snapdeal, Jabong etc. So, it is a challenging job for the online shopping inc. to differentiate their products/ service than others to attract as much as online shopping customers. The differentiation can be based on multiple factors (Athira A Nair, Feb 2017).

Table 1. Reasons for online shopping popularity

Researchers	Reasons
Poulter et al, 2013; Duarte, P et al, 2018	convenience
Palmer, 2013; Bodur, H. O et al, 2015; Gorodnichenko, Y et al, 2017	price comparisons online, product comparision
Poulter, 2013; Delacroix, E 2016	avoiding long queues
Eckler, 2013; Anil Bilgihan 2016; Lee, C. R et al, 2017	consumers can shop online anywhere, anytime
Poulter, 2013	one third of consumers shop in bed, 24/7
Lauden & Traver, 2013; Shehu, E et al, 2016; Ma, S 2017	Free offers, No crowds or no queues, Easier to find items, Direct shipping to home

Table 2. Reasons why online shopping seems to be dissatisfying and annoying

Researchers	Reasons
Rackspace (2013)	complicated check out procedures
Adeshara, 2013, Palmer, 2013; Chen, H. M et al, 2016; Wang, Y et al, 2016	High shipping costs, product information lack, security issues and few online payment options

BACKGROUND

Measuring consumer behavior and perception is an ongoing process for every industry since no business can survive without consumers/Customers. Measuring consumer behavior is also important because it helps the organization in understanding the target audience. Considering past decade it is found that there is internet usage growing and also found that businesses expanding by adopting e-commerce to mark their presence globally. Considering Asia Pacific region internet penetration for the year 2017, the top position is taken by China with 731 million internet users and India takes second place with 462 million internet users (Statista, 2017).

The Internet and Mobile Association of India and market research firm IMRB International mentioned that Indian internet penetration present is around 31% and digital transformation will take India's internet users to 829 million (59 percent of the Indian population) in 2021 from 373 million (28 percent of the population) in 2016. This indicates there is much positive to happen in e-business and online shopping in India.

Internet users increasing day by day and prefer shopping online because of social networking sites are seen increasing. But a question arises irrespective of time, how to attract the customer and make him/her as a loyal customer to the online shopping seller. To answer this question, many academicians, researcher and consulting firms have tried to answer this question but failed to give a proper solution. This may be due to the changes in the consumer behavior and market advancements. For effective marketing strategy development studying consumer behavior is used as a key phenomenon.

Online shopping is the topic that has been researched and provided proven outcomes from past to nowadays, but still, as the time passes there is a need to study to know consumer behavior. The post-purchase behavior of consumer should be studied regularly since making consumers stick to the same e-commerce is difficult these days because of steep discounts and cheap products. To measure post-purchase behavior, the consumers need to test whether they are satisfied or dissatisfied.

The satisfaction and dissatisfaction of consumers falls between product performance and consumer's expectations. The larger the gap between product performance and consumer's expectations, there will be greater consumer's dissatisfaction. Also retaining customers these days is not that easy, so a gap is open to study why these customers do shopping with different e-stores and need to find out which factors lead them to shop with other online sellers. Thus there is still a need to study post purchase behavior of the online customer in present days.

Several factors are found that govern the growth of e-commerce in India. Online players need to understand the need that holds the customer stick to their earlier purchased company or seller. This can only happen with a thorough understanding of the Indian online consumer behavior. Online shopping behavior is governed by quality, price offered and seller's reputation (Genrt et al, 2012). In the quality at any price offered, reputation will be the most dominant segment in the online shopping behavior. May be

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

this is the reason why customers tent to buy from prominent online seller's. Once the customers found to be satisfied with online shopping, they will tend to repeat purchase (Jiang and Rosenbloom, 2005).

The needs and wants of the consumers keep on changing as time goes and this needs to be remembered by the company. It's seen too often that brands focus on product catalog and forget about its customers. Always consider who your business is being built for. Remembering the wants and needs of the consumer's should be important for a company. As time goes on the tastes of the consumer's change and studies should regularly be done in knowing how to retain the consumer make him repurchase again and again. Thus, this study is focused on the factors that develop trust and repurchase intention of Indian consumers in the present competitive market.

Overview of Reviewed Articles

A systematic approach was followed to literature search. The academic publications from 2005 to 2018 were focused. In the journal papers considered more focus was made with respect to repurchase behavior and its antecedents were high lightened. Major journal papers in the areas of consumer behavior, services marketing and e-commerce were also included.

India is competing with global retailers because India is having a very good potential market. Since the internet users number is growing day by day and thus it is very necessary to identify the various factors that affect Indian consumers online shopping behavior in order to research hoe these factors stimulate the online shopping behavior (Jayendra Sinha, 2012).

Hong-Youl Ha et al. (2008) carried out a study that employs a cross-cultural perspective which explores alternative explanations in the development of the online repurchase intentions model. Structural equation modeling was applied to test the model which deals with key consumer behavior factors such as customized information, web use applications, online service and perceived interactivity which lead to formation of purchase intentions. The results explain the power of customized information that lies in its ability to influence consumer satisfaction and perceived interactivity that are proximate to repurchase intentions.

Fang, Y et al. (2009) have focused on the relationship between customer satisfaction and repurchase intention and showed that the customer satisfaction is not predominantly result in the frequent repurchase. There are many possible factors connecting to the relationship in repurchase behavior. Vinerean, S et al, (2013), worked with the psychological and social factors and cheeked their influence on online shopping behavior. The results conclude that social media or social networks influence online perception and trust with respect to a specific website through word of mouth. Hsu, C. L (2009) studied external & internal factors that influence customer satisfaction and loyalty relationship using structural equation modeling as an analytical tool. Their findings show customer satisfaction and website service quality has a positive effect on loyalty and also states that technology acceptance model factors positively influence customer satisfaction and loyalty.

Grewal *et al.* (2009) establish that online satisfactory shopping knowledge can increase in repeat purchase plan. According to self-perception theory (Johnson *et al.*, 2001), people may frequently modify their perceptions as they procure new information about the pivotal behavior. Hand et al. (2009) explored situational factors that influence adoption of online grocery shopping and posited that due to service issues some customers discontinued grocery shopping. Doherthy & Ellis (2010) in their comprehensive literature review stated that consumer has become more powerful and also stated that competitive pricing wins competition in e-retailing environment.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Mummalaneni V et al (2009) reported that service quality induce online customers to repurchase from the previous seller. Zhang et al (2011) mentioned in their research that repurchase intentions exert influences with service quality. Bhupinder ps chandar et al (2016) mentioned that with the increasing players in online market, the marketers need to have an edge in terms of service quality to gain a large market share in competitive market. This study explained the service quality concept along with most significant factor in e-service quality which attracts consumer online buying. The results say that the most important factor in measuring service quality is the privacy of website and delivery of goods on time. The growth of internet and online shopping will increase in larger number in coming years; so online sellers should think about how to make customers repeat purchase.

Richard M. O. et al. (2010) the influences of web atmosphere and internet experience on consumer e-shopping behavior is examined in this paper, which developed to the model of web navigation behavior. They assessed the role of men and women for online shopping behavior. Results revealed that, women engaged more exploratory behavior and website involvement than men. The key attitudes of website are effectiveness of information content, entertainment and challenge.

Boudhayan Ganguly et al. (2010) to provide empirical evidence that trust in online stores is positively influencing the purchase intention and reduces the perceived risk; the mediating role of trust is tested in this paper. Confirmatory Factor Analysis is performed to analyze the questionnaire. The factors such as website design, information design, visual effects and navigation influence trust through which purchase intensions increase

Su & Huang (2011) analyzed online shopping intention of China's undergraduate consumer based on theory of planned behavior. Their results posited that price of products and student' computer knowledge influences the online shopping intentions.

Mustafa I. Eid (2011) a conceptual framework which hypothesizes the relationship between the constructs of e-commerce and their antecedents to identify the factors that influence consumers trusts, satisfaction and loyalty towards B2C e-commerce. Results proved that customer's loyalty is more influenced by customer satisfaction and less influenced by customer trust. Kim Hee-Woong et al. (2011) the relative influence of price and trust on online purchase decisions of potential and repeat customers are examined in this paper. For developing customized sales strategies to target different groups of customers the relative impacts and the relative roles over customer transaction experience is useful. From the results it is observed that perceived trust has more effect than the price on purchase intensions. The repeat customers purchase intensions are much influenced by perceived price.

Ha & Stoel (2012) tested the influence of e-shopping quality on e-shopping satisfaction and e-shopping intention and also testing consumer experiential e-shopping motives as a moderator on USA apparel retail store. The results posit that website content have a significant influence on e-shopping satisfaction which indeed contributes to e-shopping intention, also found that security and consumer service have a significant impact on e-shopping intention but not on e-shopping satisfaction. Dwivedi et al. (2012) studied review of existing literature with respect to online retailing in India and identified some factors that motivate consumers to shop online. These factors include convenience, payment mode, delivery and cost saving. The challenges found out were security and transaction fraud issues, competitors are click away and consumers waiting for best offers.

Gong W et al. (2013) studied the factors those influence Chinese consumers to shop online considering the effect of demographic characteristics on e-shopping intentions. The results depict that age, income, education and marital status show significant impact on online shopping intention. Nachiappan Subramanian et al (2013) studied the impact of customer satisfaction and Chinese electronic retailer's

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

competitiveness considering quality factors. This Study proposed two conceptual models based on asset-process-performance (APP) competitive theoretical framework. By using SEM, the researchers could identify reliability in service quality along with purchasing experience in e-service quality as dominant customer satisfaction elements. They made a conclusion that to be competitive e-retailers, they have to focus more on delivery of products (logistics) compared to other intangible service quality factors.

Ariff M S M et al. (2013) the study showed the relationship and the impacts of e- SQ and e- satisfaction on e- loyalty in internet banking are examined in this research. The modified version of E-SERVQUAL instrument was used to determine e- SQ. Survey was conducted and data is collected from 265 internet banking users. The factors that affected e-satisfaction are assurance, efficient system availability, privacy, contact-responsiveness and guide constitute e- service quality for the internet banking service, and these are shown in results. The results highlighted the important features of internet banking that attractiveness and appearance of bank's website and the information and guidance provided by the websites.

Waseso Segoro (2013) this study was done seeing in the decline of customer satisfaction and loyalty in service firms. The factors such as customer perception on service quality, mooring factors and relationship quality are identified as influences of customer satisfaction and loyalty. To measure these factors questionnaire was distributed to students who subscribed to cellular operated services. The Structural Equation Model (SEM) was used for data analysis. Results showed that customer perception and relationship quality had positive correlation with mooring factors, these also have positive direct influence on customer loyalty.

Hana Uzun (2014) in a study about factors affecting online shopping behavior which measures consumer's previous experience and mentioned that if consumers are satisfied with the online seller with minimal risk level then they will buy more in future. Thus the consumers become loyal to the online seller. Brady & Cronin Jr. (2014) the effects of being customer oriented and outcome behaviors on service performance perceptions are studied in this paper. Using the two step approach the model was tested. The results showed the link between physical goods quality, services cape quality and performance service quality.

Chinho Lin, Watcharee Lekhawipat (2014) examined the effects of online shopping experience and pattern in relation to adjusted expectations for increasing online repurchase intention. Study used partial least square (PLS) as a method to analyze the measurement and structural models. The results showed that online shopping pattern acts as a moderator of both customer satisfaction and adjusted expectations, whereas online shopping experience can be perceived as a key driver of customer satisfaction. If the product or service meets the customer satisfaction will develop an intention to repurchase. Since customer satisfaction is known as bunch of many factors such as good feeling when comparing product with others, expectations match with the product and service etc.

Giovanis & Athanasopoulou (2014) in their study they tested the customer loyalty in e-tailing. They investigation was done to determine e-SQ and their dimensions to e-satisfaction and e-trust, the relevant impact of e- satisfaction and e-trust on e-loyalty. Data was collected from 451 customers of consumer electronics e-tailers. The results showed that the e-loyalty is positively affected by e-satisfaction and e- trust, the antecedents of e-satisfaction and e-trust are the e-SQ dimensions such as reliability, privacy and usability. The relationship between the information quality/benefits, responsiveness and web design & e-trust are mediated by e- satisfaction.

Srivastava M & Alok Kumar Rai (2014) this paper discussed the service quality -customer loyalty relationship in life insurance sector. By assessing the moderating influences of trust it offers further insights. Results proved that relationships are statistically significant. Customer loyalty has a strong and

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

positive relationship with service quality and trust. Zeki Atıl Bulut (2015) investigated Turkish consumers intentions considering e-satisfaction, e-trust and e-loyalty and revealed that there exists a positive relationship between repurchase intentions and these construct. Also found that e-trust is a very important determinant for online repurchase intentions. Michelle Carter et al. (2014) in this research paper the authors did an empirical study of the relative influence of trust versus switching costs on e-loyalty for online service providers. They also examined whether the relationship between switching costs and e-loyalty are moderated by trust. Results showed that trust is the important factor of e-loyalty than the switching costs. It also revealed that switching costs depends on the trust that customers have.

Mubbsher Munawar Khan, Mariam Fasih (2014) made a study to determine the satisfaction level of banking customers regarding quality of different services provided by their bank and their loyalty with the respective bank. This study was made to find out which service quality dimensions may enhance customer satisfaction and customer loyalty in a better way. Descriptive statistics, one sample t-test, correlation and regression are used to analyze the data. The results indicate that service quality and all its dimensions have significant and positive association with customer satisfaction and customer loyalty. Today's online businesses lack loyal customers. Making customers stick to the company and purchase again and again is a question raising issue. Thus it is very important for a business to manage satisfaction, belief, and customer loyalty in the adoption of E-commerce services for business development.

Gerson Tontini et al. (2015) considered the nonlinear impact of online retail stores quality dimensions on general customer satisfaction and loyalty. Using factorial analysis with verimax rotation, five service-quality dimensions are studied: service accessibility/speed, fault recovery, buying reliability, service and site flexibility and site interaction/ feedback. Penalty and reward difference analysis identifies the Kano model classification of the service-quality dimensions, and the nonlinear impact of these dimensions, and customer satisfaction, on customer loyalty. The findings show that there is a nonlinear impact of these dimensions, and customer satisfaction, on customer loyalty.

Muita Sobihah et al. (2015) has made a study which deals with E-commerce service quality on customer satisfaction, belief and loyalty. The collected data was tested by confirmatory factor analysis. This paper has sought to examine the perception of foreign tourists towards e-commerce service quality in Malaysian hotel websites that influence their satisfaction, belief and loyalty. On basis of discussions throughout this paper, it was found that customer satisfaction and consumer belief will be influenced by E-commerce service quality and also the mediator that will influence customer loyalty in using the website as a substitute for traditional purchases. The researchers conclude as, In order to have a loyal customer, the hotel industry should fulfill the service quality expected by the customer that will satisfied and have belief with the service provider.

Siqi Ma (2016) investigated delivery time interacting with shipping charges on customer satisfaction and purchase intentions and found that increase in delivery time increases customer ambiguity and perceived riskiness which negatively impact purchase intentions. Further Edlira Shehu et al (2016) worked on free shipping promotions and their impact on online retailers, his findings state that free shipping promotions will increase return shares to the sellers. Jorge Matute (2016) explored the characteristics of consumer reviews taking e-word of mouth in to consideration and its impact on repurchase intentions. The results indicate that e-word of mouth quality has a positive effect on repurchase intentions.

Lin and Jing Luo et al (2016) explored the quality factors influencing customer satisfaction in the e-commerce context using a triadic view of customer, e-retailer, third-party logistics provider, and to investigate the impacts of service quality on customer satisfaction and loyalty provider in the e-retailing supply chain. Structural equation modeling is used to analyze collected data and test the hypothesis.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The findings indicate that e-service quality and logistics service quality are strongly linked to customer satisfaction. Also found that e-Service quality positively impacts customer satisfaction with logistics services, but logistics service quality negatively impacts customer satisfaction with e-services. The results show that e-retailers should not only focus on e-service quality, but also logistics service quality, which is critical to the success of e-commerce.

Ibrahim Elbeltagi Gomaa Agag (2016) studied online shoppers in Egypt to develop a new framework that explains impact of e-retailing ethics customer satisfaction and repurchasing intention and mentioned that the factors like Security, Privacy, non-deception, fulfilment/reliability, and service recovery are strongly predict the customer satisfaction and repurchase intention.

Hong-Youl Ha et al. (2016) in their paper using trust as a mediator in online shopping they examined the effects of perceptions of information obtained from social networks. For this, they have conducted an email survey. They adopted a two dimensional view of trust i.e.., cognitive and affective trust. Using longitudinal approach direct and indirect effects of information perceptions on behavioral intentions are empirically explored. Results show that there is a significant carryover effects from time T to time $T+1$ in perceptions of information obtained. The study revealed that over time, the influence of affective trust is greater than that of cognitive trust, both in its effect on behavioral intentions as well as in its mediating role between information perceptions and behavioral intentions.

Thi Song Hanh Pham et al. (2017) studied the determinants of online customer satisfaction taking online shopping experience based on UK consumers. The items include order fulfillment, ease of return and customer service and found these items showed significant influence to online customer satisfaction. The most important interpretation was that website appearance on customer satisfaction found insignificant. Their findings also state that customer satisfaction leads to repurchase behavior and also spreading positive recommendations. Xiabing Zheng et al. (2017) this paper highlighted about that e-loyalty is the driver of online shopping. The theoretical analysis of coupon proneness and value consciousness in e-loyalty are examined. Results said that value consciousness and coupon proneness plays a important role in e-loyalty.

Yeolib Kim & Robert A. Peterson (2017) this study examined the role of online trust in B2B e-commerce. A meta-analysis on antecedents and consequences of online trust was conducted where related relationships were influenced by moderated variables. 16 pairwise relationships derived from 150 empirical studies were analyzed. This analysis revealed that online trust exhibits significant relationships with selected antecedents (perceived security, disposition to trust, perceived reputation, perceived risk etc.,) and consequences (purchase intention, attitude, satisfaction, loyalty etc.,). The Hedges and Olkin (1985) procedure for analyzing correlated coefficients was suggested for analysis of each pairwise relationship.

Oliveira, T et al. (2017) this paper tested the path model that can have solutions to increase trust for internet vendors. The three main dimensions of trust in this path model are competence, integrity, and benevolence. And assessed the influence of overall trust of consumers. The analyzed various sources of trust i.e. consumer & firm characteristics, website design and interactions with consumers. The model is tested through collecting data from email survey. Results suggest that consumers with high overall trust demonstrate a higher intention in online purchasing.

Al-dweeri et al. (2017) e-satisfaction and e-trust as mediators the present study analyzes the relationship between e-SQ and e-loyalty (both behavioral and attitudinal elements) in online shopping. Confirmatory factor analysis and structural equation model were performed to a sample of 302 website users of amazon.com. Results showed that factors such as efficiency, privacy and customer services are

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

considered as important factors of e-SQ. the relationship between e-SQ and behavioral and attitudinal loyalty are mediated by satisfaction.

Xiaolin Lin et al. (2018) this paper investigated on gender differences in the effects of perceived risk, vividness, interactivity and diagnosticity of consumers in making web-based purchase decisions. Attitude formation influences the perceived risk & interactivity more in males, in females it was vividness & diagnosticity. The results highlighted that importance must be given to gender while developing a website.

Dung H. Nguyen (2018) performed a systematic review of consumer behavior and order fulfillment in online retailing. The findings state that future research on developing consumer service strategies responses which found significant impact of order-fulfillment elements on consumer behavior.

Habeeb S & Francis K F (2019) examined the effects of service quality and satisfaction on consumer behavioral intentions. The results posit that e-service quality has a positive effect on e-satisfaction and influences behavioral intentions like word of mouth, website revisit and repurchase intentions.

Based on internet growth, online shopping is growing fast and could see great number of opportunities for e-vendors to rise and preserve interaction with customers. There is a difference between customers with respect to spending more money or spend less and buy often. Thus customer retention states to be very important concern for firms wishing to obtain a competitive advantage. Prior studies show that increase in customer retention leads to higher profits for the companies. In customer retention process, satisfaction of customer plays a vital role. Lee *et al.*, (2009), stated that a satisfied customer is more likely to return. Further it develops loyalty towards the product or service.

Till today, most of the researchers have focused on how to acquire the customer, especially focusing on the service quality and satisfaction. As the technology advancements in the online shopping and competition among the major players in India, companies such as Amazon, Flipkart, Snapdeal, Myntra, Homeshop18, pepperfry, Infibeam etc trying to satisfy the customer and making them to repurchase the product or service. It is the need of the hour to study how repurchase intention will develop in the Indian consumers and what factors influence it.

In Asia, India shares half billion of internet users. Rababah et al (2011) mentioned that the success of e-commerce is not just because of web site, low price but also because of the delivery and quality of the web site; if these factors are good, customers are willing to pay more for the product or service. This represents that quality plays a crucial role in attracting and retaining customers to the success of the company on online shopping.

Variety of firms and organizations are creating business opportunities on the internet and these corporations are spending more and more money on websites, advertising with a hope of creating customers to buy product and services through online. (Bahram Ranjbarian, Saeed Fathi, 2012) stated in a study that the success or failure for e-commerce businesses is not because of web existence or low price but delivering right quality of e-service. The researchers have conducted an empirical investigation which proposes and tested an e-satisfaction model. The adopted model categorizes five dimensions representing satisfaction with internet purchase experience and analyzes online-customers attitude towards internet shopping based on their perceptions based convenience, the kind of merchandising, website design, security in doing transaction and serviceability in e-satisfaction. Factor analysis was used and the findings shown that four factors such as convenience, merchandising, security and serviceability have influence on customer e-satisfaction but the influence of website design on e-satisfaction was not sustained despite its indirect impact on security and serviceability.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

RESEARCH GAP

Considering the development in e-commerce, growth in number of internet users, competition the market, the websites or online sellers are not able to meet the demands and needs of their customers like before, the reason could be continuous rise in customers' expectations and demand for better and cheap products or services. Seyed & Jamalabad (2011), stated in a study that there is a danger of attracting our unsatisfied customers by the competitors and this ends up in losing profits to the company. So, the business specialists should understand that losing customers is very costly to the company and developing customers trust, making repurchase happening is what needed. One of the main goals of a marketer is that look for satisfying the customers, develop trust in them which in return makes the customer to become loyal to the company and repurchase.

As the e-commerce market becomes increasingly dynamic and competitive, the marketers have acknowledge that the best core marketing strategy is to retain existing customers by satisfying them through service in terms of delivery and service quality (Bai et al, 2008; Udo et al, 2010; Kim, 2010; Ankit keshawani et al, 2017). Indian market conditions has become more competitive than before, there is need for a business to deliver consumer value by enchanting customers in long term relationships in order to increase greater chances of re-purchase.

The review of literature on online shopping has revealed that majority of research in this area has conducted outside India. There is dearth of literature available in India which explores the acceptance of online shopping by identifying the motivating factors and various challenges of online shopping. Earlier studies have focused on the influence of e- Word of mouth on consumer behavior along with antecedents and consequences (Hennig T et al, 2014; Khammash & Griffiths, 2011). Few studies have focused considering online shopping habits and experience (Khalifa et al, 2007; Meng-Hsiang Hsu et al, 2015). Most of the studies have explored the effect of isolated dimensions of information (quality & credibility) separately (Park et al, 2007; Cheung et al, 2008). Other studies have focused on the trust and website usefulness as the important determinants in explaining consumer behavior in the context of online shopping (Gefen et al, 2003; Chiu et al. 2012). However, very few studies have explained the influence of diverse online shopping determinants and consumer characteristics on e-trust and repurchase from a holistic perspective. Indian market conditions has become more competitive than before, there is need for a business to deliver consumer value by enchanting customers in long term relationships in order to increase greater chances of re-purchase.

To address the above gap, the present study develops a model to explain how quality attributes influence customer satisfaction and then the impact on customer trust and customer loyalty and their influence on customer repurchase intentions.

Conceptual Framework of the Study

Boston Consulting Group (BCG) and Internet and Mobile Marketing Association of India (IAMAI) stated in a report that Indian internet users could cross 550 million in 2018 making India online population to stand in second position in the world. The report also states that Indian e-commerce is being used by only 11 percent of internet population when compared China internet population uses 50 percent of e-commerce. With the upcoming on 4G network and cheap internet providers Indian online shopping is emerging fastly. There exist a great number of opportunities for the Indian online players to rise. The Indian e-players or e-vendors have to rise up and grab the customer base in India. There are several factors

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

contributing to the growth of e-commerce in India, firms need to understand and build on competencies that will hold the customer. Thus to with stand in a fierce competition the Indian ecommerce players had to think about customer retention.

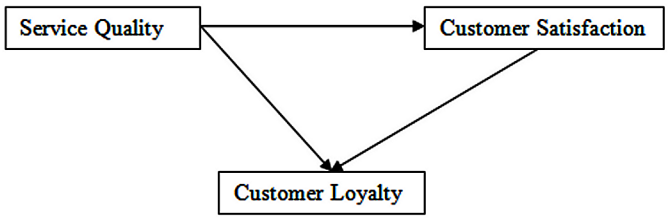
Among the most important researched concepts in practice and in academia customer loyalty, satisfaction, service quality and repurchase had to be given more important in order to study about a consumer behavior. In order to have an upper hand in competitive markets and to stand tall in grabbing the competitive advantage; customer satisfaction, loyalty, service quality and repurchase intentions shows powerful impact on e-commerce vendors (Tamilla Curtis 2013, Zineldin 2006). Despite of ample research on the relationships between customer satisfaction, service quality, loyalty and repurchase, these relationships look to be complex and are therefore not well understood. Thus this study would be performed to know which among the above relationships would grab and retain the online customers to repurchase again and again.

For setting efficient and effective business objectives and implement them, the e-commerce players should know it's customers needs, characteristics and behaviors. Allessandro Russieri, Cecilia Silvestri, (2014); Srivastava Rai, (2013); Cussignani Mular, (2009); mentioned in their studies that e-commerce players need to adopt new strategies in order to target new customers. E-commerce players should also care about retaining the old customers by making them do repeat purchases.

Yingsheng Du & Youchun Tang (2014), mentioned that in any industry customer satisfaction is to know their needs and fulfilling their needs by offering something extra. Once the customer is satisfied with the products and services provided by the e-commerce sellers, the customers become loyal to the e-commerce company. On the other hand, service quality is known to be the antecedent of customer satisfaction and service quality cannot exist without customer satisfaction. Allessandro Russieri &Cecilia Silvestri (2014), pointed that customer loyalty cannot be taken for granted since customers are attracted to cheap products and discounts from other competitors. If customer satisfaction can be pursued with service quality, there are greater choices of having satisfied customers.

(Caruana, 2000; Hou Xinggi, 2008; Deng Yingsu, 2013; Peng yan, 2006) carried out studies on relationships containing service quality, customer satisfaction, customer loyalty and proved that service quality affects customer loyalty indirectly through customer satisfaction. The model is represented in figure 1. These relationships were examined in various industries like training, catering and hotel industries and online securities trading. So the scope of future research can be done on online shopping or e-commerce industry.

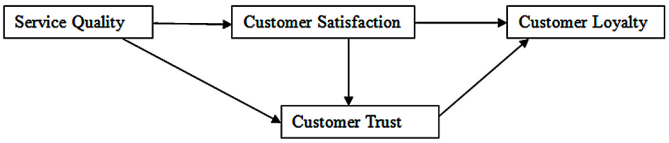
Figure 1. Caruana (2000), Hou Xingqi (2008) Model stating relationship between service quality, customer satisfaction and customer loyalty



EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chang Yaping et al (2009) and Zou Jianping (2010) worked on the concepts including service quality, customer satisfaction, customer trust and customer loyalty in the network and express industries. From the figure 2 it is seen, researchers stated that service quality affects customer loyalty through intervening variables like customer satisfaction and customer loyalty separately.

Figure 2. Chang Yaping et al (2009); Zou Jianping (2010) Model stating relationship between service quality, customer satisfaction, customer loyalty and customer trust



In above both models the researchers discussed stipulated variables such as service quality, customer satisfaction, customer loyalty and customer trust. To make the present study more interesting and result oriented, the researcher would like to add another variable i.e. repeat purchase. Because researcher have found the variable repeat purchase is yet to be tapped with respect to online shopping in India.

There are no fixed research models containing above relationships like service quality, customer satisfaction and customer loyalty. Based on existing literatures researchers or scholars should build their own research models for future study. Thus the literature reviewed in this paper gives a scope to add one more variable called repurchase intentions. Thus Zou Jianping (2010) model can be extended with adding repurchase intention or repurchase behavior to the existing model. The proposed models 1, 2, 3 are respectively shown in figure 3, figure 4, and figure 5.

Figure 3. Proposed model l

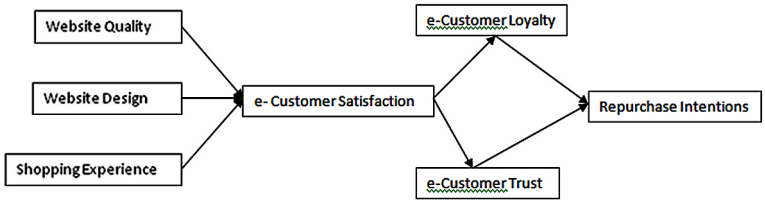


Figure 4. Proposed model 2

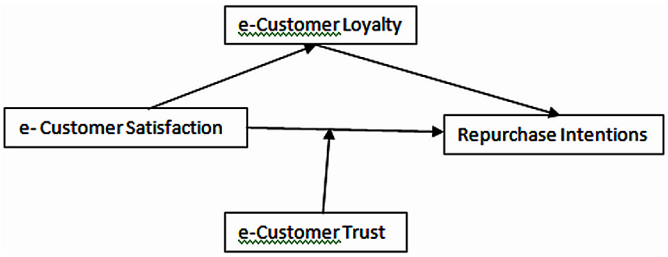
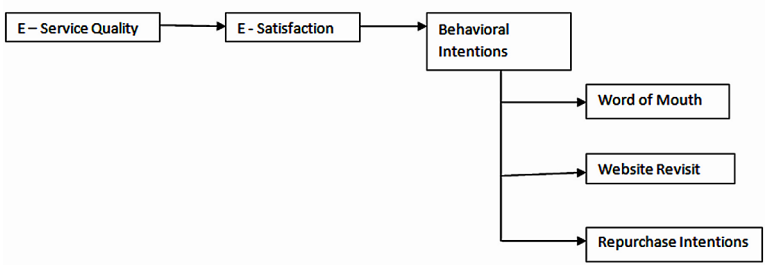


EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. Proposed model 3



Our study tries to attempt considering previous reported findings to explain the various relationships of above mentioned proposed model. The questions with respect to the model will be asked like;

1. Does e-customer satisfaction antecedents impact directly or indirectly on customer repurchase behavior.
2. Does e-customer satisfaction and e-trust influence positively the e-customer loyalty and leads to customer repurchase behavior.
3. Does e-customer trust moderately influence the relationship between e-customer satisfaction and repurchase intentions?

DISCUSSION

Cameran et al (2010); Deng et al (2010); Ojo et al (2010); Pantouvakis, (2010); in their studies found that customer satisfaction is an effective post purchase evaluation with respect to service management literature. Bayraktar et al (2010), stated that customer may switch to other online sellers if they are not satisfied with the service provided by the seller. Cameran et al (2010); Grigoroudis et al (2007); Sanchez-Hernandez et al (2010); mentioned in their studies that service quality was found to be the main determinant of customer satisfaction and also influences purchase intentions.

Caceres & Paparoidamis (2007), mentioned in his study that customer trust has more influence on customer loyalty. The online customers will continually purchase and even recommend the service if there is a prompt service is provided, this is when the customer trust the sellers (Deng et al., 2010). Grewal (2004), mentioned that positive customer trust gives high-level repurchase intentions to the online seller. Trust is a critical factor influencing repurchase behavior (Gounaris, 2005), because it makes a strong bond between the supplier and the customer.

In order to remain loyal to the sellers the consumers wants satisfaction (young & Peterson, 2004). Since the nature of the business in present days is aggressive and competitive, thus the need exists for a retailer to give some advantage and Importance to their customers to retain them (McElheran, 2013). (Ali & Sankaran, 2010: Mattson, 2009) stated that customer satisfaction is one of the main antecedent to the variables like customer loyalty, customer trust and repurchase behavior. Bagram & Khan (2012), customers becoming loyal to a company is that easy, because they do not get satisfy that easily. Thompsom (2005), in achieving competitive advantage over other online sellers, the customer loyalty plays an important role with respect to making repurchasing decisions. Thus there is a link between customer

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

loyalty and repurchase intentions (Van Vuuren, Roberts-Lombard & Tonder 2012; Singh & Khan, 2012; Vesel & Zabkar, 2009; Ang & Buttle, 2006; Thompson, 2005).

Owusuah, (2012); Rust & Chung, (2006); Thompson, (2005); mentioned in their studies that repurchase behavior or repurchase intention is the main variable considered for sales and business growth. Observing various relationships mentioned in the above literature and this leaves a gap to be filled in future studies measuring customer satisfaction influence on both trust and loyalty as mediator variables and results in causing a repurchase behavior. Thus from the above literature there exists a gap to fill, that there is very little research done on repurchase intentions along with service quality, customer satisfaction, trust and loyalty with respect to online shopping in India.

Thus there is a need to research with the combination of customer satisfaction, service quality, trust, loyalty and repurchase behavior of an online customer in India. From the above literature it is proven that customer satisfaction, service quality, loyalty, trust and repurchase intentions together are not studied. Thus studies in Indian e-commerce can be done in specific to this relationship.

CONCLUSION

Repurchase intention refers to the consumer's willingness to buy for a long time from the same company (Gounaris, Dimitriadis & Stathakopoulos, 2010). It can also refer to the individual's judgment about buying again a designated service from the same company (Lacey & Morgan, 2009).). Consumer buying behavior can be understood in two stages, thus encouraging people to purchase and enhancing them to repurchase (Zhang et al 2011). Customer repurchase expectation is of principal significance to business specialists since it means that business progression, future revenue prospects and henceforth business productivity (Chang, 2012). The intention to re-purchase is a post purchase behavioral intention that influences customer loyalty, complaint and switch intentions (Meng et al, 2011). The goal of shoppers to repurchase is subject to customer's assessment of the past purchase transactions (Maziriri et al, 2015).

Thus, both business experts and academicians alike have been keen on recognizing the precursors of customer repurchase goal. Strikingly to note, customer satisfaction, customer trust and customer loyalty are reliably among a portion of those elements that have progressively being perceived in the surviving writing as indicators of customer goal to repurchase (Flavian et al, 2006; Kandampully & Juwaheer, 2009; Sirdeshmurk et al, 2012; Chinomona, R., & Sandada, M. 2013). Many other researchers also mentioned that it very necessary to provide products and services which satisfy customer since satisfied customers develop trust in the company and become loyal and ends up in repurchase (Boshoff & du Plessis, 2009; Hong & Cho, 2011; Dabholkar & Sheng, 2012; Kun D, 2013, Zeki et al, 2015).

FUTURE RESEARCH

The future of E-Commerce is not that easy to predict. There are various factors responsible for the growth of e-commerce. E-commerce industry is also faced with serious challenges; these challenges have to be overcome for an online player to succeed in this tense competition.

Future research could collect a broader, more controlled sample and use a greater variety of products. Prospective research could also investigate elements influencing consumers' subsequent purchase behaviors, such as product quality, delivery methods, and after-sales service. In future research, Researcher

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

may study other possible factors affecting online initial trust, such as marketing tactics, product varieties, price ranges, online service, web site quality and levels of convenience.

Today's consumers continue to desire more and for a business to withstand in such a fierce competition, the businesses should target the consumers with providing services in a better manner, faster and cheaper. Businesses should target new consumer needs and trends since internet is available cheaply, internet audience have various choices to prefer. Considering the advancement in technology, the e-commerce players' need's to grab the advantage. E-commerce has to look forward to consumers repurchase and also look forward to grab loyal customer. So an e-commerce player should target in retaining the old customer and use its positive features in attracting new customers. However, e-commerce has its disadvantages including consumer uncertainties, thus these uncertainties have to be resolved with better business practices. This literature will guide the e-commerce players or sellers to prosper with much success and profitability.

DISCUSSION QUESTIONS

1. What are the steps to be taken to grab the customer's attention in the present competitive Indian online market?
2. Compare and contrast online shopping with that of offline shopping.
3. What are the main factors that affect the online consumer when considering a repurchase over the internet?
4. Explain the connection between customer satisfaction and repurchase intentions. Do customers repurchase if satisfied. Why and Why not?
5. Do you agree that studying antecedents of repurchase intentions give some scope for solutions to the organizations over the competition in present fierce online Indian market? Give your suggestions.

Chapter 81
Effect of Online Second-Hand Shopping Experience on Repurchase Intention:
Evidence From Indian Shoppers

Murali Swapana
VIT Business School, Vellore Institute of Technology (VIT), Vellore, India

Chandrasekaran Padmavathy
VIT Business School, Vellore Institute of Technology (VIT), Vellore, India

ABSTRACT

Research on online shopping experience has been studied intensively over the past years. However, there are only few studies related to online second-hand shopping experience. The present study aims to investigate the effect of online second-hand shopping experience on trust, attitude, and repurchase intention. The results indicate that online second-hand shopping experience has a significant and positive effect on attitude, trust, and repurchase intention. Attitude and trust also have a positive influence on repurchase intention. This study provides implications to second-hand e-retailers to develop marketing strategies to retain the existing customers.

INTRODUCTION

In recent years, the dynamics of shopping patterns have been changing. Customers are so passionate towards buying products through e-commerce portals. People have shifted their shopping patterns from brick-and-mortar to online stores due to its varied advantages (Dholakia and Uusitalo, 2002). Products such as electronics, furniture, apparel, and home appliances are certain product categories that fascinate online buyers and attract huge profits to an online retailer (Overby and Lee, 2006). However, online retailers face many challenges to gain competitive advantage and sustain in the business (Papatla, 2011). Understanding and meeting customer expectations is crucial to e-retailers (Sheth, Sisodia, and Sharma,

2000). Measuring the effect of customer's online shopping experience is pivotal to understand customer expectations and to develop and maintain customer relationships in online platform, since poor online customer experience can generate a loss of 24 per cent of online revenue (Econsultancy, 2011). Hence, e-retailers have to focus on providing a positive online shopping experience in order to survive in today's competitive online shopping environment.

Similar to online shopping, online second-hand shopping is highly booming in India (Singh, 2016). The rise of online second-hand shopping is increasing drastically because of expediency and cheaper rates. It attracts a large customer base by enabling customers to even dispose products respectably and still earn profit. Many studies have analysed the concept of online shopping experience in various contexts (e.g., Miyazaki and Fernandez, 2001; Zhou et al., 2007; Bilgihan, Kandampully and Zhang, 2016), only a few research have been conducted on examining the significance of online shopping experience in second-hand context. For instance, few researches have studied factors that motivates the customer to shop second-hand products offline (e.g., Guiot and Roux, 2010; Roux, and Guiot, 2008); few studies on customer initial trust towards online second-hand products (e.g., Lee and Lee, 2005); and few scholars have considered online second-hand business from seller's point of view (e.g., Turunen and Leskinen, 2015). Most of these studies have examined pre-purchase behaviour and motivating factors of online-second-hand consumers. There is a pressing need to investigate the post-purchase behaviour on online second-hand shoppers. Moreover, consumer behaviour often varies between new product and used goods consumption (Anderson and Ginsburgh, 1994). Most of the studies on second-hand shopping are based on developed countries, research on developing countries like India is essential (Kim, Ferrin, and Raghav Rao, 2009).

Hence, this study aims to address the above research gaps by testing the effect of shopping experience on customers' outcome variables. Specifically, this study examines the impact of online second-hand shopping experience on customer's attitude, trust and repurchase intention. The rest of the paper is divided as follows. The next section presents brief review of literature and develops hypotheses. We then present research methodology followed by discussion of findings and implications. Finally, the last section outlines the limitations of the present study and future research directions.

REVIEW OF LITERATURE

Online Shopping Experience

Online shopping has become the topmost activity among internet users (Bigne et al., 2008) and is attaining a popular growth, especially in India (Khare and Rakesh, 2011). According to Comscore (2013), India has the largest population of internet users and more than 100 million users opt for online shopping. As this figure keeps rising every year, online shoppers are becoming more than the number of internet users. This indicates that more users take privilege by shopping online (Farag, Schwanen, Dijst, and Faber, 2007) due to its enormous benefits. For instance, shoppers can buy products/services 24/7 through online and this enables customers to buy the products anytime at anywhere (Ling, Chai, and Piew, 2010). There are also other gains of online shopping such as time saving and comparison of prices with other sellers within a same e-commerce portal as well as other competitive e-commerce companies. In addition, customers can easily track their products, avail discounts, return and get refunds, and buy products from foreign market (Wu, Chen, Chen, and Cheng, 2014). Nevertheless, delivering positive

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

online shopping experience is crucial to an online business firm (Khalifa and Liu, 2007). E-retailers need to implant positive online shopping experience to gain customer loyalty.

Most of the scholars believe that user-friendliness and visual efficiency of online shopping websites bestow best shopping experience (Wolfinbarger and Gilly, 2003). While it is true to some extent, online shopping experience also consist of other factors like interactivity, fun, reliability, accessibility, compatibility, and playfulness (Soopramanien, 2011). All these factors compose the process of online shopping and thus inculcating these variables can evoke a positive online shopping experience. Second-hand shopping is the process of purchasing the products that are already used by other people. Recent statistics show that online second-hand shopping continues to flourish at a higher rate (Ferraro, Sands, and Brace-Govan, 2016). The success rate of second-hand business relies on the availability of rare and quality products at cheaper rates. Online second-hand shopping is growing drastically as it enables people to purchase goods that are not easily available in the primary market (Sihvonen and Turunen, 2016). In simple words, obtaining an antique or rare product without searching physically from shop to shop is the reason behind its growth. Olx, Quikr, and eBay are the most popular online second-hand websites in India that allows people to buy and sell second-hand products through online.

HYPOTHESES DEVELOPMENT

Effect of Online Second-Hand Shopping Experience on Customer Attitude

Existing literature shows that customer experience is an important antecedent that effect the level of customer attitude (Sivadas and Baker, 2000). Customer experience consists of customer perception, information quality, website design, transaction processing, and convenience which influence customer attitude (Koo and Ju, 2010; Lee and Lin, 2005). Among the factors, convenience and website design are the most influencing factors in predicting online customer attitude (Srinivasan, Anderson and Ponnavolu, 2002). Several studies show that user experience influences attitudes towards websites and brands (e.g., Fang et al., 2014; Kim, Ferrin, and Raghav Rao, 2009). Based on the above findings, we hypothesize that:

H_1: Online second-hand shopping experience is positively related to customer attitude.

Effect of Online Second-Hand Shopping Experience on Customer Trust

Though online second-hand shopping provides a greater comfort to online shoppers, the usual purchasing process is quite a change in second-hand. This creates a deep concern regarding customer trust in the shopping process. The entire process of online shopping starting from information search to purchase decision relies completely on customer trust (Gounaris, 2005).

Customer trust does not simply rely on the outline process rather, it requires very positive experiential aspects (Eid, 2011). Marketers need to make and maintain the instruments that can magnify the online shopping experience of the customers so as to develop customer trust (Park, Hill, and Bonds-Raacke, 2015). This phase mainly involves easy flow of purchasing process with an emphasis on quality and reliability. Based on the above arguments that positive online shopping experience helps the customers to develop trust towards the company, we hypothesize that:

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

H_2: Online second-hand shopping experience is positively related to customer trust.

Effect of Online Second-Hand Shopping Experience on Customer Repurchase Intention

Many studies have been conducted on identifying factors behind the formation of online repurchasing intention. Specifically, Van Schaik and Ling (2008) reveal that shopping experience based on website quality is the most influential factor in predicting customer repurchase intention. In addition, personal experience is also important for customers for repurchasing (Sun, Zuo and Kong, 2017). Coverdale and Wilbon (2013) examine that online shopping experience positively influences the intention to repurchase and recommend to other shoppers. Prior positive online shopping experience strengthens online customer repurchase intention (Bridges and Florsheim, 2008; Hwang, 2010). As customer intention to repurchase increases along with positive online shopping experience (Giannakos, Pateli and Pappas, 2012; Liu, 2016), we hypothesize that:

H_3: Online second-hand shopping experience is positively related to customer repurchase intention.

Effect of Customer Attitude on Customer Repurchase Intention

Customer attitude is the prominent factor of today's business world, particularly in e-commerce industry since rewarded customers are the ones to go for repeated purchasing (Hellier et al., 2003). Wu (2003) finds a positive relationship between customer attitude and online shopping. Relationship between customer attitude and customer repurchase intention is stronger in online than offline. Specifically, a sense of pleasure and perception are the major leads in generating customer attitude in online shopping platform (Jayawardhena, 2004). Customer attitude also influences customer loyalty (Anderson and Srinivasan, 2003) since retaining loyal customers is very important for e-commerce industries. As attitude stands as an influential factor for influencing customer repurchase intention in online shopping (Sorce, Perotti and Widrick, 2005), we hypothesize that:

H_4: Customer attitude is positively related to customer repurchase intention.

Effect of Customer Trust on Customer Repurchase Intention

Trust is a significant factor that helps in encouraging people to be engaged in a particular action (Safa and Ismail, 2013; Srivastava, Singh, and Srivastava, 2013). Several studies have assessed the effect of online trust on customer repurchase intention from various perspectives such as technological, behavioural, psychological, and economic approaches (Kirs and Bagchi, 2012). For instance, online customer trust stands as the immediate upshot involving any commercial exchanges and monetary transaction (Koh and Sundar, 2010). Customer trust based on security and safety of transaction increases repurchase intention. In addition, it inculcates confidence in customer mind in the process of online shopping, which in turn influence repurchase behaviour. Therefore, formation of customer trust is vital to maintain and develop customer relationships in the long-term and to engage them more in online transactions (Beldad, de Jong and Steehouder, 2010). Hence, we hypothesize that:

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

H_5: Customer trust is positively related to customer repurchase intention.

METHODOLOGY

Sample and Data Collection

We collected data from online second-hand shoppers to empirically test the hypotheses. A self-completion questionnaire was mailed and posted on number of Facebook pages. The respondents were instructed to answer all the questions according to their experience in online second-hand shopping. Among the returned questionnaires, 700 responses were found to be useful for data analysis after exclusion of incomplete responses.

Measurements

To measure online second-hand shopping experience 8 items were adapted from Chen and Chang (2003). To measure customer attitude, items were adopted from (Zhou, Dai and Zhang, 2007; Mamoun, Mutaz and Al-Debei, 2015; Mutaz et al., 2015), customer trust (Ponte et al., 2015; Samuel, Balaji and Wei, 2015) and repurchase intention items were adopted from (Pappas et al., 2014). All the statements were measured based on a five-point Likert scale ranging from 5 'strongly agree' to 1 'strongly disagree'.

The research questionnaire also captured the demographic profile of the respondents including gender, age, education, occupation, and income. Demographic profile is shown in in Table 1. As an initial step, we checked the data for redundancy, factor loadings (<.5), cross loadings (<.4) (Hair et al., 1998) and reliability (<.7) (Nunally, 1978). This process ended up in deletion of certain items of all the constructs (see Table 5 in the Appendix).

ANALYSIS AND RESULTS

Measurement Model

This study tested the model shown in Figure 1. Measurement model validation was assessed based on reliability, convergent, and discriminant validity using Smart PLS 3.2.6. Reliability was tested using composite reliability (CR) values, where the results show that the values of CR ranged from 0.90 to 0.95, exceeding the indicated value of 0.7 (Hair et al., 1998), confirming construct reliability. Next, convergent validity was examined using the criteria that all indicator loadings should be significant and exceed 0.70 and the average variance extracted (AVE) of all the constructs should exceed 0.50 (Fornell and Larcker, 1981). The results showed that each factor loading values exceeded 0.7 and the AVE values ranged from 0.70 to 0.80 indicating that convergent validity is good enough. The results of composite reliability and convergent validity are presented in Table 2. Discriminant validity was determined using the criteria that the square root of AVE should be greater than all other cross-correlations shared between one construct and another in the model (Fornell and Larcker, 1981). The results showed that the entire diagonal values exceeded inter-construct correlations. Discriminant validity is presented in Table 3.

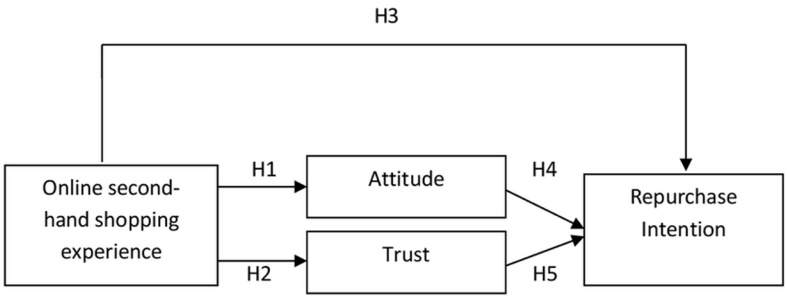
Figure 1. Effect of online second-hand shopping experience on customer outcomes



Structural Model

We then tested the structural model using bootstrapping technique in Smart PLS 3.2.6. The results of the structural model showed that online second-hand shopping experience significantly predicts customer attitude, trust, and repurchase intention. Thus, we found support for H_1, H_2, and H_3. In addition, customer attitude and trust also had significant positive relationship with customer repurchase intention. Thus, H_4 and H_5 were also supported. Structural Model results are shown in Table 4.

DISCUSSION AND IMPLICATIONS

This study has tested a model containing the relationships among shopping experience, customer attitude, trust, and intention to repurchase in online second-hand shopping context and found positive relationships among all the constructs.

This study contributes to the online second-hand shopping literature in many ways. First, this study has developed new hypotheses containing the relationship between online second-hand shopping experience and customer outcomes. Secondly, this study has developed and tested an empirical model in online second-hand shopping context. Next, this study is the first attempt to explore the significance of online second-hand shopping experience by predicting its potential outcome variables (Fang et al., 2014; Kim, Ferrin, and Raghav Rao, 2009).

In general, the findings of this research reveal that positive online second-hand shopping experience influences customer attitude, and trust, which in turn positively triggers customer repurchase behaviour. This indicates that consumer behaviour is highly dependent on pleasant experience (Guo, 2004). Specifically, this study finding indicates that shopping experience creates positive attitude among the customers. This implies the e-retailers to make their customers feel that purchases of second-products are useful and buying used goods through online is an enjoyable task. Relationship between experience and trust suggests that online retailers should make an attempt to give assurance about the safety of transaction and delivery. As attitude and trust have a significant relationship with repurchase behaviour, e-retailers should create positive attitude and build trust to covert acquired customers to loyal customers.

This study finding signifies strong relationship between shopping experience and customer retention. This implies the second-hand retailers to provide user friendly website interface; assure safe transaction and delivery; and create convenience to buy the products through the websites. This will eventually lure

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

the customers to visit the website in future. On the whole, online second-hand retailers need to create unique shopping process to gain positive attitude and trust among customers to achieve profits. They ought to fill the basic requirements of customers such as secured payment systems, privacy policies, full time servicing, flexible and easy returns to gain faith and repeat customers.

CONCLUSION AND FUTURE RESEARCH DIRECTIONS

This study indicates that shopping experience positively influences customer repurchase behaviour while shopping second-hand products through online. When customers gain enjoyments, convenience, credibility, and other benefits in second-hand shopping, they intend to develop positive attitude and trust to repurchase the products through the same website.

Though this study is the first attempt in testing an empirical model in online second-hand literature, we acknowledge certain limitations. First, the hypothesized relationships are tested using a cross-sectional research design. To enhance the generalizability of the findings, future researchers can use longitudinal research to test the research model of this study. Second, sample was chosen based on Facebook pages and groups on second-hand. Generalization based on this study sample warrants caution. Future researchers may replicate the study using broader and cross-sectional segments of second-hand shoppers. Third, future researches can test the mediation effect of attitude and trust between experience and repurchase intention. Fourth, other variables such as satisfaction and word-of-mouth can be tested in the hypothesized model. Finally, factors that compose second-hand shopping with respect to different product categories can be explored in future research.

Chapter 82
Consumer E-Loyalty for E-Grocery Shopping in a Metro City of India:
Role of Flow and TAM Antecedents

ABSTRACT

This study focuses on the e-loyalty of the grocery consumers. Understanding online behavior in developing countries is an emerging issue in these days. The purpose of this research is to examine the effects of antecedents of flow on attitude and perceived ease of use in the context of online grocery purchase behavior in a developing country perspective. Further, the study also examines the role of attitude and perceived ease of use in building e-loyalty. The present study analyzes the data of 250 respondents collected through an online survey. The data were analyzed employing exploratory factor analysis (EFA), confirmatory factor analysis (CFA), and structural equational modeling (SEM). The results show that the flow variables (concentration and enjoyment) have a positive but differential effect on attitude towards online grocery purchase. However, both concentration and enjoyment were equally important in influencing the perceived ease of use. The study also found that attitude positively influences the e-loyalty, and perceived ease of use influences both attitude and e-loyalty.

INTRODUCTION

Globally, the Information and Communication Technology (ICT) have provided various online shopping platforms that led to increasing up the number of online grocery shoppers (Van Droogenbroeck and Van Hove, 2017). Grocery is an essential daily need for all households. Conventionally, the grocery goods were bought from nearby Kirana stores (similar to mom-and-pop shops), shopping centers, convenience stores, and supermarkets. Since, the advent of internet enabled business, several grocery companies are selling their products online. However, much of their business has been restricted to few big cities primarily the metro cities. A majority of online grocery companies sell in to non-metro cities thus losing huge potential for e-grocery companies (Dattagupta, 2018). Indian consumers spent a significant proportion (~50%) of their income on groceries (Hindustan Times, 2018; Kureshi & Thomas, 2019). Retail grocery market could be around 60% of the India's overall retail market. Therefore, retail grocery has been the largest consumer segment (The Wharton School, 2018). The retail grocery market in India has been estimated between $400 billion to $600 billion (The Wharton School, 2018). Some sources stated it about $428bn thus making India as world's third largest grocery market after China (~$1400bn), and U.S.A. (~$830bn) (Financial Times, 2017; RedSeer, 2019). It is also estimated that the grocery market in India could cross $700 billion mark by 2022 (The Wharton School, 2018; Reportlinker, 2015).

It is worth mentioning that even though online shopping is gaining popularity in India the concept of buying grocery is still new. Among many motivating factors the rise in online payments, increasing penetration of Internet and rise in the usage of smart phones are some notable actors e-grocery shopping in India (Business Today, 2013). Indian has huge opportunity in e-grocery segment which is currently less than 1% ($150 mn) of total grocery market ($428bn) (Financial Times, 2017; Businesswire, 2019). Comparably the current e-grocery market share in India is much lower than many other countries such as U.K. (6.9%), China (4.2%), and U.S. (1.4%). Currently, the 'e-grocery market' in the country is projected to achieve growth of CAGR of 60% during 2019 – 2022 (RedSeer, 2019).

Rapid growth in internet and smart phone consumption is driving the growth in e-tailing in general and e-grocery shopping in particular. It is anticipated that number of internet users in India will grow from 480 million in 2019 to 660 million in 2023 (Diwanji, 2020). Thus, the size of internet user is likely to reach 55 percent in 2023 from 40 percent in 2019 thus adding more e-shopper base in India for e-grocery shopping. Generally, young adults shop groceries online because it is difficult for the parent to shop on smart phones or on internet in India (Hindustan Times, 2018). In India, majority of online buyers include 'tech-savvy' millennial (aged 18-35 years) who comprise about 34% of the total population (The Economic Times, 2018). While in the developed countries like U.S.A. and European countries, generation X (aged 36-51 years) made more purchases than the millennial (KPMG, 2017). In India, grocery retail is more than 60% of the country's total retail market ranging from $400 billion to $600 billion at present and has the potential to cross $700 billion by 2022. Out of which, Online grocery is ranging from $500 million to $1 billion and expected to increase $3 billion to $5 billion by 2022. Groceries are an essential purchase for Indians, and they spend more than 50% of their income on groceries shopping (The Economics Times, 2018; Knowledge@Wharton, 2018, The Times of India, 2018).

It is quite difficult to understand the customer behaviour of attracting the new customer over the internet (Van Droogenbroeck & Van Hove, 2020). Focusing on existing consumersby retaining and understanding what makes them more loyal has become imperative for today's e-marketers. Thus, the loyalty of the customer has become one of the critical factors in determining the long-term success of the firm. There is a need to study for the antecedent variable of customer loyalty (Srinivasan, Anderson, &

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Ponnavolu, 2002). Grocery e-tailing has the opportunity of high repeat orders if a customer is satisfied in first order (Business Today, 2013). Still, there are not enough studies investigating the customer loyal over the internet in general and mainly focusing e-grocery store (Patro, 2016). Further, the competitive environment of e-retailer has compelled them to strive for gaining competitive advantages (Rao, Patro, Nkechi, Ewomaoghene, Egenti, & Saha, 2016). Therefore, it has become the need of carrying out the study for fostering the loyalty intention of the customer. The present study aims to investigate the antecedent constructs for determining the loyalty intention of the customer from the perspective of online grocery shopping. The present study tests a theoretical model that answers the following questions.

- Do the flow constructs (concentration and enjoyment) affect the attitude and perceived ease of use (PEOU) for e-grocery shopping?
- Does Perceived ease of use (EOU) influences the attitude of the customer towards e-grocery shopping?
- Do attitude and perceived ease of use (EOU) affects the loyalty intention of the customer for e-grocery shopping.

This study extends the literature in three different ways. Firstly, the present study develops a model for the customer loyalty from the technology acceptance perspective. Secondly, the study extends the TAM model by amalgamating the relevant flow constructs (concentration and enjoyment). Finally, the research findings of this study show that the flow constructs such as concentration and enjoyment influence the perceived ease of use and customer attitude, which subsequently affects customer loyalty. The remaining part of the research paper consists of following subsections, the first section derives the hypotheses from the review of the literature, and further the methodology, results, discussion and conclusion are presented. The study concludes with limitations and future research direction.

THEORETICAL FRAMEWORK

Since its introduction, more and more researchers have been applying and integrating the concept of flowand its antecedents and consequences in the context of human-computer interaction. The concept of flow has been borrowed from psychology, researchersconceive flow as an essential factor determining the interactions of the individual with computers, and applied technologies, specifically the users' positive experience with computers and the technology (see classic works such as Csikszentmihalyi, 1990; Ghani, Supnick, & Rooney, 1991; Trevino & Webster 1992; Webster, Trevino, & Ryan, 1993). Specifically, the originator of the concept of flow, Csikszentmihalyi (1975), defines it as the holistic feeling that people experience when they act with full involvement, which can occur not only in the exercise of physical activities but in interactions with symbolic systems such as, for example, mathematics and computer languages. The state is so satisfactory that individuals tend to repeat the activity continuously. In this sense, the flow can be conceivedas an optimal, intense and intrinsically enjoyable experience evoked when the individual engages in an activity with total involvement and concentration. In the first place, it feels an intrinsic interest for the exercise of it; second, he experiences a distortion of time (Privette & Bundrick, 1987). In short, the flow induces a state where navigation itself becomes the primary reward against the results derived from its execution. The flow is therefore a useful dimension to describe the

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

interactions between the user and the computer. Following the previous investigations, the flow can be assimilated with a state of intrinsic enjoyment.

Precisely, the concept of intrinsic enjoyment is defined as the degree to which the activity is perceived as enjoyable per se, beyond the consequences that can be anticipated (Davis, Bagozzi, & Warshaw, 1992); and it is identified as an essential intrinsic motivational factor in the use of computers, contributing to the evocation of creativity and exploratory behavior (Ghani et al., 1991). Specifically, the flow as enjoyment is a reason for acceptance and use that not only incorporates a perception of the balance between the skills and challenges proposed but also incorporates processes such as telepresence and time distortion, play, concentration, etc. (Marr, 2000, cited in Sanchez-Franco, 2006). Many authors have proposed that users also experience states of enjoyment in their use of online shopping, etc. (see, for example, Trevino & Webster, 1992; Ghani & Deshpande, 1994; Sánchez-Franco & Roldán, 2005; Giao, Vuong, & Quan, 2020).

In sum, the research on the use of the Web finds empirical support in consideration of the flow as a catalyst of the intention and use of the Websites. If individuals enjoy their browsing experiences, their perceptions of online services and, in short, their intentions to use the internet for shoppingwill be significantly enhanced. That is, the websiteusagecan evoke values that are not easily picked up by dimensions such as perceived ease of use or utility (Hoffman & Novak, 1996; Singh & Dalal, 1999). Browsing an online shopping site goes beyond utilitarian aspects to motives based on optimal experiences. In this sense, Davis et al. (1992) argue that while the utility is a significant factor in the intentions of computer use at work, enjoyment will also help explain its variance beyond that explained by the factors of utilitarian nature.

Davis et al. (1992) apply the theory of motivation to the understanding of the adoption and use of technologies. They proposed a novel model, the motivational model (MM), where one of the traditional factors of the TAM model (i.e. the perceived utility) was renamed as extrinsic motivation, and an additional constituents of intrinsic motivation was added named as perceived enjoyment. Further, Venkatesh, Speier, & Morris, 2002) have presented an extended model that integrates intrinsic motivation within an original TAM model. The measures of the intrinsic motives may refer to enjoyment, pleasure and fun in use etc.

Relationship of Flow Constructs

For its part, Koufaris (2002) applies the theory of flow status to online consumer behavior to examine emotional responses in visits to online stores. This author proposes that greater enjoyment and concentration should result in greater conative loyalty. Therefore, by accepting the proposals on flow relationships, we find support for their consideration as a promoter of the behavior and use of the internet. If individuals enjoy their 'navigations', they will also favorably assess their usefulness, in short, accept, and use the internet site more frequently. The navigation through a website can go beyond utilitarian aspects and rest on intrinsic motives. In this context, the research published to date suggests that the flow as a state of intrinsic enjoyment would present relationships with perceived utility and ease of use. For example, Venkatesh (2000) shows that enjoyment indirectly influences utility via ease of use, with the greatest effects as users gain more experience and control of use. Further, Agarwal & Karahanna (2000) proposed that cognitive absorption (similar to the flow state) influences utility. Individuals seek to explain their behaviour with reasons that arise from outside of themselves, and when they do not find such explanations fully satisfactory, they turn to their interior for additional (intrinsic) causes. That is,

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

individuals who behave in a concrete way, could infer that their behavior are also due to enjoyment and satisfaction derived from the execution of the task (Bem, 1972 cited in Gruman, Schneider, & Coutts, 2016). Csikszentmihaly (1975) argues that the flow can improve if the individual perceives that the activity can be easily executed. The perceived ease of use can therefore be associated with the flow: the easier a system is to use, the more enjoyable it is. Empirical research has found support for the relationship between ease and enjoyment in the work of Igbaria, Parasuraman, & Baroudi, 1996). It is therefore conceivable that a user-friendly website that avoids user boredom to a threshold level can provide better feedbacks that stimulate the user and, consequently, lead to a higher state of enjoyment. Based on the discussion we thus propose.

H1: Concentration has a significant influence on H1A) Attitude towards online grocery shopping and H1B) perceived ease of use in online grocery context.
H2: Enjoyment has a significant influence on H2A) Attitude towards online grocery shopping and H2B) perceived ease of use in online grocery context.

Perceived Ease of Use and Attitude

Perceived ease of use defined under TAM is a belief that technology adoption will have no physical and mental effort (Davis, Bagozzi, & Warshaw, 1989). And the complexity in adoption will have adverse effect on technology adoption (Van Droogenbroeck & Van Hove, 2020). Also, ease-of-use (PEOU) is the degree to which a user believes that using a particular technology would be free from effort and helps in the adoptionof technologies including internet (Nadim and Begum, 2008). Perceived ease of use is an important construct which affects the customer intention to shop online the customer's plan to purchase products online (Cass & Fenech, 2003), and positive attitude towards an object is the result of customer expectation and satisfaction (Lee, 2007). Chen, Li & Li. (2011) mentioned that perceived usefulness (PU) and ease of use (EOU) influences customer attitude towards usage of technology.

H3: Perceived ease of use by customer influences the customer attitude towards e-grocerry shopping.

Attitude Towards Online Grocery Shopping and Loyalty

Attitude is a psychological tendency of the customers which they continuously evaluate a particular object and favor or disfavor to a particular object or situation (Eagly & Chaiken, 2007; Hasan, 2010; Haque, Sadeghzadeh, and Khatibi, 2011). The state of mind regarding internet and online shopping affects the consumer attitude online purchasing behavior (Lennon et al., 2007). Attitude affects the consumer purchase behavior (Ajzen & Fishbein, 1980; Kim & Hunter, 1993). Attitude affects social shopping behavioral intention (Kang & Johnson, 2013; Daliri, Rezaei, & Ismail, 2014). And, attitude also influences the intention to purchase online (Rodríguez-Ardura, Martínez-López, & Luna, 2010). In addition, consumer's positive attitude affects the customer loyalty (Dick & Basu, 1994; Macintosh & Lockshin, 1997; Anderson & Fornell, 2000; Yi & Jeon, 2003). And, customer loyalty has been defined in the two forms i.e. attitudinal and behavioral (Dick & Basu, 1994; Leung, Li & Au, 1998; Oliver, 1999). Attitudinalloyalty, which is related to the customer state of mind and a customer, will be loyal if it has positive or preferential attitude. Behavioral definition does not consider the state of mind, but is related to the actual conduct of customer and a customer is loyal if he buys products and continues to

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

buy (Uncles, Dowling, & Hammond, 2003). Attitude has shown a positive relationship with behavioral intention (Ramayah, Lian, Rahman, and Taghizadeh, 2017).

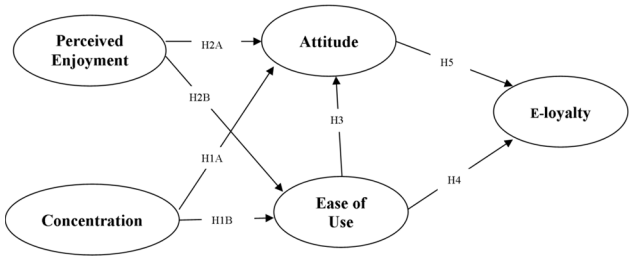
H5: Attitude of customers towards e-grocery shopping leads to customer loyalty.

Perceived Ease of Use and Loyalty

Perceived Ease of Use (PEU) is the extent to which a particular customer uses the technology with less effort (Hamid, Razak, Bakar, & Abdullah, 2016). Ease of use affects consumer intention to use smartphone (Okumus & Bilgihan, 2014).Ease of use has a direct effect on the attitude of the customers towards use (Liu & Yu, 2017) and customer intention to adopt particular technology (Ozturk, Bilgihan, Nusair, & Okumus, 2016; Abdullah, Ward, & Ahmed, 2016). If ease of use affects positively, it will lead to repeat purchase behavior and vice-versa either directly or indirectly (Jackson, Chow, & Leitch, 1997; Chiu & Wang, 2008; Filieri & Lin, 2016). Further, organizations have to pay more for acquiring a new customer than the cost of retaining the old one (Kim, Wong, Chang, & Park, 2016). Also, brand loyalty can leads to the repeat purchase of product of particular brand (Tho, Lai & Yan, 2017). Loyal consumers to specific brand are willing to pay more for that product (Shin, 2015). So, it can be said that ease of use will leads to brand loyalty(Can & Erdil, 2018) (Figure 1).

H4: perceived ease of use has asignificant impact on loyalty intention of the customer

Figure 1. Proposed research model



RESEARCH METHODOLOGY

Researcher adopted multi-item constructs (PerceivedEnjoyment, Attitude, Concentration, Easeof Use and E- loyalty*)* from the preivious literature e.g. *Perceived Enjoyment (*Chen, Hsu and Lu, 2018*), Attitude (*Amaro & Duarte, 2015), *Concentration (*Chen et al*.,* 2018*), Ease of Use (*Chin et al*.,* 2008*)* and *E-loyalty* (Khan & Khan, 2018a). The survey consists of 18 items under the five constructs adapted for measuring e-loyaty for e-grocery shoping. Kindly consult the **Table 1** for instrument items and their respective sources.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Questionnaire development

Construct	Code	Item	Source
Perceived Enjoyment	EN1	I found my visit to online grocery websites interesting.	Chen, Hsu & Lu (2018)
	EN2	I found my visit to online grocery websites enjoyable	
	EN3	I found my visit to online grocery websites exciting.	
	EN4	I found my visit toonline grocery websites fun	
Attitude	AT1	Shopping grocery online is a good idea	Amaro & Duarte (2015)
	AT2	Shopping grocery online is a wise idea	
	AT3	Shopping grocery online is a practical idea	
	AT4	Shopping grocery online an important idea	
Ease of Use	EOU1	Learning to use internet to shop grocery online would be easy for me.	Chin *et al.* (2008)
	EOU2	My interaction with online grocery websites is clear and understandable.	
	EOU3	It would be easy for me to become skilful at using online grocery websites	
Concentration	C1	While buying grocery online…..I was absorbed intensely in activity	Chen *et al.* (2018)
	C2	While buying grocery online…..My attention was focused on the activity.	
	C3	While buying grocery online….. I concentrated fully on the activity.	
	C4	While buying grocery online…..I was deeply engrossed in the activity.	
E-loyalty	EL1	Online grocery websites have adequate security features.	Khan & Khan (2018a)
	EL2	I feel safe in my transactions with online grocery websites	
	EL3	I feel my privacy is protected while shopping through online grocery websites.	

Source: Prepared by the researcher

Data Collection

The data was collected from Delhi (capital and metro-city of India) by both the researchers themselves during March-April 2019. In India, the population centres are categorized into four categories. Metropolitan centers (10, 00,000 and above), Non-metropolitan centers (from 1, 00,000 to 9, 99,999), Semi-Urban centre (population ranging from 10,000 to 99,999) and Rural Centre (Population up to 9,999) (Census, 2011). The sample frame of this research consists of online shoppers from e-grocery shoppers. The sample of this research consists of 250 responses through the researcher controlled sampling. Personal administration of questionnaire during data collection was helpful in clearing doubts of the respondents if any (Khan & Khan, 2018b). They asked to respond on a structured, non-disguised close-ended questionnaire on five-pointLikert scales, ranging from‘1’ for ‘strongly disagree’ to ‘5’ for ‘strongly agree’ for all items. As the population was unknown and the sample-size according to Hair, Black, Babin, Anderson, & Tatham (2010) for multivariate research should be more than 10 times of the study items. Our sample size is about 14 times of the study items and is well above the recommended size (Hair et al., 2010).

Sample Characteristics

The sample characteristics of the final sample consists of 250 respondents are shown in Table 2. The variables for the sample characteristics were gender, monthly family income, education and marital status.

Table 2. Sample characteristics

Demographic Variable	Attribute	Frequency	Percentage
Gender	Male	165	66
	Female	85	34
Monthly Family Income	Below 50,000	137	54.8
	50,001 – 1,00,000	102	40.8
	Above 1,00,000	11	4.4
Marital Status	Married	17	6.8
	Unmarried	233	93.2
Educational Qualification	Below Graduation	56	22.4
	Graduation	112	44.8
	Post-graduation and Above	82	32.8

Source: Prepared by the researcher

The sample consists of male respondents 165 (~66%) and 85 female respondents (~34%). The gender gap is due to the fact that only 30 percent of women shop over internet in India (Ayyar, 2018). Also, men are more frequent shoppers online than women because of demographic and purchase behavior differences (Karnik, 2016; Ahmad & Khan 2017). Most of the respondents were unmarried (~93%). As, the majority of e-shoppers in India include 'tech-savvy' millennials (aged 18-35 years) whose proportion is about 34% of the total population (The Economic Times, 2018). While discussing about the monthly family income, 137(~54%) respondents were having income less than ₹50, 000. And 112 (45.2%) respondents were having income more than ₹50,000. The educational qualification of the respondent below graduation was 22.4%, and majority of respondents was graduate (~44%) and about 32% respondents were post-graduate and above (~32%). In addition, educated people are tech-savvy and prefer shopping online to shopping from traditional e-retailer (Ahmad & Khan, 2017; Abeler, Becker, & Falk, 2014). Thus, it indicates the adequate representation of different characteristics of the respondents of the sample.

MEASUREMENT MODEL

Researcher used the statistical analysis tools such as SPSS 20.0 and AMOS 20.0 for reliability and validity analysis and for structural equation modelling (Khan & Khan, 2018b; Hair et al., 2010). Also, the postulates related to structural equation modeling including *Normality*, *Linearity* and *Multi-collinearity* was checked through SPSS 20 and found to be in acceptable range (Hair et al., 2010).

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Exploratory Factor Analysis

The measurement model was examined using exploratory factor analysis (EFA) and confirmatory factor analysis (CFA). The EFA was conducted using Principal Component Analysis (PCA) using varimax rotation with *Kaiser Normalisation*. The SPSS software was used for performingthe EFA. The EFA resulted in a clean component matrix with five latent factors as specified in the model. None of the cross loadings above 0.3 was detected and all the factor loadings were above 0.60 ranging from 0.617 to 0.859 thus demonstrating sufficient convergent and discriminant validity. The values of communalities were also above 0.4 (Hair et al., 2010) indicating that each item correlates well with other items. Further, we also the KMO value which was 0.873 exhibiting the sampling adequacy for EFA. All the factors could explain 68.55% variance in the measurement model. Thus, overall the measurement model has qualified the threshold criterions and can be deemed suitable for further analysis (Table 3).

Table 3. Exploratory factor analysis

Items	Enjoyment	Attitude	Concentration	Ease of Use	E-loyalty
EN3	0.842				
EN2	0.81				
EN4	0.788				
EN1	0.697

Confirmatory Factor Analysis

In the second step we performed the Confirmatory Factor Analysis (CFA) by employing the Maximum Likelihood Method (MLE) (Hair *ET AL.,* 2010). The fit indices in the measurement model were in reasonably well limits within the recommended criterion. The measurement model exhibited an acceptable level of fit ($\chi 2$ =213.60, df = 109, $\chi 2$/df= 1.960, CFI = .947 TLI = .934, RMSEA= .062).

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The composite reliabilities (CR) for each construct were also calculated. The CR values for each construct; Ease of Use (0.819), Perceived Enjoyment (0.867), Attitude (0.820), Concentration (0.799), and E-loyalty (0.783), met the recommended criterion of 0.70 and above (Hair et al., 2010). Further, AVE for all constructs, Ease of Use (0.604), Perceived Enjoyment (0.622), Attitude (0.536), Concentration (0.575), E-loyalty (0.549), were 0.5 and above (Hair et al., 2010). Hence, convergent validity was established (see Table 4). To establish the discriminant validity, the Fornell & Larcker (1981) criteria ($\sqrt{}$AVE> multiple correlation) was employed.

Table 4. Validity and reliability analysis

Item	Standardised loading	CR	AVE	MSV
EN3	.851	0.867	0.622	0.272

EL2	.808			
EL3	.608			

Source: Analyzed by the researcher

The square root of AVE for 'Ease of Use' is greater than the correlation of 'Ease of Use' with any other construct. Likewise, the square root of AVE for Perceived Enjoyment, Attitude, Concentration and E-loyalty is greater than the correlation of these constructs with any other constructs. Please consult the Table 5 for discriminant validity. The bold values in the diagonal shows the value of square root of AVE for each constructs. Other values in each column represent the values of correlation between the constructs (Table 5).

Structural Model

The structural model consisted of the questionnaire scales validated in the previous step was drawn in the AMOS. This model was tested using Maximum Likelihood Estimation (MLE). Seven hypotheses

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

have been tested for this research. First, four hypotheses examined the influence of each of the two flow variables (Concentration and Enjoyment) with each of attitude and perceived ease of use. Further, the influence of both Attitude and perceived ease of use on e-loyalty and influence of perceived ease of use on attitude has been examined (Table 6).

Table 5. Inter-construct correlation

	Ease of Use	Perceived-Enjoyment	Attitude	Concentration	E-loyalty
Ease of Use	**0.777**				
Perceived Enjoyment	0.476	**0.789**			
Attitude	0.513	0.496	**0.732**		
Concentration	0.475	0.522	0.589	**0.758**	
E-loyalty	0.600	0.502	0.622	0.483	**0.741**

Source: Analyzed by the researcher

Table 6. Results of structural equation modeling

Hypothesis	Standardized Coefficient	Unstandardized Coefficient	p-value
H1A: Concentration→ Attitude	.380	.443	.000
H2A: Perceived Enjoyment→ Attitude	.194	.165	.014
H2B:Perceived Enjoyment→ Ease of Use	.325	.289	.000
H1B: Concentration→ Ease of Use	.310	.377	.000
H3: Ease of Use→ Attitude	.238	.228	.002
H4: Attitude→ E loyalty	.435	.449	.000
H5: Ease of Use→ E loyalty	.386	.382	.000

Source: Prepared by the researcher

All seven hypotheses were significant however, the strength of relationships deferred for each relationship. Both concentration and perceived enjoyment influenced the personal attitude towards online grocery shopping. However, strength of relationship of concentration with attitude (Concentration→Attitude, beta=.380, p=.000) was greater than the strength of relationship of perceived enjoyment with attitude (Perceived Enjoyment→ Attitude, beta=.194, p=.014). Further, both concentration (H1B: Concentration→ Ease of Use, beta=.310, p=.000) and perceived enjoyment (H2B: Perceived Enjoyment→ Ease of Use, beta=.325, p=.000) also influenced the perceived ease of use. Thus, both the variables had almost equal impact on perceived ease of use. Further, apart from the influence of concentration and enjoyment on attitude we have also checked the influence of perceived ease of use on attitude. The relationship was positive and significant (Ease of Use→ Attitude, beta=.238, p=.002). Both attitude (Attitude→E loyalty, beta= .435, p=.000) and Ease of Use (Ease of Use→ E loyalty, beta=.386, p=.000) predicted the e-loyalty. However, Attitude was more closely related with e-loyalty. Overall, the model was a good fit as all the indices meet recommend threshold for goodness of fit ($\chi2$=218.099, df = 111, $\chi2$/df =1.965, CFI= .946, TLI=.933 RMSEA=.062).

DISCUSSION

Generally, the internet is being used in almost all sphere of life and e-shopping is also one of them. There are various factors which customer generally prefers and give priorities to them. The basic strategy of the marketers is to retain the customer and making them loyal towards the particular web store of e-grocery because loyalty of the customer is important for e-stores (Pee, Jiang, & Klein, 2018; Liao, Pham, Cheng, & Teng, 2020). In the present study as mentioned earlier, researcher extended the TAM model to measure the customer loyalty in e-grocery shopping by collaborating flow constructs such as concentration and enjoyment. The researchers adapted the questionnaire from previous studies from the perspective of e-grocery shopping and used exploratory and confirmatory factor analysis for checking the validity and reliability of the scale. Further, it has been found that concentration has significant influence on Attitude towards online grocery shopping, thus accepting the hypothesis H1A. This relationship is inline with the previous study which says concentration is positively related to attitude (Moshrefjavadi et al*.,* 2012). Further, concentration also has significant effect on perceived ease of use in online grocery context, accepting hypothesis and H1B. This result shows similar observation like the previous study on acceptance of instant messaging (Lu, Zhou, & Wang, 2009).

Enjoyment has significant influence on Attitude towards online grocery shopping, accepting the H2A. This is similar to the results of previous studies which were done on attitude for e-shopping (Zhang, 2020; Hussein & Hassan, 2017; Chiu, Chang, Cheng, & Fang, 2009; Monsuwé, Dellaertand & De Ruyter, 2004). Also, Enjoyment has significant effect on perceived ease of use in online grocery context, thereby, accepting H2B. This result is in line with the previous study by Sun & Zhang (2006).

Perceived ease of use influences the customer attitude towards e-grocery shopping significantly, thus accepting the H3. This result is in line with previous study which demonstrates that perceived ease of use (PEU) directly affects consumer's attitude towards use (Liu & Yu, 2017; Ramayah et al*.,* 2017; Hussein & Hassan, 2017). Perceived ease of use has significant effect on loyalty intention of the customer, thus accepting the hypothesis H5. This result is similar to the study by previous researcher (Abdullah et al*.,* 2016; Low, Goh, Tan, & Rasli, 2017; Can & Erdil, 2018). Different previous studies conducted in European countries e.g. Germany (Pechtl, 2003), France (Picot-Coupey et al, 2009) and England/ Denmark (Ramus & Nielson, 2005) reported that ease of use i.e. convenience is a pertinent motivational factor for online grocery behavior. The result is in line with the study conducted by Rishi, Pradeep & Vishwanathan (2018) in an India metro city and by Pham, Tran, Misra, Maskeliūnas, & Damaševičius (2018) in Taiwan for e-grocery shopping consumers.

Attitude of customers towards e-grocery shopping leads to customer loyalty, thus accepting the hypothesis H4. This result of present study is similar to previous studies, which were done by previous researchers in different context (Verhagen & Van Dolen, 2007; Hsu, Chuang, & Hsu, 2014; -Debei, Akroush, & Ashouri, 2015).

CONCLUSION AND LIMITATIONS

This study gives us insight concerning the role of flow in influencing the attitude perceived ease of use in the context of online grocery shopping. Further, we also examined the role of attitude and ease of use in shaping the loyalty towards shopping online grocery. We studied two aspects of flow, i.e. concentration and enjoyment and examined their influence on attitude and PEOU. Both the elements of flow influence

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

the consumer's attitude towards online grocery. However, we observed that concentration, as compared with enjoyment, is more closely related to the attitude.

Further, both components of flow influences PEOU equally well. Thus, we can conclude that among the two flow factors, concentration is more important in influencing the attitude while both are almost equally good in influencing PEOU. Next, we also examined the role of attitude in influencing loyalty and PEOU in influencing both attitude and loyalty. Both attitude and PEOU were positively related with Loyalty, attitude having a stronger relationship with the loyalty.

We have conducted the study on young people for shopping the grocery product online. Future researchers can enhance the population segment to include the household as well. The prospective researchers can compare the consumer behavior from online shopping with traditional shopping. Further, we have conducted the study in the north Indian city, and the future research can be done to compare with different Tier-1 and Tier-2 cities.

ABSTRACT

Information and communication technology has played an important role in the tourism industry. The internet has completely changed the tourism industry's landscape, particularly for travel agencies. Travel agencies are small and medium-sized enterprises that manage, coordinate, and provide transportation, leisure, and hospitality services. Based on prior research, travel agencies are regarded as slow adopters of e-commerce. Moreover, three factors affect the adoption of e-commerce among travel agents, which are environmental pressure, benefits of adoption, and perceived barriers. In achieving this study's aim in reference to Brunei Darussalam, an integrated conceptual framework was developed based on the technology acceptance model. A quantitative approach via questionnaires was used in the data collection. If managers are able to recognise the aforementioned factors, it could help them develop strategies to improve and sustain their businesses.

INTRODUCTION

Since e-commerce was introduced, traditional means of commerce where exchange of goods and services done face-to-face have since declined. An example of a traditional commerce is the use of a travel agency, which requires appointments with travel agents. Travel packages for different types of travellers are offered, with affordable prices and suitable locations that have been effectively researched and safety vouched for by the travel agents (Sokanu, 2019). Many things have caused the decline of the use of travel agency services, mainly the availability of online reservations or booking systems.

Online booking or eBooking is a software that allows companies to manage bookings and reservations (Odgers, 2017). As it is more convenient and faster to book online, potential travellers can now purchase their own flight tickets, book accommodations, or even buy event tickets, such as for concerts or amusement or theme park tickets, themselves. The Internet has made it easier to get information through travel blogs and YouTube, where people upload videos or video logs (vlogs) of their vacation. Twitter, Facebook, and Instagram are other online platforms which can help travellers get information on attractions and notable local food. Booking.com and Airbnb are some of the more popular accommodation websites that help make travelling bookings easier, while Trivago combines, compares, and finds the best hotel price for customers.

Travel agencies need to start adopting e-commerce, particularly Booking Commerce, in order to sustain themselves in the current industry. Booking Commerce or website booking allows travel agencies to design their own booking system that consumers can easily access with the Internet (Hackernoon, n.d). Website booking allows customers to book their tickets or make reservations through website services offered by the travel agencies. Integrating the use of website booking into their current process may expand the business of travel agencies.

As for the objective of this chapter, it is to find out the perceived benefits and perceived barriers of the e-commerce adoption among travel agents in Brunei Darussalam and how these factors influence the manager's decision. In addition to that, it is also to find out the external pressures that have led travel agents in Brunei Darussalam to adopt e-commerce to help them survive and to complete with rivals. Furthermore, this chapter would also determine the e-commerce adoption level among travel agents in Brunei Darussalam. Whereas the scope of this chapter will concentrate on the factors that influence the adoption of e-commerce among travel agents in Brunei Darussalam, specifically in Brunei-Muara, Belait and Temburong. In the next section, the chapter will look further into detail about the development of e-commerce over the years.

BACKGROUND

E-commerce

In the late 1970s, Electronic Commerce or e-commerce was referred to as the exchange of business documents, information, and transactions using Electronic Data Interchange (EDI) and Electronic Funds Transfer (EFT). However, when the Internet was introduced and opened to the public for commercial purposes in 1991, the definition of e-commerce has changed to the process of purchasing and selling goods and services over the internet. According to Nanehkaran (2013), e-commerce first began in the

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

United States and a few European countries in 1998, and Amazon.com was the first American company to create e-commerce websites which allows electronic transactions. In 2015, many cities in America, Western Europe, and East Asia began using the Internet to conduct their businesses via e-commerce.

Over the years, e-commerce has grown in popularity as people have greater access to technology, improved Internet connections, as well as benefits for users and business owners. Nanehkaran (2013) states that the advantages of e-commerce include easier price comparison between websites, ability to reach a larger global market audience, and reduced costs compared to setting up physical stores. In fact, as e-commerce becomes increasingly important for the distribution of goods and services, it has even replaced some traditional brick-and-mortar stores. On the other hand, some retailers have changed their business model to "click and mortar" after realising the advantages of adopting e-commerce for their businesses. For instance, an American grocery store company, Albertsons, has introduced e-commerce to grow sales.

According to Tamilarasi and Elamathi (2017), the basic types of e-commerce can be classified into five categories or models: 1) Business-to-business (B2B) 2) Business-to-consumer (B2C) 3) Consumer-to-consumer (C2C), 4) Consumer-to-business (C2B), and 5) Mobile commerce. The B2B model is the largest form of e-commerce, and involves online transactions of goods and services between two companies. The B2C model is the most common form of e-commerce and refers to an online transaction between companies and the end-user of products. Meanwhile, the C2C model is online transactions that take place between individuals; the C2B model is when consumers create value and provide services for businesses; and the mobile commerce model is the use of wireless digital devices to conduct online transactions.

Abou-Shouk (2012) states that there are four stages of e-commerce adoption: 1) Static web presence; 2) Interactive online presence; 3) Electronic transactions; and 4) Electronic integrations. Static web presence and interactive online presence are categorised as low-level e-commerce practices, while electronic transactions and electronic integrations are classified as advanced-level e-commerce practices. Static web presence is the use of the Internet to search for suppliers and customers, homepage to disseminate information, and email to communicate with suppliers, customers, and business partners. Meanwhile, interactive online presence refers to two-way communication between firms and customers through the company's portal, managing booking and orders with suppliers, receiving customers' orders through email, and the electronic exchange of documents within firms. An electronic transaction is when online orders, payments, and bookings are processed and received, and services are delivered digitally. Lastly, electronic integration includes post-sales services, employees' interactions using the intranet, and collaboration with business partners using the extranet.

LITERATURE REVIEW

Travel Agents and the Adoption of E-commerce

The travel and tourism industry is one of the largest economic sectors in the world and plays a significant role in a country's development. The travel and tourism industry has created jobs, increased a country's revenue, and improved infrastructure and facilities. Therefore, the role of travel agents has become more crucial in promoting travel and tourism.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

A travel agent is a middleman or an intermediary between suppliers and customers who provides travel and tourism services such as transportation tickets, accommodation, package tours, as well as car rentals. Traditional travel agents are involved in three main activities: 1) sharing information from suppliers to clients; 2) selling tickets and processing customers' transactions; and 3) providing travel plans and advice on destinations to customers (Tsai et. al., 2005). In the past, travel agents had been quite successful in gaining customers' interests in using their services by providing relevant information and tips, aesthetic photos, and maps of the travel destinations. The Internet and World Wide Web have provided suppliers, including airlines, hotels and transportation companies, the opportunity to establish their own websites that enables customers to purchase flight and transportation tickets as well as book hotels and accommodation directly online. These online travel websites became a major competitive threat to brick-and-mortar travel agencies (Heung, 2003). The disintermediation of traditional travel agencies by suppliers has also raised many questions about their future in the travel and tourism industry (Law et. al., 2004).

Therefore, in order to make their businesses more sustainable and competitive, travel agencies have adopted e-commerce that enables ticket booking and payments online. Ozturan and Roney (2004) states that e-commerce adoption in travel agencies provides many benefits such as efficiency, convenience, and access to wider international markets at a cheaper cost. On the consumer's side, it allows them to easily compare hotel and flight prices between online sites.

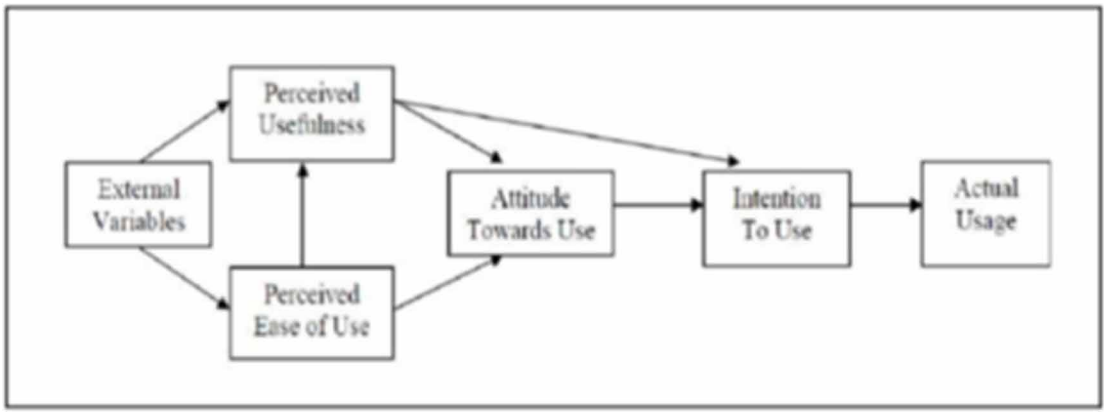
Technology Acceptance Model (TAM)

The Technology Acceptance Model (TAM) shown in Figure 1 was developed by Fred Davis in 1986 (Lai, 2017). TAM is adapted from the Theory of Reasonable Action and is used to understand the adoption of technology.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Davis (1989) uses TAM to explain computer usage behaviour, as seen in Figure 2. It helps to identify the general determinants of computer acceptance that leads to understanding the user's behaviour towards technology. Davis (1989) stated that there are two levels in the original TAM, perceived usefulness (PU) and perceived ease of use (PEU). PU refers to the degree to which the use of technology will help improve the performance of an individual, while PEU refers to the individual's belief where they do not have to make an effort in using the technology. In TAM, factors that affect a person's belief towards the system is known as external variables.

Figure 2. The first revised Technology Acceptance Model (Davis et. al., 1989)
Source: Lai, 2017



The final TAM version was developed by Venkatesh and Davis (2000), as seen in Figure 3. This TAM version is formed after Davis discovers that PU and PEU directly influence behaviour intention, thus there is a need to eliminate the idea of attitude.

Figure 3. The final Technology Acceptance Model (Venkatesh & Davis, 2000)

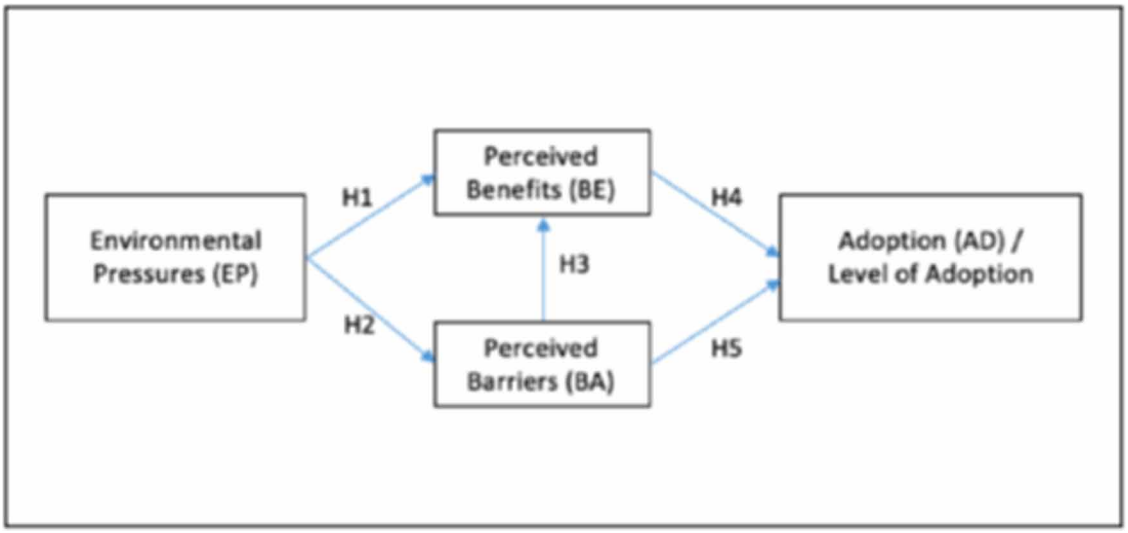
THEORETICAL FRAMEWORK

The conceptual framework for this study is developed based on TAM, adapted from Abou-Shouk (2012). Based on this model, this chapter looks at the environmental pressures (external variables in TAM), to find out whether it has any influence on the perceived benefits (PU in TAM) and perceived barriers (PEU in TAM), and to further investigate if these three factors have any effect on the level of e-commerce adoption among travel agents in Brunei Darussalam.

Figure 4. Conceptual framework based on the Technology Acceptance Model (Abou-Shouk, 2012)



The operational meaning of the variables in the framework are:

External pressures: Threats which coerce travel agents towards e-commerce adoption. These forces can be identified through potential and existing customers, suppliers, partners, or even rivals; the constant technological changes which will eventually lead to adaptation of these changes; the consequences brought about by globalisation such as disintermediation threats to travel agents; hence, the need for survival.

Perceived benefits: All the advantages brought about through e-commerce adoption, which could aid in the increase of the company's competitive edge in the market. Some advantages could be related to the company's survival in terms of financial performance, the firm's overall performance, or the relationship between the travel agent and customers, partners, or suppliers.

Perceived Barriers: This includes technological and organisational factors which could negatively affect the decision to adopt e-commerce among travel agents. Some internal factors which could be considered as barriers are resource availability, expertise, the firm's readiness in adopting the technology, or technological features such as trialability, complexity, or compatibility. Meanwhile, external factors could include suppliers, customers, or the government's readiness, or the fear of online transaction security.

The level of e-commerce adoption comes in four stages: 1) Static web presence; 2) Interactive online presence, 3) Electronic transactions; and 4) Electronic integrations (Abou-Shouk, 2012).

Research Hypothesis

Five hypotheses have been developed for this study in order to achieve this chapter's objectives.

Cheung and Lam (2009) mention that some causes that have forced travel agents to change are the increase in competition due to globalisation, the increase in expectations and demands from customers, and customer's increase in knowledge on technology. Technological improvement has also enhanced the diffusion of information, which has led to the reduction of intermediaries in the global travel market. Airlines are now providing booking functions on their website, resulting in the decrease on the importance of using travel agencies in making ticket bookings, as opposed to when airline websites were still non-existent. Therefore, the following proposed hypothesis has been developed:

Hypothesis one: Environmental pressures have a positive influence on the perceived benefits of e-commerce adoption.

In developing countries, studies have found that the essential infrastructure needed to implement e-commerce is not available; hence, hindering companies from adopting e-commerce (Abou-Shouk et. al., 2016). This could be due to the lack of accessible Internet services. Therefore, the following proposed hypothesis has been developed:

Hypothesis Two: Environmental pressures have a negative influence on the perceived barriers of e-commerce adoption.

In a study conducted in Hong Kong, Law et. al. (2001) found out that one of the reasons why travel agencies are not using the Internet or e-commerce is due to the shortage of resources and technological expertise, and considered as perceived barriers. Therefore, the following proposed hypothesis has been developed:

Hypothesis Three: Perceived barriers have a negative influence on the perceived benefits of e-commerce adoption.

Abou-Shouk (2012) has found that perceived benefits affect the adoption of e-commerce positively within travel agencies in Egypt. In the study, respondents agree that the benefits of e-commerce improve the company's marketing service, thus increases the chances of adoption. Therefore, the following proposed hypothesis has been developed:

Hypothesis Four: Perceived benefits have a positive influence on the level of e-commerce adoption.

Abu Abid et. al. (2010) reports that a business's external barriers are not considered to be a significant factor in adopting e-commerce compared to the internal barriers. Therefore, the following proposed hypothesis has been developed:

Hypothesis Five: Perceived barriers have a negative influence on the level of e-commerce adoption.

Hypothesis Development

Table 1. Table of hypotheses

Hypothesis	
H1	Environmental pressures have a positive influence on the perceived benefits of e-commerce adoption.
H2	Environmental pressures have a negative influence on the perceived barriers of e-commerce adoption.
H3	Perceived barriers have a negative influence on the perceived benefits of e-commerce adoption.
H4	Perceived benefits have a positive influence on the level of e-commerce adoption.
H5	Perceived barriers have a negative influence on the level of e-commerce adoption.

RESEARCH METHODOLOGY

Sampling and Data Collection

The aims of this chapter are to recognise and investigate the use of e-commerce in respective travel agencies, as well as to examine how the implementation of digital technologies brings benefits and challenges in travel agencies.

This section focuses on the travel agencies in Brunei Darussalam. Fifty-six travel agencies are listed under the Brunei Darussalam Tourism Development Department. A quantitative approach was used in this study, whereby 56 self-administered questionnaires were distributed. However, only 15 were returned and considered valid for analysis.

Instruments

The questionnaire was adapted from the research done by Abou-Shouk (2012) and was distributed online via Google Forms. It is divided into four parts: Part 1, to figure out the use of computers in the travel agency; Part 2, to identify internet access and pattern problems in the travel agency; Part 3, to investigate whether or not the agents are already utilising e-commerce; and Part 4, to obtain managers' and travel agents' personal details. This research uses a research model which consists of four variables: environmental pressures, perceived benefits, perceived barriers, and level of adoption. Table 2 shows these four variables and their operational definition.

Table 2. Variables and operational definition

Variables	Operational Definition
Environmental Pressures (EP)	The external factors that have forced the agency to implement e-commerce.
Perceived Benefits (BE)	E-commerce adoption/level of adoption that could help achieve perceived benefits.
Perceived Barriers (BA)	Decision to adopt e-commerce might be influenced by organisational and technological factors.
Adoption/Level of Adoption (AD)	The difference between the agents who adopt e-commerce and the agents who do not.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Semi-structured interview questions were also derived from the research by Abou-Shouk (2012). Quantitative analysis emphasises on the advantages of e-commerce to travel agencies, problems that arise from implementing and creating the website's booking system, and the manager's recommendations on how to implement e-commerce effectively in travel agencies.

Data Analysis

IBM SPSS Version 21 and Microsoft Excel 2013 are used for statistical analysis. To help measure the reliability of the data, Cronbach's alpha is used to measure reliability, while regression analysis is used for hypothesis testing.

Table 3. Statistical analysis used in this study

Measures	Statistical Analysis
To illustrate respondent's demographic factors.	Descriptive analysis
Reliability analysis of the independent variables (EP, BE, and BA) and dependent variable (AD)	Cronbach's alpha
Relationship analysis between dependent variable (AD) and independent variables (EP, BE, and BA)	Regression analysis

RESULTS

Descriptive Analysis

The statistical analysis result data are based on the application of IBM SPSS Version 21 and Microsoft Excel. In descriptive analysis, summarised data are analysed on the travel agencies' responses to gender, age, agency's age, agency's served market, rate of employee's computer capabilities, implementation of website, and e-commerce.

Gender

Table 4 indicates that out of the 15 respondents, 9 respondents are male and 6 respondents are female. It shows that male managers are more dominant in travel agencies than female.

Table 4. Respondent's gender

Gender	Respondent	Percentage
Male	9	60%
Female	6	40%
Total	**15**	**100%**

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Age

In Table 5, all 15 respondents are above the age of 21. Seven out of 15 respondents are between the ages of 21 and 30; four are in the 41-50 age range; while there are two respondents each in the 31-40 and 51-60 age range. Judging by the data in Table 5, it can be deducted that those aged between 21-30 are more likely to be hired in travel agencies.

Table 5. Respondent's age

Age	Respondent	Percentage
<21	0	0%
21-30	7	46.7%
31-40	2	13.3%
41-50	4	26.7%
51-60	2	13.3%
>60	0	0%
Total	**15**	**100%**

Number of Years in Operation

Table 6 shows that all agencies have been operating for more than one year. A majority of the respondents have been operating for more than 11 years; five have been operating for 11 to 15 years; and another five have been operating for more than 30 years. It is expected for companies that have been in operation for a long time to adopt the use of e-commerce. They have been in the industry for a long time and have gained a lot of experience and knowledge. The findings show that the five agencies that have been operating for more than 30 years do have a website and they also implement e-commerce. However, only two out of the five agencies that have been operating between 11 to 15 years have a website and implement e-commerce. Meanwhile, the remaining three agencies only have a website, which they use to provide information on their agency and services, online brochures, interactive travel planner or organiser, online search for other services, accepting inquiry and feedback, and customer care.

Served Market

In Table 7, a majority of the respondents state that their agencies serve both national and international markets (93.3%) while one respondent states that their agency only serve international market (6.7%). To surmise, in a competitive travel industry, 14 out of 15 companies serve both national and international market. However, the main tourist activity for each company differs, with some responses including outbound/ticketing/holidays overseas, tours in Brunei, niche market and cruise ship, Singapore, Temburong trips, Ticketing, full-day city tours, hajj and umrah packages, and rainforest.

Table 6. Number of years in operation (company's age)

Number of Years in Operation	Respondent	Percentage
Less than 1 year	0	0%
1-5 years	4	26.7%
6-10 years	1	6.7%
11-15 years	5	33.3%
16-20 years	0	0%
21-25 years	0	0%
26-30 years	0	0%
More than 30 years	5	33.3%
Total	**15**	**100%**

Table 7. Travel agency's served market

Served market	Respondent	Percentage
National	0	0%
International	1	6.7%
Both	14	93.3%
Total	**15**	**100%**

Level of Computer Capabilities

Table 8 shows that nine out of 15 respondents rate their employees' computer capabilities at intermediate level, while three rate their employees' computer capabilities at professional level, and another three rate theirs at advanced level. In general, the employees' computer capabilities are between intermediate level and professional level. This may be due to the difference in academic background, working experience, and technological advancement.

Table 8. Level of employees' computer capabilities

Level of Employees' Computer Capabilities	Respondent	Percentage
Lack of skill	0	0%
Beginner	0	0%
Intermediate	9	60%
Advanced	3	20%
Professional	3	20%
Total	**15**	**100%**

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Website Availability

Table 9 shows that a majority of the respondents (86.7%) say that their agencies do have a website while the remainder (13.3%) say that they don't. All agencies have internet access, email address, and social media platforms such as Facebook and Instagram. Moreover, 13 out of 15 agencies have a website that are used to provide information or services to customers including online brochures, and online booking. As for the two agencies with no website, perhaps they use email address and social media platforms to communicate with customers.

Table 9. Website adoption

Is there a website at the travel agency?	Respondent	Percentage
Yes	13	86.7%
No	2	13.3%
Total	**15**	**100%**

Adoption of E-commerce

Table 10 indicates that a majority of respondents answered yes (66.7%) and only a fraction answered no (33.3%). As mentioned, all respondents have access to the Internet in their agencies. They also have email address, social media such as Facebook and Instagram, and nearly all the agencies have a website. In addition, a majority have also implemented the use of e-commerce.

Table 10. The adoption of e-commerce

Is e-commerce used by your agency?	Respondent	Percentage
Yes	10	66.7%
No	5	33.3%
Total	**15**	**100%**

Reliability Analysis

In this study, the analysis on reliability is measured using Cronbach's alpha. A reliability test is conducted to ensure the consistency of the three variables, BE, EP, and BA, with the dependent variable AD. As Table 11, 12, and 13 present, Cronbach's alpha for all items range from 0.487 to 0.930. As Sharma (2016) mentions, Cronbach's alpha $\alpha < 0.6$ is questionable, $\alpha < 0.7$ is acceptable, and $\alpha < 0.8$ is good; hence, the acceptable Cronbach's alpha value for this study is above 0.7, and those below that value are rejected and considered as unreliable. All of the items have coefficient alpha with more than 0.7 (essential benefit $\alpha = 0.885$, competition and marketing benefits $\alpha = 0.798$, business internal efficiency $\alpha = 0.930$, resource limitation $\alpha = 0.842$, business internal environment $\alpha = 0.835$, and business external environment $\alpha = 0.838$), with an exception of two items which have coefficient alpha less than 0.7 (perceived environment

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

pressure $\alpha = 0.671$ and adopted technology attributes $\alpha = 0.487$). Although the results indicate that all items in each variable are reliable except for perceived environment pressure and adopted technology attributes, the latter is considered as acceptable even though Cronbach's alpha value is $\alpha = 0.487$. This is because a majority of researchers have agreed that technology has also become a factor that hinders the adoption of website creation due to high developing cost and maintenance. In fact, some managers have also mentioned that expensive technological cost affects website adoption.

Table 11. Reliability analysis of variable perceived benefits

Variable	Items	Measures	N	α	Min	Max	μ
Perceived benefits	Essential benefit	A. Increase in sales, revenue, and profits.	15	.885	1	5	4.26667
		B. Assists in re-intermediation effectively (re-intermediation is the introduction of a new intermediary between consumers and suppliers).	15		1	5	4.00000
		C. Attracts new investors or services.	15		1	5	3.93333
		D. Allows and assists cooperation/partnership.	15		1	5	3.93333
	Competition and marketing benefits	E. Enhances distribution channels (the intermediaries/ network through which goods and/or services travel from suppliers to consumers).	15	.798	1	5	3.86667
		F. Creates image/reputation within the global markets.	15		1	5	4.20000

Model Summary				
Model	R	R Square	Adjusted R Square	Standard Error of the Estimate
1	0.578[a]	0.334	0.152	0.22816

Predictors (constant): Environmental pressures, perceived benefits, and perceived barriers. Dependent Variable: Level of website adoption.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Regression Analysis

Regression analysis is conducted to examine the influence of independent variables (EP, BE, and BA) on a dependent variable (AD). The R-Squared in regression model explains the percentage of variance in independent variables in response to the variance in the dependent variable. As seen in Table 14, the R-squared value for this regression model is 0.334. This means that only 34% of the variance in EP, BE, and BA can explain the level of website adoption among travel agents in Brunei Darussalam.

Table 15. Regression analysis of variable perceived benefits

Perceived Benefits	Sig
A. Increases sales, revenue, and profits.	.000
B. Assists re-intermediation effectively.	.000
C. Attracts new investors or services.	.000
D. Allows and assists cooperation/partnership.	.000
E. Enhances distribution channels.	.000
F. Creates image/reputation within the global markets.	.000
G. Customisation of services according to customer needs.	.000
H. Increases customer satisfaction.	.000
I. Gains competitive edge.	.000
J. Collaborates with partners or suppliers effectively.	.000
K. Enhances responsibility.	.000
L. Increases employee satisfaction.	.000
M. Easy to perform transactions.	.000
N. Improves the flow and sharing of internal knowledge.	.000
O. Supports strategic decision making.	.000

Predictors (constant): Environmental pressures, perceived benefits, and perceived barriers. Dependent Variable: Level of website adoption. Significant $p<0.05$, Not significant $p>0.05$

B. Development of supplier programmes.	.000
C. Influence of business partner.	.000
D. Embracing the changes in technology.	.000
E. Issues of globalisation.	.000
F. To survive in the future.	.000

Predictors (constant): Environmental pressures, perceived benefits, and perceived barriers. Dependent Variable: Level of website adoption. Significant $p<0.05$, Not significant $p>0.05$

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 15, 16, and 17 illustrate the significance of regression coefficient and p-values for all variables (BE, EP, and BA) in this regression model are $p = 0.000$. Since all p-values for each variable are less than the significance level of 0.05 ($p < 0.05$), this indicates that all of the variables are significant in affecting the level of website usage among travel agents in Brunei Darussalam.

Table 17. Regression analysis of variable perceived barriers

Perceived Barriers	Sig
A. Little awareness and/or knowledge regarding the benefits of e-commerce.	.000
B. Inadequate resources to implement e-commerce.	.000
C. Employees refuse to change how they work/stick to/persist with their old ways of doing work.	.000
D. Refuse to take risks and unsure of the benefits of e-commerce.	.000
E. Characteristics/features of the business (small sized and remote location).	.000
F. Technological preparation is lacking.	.000
G. Unskilled IT labour.	.000
H. Lack of business planning and strategy (to expand the business).	.000
I. Changing traditional to new methods is time consuming.	.000
J. Regulatory issues such as privacy, copyright protection, and transaction.	.000
K. Factors influence the external environment of business operations in legal, economics, and socio-cultural.	.000
L. Lack of initiatives and support from government.	.000
M. Lack of availability of public infrastructure and internet access.	.000
N. Few successful e-commerce and verified business models.	.000
O. Issues on customer belief, culture, and satisfaction.	.000
P. Unable to implement e-commerce software during trial period.	.000
Q. E-commerce is a complicated technology.	.000
R. E-commerce is unsuitable for travel agency.	.000

Predictors (constant): Environmental pressures, perceived benefits, and perceived barriers. Dependent Variable: Level of website adoption. Significant $p<0.05$, Not significant $p>0.05$

Hypothesis Testing

Table 18 shows the summary of hypothesis testing. The regression analysis in Table 15, 16, and 17 show the p-values for all variables (EP, BE, and BA) are $p = 0.000$. These p-values are less than the significant level of 0.05 ($p < 0.05$). This indicates that all variables are significant in influencing the level of website usage among travel agents in Brunei Darussalam. Thus, we accept all of the hypothesis. For hypothesis H1, it is accepted that there is a positive relationship between environmental pressures and perceived benefit of website usage. For hypothesis H2, it is accepted that there is a negative relationship between environmental pressures and perceived barriers of website usage. For hypothesis H3, it is accepted that there is a negative relationship between perceived barriers and perceived benefits of website usage. For hypothesis H4, it is accepted that there is a positive relationship between perceived benefits and the level of website usage. And finally, for hypothesis H5, it is accepted that there is a negative relationship between perceived barriers and the level of website usage.

DISCUSSIONS

Significance of Perceived Benefits and its Effect on the Level of E-commerce Adoption

For the purpose of this study, perceived benefits consist of three variables: essential benefit, competition and marketing benefit, and business internal efficiency. Essential benefit includes the financial performance of the company; competition and marketing benefit lowers operating cost and at the same time increases the company's market reach (Khatibi et. al., 2005); and business internal efficiency are benefits that e-commerce can bring in terms of the company's internal operations, which includes improving employee satisfaction and easing transactions (Abou-Shouk, 2012).

These factors are proven to influence e-commerce adoption in businesses, as supported by a study in Malaysia by Khatibi et. al. (2005), where the ease of conducting transactions between travel agents and customers as well as decreased cost due to Internet communication are tools in a business, hence the adoption of e-commerce. Another study in Bosnia finds that respondents believe e-commerce can help enhance consumer interaction and intermediation, which can provide a new marketplace. Furthermore, it can also help save time and cost (Ozlen et. al., 2014).

Significance of Environmental Pressure and its Effect on the Level of E-commerce Adoption

Environmental pressure in this context can refer to pressures from competitors, suppliers, business partners, the evolution of technology, globalisation, and the company's future survival. In this study, the significant factors that influence travel agents to adopt e-commerce are technological changes and the company's survival. Wang and Hou (2012) find that with globalisation and the movement of open sources, SMEs are influenced to adopt e-commerce when large corporations adopt the technology. This proves that competitors and technology play important roles in e-commerce adoption among SMEs.

A study in Malaysia conducted by Kurnia et. al. (2009) also finds that EP has a positive effect towards e-commerce adoption among companies. The study is supported by Abou-Shouk (2012), who finds that travel agents in Egypt are also pressured to adopt e-commerce, mainly for their company's survival.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Significance of Perceived Barriers and its Effect on the Level of E-commerce Adoption

The quantitative results for BA in adopting website booking system is divided into four categories. The first category is the attributes of adopted technology. Despite being rejected due to its low reliability, attributes of adopted technology play a significant role in preventing travel agencies from implementing the website booking system. Based on the results, travel agencies in Brunei Darussalam view the website booking system as insignificant. The result is consistent with studies conducted by Abou-Shouk (2011), whereby e-commerce adoption does not fit with the nature of services provided by the travel agency in Egypt as their market are targeted towards religious tourism, which prefers direct and personal contact rather than using a website. Another factor to be considered as a barrier to website booking adoption is complexity. Based on answers given by managers, it is found that website booking system are difficult for staff to operate. This result is in line with findings from research on travel agencies that adopt sophisticated website booking system that are difficult for staff to understand (Alrousan, 2014).

The second category is the external environment. This category encompasses the lack of support from the government in encouraging travel agents to adopt a website booking system. According to Kassim (2014), government support is defined as support through electronic infrastructure, legislation, training programme, and financial. The significance of government support in this research is consistent with previous findings, where studies show that companies with a high level of e-commerce adoption are more aware of benefits from government support than companies with a lower adoption level. Therefore, it can be deduced that the more government support the travel agents in Brunei Darussalam receive, the higher the likelihood of website booking system adoption.

The third category is the internal environment. Characteristics such as firm size play a significant role in influencing the manager's decision to adopt a higher level website booking system. Prior studies show that firm size does affect the adoption of advanced e-commerce for travel agencies because a bigger firm usually has higher financial resources, knowledge, and expertise in using the system. Moreover, bigger travel agencies are capable of handling failure in the implementation of e-commerce compared to smaller agencies (Gharibyan, 2016; Alrousan, 2014; Abou-Shouk, 2011). Another factor that hinders managers from adopting an advanced website booking system is not having fast Internet access and an inexperienced IT department (Abou-Shouk, 2011).

The final category is resource limitation. Resource limitation encompasses a firm's financial capability. Financial resources is a significant factor that hinders a company from adopting the website booking system. This is similar to a study conducted in Nigeria by Musawa and Wahab (2012), whereby a firm requires a large amount of financial investment, effort, and time in order to adopt advanced e-commerce. Therefore, travel agency managers are advised to study the feasibility and cost effectiveness of adopting an advance booking system for their business. It is vital to consider the lack of financial resources as a barrier for managers in adopting the booking system.

RESEARCH LIMITATIONS

One of the research limitations is time constraints. Due to the limited time available to complete the study, it is difficult to find more respondents or to revise the methodology and survey used in the study. The second limitation is that there was no pilot testing. The lack of pilot testing means that the study

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

is unable to test the survey to find out which variables are compulsory and which are not. The lack of response from respondents is also a limitation; the researchers only received 15 out of 56 responses. The survey was initially distributed through emails and social media, which didn't get a response. The researchers were then forced to distribute the survey manually, which was more time consuming, difficult, and costly as the travel agencies had to be visited personally so that agents and managers could be given the survey, which then had to be picked up again upon completion. Information on the Brunei Darussalam Tourism Development Department database also has not been updated for a while, as the researchers discovered that two travel agencies have closed. Thus, there is a lack of information on the actual number of existing travel agencies in Brunei Darussalam.

RECOMMENDATIONS

As stated in the limitation, only 15 respondents took part due to time constraints and lack of initial response to the online survey on Google Forms. One of the recommendations is by increasing the number of respondents as it may help obtain a more empirically accurate data. Another recommendation is to have more reliable and updated sources. Having more time will also be helpful so that a pilot test can be conducted to check on the reliability of survey questions, and possibly increase the number of respondents. The use of other types of methodology can also help, such as interviews or a focus group study. These can provide a different insight and view with a more detailed narrative and base data.

CONCLUSION

In conclusion, the authors find that the adoption of e-commerce among travel agencies in Brunei Darussalam is influenced by the perceived benefits and the perceived barriers from environmental pressure such as competitors and globalisation. The levels of adoption are either beneficial or obstacles that influence travel agents to adopt or not adopt e-commerce. Therefore, while e-commerce adoption are mostly seen as beneficial for Brunei travel agencies to survive in the global market, barriers such as lack of IT employees restrict adoption.

ABSTRACT

The main focus of this chapter is to identify the behaviors of the consumers and sellers of e-commerce in Bahrain. It also seeks to understand the ethical and legal issues faced by the users of e-commerce and the various reasons for such behavior. The perception of the consumers regarding online retailers discussed through appropriate measures and research data. The chapter clearly explains the historical development of e-commerce in Bahrain and the processes and procedures of setting up an online business in the country. The common legal and ethical issues faced by the consumers discussed in detail and supported by different models to understand user behavior. The research onion method used to gather quantitative and qualitative data. The primary data collected through questionnaires and interviews whereas the secondary data collected through literature. The data analysis shows the results of the mixed method supported by different graphs and models. The different recommendations provided to solve the most prevalent problems confronted by the buyers and the sellers of e-commerce.

INTRODUCTION

In this modern world of Globalization, the world is changing at a rapid speed and so is the technology around us. The factors affecting our daily life, along with the lives of the upcoming generation cannot be overseen. The modern advancement and developments have narrowed the space between human beings and machines (Al-Alawi, 2014). As has been stated by Cabell (2001),"around two years ago, the total amount of knowledge on e-Commerce could be collected in a small bucket of bits. But two years from now, we might float in a sea of information on digital technology alone". This is because technology keeps changing over time and it is hard to keep pace with the continuously changing digital environment. On one hand, human beings are using technology and compromising on their privacy and on the other hand, technology is satisfying the needs of the people. But we cannot overlook the fact that human beings are unpredictable, and it is not easy to control them. Due to this fact, there is a rise in the cybercrimes and a large number of people are misusing the technology to intentionally or unintentionally harm the other users around them. Despite the fact that there are many regulations and laws that protect the individuals, there has been a drastic increase in these crimes (Al-Alawi & Abdelgadir, 2006; Al-Alawi, 2014). These crimes are not just limited to using social media and internet, but they have also left a negative impact on the e-Commerce activities around us. The world of e-Commerce is so vast that it is almost impossible to measure the extent of this impact. In the modern world, e-Commerce has gained a widespread popularity and is one of the most useful platforms for businesses as well as individuals.

The emergence of e-Commerce has made the traditional business practices expand and reduced the limitations involved in the way people used to do business. For example, the appearance and forms of businesses have changed compared to the traditional systems and these changes are the basis of decisions in all economies. With the development of virtual systems in the markets and stores, it is possible for the consumers to shop at their convenience anytime and anywhere in the world without leaving their homes. They can choose and order products or services from a wide variety of virtual shops and pay on the spot. At the same time businesses can market their products and services through advertisements (Nanehkaran, 2013).

One of the most important characteristics of the Internet is its ever-changing and fluid characteristic. Web pages vanish in seconds and users pass through the electronic highway at a relatively fast speed. The ever-changing technology is also bringing along a vast number of unethical practices and actions and this issue has been widely discussed ever since the emergence of digital technology (Cabell, 2001).

On one hand, we can reasonably conclude that e-commerce has a large number of benefits which include faster buying and selling around the clock all over the world, low costs of operations and better quality of services, easy start-up and marketing, simple and fast business services and improved customer services. But on the other hand, we cannot overlook the threats posed by availing these benefits which include privacy and security issues, fraud, illegal access, initial costs of setting up web applications and websites, User resistance, technical software and hardware issues, unsolicited emails, false advertising, product warranty, cybersquatting and cyber security.

Statement of the Problem

The expanding growth of internet and e-Commerce activities have given rise to a number of legal and ethical issues being questioned. Most of the people want to get their tasks done as quickly as possible without much hassles and e-Commerce has provided them with a great medium where they can save

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

time, money and efforts. In the past, mobile phones, faxes and telephones have opened vast opportunities for business processes. But we cannot deny the fact that every new business is born with some associated risks and same is the case with e-Commerce. Therefore, it is extremely important and beneficial to identify these issues and the different risks they carry for the users in order to try and create a safe environment for the buyers as well as the sellers.

It is fairly easy for businesses to get sidetracked in the hassle of keeping up with the technology and as a result lose track of the ethical implications. These implications would generally be easily addressed during face to face interactions with the customers, but it is a big challenge when it comes to e-Commerce. E-Businesses around the world are affected due to some of the most commonly prevailing issues which include web tracking, privacy issues, disintermediation and reinter mediation, fraud, copyright infringements, domain names and many more. These issues have to be resolved through the practical application of universally applicable ethical and legal laws, so people do not hesitate to reap the benefits of e-Commerce facilities.

The purpose of this report is to identify the behaviors of the buyers and sellers involved in online transactions in the Kingdom of Bahrain. It is directed towards providing appropriate solutions for some of the most common issues faced by the consumers and sellers in the country.

Research Significance

Ethics are usually formed through personal beliefs, thoughts, morals and behaviors of the individuals. The two main building blocks of any relationship are trust and communication. The framework for ethical web accessibility is a critical factor towards the success of the e-Commerce initiatives around the world. Studying the important factors which contribute to these issues, will help to provide suitable solutions to help the widespread issues related to e-Commerce. Managers can formulate different strategies and regulations to control the unethical actions which result in losing the trust of the customers. This research aims to understand the behavior and perceptions of the consumers of e-Commerce and provide suitable solutions so that they can reap the benefits of e-Commerce without any hindrance. It will also help to understand the viewpoints of different e-Commerce service providers, how they overcome some of the most common issues in e-Commerce and their suggestions or recommendations to improve the e-Commerce situations.

Research Objectives

The main objectives of this research are:

- To provide an insight into different practices and models of e-Commerce
- To identify the different kinds of unethical and illegal behaviors faced by the buyers and sellers in e-Commerce.
- To study the reasons for unethical consumer behavior and its impact.
- To provide recommendations and solutions to solve the most common types of unethical or illegal problems.
- To discuss suitable solutions to eliminate the risk of losing information security and prevent unauthorized accessing.
- To conduct a research on the development of e-Commerce in Bahrain.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

- To study the factors influencing the e-Commerce behavior of the consumers in Bahrain.

Research Methodology

The secondary data in the literature review was collected through different websites, journal, articles and previous research studies. The research methodologies and the data collection techniques used in the literature review were reviewed properly and the most appropriate ones were used for this research. The first part of the methodology focuses on identifying the behavior of the consumers of e-Commerce. For this purpose, a quantitative method was adopted, and a survey was conducted which included a sample of 55 students from the University of Bahrain. This survey was conducted electronically through emails and other social media.

The data collected through the survey was then reviewed to focus on the main factors to be analyzed in the study. To analyze the data collected for this study, the study used the statistical packages of science (SPSS) software 22. In order to reach a more reasonable conclusion, the factors were further investigated by collecting the qualitative data. This was done by conducting interviews with the product and service providers of e-Commerce in the Kingdom of Bahrain. The interview was conducted with the owner of a UAE and Bahrain based online shop called MENA shoppers and with the IT project manager of the E-government authority in Bahrain. The research captured information from both the sources, which was analyzed to reach the appropriate conclusion.

Research Limitations

The research does not cover the social, technological and economic issues involved in e-Commerce and focuses only on the ethical and legal aspects. It focuses on the views, experiences and perceptions of some of the e-Commerce manufacturers in Bahrain. The sample consists of 2 manufacturers and around 55 consumers of e-Commerce. However, many consumers and manufacturers in Bahrain could not be interviewed and surveyed due to the access, time and cost limitations. In addition to this, one of the main obstacles was information access, since most of the organizations hesitate to provide confidential information about the issues they face with the customers and vice versa. This research provides suggestions and recommendations to improve the e-Commerce situations but does not help in implementing them.

Study Structure

The study consists of six sections. Section one provides a brief introduction about e-Commerce and the implications of different ethical and legal issues in the modern world of e-Commerce. Then it provides the research problem, significance, objectives, limitations and methodology.

Section two discusses the development of e-Commerce in Bahrain, while Section three consists of the literature review which discusses the history, definitions and types of e-Commerce and its objectives. It also illustrated the different factors affecting e-Commerce and the reasons for this behavior.

Section four provides an overview of the different methodologies used to conduct the research. It also discusses the research tools, procedures and the research design used in the report. The data collection method, instrument design and the sampling technique used in this research is also presented along with the procedures for data analysis.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Section five is devoted to providing the data analysis, presentation and discussion. The main results and findings from different methods are presented, compared and tested with the pre-existing theories of the literature review.

Section six concludes the research by giving a short review of the findings and the research in general. It also provides different recommendations for the buyers and providers of e-Commerce in order to help them overcome the issues in e-Commerce.

The Research Management Plan

A systematic approach was followed in this research and the research work was divided into three main phases and nine activities (Table 1). This study management plan was developed in order to help and develop a better understanding of the study structure and to facilitate the management of the study work.

Table 1. The research management plan

	Phases	Activities	Outcome	Sections
Phase One	I. Research Project Definition.	1.Introduction of the research	1. Identifying the research problem, objectives, design, methodology and study structure.	Introduction
	II. Literature Review - General - Focused	2. Collect data based on pre-existing theories and previous studies through journals, articles, websites and previous research papers.	1.Understanding e-Commerce and its types. 2. Understanding the History and activities of e-Commerce in Bahrain. 3. Identifying the ethical and legal issues in e-Commerce	Literature Review
Phase Two	I. Quantitative Survey (Questionnaires).	1.Developing Questionnaire. 2. Selecting Sample population. 3. Distributing the Questionnaires.	1. Identifying the common issues faced by the consumers of e-Commerce and their importance. 2.Identifying the most common e-Commerce platforms. 3.Understanding the perceptions and reactions of the consumers. 4.Suggestions for improvement.	Methodology
	II. Qualitative Survey (Interviews).	1. Preparing Interview questions. 2.Conducting Interviews.	1. Understanding the reasons for unethical and illegal e-Commerce behaviors. 2. Identifying the issues. 3.Suggestions for improvement.	
Phase Three	I. Data Analysis	1.Entering data for analysis. 2.Findings Presentation	1. Testing the findings for research success factors. 2.Categorizing the responses.	Data Analysis
Phase Four	I. Conclusion and Recommendations. II. Write up and Submission.	1.Develop suggestions based on the findings. 2.Writing up the study	1. Concluding the research and providing solutions to solve the e-Commerce problems. 2. Final draft of the study.	Conclusion and Recommendations

E-Commerce in Bahrain

The Kingdom of Bahrain is a small island situated in the Gulf. Although the population of Bahrain is relatively less compared to other GCC countries, but the interconnectedness of organizations to the internet, makes it one of the most digitally connected regions in the Gulf. Bahrain was one of the first countries in the Gulf to install a mainframe computer in 1962 and digitalized its national and international telephone network in 1992. The internet service was launched in Bahrain in 1995 whereas the wireless internet connection 'WiMax' was launched in 2007. It also became the first country in the world to establish a Next Generation Network (NGN) in 2008 (Ms. Vivian Jamal, Bahrain Economic Development Board, 2013). Internet usage all around the world is increasing day by day and so is the use of e-Commerce in Bahrain (Alajmi, 2014). The importance of e-Commerce was realized in Bahrain in the early 1999 but a major boom in the e-Commerce activities was witnessed in 2004, when the Ministry of Industry and Commerce established the Directorate of e-Commerce and IT. This was a great initiative to support and strengthen the framework of Information technology and e-Commerce in the country, because it helped the individuals as well as the industrial and commercial sectors to reduce cost and save time through direct contact methods. The official website of the ministry has been developed throughout the years and a wide variety of online services have been included. Many programs have been administered as well in order to enrich the e-Commerce activities for all local businesses in the region. The latest technologies have been used for enhancing the website to successfully provide the e-government services to the customers. In order to encourage the citizens to avail the e-Commerce facilities rather than wasting their time by using the conventional methods, the ministry is taking many steps to promote awareness of the electronic services in the Kingdom and push it towards a digital society (moic.gov.bh).

According to Trade Arabia News Service (2011), the internet usage in Bahrain had increased from 1.2 million (2000) to 18.7 million (2010). As stated in the report by Visa and Interactive Media in Retail Group (IMRG) International, in 2011 the online sales in Bahrain had reached BD 66.15 million (an estimated $175 million), which implies that the internet usage has increased upto 800 percent compared to the year 2000, meaning 55 out of every 100 Bahrainis are using internet. This percentage is one of the highest in the GCC. The government of Bahrain has paved new ways to e-Commerce through the development of Central Informatics Organization (CIO). Stephen Leeds, the business leader of Visa Middle East e-Commerce stated in one of his interview that the youth of Bahrain is striving towards the development of the digital society since online shopping in Bahrain is still in its initial stages but just like all the countries of this world, the Bahraini consumers are also facing certain barriers in e-Commerce such as privacy concerns and lack of trust. Bahrain, being one of the world's largest retail electronic payment networks, provides a number of mediums to its consumers in Bahrain in order to encourage them and restore their trust in shopping online. The head of the IMRG, Aad Weening asserts that the aim of spreading e-Commerce awareness among the consumers is to attract foreign investors and initiatives to develop domestic websites (tradearabia.com).

Bahrain is being tested on by many companies for the new ICT technologies. Bahrain also received a special award by the United Nations in June 2010 for the improvement of e-services and for building up the delivery of its services through e-participation (Bahrain.com). Since 2010, Viva Bahrain has invested almost $300 million for the improvement and innovation of applications for using e-services and e-Commerce in Bahrain (Bahrain.com,2013). Some of the well-known electronic manufacturers in Bahrain are Ameeri Industries who deal in manufacturing and distributing electronic products under brands including AMETECH, AMELITE and AMGARD and Awal Gulf, which is one of the biggest

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

manufacturers of air conditioners in the GCC, and their products are sold in more than 40 countries worldwide (Vivian Jamal, Bahrain Economic Development Board, 2013).

According to a report by Trade Arabia Business News Information (Manama, 2011), more than Bahrain's online sales hit 175 US$ during 2010 of the retail sales in Bahrain are generated through online businesses. The "Middle East B2C e-Commerce Report 2014" shows that 90% of Bahrain's population use internet and almost 5% of internet users prefer shopping online and this figure is expected to increase by 20% in the next five years. It was also found that despite the increasing popularity of e-Commerce in Bahrain, the users also face some barriers which include predominance of cash on delivery payments, low acceptance of online shopping by the consumers and low adoption of retail channels by the local businesses. However, there are still a few markets that lead the region in the adoption of e-Commerce. The highest revenue in the region is generated through online sale of products including jewelry, computers, clothing, watches and electronics (Avinash Saxena, GDN, 2014; Manama, 2011).

E-Government Services

E-government and its services were launched in Bahrain soon after the increase in internet users and the development of e-Commerce, but it was major step taken by the government to promote e-services and save the time and processes of paying utility bills, traffic fines and applying visas. The National E-government Strategy of Bahrain in 2016 is to increase the number of e-services used by the citizens and organizations by more than 90 percent. Companies in Bahrain can now process most of the registration works, visa applications, banking services and eTendering of government contracts online.

Bahrain ranked second in the GCC in a survey conducted by United Nations Government in January 2012. Another survey which was conducted by the UN Global eGovernment Readiness among 192 countries, placed Bahrain on the 36th position worldwide for the successful application of ICT technologies for the citizens. The government has also taken measures for simplifying the procedures of obtaining a commercial registration and other business licenses. The Business Licensing Integrated System (BLIS) was launched in 2010 which aimed to enhance Bahrain's position and improve its competitiveness among other countries. It also ensured transparency in all the procedures and business processes and simplified the streamlining of all licensing requirements. (Vivian Jamal, Bahrain Economic Development Board, 2013).

Entrepreneurs in Bahrain

The Northwestern University of Qatar conducted a study in 2014 to identify the trends of social media usage in the GCC. The study showed that Bahrain had the largest number of Instagram users compared to Qatar, UAE, KSA, Egypt, Jordan, Lebanon and Tunisia. It was clear from the study that it is a great opportunity for businesses to target their audience in Bahrain through Instagram. This application which was designed by Mike Kreiger and Kevin Systrom is a great platform for the developing SME businesses in Bahrain. Some well-known entrepreneurs from the cottage industry include Rocky by Rose, Canvas.bh, Baked by T and Acai Bahrain, who have realized the early benefits and opportunities offered through Instagram. The vendors are able to communicate with the consumers for taking orders, delivering and collecting payments through emails, SMS, WhatsApp or through Direct Messaging on Instagram and market their products through posting the pictures or videos along with the features of the product and its prices. The most popular product categories include clothes, accessories, cosmetics and electronics.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The vendors deliver the products through shipping companies like Aramex or directly at the customer's address and in some cases the customers pick them up personally from the shops. The trend of 'Instapraneurs' has been recognized by both the government and the local franchises of international brands. Despite the growth and success of e-Commerce in Bahrain, the ability to make online payments has been a hassle in the process. Although Credimax and Benefit gateways do exist, but they can be difficult to use for businesses that are being run without any IT support, as it has to be integrated into the websites of the business. However, Paytab which has been launched recently allows the vendors to offer invoices and payments online without having a website (www.eastinnovations.com, 2014).

Setting Up an e-Commerce Based Business in Bahrain

In the past, setting up an e-business in Bahrain was a big hassle but now it takes less than 24 hours to develop an e-Commerce-based website. It requires less efforts due to the cheap hosting services, seamless application integration, plus and play e-Commerce utilities and custom-built web templates. One of the first ministries to provide electronic services in Bahrain is the Ministry of Industry and Commerce. A person who wishes to start an online business can apply for commercial registration with the Ministry of Industry and Commerce (Al-Alawi & Al-Ali, 2015). Tracking the status and approval of the application can also be done electronically through Business Licensing Investment System (BLIS) by visiting the website (www.business.gob.bh). The government of Bahrain established the Directorate of e-Commerce and Information Technology at the Ministry of Industry and Commerce, to provide an environment which is hassle free for the e-traders. For this purpose, the Directorate works in collaboration with the government entities, ministries and other directorates. According to the Ministry of Industry and Commerce, the steps to start an e-business in Bahrain are as shown in Figure 1.

Figure 1. Setting up an e-commerce based business in Bahrain

Selecting an e-Commerce Activity

Investors do not have restrictions for investing in most of the business sectors in the Kingdom of Bahrain, but some activities are prohibited because of their impact on the society, economy and environment. 100% foreign ownership and investment is also allowed but there are certain business activities that are legally confined only to the GCC or Bahraini citizens or organizations. All the activities of e-Commerce like e-promotion of products and services, must be registered in the Ministry of Industry and Commerce. Individuals can start a new e-Commerce-based business, or they can add it to their existing Commercial Registration. Moreover, every applicant is entitled to have an eKey which includes the user ID and password for commencing the e-business. This eKey is provided either by the Ministry of Industry and Commerce or by the eGovernment Authority of Bahrain.

Selecting the Legal Structure

The next step for the investors is to select a legal structure for the e-business. There are certain rules and regulations for commercial companies which are imposed by the Kingdom of Bahrain for selecting the legal structures in order to establish a company. In some cases, the investor might be required to seek other government organizations or entities to choose the legal structure. For example, if the new online business is media based, the approval from the Ministry of Culture is required. Some of the most common forms of legal structures for IT and e-Commerce include:

1. **Sole Proprietorship:** This kind of legal structure is only allowed for Bahrainis or GCC citizens residing in Bahrain. It is owned only by a single person as a non-incorporated entity and he is solely responsible for the debts and liabilities related to the business and his personal assets can be sold to cover the debts.
2. **Company**: A company may be owned by a single person or by multiple corporate persons and the liabilities of the company are only limited to the capital allocated by each person. The types of companies include Foreign branch company, Partnership, Single person company or a Holding company.

Selecting the Business/Domain Name

It is very important to select a unique and different name which does not match any of the existing business names. The following points should be considered while selecting a name:

- The business interest name should be unique.
- The name of the e-Commerce website should not match any of the registered businesses existing in Bahrain or anywhere else in the world.
- The Ministry of Industry and Commerce must not have the name already registered in its database.

It is important to keep in mind the terms and conditions stated by the Directorate of e-Commerce and IT and it is preferred to choose a name that ends with.bh.com.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Applying for Commercial Registration

There are two types of Commercial Registration that the investor can apply for. The first is the company commercial registration that can be applied to all types of company structures and the second is an individual commercial registration which can only be applied to a sole proprietorship. The applications for commercial registration of companies can be made at Bahrain's Investor Centre and the applications for individuals can be made at the Ministry of Industry and Commerce's Commercial Registration Directorates. The following are the required documents for the application process:

Documents required for an Individual establishment:

1. Application form
2. Registration form
3. Application form for the commercial name registration.
4. Copy of passport and CPR.
5. For employed applicants, a certificate from the applicant's employer is required stating that he has no objection on this matter and it should be signed and stamped by the employer.
6. For unemployed applicants, a proof is required that he is unemployed.

Documents required for a company:

1. Registration form
2. Single application form for the company registration.
3. Copy of CPR for Bahrainis and a copy of passport if the applicant is a GCC resident.
4. Draft of Memorandum of Association (for a single person company).
5. If the applicant is employed in the private sector and he is to hold a directorship or management post, he has to submit a no objection letter.
6. A copy of commercial agency, franchise or distribution agreement is required if the objectives of the company are related to such agreements.
7. If the company is one year old, a financial statement which is most recently audited is required.
8. A copy of the Commercial Registration of the company.
9. A license agreement for using a trademark (if applicable).
10. A resolution of the Board of Directors to join as partners.

Documents required for the single application form of company registration:

1. Copy of CPR and passport with visa pages (GCC residents).
2. Power of attorney for registration agent, if applicable.
3. A copy of commercial agency, franchise or distribution agreement is required if the objectives of the company are related to such agreements.
4. Copies of the CV, qualifications and a Draft of Memorandum of Association (for management and professional consultancy)
5. A reference letter either from a law firm, auditing firm or a licensed international bank (inside or outside Bahrain).

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Documents required for an e-Commerce Activity:

If a company or an individual proprietor wishes to add a new activity, they need to apply at the Ministry of Commerce and Industry along with the following requirements:

1. Copy of CPR or passport.
2. Copy of related certificates or qualifications.
3. The applicant should have enough time to conduct the e-Commerce activity.
4. The applicant must create a website for conducting e-Commerce activities.
5. The applicant should provide a medium for payment.
6. The applicant to provide the delivery services (if required).
7. The address for the customer service shop must be provided (if required)

Licensing and Approval of the Activity

For starting an e-Commerce-based business in Bahrain, it is enough to have a commercial registration issued by the Ministry of Industry and Commerce but for some business activities, a license or approval is required by the government authorities, before obtaining the commercial registration. No license is required if the e-commerce is enabling an existing business which is already licensed and registered but in case the business is listed in the "license required" list of Ministry of Industry and Commerce then the business has to go through the licensing process. For example, if the business is health related then it has to seek approval from the Ministry of Health and some other authorities. The approval sheet for e-Commerce can be obtained from the Directorate of e-Commerce and IT. The investors need to provide the details of the domain name, business concept, education and payment gateway for the setup of the e-Commerce business. The document is processed by the Directorate within one to three working days and they have to present their recommendations about it. Once it is approved, the Commercial Registration is processed.

Issuance of Commercial Registration

After the issuance of the Commercial Registration by the Ministry of Industry and Commerce, it has to be published in the official gazette. The only document that is required at this point of stage is a letter of request by the ministry. The Ministry of Justice's Public Notary carries out the notarization at the Bahrain Investor's Center (BIC). All the documents related to the legal structure should be issued either in Arabic or in English and Arabic both.

LITERATURE REVIEW

This section explains the literature review using primary data, which was collected through previous research papers, websites, journals and articles on e-Commerce. The literature review is divided into two sections. The first section describes the general literature review on e-Commerce, its types, history and definitions. The second part of the literature review is focused on e-Commerce and its implementation in the Kingdom of Bahrain. The purpose of this section is to investigate and form a comparative study on the implications of e-Commerce and the factors affecting it. The main ethical and legal issues involved

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

in e-Commerce will be highlighted in this section, which form the basis of the research. The impact of these issues on user behavior will be explained through appropriate research models. The research also aims to identify the adoption of e-Commerce and the process of setting up an e-Commerce-based business in the Kingdom of Bahrain.

Defining e-Commerce

e-Commerce is those activities which relate to the purchasing and selling of goods and services on the Internet 24/7. Riggins and Rhee (1998), stated according to a survey conducted among a few managers and practitioners, e-Commerce is the "buying and selling of products and services over the internet". However, according to a researcher, e-Commerce should include a wide variety of activities which should not be confined to the buying and selling of products, trading, services by using Information Communications Technology (ICT). e-Commerce can be divides into nine main different classes which include Business to Business (B2B), Business to Consumer (B2C), Consumer to Business (C2B), Consumer to Consumer (C2C), Government to Business (G2B), Business to Government (B2G), Government to Consumer (G2C), Government to Government (G2G) and Intra-organizational. The activities and the concept of e-Commerce has increased and acceptance globally (Goyal, et al. 2019, Al-Alawi & Al-Ali, 2015; Kant et al., 2015; Balasoui, 2015; Korper & Ellis, 2000).

Vladimir (1996, pp 3) defines e-Commerce as "conducting business transaction, sharing business information and maintaining business relationships by using telecommunications networks." He believes that "e-Commerce does not only include buying and selling of goods and services but the different individual business practices within the organization as well". Treese and Stewart (2003) assert that e-Commerce is, "using Internet for purchasing and selling goods and services along with customer support and service after the sale. Internet is a great tool for providing product information and advertising, but the main focus is on the complete transaction. In a broader sense. e-Commerce includes the use of communication technologies and computing in inventory management, order processing, financial business and online airline reservation. Historically, the best idea behind using e-Commerce has been the Electronic Data (EDI)."

According to Minoli and Minoli (1997), "E-Commerce is the integration of security capabilities, communications and data management in order to enable the business applications in various organization to successfully exchange information related to the selling of products and services with each other". The WTO (World Trade Organization) has defined e-Commerce as, "the distribution, production, sales and marketing of products and services through electronic means."

e-Commerce vs Traditional Commerce

The increased popularity of e-Commerce has induced many small and large businesses to adopt it as a medium for a highly profitable sales channel. It should be noted that there are many differences between traditional commerce and e-Commerce and it is important to understand these differences to save time, efforts and money. In this fast-paced world, a business may even choose to have a mixture of e-Commerce and traditional commerce which is not only profitable, but it will help the business to grow drastically. Many businesses are developing business models which are based on both the e-Commerce and traditional commerce practices. Table 2 shows the most important differences between both:

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. E-commerce vs traditional commerce

Key Elements	e-Commerce	Traditional Commerce
Value Creation	Information	Product or service
Strategy	Sense and respond Simple rules	Classical
Competitive Edge	High Speed	Quality and Cost
Competitive Force	Low barriers of entry Power of the customers	Product Substitution Power of the suppliers
Resource Focus	Demand Side	Supply Side
Customer Interface	Screen-to-face	Face-to-face
Communication	Technology-mediated channels	Personal
Accessibility	24x7	Limited time
Customer Interaction	Self service	Seller Influenced
Consumer Behavior	Personalization One-to-One market	Standardization Mass/One-way marketing
Promotion	Word of mouth	Merchandising
Product	Commodity	Perishables, feel & touch

(Source: Rahul Kavaiyya, Scope of e-Commerce, 2015)

History of e-Commerce

Online shopping was introduced and invented by Michael Aldrich in 1979. With the emergence of internet technology, many businesses began to realize that it was great medium to share information for the consumers and also helped to create a unique brand image of the business in the consumer's mind. The advent of WWW (World Wide Web), opened doors of opportunities for businesses around the world and they found it a great source of reaching out to the customers and increase their sales by putting the information for the customers on their Webpages. This also helped to create a unique brand identity for the businesses. In no time, big companies such as Amazon and E-bay were established.

According to Traver and Laudon (2008), e-Commerce history dates back to the innovation of selling and buying electrical equipment, and the internet. The e-Commerce become feasible during 1991 when Internet was initiated for business usage, then thousands of commerce taken place at the web sites. The history of e-Commerce is a "history of a new, virtual world which is evolving according to the customer advantage. It is a world which we are all building together brick by brick, laying a secure foundation for the future generations".

Early Use of Web

Businesses began availing the opportunity of e-commerce in the early 1990's, even though the use of internet among common people was not much popular back then. Most of the websites only provided basic information about the company such as their products and services or contact numbers. Due to the evolution of the technology, the use of internet became common and when the marketing departments realized that the worldwide usage of websites have increased, they decided to introduce the idea of selling products and services online. These online sales started in 1994, increasing the popularity of credit cards.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Early Online Sales

In 1994, a company called Netscape introduced SSL (Secured Socket Layer), through which the websites were able to encrypt data, and this made the use of credit cards much safer. Due to the increased security measures, many vendors and businesses shifted their focus to selling their products electronically.

Birth of Modern Web Sales

The evolution of technology soon resulted in developing websites, solely for the purpose of online buying and selling. Some examples of these websites include Amazon and eBay. Prior to the development of the modern websites, each product was manually added into the webpage, but with the invention of websites, up to 10,000 products could be added at a time which saved a lot of time. When the number of products displayed on the website increased, the online traffic and sales volume increased as well, which proved to be really beneficial for the businesses.

Advances in the Payment System

The SSL system was good, but it also had a few drawbacks. Firstly, people still did not fully trust the online transactions through credit cards. Secondly, it proved to be expensive for them while making small payments. The solution to this problem was provided by PayPal, which allowed safe and secure online payments and money transfer from bank accounts and credit cards without compromising on the users' privacy. Even today, PayPal is one of the most common and secured form of payment all around the globe.

Dot Com Boom of 2001

In the late 1990's the customer's trust began to deteriorate, and they started to hesitate using credit cards. Investments gained through Initial Public Openings (IPO) helped people to raise large amount of capital, which in turn proved to be quite profitable for companies, as it raised the value of the company. Even though many companies had good ideas, but their business plans were weak. The results were soon visible when many companies started to shut down their operations during 2001 and 2002 due to huge losses. A large number of investors started to sell their stocks below their actual values and companies like eToys were forced to shut down. Many other companies with poor business plans were also shut down during the period.

e-Commerce in Today's World

In the modern world, e-Commerce has not only revolutionized the way companies make profit, but it has also proved to be equally beneficial for the consumers. A wide variety of services including the exchange of information between the customers or other businesses, order processing through electronic means, supply chain management, electronic purchasing, and handling customer services, is effectively and efficiently carried out through e-Commerce. It cannot be denied that soon enough, e-Commerce will be the vital element of the global business marketplace. But at the same time, we cannot ignore some of the ethical issues involved in the world of e-Commerce which include "privacy and security issues,

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

fraud, illegal access, unsolicited email, trustfulness, targeting children, false advertising, pornography, product warranty, plagiarism, intellectual property and cyber-squatting" (Jie, 2012).

The Evolution of e-Commerce

The three stages in the evolution of e-Commerce are Innovation (1995-200), Consolidation (2001-2006) and Reinvention (2006-future). Innovation was characterized by excitement and idealistic visions of market in which both the buyers and the merchants could easily avail quality information. However, these visions were not fulfilled by e-Commerce in the early years of its development. e-Commerce entered its second stage called Consolidation, after 2000. The use of e-Commerce became more popular among traditional firms and they started using Web to grow and enhance their existing businesses, but they gave less importance to creating new brands. In 2006, e-Commerce entered the present stage also known as the Reinvention Stage. e-Commerce was reinvigorated with new Web 2.0 applications and social networking which helped to create new business models (D'Andrea, Ferri & Grifoni, 2014). Table 3 shows the evolution of e-Commerce and its three stages.

Table 3. The evolution of e-commerce

1995-2000 **Innovation**	**2001-2006** **Consolidation**	**2006 - Future** **Reinvention**
First mover advantages	Strategic followers	New market (1st mover)
Pure play	Bricks & Clicks	Retail (bricks & clicks) New market (pure play);
Perfect markets	Imperfect markets, brands, network effects	Online market imperfections
Disintermediation	strengthening intermediaries	Propagation of small online intermediaries
Entrepreneurial	Traditional / old economy	Large pure web-based firms
Obtaining Finance through Venture Capital	Obtaining Finance through Traditional methods	Merger & Acquisition
Focus on the Revenue Growth	Focus on Profits and Earnings	Focus on the growth of Social network and Audience
Driven by Technology	Driven by Business	Driven by Community, Customer and Audience

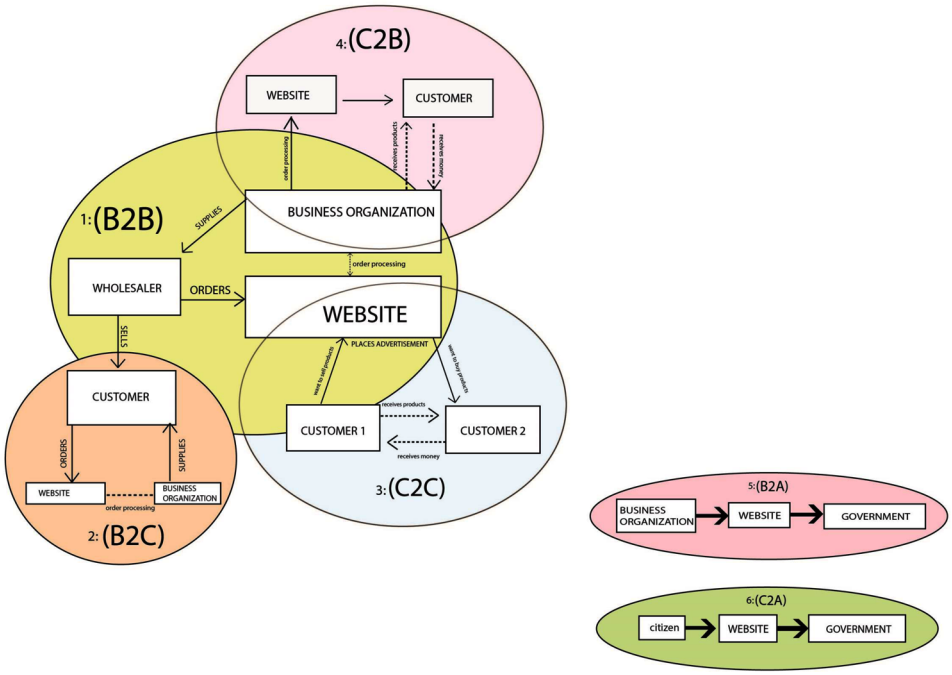
(Source: Rahul Kavaiya, Scope of e-Commerce, 2015)

The Types of e-Commerce

Most of the people make the mistake of thinking that the idea of e-Commerce is limited to buying and selling of products and services online but that is not true. We can divide e-Commerce into six broad groups according to their functions. As seen in the model displayed in Figure 2 there are six different types of e-Commerce. The figure shows the different processes of e-Commerce and how they are linked with each other through mutual connections.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. The types of e-commerce
(Source: Wall J.E, Types of e-Commerce, 2014)



Business-to-Business (B2B)

This type of business is also known as B2B and it includes the exchange of products and services or commercial transactions between two businesses rather than business to customers. Manufacturers or wholesalers generally indulge in this kind of e-Commerce. Alibaba, Staples, Quill, Office max, Medline are all some of the well-known companies dealing with B2B (Wall J. E, 2014).

Business-to-Consumer (B2C)

A business that sells the products and services directly to the customers is known as B2C business. This form of e-Commerce gained wide popularity during the Dot Com boom in the late 1990's. During that period, B2C was mainly referred to address the online retailers who sold products directly to the customers through internet (Nemat, 2011). This type of e-Commerce has been greatly developed and is one of the most common type of e-business, due to its popularity since the late 1990's. There are a large number of virtual stores and markets around the globe which sell books, cosmetics, medicines, software, electronics items, stationeries, cars, food, clothing etc. Compared to the traditional retail methods, B2C is much more convenient as it provides the customers with the necessary information of the product without leaving their homes. Most of the customers also find much cheaper products compared to other methods of purchasing with quick delivery and processing of their orders and an enhanced customer service (Wall, 2014). Amazon, Tesco, Starbucks, Taco bell and TOMS are some of the well-known examples of B2C business.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Consumer-to-Consumer (C2C)

This type of e-business involves the transactions of a variety of goods and services between one consumer and another. Individuals use an electronic platform which acts as a third party, to advertise their products or to buy the products from other consumers. There are a large number of electronic platforms which are dedicated only to carry out the C2C transactions (Wall, 2014). Some examples include expatriates.com, E-bay and OLX.

Consumer-to-Business (C2B)

C2B is a complete reversal of the business to consumer e-business and involves the selling of products or services from the consumer to the business. Groups of individuals work together to provide a variety of goods or services that are being sought by the companies. There are a number of websites where graphic designers present some samples for company logos and the companies choose the best one amongst them to purchase it. IStockPhoto is a well-known market that sell images, royalty photographs, media and design elements (Wall, 2014).

Business-to-Administration (B2A)

This form of e-business mainly deals with all kind of online transactions between companies and public administrations. B2A involves a large number of services including employment, fiscal, legal documents, social security and registers etc. It has gained worldwide recognition in the form of e-government services with a lot of investments from the government. It is a form of facility provided by the government for the ease of the citizens, with the support of information technology (Wall, 2014). Example includes the University of Bahrain using the e-government portal for the payment of fees.

Consumer-to-Administration (C2A)

C2A e-Commerce involves all kinds of online transactions between consumers and public administration. It is mainly used for the purpose of the payments of taxes, distance learning in education, making payments for social security and fixing appointments or collecting information from health centers. This is also a facility provided by the government for the support and ease of the citizens (Wall, 2014). Table 4 shows the different types of e-Commerce and their examples.

The Objectives of e-Commerce

Many small and medium businesses are not financed enough, so they cannot afford to spend a large amount of money on expanding their market through expensive advertising. They are also unable to spend money on opening stores or hiring people for sales. e-Commerce allows such businesses to reap all these benefits without much investment. Some of the main objectives of e-Commerce are listed below:

- To reduce administrative and other costs
- Increase customers
- Enter global marketplaces

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

- To offer customizable products

Galant (2005) has described the following in her article "Blending E-Commerce theory and application".

Table 4. Examples of e-commerce

Type of e-Commerce	Example
Business to Business (B2B)	Alibaba, Staples, Quill, Medline
Business to Consumers (B2C)	Amazon, TESCO, Starbucks
Consumer to Consumer (C2C)	Expatriates.com, e-bay, OLX
Consumer to Business (C2B)	Istockphoto
Business to Administration (B2A)	LMRA, EWA, e-government
Consumer to Administration (C2A)	E-government

Advantages to the Organization

1. By using e-Commerce, organizations can expand their businesses on a national and international level without much investment in the capital. They can also easily locate the potential suppliers, customers, competitors and business partners anywhere around the world.
2. Organizations can save a lot of money and paper work by providing the information on their web-sites instead of printing booklets or fliers for advertising and marketing.
3. e-Commerce helps the organization to create a strong brand image and identity.
4. It helps to provide a quick and better customer service.
5. It also helps to speed up the processes of the business and increase efficiency.
6. e-Commerce has facilitated the manufacturing process by using the just-in-time method, where the business process is started only after the customer places a request for the product or service (Galant, 2005).

Advantages to the Customers

1. Customers can buy or sell products and services around the clock from anywhere around the world without any time or geographical limitations. They can also avail the quick customer service in case of any enquiries.
2. Customers can use different applications and have a wide variety of choices. They can also track their orders and receive quick delivery of products.
3. They can compare the prices among the different products and sources and select the cheapest option available to save money.
4. Customers can provide feedback of their products and also read the reviews and comments from other users before buying the product.
5. Customers can have virtual auctions of their products.
6. Customers can have easy access to information in a short period of time without having to wait for days and weeks.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

7. Due to the increased competition as a result of e-Commerce, many organizations provide discounts in order to win the customers over the competitors (Galant, 2005).

Advantages to the Society

1. Since the customers do not need to travel to the physical stores in order to purchase the products, the traffic on the roads and air pollution is prevented.
2. e-Commerce helps to provide the products at a lower cost, so the less privileged people can easily afford them too.
3. People living in the urban and rural areas can have easy access to the products and services which were not available in their cities before.
4. The government uses e-Commerce to deliver public service messages and awareness campaigns to serve the society and educate them (Galant, 2005).

Factors Affecting e-Commerce

Since 1990's e-Commerce has not only become a fundamental part of people's life but it has also introduced a new way of conducting business (Al-Alawi & Al-Ali, 2015; Lee et al, 2007). A research in 2011 shows that 96% of the organizations of the sample population had used internet, while 69% used their own website (Chen &Holsapple, 2013). The e-Commerce has opened vast opportunities for employment for people all around the world and have also revolutionized the relationships between organizations and individuals (Lee & Lin, 2005). According to Harridge and March (2004), e-Commerce reduces the cost of the consumers since it eliminates the use of distribution channels by transferring the goods directly from the manufacturer to the consumer.

There are many classical ethical theories which were developed during the early days but most of those theories are inapplicable in today's business world since "e-Commerce is a new paradigm in business which was only developed back in 1993" (Greblikaite, Pervazaite, 2014). e-Commerce has been made possible because of the internet and this new digital technology has surely transformed the business environment, activities and processes (Judson and Kelly, 1999). Kracher and Corritore (2004) have written that "the ethical dimensions are very critical to examine in the world of e-Commerce due to the degree and speed at which its developing around the world". Big names, organizations and small or medium enterprises use e-Commerce as a basic necessity and it is one of the most appropriate method for conducting business. e-Commerce also has a positive impact on the environment protection factor, as it reduces some costs and processes (Tiwari, Singh, 2011). It provides a medium for sustainable development in digital technology and environment. Nevertheless, it should be mentioned that e-Commerce is also a way of conducting business and just like the traditional business practices, e-Commerce carries the risk of unethical and illegal behaviors and actions as well. As Freestone Mitchell (2004) states that e-Commerce is a "new environment for unethical behavior".

Kracher and Corritore (2004) state that "one of the most prominent differences in the application of ethics in the traditional business practices and e-Commerce is the *question of ethical lag,* which occurs when the speed of technology overtakes the ethical development". According to Marshall, there are several reasons for this lag. Firstly, the complexity and expense of the development of technology in today's world makes the technology developers draw more towards extremely focused and controlled business structures. And secondly, in a highly competitive environment, there are great economic returns offered

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

by new technologies. Researches show that business ethics are quite slow in development as compared to technological developments and cultural environment which keeps on changing continuously. Krachure and Corritore (2004) also consider the "lack of exploration of e-Commerce ethics" as a main factor for the unawareness among individuals and corporations. They have also stated that e-Commerce consists of immoral and unacceptable problems that occur while confronting the e-Commerce websites. According to them, some of the main issues in e-Commerce include security of information, protection of children, access, trust, privacy and informed consent and intellectual property (Kracher & Corritore 2004).

The ability of people to stay connected on the internet at all times and to get an easy access to information can be one of the limitations for e-Commerce. Despite the fact that internet is available easily in most of the public places, the factors which determine the access to information is the time and the amount of information available. The issues related to intellectual property have actually become a source for development for the internet network. It is fairly easy to violate the personal rights of an individual, but it is extremely difficult to identify the person or organization responsible for it (Kracher & Corritore, 2004). Privacy and personal information is one of the most important issue in e-Commerce (Milne, Rohm, 2000). Copyrights, patents and trademarks give rise to a number of ethical and legal issues to be questioned (Maury & Kleiner, 2002). Niranjanamurthy and Chahar (2013) state that if the consumers fear a breach of their privacy and feel that their information on the website is not secure, they will hesitate to visit such e-Commerce websites. Paddison and Englefield (2003) assert that "making e-Commerce websites, web-site accessible is a way of assisting disabled users in achieving their freedom". However, research by Leitner and Strauss, (2008) and Lightner and Eastman (2002) shows that there are a lot of e-Commerce websites which fail to provide web accessibility. Many companies collect the usernames, address, contact numbers and emails of the users who visit their website, but the use of this personal information is often vague and such issues call for customer awareness. Privacy is mostly considered as a critical and central factor in the development of ethics in e-Commerce (Whysall, 2000).

When users give their personal information on websites, it gives birth to insecurity problems and invoke more distrust and difficulties compared to brick-and-mortar businesses (Kracher & Corritore 2004). The cookies on the browser store the personal information without the knowledge of the users and these cookies can be used in any way since there is no legal restriction to prevent it. Cookies are similar to small diaries where the data of the users' website history is stored and every time a user re-enters a website, a cookie is opened by the website. This is also called "data-mining" or "profiling" (Stead, Gilbert, 2001). Most of the customers are unaware of the fact that their private information can be used in an insecure and inappropriate way. According to Bart et al (2005) credit cards and financial security is the main base of security issues. In contrast to their statement, Venkatesh (1998) have argued that the development and extension of commerce in cyberspace gives everyone the right, freedom and place to establish their identity.

Internet and the possibilities of actions on the internet give rise to children pornography issues and special measures should be taken to protect the children. Unless the child is very young, webpage blocking might not be very effective as the information on the internet is easily available worldwide (Spencer, 2002). Customer trust is the basis of a buyer-seller relationship and in this technological environment, trust is often intangible (Hwang, Kim, 2006). Teo, Thompson and Jing (2007) conducted a research in U.S, Singapore and China to find out the cultural aspect and peculiarities of e-trust and they found out that the cultural environment does have an impact on e-trust. Social trust is beneficial for e-Commerce because it helps to decrease the transactional costs of interacting with other individuals. But when it

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

comes to economic transactions, the need for monitoring the employee's behavior is being eliminated due to this trust and the transactions become economically affordable.

However, we cannot overlook the fact that in e-Commerce the distance between the buyer and seller is long, so unethical or illegal actions and behaviors are hard to notice due to their intangible nature. The entrepreneurs of e-Commerce are often young at age and therefore the moral quality of e-Commerce alone is not necessarily sufficient to maintain. At the same time the e-traders should also bear in mind that the customers do perceive ethics as something really valuable and expect to be treated fairly and ethically (McMurrian & Matulich, 2006). The traders can easily minimize the trust of the customers through unethical actions in the company or business or they can benefit profitably by being ethical and winning the trust of the customers (Donaldson, 2003, Kurt & Hocioglu, 2010).

This report focuses on the laws and ethics surrounding the e-Commerce world. According to Lyu (2012), "ethics and laws are similar to some extent but they are not same". Laws are formulated and approved by the government of the state or country whereas ethics are generally known as the rules and are in most cases unwritten. A couple of traditional theories provide some solutions for situations that are ethically questionable. "Just like the traditional business practices, ethical decision making can be incorporated in e-Commerce as well and values that are based on traditional ethics will be the basis for a strong and successful relationship between the customer and the seller" (Williams & Premchaiswadi, 2016).

Ethical Issues

Ethics can be defined as the knowledge between what is right and what is wrong. There are certain rules to follow when we interact with other people around us and our actions affect them on a great level. These rules are universal and applicable to everyone in certain situations. Business ethics are those ethical questions that the managers have to confront in their everyday decision-making. Similar to this, e-Commerce also has some ethical rules and regulation that have to be followed by e-businesses and by the consumers who avail the e-Commerce facilities (Shivani, 2012; Dozier, 2013)

The digital technology is really vast and is no doubt a great platform for e-Commerce. The e-Commerce has the ability to provide products and services at the convenience of the consumers in a fast and efficient manner, save time and money and secure the transactions through the use of credit cards. Furthermore, e-Commerce is not only a technology but a business availing the technology. Nonetheless, it is also surrounded by some rules and regulations that have to be followed while making use of the technology. This new form of technology has unrestrained advantages, but it also carries a few risks, which will now be discussed in detail (Babu, 2011; Nardal & Sahin, 2011). Table 5 shows the most common ethical issues and their definitions.

Web Tracking

Most of the businesses can track how the online visitors use their websites with the help of log files. When the log files are analyzed, the data is converted into application service or in some cases a software can be used to store the data. This is how companies track their users through cookie analysis and tracking software's, which raises an issue of privacy concerns. The tracking history is also stored in the hard disk of the Pc or laptop and this is how the computer already knows which websites have been visited by the user before. To prevent this, many users often install programs like Spam Butters, Cookie cutters etc. (Babu, 2011; Agag, 2019).

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 5. Ethical issues in e-commerce

Ethical Issues in e-Commerce	
Problem	**Definition**
1. Web Tracking	Website tracking is the act of storing the existing websites, in order to track the changes made to it overtime. (Wikipedia).
2. Privacy Invasion	Using the private information of someone without his/her knowledge or permission (Business Dictionary).
3.Disintermediation & Reintermediation	Disintermediation is known as the elimination of intermediaries like distributors and brokers that provided a link between the company and its customers and Reintermediation is known as the creation of new intermediaries between suppliers and customers in order to provide different services (Chaffey, 2009).
4.Counterfeit goods	The selling of high quality and branded products, under a different brand's name without the knowledge of the brand owner (Wikipedia).
5.False Advertising	The act of providing false information about a product or service in order to attract the consumers (Wikipedia).
6.Hacking	"Hacking is the process of accessing a computer or website in order to view, copy, or create data without destroying or harming the data or the computer (Urban Dictionary).
7.Email Spamming	Email spam involves sending identical messages via email to a large number of recipients at a time (Wikipedia).
8.Web Spoofing	Web spoofing means creating website identical to an existing website in order to lure the users and mislead them into thinking that it has been created by another source (Wikipedia).
9.Cyber Squatting	The process of registering names of famous companies or brands in order to resell them at a profit. (Wikipedia).

(Source: Wikipedia, Urban Dictionary, Business Dictionary)

Privacy Invasion

This problem is basically related to the consumers and is one of the most major issues faced by the consumers. Privacy invasion occurs when the personal information of the user is accessed or used by an unauthorized party. This can be done in four ways:

1. Many e-Commerce businesses may buy the personal information of the users like their webpage visits, shopping preferences or their personal details, with or without the user's consent. Websites which ask the users to fill in their personal information often sell this user data to other companies who use it for marketing purposes.
2. The personal data of the users can often be intercepted by a person other than the person to whom it is intended. The privacy of communication cannot be easily protected and in a vast pool of digital technology it is often impossible to avoid the interference of such intruders.
3. Since the internet cannot remember the history of a user or his frequently visited web pages, passwords or usernames, this information is stored in the cookies as a reminder. Due to this, when the user visits a webpage, malicious programs can automatically be delivered to reveal the confidential credit card information, passwords and usernames. Most of the electronic payment systems are aware of the identity of the users (Shivani, 2012).
4. Many companies track their employees' online activities through monitoring systems, in order to find out the amount of time they spend on business activities and the amount of time spent on non-

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

business activities. This might put the employees at a risk of losing their jobs and this treatment may lead to raise many ethical questions (Babu, 2011).

Disintermediation and Reinter Mediation

One of the most common issue is related to the employees losing their jobs which is known as intermediation. The intermediaries help in providing information and value-added services like consultations. Matching and providing information can be done through portals or e-marketplaces which provide free services and are fully automated. On the other hand, the value-added services are partially automated, and they require some level of expertise. The circumstances which eliminate the intermediaries who offer matching and providing information is called disintermediation and this has a negative impact on the traditional sales channels. Whereas the brokers and agents who are providing value added services may not only grow but also survive this intermediation. This process is known as reinter mediation. The internet provides many opportunities for reinter mediation through the support of e-Commerce. Therefore, an expert computer mediator is required to predict the number of participants, and the processing of large information etc. (Babu, 2011; Nardal & Sahin, 2011; Agag, 2019, and Al-Alawi & Al-Bassam, 2019)

Counterfeit Customer Goods

Alibaba is one of the most widely used online source for purchasing products and it has about 8 million small sellers who sell about 8 million different products. According to BBC news, the website has spent $160m on fake goods. Many famous luxury brands like Armani, Gucci, Yves Saint Laurent and Balenciaga filed a case against Alibaba for selling fake products of their brands and earning millions through it.

Every business is based on winning the trust of the customers to gain customer loyalty and retention. When a company displays fake goods, it loses the trust of the customers and its reputation is negatively affected. One of the basic principle of ethics is to act true to the customers and to be honest with them and displaying fake goods is an unethical act. In order to remove the fake goods and replace them with the authentic ones, a huge amount of money and time is wasted.

False Advertising and Information

Many e-Commerce websites provide wrong information to the customers regarding the price and quality of the products. Many advertisements promote feature and prices which are not actually present in the products when they are delivered. In some cases, the customers also receive damaged products or something which they did not pay for to purchase. Many websites also sell outdated products. For instance, in 2013, the Walmart's website displayed computers and other electronic items at a price of $8.85 only. However, Walmart later claimed that this was a technical error, but this received a lot of attention from the customers (Kelly & Williams, 2016).

Firstpost.com featured an article about a well-known website in India called Snap Deal which hit the news when a customer ordered a Samsung phone from their website and received a brick and half a soap bar inside the delivery box. The soap company later had to send him a Samsung phone as a compensation. Such incidents shatter the trust of the customers and they hesitate to order products online. This act is not only unethical but also a huge loss for companies (Kelly & Williams, 2016).

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Hacking

Hacking is referred to as the act of bypassing the computers or its network system. e-Commerce websites are more prone to hacking due to the ability of online payments and the use of credit cards. Therefore, they are more attractive to the hackers. All the transactions occur at the server level as it is known as the "e-Commerce place of Business". The main website for the products and services as well as the customer's database is stored at the server and if the server is attacked, all the information can be lost in seconds.

Websites like E-bay have faced a hacking attack in 2014, where all the users' information and passwords were hacked. The hackers can use this information for wrong purposes and it is quite risky for the users. Therefore, E-bay warned its users to change their private information in order to avoid any inconvenience (Orji, et al. 2016). Around 13,000 credit card numbers and passwords were hacked by a hacking group from well-known websites like Wal-Mart and Amazon. All the information was posted on a site called Ghostbin which is a data sharing site (Methmali, 2015). The bank called HSBC was also a victim of hacking and 2.7 million credit cards were exposed (Paganini, 2014).

Email Spamming

Email Spamming occurs when companies send unwanted advertisements through emails for marketing purposes. A person who sends these emails is usually referred to as a spammer. A lot of spammers also send emails with their personal information to defraud people and use their credit card or account information. Many times, the spammers send emails with links that direct the users to a fake website that looks almost the same as an authorized one and lure them to enter their personal data like credit card details or their account numbers on that webpage. This is known as phishing and is one of the most widely faced ethical issue in the e-Commerce world (Shivani, (2012).

Web Spoofing

Attackers often set up a fake website which is similar to the original one in order to lure the users to provide their credit cards and accounts details. This is called web spoofing. An example of web spoofing is when the attacker sets up a website called www.micros0ft.com, where he uses the number zero instead of an "O". Many users can sometimes mistype alphabets, but it leads them to a similar website and they pass on their personal information by trusting the website. According to the Signal magazine, a web spoofing incident involving the U.S Air Force was on the rise in 2011. Many users were fooled when they entered their passwords and usernames on a fake website which was accessed by an unauthorized party. Only the most attentive users were able to spot the difference while the others fell victims to the incident (Rita Boland, The Signal Magazine, 2011).

Cyber Squatting

When a person uses the domain name of a well-known company in order to infringe its own trademark, it is known as cybersquatting. This is done mainly for the purpose of obtaining the payments and money from the original owner of the trademark. They offer the organization domain names at a far higher price than the purchasing price. Many cyber-squatters use derogatory remarks against the company which

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

the domain is meant to represent, in order to force it to re-buy its own domain from them (e.g.www.amazonsucks.com).

In 2007 Belgium Domains, Domain Doorman and Capitol Domains were charged by Dell for cyber-squatting and selling a domain called dellfinancialservices.com. Similarly, BBC claimed back their rights to the domain bbcnews.com from a cyber-squatter (Faisal Alani, 2009).

Legal Issues

Companies involved in e-commerce must also consider the legal side of the e-Commerce and be aware of the potential risks involved in the process. When the buyers and the sellers involved in e-Commerce transactions do not know each other, the risk of crimes increase. However, the authorities who want to apply legal control and policies on e-Commerce may face many hurdles due to the global nature of internet. Similar to the traditional way of doing business, there are certain behaviors which require a legal action (Nasir, 2004). Table 6 highlights some of the major legal issues in the world of e-Commerce and their definitions:

Table 6. Legal issues in e-commerce

Legal Issues in e-Commerce	
Problem	**Definition**
1.Internet Fraud	It is known as the use of internet to take advantage of the victims and defraud them.
2.Intellectual Property infringement	It refers to the act of violating the rights of an intellectual property which include trademarks, patents and copyrights.
3.Freedom of Speech	It is known as the right to express one's opinions or beliefs without any restrictions or limitations.
4.Electronic Contracts	It is a kind of contract made between two parties, using electronic means.
5.Taxation	It is referred to as a process used by the government to bear its expenditures by charging the normal citizens or corporate entities

(Source: Wikipedia)

Fraud on the Internet

Due to the popularity of the websites and their usage, the cases of fraud in e-Commerce have increased over the years. It is a major issue for click-and-mortar as well as cyber merchants. Swindlers are the people who try to con the users to rob them off their money and they are mostly present in the area of stocks. Stock promoters try to lure the investors by promising them false profits. Auctions also induce fraud either by the buyer or the seller. The presence of pop-up ads and unsolicited emails have created a clear path for the financial criminals to gain an easy access to the personal information of the users. Phantom business opportunities and fake investments are also considered as a part of fraud on the internet (Babu, 2011; Agag, 2019). Websites like expatriates.com are widely used in Bahrain but it is also a main hub for scammers who try to lure people by promising them jobs and other incentives in order hack their systems and personal information or to rob them off their money.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Infringement of Intellectual Property

Intellectual properties include copyrights, patents and trademarks and they cannot easily be used by anyone. The copyright laws generally protect the intellectual properties, but it cannot easily be protected in e-Commerce. When a person buys a software, he is authorized to use it but not distribute it because the distribution rights only lie with the person who owns the copyrights. Plagiarism and copying contents of websites is also considered against the copyright laws (Babu, 2011, Agag, 2019).

Freedom of Speech vs Censorship

Censorship can be defined as the attempt of the government to restrict the content displayed on the internet. If the users find the material offensive, they might report or present it for censorship, and this can also have an impact on e-Commerce. Some child protection laws are present in every country which protect the children from viewing inappropriate content. But this censorship is only useful if the children are at a very young age and do not have the proper skills to use internet. These facts have to be kept in mind while conducting an e-business (Udo, (2001).

Electronic Contracts

All contracts are based on an offer, acceptance and consideration between two parties. When these contracts are made and presented electronically, the human element is eliminated and therefore it loses its authenticity and the three basic elements (offer, acceptance and consideration) are difficult to establish. However, according to McDonald (2001), the Uniform Computer Information Transactions Act (2000) states that contracts can be made even without the physical presence or direct involvement of the human beings.

Taxations

This issue is related to the fairness in competition and has a huge impact on e-Commerce when it competes with off-line marketing channels that require the payment of taxes. The borderless nature of the internet and the globalization in e-Commerce makes it extremely hard for taxation. It is also quite tricky to predict the future of the e-business and therefore the government still cannot figure out how they can tax the e-Commerce activities. e-Commerce allows an individual to participate in multiple foreign marketplaces at a time, and deal with customers all around the world without having to enter any market in particular. This idea is not much welcomed according to the rules and regulation of the government of most countries and creates a big hurdle in taxation (Srivastava, 2018).

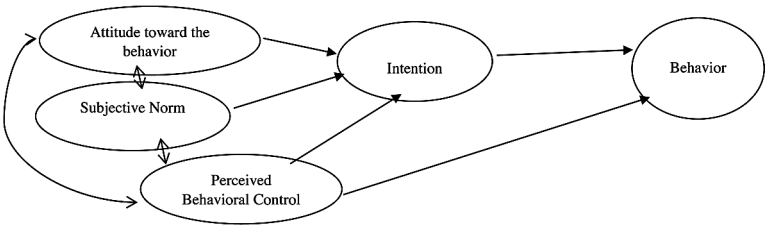
The Theory of Planned Behavior

Early attempts to understand the behaviors and issues of the consumers and merchants on e-Commerce led to the theory of Planned Behavior (Figure 3), which was formulated by Ajzen (1985,1991) as an extension to the Theory of Reasoned Action (TRA) (Ajzen and Fishbien, 1980). This theory will attempt to explain the impact of unethical and illegal behavior on the attitudes of the users. According to the TBP, “the attitudes of the users of e-Commerce, towards the target behavior and subjective norms of

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

engaging in the behavior, greatly influence their intentions". It also stated that "the perceived behavioral control of indulging in the behavior also directly influences the intention". TBP has been used many times in the past for different studies on the behavior of users while purchasing online. TBP explains that the performance of an individual's behavior is determined by his intention to perform the particular behavior. The attitudes and subjective norms of the behavior and the perceptions on the success of the individual's behavior are responsible for informing the intent. Ajzen (1991) describes attitude either as "a positive or a negative evaluation of performing the behavior. The beliefs are responsible for informing the norms, the normative beliefs and motivation to comply are responsible for informing the norms and the beliefs about the individual's possession of the opportunities and the resources required to indulge in a particular behavior are responsible for informing the perceived behavioral control". TBP has not specified the particular beliefs, related to a particular behavior, so it is left up to the choice of the researcher to determine them (George, 2004).

Figure 3. The theory of planned behavior
(Source: Ajzen, 2009)



This study is based on the unethical and illegal behavior of the users of e-Commerce and TBP provides a strong framework for testing whether attitudes lead to indulge in a specific behavior or behavior lead to the formation of an attitude. Based on TBP, beliefs of the users about the safety and security of e-Commerce should also influence their intention to use e-Commerce which in turn will influence their behavior.

As mentioned earlier, privacy is one of the main concerns of the consumers while making purchases online and many users refrain from using e-Commerce websites due to privacy concerns. A poll of the internet users in March 2000, showed that 94% of the individuals had not purchased anything online due to privacy concerns, as they feel that the companies might use their personal information to send them irrelevant information (Business Week, 2000). In other words, this is known as Email Spamming. Byford (1998) has mentioned two aspects of privacy, "a social relationship view and a property view". "The social relationship view assumes privacy as a balance for social relationship development. On the other hand, in the property view, the individuals view privacy as the extent to which they can control their information online". Although both these views are equally important in order to understand the individual online behavior, but the property view is more specific and related to the individual's concern for privacy. For instance, the GVU internet survey conducted in 1997, showed that 53% of the online users know that their personal information is being collected by the Web sites, while 66% said that they do not make online purchases because they fear that their information might be used in an inappropriate way. Culnan and Smith (1993) conducted a research on "direct marketing and attitudes towards secondary information use". According to them, "there are two scales for measuring two different aspects of

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

the user's attitudes towards using e-Commerce. The first one is the loss of control, and the second is the unauthorized secondary use. Loss of control scale refers to the loss of control of the users over their personal information and losing their privacy while using credit cards. Secondary use means that the information is being used for some other purpose rather than for what it was collected". Culnan reached a conclusion and found out that the people who are less concerned about their privacy, are more positive about using e-Commerce, and can easily cope with receiving unwanted information as compared to the users who are more concerned about their privacy. The findings of this study by Culnan can be used for studying internet privacy and the concerns of the users, which is directly related to their behaviors (George, 2004).

A similar instrument was developed by Smith et al. (1996) to measure the dimensions of the practices of information privacy by the organizations. They mentioned four different dimensions in their work, which include unauthorized secondary use, improper access, errors and collections. Although the focus of their study was on the user's attitude about how the organizations used their personal information, it can easily be used to measure the attitudes towards how different websites and online businesses deal with them or use their personal data (George, 2004; Al-Alawi & Hafedh, 2006).

An individual's attitude towards using e-Commerce for online purchasing, is influenced by their trust. Most of the users do not trust the websites enough with their personal data, to indulge in online transactions with them (Hoffman et al., 1999). A laboratory experiment conducted recently, showed that consumers perceived "online shopping as more risky as compared to print catalog shopping" (Jones and Vijayasarathy, 1998). This shows that the views of the consumers on the trustworthiness of internet, is expected to influence their willingness to make online purchases. Another study by George (2002) evaluated the trustworthiness of the users of e-Commerce by using three items which were taken from the GVU survey instruments. According to his findings, the positive attitudes toward online purchasing were developed only because of the "positive beliefs about the trustworthiness of the users". Pavlou (2002) used the TPB to prove that "the trust of the user on the online retailer was directly correlated with their attitudes towards online purchases and with perceived behavioral control" (George, 2004).

Mukherjee and Nath (2003), found out that the trust of the users is directly related to the commitment of the relationship to an online retailer. Although they did not clarify the instruments used by them for measuring the trust, but it presents a global measure for trust in the internet. In their study based on the Internet Banking, they mentioned that "the customer's orientation toward the technology of electronic communication and the Internet is frequently a proxy for their trust in Internet banking" (George, 2004).

SUMMARY

The purpose of this section was to explain the concept of e-Commerce in the modern world and its evolution since its existence. The material presented in this section also threw light on the different models of e-Commerce and its objectives, which helped to understand why e-Commerce exists and how it has facilitated our day to day lives in a positive or a negative way. Since the basis of this research is to identify the consumer behavior while using e-Commerce in the Kingdom of Bahrain, it highlighted the presence of e-Commerce and its development in the country along with the procedures of opening an e-Commerce-based business in Bahrain. The most important part refers to the factors which affect e-Commerce, aiming to explain some of the most common ethical and legal issues prevailing in the

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

modern e-Commerce world. These behaviors of the consumers were supported and explained further on by using The Theory of Planned Behavior by Ajzen (1991). Therefore, it can be summed up that the literature review presented in this section revealed some pre-existing theories and concepts based on the subject of the research which provided a basis and will help to formulate the research methodology in next section.

METHODOLOGY

This section will focus on the different methodologies used to conduct the research for testing the study. There are different methods used by the researchers for collecting data for their research. The research can either be qualitative or quantitative or both depending on the preference of the researcher. This research will use a combination of quantitative and qualitative methods which include questionnaires and interviews to depict the viewpoints of the buyers and sellers. The research outcome will help to gain a better understanding of the major problems of e-Commerce, the behaviors of the individuals and the reactions of the consumers towards the unethical issues.

The concept of e-business is so vast that it definitely requires a philosophical research into the behaviors and actions which provoke the unethical problems. For the purpose of collecting qualitative and quantitative data, the research onion method will be adopted to undermine the issues and provide appropriate solutions to the problem. This research will help to develop an understanding of why people tend to engage in unethical behavior when dealing with online transactions and how we can help to prevent such behaviors.

Identifying e-Commerce Focus Area

The e-Commerce literature suggests that there are a number of ethical and legal issues prevailing in the e-Commerce activities which affect the attitude and behavior of the consumers and raises some important concerns for the e-Commerce users. Therefore, the research will focus on what are the most common e-Commerce issues of the consumers and how they affect their behavior. The influence of each factor will be tested using various techniques.

Research Tool

The research Onion method will be used in this research to collect the qualitative and quantitative data.

The Research Onion Method

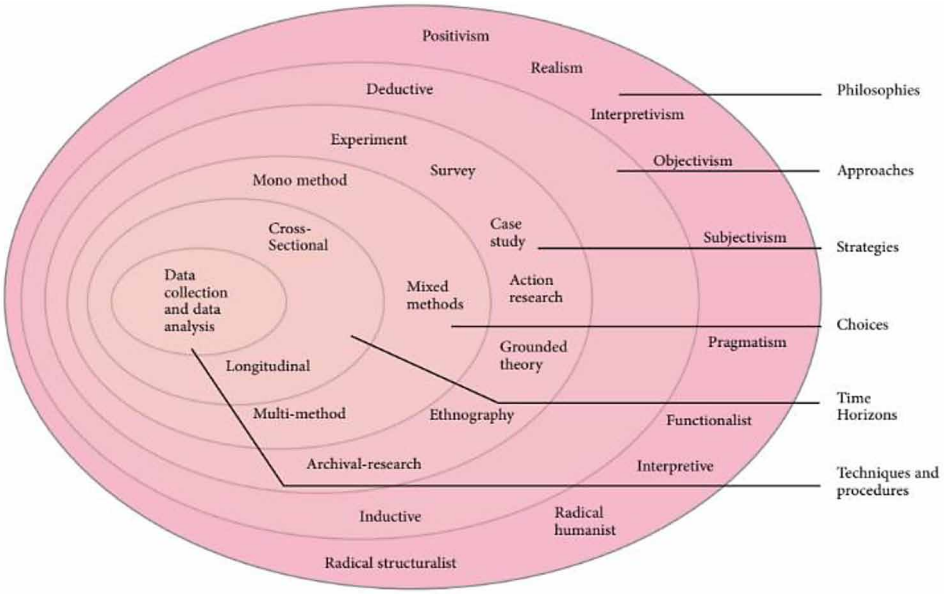
The Research Onion method was developed by Saunders *et. al.,* (2007). In this method, he has explained the stages that should be covered to develop a research strategy. Each layer of the onion presents a different stage of the process (Saunders et. al., 2007). The core or inner most layer of the onion consists of the final elements of the research and they are closely related to the outer layers, which depict the design elements. It is a very useful model to design a research methodology which is adaptable for almost any type of research in any context (Bryman, 2012).

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

There are different stages that a researcher has to pass in order to design a methodology which is effective and useful. The six different layers of the onion have a different and specific role in formulating the methodology. The first layer consists of the philosophies and this acts as a starting point to reach the appropriate research approach, which is the second layer. The third layer focuses on the different strategies or methods which can be approached for the research. The fourth layer consists of the choices that can be used for collecting the data. The fifth layer identifies the time horizon of the research to decide whether it is going to be a long term or a short-term research. Finally, the sixth layer represents the techniques and procedures which help to identify the method for data collection.

Figure 4 shows the research onion method formulated by Mark Saunders and the six different layers of the research. Each of the layers will be discussed in detail to link them to the steps used in this research and to provide a clear vision for the adopted methodology.

Figure 4. The research onion
(Source: Saunders et al, 2007)



Research Philosophies

Research Philosophies are related to the beliefs of the researcher on the method through which the data is analyzed, used or gathered (Bryman, 2012). Saunders et al. (2009) has defined it as the "the development of the knowledge and the nature of that knowledge." These philosophies are different for achieving different types of goals and also for how those goals are going to be achieved (Goddard & Melville, 2004). They exemplify the importance of understanding the aim of the researcher and what methods he will adopt to develop knowledge on the particular topic in order to provide clarification for the assumptions used in the process of the research and how they relate to the methodology.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Positivism

In order to generate questions for testing the hypothesis, positivism is used. The research questions can be tested, and they help us to measure the world's accepted knowledge. Positivism is generally concerned with adopting the philosophical stance where the researcher would like to observe and then predict the results of a particular situation. This phenomenon is quite similar to the situation of a scientist in a laboratory. Researchers who use this philosophy usually base their hypothesis on an existing theory. The existing hypothesis is properly tested before making any further developments which could be used by researchers in the future. This layer is based on the quantitative data and it needs a statistical analysis, in order to reach a conclusion. Therefore, it is known as a continuous process where the previous theories are tested and confirmed by the researchers (Saunders et al. 2009).

Interpretivism

Interpretivism is known as the study of a subject that the researcher wants to identify in the natural environment. The researcher should begin by understanding the different roles of the social actors which include human beings rather than any other sources. Saunders et al (2009) clarified the term social actors by saying that "the metaphor of the theatre suggests that being humans we are responsible for playing a different part on the stage of human life cycle. Similar to the actors who play different roles in theatrical productions and then act according to their interpretation". Interpretivism implicates that cultural factors can influence people's actions and by understanding the people's beliefs, actions and thoughts, cultural existence and change can also be understood.

Objectivism

According to this philosophy, there are forms of knowledge other than the social factors. It focuses on studying the nature of patterns, relationships, laws and regularities among the different situations measured in terms of social facts. A good example of this is to have a clear structure of the interested sample, job descriptions and duties, organizational hierarchy etc. This structure can be different for different organizations and places, but the content remains the same. In other words, true and fair information is available everywhere which is distinct from the feelings or interpretations of an individual (Saunders et al. 2009). Another example of the phenomenon is heavy rain where the people who want to go outside for the picnic are the social actors. In this case the rain exists and is real and it is acknowledged by everyone except the people who had their plan ruined due to the social phenomenon.

Subjectivism

Unlike objectivism, subjectivism in emotionally driven and refers to the judgments and decisions based on an individual's personal beliefs and opinions instead of being based on facts. Remenyi et al. (1998) states that it is important to understand and study the phenomenon in detail and try to identify the reasons behind such beliefs or perceptions in order to gain a better understanding of the situation. Decisions based solely and separately other than the social factors are based on objectivism, while subjectivism revolves around emotional values.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Philosophies Used

The philosophies used in this research are a combination of positivism and objectivism. Using positivism, the pre-existing theories on e-Commerce and its issues are revised and tested to check if the new theories are in line with the previous ones or if they are opposing them. This was done by providing proofs and evidences. Objectivism provides a scientific information which will refrain from providing personal judgments and opinions and their interference in the results presented by this study.

Research Approaches

The second layer of the research onion consists of the research approaches. After selecting the appropriate philosophies in the first layer, we then move to the second step and that is to choose the research approaches. There are three different approaches namely, Deductive, Inductive and Abductive. If the researchers properly and clearly understand the theory they are taking, it would be easy for them to identify the type of approaches they can use, and this is why this step relies strongly on the previous step because the deductive method is related to positivism, while the inductive approach is more related to interpretivism philosophy. However, such theories are deceptive not considered to be practical in real life (Saunders et al., 2009).

Deductive

This approach is similar to a scientific research, where a researcher develops a theory and then tests it. In the deductive approach, the questions or statements developed can be answered through the research. The target would be to respond to the questions either as a yes or as a no. The questions which the researcher believes can be answered, could be in the form of informed speculations or statements. The hypothesis is developed on a theory which is pre-existing and then it is tested through the formulated research approaches. Therefore, the steps of deduction include moving from the theory to the research questions, to the collection of data, from findings to the confirmation or rejection of the research question. This leads to the theory being revised and repeated by starting the process over and over again. "The deductive approach is best suited to the positivist approach because it allows the formation of the hypothesis and the statistical testing of the results to a certain level of probability" (Snieder & Larner, 2009). Having concluded that, this approach can also be used for qualitative research but the expectations formed by the pre-existing research may vary slightly (Saunders et al, 2007).

Inductive

In this approach, the theory is formulated after the research questions are answered. The process of the inductive approach is the opposite of the deductive approach and rather than taking its focus from the existing theory, it takes its focus from the researcher's working title. In other words, the researcher moves from the research questions to the observation and description to analysis and then to the theory. Therefore, the inductive approach is the best approach for the researcher if little or no information exists on the topic or subject of research. This method is most beneficial for qualitative research because it does not contain a theory and reduces the researcher preference during the data collection (Bryman & Bell, 2011). "Interviews are conducted regarding the particular phenomenon for collecting the data and

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

then the data is tested for patterns between the respondents of the interview" (Flick, 2011). However, this approach can also be used in combination with the positivist approach where the first step is to do the data analysis and then the patterns are used to find the results.

Approaches Used

The deductive approach was used to conduct this research. Since it was quite difficult to build a new theory in a limited period of time, so the pre-existing theories were studied. The approach will be both qualitative and quantitative in nature. Curran, J & Blackburn (2001) state that "a single research study may use a combination of both qualitative and quantitative techniques as well as primary and secondary data."

Research Data

There are two types of data that can be collected by the researchers for business and management researches and they are qualitative and quantitative data (Saunders et al, 2009). The type of data selected will determine the choices of the research methods which will be elaborated later in this section.

- **Quantitative Data:**Quantitative data is based on researches which rely on numbers and is used in a lot of data collection methods which include surveys, or data analysis techniques like graphs and statistics (Saunders et al, 2009).
- **Qualitative Data:**The Qualitative approach is based on the data which is non-numerical in nature and the researchers use interviews as a method to collect data and then analyze it accordingly. It represents information as pictures, videos and words (Saunders et al, 2009).

Research Data Used

The research will be based on both qualitative and quantitative data to provide more accurate and detailed results for the research.

Research Strategies

The third layer of the research onion present the research strategies and they are critical in answering the questions of the researchers as well as for data collection and data analysis. There are seven different types of strategies, out of which some belong to the deductive approach while the others clearly belong to the inductive approach. All strategies hold equal importance and the best strategy should be chosen according to the objectives and questions of the research (Saunders et al, 2009).

Survey

Surveys are used to answer questions concerning "what", "why", "how much" and "how many". The researchers are able to obtain data from large samples and enables different possibilities between the variables and the reasons for their existence. They are commonly used to collect quantitative data through questionnaires. They are commonly used in the deductive approach and helps the researcher to control the research process. Furthermore, it is simple and easy to understand (Saunders et al, 2009).

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Case Study

Case studies are used for investigation or examination of certain situations by using real life evidences from a number of sources. They are able to answer questions such as “why”, “what” and “how” and are most commonly used in exploratory or explanatory researches. The researchers who use case studies as the research strategy have to follow a technique known as “triangular Technique”. Triangular “refers to the use a combination of techniques for data collection within a study for ensuring that the data is telling you what you think it is telling you.” (Saunders et al, 2009). Case studies are basically divided into four categories which are the “holistic case study, the multiple case study, the single case study and the embedded case study”. Each type is different from each other because the number of cases, the unit of analysis and the location is different for each. Survey is a very helpful tool for researchers because it allows them to explore theories which already exist and opens doors to develop new research questions (Saunders et al, 2009).

Experiment

This strategy is basically related to natural sciences and it allows the researcher to identify the links between two different variables (Hakim, 2000). It is used for identifying “the size of change existing between two independent variables” and answers questions like “why” and “how”. Furthermore, it contains two kinds of groups known as experimental group and the control group. In the experimental group, the researcher attempts to study the particular group by manipulating or interfering factors that affect the behavior, whereas in the control group, the researcher does not use any such factors. This strategy is not commonly used in the field of education or business because it is perceived to be unfair or unethical (Saunders et al, 2009).

Ethnography

Ethnography means “to describe and explain the social world the research subjects inhabit in the way in which they would describe and explain it” (Saunders et al, 2009). It is closely related to the inductive approach and it helps the researcher to study the situation within the context of which it is appearing. In order to collect data in ethnography, participant observation is used as a technique and is used only if the researcher wishes to understand the phenomenon from the participant’s perspectives or points of view. However, it requires a lot of patience and time from the researcher as many unpredictable changes may occur (Saunders et al, 2009).

Grounded Theory

This strategy is a very helpful tool for research as it helps to forecast and analyze behavioral patterns and emphasizes its role in building theories (Goulding 2002). Grounded theory is mostly used in an Abductive approach. This strategy does not need a theoretical framework as the data is collected through different observations. According to Suddaby (2006), this theory is not perfect because it is unorganized. He also stated that “the seamless craft of a well-executed grounded theory study, however, is the product of considerable experience, hard work, and creativity and occasionally, a healthy dose of good luck”.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Strategies Used in This Research

Since the research is based on the deductive approach, a combination of surveys and interviews will be used in this research. Surveys are used for collecting the quantitative data and is one of the most affordable and easy ways to find answers to the research questions in a short period of time. For qualitative data, the interviews will be conducted in order to reach the ultimate conclusion of the research.

Research Choices

The fourth layer of the research onion is that of the research choices and it provides the researcher with more flexibility in cases where both the quantitative and qualitative data are needed along with the secondary and primary data (Teddlie & Tashakkori, 2003).

Mono Method

In this method the researcher chooses a single procedure for collecting data and analysis instead of choosing both the quantitative or qualitative methods. This method does not allow to collect information though the combination of both the methods because of the demands or choices of the philosophy and the employed strategies. It can also be used to research an opposing view to the existing mono - method. (Saunders et al., 2009).

Multi Method

If the researcher chooses a combination of procedures and techniques for collecting data, it is referred to as the multi method. It consists of two subdivisions known as the multi-method quantitative study or a multi method qualitative study. However, it is preferred not to mix the quantitative and qualitative techniques while pursuing multi method (Saunders et al, 2009).

Mixed Methods

In this method the researcher can choose both the qualitative and the quantitative data and this can be done in two ways. The researcher can either use them together in a parallel way or separately in a sequential manner. In other words, the qualitative data can be used with the quantitative data or vice versa (Saunders et al., 2009; Feilzer, 2010)

Research Choices Used

This research will adopt the mixed method since both qualitative and quantitative data will be used as a procedure for the data collection and analysis.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Time Horizons

This is the fifth layer of the research onion and it operates separately from the research choice and the research study itself. The time horizon is largely dependent on the research questions to determine if it will be conducted in a limited or a long time period (Saunders et al., 2009).

1. **Cross-Sectional Studies:** Cross sectional studies focus on pondering at one phenomenon at a time and due to time constraints, it is used widely in academic researches. They are often used with quantitative data and help to identify the reasons behind certain incidents. However cross-sectional studies can also be used with qualitative data because a lot of interviews can be conducted in a short period of time (Saunders et al, 2009).
2. **Longitudinal Studies:** Longitudinal studies are able to clarify the developments that have occurred over time. According to Schvaneveldt & Adams (1991), when the researchers have enough time to observe the people or events, they will have the capability to evaluate the undertaken variables in the research as long as the research itself does not affect them. However, if the researcher is properly aware that there has been a change overtime, longitudinal studies can also be carried out in a limited period of time (Bouma & Atkinson, 1995).

Time Horizon Used

This research will use the cross-sectional studies due to limited time. Moreover, since the deductive approach is used in the research, it will be more extracted better using the cross-sectional study rather than the longitudinal study.

Data Collection and Data Analysis

This is the final and the sixth layer of the research onion and is "dependent on the methodological approach used" (Bryman, 2012). At this stage, the reliability and validity of the research depends mainly on the process used for the research (Saunders et al., 2009). Regardless of the used research approach, two types of data can be collected, namely primary data and the secondary data.

Secondary Data

Secondary data is a very useful tool for research as it can help to gather information from the existing or new theories. Cowton, C.J (1998) states that secondary data provides information that is of great value and can answer a wide range of questions with the least cost. It includes literature publications, journals, articles, and other forms of archival data. The use of secondary data has significantly increased in the last ten years (Nicholson & Bennett, 2009).

Primary Data

Primary data is collected after the researcher spends a reasonable amount of time to collect the secondary data. The actions that the researcher takes to study his understanding of the primary or research data

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

which was previously collected is known as primary data. It can be collected through questionnaires, survey, observations and interviews (Nicholson & Bennett, 2009).

Data Collection Technique Used

This research will use both primary and secondary data. Secondary data was collected in the literature review and the introduction, in order to find the different theories for testing, while the primary data was collected through the survey and interviews.

THE RESEARCH DESIGN

The research design depicts the processes and the description of the way the research will be completed. It determines the different factors that led to the selection of the chosen methodology, the method for selecting the respondents and the method of data analysis (Flick, 2011). There are three different types of research designs which are the explanatory, the exploratory and the descriptive.

The explanatory research design is used to explain the nature of a specific social phenomenon or population (Saunders et al., 2007). This can be quite useful for quantitative framework where one variable has an influence on the other (Kothari, 2004). The exploratory study design is used for exploring a certain phenomenon or issue which has taken place without much information known for the research process and it is usually used for collecting further information about the subject in order to conduct the research (Neuman, 2003).The descriptive research design reflects the respondents' experiences and is most closely related to the ethnographic studies but it can also use a quantitative framework (Bryman, 2012).

Figure 5 shows the research design used for this research. Two kinds of research designs were adopted, which were Qualitative and Quantitative. First, the quantitative data was collected through a survey and analyzed. Based on the findings of the survey, the qualitative data was collected through interviews. The data from the interviews was then collected and captured and then analyzed to reach the final conclusions.

Data Analysis Procedures

Survey

Survey was used as a research method for collecting the quantitative data and it aims to understand the consumer's behavior while using e-Commerce. The quantitative method helps to collect data from a large number of individuals in a short period. This method generally relies on numerical data to provide an understanding of the problem so appropriate measures can be taken to solve the problem (Cohen, 2000).

The Purpose

The purpose of the quantitative research was to develop an understanding of the consumers who use e-Commerce services in Bahrain. It provided an understanding of what are the main problems faced by the consumers, their reaction, perceptions and beliefs. In order to reach a conclusion and provide suitable recommendations to the problem, it is very important to gather important facts from the consumer's point of view and this was basically done through a quantitative research. Data collected from the question-

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

naire will be used to evaluate different e-Commerce behaviors and issues and will help us to reach the ultimate solution to e-Commerce problems.

Figure 5. The research design

Data Collection

The method used to collect the quantitative data was through distributing questionnaires to the consumers of e-Commerce. Questionnaires are one of the most used research methods for quantitative research and it helps to collect specific information as a response to highly directed questions. The questionnaire was distributed electronically through social media and via emails. The response rate was much better compared to the interviews, as the respondents had to answer simple and straight forward questions which were quite basic and easy to understand.

The Questionnaire Design and Structure

The questionnaire was designed after a thorough study and research conducted in the introduction and literature review of this report. Based on the data collected in section 1 and section 2, the questions were designed in a quantitatively measurable method by using multiple choice questions, Likert scale, checkboxes and open-ended questions and it was created using survey monkey. The questionnaire had 10 questions which were direct and simple and aimed to understand the preferences and perceptions of the consumers to develop a better understanding of their behavior. The collection and data analysis of the questionnaire was done through charts and graphs created by the survey monkey website.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Validity

The questionnaire was analyzed to check the consistency. The data was organized for statistical measurement of the sample population. The validity of the study was assured through different sources of evidence, questionnaires and interviews. The layout of the questions was based on the understanding of the ethical issues prevailing in the world of e-Commerce and the individual behaviors. The questions were direct and easily interpreted and were based on the facts and information gathered in section 1 and 2 of this report.

Reliability

To ensure the reliability of the study, the questionnaire was distributed and presented to the participants in the same manner to assure uniformity of the study.

The Interviews

The interviews were used to gather qualitative data for the research. According to Yin (2017), a qualitative research refers to the gathering of data which is not numerical in nature and it helps to provide an insight into the underlying problem, generate ideas and helps to understand the hypothesis which will later support the quantitative research method. It includes an interpretive approach and helps to study the subject within its context and understand the subjective meanings that people bring to the situation. There are many e-Commerce businesses in Bahrain. However, it was impossible to conduct interviews with most of them due to limited time and limited access. The interviews were conducted with the owner of an online Instagram shop called Mena Shoppers based in UAE and Bahrain and with the IT project manager of the e-government authority in Bahrain.

The Purpose

This study was conducted because the background and introduction of e-Commerce in Bahrain (Section 2) did not provide enough information about the e-Commerce behavior in the country. This study was conducted to explore the facts and provide reasoning for the data collected through the survey. The purpose of this study was to gather qualitative data from the products and service providers of e-Commerce in Bahrain and to understand their perceptions and ideas on the subject. The different problems encountered by the e-traders were discussed based on the results of the survey, along with the suggestions and recommendations to improve the situations concerning unethical and illegal activities of the consumers of e-Commerce and how it affects the e-Commerce business.

The Methods

The data collected for the qualitative research was through semi-structured, face to face interviews through email and telephone, with 2 service providers of e-Commerce products and services in Bahrain. The interview focused on collecting the necessary information required to investigate and study the different unethical and illegal issues in the organizations of Bahrain.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Research Population and Sampling

A research population is known as the collection of individuals who have the same characteristics and common traits (Saunders, 2011). The questionnaire was designed to target those individuals who use e-Commerce in their day to day life. For this purpose, the questionnaire was mainly submitted to young, university students and fresh graduates because according to a survey conducted by the European Union in 2015 on ICT (Information and communication), young people between the age of 25-34 are more active e-shoppers compared to other age groups. To achieve the objectives of the study, the questionnaires were distributed to 55 consumers of e-Commerce. Since it is quite difficult to distribute the questionnaires to all the e-Commerce consumers in Bahrain, so the most convenient method was to distribute it among the most active consumers. Therefore, the sample can be used to generalize the results and make recommendations for the study, for the rest of the population.

SUMMARY

This section has explained the research approaches used in this project. After identifying the research variables and the focus area, the research onion method was selected as a tool to conduct the research. The different layers of the research onion were explained, and the most appropriate methods were selected. It also reported the research design which consisted of the interviews and questionnaires and the data analysis procedures followed by the sampling technique of the questionnaire. The next section will focus on the findings of the research methodology developed in this section.

DATA ANALYSIS

This section focuses on explaining the results and findings which were collected through the interviews and the questionnaires distributed among the consumers. It will link the responses to the literature review in order to throw light on the issues highlighted in the first section. The data analysis is divided into two parts. The first part focuses on the findings of the survey, while the second part focuses on the findings of the interviews. It will also link the responses of the interview with that of the questionnaires to reach the ultimate solutions to the problems.

Findings of the Questionnaire

The questionnaire was distributed to a sample of55 students of University of Bahrain, who used e-Commerce websites. The response was collected from 55 students in a period of three days.

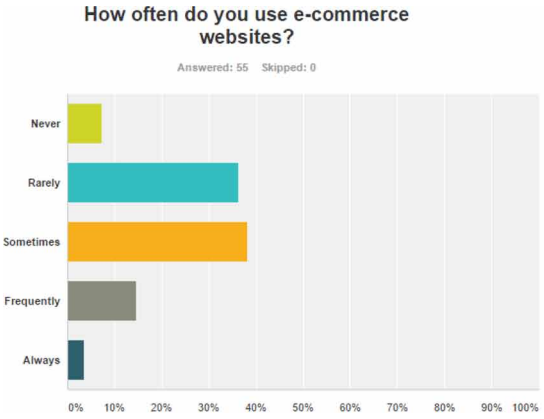
Frequency of Usage

It is important to know the frequency of e-Commerce usage among the university students in order to find out how many individuals from the sample population indulge in e-Commerce most frequently. Figure 6 shows that 38.18% of the students use e-Commerce sometimes, while with a slightly lower percentage 36.36% of the consumers use it rarely. The lowest percentage was that of the students who

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

always (3.64%) or never (7.27%) use e-Commerce. However, the target of this research were the students who frequently, sometimes or always used it.

Figure 6. Frequency of usage

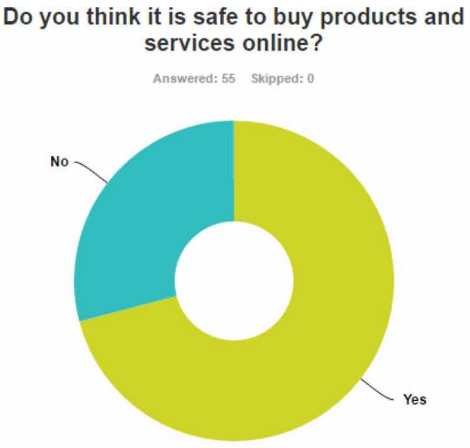


Answer Choices	Responses	
Never	7.27%	4
Rarely	36.36%	20
Sometimes	38.18%	21
Frequently	14.55%	8
Always	3.64%	2
Total		55

Safety

The next question focused on finding out the number of consumers who find it safe to order products and services online. According to Figure 7, a majority of 70.91% of the students answered that it is safe to buy products and services online. Opposing to this, 29.09% of the students do not think that is a safe method of purchasing goods and services. Even though there was a positive response from the consumers, we cannot overlook the fact that a percentage as high as 29.09 consider it unsafe to indulge in online shopping activities.

Figure 7. Safety



Answer Choices	Responses	
Yes	70.91%	39
No	29.09%	16
Total		55

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Satisfaction

From Figure 8 we can see that 45.15% of the students surveyed were neither satisfied nor dissatisfied with the online shopping experience, while 38.18% of the students were satisfied. On the other hand, 7.27% of them were dissatisfied and only 5.45% were extremely satisfied. This implies that there is a positive response as the majority of them are either neutral or satisfied with the e-Commerce websites.

Figure 8. Satisfaction

	Extremely dissatisfied	Dissatisfied	Neither satisfied nor dissatisfied	Satisfied	Extremely Satisfied	Total	Weighted Average
Rating	3.64% 2	7.27% 4	45.45% 25	38.18% 21	5.45% 3	55	3.35

Most Used e-Commerce Platforms

The consumers of e-Commerce use a variety of applications or websites, out of which, some of the most common were listed for the consumers to choose from. We can see from Figure 9 that almost 54.55% of the students use Instagram as a source for buying products and services online. As mentioned earlier Bahrain stands at the first place with the greatest number of Instagram users as compared to other GCC countries. The survey proves the fact of the rising trend of Instapreneurs and Instagram users in Bahrain. Another widely used website known as expatriates.com provides the users with the facility of buying or selling products and services online. This website is widely used all around GCC and figure 4.4 shows that almost 38.18% of the students use the website. Talabat ranked at the third place with almost 29.09% users who order food through the application. Other famous websites like amazon, e-government and e-bay were ranked next with nearly 25% users with the minority of 18.18% using Alibaba and 14.55% using OLX.

Reasons for Using e-Commerce

It was necessary to find out the reasons why the consumers prefer to order products and services and online in order to link it to the pre-existing theories mentioned in the literature review. As shown in Figure 10, a majority of 63.64% of the users ordered products or services from websites because it is easy to place an order electronically instead of going to the physical location. Furthermore 38.18% of the consumers use it due to a large variety of products and cheaper prices. As far as cheap prices are concerned, they could also be due to unauthentic products which sometimes the consumers are unable

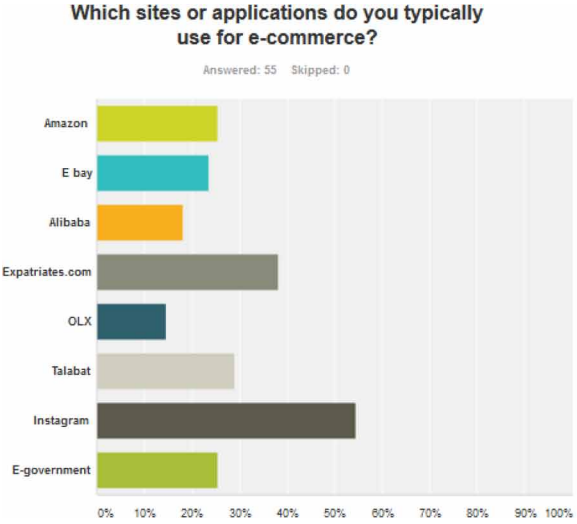
EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

to recognize. The ease of online payment was one of the reasons as stated by 25.45% of the consumers. On the other hand, 20% of the consumers order due to fast service and delivery, 16.26% order due to detailed information about the products or service and only 10.91% order due to good customer service.

Most Concerning Factors

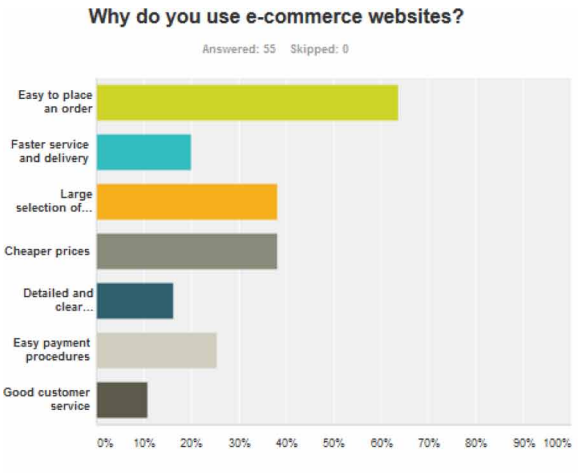
The consumers were asked to rate some of the important factors on a scale of 1 to 4, on the basis of their importance to them and the results were as follows (as shown in Figure 5):

Figure 9. Most common platforms



Answer Choices	Responses	
Amazon	25.45%	14
E bay	23.64%	13
Alibaba	18.18%	10
Expatriates.com	38.18%	21
OLX	14.55%	8
Talabat	29.09%	16
Instagram	54.55%	30
E-government	25.45%	14
Total Respondents: 55		

Figure 10. Reasons for using e-commerce



Answer Choices	Responses	
Easy to place an order	63.64%	35
Faster service and delivery	20.00%	11
Large selection of products	38.18%	21
Cheaper prices	38.18%	21
Detailed and clear information about the product and service	16.36%	9
Easy payment procedures	25.45%	14
Good customer service	10.91%	6
Total Respondents: 55		

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Information Security

A majority of 58.18% of the consumers considered the information security to be very important and 32.17% said it was important. On the other hand, 7.27% consider it to be less important and 1.82% say it is not important at all.

Privacy

According to Figure 5, a majority of 69.09% consider privacy to be a very important factor and 25.45% think it is important. While a minority of 1.82% say it is not much important and 3.64% say it is not important. This shows that while the majority is really concerned about the privacy, but there are people who do not give much importance to it.

Guarantee

The guarantee of the product or service is very important for 65.45% of the consumers whereas it is important for 27.27%. On the other hand, 5.45% consider it to be less important while 1.82% say it is not important.

Product Authenticity

Figure 5 shows that 63.64% of the consumers consider the product authenticity to be very important, whereas 30.91% think it is important. 3.64% say it is less important and 1.82% consider it as not important.

Customer Service

Good customer service plays a major role for any kind of business and it implies on e-Commerce as well. The survey results show that 43.64% of the consumers think it is very important to have a good customer service, 38.18% say it is important. A minority of 12.73% say it is less important and 5.45% do not think that it is important.

Product Quality

A majority of 72.22% of the respondents consider it to be very important for the product to be of good quality. This is higher than any other factor which were mentioned in the question. 25.93% of the respondents think it is important, whereas a 1.85% think it is less important. However, it should be noted that none of the respondents think that product quality holds no importance.

Price

As per Figure 11, 45.45% of the respondents think that the price of the product is very important or important. 7.27% said that is less important while a minority of 1.82% consider it as not important.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Delivery Time

A majority of 41.82% of the respondents said that the delivery time of the product is very important, 36.36% of them said that it is important, while 20% said that it is less important and 1.82% said that it is not important.

Figure 11. Most concerning factors

	Not important	less important	Important	Very important	Total	Weighted Average
Information Security	1.82% 1	7.27% 4	32.73% 18	58.18% 32	55	3.47

Common Issues

The respondents were asked to choose some of the most concerning issues faced by them while shopping online through a checklist which contained the most common issues discussed in the introduction. 54.55% of the respondents chose late delivery of products as the most common issue, while 43.64% said that false advertising and information is a big issue. The percentage of respondents who chose fake products was 38.18%, whereas poor customer service ranked next with 32.73%. About 27.27% chose damaged products as a commonly faced issue, while 21.82% chose fraud. Email spamming and privacy issues got an equal percentage of 20% from the respondents. On the other hand, 10.91% selected multiple payments as a common problem followed by 9.09% for hacking. Web spoofing received 7.27% while 7.27% of the respondents selected "none" as an option. Figure 12 shows the percentage and the selection of the respondents.

Reactions to the Problems

As seen in Figure 13, a majority of 44.44% of the respondents said that they contact the customer service, while 42.59% choose another website for buying the product or service. 33.33% of the respondents ask the supplier for a refund as a compensation for the issue faced by them, while 27.78% stop using e-Commerce websites and start purchasing things manually. However, only 16.67% of the respondents said that they do not take any action.

Online Payments

Figure 14 shows that when the respondents were asked for their opinion about online payments, 70.91% said that they found it safe, while 20% said that it was not safe. Among the people answered that online payments are unsafe, some of mentioned different reasons for their beliefs. According to one of the respondents the payment should be made on delivery and in cash terms, while another said he/she is concerned about online payments as their credit card information can be misused over the internet. Some respondents also mentioned that their main concern is privacy and they do not know if they can trust the website as their information might be at risk.

Suggestions for Improvement

Out of 55 respondents, only 26 of them provided some suggestions to further improve the e-Commerce transactions because it was optional to answer. According to the respondents:

- The websites should provide more variations and cheap prices because the delivery prices are high.
- More security measures should be taken, and the websites should be certified by inspection teams.
- The personal contact number of the suppliers should be provided as a safety measure.
- The delay in delivery should be reduced and the product quality should be guaranteed.
- The websites should be more user friendly, so it is easy to use.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The products should be guaranteed as authentic and in case they are not, it should be specified in their websites to save the time and efforts of the consumers.
- The websites should improve their payment systems.
- The websites should be designed in a way which is attractive to the customers and the orders should be tracked along with cash on delivery options.
- There should be an improved customer service, so in case of any issue they can report it directly to resolve it.
- Financial and information security measures should be taken along with faster shipping.
- The information of the product should be genuine and true because the idea of buying a product without seeing is very risky for the customers and the e-Commerce websites should also be accountable for the delivery of the product.
- The websites should have more ways to secure customers' details and information and guarantee the customer that the product being sold is authentic and approved by the brand.
- The government websites also need improvement to secure information.
- Email spamming should be reduced.

The majority of the respondents emphasized on faster delivery of products, product authenticity, information security and privacy.

Findings of the Interviews

As mentioned earlier, the interviews were conducted in order to develop an insight into the problems faced by the buyers of e-Commerce services and products. Based on the findings of the survey, the interview was conducted with one product and one service provider of e-Commerce in Bahrain.

MENA Shoppers (Products)

As mentioned earlier, the trend of instapreneurs in Bahrain is increasing day by day. The owner is a marketing student at the University of Bahrain and the owner of an online shop on Instagram called Mena shoppers which is a retail shop for the latest fashion trends and is based in Bahrain and UAE. The manufacturers are based in Dubai, so whenever there is an order for a product, it is shipped directly from UAE to customer. The owner explained that her fiancé is responsible for managing the orders in the UAE and she manages the orders in Bahrain.

Q.1: Why Did You Choose to Have an Online Shop Rather Than a Physical Store?

The owner explained that her business is not located in Bahrain, but it is based in the UAE. E-Commerce is good way to reach the customers not only in Bahrain but in the UAE as well, as a lot of people now prefer online shopping compared to the traditional shopping methods. Instagram is an upcoming trend in the Middle East, so she decided to choose it as a medium to reach the target customers. She also explained that her target customers are mainly the women as they are more into online shopping compared to men.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Q.2: What are Some of the Ethical Issues Faced by You From the Customers Side?

Most of the customers expect on-time delivery and since the products are shipped from UAE, sometimes they get delayed from the courier company, so the owners are blamed for the delay which causes a problem. Many customers are also reluctant to provide their personal information like their house address or their contact number for the delivery of the products which creates a lot of problems in delivering the product on time. And lastly, sometimes the customers travel after placing an order which creates a problem for the owners as the product has to be returned back.

Q.3: How Can You Prevent the Issue of Late Delivery?

The owner explained that the courier agents that she dealt with before mostly delayed the delivery and due to a large number of complaints from the customers, she changed the courier agents to professional ones which are expensive, but they are really good and fast in delivering the product. But most of the late deliveries are due to the suppliers and not due to the owners.

Q.4: How Do You Convince the Customers to Provide Their Personal Information?

The wonder stated that she tries to gain the confidence of the customers by convincing them that their information will be highly confidential, and it will be used solely for the purpose of delivering the product. But on the other hand, if they do not wish to provide the information, they have the option of directly contacting the courier agents or the shipping company and explain them the address.

Q.5: Do You Face Any Technical Issues or Any Other Problems Due to the Customers Lack of Knowledge About Using the Application?

According to owner, there are usually no technical issues but sometimes the customers do not know how to place an order, so they are instructed on the procedures and payment policies which makes it easy to solve such problems.

Q.6: According to You, Does e-Commerce Create Employment or Unemployment in the Economy?

The owner explained that e-Commerce is a great platform for young students who wish to start their own business and earn as a part time worker, since it can easily be managed and is highly profitable, so it creates more employment.

Q.7: There Are A Lot of Online Shops Similar to Yours. How Do You Provide the Competitive Edge to the Customers, So They Choose to buy From You?

Compared to the competitors, Mena shoppers provides a wide range of varieties to the customers along with seasonal offers and promotions on Eid, Christmas and other festivities. The delivery charge is also comparatively less than the other competitors.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Q.8: Do You Think the Customer Can Sometimes Lie About the Quality or Quantity of the Product? How Can This Be Solved?

The owner explained that she has never experienced any such situations, but the quality of the product is always checked before sending it to the customer to ensure that there are no such cases.

Q.9: Did You Ever Send a Wrong Order Due to Wrong Address Information?

Mena shoppers have never faced such situations because the courier agents always do a background check of the customers to ensure that the address is correct. The products are only sent after ensuring and double checking the address with the customer.

Q.10: What are Your Suggestions to Improve e-Commerce in the Future?

There should be more security measures taken by the e-Commerce sellers to ensure that the products being sold are genuine because the customers cannot see them before buying.

Q.11: Do You Provide Cash on Delivery or Online Payments?

Mena Shoppers provide cash on delivery and it is one of the reasons the customers choose them among the competitors. The payment is done after the product reaches the customer, so they can pay for what they get and if they do not like it, they can return the product. Companies like Amazon and E-bay are well-known, and the customers would not hesitate to pay online but on the other hand, they would be reluctant to make online payments for companies that are small and not well-known.

E-Government (Services)

The IT project manager at the e-government authority in Bahrain is currently working on a project which is directed towards helping the business community, particularly the individuals who wish to start online activities for their businesses in Bahrain. Any person who wants to register for an online business activity in Bahrain can do so by applying on the e-government portal and then seeking an approval to commence their online business activities. The following data was captured and collected through the interview.

Q1: Why do you think the government has taken this initiative of providing online services to the citizens?

The manager responded by saying that e-government is different from e-Commerce in the sense that it is directed towards providing online services to the customers, while e-Commerce focuses on providing products. As far as online services are concerned people use it for their ease, so they can avail the services sitting at their homes.

Q.2: Does e-Commerce create employment or unemployment in the economy?

e-Commerce creates more employment according to the manager because there are a lot of direct things in e-Commerce which include delivering the products to the customer. So, a driver has to be hired or an alliance has to be made with another company which can provide the service. When there is more demand, more people will be hired for the service. At the same time when it comes to the logistics, there

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

is no need for a physical store or a salesperson and since we cannot pay cash online, credit cards have to be used so there is no need for a cashier, but more technicians and website developer are required along with online agents to provide customer services around the clock. On one hand there will be no need for employees but at the same time other employees are hired for these things which definitely creates employment.

Q.3: According to a survey, the majority of the consumers are concerned about their information security and privacy. Do you think it is safe for the customers to rely on e-Commerce websites? How can the websites ensure security?

The customers can rely on e-government services because there are certain procedures and policies that are implemented by the e-government authorities for the security of the consumers but not all e-Commerce websites can be trusted. There are a lot of websites that ensure security and the users can know if the website has been secured or not, but many websites also capture the information of the users. So, the users should be aware about which of them are safe and which are not.

Q.4: What are Some of the Ethical Issues Faced by You From the Customers Side?

The manger stated that one of the main issues faced by e-government is that the users provide wrong information which results in them receiving wrong service and this creates a lot of problems because sometimes there are some requirements which not everyone wants to provide. Whereas in e-Commerce websites, when the customer's order a product, they need to provide their credit card information, and if the website is not secured, this information can be used unethically. There are a lot of security measures which are being implemented to ensure the customers that the website does not save the credit card information and it is only used for payment purposes.

Q.5: Sometimes There are Cases of Multiple Payments. Is it Due to the Technical Reasons or Due to the Customers Lack of Knowledge in Using the Website?

The manager asserts that multiple payments are due to technical errors and cannot be avoided most of the time. When the users send their information to the gateway, sometimes due to network issues there is a delay, but the user keeps pushing which results in another request being sent to the server and so there are cases of multiple payments. Many times, during the payment process, the bank sends a notification to the user that the payment has been done and the user closes the window which makes it difficult for the provider to find the source or destination of the payment. In these cases, the payment is made but not updated in the system. For this reason, the payment gateways display messages asking the users not to close the window while the payment process is going on. The users have to read these messages and follow the instructions carefully. Another reason for this is the infrastructure or bandwidth as not all of them has the same speed. Some may be faster than the others and vice versa. But all these technical issues can be solved if the users disclaim against them and after it has been proved, the user can be refunded.

Q.6: What Steps Can be Taken to Educate People About Using e-Commerce?

The manager explained that in the Middle East, people are not well educated in dealing with online websites or e-government services and educating people takes time and effort. This can be done through television, social media and websites which should provide clear instructions and steps to the users.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

There should be a lot of campaigns and brochures to educate the people on the subject. The banks should educate people on how to use credit cards for online shopping.

Q.7: When You Update Your Website, Are the Users Still Able to Use It?

It depends on the type of update in process. If it is a normal update, they put on a notice for the people but for major updates either the website is shut down or it is running but people cannot use it for a while. But the priority is to inform people about it.

Q.8: Many Websites Provide False Information to the Customers, Which Raises Trust Issues. How Can This Be Solved?

The manger asserted that people should never believe what they see, and the customers need to be educated properly. Many people recommend websites, but it should be taken into consideration that not all can be trusted. When people use a new website, they should read about it before doing any transactions.

Q.9: Websites or Online Portals Like E-Government are More Prone to Hacking Due to Online Payment Procedures. Have You Ever Faced Any Such Issues?

The manger stated that as far as e-government is concerned, people are forced to use it because sometimes they do not have another channel for making payments. But since there are a lot of services combined in one portal, e-government is usually targeted for hacking. However, there are a lot of security measures taken so it is rarely hacked. On the other hand, the e-Commerce websites are optional, and people have another source to provide them the products, so sometimes the e-Commerce sellers compromise on the security of the customers in order to ensure fast service without losing the customer. So, they are easily hacked.

Q.10: Do You Think That Electronic Contracts Have as Much Authenticity as the Ones Made in Person?

The manager discussed that when it comes to trading, many organizations are not always in the same country and they are forced to use electronic contracts and they have to trust a person whom they have never met or never seen due to geographical boundaries. Electronic contracts are built on trust and the quality of services because in the modern era, we cannot even sometimes trust human beings when making contracts in person.

Q. 11: One of the Major Legal Problems Faced by the Government is the Taxation of e-Commerce Businesses. How Can This Be Solved?

The taxation of e-Commerce business is very easy because all the e-Commerce websites have to be licensed and registered at the Ministry of commerce in Bahrain. Once an individual obtains a CR, he is asked for the financial statements of the business from time to time, so taxation is possible. But it is difficult to tax the businesses which are being run on social media, Instagram or other personal websites and the government should monitor and inspect such websites whenever there is a complaint from the customers' side. These businesses should be shut down or controlled by the government to ensure legality.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Q.12: What Should Be Done to Eliminate Scammers and Reduce the Risk of Fraud From Websites Like Expatriates.com and OLX?

The main thing is to educate the consumers so that they are aware of such situations. Whenever any transaction involves western union, they should know that something is fishy and avoid getting into it. The developers should read the ads on a daily basis and delete the posts which do not look authentic. If there are fewer scamming advertisements, the website can be more trustworthy for the consumers.

Q.13: Email Spamming is Also One of the Major Issues Faced by the Consumers. But at the Same Time, It is Also a Marketing Strategy Used By Most of the Businesses. How Can This be Reduced?

The manager said that sometimes the consumers give out their email to some companies to receive important notifications and offers from time to time but at the same time, the email is also passed on to other companies and they start receiving a lot of spam emails but the consumers always have an option in their email to mark these emails as spam or block them so as to get rid of such situations.

Q.14: Majority of the Customers Prefer Cash on Delivery When Buying Products and Services Online. Do You Think This is Right?

When people use a new website, they are not sure if they can trust it so it is important to have cash on delivery for the convenience of the customers, so they can see that the product is authentic and not damaged. In some cases, once the payment is done, it cannot be refunded so the consumer has to see the product and then make the payment.

Q.15: What are Some of the Major Steps Being Taken by the E-Government to Promote e-Commerce in the Country?

The manger discussed that there are many big projects coming up in the future. The main thing which helps the e-Commerce and the e-government is a good infrastructure which ensures high speed internet connections. The telecom companies are developing high speed internet services for the ease of the e-Commerce. Fiber optic networks are being introduced in the country which will boost the power and speed of the internet which will be very beneficial for the e-Commerce users.

Summary of the Findings

The findings of the research report that the majority of the consumers do trust e-Commerce websites and are neutrally satisfied with the channel. The most commonly used platform was found to be Instagram, which proves the rising trend in the country. Since applications like Instagram do not require a commercial registration and it is easy for anyone to start a business and market it, it can be prone to many ethical issues and can be one of the reasons why people confront different problems while purchasing products online. Same is the case with websites like OLX and expatriates.com where any individual can sell anything without any restriction. These factors can be the reason why the individuals are concerned about their privacy and information. They can also contribute to the rise of ethical issues like privacy invasion, fraud, late delivery of products, and so on. False information, advertising and fake products was one of the most common issue and since websites like expatriates and OLX are not monitored or

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

controlled by the government, anyone can be fooled by them. It was also found out that the majority of the users try to contact the customer service in case of an issue so this highlights the importance of a good customer service. Failing to provide a good customer service might result in the user choosing an alternate website which might result in losing the customer. Online payments are considered to be safe by most of the users but some users consider it unsafe as well due to sensitive credit card information.

The findings also reported that e-Commerce tends to increase the employment rate in the country as it is easy to start and can be used as a part time job. Issues like multiple payments and late delivery of products are mostly related to the consumer's lack of knowledge and awareness about using e-Commerce websites. Education and training forms a critical part in solving this issue. The issue of late delivery can also be related to the hesitancy of the consumers to provide private information. Damaged products can be avoided by availing the cash on delivery option, so more and more traders should provide the option of cash on delivery to win the trust of the customers, until and unless it is a well-known and trusted business. But this can be a good start for new e-Commerce businesses to expand and win the customer's trust. Another factor which can help the e-businesses to expand and win the trust of the customers is by registering their businesses at the Ministry of Industry and Commerce. This will also solve the issue of taxation. Educating the people can help them to identify the difference between a secured and an unsecured website, which can reduce the number of issues faced by them.

CONCLUSION AND RECOMMENDATIONS

The research objectives, the main outcomes of the research, a comparison of the findings along with the current literature review on e-Commerce and its implications in the society have been discussed in detail in the preceding sections. There is no doubt that e-Commerce has facilitated the lives of human beings by providing products and services at the distance of a single click. The research has argued that apart from providing many advantages, e-Commerce also gives rise to a number of unethical and illegal behaviors.

The behaviors of the consumers and the sellers of e-Commerce in the Kingdom of Bahrain have been highlighted in Section four. While investigating and collecting the data from the questionnaires and interviews, it has been highlighted that consumers and sellers are aware of the different issues surrounding the e-Commerce and are looking forward to eliminating these problems. But besides this, majority of the consumers do think that e-Commerce is a safe platform and they will continue to use it in the future. The number of consumers who are dissatisfied with the e-Commerce are very less and this shows that the situation is not as fierce as it looks. The findings also highlight the trend of instapreneurs as it shows that the majority of the consumers head over to Instagram every time they want to order a product or service. But at the same time, we cannot deny that websites like expatraites.com are also highly used by the consumers and as stated by the manager such websites increase the risk for the consumers to fall a victim of scam and fraud.

One of the most common reason for using e-Commerce was found to be the ease of placing an order online with a wide variety of choices and cheap prices. Other factors which play a big role for the consumers to decide if they should use the e-Commerce websites are privacy, information security, product authenticity, quality and the delivery time. Whereas the major issues faced by the consumers, as highlighted in the findings were late delivery of products, false advertising and product information, fake products and poor customer service. These issues shape the attitudes and behaviors of consumers while making online purchases, as explained by TBP in Section two. The solutions to these problems

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

were provided by the sellers through different suggestions as mentioned in Section four. On the other hand the major issues faced by the sellers include late delivery, wrong personal information and lack of customers' knowledge which can be solved by training the consumers or winning their trust. Technical issues can also be an important issue but cannot be counted as unethical or illegal. The online payment systems are not perceived to be risky by the majority of the consumers but cash on delivery is preferred when buying products and services from e-Commerce businesses which are not well-known. The consumers and sellers gave various recommendations and suggestions to improve the e-Commerce services which helped to support the research and reach the ultimate conclusions.

While the findings of this research have shown some similarities, contradictions and some difference with the pre-existing theories but at the same time we cannot question the validity of the findings of this research. Although the sample base was restricted to the consumers in Bahrain, the response rate was quite high in a short period of time. The experiences and thoughts of the consumers cannot be dismissed as any business cannot run if the customers are not satisfied. The evaluation of this research has been qualitative as well as quantitative. However, there are a few questions that still remain unanswered and many issues need more investigation. The research proves to be beneficial for a number of reasons. As mentioned above, there are a lot of issues and problems but the increase in the number of internet users and online consumers help to overcome this factor and contribute to the ever growing success of the e-Commerce world.

Recommendations

Based on the findings of the research, and the e-Commerce situation in the Kingdom of Bahrain, it requires concentrated and joint efforts from both the consumers and the manufacturers of e-Commerce to solve the most prominent issues faced by both the parties. This is important because the world of e-Commerce is expanding day by day and the consumers as well as the manufacturers should understand the future consequences and impact of unethical and illegal behaviors on their day to day e-Commerce activities. Therefore, the research recommends the following for the buyers and the sellers who indulge in e-Commerce activities:

Recommendations for the Sellers

According to the Sophos Security Threat Report in 2012, an average of 30,000 websites are hacked every day and it is likely to be increased by now. The security of the consumers greatly lies at the hand of the sellers and the way they conduct the businesses. Therefore, a number of recommendations can be provided to the sellers to save their websites from being hacked and to protect the user information and data as well as to solve the various issues faced by the consumers.

1. **Hacking:** The sellers or manufacturers must choose a secure e-Commerce platform by selecting an existing e-Commerce platform rather than building a new one. This is because there are a lot of security risks associated with building an e-Commerce solution from the scratch and it can be easily hacked. The sellers must not store unnecessary or sensitive customer data which is unessential to their business. An encrypted checkout tunnel should be used for processing credit cards which will ensure that the server does not see the customer's credit card data. The sellers must also update their e-Commerce solutions SSL/TLS to encrypt the browser communications when transmitting

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

confidential information. The websites must be regularly checked for any vulnerabilities and the risky software's which jeopardize online security should be deleted.

2. **Product Authenticity**: In order to ensure the authenticity of the products bought from the supplier, the sellers should introduce a new technology which uses hard to copy symbols which are similar to QR codes and can be scanned and read by a smartphone camera. These codes will help to identify the product authenticity as a part of product labels when any of the sellers request to sell their products. In this way the consumers will also be satisfied that they are actually paying for the product they are receiving. The companies should also register their trademarks with Customs agencies in order to avoid selling counterfeit products. In case the website sells duplicate or copies of original products, they should clearly mention and inform the consumers beforehand so as to avoid wasting the time and money of the consumer.
3. **False Advertising and Information:** The sellers should stop displaying fake information and advertisements on their websites in order to win the trust of the customers because the customer's satisfaction is the key to success for any business. In order to avoid misleading information in the affiliate marketing, the sellers must monitor the traffic that they are generating. Advertisements which garner a higher click rate should be suspected. The sellers should provide clear guidelines and details of the claims which the advertisements can or cannot make. They should also establish a policy framework and take action against the affiliates who break the policies.
4. **Email Spamming:** The e-Commerce sellers must avoid passing or selling the consumer data like emails and other personal information to the third parties. This will result in the customer doubting the legitimacy of the products sold by the seller and the customers' trust will be deteriorated. At the same time, the e-commerce manufacturers must also avoid sending large number of irrelevant emails to the customers because they do not necessarily interest the consumer and they might block the email which might result in losing the customer's interest in the products or services offered by the seller. The online companies must also use programs which can track things and allow the receiver to opt-in or unsubscribe from receiving the emails whenever they want to.
5. **Cybersquatting:** In order to avoid cybersquatting, the sellers should register their domain names which includes the common misspellings and other typing errors that the users might enter while searching for website. They should also continually ensure that their trademarks are up to date all over the world.
6. **Late Delivery of Products:** In order to avoid problems with the customer regarding the late delivery of products, the sellers must allow them to track their orders. They can also provide the customers with the direct contact of the shipping company so that they are not blamed for the delay. In case the shipping company is causing an unnecessary delay and resulting in losing the customers, then it is better for the sellers to choose a better shipping company with fast delivery.
7. **Damaged Products:** All the products must be checked to ensure that they are in good quality before shipping them to the customers and in case the damage is caused through the shipment then the customers should be refunded for it or the product should be exchanged. In this way, the customer will trust the company and will not hesitate to place orders in the future.

Recommendations for the Buyers

1. **Privacy Invasion:** More policies should be developed to balance the privacy concerns of the consumers with the information needed by the sellers. In this way the consumers will feel secured and safeguarded while purchasing online and the trust issues will be solved. The consumers should also use strong passwords for more protection of their sensitive data and in case they do not trust the online seller, they should directly contact the shipping company to provide information like address and telephone numbers. Another thing to be noted is that the customers should never provide their social security numbers while placing an order as it is not a requirement for purchasing. Moreover, the URL of the e-commerce websites must be checked to ensure that it is safe and secure to use.
2. **Web Tracking:** In order to stop web tracking, the consumers need to delete the third-party cookies from their browser. For deleting the existing cookies, users can install programs like CCleaner which will only target to clean the third-party cookies on the hard drive. Users can also delete all their existing cookies and start over if they do not wish to install such programs. Once the third-party cookies are deleted, the next step is to change the settings of the browsers in order to avoid any third-party cookies in the future. This can be done by changing the internet settings in the browsers and selecting the "block third-party cookies and site data" from the options.
3. **Product Authenticity**: The customers should research about the website before buying products from it and in case they receive counterfeit products from an e-Commerce seller which claims to sell authentic products, they should first report it to the seller because sometimes even the seller is not aware of receiving fake products from the supplier. In case the seller refuses to refund the consumers, then they should report it to the appropriate or responsible entity.
4. **False Advertising and Information:** The consumers should only buy products from a trusted e-Commerce website or source and in case they are buying the products from the seller for the first time, they should insist on paying cash on delivery so that they are satisfied with the product they are receiving and in case of online payments, the unsatisfied customers should ask for a refund. If the consumers see a lot of price difference between the original product and the product being offered by the seller, they should refrain from buying it because it is a sign of false marketing.
5. **Email Spamming:** The consumers can stop receiving emails from a particular e-Commerce website by selecting the unsubscribe option if it is available and in case they do not have this option, they can mark the email as spam, so the emails from that source will always automatically be sent to the junk folder. Anti-spam software can also be used for this purpose. If the users keep receiving emails even after unsubscribing, then they should report them at the Internet Service Provider's Association who are responsible to regulate spam. It should be noted that there are a large number of identity thieves who send emails to the users and ask them to update their credit card information, online payment information etc. The users should not click any links provided in such emails or respond to any such request for financial information.
6. **Multiple Payments:** In order to avoid multiple payments, the users should make sure that their internet connection is strong. While making online transactions, the users should not refresh the webpage or close it and wait for the webpage to respond. In case of multiple payment, it should be reported to the seller as soon as possible so the money can be refunded. After the payment is made, the consumers should print or save the receipt for future references.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

7. **Late Delivery of Products:** Before placing an order online, the users should carefully read and pay attention to the shipping policies and facts. According to the law, the company should deliver the product within the time period stated in the ads. In case of no time frame, the merchant must deliver the products within 30 days or give an "Option Notice" to the user which will allow him to cancel his order and ask for a refund.

Chapter 85
Cloud Security in E-Commerce Applications

Shah Rukh Malik
Government College University, Pakistan

Mujahid Rafiq
The Superior University (Defence Road Campus), Lahore, Pakistan

Muhammad Ahmad Kahloon
The Superior College (University Campus), Lahore, Pakistan

ABSTRACT

In this chapter, the authors focus on the most fundamental barrier in the e-commerce application's adoption: security. The most significant or important aspect to explore in cloud computing is how to keep the data secure in the most efficient way with cutting-edge technologies. Cloud computing has taken its place by providing its convenient services like on-demand service, pay-per-use, rapid elasticity, resource pooling, and other lucrative facilities. In this chapter, the authors will firstly describe the introduction related to cloud computing, major characteristics, types, and a few security concerns and issues in cloud computing. Furthermore, they discuss the introduction of e-commerce applications, how it is interlinked with cloud computing, and what the possible threats are. Moreover, what the possible solutions could be are discussed, so that we can secure data on both user side as well as on the server side. The authors suggest some existing solutions at the end of the chapter.

INTRODUCTION

E-Commerce has become an essential part of the user's daily life activities. Detailed discussions on E-commerce applications are already available in previous chapters of this book. Just to show the importance of E-commerce applications once the CEO of the famous Company (Amazon.com™), Jeff Bezos said, "I should have 3 million stores on the Web if I have 3 million customers" (Schafer, Konstan, & Riedl, 2001). The understanding related to consumer trust is very much essential for the growth and develop-

ment of e-commerce but it involves the number of technical issues and challenges including security and privacy (Ahuja, 2000; Feldman, 2000). In the Information Technology domain, cloud computing has become one of the booming technology. Due to elasticity, availability, vast infrastructure and better support for software, cloud technology attracts the developers of e-commerce applications towards it. The main advantages of cloud computing include low-cost infrastructure (Software, Hardware and their license) and some big companies like Microsoft and Google also offer cloud services for free or on very less cost. Despite all benefits, the major concern for the cloud's implementation in the e-commerce domain is the security issue. Security in the cloud includes data security and confidentiality related to privacy(Saleh, 2012). In this chapter, our main focus area is the Security of E-commerce related to the cloud. Transporting sensitive and important data to the cloud data centers and then to maintain its security is the most important concern nowadays. The cloud service provider (CSP) must ensure and responsible to secure and protect data traffic that travels between the application to the cloud data centers. CSP's signs a Service Level Agreement (SLA) with the service user of cloud to certify and ensure the level of security, privacy, and also facilities the user wants.

For a detailed overview of the topic and discussion, this chapter is further divided into different small sub-sections. Section 1 includes details on Cloud Computing, (a) its characteristics, (b) major service providers of cloud, (c) Deployment Models of cloud (d) Service Models of cloud (e) Security Concerns and Issues in Cloud Computing. Section 2 discusses, the Introduction of E-commerce Application and further subdivides into 2 sections (a) E-Commerce application and its relation with cloud and (b) include the Security Concerns in E-Commerce applications. Section 3 is the last section of the chapter that is based on the Solutions of Cloud Security in an E-commerce application.

CLOUD COMPUTING

Cloud computing model enables the network to access shared resources that can be provided on-demand and user can access it anywhere. This shared pool of resources is used by cloud service. Users can use this by signing an SLA with a CSP (Dikaiakos, Katsaros, Mehra, Pallis, & Vakali, 2009). Detailed characteristics and techniques are given below.

a. **Cloud computing characteristics**

Cloud have different characteristics related to their usage, In this section, we will summarize the most common characteristics defined by some famous researchers (Mell & Grance, 2011)

i. Scalability

As we know that the world's most famous giants in cloud services are Google, Amazon, Yahoo, and others, Millions of servers are located all around the world by the CSP's. They can easily add or remove nodes and servers with little modification to cloud server and infrastructure due to the scalable property of cloud.

ii. Virtualization and Broad Network Access

The client can access all the services by using any medium like mobiles, laptops, tablets, and workstations. Cloud has a built-in capacity to handle and virtualize all the physical resources used by the client

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

iii. Self-Service On-demand
A user or consumer can easily demand any service related to cloud i-e provisioning of computing resources like storage, server time, etc. without any human intervention. You just have to sign a contract of services by any of CSP's and simply you have to pay charges mentioned in your contract to use all existing services.

iv. Shared Resource Pooling
Cloud is considered as a shared pool of infinite resources. CSPs resources related to computing are arranged/pooled to serve multiple consumers request using the multi-talented model that can be easily added or released resource according to the user's virtual and physical demand. Some example resources include storage, processing, network bandwidth, and memory.

v. Minimum Cost & Availability:
Cloud services basically reduce the manpower you need to maintain the setup and to maintain the servers, you can easily maintain a complete virtual office and you don't need to rent an office hire the staff to run your setup. All these costs are reduced by using cloud services. Cloud services are quite available anywhere at any time. You just need an active internet connection and a device that have OS and Browser. It can either be mobile, laptop, tablet or another similar device.

vi. Easy to Measure and Manage
Applications that are used to access the cloud environment are quite easy to use as compared to other related environments. At the user's end, they just need a browser on a computing device and have an active internet to connect with CSP. Cloud Systems can automatically optimize and control the resources by measuring capability related to services (e.g., processing, storage, active user accounts, and bandwidth).

b. Major Service Providers of Cloud
These days there are many companies that are providing cloud services. Below Tables 1- summarize few major stakeholders in Cloud-related services.

Table 1. Cloud Services by Amazon ("Amazon Web Services," 2019)

Name of Cloud	Services
EC2(Elastic compute cloud) by Amazon	Provide elastic computing capacity on the cloud
RDS(Rational Database Service) by Amazon	Provide tools for managing DB
Simple DB by Amazon	Provide database functionalities
Scalable DNS by Amazon	Provide secure routing server over the internet
Elastic Map Reduce by Amazon	Provide a vast amount of data on the cloud

Table 2. Cloud Service by Google ("Google Cloud,")

Name of Cloud	Services
Compute Engine by Google	An IaaS, where customer can divide workload in virtual server
App Engine by Google	A PaaS, where customer can develop an application
Cloud storage by Google	It is used for storage of any type, capacity
Cloud SQL by Google	Deal with relational DBMS
Cloud data store by Google	Deal with unstructured DB
Big query by Google	Used for a large amount of data

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Cloud Services by Microsoft ("Microsoft Azure," 2019)

Name of cloud	Services
Infrastructure	On-demand infrastructure with full support
Media	This cloud is dedicating for all type of media
Web development	Platform to build and develop web apps
Mobile development	Platform to build and develop mobile apps
Storage	A large cloud storage

c. Deployment Models

Four Deployment Models are commonly considered for the cloud that the CSP's can provide to the user (Mell & Grance, 2011; Zissis & Lekkas, 2012), are:

i. **Private Cloud:** CSP's provide exclusive access to a single organization. The organization may comprise of multiple consumers. It may be owned, managed, and operated by a third party itself.

ii. **Public Cloud:** Infrastructure of the cloud may be provisioned for an open-access usage for the general public. It may be owned, managed and operated by an academic, business, or some kind of non-government/private or government organization, or maybe the mixture of them.

iii. **Hybrid Cloud:** Infrastructure commonly used in the cloud that is composed of two or more different cloud infrastructures (private, community or public). Hybrid cloud bonds together standardized technologies that enable application and data portability

iv. **Community Cloud:** This type of infrastructure is for exclusively used by a community of consumers from different organizations that may have bilateral concerns, For example, they may have a similar compliance consideration, security, and privacy policies. Community cloud may be operated, managed and owned by one or more than one organization.

d. Service Models of cloud

There are three main Service Models of cloud that the CSP's provide to the user (Mell & Grance, 2011; Takabi, Joshi, & Ahn, 2010; Vaquero, Rodero-Merino, Caceres, & Lindner, 2008; Zissis & Lekkas, 2012), they are:

i. Infrastructure as a Service (IaaS)

IaaS provides customer or user provision to use any resource like storage, network, processing, and other fundamental resources virtually. This is also working as a "virtual data center" in which the user can use any resource from any place virtually by just connecting with the cloud. The consumer can also deploy any arbitrary software on the cloud which may include any software application or operating system.

ii. Platform as a service (PaaS)

PaaS delivers an environment to the consumer where the consumer can organize and deploy his own created business application on cloud. These applications may be built with any programming language, tools, and libraries supported by service providers. In PaaS, consumers don't control over the operating system and other core components of cloud but they can manage or use only its own application.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

iii. Software as a service (SaaS)
SaaS offers consumers access to software that already installed on the cloud by providers. SaaS will be the most useable server of the cloud as the usage of cloud increases with the passage of time. The consumers haven't need to install software on their own machine. They just need a browser with a good internet connection to use this service. The software uses the computation power of the server. Figure 2 categorizes security architecture with respect to Cloud Services.

Table 4. Summarize the previously explained services of cloud w.r.t to Application Software & OS

Services	Application software	Operating system
IaaS	Customer	Customer
PaaS	Customer	CSP
SaaS	CSP	CSP

Table 5. Summary of the previously explained models of cloud w.r.t to Security

Models	*Owned by*	*Managed by*	*Security level*
Private	Single organization	Single organization/CSP	Very high
Public	CSP	CSP	Low
Hybrid	Organization/CSP	Organization/CSP	Medium
Community	Several organizations	Several organizations/CSP	High

e. Security Issues in Cloud Computing

If we talk about cloud computing there are some concerns and challenges also exists. (Popović & Hocenski, 2010) discuss some major concerns related to cloud security. (i) If you are using the cloud computing model the physical security related to data and information will lose immediately because you are sharing your computational resources with other companies. You have no knowledge about where data is placed on cloud and resources are running. (ii) Storage services provided by one CSP may be mismatched or incompatible with other vendor or service provider. So in future, if you want to migrate or shift your data from one to the other. It might be possible you face issues like Microsoft cloud is irreconcilable/incompatible with cloud services by Google (Mont, Pearson, & Bramhall, 2003). (iii) Who controls the keys for Encryption/Decryption? If keys go in some wrong hands then there are chances to harm or misuse of your important data. (iv) Ensuring the integrity of data is also a big challenge. For example, if you want to move, transfer, store and retrieve your data which authorized channel or standard you will use? A common standard yet doesn't exist. (v) Almost all E-commerce applications use payments gateways. In case of Payment Card Industry Data Security Standard (PCI DSS), your records and logs related to data must be provided to security managers and regulators (Salmon, 2008), which is also the big concern for a customer using cloud services. (vi) Some countries strictly restrict on their citizen's data that it can be stored for a specific period of time and some countries restrict to

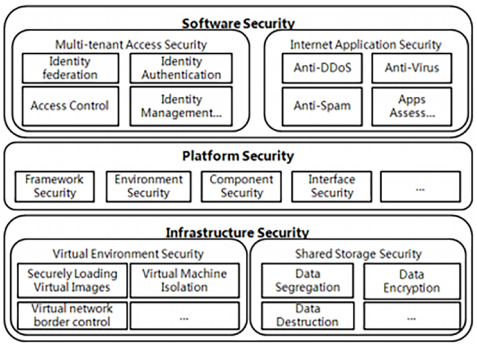
EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

place financial data of their citizens outside so E-Commerce using cloud must manage this issue. The fluid and dynamic nature of virtual machines make it problematic to maintain core issues like security and auditability of data.

User can hold key to encrypt or decrypt data but it is less secure on user side because there is a chance that he might take this as ordinary key and might forget the key or it may be stolen or misused by someone else without the owner's information. So it is not secure at all on the user end. The popular cloud services including Mega and SpiderOak are a few cloud service providers that allow the user to use specific client service applications that include encryption function during data/file uploading and decryption while data/file downloading. But this platform allows the user to keep the keys by themselves but as mentioned earlier, It is not secure at all to keep key on the user end. According to the survey ("Top 10 Security Concerns for Cloud-Based Services," 2015), the top concerns are Data Breaches, Insider Threats, Malware Injection, Abuse of Cloud Services, Insecure APIs, Shared vulnerabilities, Denial of Service Attacks, Hijacking of Accounts, Insufficient Due Diligence, and Data Loss.

Figure 1 is categorizing the security-related issues in the cloud depends upon the services that clouds are providing to its customer's i-e Software, Platform and Infrastructure as mentioned in detail earlier

Figure 1. Security Architecture of Cloud Computing w.r.t Services (Chen & Zhao, 2012)



MAIN FOCUS OF THE CHAPTER

E-Commerce Applications- Check

E-commerce is growing and popular web application that enables the partners, employees, and customers to achieve a variety of services and purposes. E-commerce Association defines "E-commerce covers any form of administrative transaction or business or information exchange that is executed by using any Information and Communication Technology (ICT)" (Saleh, 2012), There are different types of e-commerce applications such as business-to-consumer (B2C), consumer-to-business (C2B), business-to-business (B2B), and consumer-to-consumer (C2C) There are several organizations like government agencies or academic institutions that use E-commerce to improve services or reduce expenses. (King, Chung, Lee, & Turban, 1999)

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

E-Commerce Application and Cloud Computing

E-commerce applications can take benefits from the cloud in multiple ways. The most common benefits include Usage of Infrastructure, Platform, and Services. Cloud gives ease to E-commerce developers in multiple ways. For example low cost, Flexibility, Accessibility, No or minimal hardware requirement, no need to install specific software. In addition to these benefits cloud computing have some disadvantages also like Internet speed may affect overall performances of E-commerce application. If application developer takes long term subscription of cloud then subscription cost will be more than buying actual hardware by own. And the most costly disadvantage of the cloud is data security regarding applications and their Users. Cloud security issues related to E-commerce Application is discussed in detail later in this chapter

Figure 2. Compares the Benefits and Disadvantage of Using Cloud in E-Commerce Application (Kumar & Charu, 2015)

Advantages	**Disadvantages**
Shared Resources	Internet Required
Automatic Software Integration	Dependency and vendor lock-in
Cost Efficient	Non-Interoperability
Easy Access to Information	Less Reliability
Quick Deployment	Technical Issues
Almost Unlimited Storage	Security in the Cloud
Backup and Recovery	Prone to Attack
Better Hardware Management	Increased Vulnerability
Mobility	Less Control
Versatile Compatibility	No always many room

ISSUES, CONTROVERSIES, PROBLEMS

Security Issues in E-Commerce

With the increase in the usage of e-commerce applications, the concerns about users security also increase. CSPs are responsible for the security of client personal data but they always claim that their data must secure and safe on E-commerce applications. But still, cloud service worries about their personal data and information because their data is totally in the cloud service providers hands. Many customers are using the cloud services for the first time so they are not familiar with the cloud security concerns that is why they hesitate to use it because they don't want to lose the control on their private data. As the big organization is storing a large amount of their personal and business data on the cloud, this data

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

further processed and then transmitted. If any problem occurs during any of the processes then there are chances that whole data might be corrupted or harmed completely. Some security-related issues are discussed below

i. Issues during data storage

These days, mostly E-commerce sites are using cloud computing services for data storage and other important purposes. In cloud computing a data center stores a large amount of data. All the private information stored on the cloud side. E-commerce companies are also concerned about how the client's personal data stored on cloud data centers. In cloud computing, users store all the private data on a virtual data center which may be located anywhere in this world. E-commerce application data can be stored on any virtual data center. The application is mostly unaware of its location of data. They are not clear about where the data is to store and in which country their data is placed by CSP's. As millions of user are using a single application at the same time and store their personal data on applications. The main concerns here are (i) Data is encrypted or not? (ii) Is the data stored on a single data center (location) or in a different position? The similar storage concerns thus lead towards the data security issue which is one of the major issues in E-commerce applications using cloud services.

ii. Data transmission issue

In the cloud computing model, the business data is transmitted to the cloud side over the internet because the E-commerce companies are also concerned about the client data. So they want to be treated as confidential and should be encrypted before transmission so that itis not misused or captured by an unauthorized person. Keep it as strictly confidential. by using some security measures. But as data is transmitted on the internet so there are chances of corruption and miss utilization of data.

iii. Data Audit issue

If an organization manages its internal data, then in order to check the accuracy of the data, the organization needs to involve a third party that ensures the correctness of the data. You can take this as an example that if the data is transmitted from user A to user B some measures need to be checked whether the correct data is transmitted to another end. In the middle of the transmission the data is changed or not? Or due to any attack, the complete data reached on other end or not? Is it completely reached on other end or not? In a cloud computing environment, it is the CSP's responsibility to ensure the correctness of the data.

iv. Viruses and hackers attack issues:

As virtualization is used on large scale in a cloud environment, a hacker can take advantage from this technology by writing a virtual machine in form of malicious software that will be more difficult for the user to detect and remove viruses from their data. As they are unaware of hackers. So in this situation, e-commerce applications data will be harmed very badly. So more security techniques should be adopted to prevent such hackers and viruses. Hackers can take access to your data by using different means, so if your data is on some remote place i-e on Cloud it has more chances to effect with system

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

intrusion and social engineering attacks by hackers. They can misuse this data by taking control over the data blackmail the clients and e-commerce application owners. They can also destroy your data by taking monetary benefits from your competitor.

Table 6. Comparison of CSP's according to different parameters

Application Name	Price plan	Free storage	Max storage	Mobile Support Device	Security	SLA	API
DropBox	9.99$/ month	2GB	10GB	Android, IPad, iPhone, Blackberry	SSL, AES-256, Encryption	Yes	SDK for Major Platform
Google Drive	1.99$/ month	15GB	30TB	Android systems, iPhone, IPad	SSL	Yes	Java, Php, JS, .Net
OneDrive	25$/ year	7GB	100GB	Android,iPhone, Windows phone	SSL, No built-in, Encryption	Yes	REST API
ICloud	20$/ year	5GB	50GB	iPhone. IPad, iPod Touch	SSL	Yes	Yes

SOLUTIONS AND RECOMMENDATIONS

Solutions of Security in E-commerce Related to Cloud

As discussed earlier Security is our main concern when we talk about e-commerce. Different researchers have provided us with various solutions. Few of them are discussed here in this chapter.

(Zhang, Zhang, & Sun, 2010), worked on trust and try to solve the issues related to transaction security. A model was proposed which based on cloud model theory and the experiments in their work shows that this model is practical and valid for the merger of trust cloud. But this model was only applied to the customer to customer (C2C) E-commerce. (Pawar, Sajjad, Dimitrakos, & Chadwick, 2015) proposed a host and application-level framework that provide more security to the user's data by using resources in a cloud federated environment. It performs encryption on file level so it allows the user to monitor at the host or on the application level. (Rizvi, Ryoo, Kissell, Aiken, & Liu, 2018) proposed a framework to evaluate the security strength by necessary quantitative matrices. The core factors included in the matrix are interoperability, transparency, and portability. *(Hawedi, Talhi, & Boucheneb, 2018)* proposed a security service detection system by using intrusion for public cloud systems. In their work researchers used an algorithm that fills the gaps in an existing security system that provides more security to cloud service user which also help the CSPs to maintain security in an existing system. (Sharma, Dhote, & Potey, 2016) proposed an identity and access management system (IAMaaS). It was an on-demand portable available pay-per-use cost model. A similar Identity and Access Management architecture was also purposed by (Yang, Chen, Wang, & Cao, 2014) to achieve similar security requirements like Data Loss Prevention, Strong Authentication, and Security as a Service. The main benefit of their work was standardized architecture, comprehensive identity management, and scalable system design.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

In another work by (Samlinson & Usha, 2013) authors proposed user-centric trust identity service that was aimed to create trust among CSP's. The model proposed in their work had Authorization, Authentication, Provisioning and an Audit module along with Trust agent. When user move from one CSP to other their credentials follow in the federated environment. The trust agent in the Identity module sends trust token with the user's attribute which creates trust among CSP's. (Zissis & Lekkas, 2012) gave the concept of a unique security system that helps to eliminate the threats. They introduced a concept that the use of a trusted third party to ensure the use of Public Key Infrastructure (PKI). This solution provided security, integrity, authentication, and confidentiality of user data because of the use of public key infrastructure.

(Costa et al., 2005) Purposed a collaborative end to end approach for prevention and detection of the worms. Authors called this approach as Vigilante. Some specific software is needed to run on each host that captures information about the worm exploitation and spread or distribute a Self-Certifying Alert (SCA) to warn other hosts regarding the worm spreading. Then end host used that information in SCA to check that if the message or coming information vulnerable to worm then apply a host-based filter to protect from the worm. (Egele, Kruegel, Kirda, Yin, & Song, 2007) Proposed a spyware analysis tool that monitors the flow of important and sensitive data. The tool is proposed for the web browser and browser helps objects. This tool analyzed the suspicious behavior and then generate a report about data being sent and the location where this data was sent. (Elbadawi & Al-Shaer, 2009) Proposed to the use of Timm, that replay with log to achieve availability of few important services like FTP, HTTP, and SMTP. The traffic of every server is replayed and recorded to clone the virtual machines at some random time intervals. If some attack happened on any virtual machine it can be detected on time and then it automatically excludes the traffic under attack and high-performance reply to all virtual machines for fast recovery on their services.

Recently (Hawedi et al., 2018) purposed a security architecture that offered an elastic and efficient paradigm for security as a service for cloud tenants. The third parties could offer a purposed solution of security to their tenants or tenants could monitor their VM's. It was designed for the deployment on the top of the hybrid cloud. This also used anomaly detection and signature-based techniques. In past similar architecture also purposed by (Tupakula, Varadharajan, & Akku, 2011) that was deployed on IaaS against the cloud's attack. That monitored the traffic and ensured that neither traffic belongs to an intrusion or nor contain any malicious content.

(Juncai & Shao, 2011) suggested some basic tips related to safety and security which are, (a) the data that is stored in the cloud should be backed up frequently so in case of attack, theft or any other loss it can easily recover our data. (b) Your files on Cloud must be in Encrypted form and this encryption is also protected by a strong password. Encryption will protect your data if you want to move or shift from one cloud server r data center to another. (c) Hacker, data criminal or another person who wants to destroy your data on the cloud can enter into your network through Email. So the suggested method is to use a secure or encrypted email service for this author suggested using M Ute email or Hush mail for email related services. (d) Always use credible cloud services from a well-reputed organization and always read their privacy statement related to data security first before any kind of contract and agreement. (e) Always use Filters for data security. The author suggested taking services from companies like Web sense, vent, and VeriTest offers data monitoring and prevents sensitive data. Some other general tips were Enhance security-related awareness in clients and developers.

Chapter 86
Taxing E-Commerce:
Its Challenges and Future Prospects – A Comparative Analysis

Pankaj Dhaundiyal
Ethiopian Civil Service University, Ethiopia

ABSTRACT

With the advent of globalization, world governments have been under pressure to face the significant challenges of e-commerce. The vast growth of e-commerce, sale and purchase of commodities over the internet, has ruined the existing tax structure. With the smart phones and internet getting cheaper, the tax administration of every country is facing the difficulty of protecting their share of revenue in this dynamic e-market. The tussle between the developed and developing country is going to stretch as it would be an alarming signal for the reduction of the tax base for the developing economy. E-commerce challenges the current International taxation regime. In the present scenario, personal income tax is being taxed by the resident country while business income is being taxed by the source country.

INTRODUCTION

The rapid growth of e-commerce, especially the sale of goods and services over the internet, has fuelled a debate about the taxation regimes to be used. The shift from a physically oriented commercial environment to a knowledge- based electronic environment poses serious and substantial issues in relation to taxation and taxation regimes. Tax administrations throughout the world face the formidable task of protecting their revenue base without hindering either the development of new technologies or the involvement of the business community in the evolving and growing e-market place. Concerns of governments centre on the impact of e-commerce on the state and local revenue. Whereas states can impose a tax on residents' purchases from out-of-state vendors, they cannot impose an obligation on those vendors to collect the tax unless the vendor has a substantial presence, or nexus, in the state. These problems will be greater for developing countries. The shrinking of the tax base will have a disproportionate effect and further jeopardize the already fragile economy of the developing world.

E commerce offers potential benefits in the form of enhanced participation in international value chains, increased market share at the very lower cost. Changes in the ICT landscape have enlarged the scope for businesses in developing countries to engage in the E commerce. In September 2104 the initial public offering on the New York stock exchange of Alibaba group- a Chinese commerce enterprise was the world's largest ever raising $2.5 billion. Earlier in the same year African on line Jumia which is part of African Internet Group, announced that it was expanding into Cameroon, Ghana and Uganda, complementing its existing operations in Egypt, Kenya, and Cameroon. These actions of the Alibaba and Jumia are to understand the development of E commerce in developed as well as developing countries. Indeed, the fastest growth of e- commerce is now witnessed in Asia and Africa.

Definition of Ecommerce

As per the OECD the definition of the E- commerce, "The sale or purchase of goods or services, conducted over computer networks by methods specifically designed for the purpose of receiving or placing of orders. The goods or services are ordered by those methods, but the payment and the ultimate delivery of the goods or services do not have to be conducted online. An e-commerce transaction can be between enterprises, households, individuals, governments, and other public or private organizations. To be included are orders made over the web, extranet or electronic data charge. The type is defined by the method of placing the order. To be excluded are orders made by telephone calls, facsimile or manually typed e-mail."

Types of Ecommerce

- **B2B Commerce:** Accounts for the bulk of ecommerce . It involves transactions between businesses, such as between a manufacturer and a wholesaler, or between a wholesaler and a retailer.
- **B2C Commerce:** It involves sales by "pure play" e commerce enterprise to consumers and by traditional bricks and mortar retail or manufacturing firm that's add an online sales channel. Selling directly to the consumers via ICT networks can help micro and small businesses to reach new market both domestically and internationally.
- **C2C Commerce:** It covers online auctions platforms (such as ebay or Taobao) and sales within online communities. It platforms offer possibilities for informal enterprises to engage in ecommerce
- **B2G Commerce:** These transactions are similar to B2B, except that the buyer, in this case is a government entity such as in the case of public procurement.

The Global Trends

Measuring ecommerce is challenging there is no comprehensive data for the ecommerce value of domestic or international transactions. Available resources tells us that it has developed significantly in the last decade and still progressing in the developing countries especially in Asia. In the US, B2B, total revenue from the ecommerce sector amounted to $5.4 trillion. In Canada almost 64% sales were attributed to e commerce was from B2B in Korea 91% B2b sales of all ecommerce sales. In Russia 57% was from B2B.

More and more enterprise is exploiting the opportunities created by improved connectivity and great willingness by the consumers to buy online. According o some estimates there are more than 1 million

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

companies operating in Ecommerce. Largest Internet retailer companies around the world are Alibaba, Amazon, apple Otto and B2B Digital in various parts of the world

In India e-commerce market was worth about $3.9 billion in 2009, it went up to $12.6 billion in 2013. In 2013, the e-retail segment was worth US$2.3 billion. About 70% of India's e-commerce market is travel related. According to Google India, there were 35 million online shoppers in India in 2014 Q1 and is expected to cross 100 million mark by end of year 2016. CAGR vis-à-vis a global growth rate of 8–10%. Electronics and Apparel are the biggest categories in terms of sales. By 2020, India is expected to generate $100 billion online retail revenue out of which $35 billion will be through fashion e-commerce. Online apparel sales are set to grow four times in coming years. Key drivers in Indian e-commerce are:

- Large percentage of population subscribed to broadband Internet, burgeoning 3G internet users, and a recent introduction of 4G across the country.
- Explosive growth of Smartphone users, soon to be world's second largest smart phone per user base.
- Rising standards of living as result of fast decline in poverty rate.
- Availability of much wider product range (including long tail and Direct Imports) compared to what is available at brick and mortar retailers.
- Competitive prices compared to brick and mortar retail driven by disintermediation and reduced inventory and real estate costs.
- Increased usage of online classified sites, with more consumer buying and selling second-hand goods.
- Evolution of Million-Dollar startups like Jabong.com, Makemytrip, Flipkart etc.

India's retail market is estimated at $470 billion in 2011 and is expected to grow to $675 billion by 2016 and $850 billion by 2020, – estimated CAGR of 10%. According to Forrester, the e-commerce market in India saw the fastest growth within the Asia-Pacific Region at a CAGR of over 57% between 2012–13.

As per "India Goes Digital" a report by Avendus Capital, a leading Indian investment bank specializing in digital media and technology sector, the Indian e-commerce market is estimated at Rs 28,500 Crore ($6.3 billion) for the year 2011. Online travel constitutes a sizable portion (87%) of this market today. Online travel market in India is expected to grow at a rate of 22% over the next 4 years and reach Rs 54,800 crore ($12.2 billion) in size by 2015. Indian e-tailing industry is estimated at Rs 3,600 crore (US$800 million) in 2011 and estimated to grow to Rs 53,000 crore ($11.8 billion) in 2015. New sector in e-commerce is online medicine. Company like Reckwing-India, Buyonkart, Healthkart already selling complementary and alternative medicine whereas NetMed has started selling prescription medicine online after raising fund from GIC and Stead view capital citing there are no dedicated online pharmacy laws in India and it is permissible to sell prescription medicine online with a legitimate license. On line sales of luxury products like jewellery has also increased over the years. Most of the retail brands have also started entering into the market and they expect at least 20% sales through online in next 2–3 years.

Role of the Government in Developing Ecommerce

While it is generally agreed that the private sector should take the lead role in the development and use of e-commerce, the government plays an instrumental role in encouraging e-commerce growth through concrete practicable measures such as:

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. Creating a favorable policy environment for e-commerce; and
2. Becoming a leading-edge user of e-commerce and its applications in its operations, and a provider to citizens of e-government services, to encourage its mass use.

Ecommerce Policy

Among the public policy issues in electronic commerce that governments should take heed of are:

- "Bridging the digital divide" or promoting access to inexpensive and easy access to information networks;
- Legal recognition of e-commerce transactions;
- Consumer protection from fraud;
- Protection of consumers' right to privacy;
- Legal protection against cracking (or unauthorized access to computer systems); and
- Protection of intellectual property.

Measures to address these issues must be included in any country's policy and legal framework for e-commerce. It is important that government adopt policies, laws and incentives that focus on promoting trust and confidence among e-commerce participants and developing a national framework that is compatible with international norms on e-commerce (covering for instance, contract enforcement, consumer protection, liability assignment, privacy protection, intellectual property rights, cross-border trade, and improvement of delivery infrastructure, among others).

Government Can Use E-Commerce in the Following Ways

- **E-Procurement:** Government agencies should be able to trade electronically with all suppliers using open standards-through 'agency enablement' programs, 'supplier enablement' programs, and e-procurement information systems.
- **Customs Clearance:** With the computerization of customs processes and operations (i.e., electronic submission, processing and electronic payment; and automated systems for data entry to integrate customs tables, codes and pre-assessment), one can expect more predictable and more precise information on clearing time and delivery shipments, and increased legitimate revenues.
- **Tax Administration:** This includes a system for electronic processing and transmission of tax return information, online issuances of tax clearances, permits, and licenses, and an electronic process registration of businesses and new taxpayers, among others.

More often than not, the e-commerce initiatives of government are a barometer indicating whether or not the infrastructure supports e-commerce use by private firms. This means that if government is unable to engage in e-procurement, secure records online, or have customs fees remitted electronically, then the private sector will also have difficulties in e-commerce uptake. Virtually, the benefits from e-commerce accrue to the government, as the experiences of some countries reflect.

OECD E-COMMERCE

The OECD is a Paris-based international organization that serves as an outlet for reform efforts in a number of policy areas, including international taxation, for its thirty member countries. The Committee on Fiscal Affairs is the main OECD body that drives international tax reform efforts, including revisions to the OECD model tax treaty. In 1997, the OECD members first discussed cross-border e-commerce tax challenges at a meeting held in Turku, Finland and issued a brief report setting out an agenda to confront these challenges. In October 1998, an OECD ministerial meeting on global e-commerce was held in Ottawa, Canada, where the members reached agreement on two important documents relating to the taxation of international e-commerce. First, the Committee on Fiscal Affairs endorsed a set of principles that would guide the OECD in its reform efforts with respect to the taxation of international e-commerce.

Importantly, the so-called Ottawa Taxation Framework noted that traditional international tax principles should be applied to the new commercial environment promoted by the Internet and the increased sale of digital goods and services. As per the Report by the Committee on Fiscal Affairs, the approach does not preclude new administrative or legislative measures, or changes to existing measures, relating to electronic commerce, provided that those measures are intended to assist in the application of the existing taxation principles any adaptation of existing international taxation principles should be structured to maintain the fiscal sovereignty of countries, to achieve a fair sharing of the tax base and to avoid double taxation and unintentional non taxation.

Other guiding principles include the need for: maintaining neutral tax treatment between e-commerce and traditional commerce, low compliance costs for taxpayers and low administrative costs for tax authorities, clear and simple tax rules to promote business certainty, reducing the risk of tax evasion and tax avoidance, and flexibility to keep pace with technological and commercial developments.

Second, the OECD members and industry representatives signed onto a lesser-known document that similarly advocated the use of traditional international tax principles in the formulation of any new rules for the taxation of e-commerce. These two documents were an important step toward developing consensus on international tax principles and could prove to be useful beyond e-commerce purposes as the principles could be reformulated for guidance with respect to future international tax challenges.

After this meeting, Technical Advisory Groups (TAGs) comprised of government and industry representatives were formed by the OECD to promote discussion and analysis. In addition, the Committee on Fiscal Affairs directed its Working Parties to discuss and propose solutions with respect to discrete areas of policy concern (e.g., Working Party No. 1 reviewed whether the permanent establishment category within the OECD model tax treaty needed to be amended to take into consideration e- commerce developments). These forums provided the OECD members (and non-member countries in certain cases) with an opportunity to voice their concerns and to reach consensus on the types of reform that would be acceptable to move the reform process forward.

MODEL TREATY CHANGES

The most important OECD reform efforts have or will become entrenched in the OECD model tax treaty or its Commentary, which is used to assist with interpreting the treaty provisions. The model treaty and/or the Commentary are important because they are often recognized by courts as secondary sources of authority to assist with treaty interpretation. In addition, many countries—both OECD and non-OECD

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

member states— base their own bilateral tax treaties on the OECD model tax treaty (the United States employs its own model tax treaty, but this treaty largely tracks the provisions within the OECD model). OECD member states are presented with an opportunity to deliberate these treaty changes, reach consensus and, if needed, insert observations or reservations within the Commentary to the OECD model tax treaty when an individual country does not agree with proposed changes. The importance of the model tax treaty is underscored by a recent review of the way that governments and their courts interpret the model tax treaty's permanent establishment concept for domestic tax purposes: 33 of the 37 countries scrutinized generally followed the OECD model tax treaty in this area.

Permanent Establishments

Due to the advent of the Internet, cross-border commercial transactions can be enabled by computer servers (i.e., a computer that has been networked to the Internet) instead of traditional business intermediaries such as retail stores. For example, a consumer can now download digital music from a commercial web site whereas these consumers would normally have purchased this music in the form of a CD at a retail outlet prior to the rise of the Internet and digital goods. This development led to the view that the tax treaty definition of permanent establishment, which is typically defined as a "fixed place of business through which business is conducted," should be extended to these computer servers (hereinafter "servers")(Crockfield, 2006).

As a result, the Commentary now indicates that a server will constitute a permanent establishment (a "server/PE") if: (1) the server performs integral aspects of a cross-border transactions; (2) the server is owned or leased by the non-resident firm; and (3) the server is fixed in a location for a sufficient period of time. The Commentary offers an example of a server/PE that performs functions including "the conclusion of the contract with the customer, the processing of the payment and the delivery of the product," but notes that many countries would assert that a server/PE has been created even if only some of the functions described are performed via the server. The new rules indicate that it is not necessary to have any human involvement with the server, which can be accessed and maintained from a remote location, to create a server/PE. In contrast, the view that a web site, in and of itself, could constitute a permanent establishment has been rejected. Finally, the Commentary indicates that non-residents that use foreign-based servers maintained by Internet Service Providers (ISPs) will generally not constitute permanent establishments as the non-residents would not typically exert control over the ISPs.

As subsequently discussed in Part II.A., the responses by national tax authorities to the server/PE issue form a continuum of approaches: some tax authorities maintain that servers should never constitute permanent establishments, others agree with the OECD position, and finally certain countries take the view that web sites in and of themselves can constitute permanent establishments.

Income Characterization

Tax rules under domestic laws as well as treaties impose different tax treatment on different types of cross-border income. For example, business profits are generally sourced to the country where the income-producing business is based and taxed on a net basis. Royalty income, on the other hand, is generally sourced to the country where the intellectual property was used (e.g., the country where the consumer of the intellectual property is resident) and may be subject to gross withholding taxes.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The digital world raises a number of problems with respect to income characterization issues. Cross-border transactions involving the transmission of digital goods or services often make it difficult to determine whether a transfer of a product has occurred, whether services have been performed, or whether an intangible product has been licensed. The problem is that transactions involving digital goods and services often blur the lines among different categories of income.

As a result of these difficulties, the OECD promoted reform efforts to guide national tax authorities with respect to the tax treaty characterization of income produced by the sale of e-commerce goods and services. For e-commerce transactions involving software, the OECD amended its Commentary to the OECD model tax treaty to distinguish between the underlying copyright in the program and software which incorporates a copy of the copyrighted program. The Commentary now makes it clear that e-commerce transfers of all digital products should attract the same treatment as software payments, and that the technological method of transfer (whether a purchase of a program on a disk or an e-commerce online transfer) is not relevant.

A report sponsored by the OECD looked to twenty-eight categories involving potential e-commerce transactions to assist tax authorities and taxpayers in determining the appropriate income characterization for international e-commerce transactions. The findings of the report were subsequently adopted into the Commentary of the OECD model tax treaty. Generally speaking, the cross-border transmission of digital goods and services will result in the generation of business profits because "the payment is essentially for the acquisition of data transmitted in the form of a digital signal and therefore does not constitute royalties"(Cockfield, 2006) Royalties, however, may result when digital goods are downloaded to commercially exploit the copyright relating to the digital goods. The new rules strive to treat substantively similar economic activity the same way. For example, the cross-border shipment of a music CD to a foreign consumer or the Internet transmission of an MP3 file (a compressed digital music file) to another foreign consumer will both be taxed as business profits and not as royalty income under the new OECD rules.

Place of Effective Management

The United Sates and many other countries enact tax the world-wide income of their residents (so-called residence-based taxation). In the context of taxing e-commerce earnings, a residence-based system raises a number of concerns. Under the 'place-of-incorporation' test, a corporation is considered a resident in the country where it has been incorporated while corporations incorporated outside of the country are considered to be non-residents. Moreover, the place-of-incorporation test does not require a business to maintain an economic presence within the country: the simple act of filing articles of incorporation will suffice to fulfill the residency requirement. As such, residency can change by simply changing the country of incorporation. In recent years, there has reportedly been a rise in the number of Internet businesses that have chosen to incorporate their companies in tax haven jurisdictions. Incorporating an online company in a tax heaven may be motivated by tax reasons, but may also be influenced by permissive laws with respect to commercial activities such as gambling or pornography.

Countries also employ a 'place of central management and control' test to determine whether or not a company is a resident This test generally involves looking to where a company's head office is located or where the board of directors meets on a regular basis. Traditionally, directors had to hold face-to-face meetings to make business decisions. Internet technologies that promote video conferencing and email exchanges may pose a challenge to the place of central management and control test. The need for a

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

physical head office may be eliminated as senior managers and directors can attend meetings without leaving their desks. These managers and directors could maintain residences in different jurisdictions (including tax havens), making it harder for high tax countries to assert that corporations are residents of their jurisdictions.

An OECD Technical Advisory Group has proposed changes to the treatment of corporate residence issues within the OECD model tax treaty, in part as a way to alleviate the concerns noted above. The proposal involves the inclusion of a hierarchical tie-breaker rule similar to the one used for individuals. Proposed Article 4(3)(b) of the OECD model tax treaty reads: "if the State in which its place of effective management is situated cannot be determined or if its place of effective management is in neither State, it shall be deemed to be a resident only of the State [Option A: with which its economic relations are closer] [Option B: in which its business activities are primarily carried on] [Option C: in which its senior executive decisions are primarily taken]."(Cockfield, 2014)

The OECD TAG indicates that, under Option A, the corporation would be resident in the state in which it is making greater use of economic resources as well as legal, financial, physical and social infrastructures.

This could involve an analysis of factors including the location of most of the firm's employees and assets, revenues, senior management functions, headquarters, etc. Under Option B, residency would be determined by a functional analysis of the activities performed in the two countries. Finally, under Option C, a corporation would be a resident of the country in which the clear majority of senior executive decisions are taken and where the corporate headquarters are located. By emphasizing the need for substantive economic activities prior to a determination of residency, the new tests may make it harder to manipulate corporate residency in the context of e-commerce operations.

Services and Permanent Establishments

As part of its review of e-commerce tax reform issues, the OECD Business Profits TAG has proposed in a draft discussion that rules governing the taxation of cross-border service income be altered within the OECD model tax treaty. Under the proposed changes, source countries would be able to tax income from services if a non-resident firm or its representatives is present in the source country for a period of time. The proposal would replace the current permanent establishment requirement with a physical presence test that is similar to the one in the United Nations model tax treaty The rationale for the proposal is, in part, that service providers are very mobile and can generate significant income in foreign countries without the need to set up a physical facility or use a fixed base of operations.

The Information Technology Association of America has argued that the proposed changes would increase compliance costs for technology firms along with greater business uncertainty surrounding whether a foreign government can impose its income taxes on service providers. Under this view, e-commerce companies may be exposed to tax liability in multiple jurisdictions even though these companies normally remotely provide services only through the Internet along with occasional maintenance or service visits to the foreign countries where they conduct business. The proposal, however, would appear to be consistent with recent changes to the OECD model tax treaty commentary on permanent establishments that indicate a permanent establishment will be created if, in the course of providing consulting or other services to a client, the foreign taxpayer or its employees use the client's premises for a long extended period of time.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

OECD VAT REFORM EFFORTS

As mentioned, the OECD traditionally promotes reform efforts in the international income arena primarily via its model tax treaty and the Commentary to this treaty. All OECD members (other than the United States) employ federal consumption taxes alternatively referred to as Value- Added Taxes or Goods and Services Taxes (collectively referred to as VATs). Yet there are generally no model treaties or bilateral international agreements that cover VATs. As a result, there is no apparent mandate for the OECD to promote reform efforts for VATs and, prior to the rise of e- commerce, the organization had never pursued any meaningful reform efforts in this area.

In 1998, however, the OECD members agreed through the Ottawa Taxation Framework to consider VAT reform efforts in the context of global e-commerce. Importantly, the Ottawa Taxation Framework resolved an ongoing debate among OECD member states surrounding the appropriate tax jurisdiction for cross-border VAT purposes: the OECD countries agreed that for business-to-consumer (B2B) supplies the place of consumption should be the jurisdiction in which the recipient has his or her usual residence and for business-to-business (B2B) supplies tax should apply in the jurisdiction in which the recipient has located its business presence. This development helped to legitimize the European Union efforts, discussed subsequently, to impose collection and remittance obligations on non-European Union consumers who have engaged in B2C transactions with European businesses.

After 1998, the OECD developed guidelines for tax collection mechanisms for cross-border VAT purchases and began to publish a 'Consumption Tax Guidance Series' to promote consensus on the application of VATs with respect to international transactions. More specifically, an effort has been undertaken to promote consensus on reform efforts to: verify the jurisdiction and status of customers; contemplate registration thresholds whereby companies with below-threshold sales would not need to register for VAT purposes; deploy technology-based collection mechanisms; develop international administrative cooperation; and review simplification options and initiatives. Importantly, the views of business representatives and non-OECD governments were taken into consideration with respect to potential cross-border VAT reform efforts.

Problems and Solutions by Many Countries

This part of the chapter produces the responses by individual countries to challenges presented by international e-commerce. This portion discusses reform efforts in seventeen different countries where, for the most part, the responses have been tepid, often confined to agreeing or disagreeing with positions taken by the OECD. More specifically, it has been uncovered: seventeen administrative pronouncements by national tax authorities; five cases; and two tax laws (including a European Union directive on value-added taxes) passed to address international e-commerce matters. The part of the chapter concludes by discussing possible explanations for the lack of reaction at the national level, apart from OECD influence, including the absence of evidence of source country income tax base erosion resulting from international e- commerce transactions.

India

India is likely the most active non-OECD member with respect to developing positions on the taxation of international e-commerce. In 2001, a report prepared by the Indian Revenue Department's Foreign

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Tax Division advised the abandonment of the traditional permanent establishment concept in light of e-commerce developments:

The Committee is of the view that applying the existing principles and rules to e-commerce does not ensure certainty of tax burden and maintenance of the existing equilibrium in sharing of tax revenues between countries of residence and source. The Committee is also firmly of the view that there is no possible liberal interpretation of the existing rules, which can take care of these issues, as suggested by some countries. The Committee, therefore, supports the view that the concept of PE [permanent establishment] should be abandoned and a serious attempt should be made within OECD or the UN to find an alternative to the concept of PE.

In addition, the report disagreed with the OECD's view on withholding taxes, in particular the tax authorities maintained that software downloads should generally fall within definition of royalties found within Indian tax treaties and should be subject to withholding. The report noted that the Indian tax rules that classify cross-border income coincided with only 15 of the 28 categories set out within the OECD's income characterization paper.

In 2002, the Indian government announced in its annual budget that it would not immediately implement the Foreign Tax Division's recommendations due to the ongoing international discussions of e-commerce taxation issues.

In one case, Indian tax authorities assessed taxes on the profits attributable to an Indian-based server owned by VISA (a U.S.-based multinational firm). VISA requested a resolution by U.S. and Indian tax authorities under the competent authorities' provision of the U.S.-India tax treaty. The settlement remains confidential although it has been reported that the U.S. and Indian competent authorities agreed the server will constitute a permanent establishment (the amount of profits attributable to this server remains unclear).

There are additional reports that India assessed withholding taxes on foreign e-commerce firms. However, India's Income Tax Appellate Tribunal (ITAT) reportedly declined to assess withholding taxes on payments for periodic subscription fees paid by an Indian company to a U.S. company for electronic access to published materials. The materials were maintained on a database within a server located outside of India and the payments were held to be payments for business profits rather than royalties and thus not liable to tax in India in the absence of a permanent establishment. The ITAT found that the payment to the non-resident company was for the use of copyrighted material and not for the transfer of the copyright itself. Moreover, the ITAT indicated that payment for access to an electronic database cannot be said to be consideration "for use of information concerning industrial, commercial or scientific experience" (tax.network)so as to fall under the definition of royalty under article 12(3)(a) of the India- U.S. tax treaty. The ITAT's ruling appears to be consistent with the OECD's views, noted previously, on the characterization of royalty and business income with respect to cross-border e-commerce subscription payments.

In 2004, Indian tax authorities issued a Circular that sets out how foreign businesses (Business Process Outsourcing Units or BPOs) are to be taxed when they outsource aspects of their operations to individuals and businesses residing within India. When foreign companies outsource activities to Indian-based technology centers (which constitute a permanent establishment) and these activities enable the foreign firms to carry on core business activities abroad, the Circular maintained that India should be entitled to tax profits attributable to sales generated abroad (provided that the Indian permanent establishment has been charged an arm's length fee by its foreign parent). According to the Circular, "a considerable

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

portion" of the profits derived by non-residents from international sales would be taxable by India. (Rashmin Sanghvi & Associates)

This Circular led to a controversy where it was alleged that India was being overly aggressive with respect to the taxation of non-resident firms. As a result, the Circular was withdrawn and replaced with another Circular. The new Circular simply restates the provisions of profit attribution and transfer pricing found within Indian tax treaties. Indian tax authorities appear to be suggesting that traditional tax rules will determine the appropriate tax treatment: "In determining the profits attributable to an IT enabled BPO unit constituting a Permanent Establishment, it will be necessary to determine the price of the services rendered by the Permanent Establishment to the Head Office … on the basis of "arm's length principle."" The arm's length price in turn is determined by reference to Indian domestic tax law. The key area of contention appears to be the appropriate quantum of profit attribution to Indian-based BPOs.

Canada

In 2002, Canadian tax authorities issued an Interpretation Bulletin to assist with the enforcement of its VAT (called the Goods and Services Tax) on international e-commerce transactions. The Canadian changes generally maintain the *status quo* with respect to collection obligations for non-resident firms and rejected the more aggressive views set out in the European Union e-commerce VAT directive. For example, the Canadian approach advocates a multi-factoral test (e.g., the place of contracting and the place where assets are located should be taken into consideration) to determine whether the non-resident business should register for GST purposes while the EU approach mandates collection obligations for all non-EU firms with online sales to consumers residing within the European Union (see below).

In 1998, Revenue Canada (as it was then) refused to take a position when a U.S. company asked about the tax implications of storing proprietary information on a Canadian-based server. At this writing, the Canada Revenue Agency has prepared draft Interpretation Bulletins that discuss the OECD positions on server/PEs and income characterization.

Under domestic Canadian law, a withholding tax of 15% applies on payments for services performed by a non-resident in Canada. When these services are provided by a computer software hotline service, the Canadian tax authorities have taken the position that withholding is not required because the service provider was physically located outside of Canada. This position could be analogized with the provision of other cross-border electronic communications.

Austria

With respect to the server/permanent establishment issue, the Austrian tax authorities will follow the OECD model tax treaty Commentary. In 2000, the Austrian Constitutional Court held that a special withholding tax on e-commerce transactions may be constitutionally acceptable as long as the tax, among other things, is restricted to electronically performed activities and it is applied only to firms and not individual consumers

Germany

Germany's tax authorities have issued regulations on the taxation of permanent establishments, but have not provided guidance with respect to the computer server issue. A directive issued by the Karlsruhe

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Regional Tax Office in 1998 indicates that servers can be considered to be fixed places of business but should generally not constitute permanent establishments because they normally perform activities of a preparatory or auxiliary character.

The first German tax court to address the issue of server/PE status held that a server based in Switzerland and owned by a German corporation would constitute a permanent establishment in Switzerland under the Germany-Switzerland tax treaty. The German company transferred information content to the Swiss-based server, where it was accessed by Swiss customers who paid a fee via their televisions. The sums paid were collected by Swiss Telecom and forwarded to the German company, less a collection fee. The German company did not maintain any individuals in Switzerland to service or program the server. The German company deducted a fee for its services then forwarded the remaining amounts to a corporate affiliate that produced the content.

The German court held that Switzerland was entitled to tax profits attributable to the Swiss-based server although the quantum of these profits was not discussed. While an English translation of this case does not appear to be available, one report notes that the court would permit the Swiss tax authorities "to attribute a substantial amount of income" to the server (Cockfield, 2006). The court based its decision in part on earlier precedents that held that underground oil pipelines could constitute permanent establishments even without the presence of personnel. Moreover, the court cited the OECD changes to the commentary of the OECD model tax treaty (then in draft form) as support for its position that the court should scrutinize on a "case-by-case" basis whether the server is performing auxiliary or preparatory activities. At this writing, the decision was under appeal to the Federal Tax Court.

France

French tax authorities have gone on record with respect to the server/PE issue and have developed a slightly different version of server/PEs when compared to the approach adopted into the Commentary to the OECD model tax treaty. In 2001, the then-Finance Minister confirmed that as general rule servers alone will not constitute a permanent establishment without human activity associated with the server's operation. However, in narrow circumstances where the business transaction within France involves the "complete and autonomous cycle of business transactions" then a permanent establishment may be formed (Cockfield, 2006).

According to an observer, the difference between the French and OECD positions is that the OECD approach emphasizes that as a general rule a server alone *can* constitute a permanent establishment unless its functions are purely preparatory or auxiliary while the French position envisions a more restrictive test where the server needs to perform virtually all aspects of a business transaction before a permanent establishment is constituted.

Hong Kong (China)

In 2001, the Hong Kong tax authorities issued a Departmental Interpretation and Practice Note (DIPN) that indicates that Hong Kong tax authorities will apply neutral tax rules to e-commerce so that no particular business will have a tax advantage over another. A DIPN is not binding authority and can be overturned by a court or administrative board of review.

The DIPN rejects the OECD's view that servers alone can constitute permanent establishments in certain circumstances: "The Department will generally accept that the mere presence of a server does not

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

constitute a PE)(UN, 2011)"This view is based on the fact that the definition of permanent establishment within Hong Kong's domestic tax law implies the need for a physical place as well as personnel. With respect to determining profits attributable to a server based in Hong Kong (along with personnel), the "proper approach is to focus more on what and where the underlying physical operations were carried out by the taxpayer to earn the profits in question than on what had been done electronically (Alice,2001)"This view departs to a certain extent from the OECD view that would scrutinize the functions performed by the server to determine profits attributable to the computer equipment.

With respect to cross-border income characterization issues, Hong Kong's views comport with the recent changes to the Commentary to the OECD model tax treaty in that they emphasize scrutinizing the substance of the electronic transfer to see if payment should be subject to withholding taxes: "If the payment is in truth a payment for a product or service, it will not be subject to withholding. On the other hand, if it is a payment for the use of, or the right to use, copyrighted material, it is deemed to be subject to withholding as a royalty payment."(Cockfield 2006) Under this view, e-commerce transactions such as cross-border sales to consumers of shrink-wrapped software will generate business and not royalty income, which would be subject to withholding.

Greece

Greece, like Portugal and Spain, has inserted an observation into the OECD model tax treaty Commentary that it may not follow the OECD's recent Commentary changes to create a server/PE category.

Ireland

The Irish tax authorities have indicated that the mere presence of a server will not constitute a permanent establishment.

Mexico

Mexico is an OECD member and supported the recent changes to the OECD model tax treaty. In addition, Mexican income tax regulations specify that this model tax treaty should be used in interpreting Mexico's income tax treaty obligations; hence the model treaty changes surrounding, *inter alia*, the characterization of cross-border income and the server/PE rule have been expressly adopted into Mexican tax law.

At times, however, Mexico bases its negotiation position on the United Nations model tax treaty. For these reasons, the U.S.-Mexico tax treaty contains a so-called restricted force of attraction provision that permits the source country to tax activities that do not emanate from the permanent establishment in some circumstances, which actually serves to inhibit revenue losses in the context of remote e-commerce sales. Under the restricted force of attraction rule, the source country is permitted to tax the business profits derived from the sale by a non-resident firm of goods or merchandise of the same or similar kind as those normally sold through the permanent establishment. This clause is typically requested by developing countries to prevent avoidance of tax through the use of a home office in the foreign country to conduct business normally done at the permanent establishment. The clause, however, will not apply if the foreign enterprise demonstrates that the sales were not made from the home office to avoid the tax on profits attributable to a permanent establishment.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

As a result of this tax treaty rule, sales from a U.S.-based online company can be taxed by Mexico as long as similar sales are sold via an affiliate that maintains a traditional permanent establishment located somewhere in Mexico. For example, assume that Books Inc. is a large U.S.-based book retailer. Books Inc. owns retail outlets within Mexico (that constitute permanent establishments) and also maintains and operates exclusively from the United States a commercial web site that sells books. If a Mexican consumer orders online from Books Inc.'s web site then Mexico is entitled to tax the profits attributable to this sale because the company already maintains a permanent establishment within Mexico that sells the same or similar merchandise (unless Books Inc. demonstrates that its online sales do not have a tax avoidance purpose).

Netherland Antilles

The Netherland Antilles government passed a National Ordinance of Electronic Agreements along with special tax legislation for international Internet companies that base operations within the country. Under the tax legislation, effective March 2001, Internet companies based in part in the Netherland Antilles will fall under a special tax regime with a corporate income tax rate of 2%.

New Zealand

New Zealand has provided non-binding guidance to taxpayers with respect to Internet taxation issues, including cross-border income and GST matters. The government, however, does not appear to have passed any special e-commerce tax legislation although an informal administrative pronouncement offers examples of the potential income tax and goods and services tax (GST) implications of cross-border e-commerce transactions conducted by Australians in New Zealand. The pronouncement additionally notes that: Where relevant, current tax laws and interpretations will be applied to e-commerce transactions.

Portugal

Portugal has inserted an observation in the OECD model tax treaty Commentary that it may not follow the OECD's recent changes to create a server/PE category.

Spain

Spain's tax authorities maintain that, regardless of an actual physical presence, a permanent establishment exists wherever a company regularly conducts e-commerce transactions. These transactions are deemed to take place where the purchaser of the goods and services is resident. As a result, the Spanish government inserted a reservation in the recent server/PE changes to the Commentary to article 5 of the OECD model tax treaty, like Portugal, by asserting that the country may not follow the changes "until the OECD has come to a final conclusion." Moreover, the Spanish tax authorities take a broader view of the types of e-commerce transactions that could be subject to withholding, maintaining that downloads of shrink- wrapped software could attract withholding.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Switzerland

The Swiss tax authorities (federal tax administrators or FTA) have reportedly passed VAT guidelines on the taxation of telecom transactions, including comments on the tax treatment of electronic commerce.

Singapore

Under Singapore's tax laws, software payments are classified as royalties, potentially subject to withholding taxes. In 2001, the tax authorities provided a ministerial order that maintains that payments for shrink-wrap software and certain other electronic transfers by non-resident consumers would be exempt from withholding taxes."Shrink-wrap" software, site licences, downloadable software, or software bundled with computer hardware will generally be exempt from withholding taxes.

Of interest, the exemption for payments for shrink-wrap software will only apply if the end user is only granted limited rights of use (e.g., no right to make copies for commercial purposes), which is the approach adopted by the income characterization changes to the Commentary to the OECD model tax treaty But payments for site licenses, downloadable software or software bundled with computer hardware are not subject to similar limitations and will not attract withholding, which is contrary to the approach adopted by the OECD The ministerial order would seem to impose non-neutral tax treatment between, for example, software sold in compact discs for commercial purposes (e.g., for copying and resale) which will be subject to withholding and the same software sold online to Singaporean resident for downloading which will not be subject to withholding.

In addition, Singaporean tax authorities have published a guide on the income tax treatment of e-commerce. The guide discusses the income tax treatment of cross-border tangible and intangible goods. The guide also confirms that a server alone will not constitute a permanent establishment under Singapore's domestic tax law.

United Kingdom

In 2000, the United Kingdom's Inland Revenue issued a press release indicated that servers will never, in and of themselves, be considered to be a permanent establishment of a foreign company. Inland Revenue maintained this position even after taking into consideration the development of a new server/PE category within the Commentary to the OECD model tax treaty.

In 2000, Inland Revenue issued a technical note that proposed to use the OECD definition of royalties. The note also discussed proposals to create new rules for bundled payments where payment is provided for partly for intellectual property and partly for other items, which has implications for cross-border e-commerce transfers.

Finally, the Inland Revenue has ongoing consultation processes through the Electronic Commerce Consultation Forum (ECCF), which is comprised of members drawn from the tax authorities and industry participants. The ECCF is additionally broken into sub-groups that focus on specific e-commerce issues such as VAT, cross-border business profits, characterization, and tax administration and compliance.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

United States

While Internet developments have led to a number of policy developments in the area of U.S. state and local sales and use taxes (briefly discussed in Part II.C.), very little action has taken place at the federal level with respect to international e-commerce developments. After the 1996

Treasury discussion paper on international taxation of e-commerce, the U.S. government entered into joint electronic commerce agreements with a number of other countries (including Australia, Chile, Columbia, the Netherlands, Ireland, Japan, Jordan and the United Kingdom) that included a tax provision which, like the one in the European Union-United States agreement, maintains "taxes on electronic commerce should be clear, consistent, neutral and non discriminatory."

As discussed above under the heading 'India', the U.S. tax authorities have entered into an undisclosed settlement agreement with Indian tax authorities whereby both parties accept that a U.S. taxpayer's server within India constitutes a permanent establishment. The interpretation appears to be consistent with the OECD's new server/PE rule.

United States has pursued reform efforts that deal with the tax treatment of software and intangible assets, which may ultimately assist with the determination of the appropriate tax treatment for cross-border e-commerce transactions.

European Union

Effective July 2003, the European Union's directive on electronic communications (the "E-commerce VAT Directive") requires all non-EU companies selling digital goods and services online to consumers within the EU to register with an EU tax authority and charge, collect and remit VAT. Non-resident businesses can register under an interim "special scheme" arrangement with one EU member state, which will operate a form of clearinghouse to ensure that each EU member state receives its appropriate amount of VAT due to it. After remittance, the member state will redistribute the VAT to the appropriate EU countries in which the digital goods and services were sold.

The E-commerce VAT Directive is designed in part to address problems associated with online business-to-consumer (B2C) sales, which are thought to present the greatest challenge to VAT schemes as consumer rarely comply with self-assessment obligations. There is less fear that business-to-business (B2B) sales over the Internet will create compliance problems because vendors engaged in these transactions have an incentive to assess, charge and collect VAT in order to receive input tax credits to offset the VAT payments. The main impetus for the E-commerce VAT Directive appears to be the EU business lobby, which was concerned that, in absence of a rule that strived to force foreign suppliers to assess VAT, an uneven competitive playing field would persist because intra-EU supplies of goods and services would attract VAT (and corresponding higher prices) while supplies from non-EU countries could be sold to EU consumers on a VAT-free basis.

The new e-commerce VAT Directive has created concerns that it will impose costly collection obligations on non-EU firms.An OECD TAG notes that different approaches to VATs and e-commerce may inhibit commercial activities and increase the risk of international double taxation. As previously discussed, in order to counter perceived problems with respect to emerging cross-border VAT and GST issues, the OECD's Committee on Fiscal Affairs has promoted a non-binding "Consumption Tax Guidance Series" for e-commerce and other issues.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Moreover, as mentioned, there are generally no general international treaties that govern cross-border consumption tax issues (unlike tax treaties, which are mainly directed at income taxes). In absence of such a treaty, it is unclear how the European Union plans to enforce its directive. Certain non- EU firms with online sales such as Amazon.com have voluntarily agreed to comply with the E-commerce VAT Directive while others such as AOL/Time Warner have announced that they will set up operations in European Union countries to assist with compliance.

An additional VAT issue surrounds compliance obligations and cross-border e-commerce sales. Under general VAT laws, countries may impose collection obligations on foreign companies if these companies maintain "permanent establishments" within their jurisdictions. Like the income tax treaty concept of permanent establishment, this is a defined term in VAT statutes and usually has a similar meaning where fixed places of businesses can constitute permanent establishments. The European Court of Justice has held that machinery alone cannot constitute a permanent establishment for VAT purposes so that the presence of a server alone within an EU country will not likely constitute a permanent establishment. This position can be contrasted with other consumption tax laws such as the Canadian one where the presence of a server can constitute a permanent establishment for Goods and Services Tax purposes (and hence trigger foreign company collection and remittance obligations) even without the presence of a human being.

The various national responses to e-commerce tax challenges reveals that governments have chosen to approach these challenges with caution. A number of reasons could explain the lack of legislative and administrative action thus far.

First, governments may now be less concerned that e-commerce developments threaten their tax bases. Revenue losses associated with international e-commerce transactions are difficult to estimate as there are currently no empirical studies that attempt to measure these losses. In addition, there are few studies that demonstrate that e-commerce developments provide planning opportunities that would lead to base erosion in relatively high tax jurisdictions like the United States. One empirical study, however, does show that e-commerce developments may be facilitating international tax planning for U.S. multinationals although, again, revenue losses associated with this planning remain uncertain.

Tax authorities have noted the rise of certain 'grey market' business activity such as gambling and pornographic web sites located in offshore tax havens that may be leading to revenue losses, but they do not have firm estimates of these losses. An OECD report issued in 2003 notes, "Contrary to early predictions, there does not seem to be actual evidence that the communications efficiencies of the internet have caused any significant decrease to the tax revenues of capital importing countries."

The lack of empirical evidence concerning revenue losses at the international level can be contrasted with the situation in the U.S. sub national context where several studies have shown that U.S. state and local governments are suffering revenue losses in the billions of dollars as a result of increased remote consumer sales attributable to mail order and Internet transactions involving tangible goods. Moreover, there is at least anecdotal evidence that aggressive tax planning such as entity isolation strategies has contributed to these revenue losses. This evidence has in part encouraged U.S. state tax authorities to form the Streamlined Sales Tax Project whereby state governments are contemplating the radical tax base harmonization of their sales and use tax systems to encourage voluntary compliance by firms with out-of-state sales. Without similar evidence at the international level, tax authorities and legislative bodies may be understandably reluctant to focus their attention on an area that may not be contributing to significant revenue losses.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Second, the area where e-commerce presents the greatest tax challenges—cross-border business-to-consumer (B2C) sales—likely does not present significant problems at the present time. Cross-border business- to-business (B2B) e-commerce sales continue to dominate overall e- commerce and businesses, unlike consumers, have incentives to report incoming sales to, for example, justify the expensing of inputs for tax purposes or to receive credit for these inputs against other VAT liabilities. Moreover, some observers maintain that source country base erosion will not take place because concerns surrounding the withdrawal of traditional physical presences (e.g., a retail outlet) and the replacement by virtual presences (like a retail website) have been overstated. The transition of many global e-commerce companies from pure "dot-coms" to so-called "clicks and mortars" (businesses that have both a virtual and traditional physical presence) has arguably inhibited revenue losses because these businesses will continue to maintain physical presences in foreign markets that may constitute permanent establishments and attract source country income taxation.

Moreover, the move by large e-tailers like Amazon.com and online auctions such as Ebay.com to create local foreign subsidiaries (like Amazon.co.uk and Ebay.co.uk in the United Kingdom) may have reduced concerns surrounding B2C revenue losses, at least with respect to sales of tangible goods. Online B2C transactions often remain confined within countries through the use of these local subsidiaries, belying to a certain extent earlier predictions of a borderless commercial world for regulatory purposes. Finally, in certain cases large Web-based multinational firms have voluntarily agreed to abide by foreign tax laws, which reduced the necessity for legislative steps to set out the scope and obligations of these firms. As discussed previously, for example, Amazon.com and AOL/Time Warner have agreed to strive to comply with the European Union's VAT directive that strives to place VAT compliance obligations on foreign businesses for B2C transactions. As discussed, the OECD is also assisting with the development of new practices and technologies to encourage compliance with cross-border VAT rules for e-commerce.

Third, certain countries have tax laws that clarify the tax treatment of software programs and intangible assets, which may provide a framework by analogy to resolve e-commerce tax issues. For instance, the U.S. Treasury Department first proposed draft regulations in 1996 on the classification of computer program transactions. These regulations clarified that, for purposes of determining whether royalty income is generated, taxpayers should determine what type of copyright has been transferred; the transaction will generally be treated as a sale of goods (and not a copyright license that would generate royalties) as long as the purchaser does not receive the right to reproduce the software for distribution to the public. Like the OECD income classification rules discussed previously, the U.S. regulations strive to treat functionally equivalent transactions the same way. U.S. taxpayers may be able to use these rules to determine the appropriate tax treatment for cross-border digital transfers of goods and services.

In addition, the United States has proposed new regulations to govern the tax treatment of non-arm's length transactions in cross-border services, including transactions involving intangible property. Proposed rules strive to inhibit disguised transfers of intangibles without adequate compensation where the transaction is characterized by the taxpayer as a transfer of services only. For bundled transactions that involve a services transaction and a transfer of an intangible, taxpayers must choose valuation methods that take into account each component of the transaction. Intellectual property laws of the relevant jurisdiction will determine legal ownership of the intangible or, if this approach is unworkable, ownership will be determined by looking to which controlled party controls the intangible. Rules also assist in valuing intangibles that have been enhanced or developed by another controlled taxpayer.

These tax rules could be applied to many e-commerce transactions that involve the cross-border transfer of digital goods and services. The rules seem sensible as they can be imposed in a neutral manner

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

between e- commerce and traditional transactions and thus comport with the OECD's guidelines in this area that are espoused by the Ottawa Taxation Framework. In addition, this approach does not involve any significant departure from traditional international tax rules or principles and, again, appears to be consistent with the Ottawa Taxation Framework conditions.

Fourth, it may be too soon to gauge the national reaction to e- commerce tax challenges as governments and their tax authorities may be in the midst of preparing legislation or administrative guidance. Also, my survey within this Part may have inadvertently missed efforts by governments to address global e-commerce tax concerns, possibly understating the extent of this reaction.

This part of the chapter strives to promote a better understanding of the reasons that underlie the general success of the OECD's e-commerce tax reform efforts along with lessons that can be learned from these efforts. The first section argues that the OECD's 'informal' e-commerce reform process, which included the promotion of guiding principles, consultation, deliberation, and the use of non-binding mechanisms, amounted to unprecedented global tax cooperation and was generally successful in confronting international e- commerce tax policy challenges. The second section argues that the OECD's success in the e-commerce arena demonstrates that calls for a formal World Tax Organization, which could bind national tax rules of participating nations, may be misplaced. To operate as a truly informal *world* tax authority, the last section discusses the need to formalize the OECD's outreach efforts to non-OECD member states to promote a more inclusive forum for consultation and deliberation.

The previous part of the chapter reviewed how the OECD took a leadership role in the development of international e-commerce tax reform principles, which were accepted by the OECD member states. This part of the chapter discusses how the OECD's use of 'soft institutions', enhanced voice, and increased outreach to non-OECD member states assisted with reform efforts.

Soft Institutions

As discussed earlier, the OECD's e-commerce tax reform process did not involve any institutions that can bind the tax policy of its member countries in any way. The Working Groups and other expert groups serve as fore to explore different policy alternatives, but cannot enact any changes without broad support and consensus by OECD members. The OECD model tax treaty or its Commentary are not binding, and members are permitted to insert reservations and observations that set out dissenting views.

To a certain extent, the OECD approach of encouraging discussion, study, and non-binding reform efforts resembles the phenomenon of 'soft institutions.' Soft institutions are said be more informal processes employed to achieve consensus by providing a forum for actors to negotiate non-binding rules, such as principles, instead of binding conventions: "Soft institution building can provide more flexibility to actors, including the private sector, to implement the consensus." The OECD approach is consistent with emerging views in international relations theory that "government networks" (e.g., relatively informal arrangements among government officials in the same agencies) may be best at addressing global challenges. Informally coordinated and networked action by governments, it is thought, may lead to a new form of international law- and policy-making that addresses these challenges without imposing undue restrictions on national sovereignty.

Similarly, the use of non-binding institutions promotes the interests of the OECD members by reducing tax obstacles to international trade and investment (thus encouraging national economic growth) while protecting tax sovereignty to the greatest extent possible. As subsequently discussed in Part III.B., the preservation of tax sovereignty is likely a necessary prerequisite for the development of widely-accepted

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

tax rules. The OECD process more closely resembles customary international law, which is perhaps best understood as a set of normative expectations developed through observation of the actions of states.

As is the case in other areas of customary international law, peer pressure and the need to promote business certainty (again to promote national economic welfare) encourages the OECD member states to follow the consensus views once they have been adopted into the OECD model tax treaty. In contrast, conventional international law typically involves the use of treaties that, once entered into, create continuing obligations, unlike the OECD model tax treaty. Through the use of informal mechanisms, the OECD mediates and manages the expectations of its member states in an attempt to generate politically acceptable (and hopefully effective) international tax policy.

Enhanced Voice

With respect to the OECD's e-commerce tax reform efforts, Duncan Bentley notes, "It was one of the first occasions when new policy initiatives were developed at an international level before at least the OECD jurisdictions had first developed domestic policy positions. It was also the first time that public consultation both within and outside the OECD had taken place to that extent in developing new policies on international taxation.(Arthur,2006)"

The OECD e-commerce tax reform efforts arguably generated a series of 'firsts' that amounted to unprecedented international tax cooperation:

1. It was the first time that countries engaged in multilateral discussions that led to agreement on principles—the Ottawa Taxation Framework—that would guide the subsequent formulation of international tax rules;
2. It was the first time that the OECD joined with members of industry to agree to a framework—the Joint Declaration of Business and Government Representatives—to guide the development of new rules;
3. It was the first time that the OECD analyzed policy options in an extensive way through the publication of multiple discussion drafts of reports (that sometimes included both majority and minority viewpoints) from Technical Advisory Groups and Working Parties consisting of tax experts drawn from national tax authorities, industry and academics;
4. It was the first time that non-OECD countries were permitted to be part of ongoing deliberations along with the development of policy options through the appointment of representatives from non-OECD governments to Technical Advisory Groups;and
5. It was the first time that OECD member states engaged in extensive discussions with respect to cross-border Value-Added Tax (VAT) issues, and attempted to promote consensus-driven reform efforts in this area.

The use of Working Parties and TAGs provided a forum for tax experts to deliberate in an extensive manner prior to the attainment of consensus. In particular, the decision to extend TAG membership to representatives from industry and non-OECD member states likely played a strong role in encouraging participants to 'buy in' to the recommended changes as they had a chance to voice their concerns from the outset. The survey in Part II supports this view as the OECD member states have not generally developed tax laws or administrative positions that are contrary to the OECD view (with, as subsequently discussed, the exception of the server/PE issue): it serves as evidence that the OECD countries made

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

good on their promise, by signing onto the Ottawa Taxation Framework conditions, to abide by the consensus view. Interestingly, it was technology change, and not traditional policy concerns, that provoked this unprecedented global tax cooperation.

The OECD e-commerce tax reform process encouraged cooperative efforts by providing significant opportunities for input without imposing any intrusive restrictions on the tax policy of the member countries. The *work* in order to realise the full potential of the new technologies."[my italics]. Moreover, the inherently conservative view in the Ottawa Taxation Framework and the Joint Declaration of Business and Government Representatives to use traditional international tax principles in the development of tax rules for e-commerce seems, in hindsight, the most effective reform path.

In order to address possible source base erosion resulting from cross-border e- commerce sales, commentators proposed reform efforts including: (a) low, medium or high withholding tax rates for e-commerce payments; (b) qualitative economic presence tests (i.e., facts and circumstances tests) to enable source countries to tax e-commerce payments despite the absence of a traditional physical presence within the source country; (c) quantitative economic presence tests (e.g., permit source countries to tax above threshold sales such as $1 million in sales); or (d) global formulary apportionment with destination sales as one of the factors to encourage source country taxation. The lack of evidence surrounding source state base erosion resulting from e-commerce sales, however, suggests that the OECD's more conservative reform path and insistence on applying traditional principles as well as the same tax rules to e-commerce and conventional commerce was likely the better approach. As previously noted, in the longer term an increase in international e-commerce— particularly in the sensitive tax area of cross-border B2C digital sales—may call for a re-evaluation of traditional rules and principles.

The OECD members have a lengthy history with respect to negotiating tax treaties based on the OECD model treaty, which in turn was based on earlier model treaties. Moreover, the fact that the OECD member states cooperated effectively together on e-commerce reform may lead to enhanced loyalty that could encourage viable solutions in other areas of policy concern.

Because of the history of cooperation along with more recent efforts, it may be the case that the OECD member states have learned to trust the OECD process to the point where they are increasingly prepared to accept the OECD's leadership in resolving other areas of international tax policy concern, including binding multilateral mechanisms in limited areas such as transfer pricing arbitration. At a minimum, the trust encourages more modest efforts, such as enhanced multilateral information exchange, consistent transfer pricing documentation requirements and advanced pricing agreement (APA) procedures.

Tax Organizations

This part of the chapter builds on the analysis from the previous section by situating the OECD's e-commerce tax reform process within the ongoing debate on the need for a formal World Tax Organization that could impose binding tax rules on participating nations to limit adverse outcomes caused by, *inter alia*, international tax competition.

Observers have noted that international tax policy analysis suffers from a certain degree of arbitrariness because analysts and tax authorities generally cannot come to agreement on the ways that accepted general principles such as the need for inter-nation fairness should guide actual reform efforts. The problem in part is that a particular nation's international tax interests may vary depending on its economic circumstances. For example, capital exporting nations tend to support residence-based taxation under the principle of capital export neutrality, which is achieved if a taxpayer's choice between investing at home or in a for-

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

eign country is not affected by taxes. Capital importing nations tend to support source-based taxation under the principle of capital import neutrality, which maintains that companies operating abroad should be placed in the same tax position as their local competitors. Many developing nations and transitional economies prefer the rules within the United Nations model tax treaty, which strengthen source-based taxation. Other nations may be both a capital exporting nation and a net e-commerce importing nation, which complicates matters and may lead to different preferred tax approaches for different industries.

This process can be distinguished from the different tax policy positions adopted by states or provinces within federal countries: if necessary, the highest court in the land can be resorted to provide one rule for all taxpayers to clarify how tax laws will interact among the different jurisdictions. For example, the U.S. Supreme Court has developed a bright- line physical presence test in the context of U.S. state and local sales and use taxation to ensure that inter-state commerce is not unduly inhibited by overly aggressive state laws. Moreover, federal countries have legislative bodies that can pass legislation that comports with widely-accepted tax policy views (such as the passage by Congress of the *Tax Reform Act of 1986*, which reduced tax rates and broadened the income tax base, in manner that was consistent with many policy perspectives).

Similarly, within tightly integrated economic regions such as the European Union, the European Court of Justice plays an important (and increasing) role in developing a unified tax policy for the European Union countries. For example, in the 'Lankhorst-Hohorst' decision, the European Court of Justice ruled that thin capitalization rules cannot impose unequal treatment between resident and non-resident European Union companies, leading many European Union countries to re-design these rules. The European Commission also plays an important role in shaping international tax policy for the European Union countries. For example, beginning in

2001 the European Commission announced that it would begin to emphasize, as part of a longer term strategy, the 'consolidation' of corporate income tax bases, while permitting the member countries to impose their own tax rates. Moreover, the Commission has achieved success in the past with, for example, value-added tax (VAT) harmonization and unified rules for the tax treatment of cross-border interest payments.

In contrast to the situation that exists for subfederal countries or for highly integrated regional economic unions, there is no international court or organization that has the authority to impose binding tax rules on national governments. Without such an organization, there is no body to encourage or mandate agreement on principles such as the need for inter- nation equity in the sharing of the cross-border income tax base. The lack of agreement on guiding principles would frustrate the ability of a global tax institution to impose rules that would attract widespread acceptance by national governments. This situation leads to a catch-22: the lack of agreement serves as a barrier to the formation of a world tax authority and the absence of a world tax authority frustrates the development of widely- accepted guiding principles for policy purposes.

Despite the inability to secure agreement on the application of international tax principles, there have been calls for the development of an international tax body other than the OECD. An extensive literature has debated the merits of an (upper case) World Tax Organization, which would bind participating countries at the supranational level to inhibit perceived problems such as harmful international income tax competition. This section provides an overview of some of the main points within this literature, while the next section explores how the informal and flexible nature of the OECD's tax reform process serves to better address international tax policy concerns.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Arguments in favor of a World Tax Organization include the view that: (1) it would restrict income tax competition that could lead to a 'race to the bottom' as nations compete for mobile capital by reducing their corporate income tax burdens, possibly leading to revenue shortfalls and the inability to fund needed government programs; (2) as countries reduce income tax burdens on capital, they tend to increase burdens on less mobile factors of production such as labor leading to regressive tax policy; (3) binding international tax rules might inhibit tax evasion or aggressive tax arbitrage strategies that deplete national revenues; (4) uniform income tax rules among nations could potentially lower compliance costs for multinational firms as they would have expend fewer resources to deal with different national tax laws (this is the motivation behind the EU Commission's base consolidation proposals touched on previously); and (5) binding international agreements would inhibit countries from creating special tax incentives to attract mobile resources, which is thought to reduce international capital productivity as firms allocate resources to countries for tax reasons and not out of any real economic rationales.

Arguments against a formal World Tax Organization along with possible harmonization of tax bases and/or rates include the view that: (1) competition tames the so-called Leviathan tendencies of government to fund inefficient public services; (2) maintaining different income tax regimes promotes policy experimentation and innovation that could lead to future efficiency gains; (3) different income tax regimes can better address the distinct needs of different economies that, for instance, may prefer to subsidize certain business activities deemed crucial for national economic success; (4) centralized global institutions can be bureaucratic and could impose tax solutions that would create burdensome compliance costs for firms with cross-border activities; and (5) a World Tax Organization would unduly inhibit national sovereignty (this last item is taken up in the next section).

An 'all or nothing' approach identified above clearly oversimplifies the array of policy options provided to tax authorities. In fact, there exist more nuanced options that can be placed along a spectrum from the least tax sovereignty comprimising to the most, including: (a) no cooperation whatsoever; (b) bilateral coordination via tax treaties; (c) multilateral informal cooperation and coordination (e.g., via the OECD model tax treaty); (d) multilateral coordination with limited binding rules such as binding arbitration for transfer pricing purposes; (e) more formal multilateral cooperation such as global formulary apportionment where participants would need to agree on a binding formula with specified factors to divvy up the international income tax pie; (f) multilateral agreement to harmonize national rates and/or bases; (g) formal World Tax Organization with authority to issue binding rules to participating nations after multilateral negotiations take place; and (h) a World Tax Organization with legislative, executive and judicial branch for governance over international tax matters.

The OECD's e-commerce tax reform efforts fall within the spectrum under paragraphs (b) and (c) by encouraging multilateral cooperation on tax solutions that are ultimately reflected in the OECD model tax treaty, which filters down into bilateral tax treaty negotiation and coordination. These reform processes take an intermediate position by permitting OECD nations to maintain a high degree of flexibility with their tax policies (hence preserving sovereignty) while agreeing to adopt coordination measures into their treaty network to ensure a consistent application of tax rules on cross- border transactions.

While there remains an ongoing debate surrounding the need for binding global tax institutions, observers generally note that movement in this direction remains unlikely for the foreseeable future. Most nations continue to view their tax systems as an important component in pursuing socio-economic policies and wish to maintain laws and policies tailored to their national interest without interference from a formal World Tax Organization or other overly intrusive binding measures: tax sovereignty concerns remain one of the prime drivers of international tax policy.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Viewed through the lens of international relations theory, the development of international tax policy can be understood as an ongoing political process designed to accommodate the needs of important economic actors (e.g., multinational firms) by reducing tax barriers to cross-border trade and investment while, at the same time, meeting and respecting the political needs of nation states. A better understanding of the political processes that shape international tax laws could lead to more informed policy analysis.

From this perspective, the OECD appears to be a good fit as it accommodates the interests of the most advanced industrial economies and their taxpayers without imposing any rules that would bind the tax policy of its member countries. The lack of authority to enact binding rules does not necessarily mean that the OECD is "toothless" as can be seen by returning to the vexing dilemma of international tax competition.

Since 1997, the OECD has taken the international lead in disentangling "fair" tax competition from "harmful" competition. OECD member states have agreed to reduce their own "harmful preferential tax regimes" in the context of mobile financial and other services. For example, the OECD asserted that the use of foreign sales corporation provisions in the United States constituted a harmful tax practice. In addition, OECD members have agreed that they may retaliate against uncooperative tax havens who have not agreed to eliminate their harmful tax practices by December 31, 2005.

According to the OECD, by 2004 only two of the forty-seven harmful tax regimes maintained by OECD members remained.

Moreover, thirty-three tax havens had agreed to reform their tax laws to enhance information exchange and encourage transparency: only five countries remained on the list of uncooperative tax havens. While its ultimate outcome remains uncertain, the OECD's harmful tax competition project can be portrayed as another significant step forward in international tax cooperation as it encourages multilateral coordination efforts to combat the use of tax havens to avoid or evade income taxes and limited tax base harmonization among OECD member states (by prohibiting the use of certain tax measures).

The potential success of the OECD's harmful tax competition project shows that global tax institutions may be able to address policy challenges without the need to resort to binding agreements or the traditional "sticks" of international law (such as threatened trade retaliation). Similarly, the success of the OECD e-commerce reform process, where it arguably acted for the first time as a (lower case) world tax organization, serves as evidence that heightened multilateral cooperation and coordination through informal institutions can provide opportunities for the development of widely-accepted tax policy and rules.

FUTURE PROSPECTS

The fact that the OECD currently only needs to develop consensus for its thirty member states likely helps to find tax solutions. For the most part, these OECD members control the bulk of the world's capital, and have similar interests as mature industrialized nations with service and technology-oriented economies. The ability to reach consensus on reform options is likely assisted by the fact that the OECD is constituted by only thirty countries so that reform does not become bogged down in a process where broader multilateral interests come into play. The OECD members include all of the most advanced economies of the world, and many have similar national interests so that they are, in the OECD's own words, "like- minded," which facilitates the attainment of consensus.

But the fact that the OECD generally remains a "rich countries' club" is also a drawback for the development of effective international reform. Countries such as India have viewed the OECD reform

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

efforts with suspicion because of the understandable perspective that the organization is designed to protect the interests of its member countries. For example, the OECD model tax treaty eliminates withholding taxes on royalties, which supports the interests of net technology exporting countries. By merely tinkering with the permanent establishment concept through the new server/PE rule, for instance, Indian tax authorities have argued that the OECD is protecting the interests of capital exporting nations at the expense of the interests of capital importing nations. Disagreements between OECD member countries and non-member countries are to be avoided as they reduce tax certainty and increase the risk of international double taxation, which in turns inhibits international trade and investment (and harms the interests of OECD countries and their multinational firms).

One obvious way to create more inclusive reform efforts is to extend OECD membership to more countries. Mexico, for example, historically refused to enter into any tax treaties with developed nations but changed its policy and entered into its first treaty based largely on the OECD model with Canada in 1992 after Mexico was considered and later granted OECD membership in 1994 (the burgeoning Mexican tax treaty network was also influenced by Mexico's decision to enter NAFTA and the World Trade Organization). It is unlikely, however, that the OECD will significantly increase membership in the near future, although the organization is considering membership extension to certain countries.In any event, many countries may not wish to become an OECD member if it they are forced to change tax policy (such as the extension of tax holidays to non- resident firms) or other aspects of domestic policy (such as privacy or criminal laws) in accordance with the OECD mandate to encourage democracy, the rule of law, and individual human rights.

In fact, in recent years the OECD has taken several significant steps to take into consideration the views from non-member countries. In 1997, the OECD began to add the positions of certain non-member countries to the OECD model tax treaty in recognition of [the] growing influence of the Model Convention in non-member countries. In 2002, the OECD, International Monetary Fund, and World Bank announced efforts to form the International Tax Dialogue to provide a forum for input from developing countries and other international organizations on tax measures to improve co-ordination of technical assistance, share good practices and pursue common objectives in improving the administration of national tax systems.

In addition, the OECD has sponsored multilateral tax centers in Austria, Hungary, Turkey, Mexico and Korea to hold meetings with representatives from non-OECD countries. Moreover, the OECD operates tax centers in Russia, China, Malaysia and India and assists with the development of regional programs in Latin America and Africa. The OECD also provides a Global Forum on tax matters whereby non-member countries are provided some opportunities for input and design of tax reform options. Finally, as discussed, the OECD developed outreach programs for its e-commerce tax reform efforts (such as membership in TAGs) to ensure that non-member states participated in the dialogue that led to changes within the OECD model tax treaty.

A more effective solution may be to combine and formalize the different outreach programs developed by the OECD. The e-commerce example demonstrates that outreach heightens the chance for effective reform when non-member countries can participate in the deliberation and formulation of changes to international tax rules and principles. The formal structure could be designed in such a way to extend permanent membership to non-member countries to provide opportunities for them to voice their concerns and assist with the design of reform efforts. By creating a permanent structure, the OECD reform efforts could promote legitimacy with these non-members, further encouraging them to 'buy-in' to reform efforts.

Two-tiered membership could be extended to participating countries. The first tier would include all OECD member countries— consensus among these members would continue to be needed to enact

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

major policy changes, such as amendments to the OECD model tax treaty. The second tier would include non-member countries who wished to be granted permanent membership within this tier. Countries from both tiers would be invited to deliberate policy changes through the Committee on Fiscal Affairs and its committees, but only tier one countries could ultimately make these changes (this approach is similar to the OECD's e- commerce tax reform efforts).

Tier two status would be likely problematic for non-member countries but, given current political realities, it may be the best that they can hope for. Permanent membership at least would provide non-member countries with more opportunities to access OECD resources and to provide input. It would also help to allay concerns that the OECD has been 'captured' by multinational firms based in OECD countries; the perceived influence of these firms may be reducing the legitimacy and effectiveness of OECD reform efforts.

The proposal would not change the *status quo* by any significant degree and hence might attract the necessary support from OECD members. The OECD's outreach program has already been formalized to a certain extent through the Board for Co-operation with Non-OECD Economies (a subsidiary body of the Committee on Fiscal Affairs) and the Advisory Group on Co-operation with Non-OECD Economies, which administers the outreach programs and advises the Board.

In addition, the Committee on Fiscal Affairs already permits certain non-OECD member countries to participate in committee work as Observers. In 2004, China and South Africa joined Russia and Argentina as Observers in the CFA: this seems to be a positive step in that it would be consistent with the view, noted earlier, that the OECD is effective at informally accommodating the changing global economic environment. The OECD could further legitimize its reform efforts and become a truly global tax organization by extending permanent membership to non-member countries to give them more opportunities to provide input into prospective reform efforts.

CONCLUSION

The main purpose of this chapter is to determine the challenges of taxing EC The first challenge highlighted was the creation of tax laws for the conventional mode of commerce and in an era 'that could not have foreseen the technological advances of the present' (Li, 2000). Applying the current tax laws to tax EC challenges the tax principles of neutrality, efficiency, certainty, fairness and simplicity. The other challenges highlighted by other researchers were categorised into the three main categories of challenges namely, Enforcement, Application and Principles.

The principles of taxation are challenged in online trading. The difficulty in applying the tax definitions to the online environment has shaped legal dilemmas (Ahmadu, 2004). However this can be overcome. The important issues require legal resolution. The 'emergence of international and global tax dimensions have been subject to continuous negotiations throughout their history in response to changing forms and functions of society'.

According to a recent report by the Associated Chambers of Commerce and Industry, the Indian e-commerce industry is expected to touch the US$38 billion mark by 2016. This growth will be driven by increasing internet and mobile penetration, discounts, convenience and value added services, which have grown multifold, from US$3.8 billion in 2009 to US$23 billion in 2015.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

However, despite the recent e-commerce guidelines and other reforms bringing clarity on the regulatory front, there are still challenges related to tax that are leading to litigation. These issues, if not addressed well in time, may hinder the growth of the sector as a whole.

1. New e-commerce guidelines liberalize foreign direct investment regulations- The Government has brought about a lot of relaxations in the sector by releasing the much-awaited guidelines on investments by non-residents. The new guidelines permit 100% foreign direct investment (FDI) the marketplace model through the automatic route, subject to certain conditions. Companies operating on a marketplace model only provide buyers and sellers a platform to transact, and not directly engage in selling activities.The Government has also been conscious of providing a level playing field for offline stores, resulting in measures such as control on discounts offered by e-commerce companies and capping of total sales from a group company or an individual vendor, much to the disappointment of the consumers.
2. Tax regime for e-commerce and the key challenges

The income of Indian residents running e-commerce operations is taxed in India at the applicable tax rates; therefore, there is no requirement for specific provisions for them. However, there has always been a dispute on the taxability aspect of non-residents carrying out such transactions in India.The basis for the dispute is that India has traditionally adopted a source-based taxation regime for non-residents in the country, depending on physical presence in the form of a fixed place of business or a dependent agent in the source country, i.e., India. However, with e-commerce the need for a physical presence virtually ceases, which creates problems in the enforcement of tax laws. Therefore, in 2001, the Central Board of Direct Taxes constituted a High Powered Committee (HPC) to contemplate the need of a separate tax regime for e-commerce transactions. The report submitted by the HPC took into consideration the principles laid down by the Organisation for Economic Co-operation and Development (OECD) for taxation of e-commerce transactions. It maintained that the existing laws are sufficient to tax e-commerce transactions and that no separate regime is required. Accordingly, the taxation of e-commerce transactions is still governed by the extant provisions of Income-tax Act, 1961.

Direct Tax

1. While non-residents employ several business models and mediums to carry out their e-commerce business in the country, issues around the taxability of income and the corresponding litigation are primarily on account of the following reasons:

Characterization of Income in the Hands of the Non-Resident

Certain types of income such as royalty and fees for technical services deemed to accrue or arise in India are taxable in India, but business profits in the absence of a permanent establishment (PE) are not. Litigation arises when tax authorities treat payments as royalty, fees for technical services, etc. instead of business income as contented by non-residents.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Issues Surrounding PE

On the PE front, there have been issues around whether a website in India constitutes a PE for a non-resident and whether certain activities performed by an agent in India constitute a dependent agent PE.

Applicable Withholding Tax Rates on Payments Made to Resident E-Commerce/Internet Companies

There has been litigation on the applicable withholding tax rates on payments to resident e-commerce companies for activities such as e-cataloging, warehousing, logistics and payment gateways. – Sec 194C which provides for 2% rate vs Sec 194J which provides for a 10% rate.

In the recently concluded Budget, the finance minister proposed an equalization levy of 6% on payments exceeding INR 1 lakh a year made to foreign e-commerce companies as consideration for online advertisement. Through this move, the Government aims to tap the income accruing to foreign e-commerce companies in India.

Indirect Tax

The indirect tax laws in India have been more of a hindrance than a driver for growth for the e-commerce sector, mainly because of the following issues:

In the case of internet-based transactions, determining the jurisdiction of VAT becomes an issue in the absence of information regarding the physical presence of entities/goods.

There is tax leakage on account of service tax paid on listing fees by vendors to portal owners, which is non creditable against VAT payable on sales made by vendors.

The classic sale vs. service controversy is afflicting e-tailers, who end up with VAT/ CST demands in various states involved in the supply chain.

The unique and varied business models in this sector make it difficult to define a broad base for tax positions —for example, the implications on prepaid sale could be different from those on COD sale.

E-tailers are also seeing increasing litigation on account of entry tax and octroi being demanded/ collected on the movement of goods.

Various states are amending their respective VAT laws to provide for taxing of e-commerce transactions. For instance, the Karnataka Value Added Tax (KVAT) authority is contemplating charging local VAT on transactions on e-commerce websites by treating them as “dealers” according to the provisions of the Karnataka Value Added Tax Act, 2003 (KVAT Act).

The goods and services Tax (GST), which is expected to be implemented soon, would replace the current indirect tax regime and is expected to rid the e-commerce sector of the issues plaguing it. If the state of consumption gets the tax, it will eliminate all issues being raised by origination states. However, the state demanding or getting full tax earlier will lose its revenue as the consuming states will earn all the tax revenues.

Chapter 87
Electronic Commerce and Actual Problems of Taxation:
The Key Underlying Issues

Isabel Lopes Teixeira
Lusófona University of Humanities and Technology, Portugal

Inna Sousa Paiva
Lisbon University Institute (ISCTE-IUL), Portugal

ABSTRACT

This chapter examines the problems related to the international taxation of electronic commerce and identifies the alternative solutions that have been adopted in the current fiscal framework. The results obtained demonstrate the proposed models of e-commerce taxation based on existing international legislation, notably origin-based taxation, tax withheld at source and technology based solutions. This study argues that any legislative change should be implemented by a number of countries or through international efforts to harmonize practices, and sets out the future directions in the taxation of e-commerce. This chapter contributes to the scientific knowledge to accounting and tax research on the taxation of e-commerce.

INTRODUCTION

Economic growth and the globalization of international markets have driven the development of the new technologies sector. The development of new information technologies, more specifically the internet, led to the emergence of new forms of commerce. Of these, electronic commerce stands out in particular; not only has it registered steady growth, but it has completely changed the way commerce takes place and had a great impact in various areas. As a result, new markets and new products have been created and relationships have become virtual without any physical contact between buyer and seller, in contrast to what happens in traditional commerce. This change in the way commerce takes place has raised a

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

number of accounting and tax issues, notably that of identifying the best method for dealing with the accounting and taxation of this kind of transaction (Yang & Aquilino, 2016).

In recent years, the internet has ceased to be used simply for communication and information search purposes and has increasingly become a commercial network. As such, it offers multiple advantages as it allows companies to do business all over the world at low cost without the need for a physical establishment. It is usual for these companies to make their products or services available through their sites, often transcending the economic rules that govern the trade of the destination countries, and even international rules (Gamage & Heckman, 2011).

The national tax systems as well as trade and customs barriers are therefore easily by passed. Previous studies report that countries have not yet prepared legislation and methods to tax this kind of transaction (Azam, 2012; Cockfield, 2005; Ligthart, 2004; McLure, 2001, 2003). The advances in e-commerce allow sophisticated information systems to be developed, giving rise to the urgent need for various international organizations to work together on advancing common tax systems.

This chapter examines the problems related to the taxation of electronic commerce and identifies the alternative solutions that have been adopted in the current fiscal framework. The research does not intend to study all the difficulties that the taxation of this kind of commerce involves, but to analyze some of these issues, more specifically in direct international taxation.

The results obtained demonstrate the proposed models of e-commerce taxation based on international legislation, notably origin-based taxation, tax withheld at source and technology based solutions. This study argues that any legislative change should be implemented by a number of countries or through international efforts to harmonize practices. The biggest mistake that could be made would be to try to find an individual or regional solution to the problems of internet and e-commerce, without taking the international context into account. After all, e-commerce is not an issue of merely local scope but has global implications given the breaking down of borders afforded by the internet.

This chapter contributes to accounting and tax research on the taxation of e-commerce given that, according to the studies and articles published to date, governments have not yet approved any law or significant guidelines on the taxation of international e-commerce.

The chapter is structured as follows. Following a brief introduction, the next section presents the background to the internet as it is the means used for this kind of purchase, describes the characteristics of e-commerce and sets out the international institutional framework. An analysis is then made of the taxation difficulties in e-commerce, making reference to the following factors: characteristics of e-commerce, the permanent establishment, tax havens and the application of criteria for the assignment of profit. Section four develops the proposed models of taxation of e-commerce. The work concludes by outlining the main aspects of the current problems and future challenges of e-commerce.

ELECTRONIC COMMERCE

Definitions, Typologies and Characteristics

The increasing use of the internet worldwide is proof of the rapid revolution in the new information and communication technologies. The communication process has become renowned thanks to the internet and is present in various social segments. In short, the internet is a communication system that links

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

millions of computers/users around the world and allows them to have an interpersonal relationship in real time on a global scale.

Nobody owns the internet. Nobody can sell or assume ownership of it in order to turn it into a monopoly. Hence, no central authority regulates its use or publishes standards for the behavior of users. Although there are management committees in the United States and elsewhere that coordinate services, they are always subject to the technical limitations imposed by the evolution of technology.

The internet originated in the 1970s when the US military decided to link the computers of the main North American universities involved in a research project of great importance to the defense of the United States. In order to safeguard the data in the computers of Stanford Research Institute, University of California Los Angeles, University of California in Santa Barbara and the University of Utah the Advanced Research Project Agency developed a communication network that was designated Advanced Research Project Agency net (ARPAnet). The purpose of ARPAnet was to allow the information available to be accessed by any of the existing computers in the event of a nuclear attack on where they were installed (Guimarães, 2001). Parallel to ARPAnet, the US Department of Defense created another network named MILnet for the dissemination, access and storage of less qualified information.

Subsequently, another US government agency called the National Science Foundation developed a network of five super computers in the late 1970s named NSFnet with the aim of connecting all the universities and research centers in the United Stated so that researchers could share information and exchange messages. At the end of the decade, the protocol suite known as Transmission Control Protocol (TCP) and Internet Protocol (IP) was created; this permitted intercommunication between computers by including communication between the programs and protocols for the transport, transmission and control of data reception. ARPAnet became redundant due to the success of the NSFnet initiative and was closed in 1990.

In 1989 Tim Berners-Lee of CERN invented a new system to access information that was designated the World Wide Web (WWW)[1]. The World Wide Web is the most recent information system that uses the internet as the means of transmission. According to Berners-Lee, its success is due to the construction of an open internet with three critical factors:

1. Unlimited connections from any one part of the site to any other part.
2. Opening of technical standards as the basis for the continued growth of applications and innovations.
3. The separation of network layers, permitting innovation irrespective of network transport and information requests.

Driven by the constant technological advances that the world has seen over the years, the internet made it possible for consumers to buy almost anything from any vendor in any part of the world (Ligthart, 2004).

There are a number of definitions of electronic commerce. Some define it as a form of Electronic Data Interchange, in other words, an exchange of data by computers and other electronic devices without the production of any paper document. Others define it as the sale of any product or service by means of the internet.

According to the Internet Tax Freedom Act (1998), the concept of electronic commerce can be described as "any transaction made by means of the internet. which encompasses operations such as sales, locations, licences, goods, services, the supply or delivery of goods". Meanwhile, the OECD (2000)

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

defines the concept of electronic commerce as "business that takes place in a network, using contracts without property and established through an open process without much regulation". On the other hand, ANACOM (2004) describes it as "any kind of commercial transaction in which the parties involved interact electronically and not through physical exchanges or contacts".

The Eurostat (2013) defines electronic commerce as "the exchange of goods and services by means of computer networks such as the internet. This kind of commerce can be divided into e-commerce sales and purchases depending on whether the company sells or buys. Essentially, e-commerce is part of a company's business model that complements its conventional selling and purchasing activities and therefore improves its performance". According to Courinha (2001), electronic commerce is "a set of commercial transactions of goods and services, conducted by means of computers linked to the internet between various individuals, which may or may not take place within the same jurisdiction." In short, we understand electronic commerce as quite simply a mode of distant purchase in which information is received and transmitted by electronic means.

In addition to electronic transactions, electronic commerce also includes:

1. The electronic presentation of goods and services.
2. Receiving orders on the internet and invoicing.
3. Automation of orders.
4. Payments by internet and the management of transactions.
5. Automated supply chain.

On the other hand, by using electronic commerce solutions, companies can glean the following benefits: an increase in their profit margin by using the online channel, cutting of costs associated to paper processes, and providing clients with a quicker service and establishing the brand.

Electronic commerce can be classified in line with various criteria depending on the type of product or service transacted, the sector of activity, or the type of party involved in the process. Due to the numerous ways of classifying electronic commerce, the classification in accordance with the type of party involved in the electronic transaction is set out below, recognizing the following types of electronic commerce:

1. Business-to-business.
2. Business-to-consumer.
3. Business-to-administration.
4. Consumer-to-administration.

Business-to-business commerce involves transactions from one company to another and is divided into three broad areas: e-Marketplace, e-Procurement, and e-Distribution. E-Marketplaces are electronic platforms in which the companies involved adopt the position of buyer or seller with the aim of establishing a trading relationship with each other. There are two kinds of e-marketplace: one in which only companies in a specific industry participate and another which involves companies from various sectors of activity. E-Procurements are digital platforms developed to support the supply of materials to organizations; they permit the optimization of the supply chain in terms of time and costs by means of automating the processes of suppliers' interactions with the purchase base. E-Distributions consist of

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

electronic platforms that bring companies in contact with the distributors, representatives and subsidiaries and allow a range of tasks to be performed, such as issuing invoices and the reception of products.

The business-to-business model has led to increasing innovative forms of business cooperation and has helped companies face the new challenges of globalization, thus boosting their competitiveness.

Business-to-consumer commerce is achieved through establishing electronic commercial relations between the companies and the end consumers of their goods or services. This kind of commerce is typical of the retail sector; although it is characterized by being easier and more dynamic, it is also more random.

Great progress has been made in this kind of commerce due to the development of the internet and its websites, where products ranging from books, mobile phones, fashion accessories, DIY and food products are all commercialized.

Business-to-administration commerce involves all transactions between companies and the public administration undertaken via the internet. It covers a very diverse set of services, notably in the tax, social security, notary, registry and employment sectors. This kind of commerce is in rapid development, due in particular to the government's promotion and investments in the area.

Consumer-to-administration commerce encompasses all electronic transactions made between citizens and the public administration. It is applied in sectors for which the state is responsible for services, such as social security (disclosure of information, making payments), health (payments for health services, making appointments), education (disclosure of information, training with digital support), and tax (completion and delivery of tax declarations and payments). These Business-to-Administration and Consumer-to-Administration models used in the public administration are associated to the modernization process underway and improvements to the quality of public services.

Electronic commerce is a new of doing business that moves away from the traditional means familiar to us as it sets new parameters for trading due to the appearance of new technologies and everything that encompasses.

The key characteristics of electronic commerce are: dematerialization, anonymity, extreme mobility and disintermediation. Dematerialization is an essential aspect of electronic commerce. It results from the digitalization and intangible nature of the entire electronic commerce process, as well as the reduced need for physical presence. Digitalization is the conversion of text, sound, images, videos and other content into binary computer language, grouping and storing data as a set of bits and bytes, thereby allowing the integrated transmission of data by electronic means, which in turn permits electronic transaction. Digitalization is responsible for the intangible nature of electronic commerce in that nothing that happens in the technological world is like the physical and palpable.

Due to the intangible nature of electronic commerce and the fact that no physical presence is required at the place of transaction, it is understood that there is no need for the parties involved to know each other or for the parties to meet physically, as happens with traditional intermediaries, in order to complete the transaction between the producer and end consumer. There may be no intermediaries in electronic commerce, and if there are, they may not know who is who, hence the anonymity. The impossibility of controlling the internet in its entirety, which is aided by the phenomenon of encryption, a data codification technique, means that the identity and the content transmitted is only known if a person has an electronic key created specifically for each individual case, also giving rise to anonymity.

With electronic commerce, trading is immediate, unlimited in time and space and accessible to everybody regardless of where they are in the world as long as there is access to the internet. This gives rise to infinite possibilities of selling and buying anything anywhere in the world, making its great mobility a key characteristic of electronic commerce. Electronic commerce permits the relocation of

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

activities, of parties, of goods and services. As a result, it accelerates and diffuses the changes that are already in progress with an extraordinary propagation effect; it triggers an enormous increase in the interactivity of the economy and generates a new temporality that speeds up the production cycle and the satisfaction of consumers' needs. The characteristics of electronic commerce are inextricably linked with the characteristics and functions of the internet but are in stark contrast with the characteristics of traditional commerce.

The intangibility of electronic commerce is a fundamental pillar and physical presence has become irrelevant to the completion of a commercial operation, which means there is a "disintermediation" process of the traditional intermediaries. Electronic commerce permits direct contact between the sources of goods and services and their recipients, which has led to the disappearance of many intermediaries that played an important role in the traditional commercial chain with the aim of cutting costs.

Due precisely to its technological nature and new way of working, electronic commerce has generated a new phenomenon, namely the reformulation of the role of some traditional intermediaries and the appearance of other new ones: the cybermediaries. The latter may be assigned an important role of trust and action in the market; this is key to both producers and consumers. This is underpinned by the need to reformulate their action, by boosting them and adapting themselves to the new technologies and digital needs.

The advantages arising from this reformulation are based on the fact that the intermediaries are able to soothe tensions when there are conflicts of interests between the producer and consumer; moreover, the new functions of the intermediaries bring benefits for producers through the creation and dissemination of information and the product and service and this can influence purchases, promote information for the client, create space that brings the product or service into the spotlight, reduce the producer's and consumer's risk of exposure, as well as reduce distribution costs through economies of scale.

One example of the reformulation of traditional intermediaries is in the institutions responsible for the payment systems that support electronic commerce. The facility and security of electronic payment systems is a fundamental pillar of the development of electronic commerce due to the strengthened role of the financial entities that intervene and guarantee the financial transfers in the electronic transactions. This has brought new life to the traditional financial institutions; and spaces have emerged for the proliferation of new entities that are specialized in the sector both to increase the supply of services available and guarantee the safety and confidentiality of the financial data involved in the e-commerce transaction.

The major development for intermediaries in electronic commerce is that of the technological intermediaries. Telephone companies, internet providers, including cases of website hosting and website storage and even certification authorities, as well as the new professions associated to the internet universe like web page designers or experts in internet security, have emerged as new entities that mediate communication between the trader and the buyer; indeed, the internet is the communication channel between them and, as a universe with its own life, this has physical and virtual foundations necessary for the implementation and existence of the virtual communication channel.

The need for less human intermediation is a characteristic of the virtual universe, and this gives rise to increased difficulties in developing close cooperation between intermediaries and the Tax and Customs Authority. But ultimately there should be a human hand that controls the electronic arm so that a communication platform and a collaboration base can be achieved.

Institutional Framework

Due to the global character of e-commerce, a number of international and state bodies have been working towards outlining directives for this kind of trade and digital signatures. The some of these bodies include the United Nations Commission on International Trade Law, the World Trade Organization, Organization for Economic Cooperation and Development, Global Information Infrastructure Commission, Consumers International, European Union, Asia-Pacific Economic Cooperation Forum, and Asian.

The United Nations Commission on International Trade Law (Uncitral) has been expressing its concern about electronic communications since the 1970s, and the current Model Law was preceded by several other initiatives. The Uncitral Model Law on e-commerce of 1996 is one of the main pillars on which legislation regarding this subject has been based all over the world.

It should be noted that the Uncitral Model Law only serves as a model for countries associated to the United Nations. It is merely suggested that member countries use this model as a basis when preparing laws. Nevertheless, the analysis of the Model Law is important, not only because it was the first but also because it served as inspiration for the few pieces of legislation related to e-commerce.

The Uncitral Model Law defines the main concepts of e-commerce, including electronic messaging; it addresses the regulation of legal formalities for electronic messages, and regulates communications via electronic messages. We believe that most important contribution made by the Uncitral Model Law on e-commerce is to consumer rights.

At the time of the Uruguay Round, which resulted in the creation of the World Trade Organization (WTO), the subject of electronic commerce was only just emerging and far too new to be on the agenda in multilateral trade negotiations. It was at the first WTO Ministerial Conference in Singapore in 1996 that matters directly related to e-commerce were addressed for the first time. This was when the Ministerial Declaration on Trade in Information Technology Products was adopted; also known as the Information Technology Agreement, it stipulated that electronic commerce would be liberalized in some countries by 2000.

The WTO acknowledged the global importance of e-commerce on 20th May 1998 when it drew up the Ministerial Declaration on e-commerce in Geneva, Switzerland. This Declaration established a work program that would examine any matters involving e-commerce, taking into account the economic and financial needs of developing countries. The WTO understands e-commerce as any production, distribution, dissemination, sale or delivery of any goods and services via electronic means. The WTO program also takes into account any matters related to developing infrastructures that broaden the reach of electronic commerce.

The Organization for Economic Cooperation and Development (OECD) is an intra-governmental organization which includes thirty member countries and represents the world's developed countries.

The OECD provides governments with a forum to discuss economic and social policies. The exchange of different points of view among the OECD member countries leads to practical recommendations that they also discuss among themselves and which usually become national laws.

Due to the importance of e-commerce worldwide, in April 1998 the OECD issued a Guideline aimed at protecting consumers purchasing goods and/or assets on the internet. The OECD acknowledges the need and encourages each country to individually analyze and review the Guidelines before adopting its own legislation on e-commerce. The OECD Guidelines are straightforward and cover primarily the following relevant points: traders using e-commerce should take consumers' interests into consideration and act accordingly in terms of commerce, advertising and marketing, and any information provided

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

must be clear, visible and precise; companies supplying products and/or services on the internet must not use abusive contract terms; any advertising and marketing should be clearly recognizable as such by consumers.

The Guidelines include several recommendations on how to resolve e-commerce disputes as this is recognized as being the major challenge for e-commerce.

The Global Information Infrastructure Commission (GIIC), a body that describes itself as independent and non-governmental involving leaders from developed and industrialized countries, has been studying the impact of technology on society for some years. In 1997, the GIIC had already published its recommendations on e-commerce. These included the need to regulate and/or define the following points: (i) how e-commerce should be taxed; (ii) the development of electronic payment systems; (iii) the development of a Global Code for e-commerce; (iv) brands and privacy. Note that all the points raised in 1997 are still relevant to the full development of e-commerce today.

Consumers International (CI) is an international organization of national consumer groups. With its head office in London, it has a regional office for Latin America located in Santiago do Chile. CI helped prepare the OECD Guidelines on consumer protection in e-commerce, albeit defending that their positions are not the same.

One of the first community references to e-commerce was a communication to the European Parliament, the Council, the Economic and Social Committee, and the Committee of the Regions in 1997 entitled "A European initiative in e-commerce", with the aim of fostering an increase in e-commerce across Europe.

The discussions within the scope of the European Union follow along the same lines as those of the OECD, focusing on analyzing indirect taxation, seeking to establish a definition for the legislation on Value Added Tax (VAT) charged on the transaction of services sold via the internet.

On 7th June 2000, following the Lisbon European Council (which took place on 23rd and 24th March, 2000), the Commission presented a proposal for a Directive on e-commerce taxation. This proposal took into account the principles for the online supply of digital goods adopted when the European Union first established its position on e-commerce taxation at the ECOFIN Council in July 1998.

The European Union's objective is to promote e-commerce by removing any existing legal obstacles, with emphasis on the following points: (i) the location of the establishment of the information society service provider; (ii) commercial communication (advertising, direct marketing, etc.); (iii) the conclusion of contracts via electronic means, in compliance with requirements regarding the manner and place where they are signed (iv) the responsibility of the online service providers for the transmission and storage of information belonging to third parties; and (v) the application of regulations (preparation of community codes of conduct, the obligation to set up a swift and efficient legal system adapted to the online environment).

The following principles on this matter were adopted by the European Union in 1998:

1. No new taxes should be created for e-commerce. The existing tax regimes should be adopted, namely VAT, so as to be applied to e-commerce;
2. The delivery of goods by electronic means should be considered as services rendered for the purposes of VAT;
3. Only the services rendered for goods consumed in Europe should be taxed in Europe.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Based on these principles, the proposal for a Directive foresaw the alteration of the current framework on the taxation of the provision of services as laid down in the Sixth Directive provisions. More specifically, an alteration was suggested in relation to the provision of services by electronic means. The provision of services by suppliers established in the European Union is taxed as a matter of course in the location where the purchaser has its head office, a permanent establishment, domicile or usual residence; however, the location rule of the supplier's Member State is maintained in cases where the services are provided to private persons established in another Member State.

With regard to the provision of electronic services provided by companies established outside the European Union to buyers established therein, the solution depends on whether the latter are companies or private individuals. Services purchased by companies established within the EU are responsible for paying VAT applying the reverse charge mechanism. When the buyer is a private individual residing in the EU, suppliers located in other countries will have to register and comply with the tax obligations in any Member State if the annual volume of business is over 100,000 euros. If this limit is not exceeded, these operations would not be taxed or subject to any obligation.

In order to mitigate the regulation problem, the European Union drew up a legal framework for information society services and, more specifically, for e-commerce. Some of these documents relevant to e-commerce is set out below.

As mentioned above, the European Commission Communication "A European initiative in e-commerce" marked the beginning of concerns about new technologies. A set of proposals was presented for the development of e-commerce in Europe. These proposals covered access to the world market, legal and regulatory matters, and the fostering of a favorable commercial environment.

The European Commission Communication "E-commerce and Indirect Taxation" was aimed at preparing the Contribution of the EU and Member States on indirect taxation matters for discussion at the Ottawa Conference.

The Council and European Parliament Directive 1999/93/EC, of 13th December, regarding electronic signatures within the legal community framework; this sought to facilitate the use of electronic signatures and contribute towards their legal recognition by establishing a legal community framework for electronic signatures and certification services so as to ensure that the internal market functions appropriately.

Directive 2000/31/EC, Directive on electronic commerce, of the European Parliament and of the Council, of 8th June 2000, regarding certain legal aspects of information society services, particularly e-commerce; this aimed to contribute towards the correct functioning of the internal market by ensuring the free circulation of information society services between the Member States.

Directive 2000/46/EC of the European Parliament and of the Council, of 18th September 2000, on the taking up, pursuit of and prudential supervision of the business of electronic money institutions. Directive 2001/115/EC, of the Council, of 20th December 2001, regarding certain aspects of electronic invoicing. Directive 2002/38/EC, of the Council, of 7th May 2002, making definitive and temporary amendments to Directive 77/388/EEC as regard the value-added tax applicable to radio and television broadcasting services and certain services provided electronically.

In November 1998, the Asia-Pacific Economic Cooperation forum announced that they intended to look into e-commerce more closely and published the Blueprint for Action on Electronic Commerce, acknowledging that national regulation is necessary in some cases.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The other body, Asian, was founded in 1967 to foster regional cooperation among its member countries: Brunei, Cambodia, Indonesia, Laos, Malaysia, Myanmar, the Philippines, Singapore, Thailand and Vietnam. Asian is the first regional organization to adopt the harmonized legal framework for electronic commerce. Its aim was to develop consistent national legislation.

PROBLEMS AND CHALLENGES OF ELECTRONIC COMMERCE

The Problems of E-Commerce Taxation

The scope of electronic operations is such that it warrants due attention from the international political community and a suitable legal framework. Electronic commerce came into the modern economy along with new technologies. This kind of trade is part of many of the new commercial models adopted by organizations, which is why it is essential to give an appropriate response to its growing use. From the outset, the application of measures regulating e-commerce raised a range of problems. In most cases, regulating this new form of trade did not create entirely new problems but added to the many debates already on the table.

Various experts have argued that e-commerce generates a taxation problem for which an efficient and effective solution must be found rapidly (Gamage & Heckman, 2001; Ligthart, 2004; Seitz, 2005). Gamage and Heckman (2011) believe that the sudden development of internet and e-commerce in the last couple of decades contributed to a dramatic rise in the number of transactions, depriving Member States of important revenue, particularly following the economic recession and crisis.

According to Ligthart (2004), digital payments, for example downloading software and paying for it with digital money, raise complications when applying tax because the origin and destination of the transactions are not clear. Gamage and Heckman (2011) argued that the rapid increase in e-commerce has undermined the Member States by depriving them of much-needed revenue due to the non-application of taxes. According to Seitz (2005), the problems of taxing e-commerce arise from the moment the traditional taxation principle is required. This principle dictates that companies must exist physically and geographically.

Following on to this reference to the problem of taxation, it is important to clarify the main difficulties for e-commerce taxation. At the start of 1996, the US tax authorities issued a number of reports including the "Select Tax Policy Implications"; they looked into whether the development of e-commerce would make governments deal with losses in tax revenue or with the increasing use of tax havens.

Tax experts also noted that fiscal laws and principles needed to be reviewed to take into account the new commercial setting (Cockfield, 2005). While governments had taken some steps towards addressing these challenges by December 2005, many had not yet prepared a law or administrative procedure to tax international e-commerce.

This inaction on a national level was influenced by the leading role played by the Organization for Cooperation and Economic Development in establishing the basic principles and taxation rules so that governments could then deal with the international e-commerce transactions (Cockfield, 2005).

Nowadays it is broadly acknowledged that the main factors behind the difficulty in taxing e-commerce are linked to its characteristics, the complexity of defining a physical establishment, the increase in the number of tax havens, difficulties in applying the criteria on assigning profit, and double taxation.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

E-Commerce and Taxation Characteristics

Taxing e-commerce is difficult precisely because of its characteristics, notably dematerialization, disintermediation, anonymity, and mobility. Dematerialization poses a major threat for the Tax and Customs Authority thanks to factors such as digitalization, the intangible nature of the commercial process, and the limited need for a physical presence, which makes it more difficult for the Tax Authority to perceive facts and control activity. Moreover, to date, in most cases taxation depends on the existence of a physical establishment and its supervision in situ.

In digital transactions, there is little or no physical support for the operations or contact with clients, and the invisibility resulting from the lack of physical presence raises several serious problems that can only hinder the work of the Tax and Customs Authority. E-commerce is associated to multiple locations which complicates the division and allocation of fiscal powers.

There has also been a steady decline in the relevance of geographical factors due to dematerialization and this has made it more difficult to determine where fiscal powers lie as well as how to make such a decision.

The disintermediation of traditional intermediaries, another e-commerce characteristic, has generated taxation discrepancies as information about a tax situation has become harder to access and tax collectors face heightened difficulties; indeed, the Tax and Customs Authority has always depended on the support of these traditional intermediary bodies for mandatory information and to effectively collect any tax due.

It must be stressed that the disappearance of most traditional intermediaries in the e-commerce setting has unsettled the deep-rooted fiscal situation. The direct digital relationship established between the source and the consumer, together with the virtual cooperation between companies, mean that the Tax and Customs Authority can no longer rely on intermediaries to report information; this leads to a lack of data, which in turn reduces the knowledge and anonymity of e-commerce agents and transactions.

While on one hand e-commerce has led to a reformulation of the role of traditional intermediaries due to their importance in ensuring a safe and easy-to-use electronic payment system, on the other, new intermediaries have emerged: the technological intermediaries. The third parties involved in electronic transactions have not entirely disappeared and others are now appearing who can cooperate with the Tax and Customs Authority both with their knowledge of mandatory data and in the effective collection of tax due. This poses an important challenge for the Tax and Customs Authority, namely its capacity to renew and reenergize the way in which it relates with new and old intermediaries, keeping up to date with new developments, encouraging modernization, requalification and restructuring of the Tax and Customs Authority.

Anonymity is another e-commerce characteristic with major implications for the Tax and Customs Authority. It precludes knowledge of the parties involved and thus makes it impossible to identify either the taxable person or the operations which have taken place. Without any knowledge of the who or what, it is impossible to deploy the legal-fiscal relationship and difficult to collect tax revenue.

The problems raised by the lack of a physical and tangible relationship in online or direct e-commerce are a cause of concern because control becomes even more complex when only electronic support is available. Indeed, the inability to pinpoint and determine tangibility results in anonymity, which brings the risk of there being no fiscal identification and natural tax evasion; it also increases the extreme mobility of those agents, enabling a more favorable choice of jurisdiction by manipulating computer information data.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The ease of the electronic payment systems fuels this possibility for anonymity even further as transactions are not immediately identified; only the amounts are provided. Another inconvenience is the use of digital money. Both make it extremely difficult to access information and pose complex obstacles for the control of tax by authorities.

The extreme mobility of e-commerce means that the above-mentioned factors assume even greater proportions, as it allows the taxable person, goods and services, fraud and tax evasion to be relocated, creating jurisdiction problems and loss in revenue for the Tax and Customs Authority.

Mobility not only brings major threats but it is also a challenge for the Tax and Customs Office. It results in greater dynamics and engagement with other Tax Authorities, raises the value given to the exchange of information among Tax Authorities and highlights the urgent need to develop inter-support networks. Ultimately, a global strategy among the different Tax and Customs Authorities is a must.

Permanent Establishment, Tax Havens, Application of Criteria on the Allocation of Profit and Taxation

Any fixed establishment where an activity of a commercial, industrial or agricultural nature takes place is considered a permanent establishment. In Europe, and according of the OECD Model Tax Convention on Income and on in Capital (2014), a permanent establishment is "a fixed place of business through which the an enterprise wholly or partially conducts its activity", or it can also be considered "the use of facilities solely for the purpose of storage, display or delivery of goods or merchandise, for the maintenance of a fixed business establishment solely for the purposes of conducting activities of a preparatory or auxiliary nature".

Following the growth and expansion of e-commerce, international commercial transactions started taking place via computer servers. For example, a consumer can now download music from a website, whereas the normal thing to do would have been to go to a shop to buy the music on a CD or DVD.

As a result of these commercial developments, there is now a new definition of permanent establishment that includes servers. According to OECD legislation, a server is considered a permanent establishment in the following circumstances: (i) if a server conducts complete international transactions; (ii) if the body responsible for the server is an enterprise or non-resident person; (iii) if a server is established in a certain location for a certain period of time.

Under these rules, no human involvement with the server is required to create a permanent establishment, as the establishment is being used and maintained remotely.

Creating and maintaining a website is not considered a fixed or permanent establishment. Lastly, the OECD states that non-residents using foreign servers maintained through Internet Service Providers are not generally permanent establishments, if the non-residents do not have control over the server (Cockfield, 2005).

According to Silva (2012), a tax haven can be defined "as a country or territory where individuals or companies can obtain tax advantages by avoiding being taxed in their country of origin or by benefiting from a more favorable tax system, especially as regards income tax". The possibility of transferring operations and income from businesses to countries where taxation is lower acts as an incentive to use tax havens (Avi-Yonah, 2001).

While many tax havens are small island nations, some EU and OECD members also provide preferential tax systems for certain activities (McLure, 2001). Ireland, for example, charges a 10% rate on the income of foreign taxpayers; and Belgium and Holland has a special tax regime for coordination centers to attract the headquarters of multinational companies (McLure, 2002).

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The EU, as well as the OECD, are looking into measures to limit the use of tax havens. If such efforts prove successful, it means that there will be a decrease in the use of off-shores, tax havens and member countries with similar tax systems (McLure, 2003).

E-commerce is characterized as being decentralized. The location of participants in a product's value-added chain is no longer important. The costs of reproducing intangible assets are very low and a company can create them anywhere in the world and make them available to their clients, users and other branches of its company through the internet. This phenomenon takes place because the state can only tax the profit made in the country where the company has its permanent establishment. The question is: how much of the net profit is related to the company's head office in its country of residence, and how much remains in the country from which the profit originates (Seitz, 2005).

The international tax system, which was developed in the 1920s, acknowledges two bases for taxation purposes: the first is based on taxation at source, whereby the country can tax only the income which has originated within its territory; the second is taxation based on residency, whereby the country can tax residents within its territory. Determining residency for tax purposes in this system is critical; it is normally based on the activity performed and the economic ties.

Occasionally, these two taxation bases can lead to double taxation. The classic example of double taxation is when a resident in a certain country produces income in another country. This person can be taxed by their country of origin and by the country where they are residing, resulting in double taxation (Azam, 2012).

Thus, in terms of e-commerce, partnerships and international agreements are required on how the taxation system should be implemented so that different countries do not adopt strategies that become incoherent, resulting in a double taxation problem (McLure, 2003).

PROPOSALS FOR THE TAXATION OF ELECTRONIC COMMERCE

Institutional Developments

The OECD, European Commission, and other organizations and experts in the field of taxation have presented contributions to the community, formulated systems and defined principles with a view to the drawing up of legislation on electronic commerce.

Given the world-scale impact of e-commerce, the OECD proposed a model at its ministerial conference in Ottawa, Canada, in October 1998, which was accepted by the majority of countries and consisted of the application of the already existing tax principles to e-commerce. It was decided at this conference that the tax principles applied to e-commerce should be the same as those of traditional commerce. The OECD believes that electronic commerce does not require new legislative or administrative measures or amendments to be made to what already exists and that there should be no discriminatory treatment of electronic transactions; it also noted that any agreements necessary for the application of these principles should be structured so as to maintain the fiscal sovereignty of countries, ensuring that the tax base is distributed fairly between the countries and avoiding both double taxation and non taxation.

The Ottawa meeting established the following general principles of taxation: neutrality, efficiency, effectiveness and equity, flexibility, and certainty and simplicity. In accordance with the principle of neutrality, any transaction made electronically should be taxed in the same way as transactions made in the traditional manner, and there can be no discriminatory treatment or exceptions. However, as we

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

are dealing with a global market, legislation must be adopted that is based on international cooperation, avoiding situations of double taxation and tax evasion.

Under the efficiency principle, the cost of taxation and collection should be kept to a minimum. Thus, the administrative costs involved in the monitoring, collection and imposition of taxes arising from online operations should be as low as possible so as to avoid an unnecessary rise in company costs so as to comply with tax legislation.

On the other hand, the principle of certainty and simplicity implies that tax rules should be sufficiently clear and easy to understand so that taxpayers can foresee the tax implications of a transaction; they should be aware of the situations which are subject to tax as well as the time and way in which the tax is applied.

According to the principle of flexibility, tax systems should be sufficiently flexible and dynamic to keep pace with technical developments and commercial transactions; that is, they must be flexible and open to evolving market rules and technological progress, fulfilling their extra fiscal role of favoring new businesses.

According to Courinha (2001), it is the understanding of various scholars on this matter that maintaining the current rules of international taxation is the best way to guarantee compliance; only as an alternative and where the adaptation of these rules has failed completely would it be legitimate to alter the actual structure of the system.

In short, the OECD Committee on Fiscal Affairs declares that neutrality and equality are fundamental principles in the international taxation policy for e-commerce. A tax must be neutral and strive not to change the behavior of taxpayers, and equal so that the tax burden is distributed fairly, thus showing the close link of these principles.

Taxation at Source

Ryan and Miethkle (1998) and Wagner and Anderson (1999) proposed taxing e-commerce at source, that is, the place where the goods come from. This is in line with the traditional model whereby tax is charged by the seller who is responsible for collecting and remitting the tax to the fiscal authority of their own country.

This has the advantage of administrative simplicity and the reduction of costs as the sellers would only deal directly with the local tax authorities.

The disadvantages of this proposal is that it distorts the flow of trade as this method encourages fiscal competition between and within countries and between the various states or regions. The online vendors would therefore be located in the countries or regions with the lowest taxes. (Ligthart, 2004).

Tax Withheld at Source by Financial Intermediaries

McLure (2000) and the OECD (2001), suggest processing the taxation of digital products through financial intermediary, when the sale takes place, depending on the location of the purchaser and the tax to be applied in that place.

The proposal included a system that required the financial institution to keep a database of the tax rates of each state, country or region. The vendor would have to submit information about the sales and about both parties involved, such as the account numbers of the seller and buyer, the sales value, the amount of tax due, and the buyer's address where the collection was made.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The disadvantages found in this system are above all associated to the involvement of the financial institutions in the collection of taxes on consumption, which raises the issue of anonymity (Ligthart, 2004). A further disadvantage would be the increased use of digital money as another method of making payments and of evading the control of the financial institutions.

Online shops could also avoid taxation by fixing their address in countries or states where the tax rates are lower and using a PO box or a friend's address for this purpose (Ligthart, 2004). Nevertheless, this system may be appropriate to implement as it would improve the conditions of the financial institutions through investments in suitable technology and offering compensations for their costs (Ligthart, 2004).

Technology Based Solutions

Using technological means would be the simplest way to lower the costs of taxation for both sellers and the tax authorities. The best way would be to have a software that applies the tax rate of the destination country at the time of purchase, calculates the amount due, charges the client's credit card and transfers the amount due to the account of the tax authority where the goods will be consumed (Ligthart, 2004).

The software would be easy and simple to install. The computer system would be developed and made available and open to everyone so that nobody could earn money or any other kind of compensation. The program would be installed in the seller's site, which would automatically keep track of the products sold, enabling the government to receive the correct amount of tax.

After the client paid the amount of tax due for the product, that tax amount would be calculated and automatically transferred to the government bank account by electronic means of payment. The program would be codified in such a way that the price per item would vary for each client depending on which country the client is in and the specific tax rate (Ligthart, 2004). The issue raised by the proposal is that it would be necessary to create an administrative body to supervise all operations and deal with any problems that arose. Some authors are of the opinion that this should be the responsibility of the World Trade Organization, while others believe that a new body should be formed to ensure the integrity of the system.

Bit Tax

The taxation of e-commerce has motivated wide ranging debates and studies. It is a complex topic given the difficulty of harmonizing the current system with the new technological trends. The growing interest from international doctrine in finding a method by which e-commerce could be taxed in the 1990s led to Cordell and Ide (1994) and Cordell (1995) proposing a taxation on information flow: the Bit Tax.

Cordell and Ide (1994), proposed a tax that was characterized by a small fee charged in line with the number of bits transmitted by the internet. The telecommunications operators, satellites and connection systems would collect and remit the tax payment to their state.

The authors advocate the need for a tax like the Bit Tax to tax a new privileged form of producing wealth through the new information technologies. They argue that the shift to an economy of intangible goods has made it almost impossible to measure transactions and has eroded the taxable base; new instruments are therefore required that can deal with the economic changes underway and address the challenge of taxing electronic transactions.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The challenge is to define a tax base compatible with the growing presence of e-commerce. According to the authors, the new tax base is the myriad of transactions, image, voice, text and data made through the global telecommunication networks by cable and satellite.

The Bit Tax would be applied to the added value generated by the interactivity of digital transactions; it is noted that all digital communication would be subject to tax because the productivity and added value would be generated in the new economy through the interactivity existing in the new information technologies.

The taxation of bits has not received the expected consensus or international approval due to a number of discriminatory instruments, the most important of which is that it completely fails to stimulate a predominant global interest, namely, the progress and increasing use of e-commerce worldwide.

The proposal of the Bit Tax was not accepted by either the OECD or the EU. The latter's response came in the Commission's Communication entitled "A European initiative for e-commerce", in which the adoption of the Bit Tax was rejected on the grounds that the matter would be resolved by VAT; it was only necessary to analyze the impact of e-commerce on the current rules of indirect taxation and to decide on how they should be adapted. Meanwhile the OECD has totally rejected the Bit Tax, which it sees as a revolutionary and undesirable invention that could undermine the development of e-commerce.

CONCLUSION

In this chapter, we examine the problems related to the direct international taxation of electronic commerce and identifies the alternative solutions that have been adopted in the current fiscal framework. With the development of new technologies, namely the internet, new forms of commerce began to appear; of these, e-commerce stands out for its steady and constant growth.

The development of this new kind of commerce toppled international barriers and frontiers and has made cooperation between the world's states indispensable so as to facilitate its development and resolve any problems arising from it. As e-commerce is a new method of conducting commercial transactions, a taxation system must be developed that provides justice, equity and equality.

The most feasible of the systems proposed by authors is that of tax being withheld at source by financial intermediaries. This method of taxation entails the financial institutions' collaboration with the different states. These institutions would have to keep an up-to-date database with the tax rates of each country to be applied in the different operations.

An alternative proposal is based on technological solutions. This system defends having software that, at the time of purchase, would apply the appropriate rate of tax depending on the destination country. This method would give the tax authorities the ability to detect and tax operations in a timely manner.

In Europe and internationally, the European Commission and the OECD have proved to be the most dynamic organizations and have made the greatest contribution to advances in legislation that allow the tax due to be applied to e-commerce operations. The meetings of these two organizations, namely "Dismantling the Barriers to Global Electronic Commerce" in Turku, Finland in 1997 and the Ottawa Conference in 1998 entitled "A Borderless World", were the first steps and demonstrated the desire to join forces to find a way to enforce the collection of tax by governments.

In the research conducted for the purposes of this chapter, we found that the tax systems in the European Union vary from one country to another. This problem arises in part because the European Union has many member states and not all of them enjoy the same economic, social and cultural conditions.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The EU is a space in which people, goods and service circulate freely between countries, and therefore companies can benefit from the competitive advantage of being located in countries with lower tax rates.

With regards taxation on income, the connecting factor of residence comes to a crisis point when faced with the parameters of e-commerce. It is extremely difficulty to adapt the immaterial nature of e-commerce to the criterion of effective management as a means of putting the residence principle of taxation into practice. The legislative change should be implemented by a number of countries or through international efforts to harmonize practices, and sets out the future directions in the taxation of e-commerce.

In this chapter, we have stressed that the European Union should further their efforts towards bringing about greater global and fiscal harmonization between countries, so that the loopholes that persist for e-commerce are eliminated. More research needs to be done however to get a clear picture of the actual tax revenue losses/redistributions due to the rise of e-commerce.

KEY TERMS AND DEFINITIONS

Electronic Commerce: Business that takes place in a network, using contracts without property and established through an open process without much regulation. Any kind of commercial transaction in which the parties involved interact electronically and not through physical exchanges or contacts.

Internet: Is the global system of interconnected computer networks that use the internet protocol suite to link devices worldwide. It is a network of networks that consists of private, public, academic, business, and government networks of local to global scope, linked by a broad array of electronic, wireless, and optical networking technologies.

Permanent Establishment: Is a fixed place of business through which an enterprise wholly or partially conducts its activity.

Taxation: Taxation refers to compulsory or coercive money collection by a levying authority, usually a government. The term "taxation" applies to all types of involuntary levies, from income to capital gains to estate tax.

Taxation at Source: This is in line with the traditional model whereby tax is charged by the seller who is responsible for collecting and remitting the tax to the fiscal authority of their own country.

Chapter 88
Construction Basis of C2C E-commerce Credit Evaluation Index

Hua Peng
Wuyi University, School of Business, Fujian, China

ABSTRACT

C2C e-commerce rapidly develops, which is an important economic pillar. With the deepening of the network life, more and more people join the C2C e-commerce transactions. However, the credit problem of C2C e-commerce has serious hidden security problems. So, the paper analyzes the present situation of C2C e-commerce credit problem and points out the existing problems. Scientifically, systematically, validity, feasibility and comparability are taken as principles to establish the first level indicators that including commodity property, business services, and logistics services and to establish the secondary indicators that reasonable price, timely delivery and so on. Using AHP, the weight of each level indicator can be calculated. C2C e-commerce evaluation model is established. Then the model is improved on transaction amount and evaluation time, so it can provide a theoretical basis for C2C e-commerce credit evaluation system.

INTRODUCTION

With the improvement of life informatization level, e-commerce has become an important part of national economy. Especially for young people, "Taobao" is the main way of shopping (Schilling et al., 2016). However, under the background of rising prosperity, credit crisis has great hidden security problems (Kang et al., 2016). In the process of C2C e-commerce transactions, consumers can't see the material object, or even ensure the quality of the goods. The index of judging the quality of goods is business creditworthiness and the former customers' evaluation. However, due to the lack of legal norms, there are huge false information that cheats customers in the current e-commerce market, such as the exaggeration of the commodity quality, even fake commodities and so on (Sang et al., 2017; Acampora et al., 2016). So the trust between sellers and buyers is weak, and the volume of e-commerce transaction is affected.

In the transactions among strangers, credit is important, the credit status of sellers can be evaluated by a third-party certification or be permitted by law (Weng et al., 2016; Francesch, 2015). E-commerce transaction is an online transaction based on stranger's transaction, and credit system is an effective method to improve this kind of trade (Kwon et al., 2017). This is because the first step of online shopping is browsing goods, the second step is checking the credit records of sellers. So, the historical records will directly impact on consumers' purchase behavior (Chang & Chen, 2014).

Although the present big websites design the evaluation system, the system is relatively simple, and the security is not strong. There are some phenomena such as false transactions and credit hype. So, the construction of C2C e-commerce credit evaluation system is necessary. So, in this paper, scientifically, rationality and behavior principle are taken as the principles and the relevant evaluation index is established to standardize the C2C e-commerce market and achieve good faith transactions.

THE PRESENT SITUATION OF C2C E-COMMERCE CREDIT EVALUATION

According to incomplete statistics, in the process of e-commerce transaction, the most important problems attracting consumers are the delivery service and the quality of the goods. The problem that attracts the most attention is that the consistency between the actual goods and introduced goods is weak. The second problem is that goods delivery service cannot meet the requirements of consumers. And there is credit problem that can't be ignored in C2C e-commerce.

The e-Commerce Credit Status

The Goods Quality

Usually, in the process of C2C e-commerce, advertising information of products from sellers is the main way for buyers to get product information. In promotional information, sellers take the low price as the attractive point, and as much as possible describe advantages of goods even exaggerate the advantages of the goods. Therefore, the buyers cannot truly distinguish the quality of the goods, and credit problem will seriously affect the buyer's passion for C2C electronic shopping.

After-Sales Service

C2C e-commerce refers to transactions between individual and individual. Sellers can't issue formal invoice of sold goods, so there are some problems such as after-sales service, return of goods and complaints for merchants. With the vigorous development of e-commerce, there are various disputes in e-commerce. Supervisors of each C2C e-commerce websites is insufficient, so the inspection of sellers cannot be well supervised. It is difficult to implement the after-sales service (Yan & Yuan, 2012).

The Fraud Problem

If buyers choose goods, they usually choose the sellers with high credibility. But the quality level of sellers is different. The illegal sellers take advantage of credit publicity to increase their credibility. They

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

even provide false information and accept payment, but they cheat the buyers by not offering the goods. These behaviors seriously disrupt the stability of the e-commerce market.

From the perspective of trust mechanism and economic theory, online credit evaluation and feedback mechanism, the evaluation of the third-party trust company and credit card guarantee are three kinds of effective mechanisms. The researchers find effective credit mechanism should be mandatory, such as legal constraints, flexibility and adjustment of market (Arvanitou et al., 2017).

The Present Situation and Characteristics of Evaluation Model

Traditional markets transactions have been real and legal constraints. But e-commerce lacks this constraint, especially C2C trading patterns (Rouibah et al., 2016).

The Present Situation of e-Commerce Evaluation Model

Before the deal, sellers deal is credit record. However, the present credit evaluation process is simple (as shown in Figure 1), the credit evaluation model is single.

The Cumulative Credit Model

Cumulative credit model is relatively common in C2C e-commerce credit evaluation model. Its theory is that the credibility of sellers is simply accumulated. The mathematical representation is

$$B_N = B_{N\text{-}1} + b_N, b_N \in \{\text{-}1, 0, 1\} \tag{1}$$

B_N is the present credibility value of sellers.
$B_{N\text{-}1}$ is the recent credibility value of sellers.
r_N is the Nth credit evaluation scores of sellers.

The Average Credit Model

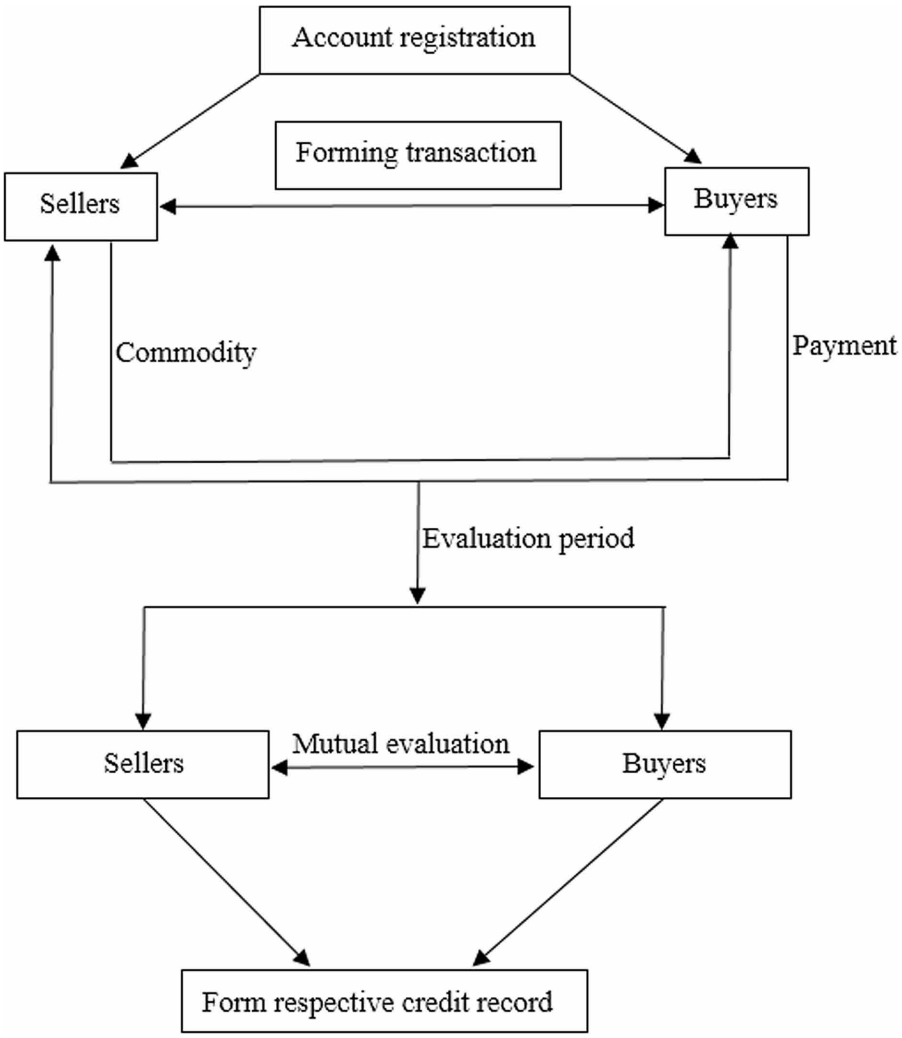
The average credit model is that all the credit scores of sellers are added, and then the average value is obtained. The result is the credibility of sellers. The mathematical representation is

$$B_N = \frac{B_{N\text{-}1} \times (n\text{ - }1) + b_N}{n}, b_N \in \{\text{-}1, 0, 1\} \tag{2}$$

B_N is the present credibility value of sellers.
$B_{N\text{-}1}$ is the recent credibility value of sellers.
r_N is the Nth credit evaluation scores of sellers.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. C2C electronic trading evaluation process



The Present Problems

The present C2C e-commerce evaluation model is simple, the evaluation index is disorder, and the layer is weak. Firstly, in the evaluation process, the subjectivity of each index is strong, it is difficult to distinguish that the evaluation is for sellers or goods. Secondly, the business credit records cannot reflect the obvious distinction; "Good, general, bad" three kinds cannot accurately feedback the quality of the goods.

The Characteristics of C2C e-Commerce Evaluation

Compared with the offline credit evaluation, e-commerce evaluation is obviously different, which is mainly reflected in the evaluation subject, the performance of the evaluation results, the reference population of the evaluation results and evaluation index (Chang et al., 2017).

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Evaluation Subject

In the process of offline business transactions, the evaluation of the credit problem should be carried out by the professional credit rating agencies (third party). In the evaluation process of C2C E-commerce, evaluation can be carried out by professional credit rating agencies. But its evaluation results are not fully recognized, and the consumer's evaluation in the latter part of the transaction is more credible (Efferin & Hopper, 2007).

The Performance of Evaluation Results

In the process of offline business transactions, the evaluation results of the credit problems are usually reported in the form of a written report to the consumer. In the evaluation process of C2C E-commerce, virtual trading platform and anonymous shopping situation will not lead to the emergence of a written report. Therefore, the electronic credit report has become the main method of the evaluation results.

The Reference Population of Evaluation Results

Due to the physical nature of the offline transactions, in the course of its transaction, consumers' attention to credit rating is not high; investors are more concerned about the credit rating report. In the evaluation process of C2C E-commerce, credit evaluation results are a strong reference whether a transaction can be continued.

Evaluation Indicator

In the process of the offline transactions, enterprise business scope, financial status, profit space and development prospects and other issues will be used as evaluation indicators. In the evaluation process of C2C E-commerce, both sides of the transaction are independent natural individuals, so consumers are more concerned about the consistency of the product description, the historical credit records of sellers and business services attitude and other issues.

THE ESTABLISHMENT OF INDEX SYSTEM OF CREDIT EVALUATION

The index system of credit evaluation should be based on the principle of scientific, systematic, legal, feasibility and comparability, as much as possible to reflect the business of credit information. The following is to build the index system of credit evaluation based on the AHP theory.

Evaluation Indicator

The Commodity Property

Commodity nature mainly refers to the consistency of the commodity physical and the figure description of trading platform, the reasonable price of goods and the coincidence degree of goods quantity and the order quantity.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Sellers' Service

Seller's services mainly refer to the customer service attitude, the sending after the completion order and delivery timeliness, and seller's service after the receipt. Among these factors, customers are more concerned about the service attitude, the online answer timely, good communication attitude.

Logistics Service

Logistics service mainly refers that whether the goods are completed in the given time, and whether goods in the distributing process are damage.

The Establishment of Evaluation Index Weight

AHP can solve the more complex and vaguer decision problems. There are four steps to use this method (Garg & Bawa, 2017):

1. To establish a program with hierarchical structure
2. To establish a judgment matrix
3. To order each level and the examination of consistency
4. The total order of levels and the examination of consistency

Hierarchical Structure

The problems solved by AHP need hierarchy, organization and logicality. Only in this way can we construct a hierarchical scheme. For elements of tedious problem, the attribute, the degree of membership and the relationship are formed multiple progressive layers. The elements on the upper layer have a dominant effect. Generally, these levels are divided into three categories (Yoo et al., 2016)

1. The first layer.
    a. This layer contains only one factor, it is the ultimate goal. This layer is also called the goal layer.
2. The middle layer.
    a. This layer exists in the middle process to achieve the objectives. It may contain many layers. It is called principle layer.
3. The bottom layer.
    a. In this layer, there are various ways to achieve the goal, which can be used. It can also be called a measure layer or a solution layer.

The number of layers in the hierarchical structure is related to the complexity of the research problems and the detailed requirements of the analysis. Usually the number of layers will not be restricted; the elements in each layer are usually not more than 9.

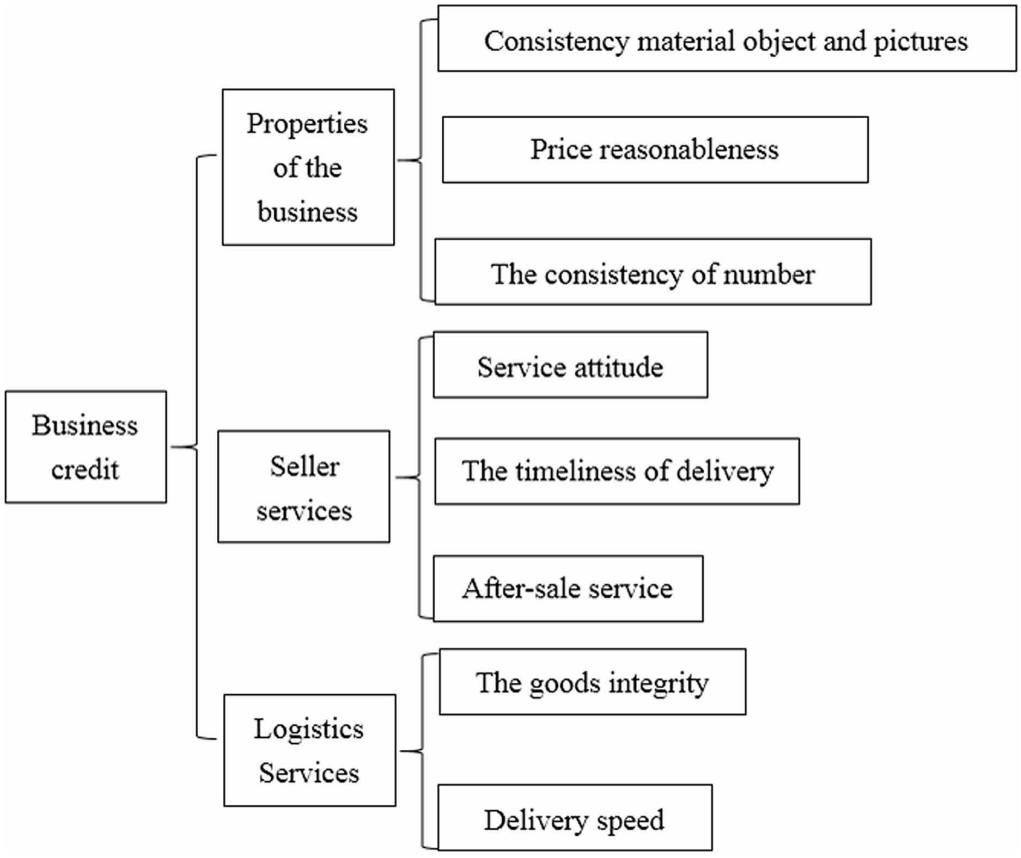
EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

In Figure 2, the nature of goods, sellers' services and logistics services are the first level indicators. The reasonable commodity price is the second level indicators. Bi represents the first level indicators; Ci represents the second level indicators. These indexes are investigated by questionnaire. The results of the survey will be used to construct the judgment matrix.

Compared with the country that C2C e-commerce developed earlier, the establishment of the credit evaluation system of C2C e-commerce in China lags behind the mode operation of C2C e-commerce.

So, the corresponding evaluation indexes should be established to meet the reasonable credit evaluation of the C2C e-commerce market. From the Figure 2, we can find that no matter what the first level indicators or two indicators are, they are different from the conventional evaluation indicators. This is because C2C e-commerce transactions are not the individual enterprises, and they are pure natural persons. General evaluation index is not enough to reflect the sellers' credit.

Figure 2. Credit evaluation index hierarchy chart



EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Establishment of Judgment Matrix

The structure between each layer can indicate the relationship among factors. But the proportion that the various factors in the middle layer accounts for the evaluation system will not be completely the same. In the minds of the reviewers, each factor has a certain proportion.

When determining the proportion of each factor, the influence of n factors $X=\{x_1,\ldots,x_n\}$ on factor Z is ensured. Saaty and other scholars proposed pair wise contrast, and then the comparison matrix was built. In other words, two factors x_i and x_j are selected for each time. a_{ij} represents the proportion of the influence that x_i and x_j affect Z. Matrix $A=(a_{ij})_{n\times n}$ represents all the comparison results. A is Z-X judgment matrix. What can be seen from the matrix, if the proportion of the influence that x_i and x_j affect Z is a_{ij} so $a_{ji}=1/a_{ij}$.

According to the theoretical knowledge of linear algebra, if matrix $A=(a_{ij})_{n\times n}$ meet $a_{ij}>0$, and $a_{ji}=1/a_{ij}$ $(i, j=1, 2, \ldots, n)$, so matrix A is positive reciprocal matrix.

The value of a_{ij} can be ensured by the scale value table in Table 1.

Table 1. Scale value table

Scale	Meaning
1	The two elements are of the same importance.
3	For two comparisons of the elements, the former is a little more important than the latter
5	For two comparisons of the elements, the former is more important than the latter.
7	For two comparisons of the elements, the former is much more important than the latter
9	For two comparisons of the elements, the former is more extremely important than the latter
2, 4, 6, 8	In the middle of the above judgment
reciprocal	The ratio of importance of i and j is a_{ij}, $a_{ji}=\dfrac{1}{a_{ij}}$

Examination of Consistency

$\lambda_{\max}$ is the maximum value of eigenvalue of matrix A, W is eigenvector. By normalizing and ordering, the weight of the comparison importance of the corresponding elements of the same layer and a factor in the upper layer, this process is called hierarchical single ranking. Although this process can reduce the interference of other factors, the comprehensive comparison of the results will inevitably appear inconsistent. If the comparison results are consistent, so factors in matrix A also meet:

$$a_{ij}a_{jk}=a_{ik},\forall i,j,k=1,2,\cdots,n \tag{3}$$

The positive reciprocal matrix is known as the uniform matrix. In order to ensure that if A can be accepted, the inconsistency of A must be checked to know whether the inconsistency is serious or not.

If A is a consistent matrix, so

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. A must be Positive reciprocal matrix.
2. Transpose matrix A^T is a consistent matrix.
3. Any two lines of matrix A is proportional, and the factor is bigger than 0. So rank (A)=1, columns are the same as this.
4. In matrix A, $\lambda_{max}=n$, n is the matrix order.
5. Eigenvector of λ_{max} is $W=(w_1, \ldots, w_n)^T$, so $a_{ij}=\frac{w_i}{w_j}, \forall\ i,j=1,2,\ldots,n$

$$A=\begin{bmatrix} \frac{w_1}{w_1} & \frac{w_1}{w_2} & \cdots & \frac{w_1}{w_n} \\ \frac{w_2}{w_1} & \frac{w_2}{w_2} & \cdots & \frac{w_2}{w_n} \\ \vdots & \vdots & \cdots & \vdots \\ \frac{w_n}{w_1} & \frac{w_n}{w_2} & \cdots & \frac{w_n}{w_n} \end{bmatrix} \tag{4}$$

A is positive reciprocal matrix with n order. When it is consistent matrix, only if $\lambda_{max}=n$ and A is inconsistent matrix, so $\lambda_{max}=n$. Accordingly, by checking the relationship of λ_{max} and n, we can know whether matrix A is consistent matrix or not.

The step of checking consistency for A.

Computing Consistent Target CI

$$CI=\frac{\lambda_{max}-n}{n-1} \tag{5}$$

Finding the corresponding average random consistency index RI

The value of *RI* is researched by Saaty, as follows in Table 2.

Table 2. The value of RI

n	1	2	3	4	5	6	7	8	9
RI	0	0	0.58	0.90	1.12	1.24	1.32	1.41	1.45

The *RI* value is obtained by the method of randomly constructing 500 sample matrices. Randomly selecting figures from the 1-9 and the reciprocal, the positive reciprocal matrix is built, the biggest eigenvalue of average λ_{max} is obtained, and the definition is

$$RI=\frac{\lambda'_{max}-n}{n-1} \tag{6}$$

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Consistency Ratio CR

$$CR = \frac{CI}{RI} \tag{7}$$

When $CR < 0.10$, the consistency of matrix A is acceptable. Conversely, it needs to adjust.

Weight Calculation

Randomly select 200 from users in the online shopping, for Internet users in C2C E-commerce, a questionnaire survey is conducted to investigate the nature of the goods, the sellers' services and logistics services. The number of valid questionnaires is 169; the recovery rate is 84.5%. Survey result shows that the concern degree of B_1, B_2, B_3 is 62.9%,13.6%,23.5%. Hence sellers' credit judgment matrix is as follows:

$$A = \begin{bmatrix} 1 & 5 & 3 \\ \frac{1}{5} & 1 & \frac{1}{4} \\ \frac{1}{3} & 4 & 1 \end{bmatrix}$$

In the same way, judgment matrix of each level index is

$$B_1 = \begin{bmatrix} 1 & \frac{1}{3} & 2 \\ 3 & 1 & 4 \\ \frac{1}{2} & \frac{1}{4} & 1 \end{bmatrix}$$

$$B_2 = \begin{bmatrix} 1 & \frac{1}{6} & \frac{1}{5} \\ 6 & 1 & 3 \\ 5 & \frac{1}{3} & 1 \end{bmatrix}$$

$$B_3 = \begin{bmatrix} 1 & 2 \\ \frac{1}{2} & 1 \end{bmatrix}$$

Using Matlab software to make AHP program, weight coefficients of all levels of factors are calculated. After consistency check, the layer weigh is ordered.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Consistency Check

$$A\lambda_{\max} = 3.1226, CI = \frac{3.0926-3}{3-1} = 0.0613, CR = \frac{0.07565}{0.58} = 0.0798 < 0.1$$

$$B_1\lambda_{\max} = 3.0952, CI = \frac{3.0952-3}{3-1} = 0.0476, CR = \frac{0.0476}{0.58} = 0.0821 < 0.1$$

$$B_2\lambda_{\max} = 3.0624, CI = \frac{3.0624-3}{3-1} = 0.0312, CR = \frac{0.0312}{0.58} = 0.0538 < 0.1$$

As the logistics service only contains two the second level indicators, consistency is acceptable. In summary, consistency test can be passed. The general sort of hierarchy weights is shown in Table 3.

Table 3. The general sort of hierarchy weights

	C_1	C_2	C_3	C_4	C_5	C_6	C_7	C_8
	(0.314)	**(0.518)**	**(0.168)**	**(0.108)**	**(0.597)**	**(0.295)**	**(0.683)**	**(0.317)**
B_1 (0.6254)	0.1964	0.3240	0.1051	--	--	--	--	--
B_2 (0.1264)	--	--	--	0.014	0.0755	0.0373	--	--
B_3 (0.2462)	--	--	--	--	--	--	0.1682	0.0780

IMPROVEMENT SCHEME OF CREDIT EVALUATION MODEL

The target of C2C e-commerce credit evaluation model is scientifically reflected credit information so as to provide better reference value for customers. So, the specific implementation measures include credit evaluation grading, weight classification and management evaluation and so on.

Credit Rating Division

The credit rating is divided into five grades by three grades. The five grades are good, better, medium, worse and poor. The scoring standard need to make the corresponding change, (+2) (+1) (0) (-1) (-2). The rating division can reduce the customer's cognitive bias, and can objectively show the credibility of the sellers.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Weight Score

In the traditional evaluation model, the credibility of the sellers is only related to the evaluation of the number; it does not consider the transaction price, evaluation date and other factors. In the improved model, the weight of these factors should be properly distinguished.

Transaction Price Weighted

Reputation is just obtained by the product adding of each score in accordance with the proportion of the weight. It cannot guarantee the fairness of credit evaluation. This is because many sellers use frequent small transactions to enhance the credibility. The key to solve this problem is to increase the proportion of large transactions in the score (Single credit evaluation=buyer's evaluation × the weight of transaction amount), to reduce the damage caused by the deliberate increase in reputation. The weight of the transaction amount is shown in Table 4.

Table 4. The weight distribution of the transaction

Transaction amount(yuan)	Weight ratio
< 1/5 (Highest commodity price + Minimum commodity price)	0.1
< 1/4 (Highest commodity price + Minimum commodity price)	0.3
< 1/2 (Highest commodity price + Minimum commodity price)	0.5
< 3/4 (Highest commodity price + Minimum commodity price)	0.8
< (Highest commodity price + Minimum commodity price)	1

Evaluation Time Weighting

The increase of reputation is changing with time; it is not only the accumulation of time point evaluation. Especially for C2C E-commerce, there will be a big difference in reputation in different periods. Therefore, the recent credit evaluation can better reflect the credibility of the sellers. In the evaluation model, weighted time formula is comprehensive credit evaluation = single evaluation × evaluation time weight. The time weights are evaluated as shown in Table 5.

THE APPLICATION OF MODEL

Randomly select a Taobao network clothing store, please use the new model of three buyers to evaluate the Taobao network shop. Evaluation process for sellers' promotion information-Customer browsing information-Customers select merchants-Communication between the two sides-Transaction Completion-Evaluation completed. The evaluation process is carried out in accordance with the five level evaluations and the analytic hierarchy process. Take a buyer's evaluation process as an example to illustrate.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 5. Time weight distribution table

Score time	Weight ratio
A recent week	1
A recent month	0.95
Two recent months	0.9
Four recent months	0.8
Six recent months	0.7
Half year ago	0.6
A year ago	0.4

The Evaluation Score of the Secondary Index

According to the corresponding weight value calculation, the paper finds the shop's credit rating is 1.5013 points from the buyer. The transaction amount is 184 yuan < 1/4(highest commodity price + lowest commodity price). The transaction took place in the last two months, so the final credit score is 0.428 points.

Table 6. The evaluation score of the secondary index

Index	C_1	C_2	C_3	C_4	C_5	C_6	C_7	C_8
score	1	2	2	0	2	1	2	-1

Advantages of Improved Model

The one is the improved model which has relatively reasonable data to improve the effectiveness of the evaluation results. It can provide buyers with more valuable credit records. The other one is the improved model which is relatively simple and easy to use, the calculation method is more scientific and it has a wide range of application value.

The experimental results show that the algorithm has a satisfactory performance compared with the traditional trust algorithm in the influence of transaction behavior on trust degree.

CONCLUSION

In this paper, the current credit status of C2C e-commerce is analyzed. On this basis, the index factors in the evaluation model are established using AHP to analyze weight, and the evaluation system is established. The credit evaluation model is improved from two aspects of the transaction amount and the evaluation time. At present, in addition to a reasonable credit evaluation system of C2C e-commerce platform, relevant credit legislation and credit management departments should also introduce a series of management measures.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Credit Consciousness and the Normalization and Standardization of Credit

Credit awareness is not strong in our country. Especially for sellers, it is necessary to guide the good faith awareness. Relevant departments should make full use of the network platform, the actual life of the window publicity column and other areas to guide the public to properly and actively carry out the relevant activities of credit awareness. For the credit standard management of C2C electronic commerce website, it should also follow the principle of unity, mobilize the enthusiasm of e-commerce sites to provide suggestions about the standard of evaluation system, so as to establish a unified credit evaluation system, facilitate the rational choice of consumers and prevent unscrupulous sellers' fraud behaviors.

The Establishment of Credit Management Rules and Regulations

Sound regulations and regulations are the constraints of integrity management. E-commerce transactions are different from traditional transactions in its lack of supervision of the actual operation. Therefore, the relevant departments should be based on the nature of the e-commerce business to develop easy to control, easy to implement, easy to discipline regulations and regulations. It forms an orderly operation and orderly management of a good e-commerce market atmosphere. For sellers who do not abide by the regulations, laws and regulations should be strict formulated. And fraud and illegal behavior in the e-commerce market should be cracked down on, so as to realize the electronic commerce credit market.

Chapter 89
Uncertainty Avoidance and Consumer Cognitive Innovativeness in E-Commerce

Osama Sohaib
University of Technology Sydney, Sydney, Australia

Kyeong Kang
University of Technology Sydney, Sydney, Australia

Iwona Miliszewska
University of Technology Sydney, Sydney, Australia

ABSTRACT

This article describes how despite the extensive academic interest in e-commerce, an investigation of consumer cognitive innovativeness towards new product purchase intention has been neglected. Based on the stimulus–organism–response (S–O–R) model, this study investigates the consumer cognitive innovativeness and the moderating role of the individual consumer-level uncertainty avoidance cultural value towards new product purchase intention in business-to-consumer (B2C) e-commerce. Structural equation modelling, such as partial least squares (PLS) path modelling was used to test the model, using a sample of 255 participants in Australia who have had prior online shopping experience. The findings show that the online store web atmosphere influences consumers' cognitive innovativeness to purchase new products in countries with diverse degrees of uncertainty avoidance such as Australia. The results provide some guidance for a B2C website design based on how individual's uncertainty avoidance and cognitive innovativeness can aid the online consumer purchasing decision-making process.

INTRODUCTION

The primary way a business-to-consumer (B2C) e-commerce firm communicates with its consumers is through their website. According to the Australian Nielsen Connected Consumers Report (2016), a large number of consumers go to manufacturers' and retailers' website directly, with 65% of consumers visiting the retailer's website and 36% visiting the manufacturer's website for online purchase (Zrim, 2016). Therefore, it is necessary to evaluate the effectiveness of websites' components to understand whether online stores are providing the interaction desired by the consumers. E-retailers should provide important stimuli and ensure that their website offers unique benefits and values to encourage consumers to buy products online. If e-retailers intends to turn first-time consumers into repeat online consumers, the e-retail experience has to deliver unique value regarding the consumer's interaction with the website. In the area of B2C e-commerce, the web cognitive landscape refers to whether consumers believe that the information presented on the website makes it easy for them to purchase products. E-commerce web design is vital because businesses can lose 50% of the potential consumer due to consumer unable to find the product what they want (van der Merwe & Bekker, 2003). This means that the structural assurance of the website provided by the e-retailer should demonstrate a clear understanding of the reasons why consumers cognitively believe that they should shop at one specific website rather than at other ones (Li, Yen, Liu, & Chang, 2013).

Countries vary significantly on innovativeness as measured by consumer reluctance (Tellis, Yin, & Bell, 2009). The concept of consumer innovativeness denotes "inter-individual differences that characterize people's responses to new things" (Goldsmith & Foxall, 2003). The success of e-commerce also depends on a consumer's culture (Sohaib and Kang, 2015a) as culture influences consumer innovativeness. Often country is used as a proxy for culture at a group level; however, it is more appropriate to measure culture at the individual level because online purchasing is an individually oriented one-person action (Sohaib and Kang 2015b). The innovative consumer plays a vital role in the adoption of new products. There are at least three approaches to the conceptualisation of innovativeness: behavioural, global traits and domain-specific activity (Goldsmith & Foxall, 2003). Behavioural refers to whether consumers are innovators or non-innovators in their attitude to adopting new products, global traits are personality traits, while domain-specific activity denotes a consumer's innovativeness within specific product categories. The most significant aspect of behaviour is its connection to cognition. Behaviour results from some form of cognition (Faiola & Matei, 2006). Our concern is with the behavioural perspective of consumers' innovativeness, which identifies consumers as innovators or non-innovators depending on their purchase of a new product. A person's perceptions may change their attitudes to new products and ideas and their level of innovativeness (Rogers, 1995).

In the context of e-commerce, how consumers react to innovation, specifically whether consumers adopt new products or not, depends on their purchasing decision-making process and a variety of internal and external influences. The measurement of cognitive innovativeness is important to this process. Consumer perception of information is directly related to cognition (Ha, John, & Chung, 2016). In addition to this, cultural experiences influence cognitive processes (Faiola & Matei, 2006), for example, online transactions can provoke a high level of uncertainty (Sabiote, Frías, & Castañeda, 2012). The cultural value of uncertainty avoidance is significantly connected to innovativeness (Dobre, Dragomir, & Preda, 2009). Therefore, consumer innovativeness plays an important role in encouraging consumers to shop online.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The first objective of this study is to investigate the influencing factors of consumer cognitive innovativeness regarding new product purchase intention. This study extends the work of Sohaib and Kang (2015b) by including the role of cognitive innovativeness towards new product purchase intention and using the moderating role of individual consumer level uncertainty avoidance (UA) cultural value. The second objective of this study is to investigate whether high UA and low UA consumers have different cognitive innovativeness towards purchasing intentions. The research questions of this study are as follows:

Research Question 1: Do web design factors affect consumer cognitive innovativeness towards purchase intention of new products in B2C e-commerce?

Research Question 2 and 3: Does the consumers' level of UA play an important moderating role between factors that affect new product purchase intention in B2C e-commerce? Moreover, what are the difference between high UA and low UA consumers?

For this study, 'new product purchase' refers to any product not purchased online in the past. To the best of the authors' knowledge, this is the first research study that investigates the role of consumer cognitive innovativeness and different levels of uncertainty avoidance cultural value in e-commerce. As such, it contributes to the understanding of online vendors' perception of innovative approaches to B2C websites.

This paper is structured as follows. We first critically analyse the literature on the consumer cognitive innovativeness, web cognitive landscape, and the cultural value of uncertainty avoidance. We then discuss the theoretical background from which we developed our research model and hypotheses. Following that, we describe our research methodology and present the results of this study. Finally, we discuss the practical and theoretical implications of the study and conclude with the limitations and future direction for research.

THEORETICAL BACKGROUND

Consumer Cognitive Innovativeness

This research defines 'consumer cognitive innovativeness' as a consumer's rational thinking, problem-solving and decision-making tendencies as related to new product purchase in a B2C e-commerce website. Scholars have enriched consumer innovativeness by measuring its various dimensions. Venkatraman and Price (1990) distinguish cognitive from sensory innovativeness, with cognitive innovativeness referring to cognitive qualities that influence individuals to seek stimulation of the mind while sensory innovativeness refers to the cognitive qualities that influence individuals to seek sensory stimulation. Consumer innovativeness refers to consumers' proneness to adopt new products (Tellis et al., 2009).

Manning, Bearden and Madden (1995) characterise two aspects of consumer innovativeness: consumer independent judgment-making and consumer novelty-seeking. Consumer independent judgment-making refers to the degree to which an individual makes innovation decisions independently, while consumers' novelty-seeking denotes the desire to look for new product information. According to Blake, Neuendorf and Valdiserri (2003), innovativeness is the relative willingness of an individual to try a new product. In the context of B2C e-commerce, this means the tendency to buy new products soon after they appear online. Consumers are categorised as innovators or non-innovators depending on their purchase of a

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

new product (Goldsmith & Foxall, 2003). According to Lim et al. (2004), the cognitive cues of a B2C website form a basis of consumer trust in an online store that does not have an established reputation. Kim (2005) notes that cognition-based trust is associated with consumers' observations and perceptions regarding the features and characteristics of an e-commerce website.

The value with the most proximate impact on an individual's cognitive interpretations is personal innovativeness (Lu, 2014). According to Venkatraman and Price (1990), individuals who have a high need for cognition are more likely to analyse information than those with a low need for cognition because they have a need to structure situations in meaningful ways. In particular, consumers with high cognitive innovativeness are more likely to adopt a technology (Venkatraman and Price, 1990). In addition to this, online consumers with high cognitive innovativeness put more emphasis on usefulness and aesthetic design (T.-L. Huang & Liao, 2014). However, "consumers with low cognitive innovativeness lack ability, knowledge, and involvement with regard to new technology; they are insensitive to the effect of the new technology in accomplishing a task" (T.-L. Huang & Liao, 2014). Considering B2C e-commerce websites, various web cognitive factors may stimulate a positive relationship with consumers with different levels of cognitive innovativeness.

Website Accessibility/Ease of Use

Website accessibility increases when a website has a high ease of use. Ease of use includes accessibility factors such as navigation, website content structure and search facilities (Lodorfos, Trosterud, & Whitworth, 2006). When a consumer visits a website for the first time, their trust is primarily based on initial perceptions of the trust-related attributes of the website, such as the cognition-based aspects which are formed from quick cognitive cues or first impressions (McKnight, Cummings, & Chervany, 1998). For example, the visual design of a website consists of graphical and structural factors from which consumers develop their first impression (Karimov, Brengman, & Hove, 2011). In the context of e-commerce, usefulness is how effective shopping on the Internet is in helping consumers to accomplish their task, and ease of use is the consumer's perception regarding how easy the Internet is to use as a shopping medium and how free the process is of effort in leading the consumer to achieve their final task (Monsuwe, Dellaert, & Ruyter, 2004). Brick-and-mortar stores are not designed to improve efficiency but to enhance persuasion opportunities. The same principle applies in the e-commerce environment, such as in designing web usability to maximise persuasion interaction (Schaffer, 2009). Website design factors such as information design and navigation design should be used in e-commerce websites to build consumer trust and subsequently enhance purchase intention (Dianne Cyr, 2013; Ganguly, Dash, & Cyr, 2010).

Therefore, the website accessibility concept adopted here considers the ease of use and usefulness aspects together with various design features that contribute to the overall website usability such as navigational design, information content and design.

Colour and Product Images

Once consumers interact with an e-commerce website, initial perceptions concerning website aesthetics often persuade the consumer to stay on the website for a longer duration (Alhammad & Gulliver, 2013). The aesthetic elements of a website such as colour and graphics usage are the most effective trust attributes of B2C websites (Tan, Tung, & Xu, 2009). The colour appeal of a B2C website is the degree to which the colours used, for example the background and font colour, are perceived as pleasing, ap-

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

pealing and appropriate. Product images are interactive image features, such as 3D virtual models, that consumers can operate to view product information by zooming in on product features, rotating a product to different angles and changing product colours. Visual design cues such as colour and product images can provide information about the Internet vendor as well as have an impact on consumers' emotional responses (Eroglu, Machleit, & Davis, 2003).

Social Networking Services

Social networking services are defined as a set of actors (people/organisations) and the set of connections among the actors representing some relationship (friendship/affiliation/information exchange) (Grabner-Kräuter, 2009). These include web communities and communication media. Web communities are online social networking sites, blogs, newsletters, forums and online product reviewing/ratings. Communication media include instant messaging, online help emails and chat. Social influence is a vital factor that determines user behaviours on social networking sites (Cheung, Lee, & Chan, 2015). Persuasive interaction ensures the perception of an acceptable level of social interaction via the use of social networking services (Alhammad & Gulliver, 2013). Consumers' trust is formed through permeating the mode of communication with a high social presence in a B2C e-commerce website. Gefen and Straub (2004) found a significant influence of social presence on consumer trust in B2C e-commerce, such as ability, integrity, predictability and benevolence. The opinions of others can impact consumers' purchasing intention (Lee, Shi, Cheung, Lim, & Sia, 2011). A model proposed by Brengman and Karimov (2012) investigated whether integrating social media cues (such as Facebook and blogs) as stimulus into an online store's website may provide a signal regarding the cognitive trust (organism) of an online vendor. The results show that social media cues have a significant effect on consumers' cognitive-based trust towards purchase intentions (response). In addition to this, Facebook advertising has a significant positive influence on consumer attitude towards the intention to purchase (Duffett, 2015). Guo, Wang, and Leskovec's (2011) study shows that information processing and trust positively influence consumer choice.

Uncertainty Avoidance

Geert Hofstede (1980) refers to the uncertainty avoidance cultural as having a certain degree of uncertainty. Australia is a practical society regarding uncertainty avoidance, with an index score of 51, and has a high degree of acceptance for new ideas, technology and business practices. For a B2C e-commerce to be successful, it is essential to note the cultural themes of targeted consumers. In particular, the uncertainty avoidance (UA) cultural value is closely associated with innovativeness in e-commerce (Dobre et al., 2009). Due to the high level of uncertainty of the virtual world, individual trust is affected (Al-Debei, Akroush, & Ashouri, 2015). As noted by Karahanna, Williams, Polites, Liu, and Seligman (2013), "Online purchasing is a decision-making process that involves inherent uncertainty". Uncertainty is an important moderator in online purchasing (Zhu, Chang, & Chang, 2015). Individuals with high uncertainty avoidance tend to desire outcomes by following the right direction for action (Duffett, 2015). Existing studies have applied Hofstede's (1980) cultural dimensions to examine the effect of cultural values on online purchasing decisions. However, in these studies, national cultural differences were observed at the country level. This is an issue as the assumption of homogeneity in any nation is

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

not suitable, in particular, if the national cultural concepts are to be integrated into information systems models that reflect individual behaviour (McCoy, Galletta, & King, 2005).

Culture is a significant influence on consumers' purchasing decisions (Constantinides, 2004; Ha & Janda, 2014), producing a range of emotional effects to a given stimulus (G. Hofstede, 2001). Srite and Karahanna (2006) argue that national culture is a macro-level phenomenon, whereas online purchasing is a one-person action; therefore, measuring culture at the individual consumer level is the most appropriate way to look at the effect of technology acceptance (Sohaib & Kang, 2015a). In addition, consumers with dissimilar cultures might have different expectations of what makes an online store trustworthy (Ganguly et al., 2010; Kim, 2005; Kim & Park, 2013; Sia, Lim, Leung, Lee, & Huang, 2009), which affects the establishment of trust.

Researchers (Hwang & Lee, 2012a; McCoy et al., 2005; Srite & Karahanna, 2006; Yoon, 2009) found Hofstede's cultural scales at the individual level acceptable in information systems research (more specifically, in e-commerce research). As B2C e-commerce continues to grow across cultures, it becomes critical to understand the cognitive influences between the consumer and the Internet vendor and the nature of cultural differences at the individual consumer level (Hwang & Lee, 2012a). Furthermore, cultural experiences influence cognitive processes that influence website design and its use (Faiola & Matei, 2006).

RESEARCH MODEL AND HYPOTHESES DEVELOPMENT

The stimulus–organism–response (S–O–R) model identifies cognitive aspects to determine the cognitive innovativeness towards purchasing intention. The S-O-R paradigm was first proposed by Mehrabian and Russell (1974) in the context of environmental psychology. The paradigm suggests that stimuli from the environment influence an individual's cognitive reactions, which in turn lead to a response. This paradigm was later extended and has been extensively applied to online shopping outcomes (Sohaib & Kang, 2015b).

The stimulus (S) is defined as "the total sum of all the cues that are visible and audible to the online shopper"; for example, "cognitive states are related to a consumer's information processing, retention, and retrieval ability" (Sheng & Joginapelly, 2012). The organism (O) represents the consumer's intermediary states of cognitive innovativeness. These internal states affect the consumer's approach, such as new product purchase intention, which is the response (R). Additionally, we also suggest the uncertainty avoidance cultural orientation moderates the effects of cognitive influences and cognitive innovativeness towards new product purchase intention. Research has shown that the uncertainty avoidance cultural value is significantly connected to innovativeness (Dobre et al., 2009). Figure 1 shows the proposed research model.

Hypothesis Development

Website Accessibility/Ease of Use

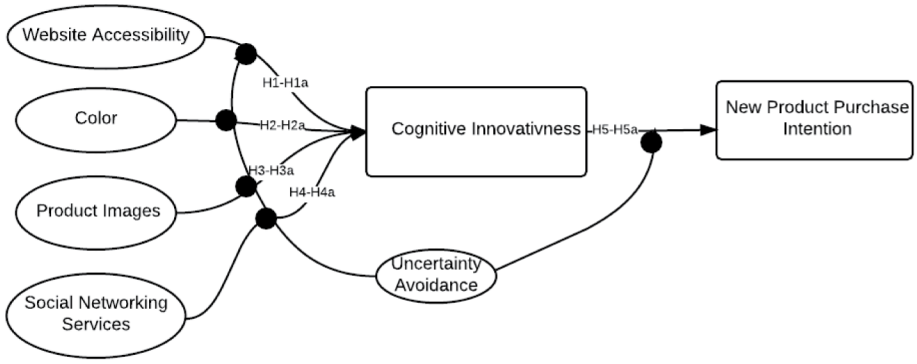
The navigation, page layout consistency and ease of access to an e-commerce website have to be designed with a complete understanding of a consumer group's culture (Cyr, 2008). According to Huang and Liao (2014), the perceived ease of use means that the consumer does not need to employ excessive cognitive

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

resources when using technology. Singh, Kumar and Baack (2005) state that online consumers from high uncertainty avoidance (UA) societies need better e-commerce website accessibility so that they do not leave the website. D. Cyr (2008) also finds that consumers who are high on the UA scale give a high value to web navigational design about to their purchasing intention. Therefore, we hypothesise:

H1: Individual level UA will moderate the relationship between website accessibility and consumer cognitive innovativeness such that the relationship is stronger for consumers in Australia.
H1a: The relationship between website accessibility and consumer cognitive innovativeness is stronger for high UA individuals than low UA individuals.

Figure 1. Research model



Colour and Product Images

The complexity of a B2C website, which includes the richness of factors such as colour scheme and use of product images, impacts online consumers with high cognitive innovativeness (T.-L. Huang & Liao, 2014). Additionally, S. Lee and Rao (2010) argue that in B2C e-commerce, aesthetic design produces differential responses in individuals. These visual appearances (colour and images) are more important to high UA consumers than low UA consumers (Ganguly et al., 2010). Therefore, we hypothesise:

H2: Individual level UA will moderate the relationship between colour and consumer cognitive innovativeness such that the relationship is stronger for consumers in Australia.
H2a: The relationship between colour and consumer cognitive innovativeness is stronger for high UA individuals than low UA individuals.
H3: Individual-level UA will moderate the relationship between product images and consumer high cognitive innovativeness such that the relationship is stronger for consumers in Australia.
H3a: The relationship between product images and consumer cognitive innovativeness is stronger for high UA individuals than low UA individuals.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social Networking Services

Online consumers with high cognitive innovativeness tend to make decisions on their own (T.-L. Huang & Liao, 2014). The integration of virtual communities like social network sites has a positive influence on cognitive-based trust towards purchasing intentions (Brengman & Karimov, 2012). In addition to this, social influence can build consumer trust in online shopping more effectively in high UA cultures than in low UA cultures (M. K. O. Lee et al., 2011). For example, people in high UA cultures such as South Korea, which has a UA index score of 85, are likely to obtain opinions of a website's reputation from friend and family recommendations, whereas those from low UA cultures such as Australia are more likely to make independent decisions. This means consumers who are from low UA cultures avoid getting into groups and instead perform online purchasing on their own without asking anybody for any help. Therefore, we hypothesise:

H4: Individual level UA will moderate the relationship between social networking services and consumer cognitive innovativeness such that the relationship is stronger for consumers in Australia.

H4a: The relationship between social networking services and consumer cognitive innovativeness is stronger for high UA individuals than low UA individuals.

Cognitive Innovativeness and New Product Purchase Intention

According to Thakur and Srivastava (2014), innovativeness affects purchasing intentions. High cognitive innovative consumers not only enjoy thinking for its sake but also tend to apply a great deal of mental energy to solve problems they encounter (Huang & Liao, 2014). Additionally, as noted by Lim, Leung, Sia and Lee (2004), online shopping naturally involves more uncertainties than buying from a brick-and-mortar business. Therefore, the adoption rates of online shopping are higher for high UA cultures than for low UA cultures (Lim et al., 2004). Yoon (2009) also highlights that high UA cultures are usually more willing to rely on online purchasing than low UA cultures. Therefore, we hypothesise:

H5: Individual level UA will moderate the relationship between cognitive innovativeness and new product purchase intention such that the relationship is stronger for consumers in Australia.

H5a: The relationship between cognitive innovativeness and new product purchase intention is stronger for high UA individuals than low UA individuals.

RESEARCH METHODOLOGY

To validate the research model, we carried out an empirical survey. This study used an online survey methodology where participants were asked to choose a localised online vendor. A localised retailer website is considered to be appropriate to the culture and the most workable option for research (Dianne Cyr, 2013). The survey was announced through university webmail and social network pages. For the validation and testing of the hypotheses, data were collected from online shoppers in Australia. Criteria for selecting participants were to have a minimum of six months online shopping experience and is an Australian citizen by birth. To determine the participant's culture, it is important to ensure that each

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

participant had lived in Australia for most of their lives and spoke the native language (English) as their primary language (Dianne Cyr, 2013).

After visiting the chosen website e-commerce website, respondents were required to fill out a closed-ended questionnaire on a seven-point Likert scale, with responses ranging from (1) strongly disagree to (7) strongly agree. Multi-scale items using at least three observable indicators measured all constructs. Previously validated survey instruments were modified to ensure the adequate reliability and validity of the measurement scales. Table 5 in the Appendix shows all items used in the study.

DATA ANALYSIS

A total of 260 responses were collected. After removing incomplete responses, a total of 255 samples were used to test the proposed model. 53% of respondents were males, and 47% were females, 95% respondents had seven or more years of Internet experience, 65% respondents had online purchasing experience of between one to three years, and 35% had more than three years.

To test the research model, a variance-based structural equation modelling (SEM) statistical technique, partial least squares (PLS) path modelling using SmartPLS version 3 (Ringle, Wende, & Becker, 2015), was used. The partial least squares (PLS-SEM) approach is a preferred analysis technique in information systems and business research because it offers several flexibilities. For example, this approach is well suited for prediction-oriented research, does not require a large sample size, does not require normality and subsequently works without distributional assumptions and with nominal, ordinal and interval-scaled variables (Haenlein & Kaplan, 2004; F. Hair, Marko, Lucas, & Volker, 2014). PLS is considered suitable as it allows investigators to evaluate measurement model parameters and structural path coefficients at the same time. It also allows both formative and reflective factors to be tested together (Chin, Marcolin, & Newsted, 2003).

In our research model, website accessibility, colour and product images, cognitive innovativeness and new product purchase intention were modelled as reflective indicators because they were viewed as effects of latent constructs (Hwang & Lee, 2012b; D. J. Kim, 2005). This is because reflective indicators are interchangeable. For example, different indicators reflect website accessibility, such as easy to learn, understandable and easy to use, to which these indicators are highly correlated. This means that an increase in website accessibility is reflected by increases in all indicators. Social networking service (SNS) is formative because it is a multidimensional factor (Sohaib & Kang, 2015b) that covers various referent groups such as social networking sites, friends and family, online help, reviews and rankings. Formative constructs are not interchangeable, which means a change in one indicator does not necessarily denote a change in other indicators. For example, an increase in influence from family would influence individuals to purchase online even if there were no influence from other sources. Additionally, the moderating effects of culture (UA) were performed using the product indicator approach. The product indicator approach by Chin (2003) refers to the products of each indicator of the independent latent variable with each indicator of the moderator variable.

To investigate the moderating influences of individuals' cultural orientation, we used the multi-group PLS analysis method to determine whether the individual uncertainty avoidance (UA) differs for high versus low uncertainty avoidance (UA) subgroups of participants, which is considered appropriate for this study (Sia et al., 2009). Multi-group PLS analysis allows for the comparisons of structural model differences between groups (Chin, 2004). The analysis was conducted by taking the standard errors of

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

the structural models' paths by comparing equivalent paths across two groups (high UA and low UA) by performing t-tests on their path coefficients.

Although Hofstede's (1980) cultural values are significant at the societal level, his cultural dimensions also tend to differ widely over individual members within societies (Tsai & Bagozzi, 2014). Yoon (2009) found Hofstede's national cultural values at the individual level impact consumers' acceptance of e-commerce. We use a median split to separate the sample according to the participants' composite score of high versus low on two UA items: (1) "I prefer to avoid making changes while online shopping because things could get worse"; and (2) "The rules and regulations of the online stores are important to me because they inform buyers what the online store does."

Reliability and Validity Assessment

The reliability and validity of the measurement model in PLS were assessed by examining internal consistency, convergent validity and discriminant validity. Convergent and discriminant validity were assessed by applying two criteria: (1) that the square root of the average variance extracted (AVE) by a construct from its indicators was at least 0.70 and was greater than that construct's correlation with other constructs; and (2) item loadings were at least 0.70 and are more strongly on their assigned construct rather than on the other constructs. Table 5 in the Appendix shows all item loadings the social networking service (SNS) factor weights. Table 1 shows the Cronbach's reliability, composite reliability and the AVE of all constructs values exceed the recommended value of 0.70. An SNS is a formative construct that cannot be analysed in this procedure. For formative indicators (social networking services), the validity of variables using outer weights was significant (p-value < 0.05). In addition to this, to determine the reliability for formative indicators, the variance inflation factor (VIF) value was less than 5, which means there is no multi-collinearity.

Cross-sectional design surveys are susceptible to common method bias, particularly if the data collection method is only perceptually anchored (Sharma, Yetton, & Crawford, 2009). However, the PLS method requires practically no bias when estimating data from a composite model population, regardless of whether the measurement model is reflective or formative (Sarstedt, Hair, Ringle, Thiele, & Gudergan, 2016). However, according to Kock (2015), if all factor level VIFs resulting from a full collinearity test are equal to or lower than 3.3, the model can be considered free of common method bias. In our research model, all factor level VIFs are lower than 3.3, indicating no bias data.

Table 1. Cronbach's reliability, composite reliability and the AVE

	AVE	CR	C-Alpha	CInn	COL	IMG	SNS	WA	UA	NPINT

Concerning goodness-of-fit (GoF) indices for partial least squares path modelling, Jörg Henseler and Sarstedt (2013) show that the GoF and the relative GoF index are not appropriate for model validation. However, the model fit was assessed by examining the model fit of the PLS path models; namely, the standardised root mean square residual (SRMR). The SRMR 0.07 is lower than the recommended value of 0.08, which indicates a good fit.

Structural Model Testing

The structural models and hypotheses were tested by examining the significance of the path coefficients and the R^2 variance for the dependent variable. The significance of the paths was determined using the t-statistical test calculated with the bootstrapping technique. A 5% significance level was employed. SmartPLS 3 can perform bootstrapping (a nonparametric procedure that can be applied to test whether coefficients such as outer weights, outer loadings and path coefficients are significant by estimating standard errors for the estimates) (Ringle et al., 2015) for both the inner and outer model to specify the t-value for significance. In order to get approximate t-values for the significance test, we used a large subsample (5,000) from the original sample to draw a standard error and the number of cases were equal to the number of observations in the original sample (F. Hair et al., 2014; J. F. Hair, Ringle, & Sarstedt, 2011). We examined the coefficients of the causal relationships between constructs in our model in order to approve or disprove the hypotheses. The coefficients and their t-value on the structural model are shown in Table 2 and 3 and the coefficients of determination (R^2) for the dependent constructs are shown in Figure 2.

The Stone-Geisser criterion Q^2 is also measured using the blindfolding method to compute the construct cross-validated redundancy for assessing the predictive relevance (Jorg Henseler, Ringle, & Sinkovics, 2009). In our analysis, all Q^2 value range of the 'new product purchase intention' endogenous construct (i.e., 0.315) is above the threshold value of zero, thus indicating a strong predictive relevance.

As Table 2 shows, all hypotheses are supported except H2, which suggests there is an insignificant relationship between the individual level UA moderation between colour and consumer cognitive innovativeness. This indicates website colour perception is not shaped by the consumer's uncertainty avoidance. However, previous research (such as Cyr et al., 2010) indicated that colour is an influencing factor in e-commerce across national cultures. Variance in consumers' cognitive innovativeness ($R^2 = 0.55$) and new product purchase intention for Australia sample ($R^2 = 0.42$) is significant, which shows that the Australian sample indicates a 42% variance in consumers' new product purchase intention.

Table 2. Hypothesis testing

	Path	Path Mean	StDev	t-Value	P Value	Supported?
H1	WA * UA -> CInn	0.25	0.03	1.98	0.003*	Yes
H2	COL* UA -> CInn	0.14	0.03	1.20	0.336	No
H3	IMG * UA -> CInn	0.31	0.03	3.61	0.000***	Yes
H4	SNS * UA -> CInn	0.42	0.05	4.79	0.000****	Yes
H5	CInn* UA -> NPINT	0.24	0.03	1.99	0.002*	Yes

Notes: CInn: cognitive innovativeness; COL: colour; IMG, image; SNS: social networking services; WA: website accessibility; NPINT: new product purchase intention; UA: uncertainty avoidance; * Significant at 0.05 level; ** Significant at 0.01 level; *** Significant at 0.001 level

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Furthermore, to meet the second objective of the study we compared the differences in coefficients of the corresponding structural paths of the high UA and low UA subsamples. As shown in Table 3, colour still does not affect consumers' cognitive innovativeness, so H2a is not supported. However, the paths from website accessibility, product images and social networking services to cognitive innovativeness is significant.

Table 3. Hypothesis testing

	Path	High UA (Subsample 140)		Low UA (Subsample 115)		Mean Difference	t-Value	p-Value	Supported?
		Mean	SD	Mean	SD				
H1a	WA -> CInn	0.20	0.04	0.15	0.04	0.05	1.957	0.049**	Yes
H2a	COL -> CInn	0.17	0.04	0.10	0.03	0.07	0.159	0.77	No
H3a	IMG -> CInn	0.23	0.05	0.19	0.04	0.04	1.960	0.048**	Yes
H4a	SNS -> CInn	0.33	0.05	0.24	0.03	0.10	3.247	0.001*	Yes
H5a	CInn -> NPINT	0.28	0.05	0.25	0.04	0.03	3.176	0.001*	Yes

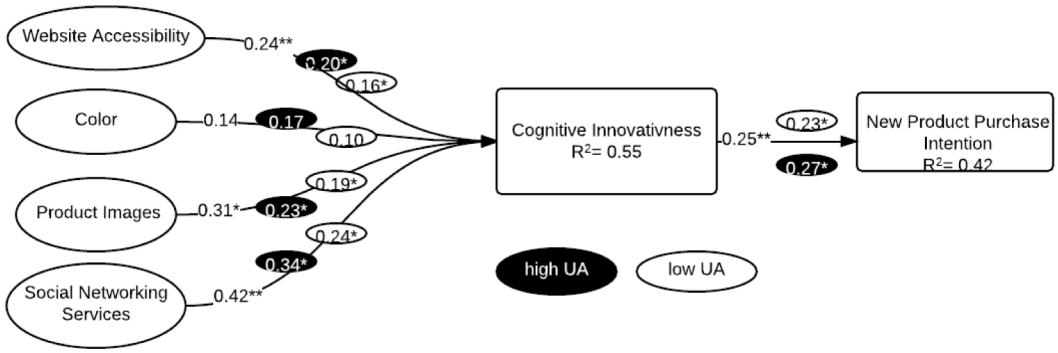
Notes: CInn: cognitive innovativeness; COL: colour; IMG: image; SNS: social networking services; WA: website accessibility; NPINT: new product purchase intention; UA: uncertainty avoidance; * Significant at 0.05 level; ** Significant at 0.01 level; *** Significant at 0.001 level

Importance-Performance Map Analysis

We also performed importance-performance map analysis (IPMA) for two groups (low UA and high UA) to produce additional findings and conclusions for managerial actions (Christian and Sarstedt, 2016). Performing an IPMA requires determining a targeting construct, such as 'new product purchase intention,' in our PLS path model.

The performance of each factor was measured on a scale from 0 to 100. The closer the value is to 100, the higher the performance of the factor. All total effects (importance) larger than 0.10 are significant at the $p \leq 0.05$ level. Table 4 and Figure 3 show the IPMA result of the all the predecessors of the selected target construct (new product purchase intention).

Figure 2. Path testing



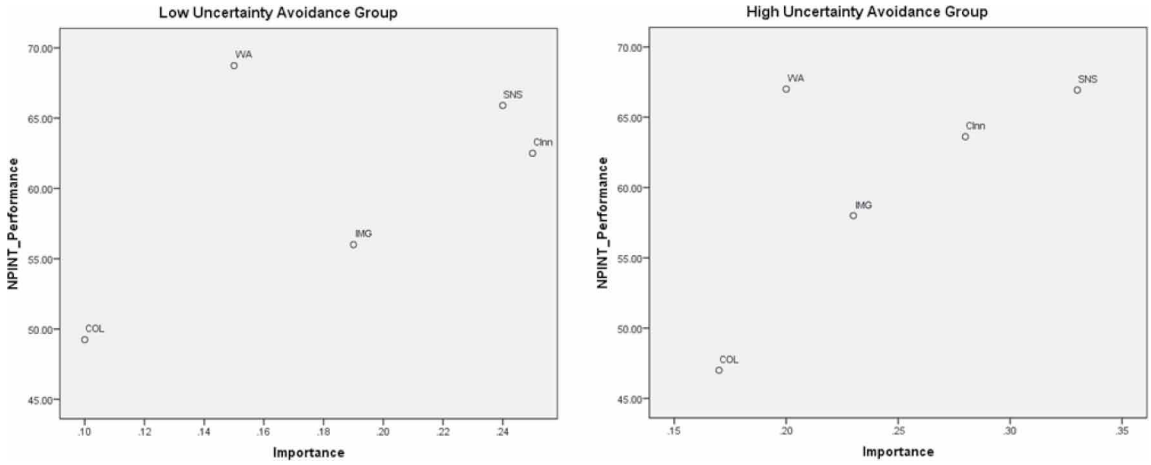
EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 4. IPMA result of new product purchase intention

Criterion: New Product Purchase Intention	Low UA		High UA	
	Importance	Performance	Importance	Performance
WA	0.15	68.73	0.20	66.93
COL	0.10	49.24	0.17	47.01
IMG	0.19	56.10	0.23	58.13
SNS	0.24	65.90	0.33	66.64
CInn	0.25	62.50	0.28	63.61
NPINT	0.23	69.96	0.27	72.78

UA: Uncertainty avoidance; CInn: cognitive innovativeness; COL: colour; IMG: image;
SNS: social networking services, WA: website accessibility; NPINT: new product purchase intention

Figure 3. IPMA of the target construct (new product purchase intention)



Regarding the new product purchase intention, as presented in Table 4 and Figure 3 the highest performance construct is 'web accessibility' followed by 'social networking services.' This means an increase in web accessibility performance would increase the performance of the target construct 'new product purchase intention' by the size of the total effect. However, the direct consequence of the 'cognitive innovativeness' construct is higher in the high UA group than in the low UA group. This means an increase in cognitive innovativeness performance would increase the performance of the target construct new product purchase intention by the size of the total effect 0.28 in the high UA group more than the 0.23 total effects in the low UA group.

DISCUSSION AND CONCLUSION

This study highlights the effects of web cognitive landscape on consumer cognitive innovativeness towards new product purchase intention. In addition to this, it examined how the individual consumer level

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

uncertainty avoidance cultural value moderated the relationship between B2C web cognitive landscape and consumer cognitive innovativeness towards new product purchase intention.

The findings of this study are as follows. First, cognitive innovativeness regarding the B2C website accessibility, colour and product images, and social networking services significantly influence consumers' new product purchase intentions. This argument is consistent with the findings of T.-L. Huang and Liao (2014), who have reported that cognitive innovativeness influences consumer behaviour towards using technology. Second, consumer cognitive innovativeness has a significant positive relationship with online purchase behaviour. This is in line with Y.-A. Huang (2003). Consumers with high cognitive innovativeness are more likely to accept an innovation (Venkatraman, 1991) such as a new product purchase. Third, cognitive innovative consumers usually trust other reliable information sources to ease the uncertainties inherent in a B2C website. For example, the findings of this study indicate that website accessibility, colour and product image, and social networking services positively affect consumer cognitive innovativeness towards new product purchase intention at the individual level. This view is consistent with Tellis et al. (2009). Fourth, consumers' level of the uncertainty avoidance cultural value is significantly connected to cognition and innovativeness in e-commerce. Consumers with low uncertainty avoidance are characterised by a higher cognitive innovativeness than high uncertainty avoidance consumers, who analyse information in a meaningful way. This is consistent with Dobre et al. (2009). Fifth, in cultures with a low degree of uncertainty avoidance (such as Australia), consumers are tolerant of uncertain situations and with innovations. We found that consumers in Australia tend to be as being highly innovative overall. Additionally, consumers' intention for purchasing new products differs considerably depending on their uncertainty avoidance. This is consistent with Tellis et al. (2009).

In conclusion, the web design factors (stimulus) of a B2C website towards which a reaction is made provides a signal regarding the consumer cognitive innovativeness (organism) influence new product purchase intention (response). Therefore, B2C websites should be designed according to consumers' level of cognitive innovativeness depending on the consumer's individual cultural orientations.

Theoretical Implications

Several theoretical implications resulting from this study. Firstly, the main theoretical contribution of the study is the development of a research model that can be used in further studies. Secondly, this study extended prior research on the effects of web cognition on innovativeness towards online purchasing intentions and provided necessary results. Additionally, this research addresses the shortcomings in the existing literature by applying individual cultural values (UA) as moderators to a proposed model to uncover new and improved methods for consumer uncertainty in a B2C website. Thirdly, this study provided an understanding of the new drivers of online consumer purchase intention. Specifically, a consumer's cognitive innovativeness towards the key components on in a B2C e-commerce website, such as web design (website accessibility, visual appearance, and social networking services), which are viewed as the vital aspects of consumer trust in an online store. Fourth, this study examined how online consumer responses towards a B2C online store differ across two different cultural value systems (high uncertainty avoidance and low uncertainty avoidance). This is the first research that has investigated this phenomenon within the Australian context. Finally, the various hypotheses supported in this study all add to the literature for developing hypotheses for future studies. Additionally, this study contributes to validating the survey instrument of the various factors used in a proposed model. Researchers can now use the survey instrument with increased confidence in an e-commerce context.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Practical Implications

The findings provide some practical implications and guidelines for online vendors to include innovative approaches to B2C websites. The results of this study may help online shopping managers who could use the insights of this research to modify their web strategies, not only for considering a country's culture but also for culturally diverse countries such as Australia. Developers and website designers can use these results to increase desirable outcomes by focusing on the relationship between web cognitive evaluations and consumer innovativeness to increase the chances that an online business will succeed in countries with diverse degrees of uncertainty avoidance. The practical implications extend to business firms to make changes to their market strategies to improve their online sales across cultures; for example, e-businesses should specifically consider introducing new products first in highly innovative countries.

Limitations and Recommendations for Future Research

Like most survey research, this study has some limitations. Firstly, data were collected from Australia only. Therefore, caution is advised in making generalisations from the study findings. Secondly, a larger sample size would have been more useful for evaluating the constancy and dependability of the findings. Thirdly, although the sound judgment was used in the selection of factors for the research model, the study did not consider all possible factors that could impact cognitive influences towards purchase intention that have been used in prior studies. While the results of this study clearly indicate there are individual-based differences in online purchasing behaviour, it will be interesting to see if there is some evidence that consumer innovativeness could be a link between country level and individual level cultural analyses. More practical support at the individual consumer level cultural values using this study's research model could be included in future studies of e-commerce, such as including Hofstede's (1980) other cultural dimensions such as power distance index (PDI), masculinity versus femininity (MAS), long-term orientation versus short-term normative orientation (LTO) and indulgence versus restraint (IND). Finally, this research did not provide a complete view of all aspects of the web cognitive landscape and new product purchase intentions, such as privacy, security, brand, advertising, and price.

Chapter 90
Domestic vs. International E-Shopping:
An Empirical Perceptions Analysis

Vaggelis Saprikis
Western Macedonia University of Applied Sciences, Greece

ABSTRACT

Contemporary commerce is completely different as regards features some years ago. Nowadays, a considerable number of individuals and firms take advantage of the information and communication technologies and conduct transactions online. In particular, the mobile industry along with the broad use of social networks and improvements in the internet bandwidth worldwide has created a completely different business environment. Consequently, the technology incited many consumers to cross-border e-shopping, allowing access to a wider variety of products and services, and in numerous circumstances, access to cheaper goods. The purpose of this chapter is to investigate the perceptions internet users have towards e-shops focusing on Greece. More precisely, it aims to find out whether there are contingent differences on customers' perceptions regarding domestic vs. international e-shops, since a gradually augmented number of people have been expressing their preference on non-domestic e-stores for their purchases. Additionally, the chapter intends to shed light on the difficulty in understanding vital aspects of e-consumer behaviour.

INTRODUCTION

Online shopping is a fact. In reality, a large number of consumers do prefer to shop online than visiting a traditional brick-and-mortal store[1]. This 'phenomenon' is greatly based on Internet's wide utilization and bandwidth improvements, along with the continuous advancement of Information and Communication Technology (ICT). Furthermore, the mobile technology industry and social networking have also played a vital role, enticing even more individuals to e-purchases. The digital buyer penetration percentage is expected to reach 65.2% at the end of 2021 compared to 60.2% in 2017 (Statista, 2017). Thus, Internet users are will be purchasing online. Additionally, not only does the number of adopters grow, but also the

volume of their purchases is proportionally increased (Monsuwe et al., 2004). According to E-Commerce Europe (2015) and E-Commerce Foundation (2017), European e-commerce sales were expected to reach €477 billion in 2015, €530 billion in 2016 and €602 billion in 2017.

In Greece, business-to-customer (B2C) online shopping has been emerged quite late compared to developed countries worldwide. Based on the latest national survey, 31% of Greek Internet users have conducted online transactions and spent 4.5 – 5 billion euros annually, however, about 20% of them made their first purchase in 2017 (Eltrun, 2017)! These results are also confirmed by Eurostat, which mentioned that 32% of Greek internet users shop online (Eurostat, 2017). Thus, despite the continuous and noteworthy annual growth -25% in 2015, 29% in 2016 and 32% in 2017-, Greek B2C e-commerce is far away from the 57% of the European-28 average (E-Commerce Europe, 2015; Eltrun, 2017; Eurostat, 2017).

Online shopping can significantly help both customers and enterprises involved. Extended literature review has revealed a considerable number of benefits to both entities. For example, consumers state that convenience, lower prices, time saving, improved customer service and ease of shopping comparison are some vital reasons that positively impact them to purchase online (Ahmad et al., 2010; E-Commerce Europe, 2015; Eltrun, 2015, 2017). On the other hand, firms mention that e-purchases help them reduce administrative costs and extend their business activities well beyond their brick-and-mortal stores.

One key characteristic of online shopping is its limitless feature. Every potential customer can hypothetically buy from any enterprise worldwide and every enterprise can attract customers beyond its geographic boundaries; from any location in the world. Therefore, online shopping gives access to a global market that expands well beyond the geographically limited borders of brick-and-mortal stores (Ahmad et al., 2010) and has greatly stimulated the process of cross-border e-shopping. The purpose of this chapter is to investigate Internet users' e-shops perceptions focused on Greek reality. Specifically, it aims to examine potential differences on their perceptions regarding domestic versus international e-shops, as a growing number of individuals choose non-domestic online stores to buy from. Characteristically, recent studies revealed that Greek e-shoppers prefer to purchase abroad (Eltrun, 2014, 2015); 60% and 65% of them bought from Greek e-stores in 2013 and 2014 in correspondence, whereas the 80%-90% of European adopters prefer to purchase from national e-stores (Eltrun, 2014, 2015). Hence, this study intends to shed light on shed light vital aspects of e-shopping behaviour and interpret this situation.

The rest of the chapter is organized as follows. The literature review in consumers' online buying behavior and the factors that encourage or hinder online shopping are presented in the next section, which is then followed by study's the methodology and results. The last section concludes the chapter by reflecting on the implications of the study, its limitations and future research directions.

LITERATURE REVIEW

Online shopping catholic acceptance has forced many researchers to investigate e-consumer behavior. Hence, numerous studies have been taken place in e-commerce area from diverse perspectives trying to gain an improved insight of e-consumer behavior (Dennis et al., 2004). According to Dennis et al. (2009), there are two basic research streams that approach it. The first investigates technical specifications of an e-store; including interface, design and navigation (e.g. Hasan, 2016; Zhang & Von Dran, 2002), payment (e.g. Liao & Cheung, 2002; Yang et al., 2015), information (e.g. Mallagrada et al., 2016; McKinney et al., 2002), intention to use (e.g. Chakraborty et al., 2016; Chen & Hitt, 2002) and

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

ease of use (e.g. Cho & Sagynov, 2015; Stern & Stafford, 2006). On the other hand, the second stream deals with the consumer-oriented approach of e-behavior. Demographics (e.g. Chahal, 2015; Hashim et al., 2009; Teo, 2006), shopping motivation (e.g. Al-Debei et al., 2015; Johnson et al., 2007), shopping orientation (e.g. Chang & Cheng, 2015; Jayawardhena et al., 2007), perceptions of benefits and risks -advantages and problems- (e.g. Saprikis et al., 2010; Teo, 2006; Thakur & Srivastava, 2015), and issues of psychological characteristics (e.g. Bilgihan, 2016; Wolfinbarger & Gilly, 2002) are examined.

Regarding the factors that positively or negatively impact on e-shopping and are investigated on this chapter, several researches have been conducted. For example, Antoniadis et al. (2014) proved that lower prices in e-stores compared to brick-and-mortal stores, wider variety of product options, convenience and less time spent are the most crucial factors that positively influence e-shopping adoption. Clemes et al. (2014) also confirmed the importance of product variety and convenience to online shopping adoption. Ernst & Young (2000) pointed out that Internet users buy online because of good product selection, competitive prices, and ease of use; but are concerned about lack of opportunity to prior examining the products, shipping costs, as well as the confidentiality of credit card and personal information. Similarly, Poon (2008) investigated consumers' concerns about payment security issues and their impact on customers' online shopping attitude. Furthermore, trust has been widely investigated and many researchers revealed its vital role in online shopping (Al-Debei et al., 2015; Antoniadis et al., 2014; Teo, 2006). The more experienced the e-shopper is, the more trustful the e-purchases tend to be (Oxford Internet Institute, 2005). A collection of the literature review regarding the factors that drive consumers to online shopping is provided by Monsuwe et al. (2004).

With reference to demographics and the perceived problems, numerous studies have already investigated e-shopping behavior. For example, Mahmood et al. (2004) pointed out that demographic and lifestyle characteristics do play a vital role in e-consumer behavior. Hashim et al. (2009) concluded that demographic variables, such as gender, age, salary, job description and marital status impact on e-shopping behavior. On the other hand, Clemes et al. (2014) confirmed that perceived risk negatively influence e-shopping adoption and Teo (2006) mentioned that non-adopters perceive e-shopping risk to a greater extent than e-consumers. Saprikis et al. (2010) proved that after-sales problems are perceived higher to traditional consumers than adopters of e-shopping. Antoniadis et al. (2014) claimed that the combination of the online and physical presence provides more opportunities to capture business than the pure online ones. Finally, Eurostat (2017) and Saprikis (2013) confirmed that perceptions related to security and privacy issues, as well as their desire to physically examine the product prevent many customers from buying online.

As a step forward, this chapter takes advantage of the relevant literature review and investigates Greek Internet users' e-shop perceptions. In Greece, about the 30% of Internet users buy online compared to the 57% in Europe-28 (Eltrun, 2017; Eurostat, 2017; Seybert, 2011). Despite the steady annual growth in Greece the last years the country still lags behind compared to the European average (Eltrun, 2014, 2017). Characteristically, a typical Greek e-adopter spends about 1500€ annually and buys online mostly travel and hotel e-booking services, computer equipment and clothes. On the contrary, in developed European countries, such as Austria, Norway and UK; this annual amount ranges between 2140€ and 2466€ (E-Commerce Europe, 2013; Eltrun, 2014, 2017). Thus, this chapter targets on revealing potential discrepancies on individuals' perceptions concerning domestic versus international e-shops because Greek e-adopters prefer to purchase abroad, whereas the vast majority of European e-shoppers prefer national e-business ventures (Eltrun, 2014, 2015). The analysis applied categorizes them in two groups; adopters and non-adopters of online shopping. As far as it is concerned there is a significant gap on this

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

side of e-consumer behavior research, therefore, this study is expected to help in filling this gap and provide tangible results to both academicians and practitioners. Regarding the managerial standpoint, the industry is about to get vital information that helps various firms pursue strategies aimed to take full advantage of the consumers' online buying habits and intentions. Thus, the study is expected to draw lessons for professionals and assist their e-business venture to a great extent.

METHODOLOGY AND RESULTS

To examine Greek Internet users' perceptions regarding domestic versus international e-shops, an electronic questionnaire was developed aimed at gathering the required data. Data was collected from October to December 2012 via e-mailing lists. The sample selected was a representative subgroup of the population as has been in accordance with data from the 'Observatory for Digital Greece' and the 'Hellenic Statistical Authority'. However, it is to be emphasized the unusual situation of many unemployed respondents; despite they have been highly educated, because of the serious economic crisis of the country.

Concerning survey's data analysis, this empirical research is descriptive in nature. Therefore, apart from descriptive statistics, only simple statistics, namely chi-square[2] and t-tests[3], were applied to analyse respondents' perceptions. With the exception of demographic-related questions, five-point Likert scale was applied to the measurement items. All of them were designed on the basis of a comprehensive literature review and prior surveys approved for their validity and reliability. Therefore, prior to e-questionnaire's distribution, they were pretested from two academicians and two practitioners to ascertain the precision of the instructions and the content validity. Furthermore, a pilot test using a sample of twenty university students helped to identify possible problems in terms of clarity and accuracy; and a number of amendments took place to improve their presentation, based on comments and feedback. Table 1 provides the literature review in which the aforementioned issues were based on and Figure 1 presents the flow of the survey design.

Table 1. Literature review of the study

Basic Categories of the Research	Source
Reasons for using online shopping (adopters only)	Ahmad et al., 2010; Chen, 2009; Ernst & Young, 2000; Kim et al., 2009; Osman et al., 2010
Reasons for not using online shopping (non-adopters only)	Ahmad et al., 2010; Chen, 2009; Ernst & Young, 2000; Osman et al., 2010; Poon, 2008
Consumers' perceptions of online stores	Ahmad et al., 2010; Poon 2008
Problems in online stores	Ahmad et al., 2010; Chen, 2009; Osman et al., 2010; Poon, 2008

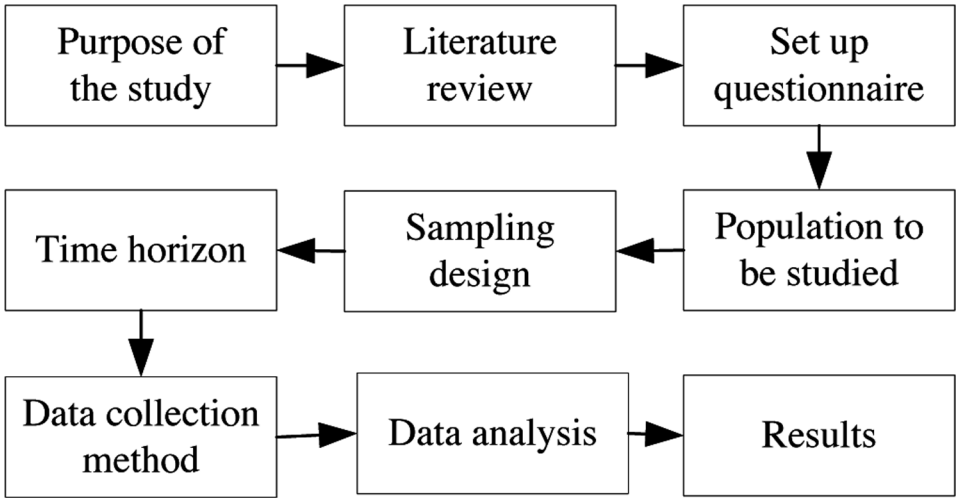
Demographic Characteristics

Table 2 depicts the demographic characteristics of the sample. In this survey, a total of 624 respondents comprised its sample. Following previous surveys (e.g., Haque et al., 2007), adopters are mainly males and use e-shopping to a greater extent than female adopters. Furthermore, the vast majority of e-consumers

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

respondents have strong educational skills as the 86.3% of them have at least/ or attend a University degree/ program. Regarding their Internet activity, adopters are more experienced than non-adopters and they spend much more time on the Internet. These results can explain in a way that their greater familiarity with the new technologies make them more receptive to alternative methods of non-traditional shopping. However, they conduct quite a few online purchases (~8 every year). This may happen because of the serious economic situation in Greece. However, they are willing to buy online more in the near future. On the contrary, non-adopters are still sceptical about e-shopping and only the 16.5% referred that they will attempt to purchase online in the next year. Regarding chi-square statistics, a significant association is observed in all examined tests between adopters/ non-adopters and demographic characteristics.

Figure 1. Survey design



Reasons for Buying (Adopters) or Not Buying Online (Non-Adopters)

Types of Purchased/ Interested Products and Services

Adopters mentioned that the main reasons for using the online stores are the lower prices compared to brick-and-mortal stores, the easiness of online buying procedures (convenience), the less time spent and the wider variety of available products (Table 3). Respondents' outcome is in full accordance with previous studies conducted from other researchers (e.g., Ahmad et al., 2010; Antoniadis et al., 2014; Clemes et al., 2014). Concerning their e-preferences, travel tickets/ e-booking services, computer hardware & software and consumer electronics top the list (Table 4) (Eltrun, 2014, 2017). However, it should be highlighted that e-banking services, along with clothing & accessories and e-tickets for shows, such as cinema and theatre, also scored quite high (Eltrun 2014, 2017).

On the contrary, non-adopters' expressed that the main reasons not to purchase online are their need to physically examine the product, their preference to purchase from traditional stores and security and privacy concerns (Table 4). The results are in full accordance with a contemporary study conducted in Greece (Eurostat, 2017). The non-use of credit card is a situation that takes place in the country. Thus,

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

the vast majority of Greek e-stores do accept the cash on delivery option to overcome it (Eltrun, 2104). Finally, just like Eltrun (2017), a considerable number of non-adopters stated that they visit or search e-stores only to get information about a product/ service (e.g., characteristics, pricing, etc.); and expressed their positive intention to e-purchases in the near future (Table 5), which is a promising sign for sure. The results are of great interest and positive responses were recorded in the majority of the provided categories of products.

Users' Perceptions Regarding Online Shopping

In order to investigate respondents' perceptions, two groups of them are revealed; a) general perceptions on e-shopping and b) perceptions on e-privacy policy (Tables 5 and 6). As it was expected, in the majority of them adopters scored higher compared to non-adopters. The former have already transacted online and have an empirical point of view of these types of shopping; therefore, they can easily understand the pros and cons of e-purchases. On the contrary, the latter are much more doubtful and clearly expressed their concerns. Therefore, the high mean scores of e-risks perceptions are not a surprise; followed similar results of previous researchers (e.g., Clemes et al., 2014; Poon, 2008; Teo, 2006).

To be more specific, regarding respondents' general perceptions on domestic versus international e-shops, the survey results do reveal significant differences. Specifically, respondents expressed that international e-business ventures provide much more than domestic e-ventures in the vast majority of the examined inquires. Thus, these discrepancies are so great that almost all t-test values reveal statistically significant differences to both respondents' groups (Tables 5 and 6). Thus, based on these dissimilarities, it comes as no surprise that numerous Greek e-shoppers prefer cross-border shopping. As a result, domestic e-stores should definitely try to improve their business models. For example, they should follow international trends and try to imitate the best practices. The Internet is a great power to customers and can help them being informed about any piece of information. Thus, it can make them much more demanding. E-ventures that are not able to follow the international trend will have serious problems to obtain a market share. Globalization along with the wide spread of the Internet may lead to catastrophic results; not only for their income, but also for their e-existence.

Regarding the privacy and security issues, it goes without saying that both are at the top of the most important factors in all types of e-purchases (e.g., Monsuwe et al., 2004; Poon, 2008). Customers should feel safe and secure, thus, domestic e-shops should have as a first priority the privacy and security policies; no matter how much they need to invest on. Firms that lose their reputation are forced to fight for their future e-survival, especially on this impersonal way of contemporary e-shopping.

Table 6. Non-adopters' perceptions regarding online stores

General Perceptions	Greek e-shops Mean (SD)	International e-shops Mean (SD)	t-test value
Online stores provide sufficient information about available products	3.09 (0.97)	3.61 (0.89)	-6.25[a]

Perceived Problems in Online Shopping

In order to investigate respondents' perceived problems in online shopping, two groups of them are revealed; a) general problems and b) after-sales problems. As it was expected, statistically significant discrepancies between examined samples were revealed (Tables 7 and 8). To be more specific, adopters personal experience in e-purchases makes them realize that the anticipated problems are not such a deterrent for them compared to non-adopters.

Concerning their perceptions, both groups of respondents expressed their concerns about e-shops, especially the domestic ones. Their opinion is also clearly depicted in the vast majority of the examined questions; and the statistically significant differences revealed are high in both adopters and non-adopters answers. With reference to no statistically significant different questions, all of them came as no surprise; as the term 'distance' has been the common issue. 'Distance' is a vital characteristic of business transactions and more or less can affect everyone; even if he/ she currently purchases online or not. Therefore, the fact that there is no significant difference to these questions between examined groups is fairly normal.

Table 7. Adopters' perceived problems in online shopping

Problems Relating to Online Stores in General	Greek e-shops Mean (SD)	International e-shops Mean (SD)	t-test value
Online stores promise more than they can practically offer	3.14 (0.94)	2.77 (0.83)	6.77[a]
Consumers can not completely trust them	3.23 (0.98)	3.03 (0.96)	3.57[a]
Online stores are not always official representatives of their offered products	3.28 (0.90)	2.99 (0.85)	5.48[a]

CONCLUSION

The aim of this chapter is to examine an unconventional case that takes place in Greek e-shopping reality; adopters prefer buying from an online store abroad to a national one. The survey conducted helps the main reasons of this situation be revealed providing a thorough analysis of adopters and non-adopters perceptions towards e-shopping features and problems, the reasons why the former buy and the latter do not purchase online, as well as the types of products and services that they buy, search or intent to e-purchase in the near future. Thus, this study intends to provide tangible results in an underexplored area of online shopping and shed light on the difficulty of understanding vital aspects of online commerce behavior. The findings are believed to provide interesting insights into Greek Internet users' perceptions towards online shopping. Adopters prefer to purchase online because of lower prices, wider variety of products and convenience compared to brick-and-mortal stores. The results are in accordance with those of previous researchers (e.g. Ahmad et al., 2010; Antoniadis et al., 2014; Clemes et al., 2014). E-tickets, computer hardware/ software and consumer electronics top the list of their preferences (e.g. Eltrun, 2017). On the other hand, non-adopters tend to physically examine the products and express serious concerns about security and privacy issues; however, they visit online stores to get informed about products and compare prices. Eurostat (2017) and Eltrun (2017) concluded to the same results as well. Furthermore, the survey reveals significant differences between national and international e-shops. Characteristically,

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

respondents expressed their concerns about reliability and trustworthiness of national e-stores. They mentioned that Greek e-ventures have more privacy and security problems compared to international e-stores. Greek e-stores provide fewer value added e-services, which are not as user friendly as the international ones. Additionally, they offer a lower variety and availability of products.

Based on the aforementioned, it is believed that this research can give important implications to both academia and practicing managers. The theoretical and managerial implications, as well as survey's limitations and future research directions are described below.

THEORETICAL AND MANAGERIAL IMPLICATIONS

Numerous researches have been conducted in e-commerce scientific field from different perspectives with the aim to understand better e-consumer behavior (e.g. Antoniadis et al., 2014; Clemes et al., 2014; Dennis et al., 2004). As a step forward, this chapter presents a significant number of recent studies examining the consumer-oriented approach of e-shopping behaviour and brings them into the academic community. Moreover, it provides a thorough empirical study in Greece where users' perceptions on domestic versus international e-shopping ventures are investigated. The importance of the results is also high if we take into consideration that a lot of differences have been revealed among the two examined categories of e-shops. Therefore, it is believed that the survey has set the groundwork for further scientific research and improvement, providing new inferences and insights on Internet users' perceptions towards cross-country e-shopping. It is expected that an analogous situation takes place in other countries worldwide as well.

On the other hand, practitioners are believed to be benefited from the results presented in this chapter as well. More specifically, the study's outcome can be of great assistance to them by making them evaluate their e-commerce ventures and follow specific strategies in order to adjust their e-shop structures with the aim to satisfy not only the existing customer base, but potential buyers as well. Especially in Greek reality where e-stores are considered lagged behind compared to similar international e-ventures. Alternatively, Greek practicing managers who are willing to invest in an e-shop business model could use the survey's results as a valuable guide to build an attractive e-store. For example, issues such as provided value added e-services, user friendly procedures, information about products and security concerns must be definitely taken into consideration.

Hence, online companies could use them as a consulting tool while organizing their work and implementing their e-business ideas. Additionally, the findings of this study could help e-ventures better understand Internet users' particular needs; and as a consequence, analogous marketing policies could be applied. To sum up, this chapter is believed to add value to both academia and the industry, as it provides meaningful information and a holistic approach concerning online consumers' behavior towards domestic and international e-stores.

LIMITATIONS AND FUTURE WORK

The survey has two basic limitations that need to be recognized. First, only simple statistics, namely t-tests and chi-square, have been applied. Therefore, the utilization of more advanced statistical methodologies helping to the development of a proposed model or framework would certainly offer a more holistic view and may provide additional important insights into academia and managers. Secondly, causal analysis that

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

could study which factors are more important for e-commerce decisions has not been applied. Regarding further research, similar studies could be conducted in other countries, taking into consideration though the different cultural notions in order to get comparative data for a cross-cultural study or a meta-analysis of existing studies. Such a comparison could be beneficial for the better understanding of cross-country e-shopping perceptions and attitude.

DISCUSION QUESTIONS

1. Taking into consideration the cross-border e-commerce situation that takes place in Greece, can you mention some actions domestic e-stores should follow in order to attract these customers?
2. Supposing you are a manager in a Greek brick-and-mortal bookstore, what would you do in order to start business online?
3. How could Greek public authorities help domestic e-shops attract cross-border e-shoppers?

ENDNOTES

1. Brick-and-mortal store: company that has a physical presence and offer face-to-face customer experiences.
2. Chi-square is used to determine whether there is a significant difference between the expected frequencies and the observed frequencies in one or more categories examined.
3. T-test can be used to determine if two sets of data are significantly different from each other, and is most commonly applied when the test statistic would follow a normal distribution if the value of a scaling term in the test statistic were known.
4. SD: Standard Deviation is a measure that is used to quantify the amount of variation or dispersion of a set of data values. A standard deviation close to 0 indicates that the data points tend to be very close to the mean (also called the expected value) of the set, while a high standard deviation indicates that the data points are spread out over a wider range of values.

Chapter 91
Influence of Perceived Benefits on Consumers' Online Purchase Behaviour: An Empirical Study

Chandra Sekhar Patro
Department of Management Studies, GVP College of Engineering (A), Visakhapatnam, India

ABSTRACT

This article describes how e-retailing has become one of the most important uses of technology relating to the internet. The activity of online shopping is considered to be one of the important features of e-retailing. The enormous advantages offered by online shopping stimulate corporate managers, marketing departments and retailers to offer their products through the websites to attract the largest number of shoppers, not only to local markets but also global markets. The change in consumer behavior along with the availability of cheaper and reliable technology for secure transactions has led to a significant growth in online sales around the world. The present article focuses on identifying the key factors influencing the consumers' perceived benefits while shopping online. The article further focuses on the influence of demographic factors on consumers' perceived benefits. The findings of the article would help e-retailers to have a better understanding and to develop strategies for making the online shopping experience more effective and trustworthy to the target consumers.

INTRODUCTION

Online shopping provides the right solution to get the desired goods and services with a touch on the computer/mobile screen. Consumers are more connected than ever before and have more information and choices at their fingertips today due to expanding connectivity of internet all over the world. Online

consumers always seek new products, new attractiveness and the most important thing being price compatibility with their budget. If e-marketers know and understand the factors affecting consumer behaviour, they can further sharpen their marketing strategies to attract and retain customers. It is becoming a serious competitor to the conventional store based distribution system. As every marketing organization aims to develop loyal customer base by delivering value that satisfies the customers, it is imminent to know the factors contributing for the consumer intentions to design their marketing programs effectively (Katta & Patro, 2016).

Perceived benefits are beliefs about the positive outcomes related to a behavior in response to real or perceived threat. Kim, Ferrin, & Rao (2008) stated that perceived benefit is a consumers' belief about the extent to which he or she will become better off from the online transaction with a certain online shopping. Perceived benefits of shopping online were the consumer's subjective perception of gain from shopping online. Perceived benefits are the consumers' needs or wants and the sum of online shopping advantages or satisfactions (Forsythe, Liu, Shannon, & Gardner, 2006). Fei and Liat (2015) described perceived convenience, financial benefits, and easy interface were all the important factors besides perceived benefits and perceived ease of use and customer satisfaction as the core motivation of consumers' online shopping decision.

Perceived benefits consider the advantages associated with online shopping experience including convenience, price comparison, time saving, return policy, ease of shopping, enjoyment and enhanced customer-retailer relationship (Elwalda, Lü, & Ali, 2016). Hsu and Bayarsaikhan (2012) identified that the four dimensions of perceived benefits of online shopping were shopping convenience, product selection, comfort of shopping, and hedonic/enjoyment. San Lim, Heng, Ng, & Cheah (2016) suggested that a well-designed website provides useful information and extra benefits to customers and in turn enhances sales volume as well the reputation of the company. Recommendation from family and friends is also considered to be influential on factor on consumers' purchase intention.

Hirst and Ashwin (2009) stated that consumers' perceived quality of information for products and services provide on the website is one of the most crucial factors influencing their purchase intentions. The benefits associated with complete and relevant information results in purchasing better quality products/ services and this may improve satisfaction and increase repeat purchasing intention by reducing the risks of dissatisfaction and anxiety in further purchase (Park and Kim, 2003). According to Jadhav and Khanna (2016), online shopping benefits and customers' attitudes and decisions toward online shopping have a strong relationship. Those shoppers who place a higher level of importance on the aesthetics aspects of websites and the specific benefits of e-shopping would likely purchase more frequently than infrequent shoppers. Customers use the Internet for their shopping due to the benefits they get, due to the concept that internet shopping is more convenient and offers competitive prices. Therefore, convenience is considered as one of most important factors that motivate customers to shop online in addition to the other benefits.

REVIEW OF LITERATURE

The study provides the review of select literature in the area of consumers' perceived benefits while making an online purchase to have a thorough understanding of the conceptual constructs and empirical research. Rasool, Gupta, Slathia, & Mahajan (2017) revealed that the factors perceived credibility, perceived usefulness, perceived ease of use and computer self-efficacy is significantly dependent on

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

customer attitude. Putro and Haryanto (2015) identified that the variables ease of use, usefulness, and perceived risk have significant positive influence on consumer attitudes, and towards intention to buy in the services of fashion online products. Saravanan and Devi (2015) found that, Amazon is the most preferred online shopping website whereas Snapdeal and Filpkart has got the second and third rank consecutively. The study also revealed that electronic products are the most preferred products followed by cosmetic, jewelry and food items. Katta and Patro (2017) found that convenience is the most influencing factor followed by the factors such as price advantage, delivery, reliability, website design and responsiveness and are significantly influencing the consumer's perception on e-shopping.

Nayak and Debashish (2017) found that the factors influencing the consumers' decision of online shopping are convenience, security & privacy on website, time and cost efficiency, online product information availability and website interface. Jadhav and Khanna (2016) identified that the main influencing factors for online shopping were availability, low price, promotions, comparison, perceived ease of use, attitude, time consciousness, trust, variety seeking, and customer service. Chakraborty (2016) stated that the reasonable cost of the product at the doorstep is the most important factor affecting the consumer purchase decision at the time of online shopping. The other most important factors such as products are available 24/7, saves time, and ease in cancellation or return are also influencing the consumers' intentions to shop online (Rao and Patro, 2017). Nazir, Tayyab, Sajid, Rashid, & Javed (2012) identified price to be the most fascinating and affecting factor for the majority of students and the general public following trust, convenience and recommendations as other important factors. Mee and Huei (2015) study revealed that Internet shoppers respond positively towards the motivational and attitude aspects of online shopping compared to the non-internet shoppers. The internet shoppers seek more convenience than non-internet shoppers, followed by innovativeness, impulsiveness, variety seeking, attitude towards online shopping, and attitude towards online advertising. The other factors which had a moderate influence on consumers' attitude are security, sale service, and discounted deals (Patro, 2017).

Jiradilok, Malisuwan, Madan, & Sivaraks (2014) explored that those who have ever purchased online mainly depend on assurance, empathy, appropriate pricing, and website information quality, while those who have never purchased online consider empathy, assurance, responsibility and reliability while shopping online. Sharma and Khattri (2013) found that the prominent factors affecting the buying decision are impulse buying, information availability and customer review. It also identified that higher the level of trust on the website more the number of times coupons have been bought by consumers. Shergill and Chen (2005) found that website design, website reliability/fulfillment, website customer service and website security/privacy are the four dominant factors which influence consumer perceptions of online purchasing. Heijden and Verhagen (2004) found that the components of online store image have predictive value for attitude towards purchasing at that particular store. Trustworthiness, settlement performance, usefulness and enjoyment are direct determinants of attitude, whereas familiarity, ease of use, and style are indirect determinants of attitude (Patro, 2016). Lee and Joshi (2007) identified that the factors delivery performance, time saving, website functional properties, internet familiarity, and price have relative importance in online service encounters for customer satisfaction.

Devaraj, Fan, & Kohli (2006) study indicated that personalization, time responsiveness, security, and reliability are significantly linked to consumer satisfaction. Website design has no significant effect to online consumer's satisfaction. Har Lee, Cyril Eze, & Oly Ndubisi (2011) indicated trust as the most significantly influencing variable for the consumers' intention to repurchase online. The other influencing factors are privacy, functionality, firms' reputation, perceived usefulness, perceived value, reliability and lastly perceived ease of use. Yi and Gong (2008) found that the outcome quality is the most important

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

predictor of overall quality, whereas environment quality is the least important predictor of overall quality, particularly when self-efficacy is high. Ranganathan and Ganapathy (2002) study emerged security as the best predictor of online purchase intent. Privacy and Design dimensions emerged as the second and third best predictors, whereas information content is a basic necessity of any website and key factor that differentiates competing ones. Wolfinbarger and Gilly (2003) found that the four factors website design, fulfilment/reliability, privacy/security and customer service are strongly predictive of customer judgments of quality and satisfaction, customer loyalty and attitudes toward the website. Atchariyachanvanich, Okada, & Sonehara (2008) study pointed out that the basic factors of confirmation, satisfaction, perceived usefulness, perceived incentives, and customer loyalty are significantly influencing the online customers' intention to repeat purchase through the Internet. Lee and Lin (2005) study show that the dimensions of website design, reliability, responsiveness, and trust affect overall service quality and customer satisfaction. However, the personalization dimension is not significantly related to overall service quality and customer satisfaction.

OBJECTIVES OF THE STUDY

The specific research objectives of the study are to identify the factors influencing perceived benefits of online consumers and also study the influence of demographic variables on online consumers' perceived benefits.

RESEARCH FRAMEWORK AND HYPOTHESES

Based on the findings of the earlier studies by the researcher the following factors are identified as perceived benefits in the present study as shown in Figure 1. The factors are: Website Functionality, Product Variety, Innovativeness, Personalization, Convenience, Reliability, Financial Advantage, Security & Privacy and Delivery.

The study formulated the following null hypotheses to test relation between the demographic factors (gender, age, educational qualifications, and occupation), and the perceived benefit factors to know its influence on online consumers' purchase behaviour with reference to the top three e-retailers (Amazon, Flipkart and Snapdeal).

1. Influence of Demographic factors on Consumers' Perceived Benefits:

H_0: The demographic factors (gender, age, education, and occupation) do not have significant influence on consumers' perceived benefits (website functionality, product variety, innovativeness, personalization, convenience, reliability, financial advantage, security & privacy and delivery).

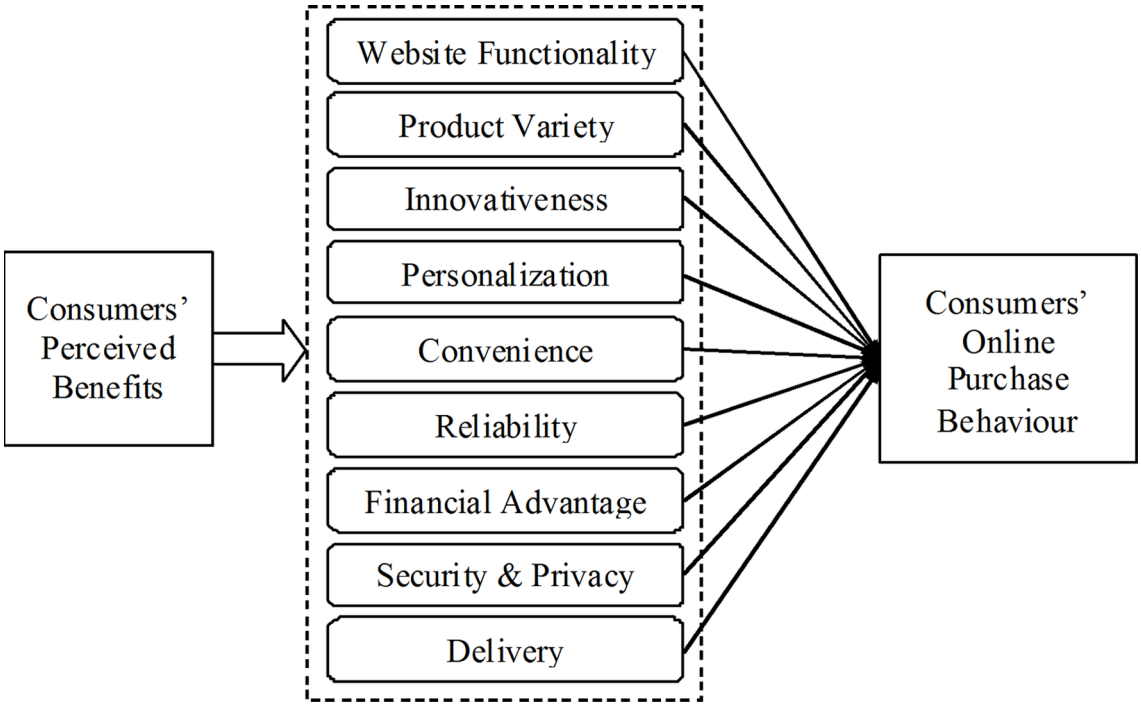
2. Perceived Benefits:

H_{01}: Website Functionality is not significantly considered as perceived benefit.
H_{02}: Product Variety is not significantly considered as perceived benefit.
H_{03}: Innovativeness is not significantly considered as perceived benefit.
H_{04}: Personalization is not significantly considered as perceived benefit.
H_{05}: Convenience is not significantly considered as perceived benefit.
H_{06}: Reliability is not significantly considered as perceived benefit.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

H_{07}: Financial Advantage is not significantly considered as perceived benefit.
H_{08}: Security & Privacy is not significantly considered as perceived benefit.
H_{09}: Delivery is not significantly considered as perceived benefit.

Figure 1. Research framework



RESEARCH METHODOLOGY

The paper discusses the various perceived benefit factors influencing on the consumers behaviour towards online shopping. To pursue the objectives of the study, the data from primary sources were collected and analyzed. The study covers the online consumers in India. For the purpose of the study three online vending companies such as Amazon, Flipkart and Snapdeal are selected based on turnover of the companies in 2015. The opinions are collected online and to ensure the matured responses, the respondents below the age of 18 years are excluded from the study. The sample size is based on the Krejcie and Morgan (1970) table, which reveals that for a population of more than 100000, a sample size of 384 is sufficient. Since the universe is very large and the responses are expected online, the researcher set a time frame to register the responses. As such the valid responses received in three months period starting from September to November 2016 are considered. The sample size of the study thus was 1200. The opinion of sample population has been ascertained on Likert scale. Cronbach's Alpha reliability test has been conducted and the value of 0.977 indicating the high degree of internal consistency of the sample. To analyze the collected data descriptive statistics frequency, percentages, mean, and regression analysis were used. IBM SPSS software version 22.0 is used for the statistical analysis.

DEMOGRAPHIC PROFILE OF THE RESPONDENTS

The demographic profile of the respondents namely; gender of the respondents, age wise classification, education background, and occupation are shown in Table 1.

Table 1. Demographic profile of the respondents (n = 1200)

Demographic Factor	Frequency (n)	Percent (%)
Gender		
Male	648	54.00
Female	552	46.00
Age of the respondents		
18 - 25 years	403	33.58
26 - 35 years	306	25.50
36 - 45 years	242	20.17
46 - 55 years	149	12.42
56 - 65 years	86	7.17
Above 65 years	14	1.17
Education Background		
SSC	25	2.10
Inter/12th	47	3.90
Diploma	71	5.90
Under Graduate	424	35.3
Post Graduate	497	41.4
M.Phil.	17	1.40
Ph.D.	95	7.90
Professional Course	24	2.00
Occupation		
Student	452	37.71
Employee	642	53.47
Business	45	3.80
Professional	24	1.98
House Wife	37	3.05

Source: Primary data

The analysis shows that out of the total respondents, 54 per cent are males and 46 per cent are females. The age wise classification shows that, 33.58 per cent of the respondents are in the age group of 18-25 years. As many as 25.5 per cent of the respondents are in the age group of 26-35 years and there are 20.17 per cent of the respondents who are in the age group of 36-55 years. The majority of respondents representing 59.08 per cent are in the age group of 18-35 years. The average age of the respondents is 33 years. The details of respondents' education show that, out of the total 41.40 per cent are post gradu-

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

ates and 35.30 per cent are graduates. There are 7.90 per cent who are of Ph.D. holders, 5.90 per cent Diploma holders, 3.90 per cent passed Intermediate, and 2.10 per cent passed SSC. The majority of the respondents representing 76.70 per cent are either graduates or post graduates. Regarding the occupation, 37.71 per cent of the online shopping participants are students and 53.47 per cent of online shoppers are employees. There are 3.80 per cent of the respondents who belong to business category, 3.05 per cent are House Wives, and only 1.98 participants are professionals. Thus, employees constitute the majority followed by students in the case of online shopping.

STATISTICAL ANALYSIS AND RESULTS

The nine factors identified as the perceived benefits influencing the consumers' online purchase behaviour are analyzed in the study. The analysis shows the mean values of all the factors for all the three websites Amazon, Flipkart and Snapdeal. The analysis also projects the f-statistic and coefficient values for the three websites in relation to the perceived benefit factors and demographic factors (gender, age, education and occupation) that influence online shoppers' purchase intentions.

Table 2. Website functionality - descriptive statistics (Mean Values) n = 1200

S.No.	Variables	Amazon	Flipkart	Snapdeal	Total
1	The website has user-friendly interface facilitating easy navigation	4.10	4.00	4.04	4.05
2	The website has visually attracting and harmonious appearance	4.05	3.96	3.89	3.98
3	The website layout facilitates quick search for products	3.97	3.97	3.83	3.94
4	Current trends are reflected in the website	4.00	3.75	3.74	3.85
5	The website provides high quality content and interactive features	4.01	3.73	3.71	3.84
6	The website loads all the text and graphic speed	3.82	3.86	3.83	3.84
7	Updates the website continuously with latest information	3.83	3.85	3.60	3.79
8	Well connected to customers with appropriate social media	3.80	3.68	3.67	3.73
9	Provides related links that makes shopping experience more fun and less frustrating	3.70	3.75	3.56	3.69
10	Live support is provided for enhancing shopping experience	3.63	3.59	3.67	3.62
Total		**3.89**	**3.81**	**3.75**	**3.83**

Source: Primary Data

The descriptive statistics (Table 2) indicates that the website Amazon has the highest mean value of 3.89 followed by Flipkart ($\mu = 3.81$), and Snapdeal ($\mu = 3.75$). Among the ten variables 'the website has user friendly interface facilitating easy navigation' secured highest rating ($\mu = 4.05$) followed by variables 'the website has visually attracting and harmonious appearance ($\mu = 3.98$)' and 'the website

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

layout facilitates quick search for products (μ = 3.94)'. The highly rated variable is the same in the case of all the three websites of select companies. It is pertinent to note that the total mean value of all the ten variables is 3.83 which indicate that the functionality of the website has positive influence on the consumers purchase behaviour.

Table 3. Website functionality - ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
Amazon	Regression	3.328	4	.832	1.564	.030[b]
	Residual	210.159	395	.532		
	Total	213.488	399			
Flipkart	Regression	4.221	4	1.055	2.593	.036[b]
	Residual	185.591	456	.407		
	Total	189.811	460			
Snapdeal	Regression	4.089	4	1.022	1.808	.028[b]
	Residual	141.345	250	.565		
	Total	145.435	254			

a. Dependent Variable: Website Functionality
b. Predictors: (Constant), Occupation, Age, Education, Gender

The results of the ANOVA test (Table 3) for the websites Amazon (F = 1.564, p = 0.30<0.05), Flipkart (F = 2.593, p = 0.36<0.05) and Snapdeal (F = 1.808, p = 0.028<0.05) indicate that the website functionality show a significant relation with the predictors occupation, age, education, and gender on the consumer purchase behaviour.

The coefficients (Table 4) reveals that, for Amazon the independent variables education (β = 0.089, p = 0.049) and age (β = 0.017, p = 0.009) show positive significant beta coefficients with the dependent variable website functionality. However, gender (β = -0.079, p = 0.045) and occupation (β = -1.101, p = 0.031) show negative significant beta coefficients with website functionality. In the case of Flipkart and Snapdeal, gender (β = 0.009, p = 0.050; β = 0.021, p = 0.047), age (β = 0.019, p = 0.048; β = 0.026, p = 0.038) and education (β = 0.128, p = 0.007; β = 0.123, p = 0.010) shows a positive significant effect on website functionality. The independent variable, occupation (β = -0.091, p = 0.043; β = -0.008, p = 0.005) show negative significant beta coefficients with the website functionality. Thus, the results provide a strong support for the rejection of the null hypothesis relating to the relationships between independent variables gender, age, education and occupation with the dependent variable website functionality in case of all the three websites. Therefore, it could be concluded that the website functionality strongly depends on the demographic factors.

The analysis of Product Variety in Table 5 indicate that the website Amazon has the highest mean value of 3.98 followed by Snapdeal (μ = 3.83), and Flipkart (μ = 3.73). Among the ten variables 'comparison of wide range of product features is possible' got highest rating (μ = 4.18) followed by variables 'larger choice of products/ services are available (μ = 4.09)' and 'facilitates selection of brands & products from different sellers at one place (μ = 3.98)'. The highly rated variable in case of all the three e-retailing websites is 'comparison of wide range of product features is possible.' It is significant to note that the

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

total mean value of all the ten variables is 3.85 which indicate that the product variety has a positive influence on the consumers' online purchase intentions.

Table 4. Website functionality - coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The ANOVA test results as shown in Table 6 for all the three websites Amazon ($F = 5.068$, $p = 0.001<0.05$), Flipkart ($F = 4.50$, $p = 0.001<0.05$) and Snapdeal ($F = 2.115$, $p = 0.049<0.05$) reveals that the dependent variable product variety show a positive significant influence on the independent variables (gender, age, education level and occupation) with reference to consumer purchase behaviour.

Table 6. Product variety - ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
Amazon	Regression	8.256	4	2.064	5.068	.001[b]
	Residual	199.946	491	.407		
	Total	208.202	495			
Flipkart	Regression	7.326	4	1.831	4.500	.001[b]
	Residual	185.577	456	.407		
	Total	192.903	460			
Snapdeal	Regression	6.260	4	1.565	2.115	.049[b]
	Residual	185.019	250	.740		
	Total	191.279	254			

a. Dependent Variable: Product Variety

b. Predictors: (Constant), Occupation, Age, Education, Gender

The coefficients (Table 7) reveals that, in the case of Amazon and Snapdeal the independent variables gender ($\beta = 0.105$, $p = 0.026$; $\beta = 0.027$, $p = 0.048$) and age ($\beta = 0.040$, $p = 0.049$; $\beta = 0.026$, $p = 0.043$) show positive significant beta coefficients with the dependent variable product variety. However, education ($\beta = -0.127$, $p = 0.005$; $\beta = -0.166$, $p = 0.009$) and occupation ($\beta = -0.121$, $p = 0.009$; $\beta = -0.061$, $p = 0.031$) show negative significant beta coefficients with the dependent variable product variety. In the case of Flipkart, the independent variables gender ($\beta = 0.106$, $p = 0.023$), age ($\beta = 0.051$, $p = 0.022$) and education ($\beta = 0.028$, $p = 0.047$) shows a positive significant effect on product variety. The independent variable, occupation ($\beta = -0.168$, $p = 0.000$) show negative significant beta coefficients with the dependent variable product variety. Thus, the analysis show a strong support for the rejection of the null hypothesis relating to the relationships between independent variables gender, age, education and occupation with the dependent variable product variety in the case of all the three websites. Hence, it could be concluded that the product variety strongly depends on the demographic factors of the consumers.

The descriptive statistics of Innovativeness (Table 8) indicates that the website Amazon has the highest mean value of 3.68 followed by Snapdeal ($\mu = 3.60$), and Flipkart ($\mu = 3.54$). Among the fifteen variables 'attracts customers with attention drawing programmes like flash sales' has the highest rating ($\mu = 3.83$) followed by the variables 'innovative methods of sales promotion strategies are followed by online stores ($\mu = 3.82$)', and 'provides super-fast and innovative delivery systems ($\mu = 3.77$)'. The highly rated variable in case of Amazon and Snapdeal is 'attracts customers with attention drawing programmes like flash sales ($\mu = 3.85$ and 3.80)'. In case of Flipkart the variable 'innovative methods of sales promotion strategies are followed by online stores ($\mu = 3.87$)' got highest rating. It is important to note that the total mean value of all the fifteen variables is 3.61 which indicate that factor Innovativeness has a positive influence on the consumers' online purchase behaviour.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The ANOVA test (Table 9) results of dependent variable Innovativeness with the predictors occupation, age, education level and gender for all the three websites Amazon ($F = 4.513$, $p = 0.001<0.05$), Flipkart ($F = 2.806$, $p = 0.025<0.05$), and Snapdeal ($F = 3.63$, $p = 0.007<0.05$) show a positive significant influence on the consumer purchase intentions.

Table 9. Innovativeness - ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
Amazon	Regression	6.530	4	1.633	4.513	.001[b]
	Residual	177.628	491	.362		
	Total	184.158	495			
Flipkart	Regression	4.653	4	1.163	2.806	.025[b]
	Residual	189.045	456	.415		
	Total	193.698	460			
Snapdeal	Regression	9.914	4	2.478	3.630	.007[b]
	Residual	170.713	250	.683		
	Total	180.626	254			

a. Dependent Variable: Innovativeness

b. Predictors: (Constant), Occupation, Age, Education, Gender

The calculation of coefficient (Table 10) reveals that for all the three websites Amazon, Flipkart and Snapdeal, the independent variables gender ($\beta = 0.907$, $p = 0.038$; $\beta = 0.029$, $p = 0.033$; $\beta = 0.051$, $p = 0.019$) and age ($\beta = 0.002$, $p = 0.040$; $\beta = 0.014$, $p = 0.296$; $\beta = 0.027$, $p = 0.037$) show positive significant beta coefficients with the dependent variable innovativeness. However, education ($\beta = -0.088$, $p = 0.043$; $\beta = -0.041$, $p = 0.037$; $\beta = -0.195$, $p = 0.002$) and occupation ($\beta = -0.162$, $p = 0.000$; $\beta = -0.145$, $p = 0.002$; $\beta = -0.112$, $p = 0.034$) show negative significant beta coefficients with the dependent variable website functionality. Thus, the analysis show a strong support for the rejection of the null hypothesis relating to the relationships between independent variables gender, age, education and occupation with the dependent variable innovativeness in the case of all the three websites. Therefore, it could be concluded that innovativeness of the website strongly depends on the demographic factors.

The descriptive statistics of the factor Personalization (Table 11) indicate that Amazon has the highest mean value of 3.69 followed by Flipkart ($\mu = 3.60$) and Snapdeal ($\mu = 3.58$). Among the nine variables 'the online store provides mobile app based shopping' secured highest rating ($\mu = 3.97$) followed by variables 'provide Help/ FAQ support to the customers ($\mu = 3.86$)' and 'remind about the items in shopping cart ($\mu = 3.85$)'. The highly rated variable is the same in the case of all the three websites of select companies with the mean values of 4.03, 3.94, and 3.92 for Amazon, Flipkart and Snapdeal respectively. Therefore, the total mean value for all the nine variables is 3.63 which indicate that factor personalization has a positive influence on the consumers' online purchase intentions.

The results of the ANOVA test (Table 12) for all the three websites Amazon ($F = 8.180$, $p = 0.000<0.05$), Flipkart ($F = 2.786$, $p = 0.026<0.05$), and Snapdeal ($F = 2.808$, $p = 0.026<0.05$) show a positive significant influence on the consumer purchase intention with the predicators occupation, age, education level and gender.

Table 12. Personalization - ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
Amazon	Regression	13.023	4	3.256	8.180	.000[b]
	Residual	195.427	491	.398		
	Total	208.450	495			
Flipkart	Regression	4.735	4	1.184	2.786	.026[b]
	Residual	193.769	456	.425		
	Total	198.503	460			
Snapdeal	Regression	9.830	4	2.458	2.808	.026[b]
	Residual	218.810	250	.875		
	Total	228.641	254			

[a]Dependent Variable: Personalization

[b]Predictors: (Constant), Occupation, Age, Education, Gender

The calculation of coefficient (Table 13) reveals that for all three websites Amazon, Flipkart and Snapdeal, the independent variables education ($\beta = -0.096$, $p = 0.033$; $\beta = -0.077$, $p = 0.005$; $\beta = -0.159$, $p = 0.011$) and occupation ($\beta = -0.242$, $p = 0.000$; $\beta = -0.106$, $p = 0.025$; $\beta = -0.117$, $p = 0.043$) show negative significant beta coefficients with the dependent variable personalization. However, gender ($\beta = -0.083$, $p = 0.072$; $\beta = -0.075$, $p = 0.110$; $\beta = -0.028$, $p = 0.663$) and age ($\beta = -0.001$, $p = 0.997$; $\beta = -0.009$, $p = 0.850$; $\beta = -0.045$, $p = 0.473$) show negative insignificant beta coefficients with the dependent variable personalization for all the three websites. Thus, the results provide a strong support for the rejection of the null hypothesis relating to the relationships between independent variables (education and occupation) and the dependent variable personalization in the case of all the three websites while null hypothesis is accepted in case of the independent variables (age and gender) and personalization. Therefore, it could be concluded that personalization depends on the demographic factors.

The analysis of the factor Convenience as shown in Table 14 indicate that the website Amazon has the highest mean value of 4.05 followed by Snapdeal with a mean value of 3.95, and Flipkart with a mean value of 3.91. Among the twelve variables 'purchasing online is more convenient, as it has 24/7 access' secured highest score ($\mu = 4.16$) followed by variables 'purchasing online enables to complete shopping effortlessly ($\mu = 4.08$)', 'no transportation is required for online shopping ($\mu = 4.08$)' and 'provides the facility to purchase products from anywhere ($\mu = 4.06$)'. In case of Amazon and Flipkart the highly rated variable 'purchasing online is more convenient, as it has 24/7 access ($\mu = 4.25$ and 4.13)', and Snapdeal, the highly rated variable is 'provides the facility to purchase products from anywhere ($\mu = 4.13$)'. It is significant to note that the total mean value of all the twelve variables is 3.97 which indicate that the convenience to access the website has a positive influence on the online consumers' purchase intentions.

The ANOVA test (Table 15) indicate that in case of all the three websites Amazon ($F = 2.159$, $p = 0.043 < 0.05$), Flipkart ($F = 2.232$, $p = 0.045 < 0.05$) and Snapdeal ($F = 2.552$, $p = 0.042 < 0.05$) the factor convenience show a positive significant influence with the predictors occupation, age, education and gender of the consumer purchase intentions.

Table 15. Convenience - ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
Amazon	Regression	3.594	4	.898	2.159	.043[b]
	Residual	204.327	491	.416		
	Total	207.920	495			
Flipkart	Regression	4.411	4	1.103	2.232	.045[b]
	Residual	225.329	456	.494		
	Total	229.740	460			
Snapdeal	Regression	5.723	4	1.431	2.522	.042[b]
	Residual	141.846	250	.567		
	Total	147.569	254			

a. Dependent Variable: Convenience

b. Predictors: (Constant), Occupation, Age, Education, Gender

The calculation of coefficient (Table 16) reveals that in the case of all three websites Amazon, Flipkart and Snapdeal, the independent variables education ($\beta = 0.016$, $p = 0.032$; $\beta = 0.080$, $p = 0.041$; $\beta = 0.191$, $p = 0.003$) and occupation ($\beta = 0.105$, $p = 0.024$; $\beta = 0.100$, $p = 0.035$; $\beta = 0.008$, $p = 0.038$) show positive significant beta coefficients with the dependent variable convenience. However, gender ($\beta = 0.100$, $p = 0.055$; $\beta = 0.079$, $p = 0.093$; $\beta = 0.008$, $p = 0.898$) and age ($\beta = 0.033$, $p = 0.470$; $\beta = 0.037$, $p = 0.426$; $\beta = 0.043$, $p = 0.489$) show positive insignificant beta coefficients with the dependent variable convenience for all the three websites. Thus, the analysis provide a strong support for the rejection of the null hypothesis relating to the relationships between independent variables (education and occupation) and the dependent variable convenience in the case of all the three websites while null hypothesis is accepted in case of the independent variables (age and gender) and convenience. Therefore, it could be concluded that convenience depends on the demographic factors.

The descriptive statistics of the factor Reliability (Table 17) indicate that Amazon has the highest mean value of 3.83 followed by Snapdeal ($\mu = 3.68$) and Flipkart ($\mu = 3.46$). Among the twelve variables 'the online store provides timely delivery of products' secured highest rating ($\mu = 3.87$) followed by variables 'the supply mechanism of the online store is effective ($\mu = 3.83$)' and 'the pricing strategy followed by the online store is consistent ($\mu = 3.79$)'. In case of Amazon, the highly rated variable is 'the online store provides timely delivery of products ($\mu = 4.12$)'. For the website, Flipkart the variable 'the pricing strategy followed by the online store is consistent ($\mu = 3.69$)' got highest rating. In case of Snapdeal, the top-rated variable is 'the supply mechanism of the online store is effective'. It is significant to note that the total mean value for all the referred variables is 3.66 which indicate that factor reliability has a positive influence on the consumers online purchase behavior.

The ANOVA test (Table 18) results for the dependent variable reliability in case of all the three websites Amazon ($F = 1.014$, $p = 0.040<0.05$), Flipkart ($F = 2.996$, $p = 0.018<0.05$) and Snapdeal ($F = 2.576$, $p = 0.038<0.05$) show a positive significant influence on consumer purchase intentions with the predicators occupation, age, education level, and gender.

Table 18. Reliability - ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
Amazon	Regression	1.519	4	.380	1.014	.040[b]
	Residual	183.889	491	.375		
	Total	185.409	495			
Flipkart	Regression	6.217	4	1.554	2.996	.018[b]
	Residual	236.529	456	.519		
	Total	242.746	460			
Snapdeal	Regression	6.254	4	1.563	2.576	.038[b]
	Residual	151.753	250	.607		
	Total	158.006	254			

a. Dependent Variable: Reliability

b. Predictors: (Constant), Occupation, Age, Education Level, Gender

The coefficient (Table 19) relationship between the reliability of the website and independent variables gender, age, education and occupation reveals that for all the three websites Amazon, Flipkart and Snapdeal, the independent variables gender ($\beta = 0.024$, $p = 0.013$; $\beta = 0.041$, $p = 0.038$; $\beta = 0.031$, $p = 0.021$), age ($\beta = 0.073$, $p = 0.008$; $\beta = 0.076$, $p = 0.004$; $\beta = 0.009$, $p = 0.009$) and education ($\beta = 0.001$, $p = 0.045$; $\beta = 0.095$, $p = 0.045$; $\beta = 0.197$, $p = 0.002$) show positive significant beta coefficients with the dependent variable reliability. However, occupation ($\beta = -0.057$, $p = 0.020$; $\beta = -0.099$, $p = 0.035$; $\beta = -0.017$, $p = 0.042$) shows negative significant beta coefficients with the dependent variable reliability. Thus, the regression analysis shows a strong support for the rejection of the null hypothesis relating to the relationships between independent variables gender, age, education and occupation with the dependent variable reliability in the case of all the three websites. Therefore, it could be concluded that reliability of the website strongly depends on the demographic factors.

The descriptive statistics of financial advantage (Table 20) indicate that the website Amazon has the highest mean value of 3.75 followed by Snapdeal ($\mu = 3.55$), and Flipkart ($\mu = 3.52$). Among the ten variables 'payment after delivery is a valuable facility' got highest rating ($\mu = 3.99$) followed by variables 'provides consumers with different payment options ($\mu = 3.81$)', and 'products are available relatively at a lower price ($\mu = 3.67$)'. The highly rated variable in case of all the three online marketers is 'payment after delivery is a valuable facility'. It is pertinent to note that the total mean value of all the twelve variables is 3.62 which indicate that the factor financial advantage has a positive influence on the consumers online purchase behaviour.

The ANOVA test (Table 21) reveals that all the three websites Amazon ($F = 1.049$, $p = 0.031 < 0.05$), Flipkart ($F = 4.923$, $p = 0.001 < 0.05$) and Snapdeal ($F = 3.321$, $p = 0.011 < 0.05$) shows that financial advantage has a positive significant influence on the independent variables (occupation, age, education, and gender) of consumer purchase intentions.

The coefficients (Table 22) reveals that, in the case of all the three websites Amazon, Flipkart and Snapdeal, all the independent variables gender ($\beta = 0.006$, $p = 0.046$; $\beta = 0.096$, $p = 0.038$; $\beta = 0.129$, $p = 0.041$), age ($\beta = 0.058$, $p = 0.002$; $\beta = 0.016$, $p = 0.031$; $\beta = 0.016$, $p = 0.037$), education ($\beta = 0.037$, $p = 0.018$; $\beta = 0.110$, $p = 0.019$; $\beta = 0.197$, $p = 0.002$) and occupation ($\beta = 0.062$, $p = 0.015$; $\beta = 0.131$, $p = 0.005$; $\beta = 0.006$, $p = 0.023$) shows a positive significant coefficient with the dependent variable

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

financial advantage. Thus, the results provide a strong support for the rejection of the null hypothesis relating to the relationships between independent variables gender, age, education and occupation and the dependent variable financial advantage in the case of all the three websites. Therefore, it could be concluded that the financial advantage strongly depends on the demographic factors.

a. Dependent Variable: Financial Advantage; All the p values are significant at 0.05 level

The descriptive statistics of the factor security & privacy (Table 23) reveals that the website Amazon has the highest mean value of 3.84 followed by Snapdeal ($\mu = 3.63$) and Flipkart ($\mu = 3.61$). Among the eleven variables 'shopping is better done at privacy of customer home' secured highest rating ($\mu = 3.89$) followed by the variables 'certified transaction platform with payment gateway mechanism ($\mu = 3.81$)' and 'consumers feel secure in providing sensitive information for online transactions ($\mu = 3.77$)'.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

In case of all the three online websites Amazon, Flipkart and Snapdeal the highly rated variable is 'shopping is better done at privacy of customer home' with mean values 3.99, 3.83 and 3.82 respectively. It is significant to note the total mean value for all the referred variables is 3.71 which indicate that factor security has a positive influence on the consumers' online purchase intentions.

Table 23. Security and privacy - descriptive statistics (mean values) n = 1200

S.No.	Variables	Amazon	Flipkart	Snapdeal	Total
1	Shopping is better done at privacy of customer home	3.99	3.83	3.82	3.89
2	Certified transaction platform with payment gateway mechanism	3.95	3.71	3.74	3.81

11	Customers privacy is guaranteed while shopping online	3.70	3.54	3.40	3.58
Total		**3.84**	**3.61**	**3.63**	**3.71**

Source: Primary data

The ANOVA test (Table 24) results reveals that the websites Amazon ($F = 0.732$, $p = 0.050<0.05$), Flipkart ($F = 4.389$, $p = 0.002<0.05$) and Snapdeal ($F = 2.606$, $p = 0.036<0.05$) shows that the dependent variable has a positive significant influence on the consumer purchase intentions with the predicators occupation, age, education level and gender.

The coefficients (Table 25) reveals that, in case of the three websites Amazon, Flipkart and Snapdeal, all the independent variables gender ($\beta = -0.069$, $p = 0.040$; $\beta = -0.067$, $p = 0.048$; $\beta = -0.058$, $p = 0.037$), age ($\beta = -0.023$, $p = 0.006$; $\beta = -0.096$, $p = 0.039$; $\beta = -0.030$, $p = 0.032$), education ($\beta = -0.021$, $p = 0.015$; $\beta = -0.042$, $p = 0.030$; $\beta = -0.180$, $p = 0.004$) and occupation ($\beta = -0.047$, $p = 0.019$; $\beta = -0.140$, $p = 0.003$; $\beta = -0.025$, $p = 0.015$) shows a negative significant coefficient with the dependent variable security & privacy. Thus, the results provide a strong support for the rejection of the null hypothesis relating to the relationships between independent variables gender, age, education and occupation and the dependent variable security & privacy in the case of all the three websites. Therefore, it could be concluded that security & privacy of a website strongly depends on the demographic factors.

The delivery factor (Table 26) indicate that the website Amazon has the highest mean value of 3.88 followed by Snapdeal ($\mu = 3.73$) and Flipkart ($\mu = 3.58$). Among the fourteen variables 'the products dispatched are well packaged' got highest rating ($\mu = 3.98$) followed by the variables 'effective system of tracking of shipping and delivery details ($\mu = 3.97$)' and 'the website provides gift packing facility (μ

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

= 3.82)'. In case of Amazon, the highly rated variable is 'effective system of tracking of shipping and delivery details (μ = 4.12)'. For the websites, Flipkart and Snapdeal the variable 'the products dispatched are well packaged (μ = 3.92 and 3.98)' got highest rating. It is pertinent to note that the total mean value of all the fourteen variables is 3.74 which indicate that the factor delivery has a positive influence on the consumers online purchase behaviour.

14	Delivery to any location specified at free of cost	3.36	3.36	3.27	3.34
Total		**3.88**	**3.58**	**3.73**	**3.74**

Source: Primary Data

The ANOVA test (Table 27) indicate that in the case of all three websites Amazon ($F = 0.425$, $p = 0.791>0.05$), Flipkart ($F = 3.573$, $p = 0.057>0.05$) and Snapdeal ($F = 2.089$, $p = 0.083>0.05$), the delivery factor does not show a significant influence on the predicators occupation, age, education level, and gender of the consumer's purchase intentions.

The coefficients (Table 28) between the dependent and independent variables reveals that, in case of all the three websites Amazon, Flipkart and Snapdeal, the independent variables gender ($\beta = 0.026$, $p = 0.588$; $\beta = 0.058$, $p = 0.213$; $\beta = 0.037$, $p = 0.567$), age ($\beta = 0.006$, $p = 0.892$; $\beta = 0.054$, $p = 0.250$; $\beta = 0.042$, $p = 0.504$), education ($\beta = 0.045$, $p = 0.328$; $\beta = 0.026$, $p = 0.576$; $\beta = 0.155$, $p = 0.114$) and occupation ($\beta = 0.038$, $p = 0.423$; $\beta = 0.162$, $p = 0.101$; $\beta = 0.086$, $p = 0.174$) shows positive but insignificant coefficient with the dependent variable delivery. Thus, the results provide a strong support for the acceptance of the null hypothesis relating to the relationships between independent variables gender, age, education and occupation with the dependent variable delivery in the case of all the three websites. Therefore, it could be concluded that the variable delivery does not depend on the demographic factors.

DISCUSSION

The perceived benefits of online shopping are playing a vital role in shifting the consumers shopping behaviour from conventional shopping to online shopping. To know the influence of the perceived benefits on the consumers' demographic profile in the case of all the three websites Amazon, Flipkart and

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Snapdeal the mean values are analyzed and to know the statistical significance the regression analysis is conducted. The descriptive statistics reveals that the convenience in online shopping is the highly perceived benefit followed by product variety and website functionality. The perceived benefits such as delivery, security & privacy, reliability, personalization, financial advantage and innovativeness also got significant ratings by the online shoppers.

	Occupation	.084	.062	.086	1.364	.174

Dependent Variable: Delivery; All the p values are not significant at 0.05 level.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the case of website functionality, 'the website has user-friendly interface facilitating easy navigation' is the most influencing variable. 'Comparison of wide range of product features is possible' is the most influencing variable under product variety. The highly influencing variable of Innovativeness is 'attracts customers with attention drawing programmes like flash sales'. In case of personalization the highly influencing variable is 'online store provides mobile app based shopping'. 'Purchasing online is more convenient as it has 24/7 access' is the most influencing variable of the convenience factor. Under reliability the highly influencing variable is 'online store provides timely delivery of products'. In the similar manner the highly influencing factor of financial advantage is 'payment after delivery is a valuable facility'. For security & privacy, the variable 'shopping is better done at privacy of customer home' is most highly rated by the respondents. Finally, in the case of delivery, 'products dispatched are well packaged' is highly influencing variable of the consumers' online behaviour. Further, it is found that all the variables are significant factors of perceived benefits.

The statistical analysis reveals that in the case of all the three websites Amazon, Flipkart and Snapdeal, the demographic factors gender, age, education and occupation shows significant relation with the factors of perceived benefits (website functionality, product variety, innovativeness, personalization, convenience, reliability, financial advantage, and security & Privacy). The delivery factor does not show significant relation with the demographic factors. Thus, it could be concluded that the all the perceived benefits except delivery depend on the demographic factors (see Table 29).

Table 29. Summary of the hypotheses outcomes

1. Influence of Demographic factors on Consumers' Perceived Benefits:	
H_{01}: The demographic factors (gender, age, education and occupation) do not have significant influence on consumers' perceived benefits (website functionality, product variety, innovativeness, personalization, convenience, reliability, financial advantage, security & privacy).	Rejected
H_{02}: The demographic factors (gender, age, education and occupation) do not have significant influence on consumers' perceived benefits (delivery).	Accepted
2. Perceived Benefits:	
H_{01}: Website Functionality is not significantly considered as perceived benefit.	Rejected
H_{02}: Product Variety is not significantly considered as perceived benefit.	Rejected
H_{03}: Innovativeness is not significantly considered as perceived benefit.	Rejected
H_{04}: Personalization is not significantly considered as perceived benefit.	Rejected
H_{05}: Convenience is not significantly considered as perceived benefit.	Rejected
H_{06}: Reliability is not significantly considered as perceived benefit.	Rejected
H_{07}: Financial Advantage is not significantly considered as perceived benefit.	Rejected
H_{08}: Security & Privacy is not significantly considered as perceived benefit.	Rejected
H_{09}: Delivery is not significantly considered as perceived benefit.	Rejected

CONCLUSION AND MANAGERIAL IMPLICATIONS

The world of retailing is undergoing an unprecedented wave of innovation. New business models are having e-retailing as an integral part and focusing a wider retail value chain. At the same time, consum-

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

ers' behavior and expectations are evolving from time to time and are being influenced significantly by online retailing. The competition among e-vendors is getting intensified year by year and all of them are adopting innovative and creative approaches to attract, satisfy and retain customers. Due to ever increasing work pressure, multiple roles in life style, paucity of time, consumers are on the lookout of such facility that can suit to their changing needs. The findings of the study drive to the conclusion that the online shoppers have positive opinion on online retailing. As per the findings of the study, convenience is the highly perceived benefit followed by product variety and website functionality in online shopping. Perceived benefits such as delivery, security & privacy, reliability, personalization, financial advantage and innovativeness also got significant ratings by the online shoppers. However, the study established the gap between the optimum benefit and the actual benefit perceived. This gap in all the nine variables indicates an opportunity to the e-vendors to initiate measures in respective areas for enhancing the benefits to the consumers. Out of the five variables identified as perceived risks, the study found that health risk is highly significant followed by security & privacy risk and convenience risk. The product related risk and financial risk were also considered significant by the respondents. E-vendors have to take measures to minimize risk perceptions of the consumers so that the overall value perception of the consumers from the e-vendors can be optimized.

However, they are certain areas wherein improvements are necessary to achieve higher quality perceptions of the online shoppers. The existing web features of the e-retailers are not providing live chat facility; therefore, the e-retailers shall provide live chat facility 24/7 for effective direct interaction. The e-retailers should recognize the problem of the shoppers and facilitate quick movement to final shopping cart web page by providing a choice to eliminate all other web pages. Reviews and customers' feedback stand as an excellent support the consumers to arrive at a purchasing decision. The e-retailers can provide more reviews and ensure technologically that they are genuine and reliable. E-marketing channels are accessible mostly to the urban population due to the limited availability of delivery channels. Due to this reason, huge market potential in the rural areas is not exploited. The e-retailers should find delivery channels in the rural markets also. Formidable cyber law should be initiated and there should be aggressive policies against the frauds of online retailers. The legal provisions should prevent the e-vendors using and sharing consumer information for any other purpose to others. Further, there must be specific provisions to facilitate web information in regional languages, so that the consumers can understand easily and place orders.

LIMITATIONS AND FURTHER RESEARCH DIRECTIONS

The scope of the study confines to determine the consumers perceived risks and their impact on the shopper's behaviour. The other behavioral dimensions are not included in the study. The results of the study could be further used by the researchers and practitioners for conducting future studies in this area. The researchers can focus on the socio economic and cultural factors influencing the consumers' online shopping behaviour. Further, the influence of various factors on the consumers' purchase decision process can also be studied. The researchers can focus on the online shoppers' behaviour on purchase of goods and services, and also focus on the potential of e-marketers to reach the organizational markets.

Chapter 92
Analyzing Online Customer Satisfaction:
The Impacts of Perceived Benefits, Perceived Risks, and Trust

Jennifer H. Gao
Macao Polytechnic Institute, Macao, China

ABSTRACT

Online shopping is becoming more and more popular in China. This study investigates factors that might influence customer satisfaction towards online shopping. A theoretical framework was established to explain causal relationships between perceived benefits, perceived risks, trust in online shopping and customer satisfaction. Data was collected from 402 respondents who had experience in online shopping in mainland China. Correlations and regression analyses were done to reveal that three factors of perceived benefits (i.e., shopping convenience, product selection, and hedonic enjoyment), product risk, and trust in online shopping were significant predictors of customer satisfaction. Implications for e-marketers were discussed, and limitations and future research were presented.

INTRODUCTION

Alibaba's 2017 11.11

Starting from 2009, Alibaba Group held the world's largest online shopping event on 11 November each year, known as the "11.11 Global Shopping Festival" This year, the event has been extended from a one-day shopping event on 11 November to a shopping festival that rolled out through 19 October to 11 November. Further validating the New Retail model to offer seamless online and offline shopping experience, and going global are the main themes this year. Alibaba reported 168.3 billion yuan (US$ 25.3 billion) in GMV compared to the 120.7 billion yuan (US$ 17.8 billion) last year. At 13 hours and 9 minutes into the sale, total GMV surpassed the total for the 24-hour sale last year. Sales growth was 39%. … (Report from Asia Distribution and Retail, November 2017)

A return/rejection rate of 35% was recorded after this year's 11.11 Shopping Festival. Main reasons were poor effects, quality discrepancy with description and imitation brand. Clothing reached the highest rejection rate of 45%, due to color differences and sizes, etc. (Express Delivery Magazine, November 2017)

Customer satisfaction is a judgment that the product or service provides a pleasurable level of consumption-related fulfillment, including levels of under or over fulfillment. It is important because it falls down an optimist outcome from the specific resources and the fulfillment of unmet needs and wants. According to Khristianto, Kertahadi, and Suyadi (2012), customer satisfaction is commonly viewed as a result of comparison between the consumption expectation and experiences, and customer satisfaction is achieved when the final deliverable (i.e., experience) meets or exceeds a customer's expectation. Satisfied customers are most likely to have the intention to repurchase if the service provider reached or exceeded their expectation. Satisfaction and loyalty are the key elements that determine the success of market concept implementation. Identifying the variables of customer satisfaction is significant as it acts as a benchmark of the business performance, and it also serves as guidelines for future improvement (Alan & Yasin, 2010). Customer satisfaction may reduce the outflow of customers. The cost of attracting new customers is significantly higher than maintaining current customers and the intention of repurchase is higher and the loyalty of the customer to purchase in the same shop is stabilized when customers are satisfied with the products and services. Moreover, negative word of mouth would be reduced as satisfied customers are more likely to recommend their choice or to share their shopping experience to the people around. Simply, customer satisfaction is a reflection of business strategy and management. It helps an organization to monitor their business in a better way.

Internet is not only a global network for communication and information sharing, it has become a platform for transaction of products and services between suppliers and buyers. Many marketers, nowadays, are beginning to develop online product marketing. Online shopping is so popular today that some people predict that retails stores will decrease and gradually disappear in the end. The rapid development of online shopping provides business opportunities as well as flexibility and convenience for customers. Both suppliers and consumers seem to enjoy this type of transaction, however, influencing factors of customer satisfaction towards online shopping need to be explored to help online retailers to have a better management system, and to maintain a sustained and sound growth.

Perceived Benefits

Wu (2003) described perceived benefits as meeting consumers' needs and wants by the sum of online shopping advantages and satisfaction. The potential benefits of online shopping for consumers involve in speed and convenience, various selection, low price, personal attention, and easy access to information (Zhou, Dai & Zhang, 2007). Forsythe, Liu, Shannon and Gardner (2006) proposed three dimensions of perceived benefits of online shopping: shopping convenience, product selection and hedonic enjoyment. Shopping convenience is perceived to be the ability to shop almost anytime from a variety of locations without visiting a store. Product selection is the availability of a wide range of products and product experience, custom designing products, etc. There is considerable empirical support for hedonic motives in online shopping (Parsons, 2002).

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Shopping Convenience

Wolfinbarger and Gilly (2001) referred convenience as saving time and effort which consist of physical and mental effort. Consumers make online purchase for both convenience and enjoyment (Childers, Carr, Peck & Carson, 2001). The main reason that motivates consumers to shop online is conveniences (Swaminathan, Lepkowska & Rao, 1999), and it shortens the geographical distance. Jayawardhena and Wright (2009) proved that online shopping reduces travel costs and related barriers and increases efficiency in searching. Wolfinbarger and Gilly (2001) revealed that consumers can shop anytime and everywhere as long as they are able to get online. Convenient access to product information could facilitate and help shoppers' making an online purchase decision (Loshe & Spiller, 1999). Monsuwe, Delleart and Ruyter (2004) identified that convenience help consumers to make purchase decision efficiently. Consumers often love to compare prices from shop to shop as they want to buy their desired product with the cheapest price. They need to spend much time to walk around which requires more time and effort. But when they shop online, they can easily obtain necessary information and online shopping saves time and effort. Thus, online marketers need to ensure online shopping process easy and simple (Jarvenpaa & Todd, 1996). So, the following hypothesis is formulated:

H(1): Conveniences significantly and positively influence customer online shopping satisfaction.

Product Selection

Online shopping offers large choices of products and brands compared to traditional shopping. Consumers have more choices of features, types, and categories. Online retailers often offer a wider range of different products, and provide sufficient information about their products. According to Forsythe et al. (2006), product selection helps consumers in making decision with beneficial products. Studies also reported that online customers prefer wider selection that is even more important than lower price. Mathieson (1991) suggested online marketers make feel to the customers that they are independent of endorsing any company's product. It ensures that customers avail enough choices of product variances in the category in order to make suitable decision (Khatibi, Haque & Karim, 2006). Bakos (1997) identified that lower search costs help consumers seek greater product to satisfy their needs. Raijas (2002) proved that superior variety of products can contribute consumers to meet their needs easier. Therefore, the hypothesis is set as follows:

H(2): Product selection significantly and positively influences customer online shopping satisfaction.

Hedonic Enjoyment

Hedonic value has been studied in both traditional and online shopping (Babin & Attaway, 2000). Similar to traditional shoppers, online shoppers also shop for leisure intentions. According to Kim (2002), consumers who prefer online shopping are also fulfilling the wants of experience and emotion, which demonstrates that internet shoppers are akin to in-store shoppers as they need utilitarian as well as hedonic value. Parsons' (2002) study found that there are plentiful hedonic shopping motivations for online shoppers, including: diversion, self-gratification, and learning about new trends. Hedonic motivations might be evaluated as predictors of online shopping and e-impulse purchases. Online sellers often try to

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

generate a hedonic environment that is favorable by many consumers with atmospheric signals (Childers et al., 2001). The main motivation of hedonic consumers for shopping is the pleasure in the procedure (To, Liao & Lin, 2007). Hedonism is oriented around the entertainment and enjoyment values that can be pertained through an online shopping experience (Park & Sullivan, 2009). Hedonism is an essential component of online shopping experiences and determines consumer buying tendency. Koo and Ju's (2002) study verified that online shopping value is created by pleasant, stimulating and novel websites that increase excitement and enjoyment during shopping. Thus, the following hypothesis is established:

H(3): Hedonic enjoyment significantly and positively influences customer online shopping satisfaction.

Perceived Risk

It is widely recognized that consumers face uncertain outcomes when purchase a product or service (Gratorex & Mitchell, 1994). Consumers are afraid of loss or gain in online shopping. Perceived less risk is important in influencing customer satisfaction and decision by online store acceptance (Hsu & Chiu, 2004). Consumers often use different strategies to reduce risk. For example, they do more research to collect information or depend on a famous brand to decrease the amount of risk (Gratorex & Mitchell, 1994). Perceived risk associated with online shopping may include different types. Forsythe et al. (2006) identified three categories: financial risk, product risk and time/convenience risk.

Financial Risk

Perceived financial risk is the possibility of monetary loss rising from online shopping transaction security. Security regarding the use of credit cards is one of the most serious concerns among online consumers (Keeney, 1999). Online stores have made great efforts in increasing their image and building up trust with customers to ensure high quality protection of online transactions. Customers feel secure when online stores use a good quality security online payment system such as Alipay. Some online platform allows trust entities or banks to hold the buyer's payments and forward them to the seller after the buyer has received the product to reduce financial risk. Therefore, it is hypothesized that:

H(4): Financial risk is negatively but significantly correlated with customer online shopping satisfaction.

Product Risk

Product risk is defined as the loss incurred when a brand or product does not perform (Horton, 1976). A higher perceived product quality may increase the perceived value consequently and a customer satisfaction (Snoj, Lorda & Mumel, 2004). During online shopping, however, customers do not physically know about the product, but see the product in online stores as they search for and buy products. Customers cannot physically touch and feel about the product, or try the product. Due to lack of face to face communication, there might be problems such as color difference, and product features not matching context, etc. Customers, thus, may develop low trust and perceive high level of risk towards online shopping. Walter, Gupta and Su (2006) pointed out that perceived product quality uncertainty is a direct cause of consumers' perceived risk of online store. Hence, the following hypothesis is developed:

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

H(5): Product risk is negatively but significantly correlated with customer online shopping satisfaction.

Time/Convenience Risk

The perception that time, convenience, or effort may be wasted when a product purchased is repaired or replaced is called time/convenience risk (Hanjun, Jaemin, Joo & Sung, 2004). Time risk is often referred to as the inconvenience occurred during online transaction, such as difficulty of navigation, difficulty of submitting orders, or delays in receiving orders. The decision of which website to use, the time of searching products, and the mode of transaction payment are all potential negative effects on customer satisfaction towards online shopping (Forsythe et al., 2006). On the basis of these studies, the hypothesis is set as follows:

H(6): Time/Convenience risk is negatively but significantly correlated with customer online shopping satisfaction.

Trust in Online Shopping

Morgan and Hunt (1994) described trust as confidence in the exchange partner's reliability and integrity. Similarly, Doney and Cannon (1997) stated trust as the perceived credibility and benevolence of a target. Trust or confidence in online business is dominant in determining the perceived level of risk associated with online purchasing. According to Medintz (1998), customer concerns about security, privacy, and protection. Shannon's (1998) research revealed that providing credit card information to an online business that has no physical location increases the perception of risk for certain customers. Many customers do not trust that the online businesses that they are dealing with would keep their purchase data confidential (Wang, Lee & Wang, 1998). Upon the research result of Singh and Sirdeshmukh (2000), trust is a crucial variable that determines outcomes at different points in the process, and serves as glue that holds the relationship together. As regards online shopping, customers who do not trust electronic business would not be loyal to it even though they are generally satisfied with the experience. In the sense, satisfaction is likely to emerge only after customers build a certain level of trust in online shopping. Consequently, the hypothesis is formed as follows:

H(7): Trust in online shopping is positively and significantly correlated with online shopping satisfaction.

METHOD

Respondents

The data were collected from 402 respondents with online purchase experience in two major cities situated on the Pearl River Delta (in Southern China). All respondents were ethnic Chinese, whose ages ranged from 18 to 46 years, and the proportion of male and female is 41.7% and 58.3%, respectively. Most respondents (66.8%) had bachelor degrees, and 70.6% had income under $8,000 per month. About 36.4% of respondents spent more than 25 hours on the internet.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Materials

The questionnaire assessed five topic areas, namely, the employee's demographics, perceived benefits (including: shopping convenience, product selection, and hedonic enjoyment), perceived risk (including: financial risk, product risk, and time/convenience risk), and trust in online shopping, and customer satisfaction. The demographics section asked the respondents to report their gender, age, ethnicity, education level, income, time spent on internet, and experience of online purchase. All the questions used a five Likert scale with 1= strongly disagree, and 5=strongly agree.

- **Perceived Benefits:** A scale of 12 items of perceived benefits covering the aspects of shopping convenience, product selection, and hedonic enjoyment was adopted from Forsythe et al. (2006). Sample questions are: "I can shop whenever I want" and "I am exciting to receive a package."
- **Perceived Risk:** A scale of 16 items of perceived risk (financial risk, product risk, and time/convenience risk) was adopted from Forsythe et al. (2006). A sample question is: "I may not get what I want."
- **Trust in Online Shopping:** A scale of 4 items was adopted from Dodds, Monroe and Grewal (1991). A sample question is: "The performance of online website meets my expectations."
- **Language of the Questionnaire:** The original English items were translated into simplified Chinese script by a bilingual professor at a university in China. Another bilingual professor at the same university examined the translated items for their English meaning and evaluated the two versions as equivalent.

Procedure

Data were collected through a web survey within several weeks. Web survey is a relatively quick and inexpensive method compared to other survey methods. As this study is about online shopping satisfaction, it is believed that only those who often surf on the internet may have online purchasing experience. Among the 610 completed questionnaires, only 402 respondents with online purchase experience were considered as valid replies and entered into data analysis.

RESULTS

Scale Reliabilities and Correlations

Cronbach alpha scale reliabilities were run on Customer Satisfaction towards Online Shopping (the dependent variable), the three Perceived Benefits dimensions (Shopping Convenience, Product Selection, and Hedonic Enjoyment), three Percieed Risk dimensions (Financial Risk, Product Risk, and Time/Convenience Risk), and Trust in Online Shopping. Reliabilities for Customer Satisfaction was .82, Trust in Online Shopping was .79. The reliabilities for the Perceived Benefits dimensions were .83 for Shopping Convenience, .89 for Product Selection, and .78 for Hedonic Enjoyment. As regards Perceived Risk, the reliabilities were .73 for Financial Risk, .82 for Product Risk, and .73 for Time/Convenience Risk.

All of the variables were then assessed for correlations. The variable means, standard deviations, intercorrelations, and scale reliabilities are shown in Table 1.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1.Means, SDs, alpha reliabilities, and correlations of customer satisfaction with perceived benefits, perceived risks, and trust in online shopping

	Alpha	Mean	SD	1	2	3	4	5	6	7
1. Customer Satisfaction	.82	3.41	.53							
2. Shopping Convenience	.83	3.78	.59	.46						
3. Product Selection	.89	3.84	.57	.36	.42					
4. Hedonic Enjoyment	.78	3.65	.49	.36	.28	.37				
5. Financial Risk	.73	3.49	.49	-.18	.04	-.04	-.01			
6. Product Risk	.82	4.07	.57	-.21	.08	.25	.24	.38		
7. Time/Convenience Risk	.73	3.20	.73	-.05	-.03	-.23	-.15	.34	.01	
8. Trust in Online Shopping	.79	3.48	.52	.63	.42	.35	.45	-.24	-.11	-.18

Significance levels for the correlations were: for $r > .17$, $p < .001$; for $r > .14$, $p < .005$; for $r > .12$, $p < .01$, for $r > .10$, $p < .05$.

The hypotheses were all tested using the correlations between the independent variables and the dependent variable. As can be seen from Table 1, there were highly significant, positive correlations between the mean scores on Customer Satisfaction and on all three of the Perceived Benefits dimension, with their r values ranging from .36 ($p < .001$) to .46 ($p < .001$), which lent strong support to H(1) to H(3). The same pattern of significant, but negative correlations were found for the two Perceived Risk dimensions and Customer Satisfaction towards Online Shopping (-.18 for Financial Risk, and -.21 for Product Risk, all *ps* < .001), which strongly supported H(4) and H(5). No significant correlation was found between Time/Convenience Risk and Customer Satisfaction towards Online Shopping, so H(6) was rejected. A significant and positive correlation was found for Trust in Online Shopping and Customer Satisfaction towards Online Shopping (.63, $P < .001$), which supported H(7).

Tests for Common-Method Bias and Multicollinearity

Whereas all the items were evaluated by every respondent, tests for common-method bias and multicollinearity were conducted. Common-method bias was assessed (following O'Connor & Morrison, 2001) by factor analyzing all the variables together, using the maximum-likelihood approach with a forced, one-factor solution. In this method, the resultant χ^2 value is then divided by the degrees of freedom to assess model fit, whereby a ratio of less than 2.00:1 would indicate a good fit (i.e., common-method bias). For the data in this study, the ratio was 14.93:1, indicating that common-method bias was not problematic.

Multicollinearity was assessed with a "tolerance" ($1\text{-}R^2$) test for each independent variable. According to Hair, Anderson, Tatham, and Black (1998, pp. 191-193), a tolerance value of less than .10 is problematic. The tolerances for the independent variables ranged from .70 to .92. Whereas all of the tolerance values were well above the recommended cutoff of .10, multicollinearity was not considered a problem for these data.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Regression

To assess the strength of the relationships between the independent variables and the dependent variable, a hierarchical, multivariate, step-wise regression was run while controlling for demographics.

A total of 54% of the variance was explained, $F(5,393) = 184.33$, $p < .001$ by five variables. The Perceived Benefits dimensions of Shopping Convenience accounted for 5% of the variance. In terms of power, according to Cohen (1992), the variance explained by the Shopping Convenience variable would yield a small "effect size," $f^2 = .05$ (where $f^2 = R^2 / [1-R^2]$). Cohen uses minimum cutoff values of .02 for a small effect, .15 for a medium effect, and .35 for a large effect. Product Selection explained 1%, and Hedonic Enjoyment explained 5%, yielding a small effect ($f^2 = .05$). Product Risk under Percived Risk explained 3%, also yielding a small effect ($f^2 = .03$). Even though the overall effect of the regression was small, the results lent further support to H(1) to H(3) and H(5).

The remaining 40% of the variance was explained by Trust in Online Shopping, yielding a large effect ($f^2 = .67$). Since the Trust variable produced the most powerful effect, the result further supported H(7).

The results of the regression are presented in Table 2.

Table 2. Stepwise regression for customer satisfaction

Customer Satisfaction		
Predictors	**Beta**	**ΔR^2**
Perceived Benefits		
Shopping Convenience	.20****	.05
Product Selection	.12*	.01
Hedonic Enjoyment	.23****	.05
Perceived Risks		
Financial Risk	-.07	
Product Risk	-.29****	.03
Time/Convenience Risk	-.01	
Trust in Online Shopping	.41****	.40
Total R^2		**.54**
Final F		**89.59****
df		**5,393**

Note: *p<.05, **p<.01, ***p<.005, ****p<.001.

The total df does not equal to N-1 due to list-wise deletion of cases with missing data.

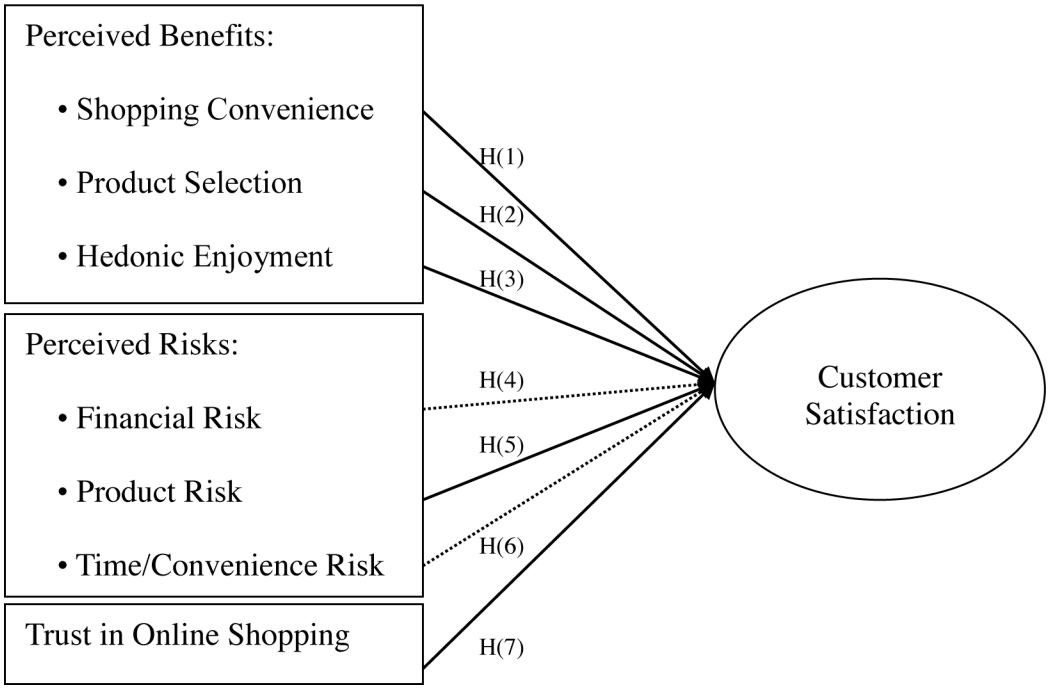
DISCUSSION

The results revealed a number of findings with regard to customer satisfaction towards online shopping, and about variables that can influence the degree of satisfaction.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Convenience is the most well-known motivation which encourages consumers to shop online. While most consumers regard convenience as advantageous comparing to traditional shopping, it also encourages impulse buying (Dawson & Kim, 2009). As LaRose (2001) pointed out, online stores are not constrained by opening and closing hours, physical locations, or, product availability. Online shopping can be done at anytime and anywhere as long as consumers want to. It is available on personal computer or smart phone, and it allows around the clock business. Shopping online enables busy working people to visit stores without disturbing their schedule, reduce travel necessity, and save time and energy consumption. It may not be affected by bad weather. People do not have to dress up, drive, or queue in a line in front of a cashier. On the other hand, online retailers are acclaimed as "no pollution" shops.

Figure 1. Online shopping and customer satisfaction



Online shopping provides broader selection of opportunities and greater access to information. Consumers can compare price and benefits offered by various sellers worldwide (Kim, 2002), and window shop a variety of products with the utmost comfort at home. Most physical stores offer a limited array of products. Nevertheless, online stores often offer a variety with diverse features. Shopping online allows customers to have access to several brands and products from different sellers at one place. Moreover, without spending money on travel, they can shop for the latest fashion in other parts of the country or even the world. If one store is out of stock, there surely will be another online store in which the product is available.

Goldsmith and Goldsmith (2002) revealed that hedonic value is a psychological variable that influences an individual's decision to participate in online fashion shopping. The findings of the study show that consumers with high hedonic shopping values tend to favor online shopping, because direct interaction

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

with product or salespeople reduces hedonic arousal. A hedonic customer seems to be more enjoyable of the purchase by clicking stores than visiting bricks. This finding implies e-marketing management that in order to be successful, they should increase the hedonic or entertainment value of their website. The fun element in website design is necessary to attract and retain online customers. It also reinforces the fact that customers with hedonic shopping values perceived greater benefits in online shopping. Restrictions of opening hours and poor customer service attitudes of traditional stores negatively affect customers' shopping mood. As Yu and Bastin (2010) pointed out, emotions dominate impulse buying process, and impulse buying behavior is a result of hedonic motivation.

Product risk has the most significant negative impact on customers' online purchase (Bhatnagar & Ghose, 2004), and it was found to have significant impact on the frequency of purchasing online (Forsythe & Shi, 2003). Online shoppers do not have physical contact with product or its performance, so they may have low trust and perceive high risk due to lack of physical sense (looking, touching, tasting, and smelling). Reducing consumers' perception of product risk may enhance customer satisfaction. In this sense, retailers online should provide clear, precise, and understandable information, and quality of their product should be the same as described at company's website.

Trust in online shopping was the dominant predictor of customer satisfaction. It alone explained 40% of the total variance. The result of the regression analysis indicates that trust in online shopping plays a crucial role in determining customer's online shopping satisfaction.

Building trusting relationship is an enormous difficult challenge that faces every organization. It may require companies to go beyond bottom-line profit making, and to differentiate themselves from competitors. Vanguard Group, the leader in building trusting relationship with their customers, has a retention rate of over 90%. Being the second largest mutual-fund seller in the world, it does not sell anything on its website, but solely devotes to continuous education of both current and potential investors, and providing information such as tax regulations and financial planning. By demonstrating to customers that the organization truly cares about them, and want to assist them in investment return and profit maximization, a strong trusting relationship is established and strengthened to guarantee customer satisfaction.

CONCLUSION

This study revealed that shopping convenience, product selection, hedonic enjoyment and trust in online shopping have positive effect on customer satisfaction towards online shopping. Most respondents agreed that online shopping has advantages over traditional shopping. It saves time, effort and money, relieves stress, and most of all, provides flexibility and convenience. The result shows that trust contributes the most to customer satisfaction, while product risk has negative effect on retaining customers in online shopping. The relative high mean scores of perceived risks in this study implied that online shopping is still considered a risky proposition in spite of its numerous benefits. To reduce online consumers' perception of risk, and to increase the possibility of purchases, marketers should take measures to minimize perceived product risk. Particularly, sufficient and accurate information of products should be provided to reduce consumers' uncertainty in product handling. Customer satisfaction is enhanced on the basis of a trusting relationship when customers receive more benefits.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Limitations and Future Research

The sample size of this study is small, and few variables are included in the framework. Future research may enlarge the sample size, present more antecedents and even outcomes. This research used a quantitative method and quantitative analysis. Future study could adopt qualitative analysis such as target group interview and discussion to collect more in-depth information. Besides, generalization of this research is somewhat limited, as it focused on mainland China only. In future, similar research may be carried out in Hong Kong, Macao, or even countries with different cultural context.

ABSTRACT

The aim of this study is to examine the factors affecting customer satisfaction in online shopping. The conceptual model for this study was developed based on the previous research in the online shopping context. In this research, ten hypotheses on factors affecting customer satisfaction in online shopping are outlined with empirical data from 337 respondents. Data was collected through a Google form. The regression results show that customer service, information quality, response time, transaction capability, delivery, merchandise attributes, security/privacy, convenient payment method, and price have significant positive influence on customer satisfaction in online shopping. From a managerial viewpoint, this study results provide support for investment decisions for customer satisfaction from online retailers in Malaysia.

INTRODUCTION

Customer satisfaction is one of the main topics in marketing, psychology, and consumer research. Researchers argue that customer satisfaction is the result of a customer's observation of the value received from the product or service what is expected in buying decision and needs associated with the buying. According to Zeithaml and Bitner (2003) satisfaction evaluate by the customers about particular product or service, to check whether it has met the expectations and needs. Researcher indicated that profitability of a firm is depending on the customer satisfaction (Zeithaml, 2000). As customers are the main source of firm's revenue, thus researchers and academician always giving importance on customer satisfaction research.

Purchasing through electronic medium is considered as online shopping where everybody can purchase any time and any location through Internet. There are many types of online shopping. In this research we considered business to consumer (B2C) online shopping where consumers buying their products and services directly from the online retailers. Now-a-days online business portals offers varieties of products to the consumers. Online researchers are well informed that annually online B2C sales volume increasing at a very high rate. According to Ecommerce Foundation (2016) globally 1.4 billion people purchase product and/or services at least one through online, in which they spent 2,272.7 billion dollars online with the annual growth rate of 19.9%. Another report eMarketer (2016) highlighted that it was expected to retail online sales 1.915 trillion dollar in 2016, accounting for 8.7% of total retail spending worldwide and also expecting by 2020 in Asia-Pacific total online retail sales will be 2.725 trillion dollars with growth rate of 31.5%.

In Malaysia online shopping fast gaining popularity because it is offering wide selection of goods and service and convenience shopping environment. Over the past few years due to increased penetration of mobile devices and affordable Internet services in Malaysia the e-commerce market has been growing steadily. According to HKTDC Research (2017) report, currently one third of total Malaysian buy product and services online. Another report by Euromonitor highlighted by HKTDC (2017) Research that online retail sales in Malaysia increased from MYR1.0 billion in 2011 to MYR2.4 billion in 2016, in which the average growth rate is 18.5%.

Due to the rapid growth of online shopping in Malaysia it is emphasizes the importance of focusing customer satisfaction issue while developing online retail store. According to Kim and Stoel (2004) customer will not return to the online outlet if they are not satisfied with their shopping experience through online. Compare to the developed countries online customers, Malaysian customers are different in terms of trust of buying through online. Customers in Malaysia are very cautious in buying decision and also they are very price sensitive. Thus, it is very important to Malaysian to examine the factors that affect online shopping satisfaction.

To gain competitive advantage, it is important to the companies to understand their customers very well, so that they can serve better and continuously. Researcher like Garver and Gagnon (2002) show that market orientation and customer satisfaction have direct relationship between customer satisfaction and organizational performance. In this competitive online business environment, it is also important for the online retail stores to know how to satisfy their customers. This will ultimately assist them to sustain their growth and market share (McKenney et al., 2002).

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

PROBLEM STATEMENT

The rapid growth of online retail stores creates new era of competition. It is important for the online retailers to differentiate themselves from one to another and to become market leader they need present themselves well to consumers. On the other hand, online consumers claimed that they are still unsatisfied with their buying experiences through online. The main reason is that consumers are unsatisfied because they do not have enough and actual information during their purchasing time. Due to aggressive competition in online retailing context it is crucial for the online retailers to identify the factors that affects their satisfaction level of online consumers. Thus, the main intention of this research is to examine the factors that affecting satisfaction of Malaysian online consumers.

According to Shore (1998) and Spanos et al. (2002) due to cultural differences information system research results limit the generalizability from one country to another country context. Other researchers also identified customer behavior and satisfaction differ in different culture, logistics and credit context (David, 2007; Sharma et al., 1995; Gentry, 1982). This justified that examine the factors of online shopping customer satisfaction in Malaysia may be different from that of other countries. Moreover, there is a dearth of research on online shopping customer satisfaction on Malaysian context, so little known about the variable of Malaysian online shopping customer shopping.

LITERATURE REVIEW

Relevant Empirical Study

Recently Rajesh (2018) identified factors affecting online shopping and its customer satisfaction in India. Using non-parametric data this study used Mann Whiney U test to analyse the data. This study results identified both male and female equally accepted good after sales service, return policy, clarity about terms and conditions, time consuming process are important factors affecting online customer satisfaction.

Yilan and Suyun (2016) conducted and empirical study on the factors affecting customer satisfaction based on B2C online shopping. This study results reveal that service value, enterprise image, product value and website security have significant effect on customer satisfaction in online context. A study conducted in China on empirical factors affecting customer satisfaction and re-purchase intention in online store. This study results show that convenience, price, product information, financial risk, return policy, delivery risk and product risk have significant effect on customer satisfaction (Khan et al., 2015).

Fang (2014) studied on students e-satisfaction in China and found that service quality, quality of logistics distribution, core value of products, network shopping safety, return policy and online shopping core advantage have positive significant effect on customer satisfaction, whereas customer expectations has negative significant effect. Another study conducted in India by Singhal and Shekhawat (2014) on customer satisfaction in online shopping experience of tourism products and confirmed that ease of website, accuracy of information, speed and price, ease of accessing websites, customized products availability and loyalty for online portals have significant effect on customer satisfaction in online context.

FACTORS AFFECTING CUSTOMER SATISFACTION IN ONLINE SHOPPING

There are a number of previous empirical research are relevant to this study. These include those addressing the factors that have significant influence on customer satisfaction in online shopping (Liu et al., 2008; Singhal, & Shekhawat, 2015; Kaur & Wei, 2013; Khan et al., 2015). There are few factors identified from the previous research which are found to significant (please refer Table 1). In this research we utilize ten factors i.e. website design, customer service, information quality, response time, transaction capability, delivery, merchandise attributes, security/privacy, convenient payment method and price are used by Liu et al. (2008) and Kaur and Wei (2013).

Table 1. Factors influencing e-satisfaction

Independent Variable	Author and Year
Convenience	Szymanski, & Hise, 2000; Moharrer et al., 2013; Ranjbarian et al., 2012
Website design	Liu et al., 2008; Kaur & Wei, 2013; Szymanski & Hise, 2000; Heiner et al., 2004
Customer service	Liu et al., 2008; Kaur & Wei, 2013
Trust	Dash, 2012
Information quality	Liu et al., 2008; Kaur & Wei, 2013
Response time	Liu et al., 2008; Kaur & Wei, 2013
Transaction capability	Kim, & Stoel, 2004; Liu et al., 2008; Kaur & Wei, 2013
Delivery	Liu et al., 2008; Kaur & Wei, 2013
Merchandise attributes	Liu et al., 2008; Kaur & Wei, 2013 Szymanski & Hise, 2000; Heiner et al., 2004; Ranjbarian et al., 2012
Security/privacy	Liu et al., 2008; Kaur & Wei, 2013
Price	Liu et al., 2008
Product variety	Dash, 2012; Szymanski & Hise, 2000
Financial security	Szymanski & Hise, 2000; Dash, 2012

Website design is one of the most important factors that could help customer to visit website. Liu et al. (2008) identified good website design has significant influence on customer satisfaction in online shopping. Combination effect of colour, website structure, navigation and ease of use are tested by Pastrick (1997) research. Kaur and Wei (2013) study also used website design is one of the predictors for customer satisfaction in online shopping. Shergill and Zhaobin (2005) study found that web site design is one of the important predictors for online shopping.

Logistics efficiency and customer service are another important predictor of customer satisfaction. Chen and Chang (2003) highlighted that in Internet transaction most common complaints are defective product, refund and billing disputed, poor customer service and product exchange and return policies. Kaur and Wei (2013) and Liu et al. (2008) used customer service is one of the important predictors to test customer satisfaction in online shopping.

Information quality, price and variety of merchandise are playing important role for the customer satisfaction in online shopping experience (Liu et al., 2008). According to Bakos (1997) to reduce search cost for customer online store need to provide product and price related information. Peterson et al.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

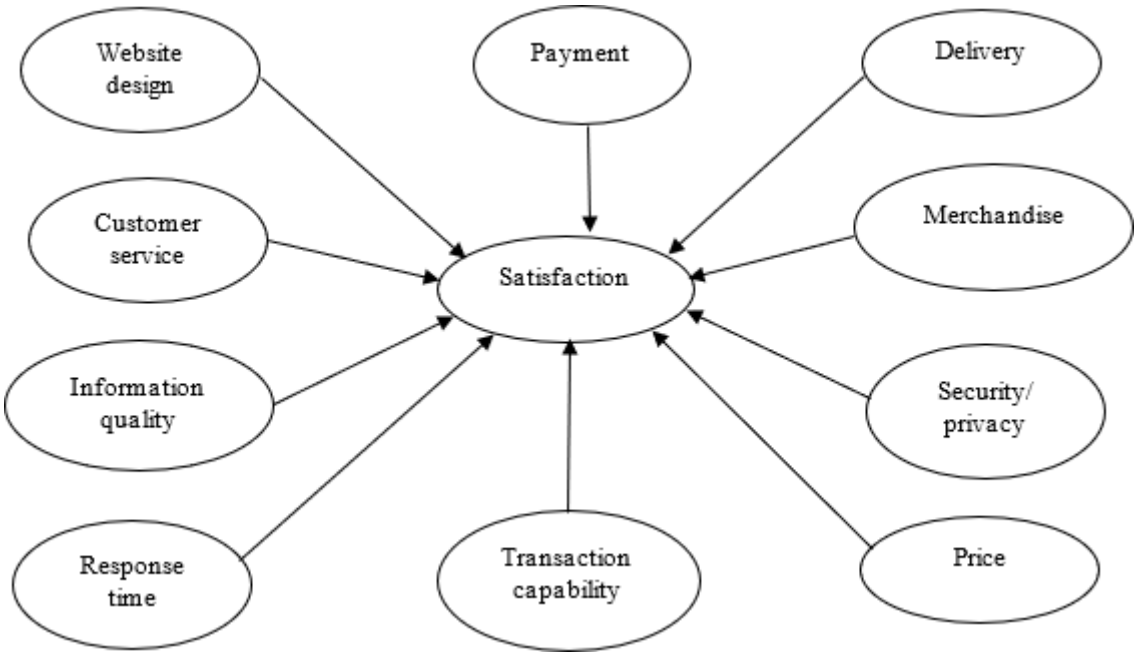
(1997) highlighted that higher level of customer satisfaction depends on the higher quality and extensive information. Price and merchandise variety are playing important for decision making. E-satisfaction would be possible if online retail store offers varieties of product and superior product assortment (Szymanski, & Hise, 2000).

Researcher argued that payment mechanisms, privacy/security, speed of operation and transaction capabilities are some of the important factors those online customer satisfaction (Liu et al., 2008). According to Grewal et al. (2004) and Friedman et al. (2000) argued that consumer preferred secured and privacy protected online store than traditional shop. Grabner-Kraeuter (2002) and Yianakos (2002) also mentioned online store lost sales if the infrastructure is not adequate, privacy is not protected and security is a concern and consumer do not trust the online store. Researcher like Chen and Chang (2003) also stated that online shoppers' tolerance power is very low. Dellaert and Kahn (1999) mentioned that on average online shoppers wait for eight seconds for system feedback before bailing out. So, web designers should provide good appearance and functional website with fastest loading time.

RESEARCH MODEL

The research model for this study was developed based on the previous empirical research done on e-satisfaction in different countries (refer to Figure 1). The model examines the factors that affect customer satisfaction in online shopping.

Figure 1. A schematic diagram of the research model



EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

The above schematic diagram of the research model shows the independent and dependent variables relationship. The above research model is the foundation of whole research.

In this research customer satisfaction in online shopping is the dependent variable. To find out the answer to the problem the dependent variable is analyse in this research. Moreover, the independent variables in this research are website design, customer service, information quality, response time, transaction quality, delivery, merchandise, security/privacy, convenient payment method and price.

HYPOTHESES

A series of hypotheses were developed based on the proposed model, are shown below:

Hypothesis 1: There is a significant relationship between website design and customer satisfaction in online shopping.

Hypothesis 2: There is a significant relationship between customer service and customer satisfaction in online shopping.

Hypothesis 3: Information quality will have positive effect on customer satisfaction in online shopping.

Hypothesis 4: Response time will have significant influence on customer satisfaction in online shopping.

Hypothesis 5: Convenient payment method has significant positive influence on customer satisfaction in online shopping.

Hypothesis 6: Good transaction capability will have significant influence on customer satisfaction in online shopping.

Hypothesis 7: Prompt delivery of product or services will have significant positive effect on customer satisfaction in online shopping.

Hypothesis 8: Wider merchandise variety will have a significant positive influence on customer satisfaction in online shopping.

Hypothesis 9: Security/privacy will have a positive effect on customer satisfaction in online shopping.

Hypothesis 10: Lower price of the product and services will have significant influence on customer satisfaction in online shopping.

RESEARCH METHODS

Primary data for this research was gathered through online survey. Questionnaire was uploaded in google form. Students from one public university were asked to respond the questions. It was clearly mentioned to the students that anybody purchase online at least one product can be the respondent for this survey. A total of 337 were responded our questionnaire.

Bivariate frequency distribution of the respondents was done based on age, gender and race and other question related online shopping.

Regression analysis was used to test ten hypotheses. The analysis enabled us to test the individual impact of independent variables on customer satisfaction in online shopping.

Female respondents were the majority (56.97%) in this research, more than 60% (62.61%) of the respondent's age between 19 and 24. Malay group was the highest contributors of the total respondents (55.49%) and the second highest group is represented by Chines with 39.76%.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Most of the respondents spent 1-2 hours on Internet (29.97%), 2 to 3 hours (37.09%), 3 to 4 hours (22.84%) and only 10.97% respondents spent less than 1 hour every day. More than 40% of the respondent buy online frequently (47.77%).

Data Collection Instrument

Structured closed ended questionnaire was used to collect the data. The measures of website design were adapted from Shergill and Chen (2005). Customer service, information quality, privacy/security were adapted from Ariff et al. (2013). Response time, transaction capability, delivery, merchandise, convenient payment and price were measured using scale developed by Liu et al. (2008). In the first section of the questionnaire included questions regarding demographic profile of the respondents. The second section consisted of questions measuring factors that affect customer satisfaction in online shopping using 6-point Likert scale ranging from 1= strongly disagree to 6 = strongly agree. The third part of the questionnaire included questions regarding online shopping habits such as how many times the respondents bought product through online, how frequent they buy and how they spent in the last 6 months.

Reliability

Cronbach's alpha value suggested by Nunnally (1978) was used to test the internal reliability of the items. Minimum value of Cronbach's alpha should be 0.7 suggested by Nunnally. The Cronbach alpha value for customer satisfaction was 0.839, website design was 0.812, customer service was 0.901, information quality was 0.786, response time was 0.841, transaction capability was 0.795, delivery was 0.817, merchandise was 0.764, security/privacy was 0.883, convenient payment method was 0.821 and reasonable price was 0.811. In this study the Cronbach's alpha for all constructs were much higher than 0.7, therefore the constructs deemed to have adequate reliability.

Test for Construct Validity: Factor Analysis

A factor analysis was conducted in order to develop factors that help in explaining the role of experience and reference group in online brand trust. As suggested by Hair et al., (1995), ten factors were identified for the factor analysis using the eigen value criteria that suggest extracting factors with an eigenvalue of greater than 1.0. In conducting the factor analysis we followed Hair et al (1995). The ten factors identified explained 69.07 percent of the total variance. The extraction method used was principal axis factoring with Varimax rotation. This method has been widely accepted as a reliable method of factor analysis (see, Alexander and Colgate, 2000). In our survey, the Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy score (0.793) was well above the recommended 0.5 level (Malhotra, 1999).

Normality of Data and Multi-Collinearity

This study involves a relatively large sample (377 respondents) and therefore, the Central Limit Theorem could be applied and hence there is no question on normality of the data. Two major methods were utilized in order to determine the presence of multicollinearity among independent variables in this study. These methodologies involved calculation of both a Tolerance test and Variance Inflation Factor (VIF) (Kleinbaum et al, 1988). The results of these analyzes are presented in Table 3. As can be seen from this

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Factor analysis

Determinant Factors	Factor Loading	Cronbach's α
Website Design		
This website provides in-depth information It is quick and easy to complete transaction at this web site I feel comfortable in surfing this site This website has a good selection It is easy to use this website The level of personalization at site is about right, not too much or too little	0.723 0.745 0.763 0.721 0.733 0.758	0.812
Customer Service		
The website showed a sincere interest in solving the problem when I face it Inquiries are answered promptly The company is willing and ready to respond to customer needs	0.782 0.801 0.813	0.901
Information quality		
The website provides accurate information The website provides timely information The website provides relevant information Information provided was easy to understand The website provides details information	0.780 0.728 0.754 0.789 0.762	0.786
Response time		
The website loads quickly When I use the website there is very little waiting time between my actions and the website's response	0.756 0.725 0.719	0.841
Convenient payment		
This website has convenient payment method This website has complete payment options I accept the payment method provided by the website	0.785 0.777 0.767	0.821
Transaction capability		
Most business processes can be completed via the website All my business with the company can be completed via the website	0.782 0.798	0.795
Delivery		
The product is delivered by the time promised by the company You get what you ordered from this site The items sent by the site are well packaged and perfectly sound I am satisfied with delivery mode of the website	0.658 0.692 0.687 0.666	0.817
Merchandise		
The product range of this website is complete The products of other similar websites can be found at this site Most of the goods I need can be found at this site There are more choices for goods of a particular type at this site	0.595 0.652 0.673 0.671	0.764
Privacy/security		
I feel my privacy was being protected by this site The transaction of the website makes me feel sage The website provides adequate security features	0.725 0.812 0.816	0.883
Price		
The general pricing of the website's goods is relatively low (goods price plus delivery price) This website has bigger offering of lucky draw and discounts than similar websites	0.701 0.723	0.811
Satisfaction		
If I had to do it over again, I'd make my most recent online purchase at this website My choice to purchase from this website was a wise one I have truly enjoyed purchasing from this website I am satisfied with my most recent decision to purchase from this website	0.762 0.792 0.813 0.841	0.839

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

data, i) none of the Tolerance levels is <or equal to 0.1; and ii) all VIF values are well below 10. Thus, the measures selected for assessing independent variables in this study do not reach levels indicate of multicollinearity. The acceptable Durbin – Watson range is between 1.5 and 2.5. In this analysis Durbin – Watson value of 1.924, which is between the acceptable ranges, show that there were no auto correlation problems in the data used in this research. Thus, the measures selected for assessing independent variables in this study do not reach levels indicate of multicollinearity.

Table 3. Test of collinearity

Variable	Tolerance	VIF
Website design	.732	2.312
Customer service	.699	2.861
Information quality	.743	1.963
Response time	.761	2.102
Convenient payment	.742	2.561
Transaction capability	.776	2.111
Delivery	.725	2.873
Merchandise	.801	2.914
Privacy/Security	.794	2.765
Price	.736	1.895

HYPOTHESES TESTING

The strength of the proposed hypothetical relationship was assessed using the respective statistical analyses summarized in Table 4.

Table 4. Regression results

Variables	t-Value	p-Value
Website design	1.567	.113
Customer service	4.952	.000
Information quality	2.596	.01

Hypothesis 1: There is a significant relationship between website design and customer satisfaction in online shopping.

The results of this study show that the relationship between website design and customer satisfaction in online shopping is not significant. The multiple regression result shows that website design have t-value 1.567; p-value = 0.113. This evidence proved that, the null hypothesis could not be rejected. These results indicate that those buying through online are not very serious about the website design of the online retailers.

Hypothesis 2: There is a significant relationship between customer service and customer satisfaction in online shopping.

Customer service is one of the important factors that affect customer satisfaction in online shopping. Most of the consumers are concerned about customer service. The results of this study show that there is a significant relationship between customer service and customer satisfaction in online shopping. This relationship is significant at 0.001 level. Accordingly, the hypothesis 2 could not be rejected. The direction of the association is positive in which it indicates that the more improvement of customer service provided by the online retailers, the higher will be satisfaction of online buyers.

Hypothesis 3: Information quality will have positive effect on customer satisfaction in online shopping.

The third hypothesis is test in this research has found another important predictor that has significant relationship on customer satisfaction in online shopping. Researcher like Liu et al. (2008) also confirmed this research result. The regression results (t-value = 2.596; p-value = 0.01) indicates that the association between information quality and customer satisfaction in online shopping is positive and significant.

Hypothesis 4: Response time will have significant influence on customer satisfaction in online shopping.

Multiple regression result shows that response time is a significant predictor of customer satisfaction in online shopping (t-value = 5.891; p-value = 0.001), which lends support to fourth hypothesis and similar finding reported in Liu et al. (2008). It is expected since past literature has consistently shown that response time has a significant and positive effect on customer satisfaction in online shopping (Kaur and Wei, 2013). This finding suggests that when online consumer finds online retail store response to their query promptly, they satisfied is more likely.

Hypothesis 5: Convenient payment method has significant positive influence on customer satisfaction in online shopping.

Convenient payment method is another important predictor for customer satisfaction in online satisfaction. Studies like Liu et al. (2008) has generally shown that convenient payment methods of an online retail shop have a positive influence on customer satisfaction in online shopping. From the Table 2, regression analysis convenient payment method showed significant influence over customer satisfaction in online shopping (t-value = 4.763; p-value = 0.001). This research therefore further proves the earlier findings.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Hypothesis 6: Good transaction capability will have significant influence on customer satisfaction in online shopping.

Transaction capability also significantly associated with customer satisfaction in online shopping. Positive sign shows that there is a positive relationship between transaction capability and customer satisfaction in online shopping. Previous studies also found that transaction capability has significant positive effect on customer satisfaction in online shopping (Kim, & Stoel, 2004; Liu et al., 2008; Kaur and Wei, 2013). Multiple regression analysis shows the results of transaction capability (t-value = 5.114; p-value = 0.001), indicating that transaction capability is another very important predictor for customer satisfaction in online shopping.

Hypothesis 7: Prompt delivery of product or services will have significant positive effect on customer satisfaction in online shopping.

Multiple regression analysis shows results of (t-value = 3.856; p-value = 0.001), implying that there is positive and significant relationship between prompt delivery of product and customer satisfaction in online shopping. This research further proves earlier findings that showed delivery of product and services as having positive and significant effect on customer satisfaction in online shopping (Liu et al., 2008; Kaur and Wei, 2013).

Hypothesis 8: Wider merchandise variety will have a significant positive influence on customer satisfaction in online shopping.

Previous researches finding shown that wider merchandise variety played a vital and significant role on customer satisfaction in online shopping (Liu et al., 2008; Kaur and Wei, 2013; Szymanski & Hise, 2000; Heiner et al., 2004; Ranjbarian et al., 2012). The regression results (t-value = 4.213; p-value = 0.001) of this study shown positive and significant effect of merchandise variety on customer satisfaction in online shopping.

Hypothesis 9: Security/privacy will have a positive effect on customer satisfaction in online shopping.

When customer feels privacy and security are protected, they are more likely to product from online retail shop. Studies like those carried out by Liu et al. (2008), Kaur and Wei (2013) and Dash (2012) have generally shown that privacy and security concern is one of most important predictors for satisfaction in online shopping. The results of this study show that when customer is not fear about security and privacy the degree of satisfaction is high. Regression analysis shown results of security/privacy (t-value = 6.354; p-value = 0.001) indicating that security/privacy is most important factor affect customer satisfaction in online shopping. All of the previous studies show that security/privacy positively associated with customer satisfaction in online shopping.

Hypothesis 10: Lower price of the product and services will have significant influence on customer satisfaction in online shopping.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Low price of the product and services are the important predictor on customer satisfaction in online shopping. Regression analysis showed that price having (t-value = 2.634; p-value = 0.01) indicating that price has significant influence customer satisfaction in online shopping in Malaysia. This is consistent with the study done by Liu et al. (2008).

LIMITATION AND FUTURE DIRECTION

It is important to recognize the limitation of this research. Firstly, since the survey was conducted among respondents from google form, the results should be interpreted with caution, particularly with respect to the generalization of research findings of Malaysian consumer as a whole. Secondly, the sample size is not big enough. A larger sample size is desirable to get accurate Malaysian consumers perception regarding satisfaction level. Further research is needed to focus on a larger cross sectional analysis in the context of online shopping and more diversified random samples to verify the findings of this present study. It is also suggested to use structural equation model to test hypotheses in future.

Implication

- The findings of this research have both research and managerial implications. Customer service and delivery plays an important role for the Malaysian online consumer's satisfaction level. Due to the competition in online business it is important for the online sellers to keep close monitoring on customer services and on time delivery. Delayed delivery and poor customer services will cause customer dissatisfaction. Lack of modern delivery system in Malaysia make customer unhappy. So, it is suggested that online sellers representative should answer customer inquiries and once the problem occurs, they need to solve the problem immediately;
- Complete and detailed services and product information is required. Online context customer cannot see the products and services as it is intangible. Customer has to rely fully on online displays. Therefore, to satisfy customer in online context online retailers should provide understandable and clear information at the transaction time. At the same time online seller should provide all required information, colour, design etc. on their websites;
- Consumer data safety and transaction security is another important concern online buyers. Therefore, online sellers should provide support to protect individual customer data and information and need to assure to the customer by improving their technological system. Annoying factors such as taking longer time to place an order online, difficult to access to the website, availability of product and services online, and mistakes in filling orders online are needed to consider online retailers.

CONCLUSION

The results analyse for this research indicated the relationship between factors affecting customer satisfaction in online shopping. More specifically, customer service, information quality, response time, transaction capability, delivery, merchandise attributes, security/privacy, convenient payment method and price exhibit significant association with customer satisfaction in online shopping. The analytical

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

results are consistent with previous studies. Privacy/security has received the most consistent support as factors that influence customer satisfaction in online shopping. Marketers need to realize that online marketing environment affects the way consumers view and develop relationship. Privacy/security is single most important predictor in online buying environment. Furthermore, it was also found that, for online buyers, response time is considered as the best predictor when compared to other constructs.

Experience buyers are different from other inexperience buyers in online shopping context. Therefore, experience gained over time has potential implications for the other buying behavior model and future research should be conducted in this area.

Regardless of some limitations, this study makes some notable contributions. First, we review previous literature in this area and develop a conceptual framework and also find out both and absolute and relative vie of the gap. Secondly, in this research we analyse factors affecting customer satisfaction in online shopping that owes its foundation to existing research and extends, thus unifying and advancing the field of knowledge.

ABSTRACT

The concept of trade has emerged with the inter-business division of labor. The internet, which is a much more recent concept than trade, has begun to get closer over time. The reason why trade is to see the internet as a commercial tool lies in the fact that the internet is spread over a wide mass network. The aim of this study is to determine socio-economic and demographic factors that are effective in purchasing or ordering goods and services by internet in Turkey. It was found that the number of information equipment, income, being male, working, and education increased the probability of shopping over the internet. It was determined that household size and age decreased. Females shop for clothing and sports goods more than males. The highest correlation with the purchase of other product groups over the internet is through holiday accommodation and other travel-related transactions.

INTRODUCTION

Today, developing technology has caused deep changes in daily life. Some of the usual activities are completely out of our lives and some of the activities have been changed. Among these changes, the way individuals shop has taken its share. In recent years, increasing technology has enabled computer and internet speeds to increase. Thus, the internet has become a part of daily life; it has become used in

many areas from communication to socialization, from entertainment to trade in daily life. Computer and internet technologies as well as developing logistics activities have led to intensive use of e-commerce.

E-commerce is done some or all of the activities related to commerce such as the purchasing, selling or marketing of any good or service over the internet. Reasons such as the ease of shopping, lower prices, product variety encourage online shopping. Today, individuals can meet their needs from a cheap product such as a pen to technological devices such as computers and holiday shopping without recognizing the country's borders through e-commerce tools. This diversity has led to an increasing volume of e-commerce. Worldwide retail e-commerce has reached the level of 2,304 billion U.S Dollars in 2017 ("eCommerce," 2019). This amount is expected to increase gradually. Because, although there is geographical or cultural distance between buyers and sellers, individuals can shop through e-commerce tools (Prashar, Sai Vijay, & Parsad, 2016, p. 28). Increasing size brings competition in the market. For this reason, it is important for companies to know their customers and develop marketing activities for their customers. Because the effect of individual characteristics on e-commerce behavior can vary for different product groups.

Since most markets are heterogeneous and have a large variety of customers, it is not practical for businesses to implement unfocused marketing activities (Dibb, 1998, p. 394). It is important for businesses to perform appropriate marketing activities by identifying their target customers and segmenting them in terms of both efficiency and effectiveness of marketing activities. Customers with different profiles can focus on different features and can be stimulated by different elements. Demographic characteristics also affect the properties of the product. Personalization in e-commerce increases sales because it increases the customer's perception of site quality (Fernandez-Lanvin, Andres-Suarez, Gonzalez-Rodriguez, & Pariente-Martinez, 2018, p. 1).

The aim of this study is to determine the individual characteristics that affect the individual's purchasing decision over the internet for different product groups. For this purpose, probit regression model, which is one of the binary choice models, was used. In addition, assuming that purchasing behavior for different product groups may affect the purchasing decision of other products, instead of estimating the models separately for each product, a multivariate probit regression model is used which allows simultaneous estimation for all products.

BACKGROUND

1994 is the starting date for online shopping (Ariguzo, Mallach, & White, 2006, p. 240). In 1999, the monetary value of online shopping was about $110 billion (Coppel, 2000, p. 3). E-commerce is one of the fastest growing sectors in the world. The size of the return on e-commerce in Turkey in 2019 is about 8,050 billion USD. Level of return is expected to grow by 25.4% year on year to 19,876 billion USD in 2023. In the world, the size of e-commerce returns is around 1.8 trillion USD. Level of return is expected to grow by 10.4% year on year to 2,674 trillion USD in 2023("eCommerce," 2019). From the beginning to the present day, shopping on the internet has increased at a high rate, and most of the shopping has started to done on the internet. This increase is expected to continue in the future and 95% of the purchases in 2040 are expected to be made via the internet ("Ecommerce Statistics for 2019," 2019).

The increasing number of online shopping makes it necessary to examine the attitudes of internet users in depth (Cristóbal-Fransi, Martín-Fuentes, & Daries-Ramon, 2015, p. 164). It is important to obtain information about customers, and to determine the factors that shape the behavior of customers

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

and affect their decision making (Sabaityte, Davidaviciene, Strakova, & Raudeliuniene, 2019, p. 206). Undoubtedly, these factors also include individual factors. Knowing the products purchased according to the individual characteristics can be used in determining the advertisements that will be provided to the individuals who have certain characteristics in social media. Individual features can also be used in the development of suggestion systems. Today, the increasing product diversity in the world makes it difficult for customers to find and choose the product they want. For this reason, it is important to use suggestion systems according to individual characteristics in e-commerce.

Some previous studies have focused on demographic characteristics that affect online shopping and internet use. Foremost among these factors are age, gender, education and income (Doherty & Ellis-Chadwick, 2003, p. 4; Koyuncu & Lien, 2003, p. 721). These factors can be used to profile and segment markets (Akhter, 2003, p. 321). These factors also affect the expectations of individuals from web sites (Lightner, 2003, p. 153). Variables such as race and habitat may be added to these factors (Stranahan, 2007, p. 432).

In recent studies, it is seen that besides the demographic factors, some psychographic factors are also focused. Ramírez-Correa, Grandón, and Arenas-Gaitán (2019, p. 794) researched the trend of online shopping by including sub-components of TRI 2.0 in demographic factors. Adamkolo, Hassan, and Pate (2018, p. 1335) researched the effect of age, gender, monthly income, occupation, education and marital status on perceived service quality. Alqahtani, Goodwin, and de Vries (2018) included age and gender as well as computer use competence in the analysis. Leong, Jaafar, and Ainin (2018, p. 75) examined electronic commerce in the context of Web Usage Theory, Confidence Transfer Theory and F-commerce usage habits in addition to demographic variables. Mobile phone usage, computer usage, social media usage, mobile money transfer use are the variables used in the analysis Hossein et al., 2017, p. 48). In some studies, the relationship between online shopping and traditional shopping has been examined (Cao, Xu, & Douma, 2012, p. 957; Lee, Sener, Mokhtarian, & Handy, 2017, p. 40).

When the studies are examined, it is seen that demographic variables are associated with the use of e-commerce in most studies. In some studies, some variables were used in addition to demographic factors. The studies are differentiated in terms of the country, period and methods used. In this study, conducted in 2018 by the Turkish Statistical Institute, Household ICT Usage Survey micro data set was used. The use of e-commerce has been evaluated in separate models for five different product groups, not aggregate for all products. In addition, the estimation of the models was made simultaneously, and the relationships between the preferences of the product groups to make purchases were determined. In this respect, the study contributes to the literature both in terms of researching e-commerce preference on product group basis and also detecting the interaction between product groups.

LITERATURE REVIEW

Individual characteristics such as income, age, gender, educational background, occupation, individual attitudes, technology etc. on e-commerce behavior has been researched in many studies (Alqahtani et al., 2018, p. 3; Cristóbal-Fransi et al., 2015, pp. 174-178; Lim & Cham, 2015, pp. 345-347). The demographic characteristics of the individual affect the e-commerce attitude. When evaluated in terms of gender, it can be said that males have a higher habit of using e-commerce compared to females (Escobar-Rodríguez, Grávalos-Gastaminza, & Pérez-Calañas, 2017, p. 141; Vicente, 2015, p. 980). In addition, social differences can differentiate the relationship between gender and e-commerce habits. In closed societies,

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

females can use e-commerce more than males (Alqahtani et al., 2018, p. 8). The habits of individuals may vary according to age. This variability also emerges on e-commerce behavior. In this respect, it can be said that young people use e-commerce more intensively (Alqahtani et al., 2018, p. 1; Cristóbal-Fransi et al., 2015, p. 172). Middle-aged people use e-commerce more than the elderly (Law & Ng, 2016, p. 261). Education affects the approach to technological innovation (Awa, Baridam, & Nwibere, 2015, p. 332). Well-educated individuals often shop online (Cristóbal-Fransi et al., 2015, p. 179; Vicente, 2015, p. 980). Another demographic factor influencing online shopping is salary (Hashim, K Ghani, & Said, 2009, p. 24). Income is a positive variable on online shopping (Burkolter & Kluge, 2011, p. 21). Individuals more familiar with new technologies use e-commerce more (Alqahtani et al., 2018, p. 8).

In addition to these factors, online shoppers are individuals who value convenience, are innovative, impulsiveness, seek diversity, and have positive attitudes towards online shopping and advertising (Lim & Cham, 2015, pp. 349-351). They are young, educated and have good income and use the internet for various purposes and online shopping (Cristóbal-Fransi et al., 2015, p. 179).

When the e-commerce behavior with the distinction between buyers and sellers, it is seen that buyers and sellers have different characteristics. Vendors are low educated, unemployed, living in low income areas and using the internet in a narrow area, while purchasing behavior is positively related to education, working, using social networks, living in high income areas and, using the internet widely (Vicente, 2015, p. 980).

DATA SOURCES AND METHODOLOGY

Data

In this study, the data of 28,888 individuals who participated in the Household Information Technology Usage Survey were used. Household Survey on Information Technology Usage of individuals living in Turkey, which was conducted by Turkish Statistical Institute in 2018, was used to determine the factors influencing their choice to make shopping over the internet.

Household Information Technology Usage Survey in Turkey in general have been covered for the selection of samples each settlement. Persons covered are household in all settlements located within the borders of Turkey. Institutional population which defined as school, dormitory, hotel, kindergarten, nursing home, hospital and prison and barracks and army residences is not covered. In addition, the settlements (small villages, nomad group, hamlet etc.) thought cannot be reached adequate sample size, which population does not exceed 1% of the total population, are excluded. According to the methodology of the study, individuals aged 16-74 years are included.

The sampling method of the study is 2-stage stratified cluster sampling. In the first stage, the clusters (blocks), which consist of 100 households, were selected as proportional to the size of the sample (PPS), and in the second stage, sample addresses were determined using the systematic selection method from the selected clusters. Classification of Statistical Region Units Level 1 is used as stratification criterion (TURKSTAT, 2018).

Table 1. Some articles related to online shopping

Author (Year)	Country / Number of Samples	Main Findings
Lim and Cham (2015)	Malaysia, Singapore and, Taiwan/1200	Online shoppers are individuals who value convenience, are innovative, impulsiveness, seek diversity, and have positive attitudes towards online shopping and advertising.
Cristóbal-Fransi et al. (2015)	Spain/700	In this study, individuals were divided into three segments. The individuals in the first segment are mostly young, educated, have good income and use the internet for various purposes and online shopping. The second segment is mostly low-income, elderly and female, uses the internet very little and avoids online activities. In the third segment, the individuals are middle-aged, mostly college graduates and individuals with higher than average income. These individuals use the internet mostly for business purposes.
Vicente (2015)	EU/24961	In this study, the determinants of customer-to-customer e-commerce were examined. The characteristics of buyers and sellers are different. Vendors are low educated, unemployed, living in low income areas and using the internet in a narrow space. Selling behavior is positively related to education, working, using social networks, living in high-income areas and widespread use of the internet. Females are less prone to e-commerce in both respects.
Escobar-Rodríguez et al. (2017)	Spain/1200	For the tourism sector, gender, age and marital status are important variables to segment the market. The most effective factors in the purchase of tourist products are perceived value and perceived trust. The relationship between perceived value and purchasing tendency is higher for male, married and elderly individuals.
Saarijärvi, Joensuu, Rintamaki, and Yrjölä (2018)	Finland/380	In this study, customer-to-customer e-commerce was examined via Facebook and 4 different customer profiles called enthusiasts, bargain hunters, salvagers and apathetics were created. Enthusiasts are those who use C2C e-commerce the most, bargain hunters use C2C e-commerce but know that they cannot meet all their needs from here, and salvagers and apathetics use C2C e-commerce because of its economic value.
Prashar et al. (2016)	India/203	In this study, individuals were divided into 4 different groups according to their internet shopping habits: traditional shoppers, benefit seekers, convenience and assurance seekers and information and price seekers. Companies targeting the largest segment, the benefit seekers, should focus on value, trust and quality. Those in the "information and price seekers" segment give importance to product, price and product appearance.
Alqahtani et al. (2018)	Saudi Arabia/904	Individuals were divided into three groups according to their e-commerce using frequency. The frequency of use is influenced by age, gender and computer proficiency. E-commerce users are often young and mostly female.
Doherty and Ellis-Chadwick (2003)	England/164	In the study, surveys were conducted on the major retail companies in the UK and it was determined that the customer base of the companies using the internet for information provision, marketing and sales were mostly male, young and upper class employees.
Koyuncu and Lien (2003)	USA/8717	Age, education and frequency of internet use increase online shopping. Shopping is more common in areas where the internet is secure. Gay and bisexual individuals are more inclined to shop online.
Akhter (2003)	USA/3087	The tendency to buy symphony tickets over the internet increases by being a man, decreases by age, and increasing education and income.
Teo (2006)	Singapore/1171	Internet users in Singapore are usually young and educated. Those who shop online are male and well educated, but older and higher incomes.
Stranahan (2007)	USA/512	Online shoppers shop for less than $1000. Indıviduals mostly shop from familiar sites, and shopping from familiar/unfamiliar sites varies according to demographic characteristics. Young people, educated, high-income and people living in suburban, rural or small towns use internet shopping more often. Caucasians make purchases more often than African Americans and Hispanics.
Hui and Wan (2009)	Singapore/211	The tendency to shop from the online supermarket is the highest for those aged 21 to 40 and the lowest for those with less than $2000. Prone customers are varied according to ease of use and the perception of usability, age and, income.

Table 1. Continued

Author (Year)	Country / Number of Samples	Main Findings
Phang, Kankanhalli, Ramakrishnan, and Raman (2010)	USA/1457	The use of combinations of relationship variables will provide a better explanation of the change in online shopping behavior. Focusing on middle income and low educated people would be more beneficial. Elderly, middle-income and low-educated people should be researched.
Ramírez-Correa et al. (2019)	Chile/788	Psychographic and demographic factors affect shopping attitudes. As the difference between gender and age increases, the difference between shopping behavior emerges. The generation of individuals reduces the relationship between the dimensions of TRI 2.0 and their shopping. Optimism has a special impact on the baby-boomers generation. Insecurity does not affect online shopping.
Wiegandt et al. (2018)	Germany/2900	In the study conducted in Aachen, Bochum, Bonn, Dortmund, Munster and Cologne, demographic and socioeconomic factors, rather than spatial factors, affect consumer attitudes for six cities. Gender, age and lifestyle affect online shopping, but not income.
Leong et al. (2018)	Malaysia /808	The study focuses on shopping, not shopping inclination on the Internet/Facebook. Previously used F-commerce, use of Facebook, hedonic motivation, shopping without membership, age, number of children, monthly income, education level are effective on F-commerce.
Hossein et al. (2017)	Bangladesh/600	The study focused on the internet shopping of individuals living in rural areas of Bangladesh. Online shopping is related to mobile phone usage, computer usage, social media usage, mobile money transfer usage, age, gender, working status, education, monthly family spending.
Law and Ng (2016)	Hong Kong/447	Middle-aged people are more inclined to e-commerce. Males are more inclined to e-commerce as they are more concerned with innovation and usability than females. Security is important for mature users.
Hashim et al. (2009)	Malaysia/210	Gender, age, salary, occupation and marital status affect online shopping attitude. Men, the 30-39 age group, high salaries and senior employees are more inclined to shop online.
Burkolter and Kluge (2011)	Germany/405	Online shoppers are generally young, male, employed, highly educated and value service quality and brand. NFE adversely affects online shopping.
Lee et al. (2017)	USA/2000	Attitudes and perceptions affect the decision of the frequency of shopping. Online shopping is influenced by utilitarian motivations and technological orientations. Shopping online and in stores is positively related.

Variable Description

The dependent variables of the study are the purchase status of goods or services in five different groups over the last 12 months. Dependent variables consist of two categories. If the individuals buy the related goods or services in the dependent variable groups over the internet, the code 1 is given and code 0 is given if an individual does not buy. The dependent variables of the study were coded as E1, E2, E3, E4, and E5. The types of goods or services in the dependent variable groups are given in Table 2.

Qualitative independent variables included in the model, gender (male, female), working status (working, not working), education level (did not finish a school, primary, secondary, high school, university) and the region where the individual lived (TR1, TR2, TR3, TR4, TR5, TR6, TR7, TR8, TR9, TRA, TRB, TRC). Qualitative independent variables are the number of IT equipment in the household, average monthly income of the household, household size and age.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Types of goods or services in the dependent variables groups

Code	Types of Goods/Services
E1	Food and daily requirements (including flowers, cosmetics, tobacco and beverages); Household goods (Furniture, toys, home appliances etc.)
E2	Clothing, sports goods
E3	Computer and other additional equipment; Electronic devices (mobile phone, camera, radio, TV, DVD player, video, etc.); Telecommunication services (TV, broadband subscription services (ADSL, etc.), fixed or mobile phone subscriptions, pre-paid phone cards to load/deposit money, etc.)
E4	Holiday accommodation (hotel etc. reservations), Other travel related activities (ticket reservation for transportation, car rental, etc.)
E5	Purchase of tickets for sports and cultural activities (cinema, theater, concerts, matches, etc.); Film, music; Books, newspapers (including e-books); e-learning tools (audiovisual materials, online learning software, electronic textbooks, etc.)

Turkey, under the name of Nomenclature of Units for Territorial Statistics (NUTS), is divided into 12 regions at Level 1. These regions and the provinces in these regions are shown in Table 3 in detail. Turkey, on the basis of the creation of the NUT, there lies obligation of the establishment of Regional Development Agencies. Since the national program, which was prepared after the accession partnership agreement with the EU, see NUTS regions as a prerequisite for the establishment of Development Agencies, NUTS regions have to be established. In forming of the NUTS regions in Turkey, current geographical regions were not taken into account, zone boundaries were determined depending on very different criteria. The most important of these is the population. Apart from the population, the cultural structure and the development status of the provinces were also taken into consideration.

Table 3. Nomenclature of Units for Territorial Statistics -NUTS 1

Code	Nuts 1	Provinces
TR1	İstanbul	İstanbul
TR2	West Marmara	Tekirdağ, Edirne, Kırklareli, Balıkesir, Çanakkale
TR3	Aegean	İzmir, Aydın, Denizli, Muğla, Manisa, Afyonkarahisar, Kütahya, Uşak
TR4	East Marmara	Bursa, Eskişehir, Bilecik, Kocaeli, Sakarya, Düzce, Bolu, Yalova
TR5	West Anatolia	Ankara, Konya, Karaman
TR6	Mediterranean	Antalya, Isparta, Burdur, Adana, Mersin, Hatay, Kahramanmaraş, Osmaniye
TR7	Middle Anatolia	Kırıkkale, Aksaray, Niğde, Nevşehir, Kırşehir, Kayseri, Sivas, Yozgat
TR8	West Blacksea	Zonguldak, Karabük, Bartın, Kastamonu, Çankırı, Sinop, Samsun, Tokat, Çorum, Amasya
TR9	East Blacksea	Trabzon, Ordu, Giresun, Rize, Artvin, Gümüşhane
TRA	Northeast Anatolia	Erzurum, Erzincan, Bayburt, Ağrı, Kars, Iğdır, Ardahan
TRB	Middle East Anatolia	Malatya, Elazığ, Bingöl, Tunceli, Van, Muş, Bitlis, Hakkâri
TRC	Southeastern Anatolia	Gaziantep, Adıyaman, Kilis, Şanlıurfa, Diyarbakır, Mardin, Batman, Şırnak, Siirt

Table 4. Frequency and percentages of dependent variables

Dependent Variables	Frequency		Percent	
	Purchased	Not Purchased	Purchased	Not Purchased
E1	2619	26269	9.1	90.9
E2	4348	24540	15.1	84.9
E3	2218	26670	7.7	92.3
E4	2194	26694	7.6	92.4
E5	2039	26849	7.1	92.9

Empirical Model

In this study, multivariate probit regression model was used to determine the factors that affect individuals' online shopping. The multivariate probit model is a preferred model when dependent variables are interrelated. When there is a relationship between the dependent variables affected by the same explanatory variables, the multivariate probit model provides more efficient results than the individual binary logit or probit model estimates for each dependent variable. Multivariate probit model is used to study the online shopping choices of individuals because it can capture latent effects among various choices, which cannot capture other alternative models (Greene, 2012, p. 752). The purchase of goods or services over the internet in Table 2 are dependent variables. The variables given in Table 5 are independent variables of the model.

The general specification for the MVP is (Greene, 2012, p. 752):

$$Y_m^* = x_m^{'}\beta_m + \varepsilon_m \quad Y_m = 1 \, if \, Y_m^* > 0, otherwise \, Y_m = 0, m = 1,2,\ldots,5 \tag{1}$$

$$Y_1^* = x_1^{'}\beta_1 + \varepsilon_1$$

$$Y_2^* = x_2^{'}\beta_2 + \varepsilon_2$$

$$Y_3^* = x_3^{'}\beta_3 + \varepsilon_3$$

$$Y_4^* = x_4^{'}\beta_4 + \varepsilon_4$$

$$Y_5^* = x_5^{'}\beta_5 + \varepsilon_5$$

$$E = (\varepsilon \mathrm{m}_{|} \, \mathrm{x}1_{,} \ldots, \mathrm{x}5_{)} = 0$$

$$Var = (\varepsilon \mathrm{m}_{|} \, \mathrm{x}1_{,} \ldots, \mathrm{x}5_{)} = 1$$

$$Cov = (\varepsilon \mathrm{j}_{\varepsilon} \mathrm{m} | \, \mathrm{x}1, {}_{\mathrm{x}}2, {}_{\ldots}, \mathrm{x}5) = \rho \mathrm{im}$$

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

$(\varepsilon 1,\ldots,\varepsilon 5 \sim {}_{N}5[0,{}_{R}])$

Where x i*s* a covariates matrix having any explanatory variables, β is a matrix of unknown regression coefficient and ε is a residual error. R is the variance-covariance matrix. The off-diagonal elements in correlation matrix ρjm rep$_{re}$sent the unobserved correlation between the stochastic component of the jth and mth options.

In this study, STATA 14 program was used for frequency analysis and multivariate probit regression analysis.

EMPIRICAL RESULTS

Characteristics of Sample Respondents

The frequency and percentages of the dependent variables used in the study are given in Table 4. According to Table 4, 9.1% of individuals purchase goods or services in the E1 group, 15.1% in the E2 group, 7.7% in the E3 group, 7.6% in the E4 group and 7.1% in the E5 group via the internet.

Descriptive statistics of qualitative and quantitative variables used in the study are given in Table 5. 52.5% of the participants were female, 56.4% were not working and 32.7% were primary school graduates. While 12.8% of the individuals are in the TR1 region, 5.1% are in the TRA region. The average number of IT equipment in the households in 2.18, the average monthly income of the households in the study is 29.92 thousand Turkish Liras, the average number of individuals in households is 3.91 and the average age of the participants in 42.

Model Estimation

The results of multivariate probit regression analysis, which was made to determine the factors influencing the situation of individuals' online shopping states, were given in Table 6.

The number of information equipment variables is significant in all dependent variable groups and has a positive effect on online shopping situations. One unit increase in the number of information equipment increases the probability of shopping from E1, E2, E3, E4 and E5 groups by 2.33%, 3.19%, 2.19%, 2.07% and 2.08%, respectively.

The monthly income variable of the household is also significant in all dependent variable groups and has a positive effect on internet shopping situations. The increase in the monthly income of the household by ₺1000 increases the probability of buying from E1, E2, E3, E4 and E5 groups by 2.9‰, 5.4‰, 2.6‰, 3.9‰ and 3.8‰, respectively.

The household size variable is significant in all dependent variable groups and has negative impact on online shopping situations. One unit increase in the household size variable reduces the probability of shopping from groups E1, E2, E3, E4 and E5 by 1.22%, 1.18%, 1.07%, 1.59% and 9.3‰, respectively.

Age variable is also significant in all dependent variable groups and has a negative effect on online shopping situations. One unit increase in the age variable decreases the probability of buying from E1, E2, E3, E4, and E5 groups by 2.4‰, 6.3‰, 2.9‰, 1.9‰ and 2.8‰, respectively.

Gender variable is significant in E2, E3, E4, and E5 dependent variable groups. It has a negative effect on the internet shopping situation for the E2 group and a positive effect on the internet shopping situation for the E3, E4 and E5 groups. Males are 4.93% less likely to shop from the E2 group than women, and 5.97%, 2.75% and 7.2‰ more likely to shop from the E3, E4 and E5 groups than women, respectively.

The variable of working status of individuals is significant in all dependent variable groups and has a positive effect on internet shopping situation. The probability of shopping among the E1, E2, E3, E4 and E5 groups is 3.71%, 5.68%, 2.6%, 3.04% and 1.09% more than the non-working individuals.

When the education level variable is examined, it is seen that probability of shopping for primary school graduates from the E1, E2 and E5 groups is 2.55%, 4.12% and 1.34% higher than the non-school graduates, respectively. Secondary school graduates are 4.83%, 7.2%, 1.86% and 2.38% more likely to shop from groups E1, E2, E4 and E5 than non-school graduates, respectively. High school graduates are 10.13%, 14.84%, 6.6% and 6.18% more likely to shop from the E1, E2, E4 and E5 groups than non-school graduates, respectively. University graduates are 16.77%, 23.1%, 15.2% and 14.95% more likely to shop from the E1, E2, E4 and E5 groups than non-school graduates, respectively. As the education level increases in all of the dependent variable groups, the likelihood of online shopping increases.

When the region variable is analyzed, it is seen that individuals living in the TR1 region are more likely to buy from the E1, E2, E3, E4 and E5 groups according to reference category (TR12) by 5.47%, 2.34%, 3.34%, 2.33% and 2.31% respectively. Individuals living in the TR3 region are 3.72%, 1.96%, 4.42% and 2.77% more likely to shop from the E1, E2, E3 and E5 groups than the reference category, respectively. Individuals living in the TR4 region are 2.95%, 2.03%, 2.65% and 2.01% more likely to shop from the E1, E2, E3 and E5 groups than the reference category, respectively. Individuals living in the TR5 region are 1.32%, 1.47%, 3.09%, 1.57%, and 2.61% higher than the reference categories in the E1, E2, E3, E4 and E5 groups, respectively. Individuals living in the TR6 region are 2.06%, 1.99%, 4.33%, and 1.04% more likely to shop from the E1, E2, E3 and E5 groups than the reference category, respectively. Individuals living in the TR7 region are 2.92% less likely to shop from the E4 group than the reference category. Individuals living in the TR8 region are 3.15%, 3.18%, 2.76% and 2.54% more

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

likely to shop from E1, E2, E3 and E5 groups than the reference category, respectively. Individuals living in the TR9 region are 4.18% and 3.51% more likely to shop from the E2 and E3 groups than the reference category, respectively. Individuals living in the TR10 region are 1.96% and 1.71% more likely to shop from the E2 and E5 groups than the reference category, and 1.26% less likely to shop from the E4 group, respectively.

Correlation Coefficients of Outcome Variables

One of the most important uses of the multivariate probit model is the ability to show the interaction between dependent variables. Table 7 shows the correlation coefficient for each model showing the relationship between residuals. According to the tests for correlation coefficients, the coefficients are significant. It shows that these models can be handled simultaneously in a single model. In addition, the coefficients are positive. That is, the probability of shopping from any product group is affected by the possibility of shopping from other product groups in the same direction. Unobservable factors for each product affect the likelihood of purchase from other products. The E1, E2, E3 and E5 categories are associated with the E4 category at most. The E4 category is associated with the E5 category at most.

CONCLUSION

This study aimed to determine the factors influencing the preferences of individuals living in Turkey to do shopping over the internet. To this end, Information Technology Usage Survey micro data set, which was conducted by Turkish Statistical Institute in 2018, was used. Multivariate probit model was used in the analysis. The number of equipment, income, household size, age, gender, working status, level of education, and region of residence affect the possibility of online shopping.

In the study, it was found that the number of information equipment positively affected the shopping on the internet. The number of IT equipment is directly related to its use (Cristóbal-Fransi et al., 2015, p. 179). The increase in the number of phones in the family also increases the possibility of online shopping (Hossein et al., 2017, p. 50). In the literature, the belief, income affects online shopping by positive way, is dominant. In this study, parallel to Burkolter and Kluge (2011, p. 21), Cristóbal-Fransi et al. (2015, p. 179), Vicente (2015, p. 980) and, Akhter (2003, p. 325), the increase in income was found to increase the likelihood of shopping over the internet. Household size adversely affects online shopping. In the study of Stranahan (2007, p. 428), the effect of the number of children was negative, small but not significant, Cao et al. (2012, p. 968) found no effect, Leong et al. (2018, p. 88) found that the effect is the same direction. Hiser, Nayga, and Capps (1999, p. 87) found that the number of children and household size had no effect. In parallel with the main literature, it was found that age affects shopping over the internet in the opposite direction. Similarly, Alqahtani et al. (2018, p. 1), Law and Ng (2016, p. 261) and Teo (2006, p. 506) found that the younger ones prefer more shopping online. The effect of gender variable varies according to product groups. The shopping preference of foodstuffs, daily necessities, and household goods does not differ in terms of gender. Females make more purchases of clothing and sports goods over the internet than men. In other categories, males prefer more to shop online. Doherty and Ellis-Chadwick (2003, p. 1), Hashim et al. (2009, p. 24) ve Escobar-Rodríguez et al. (2017, p. 141) found that males were more likely to shop online than women. In parallel with Vicente (2015, p. 980), it was found that employed ones tend to shop more on the internet than unemployed ones. It was found

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

that education affects the purchasing over the internet for all variables except technological products such as computer, other equipment, and telecommunication services. Parallel to Stranahan (2007, p. 432), Koyuncu and Lien (2003, p. 722) and Leong et al. (2018, p. 88), it was found that educated people prefer internet shopping more. The region also affects the shopping on the internet. While those who prefer to shop on the internet most live in Istanbul and West Marmara, those who prefer the least live in Southeastern Anatolia. The possibility of online shopping for all product groups is mostly related to holiday accommodation and other travel related transactions.

According to the findings of the study, it was found that the number of information equipment, income, being a man, working, and education increased the probability of shopping over the internet. It was determined that household size and age decreased. One of the interesting findings of the study is that females shop for clothing and sports goods more than men. Another is that the highest correlation with the purchase of other product groups over the internet is through holiday accommodation and other travel related transactions. This can be interpreted as the fact that those who make holiday accommodation and other travel related transactions over the internet tend to purchase all product groups over the internet and vice versa.

FUTURE RESEARCH DIRECTIONS

The study has some limitations. The dependent variables that were the subject of this study were not obtained from any commercial records. Transaction was made by considering the answers of the participants. Therefore, the answers may be biased. The variables used in this study are the variables included in the Household Information Technology Usage Survey micro data set. Variables such as occupation, marital status, race, social media usage, mobile/internet banking usage which could affect individuals' shopping via internet could not be taken into consideration. Household Information Technology Usage Surey has been conducted regularly since 2004. In future studies, the trend in the use of e-commerce of individuals living in Turkey between 2004 and 2018 can be determined. The difference between genders in the use of e-commerce in Turkey can be examined. Likewise, e-commerce usage differences according to the status of individuals living in Turkey can be determined.

ACKNOWLEDGMENT

This research received no specific grant from any funding agency in the public, commercial, or not-for-profit sectors. The authors would like to thank the Turkish Statistical Institute for the data. The views and opinions expressed in this manuscript are those of the authors only and do not necessarily represent the views, official policy, or position of the Turkish Statistical Institute.

KEY TERMS AND DEFINITIONS

Correlation Coefficient: The correlation coefficient (r) is a measure of the relationship between two variables and varies between -1 and +1. The correlation coefficient between the two variables is the degree of variation of these two variables together.

Dependent Variable: The dependent variable is a variable whose change depends a factor; whose value does not change if the factor does not change. Variables that change depends on another variable are called dependent variables.

Electronic Commerce: It is a concept that emerged with the increase of internet usage. Production, promotion, sales, insurance, distribution and payment of goods and services are carried out through computer networks.

Electronic Commerce Between Company and Consumer: It is the most known type of electronic commerce. Virtual store applications are the direct selling of goods or services to the consumer in electronic environment.

Electronic Commerce Between Consumer and Public Administration: We can define all kinds of tax, health and legal activities between consumer and public administration in this field.

Household Information Technologies Usage Survey: Household Information Technology Usage Survey have been held by Turkish Statistical Institute since 2004. The main objective of the Household Information Technology Usage Survey to determine the extent of the information society in Turkey and is the production of relevant statistics.

Independent Variable: It is the variable whose effect is wondered in any research. It is the variable that affects the dependent variable.

Multivariate Probit Regression: This is a preferred model where dependent variables (two categories) are multiple and dependent variables are interrelated.

Probit Regression: It is a model used as an alternative to logistics regression. It is a model that can be used in cases where the dependent variable has two categories. Probit model is based on benefit theory and rational choice approach.

Regression: The most appropriate relationship between dependent variable(s) (Y) and independent variable(s) (X) is expressed as a mathematical function.

ABSTRACT

This article studies online shopping and e-commerce adoption in Jordan due to the significant growth of this industry in Jordan particularly and the rest of the world generally, which is receiving attention globally and has proven to largely contribute to the growth of nations' economies. This article specifically studies the risk that online users perceive from online shopping and how they affect the growth of this industry. This study adopts a quantitative research approach, with a total of 355 questionnaires distributed by the researchers, to determine whether perceived risks of online shopping have an effect on a number of user adoptions. The article studies the two main risks of online shopping, payment risk, and product risk. Payment risks are defined as the financial loss which included risks associated with using credit cards and identity theft. Product risk is described as the loss incurred when a product does not perform as expected or does not match what was shown and described online. The study concludes that perceived payment risk and product risk affect online shopping negatively and has negatively impacted the number of users adopting this phenomenon.

1. INTRODUCTION

1.1. Research Significance

This growing industry is based on a concept that is electronic commerce and online shopping that is linked to the terms "Internet economy" and "digital economy."

These terms and concepts related to the adoption and utilization of the Information and communications technology (ICT) advancements for economic activities. The digital economy is defined as the commercial activities that generate revenue from the Internet or Internet-related products or services (Costa, 2016). On the other hand, some activities, such as building Internet connections for commercial use, are a part of Internet economy, but yet not necessarily categorized under electronic commerce. The digital economy is based on digital technologies such as a computer, software, and networking infrastructures.

Electronic commerce has been recognized as one of the most dominant concepts in this digital era, as it has actually transformed the way people conduct business and the way the design their business models and business strategies.

1.2. Business Size

E-commerce is the fastest growing retail market in the world (eMarketer, 2017). In 2015 retail e-commerce sales worldwide amounted to 1.55 trillion US dollars, in 2016, the sales grew to 1.86 trillion US dollars and It's forecasted that the sales in 2017 to be around 2.29 trillion US dollars. According to (eMarketer, 2017) online shopping is one of the most popular online activities worldwide.

Online revenues in Western Europe and Poland raised from 201.33 billion Euros in 2015 to 232.60 billion Euros in 2016 that means 15.6% growth rate (Foundation, E-commerce, 2017). E-commerce will be a mega-trend for businesses in the UAE and the market is expected to be valued at 10 billion US dollars by 2018, according to Frost & Sullivan.

Based on the (Centre for Retail Research, 2017) study, e-commerce or "Online retailing" is expected to hit nearly $333 billion in sales revenue by the end of 2018 in Europe, an increase of 18% in a single year time driven by massive growth in the number of internet shoppers, and the percentage of internet sales revenues dedicated online purchased products are trends that are expected to continue growing.

Shoppers of the US brought around 360 billion US dollars a year in revenue in 2016 and is expected to increase by 13.6% in 2017 (Statista DMO; Statista, 2017), and based on their purchase power, it was found essential for retailers and consumer behavior specialists to properly analyze and comprehend this population's attitudes toward shopping through the traditional shopping experience in shops, and retailers versus the new, emerging shopping experiences, such as e-commerce.

In the US for example, Americans are adopting a wide range of digital tools and platforms into their purchasing decisions and buying habits, according to a survey administered by Pew Research Center of U.S. adults. The survey found that 79% Americans are online shopping users: 79% have made an online purchase of any type, while 51% have purchased a product or a service using smartphones and 15% have made purchases by following a link from social media sites. The survey was a repetition for a previously conducted study that took place 17 years ago in June 2000, which found at the time that 22% of Americans had made a purchase online showcasing the massive increase in numbers, size and growth rate of this behavior and purchasing habit. (Smith & Anderson, 2016)

Furthermore, it was found that 3.4 billion people in the world access the internet daily on a regular basis (Internet Live Stats, 2017) and that internet has spread to 56% of the Jordanian population (Telecommunication Regulatory Commission TRC, 2016). Which highlights the importance of studying this area in Jordan in particular.

This study intends to better understand the local market in Jordan among this segment and understand the factors affecting online shopping adoption in order to help grow this industry in the lights of the current economic situation which will positively be reflected on the prosperity of the economy and the country as a whole.

The Hashemite Kingdom of Jordan has witnessed an increase in the online shopping websites number such as the leading, Souq.com, Cash Basha, Marka VIP, JAMALON and many others, yet this industry is still to be considered as an emerging business industry in its early stages, requiring more understanding for it to develop, progress and show greater profits.

1.3. Research Gap

As the internet penetration is exponentially increasing in today's world and be it one of the fastest-growing areas where retail businesses are starting to pay attention to considering it as one of the most important industry key success factors, and the most effective and profit-making distribution channel among their distribution networks.

Despite this growth many Jordanians are still reluctant to shop online due to the risks associated with buying online. This research intends to understand risk factors associated with online shopping from the perspective of customers and the ways to address them in the future in order to lower perceived risks and allow more customers to appreciate and use the internet for purchasing purposes.

The government and businesses efforts to adopt to this online shopping will be shattered by the customers reluctance due to high perceived risk. That is why it is very important to understand the hurdles and obstacles in the face of exploiting online purchasing by Jordanian Customers.

1.4. Research Objectives

This research is trying to achieve the main purpose of understanding the Perceived Risks Affecting Online Shopping Adoption in Jordan. This requires understanding risks associated with online shopping that are most relevant to the Jordanian context.

2. LITERATURE REVIEW

Electronic Commerce, E-commerce or online shopping, also known as e-business, which refers to the exchange of goods and services through electronic communications, such as websites, emails, and social media platforms. Which was first introduced over 30 years ago although the general public has become familiar with it only in the last decade for both types of commerce; business-to-business (B2B) and business-to-consumer (B2C).

In B2B, businesses conduct transactions with their suppliers, distributors, and other partners through electronic networks, where B2C, companies sell goods and services to end users and consumers. (Nanehkaran, 2013)

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

E-commerce or online shopping also includes mobile commerce which uses optimized websites designed or applications that are more compatible and user-friendly designed for a higher satisfaction for shopping at anytime and anywhere.

The literature review for this study has undertaken and has found that 22% of the consumers surveyed by (Rowley & Okelberry, 2000) expressed inconvenience and discomfort with shopping online, which led (Szymanski & Hise, 2000) to conduct a study that aimed to explore the shopping satisfaction using e-commerce, convenience, merchandising and website user experience using focus groups in addition to financial security. (Rowley & Okelberry, 2000) (Szymanski & Hise, 2000)

The lack of trust and online payment security have been always a concern by online shoppers since the inception of e-commerce (Kwon & Lee, 2003) (Szymanski & Hise, 2000).

(Szymanski & Hise, 2000) stated that the level of online payment security consumers perceive with e-commerce is directly related to online shopping experience satisfaction. Further, product performance and financial risk are associated with online shopping risks affecting it negatively (Bhatnagar & Ghose, Segmenting consumers based on the benefits and risks of Internet shopping, 2004).

According to Rouibah et al. (2016) many Middle Eastern countries cash is still preferred over electronic payment systems. Culture play a vital role in this; especially the issue of trust in the context of Arab and Middle Eastern countries.

Another study indicated that the most important factors that encourage consumers to buy and purchase online products using e-commerce channels and websites included the web page design, ease of navigation and the searching for information, security guarantees, and clearly stated return policies for products that the consumer might intend to replace or return (Siddiqui, O'Malley, McColl, & Birtwistle, 2003).

Other studies included different factors that encourage online shopping for products such as avoiding crowded stores especially in holiday seasons, the low prices offered by the frequent promotional campaigns e-commerce merchants announce, the ease of comparison shopping, the subsidized shipping costs, delivery, the improved customer service, convenience and time saving as key drivers for encouraging consumers for apparel online shopping (Rowley & Okelberry, 2000; Magee, 2003).

Magee's (2003) study indicated that the growth in the number of online shoppers is greater than the growth in internet users, showing that internet users are accommodating to shopping online despite the existing and dominant concerns of fraudulent chargebacks and fraudulent transactions as a threat of using credit cards and sharing their credentials online which greatly decreases the consumer confidence.

The relationship between the concerns about online and digital payment security and the tendency to use e-commerce platforms for shopping was discussed in a study conducted by (Kwon & Lee, 2003) where their study sample expressed comfort using online shopping, and observed that consumers with a positive attitude toward online shopping seem to be less concerned about digital payments fraudulent transactions. On the other hand, consumers who are concerned regarding online payment security saw this as a determinant factor and decreased their internet purchases.

Shopping involves risk because a buyer's decision has consequences that cannot be predicted and is more evident in online shopping than in traditional shopping due to the spatial and temporal separation between the buyers and sellers (Chiu et al., 2014).

Perceived risks are defined as the uncertainty of a situation and the seriousness of outcome out of a certain situation (Cox & Harvard University, 1967), which was concluded to negatively affect online shopping attitudes (Jarvenpaa, Tractinsky, & Saarinen, 1999; Kimery & McCord, 2002).

The main perceived risks studied by Bhatnagar & Ghose (Bhatnagar & Ghose, Segmenting consumers based on the benefits and risks of Internet shopping, 2004) are the financial risks and product perfor-

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

mance risk. Financial risks are described as the potential loss of money (Derbaix, 1983) including risks associated when using a credit card, while product performance risks are definite as the loss incurred when a product does not perform as expected (Horton, 1976). Trust in online retailers is a major factor inducing the success of online shopping, and in order to improve their experience, retailers and marketers need to implement new strategies to eliminate the perceived risks in consumers' minds.

Many marketers and researchers started investigating the perceived risk and how it affects consumers' attitudes towards online shopping because of the major growth in e-commerce and the number of internet users worldwide. (Chang, Cheung, & Lai, 2005), which was studied by the assessment of the respondents whether they perceive online shopping as risky or if they were concerned with the security and privacy issues of the online shopping system, the digital payment risks be it fraudulent chargebacks or credit cards faults, in addition, product's risk such as the product being faulty, irreplaceable, or not matching the specifications listed on these e-commerce platforms which stated the perceived risks are prominent obstacles in the increase of e online shopping users.

On the other hand, other researchers have also conducted studies considering those who believe that online shopping perceived risks are low confirming the hypotheses of the direct relationship between the level of perceived risk and using online shopping e-commerce channels as those were found to be frequent users (Poel & Leunis, 1999).

Online shopping levels of perceived risks are what leads to attitudes towards online purchasing, for example, those who are hesitant to use their credit card credentials on online shopping e-commerce sites are less likely to shop online (Salkin, 1999).

The literature review also confirmed that the levels of perceived risks differ from an individual to another when comparing between shopping conventionally and shopping online (Featherman & Pavlou, 2003).

Based on the differences in the way individuals perceive risks and the way they define it, it was found that the perceived risks are to be operationalized as the probability and the magnitude of a negative outcome of the purchasing online (March & Shapira, 1987).

Therefore, this research will be studying the perceived risk of apparel online shopping among individuals from both genders, 18 and above and who live in Jordan operationalized into two major constructs which are the probability of a negative outcome taking place out of online shopping and the magnitude of this negative impact on online shopping consumers.

In the risk perceptions of online payment security, this paper will study the concern of purchasers that their credit card information is not secure. As many shoppers refuse online shopping due to the perceived risk of payment security, it is also a reason why some existing shopper stop buying online. This research will study the number of participants who fear to buy online due to payment security and the number of participants who stopped using online shopping caused by an event regarding payment security and the preferred payment method this group is routed to, similarly, it will include the number of participants who make online purchases often and did not face any problems.

Further, this research will study the perceived risk of products in terms of quality and approval of the purchasers as they see a risk in assessing the product due to the intangibility of online purchasing. a might prefer buying apparel in traditional shops as they can evaluate the quality and reliability and try on these products before buying. The research will study how many participants consider this risk before making an online purchase and if it has stopped them from proceeding.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

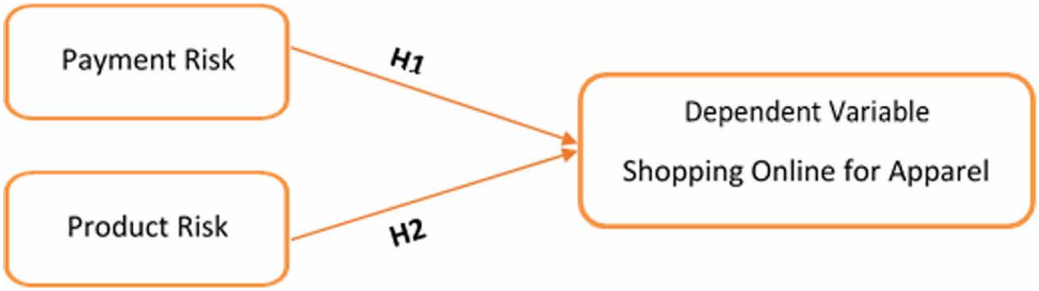
3. GENERAL OBJECTIVE

The purpose of this research is to study the concerns about Online Shopping Perceived Risks and the tendency to use e-commerce platforms for shopping online among Jordanians of both genders and above 18 years old. The reason being is that the Middle Eastern culture, including Jordan, is considered as a risk-averse culture that can be challenging.

4. RESEARCH MODEL

The research model (Figure 1) assesses two important types of risk (Payment Risk and Product Risk). Risk causes discouragement for many customers when they are buying online especially in a culture like the one that exists in Jordan.

Figure 1. Research model



5. RESEARCH QUESTION

- The first question of this research is, does risk of payment security and fraud prevent users from online purchasing.
- The second question is, does risk of receiving a product that is not the same as shown online and not matching expectations prevent users from online purchasing.

6. PROPOSED HYPOTHESIS

The hypotheses of this search are as follows:

H1: The concerns of users about payment security decrease the number of e-commerce purchasing and negatively affects the attitude towards online shopping in Jordan.

H2: The concern of users about receiving a different/faulty product than expected, decreases the number of e-commerce purchasing and negatively affects the attitude towards online shopping in Jordan.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

7. METHODOLOGY

As the research objective implies, this research will be a quantitative research to measure the effect of the perceived risks of online shopping on individual's choice for shopping online from both genders, 18 years old and above and who live Jordan which represent around 39% of the total population in Jordan (Jordan Department of Statistics, 2015). Looking into the sampling methodology, the entire population of the targeted segment (18 years old and above) in Jordan is 3,648,989. In collecting the data about this study, a total of 400 questionnaire survey has been distributed to respondents through both physical distribution and online survey using convenience sampling. However, a total of 355 surveys were filled and returned back successfully, that means a response rate of 88.75% which is quite adequate according to (Sekaran, 2003).

Then analyze the findings so we can confirm or deny perceived risks are to be recognized as an obstacle to the growth of online shopping and e-commerce adoption. The survey questions are based on the paper by (Forsythe, Liu, Shannon, & Gardner, 2006) which was a study to develop a scale to measure the perceived benefits and risks of online shopping which is appropriate to this paper.

This study employed normality and reliability for testing the goodness of data. Then, compare means T-test for testing the hypothesis using the Statistical Package for Service Solution (SPSS).

8. EMPIRICAL RESULTS

Table 1 demonstrates in details the respondents' gender, age, current place of residence, whether they do online shopping and if so, the frequency of doing online shopping. The questionnaires have been distributed to different ranges of groups to have different opinions and perspectives from different respondents.

In order to measure the perceived payment risk and the perceived product risk, a set of Likert questions have been asked for each. Where, 0 is considered as low perceived risk and 5 is considered as high perceived risk.

As mentioned above in Table 1, 97 respondents who adopt online shopping (27.3%) in their purchase behavior and 258 (72.7%) respondents who do not. Table 2 shows the descriptive analysis for these two groups.

For this study, the perceived product risk for online shopping user and non-users is higher than the perceived payment risk. That means, for both users and non-users, the perceived product risk has a higher effect on online shopping adoption than the perceived payment risk because the researchers have tested the purchase adoption for online apparel shopping in specific, and according to (Bhatnagar, Misra, & Rao, On risk, convenience, and Internet shopping behavior, 2000) the perceived product risk will be higher for product categories where feel and touch are essential.

8.1. Reliability Test

In order to examine the internal consistency and the reliability of the data. Usually, Cronbach's Alpha coefficient is used. The Cronbach's coefficient must be above 0.7 to have acceptable internal consistency and reliable results. According to (Pallant, 2013), a value below 0.7 is considered inadequate.

Table 3 shows the Cronbach's Alpha coefficient for four independent variables and one dependent variable in which all of them are above 0.7, i.e., all variables are reliable.

Table 1. Demographic analysis

	Component	Frequency	Percentage
Gender	Male	202	56.9%
	Female	153	43.1%
Age	18-23	78	22.0%
	24-29	92	25.9%
	30-35	111	31.3%
	More than 35	74	20.8%
Current residence place	Amman	167	47.0%
	Irbid	72	20.3%
	Zarqa	38	10.7%
	Aqaba	56	15.8%
	Other	22	6.2%
Do you use online shopping	Yes	97	27.3%
	No	258	72.7%
How often do you shop online	Very often	21	13.9%
	Often	41	27.2%
	Not very often	52	34.4%
	Rarely	37	24.5%

Table 2. Demographic analysis

Independent Variables	N	Mean	Std. Deviation
Payment risks for online shoppers	97	2.32	0.58
Product risks for online shoppers	97	3.49	0.62
Payment risks for non-online shoppers	258	3.55	0.5
Product risks for non-online shoppers	258	4.44	0.45

Table 3. Cronbach's alpha test

Construct	Number of Items	Cronbach's Alpha Coefficient
Payment risks for online shoppers	6	0.701
Product risks for online shoppers	5	0.728
Payment risks for non-online shoppers	6	0.717
Product risks for non-online shoppers	5	0.778
Online shopping adoption	4	0.801

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

8.2. Exploratory Factor Analysis

Exploratory Factor Analysis or EFA is used to test the interrelationship of variables. Usually, two measurements are used to check the appropriateness of the factor analysis. Which is, Bartlett and Kaiser-Meyer-Olkin (KMO). Table 4 shows the EFA results.

The Bartlett Test of Sphericity which is the Sig. (P) Values in the table above are less than 0.05 which means that the relationship between variables is significant. Meanwhile, the KMO values are above 0.5 which is the minimum for an acceptable factor analysis (Williams, Onsman, & Brown, 2010). Therefore, all the variables are appropriate and the factor analysis is considered applicable.

8.3. Pearson Correlation

In order to test the hypotheses of this study. Pearson Correlation is used to validate if there is a relationship between the dependent and the independent variables and if any to what extent. Pearson Correlation is mainly used to indicate if there is a linear relationship between two variables and to what extent.

The Pearson correlation coefficient, r, can take a range of values from +1,0 to -1. A 0 value means that there is no relationship between the two variables, a greater than 0 value indicates a positive relationship; that means, as the value of one variable increases, the value of the other variable increases. While a less than 0 value indicates a negative relationship; that means, as the value of one variable increases, the value of the other variable decreases. According to literature a value between 0 to 0.3 reflects weak correlation, between 0.3 to 0.7 moderate correlation and a value of more than 0.7 indicates strong correlation.

Table 5 demonstrates the relationship between the dependent variable (Online Shopping Adoption) and the independent variables (Payment and Product risks). Both Payment Risk and Product Risk are negatively correlated with the Online Shopping Adoption the dependent variable. The former's r value is -0.526 while the latter's r value is -0.465.

Table 4. Cronbach's alpha test

Construct	Approx. Chi Square	DF	Sig (p)	KMO
Payment risk	406.503	15	.000	0.8118
product risk	323.392	10	.000	0.7235

Table 5. Pearson correlation results

Construct	Online Shopping Adoption	Sig.
Payment risk	- 0.526	.000
Product risk	- 0.465	.000

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

8.4. Regression Analysis

Table 4 indicates that the dependent variable and the dependents variables are correlated that means the proposed hypotheses of this study are valid and accepted. Although they are valid and accepted, a Regression Analysis will be conducted to ensure that there are actual relationships between these variables.

Table 6 shows that the R square value (coefficient of determination) for this research model is 9.7%. This value indicates that about 10% of the variation in Online Shopping Adoption accounted for by the variation in both of explanatory variables in the regression equation. The remaining 90% accounted for other factors that aren't being explained in this study.

The Sig. value in Table 7, which is less than the level of significance 0.05 considered for this study, proves that the relationship between the independent variables and the independent variables and the dependent variable are significant. In other words, we proved that this model accurately predicts the impact of perceived risks (Payment risk and Product risk) on Online Shopping Adoption.

After proving the relationship between the Perceived Risks and the Online Shopping Adoption. Then, the researchers want to know the extent of this relationship. Payment Risk and Product Risk coefficients (see Table 8) have negative signs and that precisely what it's expected, that means; as these two factors decrease the Online Shopping Adoption in Jordan increases. β of Payment Risk is greater than β of Product Risk, that is; the Product Risk has the most significant relationship with the Online Shopping Adoption in Jordan.

Table 6. Model summary

Model	R	R Square	Adjusted R Square
1	.312[a]	.097	.092

a. Predictors: (Constant), Payment Risk, Product Risk

Table 7. ANOVA[a]

Payment risk	- 0.201
Product risk	- 0.134

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

According to findings of this study, researchers failed to reject the propsed hypotheses, in other words, both perceived risks, Payments Risks and Product Risks, are correlated with the Online Shopping Adoption. Specifically, they negatively correlated and negatively affect the Online Shopping adoption in Jordan.

9. DISCUSSION

The study found that perceived product risk for online shopping is higher than the perceived payment risk. Perceived product risk has a higher effect on online shopping adoption especially for product categories where feel and touch are essential.

According to findings of this study, both perceived risks (Payments Risks and Product Risks) are correlated with the Online Shopping Adoption. Specifically, they negatively correlated and negatively affect the Online Shopping adoption in Jordan.

The importance of identifying and reducing perceived risks is highly attributed to the distinction between different types of risk and to use them to examine perceptions of online purchase risks. This helps to better identify the differences in perceived risk and thus enhance the precision with which actions to reduce risk can be taken.

Payment risk such as fear of fraud, phishing or disclosing private information has negative effect on attitude toward online shopping, this is already established in the literature (Almousa, 2011; Javadi et al., 2012), However, The study results showed that product perceived risk such as the inability to judge the quality of the product over Internet was found to have a higher influence on the consumers decision to by online; lots of research indicated the importance of product related risks (Forsythe et al., 2003; Javadi et al., 2012).

10. CONCLUSION

In light of the overall findings and empirical results, the independent variables (Payment Risk and Product Risk) are correlated with the dependent variable (Online Shopping Adoption in Jordan). Regression Analysis shows a negative relationship between the two perceived risks and the online shopping adoption in Jordan, that is; as these two factors increase the online shopping adoption in Jordan decreases. Consumers worry to shop online because they have concerns about using their credit cards credentials, their personal information will be leaked or used elsewhere, and/or they have concerns about the quality, size the product.

According to this study, people in Jordan are more concerned about using their credit cards credentials than what they do towards quality, size and/or defects in the product because however, most of the e-commerce platform thanks to the new logistics technologies have managed to decrease the perceived product risks by offering a complete refund, exchange, warranties, etc.

11. MANAGERIAL IMPLICATIONS

Managers need to take perceived risk into account when designing their electronic marketing channels. To reduce perceived risk, especially frequently updated information should be provided to improve the

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

website contents. Since behavioral intention toward online shopping has positive impact on actual purchase behavior; online vendors need to understand the factors that influence the formation of consumer's intention toward online shopping.

Online retailers should send notifications to all their customers assuring them the security of their online transactions and use all the safety measures to do so, this will help in reducing the payment risk. In order to help reduce product risk; online retailers should grant customers a trial period to assess the product physically, this may happen upon the delivery for the product or for a longer period of time guaranteeing a full refund if customers didn't like the product.

Online vendors should work on their e-commerce institutional mechanisms to create a less risky transaction environment using regulatory assurances to enables customers to rely less on trust to continue a transaction (Fang et al., 2014).

Chapter 96
Legal and Regulatory Challenges in Facilitating a Sustainable ASEAN E-Commerce Sector

Lekha Kunju Pillai Laxman
https://orcid.org/0000-0002-5360-0099
Azman Hashim International Business School, Universiti Teknologi Malaysia, Malaysia

ABSTRACT

The ASEAN region's potential ability to reap the benefits of e-commerce is considerable, and it is timely to strategize a sustainable pathway for ASEAN's e-commerce market. This chapter explores the arising legal and regulatory challenges with measures needed to facilitate e-commerce activities in the region. A qualitative research design is utilized to review secondary data and analyze ASEAN's current legal and regulatory framework. The findings reveal that despite the untapped potential of the collectively large "ASEAN market," there are significant challenges to developing e-commerce in some countries. Moreover, there are additional regulatory challenges in tackling a myriad of issues related to cross-border challenges in terms of security and reliability of payments: logistics, customs and border administration, foreign market access, data protection, and the regulatory environment for national and cross-border e-commerce transactions. Some form of legal and regulatory harmonization is required between member nations in order to mutually reap the benefits of e-commerce.

INTRODUCTION

E-commerce in the 21st century has expanded at the global level at an unprecedented rate, in tandem with high market demands in most parts of the world. For the most part, this trend has been facilitated by new technologies and trends brought about by the Fourth Industrial Revolution wave. These are rapidly developing and shaping a strong digital ecosystem designed specifically for e-commerce businesses and their customers. Thus, more and more entrepreneurs and e-commerce firms around the world are explor-

ing the infinite potential of the business of e-commerce by embracing new technologies—ones such as big data analytics, the internet of things (IoT), artificial intelligence (AI), augmented reality (AR), virtual reality (VR), and blockchain technology (ESCAP & ADB, 2018). These enabling technologies allows businesses to be in sync with evolving customer needs, greater customization, maximum convenience, and security in order to attract consumers from around the world without having the inconveniences and expenses normally associated with registering and setting up brick-and-mortar businesses in numerous countries each with a different set of laws. Furthermore, e-commerce has greater potential ability to capture the untapped markets in developing nations faster than those of more developed nations due to increase internet penetration and mobile applications (Kinda, 2019).

The ASEAN region has considerable potential to reap the benefits of e-commerce. E-commerce is touted to be a contributor to economic growth for nations jointly and severally (Mik, 2019). More importantly, it could be the integrating force for the vastly diverse ASEAN nations. The projection in a report by Google and Temasek Holdings reveals that the digital market in South East Asia (SEA) could exceed US$200 billion by 2025—which is not surprising in view of it having a joint population of 630 million people, a growing middle class, and rising internet penetration. Undoubtedly, the ASEAN e-commerce market is a potential goldfield. Improvements are required in terms of technological infrastructure, and in the regulatory and legal environment in which e-commerce firms operate across ASEAN (CCS, 2017). But the realization of its full potential requires the integrating of three dimensions—environmental, social, and economic—into e-commerce in order to ensure sustainability for both present and future generations, while thriving as an industry (Oláh et al., 2019). It is thus timely to strategize the best pathway towards achieving a sustainable ASEAN e-commerce market. Such an initiative can only be successful when multiple obstacles and challenges related to economic, environmental, legal, and institutional, as well as social, developments are properly dealt with (ESCAP & ADB, 2018).

The objectives of this chapter are two-fold: (1) to evaluate the legal and regulatory challenges that will be faced by the ASEAN e-commerce sector; and (2) to suggest the concomitant measures that are required to facilitate the ASEAN e-commerce sector. A qualitative research design is utilized to review related secondary data and analyze the current regulatory framework of ASEAN with a view to identifying the challenges that arise.

AN OVERVIEW OF E-COMMERCE DEVELOPMENT in THE ASEAN REGION

Both the Organization for Economic Co-operation and Development (OECD 2011) and the United Nations Conference on Trade and Development (UNCTAD 2017a) have defined e-commerce as transactions utilizing computer networks for the purchase and sale of products (such as physical goods, and digital products or services). These e-commerce transactions generally utilize technologies such as internet and electronic data interchange over devices such as personal computers, tablets, and mobile phones. The definition of e-commerce in this chapter also includes mobile commerce (M-Commerce) consisting of the sale and purchase of goods and services using mobile (smart) phones. This is an important consideration in view of the growth in smart phone usage that is overtaking access to conventional computers/laptops (CCS, 2017).

Currently, e-commerce is precariously positioned halfway between the phases of inception and growth e-commerce with a huge potential for future growth and adoption globally (Oliviera & Toaldo, 2015; as cited in Goyal et al., 2019, at p. 3). At one end of the continuum, the ongoing innovations in

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

digital technologies is recreating new dimensions to the business, customer, and competition framework. On the other end of the continuum is the byproduct of global inequity, which—according to numerous studies reviewed by Goyal et al. (2019)—reveal most developing or underdeveloped nations to still lack basic infrastructure and access to enabling technologies which is exacerbated by low levels of computer education among the general population and low levels of internet and mobile penetration (Oliviera and Toaldo, 2015; Alshibly and Chiong, 2015; Sila, 2013; Al-Somali et al., 2011; Kamari and Kamari, 2012; Bordonaba-Juste et al., 2012; Weisberg et al., 2011; Ifinedo, 2011; Yen, 2010; Van Slyke et al., 2010; Yee-Loong et al., 2009; Boateng et al., 2008; Elbeltagi, 2007; Zhuang and Lederer, 2003; McKnight and Chervany, 2001). This scenario resonates with a majority of the ASEAN nations apart from Singapore, Malaysia, and Brunei. Such digital divides and gaps in key infrastructure and e-commerce legislation are still preventing many Asian economies from maximizing the potential benefits (Kinda, 2019). But the latest Global Digital Reports (2019) indicate that the digital landscape of Southeast Asian nations is rapidly transforming: Not only is the number of internet users rapidly increasing (416 million users with 63% internet penetration), but e-commerce spending is undergoing an even faster growth (Kemp & Moey, 2019). Statista reports (2019) referred to by Kemp & Moey (2019) reveal the following:

- The rate of growth of Thailand's ecommerce market is faster than that of any other country—with total online consumer spending in the country up by 25 percent in just 12 months between 2017 and 2018.
- The annual growth rates of Malaysia, Vietnam, Singapore, and Indonesia were in excess of 20 percent in comparison to the Philippines—recording a growth rate of 16 percent during the same period.

It is therefore essential to improve enabling factors in the region to further boost e-commerce by addressing the existing digital divides and gaps in key infrastructure such as Internet penetration, delivery logistics, and access to financial accounts, as well as limits in e-commerce legislation.

It is also critical for these biodiversity-rich nations to ensure that the activities that take place in the context of ASEAN e-commerce do not endanger sustainability. Sustainability in e-commerce refers to every party involved in e-commerce transactions—manufacturing companies, logistic service providers, retailers, and consumers—consciously working together in attaining sustainable solutions in the process of manufacturing, packaging, transporting, and reducing shipment returns, with a view to minimizes the impact on the environment (Oláh et al., 2019 citing Tang et al., 2016, at p. 4). Such cooperative strategies will have positive impacts in terms of reductions in the cost of operations, goods, shipment, and recycling—resulting in all stakeholders having economic advantages (Oláh et al., 2019). It is extremely important that the pathway chosen by ASEAN retains a balance between the growth of e-commerce businesses and the resulting environmental-social negative effects, in order to minimize the harm done to societies through pollution (Oláh et al., 2019; citing Kostakis et al., 2016; and p. 4 of Fourcroy, 2014). Such an approach, which reduces the carbon footprint of e-commerce activities, will potentially enhance overall financial, social, economic, and environmental performance (Oláh et al., 2019).

Nevertheless, merging e-commerce activities with sustainability dimensions may not be that straightforward for businesses. There is no universal, standard way of conducting such improvements or of properly incorporating it into the business strategy, where it gets even more difficult when involving companies from different countries who might have different regulations (Berglund & Svanteson, 2018 citing Zhu et al., 2012, at p. 9). This factor can negatively affect the work with merging the e-commerce

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

and the sustainability dimensions on account of variations in international sustainability laws that companies need to adapt to when selling their products globally (Berglund & Svanteson, 2018 citing Zhu et al., 2012, at p. 9). Some form of consensus is needed between ASEAN member states on the issue of sustainability to facilitate e-businesses operating in the region.

The development of sustainable strategies for the untapped potential of the ASEAN e-commerce is, indeed, not an easy task. The Economic Development Board of Singapore has pointed out that for most ASEAN nations (apart from Singapore), e-commerce accounts for a small slice of total retail which presents many opportunities for growth (EDB, 2018). Even though the collectively large "ASEAN market" has untapped potential, there are significant challenges when it comes to developing e-commerce in some countries and additional regulatory challenges in tackling a myriad of issues related to cross-border challenges in terms of the security and reliability of payments; logistics, customs, and border administration; foreign market access; data protection; the national e-commerce regulatory environment; and the regulatory environment for cross-border e-commerce transactions. An extensive review of previous studies (Goyal et al., 2019) has revealed that these challenges can be classified into the following three broad categories:

- **Macro Challenges:** Such challenges are generally in the form of inappropriate technology and banking infrastructure (i.e., internet penetration, digital literacy, financial inclusion, and credit-card penetration) as well as ineffective government policies and regulations towards dataprivacy, taxation, the fairness of competition, and secured online payment infrastructure, etc.
- **Consumer-Oriented Challenges:** Such challenges include the need for aesthetics, affordability, accessibility, availability, and awareness, in addition to managing the cognitive perceptions and attitudes of consumers.
- **Organizational-Level Challenges:** Such challenges include ones that necessitate the designing and implementing of suitable business models that have a mix of strategic actions to manage channel coordination and integration; a scarcity of skilled resources; and the need for competitive differentiation, processes, and systems; etc.

In the following section, a review will be undertaken on the ongoing regional initiatives and the macro challenges related to the legal and regulatory framework in carrying e-commerce activities between countries in the ASEAN region.

THE E-COMMERCE READINESS OF ASEAN NATIONS

Current Regional Initiatives and Regulatory Challenges that Arise in the ASEAN E-Commerce Sector

In general, there is a widespread consensus that digitalization could have far-reaching implications for the realization of the sustainable development goals of developing economies. However, as with any new technology, this is predicated on their readiness to receive and implement these technologies in a manner that is all-inclusive (digital inclusion), leaving no one behind. Although the 21st century is witnessing an unprecedented growth in e-commerce sales and the digital economy, the current digital divide is a genuine concern of many developing countries—especially least-developed countries (LDCs) (UNCTAD,

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

2019b). Clearly the gains from e-commerce are not automatic; as appropriate national policies, strategies, regulations and support measures are crucial both to building national digital industrial capacities and to improving national preparedness (UNCTAD, 2019b). Otherwise, the consequent challenges will impede these nations from drawing benefits from vibrant global digital trade due to a lack of adequate digital capacities. In this context, the ASEAN nations—in support of ASEAN regional economic integration objectives—began various initiatives a few decades ago in order to build on their digital capacities that could ensure a strong and sustainable ASEAN Economic Community (AEC). Namely, these have been: the e-ASEAN Initiative (1999), the e-ASEAN Framework (2000), the ASEAN Economic Community (AEC) Blueprint 2015 (2007), the ASEAN ICT Masterplan 2015 adopted in 2011 by the tenth ASEAN Telecommunications and IT Ministers (TELMIN) (UNCTAD, 2013), and, most recently, the ASEAN Economic Community Blueprint 2025 (2015). These continual initiatives signify clearly the intention of Member States to develop a regionally harmonized e-commerce legal framework consistent across jurisdictions, providing guidelines in order to facilitate the development of common objectives and principles for an electronic commerce (e-commerce) legal infrastructure.

The ASEAN ICT Masterplan 2015 (AIM 2015) deserves special mention. Its focus was on six strategic thrusts—i.e., economic transformation, people empowerment and engagement, innovation, infrastructure development, human capital development, and bridging the digital divide (UNCTAD, 2013). It had recognized that the establishment of harmonized e-commerce laws in each member country was vital not only to ensure a conducive information and communications technology (ICT) environment for businesses but also to build trust by facilitating secure transactions within the ASEAN community, developing a common framework for information security, and promoting cybersecurity (UNCTAD, 2013). The report by the ASEAN Secretariat reveals that the AIM 2015 (which was duly completed in 2015) can be considered as being successful in many respects, as its framework and roadmap for the regional development of ICT has enabled greater ICT development in ASEAN (ASEAN, 2015) and is evident in the following aspects:

- ICT services are now a larger component of total service exports at the macro level, thereby becoming an important engine of regional economic growth;
- Costs of internet access and mobile subscription at the individual level have reduced considerably in ASEAN Member States (AMS), thereby resulting in greater connectivity for millions of ASEAN citizens;
- Employment in the ICT sector has also increased due to the advancement of ICT; and
- Government services have become digitalized, and there is a greater awareness of cybersecurity in ASEAN due to greater ICT development.

It is clear from the above developments that AIM 2015 has made significant strides towards ASEAN integration and has further contributed to this in terms of two ASEAN plans—i.e., The Master Plan on ASEAN Connectivity and The AEC Blueprint ASEAN (2015).

A comparative analysis was made by Mik (2019) on the ASEAN Economic Community Blueprint 2015 (Blueprint 2015) adopted in 2008 with the aim of implementing the AEC by 2015 and the ASEAN Economic Community Blueprint 2025, adopted in 2015 (Blueprint 2025). The scope of Blueprint 2015 was found to revolve around the transactional aspects of e-commerce and on the mutual recognition of digital signatures, with placement of only marginal attention on consumer and privacy protections. In contrast, the focus of Blueprint 2025 was on retail payment systems in order to bolster cross-border

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

online transactions being cognizant of the importance of protecting and promoting consumer interests. This it does by adopting a more practical and consumer-centered approach and innovative e-commerce strategies that are backed by comprehensive national and regional consumer protection systems enforced through effective legislation, redress mechanisms, and public awareness (Mik, 2019; citing the ASEAN Economic Community Blueprint 2025, 2015, pp. 10–11). Although the UNCTAD found that the aims of the Blueprint 2015 were mostly achieved vis-à-vis the enactment of legal instruments for electronic contracting (Mik, 2019), the focus of e-commerce legislation harmonization was more on electronic transaction laws, and less on other cyberlaws (UNCTAD, 2013). The AEC Blueprint 2025, on the other hand, is relatively more ambitious in its efforts to ensure that the AEC integration process is more transparent and inclusive (Menon et al., 2018). It undertakes reform initiatives in difficult areas such as reducing non-tariff measures, simplifying rules of origin, deepening trade facilitation measures, and harmonizing standards and regulations (Menon et al., 2018). Underlying the 2025 Blueprint is a growing recognition that the success of AEC is dependent on fully engaging businesses and the broader community; and consequently, it focuses on creating stronger community engagement and greater partnership arrangements with the private sector and industry associations (Menon et al., 2018).

ASEAN has been generally proactive in ensuring that there are ongoing efforts to address the arising issues contributing to the digital divide and e-Trade readiness in the region. Another momentous step was taken by ASEAN with the recent ratification of the *Digital Integration Framework Action Plan 2019–2025* at the 18th AEC Meeting in Bangkok, Thailand, on 31 October 2019, with an aim to advance and overcome digital integration barriers in ASEAN through the following ways (Nantu, 2019):

- By intensifying cooperation to strengthen the competitiveness of their ICT industries, and
- Expand e-commerce and facilitate digital connectivity that included plans to sign an ASEAN e-commerce agreement and adopt an ASEAN Digital Integration Framework to help transform the region into a competitive global digital hub.

There was follow up within a few months with the signing of the *ASEAN Agreement on Electronic Commerce* (AAEC) on 12 November 2018, thereby making ASEAN the first region in the world to have an e-commerce agreement. It symbolizes the recognition by ASEAN of the digital economy's potential to contribute to regional development with the growth of e-commerce through the advancing of trade rules in e-commerce and the building up of greater digital connectivity in the region. The agreement is part of the implementation of the *ASEAN Work Programme on Electronic Commerce 2017–2025*. It has, as its objectives, the facilitating of cross-border e-commerce transactions; the creating of an environment of trust and confidence in the use of e-commerce; and the deepening of cooperation among ASEAN member states to further develop and intensify the use of e-commerce to drive economic growth and social development in the region (Zahra, 2019). The agreement denotes a firm commitment from each member state to maintain or adopt as soon as practicable, laws, and regulations governing electronic transactions with a view to enhance the efficiency of businesses in the ASEAN countries—particularly small and medium-sized enterprises.

The net result is consumers of e-commerce in these nation states will have a higher degree of certainty and trust in online transactions and will be accorded the same protection as consumers of conventional commerce. Although AAEC is a positive move in creating a common framework guiding the enactment of domestic laws and regulations in the respective ASEAN jurisdictions, each state needs to undertake considerable and timely initiatives to support the development and implementation of regional e-commerce,

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

in addition to enacting and enforcing the necessary laws and regulations for facilitating electronic commerce. These legal initiatives need to keep pace with ongoing advancements in technologies related to e-commerce. Thus, it is safe to surmise that the efforts to translate them will need considerable political will—jointly and severally at the regional and national levels, respectively.

A Review of Regulatory Challenges for a Harmonized E-Commerce Legal Environment

There is no doubt that ASEAN will continue to face uphill challenges in the creation of a favorable environment for a more effective contribution of e-commerce towards sustainable development in the region. The facilitation of e-commerce in the region is tantamount to the harmonization of the relevant laws and regulations in this area (Mik, 2019). But the mere creation and harmonization of broader e-commerce laws and regulations within an appropriate *legal* framework for e-commerce will not suffice when dealing with high-volume and low-value cross-border transactions involving multiple regional initiatives touching on a wide spectrum of cross-cutting and jurisdictional issues (Mik, 2019). The said complexity is further exacerbated by the fact that unlike the European Union, ASEAN does not have the benefit of a legal superstructure for developing a unified regime with the capacity to support regional e-commerce (Mik, 2019, Sengpunya, 2019). The constraints of the ASEAN Secretariat are particularly noteworthy, with functions being limited to those of a secretariat and not in keeping with a complex agenda to harmonize and implement policies across 10 diverse nations (Sengpunya, 2019; Menon et al., 2018).

Another overarching challenge which ASEAN must grapple with is the need to work in partnership with concerned parties to drive sustainable e-commerce, as was discussed in the preceding section. This is particularly relevant in the context of the global nations which are striving to implement the 2030 Agenda for Sustainable Development based on a universal blueprint for building peaceful, prosperous societies on a healthy planet (UNCTAD, 2019b). While harnessing the great power of information and communications technologies can potentially bring economic prosperity to developing nations via new pathways of development that also allows them access to the global store of knowledge (UNCTAD, 2019b), it is extremely prudent to ensure that it does not become a double-edged sword that negates intergenerational equity. Thus, ASEAN is presented with the perfect opportunity for developing a regional business environment that benefits companies complying with e-commerce sustainability in three dimensions—environmental, social, and economic—to facilitate future sustainable e-commerce (Oláh et al., 2019; citing Aras & Crowther, 2009, at p. 3). The challenge, essentially, is to develop sustainable regulations—and to encourage manufacturing companies, logistic service providers, retailers, and consumers to work together to facilitate sustainable solutions in e-commerce in the process of manufacturing, packaging, transporting, and reducing shipment returns, in order to ensure a favorable environment (Oláh et al., 2019; citing Macchion et al., 2017 at p. 5; and Tang et al., 2016, at p. 4). As there is yet a universally accepted methodology for including sustainable e-commerce in a business strategy, it is important to incorporate trade-offs that will bring benefits (in both the short term and long term) to stakeholders alike. Thus, ASEAN nations must not only work with one another but also with businesses operating in the region in order to create harmonious regulations that are applied uniformly across the region (Oláh et al., 2019; citing Mangiaracina et al., 2015).

It is extremely important for ASEAN to ensure that online businesses—particularly the Micro, Small, and Medium Enterprises (MSMEs) operating in the region—can reap the benefits inherent in the proposed Single Market and a regional digital economy through the Digital ASEAN initiative by avoiding regula-

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

tory inconsistencies and ensuring a coherent legal and regulatory framework for electronic commerce. Some noteworthy facts were pointed out in a report by Asia Pacific MSME Trade Coalition (AMTC), including the fact that a majority of their 2500 MSMEs that are engaged in e-commerce and digital trade stand to benefit from the application of digital technology in terms of reducing time costs by 29 percent and dropping direct business costs by 82 percent (Elms, 2019). Digital tools are particularly essential for the survival of smaller firms who can tap the benefits of digital tools in a rapidly evolving market. Although all these MSMEs are not located in ASEAN, many of those which are engaged in or which support trade-flows across the region have encountered challenges related to inconsistent trade rules and regulations within ASEAN (Elms, 2019). Such barriers to expansion in the form of restrictive forms of regulations or broad technological delays will affect all firms in the market and potentially impede the growth and development of e-commerce markets (CCS, 2017). Potential entrants or small firms are also likely to encounter barriers to entry; e.g., economies of scale or network effects (CCS, 2017). ASEAN needs address these barriers through appropriate policies and regulations.

Currently, the challenges with e-commerce law and policymaking in ASEAN is an interplay of two levels—i.e., the national level and the regional level. They include barriers ranging from differing legal systems (civil and common law) to different e-commerce frameworks at the national level (e.g. payment system and consumer protection) with policy issues being dealt with by multiple agencies. These issues are further complicated by obstacles to cross-border selling ranging from communication and language barriers, cultural nuances, and global shipping problems due to insufficient infrastructure and varying degrees of internet penetration, not to mention legal restrictions in different markets (UNCTAD, 2013).

For a detailed analysis, the e-commerce ecosystem and the components therein will provide a good starting point for determining the type of legal and/or regulatory challenges that will have to be taken into consideration when developing a regional framework for harmonious regulations (See Figure 1). Since e-commerce involves the buying and selling of goods and services electronically, the e-commerce ecosystem necessarily "involves a network of interconnected functions within the lifecycle of the buying and selling of goods and services electronically" (Mahn, 2017). The different phases of the lifecycle involve a whole range of different types of industries and companies within those industries—all of which can potentially benefit from the activities taking place within the ecosystem, but which are subject to appropriate legislation governing these activities (Mahn, 2017):

- The lifecycle usually begins with the consumer connecting to the internet in search of an online retailer in order purchase a selected item. They, then, proceed with the transaction by entering information related to the mode of purchasing the item; and conclude their part in the process by submitting the order.
- The next phase of the lifecycle involves the online merchant who processes the order, locates the product, obtains the product from their inventory (in a warehouse or distribution center), ships the order to the consumer, and (ultimately) collects payment.

Appropriate regulations for the various activities in the said eco-system need to be formulated in order to tackle complex challenges in the following areas.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Cross-Border e-Commerce

Cross-border commerce basically involves the sale or purchase of tangible products via online shops across national borders involving different jurisdictions, different currencies, and parties (to different transactions) speaking different languages (Khan, 2017). Currently, the level of e-commerce readiness amongst the ASEAN nations is at different levels by virtue of the diversities of their legal and institutional environments. Philippines and Vietnam, for instance, have created e-commerce offices and agencies to reshape their regulatory environment (EDB, 2018). Among its initiatives include an e-commerce trust-mark that is displayed on the website in order to verify the trustworthiness of the business by the issuing organization (such as TRUSTe and VeriSign). However, despite these trust-marks, shoppers in the region still lack awareness and confidence that these websites will process their information securely. Furthermore, Indonesia and Thailand still have insufficient regulations to support businesses involved in cross-border transactions (EDB, 2018). Malaysia has relatively strong e-commerce regulations but is weak in terms of the enforcement of existing regulations. Thus, each of these nations are facing different types of challenges and hurdles—particularly in the context of implementing suitable electronic payment options and providing adequate consumer protection that has the capacity to generate trust in online transactions. These differences need to be minimized for ASEAN to jointly benefit from the potentials of a sustainable e-commerce framework. It is therefore essential for these nations to harmonize the regulations to facilitate international online trade.

The complexity particularly increases when dealing with the challenge of shipping/transporting goods from one location to another has increased environmental hazards to communities—not forgetting that after delivery, some products are returned to the suppliers, simply because they do not meet the green product expectations of consumers. Sustainable solutions integrating the three dimensions (i.e., environment, social, and economic) need to be identified in order both to reduce the carbon-footprint created by these transactions and to enable future sustainable e-commerce in the region.

The following cross-cutting issues need to be addressed by devising a specific regulatory environment for cross-border activities and a general regulatory environment for e-commerce (EDB, 2018):

- **Payments:** Many of the ASEAN states still need to address policy and regulatory issues concerning the security and reliability of payments—particularly for businesses and consumers in Indonesia, Philippines, Thailand, and Vietnam, where Cash on Delivery (COD) is still the preferred payment method. E-commerce firms that operate in e-commerce ecosystems that lack well-developed e-payment systems are forced to utilize unsustainable business models. Apart from Singapore, the remaining jurisdictions still need to make major changes in order to improve the e-commerce payment infrastructures in Southeast Asia. A recent report pointed out that 25% of SMEs regarded limited cross-border payment options as being a key barrier to selling products and services online to other countries (Hoppe et al., 2018).
- **Logistics:** There is great variation in the cost and capability of logistics providers in Southeast Asia, as they face unique last-mile delivery challenges. According to a recent report, approximately 50% of SMEs that sell online consider complex cross-border trade processes or poor logistics infrastructure as being the top barriers to selling online to other countries (Hoppe et al., 2018). In addition to the high logistical costs generated by the challenging geography of many countries in the region, regulations that restrict competition in logistics have further amplified the challenges in this context (World Bank, 2019).

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Customs and Border Administration:** Most of the nations in ASEAN encounter serious issues in relation to custom transparency and inconsistent custom procedures with wide variations in import procedures, VAT, and duties across countries and for different product types. In addition, apart from Singapore, most of these nations also face problems with corruption in the customs and border process.
- **Foreign Market Access:** Most SMEs—particularly in Indonesia, Philippines, Thailand, and Vietnam—continue to encounter challenges in obtaining access to foreign markets to sell their products and services. This is largely attributable to a lack of regulations for e-commerce and to the presence of non-tariff barriers over a broad range of products. Although Malaysia has encouraged foreign business access through many free trade agreements, many minor hurdles remain in terms of accessing the market. Singapore, on the other hand, has opened its trade borders. Only the Singapore government has progressively adopted an agenda of open trade borders by lowering barriers to trade.
- **Geo-Blocking:** The EU Commission had identified geo-blocking to be an impediment to the free movement of goods and services and countered it with geo-blocking regulations. This practice essentially denies customers access to the websites of other nations in the region and/or prevents access to the products or services of a specific country. ASEAN, too, needs to address this problem through relevant regulations.
- **Jurisdiction:** There is a dire need for a specific legislation to be enacted in order to determine issues involving jurisdiction for e-commerce disputes (Khan, 2017). The determination of jurisdiction about a transaction is a primary and fundamental question in matters related to the enforcement of rights of the parties; dispute settlement; intellectual property rights; consumer protection; data protection; and taxation (Khan, 2017).

ELECTRONIC TRANSACTIONS

ASEAN requires effective laws regulating electronic transactions in order to facilitate e-commerce, as it will provide legal certainty for the recognition of electronic communications, electronic records, and electronic signatures (UNCTAD, 2013). The overall progress of ASEAN towards the harmonization of basic electronic transaction laws has been satisfactory. In ASEAN, all member countries already use either one or both of the model laws—the UNCITRAL Model Law on Electronic Commerce (1996) and/or the UNCITRAL Model Law on Electronic Signatures (2001)—as a foundation for local laws (either draft or implemented laws). Even though the national laws were based on the same international reference frameworks, some variations—sometimes significant ones—were found not only in the text of each law but also in their interpretation by the respective courts (UNCTAD, 2013).

Although most of the ASEAN member countries (except Cambodia, Lao PDR, and Myanmar) have in place legal and regulatory frameworks for secure electronic transactions, data protection and privacy, and consumer protection for online purchases, they may lack the depth and details to address current issues in the digital economy; may lack the requisite compatibility with other countries; and may be inadequate in terms of implementation (World Bank, 2019). The World Bank Report (2019) found that despite these legislations, data policies and regulations were largely underdeveloped, with some even posing potential risks to the growth of the digital economy—especially by adopting policies which take a blanket approach requiring the localization of data within national borders. Such closed approaches

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

may impede the growth of local firms due to their inability to harness digital technologies while risking similar responses from other countries.

PRIVACY & DATA PROTECTION

A report by Klynveld Peat Marwick Goerdeler (KPMG) International had cited privacy concerns as the main reason given by 55% of consumers surveyed globally for their decision against buying products online (ESCAP & ADB, 2018 citing KPMG, 2016). According to the surveys, most organizations are not equipped to deal with security or privacy issues. Consumers are further discouraged from fully utilizing online transactions due to lack of honesty among businesses and concerns over the potential misuse of personal information by government agencies and businesses alike (ESCAP & ADB, 2018). These problems are particularly serious in countries without data protection and privacy laws. An e-commerce eco-system that engenders such a high degree of mistrust toward businesses will impede the B2C e-commerce growth in the region (ESCAP & ADB, 2018). The situation in ASEAN member states is gradually improving with more nations such as the Philippines and Singapore following Malaysia's lead in passing privacy legislations since 2010 (UNCTAD, 2019b). Countries such as Indonesia and Vietnam have already put partial privacy legislation laws in place by virtue of their omnibus e-commerce laws but still lack the depth and scope of a full privacy legislation, while Thailand has taken initial steps in drafting general data protection legislation (UNCTAD, 2019b).

Although ASEAN member states have adopted the ASEAN Framework for Personal Data Protection, cross-border digital trade is still not at an optimal level. More initiatives are needed to address this challenge, since some member states have implemented cross-border data transfer restrictions to address data security issues. Digital entrepreneurs and businesses commonly found navigating digital regulations to be a commonly encountered barrier. They were particularly concerned with data localization regulations that formed a key barrier to seamless trade and which presented unwarranted hurdles in their business operations (Hoppe et al., 2019).

Consumer Protection

There is diversity in the shape and form of consumer protection available throughout the ASEAN region. Some member countries have specific consumer protection laws for online commerce. Those who did not will resolve consumer protection issues through existing laws in areas such as unfair contract terms and competition laws (UNCTAD, 2013). There is still no general guidance for online consumer protection in ASEAN, but the task of investigating issues which arise have been delegated to the ASEAN Committee on Consumer Protection that looks at these issues (UNCTAD, 2013). The e-ASEAN Framework Agreement has prescribed that international norms will be the primary source for the development of e-consumer protection in ASEAN member states (Tanodomdej, 2017). Nevertheless, the protection of e-consumer welfare is far from satisfactory, given the following challenges (Tanodomdej, 2017):

- There is no legal enforcement mechanism at the regional level requiring ASEAN members to implement the missions within the binding and non-binding instruments, despite achieving consensus to do so.
- It lacks a regional redress mechanism—an essential tool for cross-border e-consumer protection.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

- There are still no instruments in ASEAN which address the issue of a harmonized choice of law in e-commerce cases or which offer a mechanism offering cross-border enforcement for e-consumers.

Thus, the development of e-consumer protection in each ASEAN country is entirely discretionary and is predominantly influenced by the perceived economic opportunities in e-commerce (Tanodomdej, 2017). It is extremely challenging for ASEAN to develop a cohesive legal framework to facilitate a uniform e-consumer protection by assimilating countries with diverse development levels.

Cybersecurity & Cybercrime

The digital evolution taking place in ASEAN states is transforming mobile banking systems and e-commerce trading and is accompanied by the rise of cyber linkages. According to recent research, countries in the region are becoming "global hotspots" for suspicious web activities—particularly, locations with vulnerable infrastructure that are at risk of cyberattacks as well as attacks from spam botnets (World Bank, 2019). The vulnerability of the region to such risks could detrimentally impact user confidence and the resilience of the digital economy—thereby impeding the full realization of the region's digital and economic potential (Victor, 2018).

Cybersecurity is essentially a function of several elements—technical, financial, physical, and personnel-related—and an effective cybersecurity agenda must be all-encompassing and multidimensional (World Bank, 2019). Inadequate attention in any of these elements will increase the threat level. A whole range of factors has contributed to the creation of the poor state of cybersecurity in the region. An important factor is due to an under-investment in the 'hard' and 'soft' infrastructure of cybersecurity. Despite ASEAN's high threat level, the average regional expenditure/investment in cybersecurity (0.07 percent) has been below the global average (0.13 percent). Other factors that have contributed to poor cybersecurity in the region include limited threat intelligence sharing, diverging national priorities, increasing interconnectedness, and rapid technological evolution (Victor, 2018). The only member states in the region with an advanced state of cybersecurity regulatory instruments are Malaysia and Singapore while the Philippines and Thailand have already established several regulatory frameworks required to address cybersecurity. Thus, ASEAN as an institution and most of its member states are still in a nascent stage in terms of there being international frameworks beyond ASEAN that could specifically address cybersecurity issues in Southeast Asia (SPI, 2018). Several countries—such as Singapore, Malaysia Thailand, and recently, Indonesia—have developed a specific government agency to manage cybersecurity issues in their respective countries (SPI, 2018).

The focus of the ASEAN region, to date, has been on including cybercrime into existing frameworks. Consequently, the UNCTAD review (2013) had commended ASEAN for its excellent progress towards harmonization, with 8 out of 10 members (except for Cambodia and the Lao People's Democratic Republic) already having enacted legislation that is in alignment with the international model contained in the Council of Europe Convention on Cybercrime. Nevertheless, law-enforcement authorities continue to face challenges in investigating cybercrime and malicious cyber-attacks in the region due to two factors: the motives for the attacks are complex; and most cybercrimes are cross-border operations. In order to successfully combat cybercrime, it is essential for ASEAN to continue their efforts in the harmonization of laws against cybercrime and to step up their commitment to collaboration (AustCyber & Austrade, 2019).

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Intellectual Property

Intellectual property rights (IPR) protection in the e-commerce platform is one of the key areas in which ASEAN will face an uphill task for implementation and enforcement as a single economic unit. Although the ASEAN Framework Agreement on Intellectual Property Cooperation was adopted in 1995 to facilitate ASEAN integration, there are no harmonized substantive rules on IP rights that have been adopted by ASEAN members, including the principle of IP exhaustion (Calboli, 2019). In particular, the inconsistency of national approaches to IP exhaustion—combining a variety of approaches favoring national or international exhaustion, or simply failing to address the issue—may cause impediments to the free movement of goods within ASEAN (Calboli, 2019) as well as impediments to cross-border e-commerce.

Unlike the European Union, ASEAN has neither the competence nor the appropriate legal infrastructure to enforce harmonization among its member states by means of regulations or directives (Jusoh et al., 2019). The current IPR management in ASEAN remains relatively individualistic, in which each state retains sovereignty over the IPR system in their country (Jusoh et al., 2019). This will pose barriers for e-businesses planning to operate in the region in the form of regulatory heterogeneity costs—i.e., costs attributable to the fragmentation of rules. The varying regulations will inevitably hike the cost of regional economic activities, as it compels e-businesses to adapt to different regulatory environments in terms of IPRs (Jusoh et al., 2019). 3 types of costs will be incurred in this respect; namely: legal consultation costs, regulation compliance costs, and conformity assessment costs arising from duplication (Jusoh et al., 2019). These expansion barriers are contrary to the development of a sustainable e-commerce platform and will have a negative impact on Micro and Small and Medium Enterprises operating in the region. Most importantly, it will detrimentally affect the realization of the ASEAN single market and the deeper economic integration of the region.

E-Commerce Taxes

Although the e-commerce sector in Southeast Asia has been growing exponentially during the past six years, the move towards the taxing of digital transactions only began recently (Luo, 2018). But the scope of most of the existing taxation laws is limited to local players and not foreign companies (Lim, 2018a). The current scenario in ASEAN is varied — companies operating across the region are exposed to either different e-commerce tax regimes; or alternatively, no such tax regimes (see Figure 2) (Lim, 2018a). It is apparent that each government in the region is facing challenges in formulating appropriate e-commerce taxation at the national level as dictated by local considerations in view of the diversity of issues faced by the respective states in the region (Lim, 2018a). Given the diverse and uncertain legal environments of the ASEAN nations, implementing new tax regimes will not be easy (Luo, 2018). These barriers (see Figure 3) include (but are not limited to) the following challenges in enforcing e-commerce taxes:

1. Drafting suitable tax regimes for e-commerce;
2. The ‘permanent establishment’ issue due to the borderless nature of e-commerce that allows businesses to participate in multiple transactions with customers in different countries without ever having a physical presence there;
3. The difficulty in enforcing tax collections from suppliers operating outside the jurisdiction of the state where the goods are being received either if there is a lack of trusted third party involved in the tax calculation or there is an absence of a simplified registration system for foreign suppliers;

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

4. Difficulty in categorizing the various types of e-commerce income for taxation purposes; and finally,
5. Without setting a proper tax threshold, there may be a potential slowdown in e-commerce activities, as companies are discouraged from the inconveniences which arise, such as having to file multiple returns for relatively minor activities in other states (Lim, 2018b).

Competition

In the context of competition policy, the ASEAN competition authorities need to consider the nature of competition within that market—i.e., the relationships between all sides of the market, in their assessment of the market power of a firm (CCS, 2018). Generally, four broad categories of barriers to entry vis-à-vis e-commerce platforms have been identified by the Competition Commission of Singapore (CCS), and these include:

1. **The economic advantages** enjoyed by incumbents in terms of economies of scale and scope; and privileged access to essential inputs, technologies or information;
2. **Costs and network effects** that inhibit consumers from switching suppliers;
3. **Legal barriers** in the form of regulatory rules and the arising compliance costs that curtail the number of market participants, tariffs, government licensing requirements, and intellectual property ownership by incumbents; and
4. **The conduct of large incumbent firms** exercising their market power through vertical restrains exemplified by retail Most Favored Nation ("RMFN") clauses that hinders the ability of new businesses to enter, or compete effectively in, the market (CCS, 2018).

In view of the above, nine of the ten ASEAN member states had implemented comprehensive competition regimes within their jurisdictions by 2015—i.e., Indonesia, Singapore, Thailand, Vietnam, Malaysia, Brunei, Myanmar, Laos, and the Philippines. Nevertheless, there are variations between ASEAN member states on how they apply competition law and policies within their jurisdictions; and this is bound to give rise to challenges and burdens to firms that plan to carry out e-commerce activities across ASEAN—particularly in relation to the to the use of vertical restraints by firms operating in online markets (CCS, 2017). Such differences will force businesses to adapt their conduct in accordance with the different approaches adopted in the different territories in which they plan to do business.

In summary, the preceding discussions reveal that the wave of e-commerce activities taking place in individual ASEAN countries are at varying levels—and that they are encountering different types of hurdles and challenges in terms of electronic payment, taxation, logistics, privacy issues, and data and consumer protection. Some of the underlying barriers to an effective harmonized e-commerce legal framework in ASEAN include a lack of capacity building on legal issues surrounding e-commerce among policymakers and users; a lack of coordination between the different governmental authorities involved in e-commerce; a lack of coordination at the regional level on the design and implementation of relevant legislation; and a lack of strong enforcement institutions. It is extremely important that the nations of ASEAN harmonize their approaches and minimize the arising differences to facilitate a smooth transition into a digitalized regional economy which is sustainable and leaves no one behind. To this end, it is essential to develop a "sound legal architecture" for the implementation of the AEC Blueprint 2025 and the fruition of the new economic community (Hsieh & Mercurio, 2019; Sengpunya, 2019). The follow-

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

ing section will consider measures that are needed to ensure that ASEAN is strategically positioned in the global e-commerce platform.

SOLUTIONS AND RECOMMENDATIONS

ASEAN is currently in the early stages of the digital revolution and is poised to become a key digital economy at the global level in view of its current ranking as third in the world in terms of population, sixth in terms of GDP, and fourth in terms of trade value (Hoppe et al., 2018). Although ASEAN's digital economy is lagging at merely 7% of GDP relative to China (16%), Europe (27%), and the US (35%), policymakers in ASEAN can strive together to maximize its digital potential—a projected US$0.8 trillion; and a $1.1 trillion increase in GDP across ASEAN by 2025—through the removal of barriers and make digital integration a reality for all local businesses (Hoppe et al., 2018). The end goal is to ensure that the ASEAN region, as a unit, will always be resilient and relevant—despite global developments at the interface of e-commerce and digitalization of technologies including market monopoly by global giants (Devadason, 2019).

ASEAN needs to upscale its efforts to address the novel challenges it is facing when transitioning into a digital economy. It is highly doubtful that the postcolonial mindset that promulgated the "ASEAN Way" based on "non-interference and consensus-based principles" will suffice, in view of its evolving role in the region ranging from political considerations at its inception to the current economic endeavor to develop a new regional economic order (Hsieh & Mercurio, 2019). In order to effectuate its policies and gain momentum in its development as an ASEAN economic community (AEC) as well as a key digital economy in the world, there is an urgent need to reinvent itself according to the aspirations of the AEC Blueprint 2025, "A Competitive Innovative and Dynamic ASEAN." An effective implementation mechanism is critical to the success of the AEC; and consequently, the said blueprint has assigned the ASEAN Economic Council with the mandate to enforce compliance of all measures—which is a clear departure from the typical ASEAN way (Hsieh & Mercurio, 2019). It is clearly apparent that a significant shift in the ASEAN Way is required. Otherwise, the organization will end up adopting only those policies which satisfy the "lowest common denominator." In decision-making by consensus, members must see eye to eye before ASEAN can move forward on any issue (Leviter, 2010).

The next overarching issue that needs to be addressed by ASEAN is ensuring that in its pursuit to achieve regional prosperity through inter- and intra- e-commerce trade, all policies and laws must be in line with the 2030 Agenda for Sustainable Development. To this end, there have been suggestions for the development of laws and policies, with the following features for e-commerce business:

5. Support minimum trade-offs and maximum benefits in the tripartite strategy involving economics/environment/social strategy;
6. Ensure transparency while carefully considering all options that will protect the economy from ecological degradation and keep it socially viable; and
7. Joint efforts of governments with e-retailers, researchers, and experts for continuous improvement at different levels—i.e., markets, society, governments, sectors, and economies (Oláh et al., 2019; citing Choi, 2013, at p. 6).

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

More importantly, these policies should be backed up by sustainable regulations (Berglund & Svanteson, 2018; citing Macchion et al., 2017, at p. 9). It was recently suggested that trade law can be a vehicle for Sustainable Development Goals (SDGs) since they consist of bottom-up activities encompassing environmental, economic, and social dimensions (Leal-Arcas et al., 2019). This can be done in the ASEAN context by agreeing on preferential trade agreements (PTAs) with environmental and sustainable development chapters on a unilateral, bilateral, or plurilateral basis (Leal-Arcas et al., 2019). Promoting inclusive trade for sustainable development will also require ASEAN to improve both physical and digital connectivity (OECD & WTO, 2017).

As observed in the preceding section, a lack of harmonization of cross-border digital regulations constitutes one of the major barriers to e-commerce trade in the region; and this critical problem is not merely limited to logistics and customs clearance (Devadason, 2019). A pragmatic way to address this problem is to recognize that since the complete harmonization of cross-border digital regulations may not be conceivable in the near future, mutual recognition agreements (MRAs) may be an alternative for creating a single digital market with common rules on e-signatures, cybersecurity, data protection, and privacy laws (Devadason, 2019). New rules are further needed on a regional scale to keep abreast with arising issues; and this requires timely information sharing between member states (e.g., cross-border sharing of data). Lastly, a concerted regional effort is required to propel the development of e-commerce along its next growth trajectory. It will require various measures that essentially require being on top of e-commerce trends ranging from upscaling the dimensions of connectivity to strengthening their legal, physical, and technology infrastructure and improving the purchasing penetration of consumers.

Some of the following measures can be considered for ASEAN to harness the infinite potential of e-commerce:

- Develop an adequate legal and regulatory framework that enables e-commerce stakeholders to mitigate transaction risks, provide transparency, and ensure a level-playing field (UNCTAD, 2017a).
- Ensure the compatibility of each country's national legislation in the areas of e-transactions, consumer protection, data protection, and privacy with that of its trade partners to facilitate cross-border e-commerce. It is also desirable to align such laws with international legal instruments (UNCTAD, 2017b).
- Globalization and expansion in international trade has resulted in increases in the number of re-registration of applications of cross-border intellectual property rights. In response, a coherent and predictable intellectual property protection system throughout ASEAN is needed to ensure that domestic innovations are protected and promoted, as expected by foreign investors, as it is an important consideration for investors when establishing investments and commencing business operations in ASEAN member states (Jusoh et al., 2019).
- Enable the harmonization of cross-border complaints through an agreement between consumer protection regulators in each country, complemented by appropriate investigation and referral tools (UNCTAD, 2013). Furthermore, the ASEAN Committee on Consumer Protection (ACCP) should be accorded with increased powers to investigate, pursue, obtain, and share relevant information and evidence on matters relating to cross-border commercial practices. Or, alternatively, the ACCP should be given the mandate to cooperate with the consumer protection agencies of other ASEAN member states in order to enforce the rights of e-consumers (Tanodomdej, 2017).

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

- ASEAN should strengthen the investigation of cybercrimes and the enforcement of related both national and international laws across borders by stepping up regional cooperation between cybercrime law enforcement agencies. In addition, a common training and resource center needs to be established; in addition to the establishment of 24/7 national points of contact where law enforcement agencies can get help in investigating those crimes (UNCTAD, 2013).
- ASEAN, like the European Union, can consider creating a VAT Digital Single Market Package through a digital online portal—a "one-stop shop," as it were—that constitutes a single electronic registration and payment mechanism in order to reduce the administrative burdens of businesses arising from different Value-Added Tax (VAT) regimes (Cassetti, 2017). Such an effort may improve consumers' and businesses' access to online goods and services within ASEAN.
- ASEAN should consider more ways to improve the adoption of digital payment mechanisms in the region, as doing so would improve the e-commerce ecosystem in the region. The Measures that policymakers may consider include: (a) strengthening consumer protection to build trust in digital payments; (b) improving cross-sectoral coordination in policymaking and regulation, including standard-setting; (c) strengthening digital ID to facilitate the adoption of digital payments; (d) improving monitoring capabilities; (e) promoting interoperability of services; and (f) promoting electronic payments to and from government (World Bank, 2019).
- To facilitate the legal recognition of electronic signatures through the development of an ASEAN mutual recognition agreement, which would detail minimum acceptable standards for electronic signatures and related trust services based on international norms for electronic authentication (UNCTAD, 2013).
- Consideration should be given to the establishment of an effective and efficient regional online dispute resolution scheme for the handling of domain-name disputes (UNCTAD, 2013) to ensure a high level of confidence in the resolution of intellectual property (trademark) disputes arising in the internet.
- To update laws and policies in tandem with the rapid emergence of new issues (such as offshore outsourcing, e-payment, social networks, and cloud computing) has required several countries to amend and redraft legislation (legislation pertaining to privacy and data protection, for instance) (UNCTAD, 2013).
- Ensure a resilient cybersecurity ecosystem in ASEAN by carefully taking into consideration the political, cultural, and technical opportunities and challenges:
    - As a political precondition, it is critical to establish a more coordinated policy framework both at the ASEAN level and at the Member States level;
    - As a cultural precondition, combatting internet piracy and increasing cybersecurity awareness is crucial; and,
    - As a technical precondition, appropriate investment in cybersecurity initiatives is crucial to addressing the ongoing cases of attack patterns and malware (SPI, 2018).

FUTURE RESEARCH DIRECTIONS

In order to harness e-commerce's contributions to sustainable development, it is important to adopt an innovative strategy that is "concerted, holistic, cross-sectoral and multi stakeholder" (UNCTAD, 2017b). Sustainability in e-commerce is increasingly generating interest, as it impacts on the future of this planet.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Future research should explore sustainable e-commerce models or frameworks which can be adopted by businesses and governments alike.

Another area that is of practical utility for present and future e-businesses alike is the assessment of the e-commerce readiness of micro, small, and medium enterprises. It is viable for the diverse ASEAN nations to explore global initiatives such as the *eTrade for All*—launched in July 2016 at UNCTAD's 14th ministerial conference in Nairobi. This dynamic, online platform is an interactive knowledge-sharing tool that has the capacity to provide real-time assistance to ASEAN nations in a manner that capitalizes on existing knowledge and maximizes synergies with partners with a view to strengthening commerce readiness in seven policy areas—namely:

8. **E-commerce assessments,**
9. **ICT infrastructure,**
10. **Trade logistics,** the
11. **Legal and regulatory environment,**
12. **E-payments,**
13. **Skill development,** and the
14. **Financing of e-commerce ventures.**

It enables developing countries and donors to navigate the needed technical and financial support systems to enhance e-commerce and digital trade, keep abreast on trends and best practices, and promote their various initiatives and resources (UNCTAD, 2017b). In addition, it is possible for policymakers to use the UNCTAD B2C E-Commerce Index 2016 group indicators to help make an assessment both of the extent that their economies are e-commerce ready and of what areas are in greatest need of improvement. The Index comprises four readiness indicators:

15. **Internet use penetration**,
16. **Secure servers per million inhabitants,**
17. **Credit card penetration,** and
18. **Postal reliability** (UNCTAD, 2017b).

It is also important to explore appropriate platforms at the regional level that facilitate information sharing and exchanges of best practices between member countries in ASEAN—countries that are at various stages of e-commerce development (UNCTAD, 2013). Institutions of higher learning in these regions can play a role in enabling these endeavors. This may include setting up a regional database documenting and disseminating proven best practices and sharing lessons amongst networks of partners. Particular attention could be given to efficient and effective e-government applications, e-payments, and cloud applications. Financial and human (skills development) resources should also be made accessible for regular regional workshops related to e-commerce and law reform; and a resource database based on the workshop could be made available to all stakeholders (UNCTAD, 2013).

Continuous monitoring and improvement are particularly needed on harmonization in cross-border jurisdiction issues, thereby reducing conflicts and improving cooperation among ASEAN regulators and public law enforcement agencies (UNCTAD, 2017b). Further research and dialogue is needed in order to better understand the implications of e-commerce for sustainable development and to recognize the needs of developing countries in their efforts to make the most of e-commerce opportunities. ASEAN

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

can utilize several recognized international fora for multi-stakeholder dialogue, as they provide a suitable neutral platform for exchanging information, establishing contacts, and voicing concerns. Such fora would ideally include the UNCTAD Intergovernmental Group of Experts on E-commerce and Digital Economy, the UNCTAD E-Commerce Week, the UNCTAD E-Trade for All Initiative, the World Summit on the Information Society Forum, various OECD bodies, and the WTO Global Aid for Trade Review (UNCTAD, 2017b). Future research should monitor ongoing ASEAN initiatives with a view to obtaining better data for feedback and continuous improvement. This will facilitate more comprehensive assessments of the various aspects of e-commerce readiness and will help to understand better the impact of government strategies, policies, rules, and regulations (UNCTAD, 2017b).

Finally, several emerging technologies and the Fourth Industrial Revolution are expected to impact global e-commerce. ASEAN, too (in many of the Member State economies), is witnessing the digital ecosystem's rapid development of strong support for e-commerce. More and more e-commerce firms are tapping into new technologies such as cloud computing, big data analytics, the Internet of Things (IoT), artificial intelligence (AI), machine learning (ML), and blockchain technology in order to transform their e-businesses. More research is needed in order to understand the implications of these technologies and to determine whether appropriate legal responses (in the form of regulatory amendments or new laws) might be needed (ESCAP & ADB, 2018).

CONCLUSION

The rapid growth of e-commerce and digital technologies can have transformative effects on the economy and development prospects of the member nations in the Association of Southeast Asian Nations (ASEAN) region. This is contingent upon the ASEAN nations' achievement of a consensus on the appropriate pathway for leveraging information and communication technologies (ICTs) as tools for regional integration—so that the aspirations of the AEC Blueprint 2025 for "A Competitive Innovative and Dynamic ASEAN" can be achieved. It is inevitable that the expansion of the digital economy will affect all aspects of business activities. Thus, it is timely for ASEAN as a region to consider how regional policies and laws can help harness e-commerce for sustainable development.

This chapter provides an overview of e-commerce developments in the region and then analyzed the e-commerce readiness of ASEAN nations by reviewing the current regional initiatives and arising regulatory challenges in the ASEAN e-Commerce Sector. It can be concluded that most nations in the region have yet to realize their full e-commerce potential despite various regional initiatives. There are various impediments—i.e., macro challenges, consumer-oriented challenges, and organizational-level challenges—that the respective member states as well as the businesses and consumers therein must overcome before the full benefits of e-commerce can be tapped. The member states of the ASEAN Economic Community need to jointly facilitate a sustainable digital economy, including the creation of a new cross-border e-commerce framework. In order to harness the full potential of e-commerce, it is crucial not only to have access to affordable ICT infrastructure and services combined with effective logistics and payment systems but also to foster the development of trust among users—such as governments, businesses, and consumers. The effective and timely (1) enactment—and (2) enforcement—of harmonized legislation in a way that promotes regional integration are critical steps in this context. The work is never-ending, because the wheels of legislative process are not able to keep pace with the rapidly

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

evolving nature of the technologies. Thus, it is important both to continuously monitor the progress made and to identify areas that need further work and revision.

In conclusion, there is a critical need for a revitalized governance regime on the part of the 10 member states with a view to organizing and maintaining e-commerce sectorial cooperation through an efficient regional trade mechanism. This means that an appropriate sustainable model for e-trade must be developed for collaboration utilizing an adaptive and participatory management approach geared to addressing e-commerce concerns that arise at the national, international, and regional levels from time to time. The ASEAN member states also need to be cognizant of the fact that the ongoing revolutionary changes due to digitalization in the region will inevitably affect their capacity to achieve sustainable development. Since the common denominator that underlies all the regional instruments is sustainable development, there is a need for more efficient mechanisms that facilitate cooperation, coordination, and synergy at the national, international, and regional (including sub-regional) levels in order for those e-commerce laws which have already been successfully harmonized to be implemented.

ABSTRACT

The development of e-commerce business in Indonesia is very rapid. The rapid development of e-commerce in Indonesia will make Indonesia the largest digital economy in Southeast Asia in 2020. However, there are several obstacles, one of which is the provision of a trusted e-commerce database. Data has an important element in development in developing an e-commerce business in Indonesia. As the National Statistics Organizations, BPS Statistics Indonesia was pushed to collect the e-commerce data. BPS has developed several methods of collection e-commerce data using e-commerce survey and crawling technique in 2018 but still has a weakness. As a comparative study, there are several countries of G-20 that have high development in e-commerce and associate themselves as BRICS countries. With SWOT Analysis and Maturity Assessment, this study wants to analyze strength, weakness, opportunity, and thread, also measure the maturity from each method of collection used. Based on the result, Indonesia has better maturity in technology implemented, but worse regulation and people cooperation.

INTRODUCTION

The growth of e-commerce business in developing countries has been increased rapidly, including in Indonesia as one of the developing countries in South-east Asia. According to research by Google and Temasek regarding "e-Conomy SEA 2018", GMV (Gross Merchandise Value) in e-commerce sector in South-east Asia reached 23 Billion US Dollar equal to 333 Trillion ID Rupiah in 2018. This value growth indicates growth of 60 percent compared to last year. For Indonesia, GMV in e-commerce sector reached 12.2 Billion US Dollar equal to 176 Trillion ID Rupiah in 2018.

Indonesian e-commerce contributes 1 US Dollar for each 2 US Dollar spent in South-east Asia. Indonesian e-commerce contributes 50 percent of online shopping transactions in these regions. This value is the greatest in South-east Asia. In 2025, Indonesia's GMV value is predicted to increase 334,43 percent by 53 Billion US Dollar equal to 768 Trillion ID Rupiah.

As the largest e-commerce market in Southeast Asia, Indonesia has transformed in this changing digital era. In 2016, the Indonesian e-commerce Association (idEA) noted that around 24.74 million Indonesians bought products via online or around 9.47 percent of the population of Indonesia. Growth in the value of electronic commerce (e-commerce) in Indonesia reached 78 percent. The growth rate is the highest in the world.

Based on the latest data from Bank Indonesia (BI) in 2016, e-commerce transactions reached 75 Trillion ID Rupiah per year. That value includes e-commerce transactions not a market place. While over the past 10 years, the average growth in the value of e-commerce transactions has reached 17 percent, so that in 2018, the value of e-commerce transactions is estimated to be around 102 Trillion ID Rupiah. If you receive 10 percent VAT, then the potential tax revenue is already 10 Trillion ID Rupiah per year. The amount is very small towards Indonesia's GDP (Gross Domestic Product), which is assumed to reach 13,588 Trillion ID Rupiah. The contribution of e-commerce to the GDP is only 0.75% or around 1.34% of total household consumption.

According to BPS-Statistics Indonesia in 2016, the digital economy sector was able to contribute 7.3 percent of the total GDP with a value of Rp 225 trillion, growing 10 percent annually. The driving factor for the high contribution of the digital economic sector is supported by information and communication technology, especially the internet. According to a survey conducted by the Indonesian Internet Service Provider Association (APJII), in 2017 internet users in Indonesia increased to 143.26 million people and the use of mobile devices for internet surfing reached 44.16 percent. With the increasing number of internet users, it will affect the number of e-commerce agents in Indonesia. Since 2017 the number of e-commerce agents has been 81.5 million or around 30.87 percent of Indonesia's population. This number is predicted to increase until 2022 by 241.5 million users.

Based on e-commerce user side, when viewed from the label generation of their birth year, namely: X generation (1960 - 1980), Y generation (1980 - 1995), Z generation (1995 - 2010), alpha generation (> 2010). Based on data from the STATISTA, the biggest percentage is Y generation, which is 41.58 percent. Meanwhile, Z generation has also a percentage that is not much different from Y generation, which is 34.41 percent. The rest of it is X generation by 23.7 percent. Y generation dominates with almost half of e-commerce users in Indonesia. When viewed from the characteristics of gender, most e-commerce users are men (around 52.3 percent), while the rest are women (47.7 percent). When viewed from the level of income, the e-commerce user group is mostly found in the high-income population with a percentage of 34.83 percent. This number is not much different from middle-income e-commerce users, which is 33.7 percent.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Based on data of the Bank of Indonesia, the value of e-commerce marketplace transactions in Indonesia in July 2019 is estimated to reach 23.7 Trillion ID Rupiah. This value grew quite dramatically, in the amount of 124.5% (Years on Years). The frequency of transactions that occurred was 52.1 million transactions with a growth value of 73.2% (Years on Years). Product categories with the largest transaction value in the e-commerce marketplace in July 2019 are fashion (21.8%), cellphones & accessories (19.3%), and personal care & cosmetics (11.5%). Then, E-commerce transactions in July 2019 are still dominated by buyers and sellers in Java, respectively 77.6% and 88.2%.

The rapid development of e-commerce in Indonesia will make Indonesia the largest digital economy in Southeast Asia in 2020. To realize this achievement, the e-commerce roadmap in Indonesia is regulated in presidential regulation number 74 of 2017. In carrying out the roadmap, there are several principles related to e-commerce roadmap management in Indonesia. Among them are openness for all parties, legal certainty and protection, increasing human resources of e-commerce agents, as well as prioritizing and protecting national interests.

Even though the development of e-commerce is going pretty fast, there are still obstacles that interfere with the roadmap of Indonesia becoming the largest digital country in ASEAN in 2020. The obstacle relates to the availability of a reliable e-commerce database. In addition, there is not clear who recorded and what was recorded. This is because there is no mechanism for collecting and sharing data between ministries / institutions from and to e-commerce agents. Obstacles to data collection and sharing are related to conflicts of interest between Ministries / Institutions. In addition, there is also no legal protection and harmonization of regulations related to e-commerce data collection.

As the response for government demands encourages BPS as National Statistics Office to collect e-commerce data. BPS collected e-commerce data in 2018, although not all agents in this industry wanted to share their data. This weakness is a classic problem in data collection in Indonesia. E-commerce agents are still unwilling to provide real data on their income. This is suspected because education about the importance of e-commerce data to economics and statistics laws is still minimal.

The rapid development of e-commerce does not only happen in Indonesia but also in other countries. The progress of e-commerce business in a country that is classified as a developed country like the United States is in line with the completeness of e-commerce data owned by that country. However, for developing countries, the process of collecting e-commerce data independently and completely becomes a big challenge.

One of developing country association that also has great potential in the e-commerce business is incorporated in BRICS (Brazil, Russia, India, China, South Africa). As a large economic association for developing countries, BRICS is an appropriate picture in representing economic conditions including e-commerce in developing countries. BRICS have also collected e-commerce data in their countries by their own collection method. The collection methods carried out by each country have advantages and disadvantages. Some of the strengths and weaknesses of their collection methods are very related to the completeness and accuracy, privacy and data security, easy access, and technological support used.

The purpose of this research is to conduct a comparative study on the collection of e-commerce data between Indonesia and BRICS countries that has opportunities and challenges to be applied in Indonesia. By conducting comparative studies related to e-commerce data collection methods in Indonesia and BRICS countries, It is hoped that an effective and efficient method of collecting data will be obtained and can provide better e-commerce data.

LITERATURE REVIEW

E-Commerce

E-commerce (Electronic Commerce) is trade in products or services that refer to technologies such as cellular commerce, electronic funds transfer, internet marketing, online transaction processing, and Electronic Data Interchange (EDI). The use of a comprehensive Information and Communication Technology (ICT) system and global standard network infrastructure is indispensable in e-commerce practices (Turban et al 2015). E-commerce can also be referred to as a modern business methodology that answers the needs of business organizations, vendors, and customers to reduce costs and improve the quality of goods and services while increasing the speed of delivery (Vadwala & Vadwala, 2017). The major different classifies of e-commerce are (Nanehkaran, 2013):

1. *Business to Business* (B2B) *e-commerce*

This type has a focus on providing products from one business to another. There is an e-commerce platform that specifically targets companies and works in a closed environment. One of the e-commerce business models in Indonesia is MBiz (2015), a subsidiary of the Lippo Group. MBiz provides integrated web-based procurement of goods and services for companies and government institutions. Products offered by MBiz include technology products, office equipment, industrial equipment, to retail goods.

2. *Business to Consumer* (B2C) *e-commerce*

This model sells services / products to individuals, but businesses run on an online platform compared to physical stores. One of the e-commerce business models in Indonesia is Blibli. Evaluation of e-commerce reputation is generally based on consumer trust which is formed from several fagents, including product guarantee, service quality, to the effectiveness of the system presented.

3. *Consumer to Consumer* (C2C) *e-commerce*

This model is divided into two models, they are marketplace and classifieds/P2P. Consumer can sells or buys to another consumer. The examples of this classification in Indonesia are Bukalapak, Shopee, Tokopedia, etc. Besides through marketplace, trading activities can also carried out directly between individuals without including from third parties. Some examples of platforms with this business model are OLX, Kaskus, through Instagram.

4. *Customer to Business* (C2B) *e-commerce*

This type is sells services/products to business or it is a business model when end users create products and services that are used by business and institutions.

5. *Mobile Commerce* (M-C)

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

This type is allow to use access to internet and shopping in i without needing to find place to plug in. Mobile commerce transaction continue to improve and the phrase includes the purchase and sale of a wide range of products and services, online banking, bill payment, information delivery and so on.

The application of e-commerce has several advantages and disadvantages. For customers, the existence of e-commerce will facilitate them in meeting their needs. Customers becomes more flexible when buying their needs, they don't need to wait in line, and can do transactions anywhere. Besides that, e-commerce also makes customers easy to get global offers, so they can compare the prices from various sources. Through e-commerce, customers will easily meet their needs with minimum transaction costs. While for providers, the existence of e-commerce will make them easier to conduct business. They will easily offer better customer service and fast communication if customers need it. Besides that, providers are potentially to get new customers through global visibility without traditional intermediaries who take away margins.

There are several disadvantages as well as a challenge of the existence of e-commerce. First challenge is about security. When customers use e-commerce to buy something, usually they are required to provide personal data. This encourages bad people to steal and misuse customer's personal data. Then, as a customer sometimes hesitate in choosing a provider because of the possibility of bogus and fraudulent firm. Especially there is no guarantee for product quality. After that, security is also pursue to be a main problem in e-commerce. Then, form social side, e-commerce has not any contacts and relationships with other persons and loss our social contacts. While for provider, they need to provide higher logistics cost because goods have to be sent to the customer's location. Then provider will have difficulty if there are anonime customers.

E-Commerce Policy in Indonesia

There are some rules related to e-commerce in Indonesia. Through the Economic Policy Package Volume XIV published on November 10, 2016, the government provides incentives for ecommerce startups in the form of tax breaks, namely:

1. Tax reduction for local investors who invest in startup companies.
2. Simplification of permit procedures for taxation for e-commerce startups whose turnover is below Rp. 4.8 billion per year through the implementation of PP No. 44 of 2013 concerning income tax on income from businesses received or obtained by taxpayers who have a certain gross circulation, so the ecommerce startup is subject to a final tax of 1%.
3. Providing equal treatment of taxation between foreign and domestic ecommerce entrepreneurs. Foreign business agents providing services and / or content in Indonesia are required to comply with all tax requirements.

And then, the Economic Policy Package XIV: e-commerce Road Map. In the Perpres on the e-commerce Roadmap that will soon be published, there are 8 aspects of regulation, namely:

1. **Funding**, in the form of KUR for tenant platform developers, grants for startup companion business incubators, USO funding for digital MSMEs and e-commerce platform startups, angel capital, seed capital from the adoptive father, crowdfunding, and DNI opening.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. **Taxation**, in the form of tax reduction for local investors who invest in startups, simplification of tax permits/procedures for e-commerce startups whose turnover is below Rp 4.8 Billion/year, and equality of tax treatment among e-commerce entrepreneurs.
3. **Consumer protection**, in the form of government regulations on trade transactions through electronic systems, regulatory harmonization; trade payment systems and government purchases of goods / services through e-commerce; and development of a national payment gateway in stages.
4. **Education and HR**, in the form of e-commerce awareness campaign; national incubator program; e-commerce curriculum; and e-commerce education to consumers, agents and law enforcement.
5. **Logistics**, in the form of utilization of the National Logistics System (Sislognas), strengthening local / national courier companies, development of MSME logistics data transfer, and logistics development from villages to cities.
6. **Communication infrastructure** through the development of broadband networks.
7. **Cyber security**, in the form of compilation of a national supervision system model in e-commerce transactions, public awareness about cyber crime, and preparation of SOP related to consumer data storage, certification for consumer data security.
8. **Forming Implementing Management** by monitoring and **evaluating** the implementation of e-commerce roadmaps.

The e-commerce Roadmap was further refined by the presidential regulation of Indonesian Republic Number 74 in 2017. The improvement of this regulation is intended to provide the direct strategic and guidance to accelerate the implementation of e-commerce Roadmap. According to the Presidential Regulation Number 74 of 2017 in article 3 paragraph 3, this regulation has a function being a reference for the government and stakeholders. For government, it is as a reference for establishing sectoral policies and follow-up plans while it is as a reference in carrying out e-commerce activities for stakeholders.

By applying the principles of the e-commerce Roadmap that is legal certainty and legal protection, openness for all parties, increasing the competence of e-commerce human resources, and prioritizing and protecting national interests, MSMEs and start-up companies, it is expected to be able to use e-commerce maps that are possessed high economic potential for Indonesia and has become one of the backbones of the national economy. This e-commerce Road Map provides facilitation which translates into 62 action plans that support and facilitate the development of a digital economic system.

SWOT Analysis

SWOT analysis is a tool or technique that can be used for strategic planning and strategic management in organizations. There are four components in SWOT analysis, they are strengths, weaknesses, opportunities, and threats (GÜREL and TAT, 2017). This components is used to evaluate involved in an organization, a plan, a project, a person or a business activity. Through SWOT analysis, will be known how strengths are able to take the opportunities that exist and deal with the existing threats. Besides that, SWOT analysis is expected to be able to overcome weaknesses that prevent profits and create a new threat. In general, SWOT analysis is divided into two categories, internal and external factor. Internal factor consists of strengths and weaknesses, while external fagents consist of opportunities and threats. It gathers data about internal issues and external issues then analyzes the data to inform future goal, decisions, and strategies.

Maturity Assessment

Maturity refers to the ability of an organization to reliably perform. Maturity is measured by organizational readiness and capability expressed through People, Process, Data, Technology, and Measurement. Organizational maturity is directly related to the ability to carry out strategies in achieving the organization's vision and mission. Therefore, there is a need to assess organizational maturity as input to realistic plans and as a guide to achieving maturity to the desired level. Organizations that have good maturity are able to adapt and mitigate any obstacles encountered.

Maturity assessment involves the organization's assessment of specified criteria and rating schemes. A rating scale that is often defined in the range of 1–5 which shows an increase in the level of maturity is as follows:

1. **Performed** — Activities are performed in an ad hoc manner.
2. **Managed** — Activities are performed with managed processes.
3. **Defined** — Activities are defined so the organization can perform them in a uniform manner.
4. **Measured** — Oversight is given to the performed activities to ensure performance and uniformity.
5. **Optimized** — Continuous improvement processes are in place on the defined and measured processes.

METHODOLOGY

Method of Collecting Data

The data collection method that was used in this study is obtained from the guidelines of e-commerce survey in statistics Indonesia and other literatures. After that, we compared data collection method from selected countries of G-20 members (BRIICS countries). The literature review conducted sourced from journals and research reports in the selected countries. Subject collected related to:

1) Support and source data on agents and users of e-commerce
2) Data collection methods used
3) Limitations and obstacles experienced

Method of Analysis

SWOT Analysis

From a number of e-commerce data collection methods carried out by several countries that have collected from the literature, there are certainly several advantages and disadvantages of each. The strengths and weaknesses are analyzed using Strength, Weakness, Opportunity, and Threat (SWOT) techniques. In the future, the results of this SWOT analysis will be used in designing the e-commerce data collection methods that are able to accommodate all the strengths and weaknesses. It also see the opportunities and threats of each data collection method related to collection techniques that are appropriate for Indonesia.

Maturity Assessment

There are several indicators that was used to compare maturity among Indonesia and BRIICS countries. The indicators was adapt and adopt from EITBOK Maturity Assessment, including: People (Society Behaviour), Process (Ease of Access), Data (Completeness Data, Privacy and Security), Technology, dan Measurement (Regulations).

RESULT AND DISCUSSION

Indonesia's E-Commerce Data Collecting Method

As a National Statistics Office, e-commerce data is collected by BPS-Statistics Indonesia. Unfortunately, the data collection of e-commerce had several problems, such as only 20 e-commerce companies gave their data to BPS. Moreover, the data given to BPS were only the trade transactions data, although BPS wanted to record foreign and domestic investment data of those 20 e-commerce companies. From these issues, the Chief Statistician of BPS-Statistics Indonesia, Suharyanto said that his agency would classify e-commerce in several categories, such as marketplace, transportation, logistics, and payment. E-commerce companies' data in Indonesia can actually be used for many things. Aside from being a database for controlling imports of consumer goods, the data is also useful as a basis for better policymaking.

BPS has also developed a collection method through E-commerce Survey using CAPI (Computer Assisted Personal Interviewing) and PAPI (Paper Assisted Personal Interviewing). The benefit of using CAPI is e-commerce trade transactions data will be collected faster and more efficient. BPS also uses an alternative method of collecting e-commerce data by using Crawling Technique. This method is calculating the sales turnover of e-commerce products through websites. This method is commonly used in some international survey institutions engaged in the digital economy (Yudhistira, 2018).

E-Commerce Survey

Sample

This survey covered 34 provinces by listing 3504 census blocks. The unit under study was a business unit with a sample framework for the results of the 2016 Economic Census. The listing procedure was done by listing each census building in one census block as well as conducting e-commerce data collection for the business as e-commerce agents that has visited. Listing was done using CAPI in 29 provinces, and 5 provinces using PAPI.

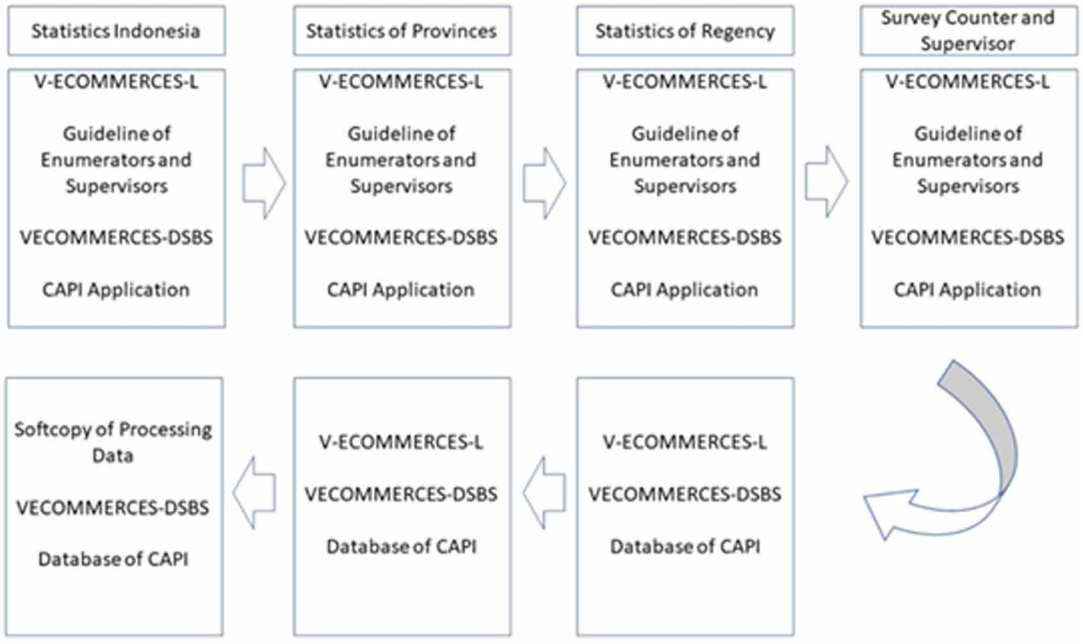
Timeline

E-commerce data collection in Indonesia was being carried out by BPS. Data from 34 Provinces had just been collected at the end of July 2019, until now it is still in the processing stage. It is likely that an e-commerce survey will be released by BPS at the end of 2020.

Following is the scheme of e-commerce survey of BPS-Statistics Indonesia:

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. The business process of data collection of e-commerce



Crawling Technique

Crawling technique is a technique used to collect information on a web automatically using keywords provided by the user. The crawler is a program that uses a certain algorithm to scan web pages. Crawling techniques are only carried out by the BPS Headquarters using Big Data with coverage throughout Indonesia.

The overview of e-commerce data collection technique has been performed by several developing countries that belong to BRICS:

BRICS Countries

China's E-Commerce Data Collecting Method

The development of information technology and economic globalization called e-commerce makes economic growth in the country of China increasingly developed. China is known as one of the developing countries with the largest number of internet users in the world above 802 million. There are several renowned e-commerce companies in China, including Amazon, Alibaba, e-bay, JD.com and Taobao as B2C and C2C companies that dominate the e-commerce market in China. The successful result of the e-commerce company is due to the trusted e-business model that offered the privacy and security of user's network and presence the state of institutions. It also presents the guarantee of e-commerce business security.

The rapid development of e-commerce was obtained from e-commerce data in China. The e-commerce data collection method were divided into two methods, they are a retail survey conducted on several

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

large e-commerce companies and SWOT analysis of cross-border e-commerce in China in 2017. The result from survey retail showed that e-commerce users came from 62 percent in population from the age above 25 to 44 years. This increasing number of internet users and e-commerce market in China caused the value of China's GDP that rose into $15.543.710 in 2018.

Brazil's E-Commerce Data Collecting Method

Brazil is known as an economic market users with the fifth largest economy where started to use e-commerce since 2011. It was representing 42 percent of e-commerce users in Latin America with the internet user above 150 million. Most of its online orders categories are fashion, accessories, cosmetics and appliances. It knows how to get potential customers with the right product at the right time. Unfortunately, the official data from Brazil are still unavailable in the public government. However, some researchers have begun to study about SWOT analysis. Some studies include the development of business management for shipbuilding in Santa Carina in 2018 and the method of storing/shipping goods in general in 2019.

Russia's E-Commerce Data Collecting Method

Russia doesn't have any definition and formal statistics in e-commerce indicator. Russia's National Statistics Organization don't consider cross border e-commerce. Between association and e-commerce agents still use different numbers and data. Even the Ministry of Industry and Trade related to trade data still depend on market consultations.

India's E-Commerce Data Collecting Method

Based on the metadata of Ministry of Statistics and Implementation Program, the official statistics database of e-commerce in India is still not available. The Equity Brand Association in India has published B2C (business to consumer) as development of draft e-commerce national policy in India. The size of B2B (Business to Business) in India has reported in news and articles based consultant research. According to the result analysis, ratio between B2B and B2C in 2015 was used to estimate the total of e-commerce in 2017. Until now, the government is still focusing on developing of classification code for e-commerce.

South Africa's E-Commerce Data Collecting Method

South Africa still has the same problem with Russia and India, which is the availability of official statistics database off e-commerce. As an effort to produce e-commerce data, South Africa still uses adjustment based on result of retail trade or retail business survey that using 2800 companies. From the sample grouped by type of transaction and the type of business, we can estimate the number of e-commerce companies and including their characteristics.

SWOT Analysis Result

Based on information from the data collection methods that have been obtained for Indonesia and the BRICS Country, SWOT Analysis can be made as follows:

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

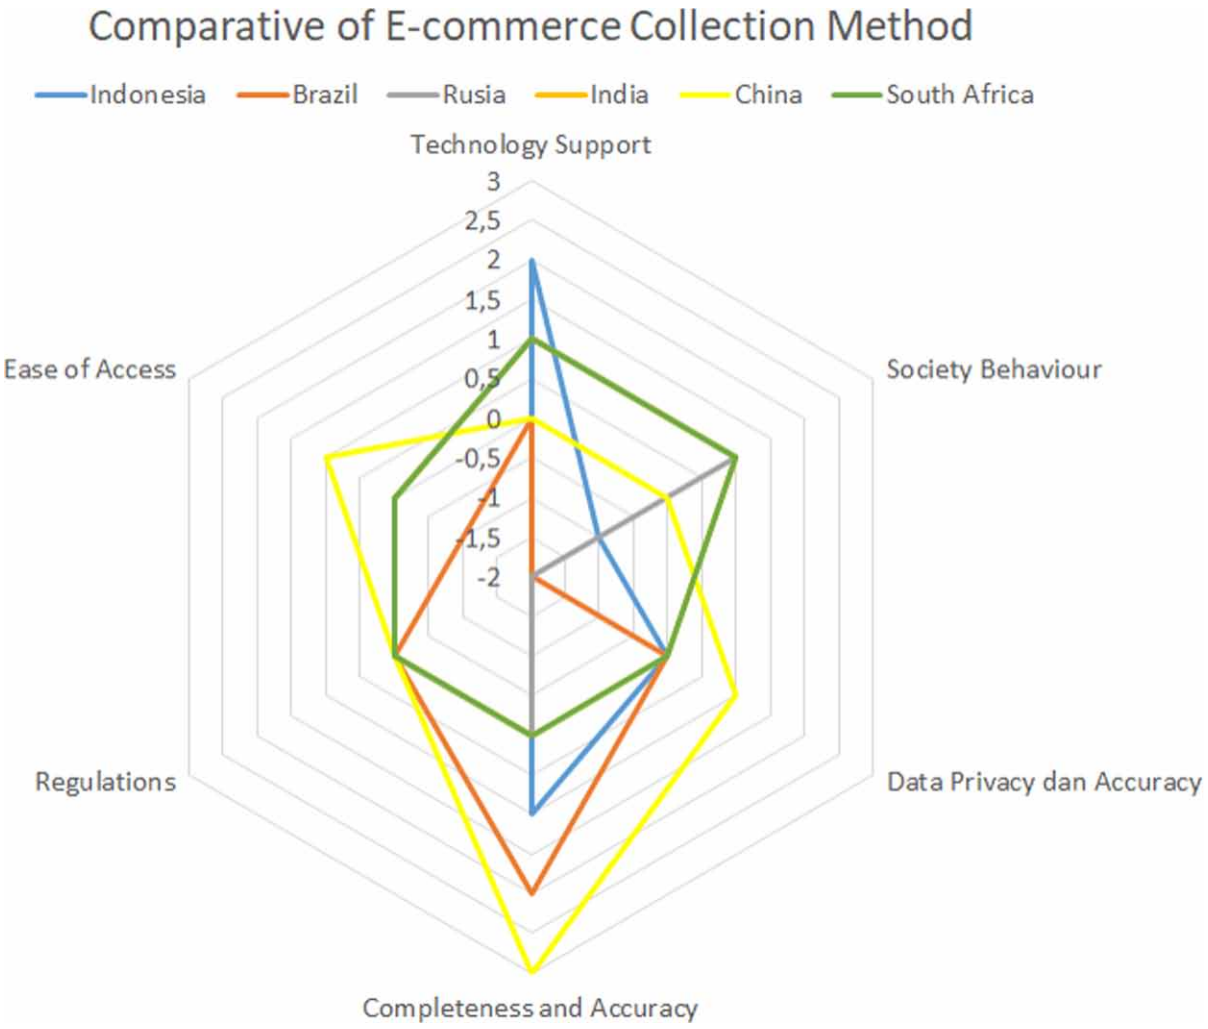
Table 1. SWOT Analysis Results

Country	Strength	Weakness	Opportunity	Threat
Indonesia	- Utilizing CAPI as a data acquisition tool **(Technology Support)** - Using crawling techniques from several e-commerce websites **(Technology support)**	- Not harmonized regulations **(Regulation)** - There are weak laws and regulations **(Regulation)** - Official e-commerce database is still not available in National Statistics Office **(Technology Support)**	- Large market share **(Ease of Access)** - data collected can be very diverse **(Ease of Access)** - Has a lot of cross border e-commerce transactions **(Completeness and Accuracy)**	- Not cooperative Respondent **(Society Behaviour)** - Wide area coverage **(Ease of access)** - Not cooperative e-commerce players **(Ease of access)** -
China	- A large capital data accumulation **(Completeness and Accuracy)** - High efficient fulfillment network strategy and databases **(Technology Support)** - Accumulated media resources **(Ease of access)** - Cross-border shopping business and data preparation **(Completeness and Accuracy)**	- Incomparable advantage of users data in each area/district **(Completeness and Accuracy)** - Slow localization process for summarizing local customer data **(Technology support)** - Different attitudes to email the e-commerce marketing promotion **(Technology Support)**	- The future big data trend from C2C and B2C companies **(Completeness and Accuracy)** - Many statistical tools that can be used to analyze the e-commerce product in each company **(Technology Support)**	- The implementation of cross-border business became threatened of the security in individual data, fraud and strange competitors **(Data privacy and Security)**
Brazil	- Nationalization studies of product in e-commerce **(Completeness and Accuracy)** - Share knowledge through personal interaction **(Data Privacy and Security)** - Represent the largest e-commerce market in Latin America **(Completeness and Accuracy)** - Competitive prices and proliferation of payment method which help the e-commerce growth **(Regulations)**	- The using of e-commerce data was not come from NSO official data **(Data Privacy and Security)** - Brazil has cultural need to try before buying and it affects the rate of e-commerce **(Society Behaviour)** - Most of the products are attractive to females only **(Society Behaviour)** - The worst prepared nation to adopt cloud technology because of its week legislation against cybercrime **(Technology Support)**	- Corporates are experiencing high levels of risk and will be looking out for structured finance deals that provide an opening for e-commerce data **(Ease of Access)** - E-bit is going to enhance trust in internet shopping by publishing on its website the results of evaluation of people who bought online **(Technology Support)** - Brazil's federal government is creating a national plan to provide cheap broadband internet access **(Society Behavior)**	- The trade war between the US and China impact on Brazilian's e-commerce data, so that Brazil has a hard time for having its own data **(Regulations)** - The growth of e-commerce id slowing and declining **(Society Behaviour)** - Increased fraudulent activity **(Data Privacy and Security)** - E-commerce shopper penetration is lower than developed nations **(Society Behaviour)**
Rusia	- It has a large number of e-commerce users **(Society Behaviour)**	- In providing e-commerce data, it still uses data from market consultants and there is no official data from NSO in that country. **(Data Privacy and Security)**	- Development to carry out standardized measurements of the market value and characteristics of e-commerce in the country. **(Technology Support)**	- There are no officially e-commerce data collection by NSO. The collection was done by an Outside Organization which can endanger the country **(Data Privacy and Security)**
India	- The country with a large number of e-commerce users **(Society Behaviour)**	- Official e-commerce database still not available **(Technology Support)**	- Development of special e-commerce classification codes and preparation for conducting e-commerce surveys for e-commerce users **(Technology Support)**	- There is no implementation of e-commerce data collection in accordance with market conditions **(Technology Support)**
South Africa	- The country with a large number of e-commerce users **(Society Behaviour)**	- Official e-commerce database still not available **(Technology Support)**	- There is an opportunity to conduct e-commerce surveys **(Technology Support)**	- Still using adjustment numbers that making not reliable data and not relevant to existing market conditions **(Technology Support)**

Maturity Assessment Result

This is Maturity Assessment for each countries of e-commerce data collection:

Figure 2. Comparative of E-Commerce Collection Method



Based on figure 2, China has high score of maturity assessment in almost every aspect except regulations. On the other side, Brazil has the lowest score of maturity assessment in society behaviour. Many Brazilians don't like buy goods from e-commerce platform. But, Brazil has high score on the regulation aspect. Then, Russia has weak score in data privacy and security of e-commerce agents because the e-commerce data is collected from Non Government Organization. The data from NGO has risk of data trading. India and South Africa have similar score of maturity assessment. They are developing e-commerce survey because they have big users of e-commerce. The maturity of e-commerce data collection in Indonesia, has highest score in technology, but weakest in regulation.

EBSCOhost - printed on 2/8/2023 2:15 PM via . All use subject to https://www.ebsco.com/terms-of-use

Based on the Figure 2, although Indonesia e-commerce has high score especially on Technology. Based on Global Innovation Index, Indonesia has a score of 29.8 or 85th rank of 129 countries. In the ASEAN region, Indonesia innovation's rank is the second lowest position. Indonesia Innovation Index decreases from 32 (2013) to 29.8 (2019). From that data, Indonesia need allocate the budget to improve the information communication technology in the era industry 4.0 right now.

We consider that Indonesia has a big e-commerce data transaction. However, the real problem that we faced as being researcher are the availability and reliability of e-commerce data. From the availability side, there are some problems such as weak regulation and incorporative respondent from e-commerce corporate. While, from the reliability of e-commerce data is still not being official statistics at National Statistics Office of Indonesia. Thus, the data consumer couldn't use the e-commerce data for their researches and public policies. Both of these e-commerce problems are correlated to the activity for data collection.

CONCLUSION

Statistics Indonesia have been collecting the e-commerce data using crawling technique and e-commerce survey in 2019. On the other hand, China has developed e-commerce data collection since 2003. The other countries are similar with Indonesia, they are still trying to develop the method of e-commerce data collection. Indonesia always hope for having the opportunity to grow-up on providing the sustainable data collection for e-commerce and deploy the chance on e-commerce data serving.

This chapter has some weakness such as some information about e-commerce in Indonesia in details. However, this chapter contributes about the e-commerce in Indonesia as a whole. This chapter has used new measurement about e-commerce quality comparation among BRIICS countries.
