KEY TERMS AND DEFINITIONS

Employment Loss: A major consequence of discrimination in the workplace.

Epe General Hospital: A secondary level hospital in Epe local government area. The hospital has a screening center for HIV. Once a person's blood tests positive for HIV, the individual is referred to Nigeria Institute of Medical Research, Lagos Mainland LGA, Lagos.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Epe Local Government Area (LGA): A rural riverine area as at 2005 but is now considered an urban setting. It has a high HIV prevalence rate, which was 6.9% in 1999 but has declined to 2.7% in 2010.

Lagos Mainland Local Government Area (LGA): An urban setting located at the metropolis of Lagos State. It harbors areas that drive HIV infection. The HIV prevalence rate is not known.

Nigeria Institute of Medical Research: One of the popular centers for the National Anti-Retroviral Therapy (ART) Programme in Nigeria. The institute assisted in identifying PLHIV.

Sero-Positive Status: A state of being infected by Human Immunodeficiency Virus (HIV).

This research was previously published in Human Rights, Public Values, and Leadership in Healthcare Policy; pages 22-47, copyright year 2019 by Medical Information Science Reference (an imprint of IGI Global).

Chapter 65
Working With Lesbian, Gay, Bisexual, and Transgender People in Care Relationships

Gabriel Aleksandrs
Carers Victoria, Australia

ABSTRACT

This chapter details some key considerations for health and human services professionals working with lesbian, gay, bisexual, and transgender (LGBT) people in care relationships. Reflecting on the impacts of stigma and discrimination as well as the social, cultural, and political contexts of LGBT communities and carers, this chapter will explore some of ways these factors (as well as heterosexist and cis-genderist assumptions about families and partners) impact the identification, support, and recognition of LGBT people in care relationships. Finally, this chapter will recommend strategies to reduce poor mental health and wellbeing outcomes among people in care relationships where one or all people involved are LGBT, and explore some key actions that may assist health and human services better support and include LGBT people in care relationships.

INTRODUCTION

Research on the physical and mental health of lesbian, gay, bisexual and transgender (LGBT) populations has identified that LGBT people face unique hardships and obstacles to wellbeing. These can include experiences of physical and mental abuse, persecution or economic disadvantage, and can occur within a range of public life domains such as employment, education, criminal-justice law and relationship recognition. These hardships can be directly linked to negative discriminatory societal responses to diversity of sexual orientation, gender identity or expression and include exclusion or discrimination in personal spheres, such as within significant interpersonal relationships (Rosenstraich, 2013; Moleiro & Pinto, 2015).

For LGBT people in care relationships, intersections might arise between these hardships and the experience of providing or receiving informal support to or from another person. This can result from direct stressors, dynamics of the care relationship itself, or circumstances arising within a person's family or community, economic or socio-political context.

This chapter specifically refers to two sub-cohorts of "carers". One cohort is L, G, B, and/or T people who support a person/s with a chronic illness, disability, mental illness, substance abuse issues or who have aged-related needs. The other sub-cohort are non-LGBT people who care for L, G, B and/or T person/s who (due to one of these same circumstances) require support. Other terms include "people in care relationships" and "LGBT people in care relationships", these refer to carers as above, but also to LGBT people receiving care.

BACKGROUND

Access to Health and Human Services

Literature on LGBT people's use of health and human services acknowledges the impact of stigma attached to non-heterosexual orientations and transgender identities is often a determining feature of the difficulties people experience in accessing them (Johnson, Mimiaga & Bradford, 2008). Emergent research on the experiences of LGBT people seeking or using health and human services (inclusive of carer supports) has recognised a variety of potential barriers to, and gaps in, appropriate service provision as well as fear of self-disclosure among LGBT service users (Albuquerque, de Lima Garcia, da Silva Quirino, Alves, Belém, dos Santos Figueiredo,... & de Abreu, 2016; Coon, 2007).

Many services designed for community and individual wellbeing, safety or capacity building (such as housing, policing, justice, legal, education and employment services) are perceived as unreliable or untrustworthy by LGBT people. LGBT populations have reported inequitable assistance and discriminatory practices in these sectors and highlighted many providers are simply inappropriate or ill-prepared to meet LGBT client needs (Aldridge & Somerville, 2014; Campo & Taylor, 2015; Rossman, Salamanca & Macapagal, 2017).

Circumstances surrounding LGBT communities suggest the need for tailored health and human services, which target the unique challenges and risks they face (Burwick, Gates, Baumgartner & Friend, 2014; Coon, 2007). LGBT people experience sizeable disparities in health and wellbeing outcomes compared to non-LGBT people. Among these are poorer mental health, greater suicide and self-harm risk, increased risks to sexual health, chronic illness, high rates of substance misuse as well as a higher likelihood of being a victim to bullying, violence and harassment (McKay, 2011; Scott, Pringle & Lumsdaine, 2004; Whitehead, Shaver & Stephensen, 2015).

Experiences of discrimination, stigma and harassment on the basis of sexual orientation and gender identity is recognised as a key determinant of health and connected to poorer mental health outcomes among LGBT people (Rutherford, McIntyre, Daley & Ross, 2012). Research on LGBT mental health has identified links between discrimination and levels of depression, suicidal ideation and anxiety (Rosenstreich, 2013; Leonard, Pitts, Mitchell, Lyons, Smith, Patel,... & Barrett, 2012).

Furthermore, while research on comparative health risks and outcomes between the distinct subgroups under the LGBT umbrella remains innovative, significant disparities and differences between each cohort

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

are noted in available data (LGBTI Health Alliance, 2016; Whitehead, Shaver, & Stephenson, 2016). Where there is overlap between cohorts, for example gay transgender men, these risks may be magnified.

Wellbeing of Carers

LGBT people in care relationships are subject to these and other health disparities. Research on the health and wellbeing of carers (and former carers) has identified higher rates of psychological distress and self-reported poorer physical health than people who do not provide care (Schofield, Bloch, Herman, Murphy, Nankervis, & Singh, 1998).

Negative outcomes are not only due to caring, but also attributed to indirect, secondary stressors: a lack of support outside the care relationship and daily life concerns such as poor health, can both impact carers lives (Stalker, 2003). However, it is important to note carers are regularly exposed to stressors and distressing events at a significantly high rate, which increase the risk of common mental disorders (Stansfeld, Smuk, Onwumere, Clark, Pike, McManus, ... & Bebbington, 2014) as well as physical injury (Brown & Mully, 1997; Tong, Haig, Nelson, Yamakawa, Kandala, & Shin, 2003) and illness (Schofield, Bloch, Herman, Murphy, Nankervis, & Singh, 1998).

Indirect impacts on carers (such as limited time, stretched resources or insufficient energy to achieve desired goals in priority life areas) may negatively impact their social life, increase isolation, or create clashes between care relationships and employment. This can subsequently impact intimate partnerships and other family or friend relationships (Oyebode, 2003). Such indirect impacts are an important consideration for policymakers and service providers aiming to mediate health and psychological strains on carers (Stansfeld, Smuk, Onwumere, Clark, Pike, McManus, ... & Bebbington, 2014).

Amplified disadvantage can occur among LGBT carers, where direct or indirect stressors related to care responsibilities combine with anxieties due to L, G, B and/or T discrimination. The experience of real or perceived discrimination can also influence a person's wellbeing. Anxieties regarding the cultural safety of a service provider can be a barrier to using carer or related services, which may otherwise sustain the quality of their relationships. For example, an LGBT carer who is concerned about reactions towards them at a carer support group may choose not to access this form of support, which is known to otherwise alleviate social isolation for others who feel welcome. Also, LGBT people supported in care relationships may experience barriers to accessing services and community due to stigma or discrimination experienced as an LGBT person, as well as due to a disability, mental or chronic illness or their age-related care needs.

Inclusion Criteria

Finally, in some literature, 'LGBTI' is used in an effort to include intersex people and recognise their contributions to LGBT communities. References to L, G, B and T people in this chapter are made with acknowledgment some LGBT people are intersex. However, not all intersex people are LGBT (OII Australia, 2012). Therefore, 'LGBTI' is considered insufficient and inappropriate to refer to intersex experiences here.

While there is overlap with LGBT experiences for some intersex people, major differences between intersex, sexuality and transgender issues remain. These include the nature of acts of violence and discrimination used against intersex people, such as non-consensual medical surgeries. Additionally, there are differences between sexual and gender identity issues and those related to intersex body experiences

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Androgen Insensitivity Support Syndrome Support Group Australia (AISSGA), Intersex Trust Aotearoa New Zealand (ITANZ) Organisation Intersex International Australia (OIIAU), Black E., Bond K., (AISSGA), Briffa, T., (OIIAU/AISSGA), Carpenter M., (OIIAU/Intersex Day Project, Cody C., (OIIAU), David, A., (OIIAU)… BEECHAC, Yovanovic, 2017, pp. 2-4). Conflation of intersex and LGBT issues is problematic in the context of health and discrimination experiences. Therefore, 'intersex' is excluded from the acronym throughout this chapter except where the literature referenced includes it. Inappropriate inclusion of 'intersex' in 'LGBTI' frames illustrates while the acronym may seem convenient, it is not inevitably matched by shared experiences among the communities it refers to.

Interaction Between Carers and Services

Fredriksen-Goldsen and Hooyman (2007) note that although studies identify poor physical and mental health outcomes among carers, there is less exploration on whether or how health or human services can address them, particularly in relation to traditionally marginalised groups. It has also been identified that primary and frequent carers can experience lower life satisfaction than people who care less often (Borg & Hallberg, 2006).

Despite this, health, welfare and government services are often inadequate to address these issues and people with care responsibilities risk not having their needs or concerns addressed alongside those they support. Literature on care relationships cite carers and caring family members who felt overlooked, inadequately informed by professionals (Theed, Eccles & Simpson, 2017), excluded from care teams and care planning, and who had their skills or knowledge downplayed (Williams, 2007; 2012).

An online survey conducted in 2017 questioned 3,516 unpaid carers aged 18-75 across Australia, France, Germany, Italy, Spain, the UK and the US. It found 28 per cent of carer respondents felt their role was unrecognized by their healthcare system, and approximately 43 per cent of surveyed carers living in suburban areas did not feel supported at all by social/welfare services. This survey also found 54 per cent of respondents did not have time to book or attend their own medical appointments, while about 42 per cent put the health of the person they are caring for above their own (Embracing Carers, 2017).

In addition, literature on carers identifies that care relationships can be hidden within a range of contexts, while particular cohorts of carers are even less likely to be identified (Knowles, Combs, Kirk, Griffiths, Patel, & Sanders, 2016). Carer isolation may also increase in countries and contexts where client centered or consumer directed models of care and self-management approaches for people are increasing (Knowles, Combs, Kirk, Griffiths, Patel, & Sanders, 2016; Ottmann, Laragy & Haddon, 2009). If gaps for carer inclusion are not addressed within these service approaches, a risk of damage to the quality of care relationships and new stresses within them remain (Ottmann, Laragy, & Haddon, 2009).

Likewise, ambiguity of relationships between formal service providers and carers has been well documented. Twigg and Atkin (as cited in Rogers & Barnes, 2003, p. 121) identified four policy and service provider approaches to carers, which describe how carers fall either within or beyond health and human services system concerns or responses:

1. The first was *carers as a resource*. This model primarily saw carers as a broad spectrum of people with no distinction between friends, neighbours or primary carers, who could provide support to a service user. These carers are viewed to function in the background to formal service provision and only considered when they are struggling;

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. The second is *carers as co-workers,* where carers are seen as working with formal service providers who may negotiate with carers to delineate between informal and formal care. While the main focus of this model is still the client, carers are considered more central than in the resource model. Despite conflicts of interest being recognised in the 'co-worker' model, these are usually dismissed in the belief carers want to perform the role. Enabling this is seen as the best way for services to build a relationship with the carer;
3. The third model is the *carers as a co-client*, which concentrates on people who are primary carers with considerable responsibilities. It includes the likelihood of co-existing carer needs, which may need to be met alongside a client. This approach recognises carer needs may conflict with those of the service user's, and that prioritising of need can ignite tensions which need consideration;
4. Finally, there is the *superseded carers* model, which frequently guides service provider interactions with carers supporting people with intellectual disabilities, physical disabilities or mental ill health. Service providers do not sustain care relationships in this instance but rather attempt to remove the need for them. This is done by focussing on the service user and increasing their independence or through interventions, which aim to reduce or remove dependence on a carer.

Throughout this chapter, readers are encouraged to consider how bias towards particular family structures, or discrimination against particular service users, may influence work with LGBT people in care relationships. Readers should seek to identify circumstances where carers might be vulnerable to being considered a resource, a co-worker, a co- client or superseded, or where attitudes to LGBT people receiving care may influence how staff respond to the care relationship and caregiver.

Forms of Discrimination and Stigma Towards LGBT People

Barriers to services, discriminatory treatment and unsuitable supports jeopardize the wellbeing of LGBT people and accrue substantial human and economic cost (Banks 2003). The high societal and economic value of care relationships, combined with their regularity across society (CANCA, 2017), underlies the importance of both mainstream and targeted LGBT services being capable to respond to them appropriately.

A key to providing useful responses to LGBT client or carer needs is recognising homophobia, heterosexism, bi-phobia, transphobia and their impacts. Homophobia typically refers to fears and hatred of lesbians or gay men based on their desires and sexual practices, which can lead to discriminatory behaviour, physical violence or verbal abuse (Leonard, Marshall, Hillier, Mitchell & Ward, 2010).

Heterosexism is related to homophobia insomuch as it refers to assumptions and beliefs that all people are, or at least should be, heterosexual (Leonard, 2002). Heterosexist perspectives perpetuate discrimination against LGBT people through implication that non-heterosexual sexualities are harmful, abnormal and a risk to societal wellbeing (Leonard, 2002; Rosenstreich, 2013; Smith & Ingran, 2004). However, heterosexism is not expressed only by direct hatred for LGBT people, but also through unconscious or deliberate omission of LGBT needs and perspectives. Regardless of its presentation, heterosexism results in heterosexual behaviors, identity or norms, being privileged over those of sexual minorities who are consequently discredited.

For LGBT people in care relationships heterosexist views and assumptions about family, intimate partnerships, parenting and communities among health and human services staff are an additional hurdle (Willis, Ward & Fish, 2011). Heterosexist (and cis-sexist) assumptions by service staff can reduce

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

awareness and identification of LGBT service users and their care relationships (Willis, Ward, & Fish, 2011). This can obscure LGBT status, inhibit self-expression and client help seeking around particular needs (Irwin, 2007).

Homophobia can also extend to bisexuals who are in same gender relationships and may be experienced alongside bi-phobia. Bi-phobia is similarly based on an aversion to sexual desires or practices; however, fear and hatred of bisexual people can also result from mono-sexist beliefs. In other words, the view that only 'single-gender sexual orientations' (heterosexuality and homosexuality) are legitimate (Ross, Dobinson & Eady 2010, p. 496). Mono-sexist views are not limited to heterosexual populations and can be held by gay or lesbian people, thus impacting the safety and inclusion of bisexual people in gay, or shared "LGBT" environments (McLean, 2008).

Likewise, transphobia is defined as an irrational hatred towards individuals who do not conform to societal gender expectations. Enabled by cultural ideologies of heterosexist views of masculine and feminine expression (Rosenstreich, 2013), transphobic views reinforce gender non-conformity between sex and gender as an objectionable characteristic. Transphobia correlates with cis-genderism, which refers to the view conformity between assigned sex at birth and gender identity is normal or natural; or alternatively the view that people whose gender identity is incongruent with the sex they were assigned at birth are odd or threatening (Leonard, Lyons, & Bariola, 2015, cited in Blumer, Ansara & Watson, 2013; Preciado, 2013).

As the focus of transphobia is on gender identity and expression, transgender people of any sexual orientation are vulnerable to experiencing it. Similar to biphobia, it is not only heterosexual people who may be transphobic. Literature on transgender and gender diverse experiences identifies transphobia and cis-genderist interactions among lesbians, gays, and bisexuals (Nadal, Whitman, Davis, Erazo & Davidoff, 2016, p. 499; Cashore & Tuason, 2008, pp. 388–390).

MULTIPLE MARGINALITIES AND INTERSECTION OF LIVED EXPERIENCES

Terminology and Identity

LGBT communities are overlapping, yet separate groups whose experiences of sexual orientation, gender expression and identity are shaped by a range of intersectional lived experiences. It is essential service providers understand how discrimination related to sexual and gender identity or expression may intersect with non-LGBT related marginalities.

Central to the provision of care relationship support is whether people identify with the term "carer" or not. This may depend on a range of individual and relationship characteristics. For example, care relationships may be concealed due to stigma associated with mental illness disability, or a chronic illness (Koschorke, Padmavati, Kumar, Cohen, Weiss, Chatterjee, ... & Balaji, 2017). Carers may hide a care relationship out of respect for another person's decision to not disclose their condition or disability (Kittikorn, Street & Blackford 2006).

Furthermore, despite carer or "caregiver" being a reasonably established term in many health and human service settings, there is fluidity in the way people identify with it. Indeed, there has been contestation regarding the usefulness of this term and arguments it is divisive (Molyneaux, Butchard, Simpson & Murray, 2010). Similarly, its relevance to Aboriginal and culturally diverse communities has been

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

questioned (Hill, Cass, Newton & Valentine, 2012), while disability researchers have challenged carer language dichotomies which focus on dependency or imply loss of autonomy (Stalker 2003).

Perceptions of the term carer orientate around supportive tasks, which originate from preluding affiliations, friendships or familial circumstances. However, distinguishing care relationships from other patterns of care in families and society, or interdependent characteristics of personal, gender and family relationships is difficult (Rogers & Barnes, 2003).

LGBT communities by their nature challenge more traditional definitions of gender and family models, while their relationships may exist within private or selective spheres where they feel safe to express them (Fish, 2006). Nonetheless, caregiving can implement and ascribe value to a range of relationships or social bonds that LGBT people may be part of (Williams, 2012). These include intimate partnerships and "family of choice" – including ex-partners or non-LGBT allies/supporters/friends (Barrett, Whyte, Comfort, Lyons & Crameri, 2015; Kia, 2012; Muraco & Fredricksen Goldsen, 2014). They may also be parent-child relationships (Parslow & Hegarty, 2013; Washington, McElroy, Albright, Oliver, Lewis, Meadows, & Elliott, 2015) or relationships between biological family members, such as siblings (Coon, 2007).

Whether responsibilities are named "caring" or not, people in care relationships require assistance, preferably before the toll on their physical and mental health becomes unsustainable. This does not mean replacing all informal supports – but rather working collectively with carers and service users to remove or mitigate damaging stress factors; and supporting relationships which help them thrive.

As care relationships express a variety of bonds, the health and wellbeing of people in care relationships can be improved when they are able to express themselves in ways independent of the need for support or the ability to provide it. When optimally supported and functioning well, care relationships should enhance emotional and physical independence, confidence, and the autonomy of all parties. Care relationships must also tap into community resources and capacity.

Higher rates of poor mental and physical health and disability among LGBT people suggests many have an increased likelihood of requiring informal care from a friend, partner of family member over their life course or knowing a person who does. With this in mind it is also worth noting that care relationships can be reciprocal and interdependent where two or more people exchange distinct types of support for one another, or the same type of support at various times (Greenberg, 1995; Stalker, 2003). The dichotomy between service user and carer is not always clear-cut. Reciprocity has been identified as a protective factor against carer stress and it is important for services to recognise and support this aspect of care relationships (del-Pino-Casado, Frías-Osuna & Palomino-Moral, 2011).

Disability, Illness and Stigma

Discrimination, stigma and systemic inequality directed at people with disabilities, chronic or mental illness, or because of care responsibilities, can add pressures to everyday life. This can create impediments to care relationships being visible, positive or advantageous.

For example, LGBT people with a disability have cited ableism within LGBT communities as an issue (Harley, Nowak, Gassaway & Savage, 2002; Jowett & Peel, 2009), as well as being desexualized in the eyes of the public and service providers (McCann, Lee & Brown, 2016). Assumptions about what make bodies "normal", attractive, capable of intimacy and sexual function can obscure LGBT identities among people with disabilities (Chappell, 2015).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

People in care relationships may also face poor disability access to LGBT community venues and events, which would otherwise provide a sense of belonging. Alternatively, they may experience social stigma related to a disability or mental illness. Exclusion like this can increase distress among LGBT people who are already at heightened risk of experiencing poor mental health. Discrimination in multiple spaces, such as disabled communities and LGBT communities for example, may be especially stressful if a person is struggling to accept their sexual orientation or gender identity, or feels alone due to homophobia in wider society or among disability networks.

Ageism

Ageism, too, can further marginalise people in care relationships. Ward (2000) notes that ageism can be a violation of human and civil rights by categorising and discriminating against people based on age. This deprives older people of autonomy, choice and can force dependent status on them. Ward highlights ageist views that perceive growing older as undesirable and enables community disassociation from ageing. Ageism is not limited to the general public and can also be institutionalised within professional healthcare practices, which has implications for care relationships. For example, a doctor may assume a person is incapable of providing support because of their age and ignore their observations about a patient.

Ageism can also impact LGBT people in unique ways. For instance, a social worker may assume an elderly man is heterosexual and living with a 'friend' simply because he has a grandchild. Rather than imagining the possibility the man may have formed a gay relationship later in life, the social worker's perceptions reflect tendencies in the field of gerontology to overlook the diversity of gay and lesbian ageing (Price, 2012). Haghiri-Vijeh (2013) notes cases of LGBT people who were excluded from end of life decision-making processes while their partners were in care. Experiences of ageism within LGBT communities and negative perceptions of ageing among gay men have also been raised (Tinney, Dow, Maude, Purchase, Whyte, & Barrett, 2015).

Gender

Lesbian, bisexual and transgender women can experience intersections of marginalisation due to gender related discrimination within public spheres and their families. For instance, research has identified gay men and lesbians are more likely to undertake parent care than heterosexuals (Glaesser & Patel, 2016). However, community expectations – or the carer's own expectations – of traditional gender roles (Reczek & Umberson, 2016) alongside assumptions lesbian or bisexual daughters were "single" may increase the likelihood they would be assumed to care for parents in comparison to their male counterparts (Parslow & Hegarty, 2013). It is not unlikely transgender women may also experience expectations of "nurturing" or "caring" behaviour upon transition and expression of their gender identity.

Race, Religion and Culture

Assumptions about race, religion or culture can also compromise health and human services provision and have flow on effects for the wellbeing of ethnically and faith diverse LGBT people seeking supports. Pallotta-Chiarolli and Rajkhowa (2017) note that being LGBT within a minority ethnic or faith community means navigating, negotiating and living between varied and multiple conventions, expectations and social codes regarding gender, sexuality and ethnicity. Young same sex attracted and gender diverse

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

refugee and asylum seekers, for example, can experience significant ongoing stress and fear about the impacts of being out, and also the impacts of this upon their families due to shame and humiliation (Canales & Leonard, 2016).

Assumptions LGBT people do not exist within minority faith or ethnic communities can be prevalent within the communities themselves or originate beyond them. The perception, inclusion and influence of LGBT people is problematic in global, post-colonial countries and contexts where histories of colonialism, racism and segregation cross with contemporary, "Western" ideas of sexuality and gender identity.

Colonization of gender and sexualities can result in erasure of identities such as race, ethnicity, nationalism, class and gender and subsequently extend invisibility of LGBT sub-cohorts such as lesbian women, even in physical and cultural spaces that aim to disrupt hetero-normativity (Reygan, 2016). Similarly, the oppression of local diverse sexualities and genders may stem from views that see being L, G, B and/or T is a symptom of secular or decadent moralities of urban white culture (Pallotta-Chiarolli & Rajkhowa, 2017). Racism may also be experienced within LGBT communities (Walters & Old Person Jr, 2014).

Furthermore, cultural norms vary in relation to stigma and meanings attached to health conditions or disabilities, which can influence people's interaction with health and human services or their likelihood to provide care. Some research has identified a sense of "duty" among some ethnic and religious groups, yet human services do not always respond in culturally sensitive ways (Greenwood, Habibi, Smith & Manthorpe, 2015). It has been noted that social work literature, for instance, remains wanting for tools or guidelines to address the intersection of multiple marginalities, identities and experiences of LGBT people of colour (Walters & Old Person Jr, 2014). Without guidance, staff run the risk of responding poorly or focusing on a carer's ethnicity and assumed cultural preferences over their needs specific to their lived experience of gender or sexuality.

Case Study: Jin

Jin supports her mother who has severe arthritis, chronic depression and anxiety. Since the death of Jin's father, her mother has struggled at home alone, so Jin spends two hours daily travelling to and from her mother's house to assist with meals, personal care and transport to medical appointments. Jin also provides financial support to her mother, which is placing strain on Jin's relationship.

Jin is in a lesbian relationship of three years. Her partner is not "out" to her Chinese family, who hope she will marry a Chinese man. Jin's partner's family think her and Jin are just friends as they are studying at university together. Jin's partner is covering more of their household bills.

Jin's mother began phoning her late at night. During these calls, she swings between sobbing about her husband's death and becoming abusive, telling Jin she is a 'disgusting lesbian'. Being awakened late during the night and the stress of these calls is making Jin depressed, as is an increase in arguments with her partner.

Jin's mother was recently admitted to hospital due to a severe depressive episode. However, when she was discharged the duty social worker saw no need to refer her to extra supports because Jin's mother said via an interpreter she had a dutiful daughter and it was the 'traditional Chinese way' for the community to look after its own.

Refugee Experience

LGBT refugee or migration experiences can also influence help seeking of LGBT people (Canales & Leonard, 2016). Past discrimination by service providers can deter LGBT people from accessing health and human services or self- disclosure. Likewise, distrust towards service providers can exist among refugee LGBT people who experienced persecution, violence and threats in their countries of origin (Reading & Ruben, 2011). There are high rates of post-traumatic stress and trauma among refugee populations (Reading & Ruben, 2011). Reluctance to use services can be particularly detrimental in populations who collectively cope with high rates of trauma as ripple effects spread through whole communities.

Even in countries where LGBT people have significant legal protections, they face more vulnerability than cis-gendered heterosexual populations to poor health. Substantial evidence indicates LGBT persons experience significant health inequalities and poorer outcomes than heterosexual persons worldwide (World Health Organization, 2013).

Mental Health System Experiences and Mental Health Outcomes for LGBT People

Cognizance of high rates of mental ill health among LGBT people is vital when working with those who are in care relationships, whether they are caregivers or receiving care. Risks to mental health, combined with threats to wellbeing associated with the direct or indirect stressors of caregiving, create a potential for crisis flashpoints in care relationships, which require monitoring and mitigation.

Research has identified LGBT people's experiences of discrimination can extend to their use of mental health services (Croghan, Moone & Olson, 2014; Kidd, Veltman, Gately, Chan & Cohen, 2011; Rutherford, McIntyre, Daley, & Ross, 2012). This includes an unhelpful legacy of stigmatising clinical theories and diagnosis ascribed to LGBT people, which was at the heart of many psychiatric institutions and practices (Drescher, 2015; Whitehead, Shaver, & Stephenson, 2016).

For a large part of modern gay, lesbian, bisexual and transgender history, LGBT people have been categorised by psychiatric pathological views that associate non-heterosexual attractions or transgender identities with disease, developmentally disruptive external factors (such as sexual abuse, or "excessive mothering") and other kinds of psychological inferiority (Drescher, 2015). This coincided with a range of heterosexist views, perpetuated within health, scientific and psychiatric circles at different times and which have served to exclude LGBT people. For example, some of these views labeled LGBT people as biologically inferior or suggested they have hormonal disorders, while others presented LGBT people as genetically inferior, emotionally inept or morally dangerous (Fish, 2006).

Moleiro and Pinto (2015) note although the American Psychiatric Association removed homosexuality from the Diagnostic and Statistical Manual in 1973, formal pathologisation of homosexuality did not cease with this change. The DSM-II contained the diagnosis of 'sexual orientation disturbance', which was then replaced by 'ego dystonic homosexuality' in the DSM-III, by 1980. Both these diagnoses continued to legitimise sexual "conversion" therapies among people with homosexual attraction who were distressed by or sought to change their orientation. Furthermore, the World Health Organization's International Classification of Diseases (ICD-10) did not remove homosexuality until 1992 and still contains a diagnosis similar to 'ego-dystonic homosexuality' which is due to be modified in the next revision (Moleiro & Pinto, 2015, pp. 2-3).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Likewise, the World Health Organization is moving towards declassifying transgender identity as a mental disorder in the ICD-10 by no longer classifying "Transsexualism" under the category of "Mental health and disorders". It is proposed, instead to be classified as "Gender incongruence of adolescence and adulthood" under the category "Conditions related to sexual health" (Thomas, Pega, Khosla, Verster, Hana, & Say, 2017). 'Gender identity disorder' was only recently removed from the DSM and debate persists among transgender people as to whether it should remain at all. As Moleiro and Pinto (2015) note, many believe inclusion of transgender identity within diagnostic tools plays a significant role in perpetuating and rationalizing prejudice toward transgender people.

Transgender populations face unique obstacles accessing mental health care. Some include poor access to sensitive and capable professionals; difficulty finding information about gender dysphoria, hormone therapies or surgeries; inadequate access to safe prescription and supervision of hormone therapy; and poor affordability and availability of surgeries (Lo & Horton, 2016).

These obstacles impact core domains gender affirmation traverses, such as the social (e.g. name, pronoun), psychological (e.g. internal, felt self), medical (e.g. hormone therapy, surgeries, or body modification), and legal, such as official gender markers or legal name change (Reisner, Poteat, Keatley, Cabral, Mothopeng, Dunham,... & Baral, 2016). Achieving gender affirmation will also depend on a person's context (e.g. country and region), issues of economics or poverty, and the criminalisation of sexual and gender minorities.

This can cause mental distress and slow down outcomes transgender people highly anticipate. It can also increase the risk of violence and discrimination as they go through visible physical changes or when mismatching legal identification reveals transgender identity. Seeking mental health support to cope with such circumstances can be difficult. The complexities of accessing treatments to transition have added to the perception of service providers as "gatekeepers" among transgender and gender diverse people (Cruz, 2014).

For example, the World Professional Association for Transgender Care (WPATH) Standards of Care stipulates that mental health professionals are the first point of contact for transgender people seeking affirmation of their gender. Referral for hormone therapy or surgery requires a mental health professional's assessment of a person's eligibility, suitability and readiness, with lower genital surgery often requiring two mental health professional referrals. In addition, the use of DSM-5 is embedded in the Standards of Care to assess whether distress is not accounted for by another diagnosis (Schulz, 2018). This may result in reluctance among transgender people to disclose poor mental health where this may jeopardize medical transition or result in a perception of impaired decision-making capacity.

Health and human service staff should avoid assumptions that client distress is related to gender identity or sexuality, rather than a range of issues in other life domains. Discerning stressors and avoiding conflation of LGBT status with mental illness is crucial when supporting a care relationship where the mental distress of a transgender person is an issue.

Case Study: Emma

'Emma' is a transgender woman who lives with bi-polar 2 and PTSD. She has managed on a low dose of medication and meditation classes for three years. Over recent months her panic attacks increased after she was harassed by a group of men on a train who tried to rip off her dress. Emma's long-term bisexual partner Alice supported Emma to report the incident to police and assisted Emma to resume regular counseling. When Alice suggested Emma review her medication, Emma said she was fearful

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

her symptoms would result in her psychiatrist refusing her female hormone prescriptions and gender reassignment surgery. Alice fully supports Emma's gender transition, but knows that the last time Emma increased her medication during a relapse of severe symptoms it helped.

Alice is experiencing insomnia, she cries often and worries about Emma. On occasion, she has left work early to meet and comfort Emma and ensure she does not self-harm. Recently she took Emma to hospital during a panic attack where she couldn't breathe. Emma did not present as a woman at emergency because she was afraid of how staff would react. Emma requested strict confidentiality from Alice about her symptoms getting worse and hides them from her GP. Despite these issues Emma and Alice remain excited about Emma's transition and Emma only has three more psychiatrist appointments over four months before she will be approved for hormone therapy.

SOLUTIONS AND RECOMMENDATIONS

Proposed solutions to improve LGBT access to health and human services include: addressing discrimination against LGBT people globally and within broader society, (Carroll & Mendos, 2017); legislative protections; improved service delivery standards and LGBT inclusive guidelines (Daley & MacDonnell, 2011); staff training on LGBT community needs (Irwin, 2007); de-stigmatisation/de-pathologisation of LGBT people (Lim, Brown & Jones, 2013); and the development of models of health and community care that increase both safety and relevance of services for LGBT consumers (Barrett, Turner & Leonard, 2013).

Consider Issues Surrounding 'Families of Choice'

Some carer support agencies and programs recognise the likelihood of LGBT people seeking "families of choice" due to possible or actual rejection by family of origin as a result of their sexual orientation or gender identity. Indeed, available research indicates a high value ascribed to friends as potential caregivers among LGBT people (Croghan, Moone & Olson 2014; Fredriksen-Goldsen, Kim, Muraco & Mincer, 2009).

It has been suggested that care circles initiated by partners, friends and community allies were a development among LGBT communities during the AIDS crisis when friends and partners were heavily impacted (Glaesser & Patel 2016; Shiu, Muraco, & Fredriksen-Goldsen, 2016). It is no surprise the protective nature of care relationships with friends and partners may be appealing or favoured, especially if formal services and family or community of origin, are seen as unsafe or inappropriate (Fredriksen-Goldsen, Kim, Muraco, & Mincer, 2009). It is not just the provision of care, which is valued. Family of choice can be a source of refuge for LGBT people who are caregivers and support them in their role as a carer enabling them to carry on during times of stress (Butler 2017; Dykewomon, 2017; Price, 2011).

However, friend and family of choice care remains under-researched (Shiu, Muraco, & Fredriksen-Goldsen, 2016). Furthermore 'families of choice' should not be assumed just because a person is L, G, B and/or T. This presumes circumstances, community connections and personal capacity capable of close and well-resourced relationships, which are supportive in family-like ways. This may not be the case.

In addition, some people may not have access to deeply reciprocal relationships with others who are physically able to meet their care needs (Hash & Nettling, 2009). Where illness carries tremendous

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

stigma, such as in severe mental illness, people may find close relationships difficult to maintain. Some LGBT people may also be reliant on or supporting a person they are not "out" to or is homophobic (Barrett & Crameri, 2015) thus isolating them from other communities. Improved clarity of the relationship between care giving and families of choice, particularly among marginalised extended communities, is required. This will better inform targeted, helpful health and human service interventions, and aid the development of strengths-based approaches that reflect the full range of relationships LGBT people are in, and the extent to which these relationships are supportive to service users.

Relationship Recognition

It should be noted too, family of choice might be reluctantly used or a substitute term for people who would like more legitimacy afforded to their relationships or those of their loved ones. Legal recognition for LGBT people is inconsistently granted from country to country. Not all people wish to marry and some LGBT people may indeed prefer to accentuate less conventional relationships or see families of choice as a form of political resistance to conventional relationships overseen by the State (Price, 2011). Legal relationship recognition has been highlighted in many global LGBT human rights campaigns; likewise, many LGBT relationship recognition campaigns have focused on human rights, equality and the practical barriers insufficient legal recognition of partner relationships can create.

Beyond the legalities, common societal views of what constitutes families (including among non-LGBT people) can vary significantly and change over time, as can the visibility or acknowledgement of LGBT family structures. For example, Mizielińska and Stasińska (2017) cite shifts in Poland during public and political debates regarding two civil union bills proposed by SLD (the Democratic Left Alliance party) in 2011.Their research identified changes within Polish public discourse on LGBT families over the last decades from very conservative and traditional definitions of family in the early 2000s to more open definitions by 2010–2011. They note media debate shaped the public conversation on civil unions by contextualizing same-sex unions within wider-ranging changes in the way families function. They also found many voices in the public sphere regardless of whether they were for or against same-sex unions acknowledged the existence of LGBT parents.

Legislation does not always accommodate changing social views however, and as Mizielińska and Stasińska (2017) note 'family is a construct that suits a specific vision of society and its politics. It is nothing fixed and permanent' (p. 1812). It is therefore not surprising the rights afforded to LGBT people and the social recognition of their relationships are vulnerable to political and social volatilities.

The civil union's bills in Poland would have enabled tax benefits, widow pensions, the right to inheritance and social insurance to married gay and lesbian couples (however it excluded rights to adoption). Nevertheless, the civil partnership act or recognition of same-sex families did not prevail in Poland (Mizielińska & Stasińska, 2017), which no doubt had significant repercussions for some Polish LGBT people in care relationships.

Similarly, other issues have been identified for LGBT people in care relationships living in the United States. These include: being ineligible for government and workplace family benefits and leave; and high levels of discrimination in employment and housing, including public housing and long-term care housing (Fredriksen-Goldsen, Kim, Muraco, & Mincer, 2009). Again, progress addressing these issues remains dependent on political climates, which, at least currently for LGBT Americans, appears fickle.

Service providers ignoring or misunderstanding legal protections, and rejecting LGBT carers as powers of attorney (Croghan et. al 2014), partners (Valenti & Katz, 2014) or beneficiaries (Czaja,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Sabbag, Lee, Schulz, Lang, Vlahovic,... & Thurston, 2016) has also been raised. There has been some success in achieving recognition of child guardianship via second parent adoption and recognition for non-biological parents in some countries such as the United States (Knauer, 2016) and Australia, where law is increasingly including and recognising gay and lesbian couples and their children (Sifris, 2014). However, where lesbian and gay parents cannot adopt (including transgender people in lesbian or gay relationships) remains an issue. From this perspective families of choice may not seem compensatory for people who would rather alter the legal expression of their closest relationships if they had the opportunity.

LGBT people in care relationships can experience discrimination and may face the indignity of requests to "prove" their relationship to service providers in countries where they are not legally recognised. Conscious recognition of how care dynamics are impacted by legal or social inequities can improve the sensitivity of service responses to mental distress among consumers, carers and families who struggle to have their bonds recognised legally and socially.

Marriage equality is one measure, that can influence access to income support programs — either by increasing or decreasing access — or by altering the household income or composition considered to determine eligibility for programs (Burwick, Gates, Baumgartner, & Friend, 2014). However, the right to marry needs to be matched with the principle that all marriages are equal; alongside non-discrimination laws on the basis of sexual orientation and gender identity which cover all life domains. This would better meet the needs of LGBT people across the range of care relationships discussed in this chapter. Despite the complexities of families of choice as a broad concept, they nonetheless remain a source of support for many service users and carers, and require recognition by service providers.

RECOMMENDATIONS AND TIPS FOR PRACTICE

There are many affirmative actions that health and human services can take in response to LGBT people in care relationships to help mitigate the impacts of discrimination and care relationship stress.

Address Heteronormative and Cis-Gendered Service Delivery

As touched on earlier in this chapter there are a growing number of affirmative practice guides available to assist health and human services develop inclusive practices for LGBT service users. Many of these provide a starting point and go some way in reducing discriminatory heteronormative and cis-gendered practices. In some countries, sector accreditation and minimum standards in LGBT inclusive service provision, such as the Rainbow Tick in Australia (Gay and Lesbian Health Victoria, n.d.), have been designed for the community, health and human services sectors as well as service benchmarking initiatives like the Health Equality Index by the Human Rights Campaign Foundation.

Work in this area also includes guidelines on the primary care of LGB health consumers in a range of countries including the US, Australia, UK, Canada and Ireland (McNair, 2010) and social work guides for best practice working with LGB people in Ireland (IASW, 2011). Guides associated with these standards can assist with the adoption of LGBT inclusive policies and practices. Similarly, literature initiatives addressing hetero and cis-normative practices have provided overviews of best practice. Examples of practical actions within these standards, guides and available literature include things like:

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Use open gender neutral/appropriate language and terminology with service users when referring to relationships and gender identity (Irish Association of Social Workers, 2011; The Joint Commission, 2011);
- Design service forms which capture sexual and gender diversity or amend government mandated templates and documentation to ensure they are LGBT inclusive (Barrett & Crameri, 2015);
- Understand legal service provider obligations and anti-discrimination laws which, protect LGBT people and the range of jurisdictions in which they apply (The Joint Commission, 2011);
- Create a welcoming environment, e.g. display posters affirming LGBT communities, use images of LGBT people in service materials (Friedrickson-Goldsen & Hooyman, 2007), display rainbow, bisexual and transgender flags (Barrett & Crameri, 2015) ensure LGBT specific service brochures are available;
- Build mutually beneficial partnerships between LGBT community groups and health and human service providers to collaborate and pool resources with the goal to create effective care pathways and supports for LGBT people in care relationships (Coon, 2007);
- Train staff to ask questions regarding sexual and gender identity appropriately at service gateways (LGBTI Health Alliance, 2013) and challenge their assumptions about sexuality and gender (Barrett & Crameri, 2015);
- Be clear to service users and carers that all genders and sexualities are respected and considered equal (Barrett & Crameri, 2015);
- Incorporate affirmative recruitment policies, ensure equitable treatment and inclusion of LGBT staff (The Joint Commission, 2011).

The complex issues surrounding the development of carer and consumer experience and outcome measurement instruments, evaluations and assessments exceed this chapter's discussion. Suffice to say these are common tools in health, mental health and other human services settings that vary in application and domains of measurement, and are often tailored to services provided.

Furthermore, reliable measurement of service user and caregiver experience and outcomes at various points of the service journey over time is useful. Quality service validation and outcome measurement tools can increase knowledge of how carer or consumer concerns change, decrease or escalate over time. Ideally these instruments and tools can build service capacity to identify changes at various stages of care relationships and during different interventions (e.g. when a person is admitted, treated or discharged from a program/service). Service experience and outcome measurement instruments that capture LGBT data are required to detect causes of positive and negative outcomes for LGBT people in care relationships in a range of circumstances and service contexts.

However, measuring LGBT service experience requires ascertaining not only who LGBT people are, but also any capacity to record and report on this data. Data collection can be influenced by circumstances such as whether people are "out" about their sexuality (LGBTI Health Alliance, 2013; Valenti & Katz, 2014) or in a heterosexual relationship at the time but are bisexual, for example. Counting transgender people can be complex if they are not "perceived" as trans, are assumed to be cis-gendered or they identify as either 'male' or 'female' only. Transgender people may also provide different responses to queries regarding their gender at various stages of their journey, or identify in ways that are inconsistent with a range of legal documentation services may refer to (LGBTI Health Alliance, 2013).

These issues require consideration and consultation with LGBT communities, organisations, specialist service providers, activists and community groups (where possible) to design relevant, respectful data

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

collection and measurement tools and decide how the information will be collected, by who, and under what circumstances.

Be Person Centered and Relationship Aware in LGBT Service Delivery

Outcomes for services wanting to improve LGBT consumer and carer inclusion depend largely on whether they understand an L, G, B and/or T person's lived experience, choices and views from a holistic perspective. This includes but is not limited to consideration of:

- The variability of desire among LGBT people to use an 'LGBT specific' service;
- How connected service users feel (or want to be) to LGBT communities;
- The separate and overlapping nature of gender and sexuality;
- Whether multiple identities are significant to a person and whether an order is attached to them (e.g. their ethnicity, religion, identity as a carer, gender identity, experience as a person with a disability);
- Pre-existing relationships the service user is party to (whether these are in the LGBT community or not), the importance and purpose ascribed to them and ways these are defined.

Ascertaining the priority of concerns for LGBT people and their allies in care relationships requires open in-depth inquiry and discernment to ensure quality support and referral. This is particularly the case in mental health or carer counseling settings where distress may be expressed in raw forms at crisis points. For example, poor mental health or increased anxiety among LGBT (or ally) carers could be due to any one or a combination of factors such as:

- A lack of support for their care role;
- Care relationship conflicts, or conflict external to the care relationship;
- Heightened concerns about the person they support (e.g. risk the person will self-harm or a sudden change in physical health);
- Discrimination against either themselves or the person they support;
- General poor health and human service system responses;
- A lack of service recognition of expertise within the care relationship or poor service recognition pre-existing support strategies;
- Significant care responsibilities being required over a prolonged period;
- Whether the carer provides support to more than one person.

Understand Service User Family Roles and Dynamics From LGBT Perspectives to Inform Work With LGBT People in Care Relationships

While LGBT consumer guides are useful, addressing care relationship needs is also required. Family-focused and integrated service approaches to supporting care relationships must reflect the range of relationships LGBT people are in, and consider the unique strains LGBT people are vulnerable to experiencing within their families and communities of origin (Friedrickson-Goldsen & Hooyman, 2007).

For example, information about sexual orientation and/or gender identity needs to be handled appropriately in family and care relationship contexts. Staff working with LGBT people in care relationships

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

should ensure the status of their consent to disclose sexual or gender identity is clear. Health and human service staff need to explicitly clarify how information is recorded as well as how or where it is used and who with (LGBTI Health Alliance, 2013). This can avoid negative or damaging impacts of unwelcome disclosures, which may harm the foundations of a care relationship or reduce support to people who are party to them or lead to trauma or mental illness for the carer. Available literature on LGBT care relationships and caregiving also identify some useful actions and strategies, which include but are not limited to the following strategies:

- Identify carer and carer peer support groups that welcome LGBT people or develop LGBT support groups (Barrett & Crameri, 2015; Coon, 2007);
- Support consumer and carer peer groups and peer workers to improve LGBT literacy and awareness (Barrett & Crameri 2015);
- Develop or adopt policies ensuring equal visitation and the right for service users to identify a support person (or persons) of their choice (The Joint Commission, 2011);
- Provide professional development and training on the needs of those in care relationships (Schofield, Bloch, Herman, Murphy, Nankervis, & Singh, 1998) – this could include carer identification, referral, supports, carer advocacy and advanced planning with carers;
- Understand the law and ethics context which form a backdrop to all aspects of caring (Ross, 2003) and ensure this informs service practices with care dyads. Understand how this context intersects with laws impacting the rights afforded to LGBT people;
- Incorporate language, processes, procedures and practices that include and conceptualise family in a broad sense (Price, 2011) and which recognise LGBT parent arrangements and partnerships.

Consider Your Service's Approach and Tools

Systematic identification of carers at risk of poor mental health is a priority and it is a breach of care if the significant numbers of carers who meet the criteria for psychological distress are not offered support. In reference to palliative care, Hudson (2013) notes the challenge workers experience in supporting carers implies potential merit in recognising carers as "care recipients" to justify much needed time, resources and interventions where appropriate.

Screening consumers at health, disability, youth, aged, and mental health service gateways to ascertain if they have a carer partially addresses identification of carers. Additional clarification whether consumers provide care to another person would also be of assistance. This can enable prompt referral to interventions for people in care relationships and improve service provision for carers experiencing distress or poor health, whether it is related to their care role or not. In mental health settings screening for care responsibilities combined with competent data collection could aid understanding of the mental health impacts of care relationships, the mental needs of carers, which services carers use and how useful they find them.

Care responsibilities can be established without using the term "carer" and this may increase the likelihood of identification of care relationships. Asking questions of service users around their day-to-day life is helpful, such as 'are there people who rely on you to help with things?' or 'are there people you rely on to help you regularly or from time to time?' Regardless of whether service data collection fields refer to the existence of carers, face-to-face inquiry should reflect everyday lives and relationships. A

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

list of thoughtful standardized intake instruments can be a useful prompt, particularly if they have been developed in consultation with communities a service is targeting.

Work and Plan Mutually, Particularly Where the Care Relationship Is at Risk

Where people in care relationships have negotiated issues of emergency planning, and a service user has made choices and decided to access supports in identified circumstances with the assistance of their carer, it is important that health and human services staff honor these choices. New care plans and support strategies for people in care relationships should include all parties and provide space for the carer to manage their health or self-care alongside the service user's needs.

Empowering LGBT people to clarify wishes is vital, especially where care responsibilities may not be as readily assumed as it would of "spouses" or biological families. This is particularly the case, if additional legal or practical steps are required to ensure the rights of primary carers, family members or partners are recognised. Identification of consumer preferences for nominated persons, guardians and medical powers of attorney is as important as identifying 'a carer'.

Connect With LGBT Organisations to Raise LGBT Literacy

Social isolation among LGBT people and their allies in care relationships can also be addressed through increasing awareness and recognition of care relationships within LGBT communities. This can include highlighting community access issues and barriers people in care relationships may face due to disability, mental or chronic illness, or age-related needs. LGBT people working in health and human services may be well positioned to play a unique role bridging the knowledge gap between services (including carer supports) and their own communities. Peer supports are an important source of social interaction and education (Broady & Aggar, 2017). LGBT consumer and carer peer leaders could increase care relationship literacy in LGBT communities. Peer carer and consumer reference groups, committees and organisations should reach out and encourage participation of LGBT people via LGBT community networks and at LGBT events.

Limitations

It has been noted that broader political, economic and social settings in which human services are positioned, including national and global contexts, also contribute to the possibilities and limitations of their interventions (Johnson, Mimiaga, & Bradford, 2008). Likewise, it is essential to concede this chapter's deliberations are limited by the research and literature they are based on. These are primarily from countries and settings where social welfare, health and human services, and social safety nets are available in adequate capacity to warrant discussion within social science and related professions. Conclusions are shaped by the views, experiences and perceptions of those who contributed to this literature as well as the chapter's author.

Another central limitation of this chapter is the emergent nature of literature on LGBT carers. Social work research specifically on LGBT people who provide regular informal support, or on LGBT social support systems, remains limited (Orel & Coon, 2016, p. 41; Willis, Ward & Fish, 2011, p. 1306). In addition, knowledge about LGBT people in care relationships is framed by persisting questions regard-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ing the lived experiences of LGBT people which from a global view can be vastly different from one nation-state to the next.

However, there is no reason why existing knowledge (for example on carers, LGBT communities, health and wellbeing, disability, ageing, cultural and religious diversity and physical and mental illnesses) cannot be combined and contrasted to collectively inform health and human service professionals enough to further inquiry and initiate some service adjustments.

CONCLUSION

As a general social policy category, caregiving has undergone significant study and research. This is particularly the case in countries where de-institutionalisation has resulted in a greater policy focus on independent community living. However, a defining feature of this research is a lack of mature critical perspectives and an emphasis on dichotomies of carer vs service user rather than the relationship between them (Lloyd, 2003). In addition, research on caregiving generally focuses on biological family and marital relationships (Shiu, Muraco, & Fredriksen-Goldsen, 2016). Expansion of existing literature on carer relationship perspectives that focus beyond cis-gendered family frames would be useful.

Ending global inequalities among LGBT people, including human rights abuses against them, their families and communities, is an urgent and complex task. LGBT people in care relationships also must deal with the impacts of inequality and discrimination, which in turn may increase the likelihood of LGBT people being in a care relationship.

Workers in health and human services need to examine service systems and practices that perpetuate discrimination and health inequalities against LGBT people. For example, it is noted that the medical paradigm has been a causal power contributor to social isolation and exclusion of LGBT people, and prevented them from being recognised in family units. Countries that are anti-LGBT continue to treat people from these communities with shock therapy, medications and surgical procedures to alter "abnormality" in an attempt to treat and cure. Furthermore, health service provider assumptions and discrimination toward LGBT people may persist if underlying beliefs and attitudes shaped by medical, religious and cultural values are not addressed (Haghiri-Vijeh, 2013).

Unique circumstances of stigma and discrimination experienced by LGBT people, especially human rights abuses within mental health and human services settings, require proactive consideration by workers when planning supports for LGBT people (and their allies) providing or receiving care. Cultural safety for LGBT consumers and carers is particularly important when mental health interventions are required.

Reducing deficits in health and human service provision for LGBT people will address many barriers they may face in seeking validation of their relationships. However, service providers also need to voice resistance to discrimination against LGBT people and advocate for improvements to the rights granted them wherever possible to establish an environment for best practice with LGBT cohorts.

In addition, health and human service providers should ensure inclusion, recognition and support of care relationships is embedded in the design, implementation, review and evaluation of services. Professional practices should recognise the interdependent reciprocal qualities of care relationships and the intersection of LGBT, cultural, or disabled identities; as well as the social, economic, cultural and political context of LGBT service users and carers (Coon, 2007). Given the regularity of care relationships and the significant contribution they provide communities, it is essential that supports reach hidden carer

cohorts like LGBT people. This can enable more sustainable, healthy, safer, connected and productive communities and reduce the financial and human costs of long-term care.

FUTURE RESEARCH

Research on caring in the LGBT community is in the initial stages of development, while existing empirical studies on caregiving and LGBT people are qualitative in methodology. Subsequently there is little quantitatively verified information on LGBT caregiving, including the demands on LGBT caregivers, supports to LGBT people in care relationships and the psychological impacts of care. Fredriksen-Goldsen and Hooyman (2007) note a lack of theoretical grounding to LGBT caregiving research and suggest life course and longitudinal approaches might provide more in-depth knowledge. This includes information on: whether people within diverse communities have similar or different life courses; the impact of specific risk or protective factors over different life stages; generational experiences of being in a care relationship; and the influence of family context and structure (Fredriksen-Goldsen & Hooyman, 2007).

Willis et al. (2011) also note LGBT carers are often spoken about as a single social identity, with bisexual and transgender issues being subsumed into gay and lesbian research and practice. Failure to distinguish between sexual orientation and gender assumes the same needs for both and has resulted in data not being separately analysed in research. A lack of available research evidence on transgender and bisexual carers is subsequently noted. Research on differing kinds of care practices within transgender communities is identified as an issue that should generate questions for future social work inquiry.

Available research on LGBT carers identifies that LGBT carers have poorer health and wellbeing outcomes than non-LGBT carers (Shiu, Muraco, & Fredriksen-Goldsen, 2016). This reflects broader health inequalities among LGBT populations. While issues for LGBT people and their allies in care relationships raised in this chapter are not universal, they may influence intervention outcomes and the choice of particular approaches. Health and human service providers need to examine how discrimination and stigma; and views, assumptions and societal or political treatment of LGBT people, may affect work with, or support for, the health and wellbeing of LGBT people in care relationships.

Chapter 66
Gender Discrimination in Tourism Industry

Aslı Albayrak
Istanbul Arel University, Turkey

ABSTRACT

Compared to the past, business life has considerably developed in any area in the last century. All of the goods and services producing enterprises have made very important developments by taking advantage of science and technology at every stage of consumption and post-consumption processes starting from production. However, it can be said that the most important of these developments is the entry of the female workforce into the business life in the twenty-first century. The involvement of women in business life has not only changed the forms of production and presentation of the enterprises but also led businesses to achieve a completely different perspective.

INTRODUCTION

It is not possible to talk about the equality of the position and status of women in the workplace, their rights and working conditions with those of men; while women's are being actively involved in working life is considered one of the revolutionary events of the last century. Although women and men are protected under the laws that they should have equal rights both in social life and in business life, it is observed that gender-based discrimination is frequently made in business life. It has been demonstrated that discrimination in business life to be found in all of the developed and developing countries has resulted from many complex reasons including economic, social and cultural. When it has been taken into consideration that even the countries known as the superpower of the world have discriminated, it can be said that discrimination is mostly caused by personal and societal reasons.

One of the most important industries where gender-based discrimination is seen in business life is the tourism industry. Although the number of women working in the industry, which consists entirely of enterprises which offer different kinds of services, is about twice more than the number of men, women working in the industry are exposed to different practices and discrimination due to their gender. Until now, almost all of the studies done by academics and international organizations have shown that

women are exposed to discrimination in terms of their jobs, wages, working conditions, promotion and internal social relations due to their gender. Giving women specific rights and responsibilities taking into account their gender, rather than their qualifications, background, education, and experience constitutes the most obvious indication of discrimination. Considering that the most basic aim of tourism businesses is to provide the best service to their customers in order to satisfy them and increase their income and profitability, it is important for the future of the businesses to evaluate the employees within the industry in terms of their qualities, rather than their gender. Therefore, the reasons and practices of gender discrimination in business life and tourism industry are given in this section and gender discrimination was generally evaluated as a result of the research and suggestions were made to prevent gender discrimination in tourism enterprises.

BACKGROUND

Concept of Gender and Gender Discrimination

Gender, in its broadest definition, defined as nature, sex and sexuality that gives a distinctive role to an individual for reproduction and provides to distinguish between male and female (TDK, 2017) refers to the biological orientation of being male or female (Dokmen, 2010). Although gender is a concept used to describe features of women and men that are different from each other, it is generally considered as biological sex and social sex in two respects. Biological sex is the type of gender that can be understood at first sight and is innate and expresses that the person is male or female. In other words, biological sex is due to the genetic constitution of people or their chromosomes. Social sex is also regarded as a concept including the perceptions of women and men in social life and expectations from them apart from biological differences (Yuki, 2003).

Since the days of mankind, women and men have undertaken different meanings, different duties, and responsibilities both in family life, societal and social life. From a biological point of view, this difference, which is only regarded as the difference in the chromosome, completely separates the woman and man in societal and social life. It has often been argued that these different meanings, duties, and responsibilities which are laid on them are related to nature. For example, it is believed that women must be responsible for children and households because of their productive or men must work out because they are physically stronger and more durable than women, which actually the result is arising from the difference between nature of women and men. Absolutely, there may be some points that women and men should be separated from each other in the home, society and social life. However, it is out of the question that some factors leading to discrimination such as the fact that women and men do not behave equally in formal relations and they are faced to different procedures in education and the right to life, which deprives them of the right to be an individual, are based on gender differences.

Gender-based discrimination, which arises from different reasons in societal and social life, is seen in almost all fields, and individuals are exposed to discrimination in social life, social environment, group and organization in which they are involved due to their biological and social gender. One of the areas where discrimination is most experienced is business life. Gender discrimination in business life is expressed as depriving a person of certain rights by assessing her/his gender characteristics that are not related to her/his work and performance (Arrow, 1973).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The statistics and reports published by the International Labor Organization, the World Bank, the World Economic Forum, the European Commission and the Social Monitoring Organization has shown that gender inequalities continue to exist in the labor markets both globally and regionally for all the world countries and more women are exposed to discrimination (Uguz & Topbas, 2016). The most known gender discrimination against women in business life is vertical discrimination in which women are forced to work in lower positions and with less responsibility and they have little or no possibility of promotion. However, horizontal discrimination is also stated that different duties and responsibilities are given to women and men are assigned to more critical and responsive tasks although women have the same position at work with men for reasons such as women's active participation in the business life and increasing their levels of education (Boddy, 2002).

Another type of gender discrimination is expressed both explicitly and implicitly (Gutek, Cohen, & Tsui, 1996). Explicit perception of gender discrimination refers to that someone being a different sex is privileged despite the fact that all employees have similar characteristics. It is called the implicit perception of gender discrimination especially when a certain group of genders is negatively affected, although there is no suspicion or situation under consideration that would lead to think discrimination through an objective approach (Arisoy & Demir, 2007).

As stated above, unfair practices including that gender differences are used a criterion in business life with the difference between men and women in some roles and responsibilities; women and men are/are not employed in certain jobs due to their gender; they are not allowed to promote and they are less paid, are important issues. Thus, employment and professional agreement published by the International Labor Organization (ILO) for more than half a century, has also expressed that people are not allowed to perform any kind of discrimination, segregation or privilege, which is a destructive or disruptive for equality in order to acquire employment or profession or in their own employment or profession without regard to race, color, gender, religion, political belief, national or social structure. The ILO's contacts to prevent gender discrimination between men and women in business life are as follows:

- In code 100 Equal Remuneration Convention, which adapted 1951, there is a requirement that remuneration equality is provided between male and female workers for equal value work. Here, the remuneration also includes other remunerations such as basic wages, premiums, co-payments, and bonuses. On the other hand, it is underlined that things must be objectively assessed in order to ensure equal pay for contracts (ILO, 1951).
- According to code 111, Discrimination (Employment and Occupation) Convention, which adapted 1958, exclusion or preference made on the basis of race, color, sex, religion, political opinion, national extraction or social origin, which has the effect of nullifying or impairing equality of opportunity or treatment in employment or occupation is prohibited (ILO, 1958).
- In the Maternity Protection Convention, decisions have been made to protect the rights of women in the business life while giving birth and fulfilling their motherhood duties. It is stated that women who leave the work due to pregnancy can return to the same position, that the permission to be given to the working woman by the birth cannot be less than 14 weeks, that the woman can get breastfeeding more than once a day during the work and that the women cannot be removed from the work due to pregnancy and childbirth (ILO, 2000).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the United Nations Declaration of Human Rights, there are some items expressing that women and men are equal in business life. To prevent discrimination in the workplace, the Universal Declaration of Human Rights contains the following expressions (United Nations, 2017):

- Everyone is entitled to all the rights and freedoms set forth in this Declaration, without distinction of any kind, such as race, color, sex, language, religion, political or other opinions, national or social origin, property, birth or another status.
- Everyone has the right to work, to free choice of employment, to just and favorable conditions of work and to protection against unemployment.

Everyone, without any discrimination, has the right to equal pay for equal work. Everyone who works has the right to just and favorable remuneration ensuring for himself and his family an existence worthy of human dignity, and supplemented, if necessary, by other means of social protection.

Despite legislation, international conventions and the laws and regulations that countries make at the national level, the ongoing discriminatory practices in the workplace has shown that the problem of discrimination against women in business life is a matter of implementation rather than that of law. In business life, some of the features related to business are often attributed to only one gender and another gender is presumed to be completely devoid of these qualities. Some studies (e.g. Kobrynowicz & Branscombe, 1997; Blau & Tatum, 2000; Hemmati 2000; Ngo, 2000; Burgess, 2003; Turpcu, 2004; Fernandez, Pena-Boquete, & Pereira, 2009; Cave & Kilic, 2010; Costa, Carvalho, & Breda, 2011) have systematically demonstrated that women are exposed to discrimination in their working lives and they are less likely to benefit from opportunities in many areas such as education and training, vocational training and business life and are more employed for less qualified, low-paid jobs than men. On the other hand, discrimination against women in business life lead them to be more worn out spiritually, suffer psychological problems, low power and self-confidence, business-based conflicts and low prestige perception (Foster, 2000; Fiona, 1997).

Reason of Gender Discrimination in Tourism Industry

Today, the tourism sector is an important sector which contributes to the increase in employment opportunities, especially in most of the countries where traditional agricultural production has declined. As a matter of fact, according to the World Tourism Organization (UNWTO, 2016), the number of international tourists increased from 25 million in 1950 to 278 million in 1980, 674 million in 2000 and 1186 million in 2015. It is estimated that this number will reach 1.8 billion by 2030. Therefore, employment in the tourism sector based on manpower (labor-intensive) is more intensive than in other sectors, because the tourism industry needs less automation than the other sector and creates the need for the trained people because of the quality of service it provides. Thus, it is not seen that only 3-S (Sea-Sand-Sun) or a tourism strategy consisted of historical and natural beauties are centralized and, the organization and manpower which make these values meaningful also stand out when we look at the examples of developed tourism countries (Yanardag & Avci, 2012; Icoz & Kozak, 1998). It is not the right approach to limit this human resource to only those who work in tourism businesses, because the tourism industry offers a wide variety of employment opportunities (direct, indirect, and stimulated) in terms of volume and type of sector (Levy & Lerch 1991; Icoz & Kozak 1998; Liu & Wall 2006).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Employees in the sector consist of people working in the industry, those who provide sources to it and those spending the obtained income from the industry for it again.

- Due to the types of employment mentioned above, the number of employees in the tourism industry can never be exactly determined. Along with women working in the tourism industry, women who work under indirect and stimulated employment take an important place in direct employment. On the other hand, it is impossible to clearly determine this number because of the presence of part-time and informal working women in the tourism industry. According to the report published by the World Travel and Tourism Council (2017), it is reported that more and more women are recruited in the tourism industry than those who are registered under the sector. Although it has been stated that the number of women working in the tourism industry all around the world is very high, it has been seen that gender discrimination is performed in a substantial part of the works carried out within the industry and jobs and recruitment are made based on gender.
- Different factors that change the tourism employment and gender distribution in employment can be summarized as follows (Olali & Timur, 1988; Purcell, 1993; Cooper, Fletcher, Gilbert, & Wanhill, 1993; Purcell, 1996; Akoglan Kozak, 1996; Kantar, 1999; ILO, 2001; Akoglan Kozak, 2001; Riley, 2002; Dura & Atik, 2002; Szivas, Riley, & Airey, 2003; Tukelturk & Percin, 2008; Gunel, 2009; Yunis, 2009; Halis & Camlibel, 2011; Albayrak, 2013):
- Due to the fact that the tourism sector is labor-intensive, the number of people working in this sector is high and this increase leads to a large of female employees. However, the number of women working in the sector is increasing, because women (feminine) can easily do the jobs in the sector.
- As tourism movements especially performed in mass can be carried out during certain periods of the year, tourism businesses have employed seasonal personnel as well as their permanent employees in order to meet the demands during these periods. A majority of services needed there consists of support services and these jobs are considered to be female-specific, which increases the number of women in seasonal recruitment.
- Enterprises such as hotels, motels, pensions etc. in the tourism industry are predominantly family businesses. Therefore, personnel including women, children, and elders who are family members, are employed much more than other sectors.
- Nowadays, it is seen that alternative types of tourism including cultural tourism, rural tourism, and gastronomic tourism as well as traditional mass tourism are performed in many countries. Women are actively involved in the production, presentation, and promotion of tourism products and services in the regions in which these types of tourism are taken place. In particular, women can be said to have a prominent effectiveness in business.
- Many enterprises, including accommodation and catering services, serve 7 days and 24 hours within the tourism industry. On the other hand, periods such as weekends, nights, special holidays are the periods when the employees of the tourism industry work the most intensively. Therefore, this is especially troublesome for female employees.
- Personnel share the same environments with the customers in many stages of the service production in the tourism industry. Guests are expected to meet their requests from the tourism industry. Female employees are finding employment opportunities in the tourism sector because hospitality and hosting are the mission to be taken on most women in the society. The fact that women can better address human emotions, their social and family status and personal characteristics are major reasons for preference to employ women in the hospitality industry. With increasing the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

number of female employees in the tourism sector every passing day, this situation leads to discrimination, because especially women are employed in such kinds of jobs.

- The number of women working in the tourism sector (especially the young ones) is higher than the other sectors. Women employment have increased in the tourism industry compared to other sectors because of reasons such as that many jobs do not require physical power in the service industry, flexible working hours, the presence of jobs in settlements or surroundings. It has been observed that women working in the sector are predominantly employed in departments such as housekeeping, laundry, food preparation and customer service. Due to the reasons mentioned above, it is possible to talk about employment between men and women on different conditions in the tourism industry. As a matter of course, different practices are acceptable to a certain extent. For example, some practices such as those particular women with low levels of education can be employed in rural areas or those having the same qualities are employed in the areas such as cleaning services and laundry during the production of services, can be considered as advantageous for them. However, discrimination against women at the workplace, the inequality in their personal rights and the exposure of women to negative practices due to their sexes constitute an important problem.

Woman Employment in Tourism Industry and Gender Discrimination

Economists and social scientists have studied on discrimination to which women are exposed in the workplace for a long time. The need for manpower is increasing day by day for the continuation of the labor-intensive tourism industry where manpower is used in the most effective way. In the last 20 years, the tourism industry has entered a period of a considerable growth and as a result, a rapid job opportunity and development have occurred in the tourism industry. Considering the total number of employment all around the world, the percentage of employment in the service industry is increasing in parallel with the number of travelers. According to the data in 2016, the employment rate of the service industry in the total number of employees is slightly over 50.0%. Similarly, the percentage of women employment which was 41.1% in 1995 increased to 57.4% in 2015 (ILO, 2016: 5). In parallel with this increase, the employment of women in the tourism industry is more than twice that of other sectors in the world (Cukier, Norris, & Wall,1996). However, the increase in the number of women working in the tourism industry does not show that the employment of women is adequate and appropriate. The main reason for this is that women and men are distinguished in the industry; that is, they are subjected to discrimination.

In the 21st century, women are now better trained, educated and improve themselves in different subjects and fields as much as possible; they aim to work with men in the jobs they do. However, the female labor force is faced with more different problems than men in both social and economic life. Many researches on this issue have determined that the multi-faceted discriminatory practices which women have experienced in the labor market are not due to their own choices and personal deficiencies but to sexist perception in social and cultural structure and the institutional hurdles they encounter in the education, vocational training, and employment process (Uguz & Topbas, 2016).

The diversity and complexity of the jobs carried out in the tourism industry prevent the generalization and researches on tourism have suggested that women are more limited to be in administrative positions which are better paid and require the ability. Although women constitute the majority of the labor force just like in tourism businesses as well as in other areas of tourism, their professions are generally gendered (Fiona, 1997). For example, women in the industry are mostly employed in housekeeping and

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

laundry services (Halis & Camlibel, 2011; Catherine & Pine, 2003; Doherty & Manfredi 2001; Woods & Vienhland, 2000), while they are hardly ever assigned to be the senior manager (Akgemci, 2004).

Gender discrimination occurs vertically and horizontally in the tourism industry. Women and men are working in different jobs in horizontal discrimination; in other words, women are recruited as a waitress, cleaning lady, housekeeper, travel agency saleslady, while men are employed as waitress, barman, and driver. The typical sexual pyramid is common vertically in the tourism industry. The typical sexual pyramid is also prevalent in the tourism sector; men are dominant in the key tasks of the administrative positions, whereas women are concentrated on the jobs which have very fewer opportunities to develop career and are at lower levels (Hemmati, 2000). The problems women have experienced in the tourism industry and discrimination against them are summarized below:

Inequality in Promotion and Glass Ceiling

Despite the increase in the number of women working in the tourism industry, women are more likely to work in lower and middle positions because of the existence of male-dominant systems. Even women often put up with higher personal costs (time, labor, pressures, prejudices, etc.) than men to access the top positions (Mueller, 2004). However, even highly educated and experienced women are left behind men in achieving to the top management. In general, the opinions of business owners are that working women are not promoted and brought to the top management since they are actually working temporarily because of having children and their responsibilities within the family (Aytac, Sevuktekin, & Işıgıcok, 2002).

According to the researches, the reasons that prevent women from reaching the top are as follows (Griffin, 1993):

- Women have to slow down and stop their career processes in order to raise children after a short time when they start working, which is a major obstacle in reaching to the top management. In fact, the results of the researches have shown that pregnant women are primarily considered to dismiss them for employment.
- Women generally have to provide a balance between their responsibilities of family and business life. It is thought that women will not have enough time for senior management tasks when they need to allocate some time for the responsibilities for their children and domestic tasks. It is therefore assumed that women will be seriously affected by the role conflict in the course of a career.
- The belief that women do not have management, engineering, business, leadership skills or that these skills do not adequately develop has formed a prejudice that they are not ready for the responsibility of the senior management.
- Women are considered to be inferior to men in terms of establishing the authority and making someone work.
- Women are thought to lack the ability to manage because they are emotional.

Arbitrary obstacles which are placed between women and senior management in order to stop women from progressing to the top management levels of the organizations and prevent them from proceeding regardless of their achievements are called the glass ceiling (Boone & Kurtz, 1992). The glass ceiling is a concept that is used when women are not as well assigned to the upper levels, even though they are as much educated as their male colleagues (Celikten, 2004).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The glass ceiling leads women, especially married and with children, to less promoted and rewarded in terms of their careers when compared to their male colleagues in business life. This ceiling is seen as a very difficult obstacle to break. Honestly, very few women can overcome these obstacles and become top managers (Aytac, 2000). Women can be promoted at the bottom of the glass ceiling, but they cannot go beyond the ceiling (Baxter & Wright, 2000).

The obstacles defined by the concept of the glass ceiling leads to problems in the organizational performance due to at least three reasons. Firstly, women managers feel that they are prevented from reaching senior management levels because of their gender, reducing their desire and motivation to work. Therefore, the belief that overtime work or high achievement will not be rewarded reduces efficiency at all levels of the organization. Secondly, the lack of homogeneity among the members of the senior management results in weakness and lack of judgment. Finally, gender-based obstacles to female managers cause the organization to be deprived of the skills and resources it needs (Dreher, 2003).

One of the most important sectors where the glass ceiling is felt by women workers is tourism. According to the studies on the relevant subject carried out on different countries, a large number of women who are especially working in hospitality businesses have expressed that they feel the glass ceiling in the enterprises where they are working and it interrupts their careers (Li & Leung, 2001; Mathur-Helm, 2006; Anafarta, Sarvan, & Yapıcı, 2008). Studies conducted by Garey (1991) and Dalkiranoglu (2006) have also shown that women are suspended from businesses that require leadership and high responsibility and they are directed to lower-degree jobs. Besides, these studies have stated that women are not adequately trained to become managers and are negatively influenced by male-dominant work network and they are also professionally exposed to non-credibility and unreliability of the top management.

Working Hours and Salary System

Although the International Labor Organization adopted equal pay between male and female workers for equal works in 1951 (ILO, 1951), women's wages correspond to 70% to 90% of men's wages in the majority of countries (Plantenga & Remery 2006). On the other hand, the European Commission has stated that the wage difference between men and women is constant and women earn 5% less than men per working hour (ITUC, 2009).

The fact that women's jobs are usually temporary and low-wage jobs lead to a very limited number of women in employment, an increase in the rate of transition to unemployment, a decline in the quality of women's workforce and a restriction of women's long-term employment. The common belief that women are working to support their family in many countries leads to the idea that women constitute a spare workforce that is needed during the period of economic growth and is marginalized during the period of regression.

One of the discriminatory behaviors in wages between women and men is the issue of additional rights. As female workers with very low chances of becoming managers in the industry are not able to benefit from the rights of additional indicators and severance pay, which are valid for certain managerial levels, it means that women have not the same opportunities as men as they get the financial opportunities provided by the market (Alparslan, Bozkurt, & Özgöz, 2015).

For the tourism industry, a majority of women are employed in part-time or temporary jobs or they are less paid for the same work. For example, the study conducted by the ILO (2016) has demonstrated that 57.0% of women are employed in part-time. Although the laws that have been issued since the industrial revolution have suggested equal pay for equal work regardless of gender difference, it is seen

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

that they are inadequate and not performed. The position of the woman in the tourism industry is usually concentrated in labor-intensive but unqualified and low-paid jobs (Aytac, Sevuktekin, & Işıgıcok, 2002). The concentration of women and men in certain business lines such as tourism leads to the advantageous position of men in education and work experience resulting in low wages paid to women (Hoffman & Everett, 2005), women face on discrimination on wages even if they progress equally to men in their careers (Stockford, 2004). Thus, some studies have shown that women working in the same position with men in the tourism sector receive less salary (e.g. Burgess, 2000; Demirkol, Fidan, & Pelit, 2004; Santos & Varejao, 2007; Skalpe, 2007; Thrane, 2008; Soria, Ortega-Aguaza, & Ropero-García, 2009; Eyuboglu, 1999; Costa, Carvalho, Caçador, & Breda, 2012; Garcia-Pozo, Campos-Soria, Sánchez-Ollero, & Marchante-Lara, 2012; Yanardag & Avci, 2012; Uguz & Topbas, 2016).

One of the most important issues faced by women in the tourism industry is related to working hours. The industry continuously provides service and businesses incessantly need to provide service, which requires working for long hours, occasional night, evening, weekends and special days. Although it is also valid for male employees, this negatively affects women's working life in the industry.

Mobbing, Emotional and Physical Abuse

Mobbing or emotional abuse is also expressed as psychological and emotional pressure, coercion and psychological violence. Psychological violence is apparently or allusively applied to the person by their superiors or colleagues through disrespectful, degrading, abusive, aggressive behaviors. If this situation is continuous, the person desires to move away from the environment in which s/he exists and her/his job or s/he is sick of it. Undoubtedly, mobbing can be applied to both women and men at work. However, female employees are less resistant than men in coping with mobbing.

Physical abuse is one of the most important problems faced by women working in all sectors, especially in the tourism sector. This situation causes women to be unable to work for a long time in the industry, not to love their jobs, to be unsuccessful, and to be unable to exist within the enterprise. Women are occasionally disturbed and negatively affected to make a career in the tourism industry because of the reasons such as working in the same environment with the customer, night shifts and the comfort of the customer in the psychology of entertainment in the tourism industry. Most researches (Kozak, 1996; Demirkol, Fidan, & Pelit, 2004; Turker, 1997) in various countries have indicated that sexual harassment is a common problem in the tourism industry. On the other hand, the image of harassment in the tourism industry affects women's career opinions negatively. In particular, the use of the female body as a marketing and media tool in the tourism industry, suggests that the journalists who advertise tourism are working in a male-dominated field and affects its reflection on the press negatively (Tuncel, 2011).

Multiple Role-Taking

Women who are actively involved in today's work life must fulfill the tasks they undertake at work while trying to fulfilling the role of being a spouse and mother in the house, which the community places a load on them. Especially in patriarchal societies, the career plans of women in business life can be kept in the background, because it is assumed that the role of women is to carry out housework and provide care and development of children. Although there are differences depending on the country, the traditional role of a woman is limited to home, child, and family and it is restricted by various obstacles to reach certain positions in business life (Aytac, 1999). There is also the exact opposite situation. It is seen that

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

women who are actively involved in business life and are particularly working in any job with irregular working hours such as tourism sector, but have more responsibilities in the family neglect their jobs and/or push their careers into the background (Ozkaya, 1999). Women have generally stated that they have to marry late and are late to have children when they care about their careers, and they are divorced because of it (Alben & West, 1992).

Women's Personal Preferences and Perceptions

How women see themselves, their education, personal development, experiences and special interests show their orientation to the profession and their potential for success and promotion in the profession they will perform. Although the roles socially undertaken to women in the past have influenced their job preferences, their preferences and professional perceptions affect how women perceive themselves and where they put themselves in their careers. Women often perceive themselves as sexless and equal to men in business life. However, the attitudes that women face in their business life or in the family can also affect their personal preferences. According to the studies, almost half of the women do not feel the support of their families and there are conflicts in terms of family and work roles. In other words, their psychology and their roles can be considered as problems of women employment in tourism besides external factors that prevent women (Li & Leung, 2001). Conversely, Iverson (2000) found that women in the hospitality industry have fewer salary expectations than men both in the beginning and high levels of their career. Even the differentiation of this expectation based on sex indicates that female employees feel disadvantaged. According to the study by Ensari et al. (2006), it was demonstrated that women do not consider themselves structurally suitable for being a manager and some women prefer to be governed because they believe male competitors are better at managing.

Other factors related to women's self-perception in business life are as follows (Orucu, Kılıc, & Kılıc, 2007):

- Women's attitudes towards gender roles,
- Internalizing social values without questioning,
- Accepting negative prejudices against women and acting in this direction,
- Experiencing work-family conflict and unable to cope with feelings of guilt because of the role assigned to her in the family,
- Lack of self-confidence, indecisiveness, not knowing what you want; the desire to improve themselves and change circumstances, not to have faith or opportunity,
- The belief that the system cannot be changed, feeling the obligation to support the system,
- Not to choose to advance in career/not to be career oriented, not to bear requirements and necessities to advance in career.

Lack of Role Model

Role modeling is a peer-to-peer relation which aims to provide individual and professional development experienced between an experienced member and inexperienced member through coaching, supportiveness, and guidance (Palankok, 2004). As noted earlier, female employees are assigned to senior positions in tourism businesses, which leads to the lack of the sufficient number of role models to guide women in tourism enterprises.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Organizational Culture

Every organization has a personality that distinguishes them from the others, as each individual has its own unique personality. Organizational culture is defined as a collection of values, standards, norms, beliefs, and understandings shared by members of the organization (Hofstede, 1980). Different structures of organizations constitute this culture and distinguish the organization from the others. An organizational culture that an organization creates within itself also affects employees' morale, motivation, job satisfaction, job commitment and even their decision to stay in business. However, in today's world, the organizational culture which is dominated by men makes it difficult for women to be fully included in this group, which makes the woman alone in the organization. Men are more reluctant to share power with women in their business lives (Hale, 1999). It is obvious that women have difficulty in being involved in organizational culture in tourism businesses, especially because the line management of the enterprises in the tourism industry are mainly consisted of men and women are employed for certain jobs.

Organizational Politics

One of the most important factors affecting the business life of women is organizational politics. Politics such as unwillingness of the business to hire female employees, imposition of some restrictions in spite of the conflict of the enterprise with job specifications in the recruitment and selection of the personnel or matching of the characteristics sought in candidates who are to apply for employment with gender have yet to distinguish between women and men regardless of their qualifications. On the other hand, the enterprises can practice different gender-based applications depending on the management policies in the processes such as the promotion of the employees, their inclusion to the staff and pricing. Ersari et al. (2016) also suggested that there is a significant relationship between organizational culture and women's careers, and the career barriers are decreasing for women as organizational culture increases in terms of function/integration.

Non-Participation of Unofficial Non-Corporate Communication Networks

It is a body of unofficial relations composed of interpersonal relationships among members of an organization in an organization, in a workplace. Informal organizations that, while not written, allow an organization to fulfill tasks completely and in the shortest possible time, represent a whole of interpersonal relationships that affect decisions within a business or an organization. In business life, women are generally perceived as a minority by men and are excluded from informal relations (Starcevich, 1999). For example, male managers maintain their relation networks by participating in sports, social organizations and evening meetings after working hours, whereas women are passive in their participation in social networking because of their responsibilities in private life (Mueller, 2004). Women are excluded from this process because informal relations that are maintained outside the workplace are also the environment where business related matters are also discussed.

Gender Stereotypes: Occupational Segregation and Position

The main reasons for discrimination are prejudices. In business life, especially the prejudices of those, who are managers, against women and men lead to discrimination among people. When women are

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

included in business life, different perceptions and assessments have emerged for both women and society. In particular, many obstacles such as where the woman will work or which professions they may be involved in have been tried to be created. Hence, society expects people to undertake different roles in terms of their sexes. These expectations expressed as gender roles also determine the distribution of the duties that individuals are required to perform between genders (Yaylaci, 2004). Gender stereotypes result from the belief that there is a difference in personality, role difference, and stereotypical professional gender differences between men and women. The most important problem women encounter in business life is gender stereotypes (Demiriz & Yasar, 2009; Barutcugil, 2002). While the prejudice that women are more emotional and men are more rational is based on the belief that there is a personality gap between men and women, the belief that men should not work in a lower position than women is based on the prejudice that there is a role difference between men and women. The above-mentioned situation is also valid in the tourism industry and administrative tasks are deemed appropriate for men, while duties such as cleaning and service are seen as suitable for women. Thus, Tucker (2007) stated that women are not suitable for working in the tourism industry and tourism is considered as male business.

FUTURE RESEARCH DIRECTIONS

This chapter emphasizes the gender discrimination in the tourism industry. It seems that gender discrimination is major problem both developing and developed countries. This distinction does harm to both women who are working and/or want to work or make a career, and businesses. The issue is also an important problem for the tourism industry. Therefore, it should be investigated by all enterprises, especially tourism enterprises. This will be an important step in avoiding the gender discrimination of research and supervision by national and international organizations. On the other hand, the studies to be done on how the gender discrimination in the tourism industry can be put into practice in future periods is also thought to be an important step in solving this problem.

CONCLUSION AND RECOMMENDATIONS

Gender equality in business life remains a common problem that is addressed at a national and international level today. Although female employees are now as knowledgeable and talented as men, they are subjected to discrimination because of their gender rather than their job qualifications. Discrimination begins in the process of the employment application and continues in working conditions, in personal rights, in organization culture, and in progress/promotion opportunities. This means that the enterprise does not give a chance to the qualified employees and cannot make sufficient use of its qualified employees in terms of business. However, it is clear that this situation creates much more negative effects on female employees. Women who are exposed to discrimination in business life are disappointed and lose their business commitment.

It is clear that the main reason for discrimination in business life is not biological differences. Manpower is more needed as mental power than physical strength in our age when mechanization has intensively continued. Hence, almost all of the issues that women are exposed to discrimination in business life do not originate from biological differences. In general, it can be seen that gender discrimination in business life is caused by social norms, roles and statues assumed to women. It is obvious that the social

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

difference of the sexes cannot be an obstacle in succeeding a job because many women now fulfill their responsibilities such as being a mother, a spouse, looking at a house and they can also be successful in their work as much as men.

One of the most obvious discriminatory practices related to sex in the workplace is seen in the tourism businesses. The structure and characteristics of the works carried out in the industry are considered to be the male and female task and this prejudice is taken into consideration on the recruitment and the distribution of duties and responsibilities. Therefore, women are mostly employed in unskilled jobs and are not allowed to promote in the industry as a whole. On the other hand, it is seen that the employment of married and/or women with the child is obstructed as a significant part of the enterprises in the industry provide uninterrupted service every day of the year. It is important to change the perception of the countries to the family life. It can be recommended to the countries that men should be trained on home and child care so that women and men can equalize their responsibilities in family life.

One of the important issues women face in the tourism industry is related to wage inequality and working conditions. Due to the unpredictable demand, women in the tourism industry are often seasonally employed and paid less, and female employees are firstly laid off when it comes to dismissal. The most important problem of it seems to be the implementation of these regulations, not legal regulations. Therefore, the top management units of the countries should examine the difficulties in practice in order to avoid it.

Unfortunately, the prejudices settled into society in a long-time cause women to be in a learned helplessness. Social disciplines and general acceptance lead women to be unable to advance themselves in senior positions or to accept less salary, more adverse working conditions. In fact, this is due to the fact that women have been left behind in the business life since the beginning of their careers. On the other hand, occupational groups that are socially associated with gender are also obstacles for women to work in some jobs.

Gender discrimination in the tourism industry is seen as a major problem for the promotion of women in their business life (glass ceiling). On the other hand, women do not have sufficient access to training and career development processes that prepare them for the management positions. Given that women are as educated, skilled and self-developed as men, it is obvious that the main reason why women are not recognized for their opportunities to promote is the organizational cultures and policies of the businesses. Therefore, first of all, the businesses should break down their prejudices against women and include all talented and qualified people in the studies on career development regardless of their gender in order to solve the problem.

As the tourism industry is focused on relaxation and entertainment, it can also cause women to be interpreted by both business people and customers from time to time. In particular, the misinterpretation of a female figure in the written and visual promotional activities can lead women to be damaged verbally and physically, which completely distracts women from the idea of working in the tourism industry.

Consequently, it is clear that women are subjected to gender discrimination for various reasons in all businesses, especially in the tourism industry. Given that women are as talented, skilled and educated as men, it is the easiest precaution for business managers to move away from social prejudices and recognize women equal rights with men. On the other hand, the measures taken by the countries and the follow-up of the legislation they enact will cause the problem to be solved.

KEY TERMS AND DEFINITIONS

Gender: The state of being male or female and generally used with reference to social and cultural differences rather than biological ones.

Gender Discrimination: Gender discrimination indicate that discrimination based on a person's gender. Because of gender discrimination, woman (man) do not have the same opportunities for education, careers, social life, etc.

Gender Discrimination in Tourism Industry: Because of the diversity and complexity of the jobs carried out in the tourism industry, from biological point of view woman and man separate about their work.

Gender Role: Gender role socially constructed of women and men. Gender role or behavior learned by a person as appropriate to their gender, determined by the prevailing cultural norms. Gender role change among different societies and cultures, classes, ages and during different periods in history.

Tourism Industry: Tourism industry occur people, activity and organizations involved in providing services for tourist on holiday. The tourism industry includes hospitality (accommodation, restaurants), transportation (airlines, car rental), travel facilitation and information (tour operators, travel agents, tourist information centers), and attractions and entertainment (heritage sites and theme, national, and wildlife parks).

Chapter 67
Work Role Stress and Employee Outcomes:
Mediating Role of Job Satisfaction

Bindu Chhabra
International Management Institute, India

ABSTRACT

Work Stress is taking its toll on the working adults and the evidence of its detrimental effects is building in India as in United States and other developed countries. Research has shown that the work stress can lead to physical and psychological disorders that reduce job performance and negatively affect other employee outcomes. The purpose of the study was to examine the direct effect of work role stress on job satisfaction and two dimensions of employee outcomes i.e., organizational citizenship behaviour (OCB) and turnover intention in the Indian organizations. The study further aimed to investigate the mediating role of job satisfaction in the relationship between work role stress and two employee outcomes, i.e., organizational citizenship behaviour and turnover intentions. Data, using a structured questionnaire comprising the standard scales for work role stress, job satisfaction, organizational citizenship behaviour and turnover intentions, was collected from a diverse range of organizations in Delhi and NCR.

INTRODUCTION

Work stress is a common concern for managers and organizations and has been a popular topic within the public media over the past decade (Mamberto, 2007; Sanchez, 2011; Scarff, 2000). The consequences of stress are of utmost importance to both the employees and the employers. Previous research has shown that employees across all levels in the organizational hierarchy are susceptible to the negative consequences of stress (Kiev, 1987; Spielberger, Vagg & Wasala, 2003). Stress has been shown to have deleterious effects on employees' mental and physical health, as well as on organizational outcomes such as job satisfaction, job performance and employee turnover (Ngo, Foley & Loi, 2005; Kahn & Brosier, 1992; Newton & Jimmieson, 2009; O'Driscoll & Beehr, 1994).

According to a survey by Associated Chambers of Commerce and Industry of India in 2015, increasingly demanding schedules and high stress levels in the private sector employees are leading to depression or general anxiety disorders and have wide range of effects like daytime fatigue, physical discomfort or low pain threshold leading to increased absenteeism and performance deterioration. The survey further points out that nearly 45% of the corporate employees in private sector sleep less than 6 hours a day, leading to severe sleep disorders. A high cost economy which has been in prolonged slump; shrinking incomes and fear of layoffs are considered to be some of the causes. On-the-job stressors range from ambiguous job roles and deadline pressures, which are compounded by off-the-job stressors like dual-worker families, responsibility of taking care of the children as well as addressing the concerns and medical issues of aged parents. This presents a unprecedented set of challenges for the growing number of sandwich generation Indians, who have to simultaneously take care of their elderly parents as well as young children. This presents a unprecedented set of challenges for the growing number of sandwich generation Indians, who have to simultaneously take care of their elderly parents as well as young children.

There is voluminous research evidence showing that work stress can lead to physical and psychological disorders that reduce job performance, impeded learning transfer, resistance to change, employee dissatisfaction, absenteeism, tardiness, turnover, counterproductive behaviors and accidents leading to an increase in the overall cost of the organization in medical expenses (e.g. Danna & Griffin, 1999; Quick et al., 1997; Quick & Tetrick, 2003; Schat, Kelloway & Desmarais, 2005, Spielberger et al., 2003). Hence, there is a financial and ethical impetus for the organizations to reduce strain.

The present study aims to contribute to the existing body of literature by examining the direct effect of work role stress on job satisfaction, organizational citizenship behavior and turnover intention in the Indian Organizations. The study further aims to investigate the mediating role of job satisfaction in the relationship between work role stress and two employee outcomes, i.e. organizational citizenship behavior and turnover intentions.

Objectives of the Study

- To study the direct effect of work role stress on
  - Job satisfaction (JS)
  - Organizational citizenship behavior (OCB)
  - Turnover intentions (TI)
- To examine the effect of job satisfaction on OCB and turnover intentions.
- To investigate the mediating role of job satisfaction in the relationship between work role stress and the following employee outcomes
  - Organizational citizenship behavior
  - Turnover intentions

Theoretical Framework and Hypotheses Development

Work Role Stressors and Employee Outcomes

Research in the field of stress has been focused on the stimulus response paradigm suggesting that the employees in an organization have to work in stressful working conditions (stressors), which can result in a response characterized by negative attitudes and behaviors (Netemeyer, Maxham, & Pullig, 2005;

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Walker, Churchill & Ford, 1975). It has been seen that work role stress leads to emotional exhaustion in the employees leading to the feelings of helplessness, lowered self-esteem and lack of accomplishment (Cordes & Dougherty, 1993; Moore, 2000). The employees thus feel anxious and frustrated and develop negative attitudes towards their organizations, their work and towards themselves. This, in turn leads to job dissatisfaction. A large number of studies have shown a negative relationship between work role stressors and job satisfaction (Bedeian, & Armenakis, 1981; Chang, Rosen, & Levy, 2009; Lang, Wittig-Berman, & Rizkalla, 1992; Mulki, Jaramillo & Locander, 2008; Ngo, et al., 2005; Örtqvist &Wincent, 2006; Sullivan & Bhagat, 1992).

However, the impact of work role stress has not been as widely studied on another work outcome namely organizational citizenship behavior (OCB). Citizenship Behaviors are defined as the discretionary behaviors on the part of an individual, not formally recognized by the organizational reward system, yet they contribute to the effectiveness of the organization (Bateman & Organ, 1983; Smith, Organ & Near, 1983). The employees to support the interests of the organization even though they may not directly lead to individual benefits (Moorman & Blakely, 1995) often perform these behaviors. Since OCBs are acts that typically go beyond an employee's roles and duties, it is likely that work role stress will discourage employees from indulging in such behaviors. When the stress at work becomes excessive and exceeds available resources, employees respond by reducing OCBs rather than compromising on their task performance. This is because of the fact that the negative consequences associated with lower OCBs are less than those associated with lower task performance (Organ, 1997). Further, social exchange theory (Cropanzano, Rupp & Byrne, 2003), effort-reward imbalance theory (Siegrist, 1996), and resource allocation theory (Kanfer & Ackerman, 1989) all propose that higher levels of work stress will lead to lower levels of OCBs. Recently, Jain and Cooper (2012) conducted a study on 402 operators working in business processing organizations (BPO) in northern India, to study the impact of stress on OCB. They found that stress was negatively related to most dimensions of OCB.

Working in a stressful work environment leads to lower job involvement and psychological withdrawal from the work group (Brief & Aldag, 1976) and hence increases the turnover intentions. Intentions to leave may be regarded as the last stage in the sequence of withdrawal cognitions, ranging from thinking of leaving to intending to search for alternative employment (Tett & Meyer, 1993). Work role stress is considered an important antecedent of withdrawal cognitions and turnover behavior (Hom & Griffeth, 1995). According to the theories of role stress, ambiguous or conflicting role demands evoke role strain (Kahn et al., 1964; Netemeyer, Johnston & Burton, 1990), which in turn leads to dissatisfaction and turnover behavior (Fisher & Gitelson, 1983; Jackson & Schuler, 1985; Ngo et al., 2005).

The review of literature for this section demonstrates that role ambiguity; role conflict and role overload will have a negative impact on employee outcomes. In order to explore the relationship between work role stressors and the important employee outcomes of job satisfaction, OCB, and turnover intentions, the following hypotheses are proposed:

H1: There exists a negative relationship between work role stress and OCB
H2: There exists a positive relationship between work role stress and Turnover Intentions
H3: Work role stress is negatively related to Job Satisfaction

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Job Satisfaction and Employee Outcomes (OCB and Turnover Intentions)

The relation between job satisfaction and turnover intentions is well documented in the literature (e.g. Porter et al., 1974; Shore and Martin, 1989; Tett and Meyer, 1993). Cognitions about the job impact subsequent judgement-driven behaviours such as quitting (Fischer, 2000), meaning that, with increasing job satisfaction, disassociation is less likely (Maertz and Griffeth, 2004; Wright and Bonett, 2007). Analysis of the relationships between JS and OCB has generated a considerable volume of empirical work (e.g., Bateman and Organ, 1983; MacKenzie et al., 1998; Rioux and Penner, 2001; Schappe, 1998; Smith et al., 1983; Tansky, 1993; Williams and Anderson, 1991). In the current state of knowledge, relations are more often positive (e.g., Podsakoff et al., 2000), or sometimes nonexistent (e.g., Konovsky and Organ, 1996; Schappe, 1998; Williams and Anderson, 1991), but they are never negative. Payne and Webber (2006) found that the JS was positively related to service-oriented OCB, customer satisfaction, and customer loyalty. The extent to which the predictor variables interacted with one another and the role of employment status on these relationships was explored. High levels of JS or affective commitment resulted in more service-oriented OCB for employees and self-employed workers, whereas high levels of both resulted in more service-oriented OCB for owners. Chhabra and Mohanty (2014) also found a positive relationship between JS and various dimensions of OCB, mediated by organizational commitment.

To explore the relationship between JS and the two dimensions of employee outcomes i.e. OCB and turnover intentions, we propose the following hypotheses:

H4: There exists a positive relationship between Job Satisfaction and OCB
H5: There exists a negative relationship between Job Satisfaction and Turnover Intentions.

Mediating Role of Job Satisfaction in the Relationship Between Work Role Stress and Employee Outcomes

The proposed hypotheses and the theoretical arguments suggest that job satisfaction is a possible mediator in the relationship between work role stress and employee outcomes of OCB and turnover intentions. As discussed earlier, work role stress leads to emotional exhaustion, leading to the feelings of helplessness, lowered self-esteem and lack of accomplishment (Cordes & Dougherty, 1993; Moore, 2000). This leads to the feelings of frustration and anxiety among employees, who develop negative attitudes towards their organizations, their work and towards themselves. These negative feelings towards the job and organization impact subsequent judgement-driven behaviours such as whether to put extra effort in the existing job or in extreme circumstances, quitting the job. When the employees are satisfied with their jobs, they show considerable trust in its goals and values of the organization and are willing to work hard for it (Mowday et al., 1982). As a result, they play proactive roles and devote more energy than is required by the formal job description. The employees thus translate the positive effects of JS into extra role behaviours. These employees are also less likely to think of leaving the organization at the time of difficulties. Therefore, given the links of work role stress with job satisfaction, and of job satisfaction with employee outcomes, it seems likely that at least part of association between work role stress and employee outcomes is explained by job satisfaction.

H6: The relationship between work role stress and OCB is mediated by job satisfaction.
H7: The relationship between work role stress and turnover intentions is mediated by job satisfaction.

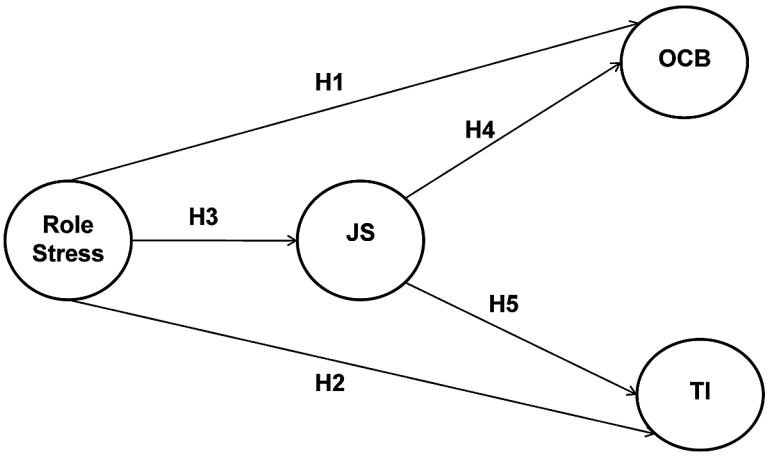
Figure 1. Proposed model



Methodology

Sample

Purposeful (maximum variation) sampling was employed (see Patton, 1990). A diverse range of organizations was approached to enable investigations of patterns relating work role stress, job satisfaction, and organizational citizenship behavior and turnover intentions. In all 450 professionals were contacted but only 347 completed questionnaires were collected (response rate 77%). The sample consisted of the executives mainly from five sectors viz. education (40), service (86), information technology (112), manufacturing (62) and health care (14) working in Delhi and NCR. However, 33 respondents were from the other sectors. Respondents ranged in age from 22 to 64 years (mean age 30.91 years and SD 9.25), 234 of them were males and 113 were females. Out of the total sample size, 164 respondents were married and 183 of them were single. Maximum number of respondents fell in the age range of 31-40 (116) and the majority of them (207) had the tenure ranging from 1-7 years in the organization.

Procedure

The employees of the various organizations were contacted and were asked to fill in the questionnaire. They were appraised regarding the academic purpose of the study and confidentiality of their responses was ensured.

Research Instruments

- **Work Role Stress:** Work Role stress was measured using a 13-item scale developed by Peterson et al. (1995). The scale consists of 3 items for measuring role conflict (e.g. I often get involved in situations in which there are conflicting demands), 5 items for measuring role ambiguity (e.g. I have clear planned goals and objectives for my job) and 5 items for measuring role overload (e.g. There is a need to reduce some parts of my role). Responses to these items were on a 5-point scale

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(1= strongly disagree and 5 = strongly agree). However, the five items pertaining to role ambiguity were reverse-coded.

- **Job Satisfaction:** Facets of job satisfaction was measured using nine items chosen from Cellucci and DeVries (1978) questionnaire. There were two items for satisfaction with pay, three items for satisfaction with coworkers, two items for satisfaction with supervisor and two items for satisfaction with work itself. The sample items for measuring these four facets respectively are, "My organization pays better than competitors", "When I ask people to do things the job gets done", "The managers I work for back me up", and "My job is interesting". These nine items were rated on a five-point Likert scale (1= strongly disagree and 5 = strongly agree). High scores imply satisfaction with the facets of job satisfaction and low scores imply dissatisfaction with the facets of job satisfaction.
- **Organizational Citizenship Behavior:** OCB was measured by adapting the Podsakoff et al. (1990) Organizational Citizenship Behavior Scale. The three OCB factors included were sportsmanship, conscientiousness, and civic virtue. Examples of these items are 'is willing to risk disapproval in order to express individual beliefs about what is best for the company' and 'turns in budgets, sales projections, expense reports, and other documents earlier than required'. These items were rated on a five-point Likert scale (1= strongly disagree and 5 = strongly agree). Average scores on the eight items were taken to yield a summary score reflecting OCB.
- **Turnover Intentions:** A 3-item scale originally developed by Vigoda and Kapun (2005) was used. The sample item is 'I will probably not stay with this organization for much longer'. The scale ranges from 1 (strongly disagree) to 5 (strongly agree). A higher score meant higher intentions to leave the organization or department.

Control Variables

Control variables in this study included gender, age, marital status, industry type and organizational tenure. Gender was assessed using a dichotomous scale: male (1) and female (2). Marital Status was also assessed using a dichotomous scale: married (1) and single (2). Industry type was assessed using a nominal scale: education (1), service (2), IT (3), Manufacturing (4), health care (5) and any other (6). Age and organizational tenure was measured in years using a continuous scale. Gender, age, marital status, industry type and organizational tenure were controlled for all regression analysis in order to minimize their influence on the focal variables in the study.

DATA ANALYSIS, RESULTS AND DISCUSSIONS

Table 1 presents descriptive statistics (means and standard deviations), correlations, and Cronbach alpha. All scales demonstrated good internal consistency.

Table 2 shows the results of the multiple regressions. As can be seen from the table, role stress has a significant negative relationship with OCB ($\beta = .21$; $p < 0.01$) and a significant positive relationship with turnover intentions ($\beta = .195$; $p < 0.01$) explaining 10.2%, and 21.4% variance respectively. These findings validate the hypotheses H1 and H2. There is also a significant negative relationship between role stress and job satisfaction ($\beta = -.402$; $p < 0.01$), explaining 25.4% variance and supporting H3. The effect of job satisfaction on OCB comes out to be significantly positive ($\beta = .331$; $p < 0.01$) explaining 18.2%

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

variance and validating H4. Further, as proposed and supporting H5, job satisfaction has a significant negative effect on turnover intentions ($\beta = -.27$; $p < 0.01$), explaining 28.5% variance.

The mediating effect of job satisfaction on the relationship between role stress and two employee outcomes viz. OCB and turnover intentions was examined in four stages as suggested by Baron and Kenny (1986). According to them, the positive test of mediation requires three conditions to be fulfilled. First, the independent variable must be related to the dependent variable. Second, the independent variable must be related to the mediator. Third, the mediator must be related to the dependent variable. All

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of these relationships should be significant to have a mediation effect. Further, the relation between the predictor and criterion should be reduced after controlling the relationship between the mediator and criterion variables.

As hypotheses H1, H2, H3, H4 and H5 are supported; the required conditions for testing the mediating role of job satisfaction in the relationship between CSE and two employee outcomes are fulfilled.

As can be seen from Table 3, there is an evidence of partial mediation of job satisfaction in the relationship between role stress and both the employee outcomes i.e. OCB and turnover intentions. OCB had a decrease in beta weight from $\beta = -.21$ ($p < 0.01$) to $\beta = -.10$ ($p < 0.01$), as did turnover intentions from $\beta = .195$ ($p < 0.01$) to $\beta = .11$ ($p < 0.01$). Further, job satisfaction was significant in both the regression models towards OCB ($\beta = .278$, $p < 0.01$), and turnover intentions ($\beta = -.213$, $p < 0.01$), showing that job satisfaction acts as a mediator in both the relationships.

In order to support the above results, the Sobel test was used. The Sobel test results indicated that there was a significant mediation effect of job satisfaction for role stress and OCB ($Z = -4.98$, $p < 0.01$) and for role stress and turnover intentions ($Z = 6.118$, $p < 0.01$). These results are in line with and support H6 and H7.

DISCUSSION

The purpose of this study was two-fold. The study aimed to see the direct effect of work role stress on job satisfaction, OCB and turnover intentions. The study also aimed to see if job satisfaction acts as a mediator in the relationship between work role stress and two employee outcomes viz. OCB and turnover intentions. The findings based on the sample from diverse range of organizations show that work role stress is negatively related to OCB and positively related to TI, proving H1 and H2. There is also a significant and negative relationship between work role stress and job satisfaction, hence supporting H3. The effect of job satisfaction on employee outcomes is also seen to be significant, positive in case of OCB and negative in case of TI. This supports H4 and H5. The results find evidence for the fact that there is a direct link of work role stress with job satisfaction and the employee outcomes of OCB and TI. In addition, the results prove that the link between work role stress and employee outcomes is partially mediated by JS. These results are in line with H6 and H7.

Research has shown that OCBs enhance productivity; help organizations compete with limited resources; and lead to greater coordination among employees (Koys, 2006; Podsakoff and MacKenzie, 1994). Especially in knowledge economy, where roles are less defined and the external environment is rapidly evolving, organizations increasingly rely on employees to fill the gap between what they are specifically rewarded for and the emergent behaviors necessary for the organizations to remain competitive. Organizations in this competitive scenario are attempting to become an employer of choice, which refers to an organization that outperforms its competition in attracting, developing and retaining people with required talent for its business (Joo and McLean, 2006). There is also a quest for the strategies to retain key employees without giving in to what are seen as excessive demands.

The findings of this study contribute to the organizational behavior literature by supporting previous studies linking role stress, job satisfaction and employee outcomes. Our results support a mediation model in which work role stress, as a distal predictor of behavior, influence the employee outcomes of OCB and TI through the proximal predictor of job satisfaction. The workplace today poses a lot of responsibilities on the employees and people are expected to be work long hours. The organizations require the employees to be "on-job" 24X7, by using highly advanced communication technology. This creates a serious work-life imbalance leading to increased stress. To make the matters worse, in this age of competition, the employees are sometimes required to perform roles which are conflicting and ambiguous. People experiencing this high work role stress are less satisfied with their jobs and feel less attached to the organization. This lack of satisfaction is reflected in the employees' behavior which would then be focused on doing only the work which is absolutely necessary and a part of their job description. These employees will not walk an extra mile for the organization and are likely to harbor the thoughts of leaving the organization. When organizations provide favorable work settings and stress free environment, the jobholders view these as rewards and thus reciprocate by making an emotional attachment with the organization, which may be demonstrated through more effort, regular attendance and greater participation in work. Strong emotional attachment and identification with the organization drives individuals to demonstrate behaviors, which are not directly linked with the formal reward system but support the effective and efficient functioning of the organization. Their psychological attachment may stimulate an increased desire for affiliation, without direct links to reward system and they may contribute to achieve organizational effectiveness by helping others with organizationally relevant tasks.

Implications of Results for Research and Practice

The present study has practical implications for managers and policy makers. The study shows that work environment features play an important role in workplace attitudes and behaviors. Organizations that are able to modify the work environment to make it reasonably stress-free are more likely to have satisfied employees who are willing to walk an extra mile for the organization and are less likely to think of leaving the organization. The organizations need to find ways for mitigating the factors contributing to job stress such as long working hours, employees possessing conflicting roles and highly ambiguous jobs. The managers should ensure that the employees understand their role requirements and expectations and have an adequate information about their jobs. However, since it is difficult to reduce workplace stressors beyond a point, it is important to find other effective ways to improve job satisfaction of the employees since it has serious ramifications in the form of decreased citizenship behaviors and increased turnover intentions. In order to achieve that, the managers can formulate various HR policies and practices, which nurture job satisfaction among the employees. Organizations need to find innovative solutions ensuring functional autonomy, flexibility and a sense of ownership people have towards their job. This involves making jobs more interesting and challenging, including employees in the decision making process and providing them with the opportunities for growth and advancement. Employees working in such an environment will go beyond the call of their duty to ensure its effectiveness and efficiency. The biggest benefit of the employees displaying improved OCBs will perhaps be reflected in reduction of attrition rates with all its associated benefits of cost and time efficiencies. These findings are supported by Guchait and Cho (2010) who suggest that the employees' belief that an organization intends to support them through its HRM practices (training, rewards etc.) can make them more committed to the organization and lower their turnover intentions. It further confirms the recommendations made by Biswas and Varma (2007) that Indian organizations need to pay more attention to employee perceptions of the work environment, thus providing an environment, which is employee friendly and promotes in-role and extra-role performance. The role of HR managers is of paramount importance in this scenario, as the employees perceive many of the critical organizational variables through the lens of their interactions with their managers. Practices such as counseling, development planning and career planning and supporting the subordinate through various initiatives like mentoring can increase the subordinate's engagement with the organization (Krishnan and Singh, 2010). This engagement will be reflected through the employees exhibiting the organizational citizenship behaviors and intending to stay with the organizations even at the time of adversity.

Limitations of the Study

As the design of the present study was cross-sectional, causal conclusions concerning the impact of job satisfaction on OCB and TI cannot be drawn. For example, the present study suggested that job satisfaction leads to organization citizenship behaviors and TI. However, it can be possible that exhibiting citizenship behaviors will lead to satisfaction with the job. With the cross-sectional design, there is no way of teasing out the relative contribution of these effects. A longitudinal study where job satisfaction is related to OCB and TI at a later point in time would provide a more rigorous test of relationships.

This study uses self-report measures to assess stress, job satisfaction, citizenship behaviors and TI. Although the measures used were reliable, the very fact that the independent, dependent and mediating variables were assessed using self-report measures could lead to the problems of common method vari-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ance. Further, with self-report measures, social desirability biases become a cause of concern. Future studies can also employ qualitative techniques to identify emergent themes in this area. The sample of the study was limited to the Indian employees from Delhi and NCR. There might be some culture specific issues, which were overlooked. Future studies may benefit from an exploration of a wider range of employees at different organizational levels, cultures, and sectors.

ABSTRACT

This chapter aims to know the mental workload level and its effects on middle and senior managers in manufacturing companies. The chapter aims to know the mental workload level related to gender, age range, civil status, number of children, years of experience, and worked hours per week. As method, the NASA-TLX method was implemented. This method measures mental workload based on six dimensions: mental demand, physical demand, temporal demand, effort, performance, and frustration level. Data was collected by applying an online questionnaire. Results indicated that some dimensions contributed to mental workload in the following decreasing order: mental demand, temporal demand, effort, performance, frustration level, and physical demand. Similarly, results from mental workload level varied from 55.73 to 64.10. Nevertheless, there was no clear relationship between the gender, age range, civil status, number of children, years of experience, worked hours per week, and mental workload level. Finally, employees manifested mental workload mainly due to stress, mental fatigue, and headache.

INTRODUCTION

Nowadays, the scientific and technological advances that have been developed in the last hundred years have facilitated the daily life in several aspects, decreased the physical effort in the tasks, as well as work-related activities that require greater technical and intellectual skills for their implementation. In fact, this affects the way in which occupational diseases have evolved as well as the Ergonomics approach by applying theoretical principles, data, and methods to design which are used to optimize the human well-being and overall work system performance (Dul et al., 2012; International Ergonomics Association (IEA), 2018).

Specifically, Ergonomics is both a scientific discipline and a profession. From a scientific discipline perspective, and according to several authors, Ergonomics involves the understanding of interactions among human beings and other elements of a system. On the other hand, from a professional perspective, Ergonomics applies theoretical principles, data, and methods to design in order to optimize the well-being and overall performance (Dul et al., 2012). In addition, to achieve its objectives, Ergonomics applies knowledge from different sciences, such as Medicine, Physiology, Physics, Psychology, among others.

Therefore, Ergonomics is a multidisciplinary science (International Ergonomics Association (IEA), 2018). According to the object of study, Ergonomics is divided into Physical Ergonomics and Cognitive Ergonomics. Physical Ergonomics focuses on physical aspects of work and human capabilities, such as force, repetitive movements, and body postures (Choppin, Roth-McDuffie, Drake, & Davis, 2018), the design of working environments to fit human physical abilities, i.e., Physical Ergonomics deals with physical variables that can affect human beings: repetitive movements, body postures, physical load, and environmental conditions (Goonetilleke & Karwowski, 2018). In order to achieve its main goal of optimizing the human well-being and the work systems performance, Ergonomics applies different assessment methods. For instance, methods of Physical Ergonomics include Rapid Upper Limb Assessment (RULA), the Rapid Entire Body Assessment (REBA), the National Institute for Occupational Safety and Health (NIOSH) lifting equation, Occupational Repetitive Action tool, and the Job Strain Index (JSI) (Otto & Battaïa, 2017).

However, the cognitive Ergonomics domain comprises mental and psychological variables, such as perception, information processing, decision-making, action-taking, memory, reasoning, and mental workload (Belkic, 2003), as they affect interactions among human beings and other elements of a system (Wung & Schatz, 2018). This last variable, mental workload, focuses in activities that are mental or cognitive in nature and may comprise physical coordination, but excludes physical activities (Jin, Zheng, Pei, & Li, 2017). Currently, it is presented in most of employees from different labor sectors (agriculture, aviation, manufacturing, services, education, among others) (Claxton Bomme & Fendley, 2018; Jin et al., 2017; Li, Cao, Lin, Braithwaite, & Greaves, 2017; McLean, Abry, Taylor, Jimenez, & Granger, 2017). As a result, it is urgent to promote research on the causes, effects, and methods of evaluation, as well as the generation of new knowledge concerning the mental workload in different labor sectors. Also, cognitive Ergonomics includes methods, such as NASA Task Load Index (NASA-TLX), Systematic Human Error Reduction and Prediction Approach (SHERPA), Subjective Workload Assessment Technique (SWAT), Cognitive Work Analysis (CWA), and Task Analysis for Error Identification (TAFEI) (Stanton, Salmon, Walker, Baber, & Jenkins, 2018). All these methods help reduce or eliminate occupational risk factors, provide well-being to workers, and improve the organizational performance in companies (Khani Jazani, Salehi Sahlabadi, & Mousavi, 2018).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Furthermore, the mental workload impact varies from one individual to another, for this reason, the authors of this chapter propose a research to determine the level of mental workload in middle and senior management from the manufacturing industry in Tijuana, Mexico. Also, it is intended to acknowledge those factors that may affect the level of mental workload, such as age, civil status, the number of children, just to a few aspects. At the same time, authors also seek to know the effects that mental workload may have on middle and senior management in the manufacturing industry; such effects may include mental fatigue, work errors, memory loss, irritability, among others.

Finally, in order to measure the level of the mental workload, the authors applied the NASA-TLX method, which is one of the most popular worldwide method.

LITERATURE REVIEW

Mental Workload

Mental workload is defined as the amount of effort involved in performing a particular task (Boet et al., 2017). Currently, employees from different labor sectors (agriculture, aviation, education, manufacturing, among others) are involved in several projects in the company where they work for. This fact leads employees to use, analyze, and process too much information at the same time, which cause them a mental workload. Additionally, employees are under frequent pressure to deliver results at a specific period of time, which increase the mental workload. For instance, in the agricultural sector several authors, such as Jin et al. (2017) have stated that recently agricultural vehicles have new features, which may lead mental workload to seem to be a critical problem. Similarly, Bashiri and Mann, (2015) point out that the increasing trend of automation in agricultural vehicles raises some concerns about the drivers' mental workload in such vehicles. These authors performed a case study using a tractor driving simulator, where they found that reaction time and number of errors made by drivers both decreased as the automation level increased.

Moreover, they found that there is a correlation among performance parameters and subjective mental workload reported by the drivers. Regarding the field of aviation, Young, Brookhuis, Wickens, & Hancock (2015) found that this field is the second one with more research on mental workload; only after driving field. Some other authors have focused on the decision-making and performance of pilots (Moriarty & Jarvis, 2014; Salas & Maurino, 1988; Wiegmann & Shappell, 2017). In fact, some studies have indicated that impaired situational awareness (SA) resulting from an excessive mental workload significantly degrades the quality of decision-making (Endsley & Garland, 2000; Lee & Liu, 2003; Salas & Maurino, 1988). Several authors mention that workload of pilots and air traffic controllers are heavy during landing, which leads to a stressful management of mental workload (Loft, Sanderson, Neal, & Mooij, 2007; Moriarty & Jarvis, 2014). Excessive mental workload in pilots may cause communication conflicts and accidents. For instance, Mosier et al. (2013) documented that 52% of communication conflicts occurred during the approach phase. Another study reported that communication errors were involved in 37% of aircraft accidents (Plane Crash Info, 2013).

Several authors have found that education is another labor sector in which employees suffer from high levels of mental workload. For instance, Xiao et al. (2015) study the effects of mental workload in the work ability in primary and secondary school teachers. They measure the mental workload levels and the work ability by applying the National Aeronautics and Space Administration-Task Load Index

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(NASA-TLX) and Work Ability Index (WAI) questionnaires, respectively. Also, these authors found that primary and secondary school teachers work ability reached the highest level at a certain level of mental workload (55.73 < mental workload ≤ 64.10). When the teachers' mental workload was lower than the level, their work ability had a positive correlation with the mental workload, i.e., their work ability increased or continuous stable with the increasing mental workload. Also, these authors found that the percentage of teachers with good work ability increased, while teachers with a moderate work ability decreased. These authors concluded that too high or low mental workload will result in the decrement of primary and secondary school teachers' work ability, whereas moderate mental workload (55.73∼64.10) will benefit the maintaining and stabilization of their work ability. Likewise, Mohammadian, Malekpour, Malekpour, Zoghipour, and Malalekpour (2015) analyzed the rate of mental workload on teachers and its correlation with their quality of life (QOL). As in the previous study, these authors applied the NASA-task load index (TLX) tool, and a questionnaire of QOL (SF36). They found that the median from mental workload between the teachers with two jobs and single job was significantly different ($P < 0.05$). Also, it was found that in the median between mental workload and dimensions of QOL (activity limitation due to emotional problems as well as social performance and general health) there was a significant negative correlation ($P < 0.5$). The median of the mental workload score was higher among teachers, which can negatively impact teachers' life quality, and the quality and quantity of their education. Some other authors that have done research on mental workload in teachers are Pimenta et al. (2015), who point out that long or demanding tasks are often performed in an educational context, which causes teachers feel exhausted with a performance degradation. In addition, Gray, Wilcox, and Nordstokke (2017) studied mental workload on teachers; they mention that teachers are in a profession with high demands, since they work to meet the diverse learning needs of their students. Consequently, many teachers experience high levels of stress contributing to fatigue, and unfortunately, many of them quit.

Furthermore, other labor sector where employees have experienced high levels of mental workload is the manufacturing industry. Choe, Tew, and Tong (2015) mention that operators who work in the material handling system must perform physical and cognitive tasks. These cognitive tasks include supervision, decision making, and control based on the available information. Thus, the automation of cognitive activities has become as significant as the automation of mechanical activities in today's material handling systems. These authors claim that a high level of cognitive automation may improve the operators' performance and decrease their mental workload. As a result, an increased level of cognitive automation and improved information flow can provide a better support material-handling operator, thereby enhancing manufacturing flexibility. Similarly, Zhao, Hsu, Chang, and Li (2016) state that the increasing complexity of products variety can increase mental workload in manufacturing activities. These authors also mention that mental workload can improve product quality and guarantee the efficiency simultaneously. However, minimal research has been done for balancing the quality production and efficiency, which is based on the mental workload effect and complexity in manufacturing activities. Therefore, these authors proposed a mathematical model to formulate the multi-objective problem in an assembly line, where the genetic algorithm for problem solving due to the computational complexities was applied. Their results showed that by incorporating the impact of mental workload on performance may consider the rolled throughput yield (RTY) and efficiency balance when designing an assembly line.

Based on the previous backgrounds, it is declared that mental workload influences employees' health and performance. This chapter focuses on measure mental workload in middle and senior management from manufacturing companies in Tijuana, Mexico. Also, this chapter provides descriptive information on several characteristics of employees, their level of mental workload, as well as the effects it causes

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

on them. Such characteristics include age, civil status, number of children, gender, years of experience, among others.

Effects of Mental Workload

As it was mentioned before, mental workload is presented continuously in activities from different industrial sectors. When these activities demand high levels of mental workload, several negative effects may be visible on employees. For instance, Pimenta et al. (2015) mention that mental workload can lead employees to suffer mental fatigue, mental health problems (i.e. chronic fatigue syndrome or depression), performance degradation, lack of attention in tasks, errors, and accidents. Similarly, several authors mention that high levels of mental workload may cause occupational stress on employees (Hong, Zhijian, & Baohua, 2003; Mohammadian et al., 2015), bad quality of life (Mohammadian et al., 2015), physical health problems (Babazono, Mino, Nagano, Tsuda, & Araki, 2005; Gholamreza, 2006; Lederer, Weltle, & Weber, 2001; Mohammadian et al., 2015; Stansfeld & Candy, 2006), occupational discomfort (Babazono et al., 2005; Lederer et al., 2001; Mohammadian et al., 2015; Stansfeld & Candy, 2006), anxiety (Babazono et al., 2005; Forcella et al., 2007; Maslach, Schaufeli, & Leiter, 2001; Mohammadian et al., 2015; Schaufeli & Greenglass, 2001; Unterbrink et al., 2008) and hypertension (Babazono et al., 2005; Forcella et al., 2007; Maslach et al., 2001; Mohammadian et al., 2015; Schaufeli & Greenglass, 2001; Unterbrink et al., 2008). Different authors have pointed out that both low and excessive mental workload levels result in poor operation performance of employees (Xiao et al., 2015; Zhao et al., 2016). Therefore, a medium mental workload level (55.73∼64.10 with the NASA-TLX) is appropriate.

Table 1 portrays a literature review summary of mental workload effects. It is relevant to notice that 19 negative effects are listed in Table 1, therefore, it is important that senior managers pay attention to the mental workload they assign to their employees.

Methods to Evaluate Mental Workload

There are several methods to evaluate mental workload. The following sections explain some of these methods.

NASA Task Load Index (NASA-TLX)

The NASA Tsk Load Index (NASA-TLX) is the most widely used method for measuring mental workload (Galy, Paxion, & Berthelon, 2018; Rizzo & Longo, 2017; Ruiz-Rabelo et al., 2015; Tubbs-Cooley, Mara, Carle, & Gurses, 2018). This method is a subjective validated workload assessment scale that was developed initially as a tool for subjective evaluation of individual workload in air traffic control, flight simulation, and vigilance, which has been increasingly applied to other sectors (Hart & Staveland, 1988; Ruiz-Rabelo et al., 2015; Tubbs-Cooley et al., 2018), such as nuclear energy, transportation, health care (Hart, 2006; Hart & Staveland, 1988; Hwang et al., 2008; Jacobson et al., 2011; Mazur et al., 2012; Tubbs-Cooley et al., 2018), transportation, cognitive psychology, and human computer interaction (Longo, 2012; Rizzo & Longo, 2017). It comprises six dimensions (mental demand, physical demand, time demand, performance, effort, and frustration), which are evaluated based on a 20-point scale ranging from 0 (very low) to 20 (very high) (Galy et al., 2018). These dimensions are also estimated through a paired comparison procedure. In this procedure, participants are required to decide, for

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

each paired comparison (there are 15 paired comparisons among the 6 dimensions), which aspect out of the two contributes the most to mental workload during a task (Rizzo & Longo, 2017). This procedure provides an overall index of mental workload as well as the relative contributions of each dimension (Ruiz-Rabelo et al., 2015). The overall index is the sum of the relative contributions of each dimension, and it is intended to measure the total of the mental workload experienced by an individual during a specific time, event, or situation (Hart, 2006; Tubbs-Cooley et al., 2018). The weights w represent the number of preferences for each dimension (i.e. the number of times each dimension was chosen) in the 15 paired comparisons. Therefore, the preferences range is from 0 (not significant) to 5 (more significant than any other attribute). The final mental workload score is estimated as a weighted average, considering the subjective rating of each attribute d_i (for the 6 dimensions), and the corresponding weights w_i (Equation 1) (Rizzo & Longo, 2017).

Table 1. Literature review of mental workload effects (The Authors, 2019)

Reference	Effects of mental workload

$$NASA-TLX = \frac{1}{15}\sum_{1}^{6} d_i w_i \quad (1)$$

Stanton et al., (2018) point out that the NASA-TLX has several advantages and disadvantages; the advantages are the following:

1. The NASA-TLX provides a quick and simple technique for estimating operator workload.
2. The NASA-TLX sub-scales are generic, therefore, the technique can be applied to any domain.
3. The NASA-TLX has been tested thoroughly in the past and has also been the subject of several validation studies.
4. There is a software package from the NALSA-TLX, however, for those who cannot acquire the software, the method format is also available in a handwriting form.
5. This is probably the most widely used technique for estimating employee workload.
6. The NASA-TLX is a multi-dimensional approach for workload assessment.
7. Different studies have shown the NASA-TLX is better than the SWAT technique.
8. When post-trial is performed the approach is non-intrusive to primary task performance.
9. The NASA-TLX has demonstrated sensitivity to demand manipulations in numerous flight experiments.

Similarly, the disadvantages of this method are the following:

1. When it is performed on-line, the NASA-TLX can be intrusive to primary task performance.
2. When it is performed after the fact, participants may have forgotten high workload aspects of the task.
3. Workload ratings may be correlated with task performance i.e. subjects who performed poorly on the primary task may rate their workload as very high and vice versa.
4. The sub-scale weighting procedure is diligent and adds more time to the procedure.

Other Methods

Stanton et al., (2018) mention that there are different methods to evaluate mental workload, such as Subjective Workload Assessment Technique (SWAT), and Subjective Workload Dominance Technique (SWORD), to mention few. Also, these authors point out the corresponding advantages and disadvantages. Table 2 provides a summarize about the other methods that can be used to evaluate mental workload, as well as their advantages and disadvantages.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Methods to evaluate mental workload and their advantages and disadvantages (Stanton et al., 2018)

Method	Advantages	Disadvantages
Modified Cooper Harper Scales (MCH)	1. It is easy and quick to use, and it requires minimal training. 2. Non-intrusive measure of workload. 3. It has been widely used to measure workload in a variety of domains. 4. It is accessible, unobtrusive, easily to performed and easily transferable. 5. High face validity. 7. It has been successfully applied to workload assessment in different flight simulation experiments incorporating demand manipulations. 8. The data obtained when using uni-dimensional tools is simpler to analyze than when using multi-dimensional tools.	1. It is a dated approach. 2. It was developed originally to rate controllability of aircraft. 3. It is limited to manual control tasks. 4. Data is collected post-trial, which is a subject for different problems, such as correlation with performance. Also, participants are restricted when reporting past mental events. 5. It is uni-dimensional.
Subjective Workload Assessment Technique (SWAT)	1. It offers a quick, simple, and low-cost procedure for estimating participant mental workload. 2. Its dim can be applied to any domain. 3. It is one of the most widely used and well-known subjective workload assessment technique available. 4. The Pro-SWAT variation allows the technique to be used to predict operator workload. 5. It is a multidimensional approach to workload assessment. 6. This technique has demonstrated a sensitivity to demand manipulations in flight environments.	1. It can be intrusive if it is performed on-line. 2. Different validation studies have reported that the NASA-TLX is superior to SWAT in terms of sensitivity, particularly for low mental workloads. 3. It has been constantly criticized for having a low sensitivity to mental workloads. 4. It is time consuming and diligent. 5. The post-trial collection of mental workload data has several associated disadvantages, including a potential correlation between mental workload ratings and task performance, and participants may be forgetting different parts of a task when workload was especially low.
Subjective Workload Dominance Technique (SWORD)	1. It offers a quick, simple use, and a low-cost approach for assessing mental workload. 2. It is especially useful when comparing the mental workload imposed by different tasks of devices. One potential evaluation would be for the evaluation of the mental workload imposed by different design concepts. 3. It is performed by post-trial, therefore is non-intrusive to task performance. 4. It has high face validity. 5. It has been demonstrated to have a sensitivity to mental workload variations.	1. The post-trial collection of mental workload data has several associated disadvantages, including a potential correlation between mental workload, ratings, and task performance, and participants may be forgetting different parts of a task when workload was especially low. 2. Only limited validation evidence is available in the literature review. 3. It has not been as widely used as other mental workload assessment techniques, such as SWAT and NASA-TLX. 4. The SWORD output does not offer a rating for participant mental workload as it is; only a rating list of what type of tasks or devices imposed greater mental workload than others.
Dra Workload Scales (Draws)	1. It offers a quick, simple use, and low-cost approach for assessing mental workload. 2. Data is obtained on-line during task performance, therefore, the problems of collecting posttrial mental workload data is discarded. 3. It has high face validity. 4. Sensitivity to workload variation has been demonstrated. 5. The workload dimensions used in the DRAWS technique were validated in several studies during the development of the technique. 6. Although its application was developed for the aviation domain, the workload dimensions are generic, allowing the technique to be applied in any domain.	1. It is intrusive to primary task performance. 2. There are limited applications reported in the literature review. 3. The workload ratings may correlate highly with task performance when it is implemented. 4. There is limited validation evidence available in the literature review. 5. The technique requires further validation.
Malvern Capacity Estimate (MACE)	1. It offers a quick, simple, and low-cost approach for assessing participant spare capacity. 2. The output is potentially useful, indicating when operators are experiencing mental overload and mental underload. 3. It provides a direct measure of operator capacity. 4. On-line implementation removes the problems associated with the collection of mental workloads posttrial (i.e. correlation with performance, forgetting certain parts of a task, etc.).	1. The technique is totally dependent on the participant's ability to estimate their remaining capacity. 2. The technique remains largely unvalidated. 3. The reliability and accuracy of this technique is questionable. 4. The MACE technique has only been used in simulators; it would be an intrusive technique if it is applied on-line during task performance in the 'real-world'.

Table 2. Continued

Method	Advantages	Disadvantages
Workload Profile Technique	1. The technique is based on sound underpinning theory (Multiple Resource Theory). 2. It is quick and easy to use, requiring minimal analytical training. 3. It also offers an overall task workload rating; the output also provides a workload rating for each of the eight workload dimensions. 4. It is a multi-dimensional mental workload assessment technique. 5. As the technique is applied post-trial, it can be applied in real-world settings.	1. It may be difficult for participants to rate workload on a scale of 0 to 1. 2. A more sophisticated scale may be required in order to obtain a more appropriate workload measure. 3. The post-trial collection of mental workload data has several associated disadvantages, including a potential correlation between mental workload ratings and task performance, as well as participants may be 'forgetting' different parts of a task when workload was especially low. 4. There is minimal evidence of the actual usage of the technique. 5. There is limited validation evidence associated with the technique. 6. Participants require an understanding of mental workload and multiple theory resources. 7. The dimensions used by the technique may not be fully understood by participants with limited experience on psychology and human factors. In a study comparing the NASATLX, SWAT, and workload profile techniques, it was found that there were problems with some of the participants understanding the different dimensions used in the workload profile technique.
Bedford Scales	1. It is very quick and easy to use, requiring minimal analytical training. 2. Its scale is generic; therefore, the technique can be easily applied in different domains. 3. It may be useful when it is applied along with other mental workload assessment techniques. 4. It has low intrusiveness.	1. There is minimal evidence of actual implementation of this technique. 2. There is limited validation evidence associated with the technique. 3. It offers limited output. 4. Participants are not efficient at reporting mental events 'after the fact.'
Instantaneous Self-Assessment (ISA)	1. ISA is a simple technique that it is easy to learn and use. 2. The output allows a workload profile for a task under analysis to be constructed. 3. ISA is very quick on its application as data collection occurs during the trial. 4. It has been used extensively in several domains. 5. It does not require too much resources. 6. While the technique is obtrusive to the primary task, it is probably the least intrusive of the on-line workload assessment techniques. 7. It is a low-cost technique.	1. ISA is intrusive to primary task performance. 2. There is a limited validation evidence associated with the technique. 3. ISA is a simplistic technique, offering only a limited assessment of operator workload. 4. Participants are not very efficient at reporting mental events.
Cognitive Task Load Analysis (CTLA)	1. The technique is based on sound theoretical underpinning. 2. It can be used during the design of systems and processes to highlight tasks or scenarios that impose especially high cognitive task demands. 3. It seems to be suitable for analyzing control room type of tasks or scenarios.	1. The technique seems to be quite complex. 2. This technique would be very time consuming when it is applied. 3. A high-level of training would be required. 4. There is no guidance on the rating of cognitive task load; it would be difficult to give a task load a numerical rating based on the underlying model. 5. Initial data collection would be time consuming. 6. The CTLA technique requires validation. 7. Evidence of its implementation is limited.
Pro-Sword – Subjective Workload Dominance Technique	1. It is easy to learn and use. 2. It is non-intrusive. 3. It has high face validity. 4. SWORD has been demonstrated to have a sensitivity to workload variations. 5. It is very quick in its application.	1. Data is collected post-task. 2. SWORD is a dated approach to workload assessment. 3. Workload projections are more accurate when domain experts are involved. 4. Further validation is required. 5. The SWORD technique has not been as widely used as other workload assessment techniques, such as SWAT, MCH, and the NASA TLX.

Table 2. Continued

Method	Advantages	Disadvantages
Primary and Secondary Task Performance Measures	1. When using a battery of mental workload assessment techniques for mental workload assessment, the data obtained can be crosschecked for reliability purposes. 2. Primary task performance measures offer a direct index of performance. 3. Primary task performance measures are particularly effective when measuring workload in tasks that are long in duration. 4. Primary task measures are also useful when measuring operator overload. 5. It requires no further effort besides the analyst to set up and record the data; as primary task performance is normally measured anyway. 6. Secondary task performance measures are effective at discarding tasks when no difference was observed while assessing performance alone. 7. Primary and secondary task performance measures are easy to use, as a computer typically records the required data.	1. Primary task performance measures isolated may not distinguish between different levels of workload; particularly minimal ones. Different operators may still achieve the same performance levels under completely different workload conditions. 2. It is suggested that primary task performance is not a reliable measure when it is used isolated. 3. Secondary task performance measures have been known to be only sensitive to gross changes in mental workload. 4. Secondary task performance measures are intrusive to primary task performance. 5. Considerable attention is required during the design and selection of the secondary task to be used. The analyst must confirm that the secondary task is having the same resources as the primary task. The secondary task must be carefully designed in order to be an appropriate measure of spare attentional capacity. 6. Extra work and resources are required in developing the secondary task performance measure. 7. The techniques are required to be implemented together to be effective. 8. Using primary and secondary task performance measures may be expensive, as simulators and computers are required.
Physiological Measures	1. Several physiological techniques have demonstrated a sensitivity to task demand variations. 2. When using physiological techniques, data is recorded continuously throughout task performance. 3. Physiological measurements can often be taken in a real-world setting, removing the need for a simulation of the task. 4. Advances in technology have resulted in an increased accuracy and sensitivity of the several physiological measurement tools. 5. Physiological measurement does not interfere with primary task performance.	1. The data is easily mistaken by foreign interference. 2. The equipment that is used to measure physiological responses is typically physically obtrusive. 3. The equipment is also typically expensive to be acquired, temperamental, and difficult to perform. 4. Physiological data is highly difficult to obtain and analyze. 5. In order to use physiological techniques effectively, the analyst(s) require a full understanding about physiological responses to workload. 6. It may be difficult to use certain equipment in the field i.e. brain and eye examination equipment.

METHODOLOGY

Instruments

Authors rely on the following instruments to perform the research on mental workload:

- **Computer equipment:** Laptop Toshiba Satellite C645d and Dell Inspiron 7567
- **Google forms**
- **Microsoft Excel®**

Method

The method presented in this chapter is divided into some phases. Figure 1 shows the different phases.

Phase 1: Contacting manufacturing companies. It is carried out in two ways: 1) students working in the manufacturing industry, and 2) the educational institution liaison office. In the first case, several students have a senior or middle job position, and/or interact with manufacturing employees who have these positions. Once students are contacted, they receive an explanation about the project and its objective, and if there are doubts, they are clarified. In the case of the liaison office, a similar explanation is given,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and then, the office contact ex-students who have a senior or middle job position in the manufacturing industry. Once ex-students are contacted, the same explanation is given to them.

Phase 2: Applying the mental workload questionnaire. Once manufacturing companies are contacted and employees are willing to participate in this research, a mental workload questionnaire is applied to them. The original questionnaire is written in Spanish and it is applied online through a Google form. The questionnaire contains items, such as job position that the employee currently has, gender, age, and number of children he/she has, to mention few. The Appendix, Figure 17 shows the English version of the mental workload questionnaire.

Phase 3: Debugging the database. Once employees answered the questionnaire, the information is registered automatically in an Excel® file, generating a database. From this information, some answers are removed from the database. For instance, if a participant answers that he/she is currently an operator, all the responds provided by this participant are removed from the database, since operator is not a senior or middle job position in manufacturing companies. The same happens if incoherent answers are given to other items.

Phase 4: Analyzing the data. Once the database is ready, the data is analyzed. This analysis is performed for all the companies in a general way. The analysis includes a comparison of the responses for each item with the mental workload level. This in order to determine the variables, and their levels, which can facilitate the increase or decrease of the mental workload. Mental workload is estimated by applying Equation (1).

Phase 5 Obtaining results. After the data analysis is finished, the results are obtained. These results are illustrated through graphs or tables for each item.

Phase 6: Analyzing results. Results are analyzed to stablish conclusions about the impact of each variable on the mental workload level in middle and senior management in manufacturing companies. As a summary, variables are arranged in a decreasing order according to their contribution level to mental workload.

Figure 1. Methodology applied to obtain mental workload on senior and middle managers in manufacturing companies

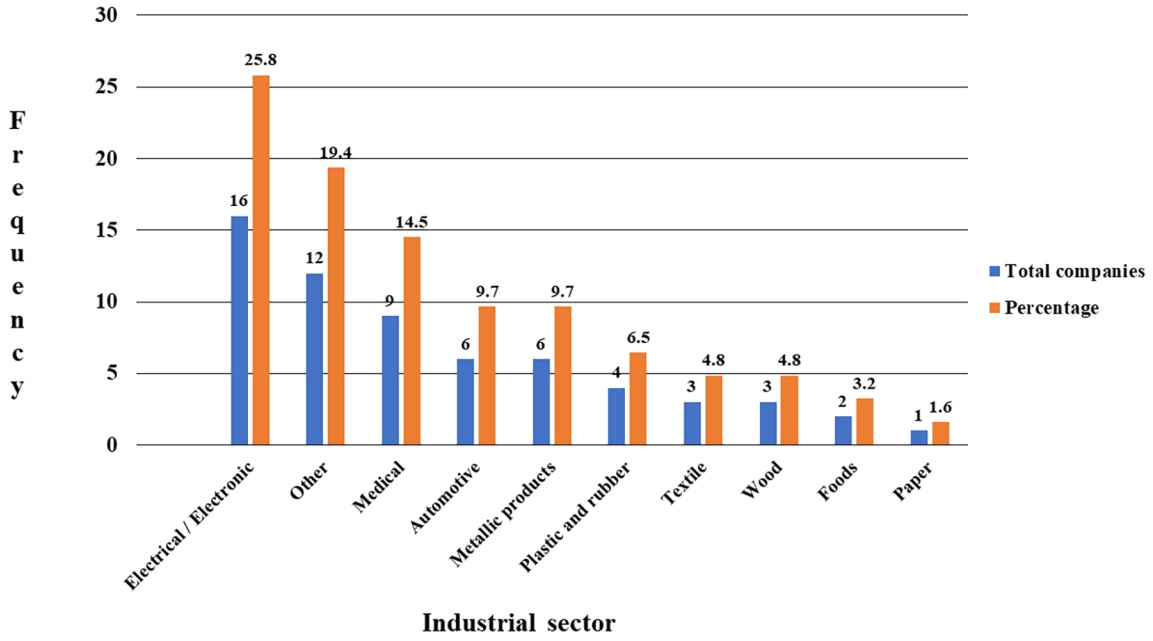
RESULTS

Phase 1

Results from phase 1 indicated that 62 companies were contacted. Figure 2 shows the distribution of these companies by industrial sector. It is important to notice that most of the companies belonged to the Electrical/Electronic sector, with 16 companies, representing 25.8% out of the 62 companies. On the other hand, only one company was in the Paper sector, this represents only 1.6% out of the 62 companies. Other sectors included Automotive, Medical, Food, Textile, Wood, Metallic products, Plastic and rubber, and Other.

Figure 2. Distribution of the surveyed companies by industrial sector

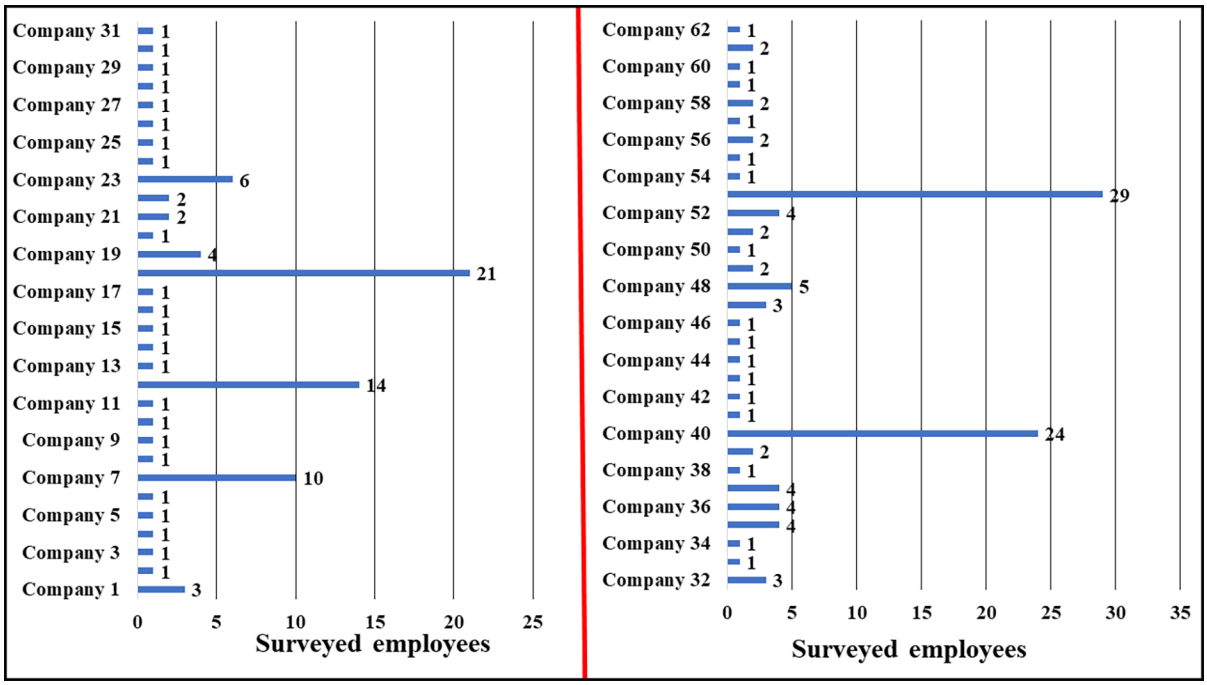


Phase 2

From the 62 manufacturing companies, 193 employees belonging to the middle and senior management were surveyed. The company with most surveyed employees was Company 53, with 29 employees, which represents 15.03% of the 193 surveyed employees. Most of the companies (39, i.e. 62.9%) contributed with only 1 employee to the research. One employee represents 0.52% of the total participants. Figure 3 presents the number of surveyed employees by company.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Surveyed employees by company



Phase 3

From the debugging of the database, it was obtained that the 62 originally surveyed companies, only 55 companies continued towards the final analysis of mental workload. Company 6, Company 16, Company 21, Company 26, Company 39, Company 51, and Company 57 were discarded from the database due to incorrect answers, such as omission of the company's name, the job position does not belong to middle and senior management, or that the company did not belong to the manufacturing field.

Specifically, from the 193 surveyed employees, only the data of 167 employees were acceptable in the database for further analysis.

Final Results

Mental Workload According to Gender

From the 167 surveyed employees, 99 were men while 68 were women. In both, mental demand was the dimension that impacted the most on mental workload, with values of 60.6 and 57.9 in men and women respectively. The second dimension that impacted the most on mental workload level was the time demand, with a value of 37 in men and 38.1 in women. Figure 4 shows the impact on mental workload level of the six dimensions, both in men and women. The average mental workload level for men was 65.1, whereas for women was 66.4. Figure 5 displays these results.

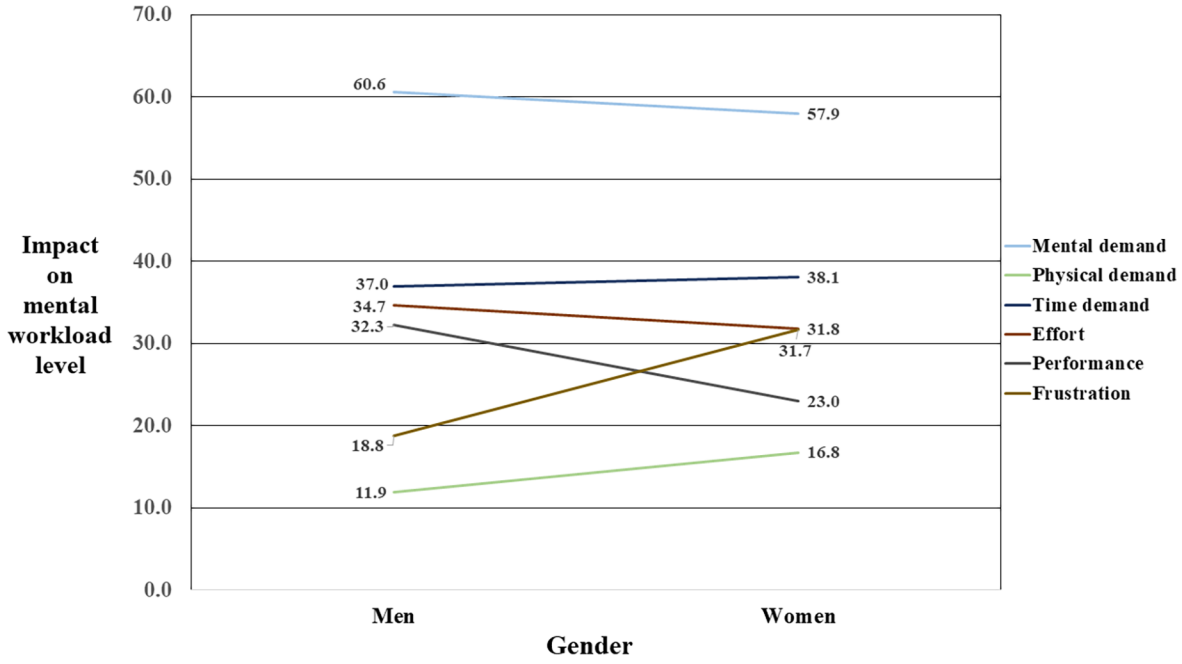

Figure 5. Mental workload level in men and women

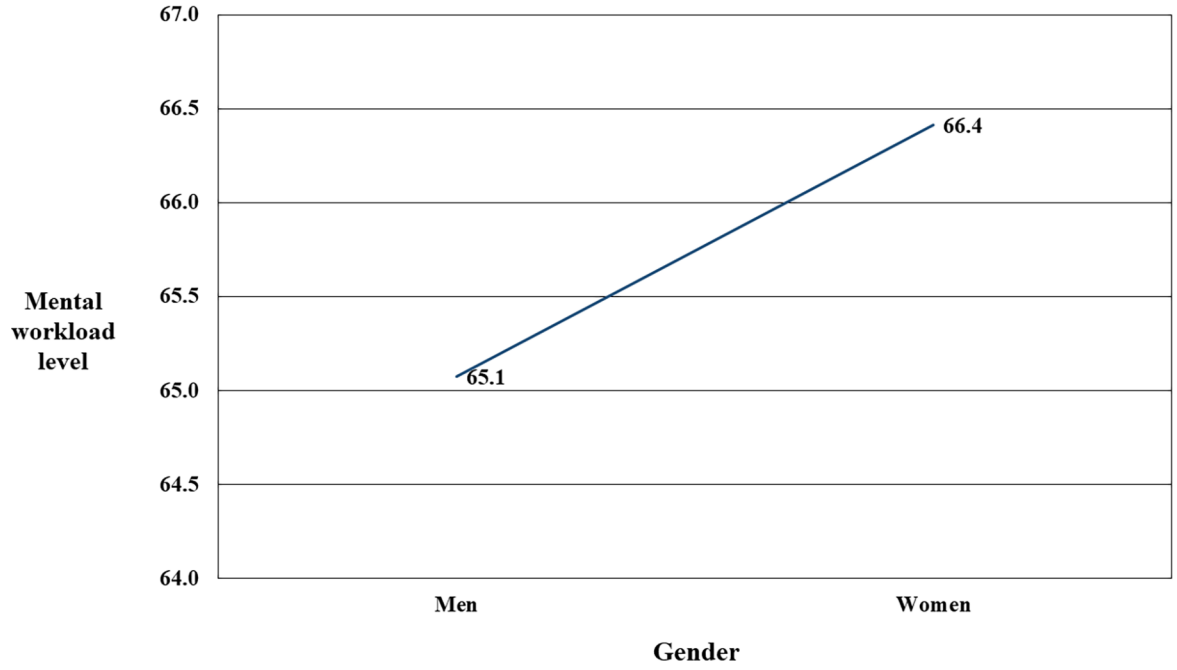


EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Mental Workload According to Age Range

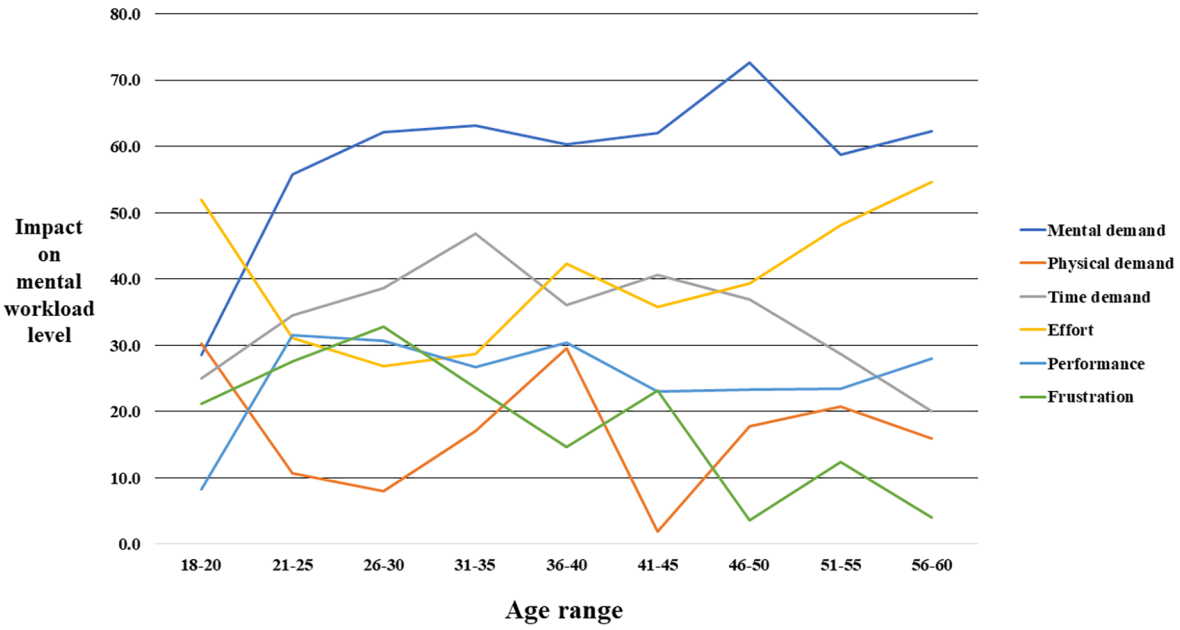
As in the case of mental workload by gender, mental demand was the dimension that more impacted on the mental workload by age range, followed by effort and time demand. Again, the dimension of physical demand was the dimension that has the lowest impact on mental workload. Figure 6 shows the impact on mental workload of the six dimensions according to the age range. Results of mental workload level according to the age range indicated that employees between 18-20 years old had the lowest level of mental workload with a value of 55.1. However, from the 21-25 age range to the range of 36-40 years old, results indicated that there is an increasing trend on the mental workload level, being employees in this last age range who presented the highest mental workload level with a value of 71.1. From employees between 41 and 60 years old, mental workload level varied from 61.7 to 64.6. Figure 7 shows these results.

Mental Workload According to Civil Status

Results of mental workload based on the civil status from surveyed employees showed that the dimension of mental demand was the one that impacted the most on the general mental workload level, followed by the dimensions of time demand and effort. On the other hand, dimensions of physical demand and frustration had the lowest impact on the general level of mental workload. Figure 8 presents the impact on mental workload of the six dimensions according to civil status.

Regarding the mental workload level, results indicated that married employees had the highest one, with a value of 66.9, whereas employees in free union had the lowest mental workload level, with a value of 63.2. Figure 9 shows the results of mental workload level according to civil status.

Figure 6. Impact of the six dimensions on the mental workload level according to age range



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

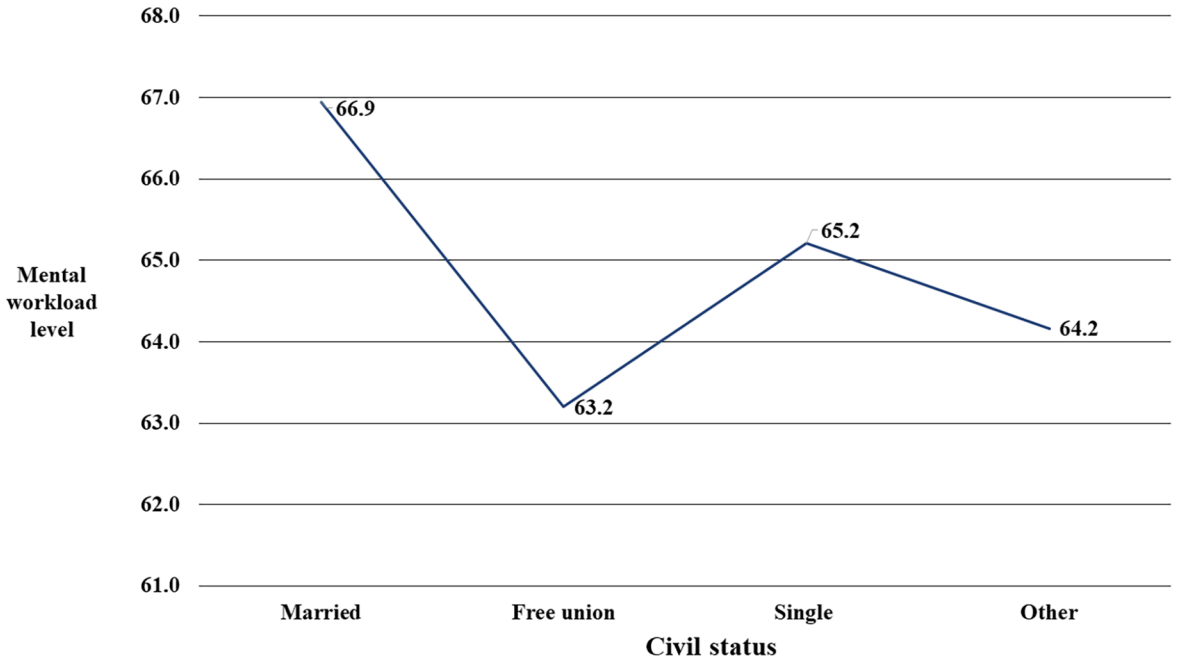
Figure 9. Mental workload level according to civil status



Mental Workload According to Number of Children

Results from mental workload, according to the number of children that employees have, indicated that the dimension of frustration had the lowest impact on the mental workload level, since for employees with ˃ 4 children, this dimension had a value of zero. The second dimension with the lowest impact on mental workload was the effort. On the other hand, it is repeated that the dimension of mental demand had the highest impact on the mental workload, followed by the effort and time demand. Figure 10 shows the impact of the six dimensions on the mental workload level according to the number of children. Similarly, Figure 11 presents the general mental workload level of surveyed employees according to the number of children they have. Notice that the employees with only one child had the lowest mental workload level, with a value of 61.4, whereas employees with 3-4 children had the highest mental workload level with a value of 61.4. Employees with no children had a medium level of mental workload, with a value of 65.8.

Mental Workload According to Years of Experience

Once again, results indicated that mental demand was the dimension that contributed the most to the mental workload level, this time according to years of experience. Effort and time demand were the other two dimensions that contributed the most to the mental workload level. On the other hand, frustration, physical demand, and performance had the lowest impact on the mental workload level. These results are shown in Figure 12. Regarding the mental workload level, employees between ˃ 25-30 years of experience had the lowest level of mental workload, with a value of 55.4, whereas employees between ˃ 30-35 had the highest mental workload level, with a value of 76. Figure 13 shows all the results of mental workload level according to the years of experience.

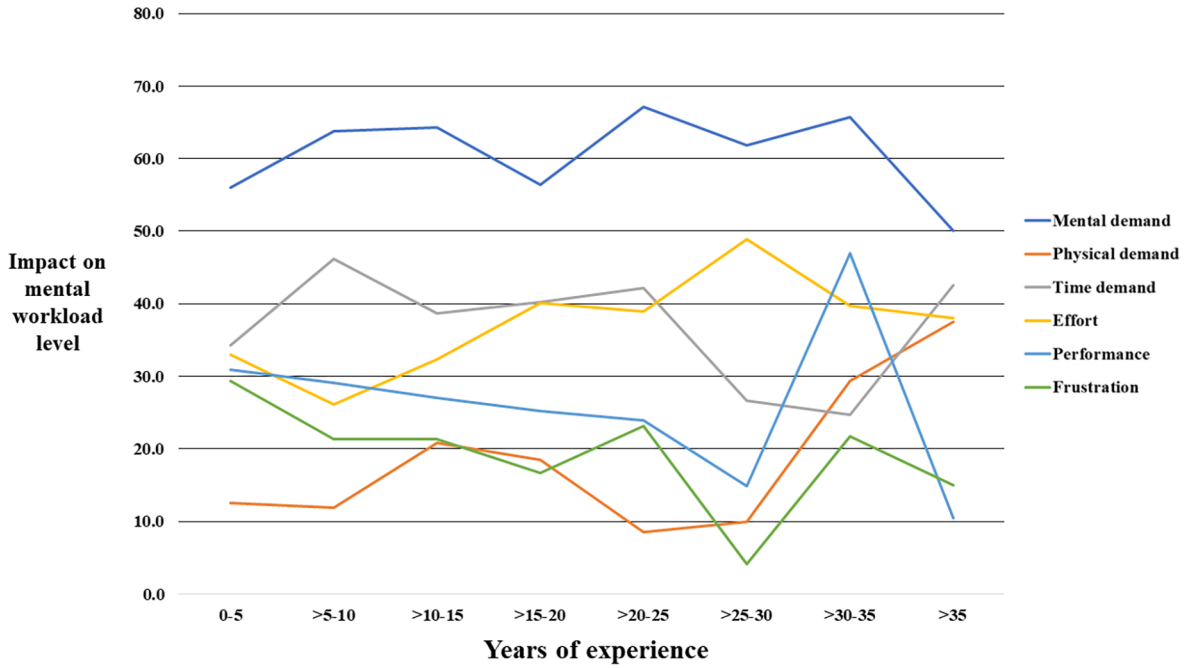

Figure 13. Mental workload level according to years of experience

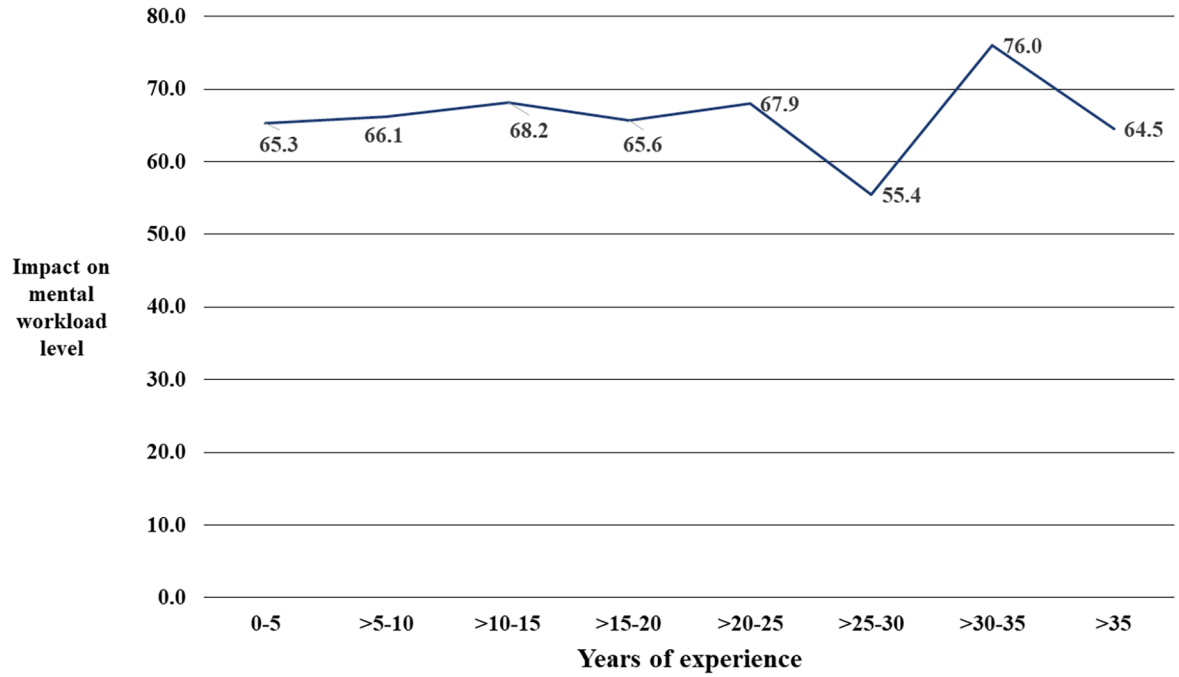

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Mental Workload According to Worked Hours per Week

As in all other results, mental demand was the dimension that contributed the most to the mental workload according to the hours employees work per week. The other two dimensions that contributed the most to the mental workload level related to the worked hours per week, were time demand and performance. The lowest impact on mental workload was due to the dimensions from physical demand, frustration, and effort; Figure 14 shows these results. Regarding the mental workload level, employees that work between ˃ 30-35 hours per week had the lowest level of mental workload, with a value of 62.4. On the other hand, employees that work between ˃ 25-30 hours per week had the highest level of mental workload, with a value of 73. Figure15 displays the level of mental workload according to the worked hours per week. Notice that in these results, as in the other ones, there is no trend that indicates that the mental workload level increases according to the value of a specific variable.

Effects of Mental Workload

Regarding the mental workload effects, results indicated that employees have suffered from stress, headache, physical and mental fatigue, irritability, depression, work errors, loss of memory, social problems, and increment on body weight. The most frequent effects were stress and mental fatigue, whereas the less frequent effects were social problems, depression, and loss of memory. Figure 16 shows these effects and their frequency.

FUTURE WORK

As a matter of fact, while considering the present research, including not only the results, but also the data, there is an opportunity to perform a deeper investigation on the causes and effects of the mental workload. Therefore, it is suggested to propose specific hypotheses and create a hypothetical causal model. Consequently, performing a statistical analysis through a structural equation modelling (SEM) will help obtain more precise results concerning the effects of age range, civil status, number of children, years of experience, and worked hours per week over the mental workload level of middle and senior management employees in manufacturing companies. Similarly, future research will help to know the mental workload effects and their significance on this type of employees. Specifically, such effects may include those presented in Figure 16, i.e., stress, mental fatigue, headache, depression, just to mention few. This future research will allow to apply statistical tools to acknowledge concretely if there is a relationship among the variables analyzed in this chapter.

CONCLUSION

Based on the results previously presented, following conclusions are established about the six dimensions from mental demand:

- Mental demand is the dimension that contribute the most to the mental workload level in middle and senior management employees in manufacturing companies.
- Temporal demand and effort are the second and third dimensions that contribute the most to the mental workload level in the mentioned employees.
- On the other hand, physical demand is the dimension that contribute the least to the mental workload level in middle and senior management employees in manufacturing companies.
- Similarly, frustration level and performance are the second and third dimension that contribute the least to their mental workload level.

These conclusions lead a general conclusion, which is the following:

- Middle and senior management employees in manufacturing companies are exposed to high mental demand tasks, which is not a physical demand, as they feel pressured by the time, consequently, it leads them to maximize their effort to finish the tasks on time. Despite this, they meet the required expectations and feel satisfied with their performance.

Similarly, results lead to the following conclusions regarding the mental workload level:

- There is no significant different between the mental workload level in men and women.
- There is no relationship between the mental workload level and the age of the employees.
- There is no relationship between the mental workload level and the civil status of the employees.
- There is no relationship between the mental workload level and the number of children employees have.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- There is no relationship between the mental workload level and the years of experience employees have.
- There is no relationship between the mental workload level and the worked hours per week employees have.

As it can be seen, results of the mental workload level varied from 55.1 to 76.0. Considering that Xiao et al. (2015) mention that there is a better work ability when mental workload level varies from 55.73 to 64.10, the mental workload level of middle and senior management employees in manufacturing companies are out of this range, which may cause some effects, such as mental fatigue, stress, headache, just to mention few, as it is presented in Figure 16.

KEY TERMS AND DEFINITIONS

Effort: It refers to the degree in which a worker must expend energy, either physical or mental, to achieve the objectives of the company.

Frustration Level: It refers to the level at which employees feel insecure, dissatisfied, stressed out, and unmotivated when they perform a task.

Mental Demand: It refers to the amount of work where the execution of a specific task requires that employees perform mental processes, such as thinking, deciding, calculating, remembering, analyzing, searching, observing, to mention few.

Mental Workload: It refers to the resources demanded by a specific task. It may be influenced by effort, frustration, mental demand, physical demand, performance, and temporal demand.

NASA-TLX: It is the most widely used method to evaluate the mental workload in a specific task. It is based on six dimensions: effort, frustration level, mental demand, physical demand, performance, and temporal demand

Physical Demand: It refers to the physical effort required by a specific task, i.e. pushing, pulling, controlling, activating, and turning.

Temporal Demand: It refers to the time pressure that employees feel when performing a specific task.

This research was previously published in Evaluating Mental Workload for Improved Workplace Performance; pages 109-137, copyright year 2020 by Medical Information Science Reference (an imprint of IGI Global).

APPENDIX: MENTAL WORKLOAD QUESTIONNAIRE

Figure 17. Mental workload questionnaire

EVALUATION OF THE MENTAL WORKLOAD AND ITS EFFECTS IN MIDDLE AND SENIOR MANAGEMENT EMPLOYEES FROM MANUFACTURING COMPANIES

SECTION I. PERSONAL INFORMATION

Name and signature: _____

E-mail: _____

Company where you work _____

Current job position: _____

Date, City, State: _____

SECTION II. DESCRIPTIVE DATA

Instructions: Carefully read each question and select the option that best suits your reality.

1. Gender*
- ◯ Male
- ◯ Female

2. Age*_____

3. Civil status*
- ◯ Single
- ◯ Married
- ◯ Free union
- ◯ Other

4. Number of children*
- ◯ 0
- ◯ 1
- ◯ 2
- ◯ 3-4
- ◯ >4

5. Sector of the manufacturing industry where you work*
- ◯ Automotive
- ◯ Medical
- ◯ Electrical/Electronic
- ◯ Food
- ◯ Textile
- ◯ Wood
- ◯ Paper
- ◯ Chemistry
- ◯ Plastic and rubber
- ◯ Metallic products
- ◯ Computer equipment, ICTs
- ◯ Other

6. Years of experience in the manufacturing industry*
- ◯ 0-5
- ◯ >5-10
- ◯ >10-15
- ◯ >15-20
- ◯ >20-25
- ◯ >25-30
- ◯ >30-35
- ◯ >35

7. Number of worked hours per week*
- ◯ 0-5
- ◯ >5-10
- ◯ >10-15
- ◯ >15-20
- ◯ >20-25
- ◯ >25-30
- ◯ >30-35
- ◯ >35

SECTION III. EVALUATION OF MENTAL WORKLOAD WITH THE NASA-TLX METHOD

Instructions: Next, dimensions and scales that the NASA-TLX method uses to measure the mental workload are mentioned. Please select, for each dimension, the value that best represents your work, where 1 is Low and 20 is High*.

Dimension	Scale																			
Mental demand: How much mental demand and perceptual activity is required to perform your work (for example, thinking, deciding, calculating, remembering, searching, etc.)? 1 = Low, 20 = High	1																			20
Physical activity: From 1 to 20, how much physical activity is required, for example pushing, pulling, turning, controlling, activating, etc., to carry out their work? 1 = Low, 20 = High	1																			20
Temporal demand: From 1 to 20, how much time pressure do you feel due to the speed or pace at which tasks or task elements occur? 1 = Low, 20 = High	1																			20
Effort: From 1 to 20, how hard do you have to work (mentally and physically) to achieve your level of performance? 1 = Low, 20 = High	1																			20
Performance: From 1 to 20, how satisfied are you with your performance in achieving your objectives? 1 = Good, 20 = Poor	1																			20
Frustration level: From 1 to 20, how insecure, discouraged, irritated, stressed and upset you feel while performing your tasks? 1 = Low, 20 = High	1																			20

ABSTRACT

Companies are in constant search of greater productivity and better use of resources; however, they have neglected the human being. In this regard, it is important to analyze the presence of the psychosocial factors to which workers are exposed at all levels. These factors exert both a positive and a negative influence and indeed turn into a risk when they are not in balance with worker capabilities. This literature review aims to provide a comprehensive understanding of the psychosocial factors present in the manufacturing industries. The methodology consisted of conducting a search in two databases in addition to government pages. A combination of keywords was used for the search, and each publication was classified according to the factors analyzed, the type of evaluation, and the area of application. Out of all 2,468 publications found, eight were selected. Finally, work-related psychosocial factors were found to be the most analyzed.

INTRODUCTION

Currently, companies are looking for a better use of resources in order to increase their productivity. However, they are neglecting the most important resource which is the human element. As years go by, high market competitiveness and globalization have caused changes in the work environment, which have resulted in greater demands on workers. Such demands are placed by the need to execute more complex tasks in stressful work environments, with a high mental workload, and in the face of harassment and work violence among other factors. Such conditions are known as psychosocial work factors, and their importance has begun to be recognized throughout organizations because of their impact on the performance of workers and companies. However, the study and evaluation of such factors involve challenges that countries must recognize in order to face and evaluate them, and to develop strategies for their better management and prevention. Indeed, psychosocial factors are highly complex and, thus, difficult to understand as they depend on workers' perceptions and include aspects that range from individual characteristics to the social situations in which they operate outside of work hours. Thus, one way to facilitate the analysis of psychosocial factors is by grouping them into categories or areas; for example, they can be classified as personal aspects, factors inherent in work tasks, and organizational factors, among others, to try to explain the nature of their interactions and effects on health (International Labor Office, 1984).

In this regard, it is normal to observe that workers in the manufacturing industries are exposed to psychosocial factors as well as psychosocial factor risks. The International Labor Organization deemed the workplace as an important source of psychosocial risks by identifying that human beings spend most of their life at work. Consequently, it presented the workplace as the ideal place to treat workers and to look after their health and well-being. On the other hand, that organism affirmed that the psychosocial risk factors that take place in the world, and particularly in Mexico require effective government participation that supports the increase of health and safety in the workplace. Government must promote and help providing healthy working environment that allows workers to achieve honest or decent work through policies, strategic lines of action and projects with a preventive focus, so that work centers with safe and healthy conditions can prevail (Secretaría del Trabajo y Previsión Social - STPS, 2016).

This present era is one in which the population is being affected by stress due to the excessive, and perhaps self-imposed, pace of life and work. Workers are continually exposed to situations that create an imbalance on a personal and work level, placing them in a state of vulnerability to diseases associated with nervousness, stress and unjustified fear (Lupien, McEwen, Gunnar, & Heim, 2009). These constant changes in the work environment are perceived by workers as threats and could lead to chronic stress, acting as backdrops for health disorders. The risk factors generated by the organization at the workplace lead to physiological, emotional, cognitive and behavioral responses that result in disease under certain conditions of intensity, frequency and duration (Trade Union Institute of Labor, Environment and Health - ISTAS, 2010). Finally, after analyzing the increase in these diseases, the World Health Organization has signaled 2020 as the year when chronic stress-related depression will be the second cause of disability in the world (Organización Mundial de la Salud- OMS, 2012).

Based on the foregoing, it can be affirmed that identifying and assessing psychosocial risks is an important task in this investigation due to the great impact they have on the workers' health and on their performance in the company, specifically in manufacturing companies. This work's main objective, then, is to determine the state of the art on the psychosocial factors present in manufacturing companies, as well as the instruments that are used to identify and evaluate them. Another important objective is

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to analyze the instrument provided by the Ministry of Labor and Social Security (STPS) through the standard NOM-035-STPS-2018, which is mandatory for all work centers located in the country. Finally, other goals are to make recommendations on the usefulness of evaluating psychosocial factors and to offer suggestions for further research.

Background

Psychosocial factors are present in all work areas without exception, thereby the importance of their analysis. Currently, different ways to refer to psychosocial aspects are being used; therefore, it is important to point out their differences. Psychosocial factors are concerned to conditions in the individual, in the non-work environment and the intra-work environment, which depending on the intensity and duration can have a positive and negative impact on a worker, groups of workers or entire organizations (Oficina Internacional del Trabajo - OIT, 1986). While psychosocial risk factors are those that are likely to negatively, influence the workers' health and well-being (Benavides, *et al.,* 2002).

Worldwide, occupational health and occupational medicine perform a wide variety of studies aiming to ensure health and well-being of the worker (Kawakami & Tsutsumi, 2010, Siegrist, 2008, Van Vegchel, De Jonge, Bosma, & Schaufeli, 2005). As a result of globalization and technological advances, there have been created work environments with high cognitive, emotional and psychological demands, with little control over the task, under low social support and poor quality of leadership (International Labor Office, 2012).

In relation to the above, there is evidence to affirm that these work characteristics are strongly related to cardiovascular risk factors with a high probability of cerebrovascular events and ischemic heart disease (Belkic, 2004, Hausser, Mojzisch, Niesel, & Schulz-Hardt, 2010; Juárez, 2007; Smith, Roman, Dollard, Winefield, & Siegrist, 2005; Steptoe & Kivimäki, 2012). Likewise, there is significant relationship between psychosocial risk factors in the workplace and different types of disorders, such as musculoskeletal injuries (Palliser, Firth, Feyer, & Paulin, 2005), work stress (Shultz, Wang, Crimmins, & Fisher, 2010; Valverde, 2007; Wang, Schmitz, Dewa, & Stansfeld, 2009), absenteeism (Darr & Johns, 2008; Gartner, Nieuwenhuijsen, Van Dijk, & Sluiter, 2010), the increase in work-related accidents (International Labor Office (ILO), International Program on Safety and Health at Work and the Environment & International Occupational Safety and Health Information Center, 2007), interference in the work-family relationship (Kawakami & Tsutsumi, 2010; Kinman & Jones, 2008), sleep disorders (Heponiemi, *et al*., 2009; Kudielka, Von Kanel, Gander, & Fischer, 2004; Yang, Ge, Hu, Chi, & Wang, 2009) and alterations in mental health (Bourbonnais, *et al*, 2006; Burr, Albertsen, Rugulies, & Hannerz, 2010; Wang, Schmitz, Dewa, & Stansfeld, 2009; Griffin, Greiner, Stansfeld, & Marmot, 2007; Kirchhof, *et al*., 2009; Laurent, Pinte, Gerard-Guery, Wehrly, & Pamart, 2009: Lehr, Hillert, & Keller, 2009; Silva, De Souza, Borges, & Fischer, 2010) as affective-depression disorders (Lehr, *et al*., 2009; Rugulies, Bultmann, Aust, & Burr, 2006; Ylipaavalniemi, *et al.,* 2005) and anxiety disorders (Griffin *et al*., 2007). This evidence provide theoretical frame that emphasize the relevance of psychosocial factors at work. Developing countries such Mexico are recognizing this importance by releasing initiatives and normative standards that can contribute to their detection and prevention. In this chapter, some of this normative is commented and described.

PSYCHOSOCIAL FACTORS AND THEIR ASSESSMENT

As previously mentioned, in the workplace and especially in the manufacturing industries, workers are exposed to a great variety of psychosocial factors that can influence their health. Thus, it should be considered that work conditions ought to ensure the safety and health of the worker at the workplace in addition to seeking to provide them with free time to rest. Another aspect that should be allowed for should be the opportunity to collaborate with society and to engage in the search for self-realization. According to the International Labor Office (2012), the presence of psychosocial risk factors is becoming more evident in both developed and developing countries, affecting all workers. These factors have a severe impact on workers' health, absenteeism and performance. One of the main reasons is that the pace of life is getting faster each day, and technological changes are occurring more rapidly. Companies, then, should look for an optimal way to identify, assess and effectively deal with such factors. A starting point should be to define the characteristics that a work center should show to promote health:

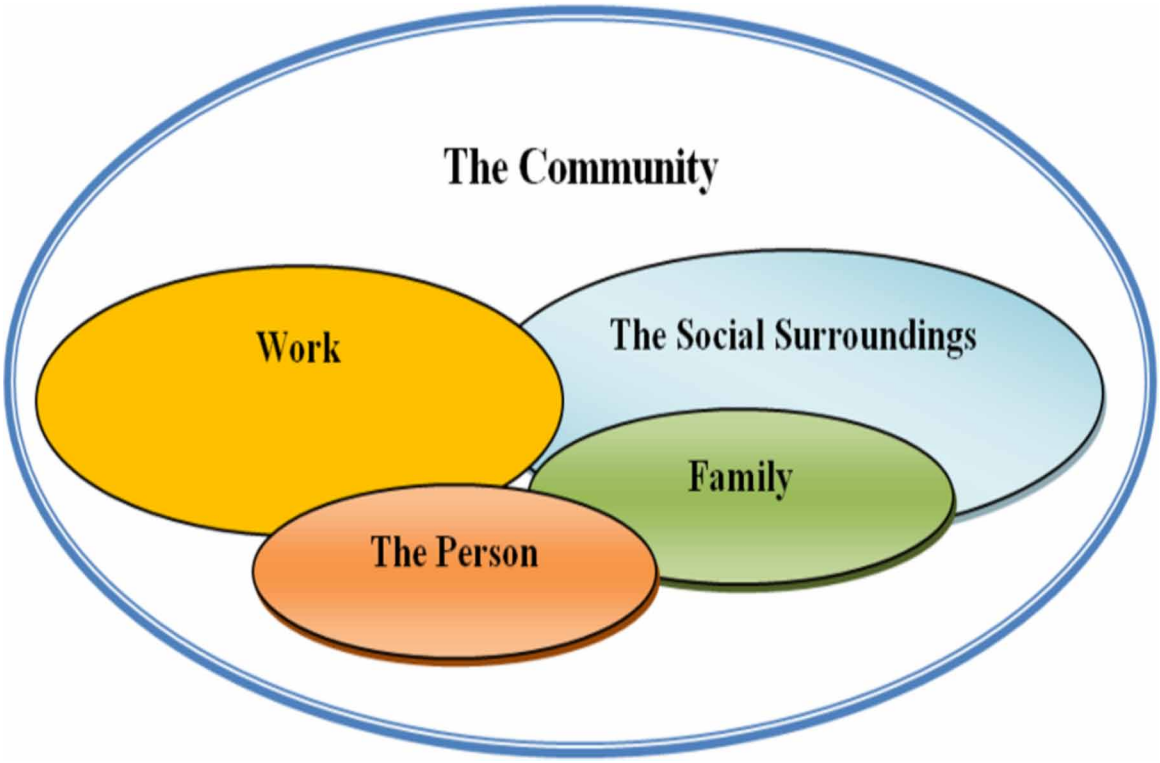
1. Incorporate safety and health measures at work, reinforcing the quality of work life as well as the worker's (physical and mental) health.
2. Support workers so that they develop the capacity to face work, personal or family-related problems that may affect their health and work performance.
3. Encourage workers ability to handle their chronic conditions, so that they become proactive in caring for their health and seeking a better quality of life.
4. Promote health from a collective point of view as it looks to improve task organization, working conditions, and the environment while encompassing both the family and the social contexts.
5. Consider a balance between its demands and workers' capabilities.
6. Consider that workers learn at the workplace, and learning is ongoing.
7. Consider aspects on which the worker can make decisions.
8. Realize the need for a certain degree of social support and recognition at the workplace.
9. Understand that workers must be able to establish a relationship between what they do or produce and social life.
10. Workers must be motivated by perceiving that their job leads to some kind of desirable future.

Regarding the previous points, the ecological model (see figure 1) consists of analyzing the psychosocial factors considering aspects ranging from the personal to the social. The reason in that it recognizes that there is a wide variety of factors that influence the health of the worker and that not all of them necessarily belong to the workplace, considering that human beings are a part of a complex system of interrelations that can influence them both positively and negatively.

When analyzing the ecological model, it is evident that risk factors can be present at work, at home or in the social environment, and each environment could contain one or more stress factors. Because it is highly difficult to achieve a separation between them, the presence of risk factors in any given environment tends to affect the others. Below is a description of each of the environments and their stress-vulnerable points.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Ecological model (Source: Oficina Internacional Del Trabajo, 2012)



The Person

In individual terms, aspects such as age, gender, some type of disability and socioeconomic status are related to the presence of stress, and most times stress results from a combination of factors. For example, the relationship between gender, work and stress is a highly complex one. The reason is that women play a fundamental role in caring for the family. In this sense, the daily work load for women who have a full-time job outside the home is usually greater than that of men as regardless of the working day, they must still fulfill family responsibilities at home.

The Family

One of stress triggers can be the work-family relationship, especially when both parents work. It is difficult for workers to balance the different schedules and shift durations while keeping in mind the lack of control they have over their work.

The Community

The ability to socialize is often key in the stress levels. This environment considers the ease with which people establish good communication and support with their family members, or friends. These rela-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tionships range from frequent family gatherings to belonging to sports groups, both of which promote adequate handling of problems.

Social Surroundings

This environment can have both positive and negative effects on psychosocial risks. For instance, the social environment can contribute with aspects such as regulations that allow a better response to potential stressors such as addictions. Likewise, if the society in which people operate has good public transportation, sports facilities, social support such as workshops to help them better cope with problems, and good medical service, people will be able to face stress factors more effectively as the situations that represent a threat to their stability are reduced.

The Workplace

Technological changes and constant competition worldwide promote new forms of work organization where the intensity of work, hours and shift durations, new forms of employment (partial or temporary contracts), hiring requirements (age, experience, and training), among others, stand out. Consequently, the workplace has become the most important source of risk, having the greatest impact on the balance between work and private life. The workplace can help to prevent stress by matching workers' capabilities to the workload and tasks assigned to them. It is certainly recognized that the level of stress can serve as essential motivation to boost performance and create a bond with work. However, there can be a point where that initial stress becomes excessive.

Also, it is possible to classify the psychosocial factors according to the place where they originate. This literature review focused on the psychosocial factors to which workers at the workplace are exposed. These refer to the organizational conditions that can be both positive and negative (Minztberg, 1993). There is a great variety of them, and they are classified according to what one wishes to analyze. These factors facilitate work, job growth and job satisfaction, and increase workers' productivity and motivation (Kalimo, El-Batawi, & Cooper, 1988). For example, Table 1 shows Roozeboom, Houtman and Van den Bossche's (2008) classification of the factors that can be observed in an organization.

In addition, psychosocial factors become psychosocial risks when they begin to negatively affect workers' health and performance. Just as there is a great variety of psychosocial factors, the number of risk or stress factors is also quite broad. Cox and Griffiths (1996) state that each of the psychosocial factors can lead to a number of risks. Table 2 lists some of them.

In general, it is appropriate to say that the purpose of most of the instruments is to analyze the psychosocial factors related to intra-labor conditions, which are associated with the work and organization characteristics that influence the health and well-being of people. The work environment-related psychosocial factors can be grouped into the following four categories: work demands, control over work, presence of leadership and reward or recognition of worker's performance.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. List of organizational factors

ORGANIZATIONAL FACTORS		WORK FACTORS	
Organization's Philosophy and Policies	Work-family relationship Human resources management Health and Safety policies Corporate social responsibility Commercial strategies	Work Conditions	Type of contract Salary Career design
Organizational Culture	Work relationships policies Organizational Information Organizational Communication Organizational Justice Supervision / Leadership	Job Design	Staff turnover Group work
Industrial Relationships	Work climate Trade Union representation Collective agreements	Work Quality	Use of personal skills Job demands Autonomy and capacity to control Physical safety at work Social support Work hours Teleworking

Table 2. Psychosocial stress factors

Work content	Lack of variety at work, short work cycles, fragmented and pointless work, low use of skills, high uncertainty, intense relationships.
Overload and pace	Excess of work, work pace, high temporary pressure, urgent completion deadlines.
Schedules	Changing shifts, night shift changes, inflexible schedules, unpredictable work schedule, long work hours or without time for interaction.
Control	Low participation in decisión-making, low capacity to control the work load, and other work factors.
Environment and teams	Poor working conditions, inadequate work teams, lack of equipment maintenance, lack of personal space, poor lighting or excessive noise.
Organizational Culture and functions	Poor internal communication, low levels of support, lack of task definition or not in accordance with organizational objectives.
Interpersonal relationships	Physical or social isolation, scarce relationship with bosses, interpersonal conflicts, lack of social support.
Role in the organization	Role ambiguity, role conflicts and responsibility for others.
Career development	Uncertainty or halts in the professional career, poor remuneration, contract insecurity.
Work-family relationship	Conflicting demands between work and family, low family support. Dual career problems.
Contract safety	Dangerous work, temporary work, uncertainty regarding work future. Insufficient remuneration.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Work Demands

These encompass the work demands imposed on the individual. Among them are the following:

1. The amount of work that must be done during a work day turns into a risk when the time available to carry it out is insufficient; this results in accelerated work rates and in having to work overtime to achieve the expected objectives.
2. Mental requirements are defined by the quantity of information and its complexity as well as by whether the task requires considerable memory, attention or concentration efforts.
3. Emotional demands occur when workers must understand other people's situations and/or feelings and exert self-control over their own emotions so as not to affect their work performance.
4. There is high degree of responsibility, for example, when workers must answer for the results of their work area or section.
5. Environmental and physical demands are considered a risk factor when workers must perform their work under unsafe or unhealthy conditions which also require a great amount of physical effort.
6. The type of shift becomes an important aspect to analyze since there is evidence that when working on night shifts, for long hours or during rest days, workers experience a greater toll on their health (Tucker & Rutherford, 2005).

Control Over Work

It refers to the individual's ability to influence and make decisions regarding some of the aspects involved in the performance of their work. These aspects occur more frequently when workers have the ability to adapt to the challenges of the workplace and when the task fosters the application of the worker's knowledge along with the development of new knowledge and skills. In this sense, it is essential to consider the workers' ability to establish the sequence of their activities as well as their work pace.

Leadership and Social Relations at Work

Leadership refers to a type of social relationship that occurs between the hierarchical levels in descending manner, whose characteristics influence the way of working and the work environment. Thus, it is important for leaders to establish a good relationship with their workers (subordinates) to achieve the expected results. Likewise, they must find the best way to approach conflict resolution and must be in constant pursuit of motivation, support and good communication with their collaborators. This is achieved when leaders offer their subordinates effective feedback, one that allows them to identify their strengths and their areas of opportunity to improve their performance.

Reward

This term deals with the recognition that workers obtain in exchange for their performance. This category includes various types of remuneration: financial (economic compensation for work), esteem (psychological compensation, which includes recognition of the social group and fair treatment at work) and opportunities for promotion and safety at work. Receiving these rewards from the organization boosts workers' feelings of pride and the perception of job stability, as well as their feeling of self-realization.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

IMPACT OF PSYCHOSOCIAL FACTORS

Several authors affirm that the presence of psychosocial factors in the work environment is closely related to stress as most of the factors become a risk when they create working conditions that exert higher demands on workers. In this regard, Palmer, Cooper, & Thomas (2003) affirm that stress is triggered when the demands or the pressure perceived by workers exceed their ability to cope with them. It is also noteworthy that stress is a natural defense mechanism that contributes to human survival. However, it is also a cause for stress when either a single worker's or a group's knowledge and ability to resist, face and overcome difficulties does not match the expectations of a company's organizational culture. Moreover, as technology advances, people spend 24 hours a day connected to their phone, email, internet and other means of electronic communication, which allows them to be able to deal with job issues outside their work schedule. Thus, the boundaries separating work from domestic life are increasingly blurred as the workplace is set by the multiple and instant types of communication and the high level of global competition.

When speaking of work, both formal and informal types of work are considered. In the case of the latter, it can be even more difficult to separate work demands from those of everyday life since its financial survival depends on an enormous amount of workload and highly unpredictable working conditions.

On the other hand, the workers' perceived need to keep working to ensure a steady income can lead to many personal concessions resulting in physical, psychological or behavioral reactions caused by stress. When these demands are maintained for a prolonged time, some workers tend to suffer from anxiety disorders, emotional exhaustion, and severe depression, which gives rise to a loss of interest first in their work and then in life in general. The World Health Organization (WHO) affirms that more than 300 million people in the world suffer from depression, a disorder that is the main current cause for disability. At the same time, many of them also suffer from anxiety symptoms. According to a recent study conducted by the WHO, depression and anxiety disorders cost the world economy one billion dollars per year in lost productivity (Organización Mundial de la Salud - OMS, 2017). In Mexico, 40% of employees suffer from work-related stress. This stress is associated with pressure from supervisors and clients, lack of work stability, and excessive workloads (Oficina Internacional del Trabajo, 2012). On the other hand, as Figure 2 shows, an analysis of the presence of depression in households showed that the percentage of household members who are 12 years old or older and who have felt depression at various times during the year has increased. When researching the information a bit further, it was found that during the year 2017, 60% of the people who suffered from this disorder were women. (Instituto Nacional de Estadística y Geografía - INEGI, 2017)

As can be seen, the main consequence of psychosocial risk is stress, whose most frequent symptoms range from irritability to depression and are generally accompanied by physical and mental exhaustion. Likewise, stress directly affects workers' performance, which results in low productivity and affects work comfort. The reason for the above is that a person undergoing a large amount of pressure is incapable of making correct decisions, and his/her creativity decreases notably as the mind is unable to find the multiple solutions required for successful performance. Güilgüiruca, Meza, Góngora, & Moya (2015) pose that a company with many stressed people usually features a poor work environment. Based on the above, it is important for employers to understand that poor intervention leads to a decrease not only in productivity but in the quality of life of those suffering from stress, which may even be a reason for permanent sick leave.

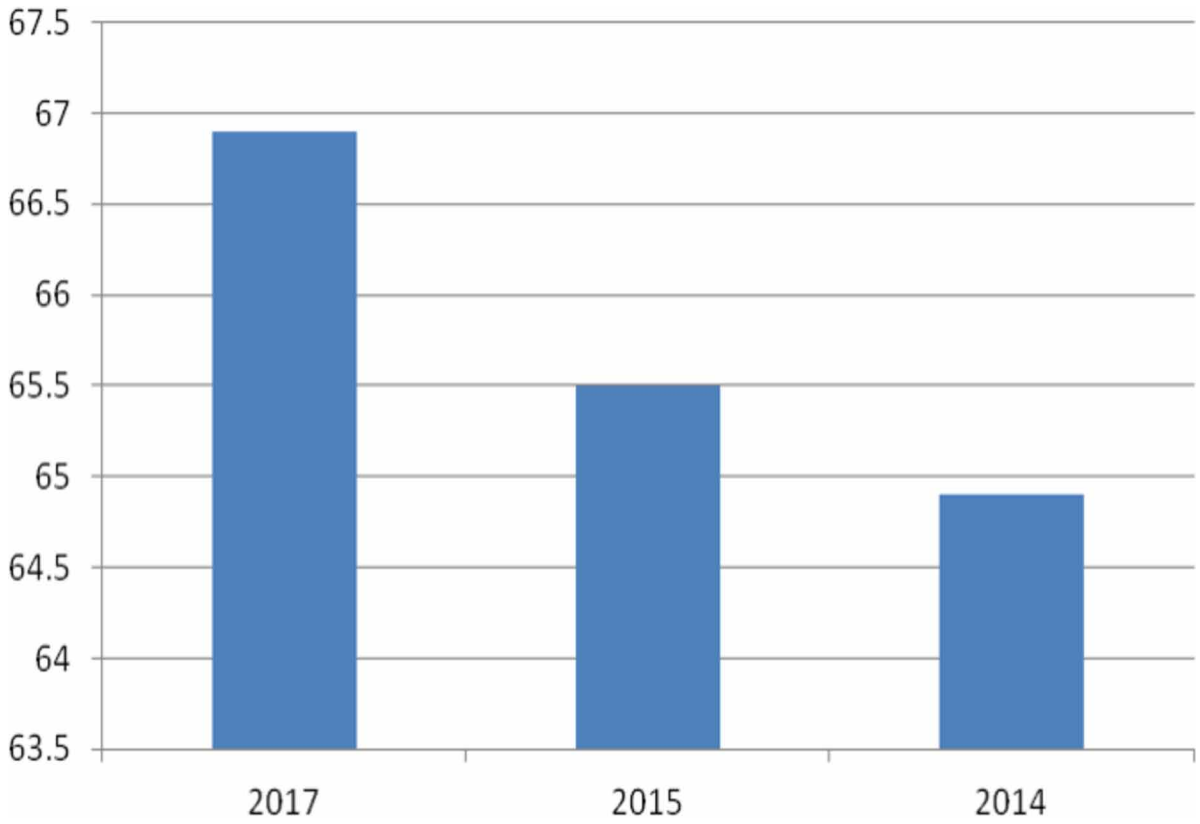
Figure 2. Percentage of household members who experience feelings of depression at various times during the year



Human beings are complex by nature, and since they are an organization's most important resource, they represent a constant challenge for the future of companies. Thus, there is an important need to incorporate processes that understand and address both the human and the work dimensions of the people that make up each company. Doing so will allow companies to identify the influence that psychosocial and organizational factors have on productivity, as well as to work on strategies that allow for continuous improvement. Along these lines, work policies worldwide are establishing wellbeing programs which are based on the analysis and evaluation of the factors that affect mental health, such as the standard of living and the working conditions, while preventing and promoting health, including mental health. This is done through activities that reduce stigma and discrimination and improve health services, including occupational health services, to expand the access to scientifically proven care.

Issues, Controversies, Problems

Immersed in a constant change due to technological development and communications, in new forms of organization with more automated production processes, and in the search for global competitiveness in the midst of an economic crisis, companies remained unaware that it would be necessary to create new profiles for job positions as the task demands on workers increased, taking a toll on both workers'

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

health and company productivity. The Ministry of Labor and Social Welfare in Mexico, through the National Program for Emotional Wellbeing and Human Development at Work (PRONABET) began to investigate the possible causes for psychological resignation, high rates of absenteeism, staff turnover, lack of loyalty, increase in sick-leave days, costs due to accidents, and employees' low sense of belonging. An important point in this research was that the above-mentioned problems were observed even in those companies that complied with the current regulations, which focus on safeguarding workers' safety and health within the work area. In this sense, it has been observed that neglecting to factor in the psychosocial factors to which workers are exposed can create problems for both the company, such as low work performance, and the workers' health.

The International Labor Office (2012) states that in the long term, stress at work can be a factor in the presence of musculoskeletal disorders, hypertension, cardiovascular diseases and overall poor health. Likewise, stress could alter immunological functions, thus allowing for the development of cancer. In addition, work-related stress can contribute to an inability to cope with work and to a decrease in job opportunities and prospects.

It can also indirectly cause problems inside and outside the workplace, such as violence; drug, tobacco and alcohol abuse; tension in family relationships; depression and even suicide. These are potentially enormous costs, both in terms of personal loss and economic burdens. Upon considering the above, the need arose to evaluate psychosocial risks in a context of major social, political, economic and technological transformations, all of which have an impact on the workplace. It has been shown that working conditions take a toll on workers' health and that stress is known to be one of the main causes of occupational diseases. Consequently, there is increasing political interest in safeguarding workers' health and well-being (The International Labor Office, 2012; Secretaría del Trabajo y Previsión Social - STPS, 2016; Organización Mundial de la Salud - OMS, 2017). By reflecting on the wide variety of instruments available and taking into account that the identification of psychosocial factors for their evaluation requires a very different analysis from that of traditional assessments, it is not possible to establish one general instrument as either ideal or invalid. Rather, it is necessary to choose an instrument that allows for a precise diagnosis of the real conditions of a specific organization -one that takes into account the particular characteristics of the economic sector to which the organization belongs. Likewise, it is important to ensure that the choice of instrument does not obey any private interests of the organization other than to determine the tool that is the most convenient for each company and always respecting the legal guidelines established in each country.

Juarez (2008) holds that evaluation instruments or methods can be grouped into three categories: a) environment-centered models, which focus on the realities of work in the search for risks or potentially inconvenient conditions; b) individual-centered models that explore workers' traits, characteristics or internal conditions as well as the way in which these can adversely affect their health, well-being or performance; and c) models centered on exploring the effects of individuals' interactions with their context. He concludes that in structuring psychosocial models, one of the universal principles should be the consideration of these three dimensions. In Mexico and Colombia, the development of instruments is more recent. However, in many of the cases it is decided to use instruments created in other countries, although it is not always possible to obtain the evidence that these instruments have psychometric properties. It is important that developing countries have validated instruments, since with societies with different labor characteristics and that must face strong changes at the economic and social level; propitiating the presence of work stress problems (Gómez, 2010). Although this field contains abundant literature reporting results on the effect of work conditions on health (Uribe, 2008, Whaley, Morrison,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Payne, Fritschi, & Wall, 2005, Tucker & Rutherford, 2005), there is still a lot to examine to attain clear knowledge on the subject. In this regard, it is important to mention, for example, the studies on work stress, psychological exhaustion, psychosomatic disorders or psychopathological problems and more specific issues such as depression, anxiety, or low back pain, to name a few. In all these cases, evidence has been shown of the relationship between work conditions and these effects.

METHODOLOGY

As shown in Figure 3, the methodology followed in the conduction of this work consists of five stages: a) selection of the database and government pages to be used, b) selection of keywords, c) sorting out of the results, d) final selection and e) selection of the instruments for the evaluation of psychosocial factors.

Selection of Database and Government Pages

Database selection was done by identifying those that showed a greater number of indexed journals and focused mainly on the areas of engineering, social sciences and public health.

Key Word Selection

Once databases were selected, key words were chosen according to the search characteristics of each one.

Sorting out of Results

After the results of the databases advanced searches were obtained, they were exported and analyzed to then be sorted out. The results were classified according to the following criteria: Psychosocial factors background, psychosocial factors assessment instrument, and application sector (manufacturing, health centers, education, others). Both the publications that did not yield information on these criteria and duplicates were eliminated.

Final Selection

After this first sorting out, the articles centering on the analysis of psychosocial factors from their context and those focusing on analysis within the manufacturing area were preselected. Next, their whole content was analyzed. Those articles showing the entire content and those whose research, application and/or development took place inside the manufacturing companies were identified.

Compilation of the Psychosocial Factors Assessment Instruments

Once the content of both the chosen publications and the government pages was analyzed, a compilation was made of the instruments used to evaluate the psychosocial factors at the workplace.

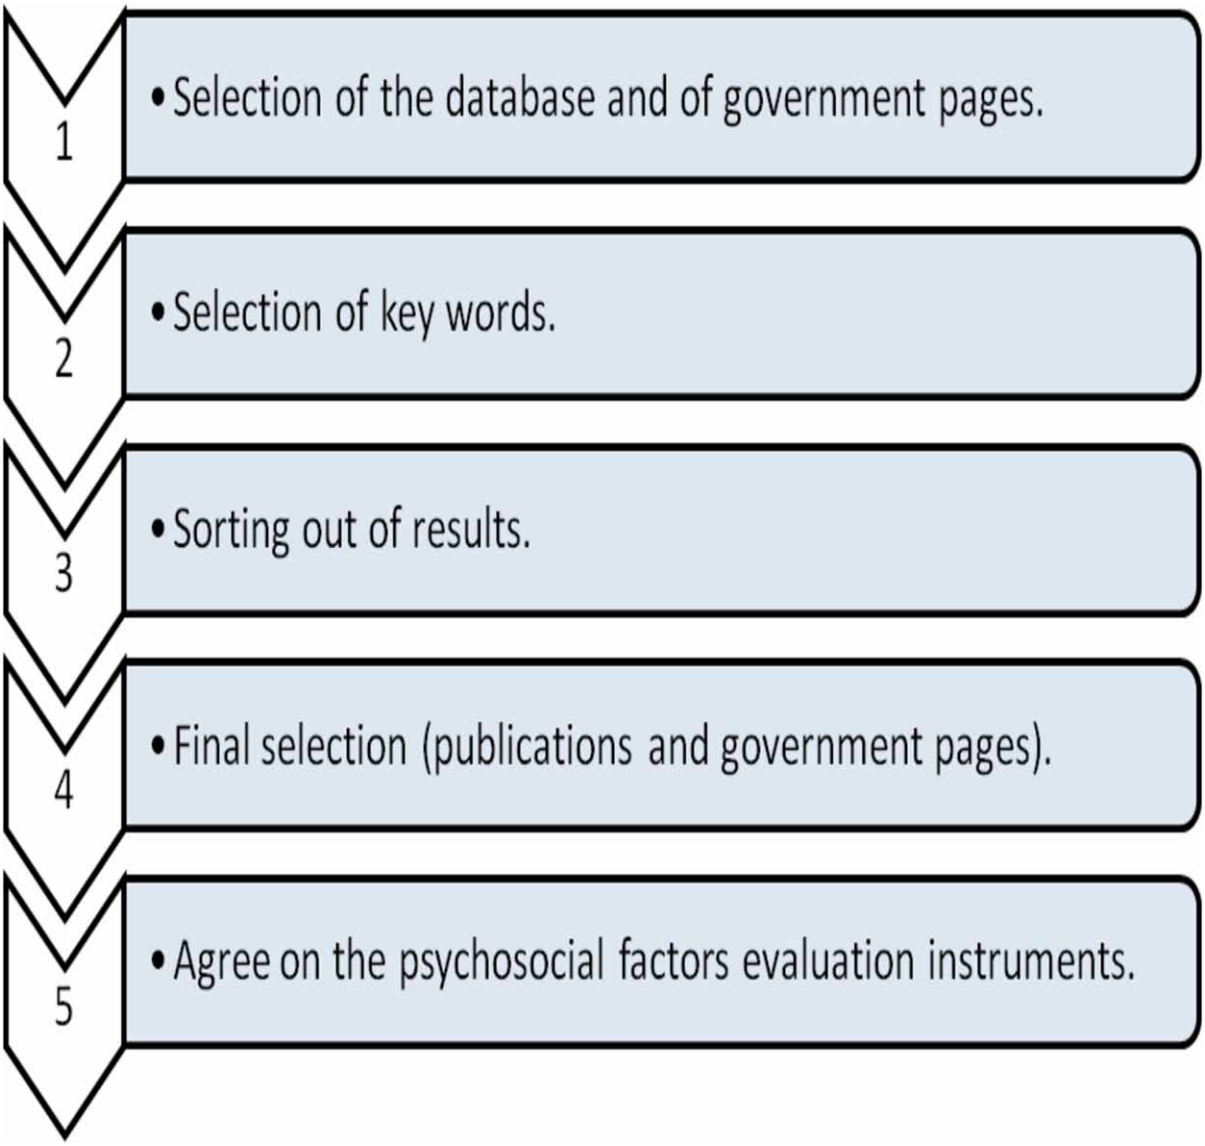
Figure 3. Methodology stages



RESULTS

The results obtained throughout the four phases of the methodology are shown below.

Selection of Database and Government Pages

The selected databases were ScienceDirect and CONRICyT. They were selected because they feature a large number of indexed journals. Besides, they focus mainly on the manufacturing sectors. On the other hand, the following government pages were selected: the Ministry of Labor and Social Welfare (STPS), the Mexican Institute of Social Security (IMSS), and the International Labor Office (OIT).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Key Word Selection

The key words used during the search were: Psychosocial factors, Psychosocial risk factors, Evaluation of psychosocial risk factors, manufacturing industry.

Sorting out of Results

During the first search, a total of 2468 publications was found. In the "firs search" column, Table 3 shows the number of articles obtained per database. The next step consisted of classifying those articles into either literature review or application of a psychosocial factors-evaluation instrument according to the information they contained. Once this classification took place, the number of articles was reduced to 22.

Final Selection

Finally, out of the 22 publications that met the established criteria, only those that could be freely accessed were selected, yielding an end total of 8 articles (see Table 3). Two of the studies described methodologies for psychosocial factors assessment, three consisted of literature review, and 3 addressed the use of a psychosocial assessment instrument at the workplace (see Table 4).

Table 3. Number of items found by database

Database	Number of items			
	First search	First selection	Second selection	Final selection
ScienceDirect	2063	20	10	7
CONRICyT	405	2	1	1
TOTAL	2468	22	11	8

Application of psychosocial factors assessment instruments	3	(Luceño Moreno, Martín García, Jáez Díaz, & Díaz Ramiro, 2005; Blanch, Sahagún, & Cervantes, 2010; Vaquero Álvarez, Álvarez Theurer, & Romero Saldaña, 2018)

Psychosocial Factors Assessment Instruments and Techniques

The Ministry of Labor and Social Welfare (2018) states that psychosocial factors prevention and control measures, which also foster a favorable organizational environment, should be established at three levels: a) The organizational plane, where the necessary policies and measures to foster a favorable environment

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

are established; b) The group plane, in which workers' interrelations, time of work, sharing of information to worker, and provision of the necessary courses to promote awareness of what the company's goals are fostered; and c) The individual plane, when it is confirmed that there are health alteration symptoms.

Because psychosocial risk factors depend mostly on the workers' perception, they need to be evaluated systematically as it has been difficult to prevent them. Several authors hold that such difficulty stems from the methodologies used since risk factors assessment differs from the traditional physical, ergonomic and other types of assessments (Blanch, Sahagún, & Cervantes, 2010; National Institute of Safety and Health at Work -INSHT, 2004; Villalobos, 2005; Tejada & Gómez, 2009). Another difficulty lies in the lack of standardization among some of the questionnaires and diagnostic methods as they do not have psychometrically reliable data (Guardia, Peró, & Barrios, 2008, Ministerio de la Protección Social, 2009).

On the other hand, Guardia, Peró and Barrios (2008) consider that an important cause for the difficulty in addressing psychosocial risk factors is that organizations tend to perform very simple and general systems, focusing on survey application as their only option to address such risks while ignoring other indices such as occupational health and job position evaluation, among others, which could be very useful.

Meliá indicates that any psychosocial risks evaluation instrument must be based on research, an index of reliability, (construct and content) validity tests, an item quality psychometric analysis and standardization processes for the specific application to be done (Ministerio de la Protección Social, 2009). In addition, the instrument confidentiality must be ensured, and the participants must receive guarantee of anonymity and confidentiality through the use of an informed consent. That is why currently, many companies in the search for results that are as close as possible to reality hire an external person to, first, explain what the study consists of and, then, continue with the study, including the analysis of both the surveys and of the afore-mentioned indices.

Furthermore, Rodríguez, González and Carbonen (2007) point out that, even if doing so results in the organization's using more resources (time and money), it is highly important for questionnaires to be adapted to the organization being analyzed as this aspect has an impact on the instrument's reliability.

The most widely used psychosocial factors identification and assessment instruments are listed below. Table 5 shows a compilation of them. The instruments are arranged chronologically and are accompanied by their country of origin, year of creation, aspects they evaluate, and the number of items that make up the instrument.

Table 5. Instruments for the assessment of psychosocial risks at work. Improved from (Charria, Sarsosa, & Arenas, 2011)

As can be seen, there is a wide variety of instruments, most of which most were developed in Spain. On the other hand, Mexico has two instruments; the first one consists of the Psychosocial Factors Identification Guide, created by the Mexican Institute of Social Security (IMSS) in 1986, and the second one created by the Ministry of Labor and Social Welfare (STPS) in 2018. Moreover, all the questionnaires take into account the task's different demands as well as an assessment of the work relations.

DISCUSSION

The interest in identifying and assessing psychosocial risk factors has increased considerably in recent years, and its purpose has been to achieve a favorable work environment in all productive sectors. When considering the instruments analyzed above, it can be seen that out of the last two, one corresponds to the Battery of psychosocial risk factors assessment instruments, prepared by the Ministry of Social Protection in Colombia. This is one of the few instruments that show evidence of compliance with the necessary psychometric tests to back up the instrument's validity (Albarrán, *et al.,* 2018). The other and more recent questionnaire is the one proposed by the Secretariat of Labor and Social Welfare in Mexico. However, unlike the Colombian battery, this instrument does not yet show evidence of having been administered at the workplace, and therefore, there is no evidence of its validity. It must be highlighted that despite the fact that the work centers in much of northern Mexico belong to the manufacturing sector, at the time when this research was conducted, no evidence was found of studies related to psychosocial factors to which employees were exposed at work, this revealing the scarce amount of existing research on this subject in the manufacturing or industrial sector.

Currently, Mexico is undergoing a process of adaptation. The reason is that on October 23, 2018, through government organizations, Mexican Official Standard NOM-035-STPS-2018 was accepted. Its objective goes beyond identifying and assessing psychosocial risk factors as it aims to foster favorable organizational environments in the workplace, considering aspects such as leadership and work relations, control over work, social support, violence at the workplace and workloads. It is worth mentioning that this norm will be auditable as of October 23, 2019 (Secretaría Del Trabajo y Previsión Social-STPS, 2018).

FURTHER RESEARCH SUGGESTIONS

It is important to recognize that due to the databases constraints, some articles may not have been considered. However, by the date of publication there were no records of administration of the instrument not only in the manufacturing industry, but in any work center. Thus, it is of essence to carry out research on psychosocial factors in any field, but mainly in industry as it is one of the sectors with the highest task demands on workers. Likewise, it would be ideal to conduct studies on the impact of psychosocial risk factors on organizational goal achievement.

As was mentioned in the discussion section, there is no evidence of the suggested questionnaire having been administered by the Secretariat of Labor and Social Welfare at the different work centers, nor of its validation. Therefore, it is important to consider that because the tool is part of an auditable standard whose purpose is to ensure workers' health and welfare, certainty of its validity is paramount.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

From the information covered in this chapter, it can be concluded that the effects related to psychosocial risk factors are multicausal as they result from the interaction of intra-labor, individual and outside-of-work conditions. Therefore, the interventions carried out should consider the working conditions and provide older people with tools to face the situations that arise, thus fostering a work/non-work life balance. This type of interventions mixing the organizational and the individual level have proven to be the most effective for both companies and people (Organización Mundial de la Salud - OMS, 2017). Furthermore, this chapter analyzes the lack of consideration of the psychosocial factors at the workplace and of the importance of their identification, assessment and prevention in the workplace worldwide. In doing so, it highlights the main psychosocial factors to which workers are exposed as well as some of the instruments used for their identification and assessment. It also shows evidence of the psychosocial risk factors impact both on the health of the worker and on the productivity of the company. According to Moreno and Baéz (2010) the psychosocial risk factors to which workers are exposed greatly influence their health (creating physical and mental issues, substance use and psychosomatic disorders) as well as their performance and attitudes towards the organization (their job satisfaction, involvement, commitment and counterproductive behaviors), causing organizations to show high rates of staff turnover, presenteeism, sick leave, work accidents, and low performance and productivity.

Despite the exhaustive literature review, the number of research articles found was insufficient. Thus, the field of research on psychosocial factors in the manufacturing industry presents an opportunity for researchers to work further in the area. In addition, a precise approach for the identification, measurement and assessment of psychosocial risk factors poses the most important challenge for the implementation of the 035 standard and its consideration in companies wishing to achieve a favorable organizational environment that contributes to workers' health care and welfare since much of life is spent at the workplace. Finally, among the psychosocial risk factors identification and assessment instruments, not only are the tools in Colombia the second most recent, but they also feature validation data, which offers a considerable advantage over the other instruments.

ACKNOWLEDGMENT

We thank Leslie Yaratzed Cedeño Castillo for her outstanding support translating and improving this work.

KEY TERMS AND DEFINITIONS

Favorable Organizational Environment: It is the one in which workers have a sense of belonging to the organization. Among other aspects, it features an adequate method for the performance of tasks, clear responsibilities, and proactive participation of workers, in accordance with the Federal Labor Law, as well as performance evaluation and recognition.

Ministry of Labor and Social Welfare (STPS): The Ministry of Labor and Social Welfare, as a Federal agency, is in charge of the performance of the powers attributed to it by the Organic Law of the Federal Public Administration, the Federal Labor Law, and other laws and treaties, as well as regulations, decrees, agreements and orders of the President of the country.

NOM-035-STPS-2018: It is a norm that came into force in October 2018, aiming to outline the elements by which to identify and prevent psychosocial factors and promote a favorable organizational environment in the workplace.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

PRONABET: It is a public policy focused on creating a new occupational health culture in Mexico by promoting emotional care at work and the prevention of psychosocial risk factors that affect workers' welfare.

Psychosocial Risk Factors: These are organizational conditions that are likely to adversely affect the physical and psychological health of the worker.

Psychosocial Risks: They are those conditions inherent in the workplace, which relate to 1) work organization and its social environment, 2) work content and task performance, and which have the capacity to affect the workers' performance and health (physical, mental or social).

Social Support: These are actions to improve social relations in the workplace, in which the mutual support for the solution of work problems among the workers themselves is promoted.

Work Loads: They refer to the work demands imposed on workers, exceeding their capacity. They can be of different types such as quantitative, mental, emotional, and responsibility-related, among others.

This research was previously published in Evaluating Mental Workload for Improved Workplace Performance; pages 24-48, copyright year 2020 by Medical Information Science Reference (an imprint of IGI Global).

Chapter 70
Burnout Among Formal Caregivers and Risk of Violence Against Institutionalized Elderly

Susana Valido
Hospital do Espírito Santo de Évora, Portugal

Ermelinda do Carmo Caldeira
Universidade de Évora, Portugal

Felismina Mendes
Universidade de Évora, Portugal

ABSTRACT

Sociodemographic changes occurring in past decades are reflected as increased population aging, resulting in a higher need to institutionalize elderly. Violence against elderly is a relevant public health problem. The aims of the present cross-sectional exploratory and descriptive study with a quantitative approach were to analyze burnout among formal caregivers at institutions for elderly and to assess the risk of violence against institutionalized elderly. As a part of project ESACA—Envelhecer com Segurança no Alentejo (Prevenir as Quedas e a Violência sobre Idosos)—Compreender para Agir (Aging Safely in Alentejo [Preventing Falls and Violence against Elderly]), the present study analyzed 34 formal caregivers from three institutions that provide care to elderly in the Evora district, Portugal. No situations involving violence against institutionalized elderly were detected. Most participants (96.3%) did not exhibit burnout, although they did report feeling physically and emotionally tired.

INTRODUCTION

Population pyramids have undergone considerable changes in recent years, pointing to demographic aging, with consequent challenges to unprepared governments, families, and communities.

Demographic aging is a social phenomenon with significant multidimensional impacts that demands urgent reflection and decisions to help adjust social contexts and integrate this new reality with a minimum of negative consequences for citizens while strengthening consensual harmonization. It is not difficult to recognize that healthcare will be one of the sectors most likely to feel the impacts of demographic aging.

Social responses that address a significant number of elderlies are therefore a priority; such response essentially involves speaking about reform in the Portuguese state, and of a period of transition, with a view toward well-being, social protection and social rights. This new paradigm calls for qualified formal caregivers for elderly, with the expectation that better training of the former will result in better provision of care and, consequently, better quality of life and protection of the latter.

According to the Portuguese Association for Victim Support (Associação Portuguesa de Apoio à Vítima – APAV) (2010, p. 41), "recognizing that elderly are victims was slow, but at present it is an increasingly evident phenomenon within the current process of global population aging" (Portuguese Association for Victim Support – APAV, 2010, p. 41). According to The APAV (2013) estimates, 39.4% of elderly in Portugal are victims of aggression. The country is ranked by "the World Health Organization as the fifth among 53 European countries surveyed with significant rates of violence against elderly" (Coler, 2014, p. 19).

Institutionalization might promote the occurrence of violence against elderly, for which reason accurate knowledge of the associated conditions and risk factors is necessary to develop intervention/prevention strategies (Carrilho, Gameiro & Ribeiro, 2015).

Several authors (Jamieson, Teasdale, Richardson & Ramirez, 2010) observed that exposure to stress at work might harm the mental health of formal caregivers, particularly the more compassionate and altruistic ones, resulting in patient exhaustion and impacts on their own personal, family, and institutional lives. Studies on burnout are critical, as formal caregivers of institutionalized elderly are considered a high-risk group as a function of the demands inherent to their job (Meireles, 2016).

The aims of the present study were to analyze burnout among formal caregivers at institutions for elderly and to determine the risk of violence to institutionalized elderly within the context of project ESACA — Envelhecer com Segurança no Alentejo (Prevenir as Quedas e a Violência sobre Idosos) — Compreender para Agir (Aging Safely in Alentejo [Preventing Falls and Violence against Elderly] — Understanding to Act) Ref: ALT20-03-0145-FEDER-000007.

THEORETICAL FRAMEWORK

Aging

Even though defining elderly exclusively based on age is controversial and limited, here, this group is considered to include men and women aged 65 years or older. This notion is accepted by international organizations such as the World Health Organization (WHO) and the United Nations (Paschoal, 2000). Aging is a variable process, and according to "the times, culture, lifestyles, and scientific, medical and technological means, thus are the changes in the aging process" (Imaginário, 2008, p. 41).

Lehr (1998) observed that aging occurs at the biological, physiological, mental, and social levels. According to the National Institute of Statistics (Instituto Nacional de Estatística–INE),

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

demographic aging expresses changes in the age distribution of a population, denoting a higher proportion of elderly in the population. This dynamic is a consequence of the processes of birth rate decline and increased longevity, and is internationally understood as one of the most significant demographic trends of the 21st century (INE, 2015, p. 1)

As a result of declining birth rates, increased longevity, and reduced mortality, youths and the population of economically active age have decreased in Portugal in the past decades, while the elderly adult population has increased (INE, 2015).

From 1970 to 2014, "the dependency ratio for elderly continuously increased, from 16 elderly/100 people of economically active age in 1970 to 31 in 2014" (INE, 2015, p. 3). In turn, the turnover rate of economically active persons has decreased, especially in the past 15 years: indeed, it has continuously decreased from 1999 onward to become less than 100 in 2010 and 84 in 2014 (INE, 2015) (Figure 1).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

According to INE projections for the Portuguese population, relative to the period until 2080, "the peak number of elderly will be reached by the end of the 40s to begin decreasing afterward" (INE, 2017, p. 4). This development is because "larger generations will reach this age range, [generations] already born within a context characterized by sub-replacement fertility" (INE, 2017, p. 4).

Institutionalization and Risk of Violence against Elderly

Increasing population aging, socioeconomic and cultural changes, and modifications in the structure of families in the past decades—reducing their ability to meet the needs of older members—have resulted in an increasing need for institutionalization (WHO, 2011).

Sousa, Figueiredo, and Cerqueira (2004) essentially describe institutionalization as the process of elderly leaving their homes (for a short or long period of time) that comprises the steps of decision-making, choice of institution, and adapting to the new environment. According to Fernandes (2000), institutionalization is a relevant resource for the elderly when considering their general state of health and autonomy.

Throughout the process of institutionalization, elderly must deal with several problems that interfere with their functional autonomy and abilities in various ways (Fernandes, 2000). The consequences of adaptation to institutionalized life might have a positive or negative influence on their quality of life. Institutionalization might be deleterious when elderly are deprived of their daily and family activities and are restricted by institutional regulations (Pestana & Espírito-Santo, 2008).

Institutions that provide care to elderly include different actors (older people, their family, formal caregivers, the community, etc.), and in this context, human dynamics and organizational aspects underlie the actual provision of care.

While institutional violence is a fact, it seldom reaches official sources of information, often remaining restricted to informal complaints. Therefore, the awareness of healthcare professionals and society at large about the risk of violence at medical and social institutions established to protect elderly is crucial (WHO, 2011). Healthcare professionals see some practices as "forms of abuse and neglect and that within the family context, it is worth noticing that some such practices are not considered by them as violent or abusive actions, but are even a part of professional standards and procedures" (Gil & Fernandes,2011, p. 9).

The risk factors for violence seem to be present in all levels of the ecological context of human development, including the interpersonal/psychological, interpersonal/familial, social networks, institutional, community/social, cultural, and historical (Schiamberg et al.,2011). Institutionalized elderly might be exposed to higher risk of violence as a function of their dependence, physical weakness, and ignorance of their legal rights, combined with fear of retaliation for eventual complaints (Dias, 2005).

Formal Caregivers

The rise in population aging and in the frequency of chronic and progressive degenerative diseases poses new challenges to families and institutions for older people and, consequently, also to formal and informal caregivers. Within this context, formal caregivers have "an outstanding role, inasmuch as changes in the family structure often result in the need to transfer the task of caring for elderly to institutions specific for this age group" (Meireles, 2016, p. 1).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Here, it is worth calling attention to differences between informal and formal caregivers. The former correspond to situations in which care is continuously provided to dependent older people by family members, friends, and/or neighbors, who are not paid and do not have specific training for this task (Silva, 2016). In contrast, formal caregivers have "specific training for the role entrusted to them, and are integrated into the occupational environment according to the particular competencies of each professional, and are paid and/or volunteer at hospitals, hospices, the community institutions, etc." (Meireles, 2016, pp. 8-9). Formal caregivers are therefore professionals with competencies that enable them to implement an intervention based on a holistic approach to aging (Kim, Bursac, DiLillo, White, & West, 2009). They have accurate knowledge of the needs of older people and provide them support in the performance of the activities of daily living (Hartke, King, Heinemann, & Semik, 2006).

The aim of professional provision of care to elderly is to improve their well-being and quality of life and to compensate for transient or permanent functional disabilities whenever possible (Silva, 2016). Therefore, formal caregiving demands different social responses and the involvement of multidisciplinary staff, requiring contributions from qualified health, psychology, and social science professionals, among others.

The inherent complexity of providing care to elderly places high professional, emotional, and personal demands on formal caregivers, which might interfere with their health and often serve as stressors (Ferreira, 2014; Meireles, 2016).

Moreover, inadequate working conditions might be a source of stress for caregivers that might become permanent and contribute to the development of burnout syndrome (Silva & Carlotto, 2008), which is characterized by clear manifestations of emotional exhaustion, depersonalization, and reduced personal accomplishment (Tamayo & Tróccoli, 2009).

While some caregivers who abuse elderly are opportunists or sociopaths, others might simply have an excessive workload (Sibbald & Holroyd-Leduc, 2012), an increasingly common situation in Portugal (Carrilho, Gameiro & Ribeiro, 2015).

Given the constant challenges posed to formal caregivers and the pressures to which they are subjected, there is a need to reflect on the problem of burnout and on policies and practices.

Burnout Among Formal Caregivers

Several studies on burnout "point to the occurrence of exhaustion and fatigue triggered by compassion in the relationship between formal care providers and recipients" (Saúde, 2013, pp. 3-4).

Maslach (2003) observed that occupations involving provision of care are the most susceptible to burnout, as caregivers are required to establish a strong and durable relationship with people often undergoing problematic situations who are full of feelings of frustration, fear, or despair. The tension and stress that result from such relationships might trigger the phenomenon of "emotional dryness," which makes professionals feel empty and emotionally predisposed to burnout.

The notion of burnout was first discussed in 1974 by Herbert Freudenberger within the context of a study with healthcare professionals in which he realized that many of the volunteers at healthcare services gradually developed emotional depletion, loss of motivation and reduced commitment, accompanied by physical and mental symptoms which pointed to a state of exhaustion. Freudenberg noticed that the professionals in such a state of mental and emotional exhaustion were idealistic, seemingly highly competent, dynamic, tireless, and active even when the outcomes they achieved were not those expected (Meireles, 2016).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Thus, Freudenberger detected the occurrence of continuous stress in the workplace and defined burnout as "wearing out, physical and emotional exhaustion, derived from excessive and highly demanding work in physical, emotional and/or psychological terms" (Ferreira, 2014, p. 10). Burnout syndrome is therefore a "state of fatigue or frustration brought about by devotion to some cause, way of life or relationship that failed to produce the expected reward" (Freudenberger, 1980, as cited in Queirós, 2005, p. 27).

The term burnout is morphologically composed of the words burn and out, "which suggests that the individual affected by this type of stress is physically and emotionally consumed, and evidences manifestations of aggressive behavior and constant irritation" (Meireles, 2016, p. 14). Vernacularly, burnout points to something that stopped working due to absolute lack of energy, and this term might be metaphorically applied to the individuals who have reached their limit due to lack of energy and exhibit a consequent state of physical and mental fatigue. This phenomenon affects countless professionals, and the idea is that of a "candle or bonfire dying out" or a "discharged battery" (Benevides-Pereira, 2002; Queirós, 2005).

In 1974, Freudenberger (as cited in Queirós, 2005) described the following as causes of burnout: low job commitment, lack of supervisor and manager support, high levels of work pressure, age, job characteristics, lack of social support, task uncertainty, low autonomy at work, physical discomfort, and technological changes.

Based on Freudenberger's studies, in their research, Maslach and Jackson (1982) concluded that burnout syndrome has three components:

a) Emotional exhaustion, which involves personal and situational factors. The affected individuals feel an emotional load heavier than that under normal conditions, a feeling of exhaustion which makes them feel unfit in regard to others, deprived of any type of emotional resources whatsoever, which reduces their performance at work.
b) Depersonalization, characterized by the adoption of a rather inflexible and impersonal stance toward others and while performing one's duties. This attitude might be seen as a defense mechanism, in the sense it mitigates the feelings of powerlessness, defenselessness and personal hopelessness.
c) *Reduced personal accomplishment, namely, the feeling that one's job is not deserving of any energy expenditure, that each and any eventual effort to change the profession or move to another institution is nothing but an utter waste of time* (Ferreira, 2014, pp. 9-10).

According to Ferreira (2014), burnout begins with stress and efforts to overcome it, evolving along three stages:

The first consists of an imbalance between the level of stress and the resources to cope with it; the second stage is signaled by the appearance of emotional tension, fatigue and exhaustion. The third step involves changes in attitudes and behaviors, a tendency to deal with clients in a mechanical manner and a concern with personal gratification (Ferreira, 2014, p. 10).

Silva (2016) observes that one should distinguish between stress and burnout, since prolonged occupational stress might lead to burnout. Stress is the result of an imbalance between a caregiver's resources and the demands placed on him or her, although the individual has full awareness of such imbalance and the feeling that he or she might control the situation, which would make discomfort go away (Neto, Areosa, & Arezes, 2014; Bakker, Demerouti & Sanz-Vergel, 2014). In contrast, under a state of burnout,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

caregivers have few personal resources, and it is very difficult for them to confront the situation that causes stress; the negative tension that arises in the workplace compels them to change their attitudes and behaviors (Silva, 2016).

As a result of depersonalization, professionals lose their ability to identify and empathize with the people who seek their help, and do not deal with them as human beings, but as "things," "objects." They tend to see anything related to their job as a disturbance, as just one further problem to be solved (…) Thus contact with people is merely tolerated, and the overall attitude one of intolerance, irritability, anxiety (França & Rodrigues, 2005, p. 54).

Maslach (1976), as cited in Queiroz (2005), describes burnout as a state of exhaustion, expressed as physical and mental fatigue, characterized by a set of strategies adopted by individuals—such as detachment and depersonalization—which change their behavior in the workplace. The emotional demands to which formal caregivers are subjected are the main cause of burnout (Maslach, 2003).

Burnout is one of the most relevant consequences of occupational stress, especially among workers whose job is based on interpersonal relationships.

Indeed, within the context of provision of care to elderly, burnout is common when workers do not have sufficient resources to meet task demands (Silva, 2016).

Providing care to elderly might elicit psychological discomfort and physical illness, resulting in patient tiredness and the worker's feelings of deteriorating health, physical and psychological exhaustion, and consequent burnout (Ferreira, 2014).

Burnout is certainly a relevant issue to consider in the world of work at present, because its consequences are perceptible to the affected individuals, the institutions to which they are affiliated, and the recipients of care, which becomes of questionable quality Studying these aspects substantially elucidates the consequences of the impact of occupational activities on workers at organizations (Silva, 2016).

Several studies have shown that the high demands to which formal caregivers of elderly are subjected in the workplace and their concomitant impact on health translate as high levels of stress. It is worth observing that organizations lack mechanisms to deal with their employees' problems (Saúde, 2013).

According to Maslach (2003), one way to prevent burnout is to promote a compromise between professionals and the institutions where they work to increase caregivers' energy, thereby helping to enable them to perform their job with greater commitment and efficacy.

METHODS

A cross-sectional exploratory and descriptive design was selected for the present study to accomplish the intended aims.

Sample

Participants were 34 formal caregivers from three institutions that provide care to elderly in the Evora district and are participating in project ESACA, Ref. ALT20-03-0145-FEDER-000007 (ESACA, 2017). The participants met the inclusion criteria set in project ESACA: they were caregivers of frailer elderly

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and agreed to participate in the study by signing an informed consent form and had no serious cognitive deficits.

Data Collection Instruments

Considering the research topics and aims of the present study, questionnaires were selected as data collection instruments. The following questionnaires were administered: Copenhagen Burnout Inventory (CBI) (Kristensen, et al. 2005) adapted and validated for the Portuguese population (Fonte, 2011) and the Shirom-Melamed Burnout Measure (SMBM) (Gomes, 2012).

The CBI investigates burnout through 19 questions distributed across three scales:

- **Personal Burnout:** Six Questions that investigate the frequency and degree of physical, psychological, and experienced personal exhaustion, answered on a five-point Likert scale (1=always; 5=never/almost never).
- **Work-Related Burnout:** Seven questions that investigate the degree of physical and psychological fatigue and perceived work-related exhaustion, answered on a five-point Likert scale (1=always; 5=never/almost never).
- **Client-Related Burnout:** Six questions that investigate the perceived degree of physical and psychological fatigue and exhaustion related to work with clients, answered on a five-point Likert scale (1=always; 5=never/almost never).

The total score is calculated by adding the average scores of items; scores equal to or below 3 indicate a high level of burnout.

The SMBM was adapted to the Portuguese context by Gomes (2012), based on the original studies by Armon, Shirom, and Melamed (2012) and Shirom and Melamed (2006). This instrument comprises 14 items answered on a seven-point Likert scale (1=never; 7=always) and distributed across three domains: physical fatigue—questions #1 to #6 (feelings of tiredness in regard to work resulting in reduced physical energy); emotional exhaustion—questions #7 to #11 (feelings of emotional exhaustion in interpersonal relationships, e.g., with coworkers, clients, etc., manifesting as reduced cordiality and sensitivity to other people's needs); and cognitive weariness—questions #12 to #14 (feelings of cognitive exhaustion in regard to work manifesting as reduced attention and thinking capacity). According to Gomes (2012, p. 3) "the score is obtained by adding [the scores] on each subscale items," such that "higher scores indicate higher levels of physical fatigue, emotional exhaustion and cognitive weariness." In other words, "higher levels of burnout are associated with higher physical fatigue, emotional exhaustion and cognitive weariness scores" (Gomes, 2012, p. 3). The SMBM helps to determine the level of exhaustion of the respondent's energy resources by calculating the global score that "results from adding the scores on the three subscales, then [dividing] by three" (Gomes, 2012, p. 4). As these are "merely indicative scores to establish the presence of feelings of burnout (without diagnostic application, as there are not references values available) one might suggest values equal to or over five on the Likert scale ('sometimes') as indicators of problems in this domain" (Gomes, 2012, p. 4).

Procedures

Data collection was performed in August and September 2017.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Treatment and statistical analysis of the data were performed using the SPSS–Statistical Package for the Social Sciences software (version IBM SPSS Statistics 21.0).

Given the relevance of assessing the sensitivity and reliability of the data, the items corresponding to personal burnout, work-related burnout, client-related burnout, and the SMBM were subjected to internal consistency analysis by means of Cronbach's alpha (α).

Once the questionnaires were administered, analysis of the internal consistency of the various domains of the CBI was performed. The obtained Cronbach's Alpha was 0.894 (Table 1), which indicates that the instrument and its domains are reliable.

Table 1. Internal consistency of the various burnout domains

Domains	Number of items	Cronbach's alpha	Categorization
Personal burnout	6	0.869	Very good
Work-related burnout	7	0.748	Good
Client-related burnout	6	0.863	Very good
Global score	19	0.894	Very good

The internal consistency of the SMBM was also assessed. The obtained Cronbach's alpha was 0.880 (corresponding to the "very good" category), so the global score of the scale and its various items was used for analysis.

The study complied with all the ethical requirements (informed consent, confidentiality, and anonymity) included in the Declaration of Helsinki on ethics in research involving human beings.

All the participants were informed as to the subject, aims, purpose, and possible usefulness of the present study. They received clear information about all the procedures and declared their awareness of the voluntary nature of participation. All the participants signed an informed consent form.

RESULTS

Most participants/formal caregivers at the three analyzed institutions were aged 45 to 50 years old (30%), followed by the age range 40 to 45 (20%), while only 3.3% were 55 to 60 years old. All of the participants were female.

Approximately 56.3% of the sample was married, 31.3% had a stable union, 9.4% were divorced, and 3.1% were single.

Approximately 87.1% of the participants had children, while 12.9% did not. Among the participants with children, 45.8% had two, 41.7% had one, and 12.5% had three. Approximately 78.9% of the respondents did not have other dependents, while 21.1% did (one single participant reported having three dependents).

In regard to their educational level, 45.5% of the sample had completed secondary school, 30.3% had finished elementary education (3rd cycle), 12.1% had completed higher education (BA), and 6.1% had completed the 1st cycle and 6.1% the 2nd cycle of elementary education.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Most participants had worked in the job for five to 10 years (51.5%), followed by one to five years (15.2%), and 15 to 20 years (15.2%). Approximately 43.8% of the participants had worked in the current institution for five to 10 years, 28.1% one to five years, and 15.6% 15 to 20 years; 2.9% of the participants worked at another institution for a total of 17 hours per week.

Approximately 37.5% of the participants worked in shifts, and 62.5% had a fixed work schedule. The working hours were quite variable: 55.6% of the participants worked 40 hours/week, 29.6% 35 hours/week, 7.4% 42 hours/week, and 7.4% 37 hours/week. Approximately 60% of the sample had permanent employment, and 40% had precarious, fixed-term contracts.

Approximately 33.3% of the participants provided care to elderly admitted to institutions, and 66.7% provided home and institutional care.

Approximately 68.8% of the sample reported having never missed work in the past year, 25% having missed seldom, 3.1% having missed sometimes, and 3.1% having missed work often. Approximately 87.1% of the participants reported having never missed work in the past month, 6.5% having missed seldom, 3.2% having missed sometimes, and 3.2% having missed work often.

Approximately 74.2% of the participants stated that they would not quit their job at the current institution, and 25.8% that they would, given the possibility to do so. Approximately 66.7% of the sample reported that they would remain in the profession, while 33.3% would change their occupation.

In regard to their state of health, 67% of the participants stated that they did not have any disease diagnosed by a physician, while 32.4% did. The most frequent diseases reported were hypertension, musculoskeletal disorders, depression, chronic venous insufficiency, heart problems, and diabetes. Approximately 54.5% of the sample did not regularly take medications, and 45.5% used medications often, 76.5% of them with a medical prescription.

Burnout

In regard to physical, psychological, and experienced personal exhaustion, 88.2% of the participants reported feeling tired "often" or "sometimes," and 8.2% reported feeling fatigue "often" or "sometimes." Feelings of being weak and susceptible to disease were reported less frequently: 44.1% of the sample responded "seldom" and 17.6% "almost never/never."

The participants' responses to feelings of personal burnout were as follows: 58.8% of the responses were "sometimes," 23.5% "seldom," and 14.7% "often" (Table 2). The average score for personal burnout was 3.03, standard deviation 0.71, which denotes a low level of personal burnout (Table 3).

On the assessment of work-related burnout, 47.1% of the participants responded that their job is "always" or "often" emotionally exhausting, and 64.7% said that they "sometimes" felt exhausted at the end of the working day. Nevertheless, 41.2% of the sample stated that they still have time for family and friends in their leisure time. Approximately 65.6% of the participants were classified as being at level 3, 18.8% at level 4, and 15.6% at level 2 (Table 2). The average score for work-related burnout was 3.03, standard deviation 0.59 (Table 3).

Regarding client-related burnout, for 58.85% of the participants, it was "sometimes" hard to work with clients, and 41.52% "sometimes" wondered how long they would be able to continue working with clients. Statistical analysis of the global score showed that 57.6% responded "seldom," 36.4% "sometimes," and 6.1% "almost never/never" to questions asking about frequency of client-related burnout (Table 2).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Burnout global score

	n	Always 1	Often 2	Sometimes 3	Seldom 4	Almost never/Never 5
				%		
Personal burnout	34	2.9	14.7	58.8	23.5	0.0
Work-related burnout	32	0.0	15.6	65.6	18.8	0.0
Client-related burnout	33	0.0	0.0	36.4	57.6	6.1
n – number of valid cases						

The average score for client-related burnout was 3.69, which denotes a low level of this category of burnout. Standard deviation was 0.58. The participant with the lowest level of client-related burnout had an average score of 5, and the one with the highest level of burnout an average score of 3 (Table 3).

Table 3. Sample characterization according to average burnout levels

	n	Minimum	Maximum	Mean	Standard deviation
Personal burnout	34	1	4	3.03	0.61
Work-related burnout	32	2	4	3.03	0.59
Client-related burnout	33	3	5	3.69	0.58
n – number of valid cases					

Physical Fatigue, Emotional Exhaustion, and Cognitive Weariness (SMBM)

Statistical analysis of the global score on the physical fatigue scale showed that it was equal to or over 5 (sometimes) for 35.7% of the participants (Table 4). According to the results relative to the global score on the physical fatigue scale, 35.7% exhibited values establishing the presence of feelings of burnout (however, without diagnostic application, as there are no reference values available) as indicators of problems in this domain.

In regard to cognitive weariness, 16.6% exhibited scores equal to or over 5 (sometimes) (Table 4). Analysis of the global score on the cognitive weariness scale showed that only 16.6% exhibited values establishing the presence of feelings of burnout (however, without diagnostic application, as there are no reference values available) as indicators of problems in this domain.

Statistical analysis of the global score on the emotional exhaustion scale evidenced that no participant exhibited scores equal to or over five (sometimes) (Table 4). Therefore, according to the global score on the emotional exhaustion scale, no participant exhibited values indicating the presence of feelings of burnout.

Next, the global score on the SMBM was subjected to statistical analysis, which showed that 3.7% of the participants reported scores equal to or over 5 (sometimes) (Table 5). According to the analysis of the global SMBM score, only 3.7% of the participants exhibited values establishing the presence of feelings of burnout (however, without diagnostic application, as there are no reference values available) as indicators of problems in this domain.

RESULTS DISCUSSION

The results of the present study indicate that the analyzed formal caregivers (96.3%) did not exhibit burnout, although they reported feeling physically and emotionally tired. They feel that their job is emotionally exhausting, and most (64.7%) feel exhausted at the end of a working day. They often (15.6%) or sometimes (65.6%) feel burned out because of their work. It is worth noting that the analysis of the global score on the SMBM showed that one participant exhibited values suggestive of burnout. These results agree with those of the study by Melo, Gomes, and Cruz (1997), who reported high levels of stress related to work overload and suggested eventual consequences relative to job dissatisfaction and the possibility of stress generating pressure and discomfort among caregivers.

As in the previously mentioned study, in the present study, job dissatisfaction was identified, since 25.8% of the sample stated that, given the possibility, they would leave their job at the current institution. In addition, 33.3% would change their occupation. Over the course of the study, we came to understand that the participants' desire to leave their jobs was associated with personal burnout ($r=0.38$; $p=0.025$). This relationship is corroborated by Pereira (2002), according to whom individuals with burnout usually manifest a desire to leave their job. In addition to the employees, institutions might also feel the effects of burnout through reduced employee performance, low job satisfaction, and diminished interest in the profession, which could increase absenteeism and might result in actual exit from the job. Therefore, implementing preventive strategies against burnout that are likely to improve working conditions is essential, as improvements will be reflected in better provision of care.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The participants' dissatisfaction notwithstanding, they tended not to miss work. Approximately 68.8% of the sample reported not to have missed one single work day in the past year, and only 3.1% stated that they missed work often. This situation became more evident when, upon being asked about absences from work in the past month, 87.1% of the participants responded they had not missed one single day, while only 3.2% stated they missed work often.

Formal caregivers of elderly with considerable levels of burnout exhibit physical and mental health problems and low personal accomplishment, the rate of absenteeism is high, and the quality of the care provided is impaired, resulting in client dissatisfaction (Saúde, 2013). Approximately 32.4% of the participants in the present study reported having diseases diagnosed by physicians, the most frequent being hypertension, musculoskeletal disorders, depression, chronic venous insufficiency, heart disease, and diabetes. Approximately 45.5% of the participants reported taking medications often, 76.5% of whom had a medical prescription.

Approximately 55.6% of the sample worked 40 hours per week, and 7.4% worked 42 hours per week. According to the literature, the working hours are among the organizational factors that might contribute to the development of burnout syndrome, especially when workers are continuously forced to change their work schedule over a short period of time or to work shifts (Patrick & Levery, 2007).

CONCLUSION

Violence against elderly is an alarming public health problem that amounts to explicit violation of human rights. There is an urgent need to analyze the risk of violence against elderly and to formulate healthcare policies and community intervention strategies to minimize this problem. It is also necessary to dispel the negative stereotypes associated with aging and to change the current way of conceiving of and perceiving aging to increase the social value of elderly and the attention paid to problems related to their rights and needs.

Analysis of the results of the present study evidenced a low risk of violence against the elderly admitted to the three analyzed institutions in the Evora district in association with burnout among formal caregivers. Most of the caregivers (96.3%) did not objectively exhibit burnout, although they reported feeling physically and emotionally tired. It is worth emphasizing that tiredness is not a synonym of burnout, as the latter consists of a state of emotional exhaustion, depersonalization, and reduced personal accomplishment. However, a small proportion of the sample, 3.7%, exhibited levels compatible with burnout, which might represent a risk to the elderly under their care.

Organizations should be able to manage situations characterized by physical and emotional fatigue, prevent burnout, perform periodic evaluations of employees through appropriate instruments, and formulate and adopt measures to minimize and prevent these situations. In this way, they will help improve working conditions and, consequently, the care provided to elderly. Institutions are responsible for implementing policies and organizational management strategies to prevent burnout among formal caregivers and thus to help avoid the occurrence of violence against institutionalized elderly.

Chapter 71
The Impact of the Attitude of Medical Staff From Burnout on the Level of Ongoing Medical Services

Anita Wójcik
10 Military Hospital, Poland

ABSTRACT

This chapter describes how contemporary, dynamic development in all available human areas is unavoidable and necessary. However, along with the benefits and progress made by civilization, there is also a growing margin of vulnerability and unfavorable price developments. Professional burnout is becoming a global problem. It identifies the limits of current human capabilities to the serious phenomenon. In particular, nurses and medical rescuers, who are in direct contact with the patient, experience unpleasant symptoms of burnout.

INTRODUCTION

The concept of burnout is a very trendy, popular and widely used term. Basically, the term can be seen as the mark of the modern times. Although originally, we have been in contact with this phenomenon (not yet a concept) in the story of Graham Greene, *A Burn-Out Case*. That is where the author presents the main character who openly demonstrates his "overall fatigue". Despite his professional fame, financial and, you would think, social comfort he is definitely forced to declare that he has had enough. His psychosocial fatigue has brought him to a situation where he reevaluates his life and views. The decision of social alienation and living deep in a bush, away from the civilization echoes is not as much an escape as a way of saving his being, the wreckage of his suffocated *ego.* Later, as a result of the carried out analysis and research, psychology would call that way of dealing with stress a reset, which restores an emotional balance. In the literature that was the first case of such an immeasurable revealing of a burnout symptom (Schaufeli, Enzman, 1998).

The emergence of the sole concept of burnout is not an artificial stimulation. That term rather constitutes the outcome of a spontaneous, but evolving problem of specific occupational groups. In principle, it should be assumed that used for years ordinary term or a metaphor has been an anchor to bring attention to the existing internal problem of escalation of the professional life on a human being as the biopsychosocial entity. Something what for years has been existing as a jargon of specific professional environments has become the subject of scientific researches (Smith, 2007). Initially, psychology considered that concept as very detached and not quite serious, not having enough essential foundations to undertake any detailed analysis. Basically, the problem of inability to deal with professional aspect of life and a very wide influence of its debilitating effects on many other areas of human life have forced contemporary psychology to look into the problem of burnout (Anczewska, Edwards, Roszczyńska, 2005). It has been a quite bumpy road to achieve the scientific psychology acceptance of the fact of the burnout phenomenon. Substantially, that was partially caused by the "victims" themselves. That would be embarrassing for stockbrokers or lawyers to shout out loud their tiredness and fatigue. Such behavior could have a negative influence on their professionalism and might significantly diminish the rank of their position. Moreover, even nowadays such a recognition of human frailties is considered to be inappropriate and socially denuding or unacceptable in certain professional groups (Maslach, 2001).

Whereas the first reliable descriptions and analysis of the stress effects and the use of the concept of burnout appear in the second half of the 20th century. They were concurrently, but independently of each other introduced to the scientific terminology by a psychiatrist Herbert Freudenberg and social psychologist Christina Maslach in America in the early 1970s. First time, Burnout Syndrome was described by Freudenberger in 1974. While he was working with juvenile drug addicts at New York facility with a group of committed and idealistic volunteers recruited from young Americans, he observed gradual loss of their charisma, motivation and charity commitment leading to the presence of many psychosomatic symptoms. Such a very dynamic and strong dedication to work for the entire year within that specific environment led them to apparent exhaustion, which he called a "burnout". This term was commonly (but highly accurately) used there to describe functioning of people who have been addicted for a long time (Freudenberger, 1983).

Maslach has explored the phenomenon of burnout in slightly different way. While working together with her colleagues from the University of Berkeley and conducting extensive research among working in stressful occupations people (including social workers, psychiatric nurses, lawyers providing legal advice and assistance to the poor, clinical psychologists, psychiatrists, prisons' employees), she tried to determine how they deal with their work related emotional tension. She was interested in the types of techniques they were using to successfully distance themselves from their clients' or patients' problems, and what were the personal and social consequences of applying those techniques (Maslach, 1993). Collected data revealed that many people – by analyzing their own professional experience – reported their emotional exhaustion and weakened feelings, increase of negative perception and patient misconduct and, as a result of those emotional tensions, apparent signs of professional competence crisis. Many of them suggested the reduction or gradual loss of empathy towards others. During the presentation of the study outcomes one of the lawyers has called this specific phenomenon a "burnout". The term has been picked up by other participants, and then – not without the mentioned above obstacles – introduced to the psychological literature (Maslach, Schaufeli, 1993).

Today, the burnout occurs commonly in modern organizations, although most often is not considered to be an organizational problem at the workplace. Common thinking about the professional burnout is focused on employee and his weaknesses related to dealing with his psychological difficulties. Whereas,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the burnout syndrome is strongly associated with the stress inducing place of work and the chronic emotional burden experienced by the employee. People working under such a long lasting, permanent stress begin to experience a lack of harmony between themselves and organization, what leads to losing their motivation to continue working with the previous commitment. The effects in the form of symptoms of burnout are not only the entity's personal problem, but they cause some measurable costs for the organization, thus the phenomenon of burnout becomes a major social problem. Therefore, the issue of burnout, in the context of organizational pressure, demands some broad researches and practical advices for the modern working environments. The past decade has brought a dynamic scientific, academic progress in the broad concept of the burnout occurence. We have already known that term does not apply to all occupational groups. There are certain conditions that must exist to initiate the process of burnout. The truth is that there are no "secure" professions free from the problems of stress, but definitely, it was found that certain groups of professions are almost doomed to a constant rubbing risk of the burning out. The group of professional health care workers has become a basis for hundreds of studies conducted and initiated by Maslach. They have been conducted on physicians of all specialties as well as nurses, paramedics and physical therapists. Studies have proven that they belong to a high-risk group of people particularly susceptible to a work-related stress, what is a specificity of their profession. So let's stop for a moment and take a closer look at the problems concerning people who are saving others' health or lives, but more often, in an uncontrolled way, force themselve to reduce the quality of their own lives at the expense of both their physical and mental health. There should be implemented an analitic method of studying the origin of the burnout syndrome formation in order to understand the threat resulting from the job-related stress or unnatural, excessive involvement at the work life. In my opinion, the most reliable model in this matter is the one developed by Christina Marslach, which is the most exact, illustrative and, at the same time, the most refined.

It includes three basic dimensions: (1) emotional exhaustion; (2) depersonalisation (3) decreased satisfaction from the achievements.

1. **The Emotional Exhaustion:** A feeling of excessive fatigue and emotional exhaustion of resources. Characteristics for this dimension are: a sense of general fatigue, a lack of natural energy and zeal to act, no joy of life, increased irritability and impulsiveness. There are some signs of the need of greater efforts to perform professional tasks. Thera are also many other psychosomatic symptoms. The main the causes of exhaustion are: an excess of duties and conflicts at work. On the professional level, a person feels exploited and exhausted, and at the same time, does not see the possibility of recuperation. He most often complains of the lack of energy to start a new day and meet people, whom he is supposed to help. In the psychological aspect, it is observed the loosening of emotional bonds with his mentee, which often is demonstrated by a loss of attachment and intimacy.
2. **Depersonalisation:** This term has a different meaning from the one accepted in psychiatry. It defines the specific attitude towards other people, which is expressed by the negative, cynical, excessive interpersonal dissociation, and often the loss of idealism. Relationships with others lose their previous personal character, become impersonal, de-identified. Depersonalisation is derivative of an excessive emotional exhaustion. It can be seen as a form of self-defense by creating emotional indifference buffer to protect himself from any interactions. However, there is a risk that the attitude of indifference can lead to an apersonal attitude toward others and dehumanization.
3. **Diminished Satisfaction From the Professional Achievements:** Manifested by decrease of the sense of competence and work productivity. This reduction of the sense of self-efficacy and ef-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

fectiveness may be associated with one's depressiveness and difficulties in dealing with the job requirements, and the stress associated with performing the professional duties.

The situation may be worsened by the lack or insufficient support from the environment, as well as neglecting the improvement of professionalism and competence. The existing state of professional apathy can be associated with a sense of meaninglessness and resignation attitude. The employee demonstrates the increased feeling of inadequacy and the lack of skills which are necessary to assist his customers. As a result, that may lead to erroneous beliefs in his own worthlessness.

All mentioned above symptoms in conjunction with the circumstances of their occurrence create a distinctive syndrome of bad adaptation at work. On its grounds is the exhaustion caused by excessive burden of the employee. It is noted that the advantage of the three-dimensional model is the appropriate expounding the sources of experienced stress in the weave of social conditions, which allows you to distinguish the burnout from other, non-work related unpleasant experience and stress. The main interpersonal relations at work, including relationships with patients, colleagues and managers, are the most important in the process of burning out. However, please note, that they can be both a source of emotional tension and gratification or motivation. In the latter case, they become helpful (especially if they carry a positive aspect) in dealing with job related stress and the effects of the burnout. Maslach (1982) emphasizes that, if the examination of the phenomenon of burnout is limited only to emotional exhaustion – bypassing the depersonalization and the job dissatisfaction-it will lose the full picture of socially important phenomenon. A 3D model of the burnout, proposed by Maslach, is widely accepted and the adopted dimensions have become widely used by different specialists in various polemics about the job-related stress. Maslach points out that even in a situation which does not clearly refers to this model, the established terminology is used in many discussions and scientific works or is synonymous to what she has proposed. However, the source and effect remain the same. For example, the exhaustion sometimes is known as an attrition, loss of energy, fatigue, weakness. Depersonalization is a negative or inappropriate attitude to patients, loss of idealism, annoyance, and lack of professional satisfaction shall be replaced by terms: decreased productivity or capacity, lowering morale, withdrawal or inability to deal with work responsibilities (Maslach C. 1997).

Analysis of the latest research, taking up the issue of the burnout structure, points out a tendency to describe the three-extracted basic dimension of burnout in more general terms than it was done in the original version. The sole emotional exhaustion is not talked about, but is generally about exhaustion, which applies to both aspects, emotional and physical condition.

Depersonalisation-expressed by an unfavorable change in attitudes towards patients-is replaced by the designation ' cynicism ', pointing to the coolness, distance and indifference attitude towards their own work, and also towards their students or clients. The lack of professional satisfaction is replaced by the designation of the inefficiencies of what connects the notion of professional inadequacy and loss of confidence in their own abilities. This change in terminology, in a large extent, is dictated by an attempt to develop a more general concept of burnout, and of not restricting it only to the competition, which took place in the initial period of this phenomenon studies.

In fact, there is no ordinarily accepted definition of burnout. In general, we can say that it is an extended reaction to some prolonged active emotional and interpersonal work stressors (Maslach 2001). Freudenberger and Richelson defines the burnout as a state of fatigue or frustration resulting from dedication to some matters, way of life or to a relationship, which did not bring the expected rewards (Pines, 2000). The multidimensional concept of Maslach is the most popular. According to the author burnout is

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

a psychological syndrome of emotional exhaustion, depersonalization, and diminished sense of personal achievements, which can occur in people who working with others in a specific way (Maslach, 2000). The emotional exhaustion is the feeling of excessive emotional load, tiredness, emotional emptiness, the lack of mental and physical energy. It is the most striking symptom of the syndrome. The term depersonalization, unlike the one in the psychiatric tradition, refers to negative attitudes towards patients, clients, students, alumni, tendency to treat children in a neutral, impersonal, cynical or contemptuous way. Perhaps, in order to avoid confusion, it could be better to use the term depersonalization in Polish or to propose the term dehumanization. Depersonalization in the psychopathological sense is a condition, while in the case of a dimension of burnout it means the dynamic defense process of standoff towards recipients. This dimension of the team in a special way, emphasizes its interpersonal aspect. The third component of burnout is the tendency to evaluate their own work in a negative way, professional skills and accomplishments. The English term a reduced personal accomplishment is usually translated as reduced sense of personal achievements, however, it sometimes is used in the context of the reduction of the personal job involvement, a diminishment of personal achievements or reduced satisfaction. Sęk believes that the present state of knowledge does not allow for a rigid use of one term (Sęk, 2001). According to Maslach athe burnout affects mainly the specific occupations representatives, w providing social services and requiring a close direct work with people, personal involvement in the interpersonal contacts, which are often associated with helping others, and in which their social skills are the essential tools. These are the jobs subscribed in English as human services or helping professions. They include doctors, nurses, psychologists, social workers, teachers, educators.

An alternative understanding of the burnout was proposed by Pines and Aronson. According to them it is a state of physical, emotional and mental exhaustion, caused by prolonged involvement in various burdensome emotional situations. The authors mention about three dimensions of this syndrome, however, all come down to one, the exhaustion. Discussion becomes The separation of understood that way the burnout syndrome from the exhaustion strongly related stress becomes controversial (Schufelli. 1998). According to Pines and Aronson the burning out also occurs in professions that are not targeted to working with people, as well as in situations unrelated to work. For example, it may apply to the marriage or long term aquaintance and friendship. The following definitions of Burnout vary in the scope of their concepts and amount of the marked dimensions. Some include dynamical burnout, rather as the process of burning out (such as a three-step Chernissa's model) (Burke, 1995). Schaufeli and Enzmann (1998) proposed the following definition: Burnout is persistent, negative work-related condition, occurring in persons generally healthy. It is characterized mostly by exhaustion, accompanied by psychological and physical discomfort, a sense of reduced efficiency, diminished motivation and dysfunctional attitudes and behaviors at work. This condition develops gradually. and comes from the discrepancy between the intentions and the realities of the profession. The burnout often is a self-reinforcing process due to inadequate coping strategies. This definition captures the most important aspects of the syndrome, sums up the content of the definitions by other authors and some therapeutic implications. Difficulties in determining the order of appearance of individual expressions of the burnout and their correlations are partially related to a small number of studies. The prevailing view, where the necessary factor to initiate an adverse phenomenon leading to a burnout is work related stress resulting from the lack of balance between the work requirements and the human capabilities, and especially with the load the problems and also resulting from patients, students, pupils, interpersonal work expectations. The crucial sense might have a feeling of the great discrepancy between the expected work-related ideals and the true requirements, the reality of the profession. In this case, the burn out would mostly affect the most

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

motivated and idealistic newcomers at the beginning of his career, sucriphising way too much energy to fulfill their unrealistic expectations. Freudenberger notes, for example, that the burnout occurs about one year after the start of work (Freudenberg, 1974). An alternative approach assumes the burnout is a final result of chronic exposure to stressors at work, and appears later. The empirical researches show that indicators of the burnout are fairly stable in course of time, what supports the latter concept. Stress is necessary, but it is not a sufficient condition for the burnout development. According to Sęk, the burnout is not as much a direct result of chronic stress as it derives from an non-modified stress of your own proactive activity (Sęk, 2000). The basis for the burnout development is the widespread experience of failure in dealing with stress. In the classic model of burnout, proposed by Maslach and Leiter, in case of a staff member whose adaptability in dealing with stress have collapsed, initially there is an emotional exhaustion development. Being unable to cope with this status the employee begins to resist some of the too close, meaningful relationships with his recipients by increasing emotional distance, demonstrating more and more callous, indifferent treatment and their depersonalization. The consequence of this unreliable defensive strategy is the lack of job satisfaction, the tendency to negatively assess their own performance and diminished commitment. This is a sequential model, in which the individual dimensions of the burnout appear in a specific order, are interrelated, mutually reinforcing. Golembiewski proposed the model called phase (Golembiewski, 1998). At the beginning the agitation appears, followed by a reduction of the sense of personal achievements, and emotional exhaustion. The author also suggests that the three dimensions of the burnout can develop at the same time, but independently of each other, giving, as a result, eight patterns or phases of the burnout. Perhaps the relationship between dimensions of the burnout vary in each group. In Sęk's study there is a sequential, selfstrengthening structure with an emotional exhaustion at first, leading then to the depersonalization and consequently to reduced sense of personal achievements among nurses, while in the group of the surveyed teachers the individual elements of the syndrome are independent of each other.

There still is a remaining open question about the separation of the burnout syndrome and the types of connection with other status and mental disorders. The subject of controversy is especially a differentiation of the burnout and stress, depression, reduced work satisfaction and chronic fatigue syndrome (Bakker A.B. 2000). Current researches do not allow for a clear resolution of this issue. Burnout is usually seen as a specific form of response to stress. However, it seems that these are separate phenomenon, because: Burnout is a long lasting process, emerging as a result of a work related stress with the collapse of adaptability, and the strength of that emotional exhaustion highly correlates with stress, however, depersonalization and reduced sense of personal achievements are not listed among common stress reactions and show only little or moderate correlation with the stress, the burnout depends on the original motivation and high job expectations, while stress can be experienced by each individual regardless of the motivation level. Therefore, the burnout is rather a chronic, multi-dimensional response to the stress, which especially the second and the third dimension are specific. Many of the burnout symptoms can also occur in depression. Like in the stress, there is a quite a strong correlation between depression and emotional exhaustion, and the other two dimensions are much weaker (Schaufeli in 1998). Probably they are congenial, but separate states. However, the stronger are signs of burnout, the greater the resemblance to depressive symptomatology. It's also possible that similar personality factors promote both states (Iacovides. 2003). The main difference between them is that depression penetrates all aspects of life, whereas the burnout is limited to the job, leaving the functioning in other areas of life unchanged, at least in the initial period. The symptoms of chronic fatigue syndrome might be similar to the burnout, but in the clinical picture they are dominated by physical ailments and mental accompany

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

them. As in the previously mentioned states, the similarity of burning refers primarily to emotional exhaustion, the other two dimensions do not exist in the chronic fatigue syndrome. Satisfaction is a congenial term and it has a longer history than the burnout. It negatively correlates in a moderate way with emotional exhaustion, slightly negatively with depersonalization, and positively, though insignificantly with a personal commitment. So, these are the concepts related to each other, but the interpretation of the mutual dependencies remains contentious so far. It is not known whether smoking is the cause of the lack of professional satisfaction, or a reduction job satisfaction contributes to the onset of burnout. It is possible that both burnout and reduction of work satisfaction are caused by a common factor, for example, bad working conditions. The burnout, and especially its dimension of personal commitment, needs to be distinguished from the original lack of engagement, as both the states might be similar in their external manifestations. According to Sęk, the knowledge about burnout sometimes might be a specifically cognitive overbuilt defensive pattern against the original lack of professional engagement. It is believed that the burnout might develop only in people with high levels of their initial motivation. The term exhaustion assumes prior state of high arousal. To burn out, you have to first burn. There are some present discussions on the issue of the inclusion of burnout syndrome to the international classification of diseases and related health problems. Wiesmuller and his associates postulate to include the burnout syndrome to a somatic group of disorders (Somatoform Disorders). In the classification of the Diagnostic and Statistical Manual of Mental Disorders (DSM-IV) it is the category designed phenomena that does not meet the criteria of mental disorders, however, require attention and treatment. It describes many job-related problems: lack of job satisfaction and uncertainty concerning the choice of career. The ICD-10 of mental and behavioral disorders places the burnout among some factors affecting the overall health status and contact with health services (Vesalius 2000). The developed to date tools allow us to compare the level of the burnout to different study groups. However, except the arbitrarily adopted statistical criteria of objective standards, there is no specific criteria taking into account some national and cultural specificities, that would allow to properly diagnose it. The presumption is that cultural factors play a significant role, because the hitherto conducted studies reported significant differences in burnout terminology in various countries (Turnipseed DL. 1997). In general, studies conducted in the United States reported a higher average level of emotional exhaustion and depersonalization than the one conducted in Western European countries.

The results obtained from the study of population of Polish nurses were closer to American indicators, which are higher than in most of the studies conducted in Western Europe (Schaufeli in 1994). At the present stage of knowledge, the MBI questionnaire or any other tool are not suitable for diagnostic purposes. To change that it is necessary to determine clinically relevant border points, by comparing the results of self descriptive questionnaires with an independent assessment of psychologists or psychiatrists. Some studies confirm the usability of the MBI questionnaire in an individual assessment of burnout.

Some temporary, requiring further verification, diagnostic criteria were elaborated only in the Netherlands. The preliminary estimates show that about 4% of the Dutch working population suffers from the clinical burnout syndrome.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

WORK-RELATED AND THE INSTITUTION ORGANIZATIONAL STRUCTURE FACTORS

In this group there are included some work requirements and resources: their deficiency or absence (Bakker AB 2003). The lack of comfort and free access to the tools necessary to obtain the proper working effect is very significant. Extremely important is an employee's feeling, that with appropriate equipped technical and substantive support he can sustain the quality of his work. This is one element of this group. However, it is also important the sole work demand as it relates to the colloquial sense of being useful, being a part of a whole.

The Job Requirements

Among the job requirements there are work-related stressors and also stressors arising from the peculiarities of working with people. This distinction is important for theories of burnout, because if it is to be specific for the social service professions, the second group of factors should play a greater role. The stressors associated with the profession are: workload, time pressure, which is too much work to do in a too short time, role conflict and role ambiguity. Role conflict occurs when you meet at work, contrary to the requirements of, put up with for example. the role of educational and disciplinary action. The ambiguity of roles associated with the lack of necessary for performance of work information and lack of clarity as to the purpose of work and responsibilities. Workload and time pressure are strongly related to emotional exhaustion, with depersonalization and a sense of personal achievements. The physical exhaustion is often an inflammatory factor of diminished emotional performance. In addition, the conviction about performing this job on a regular basis, periodically working for another person or performing duties that go beyond his competence can be demotivating. This leads to the very troublesome situation and confirms the fact that role conflict and role ambiguity exhibit moderate or strong relationship with burning out. Among the arising from the peculiarities of working with people stressors are listed those usually in direct contact with customers, patients, students, their number, the load of their problems, the confrontation with suffering, death and with aggression. A lot of research, contrary to the intent of the theoretical, not confirmed by stronger depending on the burn from this group of factors (Schultz, 1995).

The Lack of Resources

Resources include such factors as support, feedback, autonomy at work, participation in decision-making, control of their own work, remuneration, career opportunities. The most common tested of these factors is the support from his superiors, colleagues or other people (Halbesleben., 2004). Support, especially from his superiors, is negatively correlated with burning out, however, much less than the requirements of the work. Other factors included in the resources also correlate (as expected) with all the dimensions of burnout, the strength of these compounds in the various studies is often small. Some authors suggest that the work requirements are stronger related to emotional exhaustion and the resources mainly with depersonalization and a sense of personal achievements, however, the results of research are not always clear and in this respect not always confirm assumed findings (Leiter MP. 1996).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Individual Factors, Demographic

As regards age, more burnout cases are observed among younger individuals. Perhaps this is related to a painful confrontation between dreams and expectations with reality, or with lack of experience. That cannot be excluded that your burned out employees just abandon profession quickly, so in an older group remain those who know how to develop the adaptive mechanisms. Conflicting test results regarding a gender (Leiter MP., 1996). In part the study women gain higher scores on a scale of emotional exhaustion, and the men on the scale of depersonalization. In some studies, single people have higher indicators of the burnout than the ones living in relationships. Slightly higher levels of the burnout can be observed frequently in people with higher education. Perhaps people better educated have higher expectations and take up a position with bigger responsibility. In a substantial part of the research, however, do not seem to be any significant relationships between demographic variables and indicators of Burnout (Maslach, 2001).

Personality Factors

The impact of personality factors was less studied than situational factors, however, certain dependencies are described in the literature fairly consistently. People with low levels of so-called mental resistance are more vulnerable to the burnout process. People mentally resistant are characterized by a tendency to strongly engage in what they do, openness to changes, interpreting stressful events as challenges, and a sense of having a full control of different events and their own lives (Heszen-Niejodek, 2000). Burnout rates are usually higher in people with an external location of source control, coping with their stress in a passive way. The self-esteem correlated with all dimensions of the burnout is low, but it's hard to tell if it is a disposing factor to burnout or rather its consistency. The researchers quite often studied five factors of personality called the big five by Costa and McCrae. These studies show that the burnout promotes mainly high level of neuroticism.

This dimention includes: anxiety, hostility, depression, impulsiveness, sensitivity and shyness (Leiter MP., 1996). According to Sęk's studies the symptoms of conditions predisposition to burn are: the tendency to judge the situation in terms of risks, a mechanism to avoid the difficulties and irrational beliefs, while the immunizing are: general sense of self-efficacy and cognitive control based on the positive experiences focused on the individual's changes. Correlations between burnout and a sense of coherence or sense of meaning in life has been studied relatively rare (Söderfeldt M 2000).

Work Related Attitudes

High, unrealistic expectations to work were very often cited as one of the main factors conducive to the burnout. Conceptual confusion and methodological differences may be the reason of the lack of conclusive research results. In fact, not always legible is to distinguish whether the expectations relate to the characteristics of the sole work to be enjoyable, interesting, or to the results of the learning progress of students, the recovery of patients, or the possibility of success, achieve significant (Schaufeli in 1998).

An attempt to systematize the issue Burnout is important. It allows to capture the problem in the most figurative way. However, it is essential to know the causes of pressure which yields an individual, which uncontrolled and not eliminated on time lead to psychological and physical breakdown, loss of balance

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and necessity to change the present life and way of thinking. The most common reason is stress. In any form, in any quantity, especially the long-lasting.

The phenomenon of stress is currently one of the most popular topics of both conversational considerations as well as scientific researches. Therefore, the term stress is no longer just scientific, though undoubtedly calls for the scientific description and precise clarification, as it is responsible for a variety of disorders of human functioning. Research on stress shall be taken in such disciplines as psychology, sociology, anthropology or widely understood medical science.

In accordance with the recognition of the term, stress means "the state of the burdening of the system of psychological adjustment, occuring in dangerous situations, hindering or inability to implement the individual's important objectives, targets, values." Many scientists understand the phenomenon of stress just as the situation that arises when the individual's challenges and external circumstances exceed its ability to cope with perceptual stresogenic situation.

In a variety of approaches, however, slightly different emphasized the importance of the selected aspects of stress. One of the first considerations on stress was run by H. Selye, focusing on the physiological meaning of stress and specifying this phenomenon as a status of the body, with a non-specifc physiological changes that respond to certain body challenges. In this approach, the stress is a part of Cannon's concept, developing the idea of homeostasis or balance, and acknowledging that stress is the result of internal disorders of homeostasis, and resistance to stress is associated with the ability to maintain the stability of the internal environment (homeostasis) conditions being subject to different stimuli. The author has used the concept of stress for the determination of the reactions of the body as a kind of fight, search methods, defense or escape from the unfriendly elements of sterss builders. All that in order to restore the balance of the body to minimize or eliminate the operation of various factors of pressure.

In another sterss research they clearly expanded scientific studies on the psychological aspect, what started the stage of understanding stress as a psychological category. In that approach they have studied the different emotional disorders experienced by anindividual in some life-threatening conditions or experienced difficulties in interpersonal relationships and tasks. It was noted that situations do not have to be especially threatening to worsen the mental functioning of the human being. The problem occurs in everyday life, in fact, is associated with various factors, which arouse in each individual. Often there are situations, in spite of all its (assumed) destruction, very effective, stimulant, constructive, forcing the above-average activity.

Stress was also featured as a result of the difficult situation in which there was a discrepancy between the tasks or the needs of man and the possibilities to perform these tasks or meet the demanding the needs fulfilment.

In the classical approach to stress there should also be brought up the trading model developed by R.S. Lazarus and s. Folkmana, who put emphasis on individual's interaction with the environment, a subjective rating this interaction by the individual and following the type of activities undertaken by the individual acting in a stressful situation.

In analyzing the phenomenon of stress you should also pay attention to the approaches attempting to reconcile different perspectives, in order to fully and multifaceted characterize this phenomenon. This way, J. Strelau developed definition of stress reconciling the physiological approach (centered around ˆphysical response to the stress) and the interactive approach (stressing the body's reactions to external stimuli). The author suggested to define stress as "the state consisting of strong negative emotions and the accompanying by some physiological and biochemical changes, excessing the normal state of arousal".

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

It should also be taken for consideration the definition of stress proposed by P. G. Zimbardo and F. Rucha who in their analysis of stress have noted that the causes can varied, and most importantly, both in a pleasant and an unpleasant way. Their essence is that they all require changes, and consequently re-adapt to the situation. The authors stress that, regardless of the source of stress biological body's reactions are always the same, and therefore an individual throughout his life span will face the stress and its consequences, whenever he has to confront some new requirements.

Based on various observations of people behaviour in stressful situations Lazarus pointed out three significances of this phenomenon:

- **Load:** Understood as the external stimulus;
- **The Pressure:** Referred as an internal reaction triggered by a stimulus;
- **Voltage:** Understood as a disorder.

This way, the author has defined stress as a highly subjective phenomenon, because the variety of stimuli stressors and subjective evaluation of the events by the individual makes stress something strongly individualized and difficult to determine. It is important, however, that in their mutual interactions between the individual and the environment take into account both the requirements of the environment, as well as individual people deal with committing events (Lazarus, 1999).

The last consideration on stress popularity won the concept stress Hobfolla, referred to as the theory of behavior resources (COR). In this approach, the author is looking for general principles that guide the deliberate human behavior. Defines them as the desire of individuals to maintain, protect and contribute their own resources. To create for them the enclave of untouchability and controlled. Resources and are understood as valued by the items, personal property or the circumstances, experiences. According to the author the man continuously tries to acquire resources, which does not have yet, keeps the ones he already has got, and protects those who for some reason are subject of risk. And therefore, the source of stress is an imbalance in the exchange of resources between the individual and the environment (Hobfoll, 1998).

As you can see, the evolution within the meaning of the phenomenon of stress is associated with multidisciplinary approaches. However, regardless of the differences in this matter, today's psychologists understand stress as a result of any stimuli, both positive and negative, that might be the cause of the disorders and psychosomatic diseases, but they can also mobilize the body and provide an opportunity for human development.

Work is natural for man and desired activity. However, since ancient times, there have aroused very ambivalent emotions, positive or negative. Depending on the circumstances and of the purposes can be used, to support the development and provide satisfaction, but it can also be a pathogenic agent, be a source of tension the emotional illness, disorders in social and family functioning of the human being. Work-related stress (stress professional) is a very serious problem not only for individuals experiencing stress, but also for organizations and society as a whole. The results many studies are very disturbing, because professional stress is a phenomenon very common, but also indicators of work-related stress are constantly on the rise. It indicates the fact that, over the past several decades of professional stress levels alarmingly increased. This applies mainly to industrialized countries, and manifests itself in the rapidly growing indicators of sickness and incapacity for work caused by stress. Each work may be a place where the employee comes into contact with stressors causing the state a strong tension. Thus, each work can be a source of stress. Stress factors related to work are classified in many ways. Synthetic cap ture proposed by Stranks (Stranks J. 2005), groups professional stressors into three categories:

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Environmental Factors:** The conditions under which a given unit came to work, for example noise or air temperature;
- **Professional Factors:** For the same work, responsibilities and requirements, the amount of work and the scope of control over the tasks;
- **Social Factors:** Contacts with other people, your colleagues, but also with your friends, your loved ones outside of the organization.

David Fontana also has identified three groups of work-related stressors, subjecting them to more detailed split (Fontana, 1991):

1. **Organizational Problems:**
   a. Lack of support for the employee,
   b. Long and inconvenient working hours
   c. Low prestige, wages and promotion prospects,
   d. Unnecessary rituals and procedures
   e. The uncertainty and lack of a sense of constancy
2. **Work-Related Problems:**
   a. Difficult customers or employees/colleagues
   b. Inadequate preparation
   c. The liability associated with the work
   d. Inability to efficient operation of or the provision of assistance to another,
   e. Work overload or underload
3. **Specific Causes of Stress:**
   a. The ambiguity of roles
   b. Role conflict
   c. perfectionism
   d. There is no impact on the decisions
   e. Frequent conflicts with superiors
   f. Lack of support from colleagues
   g. Monotonous work
   h. Poor communication
   i. Inappropriate targeting
   j. Conflicts among workers

Organize work-related stressors can be shot n. hop, in which the author clearly presents their categories. This is the content of the work, work conditions and social relations at work. The table shows the most important stressors, belonging to each of these categories. Based on this statement, and earlier, for example, cited the classification, it can be concluded that the source of stress may be factors from different areas of the functioning of the professional man. Literature review, we can conclude that most of the studies on stress has been focused on the content of the work and working conditions. Today, while the plane relevant search becomes an area of human relationships.

Regardless of the category of the stimulus may show different types of physiological and emotional response to stress. In people who experience high levels of stress. There are many symptoms of psychosomatic and stress relieving capacity of the disorder and rest from work. In a number of studies have

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

demonstrated that the greater stress professional experience, this has less satisfaction with work, and greater dissatisfaction with its implementation. Often feel also a sense of failure and incompetence, leading to a reduction in self-esteem (Hops n. 2007).

So for many people, work is a source of stress is the cause of ailments-physical and mental health. At the same time, professional stress is a phenomenon the inevitable, what more is increasing as a result of structural change and economic. One of the serious consequences of experiencing the stress of work, especially long-term, chronic becomes a Burnout, which is today a serious organizational problem and obstacle in building environmentally friendly jobs.

The phenomenon of the burnout can be defined as a psychological syndrome emotional exhaustion, depersonalization, and reduced sense of personal achievements. These three components are therefore about burnout and distinguish it from other psychological States such as stress, fatigue or feeling of alienation (social alienation). Emotional exhaustion means a sense of the person, that is excessively charged emotionally in the work. It is often described as fatigue, loss of energy, weakness or fatigue. Depersonalisation is revealed in the form of a question, respond to other people, who are the recipients of the services of the person concerned, and so for example. customers or clients. Most frequently manifested in the adoption of neutral posture, soulless or even negative, in contrast to irritability, dislike and low level of interest. In turn, the reduced sense of personal achievements means a decline in the sense of one's own competence and success in professional life. Is associated with the belief of the person about their own nieproduktywności, reduced the possibilities of the implementation of the tasks and the inability to cope with difficult situations at the level of working life.

Maslach and Leiter have six main areas, in the context of which the can be considered a source of Burnout:

- Excessive workload (too many assigned tasks, exhaustion, excessive availability, time pressure)
- The lack of a sense of control (lack of participation in the decisions, ineffective leadership)
- A sense of they underestimated and lack of job satisfaction (too low salaries, lack of discretion)
- Interpersonal problems in the workplace in terms of communication and obtain support
- A sense of injustice/unequal treatment of employees
- The discrepancy between personal values and the values of the organization.

Each of the above-mentioned areas can be individually and subjectively experienced and will require another direction changes. Always, however, reactions of Burnout will have a similar symptomatologię, regardless of the specific area, generating signs of burnout.

The phenomenon of Burnout is characterized by five stages:

1. **Physiological Stage:** This is a phase of the physiological symptoms, IE. pain, malaise, loss of appetite, exhaustion, difficulty in sleeping.
2. **Stages of Social:** This is the stage for which are characteristic: irritability, isolating to uncertainty in human relationships, grievances and grief to others.
3. **Intellectual Stage:** In this phase comes to disorders of cognitive processes, What is revealed difficulties in adopting and communicating information, and delighting in the errors in thinking.
4. **Psychoemotional Stage:** At this stage appear behavioral changes, i.e.. the abuse of alcohol, tobacco, drugs, drug, disregard of its obligations, decrease in liability and risk.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

5. **Stage of the Spiritual:** This phase is associated with loss of faith in the fundamental principles and values, reveals the inner emptiness and lack of interest in other people.

It should be noted that the transition from one stage to another is unstable and often takes place outside of individual's wareness. Always, however, the person affected by Burnout Syndrome experience the exhaustion of physical, emotional, the intellectual and spiritual. Importantly, these problems occur both at working life and leisure time. Therefore, the influence on behavior the unit not only in the workplace, but also have their transfer to family and social environment. Burnout is a complex process, which builds up slowly. Does not appear Suddenly and unexpectedly, but is distributed in time and is usually measured in years. The state of Burnout is the result of prolonged and repeated stress load. Most frequently as a result of years of very intense work, usually associated with intensive operation contacts unfortunately. As a consequence of human functioning in conditions of prolonged stress becomes a factor triggering processes of exasperation, listlessness, discouragement and exhaustion. This collection of symptoms over the months or years to effect what is burnout.

Burnout syndrome is the result of chronic mental exhaustion and sense of the lack of meaning in the action taken. An important factor in the level of Burnout are both stress factors, working conditions, and individual properties of an entity. It is observed, after all, a person, which, despite the unpredictable workloads are still just as involved, charismatic and well know methods for dealing with stressogenic situations. However and unfortunately, most of the public responds to the workload (in each dimension) think ourselves showing: fatigue on many levels of life. Full involvement in work, close contact and the desire to be interpersonal being a professional in their professional activities make you see symptoms of burn-out. Affected people realize a decrease in strength, the sense of the reduction or lack of competence, low self-efficacy and belief about the lack of ability to control events in your life both professional and private. Among the features people particularly susceptible to Burnout instance is given by:

- A strong commitment to work
- Big expectations for their own people
- Denying your own load limits
- Offset by the wayside to your needs and interests
- Willing to accept new responsibilities and tasks
- The imbalance between workload and life satisfaction.

According to the international classification of diseases and related health problems ICD-10 Burn-out belongs to the category of problems related to the difficulties in life. Thus, the burnout is related to vulnerability to drift unit loads psychological, and it can be assumed that it is personal experience stress in the social context of work. According to the C. Maslach emotional exhaustion is this component Burnout vocational training, which is most closely associated with stress, which confirms the relevance of the Locate the phenomenon of burn-in stress (personal immunity to stress). At the same time, the author stresses that personality variables and individual differences are less important in the emergence of a burn-out from the social factors. In this way, C. Maslach assigns a special role factors-and as a key source of Burnout indicates the functioning of the organization.

In-depth analysis of the phenomenon of burnout and the results of numerous studies require sacrifice. Special attention needs sytuacyjnemu in startup process of burnout. According to the C. Maslach and Leiter P.M. causes Burnout can be traced in six areas: excessive workloads, lack of a sense of control,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

insufficient reward, the collapse of the community, the lack of fair treatment and conflict of values. Organizational irregularities in these areas contribute to a work overload, a sense of being undervalued, the loss of the joy of work and the breakdown of relationships. Consequently, the talented, committed and full of good intentions, employees begin to experience difficulties in the relationship with the work (Maslach C. 2001). Chronic burnout seems to be an unavoidable consequence of the lack of response organizational environment for people. Employees working in the state of long-term, permanent stress begin to experience a lack of harmony between your person and the organization. A sense of lack of fit, in effect, provides a starting point for an instance of the burnout. You can therefore be made by Maslach, that causes Burnout should be increasingly sought in the work environment than in the properties of the people.

Nurses

This burnout risk group includes: doctors, nurses, social workers, teachers, police officers, emergency service workers. Among them, a nurse profession holds a special place. Many authors claim that in this profession there is many elements relevant to the development team burnout. These include: personality traits, which are the most desirable image of the role of the professional nurse, beliefs and values that govern the choice of profession, work tremendously demanding emotionally and the structure and organization of work.

Therefore, the occupational group of nurses from the beginning research on burning was the focus of investigators. Studies have helped define this phenomenon, have provided knowledge about its structure and dynamics, there are many theoretical models, which in turn have pointed out how can you prevent the formation and the development of burnout. Burnout can be a huge obstacle in working life and personal people that perform the profession of nurse. Therefore, no investment in prevention of occupational burnout among nurses may not be misconceived. The more that people working in occupations exposed to burn can specify, at least in general, the phenomenon of burnout, it is their awareness of the causes of and capabilities to counter burning is already greatly reduced and falsified. When Freudenberger described for the first time, Burnout, described it as a drop in energy levels that occurs in the employee due to overload other problems. This situation may take place when work is based on the relationships, interpersonal skills, requiring emotional. The author pointed out that the drop in energy results in impaired mental and physical man, which, in turn, negatively affect his professional life and private. For Aronson Burnout is slowly following cessation.

A man in this state has a sense of emotional exhaustion, mental and physical, feels helpless, cannot see in front of you, the work no longer, and integrated tsearch loses also the joy of living. Maslach, a forerunner of research on burning, and the author of basic publications on this topic, she attributed this phenomenon to people carrying out social events in which work with people is on caring relationships. Research carried out among representatives of these professions have resulted in the development by Maslach and Jackson three-material model of burnout, according to which it is defined as a "psychological exhaustion syndrome emotional, depersonalization, and reduced sense of personal achievements, which can occur among people, working with other people in a certain way ". Emotional exhaustion applies to the sense of the person concerned, that the emotional load, which experiencing, beyond its capabilities, that no longer has sufficient resources of emotions, in order to meet the expectations of other people and act as the existing roles. Depersonalisation specifies the ratio of the unit to the other, expressing the excessive isolation, relevant, and even indifferent response to clients or recipients of services. Reduced

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

sense of personal achievements applies against a unit to itself, the deterioration of her sense of competence and efficiency at work.

Nursing belongs to a group of professions of trust society, whose role and social roles are infiltrating, and their representatives are expected to professionalism and conduct by higher ethical-moral standards than those which generally apply to the rest of society. People deciding to practise the profession expect will draw from work satisfaction and satisfaction, that giving of yourself to others will be a source of energy for their own life drive. Work in this profession is associated with experiencing stress on many levels, which, in the absence of effective ways of coping, can lead to a sense of discouragement, load and loss of professional satisfaction. Daily contact with the disease, suffering and death forces the nurse to frequent confrontation with the nieodwołalnością loss of life and health. The provision of nursing care is based on establishing and maintaining a close relationship with a patient symptoms and his loved ones, cooperation with other members of the team of therapeutic and other health professionals and non-medical. The entire surrounding nurse or nurse the world professional also consists of people. Each of them have their psychosocial considerations, set out the views and habits, and each of them is the daily briefs-, which often have their reflection in contact with another human being. This specific type of stress generated by the working relationship with another human being, it makes the profession of nurse one of the most exposed to burnout. Although the commitment, high sensitivity and a sense of responsibility for others, as well as resourcefulness and reliability are the characteristics of a very desirable, because it allow you to be a good nurse, is very conducive to emotional overload. The susceptibility to burn predisposes also multi-purpose nature of the work and its complex structure and organization. Occupational requirements in relation to the nurses continually grow to meet them, it is necessary to increase the level of knowledge and professional qualifications and social skills. The nominated social can be for nursing staff a heavy load. The society believes that nurses profession is a very responsible job and often expresses itself in dealing with staff. It is not always done in a glorious and often a nurse as a direct contact with the patient experiencing unpleasant situation, and claim-in its meaning of degrading its dignity and giving seed of guilt and discomfort.

In the course of being carried out repeatedly for research on the burnout phenomenon on nurses, there were burdensome and negatively perceived characteristics of the profession, which are grouped into specific categories.

Requirements related to the specificity of the profession (they can be analysed before the decision on the selection of the profession because they are predictable, but impossible to eliminate), irregular lifestyle caused by work on the shifts, particularly at night. The lack of regularity in the functioning of the body, collapsing circadian rhythm with the need to sleep during periods for physiological sleep is seen by the nurses as a very big disadvantage. After decades of mixing on the same night the body goes (many people) in the phase of the rebellion with often severe psychosomatic symptoms. Often, women bringing up young children complain of terrible fatigue when after a few months or even weeks of his notorious Act by your child at night are finished and chronically tired. The same problem applies to people from the circadian rhythm in case of frequent travel, especially with the change of time. Adjusting and reverting to hemostasis is not simple and requires always the time. We are at the stage of evolution of the accustomed to regularity you dictate by the Sun, the light and the pineal gland. It allows us to organize our existence in a certain framework and allows the cyclical reset. Unfortunately, even the regular participation in the disturbed, but reversed rhythm of life does not cause organic habit. This includes, inter alia, the duty of health care professionals. Because continuous exposure to currency fluctuations in this topic might be for those inconvenient or even harmful.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The possibility of being infected through close physical contact with the sick, contact with secretions, feces and dirt-is another aspect that was extracted as a factor stimulating a sense of inconvenience. Uncertainty concerning the contact with another human being, limited confidence as to his sincerity, integrity in a situation when the US obligation to provide him with the necessary assistance can be applied. Continuous vigilance procedures and rapid assessment of the situation in order to obtain the maximum safety for health and life not only the patient, but also his, is always at the expense of emotional. Especially in the case of contact with the patient difficult, aggressive, bet live as Newcastle try. Always, after all, there are somewhere in the US care for coming and for their safety. Sick, or the transfer of disease to family members is something undesirable, it's obvious. The element of risk is also seen very unfavorably inclined not only incidentally by the nurses.

The cumbersome lists also the elements of physical work accompanying the implementation of treatment steps and nurturing. To perform the difficult and complicated medical procedures with the patient is picked up by a nurse as a big minus in the performance of professional activities. Despite the technical facilities and the specific rules and procedures many times reality put nursing staff before the ruthless reality. Heavy patients, helping with daily activities or monotone each step does not allow you to find here comfortable conditions of work. Nurse, by participating in the many hours of interdisciplinary operations with a huge amount of equipment wysokospecjalistycznego, must force your body to long hours of inconvenient and niefizjologicznych body position. Preparation of equipment, tools and material completed in weighing several kilograms's also is entered in the roles of nurses working in operating room. Many times it has been shown that physical exhaustion factor or systemic diseases (diseases of the spine, heart disease) are link inflammation to begin a process of frustration ending multi-clip tray of the burnout syndrome. Symptom of disability, infirmity of his own body in the case of nursing personnel is reflected in the thinking about reduced fitness in your profession. This is a very sad, but but very real picture.

To the mental stress include (reasonably foreseeable, but their effort makes itself felt only in the course of work) a huge responsibility with which involves medication and treatment and the awareness that the mistake may be worsening of the patient's health or even death. Aggravating also need to maintain vigilance and control to frequent contact with pain, suffering, disability and death. Experience with human suffering, including suffering (sufferers often associate in nurses who accompanied in the healing process) is an amazing emotional baggage for this occupational group. The emotional considerations, which should be equipped with a nurse, although so very desirable, are often shot in the knee. Unconditional empathy can improve, refine the process of treatment, thanks to the wczuciu the role of the patient. Allows you to visualize your needs. However, the excess emotional border integration with the patient can be an emotional suicide for medical staff. Especially if the final effect of the treatment process, very different from the initial assumptions and perceptions. There are known cases when the death or disability of a patient, despite all efforts, wyryły in so destructive in the personality of the employee, that caused the collapse of his own professional values, led to rebellion and abandon the profession. An important element contributing to the determination of this criterion are also normal, everyday interpersonal relations. It is important who we work with, we exchange views and who listens to us, especially if we are in the process of treating another human being. The most difficult are the relationships in times of high tension associated with the performance obligations. Often, the dynamics of the treatment process-which include unplanned phrases in the healing process of the patient as a cardiac arrest patient, massive bleeding during the operation or totally unexpected reactions of the organism – cause no self-control of some co-workers. Surgical nurses adept to the profession, as the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

biggest stress determine deposited operator. The lack of the basic principles of social interaction, lack of manners and aggressive ignorance represent a major challenge to maintain emotional balance and often and activities of nurses. To pass on mutual professional liability or official blame incompetence (often not scratch) only for the release of your own emotions for example. the doctor is not at all uncommon. Although that offended by the nurse is aware of your own values and refuted such accusations, however, it is always associated with huge interpersonal discomfort and at rozchwianiem. Difficult subject is also alienation and lack of acceptance in the environment. Is a very serious matter, and many employee, not only in health care, forced to change career plans.

The lack of conditions for the treatment of (elements that hinder or prevent the process of treatment and nursing care, and nurses have no effect on their occurrence): instrumental deficiencies (e.g., lack of medicines, bandages, disposable equipment, medical equipment), some general (for example, for an insufficient nursing staff in relation to the number of patients, architectural barriers, bad liked) and system deficiencies (e.g. obsolete provisions, storage meltdowns, organisation of medical care). To the wider comfort nursing also contributes in no small degree of technical facilities. For educated and experienced nurses lack of comprehensiveness in the treatment of the patient is very disruptive and clearly this is marked in the form of various surveys and forms when examining the problem of burnout or evaluating of the quality of working conditions. Is a very important element of a sense of safety in the workplace. Very depressed for nursing environment fact simultaneous contact with the responsibility of compliance with defined and imposed top medical procedures in the collision with the lack of physical (hardware, lekowym, human resources) the completion of these formalities. It reminds the situation if we wanted to write a book, we know the spelling rules, we know what will be its title and plot but ... we have no paper or have only a pen and a twist on what to start writing. Sad but true and unfortunately very common. As previously mentioned the nurses most often do not have this effect, and it's even more compounded by frustration in them which is a vector to burnout. The lack of any manoeuvres, impotency and often forcing the overriding quality standards makeshift solutions gives nurses a feeling of flimsiness of their hard work. This peculiar and painful despair, Inc. in their working lives of nurses. Due to the expansion of the scope of the rights of the patient and the number of lawsuits for not done medical procedures-this situation is planned to improve it but it is still an element of stressful work of health protection.

Low wages, that is, whether the remuneration of nurses to professional requirements and individual effort expended by the nurses in its execution, is also unfavorable for nurses disparity in salary compared to other professional groups. Becoming a nurse in the whole world is with very very difficult multi-stage education. In the field of higher education in many countries over the last 30 years a huge transformation and expanded the level of teaching in the training of nursing personnel. In addition to the graduate medical universities is also required continuous training to postgraduate. Also because of the quite understandable breakdown of the specialties in nursing (dictated by the dynamic development of the Departments of Medicine) is required to have the title of specialist in the active field of nursing. It is therefore the obligation of continuing education for nurses and broaden his knowledge. If we add to these values responsibilities per nurse, her kompetencyjność and responsibility, we have before us a highly qualified provider of security services society health needs. So why to continue this profession if they cannot look forward to an appropriate financial gratification for their work? Dissatisfaction with the salary is not a whim or unelegant nudge. It is a response to discomfort. For centuries, it is known that one of the strongest motivators to action is money and ethical consideration for the work. In many countries it is a very controversial topic and although low salaries of nurses are a matter of indisputable unfortunately are field continuing battles with the dignity of this group financial professional. Referring

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to the burnout it is not difficult to understand that this issue is a very important element influencing negative perceptions of their profession through the prism of financial attractiveness. The lack of opportunities for a dignified existence received salary or work in several hospitals to go on holiday are an effective intimidation to perform the profession and factor effectively lowering your own ego. Hence, the simple way to burnout.

Low professional status, which is manifested by lack of real social recognition for easy work of nurses, lack of legal acts governing the position of nurses in the functioning of the health system. Still, the role of nurses in society is unclear, not clearly identified and conflict. There are people who regard nurses for wise and competent person, trustworthy and socially necessary. However, still and too often, this occupational group is considered from the point of view of its servile function. Crushed by centuries of belief may not enjoy the concept of nurses as independent skilled professions that the profession of public confidence and the necessary to the proper functioning of health care at a high level. Nurses are today members of the treatment team, the leading independent responsible processes of patient care. Often, the nurse is a source of knowledge about the patient and often first takes important first steps in the healing process. The enormity of the knowledge and skills required to have a nurse puts them to a high degree in the hierarchy of professions, not just medical. Very unfair is the treatment of these people only as a medical and social assessment this low contributes to very bad emotional sentiment among nursing staff. Nurse pay duties, overwhelmed by the vastness of knowledge and unappreciated for inserted in their work efforts and commitment have the right to be frustrated, has the right not to feel satisfaction from the way they chose. The base to the very conflicting, warring emotions between vocation and pure regret to ... yourself, to your colleagues and also for the patient.

The evil team cooperation to healing, the most important are the problems resulting from the hierarchical structure of the profession, such as: receiving conflicting instructions from supervisors at different levels and dumping responsibility for the effects of the therapy for nurses. The cumbersome lists also difficulty in interpersonal relations with people involved in the same issue, for example. with medical staff, technical, secondary, employees of the administration. This category lists also demote work nurses by people directly working with them, in a situation when the presentation of recognition would be for them an important gratification. In principle, this category is something like the previous problem with low respect for the nursing profession. As previously mentioned, it is difficult to break, change ingrained social position on the status of this group. Any produced no balance of competence or the correctness of the interpersonal relationship on different lines: the superior-nurse, doctor-nurse, the patient-nurse are the consequence of too low a recognition of this profession. This is reflected in the many aspects, not only about personal dignity but also to promote.

Bad cooperation with patients and their families: the difficulties in building correct relationships caused by personality traits and the wrong understanding by them of the role of nurses, the instrumental treatment of nurses, lack of respect, excessive requirements and requests of the sick, the lack of feedback from patients about the satisfaction with the work of nurses, which deprives them of one of the most important gratification in this profession, namely recognition in the eyes of the patient and his family. For real, involved nurse patient is the meaning of her work. Every action and every think that performs on the professional field is dedicated to the patient. The real nail in the coffin in the course of professional work, unimaginable defeat and a very unpleasant experience for nurse is the patient's dissatisfaction and lack of therapeutic effect, even though the wearer effort and dedication. It is often lightly tossed, misplaced. Often, malice caused by frustration of the patient or his family. However, it is always a painful kick that remains in the minds and prompts to the destructive analysis and ask questions: what I did wrong?

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

You may need to be different?, And so on. Such events definitely reduce the value of self-assessment of nurses, subject under question the meaning of her dedication and sacrifice.

Illustration of the above categories on the burnout clearly shows that the causes are very complex. Many authors agree that overall, Burnout is the result of chronic stresowego the nature of the interaction that occurs between the person and the situation. Repeatability of certain hostile events, fear them or their consequences are the engine for progressive, most often the slow evolution of burnout syndrome.

Paramedics

Medical emergency is an area, where the source of stress is the second, the stranger and the situation which led to interference with emergency services. Sometimes it is the same patient, and sometimes the people with whom you interact in providing aid. Paramedic is a qualified health care professional who participates in the immediate life-saving interventions or human health. For him the situations or the average, but not devoid of large dose of stress. Is a member of a small team, working with doctors, nurses, emergency response personnel from other ambulances and hospital Emergency Room workers. Is in direct contact with the family of the patient, which can be particularly difficult in a situation of sudden illness or accident of a child when it needs to alleviate the fear and panic of his parents. The rescuer often passes through a thin barrier of privacy of the patient, and even his intimacy. Enters into his apartment, he finds it in moments of greatest weakness, not only physical, but also mental and social. The patient expects from the rescuer fast and professionally, alleviate suffering, his focus and commitment. This situation is stressful for the rescuer, and the same patient for which lifeguard is still a foreign person, often decisive to its fate (Cydulka R.K. 2008).

There are some common factors in the work of the paramedic, who are the primary source of stress. These include a sense of lack of control-as a lifeguard is a variety of factors, which it influences and such that are outside of its control. As a result of the complicated and very elaborate apprenticeships in the course of education and training-is a conscious situation and predict events that may arise in the course of its activities and current circumstances. Is prepared for a rapid response and to prevent unwanted effects. However, despite a solid preparation, you may receive a number of inconveniences and unconventional situations, which may come as a surprise to the rescuer, and at the same time to become a source of stress. The latter situations when rescuer meets with violence on the part of the patient or his family, which especially happens when they are under the influence of alcohol or other drugs (Popa f. 2010) Sometimes also known by paramedic is the body's response to the deployed treatment-positive or negative, sometimes despite the efforts of the terminating in death. Next a stressor is a sense of uncertainty – it may arise from doubts about the rightness of choices, as well as doubt their own abilities. When the rescuer takes professional activities to help the patient his knowledge about the patient is quite limited. Not always to the end of the spectrum is able to obtain information about his health status, lifestyle, recent activities or medicines. Follow specific tailored to the situation of the procedures, however, the choice of the proper procedure may be initially it works, a huge dose of stress. Everyday work in a medical emergency is the need to make tough decisions in a short period of time. When you are not certain your wrong, which may depend on a human life, there is uncertainty as one of the biggest stressors that can lead to burnout syndrome. As in the case of nurses, eternal fiancee fights with uncertainty and stress of taken decisions is a great field to the development of burnout syndrome.

To paramedic are high requirements. The specificity of work in emergency services undoubtedly involves the exposure of their situations dangerous to life. They are related to the high voltage przeplat-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

anym long periods of relative calm, or routine. Negative interpersonal relationships, the excess duties are sources of stress in the emergency services and the nature of traumatic events with which the rescuers come together every day to increase work-related tensions. The threat of physical harm to health, participation in situations requiring rapid and difficult medical decisions, frequent confrontation with life threatening and the sheer scale of the death and a sense of helplessness during the rescue process, causes massive emotional tension and mental exhaustion. Where the magnitude of the maximum concentration and emotional involvement with the use of manual, physical skills wieńczony is a poor result or the death of a patient before a lifeguard stands tall internal skill understanding and come to terms with it.

It is understandable, therefore, that this work requires special predisposition and high resistance. In the relationship with the patient lifespan is based on its competence and trust, which must get in the eyes of the victim in a very short period of time. Typically, the contact with the patient is short-lived, and the opinion that creates the situations is persistent. Therefore, it is essential to have a good psychological paramedic preparation for some undesirable patient relationship did not become a source of emotional discomfort in a lifeguard.

In particularly difficult situations, paramedic must be prepared to make a decision not or the cessation of rescue intervention. This applies to patients able to extremely severe, Terminal, or if the action to restore vital functions exceeds the time specified procedurally. Decisions "do not resuscitate" are also part of ethics and moral in the relationship with the patient and his family. These moments of rescuers describe as exceptionally difficult and dangerous to your psyche. Tangible contact with death and accompanied by her circumstances (despair of loved ones) is always a huge experience and long stays in memory. Many rescue workers shall be loose talks that several relatives were abandoning the profession because of the trauma of a failed rescue action.

Stress also has an impact on the take by paramedic yet difficult decisions in emergency mass, epidemics or disasters. Sense of responsibility for a lot of people in conjunction with stress-can run be paralysing for a person with low adaptive capacity. As a rule, adrenaline makes the increase in activity and physical mobilization. However, the repeated experience of such situations leads to the gradual burnout, indifference and fatigue. A symptom is also addiction to adrenaline and desire to participate in such events is made only for a specific boost having no connection with the empathy and the desire to help. However, these are isolated cases.

Another source of stress may be the feeling of failure to meet expectations **-** every man from the people, which to some extent deliberately helps counts on gratitude or though a good word, which is the simple word "thank you". Similar expectations, often unconscious, has a paramedic in relation to the people that care, helps in difficult circumstances, sometimes even saves lives. However, at the time of the threat to his health or life the patient focused on yourself and do not mean that at this point, to show gratitude to someone. All of this can cause the rescuer feeling that more gives you from each other than an instead. An important and always found a stressor is paramedic work stress of shift work. Problem discussed in the case of group discussion in this nursing profession have similar consequences. It results mainly from the natural circadian cycle disorders, or work during the day and sleep at night. However, it is a part of their job description, because the health service providers must be constantly available, and the quality of their action must be the same at any time of the day. Shift work entails adverse effects for the body, such as sleep disorders, chronic fatigue, which leads to a deflection and dysfunction in family life and society. It contributes to the severity of the negative feelings, the deterioration of the health and physical and mental. It lowers the sense of satisfaction, causes increased tension, the deterioration of

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

self-esteem and decrease efficiency. For employers, this means a decrease in performance and safety and increased sickness absence.

Too long exposure to stress at work can have irreversible health effects, directly affects the reduction of efficiency, lack of compassion for the victims and the existence of negative feelings to yourself such as lowering self-esteem or self-worth. All of these factors can result in reduced ability to overcome stress and consequently move away from the profession.

In the activities of the paramedics there is also the problem of injuries and exposure to infection to pathogenic organic material. Lifting heavy patients and transporting them to the vehicle contributes to later problems with their bones and muscles injuries. The scale of paramedic workers problems is huge and often disqualifies a person to practise this profession.

The profession of paramedic is a job in which exposure to stress is high and where there is a risk of the burnout syndrome. In an Israeli study of a group of paramedics, the burnout occurred in 35% of the polled individuals(Nirel N. 2008). A similar result can be observed in the study, in which 35% of respondents noticed to feel tired at home exhausted all day, what is considered to be a symptom of the burnout. In addition, most of the surveyed people considered their work to be too stressful, and noted the presence of the selected symptoms of the burnout.

Most incriminating factor at work in the light of the results obtained is the remuneration system. However, the most common sign of the burnout was a signifficant tiredness after work. Most of tested individuals have confirmed the use of some constructive ways to deal with stress, but also the unconstructive ones, such as the use of stimulants (including caffeine and nicotine), where consumption increased in difficult situations. Although the vast majority of paramedics have recognized his work as valuable and would have chosen a job in this profession again. There was a moderate and high level of job satisfaction among the responders, what is similar to the results of the research done among American doctors of emergency medicine specialties, where, despite the high level of the burnout, 65% of physicians found their work to be satisfying. Based on the research it can be concluded that among working in Krakow and the surrounding area paramedics there is a dangerously many symptoms of the burnout. This shows the employers the need for creation and implementation some activities to reduce stress levels among employees and to prevent the occurrence of the burnout. Early action, such as a minimalization of the excessive stress or reduction of early symptoms of the burn-out, would prevent the progress of a full-blown intrathecal burnout syndrome (Dudek B. 2004). It is very important that the effects of stress and burnout are experienced not only by employees, but also by the paramedics' employers, who have got among their staff members many worse burnout cases than some of the patients, who consequently receive lower quality care. Nevertheles, there are many effective interventions helping to build a resistance to stress, lower the tension during especially difficult situations (death of the patient, the mass event, etc.), such as providing psychological support and training, relaxation techniques, promoting physical activity and maintenance of appropriate rest periods between their work shifts.

One of the popular methods implemented by employers should be the hiring of psychologist, who helps the paramedics in difficult situations. Particularly important aspect of this form of support is working with rescuers immediately after a particularly traumatic experiences, so called debriefing. The importance of this method was asknowledged by an international practice, since the lack of a suitable psychological action after such an event can lead to post-traumatic stress disorder and serious risk of the rapid burnout (Regel S. 2007). In addition, some employers promote active leisure time as a form of coping with stress and finanse employees tickets to the gym, swimming pool, etc., which is an important element in supporting psychological interventions. So far, however, there haven't done any research

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

studies to analyze the effects of these interventions on the level of work-related burningout among paramedics (at least in Poland).

The analysis of these two occupational groups provides a good illustration of the causality of the onset of the burnout symptoms. In recent years the scale of the problem is so large and growing that it has become the subject of verification and observation in each group. Modern psychology very seriously treats this phenomenon and continues working on developing some ways of minimizing its prevalence.

Therefore, the measures taken to prevent burn-out are associated directly with the antistress activities. Primary prevention concerns the work environment. It should consist of the assessment of the psychological risk and elimination or modification of those risk factors that put stress upon employees in order to minimize their amount and eventually to avoid the occurance of the tension. Secondary prevention relates to people. Its mission is to teach the employee how they can effectively deal with the existing stressful situations. Secondary prevention relates to an individual, not to the work environment. Tertiary prevention also applies to a person, but it is to treat the health consequences experienced by the stressed out employee.

According to H. Sęk, the burnout counteracting factors are: a sense of cognitive control, which comes from some positive self-esteem experiences and willingness to make certain personal changes; general acceptance of the own job effectiveness as a positive feeling of resoursefulness. Therefore, the measures to prevent the burnout symptoms development should include the improvement of employee's self-esteem, mainly by increasing his sense of professional competence; strengthening the initial challenge assessment, which is assessing the employee's situation as a challenge. According to H.Sęk, the prevention of burnout should find both the positive and negative strategies. Positive strategies aim at strengthening environmental resources. With regard to the nursing profession, positive approach would be equipping medical field professionalists and students of nursing with the general skills to deal with their stress. The social skills improvement and the proper use of the commitment decks and empathy are as important as professional preparation. It is also crucial to develop the skills to use the positive life experiences and evolution of realistic professional beliefs. The negative strategies are adjusted to minimize risk factors. They consist of reducing and eliminating job nuisance, especially at the macro-social level, for example, by changing the salaries, strengthening the social status of the profession, reducing financial and organisational deficits. The intensity and duration of the stress impact stress can be also decreased by some individual's activities, for example by an appropriate rest, relaxation, maintaining work-life balance. The negative strategy should also modify favorable burnout attitudes and personality traits and the completion of the actual shortage of professional competence. Most of the authors suggests that preventive efforts and countermeasures to Burnout took place at several levels: individual, institutional and institutional indywidualno.

Action at the individual level are based on the use of personal resources of the unit to prevent the negative effects of stress. Most commonly used strategies for samopoznaniu and strategies on reducing the effects of stress.

The first consists of employee learning techniques of self-observation, self metric using professional measuring tools to detect signs of burnout, stress control by passive and active knowledge on this topic. To strategies to reduce the effects of stress include: promoting a healthy lifestyle (regular physical activity, proper nutrition, a sufficient number of hours of sleep, to comply with naprzemienności of work and rest, smoking tobacco), the use of different relaxation techniques (in order to remove unwanted, physiological stress response), cognitive behavioral techniques notes the erroneous and harmful beliefs about work to be done. Action at the level of the relationship – the unit is addressed mainly to increase the resilience

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of the employee's work-related stressors. The task of the intervention in this area is: increased employee knowledge about its own capabilities and limitations, developing effective strategies to handle deal with problems and negative emotions, emotional, instrumental and support in the workplace, the availability of treatment for people at risk of burning and rehabilitation for people "shred". Among the possible to take preventive actions at the level of the employee-company work include: the implementation of educational programmes on stress and burnout, organizing training interpersonal skills, communication and conflict resolution, coping with stress, training, management of own time and the proper use of working time, promoting realistic knowledge of the profession and "professional life". An important element in the prevention of stress and burnout on the level of intervention is to organise in the workplace social support system. Employee support groups would create the appropriate social climate in the environment work, give the possibility of emotional odreagowania issues and get advice from people more experienced. Social support obtained by other team action than formal support groups led by trained leaders also fully protective function before burning. Especially the involvement of associates in creating the atmosphere of camaraderieand kindness, help in the adaptation of the professional staff, common to discuss issues of care, the possibility of exchanging professional experience, showing itself by associates of mutual respect and recognition of [1]. Measures to prevent the development of symptoms of Burnout at the level of the institutions are targeted to increase quality and reduce costs. To this end, it is proposed to carry out regular staff, anonymous testing, allowing to estimate problem of stress and the risk of burnout. Employees in addition to the mandatory health examinations, should be able to carry out a voluntary survey assessing the symptoms of burn-out. Workplace can and should strive to improve the work environment by removing or modifying the stressors, improve mutual communication workers, prevention of buiding up theconflicts at work, the introduction of additional holidays or breaks to enable a more efficient recuperation, to enable employees to participate in internal and external training. Other suggestions relate to the introduction of flexible work plan, adequate to the contribution of the reward system, establish clear and fair principles of management, a clear determination of professional obligations, the inclusion of employees in planning professional development. Reasonable is considered also the creation of the Department of Health Care Services, which would provide a professional guidance for people at risk of burning out and implement prevention programs. As you can see the possibilities of preventing burnout among professional nurses is much. The burnout prevention strategy should already begin at the stage of medical training and last throughout the period of individual's career. It seems that the implementation of a preventive measure system would help to reduce this negative phenomena among nurses.

CONCLUSION

In the face of numerous studies on the working environment, the concept of professional burnout is not new. Around the world, almost every civilized country is home to organizations and institutions that research the working environment. Establishing and accepting that the working environment, the type of activity performed, and any inconveniences that may be a part of the psychophysical state of an employee, actually took years. Several decades of work, primarily psychologists and sociologists, have resulted in the systematization of the notion of professional burnout. While already observing such a phenomenon among the professional community can be regarded as undoubted success in the field of health and safety at work, implementation and public recognition is not always easy and achievable. In many countries, this topic is still very controversial or is not very serious. The phenomenon that disturbs the assumption

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of efficient and effective work in which an employee is merely a source or income vector is by no means undesirable. The concept of professional burnout after lichen in many communities does not work. This is primarily a topic that concerns certain professions. The isolation of particular occupational groups, particularly those exposed to professional burnout, contributed to the analysis of the working conditions of the people who performed the occupations. It has confirmed the socio-psychological assumption that all our human actions leave us unmovable, often very lasting. Once again it was proved this time on the professional canvas that man is an integrated psychophysical whole. Working, carrying out daily duties is a huge part of life for the vast majority of mankind. For many it is the meaning and the driving force of life. A force that can not be rid of or separated from everyday life. But there are some people for whom work is not a passion and a source of satisfaction. The conditions under which they have to perform the imposed duties are so unfriendly and in many respects contradictory to the correct rules of work hygiene, ethics and social cohesion that are rather a substitute for discomfort and perception of work as necessary evil.

Medical staff is a special occupational group. Mental involvement in contact with another person, the individual treatment of each patient through the lens of empathy and compassion in connection with severe technical conditions (such as patient lifting, exposure to injury and infection) is a cocktail that translates into many aspects of a medical worker's life. Not without reason the nurses are included in the results of many studies as workers are exceptionally exploited and are particularly exposed to the windshield and short working life. Also, medical staff life expectancy does not reach long periods of time. The embarrassing "professional burnout" is primarily a worker's performance problem. However, few employers analyze the working conditions that their employees provide. The ignorance of the problem and noticing the needs of subordinates, not perceiving the "human element" in them, leads most often to lowering the quality of their services. In the case of public health, it is a very risky practice to take care of the health and life of the public. Balancing on the border of safety and responsibility. Lack of decisive, wisely developed and above all the stubbornness of the implemented methods of preventing this phenomenon. Although employers' awareness and work culture evolve, however, the prevention of this topic is very low. Young people who start medical studies in the fields of nursing or medical rescue of the "second face" of the profession are not anticipated. Nobody prepares them and does not realize how to handle the tremendous amount of stress they will face in professional life. They are not aware that, as a result of total sacrifice and lack of separation skills from private life, they may "burn" and that the risk of burnout is so great. They learn about it accidentally or when they feel discouraged for work, fall into depression or have a full spectrum of psychosomatic symptoms. Only the enormous involvement of occupational psychologists, even greater popularization of the issue, and top-notch recognition of occupational burnout as a rational threat to health and disease - will gradually increase our self-awareness as employees as contributors to the proper functioning of our communities.

ABSTRACT

Globally, companies are increasingly considering the importance of mental health in workers and their relationship with productivity, which has led to increased research on work stress, which showed that there is a relationship between stress related to work and health disorders, both physical and mental. This chapter addresses the analysis of two of the main consequences that a worker can develop when having work stress: burnout syndrome, measured by the Maslach burnout inventory general survey (MBI-GS) and obesity, through the body mass index (BMI). The study was carried out in 118 people who occupy middle and upper management of the manufacturing industry of Baja California, having as objective to find the relationship that exists between the two variables, using ordinal logistic regression, as well as to characterize the sample using mean difference and hypothesis testing. From this perspective, this chapter can serve as a guide to study the behavior of variables and propose organizational development strategies aimed at reducing and preventing these problems.

INTRODUCTION

On a global scale, companies are increasingly considering the importance of their workers' mental health and the relationship it bears with productivity. In general, job strain ranks among the ten main work-related health problems, often resulting in serious mental health disorders (World Health Organization, 2016). However, although it starts by having psychological effects, it is occasionally associated with diseases that affect a person's physical health as well.

Job strain occurs when work demands are in disproportion or exceed workers' capacities and resources. On the other hand, it can also occur when a worker's knowledge and skills to meet such demands do not match the expectations of the company's organizational culture. Thus, the severity of job strain will depend on the magnitude of the demands to be met within a certain period of time, the individual's feeling of control over them, and the decision latitude that he/she has in regards to them (American Institute of Stress, 2016).

Worldwide, Mexico ranks first in job strain, with 75% of Mexican workers suffering from stress. It is followed by China, with 73%, and the United States, with 59% (World Health Organization, 2016). Financially speaking, employers and governments are increasingly becoming aware of the high toll stress takes both on individual companies and on the economy in general (Gamero, 2010), namely poor productivity, the increase in the number of lost work days due to absenteeism, constant job switching, an increase in the rate of work accidents, increasing customer complaints, replacement of absent workers, and training of substitute workers, among others (World Health Organization, 2008). This situation can lead to losses of between 0.5 and 3.5% of countries' Gross Domestic Product (GDP). Particularly in Mexico, stress among workers results in losses of between 5,000 and 40,000 million dollars a year (Noticias Tijuana, 2015).

Therefore, research on the subject of job strain has been increasing, the results of which show a clear relationship between work-related stress and both physical and mental health disorders (Kang, Koh & Cha, 2004; Gonzalez & Landero, 2008; Lazarus & Folkman, 1984). The consequences of suffering from this condition include the appearance of exhaustion, burnout (Aranda, Pando & Salazar, 2015), anxiety and depression (Organization Internacional del Trabajo, 2016), alcohol abuse, poor sleep quality, smoking habits and an unhealthy diet that can lead to weight problems (Norma Oficial Mexicana NOM-043-SSA2-2012) to name a few.

This study analyzes two of the main consequences a worker can suffer when undergoing job strain. The first one is the burnout syndrome. This term refers to a prolonged response to job strain, generally understood as a state of extreme tiredness (Ksiazek, Stefaniak, Stadnyk & Ksiazek J., 2011), which develops from prolonged exposure to high levels of psychosocial risk factors (Aranda et al., 2015). The first professions associated with this syndrome shared the characteristic of being more frequent in the service sector (Ksiazek et al., 2011). This was due to the supplier-client interaction, where the individual offering a service had to deal directly with the one receiving it. However, the scope of such professions has widened to include jobs that fit the characteristics of "high demand". An example of this phenomenon is the presence of the burnout syndrome for long periods of time among company managers, who soon began to have health problems such as cardiorespiratory conditions, obesity, gastritis, ulcers, and sleep difficulties (Gil-Monte, 2008).

The burnout syndrome is characterized by having three dimensions (Maslach, 2003): the exhaustion dimension refers to the feeling of lacking enough mental and physical strength to meet the level of demand that the assigned activity poses. In this dimension, employees believe that they have no source of

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

energy replenishment, which in turn triggers a greater sensation of weakness. Next is the dimension of cynicism, which surfaces in negative and apathetic attitudes towards both people and work activities. At this level, individuals reduce their performance to a minimum, considering practices such as spending less time in the workplace or lowering the amount of energy used in it. The final dimension is that of inefficiency, which refers to the feeling of lack of productivity at work. As a result of all of the above, individuals develop thoughts of professional failure, negative attitudes towards co-workers, and feelings of emotional exhaustion (Gil-Monte & Peiró, 1999).

Secondly, this research work analyzes obesity, which is defined as the abnormal or excessive accumulation of fat that can be harmful to health. In adults, it is present when there is a body mass index (BMI) equal to or greater than 30 kg / m^2, or equal to or greater than 25 kg/m^2 in adults of short height (NOM-043-SSA2-2012). The World Health Organization (WHO) uses the BMI as an indicator to measure obesity; this indicator is obtained by dividing the weight in kilograms divided by the square of the height measured in meters. Obesity has become a health problem due to the fact that since 1980, it has more than doubled around the world. By 2014, more than 1,900 million adults 18 years of age and older were overweight, the equivalent to 39%, and more than 600 million of them were obese (WHO, 2016). The highest prevalence of overweight and obesity occurred in the Region of the Americas (overweight: 62% in both sexes, and obesity: 26%) and the lowest in the Region of Southeast Asia (overweight: 14% in both sexes, and obesity: 3%) (WHO, 2012).

In Mexico, non-contagious diseases such as overweight and obesity have become one of the main problems affecting not only the health system but also the quality of life of Mexicans of all ages. Results of the National Health and Nutrition Survey (2012) show that the prevalence of overweight and obesity in adults in Mexico was of 71.3% (amounting to 48.6 million people). Specifically, the prevalence of obesity in this group was of 32.4% and that of overweight was of 38.8%. Obesity was higher in females (37.5%) than in males (26.8%), unlike overweight, where there was a prevalence of 42.5% in males, while in females there was a prevalence of 35.9%. In the case of obesity, the highest prevalence occurred in the age group between 40 to 49 years in men and between 50 to 59 years in women. Moreover, the problem was also 28.5% higher in urban locations. Finally, the prevalence of overweight, obesity, and morbid obesity was higher in females, and its cost was approximately 67,000 million pesos in Mexico (Encuesta Nacional de Salud y Nutrición de Medio Camino, 2016).

This study focuses on the manufacturing and export service industry (IMMEX, for its acronym in Spanish) in Mexico as this sector contributes importantly to the strengthening of the Mexican economy by creating benefits such as a decrease in unemployment rates, an increase in technological development, increasing participation in international markets and constant training for workers employed in this type of industry (Consejo Nacional de la Industria Maquiladora y Manufacturera de Exportación, 2016). In the period between January 2015 and May 2016, the IMMEX sector showed a growing trend, with an increase in business of 0.47%. The manufacturing companies registered in the program amounted to a total of 6,134 in the year 2016 (March), 5,024 of which belonged to the manufacturing sector and 1,110 of which, to non-manufacturing companies. Of the 32 states in the country, 11 represent 81.8% of IMMEX businesses, namely Baja California, Nuevo Leon, Chihuahua, Coahuila, Tamaulipas, Jalisco, Sonora, Guanajuato, State of Mexico, Querétaro and Puebla. Regarding the employed personnel, 82.6% is represented by the same previous 11 states, although holding different positions. In the indicator of hours worked in the companies, 7 states represent 85.5%: Durango, Michoacán, Tamaulipas, Chihuahua, Baja California, Guanajuato and Sonora (Instituto Nacional de Estadística y Geografía, 2016).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The largest number of IMMEX establishments is located in the northern border region of the country, as a result of this, there is a greater number of hours worked and personnel employed, than in the rest of the states. The above, together with the prevalence of obesity in adults 20 years of age or older in this area, (Encuesta Nacional de Salud y Nutrición de Medio Camino, 2016). It makes evident the need to initiate research in the State of Baja California, mainly in the cities of Tijuana and Mexicali.

The aim of the study is to find out the impact of obesity and the burnout syndrome on the IMMEX of Baja California, as well as the existence of positive or negative relationships between them. The staff under study are middle and upper level managers as research results show that the most stress-generating type of work is that where demands and pressures exceed the worker's knowledge and abilities, opportunities to make decisions or exercise control are scarce, and there is little support from others (Leka, Griffiths & Cox, 2004). The profile of middle managers in industries meets the above characteristics. Holding a college degree gives them the opportunity to start at a medium level and not as operators; thus, the lack of operational experience, the pressures of senior managers and the position's high demands can become a source of stress. On the other hand, they are limited and sometimes hindered in their ability to make decisions; a different scenario would help increase their self-esteem and self-value. Furthermore, the role of senior managers entails constantly facing activities aimed at achieving the company's objectives and having to make decisions that can affect the survival or the disappearance of the company. Thus, the responsibility of the upper management is to be effective and to stay that way (Salgado & Mejía, 2008). Yet having to maintain that effectiveness is precisely what triggers the stress process and turns it into an ever increasing threat (Bittel & Ramsey, 1988) both to the individual and the company as the success of companies is based, largely, on its executives' capacity, ability and well-being.

METHODOLOGY

This section outlines the methodology used in this project, which essentially consisted of five stages: description of the sample, validation of the instruments of measurement, statistics of the sector under study, analysis of difference of means and analysis of association of variables. Each stage contains a detailed description of the methods of analysis used and the partial results obtained.

Phase One: Description of the Sample

A cross-sectional, observational study was conducted along the Mexico-United State border area in the state of Baja California, particularly in the cities of Tijuana and Mexicali. Through the use of a non-probabilistic sampling for convenience (Alaminos & Castejón, 2006), 121 surveys were administered to employees in middle and upper management in the manufacturing industry and export services in seven different companies. Out of the total sample, 42 surveys belonged to the city of Tijuana, with 33 men and 9 women; on the other hand, 79 belonged to the city of Mexicali, with 42 men and 37 women. The ages of the participants ranged from 20 to 60 years with an average value of 35.11 years and a standard deviation of 10.2 years. The respondents mentioned a time of seniority in the company ranging from 1 month to 35 years of service. Figures 1 to 4 show the descriptive statistics of the collected data classified into the respective categories.

Phase Two: Validation of Instruments of Measurement

To analyze the two thematic variables, occupational stress and obesity, a self-report questionnaire was provided in physical form to each worker, which included a brief introduction explaining the objectives pursued and emphasizing the information's anonymous character as well as the consent required to collect it. The questionnaire was divided into three sections: the first included an introduction and the employee's general data, accompanied by the signature of consent. The second section consisted of the self-report questionnaire called Maslach Burnout Inventory General Survey (MBI-GS), prepared by Maslach, Jackson and Leiter in 1996. This study used the version translated by Moreno, Rodríguez & Escobar (2001), with highly satisfactory reliability indices, which oscillated between 0.84 to 0.89 for all the three dimensions. This instrument is generic as it was addressed to all personnel regardless of their profession. It consisted of a total of 16 items assessing job strain through three dimensions (emotional wear, with 5 items; cynicism, with 5 items; and professional efficiency, with 6 items). The response scale was Likert type of 7 points. The output variable was a worker characterized in one of the five available levels of work stress: nothing, low, medium, high and extreme. The last section included weight and height measurements for the analysis of the obesity variable. To classify each individual into a type obesity, the ratio of Body Mass Index (BMI) established by the World Health Organization (2006) was used, which estimates the degree of obesity by means of the quotient of its weight in kilograms divided by its height squared and expressed in meters (Welborn, Dhaliwal & Bennett, 2003). The convenience of using this method lay in that it was proposed by a highly recognized world organization and is currently the most accepted criterion used in America and Europe (Guzmán, Del Castillo, & García, 2010) to classify individuals according to their weight. The categories are shown in Table 1 for people over 20 years of age.

Table 1. Classification of BMI (Secretaría de Salud, 2013)

Category	BMI (Kg/m^2)
Underweight	<18.5
Normal weight	18.5 – 24.99
Overweight	>25
Class I Obesity	30 – 34.99
Class II Obesity	35 – 39.99
Class III Obesity	> 40

In order to guarantee the formal validity of the Maslach Burnout Inventory General Survey (MBI-GS), which all questionnaires must show before being used (Cook & Beckman, 2006), an internal consistency analysis was conducted using the Cronbach's α method, with the purpose of finding out the variables of interest in the specific sample and geographical area under study. The results show that the instrument has the necessary validity (Huh, Delorme & Reid, 2006) for data collection in samples of personnel in middle and upper management in the industrial sector of the Baja California Norte border area, featuring an α value of 0.892 for the dimension of emotional exhaustion, 0.816 for professional efficiency, 0.847 for cynicism, and 0.814 for the instrument as a whole since alpha values greater than 0.80 are considered acceptable.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Each worker's weight was measured with a TAYLOR brand glass digital scale. To ensure the reliability of the scale, a cross-method reproducibility and replicability study was conducted which focused mainly on determining what part of the variation observed in the process was due to the measurement system used (Portuondo & Portuondo, 2010). The data collection procedure took place as follows:

- Three operators were responsible for taking the measurements.
- A sample of ten people was selected, representing the range of expected value with respect to its weight.
- The three operators measured the ten people the same number of times.
- All measurements were taken with the same instrument, in this case the scale.
- To prevent the order of measurement from altering the results, each operator measured each of the ten people in random order within a replica.
- The procedure was repeated until three replicas are obtained.

The results of the study described above, indicate that the variation of the measurements of the sample was 99.9%, so it is concluded that the difference is due to the weight characteristics of each person and not to the error of measurement by the operator. The variation provided by the device, in this case the scale, is 0.1% repeatability, in addition the system is able to distinguish between 44 different categories, so it is possible to affirm that the instrument is valid (Automotive Industry Action Group, 2010) to perform taking measurements in the population studied.

The depuration and analysis of the weight variable was performed. The database, consisting of 121 weight measurements collected, showed 1 atypical piece of data and 3 missing pieces of data, a reason why it was necessary to replace the missing values and treat the atypical data according to statistical guidelines in order to perform future analyses. Considering that the variable was quantitative, the substitution of missing data was done by means of the average method of two adjacent numbers (Nakai, Chen, Nishimura & Miyamoto, 2014), which was considered the most convenient for this case since the data generated gave continuity to the series of values without altering it. Likewise, the missing height data were replaced by the method of the mean of two adjacent data.

Phase Three: Analysis of the Sector Under Study

Based on the statistics obtained regarding the variables of interest and the participating staff, the following graphs were prepared, where information was organized by gender and city.

Workers were classified into 6 levels using the BMI to determine their degree of nutrition. Thirty-two point eight percent (32.8%) of the total sample was found to have a normal weight, with a higher percentage, 44.3%, suffering from overweight, 19% showing class I obesity, 2.5% featuring class II obesity and 0.8% under te category of class III obesity.

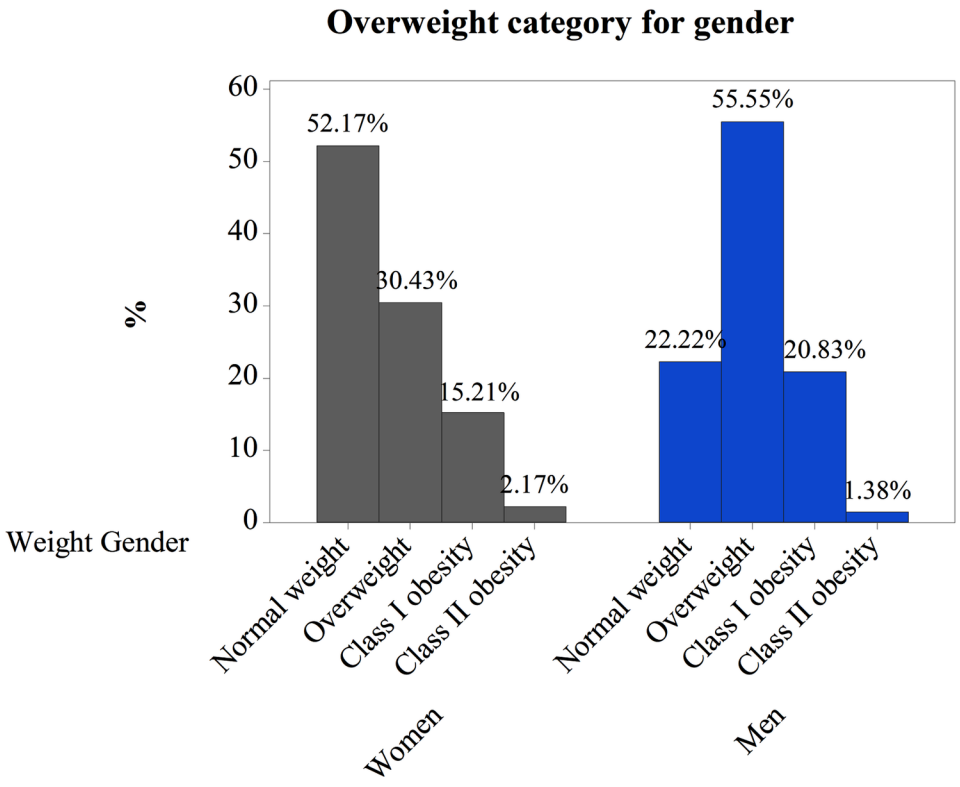
Reagrding job strain, 23% of the total sample of workers fell under the category of low level, 23.8% to the medium level, 19.7% to the quite high level, 13.1% to the extreme level and 19.7 did not show signs of suffering from any kind of job strain.

Figure 5 shows nutrition levels in relation to gender. It can be observed obesity class I occured in 20.83% of men and in 15.21% of women; class II obesity, in 1.38% of men and 2.17% of women; and class III obesity, was not present in both men and women. Overweight had a higher percentage in men,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

with 55.55%, than in women, with 30.43%. Finally, 22.22% of men are within their normal weight, while 52.17% of women maintain their weight.

Figure 5. Overweight category by gender (Elaborated by the authors)



The classification of the level of nutrition by cities is featured in Figure 6. For Mexicali, the results were as follows: Featuring the highest percentage, overweight was present in 44.15% of the sample, class I obesity in 15.58%, and class II obesity in 2.59%, while 37.66% featured a normal weight. For the city of Tijuana, the following results were obtained: 48.78% were overweight, 24.39% had class I obesity and 26.82% remained at their normal weight.

Regarding the job strain variable, the percentages that feature this condition are shown by gender in Figure 7. In males, 25% of individuals have a little level of job strain, 26.38% maintain a medium level, 16.66% falls under the category of enough, 11.11% have an extreme level and 20.83% do not have this condition. In females, 21.73% have a little level, 19.56% have a medium level, 26.08% have the condition of enough, 15.21% have this condition at an extreme level and 17.39% of women do not suffer from job strain.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 6. Overweight category by city (Elaborated by the authors)

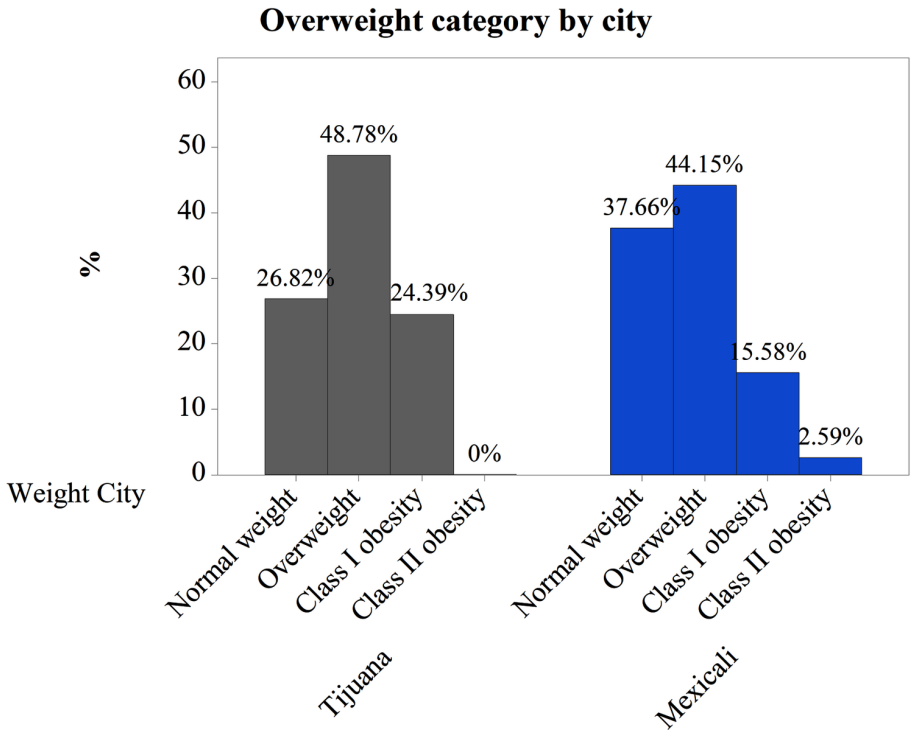


Figure 7. Burnout category by gender (Elaborated by the authors)

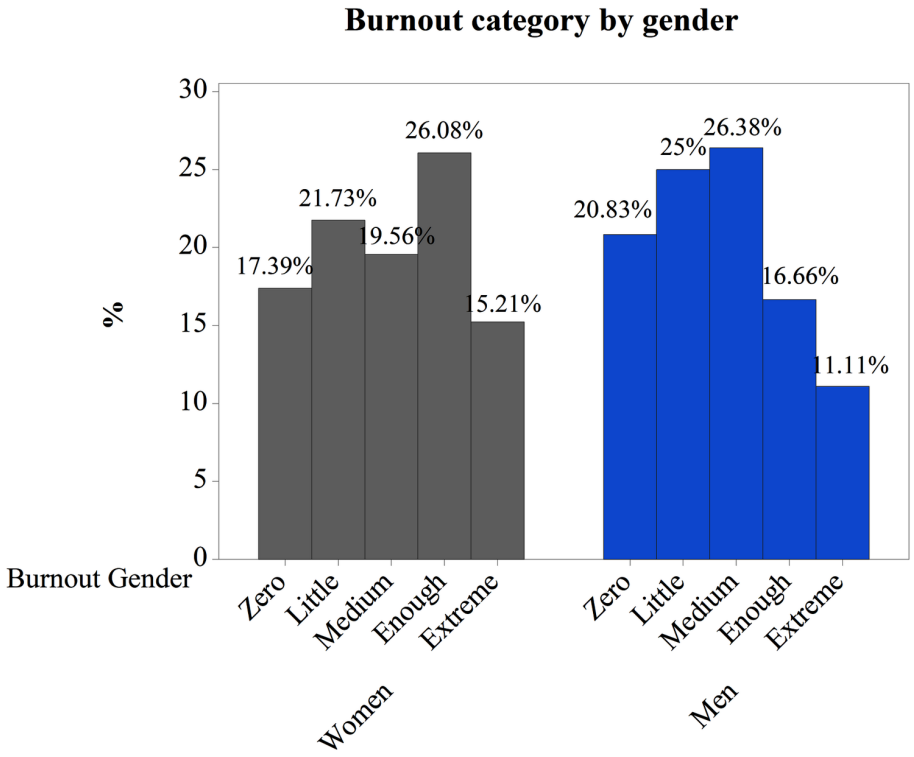
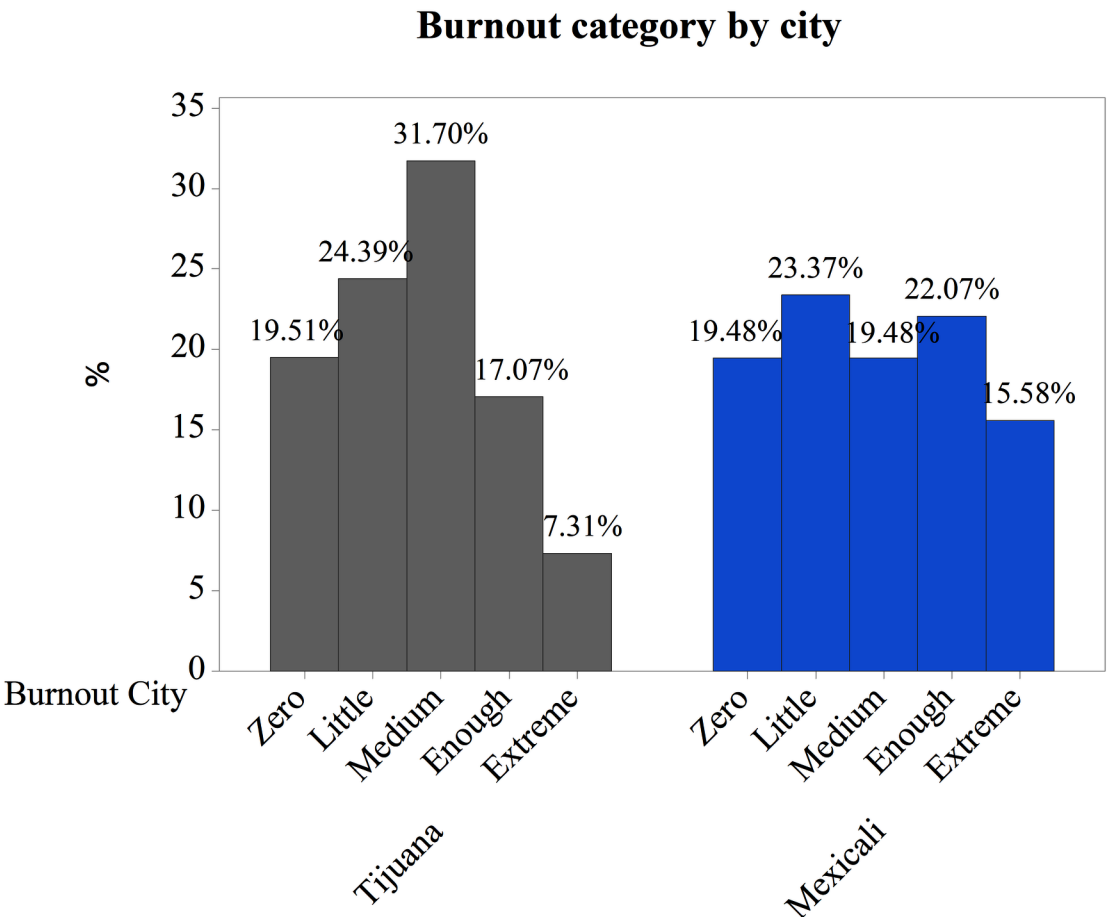


EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Regarding cities and their level of job strain, the following results are shown in Figure 8: for the city of Tijuana 24.39% of workers have a little level, 31.70% maintain a medium level, 17.07% have the condition of enough, only 7.31% has an extreme level and 19.51% of workers do not have this condition. As for Mexicali, 23.37% presents a little level, 19.48% an medium level, 22.07% a enough level, 15.58% an extreme level, and 19.48% of workers do not have this condition.

Figure 8. Burnout category by city (Elaborated by the authors)



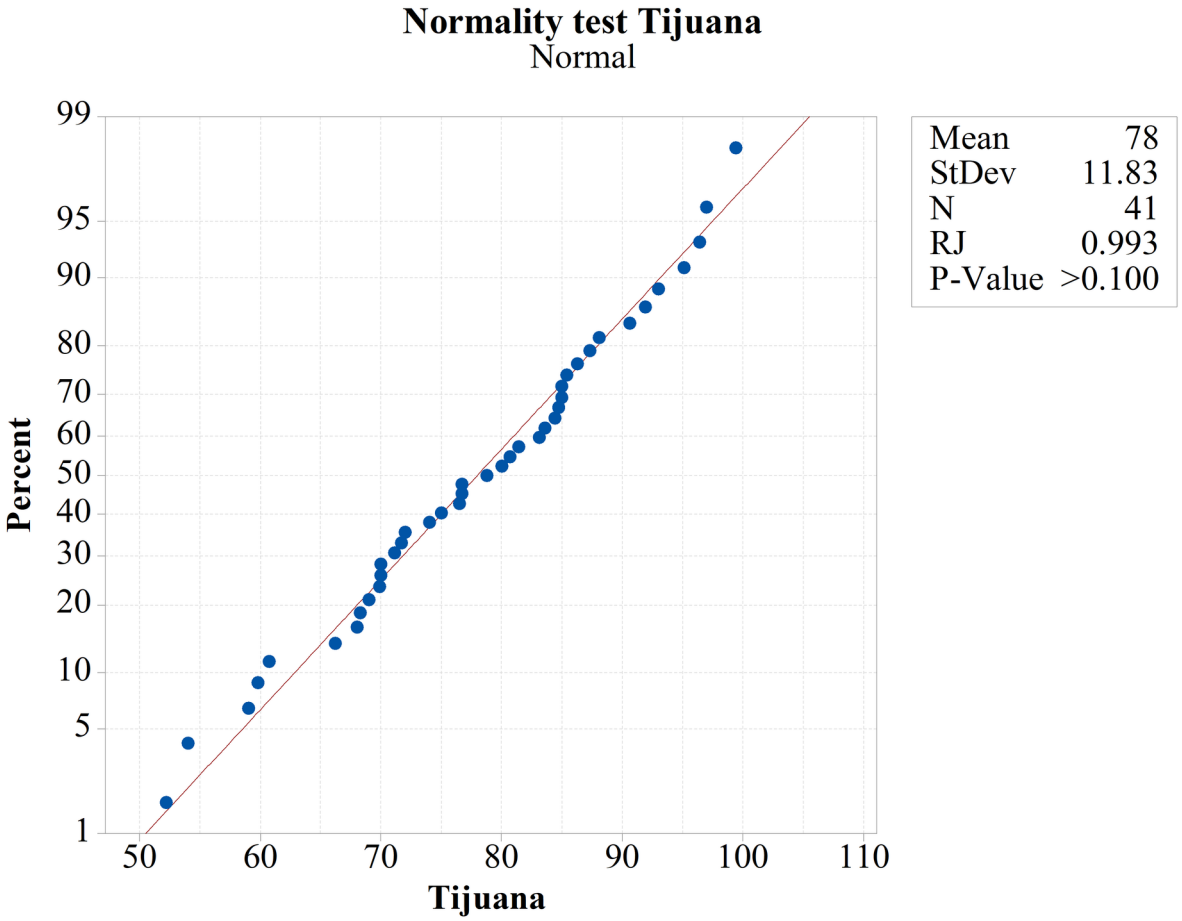
Phase Four: Difference of Means in Relation to Weight

The procedure of difference of means was carried out in order to know whether there were differences between the weight men and women, who occupy middle and upper management positions in the manufacturing industry of the cities of Tijuana and Mexicali. For this analysis, the data had to comply with the assumption of normality (Pearson, 1931; Barlett, 1935; Geary, 1947) and equality of variances, which becomes critical when the sample sizes are noticeably different in each group (Welch, 1938). The analysis was conducted from the 118 pieces of data collected in the two cities.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

First, the validity of the assumption of normality for weight in the city of Tijuana was estabblished; the test used was that of Ryan Joiner with n = 41; this test is similar to the Shapiro Wilk test, suitable for sample sizes <50. The results showed that the data follows a normal distribution with a p-value of 0.100 (Figure 9).

Figure 9. Normality test for Tijuana data (Elaborated by the authors)

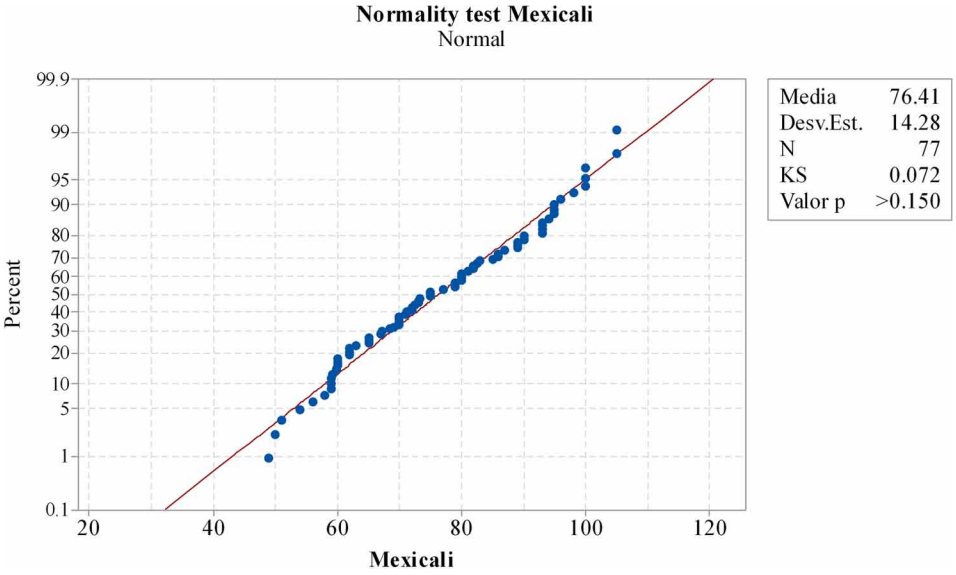


Normality in the weights in the city of Mexicali was determined with the Kolmogorov-Smirnov test considering n = 77. The results showed that it is possible to accept the null hypothesis with a confidence interval of 95% with a p-value of 0.150 shown in Figure 10; confirming the normality of the data.

For the assumption of equality of variances the results show that there is no significant difference between the groups because in the test through the Bonett's method there is a p-value of 0.060, and through the Levene's method the p-value is 0.069; both values are greater than the significance level of 0.05; In addition, the group intervals overlap, with values of 9.914 to 14.828 for the group of people from Tijuana; and from 13.219 to 16.761 for the people in Mexicali, thus confirming the assumption of equality of variances for both groups. The pieces of data used in latter analyses were 118.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 10. Normality test for Mexicali data (Elaborated by the authors)



A comparison was drawn between the weight of the women, who occupy middle and upper management positionsin the manufacturing industry, of the two selected cities, with a confidence interval of 95%. The results are shown in Table 2 and Figure 11. The p-value in this case was of 0.935, so it is possible to accept the null hypothesis and consider that there are no differences in women's weights due to their working in different cities.

Figure 11. Boxplot of the women´s weight in middle and upper management (Elaborated by the authors)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Difference of means por the weight of women

Weight of Women	N	Mean	StDev	SE Mean
Tijuana	9	67.0	10.2	3.4
Mexicali	35	66.7	10.8	1.8
Difference = μ (Tijuana) – μ (Mexicali)				
Estimate for difference: 0.32				
95% CI for difference: (-8.11, 8.75)				
T-test of difference = 0(vs≠): T-Value = 0.08 P-Value=0.935 DF=12				

In the case of men occupying these positions, the same comparison was made. The results show that the difference in means oscillates between -8.60 and 1.81, with a confidence of 95%, see Table 3 and Figure 12. In this case there is no statistical evidence to reject the null hypothesis, with a p-value of 0.198. It is considered that there is no difference between the weight of men in the city of Mexicali and the weight of men in the city of Tijuana.

Figure 12. Boxplot of the men´s weight in middle and upper management (Elaborated by the authors)

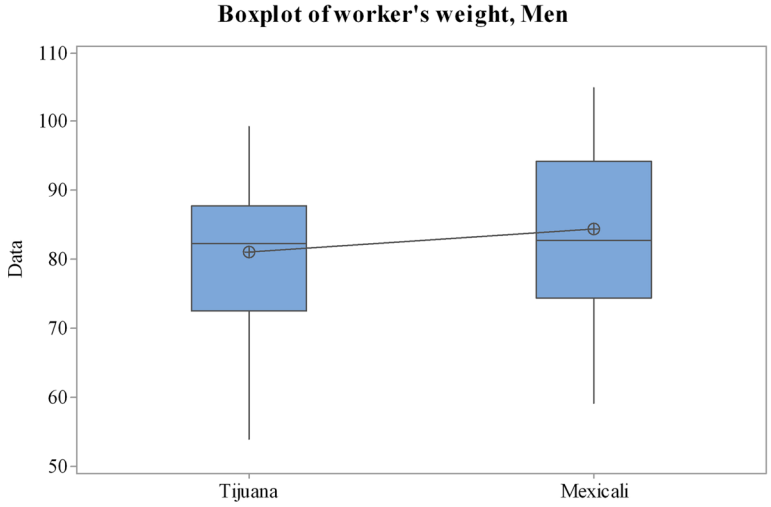


Table 3. Difference of means por the weight of men

Weight of Men	N	Mean	StDev	SE Mean
Tijuana	32	81.1	10.4	1.8
Mexicali	42	84.5	11.6	1.8
Difference = μ (Tijuana) – μ (Mexicali)				
Estimate for difference: -3.39				
95% CI for difference: (-8.60, 1.81)				
T-test of difference = 0(vs≠): T-Value = -1.30 P-Value=0.198 DF=72				

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Phase Five: Analysis of Association of Variables

With the aim of analyzing whether there is a relationship between the weight of the personnel that occupies middle and high level management positions and the level of stress they experience, an ordinal regression analysis was carried out based on the information obtained in 74 men and 44 women. For this, the software minitab 17 was used and the model adjustment was first made considering the information referring to men. The results obtained are shown in Table 4.

Additionally, a p-value = 0.078 was obtained for the test that all the coefficients are equal to zero. With the above information it can be said that the weight of men in this positions is related to the level of stress they experience, for a confidence level a little higher than 90%.

In relation to women, the same adjustment was made and the results obtained are shown in Table 5.

For these data, a p-value = 0.496 was obtained for the test that all the coefficients are equal to zero. With the above information it can be said that in the case of women, the weight is not related to the level of stress they experience.

Table 4. Parameters obtained in the analysis of ordinal regression for men

Predictor	Coeficient	P - Value
Constante (1)	-12.199	0.029
Constante (2)	-11.041	0.047
Constante (3)	-9.913	0.074
Constante (4)	-8.805	0.110
Weight	0.250	0.055
Weight * Weight	-0.001	0.050

Table 5. Parameters obtained in the ordinal regression analysis for women

Predictor	Coeficient	P – Value
Constante (1)	-5.605	0.591
Constante (2)	-4.461	0.669
Constante (3)	-3.734	0.720
Constante (4)	-2.229	0.830
Weight	0.091	0.766
Weight * Weight	-0.000	0.842

SOLUTIONS AND RECOMMENDATIONS

Based on the results, it is possible to conclude that at least in a preliminary way that there is a significant relationship between the weight of the personnel with middle and high level management positions and the level of stress they experience. In the case of women, this relationship was not present; however, the authors consider that this was due to the sample size that is not sufficient to detect the relationship. Therefore, it is proposed to explore this relationship, but using larger sample sizes in both cases, either to discard or confirm this relationship.

CONCLUSION AND FUTURE RESEARCH DIRECTIONS

According to the World Health Organization (2016), Mexico is in the first places, along with China and the United States, with the largest number of people stressed worldwide. The performance of the workforce is impaired due to inadequate workspaces and lack of work benefits that encourage frequent

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

medical review, which is why most of the chronic diseases that Mexican society suffers today are triggered by pressure and the work stress that is exposed for years.

Some of the illnesses unleashed by stress that most afflict the health and economy of Mexicans are: depression and anxiety, gastrointestinal diseases, chronic fatigue, obesity and overweight, the latter caused by sedentary lifestyle and poor diet, which together they affect 71.3% of the adult population, which positions Mexico as the first country in the world on this issue, according to the Food and Agriculture Organization of the United Nations (FAO). According to the sample selected for the study presented, the middle and upper management of the manufacturing industry of Baja California, maintain these percentages, having 73.17% of people with this condition, while in Mexicali it is 62.32.

In the sample, obesity was higher in men (22.21%) than in women (17.38%), as well as in overweight, where there was a prevalence of 55.55% in men, while in women there was a prevalence of 30.43%, below what is reported in adults of the Americas region, considered as the highest population in these conditions, which presents 62% of overweight and 26% of obesity in both sexes.

Even though the results show no difference between the weights of those in the middle and upper management of both cities, it is necessary to point out that women who occupy these positions perceive a higher and more extreme level of stress (41.49%) than men (27.77%).

For the above, it is considered of utmost importance to continue with the study to generate a model that explains the relationship that exists between the variables, which will allow the development of strategies to improve the health of employees by reducing work stress and its consequences, what will positively impact the quality of life of people and the productivity of companies.

Chapter 73
Analysis of Role Stress in the Indian IT Industry

Shubhangini Rathore
IBS Gurgaon, India

ABSTRACT

Contemporary industries face new competition requiring employees to work for longer hours under competitive time-bound deadlines. Prolonged exposure to such stressful situations leads to a depletion and exhaustion of resources in the mind and body with dysfunctional effects on job performance and overall organizational effectiveness. The Indian IT industry is a fast-paced service industry that is characterized by such stressful work situations and related outcomes. This chapter analyses the various factors that contribute to organizational stress and the role of demographic factors on role stress among the professionals of the Indian IT industry. A sample of 250 employees has been collected from the Delhi NCR region. Role stress has been measured by using the ORS scale which comprises of 10 dimensions of the role of stress that are measured by 50 items. The results show that there is a considerable amount of work related stress along with a significant impact of demographic factors on the role of stress amongst the IT professionals.

INTRODUCTION

The India Information Technology (IT) Sector is seen in conjunction with the Information Technology enabled Services (ITeS). The sector has a substantial contribution to the national economy as it caters to domestic and foreign markets. The rise of exports makes it account for almost 75% of its total earned revenue. Broadly, the sector is divided into four large segments that comprise of IT services, ITES-BPO and Software; which includes both Research and Development and Engineering.

Apart from various other accolades this sector has also been instrumental in energizing economic growth through its interaction with the higher education sector pertaining to computers and all the Engineering fields.

As economic times get harder; there arises diminishing security of jobs, because of which people remain in jobs that are consistent; but not fulfilling. The IT sector is seen to be characterized with high Role Stress (Colomo-Palacios et al., 2014b; Karad, 2010). The nature of work pressures in contemporary organizations requires employees to work longer hours, under stressful conditions of workload, performance pressure and competition. The IT industry is seen to be characterized by challenging conditions of organizational Stress 4 6. Stress has highlighted itself in the visibility of a rising trend of employee sickness, premature labour turnover, and premature retirement due to ill health, lost production. In 1936, Prof. Hans Selye, "The father of modern stress", researched on dysfunctional effects of stress on the human body due to overarching demands on it. The empirical research in the field began only after Hans Seyle's first article on stress in 1956 20. Stress can be categorized into positive and negative aspects. Positive stress is also called *eustress* and can be defined as a pleasant or curative stress that helps a person to perform better, given the situational demands. The General Adaptation syndrome considers *eustress* as a part of the initial indication of the alarm in the body, but problem seems to arise when the alarm is ignored and ones resources are completed depleted and result in a burnout 21. Negative stress is reached by the body when the body alarms are ignored and the body heads towards a burnout. Increasing workplace demands along with increasing professional aspirations create a point of dissonance for the employee by making him work against all odds of time and resources. A big challenge for organizations now is to create an environment that equips employees with well suited coping mechanisms and programs in fruitful stress management.

Particularly in the IT organizations; organizational culture is seen to be lacking in terms of assisting the employees on the knowledge about stress and coping for psychological problems. The work process are highly dynamic and time bound, as employees have definite targets to meet, that are incubated in different time zones. The life expectancy of products and programs declines each year, while the demands on employees to provide better solutions increases. Internal IT departments that cannot keep pace with the changes and are not sufficiently adaptable are in a danger of being outsourced. Because of the unique set of environmental pressures in IT functions - continuous re-engineering, outsourcing, more demanding customers, general information overload (Karad, 2010) and hard decisions (Colomo-Palacios et al., 2013).

In the Indian IT industry, the trend towards aspiring youngsters who would work extra hours to acquire material comforts; seems to increase. Researchers have shown that broadly the major causes of workforce attrition in the IT sector are work-related, psychological and emotional. The specific variables are effort- reward imbalance, perceived workload and emotional exhaustion. Research shows that there is a very common practice of software engineers who have less than five years of work experience; to leave work. This is a resultant of issues like a shrinking student base, low attractiveness of the profession in terms of image and status (García-Crespo et al., 2008; Day, 2007). A direct outcome of stress is seen in the high levels of attrition that the industry faces. A big challenge for contemporary organizations is to create an environment that equips employees with well suited coping mechanisms and programs in stress management. Research shows that, high levels of stress can lead to emotional exhaustion, lower organizational commitment, and increased turnover intentions (Cropanzano et al. 2003). More recently, research by Colomo-Palacios et al. (2014) shows that stress also leads to IT career abandonment.

A big challenge that the organizations face is that, stress interventions cannot be used as a blanket strategy for all the employees. Apart from individual differences that exist in the workforce; there are always generic differences that are brought forward by demographic factors. The present study explores in detail, the role of various demographic factors in studying workplace stress among the professionals of the IT industry. There are extremely few researches that explore this aspect in the Indian IT industry.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The IT sector is also seen to be characterized with high role stress (Karad, 2010). The employees have definite targets that they have to meet, as most of the projects are time bound and incubated in different time zones. Employees need to work through night shifts and deliver the services. Apart from this, the nature of the IT industry makes it subject to phenomenal and increasingly rapid changes. Internal IT departments that cannot keep pace with the changes and are not sufficiently adaptable are in danger of being outsourced. Thus, given the scenario, the employees of the sector need to develop the 1) the ability to learn, 2) the ability to work in teams, 3) oral and written communication, 4) problem solving and reasoning, and 5) a point of reference to health and wellness (Colomo-Palacios, R. et al,2014). More recently, research by Colomo-Palacios et al. (2014) shows that stress also leads to IT career abandonment (Korczynski,2001)

The outcomes of the study will be beneficial for the management professionals in dealing with different strata of employees, when it comes to the issue of workplace stress.

ORGANIZATIONAL STRESS: A REVIEW OF LITERATURE

Lazarus (1993) explained Stress, as a condition or feeling experienced when a person perceives that the, "environmental demands exceed the personal and social resources that the individual is able to mobilize". Hans Selye referred to stress as the, "non-specific response of the body to any demand for change" (Selye, 1997). Research shows that Stress has been studied from various contemporary and historic perspectives. Its impact on work outcomes has been heavily research upon. Researchers have also tried to identify the role of different cultural, demographic and social factors on stress. While on the one hand it has been reported that there are no differences between women and men in relation to workplace stress, it has also been noted that there are differences in both stressors and the severity of stress between the genders.

Spielberger & Reheiser (1994) conducted a study with 1781 working adults, measuring gender differences in occupational stress using the Job Stress Survey (JSS) in American university and corporate settings. It was found that there were no significant differences in the overall stress levels for the two genders, although occupational stress level was highly significant with managerial/professional participants (Spielberger & Reheise, 1994).

Nelson, and Quick (1998) explored the various reasons of work stress in organizations. The researchers have identified four basic factors which are; *Role Factors, Job Stressors, Physical Stressors and Interpersonal* Stressors (Michailids & Elwaki,2001). They explained *Role* based factors causing stress by virtue of an expectation set that is placed on an individual within an organization; especially if these are confusing, ambiguous or conflicting. *Job stressors* are explained as factors related to the basic quality and quantity of work performed as well as the feedback and appraisals that individuals receive regarding their job performance. *Physical Stressors* are explained as stressors that affect the senses, such as light, noise, vibration, smell, temperature, etc. *Interpersonal Stressors* are the factors that deal with one's inability to manage and cope with co workers, friends, family and all associates in general.

Russell & Zinta (2000) investigated the relationship of Organizational Stress and exhaustion to work outcomes such as commitment, turnover intentions, and organizational citizenship behaviors. Based on the Conservation of Resources (COR) model, it was found that stress & emotional exhaustion were negatively related to organizational commitment and supervisory commitment. Emotional exhaustion effected turnover intentions positively. Organizational citizenship behaviors were studied and were found

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to be negatively related to organizational stress & emotional exhaustion. Therefore a stressed employee was more likable to quit his job.

Neelamegam & Asrafi (2001) identified & measured the level of stress of bank employees that was resultant of the changes in the banking sector due to policy changes, globalization and liberalization and increased competition from the entrance of more private (corporate) sector banks. The study established that stress levels were negatively correlated to years of service and qualification. Incongruent roles, insults, long work hours were identified as major factors of work related stress.

Oi-ling Siu (2002) examined the levels of stress in Managerial and Non Managerial employees in organizations in China and Hong Kong. Standard instruments were used to carry out this research. The study showed that occupational stressors play a significant role in determining job satisfaction, mental and physical well-being. It was also seen that organizational commitment and well-being are positively related to each other, emphasizing that committed employees would have less levels of stress and vice versa.

Michailids & Elwkai (2003) studied factors contributing to workplace stress in the fast-food industry. The Occupational Stress Indicator was used for examining these factors with a sample size of 100 respondents working in different fast food restaurants. It was found that factors such as, ones feeling about their job, behaviour, interpretation of events around them and coping differences contributed to stress. There was significant difference in the perception of stress between women and men as well as individuals in managerial and non-managerial positions with regards to their personality, the degree of ambition and work dedication they possess.

Bacchino et al. (2003) Studied the congruence between personal and organizational values (P-OC), perceived psychological contract violations (PCV), and work stress in the context of age, gender, and job tenure. The results of the study showed that employees reporting higher levels of psychological contract violations are more likely to experience organizational stress. Male Employees were reported higher amounts of stress. Beehr et al. (2003) studied the congruence between sources of the stressor and social support. A sample of 117 respondents was chosen. Two social support measures were used; mainly social support from the supervisor and from the co-workers. A social support scale was used for analysis. The results showed that the Congruence between the sources of stressors and of social support appeared to make little difference in determining the moderating effect of social support on the relationship between stressors and strain. It was seen that role ambiguity and workload originating from the supervisor were positively related to stress.

It has been reported that although women and men are exposed to the same stressors, women are also facing unique stressors. This is particularly important according to Hofboll et al. (2003) as several studies have found that the provision of workplace support was more effective in reducing occupational stress in men than in women. It was reported that women in particular are exposed to the following stressors: multiple roles; lack of career progress; and discrimination and stereotyping.

Aziz (2004) examined the levels of organizational *Role Stress* among women in the IT private sector organizations. The ORS Scale was used on a sample of 256 women professionals. Amongst the major stressors, it was seen that, Resource *inadequacy (RIN)* was ranked as the most potential stressor and was followed by Role *Overload (RO)* and *Personal Inadequacy (PI)*. It was seen that there was significant difference in the stress levels of professionals who were not married and married (Rydstedt, L. W.,et al,2004).

Loosemore & Waters (2004) studied the influence of gender on stress levels in the construction industry. The studies significantly found that overall; men experience slightly higher levels of stress than

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

women. They added that men get more stressed by risk taking, disciplinary matters, and implications of mistakes, redundancy, and career progression. Women on the other side were more influenced with factors such as, opportunities for personal development, rates of pay, keeping up with new ideas, business travel, and the accumulative effect of minor tasks.

Sharma (2004) examined the role and causes of stress in the lives of doctors working in private and public hospitals. Role overload and conflict were seen to be the major reasons of stress. Torkelson & Muhnonb (2004) studied the relationship between coping and health problems in the context of gender and level in the organization. Data was collected from a sample of 279 women and men (100 managers and 179 non-managers) at a sales department in a Swedish telecom company. The nature of work for both men and women were kept similar. The analysis showed that with the level and gender kept controlled, there was no relation between problem-focused strategies and health. On the other hand, emotion-focused strategy of seeking emotional support was associated with fewer health problems. It was observed that the coping mechanisms of individuals were related to the levels that they held. At senior levels, similar coping strategies were used where as at non managerial levels, conventional coping patterns were used.

Michailidis & Georgiou (2005) examined occupational stress of employees in the banking sector by taking a sample of 60 bank employees working at different levels. The Occupational Stress Indicator (OSI) was used for analysis. The results showed that employees' educational levels affect the degree of stress they experience in various ways. Factors such as educational background, the strength of the employees' family support, and the amount of time available for them to relax was also instrumental in contributing towards workplace stress experienced by individuals.

Härenstam and MOA Research Group (2005) studied the management strategies and working conditions in 72 establishments by classifying these elements by type of operations and company position, in order to learn about the increase in occupational stress and sick leaves. The results showed that management technologies distribute risks between segments of the labour market and different groups of the labour force. The developments were most favorable in high tech and knowledge-based operations and least favourable.

Rydstedt et al. (2004) studied the lay theories of stress .The researchers aimed at studying the lay beliefs concerning work stress and perceived strain. A sample of 2270 was used to build on an earlier study of lay beliefs that were assessed by a scale consisting of 36 items. Factor analysis gave a solution with five factors on perceived causes and four factors of perceived alleviation of work stress. Significant relations was found between lay beliefs of work stress and perceived mental strain as well as job stress. It was also found that individual's subjective beliefs about work stress were a potentially mediating factor between objective working conditions and stress outcomes.

Dasgupta & Kumar (2009) analyzed the sources of *Role Stress* among a sample of female doctors working in Shimla. The study revealed that *Self-Role Distance (SRD), inter-role distance (IRD), Role Stagnation (RS), Role Ambiguity (RA), Role Overload (RO), Role Isolation (RI), Role Expectation Conflict (REC)* and *Role Inadequacy* (RI) are the major sources of role stress. The study also showed that there was no significant difference among the male and female doctors, except on the parameters of inter-*role distance* (IRD) and *role inadequacy (RI).The male* doctors were found to have greater mean scores on these two parameters 110.

Nikolaou & Tsaousis (2009) studied the relationship between emotional intelligence and stress in a sample of professionals in mental health institutions. A total of 212 participants were administered the Emotional Intelligence Questionnaire as well as the Organizational Stress Screening Tool (ASSET), a

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

new organizational screening tool, which measures workplace stress. The results of the study showed that Emotional Intelligence was negatively co related to stress and positively related to affective commitment.

Smith (2011) researched on the effect of demographic and diversity statistics on stress and highlighted that here is a need to establish a unified definition of perceived stress as it means different things to different people. A universal understanding and role of individual differences is still unclear through research.

Wirtz et al. (2013) Investigated whether occupational role stress is associated with differential levels of the stress hormone. Findings suggested that occupational role stress in terms of role uncertainty acts as a background stressor that is associated with increased HPA-axis reactivity to acute stress.

Yongkang (2014) explored the relationship among role conflict, role ambiguity, role overload and job stress among the middle-level cadres in the Chinese local government. A sample of 220 employees was selected. The results showed that time pressure was significantly correlated with role conflict and role overload. Along with this, the study also established that job anxiety and job stress were significantly and positively correlated with role ambiguity, role conflict and role overload; role ambiguity had a significant and positive effect on job anxiety and job stress; role conflict and role overload had a significant and positive effect on time stress, job anxiety and job stress.

ORGANIZATIONAL STRESS

As shown in chapter 2, a detailed review of literature was done in order to analyze the various key words in definitions and constructs that have been used to explain Stress.

Steps and Procedures in Factor Identification

Step 1

Table 1 shows the different groups in which key words of similar meaning and application are grouped together

Step 2

After identifying the key variables that explain the various dimensions of *Organizational Stress*, an analysis of the variables is done with the four ***Historical Approaches*** of Workplace Stress

Four Major approaches of stress that highlight the eminent works of researchers such as Canon, Lazarus, Kahn and Levinson have been studied

Historic Approaches of Stress

- **The Homeostatic/Medical Approach:** This approach highlights the work of Walter Cannon who discovered the stress response, initially called the "the emergency response," or "the militaristic response." In this case an external demand spoils the homeostasis of the body, which is more or less a neutral and natural bodily state; ultimately causing stress.
- **The Cognitive Appraisal Approach:** Richard Lazarus contributed to the field of success and highlighted that individual differences play a key role in the inception of stress. Thus individuals

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Identification of key words from literature review

Key Words (Research Definitions)	Group
Physical damage as a result of the bodies general over adaptation to the stressor (Selye, 1997)	Physical damage felt by the body
Discrepancies between the way in which individuals view themselves, the ways in which they perceive others as responding to them, and the actually do evaluate them. (Lundgren, 1978)	One's sense of self concept
• Non-specific response of the body to, demand for change, perception (Selye, 1997) • Perceiving stressor as a stressor (Briner et al. 2004) • Responding to an event that could be imaginary or real (Brieir & Elliott, 1988) • Individual's own judgment (Holroyd & Lazarus 1982)	Stress as one's individual perception
• Discrepancy in environment its demands of us • A reaction of a particular individual to a environmental stimulus. (Hinkle 1973). • Individual and environment coexisting in a dynamic relationship.(Folkman, Lazarus, Gruen & De Longis, 1986)	Strain of Environmental demands
• An over or under load of information or matter (Steinberg & Ritzmann 1990) • Demands exceed the personal and social resources (Lazarus 1993)	Work Overload& under load
• Incompatible behaviour, multiple expectations or obligations associated with a single social role (Levi, 1996) • A misbalance between what we actually need versus what we are capable to provide (Levi, 1996)	Non clarity of one's roles
• Individual difference in stress inception such as; personality, self esteem, locus of control, coping style, hardiness, type A, attribution style, demographics, expectations, preferences, commitment, health related factors and abilities (Payne, 1988; Parkes, 1994) • Individual Differences such as locus of control, hardiness, and coping resources (Cox & Ferguson, 1991)	Individual differences and Personality

may not see a stressor in the same capacity as another person. As, individuals differ widely in their appraisal of situations of people, Perception and cognitive appraisal formed major parts of the stress process in an individual.

- **The Person−Environment Fit Approach:** Robert Kahn explained this as a fit between ones expected demands from his role and the skills that he is capable of providing. Thus confusion between the two leads to stress. A good person – environment fit arises when there is a good balance between expectations and demands.
- **The Psychoanalytic Approach:** Harry Levinson took from the Freudian approaches to explain stress in terms of the ideal self and the real self. Where an ideal self is desirable by a person; a real self is a person's direct witness of self personality. Thus a difference between the two leads to stress between individuals.

As identified in the literature; Table 2 shows the groups of the key words that have been highlighted by various researchers. The factor, "Physical distress", finds its congruence with the Homeostatic approach as both talk about the nature of stress that is imbibes in physical distress or strain in the body. Stress tends to grow in the individual as the physical strain grows. The Cognitive Appraisal Approach finds congruence with the factor, "Individual Perception", or the way in which one perceives his role in the organization. The way in which individuals appraise their stressor is also a matter of perception. Role under load is one such factor in which a sense of insecurity and a feeling of under competence start to develop.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Congruence of historic approaches with identified key words of stress

Keyword Identified/Concepts Evolving From the Review of Literature	Congruence With Approaches	Identified Factor
Physical damage as a result of the bodies general over adaptation to the stressors (Selye, 1936)	Homeostatic Approach	Physical Distress
• Discrepancies between the way in which individuals view themselves, the ways in which they perceive others as responding to them, and the actually do evaluate them. (Lundgren, 1978) • Belief in ones capacities (Payne, 1988; Parkes, 1994)	The Psychoanalytic Approach	Self Image
• Non-specific response of the body to, demand for change, perception (Selye, 1936) • Perceiving stressor as a stressor (Briner et al., 2004) • Responding to an event that could be imaginary or real (Brieir & Elliott, 1988) • Individual's own judgment (Holyroyd and Lazarus 1982)	The Cognitive Appraisal Approach	Individual Perception
• A reaction of a particular individual to an environmental stimulus. (Hinkle 1973). • Individual and environment coexisting in a dynamic relationship. (Folkman, Lazarus, Gruen & DeLongis)	Person–Environment Fit Approach	Work Environment
• Under load or overload of matter, energy or information • Demands exceed the personal and social resources (Lazarus 1993)	Individual - Environmental Fit	Work Overload & Work under load
• Incompatible behaviour, multiple expectations or obligations associated with a single social role (Davis, 1995) • A misbalance between what we actually need versus what we are capable to provide (Levi, 1996)	Person–Environment Fit Approach	Role clarity
• Incompatible behaviour, multiple expectations or obligations associated with a single social role(Davis, 1995) • Individual difference in stress inception such as ; personality, self esteem, locus of control, coping style, hardiness, type A, attribution style, demographics, expectations, preferences, commitment, health related factors and abilities (Payne, 1988; Parkes, 1994) • Individual Differences such as locus of control, hardiness, and coping resources.(Cox & Ferguson, 1991)	Person–Environment Fit Approach	Personality

The Person–Environment Fit Approach finds congruence with factor named "Role Overload & Under load, Personality & Work Environment"; which explains concepts of, role conflict, ambiguity and individual differences in perceiving the environment, as the individual is incapable of understanding the exact and reasonable demand from his resources in the organization. The Psychoanalytic Approach finds congruence with the factor, "Self Image"; which explains a person's self image as a major reason as perception of stressor in one's mind as an off shoot of his self concept.

List of Variables Identified for the Study

1. Physical Distress
2. Individual's Perception
3. Role overload
4. Personality
5. role clarity
6. Self Image

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

7. Workplace Environment
8. Role Under load

Rationale for Adapting Organizational Resource Stress Scale (ORS): Dr.Udai Pareek

After reviewing the various approaches and concepts of workplace stress, a comprehensive list of variables has been identified.

Step III

Organizational Role Stress Scale

The scale comprises of ten factors, namely; Inter-role distance (IRD), Role expectation conflicts (REC) Role isolation(RI), Self-role distance (SRD), Role erosion (RE), Role ambiguity (RA), Resource inadequacy (RIN), Role stagnation (RS),), Personal inadequacy (PI), Role overload (RO),

Table 3. Congruence between identified factors and ORS scale factors

Identified Factors (Literature Review)	ORS Scale (Dr.Pareek)
1. Physical Distress 2. Individual's Perception 3. Role overload 4. Personality 5. Role clarity 6. Self Image 7. Workplace Environment 8. 8) Role Under load	• Role stagnation (RS) • Role expectation conflicts (REC) • Role erosion (RE) • Role overload (RO) • Role isolation(RI) • Self-role distance (SRD) • Role ambiguity (RA) • Role Inadequacy(RIN) • Inter Role Distance (IRD) • Personal Inadequacy(PI)

Physical Distress, Resource Inadequacy (RIN)

Resource Inadequacy (RIN): is seen to arise in a situation where one perceives that his personal and material resources are not enough to accomplish his role requirements and demands. An outcome of this is physical pressures on the body. Physical distress as previously explained is explained as Hardship, pain, torture, exertion starvation and physical damage are a result of the bodies general over adaptation to the stressors. It has also been studied as Physical damage as a result of the bodies general over adaptation to the stressors (Selye, 1936).

Self Image, Self-Role Distance (SRD), Inter-Role Distance (IRD)

Self-Role Distance (SRD) arises from a discrepancy that arises between ones concept of the, "self", and the demands made on him by the role that he performs. Thus the individual perceives himself as incompetent for the job. Discrepancies between the way in which individuals view themselves, the ways in which they perceive others as responding to them, and they actually do evaluate them (Lundgren, 1978). It is also reflected in one's Belief in ones capacities (Payne, 1988; Parkes, 1994). Inter-Role Distance (IRD) is experienced when there is a stress due to in congruence between the roles that one performs in his professional life versus his personal roles.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Role Clarity, Role Expectation Conflict (REC), Role Ambiguity (RA)

In a broad perspective, role clarity can be related to Inter-Role Distance, Role Expectation Conflict and Role Ambiguity.

1. **Role Expectation Conflict (REC):** Arises out of conflicting demands originating from an individual's superiors, subordinates or peers.
2. **Role Ambiguity (RA):** Arises due to a non clarity that arises due to the multitudinous the expectations of one's professional.

Role Clarity arises as a result of Incompatible behaviour, multiple expectations or obligations associated with a single social role (Davis, 1995).A misfit between our capability and role demands (Levi, 1996).

Role Overload, Role Overload (RO), and Personal Inadequacy

Role Overload (RO): This arises from a feeling that one is burdened with a lot of work and responsibilities. Researchers have this as an an over or under load of information or matter (Steinberg & Ritzmann 1990). Personal Inadequacy arises when the individual feels that his resources are not enough to take up the demands of the environment.

Role Under Load, Role Stagnation (RS)

Role Stagnation (RS): arises when one perceives that he has been stagnant and stuck in one role for a considerably long time, also due to a scarcity of developmental opportunities. As previously explained; factors such as underuse of skills, work under load, poor leadership and poor career progress can be attributed to role under load.

Unique Factors Literature From Literature Review, Not Covered by the ORS

The study of organizational stress covers many aspects of stress. Yet, the review of literature shows limitations, in terms of the two factors; Personality and Perception; that are not heavily researched on. The role of personality and individual perception cannot be undermined, as one tries to understand the causes of workplace stress.

1. **Personality:** Incompatible behavior, multiple expectations or obligations associated with a single social role. Individual difference in stress inception such as; personality, self esteem, locus of control, coping style, hardiness, type A, attribution style, demographics, expectations, preferences, commitment, health related factors and abilities (Payne, 1988; Parkes, 1994)Individual Differences such as locus of control, hardiness, and coping resources (Cox & Ferguson, 1991)
2. **Perception:** A Non-specific response of the body to, demand for change, perception (Selye, 1936). It can be explained as perceiving stressor as a stressor (Briner et al., 2004). Responding to an event that could be imaginary or real (Eliot, 1988). It is also a matter of an Individual's own judgment (Holyroyd and Lazarus 1982)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

3. **Work Environment:** This can be explained in the discrepancy in environment its demands of us. A reaction of a particular individual to an environmental stimulus. (Hinkle 1973). Individual and environment coexisting in a dynamic relationship (Folkman, Lazarus, Gruen & DeLongis).

Unique Factors From ORS, Not Covered by Literature Review

1. **Role Erosion (RE):** This arises as one perceives that tasks that are a part of his role are being performed by others.
2. **Role Isolation (RI):** This arises as a person feels that his role is secluded form all the mainstream organizational activities.

Unique Factors Literature From Literature Review, Not Covered by the ORS

Research Instrument

The ORS scale (Pareek, 1993), was used to measure the levels of stress among the employees on ten dimensions of workplace stress. One of the pioneers of research on organizational role stress, Pareek (1993) has reiterated that the performance of any role in an organization has built in potential for conflict due to which stress may arise. The scale has been widely used through researches on Role stress. Pestonjee (1992) observed that ORS is certainly one of the best instruments available presently for measuring role stress, as it has a very high reliability and validity.

The Ten dimensions that measure Role Stress are:

Organizational Role stress was measured using the Organizational Role Stress scale by Dr. Udai Pareek; comprising of 50 items that measure stress on the following 10 dimensions

3. **Inter-Role Distance (IRD):** Is experienced when there is a conflict between organizational and non-organizational roles.
4. **Role Stagnation (RS):** Is the feeling of being stuck in the same role for long due to lack of opportunities or development.
5. **Role Expectation Conflict (REC):** Arises out of conflicting demands originating from Superiors, subordinates or peers.
6. **Role Erosion (RE):** Arises when a role occupant feels that others are performing certain Functions, which should have been a part of his role.
7. **Role Overload (RO):** Is the feeling that one is required to do too much.
8. **Role Isolation (RI):** Arises when a person feels that his role is isolated from the mainstream of organizational life.
9. **Personal Inadequacy (PI):** Is created by the lack of adequate skills and the resulting inability to meet the demands of one's role.
10. **Self-Role Distance (SRD):** Arises from a gap between one's concept of self and the demands of his role.
11. **Role Ambiguity (RA):** Is experienced when there is a lack of clarity about the demands of the role.
12. **Resource Inadequacy (RIN):** Arises when human and material resources allocated are Inadequate to meet the demands of the role.

For *Role Stress*, the score on each role stress thus ranges from 0 - 20 as the dimension includes 5 items each, having minimum 0 and maximum 4. The overall organizational role stress score is obtained by adding the score of all dimensions. The total organizational role stress score thus ranges from 0 - 200. *Inter-role distance (IRD)* is measured by adding items 1,11,21,31,41 *Role stagnation (RS)* 2,12,22,32,42, *Role expectation conflicts (REC)* 3,13,23,33,43, *Role erosion (RE)* 4,14,24,34,44, *Role overload (RO)* 5,15,25,35,45, *Role isolation(RI)* 6,16,26,36,46, *Personal inadequacy (PI)* 7,17,27,37,47, *Self-role distance (SRD)* 8,18,28,38,48, *Role ambiguity (RA)* 9,19,29,39,49, *Resource inadequacy (RIN)* 10,20,30,40,50.

Inter-role distance (IRD) is measured by adding items 1,11,21,31,41 *Role stagnation (RS)* 2,12,22,32,42, *Role expectation conflicts (REC)* 3,13,23,33,43, *Role erosion (RE)* 4,14,24,34,44, *Role overload (RO)* 5,15,25,35,45, *Role isolation(RI)* 6,16,26,36,46, *Personal inadequacy (PI)* 7,17,27,37,47, *Self-role distance (SRD)* 8,18,28,38,48, *Role ambiguity (RA)* 9,19,29,39,49, *Resource inadequacy (RIN)* 10,20,30,40,50.

Pretesting of ORS Questionnaire

In order to test the reliability and validity ORS, the same was administered to 150 respondents of the hospitality & it industry. The collected responses were tabulated. Reliability and validity tests were conducted on the data to check the validity and usability of the instrument. Cronbach's alpha, KMO measure of adequacy and Bartlett's test of sphericity were checked and found suitable.

The analysis of Table 4 shows that all the items of the ORS scale load appropriately on the factors and have acceptable levels of alpha value >0.5.The ORS scale was thus used as a tool to measure Organizational Stress in the study.

Sample Profile

The study consisted of a sample of 250 professionals. The details of the sample are shown in Table 5.

Table 5. Descriptive representation of the Respondents (N=250)

Variable		Frequency	Percentage
Gender	Male	163	65
	Female	87	35
Designation	Manager	120	48
	Executives	130	52
Qualification	Post Graduate	115	46
	Graduate	135	54
Age	20-26years	99	40
	27-35years	59	24
	36-45years	78	31
	46-58years	14	05
Work Experience	1-5years	35	14
	6-10years	118	47
	11-20years	85	34
	Above 20 years	12	05

Table.5 shows the descriptive representation of the sample group. Among the participants, 163 (65 percent) were men and 87 (35 percent), women. There were 120 (48 percent) managers and 130 (52 percent) Executives. In the qualification demographics, there were 115 (46 percent) Post Graduates and 135 (54 percent) Graduates. After collecting the data, the demographics were analyzed for age. The sample was divided into four brackets of age, 20-26 years 99 (40 percent) respondents, 27-35 years 59(24 percent) respondents, 36-45 years, 78 (31 percent) respondents and 46-58 years, 14 (5 percent). In the work experience category, the brackets were from 1-5 years, 35 (14 percent) respondenrs,6-10 years,118 (47 percent) respondents 11-20 years,85 (34 percent) respondents and Above 20 years, 12 (5 percent) respondents.

Result and Analysis

The following section explains the results of the present study. The Table 6, shows the mean values and SD of the employees on the parameters of role stress.

The highest levels of stress as seen in Table 6. are seen on the parameter of Role Ambiguity, (M=16.12,SD=4.48), followed by Role Overload (RO) (M=16.00,SD=4.48), Inter Role Distance (M=15.87,SD=4.71), (IRD)Personal Inadequacy (PI) (M=15.83,SD=4.62), Role Stagnation (RS) (M=15.80, SD=4.52), Role Erosion (RE) (M=15.66,SD=4.25), Role expectation Conflict (REC) (M=15.48, SD=4.43), Inter Role Distance (SRD) (M=15.20, SD=4.90), Role Isolation (RI) (M=15.14,SD=4.62)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and Resource Inadequacy (RIN)(M=14.78,SD=5.04). It is seen that the overall levels of stress in the employees of the IT industry are moderate. It is important to keep in mind that measures to control stress are essential in order to control any aggravation in the levels of stress among the employees.

Table 6. Showing mean and standard deviation of role stress of employee in the IT

Variables	No. of Items	Score Range	Mean Score	Std. Deviation	Cronbach Alpha
Inter Role Distance (IRD)	5	5-25	15.87	4.71	.818
Role Stagnation (RS)	5	5-25	15.80	4.52	.839
Role expectation Conflict (REC)	5	5-25	15.48	4.43	.802
Role Erosion (RE)	5	5-25	15.66	4.25	.802
Role Overload (RO)	5	5-25	16.00	4.48	.819
Role Isolation (RI)	5	5-25	15.14	4.62	.837
Personal Inadequacy (PI)	5	5-25	15.83	4.62	.836
Self Role Distance (SRD)	5	5-25	15.20	4.90	.867
Role Ambiguity(RA)	5	5-25	16.12	4.48	.820
Resource Inadequacy (RIN)	5	5-25	14.78	5.04	.889

Examining the Impact of Demographic Variables on Organizational Stress

An in-depth review is done by analyzing the impact of the demographic variables on the organizational stress experienced by the employees. The demographic variables include Gender, Age, Qualification, number of years of work experience and designation of the employee.

The results of Table 7 indicate that there is no significant difference between the Male and Female respondents of the IT sector in terms of Organizational Stress, except for significant difference, $p<0.05$on the parameter of Inter Role Distance (IRD), and Resource Inadequacy (RIN). The result shows that Female employees experience greater levels of role stress than their male counterparts.

The results of Table 8 indicate that There exists significant difference $p<0.05$, among the Managers and Executives of the IT industry in the parameter of Inter Role Distance (IRD), Role Overload (RO), Personal Inadequacy and Self Role Distance (SRD), As indicated by the mean scores, the results show that the Managers show higher levels of stress than the executives of the IT Industry.

The results of Table 9 indicate that there is no significant difference in the levels Organizational Stress based on qualification levels of the employees of the IT industry .We cannot make a clear distinction that based on qualification levels, that either group would be experiencing more or less stress.

Table 10 shows the F-value, significance levels and an interpretation of means through sub script, 'a' and 'b'; with the help of post hoc *Duncan analysis*. As noted above, there is significant difference $p<0.01$ for above given parameters of Organizational Stress. Results indicated that for all the parameters; except Role Overload (RO), Role Isolation (RI) and Personal Inadequacy (PI), there is a significant difference in the mean scores of the Age Group (46-58 years).The overall results indicate that this age group experiences the least levels of Stress among the other age groups of employees, as indicated by the mean scores. For all role stress parameters, there is significant difference $p<0.05$, with the age group

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(46-58years), showing the least amount of role stress as indicated by the mean scores. As shown by the transcripts, the other employees in the age groups (20-26 years) (27-35 years) and (36-45) have similar levels of stress within which, the age group (27-35 years) shows higher levels of role stress. Similar results were confirmed by previous literature that showed the existence of maximum stress among the young professionals of the IT industry, which makes them leave their jobs. Various other studies have also confirmed that stress tends to decrease with ones age and tenure in the organization. There can be various reasons for the same, which could include; increased comfort level, emotional intelligence and one's life tenure. The younger generations are mostly stressed due to aspirations of over achievement and starting family responsibilities. There seems to be no difference for the parameters Role Overload (RO), Role Isolation (RI) and Personal Inadequacy (PI).(Role Overload) and (Role Isolation) and (Personal Inadequacy), arises as one feels burdened due to job responsibilities and a lack of being adept to handle the same with existing resources. It is seen that the young and older employees may feel overburdened. Previous studies confirm that managers and senior positions in the IT industry, shoulder greater responsibilities based on accountabilities; that may lead to greater stress (Spielberger & Reheise, 1994).

Table 7. t- value of male and female respondents of IT industry in relation to organizational stress

	Gender	N	Mean	Std. Deviation	t-Value	df	Sig. (2-Tailed)
Inter-Role Distance (IRD	Male	163	13.1043	4.03628	2.043	248	.041*

**Significant at 0.01 level, *Significant level 0.05 level

Table 11 shows the F-value, significant levels and an interpretation of means through sub script, ‘a’ and ‘b’; with the help of post hoc Duncan analysis. As noted above, there is significant difference $p<0.01$& $P<0.05$ for all the parameters of Role Stress.

There is no significant differences in the mean scores except on the parameter of Self Role Distance (SRD).For the parameter of Role expectation Conflict (REC), Role Overload (RO) and Role Isolation (RI); there is a significant difference in the mean scores. As indicated, the highest mean scores are for the group (6-10years) and (11-20years) and the lowest for the (Above 20 years) group. For the parameter of Inter Role Distance (IRD), there is significant difference in the groups (1-5 years) and (above 20 years), the group (6-10years) and (11-20years) forms one group with the highest mean scores. For the parameter of Role Stagnation (RS), there is significant difference in the mean scores of the group (above 20 years), with the lowest mean score. For the parameter of Role Erosion (RE), there is significant difference brought about by the group (11-20 years), also having the least mean scores. For the parameter of Personal Inadequacy (PI), there is significant difference $p<0.05$ between the groups, with the (above 20 years) group) having the lowest men score. For Role Ambiguity (RA), there is significant difference between the three groups, with the group (6-10years) having the highest mean scores and the group (above 20) with the lowest means scores. For Resource Inadequacy (RIN), there is significant difference between the three groups (1-5years), (above 20 years) and the mid group (6-20 years), with this group having the highest mean scores on the parameter.

Table 11. Post hoc comparisons using the Duncan to assess the difference in the levels of organizational stress based on the number of years of work experience of employees

	Work Ex Groups	1-5 Years	6-10 Years	11-20 Years	Above 20 Years	Sig- Value
	N	35	118	85	12	
Inter Role Distance (IRD)	Means	12.15a	14.55b	14.96b	10.42a	F(3,246)=11.63,P=0.000
Role Stagnation (RS)		13.01a	15.98b	14.79 a,b	9.64c	F(3,246)= 13.72,P=0.000
Role expectation Conflict (REC)		11.80a	14.42b	14.21b	10.64a	F(3,246)=8.26,P=0.000
Role Erosion (RE)		14.72a	15.57a	15.39a	10.92b	F(3,246)=6.46, P=0.000
Role Overload (RO)		11.91a	15.27b	14.33b	11.78a	F(3,246)=9.14, P=0.000
Role Isolation (RI)		12.27a	14.69b	15.06b	10.78a	F(3,246)=10.1, P=0.000
Personal Inadequacy (PI)		13.22a,b	14.44b	14.73b	12.21a	F(3,246)=2.81, P=0.04
Role Ambiguity(RA)		11.19a	13.94b	13.56b	8.21c	F(3,246)=10.76, P=0.000
Resource Inadequacy (RIN)		12.71a	15.11b	14.39b	9.78c	F(3,246)=8.76, P=0.000

Note: Means with similar subscripts do not differ significantly and means with different subscript differ significantly

The results show that the least stress is experience by the employee's whit the maximum tenure in the organization. As cited earlier, age is inversely proportional to the inception of stress in an individual. Hence older employees with greater work experience seem to experience the least amount of stress. As one spends more time in an organization, he becomes familiar with the ways to handle workplace demands. The age and life situation also make the person complacent, as his understanding of work is well developed. Thus organizations need to deal more effectively with the work experience group (6-10 years) and (11-20 years); as that is the most stressed group due to career inhibitions and rising competition.

CONCLUSION

There are many reasons for the inception of role stress amongst the professionals of the IT industry. Overall, results indicate that the professionals experience moderate levels of stress. These moderate levels need attention of the human resource professionals, as they could further lead to mild and alarming rates of stress. Wells et al. (2009) conducted a study that showed a positive relationship between job stress and organizational commitment and a negative relationship between job stress and career commitment. However, this commitment can be improved by means of tools like mentoring (Casado-Lumbreras et al., 2009; Casado-Lumbreras et al., 2011). In any case, the nature of work in this industry is characterized by large workgroups comprising of hundreds of members allocated working together in teams. There may be limited scope towards ownership of a complete process, which could be a reason for dissatisfaction among the employees.

Role Ambiguity (RA) seems to be evolving as the most significant stressor in this industry. Role Ambiguity is a result of non clarity of the expectations of work. A clarity in roles and is experienced by the professionals. Thus, the organizations can make their employees more competent by imparting adequate time bound trainings which will help the employees to see more personal and professional growth prospects. This is followed by Role Overload (RO) and Inter Role Distance (IRD). Role overload

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

is resultant of a feeling of having too much work to do, without apt resources. Inter Role distance occurs of the incumbent feels that the various professional roles and personal roles that he plays, are at a clash with each other. This indicates that the employees of the IT industry experience a sense of limitation in resources and time. The hard pressed time lines force them to work under pressures of quick delivery which could lead to role stress. Similar results were confirmed by a study conducted by (Sharma, 2004). Other stressors like Personal Inadequacy (PI) and Resource Inadequacy (RI) are created by the lack of adequate skills and the resulting inability to meet the demands of one's role. This is sometimes results of sufficient training programs that are designed for these professionals.

Comparing with other business sectors the time pressures make it difficult for team members to relieve other members to attain three training programs. Role Isolation is bound to occur when a person feels that his role is isolated from the mainstream of organizational life. This is mostly a result of the nature of tasks that are handled by different teams and their contributions in the overall process. A software developer would have the product or service passed on to the software tester, such that all important appropriations can be made. A lack of ownership in the end product is likely to arise, creating a sense of role isolation. Research and current training practices in the IT industry also show that the training is mostly related to technical skills. The industry needs to focus on behavioral training also that will help the employees in dealing with attitudinal issues related to work and this would help in developing coping mechanisms and well-being.

The role of demographic factors on the conception of organizational stress is also important. We notice that in terms of gender; on the parameters of Inter role distance (IRD) and Resource Inadequacy; women feel more stressed than their male counter parts. Inter Role Distance (IRD) can be explained as a gap between one's concept of self and the demands of his role For example, the role of an executive vs. the role of a husband/wife that one plays in his day to day life. Mostly women have to multitask and play their professional and personal roles parallel, that paves way for a feeling of distance amongst the two extreme roles and the inability to suffice any successfully. Resource Inadequacy (RIN) arises when human and material resources allocated are inadequate to meet the demands of the role. This is also a cause of stress for women. Role Erosion (RE) and Role stagnation (RS) occur as one sees a lack of advancement opportunities in one's career. Previous researches also show that women experience more subjective stress than men (Aziz, 2004). Within the IT industry, it is seen that the skill requirements vary through different projects and the skills of a professional; need to be updated with the fast paced evolution in technology. Thus the cycle time for training needs to be taken care of.

The results also show that education does not contribute to any significant difference among the employees. Both graduate and post graduate employees face equal amounts of stress. In terms of age and work experience, we see that there is significant difference $p<0.05$, with the age group (46-58years), showing the least amount of role stress as indicated by the mean scores. The age group (27-35 years) shows higher levels of role stress. In terms of work experience, we see that the least amount of stress is the group with work ex (above 20) years and the maximum in the age group (11-20 years). The results of the study can be further used to analyze the reasons and initiatives that can be undertaken to reduce role stress amongst the employees of the IT sector. Though the sector shows moderate levels of stress, yet a step in the right direction would be helpful in ensuring that the same does not lead to future burnout and exhaustion.

ABSTRACT

Accidents and near-miss accidents in chemical industries are widespread. Most of the incidents occurred due to combinations of organizational and human factors. To identify the causes for an incident of an accident analysis is needed, because it reveals the possible causes behind the accidents. Accident analysis shows the human and organizational factors that support learning from the events. Literature review shows that human error plays an important role of accidents in process industries. The chapter discusses some case studies which are received very little media publicity and also no proper assessment. At first reports on the incidents were collected from newspapers and then the place was visited to conduct an interview with local people and present and past workers with the help of the PESO (M/S Petroleum and Explosive Safety Organization, Eastern Region, Govt. of India).

INTRODUCTION

Among industrial sectors chemical industry is one of the important and biggest industrial sectors. It is also an important source of employment sector. Small scale chemical industries manufacture products often run as a batch operation and large-scale production is mostly run as continuous operation. In both cases there may be various kinds of technical systems like chemical reactors (which often have to withstand high or low temperatures and pressures), separation devices (distillation, filtration, etc.), and fluid systems for liquids and gases (pumps, valves, tanks), etc. Large or small scale both chemical industries handled harmful and hazardous chemical for large production. The complex nature of chemical plants increases the health risks of workers. As new industries develop with new technologies then automatically risk arises on human health. Each year all over the world a large number of workers from chemical industries are suffered from work related accidents and illness. Workers suffer from acute effects such as poisoning suffocation; long-term affects respiratory diseases, occupational cancers and health effects that can be both acute and long-term, such as skin diseases, allergies, reproductive problems and birth defects.

There are many types of chemical plants such as refineries, power plants, wastewater plants, biochemical plants etc. Recent years due to rapid development most of plant use more complex technology which create more unsafe process conditions. In general, as the chemical process plant handled dangerous substances and their plant complexity, they can be characterized by a high accident potential. The number of accidents occurred in chemical industries due to different reasons, but one of them is the worker ignorance, as they are not appropriately trained. Sometimes they have a lack of basic knowledge, and also skills. Plant operators are monitor and control the plant for proper functions, so they have responsibility to save equipment and workers health and safety. Due too much stress or pressure some time they play wrong performance. To identify the actual causes for an incident an accident analysis needed, because it informs the unsafe work procedure, analyze how human and organizations failures create unsafe situation which leads accidents that support learning from the events.

Accident analysis carried out to discover the real causes of an accident and also recommend the preventive measure. It also gives useful information to plant personnel in future how to prevent plant operations from accidents. For improvement of process plant safety, it is very important to analyses the past accidental case studies. Because it not only gives the useful information, it also increases knowledge of workers and inform the safe practices. In recent years many research works identified the causes of accidents and lessons learn. Accidental analysis showed that not only one single cause responsible for major accidents but most have multiple and interrelated factors. If accidents are properly reported or investigated then the causes are identified properly and recommended some preventive measures for control future similar accidents. At first collecting the facts, then analyses the gathering information, identify the main causes and then implement the plan of action for future prevention. Many researchers research on Process safety and have analyzed incident or accidents and find out new risk situations. This chapter focused on how to analyze human factors. According to Rassmussen et al. (1990) "Human Factor" plays a part of operators, designers or managerial role which leads error and also worked on the psychological factors and industrial analysis to develop human error taxonomies. Literature review shows that various works has been done on human factor analysis to control hazardous situations and also save life and property. PHA, QRA, HAZOP, HRA, WHAT-IF, FTA, FMEA, SWOT, JHA etc. analysis gain information about how and why situation become uncontrollable, wrong approaches, real unsafe situation, inadequate risk control management and also prevent similar adverse conditions, increase safety knowledge of workers.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

PHA or Process Hazard Analysis used for finding, evaluating and controlling unsafe situations of process. Conducting PHA, also need a PHA team included safety specialist, engineers, supervisors, workers who have sufficient safety knowledge about safe plant operation. PHA is one of the most important elements of PSM (Process Safety Management). QRA or Quantitative Risk Assessment used for measuring total safety management of a chemical process industry. QRA identify the risk zone of storage area or handling process of chemical products. This process also recommends some preventable measures for save human live, environment and property. QRA widely used as for assessing oil and gas installations like refineries, tanks, pipelines, terminals, etc. HAZOP is a review process. HAZOP team finds out the possible causes and consequences of the deviation as well as existing safeguards protecting against the deviation. If any unsafe situations are detected, then they recommend some risk prevention actions. HRA or Human Reliability Analysis measures human reliability and the probability that workers perform the full task correctly in a fixed time. HRA is a group of many different methods like THERP, CREAM used as commonly. HRA is a method under of QRA. Swain and Guttmann (1983) present methods, models and estimated human error probabilities in nuclear power plants. According to Hollnagel (2005) HRA maximum used on its own both ways to assess the risk from human error and as a way to reduce system vulnerability. Kirwan (1994) stated that HRA has three principal functions as identifying what error can occur (Human Error Identification), deciding how likely the errors occur (Human Error Quantification) and enhancing human reliability by reducing error likelihood (Human Error Reduction). FTA is also known as Fault Tree Analysis is a software tool where analysis starts with an unwanted event and identifies the root causes. The result is represented as a logical diagram. FMEA or Failure Mode and Effect Analysis is used to eliminate faults in a system before they occur. Results are displayed in a table form like causes, effects, frequency, severity, probability and recommendations. WHAT-IF, SWOT and JHA analysis are briefly discussed in case study analysis section of this chapter.

The present chapter discusses the safety issues or risk factors associated with human factors. It informs about unsafe behavior of wrong task performance of workers and management. Three accident case studies of chemical industries are discussed in the present chapter where human factors play as a primary cause, but it is received very little media publicity and also no proper assessment. This chapter is useful for academician, practitioners, safety personnel, managers and workers who directly or indirectly associate with process safety management.

BACKGROUND

Process safety or workplace safety is not a new term. Research work started on workplace safety in the early 1980s. Zohar's (1980) study on safety climate received scant attention on organizational and psychological factors which are effects on safety climate. Nowadays, most companies/industries give priority to safety first. So, it is necessary for every process plant to include safety programme for their workers. For better safety performance, it is essential to investigate and analyze past accidents. It not only gives awareness about the causes behind accidents but also identifies, evaluate, and reduce occupational risks.

Most of the accidental factors related to:

1. **Task:** Ergonomics, process, materials, workers, safety work procedures, long hour of work
2. **Material:** Hazardous substances, faulty design of machine

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

3. **Environment**: Weather, temperature, improper light, personal protective equipment, noise, improper ventilation, workspace
4. **Human Factors:** Physical and mental capability like age, experience, training, health absenteeism, fatigue, frustration, alcohol addiction, carelessness, inattentive, ignorance
5. **Management Error:** Safety policies, safety knowledge, preventive measures

Industrial accidents directly effect on both public and environment. Accidents may damage the industrial economy and also results in injuries, pain, or even death of workers.

MAIN FOCUS OF THE CHAPTER

Industries are the backbone of economy to a nation. It produces goods from raw materials and engaged in making particular product or providing a particular service. There are many types of industries like agricultural industries, manufacturing industries, construction industries, craft industries, mining industries, chemical industries etc. Each industry has its own hazards. Among them chemical industries is one of the more accidents prone sectors.

Why Chemical Industries are More Unsafe

Chemical process plants handled and manufacture complex and hazardous chemicals in a large scale. Different chemical plants have different type of work procedure. All plant structure also different from designing. Some have fluid system and chemical reactor system, some have storage pressurized tank. Due to development of industrialization, the chemical plant structure change for continuous growth of complex materials with complex process equipment, technology in manufacturing process. Chemical process plant handled dangerous substances, so it is a high accident potential sector. Chemical plants need more attention because it stored large quantity of flammable and toxic materials. Hazardous chemicals have acute effects like poisoning, suffocation, long time effects like respiratory diseases and occupational cancer, skin injuries (skin burns, skin cancer), allergies, reproductive problem, birth defects etc. Chemical inhalation or irritant chemical substances may result asthma, chronic obstructive pulmonary diseases and chronic bronchitis. Exposure to diesel motor exhaust may cause of lung cancer. Certain substance from petro-chemical industries such as toluene and xylene effects on reproductive systems. Carcinogens that may be present in benzene, 1,3 butadiene, ethylene oxide etc.

Survey work done by Khan and Abbasi (1999) reveals that 1744 significant accidents have occurred in chemical industries during the period 1928 - 1997. Analysis of some major accidents and disasters in last few decades have given some valuable lessons like Texas city disaster in 1947, the worst ever accident in the chemical process industries involving toxic release occurred at Bhopal in 1984, offshore accident occurred in Piper Alpha in 1998, Flixborough disaster was an explosion at a chemical plant in 1974, Chernobyl disaster was a nuclear accident that occurred on 1986, Texaco refinery fire in 1994, Vishakhapatnam refinery in 1979, etc. A summary of major catastrophic accidents of chemical industries is presented in Table 1.

Table 1. Major accidents in chemical industries

Year	Location	Chemical	Event	Deaths/Injured
1926	St. Auban, France	Chlorine	Toxic release	19/105
1928	Homburg, Germany	Phosgen	Toxic release	10/50
1939	Zarnesti, Romania	Chlorine	Toxic release	60
1943	Ludigshafen, Germany	Butadiene	Explosion	57/37
1944	Clevelland, Oll	LNG	Fire and explosion	128/300
1947	Rauma, Findland	Chlorine	Toxic release	19/200
1947	Texas City, TX, USA	Ammonium nitrate	Explosion	552/3000
1948	Ludigshafen, Germany	Dimethyl ether	Explosion	245/2500
1950	Poza Rica, Mexico	Hydrogen sulphide	Toxic release	22/320
1954	Bitburg, Germany	Kerosine	Fire	32/16
1959	Meldrin, GA, USA	LPG	Explosion	23/78
1959	Ube, Japan	Ammonia plant	Explosion	11/40
1960	Kingsport, TN, USA	Aniline plane	Explosion	15/55
1962	New Berlin, TY, USA	LPG	Explosion	10/75
1965	Natchitoches, LA, USA	Natural gas	Explosion	17/56
1966	Freyzin, France	Propane	Fire and explosion	18/83
1968	Lievin, France	Ammonia	Toxic release	5/35
1969	Repcelak, Hungary	Carbon dioxide	Explosion	9/23
1970	Philadelphia, Panama	Catalytic cracker	Explosion	7/43
1972	Rio de Janerio, Brazil	Butane	Explosion	37/53
1972	Netherland	Hydrogen	Explosion	4/40
1972	West Virginia, USA	Gas	Explosion	21/20
1973	Kingman, AZ, USA	Propane	Fire	13/89
1974	Czechoslovakia	Ethylene	Explosion	14/79
1974	Flixborough, UK	Cyloheane	Explosion	28/76
1974	Madras, India	Potassium Sol.	Hot release	9/15
1975	Beek, Netherland	Propylene	Explosion	14/108
1976	Seveso, Italhy	TCDD	Toxic release	1/>300
1977	Gujarat, India	Hydrogen	Explosion	5/35
1978	Santa Cruz, Mexico	Propylene	Fire	52/88
1984	Sao Paulo, Brazil	Gasoline	Fire and Toxic release	508/221
1984	Mexico City, Mexico	LPG	Fire and explosion	550/23
1984	Bhopal, India	MIC	Toxic release	2500/100,000
1985	Brazil	Ammonia	Toxic release	>5000 evacuated
1985	Priola, Spain	Ethylene	Explosion	23/11
1985	Algerais, Spain	Naphtha	Explosion and Fire	18/56
1986	Basel, Switzerland	Fungicide	Toxic release	Severe damage to ecosystem
1988	Piper Alpha, UK	Hydrogen	Explosion	167/55
1988	Maharashtra, India	Naphtha	Fire	25/23
1989	Antwerp, Belgium	Aldehyde	Explosion	32/11

Table 1. Continued

Year	Location	Chemical	Event	Deaths/Injured
1989	USSR	Ammonia	Explosion and Fire	7/57
1989	Pasadena, TX, USA	Ethylene	Explosion	23/314
1989	Phillips, USA	Ethylene	Explosion	23/130
1990	Thane, India	Hydrocarbon	Fire and Explosion	35/10
1992	Sodegraura, Japan	Hydrogen	Explosion	10/7
1993	Panipat, India	Ammonia	Explosion and toxic release	3/25
1994	Dronka, Egypt	Fuel	Fire	410
1995	Gujarat, India	Natural gas	Fire	-
1996	Bombay, India	Hydrocarbon	Fire	2/45
1997	Chennai, India	LPG	Fire	3 /4
1997	Chennai, India	Molten metal	Explosion	2/5
1998	Hahnville, Louisiana, USA	Nitrogen	Asphyxiated by nitrogen	1/1
1998	New Jersey, USA	Yellow 96	Runaway reaction	0/7 2 severely burnt
1999	Martinez, California, USA	Naphtha	Fire	4
2001	Hangzhou, China P Rep	Aniline	Gas Leakage	0/700
2002	Missouri, USA	Chlorine	Toxic release	63 people seek medical evaluation
2002	Shenxian (Shandong province) China P Rep	Ammonia	Gas Leakage	13/11
2003	Kentueky, USA	Aquo ammonia	Explosion	1/26 evacuated
2003	Miami Township, Ohio, USA	Nitric oxide	Leakage & Explosion	Severe damage the plant
2004	Skikda, Algeria	LNG	Explosion	27/74
2004	Near Santiago, Chile	Acidic Chlorohydroquenone	Chemical spill	0/2 500 affected
2004	Songjia (Panjing, Liaoning), China P. Rep.	Hydrogen sulphide	Gas Leakage	0/120
2004	Oigihar (Heilongjiang) China P. Rep	Chlorine	Gas Leakage	0/134
2004	Fuzhou (Fujian province) China P. Rep.	Phosgen	Gas Leakage	1/300
2004	Houston, USA	Raw material for polyethylene wax	Explosion	2 firefighters injured during emergency response
2005	Perth Ambay, NJ, USA	Liquid waste in acetylene generator system	Explosion	3/11
2005	Juba, Sudan	Store ammunition depot	Explosion	31/150 4,000 homeless
2005	Hauinan (Jiangsu), China P. Rep.	Chlorine	Gas Leakage	27/285
2005	Texas City, USA	Hydrocarbon liquids and vapours	Sudden release of flammable liquids and vapours	15/170
2005	Lahore, Pakistan	Ammonia	Explosion	27/8

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Indian industry benefited credibility from the past in the mind of the common man who saw in its hope for better tomorrow. However, the Bhopal tragedy shook this credibility, thereby set bay in motion a process of revolution and rethinking. Industries were established in India as early as in the 1850s. Large-scale industrialization, however, started after the country became independent in 1947. Today India is one among the top 10 most industrialized nations in the world. Planning commission (1997) of India revealed the information that Indian labour force had grown to 397.2 million, which is nearly 42% of the total population (951.2 million) of the country. Due to improvement of Industrialization in India the more and more complex industries established and work with hazardous materials for growth of production. So workers handled hazardous toxic and harmful materials which increase the number of occupational injuries and deaths. According to the International Labour Organisation informed that in India more than 403,000 workers died per year due to work related problems or due to unsafe working conditions. It also informed that every day more than 1,000 and per hour 46 workers died due to occupational cancers or diseases. There is very little awareness about workplace hazards due to lack of access to information, education, and training, working conditions effects on the body as well as the mind of workers. A various study indicates that in many factories and services in developing and developed countries, workers are exposed to a different physical and psychological problem. In present situation lack of safety awareness, safety education, safety training, implementation programmes are very poor.

Process Safety Information

Government has emerged several rules and regulations for reducing the impacts of fire and explosions occurred due to chemical releases in chemical process plant. These are developed based on previous incidents that occur in process industries and their impact on process industries. Hence, the incident records are necessary and essential to learn a lesson from the mistakes. Only few accident databases are available in developed nations like MARSH (Major Accidents Reporting system), MHIDAS (Major Hazard Incident Data Service), HSEES (Hazardous Substances Emergency Events Surveillance), ARIP (Accidental Release Information Program), ERNS (Emergency Response Notification System), ARIA (Analysis, Research and Information on Accidents) etc. but unfortunately in India no such databases exist. Analysis of previous incidents as an essential aspect to reduce the frequency and severity of the future incident and also provides more accurate information which evaluates the industry's safety progress. Ministry of Labour and Employment of India tried to improve occupationally save the workers from mines, factories and ports. So, obtain to this principles incorporated in the constitution of India in the area of occupational health and safety in the above three categories implement laws and regulations which cover the areas of industrial safety, health and hygiene, industrial medicine, workers training and safe procedure of productivity, communication, primary accident hazards control, computer center.

Analysis of Incident

Investigation and analyzing any incident or accident are essential for process safety. Analyses are established both direct and indirect causes. Analyses results also measure the frequency and seriousness of accidents. Analysis method should be useful in

- Exposure of hazardous materials which will be susceptible to risk migration;
- Identify the high-risk operation;

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Analysis technique must be of use new safe process; at first, it analyzes new technology in a process and identifies hazards and changes and recommends safe operations.

So, analyses of incidents give more accurate and relevant information on the industry's safety progress in the future. For any general accident analysis, at first investigate the accidental data – gathering information, reconstructing events establishing what happens, then analysis the incident step by step. Various type of hazard analysis techniques used for analyzing accidents or incidents in recent years. Table 2 represents some accident analysis or accident investigation methods. Each methods has own strength and weaknesses and each has different application. Sometimes combination of methods used to analyses of complex accidents.

Table 2. Some incident/accident investigation/analysis methods

Sl. No.	Name of Incident/Accident Investigation/Analysis Methods
1.	ARCA – APOLLO Root Cause Analysis

38.	FMEA – Failure Modes and Effects Analysis
39.	HAZOP - Hazard and Operability Analysis
40.	Cause-consequence analysis
41.	ETA - Event Tree Analysis
42.	LOPA - The Layer of Protection Analysis

According to Bird and German (1992), Reason (1997) and Glendon et al. (2006) analysis of an accident is very important because it identify the possible unsafe working conditions like improper work planning of the organization, insufficient training, lack of attention, deficient maintenance of technical equipment, absent of job descriptions, wrong choice of materials or non-use of safety equipment and lack of attraction of employees. The qualitative, quantitative hazards, and risk techniques are commonly used are pointed below. Qualitative analysis is descriptive measurement and depends upon the decision making skills of organizational personnel to determine the impact of risk probability, like health and safety risk. Quantitative analysis is used to analyses accidents case studies in a more developed risk model, depending on the quality of the data inputted. This assessment can point out more useful information that can help safety risk assessment.

Qualitative Techniques

These methods are usually used to identify the potential accident scenarios and evaluate in detail to make a reasonable judgment of risk. These techniques are,

1. Preliminary Hazard Analysis (Pre HA/PrHA/PHA)
2. Checklist
3. What-If Analysis
4. What-If/Checklist Analysis
5. Hazard and Operability (HAZOP) Analysis
6. Failure Modes and Effects Analysis (FMEA)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Quantitative Techniques

These methods judged the risk of judgment by provides more detailed and statistical evaluations of the risk of a specific accident scenario. These techniques are,

1. The Layer of Protection Analysis (LOPA)
2. Dow Fire and Explosion Index (F&EI)
3. Dow Chemical Exposure Index (DCEI)
4. Fault Tree Analysis (FTA)
5. Event Tree Analysis (ETA)
6. Cause-consequence analysis
7. Human Reliability Analysis (HRA)

The Human Factor in the Chemical Industry

In recent years the chemical process industries have achieved in optimization of plant design and also inherently safe plant. However, in chemical process plant small and sometimes major accidents do occur and recur, many of them have quite similar characteristics. Joschek (1981) and Bea (1996) showed that 80% accidents occurred in chemical and petrochemical have due to human failure as a primary cause, and these are approximately lost 30 million working days. Human error was mostly responsible in the 514 industrial incidents of potential major consequence in Canada as reported by Lees and Laundry (1989). Salminen and Tallberg (1996) reported that in Finland, human error is a prime factor of 84-94% of 300 hazardous material events in the workplace resulting in fatal and serious injuries. Chung and Jefferson (1998) observed that the chemical industry as a whole does not learn from past accidents. Most human errors are the result of either moment's forgetfulness/aberration, or the errors of judgment. Inadequate training or instruction or inadequate supervision are one of the main causes as reported by Kletz (2001). Löwe and Kariuki (2004) reported, based on a survey conducted by Technische Universität, Berlin, that 64% of the total in Germany, industrial incidents are due to human failure. Gangopadhyay and his subsequent publications (Gangopadhyay and Das, 2005, 2007 a, b, c, d, 2008 a, b, 2009 a, b) indicated that need of accidental analysis and also to find the root causes for the safety application in chemical process industries. Zhang and Zheng (2012) demonstrated that the chemical accidents in hazardous installation in China from the year 2006 – 2010 are due to human errors, i.e., exclusively 46.8% or partially (human and equipment) is 18.3% out of 1632 hazardous chemical accidents. Kidam and Hurme (2013) analyzed 549 accident cases from the Japanese Failure Knowledge Database (FKD, 2011). They observed about 66% (364 out of 549) of the cases are chemical process industry related. They observed that the accident contributors are the human and organizational failures (20%), contamination (12%), heat transfer (12%), flow-related problems (11%), reaction (9%), layout (7%), fabrication construction and installation (7%), corrosion (6%), construction materials (6%), static electricity (3%), mechanical failure (2%), external factor (2%), vibration (1%), erosion (1%), utility-related problems (1%). Qi et al. (2012) observed that the accidents occurred on a regular basis in the chemical process industries due to insufficient understanding to recognize to the best actions and lack of drive for safety improvement in the organization. They also reported the following issues for process industries,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The organization has no memory – Similar incidents occurred in a different part of the world, and it is due to organizational failure as they failed to develop "organizational memory". Kletz (1993) and Mannan et al. (2009). The organizations failed to progress and execute effective learning from past incidents.
- Inadequate observation to main factor - Many factors contribute the safe operation of a plant, but the failure of maintenance of such factors like cost reduction, decrease training, the communication gap between management and workers, lack of supervision, workers fatigue, inadequate instrumentation, and improper equipment maintenance. Threat due to terrorism in chemical process industries has a new concern according to Bajpai and Gupta (2005), Reniers and Amyotte (2012).
- The growing complications of process operations and lack of communications – Modern chemical process industries are very complex and complicated. Poor management, lack of awareness, improper training may lead to an accident.
- Risk is also increased because of large population density in the off-site of the plant.

Human Factors and Human Errors

According to Health and Safety Executive (2005), the human factor is defined as "Environmental and organizational and job factors, system design, task attributes, and human characteristics that influence behaviour and affect health and safety".

The human error is defined as "Any human action or lack thereof that exceeds or fails to achieve some limit of acceptability, where limits of human performance are defined by the system" according to Lorenzo, (1990).

Bea et al., (1996) describe human error as a subset of the human factor, and the meaning of human error is unsafe acts made by worker in workplace. Human factors have received scant attention for various reasons in the process industries and are as follows:

- Lack of awareness
- Lack of understanding
- Lack of need
- Misunderstanding of human factors
- Lack of integration
- Lack of approaches to remediation of some human factors issues
- Lack of qualified analysts
- Lack of motivation

May and Deckker (2009) stated that the most of the human failures occurred due to lack of knowledge, underestimation of influence, unawareness, insufficient attention and negligence, poor memory or laps of memory, depending on others insufficient control, fault situation, unspecific definition of responsibilities etc. These are all cognitive factors of workers which reflect on the behavior of the workers. There are three related elements which determine the human factor and are

1. Job characteristics
2. The nature or behavior of the worker
3. Organizational systems and culture which may or may not include a safety management system.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Understanding Human Factors

Research shows that 50% – 90% of industrial incidents can be attributed to human error. So the attention must go to the unsafe acts by human as the most probable cause of frequent accidents happening in industries. Hence, human factors are an essential factor for accident prevention and are also necessary to control the occupational health of the workers. The traditional viewpoints of accidents are as follows

1. Accidents are caused by workers by inattention or ignorance of rules/ procedures;
2. Therefore accusation each other;
3. Prevention is then by following safeguard procedures, correct actions, safety training, strict supervision for the individual.

To increase process safety detect human factors, human abilities and barriers must first be understood at first,

- **Attention:** It is a cognitive process that means how human actively collect and save information and use them in a proper working conditions.
- **Perception:** It is a process where human collect information from their environment and used that information in order to interact with their environment safely. So, always correctly perceive. Work environments sometimes change human perception systems and information which not properly explained.
- **Memory:** It is the capacity to remembering information from the past experiences and in order to use this information in present situation often put undue pressure.
- **Logical Reasoning:** It is one of the fundamental skills of effecting thinking. In failures in reasoning and decision making can affect complex systems such as chemical plants, and tasks like maintenance and planning.

Classification of Human Error

Human error classifications facilitate the identification and analysis of human errors. There are various ways of classifying human errors. The simplest is the classification by mode or action according to Swain and Guttmann (1983) are as follows

- **Omission Error:** Proper working procedure is not followed.
- **Commission Error:** Wrong working procedure performed.

Generally, human error can be categorized into two steps, i.e., unintentional and intentional. The unintentional step further categorized in more steps, as

- **Slips:** When the wrong action is performed.
- **Lapse:** When an action is omitted, or memory failures occurs.
- **Mistakes:** If a rule or work procedure has been forgotten or never fully understood.

The intentional step further categorized into the following step as,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Violation:** Operator breaking organizational rules or operates unsafe procedures intentionally, etc.

Meister (1962) categorized human errors as errors in operations, design, maintenance, fabrication, inspection, and contributory. Operating errors result from the wrong operation/handling of equipment by the human, and it may be due to motivational error, wrong action performance, failures to follow procedures etc. Design errors occur due to improper design practices. Maintenance errors are failure to carry out right procedure. Other maintenance errors are the error of calibration of equipment, repair and installation etc. Fabrication errors result from poor quality, use of incorrect component, use of incorrect material of construction, and departure from the drawing supplied. Inspection errors result from inadequate inspections that mean anybody breaking organizational safety rules or hide any faulty work process in the time of inspection.

Lincon (1960) indicates that operating error further classify five types of errors as

1. **Attention Errors:** The operator fails to concentrate that require attention.
2. **Memory Errors:** The operator does not remember the actual task procedure or fails memory to perform required task is call memory errors.
3. **Interpretation Errors:** When operator could not understand the right meaning of given information by plant personnel and perform the task incorrectly.
4. **Operation Errors:** The unsafe or incorrect work procedure followed by the worker.
5. **Identification Errors:** The items are not identified.

The combination of Attention errors and memory errors are the errors of omission whereas interpretation, operation, and identification errors are commission errors.

Managing Human Factors

According to HSE (Health and Safety Executive) the fundamental principles of managing Human Failure are

- Human failure is reasonable and predictable. Human factor can be identified by analyzing accidental case studies and it is also manageable. All process industries should include safety management system to reduce human factors.
- Implement good human factors in engineering. It is also called ergonomics, which are concerned with design jobs, operating process, mechanism of machines, and suitable working environment. Ergonomic factors like improper vision, improper motor controls, uncomfortable posture in work procedure and work overload in insufficient time schedule should be prevented.
- Human errors can be prevented by clear, accurate procedures and instructions which also improve workers skill and memory.
- Risk assessment and accidents investigation should identify where human failure can occur in safety critical tasks.
- Manage working areas conditions, e.g., extremes of heat, humidity, noise, vibration, poor lighting, and insufficient workspace.
- Manage workload.
- Social and organizational factors, e.g. insufficient staffing levels, long hour work schedules, unawareness about health and safety; should be manage.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Psychological and social factors should be managing, like high levels of tiredness, family problems, health problems, addiction of alcohol and drugs.
- Providing proper supervision particularly for inexperienced staff, plant inspection and check proper maintenance in regular interval of time.
- Provide job relevant training and practices for managing abnormal and emergency situations.
- Develop new safer working methods through new procedures can reduce human factor and enhance safe environment in workplace.
- Identify unsafe behaviors associated with previous accidents.
- Inform the workers about how to use of personal protective equipment for individual safety and also give safety knowledge about general housekeeping, access to heights, lifting and bending, and contact with chemicals.

Three accidental case studies of chemical industrial accidents are discussed to find out the actual causes and human factors behind the incident.

CASE STUDY 1

Leakage of Chlorine from a Baby Cylinder

The Incident

A small unit manufactured calcium hypochloride solution by passing chlorine into lime solution. The occupier brought a cylinder of chlorine (baby cylinder – 60 kg. capacity) from the nearby dealer for the preparation of hypochloride solution. During the nighttime, the cylinder, which was kept lying in the ideal condition started leaking from its bottom all on a sudden. The worker brought some ice from the nearby shop and kept the cylinder in the ice pot with anticipation that the chlorine leak from the cylinder will stop if the cylinder is cooled down by ice. After a few minutes the leak increased instead of stopping.

Chlorine gases profusely spread from the cylinder and dispersed according to the direction of wind affecting the people on its path in the adjacent houses, 4 people died by the chlorine gas and other 87 people were injured. The calcium hypochloride unit was located in a heavily populated area in a metropolitan city, Kolkata and most of the buildings were multistoried, normally shops were in the ground floor and residential accommodation from first floor onward. As the chlorine gas is heavier (vapor density of 2.48 gm/cc) than air it spreads in very little quantities in the first floor level. 87 people were affected who needed only first aid treatment for the minor injury by inhalation of the chlorine gas.

Incident Analysis

The main event was identified as

1. The chlorine cylinder was badly corroded.
2. Chlorine dispersed according to the wind direction and caused the death and injury.
3. No emergency first aid response was present.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Major Contributing Conditions Were Also Identified

- The man engaged in the manufacturing process had no knowledge regarding the hazards of the chlorine.
- The management and the worker were ignorant. The management's reaction was to put the chlorine cylinder on the ice pot and the reaction of the metals of the chlorine cylinder with chlorine and water ultimately increased the diameter of the leaky portion of the cylinder.

Corrosion Mechanism

Carbon steel is most common material of construction of baby cylinder. The dry chlorine reacts with the iron present in carbon steel as

$$2Fe + Cl_2 = 2FeCl_3$$

The ferric chloride is formed a proactive layer on the steel surface, however it is very hygroscope, and absorbs moisture and water, which accelerates the rate of corrosion (The Chlorine Institute, 2000).

The chlorine reacts with water to form hypochlorous acid (HOCl) and hydrochloric acid (HCl) as

$$Cl_2 + H_2O = HOCl + HCl$$

The hypoclorous acid is unstable and dissociates as,

$$2HOCl = 2HCl + O_2$$

According to Updyke (1982) and Saroha (2006) in the presence of water the protective layer of ferric chloride is dissolved. The acids and the dissolved salt enhance the corrosion of the cylinder.

Lessons Learned From this Incident

1. Implement the safe maintenance and gain knowledge about risk management.
2. Always perform the job safety analysis under the guidance of trained personnel and also understand the outlines of total incidents. Methods statements should be prepared which clearly define roles, responsibilities and the controls to be applied.
3. Inform chlorine cylinder supplier's about the safe procedure of carrying chlorine cylinder.
4. Cylinder leakage should be addressed to the manufacturer or local task force to tackle this problem immediately and to provide PPE's.
5. Arrange awareness programme on chlorine related hazards and motivated to participation of all staff.

What-If Analysis

The What-If method is the least structured of the creative Process Hazard Analysis techniques. It is a brainstorming approach in which a group of experienced people familiar with the subject process ask

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

questions or voice concerns about possible undesired events. This analysis starts a series of questions that begin with, "What if…?" What-If questions can be formulated around human errors, process upsets, and equipment failures and each question represents a potential failure or miss-operation of the process. Then the "Consequence" which is the effects of What-if condition traced all the way to the loss event. Then the operator's responses are evaluated to determine if there is a chance or possibility of potential hazard. If so, then the proper modifications of the system should be recommended.

This method quickly focuses on issues that are critical and the speed of What-If analysis also helps reduce the boredom. It is also good at analyzing global issues, such as loss of utilities or the impact of a major fire.

Due to its lack of structure, the success of a What-If analysis is highly dependent on the knowledge, creativity, experience and attitudes of the individual operators. The "What-if" table generated for the human factor analysis shown in Table 3.

Table 3. What-if analysis

What - if questions	Consequences	Recommendations
If the chlorine cylinder titled to facilitate the leak of chlorine gas	The amount of chlorine leak is minimum	Ideal solution for initial period of liquid chlorine leakage.
If the leak cylinder put on the ice-pot	Increase in leak due to corrosive action with water	Educating workers about the hazards of chlorine and also encourage to participate in training and monitoring programs in the work place and set-up emergency plan.
If chlorine gas come out from the chlorine cylinder	It may fume while on contact with moist air and create highly corrosive atmosphere	Establish an emergency response plan for responding to leaks and also arrange the proper training for workers.
If chlorine gas spread offsite	Severe irritant to the eyes and respiratory system and also burn the skin	Establish an emergency response plan for responding to leaks.
If the workers are illiterate or if the operating procedure is not properly followed	Accidents may occurr	General chemical and hazardous information should be displayed and provide contact no. for possible help. Proper information and training for proper handling chlorine should give all the workers.
1. If chlorine cylinder become corroded	There is a possibility of leakage	Cylinder should be checked in regular interval of time.

Human Errors

After investigation it was observed that the worker was illiterate and he had no knowledge about the hazardous nature of chlorine. The small establishment did not have a telephone for communication. The following human errors are identified,

- **Lack of Knowledge:** Unawareness of the hazards of chlorine.
- **Lack of Logical Thinking:** In any technological situation logical procedures are necessary, but illogical thinking or the behavior lead to accident. Liquid chlorine is leaking from the cylinder

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

if the cylinder was titled to facilitate the leak of chlorine gas, then the amount of chlorine leak is minimum. One volume liquid chlorine spreads as 460 volume gas chlorine. But the worker put the leaked cylinder on the ice pot which increased the leak diameter and release liquid chlorine.

- **Mental Inefficiency:** A situation which does not have the mental capacity to deal with the information that must be processed in the activity. The worker is illiterate and his mental capacity is also very limited to process any information in acute conditions.

Accident Prevention and Recommendation as Preventive Measures

There is a need for major precautions while working with chlorine. Arrange safety workshops for safely handling of chlorine cylinders such as movement, appropriate storage facilities and maintenance procedures to be used. Consult the Safety Engineer/supplier's safety officers for safe operational procedures to be followed in an emergency situation stated by Spellman (2003) and Gangopadhyay et al. (2005b, 2007a).

Some general recommendations set up for handling chlorine cylinder, control human error, administrative control and safety work procedure control were followed.

Handling Chlorine Cylinder

Cylinder Movement

The appropriate technique for cylinder movement is the valve cap should be placed and dropping a cylinder or allowing an object to strike the container with extreme force must be prevented. Chlorine cylinders should not expose on heat and never lift a cylinder by its hood. Always use clamp support for cylinder movement. Lifting the cylinder by crane, rope sliding chain or magnetic device should not be use. Lifting the cylinder by holding the valve cap or its neck is prohibited.

Cylinder Storage

The chlorine cylinder storage area is to be a well-ventilated, secured and protected from weather away from heavily congested areas and emergency exits. Never cylinder stored near salted or other corrosive, combustible or flammable materials. Full or empty cylinder should be marked. To prevent full container from being stored for long periods of time use first-in first-out inventory system. Check the cylinders visually at last in every week to detect any indication of leakage or others problems. Provide leak detectors and high concentration audio visual alarm in storage area. To avoid liquid/water ingress in the cylinder while consuming the chlorine, outlet line from cylinder to consumption point should be provided with 32 ft. high barometric leg.

Control of Human Error

1. The workers need proper education and training about the hazards of chlorine.
2. They must have knowledge about the emergency response plan for responding to leaks or accidents.
3. Workers must wear PPE's and breathing apparatus for handling chlorine cylinders or compounds.
4. Follow the manufacturer's instructions during emergency and display the instructions from the material safety data sheet (MSDS).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

5. Do not spray water on damaged or leaking containers; it can make the leak worse.
6. When handling chlorine compounds or cylinders the workers should not eat, drink or use tobacco products.
7. The hands and face should be washed before eating or drinking.

General Control

1. Dragging, rolling or dropping of cylinder should be avoided.
2. Fusible plug safety device on containers should not be tampered.
3. Chlorine supplier is to be immediately contacted if any damage is found.
4. Repair a container or its part like valve should not be done – immediately contact the supplier.
5. In any reason never place a container in hot water, or apply direct heat to increase the flow rate.
6. Once the cylinder has been connected to the process, cylinder is to be opened slowly and carefully.
7. If user experiences any difficulty in operating cylinder valve, disconnect use and contact supplier.
8. When tank valves are in closed do not perform any maintenance work.

Administrative Control

1. Arrange training on safe work procedure to handling chlorine for workers, inform them about the health hazards from exposure to chlorine.
2. Plan an emergency preparedness for handling leak or spills of chlorine cylinders at the work site.
3. Prepare emergency exit plans from the working areas and to move uphill and upwind.
4. Follow the rules for handling or maintaining hazardous materials.
5. Store the cylinders in well ventilated areas and training to the workers is necessary for the operation and maintenance of these systems.
6. In storage area where chlorine used as a raw material, always work with proper cloth and gloves and approved self-contained breathing apparatus in working areas.
7. The ventilation system in the chlorine storage room should be on and functional when workers are in the room.
8. Every plant must have chlorine alarm system of the outside area of the working zone.
9. Clean up chlorine spill as soon as possible and workers must use appropriate protective equipment and clothing.

Conclusion

The incident of chlorine leakage from a baby cylinder and the off-site consequences are described. The analysis of the incident has been carried out with respect to human errors and causes due technical faults. Lack of knowledge among workers about the hazardous nature of chlorine and also some maintenance ignorance on plant safety was the main cause of this incident.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

CASE STUDY 2

Phenol Formaldehyde Runaway Reaction in a Resin Factory

The Incident

One incident occurred in a plant in Kalyani, Nadia District, West Bengal, India. The plant operator started a preparation of a trial process using ammonia catalyst instead of caustic soda under the supervision of an expert. The earlier operation was done by another catalyst caustic soda. When using ammonia catalyst, the plant does not maintain any safe operational procedure and the entire process was started using manual control under expert supervision. The plant stored sufficient amount of phenol formaldehyde and liquid ammonia.

At first 87% phenol in water was taken in the reactor then the 37% concentration of formalin was transferred to the reactor. Then the stirring was started slowly. After that the catalyst liquid ammonia was added manually. During the catalyst addition small quantity of liquid catalyst flashed on the hand of the operator and the operator felt some burning sensation. The temperature of the reaction mass was already raised by steam heating to nearly 100^0 C and after few minutes it was observed that the temperature was increasing abnormally. The supervisor felt some abnormality in the reactor and instructed to drain the reaction mass from the reactor in several 100/200 lit. drums as available in the plant. After filling the drums, the operators closed the lids of some drums and all those were taken away in the open space at a distance from the reaction zone. Till some reactants were kept in the reactor. After a few minutes the closed barrels exploded one after another and some were flying at a height of 30 – 40 ft. and struck the wall and roof of the shed of the nearby areas. The residual mass in the reactor drained to the other empty drums and lids of those drums were not closed and these drums did not explode.

Probable Causes of the Accident

It was observed that there is wrong catalyst used. The liquid which add as a catalyst was not liquid ammonia, but it was concentrated nitric acid. So, there is vigorous reaction occurred inside the reactor. Concentrated nitric acid converts the reaction as a runaway reaction, which increased temperature of the reactor mass. It is observed that abnormal temperature rises in the reactor and there is poor cooling arrangement to control the reactor temperature. So, the expert decided to transfer the reaction mass to 100/200 lit drums and in the few drums the lids were closed and all drums were placed away from the reactor zone. Due to strong reaction at high temperature (as rate of reaction doubled roughly at increase of every 10° C) and evolution of stream, the closed drums experienced high pressure. The high pressure led to the explosion of the drums. The drums without lids did not explode. Draining of the reaction mass saved the reactor. So, it was cleared that the operator added wrong catalyst, concentrated nitric acid instead of liquid ammonia to the process and also at a high rate. Investigation shows that the incident occurred due to human and maintenance error.

The incident analysis shows that operating and maintenance error are primary cause of this incident. The worker used the catalyst from unlabeled jar and which containing wrong chemical compound. Analysis also concluded that though the supervisor had safety knowledge, but the unsafe organizational management process was the leading cause of the accident. Job Hazard Analysis (JHA) and SWOT analysis used to identify the potential hazards in the works place.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Job Hazard Analysis

Job Hazard Analysis (JHA) is very useful procedure for detecting workplace hazards. It recognizes the possible unsafe working situations before they occur. Chao and Henshaw (2002) stated that the method used for identifying, evaluating and controlling risks in industrial procedures. It also identifies the connection between the operator, the working procedure, methods or tools and the work environment. JHA identified the proper job procedure after carefully studying and recording each step of the job, then identifying the existing or potential job hazards, safety and health to determine the best way to perform the job to reduce or completely eliminate the hazards potential. According to Holt, (2001) Job Hazard Analysis is a safest planning procedure of a work. The advantages this analysis is to

1. It prevents worker injuries and illnesses and enhance organizational health and safety of workers
2. It identifies more effectual safe work procedures
3. Increase plant production
4. Prevent harmful situation
5. Reduce workers compensation costs
6. It is a precious technique for safety training of new employees.

To avoid maintenance error the management of a plant must give a practical explanation to the worker on health and safety, working procedures such as how skillfully use of machines and perform other working procedures by taking the corrective measures as identified by JHA. JHA gain trust and reliability of the workers even under harmful situation stated by U.S. Department of Labor, OSHA (2002). According to Chao and Henshaw (2002) the JHA conducted in to three main steps as

1. **Identification:** Selecting a particular job, then divided into different sequence stages and identify probable accidental/ unsafe situation of working procedures.
2. **Assessment:** Assess the possible hazards situation may be occur during the work.
3. **Action:** Evaluate to decrease the risk.

Friend and Kohn (2003) and Ramsay et al. (2006) describe that JHA also define job procedures in a proper way and step by step that workers and trainers both can completely understand the working procedures and also gain knowledge about unsafe working procedures and follow the proper method of the job.

SWOT Analysis

The SWOT analysis (Strengths, Weakness, Opportunities and Threats) is a valuable and helpful method which recognize strengths, weaknesses and also to examine the opportunities and threats of an industry. Strength and weakness analysis focuses on the previous work procedures, existing strength, resources and capabilities. The opportunity analyses pay attention to the improvement of working procedures and working conditions. Threats indicate the barriers or difficulty of job procedures which influence the production.

The SWOT method is used to recognize a solution of a problem or establish a plan of work which evaluates the strengths and weakness within organization and the opportunities and threats outside the organization. The internal and external factors indicate the positive points, strengths and opportunities

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and negative points, weakness and threats of the organization. It recognizes the clear idea about the job and the working environment to the management and workers. Hence it decreases the accident/near misses situations and also raising safety awareness.

Job Hazard Analysis (JHA) and SWOT analysis has been carried out to investigate the accident. Table 4 shows the basic step of JHA which represents the all possible factors of the incidents. It explains step by step the incident in a simple way. JHA indicates that operating error and maintenance error were the main causes of this incident. The maintenance error occurred due to management ignorance because the catalyst jar was not labeled so, the worker added wrong catalyst. This analysis also suggests the preventive measures shown in Table 4. Table 5 shows SWOT analysis which represents the strengths, weaknesses, opportunities and threats of this manufacturing plant which identified the reasons of this accident and also finds out the solution which prevent this type of accident in future. This analysis concluded that the supervisor of the plant had knowledge and experience about the process but faulty management was the main cause for accident.

Table 4. Job Hazard Analysis

Basic Job Steps	Potential Hazards or Injuries	Cause	Required Safe Job Procedures
This process based on ammonia catalyst	Wrong catalysts causes the reaction to run out of control	Wrong catalyst, a concentration of nitric acid used	Proper catalyst should have been added.
Adequate cooling arrangement should be provided	Inadequate cooling increases temperature	The reaction rate is doubled approximate increase of 10°C and also evaluation of water vapor a reaction product is large amount	Adequate vent arrangement (proper sized vent) in the extreme condition should be provided, otherwise there was possibility of explosion due to over pressure, it causes complete destruction of the reactor vessel and possibilities of flying of metal pieces in an around the plant which is dangerous for the human in-site and out-site and also release of hazardous materials
In store material should keep in proper order, display MSDS in working areas, check delivery order etc. are required to avoid mixing the wrong chemical in the process	Proper reactants or catalyst should be identified and used for the reaction and also use in proper sequence	Wrong reactants or catalysts or wrong sequences in the input to the reactor can also lead the reaction runaway	Chemical should be labeled and the use of Personal Protective Equipment (PPE) for carrying the chemicals
The runaway reaction exothermic in nature; therefore, increases temperature, so the reaction mass transferred or draining away from the reactor zone in case of emergency	The reaction mass transferred in a container close lid conditions leads to the explosion of the container	Create high temperature (as rate of reaction doubled roughly at increases of every 10°C) inside the container and also release of steam – pressure rises	Always transferred the reaction mass in a container in open lid condition which does not creates high pressure inside the container
Any kind of operating negligence occurred	Accident, blast, explosion occurred	Reaction is very exothermic, so any negligence can lead to the accidental situation	Implement various protective measures; arrange operator training, gain knowledge about chemical reactions, showing them past accident histories

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 5. SWOT analysis

	Positive	Negative
Internal	**STRENGTHS** 1. Standard process 2. Experience in the process technologies by the engineers, also the knowledge and experience in runaway reaction 3. Due to sufficient knowledge and experience dangerous situation is avoided, otherwise reactor may burst, create more adverse situation 4. Management is committed for the new product using ammonia as catalyst	**WEAKNESSES** 1. The chemicals are not labeled in the storage 2. Inadequate knowledge of the workers 3. Faulty management system 4. Management is not confident enough in the new process 5. No emergency planning for in-site and off-site 6. Lower levels staff are mostly illiterate not much knowledge of the process due to lack of training 7. Lack of communication skill of the workers 8. Lack of knowledge of the released chemicals and their amounts in the accident scenario
External	**OPPORTUNITIES** 1. Proper training – to impart knowledge about the process and the runaway condition of the process 2. Showing MSDS of the chemicals in the proper place 3. Adequate cooling arrangement in the reactor 4. Chemicals should be added in the reactor in proper sequence 5. Proper storage facilities 6. Separate racks for separate chemicals in the storage with proper labeling 7. Profit margin is going up due to high market demand particularly in locality and also export market	**THREATS** 1. Uncontrolled exothermic runaway reaction 2. Human error/maintenance error 3. Accident or explosion 4. Loss of life and productivity

Remedial Measures

All the chemical reactants should be kept in proper storage area with proper identification. The reactants are to be added standard measured quantity and maintaining a precise sequence as prescribed in the operating manual.

Lessons Learnt

1. Job Hazard Analysis and SWOT analysis conducted to analyze the incident. Both analyses recommend the following preventive measures
   a. For identifying the chemicals are labeled in the storage area.
   b. Chemicals should be stored in properly arranged manner.
   c. Chemicals should be added in the reactor in proper sequence.
   d. To avoid runaway reaction adequate cooling arrangement is to be provided to the reactor.
   e. Material Safety Data Sheet (MSDS) should be display in the working zone.
   f. Use Personal Protective Equipment (PPE) while carrying the chemicals.
   g. Safety training programme for the worker should be arranged at regular interval of time, at least once in a year to avoid operating error.
2. Administrative controls
   a. Management is to be prepared the SOPs (Standard Operating Procedures) of the process.
   b. Emergency preparedness programmes are to be prepared for onsite and offsite.
   c. SOPs are to be followed.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

3. Proper sized emergency relief valve must be provided in the reactor.
4. Past accidental case studies give appropriate guidelines on how to control accidents in future. The workers also learnt safety lessons from it.

Steps to be Taken to Reduce Hazards

1. SOPs (Standard Operating Procedures) for the new ammonia catalyzed process are to be developed to improve the inherent process safety.
2. Implementation of various protective measures like temperature control, instrumentation and interlocks to eliminate the opportunities for minimize the human errors.
3. The operators must be understood the hazardous information about the chemical and the process hazards and the consequences are to be evaluated for the process hazards assessment.
4. Operators should be followed SOPs.
5. To prevent this type of incident in future, identify the root causes and lessons learnt and all recommendations are to be incorporated to prevent recurrence.
6. Management should arrange training programme for the operators at regular interval of time to improve workplace safety.

Conclusion

An accidental case study in the process of manufacturing of phenol-formaldehyde resin has been reported using ammonia as catalyst in the new trial run process. Operator and management ignorance allowed for concentrated nitric acid added to the reactor instead of ammonia and a runaway reaction was started. The probable causes and remedies discussed on the basis of The Job Hazard Analysis (JHA) and SWOT analysis.

CASE STUDY 3

Carbide Fire in an Acetylene Gas Plant

The Incident

The incident took place in an industrial gas plant in West Bengal, India in one night of March 1993. The shift officer was on routine visit in the plant at around 11p.m. It was a summer night and there was heavy downpour around for two hours from 8 to 10 p.m. There was water logging in the factory roads due to rains. The shift officer was on round by company car after the rain stopped. While passing beside the calcium carbide godown, heavy smoke was seen issuing from the entrance of the main godown. The officer then stopped the car on road and observed that smoke was issuing from a carbide drum. The drum was kept on floor outside the godown beside the covered walkway approaching acetylene gas generator room. No flame was found to come out of the drum. The drum lid was in open condition. The fire was extinguished by fire extinguisher immediately. There was no loss of life and no loss of property.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Process of Fire in the Plant

Water ingress to the carbide drum occurred during rain. Thus, a typical carbide fire occurred as soon as carbide came in contact with water followed by formation of acetylene gas as result of temperature raised to the flash point of acetylene and there was auto ignition of acetylene.

Probable Causes of the Incident

1. Carbide drum with dust and lump was kept for long time for necessary disposal
2. Carbide dust was partially exposed to atmospheric air
3. There was water ingress into exposed drum
4. Formation of acetylene in the drum
5. Auto ignition of acetylene inside the drum due to rise of temperature in drum
6. Safe procedure was not followed for disposal of carbide dust and lump
7. Strict supervision was lacking

Errors and the Accident Analysis

What-if analysis used to identify the possible errors, and the unsafe activities. The human error, unsafe act committed by the system operator which led to the accident. This unsafe act either involve doing something wrong or failing to do something. Table 6 shows what-if analysis. It reveals that the accident occurred due to maintenance and operating error. The maintenance failure is also a major cause of human errors. The management of the gas plant does not maintain the maintenance procedure of the carbide storage and the plant operators had insufficient knowledge as,

1. The carbide drum which was necessary for disposal was kept for long time outside the go down on floor beside the walkway approaching acetylene gas generator room.
2. The lid of the drum was also in open condition.
3. The maintenance of the roof of walkway was very poor, so the water ingress to the carbide drums during rain due to spillage of rainwater in the drum.

Thus, the plant was running poor supervision. Although there was no loss of life and no loss of property, but a big incident could occur.

Lessons learnt

1. Calcium carbide dust, sweeping, calcium carbide lump etc. should be disposed as soon as possible
2. Carbide dust, lump, etc., be stored at dry place before disposal
3. Care must be taken for supervision of carbide handling and storage
4. Refresher training programme to be in place in close frequency for all concerned
5. Encourage good performance in maintenance work
6. Good communications in maintenance team, working conditions (enough light, not very hot or not very cold, well ventilated clean storage area) are maintained by the management.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 6. What-if analysis

What - if questions	Consequences	Recommendations
Are calcium carbide drums in contact with moisture?	Acetylene formations occur	Use local exhaust ventilation or workers should worn respirators and personal protective equipment (PPE).
If acetylene gas mixes with air?	Explosions occur	Establish an emergency response plan for responding in accidental situation.
If workers are illiterate or if operating procedures are not properly followed?	Accidents may occur	General chemical and hazardous information should be displayed to the workers and train them for proper handling calcium carbide.
If the calcium carbide rules, 1987 are not properly maintain?	Typical carbide fires occur	Follow the Calcium carbide Rules, 1987.
If acetylene gas spreads off-site?	Severely irritate and burn the eyes, skin, mouth, throat and shortness of breath	On skin contact immediately wash or shower to remove the chemical, use P.P.E and goggles.
If acetylene fire breaks down?	Explosion occurred	Establish an emergency response plan for responding in accidental situation and use explosion proof electrical equipment and fittings.

Corrective Action

1. Training was conducted for all concerned responsible for acetylene plant operation, in regular interval of time
2. Intense care was taken for carbide dust and lump disposal in the regular frequency
3. Storing carbide outside carbide godown was bad practice, management should strictly follow the Calcium Carbide Rules, 1987, Chapter V for storage (Ministry of Industry, India).

Disaster Management

All the fire in acetylene plant hazards can lead to disaster within a short while in acetylene plant due to inflammable nature of acetylene. The acetylene plant must have a disaster management plan to meet emergency situation. A very short resume of disaster management plan is cited here. The salient features of the plan are as usual the following basic steps of a standard hazard management plan. They are as under,

1. Hazard identification, Safety audit, etc.
2. Hazard analysis / evaluation, HAZOP (Hazard and Operability Study) study, etc.
3. Mitigation of hazard.
4. Prepare emergency plan for working areas inside or outside of the plant.
5. Save workers from the worse situation and shift the entire staff form accidental zone.
6. Provide safety information about the plant operations.
7. Roles and responsibilities of managerial and worker.
8. Testing the plan.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Recommendations

1. Management must take the responsibility to train their personnel to be sure that they understand the hazards while handling flammable materials and training should be carried out in regular interval.
2. Carbide must always be stored and handled at dry and moisture free condition, as per calcium carbide rules, 1987.
3. Carbide must be used in the process on FIFO (First in First Out) principle.
4. Handle carbide/dust only with spark proof shovels. Disposal of carbide dust must be done in the open with copious supply of water as soon as possible.
5. System must be in place for periodic audit of operation and safety procedure of the plant by internal and external audit team.
6. At no condition acetylene release, leakage, etc., can be allowed in an acetylene producing plants. All leaks to be identified and stopped with immediate effect. No delay is permissible.
7. All maintenance jobs must be done with best care and under permit of work procedure.
8. All operating staff must use Personnel Protective Equipments (PPE's), e.g., air stream helmet, cotton suits, fireproof hand gloves, safety shoes while charging carbide to acetylene generator and other jobs to be performed with the recommended PPE's.
9. The alarm system should be provided in different work area to operate the plant safety.
10. All do's & don'ts must be displayed at the entrance and also important areas of the plant.
11. To detect human failure conduct HAZOP study and draw a plan for emergency disaster management.
12. The management is to manage available tools/equipment, reduce interruptions and distractions, housekeeping and tool control, manage fatigue-work schedules, manage boredom- by task assignment, appropriate rules procedures, reduce action slips, reduce memory lapses, improves task completion, improve attention and memory, reduces complacency and overconfidence, reduce risky decision making.

CONCLUSION

The analysis of the incident has been carried out with respect to human errors. The carbide drum was for disposal kept for long time outside the go down and water ingress into the drum due to rain. The management of the gas plant does not maintain safety rules. In future to prevent this type of incident must follow the suggestive and corrective actions and recommendations.

DISCUSSION

Chemical industrial accidents include fires, explosions, and leakages of toxic or hazardous materials are harmful for people and environment. The causes of accidents are poor design, inadequate maintenance, human error etc. The chapter discussed about human factors is one of the major causes for accidents. Human factors occurred due to lack of knowledge, lack of motivation, lack of attention, lack of perception, carelessness/negligence, lack of memory etc. So, operating error, maintenance error, inspection error, attention error, identification error, interpretation error etc. occur as human error. Three accidental case

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

studies also find the probable human factors behind the incidents. Engineering students, safety personnel, workers and all other persons related with plant safety also benefited from this chapter.

KEY TERMS AND DEFINITIONS

Accident: An unfortunate event which is unexpected, unavoidable, unintended and damage property and life is called accident.

Analysis: A systematic examination and evaluation of data or information, by breaking it into its component parts to uncover their interrelationships.

Chemical Industry: Chemical industry is one of important and biggest industrial sector which produce chemicals in a complex manufacturing process.

Errors: The primary meaning of error is mistake. Sometimes error defined as incorrect or wrong procedures.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Hazards: Any harmful component that can cause harm or damage to human, property or the environment.

Incident: An unpleasant or unusual event which make situations accidental.

Occupational Safety: Concerns with physical and psychological conditions of workers and employers in workplaces which primary focus on preventing hazards, risk factors, diseases, stress related disorders etc.

Process Safety: It means preventions from all accidental possibilities or situations in industries and also preventing unintentional releases of hazardous materials which can have a serious effect to the plant and environment.

ABSTRACT

Within the agricultural sector, it becomes essential worldwide to analyze the magnitude of OHS problems. However, there is a lack of study in Odisha (India) to assess the prevailing situations. Hence, an attempt was made in this study to explore the issues related to OHS among the farmers of Odisha in India. There is a dual main contribution in this study. At first the occupational health and safety issues of farmers of Odisha in India were analyzed based on the literature review and the data collected by personal interaction and questionnaires. In the second part, the step-wise weight assessment ratio analysis (SWARA) method was used to rank the different farming processes, as well as different risks involved in various farming activities.

INTRODUCTION

Occupational health and safety (OHS) has been a major concern worldwide spreading from industrial to agriculture sectors. A variety of hazards having undesirable consequences are associated in farming like infection by pathogens, injuries from exposure, physiological disorders, poisoning, respiratory infections, and musculoskeletal disorders, etc. In terms of injuries and work related illness, agriculture has been ranked among the top three most hazardous occupational groups by the Centers for Disease

Control and Prevention (CDC, 2013). Thus, the well being of farmers as well as the sustainability of agricultural sectors can be ensured by emphasizing on OHS issues within this sector (Jugmohan, 2013). It has been highlighted for the necessity of improving the existing laws, based on a study made from cases in Gujarat (India) to explore the ethical challenges in OHS (Patel et al., 2016). The agricultural system is governed by accumulated knowledge, technology, integrated value chains, institutional innovations (Byerlee et al., 2009), globalization (Von Braun et al., 2008) and physical, biological and cultural environment (Vasey, 2002). However, agriculture greatly affects the ecosystem by clearing of lands, fragmentation of habitats, variation in ecosystem, desertification, erosion of soil, loss of biodiversity, and eutrophication (Conway & Barbier, 2013; Fan et al., 2012; Rosset et al., 2000). The ecosystems are polluted (Conway & Pretty, 2013; Diaz & Rosenberg, 2008) and human health is affected (WHO, 1996) by the use of agrochemicals like pesticides and fertilizers. Most of the agricultural tools and equipments are made locally with the available materials such as woods, iron and stones (Karthikeyan et al., 2009). As these locally made tools lacks the ergonomic aspects in its design, so it results in more drudgery and work related accidents or injuries. It has been suggested to conceptualize the association between unsafe employment and occupational health (Quinlan et al., 2001).

There is a lack of organizational framework in the agricultural sectors needed for OHS management techniques to operate effectively. Thus within agricultural sector, it becomes essential worldwide to analyze the magnitude of OHS problems. However, there is a lack of study in Odisha (India) to assess the prevailing situations. Moreover, most of the farmers are unaware of the potential risks in their jobs and there are no educational extension programs addressing these issues. Hence an attempt was made in this study to explore the issues related to OHS among the farmers of Odisha in India. The findings in this study may have positive implications for extension programs and policy formulation in the sustainability of agricultural sectors.

BACKGROUND

The agricultural hazards are as a result of exposures to agrochemicals, psycho-social stresses, poor ergonomics, and poor physical working conditions (White et al., 1989). The use of chemicals in modern farming has become an essential element exposing farmers in direct contact to agro-chemicals, flowing of agro-chemicals in unprocessed areas, and residual contact of equipments and processed crops (Strong et al., 2008). Because of the lacking of personal washing facilities on the farm, the farmers are supposed to expose their families to agro-chemicals by taking their contaminated clothes to home (Quandt et al., 2010). Some of the instant or short term diseases on human health due to pesticide exposures are headaches, respiratory problems, coma, disorientation, rashes, vomiting & nausea, and shocks. Whereas, cancer, reproductive, and neurological problems are also caused as long term diseases (Arcury et al., 2002; Das et al., 2001; ILO, 1986). Heavy physical workloads and poor ergonomic working conditions, results in injuries and musculoskeletal disorders (Giuffrida et al., 2001). Neck, shoulder and back pain were most commonly observed in Ireland (Osborne et al., 2012). The performance of work and the associated work setting attributes greatly to the work related musculoskeletal disorders (Collins et al., 2011; Punnett et al., 2004). Kumar et al. (2013) have revealed the seriousness of work related musculoskeletal disorders and reported that the musculoskeletal disorders were because of prolonged exposure to loads having variable work intensities. A total of 36 agricultural injuries were reported during a year considering twelve villages of Punjab in India. Moreover, the injuries rate per thousand machines per

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

year for tractors, sprayers, electric motors, threshers, and fodder cutters was 23.7, 15.5, 7.1, 5.7, and 2.2, respectively (Mittal et al., 1996). DeMuri et al. (2000) have highlighted that the injuries in agricultural sectors are as a result of lacking in proper supervisions, unreasonable expectations, economic troubles, and improper safety devices. Xiang et al. (2000) have conducted the face to face interview of 1358 Chinese farmers out of 1500 farmers considering 14 villages to evaluate the agricultural related injuries. A higher fatality rate and the injuries rate of 0.22, and 5 to 166 per 1000 workers per year were revealed in an agricultural survey in USA (Rautiainen et al., 2002). The agricultural accident rate was reported as 1.25 per thousand workers per year in Madhya Pradesh (India). It was further found that 77.6% of accidents were due to farm machineries, while 11.8% by the use of hand tools, and rest due to other reasons (Tiwari et al., 2002). As compared to the industrial workers, the injuries of farmers were reported to be higher (Helkamp et al., 2002). Kumar et al. (2008) have reported a total of 576 agricultural related injuries with hand tool related as 332 i.e. 58%, considering nine villages with 19,723 persons in 1st phase of their study. Additionally, in 2nd phase of study by considering more 21 villages with 78,890 persons 54 i.e.19% of hand tool related injuries out of 282 injuries was reported. It was further recommended to have intervention training and development activities at block levels for the safety measures of tools & equipments. In an investigation for the agricultural accidents between years 2000-2005, of 42 villages in Arunachal Pradesh (India) the accident rate was reported as 6.39 per thousand workers per year having farm implement related injury of 40% (Kumar et al., 2009). The workers and farmers engaged in livestock like dairy farms are subjected to adverse health risks (Karttunen et al., 2013). A total of 576 injuries in the agricultural sectors of Haryana in India were reported for 9 villages in a year. The injuries reported as minor were 87%, 11% as moderate and left over as severe. Most of the injuries were revealed of occurring because of hand tools like spades and sickles, bullock carts, manually and power operated fodder cutters, diesel engines and tractors (Mohan et al., 1992). By considering a total of 1000 farmers in Alabama limbs were found to be the most injured body part in agricultural accidents (Zhou et al., 1994). Giuffrida et al. (2001) have reported the adverse health effects on farmers by physical hazards due to noise, heat, vibrations, and other harmful climatic conditions. The psycho-social hazard to farmers occurs due to occupational stress and depressions. The study about the occupational stresses among farmers in India revealed that farming occupation causes high level of stresses, since farmers and their families work under the most stressful conditions such as financial problems, time pressures, diseases, government policies, heavy workloads, and unpredictable weather conditions (Ramesh et al., 2009). Effective interventions for reducing MSDs are the psychosocial and socio-cultural aspects of the work environment (Fathallah, 2010). Slips, trips, and falls on farms while performing agricultural activities were reported as the most important reasons of work related injuries among farmers (ACC, 2002). Moreover, the presence of wet, slippery, and muddy surfaces are the primary causes of slips, trips, and falls. A study in the Swedish agricultural industry revealed that injuries such as cuts, dislocations, and broken bones occur mainly from slips, trips, and falls. Furthermore, some injuries may result in permanent disability and can even be more serious & deadly (Lundqvist et al., 2012). There has been an increased food and fiber production leading to profits in agriculture with the use of pesticides. However, the use of pesticides is associated with the death of farm animals, human health risks, and in the alteration of local environment (Tchounwou et al., 2002; Calvert et al., 2001). The lower level exposures to one pesticide are greatly influenced by the associated exposure to other pesticides and to air, water, food and drugs pollutants (Akter et al., 2009). New tools or techniques having larger reliability than the existing are required to reduce the adverse effects pesticides on human health as well as the environment. Additionally, the alternative implementation of cropping systems with

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

less dependency on pesticides, developing new pesticides with novel action modes and enhanced safety profiles, and the improvement of already used pesticide formulations towards safer formulations could reduce the adverse effects of farming. Besides, the use of well-maintained and appropriate spraying equipment considering all precautions that are required in all stages of pesticide handling could minimize human exposure to pesticides as well as the potential adverse effects on the environment (Damalas et al., 2011). Farmers in remote agricultural areas are more affected by pesticide illness and poisoning, as these areas have inadequate occupational standards for safety, insufficient pesticide-related legislation enforcement, pesticide containers with poor labeling, illiteracy, inadequate protective clothing and washing facilities as well as lack of knowledge of hazards due to pesticides (Tchounwou et al., 2002; Snelder et al., 2008). Nag et al. (2004) have reported of the tractor related incidents such as overturning, falling from tractors, etc. as highest which was followed by the accidents due to threshers, sprayers, crushers, and chaff cutters. Further it was found that most of the fatal accidents were because of the use of the powered machineries. A major source of mortality and morbidity among workers are associated with occupational hazards (Driscoll et al., 2005). Animal workers in their daily practice have been reported to be exposed to various hazardous situations (Adedeji et al., 2011; Olowogbon, 2011). The awkward working postures, high rate of work, and deficiencies in the design of hand tools used in farm activities result in cumulative musculoskeletal strain and injuries (Vyas, 2014). The proportions of health problems are not the same for both men and women. Usually long static postures adopted by them for some of the activities increases the physiological costs as well as lower the productivity (Tripathi et al., 2013; Tripathi et al., 2015). Various types of physical hazards were reported among the farm workers engaged in dairy, poultry, piggery, husbandry and dealing with animals in a variety of agricultural activities (Driscoll et al., 2005; Stallones, 2011; Ghosh et al., 2014). Moreover the physical hazards occur due to slippery floors, dung pits, cages, and dusty feeding areas around the cattle, goat and sheep production units (Myers et al., 1997). A majority of workers in Nigeria, associated with livestock rearing were reported to be unaware of various preventive measures about work related risks and hazards. The prevalence of occupational hazards exposure was revealed as 69.6%, with hospitalization cases related to work of 6.5%, and occupational related sickness & diseases of 14.3% (Awosile et al., 2013). Over 5% of rural occupants were reported of suffering from ringworm infections. Moreover the chemical hazards were reported by both male and female respondents with a significant difference in its extent. It was found that the chemical hazards were due to use of chemicals in disinfection, decontamination, cleaning of animals (Chatterjee et al., 1980). Female farmers were reported to be more vulnerable to psychological hazards when compared to the male farmers (Malmberg et al., 1997; Melberg, 2003). A majority of workers in Nigeria, associated with livestock rearing were reported to be unaware of various preventive measures about work related risks and hazards (Awosile et al., 2013). The respondents taking the risk and perceiving the farm related injuries as inevitable were reported to have multiple injuries than those practicing safe farming such as operating machinery safely, and wearing of protective clothes (Harrell, 1995). Chikerema et al. (2013) have reported in a study in Zimbabwe, that less than half of the workers were aware of various preventive measures against work related diseases. The percentages of workers found of aware about the use of protective clothing, washing of hands after work periods, and good sanitary practices were 23.5%, 6.5%, and 7%, respectively. With the objective to guard animals, the farmers usually live with them under the same roof. This in turn increases the probability of exposing to zoonotic diseases having bacterial origin, like internal parasites such as tapeworms and ectoparasites such as fleas & mites (Nasinyama et al., 2000). In a study carried out in Odisha (India), it was observed that out of a total of 45 farmers, 43 farmers were victims of farm related accidents due to the use of hand tools (Mishra

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

et al., 2018a). Dube et al. (2018) have made an ergonomic assessment for different postures of farmers of Odisha in India during seeding, fertilizing and weeding processes in agricultural field, and based on the obtained RULA scores, different action levels were suggested for the existing working techniques and methods. Mishra et al. (2018b) have studied the musculoskeletal disorders during threshing of crops for farmers in Odisha, and suggested to prefer ergonomic design of farming tools.

There is a dual main contribution in this study. At first the occupational health and safety issues of farmers of Odisha in India, were analyzed based on the literature review and the data collected by personal interaction and questionnaires. Based on the recommendations of different studies where the SWARA methods are used not only to determine the weight of criteria, but also to completely solve MCDM problems, in the second part the "Step-wise Weight Assessment Ratio Analysis (SWARA)" method was used to rank the different farming processes, as well as different risks involved in various farming activities.

Step-Wise Weight Assessment Ratio Analysis (SWARA) Method

The SWARA (Step-wise Weight Assessment Ratio Analysis) method developed by Kersuliene et al. (2010) is one of the methods used for determining weight values in a decision-making process. Alimardani et al. (2013) have used SWARA and VIKOR analysis as two multiple attribute decision-making (MADM) methods for agile supplier selection based on four criteria including performance, cost, flexibility and technology. SWARA was used for determining the importance of each criterion and calculating their relative weights, while VIKOR was used for evaluating and ranking from the best to the worst of the supplier alternatives. Zolfani et al. (2014) have used SWARA and COPRAS as two MCDM methods on decision and policy making of high tech industries in Iran. Finally they have concluded with Nanotechnology at the top priority in Iran and also recommended this methodology for other areas of research. An extended version of stepwise weight assessment ratio analysis (SWARA) was proposed for criteria evaluation in decision making. As SWARA analysis involves two important steps where the first is prioritization of the criteria by experts, and the second is the calculation of relative weights. The reliability evaluation of experts' idea into the first step of SWARA analysis was recommended to improve the quality of the decision-making process (Zolfani et al., 2018). The integration of the delphi technique and the adapted SWARA method was successfully applied for creating a set of evaluation criteria for the sales managers and for defining the relative weights of such criteria (Karabasevic et al., 2017). There are few approaches that are based on the idea of SWARA method and also SWARA extensions, such as: selecting of personnel with the use of the adapted weighted sum method based on the decision-makers preferred level of performances (WS PLP), and the SWARA Method (Stanujkic et al., 2017).

Based on Kersuliene et al. (2010) and Stanujkic et al. (2015), in this method the opinion of experts on the significance of criteria involved in a decision making process are obtained to form the list of criteria.

Then the below steps are followed.

Step 1: Criteria are sorted according to their significance.

In this step, the experts perform the ranking of defined criteria according to the significance. The most significant is placed in the first place, while the least significant is placed in the last place.

Step 2: Comparative importance of average values (s_j) are determined.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In this step, starting from the second ranked criterion, the significance values are determined i.e. how much the criterion c_j is more important than the criterion c_{j+1}.

Step 3: The coefficients (k_j) are calculated as follows:

$$k_j = \begin{cases} 1, j = 1 \\ s_j + 1, j > 1 \end{cases} \quad (1)$$

Step 4: The recalculated weights (q_j) are determined as follows:

$$q_j = \begin{cases} 1, j = 1 \\ \frac{q_{j-1}}{k_j}, j > 1 \end{cases} \quad (2)$$

Step 5: The relative weights (w_j) of the evaluation criteria are determined as follows:

$$w_j = \frac{q_j}{\sum_{k=1}^{n} q_k} \quad (3)$$

where, n denotes the number of the criteria.

Research Methodology

This research was based on the detailed review of literature was carried out in this study related to the agricultural OHS issues and then identification of the risks associated with different farming activities in the agricultural sector of Odisha (India) was done. The identification of the farming risks and the subsequent ranking on the basis of their importance was done on the basis of the literature review, personal interaction with farmers during different farming activities, and opinion of decision making experts. The SWARA method was used in the study to calculate the weights and corresponding ranking of the criterion and sub-criteria. The characteristics of the decision-making experts are as shown in Table 1. The criteria's and sub-criteria are based on the risks associated with different farming activities, which were identified from the literature review is as shown in Table 2.

Table 2. Continued

Symbols	Criteria and Sub-Criteria
C_{5-1}	Injuries from manually operated harvester.
C_{5-2}	Exposure to vibration of harvesting machines.
C_{5-3}	Exposure to noise of harvesting machines.
C_{5-4}	Injuries while operating harvesting tractors.
C_{5-5}	Musculoskeletal problems from incorrect postures in harvesting.
C_{5-6}	Musculoskeletal problems from lifting heavy rice stacks.
C_6	**Threshing process**
C_{6-1}	Injuries from manually operated thresher by striking on wooden frame or using hand operated mechanical thresher or using draft animal driven thresher.
C_{6-2}	Exposure to vibration of threshing machines.
C_{6-3}	Exposure to noise of threshing machines.
C_{6-4}	Musculoskeletal problems from incorrect postures in threshing.
C_{6-5}	Exposure to grain dusts.

Results and Discussion

The most important criteria for this study as illustrated in Table 2 are land preparation process, seed soaking and scattering/fertilizer applying process, pesticides mixing and spraying process, weed pulling process, rice harvesting process, and threshing process, respectively. The sub-criteria's are the risks involved in different farming activities as illustrated in Table 2. The weights criteria and sub-criteria are calculated by using SWARA method as shown in Table 3-Table 9. The criteria's and sub-criteria's have been arranged according to the priorities defined by experts. The final ranking of criteria's and sub-criteria's are obtained considering their respective calculated weights (Table 10). Final weights of sub-criteria based on agricultural farming related risk in context of different criteria such as land preparation process, seed soaking and scattering/fertilizer applying process, pesticides mixing and spraying process, weed pulling process, rice harvesting process, and threshing process, are shown in Table 4-Table 9. It may be noted that the final weights of sub-criteria's are based on the respective weights of criteria's. The assessment scale is based on 5 percent steps. i.e., experts indicated a comparative and value differences on the basis of 5 percent increments: 5%, 10%, 15% and so on. Final numbers in this part are calculated from the arithmetic average of experts' ideas.

From the overall ranking of all five criterions, land preparation process ranked the first, followed by rice harvesting process, threshing process, weed pulling process, seed soaking and scattering/fertilizer applying process, and pesticides mixing and spraying process at the last rank, respectively. While considering the ranking of sub-criteria only, it was found that musculoskeletal problems from incorrect weeding postures in the criteria of weed pulling process ranked first, while musculoskeletal problems from incorrect working postures in the criteria of land preparation process ranked the last as illustrated in Table 10.

CONCLUSION

In the present study considering different rice farming activities as different criteria for SWARA method, it was found that land preparation process ranked the first, followed by rice harvesting process, threshing process, weed pulling process, seed soaking and scattering/fertilizer applying process, and pesticides mixing and spraying process at the last rank, respectively. While considering the different risks involved in various farming activities as sub-criteria, it was found that musculoskeletal problems from incorrect weeding postures in the criteria of weed pulling process ranked the first, while musculoskeletal problems from incorrect working postures in the criteria of land preparation process ranked the last.

ACKNOWLEDGMENT

We would like to convey our sincere thanks to the farmers participated in the present survey and to KIIT (Deemed to be University) for continuous encouragement in carrying out such research work.

This research received no specific grant from any funding agency in the public, commercial, or not-for-profit sectors.

KEY TERMS AND DEFINITIONS

Agricultural Injury: It is the injury that occurs while performing farm work.

Biological Hazards: It refers to the biological substances which may cause harmful effects to the health of living organisms.

Chemical Hazards: It refers to the dangerous and poisonous chemicals which may cause harmful effects in the workplace.

Farming: Farming is a part of agriculture. It is the growing of crops or keeping animals by people for food and raw materials.

Injury: Injury is the damage to the body caused by external force. This may be caused by accidents, falls, hits, weapons, and other causes.

Occupational Health: It refers to the identification and control of the risks arising from physical, chemical, and other workplace hazards in order to maintain a healthy and safe working environment.

Physical Hazards: The factors or circumstances which may cause harmful effects with or without contact.

Psycho-Social Hazards: It refers to the risks to the mental and emotional health and safety of workers, such as job insecurity, poor work life balance, and long working hours.

Chapter 76
Exploring Blue- and White-Collar Employees' Well-Being at Work System:
Differences in Indicators of Physical and Psychosocial Conditions of Occupational Groups

Seppo Tapio Vayrynen
University of Oulu, Oulu, Finland

Heli Katariina Kiema-Junes
University of Oulu, Oulu, Finland

ABSTRACT

The aim of this study was to examine occupational group-related differences in well-being at work (WBW) indicators ranging from real accidents, absences and retirement to experienced pleasure at work. Occupational group included two categories: blue- and white-collar employees. The study is based on analysing national statistics or ones of various industrial sectors (Study 1), or bases on findings of questionnaires in Finnish case companies (N=7) (Studies 2 and 3). WBW questionnaires answered by 3500 employees. Analysis utilised data that employees of two occupational groups, or company and national statistics revealed about WBW. Analysis was based on factors related to employee, task, tool, organisation and work environment (traditional work system (WS)), psychosocial factors, and information and communication within WS. The biggest and statistically significant differences were emphasised in results and discussion. Although two groups' roles and tasks provide reasons for many differences, the ones should be measured, thoroughly discussed and consciously managed.

INTRODUCTION

General Background

People in various roles, as well as their tools (e.g., technology), are the core elements of the jobs carried out within a work system. A fluent interplay of all system elements is necessary for successful work. The work system (WS) is a holistic concept that addresses all the relevant elements (employee, task, tool, organisation and work environment) and aspects of working (ISO, 2004). Organisations tailor WSs to fit various industries and services and to act as enablers of businesses; for example, they may be used as well for describing how to achieve desired outcomes for employees and patients in contemporary healthcare (see Hignett, Carayon, Buckle & Catchpole, 2013). The relevant elements provide a framework for a system's outcomes and functioning including, in our version, psychosocial interaction, social skills, information, knowledge and communication (Figure 1). As Hatch & Cunliffe (2013) concluded, differences and changes in organisations, including technologies and management, affect social relationships, attitudes and feelings at work. This conclusion is an important basis for our approach.

Both the empowering and defending characteristics must be included in current and future WSs. The former function is broadly related to desired outcomes (Figure 1), i.e., high performance of employees, including happiness as part of well-being at work. The latter function addresses undesired outcomes, i.e., various types of ill-being, including complaints, diseases, accidents, injuries, absences, early retirement, losses, errors, non-conformities, deviations concerning quality and risks in general.

We use the following definition of well-being at work: "WBW means safe, healthy, and productive work in a well-led organisation by competent workers and work communities who see their job as meaningful and rewarding, and see work as a factor that supports their life management" (Anttonen & Räsänen, 2009, p. 17). This definition is primarily limited to the context of WSs in our study, i.e., home and leisure contexts and living conditions are excluded.

The scope of this study involves a diverse range of employee positions and roles as subjects and objects within WSs and organisations. We examine employees' experiences of their WS conditions, as well emphasising psychosocial factors and employees' skills, information and communication. On the other hand, based on statistical facts, employees' accidents at work, absences and early retirement are dealt with.

Diverse individuals in a WS can be divided into two occupational groups, categories: blue- and white-collar employees. The European Union's (EU's) general classification of occupations, which we utilise in this study, makes the following divisions: (1) managers; (2) professionals; (3) technicians and associate professionals (including science, engineering, health, business, administration, legal, social, cultural, information and communication professionals); (4) clerical support workers; (5) service and sales workers; (6) skilled agricultural, forestry and fishery workers; (7) craft and related trades workers (including building, metal, machinery, handicraft, printing, electrical, food processing and wood working); (8) plant and machine operators and assemblers (including drivers); and (9) elementary occupations (including cleaners, helpers, agricultural, forestry and fishery, mining, construction, manufacturing and transport labourers) (Statistics Finland, 2016). Categories 1 to 4 are considered white-collar occupations by us, whereas blue-collar occupations comprise those in categories 5 to 9.

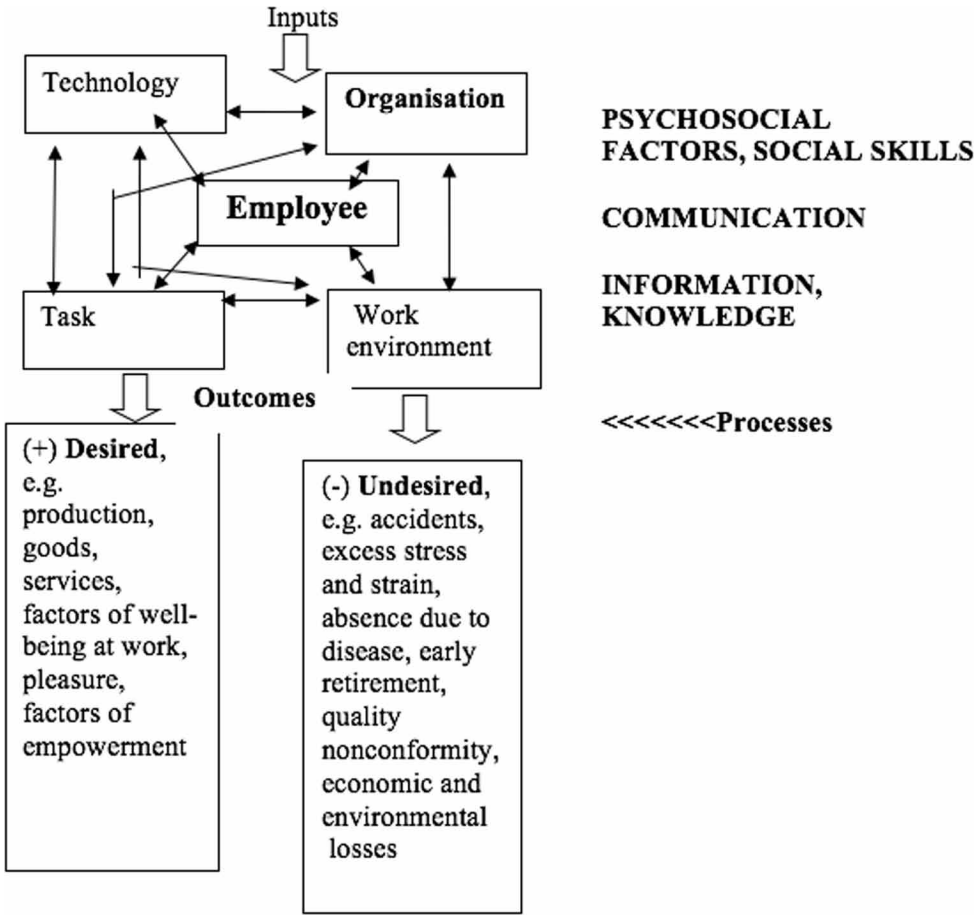
Figure 1. Model of the work system with outcomes, modified to represent a general systemic structure and the enablers and processes behind desired and undesired outcomes at work. Psychosocial factors, social skills, information, knowledge, and communication, contribute and play an essential role (Carayon & smit, 200; Carayon et al., 2014; ISO, 2004; Smith & Carayon, 1995; Smith & Sainfort, 1989; Vayrynen, Roning & Alakarppa, 2006; Vayrynen & Nevala, 2010; Vayrynen, Jounila, Latva-Ranta, Pikkarainen & von Weissenberg, 2016)



Balanced and Optimal: Characteristics of WSs and WBW

Well-being at work can be identified by job demands and job resources in the following theoretical models. The job strain model defines WBW as the balance between job decision latitude and job demands (Karasek & Theorell, 1990). The "job resources and demands" model (Bakker & Schaufeli, 2004; Demerouti, Bakker, Nachreiner & Schaufeli, 2001) classifies WBW by the balance between job demands (physical or mental) and job resources (physical or mental). Effort-reward balance theory defines WBW as the balance between intrinsic and extrinsic effort and rewards (Siegrist, 1996). Main resources are linking mainly to job conditions, leadership and management, the balance between work and family, the social capital and social interaction at the workplace, the work itself and for example personal characters

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Hobfoll, 2002) and that they are correlating with work engagement (Bakker, Hakanen, Demerouti & Xanthapoulou, 2007; Xanthapoulou, Bakker, Demerouti & Schaufeli, 2009).

WBW is associated with better work ability, better work quality and fewer absences or leaves due to disease (Karasek & Theorell, 1990). An essential resource for WBW is social capital which reflects reciprocity, trust and societal values; employees also need to see rules and activity toward shared goals within the work community and desired outcomes of its business (see Figure 1) (Carayon, 2009; Chen, Wei, Wang & Pen, 2016; Luthans, Youssef & Avolio 2007). WBW is influenced by factors including work conditions, organisational position, communication between co-workers, individual physical and mental resources, positive interventions, recuperation from work stress and work-life balance (Demerouti et al., 2001). WBW can be associated with WS balance theory, i.e., if an acceptable holistic balance situation is not achievable by minimising the negative aspects of an element of WS, the desired WS balance should be improved by enhancing the positive contributions of the other elements to WS (Smith & Carayon, 2000) as can be seen in Figure 1, and according to Karasek & Theorell's (1990) model of job strain. Social support was considered a psychosocial factor in Karasek & Theorell's model; this can be an important dimension for enhancing WBW (Carayon, 2009; Karasek & Theorell, 1990).

Differences of experienced WBW among blue- and white-collar employees is further explained by the work challenges and features. White-collar jobs characteristically involve more autonomy and positively challenging tasks than blue-collar jobs which are essential features for WBW (Toppinen-Tanner, Kalimo & Mutanen, 2002). Role problems, interpersonal conflicts, cognitive and psychosocial workloads are the main reasons for work stress in white-collar jobs whereas high monotony and low control and autonomy are the main factors creating job strain and stress (Toppinen-Tanner et al. 2002).

A work system can generate both desired and undesired outcomes (see Figure 1). Therefore, it is important to analyse how WSs and their elements should be designed, balanced and managed optimally so that work is satisfactory for desired outcomes, employees in the focus, in the role of a subject or an object (Carayon & Smith, 2000). The interactive combination of the elements of a WS should be as productive, safe and high-quality as possible (cf. ISO, 2004; Väyrynen & Nevala, 2010). Absences from work or early retirement, which may result from injury or occupational diseases, cause considerable losses to employees, organisations and society. According to the principles of occupational risk prevention, employees must be protected within the whole entity. Empowerment, which can be used as a mechanism for desired outcomes of WBW, must occur within and throughout the system. The control of undesired losses in the WS is linked to concepts such as safety culture and climate, human factors and ergonomics, as well as to a more concrete approach to safety management, including daily actions in every employee's own part of the WS (e.g., Eeckelaert, Starren, van Scheppingen, Fox & Brűck, 2011; Väyrynen et al., 2016). "Own part" includes, e.g., the role of autonomous learning (cf., Noe & Ellingson, 2017). One example of improving WBW could involve applying ergonomics knowledge the design of tools and workstations to improve usability. Whether tangible or intangible, WBW outcomes should be measurable for better information, control and management.

Psychosocial Factors and Social Skills

Work system modelling (Figure 1) is an optimal way to illustrate tangible physical or physiological issues at work, although intangible ones must also be included and evaluated. Intangible issues can predominantly be presented under the umbrella of psychosocial factors and social skills. Wilson & Haines

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(2000) identified the following driver to activate social and technical skills for desired outcomes at work: employees' participation that build and enable motivation, competence and confidence.

Social skills play a central role in the workplace (Orgambidez-Ramos & Almeida, 2017), as well as within specific WSs. Social support from colleagues or supervisor is one important implication of well-functioning psychosocial interaction within WS (Orgambidez-Ramos & Almeida, 2017; Carayon, 2009). Open and fluent interactions increase functionality at work and enhance employee engagement and commitment (Harris & Sherblom, 1999; Kiema, Mäenpää, Leinonen & Soini, 2014; King, 2005). The quality of the supervisor-subordinate relationship has been shown to have a great impact on employee job satisfaction and well-being, reduced staff turnover and employee innovativeness (Graen & Uhl-Bien, 1995; Erdogan & Enders, 2007; Loi, Chan & Lam, 2013).

Research Focus and Objectives

We assume that higher numbers of the key indicators of some undesired features in blue-collar employees, such as sick leaves and accidental injuries, may be obvious due to the differences in many organisations between blue- and white-collar employees. In a way, an extreme part of "bad" WBW comprises physical and mechanical accidents, as well as diseases, that may be considered by many people as events encountered predominantly by blue-collar employees within their WSs, which have tangible risks. These circumstances often cause easily observable periods of absence. On contrary, accidents at home, like those during leisure and commuting, may happen among employees of all occupational groups.

The above mentioned real situation may also be one reason behind probable differences in the employees' experiences of intangible indicators. For instance, the experienced-safety climate scores differed between blue- and white-collar employees of two chemical manufacturing plants within the same company (Bergh, 2011; Bergh, Shahriari & Kines, 2013). Safety climate is a useful concept for this study; it uses a psychological approach to safety culture (Eeckelaert et al., 2011). Safety is here seen as a fundamental prerequisite of WBW in the holistic approach (Anttonen & Räsänen, 2009) we presented in the Introduction. The Nordic Occupational Safety Climate Questionnaire (NOSACQ-50, 2012), consisting of 50 Likert-style statements related to respondent's attitudes and experiences of the workplace, was used to evaluate the safety climate in that chemical manufacturing organisation. Eeckelaert et al. (2011) defined safety culture as the deeper, implicit convictions that are shared amongst the members of a group, and which are expressed through the safety climate, i.e., the shared experiences of workers regarding safety and their working environment (cf. Huang et al., 2015). The NOSACQ-50 (2012) has been used by various industries in many countries, including this case from the Swedish chemical process industry. The main differences observed in the safety climate of this Swedish chemical process industry site were the following: First, shift workers chose significantly lower Likert-scores on the NOSACQ-scales, indicating worse safety climate, than daytime-only workers. The proximity of production lines, while shift-workers are obliged to work in their areas of the whole WS, was seen as another reason for the differences in experienced lower level of safety. Second, blue-collar employees had significantly lower ratings ($p < .01$) for many safety management dimensions than managers and supervisors (who represented typical white-collar staff). For the current study, we wanted to see whether one's occupational group (blue- versus white-collar employees within the same enterprise), one's role in the WS and in the organisation were related to differences in WBW, based on our indicators and WBW studies that emphasise safety climate and communication. We also wanted to check whether the phenomenon

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

discussed in the section above is present (and if so, to what extent) in our own results, as well as in the statistics-based resources we gathered. So, the research questions were:

1. Do statistics about absence from work, accidents and retirement reveal possible differences, and their reasons, related to occupational group?
2. Are there differences in experienced indicators of WBW between blue- and white-collar employees in the workplaces of our study material, and if so, which differences are the biggest?
3. What kinds of indications about the differences are presented in the literature?

MATERIALS AND METHODS

First, we collected and reviewed quantitative statistical data from various literature sources, registers and records (see Study 1). We had access to official nationwide data of interest, or studies based on that, from Finland and Sweden, as well as EU data (mainly statistics regarding accidents, absence from work and retirement). Additionally, we used detailed data from large companies, including a metal processing company (Finland), and energy sector company (France).

Our study's following materials were gathered from the case companies (N = 7) in the fields of manufacturing (of metal components or vehicles), mechanical engineering and various other services (telecommunication, industrial planning and construction, energy, transport). We used survey-style questionnaires as our data collection method, which were answered by approximately 3500 employees of all occupational categories. In the Studies 1 and 2 the respondents assessed their own WBW, based on their experiences of their own jobs. For the core material each respondent was asked to give his or her opinion (the degree of agreement) with presented statements (opinion or description) of a given WS or WBW condition. The choices ranged from 1 (strongly disagree) to 5 (strongly agree) (a five-point Likert scale to measure satisfaction (Allen & Seaman, 2007)). The field data were gathered during 2013 and 2014. The analysis took into account the WS's characteristics and psychosocial conditions within. The six-case study (see Study 2) examined companies situated in northern Finland. Study 3 focused on one large company operating in all parts of Finland. Some results related Studies 1, 2 and 3 have been presented already in the earlier reports, but predominantly we analysed and discussed all here in a new way and for a new purpose (cf., Filppa, 2014; Kiema et al., 2014).

We used a large, diverse set of WBW indicators available for studying the aimed differences between blue- and white-collar employees, and presented it generally in the Introduction chapter and in details in Results chapter and in the Appendix, comprising more than 100 single variables related to our multi-factorial approach to WBW. Approximately 10% of these factors were considered in Study 1; the allocations for Studies 2 and 3 were 20% and 70%, respectively. The close analysis and results presentation focused on occupational group-based differences in each of the three studies.

Study 1

For this study, we searched and used literature and published nationwide data from Finland and Sweden, as well as EU-wide data; this data concerned occupational accidents, especially causes and circumstances of the ones, absence from work and retirement (European Commission, 2009; TVK, 2016; Sysi-Aho, 2016; Laaksonen, Rantala, Järnefelt & Kannisto, 2016; Falkstedt, Backhans, Lundin, Allebeck & Hem-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

mingsson, 2014; Mänty et al., 2016; FIOH, 2017). We needed sources that described the occupational group of employees who had encountered accidents, too. Many sources lack this variable.

Further, the following aspect was an essential one for Study 1: Normally, like the above EU-wide analysis (European Commission, 2009), only accidents at work are dealt with, while our own study (Yrjämä-Huikuri & Väyrynen, 2015) and a French one we found (Verrier & Chevalier, 2007), takes into account the whole daily life of employees. So, not only accidents at workplace but as well all those ones from which both the employees and employers suffer need the consideration. Accidents at home, leisure accidents, and commuting accidents to and from workplace are important undesired outcomes though not directly related to WS causes but affecting WS and WBW indirectly. The corresponding total analysis of employees' accidents is not so common, at least as what we as authors know.

Study 2

The study of which Study 2 is a part composed of many different empirical activities (Filppa, 2014; Kiema et al., 2014). First in the study, a survey within six companies was conducted to establish all employees' experiences of features of their company's WBW and WSs (N(statements) = 22, see Appendix Figure 4). Study 2 is predominantly based on this questionnaire survey. The questionnaire form consisted of questions about respondents' background and included space for them to write their views or short descriptions about current situation at work and possible needs for developments of it. The answers of the blue- and white-collar employees were analysed to reveal how they separately felt about their WS, and specifically the communication and psychosocial factors related to WS and WBW.

The survey was conducted using a web-based form, but some respondents who did not have access to the Internet were given a paper form. The questionnaires were distributed to employees at different levels of the participating companies. Of the potential respondents (N = 658), 431 (66%) ones returned the form (364 blue- and 67 white-collars).

Study 3

Our third case study, Study 3, is based on studying empirically and extensively occupational safety (OS) and background and related issues of WS and WBW in Finnish rail transport and multiple of its cargo, service, construction, support, engineering, etc. activities. The goal of the project was to generate knowledge about OS, and attitudes related to it, of the workers and their superiors, and experts and upper management in a corporation, the dominating transportation operator in Finland. Key focuses included safety management, OS culture and climate, professional interactions and communication, holistic WBW and total quality management. The survey questionnaire for this study was distributed to the entire staff of the corporation, and approximately one-third (N = 3042) of staff members answered to it. Both blue- and white-collar employees participated in the study, so it was possible to examine the differences between them revealed by the survey. The questionnaire was available whether as printed form and via the Internet. In addition to the core OS issues (71 Likert-style questions, mainly statements about experienced OS and attitudes), the questionnaire also contained questions about respondents' backgrounds, as well as questions concerning key matters of the corporation's transport and other operations.

As members of the original research team, the authors further processed the data of survey questionnaire, specifically were analysed its key findings and their statistical significance, for the purposes of the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

current new study; i.e., to reveal the differences between blue- and white-collar employees in answers and opinions about OS culture, and WBW and WS in general.

RESULTS

Study 1

In Finland from 2005 to 2014, employees with a primary or secondary education spent more time on a disability pension than did people with a tertiary education in all disease categories that reduce ability to work (Laaksonen et al., 2016). Predominantly, blue-collar employees have only a primary or secondary education, without any further higher education, and typically their roles in WSs and organisations are linked to manual, operational tasks. Retirement statistics in Finland show that socioeconomic status, education level, occupational group and WS all influence retirement (Laaksonen et al., 2016). Frequent retirement due to disability pension is linked to more strenuous physical workload or occupational hazards (Laaksonen et al., 2016; Mänty et al., 2016). Regarding the neighbouring country of Sweden, Falkstedt et al. (2014) concluded that "…working conditions seem to partly explain the increased rate of disability pension among men and women with lower education even though this association does reflect considerable selection effects based on factors already present in late childhood." High physical strain at work and low job control also both contributed to explaining the associations between low education and disability pensions in multivariable models (Falkstedt et al., 2014). The following factors may encapsulate sources of physical strain: (1) daily heavy lifts; (2) repetitive and one-sided work movements; (3) awkward work postures; (4) heavy shaking or vibrations; (5) daily perspiration from physical exertion; (6) contact with dirt; (7) deafening noise; (8) risk of exposure to accidents.

With regard to work absences and accidents vs. occupational group within organisation, we found the following report: The average number of work absences in Finnish municipalities for white-collar workers is around half the average for blue-collar workers who perform physical tasks (FIOH, 2017). The average annual days of absence from work in various occupations within Finnish municipalities, employing hundreds of thousands of individuals, are as follows:

- 11 days for managers and professionals;
- 16 days for office clerks or corresponding assisting professions;
- 23 days for labourers of physical tasks or employees carrying out direct provision of services.

Occupations and WSs that are typically blue-collar are clearly linked to a higher incidence of injuries from accidents, as shown in EU-wide analysis (European Commission, 2009), in Finnish studies (Yrjämä-Huikuri & Väyrynen, 2015; Sysi-Aho, 2016; TVK, 2016) and in a French company case study description (Verrier & Chevalier, 2007).

European Commission (2009) reports the following:

For example, construction companies do not only employ building workers, but also engineers and office clerks. Occupation therefore provides a more accurate reflection of potential risks at work. For both fatal and non-fatal accidents at work, the highest incidence rates were observed for industrial and agricultural workers. Around 75% of fatal accidents and 68% of non-fatal accidents occurred among 'craft and related trades workers', 'machine operators' or workers employed in an 'elementary occupation'.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

At a more detailed level of classification, the incidence rate for non-fatal accidents at work was highest among 'labourers in mining, construction, manufacturing and transport', 'stationary and mobile-plant operators' and 'extraction and building trade workers'. (p. 26)

The incidence rate for the employees classified according to the last lines of the above quote typically reaches values up to 2.5 times as high as the amount for all occupations on average (around 2700 accidents with more than three days of absence per 100,000 employees). Sysi-Aho (2016) has concluded that almost equal occupations or branches of business show the highest numbers in Finland, alike to the EU numbers above.

Regarding the home and leisure injuries of people employed by the large energy sector company in France (47,681 employees), Verrier & Chevalier (2007) reported that the risk of injuries was higher among men than women (RR = 1.3, (a relative risk estimate)); among men, the risk was five times higher among operating employees (i.e., blue-collar workers) than managers (i.e., white-collar workers). The difference in risk was similar for the company's employees during work hours (Verrier & Chevalier, 2007), regarding the control of accidents the authors conclude: "… analysis of the behavioural factors of injuries led us to propose programs aimed at changing the risk behaviours related to do-it-yourself, stairs falls and gardening."

Quite similarly, Yrjämä-Huikuri & Väyrynen (2015) analysed all accidents at the large Finnish metal processing company (years 2009-2013). In their study, an accident constituted one or more day's absence from work. The analyses showed that accident risk was statistically significantly lower during time at the workplace than during time spent commuting, or during home and leisure time. Accident rates among staff, production workers (i.e., blue-collar workers) and supervisors, including experts (i.e., white-collar workers), were compared based on the RR statistic (Yrjämä-Huikuri & Väyrynen, 2015): The estimated RR statistic (metal processing company, year 2012, N(employees) = 3119) shows that the incidence of injurious home and leisure accidents was relatively higher for blue-collar employees than for white-collar employees (3.7). The corresponding relative risk RR statistic for accidents at work was 9.2.

The statistics and studies show endless amount of details of accidents and injuries. In Finland, most fatal accidents are specially investigated utilising a research-like, so-called TOT investigation procedure (TVK, 2017): Finnish Workers' Compensation Center's (TVK) TOT reports show the dominance of the blue-collars, while including 50 last cases between 2010-2018(early), only 3 of them concerned white-collar employees (managers or entrepreneurs) as victims. TVK's research as well describes the following: "In the oldest age groups (over 60 years) accident frequency was higher than among middle-aged employees. Employees older than the pension age (63 years) had a higher accident frequency; 36% higher than that of the 50–55 year age group, which had the lowest accident frequency. The accidents of the oldest age group were also more often serious." (Salminen, Heinonen, & Sysi-Aho, 2016. In addition to the variable age, the variable gender causes differences: workplace accidents happen most often to men (62%) whereas accidents related commuting to and from workplace are predominantly a problem of women (68%) (TVK, 2018). The same source describes the final injuring mechanisms that comprise, in order of frequency (5 of them): horizontal or vertical impact with or against a stationery object (the victim is in motion); physical or mental stress; contact with sharp, pointed, rough, coarse material agent; trapped, crushed, etc.; struck by object in motion, collision with. The authors did not have opportunities, based on the published general sources, to clarify how the occupational group affects the distribution of the most ones of the above listed important variables.

Study 2

Appendix Figure 4 shows the individual items of the questionnaire, with the means and standard deviations for each item, listed separately for blue- and white-collar employees. As a whole, white-collar respondents gave higher assessments, i.e., agreed more, on the Likert scale 1…5 than blue-collar respondents. The means were 3.8 and 3.4, respectively.

Table 1 shows the distribution of the scores of the experience-based five-point Likert scale assessments for each of 11 statements given by each blue-collar (N=364) and white-collar (N=67) employee (N(total) = 431) from each of the six companies in the case study. The more in-depth analysis was of 22 statements in which the difference (measured as mean) was the biggest between the two analysed employee categories (compare with Appendix Figure 4). The Chi-square statistic, calculated from cell frequencies of the Table 1, shows a statistically significant difference between the assessments of blue- and white-collar employees.

Table 1. Distribution of scoring experience-based five-point likert scale assessments for 11 statements, as given by each blue-collar (N=364) and white-collar (N=67) employee (N(total) = 431) in all six of the case study companies. The more in-depth analysis represents 11 (of total 22) statements in which the difference (measured as mean) was the greatest between blue- and white-collar employees (compare with Appendix Figure 4)

Employee category	Distribution of assessments by employees (N=431) vs. employee category, Likert-scored values, % (N(blue-collar)= 364 N(white-collar)= 67)					Total, assessments
	Likert-score 1	**Likert-score 2**	**Likert-score 3**	**Likert-score 4**	**Likert-score 5**	
Blue-collar	5	12	34	34	15	4004 (100%)
White-collar	1	5	26	46	22	737 (100%)
Grand total						4741 (100%)

The chi-square statistic is 113.4485. The *p*-value is < 0.00001

Figure 2 shows the mean Likert scores (y-axis) from experience-based assessments of 22 statements for blue-collar (N=364) and white-collar (N=67) employees (N(total) = 431) in the six different companies of the case study (x-axis). Analysis of variance for revealing the effect of employee category (blue- or white-collar) and company was carried out (Table 2). The employee category had a significant statistical effect on Likert scale scoring; i.e. white-collar employees chose higher scores ($p<0.05$) than blue-collar employees, although the small number of respondents from Company 3 did not show any difference at all. The company has effect but not enough to reach the level of statistical significance.

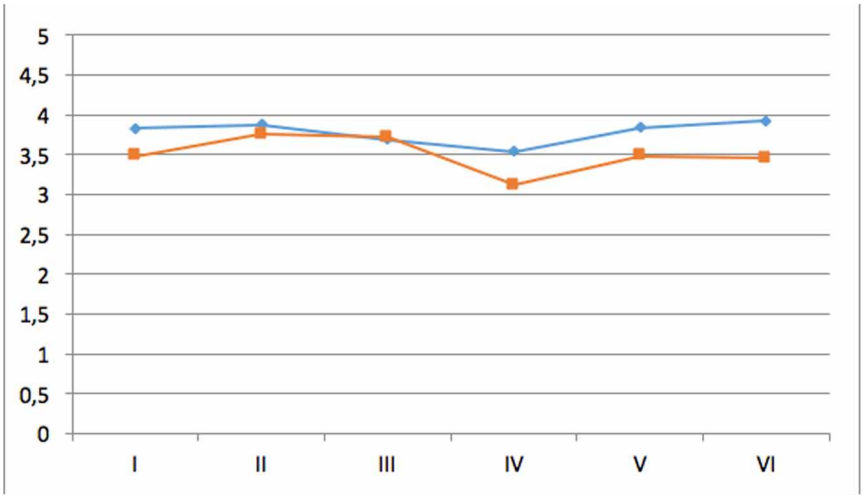
EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Result of two-way analysis of variance of the data in Figure 2. Employee category (i.e. blue- or white-collar) has a significant statical effect on Likert scale scoring; the scores chosen by white-collar employees were higher ($p<0.05$) than the blue-collar employees. The company has effect but the significance was only near the level $p<0.1$ ($p=0.14$)

ANOVA

Source of Variation	*SS*	*df*	*MS*	*F*	*P-value*	*F crit*
Company	0.263791	5	0.052758	2.811214	0.140574	5.050329
Blue- or white-collar	0.233802	1	0.233802	12.45809	0.016747	6.607891
Error	0.093835	5	0.018767			
Total	0.591429	11				

Figure 2. Mean Likert scores (y-axis) from experience-based assessments of 22 statements for blue-collar (red line, N=364) and white-collar (blue line, N=67) employees (N(total = 431) in the six different companies of the case study (x-axis). Analysis of variance for revealing the own effect of employee category and company was carried out (Table 2)



The five biggest differences between blue- and white-collar employees, in order of magnitude, were the following (cf. Appendix Figure 4, in all these five comparisons white-collars gave higher scores than blue-collars). The differences in parentheses show the difference in the mean scores between blue- and white-collar employees.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Statement 20: I get enough opportunities to participate in the training needed. (0.9)
Statement 16: I get enough opportunities to take part in the development of workplace issues. (0.8)
Statement 22: I am active in communication about my workplace. (0.6)
Statement 5: Interaction with customers works well. (0.6)
Statement 19: I can put forward ideas that aim to improve the product or working methods. (0.5)

Overall, blue-collar employees seem to be less active in contributing to developmental activities: they may feel that they need a better knowledge base, a more active role and more opportunities in order to give ideas for improvements. On the other hand, only a small difference was found between blue- and white-collar employee responses regarding the straightforward contacts and communication between colleagues, the role of enabling meetings and management, and job conditions provided by the company (cf. Appendix Figure 4).

Study 3

Appendix Figure 5 shows the WBW-related items of the questionnaire that revealed the biggest differences between blue- and white-collar employees, as well as the mean values for each item. The items are categorised into two groups: (1) those with the biggest difference in mean values, ranging from 0.8 to 0.2; and (2) the employee category (blue- or white-collar) that gave higher responses (higher Likert scores on the scale 1…5).

Figure 3 is an illustration based on Appendix Figure 5, and shows the statements with the biggest differences between blue- and white-collar employees. Examples of the statements of this figure included: The problems are not stuck to until something happens; I am an active actor in the development of my work and workplace; The frequency of accidents in my job is too high; Rushing my tasks affects occupational safety; Safety is a part of general quality in our activities; Accidents and disturbances are actually totally useless events.

DISCUSSION

Safety Performance and Other Statistics-Based Findings

According to Study 1, more frequent early retirement due to disability to work pension is linked to more strenuous physical workload or more occupational environmental hazards, and both of these risks are typical in blue-collar employees. In the same way, Study 1 showed that incidences of accidents at work and absences from work were clearly more common in blue-collars than white-collars within work organisations. Our examples from literature present evidence that the above phenomena can be alleviated, and many means for that are theoretically very near to the issues we see important for optimal WS with more minimal amount of the causes for real undesired features related to decreased WBW. The Introduction emphasises especially the following issues linked with achieving good results in prevention of the phenomena listed: knowing in detailed way the WS in question, enhancing information and communication processes, and involving all in organisation for developments in risk management. More and more often all shall include supplying companies' employees and HSEQ enablers for them (e.g., Väyrynen et al., 2016).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Mind map illustration of results of five-point likert scale assessing attitudes toward occupational safety in Study 3 (N = 3042 (total number of respondents)). Fourteen statements, of the total of 71, appeared to be the most differentiating between blue- (N=1840) and white-collar (N=1202) employees, based on the means of the scores. Details on statements are included in Appendix Figure 5. "Clearly more" indicates that the difference in distribution of blue- and white-collar worker responses to a given statement is statistically significant (Chi-square test, p<0.05)

For progress, the importance of a lot of knowledge within organisation and its management is seen as a general key by Knardahl et al. (2017), Leino, Elfving & Ballard (2010) and McKinnon (2016), too. In detailed views, e.g., observation of factors related to safety and other WS factors by all employees, and discussion-based (e.g.,"tool box" meetings), and further improving WS to prevent or alleviate risks is emphasised (Levitt & Samelson, 1993; Van der Schaaf, 1991). Actually, this can be called one of concrete core features of safety culture (NSC, 2013; Reason, 1991). Construction sector is a concrete example of positive culture change cases within industries though blue-collar jobs and demanding WSs traditionally define the whole sector. For instance, between 2005 and 2009, one of the biggest construction companies in Finland, with 2900 employees, improved its safety performance dramatically, and its accident rate decreased from 57 to 9 accidents per million work hours (Leino et al., 2010).

We propose that many kinds of different new analyses or discussions related to accidents vs. occupational group should as well be carried out: for instance, the ones that are dealing with

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Strategy, financial effects (cf., Reiman, Räisänen, Väyrynen, & Autio, 2018; FIOH, 2018)
- Type of boss (cf., Mellish, 2017)
- Autonomous learning as an approach for safety promotion instead of just attending formal training, courses, development events, and programmes (cf., Noe & Ellingson, 2017)
- Just culture (cf., Dekker, 2007)
- Participatory, psychosocial intervention was not always "a straight way" to successful results only (cf. Gupta, Wåhlin-Jacobsen, Abildgaard, Henriksen, Nielsen, & Holtermann, 2018)

Information and communication (IC) as general topics are closely linked with the above safety knowledge, but as well, e.g., competence, wisdom, social and technical skills, discussion, interaction, feedback, various concrete means of instruction and communication, IC technology, motivation, and creating and maintaining confidence comprise essential ones (Crawford, Davis, Walker, Cowie & Ritchie, 2017; Glendon, Clarke & McKenna, 2006; Kath, Magley & Marmet, 2010)

The last-mentioned confidence is a key to success in utilising participation (Wilson & Haines, 2000). Employee participation, psychosocial and organisational mechanism, is generally recommended and results of it presented (Rajala & Väyrynen, 2013; Vinodkumar & Bhasi, 2010).

Findings-Based Experiences

The biggest differences in the indicators of WBW experienced by the blue- vs. white-collar employees in manufacturing and engineering companies were associated with the following themes: participation in training and development within the organisation, professional communication in the workplace, the ability to put forward ideas, and level of interaction with customers.

In a large rail transport corporation with many divisions and a wide spectrum of occupations, employees experienced that improvement occurs only after something undesired happens. Our results also revealed that blue-collar employees considered their collaboration with superiors weaker than white-collar employees did. White-collar employees found their own role in WBW more important than blue-collar employees did. Blue-collar workers considered WBW part of the organisational strategy, whereas white-collar workers considered WBW a component of self-management. Blue-collar employees considered active participation in the organisation more important than white-collar employees did.

The findings show that the biggest differences between blue- and white-collar employees relate to involvement in organisational activities and management, decision-making and developmental action within the WS (cf., "I am an active actor in the development of work and workplace"). The differences between blue-collar and white-collar employees seem, on the other hand, to be revealed by increased work absences, accidents and early retirement, related to occupational and organisational features. These features are predominantly due to physical strenuousness within a WS that is typical of certain sectors' jobs. However, due to a wide variety of nuances related to WBW, the study of effective solutions should be careful and well considered.

Further Key Arguments

We analysed the results to determine the reasons, which were found to be as well psychosocial, behind these observed differences. We wanted to see whether and how management is able to enhance WBW as we know how management has clear impact on WPW (Proudfoot, Corr, Guest & Dunn, 2009). A

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

growing body of research indicates that a large number of problems in work settings are related to job stress and burnout (Harnois & Gabriel, 2000; Rousseau, Aube, Chiocchio, Boudrias & Morin, 2008) which are resulting from social interaction (Schaufeli & Peeters, 2000). Social and communication skills are associated with two indicators of psychological well-being as part of WBW: reduced symptoms of depression and increased life satisfaction (Segrin & Rynes, 2009). Current research has also shown that fluent internal communication is associated with commitment, discretionary effort and meaningful work, which can all be seen as factors of work engagement (Hayase, 2009; Schaufeli & Bakker, 2004). Juvani et al. (2016) emphasised the importance of organisational justice in the workplace. Organisational justice is similar to confidence or trust (cf. Wilson & Haines, 2000). Juvani et al. (2016) found that "supervisors' fair treatment of employees and fair decision-making in the organisations are associated with a decreased risk of disability pensioning from all causes, depression and musculoskeletal diseases."

As pioneers of the concept of WS within a scientific context, Smith & Carayon (2000) stated that when an acceptable balance is not achievable, able to be compensated, through minimising negative aspects within a WS, the whole system should be improved by enhancing the positive aspects. This suggestion could be realised more frequently in solutions, by utilising the standards of good practices at work organisations (ISO, 2011; ISO, 2016a). Blue-collar jobs do not inevitably mean worse work conditions and experiences of work that are more negative than those of white-collar employees – a lot of means for improvements exist. Our definition of WS with added functional enablers provides the essential elements and variables for comprehensive analysis.

We have found many links between WS modelling and especially the following: holistic thinking, considering both the body and mind, potential enablers for both success and risks, undesired over- or under-load, excess stress and strain, sustainability, responsibility, and stakeholders (cf., Edwards & Jensen, 2014; ISO, 2016b; Marras & Hancock, 2014; Rocha, Mollo & Daniellou, 2015; Zeilstra & van der Weide, 2013; Zink & Fischer, 2013; Sparer Catalano, Herrick & Dennerlein, 2016; Väyrynen et al., 2016). Regarding company stakeholders, we propose that both blue- and white-collar employees will be remembered in a way that enables progress in their specific areas we think we were able to reveal. How can the in our study presented situation be seen by other stakeholders like the state, municipalities, and various institutions within insurance sector?

The differences between blue- and white-collars' experiences, and in real undesired outcomes related to WBW and WSs, should and can be diminished. Early retirement, occupational diseases and injuries cause not only human suffering and losses but as well high costs to the other stakeholders than the employers and employees in question.

We propose that experienced WBW for different employee groups should be measured using multi-criteria factors, such as the Likert scales used in this study. In addition to the statistics of the organisation, national statistics can be a useful source in studying the differences between occupational groups, blue- and white-collar employees. Actions should be taken within the WS to comprehensively improve work conditions, and to improve leadership as it relates to psychosocial conditions and culture of all.

The biggest differences in the means of Likert-scale assessments	N(blue-collar) =1840 (60.5%); N(white-collar) =1202 (39.5%); N(total)=3042 x_{mean} is mean (total), i.e. calculated for all respondents (N=3042) The difference in Likert distribution in all of these statements is statistically significant (Chi-square test, p<0.05, despite nros 32 and 42)	The Likert-scored value bigger in the employee category
0.8	5 Problems are not sticked to until something happens (x_{mean} = 2.9)	Blue-collar
	10 Managers' and foremen's example related to safety is powerful (3.8)	White-collar
	23 Rushing my tasks affects occupational safety (3.6)	Blue-collar
	65 Violence or the threat of it is often a risk factor in our job (2.1)	Blue-collar
0.7	66 While working I meet unfair treatment (2.6)	Blue-collar
0.6	20 Emphasising quality is not an issue in the actual work (2.1)	Blue-collar
	28 I am an active actor in the development of work and workplace (3.6)	White-collar
0.5	16 Accidents and disturbances are actually totally useless events (2.7)	White-collar
	26 Safety is a part of general quality in our activities (4.0)	White-collar
	29 Protecting environment is a part of our quality activities (3.9)	White-collar
	40 Foremen' daily solutions affect our occupational safety (3.6)	White-collar
	73 The frequency of accidents in my job is too high (2.3)	Blue-collar
0.4	13 I think the public image of our safety is negative (2.2)	Blue-collar
	21 We who work here think that every accident is preventable (3.6)	White-collar
0.3	4 Guidelines and principles of work are clear at my work place (3.7)	White-collar
	12 Our safety affects our company's reputation (4.1)	White-collar
	27 I find me an important actor in a responsible work community (3.9)	Blue-collar
	41 Decisions of management affect our occupational safety (3.4)	White-collar
	43 At my work place, acting against rules is not accepted (3.8)	White-collar
	63 I believe I will avoid accidents during coming five years (4.3)	White-collar
	67 Behaviour of subcontractors' staff affects my safety, too (3.6)	Blue-collar
0.2	2 I think our work climate overemphasises safety (2.6)	Blue-collar
	3 Safe work is a part of my team's normal activity (4.3)	White-collar
	6 My attitude towards safety is based on my own experiences (4.0)	Blue-collar
	8 Our unit's way of acting guides my safety behaviour (3.7)	White-collar
	17 Safety is able to affect my workplace's better profitability (4.2)	White-collar
	22 Due to rushing I neglect safety (3.3)	Blue-collar
	32 Improving tools means effective accident prevention (4.6)	Blue-collar
	34 I think prevention of accidents is an essential part of my professional skills (4.3)	Blue-collar
	35 I find that decreasing of carelessness is needed, and by intervening risk taking (4.5)	White-collar
	42 I think safety promotion is more successful throughout recompensing than punishing (4.5)	Blue-collar
	45 My safety actions are based on skills I have learned, and routines (4.1)	Blue-collar
	46 I know the guidelines of safety (4.1)	Blue-collar
	55 I am proud of my work, enjoying it, and I as well am resilient if I encounter troubles (4.1)	White-collar
	59 Stress decreases safety at work (4.2)	Blue-collar
	68 I think we work in safer way than our subcontractors' staff (3.9)	Blue-collar

Chapter 77
Individual Risk Assessment (ERIN): Method for the Assessment of Workplace Risks for Work-Related Musculoskeletal Disorders

Yordán Rodríguez
University of Antioquia, Colombia

ABSTRACT

Work-related musculoskeletal disorders (WMSDs) prevention has become a global phenomenon and nowadays is one of the main challenges that ergonomics and work safety professionals face. The evaluation of risk factors exposition related to the WMSDs is one of the main activities that are performed for prevention. In order to accomplish it, many ergonomic assessment methods have been developed. In this chapter, an ergonomic observational individual risk assessment (ERIN) method is presented, which is distinguished for being easy to learn, apply, and it needs short training time. Results on the reliability, validity, and usability studies of ERIN are included too, as well as an example of how it can be used in the workplace intervention process.

INTRODUCTION

Work-Related Musculoskeletal Disorders (WMSDs) prevention has become one of the main focus to the Ergonomics and Occupational Safety and Health fields. It is accepted and acknowledged that these diseases emergence is due to the existence of workstations/tasks that do not meet ergonomic principles, exposing workers to risk factors related to these diseases (NIOSH, 1997). On consequence, from a few years ago, many professionals and researchers have been interested in refining the evaluation of the exposure to risk factors related to the WMSDs, resulting in the creation of new methods/tools and the update of some existent ones (Takala et al., 2010). These can be grouped into three fundamental cat-

egories: direct measurement, self-report and observational (S. Bao, Howard, Spielholz, & Silverstein, 2007; David, 2005; ISO 11228-3, 2007; Li & Buckle, 1999; Neumann, 2006).

Direct measurement methods usually use sensors placed over the individual's body (electrogoniometers, inclinometers, lumbar motion monitor, among others), and they offer a high accuracy on the measures if used correctly (Stephen Bao, Howard, Spielholz, Silverstein, & Polissar, 2009; N. Corlett, 1995; David, 2005; Li & Buckle, 1999). They are used for simulated tasks study and allow registering body coordinates in real time with high precision. As the main disadvantage, it can be mentioned that the sensors placed on the subject's body can cause discomfort and changes in its behavior, it requires time for the analysis and data interpretation, instrument calibration and workgroups with high qualification and experience. Due to technological limitations, such as the number of entry channels available on an instrument and its space for information storage, these methods are usually limited to evaluate a reduced number of people and body parts (Stephen Bao et al., 2009). Furthermore, the main disadvantage is that the related costs to direct measurement are usually very high, which makes them unpractical in large epidemiological studies on WMSDs or for most ergonomics internships.

Other advanced measure techniques have been developed for posture variation analysis on highly dynamic activities. For this, information is registered as from filming the individual on real time for a representative work time lapse, registering relevant information for its later analysis on specific programs. The analysis can include the use of biomechanical models that use anthropometric and posture information and manipulated load to calculate the momentum and forces between the body segments. The complexity of these models varies from static dimensions to dynamic tridimensional. These techniques are very expensive, require of highly qualified personnel, and are mostly used for workstation and objects design (cars, machinery, plane cabins, etc.), they do not have a practical usage for evaluating existing workstations and are better for the analysis of simulated tasks (Bubb et al., 2006; Chang & Wang, 2007).

Self-report methods are used to collect data on the exposure to physical and psychosocial factor on the workstation, these include work diaries, interviews, and questionnaires (Neville Anthony Stanton, Hedge, Brookhuis, Salas, & Hendrick, 2004), in which the usage of human body maps and varied punctuation scale are frequently used (E. N. Corlett & Bishop, 1976; Sinclair, 1995; Straker, 1999). These methods have the apparent advantage of easy usage, applicable to a broad spectrum of work situations and allowance to show large samples at relatively low costs. As the main disadvantage, it can be mentioned the necessity of large amounts of samples to achieve representativity and that the information obtained through the worker's perception is generally imprecise and unreliable (David, 2005), this approach of self-report has proven to have low validity and reliability levels related to the ergonomic interventions necessities (Li & Buckle, 1999). Nonetheless, ergonomics practitioners frequently use these types of methods on workplace assessments, given the apparent mentioned advantages.

On the other hand, observational methods are of practical use on a broad range of workstations, allow the study of large samples at relatively low costs and their usage usually does not require interrupting work. As main disadvantages, it could be mentioned that score systems are hypothetical, require knowledge and experience from the observer and the possibility of its bias when the evaluation is being executed. Observational methods have been considered a practical tool with a reasonable reliability among epidemiological investigations on WMSDs, for which they have gained popularity amongst safety and health professionals, since they respond better than direct methods and the self-report ones, which usually require time and limited resources and are in need of guides and intervention priority criteria settling (David, 2005; Takala et al., 2010).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

So far, observational methods have had the biggest acceptance among ergonomists, despite having been mostly created for experts to use them (Li & Buckle, 1999; Takala et al., 2010). Furthermore, it is acknowledged that, for the correct application of these methods, specific ergonomics knowledge, experience, and an adequate training are required (Takala et al., 2010); these reasons have restrained its massive usage on the evaluation of workstations/tasks as part of WMSDs prevention.

For example, in Latin-American countries, the amount of experts on the usage of these methods is very limited. However, each time, normative, laws, and government institutions demand and encourage the perform ergonomic assessments of workstations/tasks. From this point of view, it would be worth to ask: How correctly are the ergonomic evaluations being done with the observational methods?

The results from a recent study, which involved 290 professionals from 20 different countries, with a notable representation of Latin-American countries, quantified and confirmed the suspicions that the author of this chapter had about the correct use of these methods. 30% out of the 442 reviewed evaluations presented mistakes (Diego-Mas, Alcaide-Marzal, & Poveda-Bautista, 2017). This study shows a clear alert: We have to take several actions to improve the workplace ergonomic evaluation process, in order to increase the efficiency of occupational WMSDs prevention.

In this case, on an attempt to contribute to attenuate the previous outlook, this chapter's author along with other investigators, starts many years ago the development of an observational method which took into account the necessities, limitations and capacities of non-experts, attempting to answer the workstations ergonomic evaluations demands on real contexts, whilst maintaining acceptable levels of reliability and validity. As a result, the Individual Risk Evaluation (ERIN) method was obtained (Rodríguez, 2001; Rodríguez, Viña & Montero, 2013a, 2013b), which is presented in this chapter, along with reliability, validity and usability method results, as well as a procedure on how the ERIN method can be used during the evaluation and intervention of workstations process, illustrated through an example.

INDIVIDUAL RISK ASSESSMENT: ERIN

Background

ERIN is an observational easy-to-use method, developed so non-expert and low-trained personal can evaluate individuals exposed to risks associated with WMSDs. It was conceived through existent methods, the epidemiologic evidence on WMSDs and the practical needs of non-expert users on the evaluation of WMSDs risk factors exposure on workstations (Rodríguez, 2011; Rodríguez et al., 2013a, 2013b).

ERIN evaluates the trunk, arm, wrist, and neck's posture and their movement frequency; the rhythm, given by the work's speed and the effective duration of the task; the intensity of the effort, result of the perceived effort by the evaluator and its frequency, and the self-evaluation/perception of the referred stress on the subject about the task it is performing (Appendix). On the method, many actions and risk levels are recommended according to the total risk (Table 1), which is calculated summing the seven evaluated variables risks. The used additive model allows to easily identify the influence of each factor and to locate which elements must be intervened to lower the risk level.

The brief time dedicated to the process evaluated with ERIN allows studying a large amount of workstations/tasks on different economy fields, at relatively low costs and without interrupting work. Its application only requires a sheet and pencil, although the previous training and knowledge of the observer will influence its effectiveness.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Risk levels and recommended action according to the total ERIN risk

Zone	Total Risk	Risk Level	Recommended Action
Green	6-14	Low	No changes are required
Yellow	15-24	Medium	Further investigations are needed and changes may be required
Orange	25-34	High	Investigations and changes are required soon
Red	≥ 35	Very high	Investigations and changes are required immediately

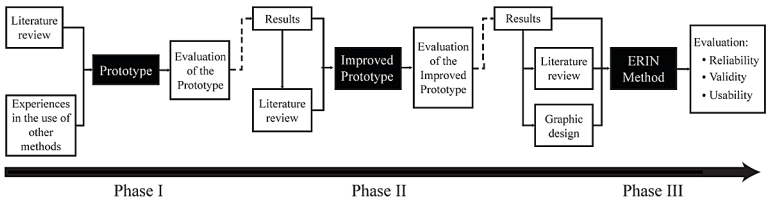
ERIN can be used to evaluate, design, and redesign static and dynamic tasks. Its score system allows establishing low criteria to evaluate the impact of the changes that have been made (before and after), assuming that low scores correspond to more favorable conditions.

The ERIN results can guide the personal dedication to the management and prevention of occupational risks on which changes must be made and towards where. Once the changes are made, the same approach can be used to quickly show to what extent the risks have lowered and the work conditions have improved.

Development Process of ERIN

The ERIN method was developed in three stages: (1) Prototype building, (2) Improvement of the prototype, and (3) Conformation of the ERIN method (see Figure 1).

Figure 1. ERIN method development process diagram
Source: Taken from (Rodríguez, 2011).



On the first stage a prototype of the method is made and tested, and the aspects that should be changed and improved, parting from the obtained results from the experiments and the evaluator's feedback are identified. The second stage was about improving the identified aspects of the prototype regarding the variable, score system, field sheet design and the procedure. This improved prototype was tested on the field and analyzed with the purpose of establishing the elements to be improved. During the third and last stage, the ERIN method conformation is made as a result of the changes done to the improved prototype and the addition of graphic design elements. The main results of the reliability, validity and usability evaluation that were made are presented at the end of the chapter.

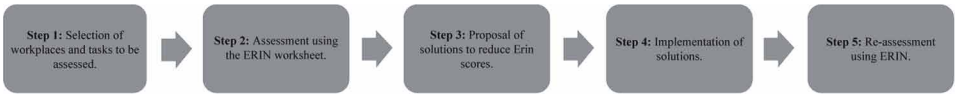
ERIN Guideline of Application

In Figure 2, the ERIN method application process is shown.

Figure 2. ERIN method process application



Step 1: Select the Workstations/Tasks That Will Be Evaluated Within the Company

Although ERIN was conceived to perform massive evaluations on the company, it is very convenient to establish a priority order. For the selection of the workstations to be evaluated, it must be considered the WMSDs statistics, the musculoskeletal symptoms, the worker's opinions, area chiefs, supervisors, and workstation impact on the productive system, among others. The experience and knowledge of the person conducting the research is a factor that favors a correct selection.

Step 2: Evaluate According to the ERIN Field Sheet

In this step, the workstations/tasks of greater risk and that need to be intervened to reduce the WMSDs risk factors are identified. In this case, ERIN is a tool that has been used to set priorities. If during the evaluation non-considered ERIN risk factors are identified (e.g. Vibration, awkward posture of lower extremities), these must be registered for their later study. In brief, the steps within the beginning of the ERIN field sheet (Appendix).

1. Observe the worker and select the critical posture for each body part evaluated (help yourself with text and figures).
2. Add an adjustment in case it corresponds to obtain the postural load.
3. Determine the variable risk given by the postural load and the body part movement; write it down in the corresponding box.
4. Determine the risk value for rhythm, effort and self-evaluation variables according to each table; write it down in the corresponding box.
5. Sum the risk values to obtain the Total Risk.
6. Determine the corresponding Risk Level.

Step 3: Propound Solutions Aimed to Reduce the ERIN Scores

The proposals (engineer, organizational and behavioral) that are performed are based on the evaluation obtained with ERIN, looking to reduce the given scored, at least on the most critical variables. The proposals must be accompanied by the before and after ERIN scores. It is possible that the changes in the variables scores do not lead to reduce the risk level. Nonetheless, a movement focused on improving the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

work conditions from an ergonomic point of view is created. It is highly recommended that the workers participate in the proposals and that these are certificated by a cost-benefit analysis.

Step 4: Implement the Solutions

Within the intervention process, this step has been the most complicated, for the solutions are often not implemented because of the lack of needed resources, or they have not been appropriately justified since the personnel sometimes use the ERIN method but do not possess the right education to justify the proposals in business terms. Fortunately, many times, the cost of the proposals can be ignored, or do not imply any cost at all, which undoubtedly has helped its implementation (Rodríguez & Pérez, 2013a, 2013b).

Step 5: Reevaluate Using ERIN

Once the workstation/task has been modified, it is reevaluated with ERIN. This will allow proving if the changes made were effective in the reduction of WMSDs risk factors exposition.

Annotations for the Correct Use of the ERIN Method

- Sometimes the work is executed with great speed, making difficult to observe some postures. In this case, the observer can ask the worker to simulate the posture for this can be observed in detail.
- In the given case that the body parts evaluated with ERIN (trunk, arm, wrist, and neck) maintain a low variability posture in time, it is recommended to evaluate the posture that is repeated the most for each body part and compare the results with critical postures.
- To evaluate the intensity's effort, two approaches are proposed. The first one is directed to ask the worker/s about the required effort to perform the task one time. This option is highly recommended when the personnel that performs the evaluation possess very to little experience. The second approach is to use the evaluator's criteria. The efficacy of the delegated perception of the effort, performed by non-expert personal has been reported (Dury et al., 2006). Nevertheless, given the high subjectivity required to evaluate this variable, it is recommended to integrate both approaches.
- In case that the task requires performing many types of effort, to sort this aspect out, the highest one performed must be selected and quantified to obtain the effort's intensity variable risk. Since the average's estimation of the effort can be though for non-experts and high force peaks could remain hidden.
- The movement frequency for each body part evaluated must be determined by the number of times said part moves and not by the times the critical posture repeats. This must be estimated by the time the performed work is done with the most intensity.
- The recording of the evaluated tasks is generally suggested, especially for the newcomers or low-experienced in these types of ergonomic evaluations. The use of this technique facilitates the estimation of postures and movement frequency, for the freezing of images and low motion camera use is very easy in video players nowadays. Besides, it allows for the evaluation to be performed at some other time and group. However, the advantages that the recording technique provides must be used carefully to avoid problems like the lack of image stability, insufficient time and cycles, poor workstation overview, frequent zoom-in's and out's, view-blocking objects that diffi-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

cult the observation, and filming from positions that make the observation of body angles difficult (Cochran, Stentz, Stonecipher, & Hallbeck, 1999).

- It is possible that, when evaluating arm and wrists, it will not be evident which side (right or left) is the most affected, in this case, it is recommended to evaluate both sides and chose the one with more postural load, according to ERIN. This meaning that the posture is the aspect that determines which body part is the critical one, regardless of the other body part performing movements with more frequency.
- Sometimes, many people work at a workstation and it is necessary to assign a risk level to the workstation. In this case, it is recommended to select the trend for each of the evaluated variable. For example, let's suppose that seven workers that perform the same task on an assembly line are evaluated. When analyzing the trunk variable posture, two of them adopt a critical posture of 0-20º, for 20-60º and one above 60º. In this case, the critical trunk posture would be determined by the modal value (20-60º). Similarly, this would apply for the rest of the variables, forming the workstation score.
- Frequently, a worker must execute multiple tasks in one work shift. In these cases, the worker's risk is calculated using the following equation:

$$Multi\ \ Task\ \ ERIN = \sum TR_i \times P_i$$

where:

Multi-Task ERIN: Estimated risk for when a worker performs multiple tasks during a work shift.
TR_i: Total i task risk according to ERIN.
P_i: Proportion of the i task effective time, regarding the total tasks time.

If all of the evaluated tasks belong to the same workstation, the calculated risk corresponds to the workstation risk.

In Table 2, it is explained how to perform the multi-task analysis with ERIN.

Table 2. Example of the multi-task analysis with ERIN

Task	ERIN Total Risk	Effective Task Duration (Hours)	Total Time Proportion	Equivalent Task Risk
A	25	4	4/8 = 0.5	25 x 0.5=12.5
B	30	2	2/8=0.25	30 x 0.25=7.5
C	28	2	2/8=0.25	28 x 0.25=7
Total		**8**	**1**	**27**

EVALUATION AND INTERVENTION OF A WORKSTATION USING ERIN METHOD

The following example shows how can the ERIN method be used on the evaluation and improvement of a workstation, following the procedure described previously.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Selection and Description of the Box-Washing Task (Step 1)

On the workstation, the plastic boxes from the production area of a food product company are gathered. The task is cyclic and consists of the following activities: 1) move a dirty boxes pile to the washing machine, 2) insert three boxes through the washing machine entrance slit, taking one at a time from the pile and inserting them likewise, 3) gather the three clean boxes that come out of the exit canal from below the washing machine, and pile them, one at a time; lastly, 4) move the clean boxes pile to a storage located a few meters away to reincorporate them to the company's productive process. The floor will be permanently wet, for which the pile movement will be accomplished by sliding them. The plastic boxes have an approximate weight of 2.3 kg. Approximately 3 cycles per minute are performed, which is equivalent to 9 boxes per minute.

Evaluation Using the ERIN Field Sheet (Step 2)

Figure 3 shows the evaluation of the plastic boxes cleaning tasks delimited according to the ERIN field sheet. As it is explained at the beginning of the field sheet, the next step is to select the critical posture of the trunk, arm, wrist and neck adopted by the worker during the task cycle and the movement frequency of each body part. On the wrist and arm's case, the observer must choose which side, left or right, represents the highest postural risk. In case of any doubts, both sides are evaluated and the highest risk, according to ERIN, is chosen.

On Figure 4 it can be observed that the trunk's critical posture occurs the moment the worker has to reach the clean boxes coming out of the washing machine. The trunk is severely flexed (over 60º), which belongs to a score of (3), and it is also rotated, meaning an adjustment of (+1). Therefore, the trunk's postural load is 3+1=4. The trunk's movement during the task is "very frequent", more than 10 times/min. obtaining a score of 9 for the *Trunk*.

Figure 5 shows that the shoulder/arm critical posture occurs when the worker takes the dirty boxes placed on the piles upper side to introduce them in the washing machine, being the right arm the highest riskier. A similar situation is presented when the worker places the clean boxes on the upper side of the pile. The arm is severely flexed (over 90º), which belongs to a score of (3) and it is abducted, meaning an adjustment of (+1). Thus, the arm's postural load is 3+1=4. The arm's movement during the task is "very frequent" (almost a continuous movement), obtaining a score of 9 for the *Arm*.

Figure 6 shows that the shoulder/arm critical posture occurs when the worker is inserting the dirty boxes in the washing machine. The right wrist is severely extended (over 45º) which belongs to a score of (2) and is deviated (+1), plus the hand is holding the boxes (static object press) for longer than the cycles 50% of the time (+1). It must be mentioned that there are other moments during the task execution where the wrist performs flexo/extensions higher than 45º. Therefore, the wrist's postural load is 2+1+1=4. The right wrist's movement is "very frequent", more than 20 times per minute, obtaining a score of 6 for the *Wrist*.

Figure 7 shows that the neck's critical posture occurs when the worker is reaching for the clean boxes coming out of the washing machine. The neck is severely extended (over 20º), which belong to a score of (2), plus it is rotated, meaning an adjustment of (+1). Therefore, the neck's postural load is 2+1=3. The neck's movement during the task execution is "constant", obtaining a score of 7 for the *Neck*.

To accomplish the assigned load during the workday, the worker executes the activities at a "normal work speed" and requires approximately 7 hours of effective work, obtaining a score of 3 for the *Rhythm*.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The intensity of the effort, given by the muscular effort required to execute the task one time (taking a box from the pile and putting it in the washing machine/ taking a box from the machine's output and pile it), is considered by the worker as "something hard" and has a frequency higher than 10 times per minute, obtaining a score of 6 for *Effort's intensity*.

On this workstation, only one worker labors and he has perceived the task as "little stressing", which belongs to a score of (1) for *Self-evaluation*. Finally, the variable risks scores are added and a total risk of 41 is obtained, corresponding to a "very high" level risk. This indicates that it is required to make immediate changes.

Improvement Proposals Based on the ERIN Evaluation (Step 3)

With the purpose of reducing the exposition to WMSDs related risk factors, parting from the ERIN evaluation, three improvement proposals are made.

Proposal 1: Redesign the actual washing machine. The redesign would imply to modify the clean boxes output' slit height, rising it to the same level of the input slit (Figure 8 and Figure 9). This modification would avoid that the worker flexes the trunk (over 60º) and the rotation/inclination during the clean boxes pick up. This proposal implies the hiring of another worker to pick up the clean boxes coming out of the output slit, which implies an additional cost. This way, the workload is divided into two workers and two sub-tasks would be created, where similar activities would be executed (same risk exposure).

Proposal 2: In case the washing machine modification is not possible (Proposal 1), then it is recommended to hire another worker to pick up the clean boxes coming out of the output slit, located on floor's level (actual situation), but on the contrary side to where they are introduced to the washing machine. On this case, two sub-tasks would be created, each one executed by a worker: A) input of the dirty boxes on the washing machine and B) pick up of the clean boxes. This way, the workload would be divided between two workers, making a rotation between sub-tasks possible.

Proposal 3: Consists of modifying the work method. Actually, the worker stashes around 30 boxes, which causes the pile's height to notably rise, causing the worker to labor over the shoulder's height (shoulder/arm flexion over 90º), therefore, it is recommended to work with piles of 15 boxes, reducing the height to half of it and the shoulder/arm's flexion angle to 45-90º- The implementing of this proposal does not require an additional cost.

Re-Evaluating With ERIN to Measure the Proposals' Impact (Step 4)

Table 3 shows the variable ERIN method risk for the actual situation, and the projected for the integrated proposals.

As for the trunk's frequency movement, both of the integrated proposals group would reduce it from very frequent (over 10 times/min.) to frequent (5-10 times/min.) for both sub-tasks. Given the approximate production rhythm of 9 boxes/min., just one worker would perform around 18 flexions/min., for two trunk flexions are performed for the box, one when the dirty box is taken from the pile to insert it and another when the clean box is picked up from the washing machine.

Figure 7. Neck's critical posture on the box-washing task

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Proposals impact projection on ERIN method's scale

ERIN Method Variables	Actual Situation	Proposal 1 + Proposal 3	Proposal 2 + Proposal 3	
			Sub-task A	Sub-task B
Trunk	9	6	6	9
Arm	9	7	7	7
Wrist	6	6	6	6
Neck	7	6	6	7
Rhythm	3	2	2	2
Effort's intensity	6	2	2	2
Self-evaluation	1	1	1	1
Total risk	41	30	30	34
Risk level	**Very high**	**High**	**High**	**High**

In the two integrated proposals groups, the division of tasks causes a reduction of effective time, reducing it from 7 hours to 3.5, which implies a reducing of the Rhythm variable score from 3 to 2 points, for the work speed, would still be "normal".

Proposal 3 solely affects the arm's postural load, but not its movement frequency. This reduces the arm's score from 9 to 7 points.

As Table 3 shows, the sub-task B risk is higher than sub-task A, for the severe flexion movements (over 60º), the trunk rotation, and the neck's extension and rotation remain at the time of the clean boxes pick up of the output slit on floor's level.

In regard to the trunk's posture, it must be mentioned that, even though the proposals cut out the sever flexion (over 60º) and the trunk's rotation during the clean boxes pick up, the worker continues to perform trunk rotations over 60º during the pick up and stashing of the boxes from floor to pile. For said motive, the trunk's score only reduces from 9 to 6 points, meaning an aspect to improve with other intervention proposals.

Implementation and Tracing (Step 5)

It is left to the company's decision-makers' consideration which actions to implement. In these cases, the ergonomist or professional in charge must qualitatively and quantitatively offer the potential benefits that are generated on the health, security, productivity, and quality indicators. Involving from the beginning of the intervention process the different interested actors (ej. Workers and directives), facilitates the implementing process, for they feel involved in the proposed solutions.

Additional Commentaries

As it was previously showed (Table 3), despite the reduction of the total 41 points score (very high-risk level) to 30 points (high-risk level), the task remains a high risk, according to ERIN. This proves that the improvement process of the workstations/tasks is gradual, and how it gets difficult and the costs rise when the ergonomic principles are not taken into account from the design phase (Hendrick, 2008).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Finally, it must be highlighted the importance of multiple measures integration, in order to reduce the exposition, for in many cases just one measure does not manage to positively impact on every aspect of the workstation/task to intervene, and thus reduce the exposition of WMSDs related risk factors.

Figure 8. Washing machine redesign proposal

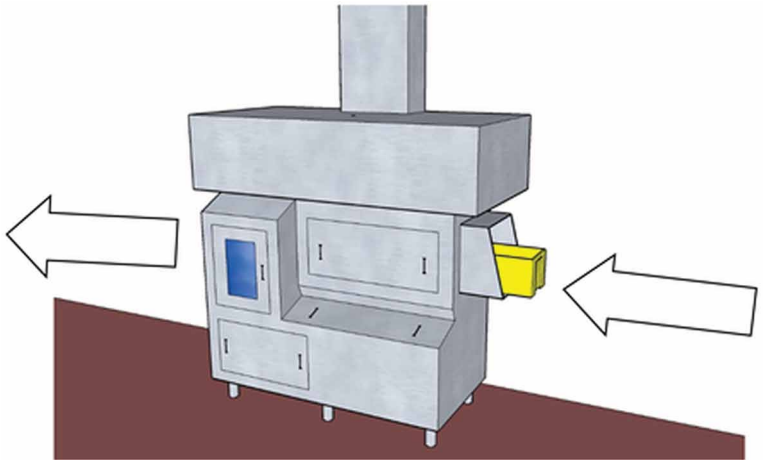

Figure 9. Washing machine redesign proposal

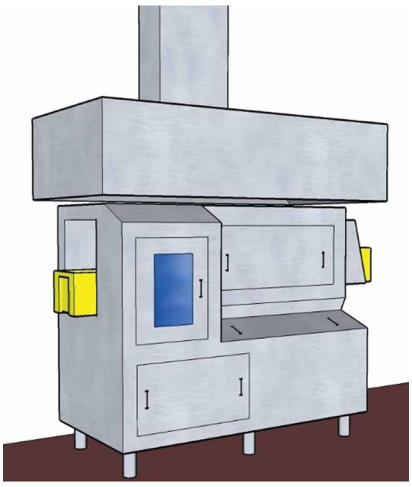

RELIABILITY, VALIDITY, AND USABILITY

Many studies have been executed to evaluate the reliability, validity, and usability of the ERIN method. Following, the main results are described and presented (Rodríguez, 2011).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Inter-Observer Reliability

Study Description

A group of 42 subjects evaluated with videos and the ERIN's field sheet, seven tasks selected from the industry. In the selection, it was evaluated the variety of the tasks, and the representativity of different industry fields, filming quality, corporal angles visibility from different perspectives, standing, and seated tasks, and repressing of complete work cycles. The video projection was random, one at a time and the projection was repeated until each observer was done with the evaluation, in order to proceed to the next video. It must be mentioned that the evaluators could not stop the video. The participants were classified as non-experts, for they had not performed WMSDs risk evaluations before.

With the purpose of analyzing the training time influence, half of the evaluators received 3 training hours, whilst the other half received 6.

Methodology

For the dichotomic variables, the statistic ICC (KR-20) was used. For the remaining variable, which scale is ordinal, the statistic ICC (2.1) was used employing the individual measures and complete agreement (McGraw & Wong, 1996; Shrout & Fleiss, 1979). The results were interpreted as follows: if the ICC < 0l40, the reliability is poor; if the ICC is between 0.40 and 0.75, the reliability is moderated to good; and if the ICC > 0.75 the reliability if excellent (Stephens, Vos, Stevens, & Steven Moore, 2006; Stevens, Vos, Stephens, & Steven Moore, 2004). Additionally, in the ordinal scale variable, it was used as an agreement measure the Kendall's concordance coefficient. This coefficient can vary from 0 (no association) to 1 (perfect association). The agreement levels measured with W are interpreted as follows: poor association $0.0 < W < 0.6$; moderate association $0.6 < W < 0.7$; good association $0.7 < W < 0.8$ and strong association $0.8 < W < 1.0$ (Lee & Ferreira, 2003).

Results and Analysis

It was obtained that the dichotomic variables (trunk adjustment, arm adjustment, wrist posture, neck adjustment and neck posture), presented the value of ICC (KR-20) over 0.75, indicating an excellent agreement among the evaluators. On the wrist adjustment evaluation (deviation or rotation) the agreement was poor according to the ICC (KR-20) = 0.081.

The agreement values varied more on the ten ordinal variables (trunk's posture and movement, arm's posture and movement, wrist's movement, neck's movement, work speed, effort, movement frequency and risk levels) than in the dichotomics.

In the trunk's posture evaluation, the agreement was excellent, according to the ICC (2.1) = 0.768, and the Kendall's coefficient of 0.807. In the variables evaluation: trunk's movement, arm posture, and effort, the agreement level is moderated to good since the ICC (2.1) values vary between 0.574 and 0.728, and the Kendall ones between 0.638 and 0.755. In the arm, wrist, and frequency movement, effort and work speed evaluation a poor agreement coefficient was obtained. The ICC (2.1) values vary from 0.088 to 0 0.298, and the Kendall's coefficient from 0.134 to 0.359.

In the total risk variables (obtained when summing the risk per variable) and the risk level (obtained when categorizing in one out of four levels the total risk value), the agreement was from moderate to

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

good, with ICC (2.1) values of 0.465 and 0.471 respectively. When establishing two categories to evaluate the risk level: the first was a result of grouping up the risk levels "low" and "medium" in the category "low risk", and the second a result of grouping risk levels "high" and "very high" on the category "considerable risk", with the purpose of analyzing the agreement obtained when using the ERIN method to solely detect if there is a risk at all, it gives out that the ICC (KR-20) is 0.944, indicating an excellent reliability, and thus that the method is adequate for this purpose.

The agreement indexes were usually higher for the evaluator's group that received a higher training time, although in this study the differences were not big enough to give out definitive criteria on the influence of this factor. Nonetheless, the obtained results support the idea that if it is desired to raise the reliability, the training time must be raised as well (Takala et al., 2010).

Overall, the inter-observer reliability was moderated to good, since out of the 17 variables studied, 7 showed an excellent agreement, 5 moderate to good, and 5 poor. If in the variables where ICC (2.1), among which the five poorly agreed reported ones are, had used the average indexes, the evaluator's mistake impact would have been lower regarding the reliability indexes. As it was expressed, the average ICC's measures provide higher reliability indexes than individual indexes. A study that uses the average measures, must provide higher indexes than the calculated on this research (Shrout & Fleiss, 1979).

Lastly, it should be noted that if the evaluators had had the opportunity to stop the video or use the slow motion during the evaluations, as it is usually done nowadays, it is possible that higher agreement levels would have been reported in this study.

Intra-Observer Reliability

Study Description

A group of 17 subjects using the ERIN field sheet evaluated on two occasions a total of seven industry-selected tasks. The elapsed time between the first and second evaluation was three weeks.

Methodology

The statistics ICC (KR-20) and Cohen's Kappa were used for the dichotomic variables. The statistics ICC (2.1) and Spearman correlation coefficient were used for the ordinal scale variables. The interpretation of the ICC categories is the same as the explained for the inter-observer reliability analysis, and for the Cohen's Kappa values it is based on the Landis and Koch criteria cited by (Burt y Punnett, 1999), poor $K < 0.0$; light $0.0 < K < 0.2$; regular $0.2 < K < 0.4$; moderated $0.4 < K < 0.6$; substantial $0.6 < K < 0.8$, and almost perfect from $0.8 < K < 1$. The interpretation of the Spearman correlation values was: over 0.7 strong relation, between 0.3 and 0.7 a medium strength relation, and below 0.3 a weak relation (Li, Rosenthal et al, 1996).

Results and Analysis

It was obtained that for the dichotomic variables (trunk's adjustment, wrist posture, neck's adjustment, neck's posture) parting from the ICC (KR-20) and Cohen's Kappa statistics, showed a reliability level from moderate to good, and moderated, respectively.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

On the wrist adjustment variable, the agreement was poor according to the statistical methods, coinciding on the obtained results on the inter-observer reliability study and other reported in the literature about the low-reliability levels on the smaller body areas evaluations, as is the wrist's case.

Out of the studied ordinal variables, three are classified as of excellent reliability, considering the ICC (2.1) values and the Spearman correlation coefficient, which varied between 0.786 and 0.833, and between 0.784 and 0.83, respectively. Five showed a moderated to good agreement, according to the ICC (2.1), with values between 0.416 and 0.676, and a medium according to the Spearman coefficient with values between 0.401 and 0.677.

It was only found a poor or low agreement on two variables. The first case was the wrist's movement, with a 0.256 value, according to the ICC (2.1), and 0.22, according to Spearman, coinciding with the expressed about the complexity of observation on this body part. In the case of the neck's movement, the agreement was poor, according to the Spearman values of 0.305, and an ICC (2.1) of 0.31.

Overall, the intra-observer reliability behaved moderated to good, for out of the 16 studied variables, 10 presented a moderate to good agreement, 3 excellent, and 3 poor.

Validity

Study Description

Study 1: The evaluation of seven tasks taken from videos by 42 observers, with three experts defined pattern were compared. These experts had the possibility of stopping the videos, freezing the images to observe the postures in detail, interchange criteria and reduce the speed of the film's projection. This procedure was established to reduce the present mistake on the observational processes.

Study 2: The evaluation of two workstations realized out of videos by 8 health field professionals (doctors and traumatology, physiology and rehab specialists), with three experts defined pattern were compared. It must be noted that these professionals had no experience on the usage of ergonomic evaluation methods, but they did on related subjects. The evaluators received an hour of training on the usage of the ERIN method.

Study 3: The obtained risk levels when evaluation 32 workstations with ERIN, RULA, and REBA methods were compared (Rodríguez, 2011). The RULA and REBA methods were selected among the existents because of the coincidences regarding the evaluated body zones, and ERIN related risk factors that propose a final risk level, result of the combination and consideration of the evaluated risk factors that have been used since many years ago on the workstations evaluation. Two observation strategies were employed for the evaluation: the critical posture, and the most common.

Methodology

Study 1 and Study 2: The total percent agreement was calculated, as well as the percentage with one and two or more different categories between the expert-given value, and the non-expert evaluators, for each of the 17 analyzed variables.

Study 3: Four levels were defined (low, medium, high, and very high). On the REBA method case, five risk level classification categories (Hignett & McAtamney, 2000), for which, in order to establish the comparison between the methods, categories 1 and two were grouped in the low level, remain-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ing four categories as ERIN and RULA. To study the agreement level, according to the different methods, ICC (2.1) and percent agreement indexes were calculated.

Results and Analysis

Study 1: Out of the studied variables, 12 presented percent agreement above 60%. Out of these, five obtained values above 70%. Five variables presented percent agreement values lower than 60%, out of which four are related to the movement frequency estimation of the body parts (trunk, arm, wrist, and neck). These results correspond to the low-reliability indexes reported on these variables. Therefore, it is evident that the determination of the body parts movement frequency in real time is an aspect that the non-expert evaluators find difficult. The cases where the evaluations differed in more than one category were low, between 1 and 6%. Mostly coinciding with the lower total percent agreement variables previously referred.

Study 2: All of the variables, except the wrist and neck movement with percentages of 63%, presented total percent agreement above the 70%. Out of the 17 studied variables, 12 presented values above the 80%, and out of these, four were superior to 90%. No variable differed on more than one category. All of the above indicates that expert personnel with less than an hour of training is capable of offering validate and consolidate results when employing ERIN in workstations evaluation.

Study 3: The agreement between ERIN and RULA methods was, for the critical posture, of an ICC (2.1) = 0.403, and a percent agreement of 56%, as for the most common posture had an ICC (2.1) = 0.457, and a percent agreement of 56%. The agreement between the ERIN and REBA methods for the critical posture was of an ICC (2.1) = 0.554, and a percent agreement of 66%, as for the most common posture had an ICC (2.1) = 0.556, and a percent agreement of 59%. It was proposed that, regardless of the employed observation strategy, when using ERIN instead of RULA or REBA, the agreement regarding the final risk level is moderated to good. Nevertheless, the characteristics, strengths, and weaknesses must be analyzed in each of these methods when selecting them to evaluate a given situation (e.g. Personal that will use it, a dynamic or static task, involved body parts, among others).

On ERIN's predictive validity, until now no studies have been reported. To date, ERIN has been applied to the ergonomic evaluation of dissimilar workstations in different countries (Brazil, Canada, Cuba, Colombia, Mexico, Panama, Ecuador, India, China, Peru, among others). The evaluators, workers, and other interested subjects that have used it have considered it a useful and practical tool. This translates as ERIN having a good preliminary validity "face validity", as well as in contexts where many ergonomics-related situations must be solved, like in developing countries (Latin-Americans), the preliminary validity gains importance.

Usability

Study Description

Study 1: To a 42-subject group, classified as non-experts, after evaluating 7 video-projected tasks with the ERIN method, an instrument to evaluate ERIN's usability was provided. This instrument is a modification of one that was developed to measure the usability of informatics programs (Neville

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

A Stanton & Young, 1999). As part of the usability study, the time that each subject took on each task evaluation was registered too.

Study 2: Like in the study described above, a group of 8 health field professionals was provided with an instrument designed to evaluate ERIN's usability, after evaluating two tasks. The evaluators received an hour of training previous to the ERIN method's usage.

The evaluation of two workstations realized out of videos by 8 health field professionals (doctors and traumatology, physiology and rehab specialists), with three experts defined pattern were compared. It must be noted that these professionals had no experience on the usage of ergonomic evaluation methods, but they did on related subjects. The evaluators received an hour of training on the usage of the ERIN method.

Methodology

Study 1 and Study 2: Table 4 shows the used tool which consists of 10 questions focused on exploring the following aspects: easy learning, little training time, needed time to realize the evaluation and applicability on a varied group of tasks (dynamic and statics). Starting from the tool, the usability index was obtained, varying from 0 to 100 points. This index is calculated when subtracting the value one to each answer of the odd questions and subtracting the value five of the answer to the even questions; next, the ten obtained values are summed and multiplied by 2.5.

Table 4. Format used to measure the ERIN's method usability

In case of the answer you consider taking into account that the analysis is different for even questions (2,4,6,8,10) and odds (1,3,5,7,9).					
	Total Disagreement				**Total Agreement**
1. ERIN is easy to use.	1	2	3	4	5
2. ERIN's evaluation takes too much time.	1	2	3	4	5
3. ERIN allows evaluating a broad range of tasks.	1	2	3	4	5
4. ERIN requires the help of specialized personnel.	1	2	3	4	5
5. Most people will learn to use ERIN quickly.	1	2	3	4	5
6. I need to learn many things to use ERIN.	1	2	3	4	5
7. I feel safe when using ERIN.	1	2	3	4	5
8. I find the tool difficult to use.	1	2	3	4	5
9. The ERIN's field sheet design facilitates the usage of the tool.	1	2	3	4	5
10. The terms used in ERIN are confusing.	1	2	3	4	5

Results and Analysis

Study 1: The usability index varied among 60 to 100 with an average of 80, and a deviation of 10. The results show that the practical value of the method, according to the user's criteria is high. Additionally, the agreement between the evaluators was analyzed, when responding the questions related to usability. To analyze the agreement among the subjects when answering said questions, the ICC (2.1) was calculated with 0.642 individual indexes and 0.987 averages. Indicating a regular to god agreement for each individual and excellent for the group (Stevens et al., 2004).

The average evaluation time per task was 6.5 minutes, with a tendency to reduce as more evaluations were being done. This was presumably due to the familiarization of the evaluators with the method.

Study 2: The usability index varied among 62.5 and 92.5 with an average of 84 and a deviation of 12. The results show that the method's practical value is high. To analyze the agreement among the professionals when answering the asked questions, the ICC (2.1) was calculated with an individual index of 0.747 and 0.947 average. Indicating an agreement very close to excellent for each individual and excellent for the group. Therefore, the obtained agreement for the usability usage was excellent.

ERIN SOFTWARE

To ease the ERIN method's application, a free-access online application has been developed (Figure 10 and Figure 11), in English as well as in Spanish, and the ERIN 1.7 software (Figure 12 and Figure 13), that allows storing the evaluations, generating reports and making recommendations according to the evaluation's results.

FUTURE RESEARCH DIRECTIONS

Nowadays there is a higher interest for the approximation of a real evaluation on the exposition of real people to WMSDs risk. This is an extremely complex phenomenon given the multi-factor origin of these diseases, and how hard it becomes to control all of the risk factors present in the work environment, as well as outside of it. Some authors have presented other paradigms, where they highlight the necessity of a broaden vision to act beyond the workstation, on the hope of a bigger impact (Punnett et al., 2009). In my opinion, this philosophy will gain strength over the years, although I must point out that it will find many barriers, mainly on sub-developed countries, where there are more urgent political, economical, and social problems to solve.

Although the race for the risk factor's evaluation perfectionism must not stop and will surely be an impulse by the incessant technological developments, the professionals and ergonomic-field researchers must increase their attempts to improve the effectiveness of the intervention and transformation process of the workstations and systems, under a systemic ergonomic perspective. As of today, it is very common to find workstation evaluation courses, but very few on how to intervene the workstations and systems. Expressing it differently, only by evaluating we are not going to change the actual overview that we have in regard of WMSDs, we must step into actions. In order to do so, the future development and perfecting of the ergonomic evaluation methods must find a balance between the effort dedicated to evaluating and the utility of the intervention results.

CONCLUSION

The ergonomic methods available to evaluate the exposure to WMSDs risk factors have been mostly developed for specialized personnel that also has experience in said activities can use them. This has made the massive evaluation of workspace/tasks very difficult in many countries as part of the primary preventive actions of these diseases since the existence of this personnel is limited. For said reason, the creation of tools and practical methods is necessary, for them to be correctly used by non-expert personal and to favor the evaluation-intervention process. With ERIN it is hoped to lower this problem, given the fact that it has proven to have an acceptable level of reliability and validity, as well as a great acceptance among professionals that perform ergonomic evaluations on real contexts since its use requires low training, sources and time.

ACKNOWLEDGMENT

Gratitude to professors Silvio Viña Brito and Ricardo Montero Martínez for their company during the ERIN method development process, and to Elizabeth Pérez Mergarejo for her valuable input on the conforming of this chapter.

KEY TERMS AND DEFINITIONS

Ergonomic Intervention: Changes directed towards the improvement of a task, workstation, or work system from the ergonomic perspective.

Ergonomics Assessment: Testing on the fulfillment of the principles and approaches that ergonomics promotes.

Inter-Observer Reliability: Consistency grade reached for various observers when evaluating a given situation using the same method.

Intra-Observer Reliability: Consistency grade reached by an observer when evaluating at least twice, given a situation, with the same method.

Linguistic Descriptors: Word used to describe the movement range and the frequency of the body parts movement.

Task: Group of actions that are executed to achieve a determined goal.

Usability: Magnitude in which a method is considered simple, easy to use and learn, and applicable to varied situations in real contexts.

Validity: Grade in which a method or tool measures what it is supposed to measure.

Workplace: Workspace where many worker-assigned tasks are executed.

Chapter 78
Prevalence of Musculoskeletal Disorders of Odisha Farmers in Selected Agricultural Tasks:
A Critical Analysis During Seeding, Fertilizing, and Weeding of Crops

Debesh Mishra

KIIT University (Deemed), India

Suchismita Satapathy
KIIT University (Deemed), India

ABSTRACT

In the chapter, there are dual main contributions. In the first phase, based on the extensive review of literature on the application of cuckoo search (CS) methodology, its application for the optimization of agricultural pesticide sprayers for maximum efficiency was suggested. In the second phase of study, 75 farmers of Odisha in India were considered to assess their musculoskeletal disorders (MSDs) during seeding, fertilizing, and weeding of crops using a Standardized Nordic Questionnaire with a five point rating scale (i.e., 1 = Very less, 2 =Less, 3 = Nil, 4 = Strong, 5 = Very Strong). Factor analysis was performed for "seeding, fertilizing, and weeding characteristics," "economical characteristics," and "tools and equipment characteristics of farmers." Then Pearson correlation coefficient matrix was generated for the seeding, fertilizing, and weeding characteristics of farmers, followed by regression analysis for the economic characteristics of farmers.

INTRODUCTION

Agriculture has been considered as the source of livelihood for most of the Indian families. Its contribution is about 18% of the gross domestic product in India (Department of Agriculture, Cooperation & Statistics, 2014). Similarly agricultural sectors in India also largely contribute to 49% of the total labor force. Most of the Indian spends more than half of their income in food-preservation & security (NSSO, 2013). However, the growth rate of the agricultural sectors in India has been fluctuating and it depends primarily on the rainfall, as most of the cultivating area in India depends on rainfall (Dev, 2013). Farming is also greatly influenced by the techniques and tools used in various stages and activities involved. Though with the development of machinery and equipments, the farming process has become easier, more efficient and productive; still most of the farming activities are carried out by the conventional tools and techniques.

As most of the engineering problems are solved by optimization techniques where the goal is to determine either a maximum or a minimum value of the problem being solved generally known as the objective function. However, for solving the global optimization problems, the Cuckoo Search (CS) method is considered as the most powerful nature-inspired algorithm. It is inspired by the breeding behavior of some cuckoo species, and because of the simplicity & more performing efficiency, the Cuckoo Search method has been applied to various optimization problems in the engineering problems including the agricultural sectors.

Cuckoo Search Method

Cuckoo search is a meta-heuristic algorithm inspired by the bird Cuckoo; these are the "Brood parasites" birds. It never builds its own nest and lays their eggs in the nest of another host bird nest. Cuckoo is a best-known brood parasite. Some host birds can engage directly with the intruding cuckoo. If the host bird identifies the eggs that are not their egg then it will either throw that eggs away from its nest or simply rid its nest and build a new nest. Each egg in a nest represents a solution, and a cuckoo egg represents a new solution. The aim is to use the new and potentially better solutions (cuckoos) to replace a not-so-good solution in the nests. In the simplest form each nest has one egg of cuckoo, in which each nest will have multiple eggs representing a set of solutions.

CS is based on following idealized rules (Yang & Deb, 2009)

1. Each cuckoo lays one egg at a time, and dumps its egg in a randomly chosen nest;
2. The best nests with high quality of eggs will carry over to the next generation;
3. The number of available host's nests is fixed, and the egg laid by a cuckoo is discovered by the host bird with a probability P Є (0, 1). Discovering operates on some set of worst nests, and discovered solutions dumped from farther calculations.
4. Levy Flight is used when new solution is derived from the old one to attain realistic approach.

Based on these rules, the possibility is the host bird can either throw the egg away or abandon the nest, and build a completely new nest. For simplicity, this last assumption can be approximated by the fraction P_a of the n nest is replaced by new nests (with new random solutions). An important issue of Cuckoo Search is the applications of Levy flights for generating new solutions, $X_{(t+1)}$ which is given by equation (1):

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

$$X_{(t+1)} = X_{(t)} + s\,E_{(t)} \tag{1}$$

where, $E_{(t)}$ is drawn from a standard normal distribution with zero mean and unity standard deviation for random walks, or drawn from Levy distribution for Levy flights. Then, the random walks can also be linked with the similarity between a cuckoo's egg and the host's egg which can be tricky in implementation. Then the step size *s* determines how far a random walker can go, for a fixed number of iterations. Additionally in certain condition where *s* is too large, then the new solution generated will be too far away from the old solution (or, even jump out side of the bounds). Then, such a move is unlikely to be accepted. If *s* is too small, the change is too small to be significant, and consequently such search is not efficient. So a proper step size is important to maintain the search to be as efficient as possible.

Cuckoo Search Algorithm

The algorithm can be extended to more complicated cases in which each nest has multiple eggs representing a set of solutions.

The pseudo code defined algorithm by Yang and Deb (2009) is as follows,

```
Generate initial population of n nests x_i, i = (1, 2. . . n)
for i = 1: n
Determine fitness value F_i = (x_i)
end for
while (stopping criterion is not satisfied)
Generate a cuckoo egg (x_j) from random nest by L´evy flights
Determine fitness value F_j= (x_j)
Select a random nest i
if F_j > F_i then
x_i ← x_j
F_i ← F_j
end if
Abandon a fraction p_a of the worst nests
Build new nests by L´evy flights
Compare fitness of new nests and keep best nest
end while
```

Application of Cuckoo Search in Agricultural Pesticides Spraying

Pesticides are substances which are used mostly to protect plants or crops from weeds, insects or fungi in agricultural sectors. Most of the farmers use the pesticide sprayers to apply the pesticides and fertilizers on agricultural crops. As the farmers can't afford to lose their crops due to insects so they spray chemicals, pesticides, on them which repel the insects also prevent diseases from spreading. So using pesticides reduces the risk of losing crops of the season. One of the most important considerations when using the sprayer is optimization of the spray. As the Cuckoo search (CS) method, has been successfully used by different researchers and authors in different optimization applications which includes but not limited to systems design, electricity network operation, electricity generation, wireless communications

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

routing and minimization of energy losses during electricity transmission (Belic et al., 2017; Koppel et al., 2017; Platonov, 2016; Das et al., 2017; Yan et al., 2017; & Parkinson et al., 2013). Figure 1 shows the use of Pesticides Sprayer in agricultural sectors.

Figure 1. Use of agricultural pesticides sprayer

From the Figure 2, it is clear that the Cuckoo Search (CS) algorithm has been successfully applied in major categories such as in Engineering, followed by Pattern Recognition, Software Testing & Data Generation, Networking, Job Scheduling, and Data Fusion & Wireless Sensor Networks. Yildiz (2012) have used Cuckoo search (CS) method for selecting the most favorable parameters in milling-operation. Chifu (2012) have used Cuckoo search method to optimize semantic web-service composition process. Kumar et al. (2011) have obtained the optimum design for a 'reliable embedded-system'. Yang and Deb (2010) have proposed a new technique of Cuckoo Search to solve the engineering-design optimization problems, where the objective is to minimize the spring weight and overall fabrication cost, for springs & welded beam structures. Mareli et al. (2017) have investigated the CS algorithms performance by dynamically increasing switching parameters. They developed three CS algorithms using linear, exponential, and power increasing switching parameters, and tested them against the constant & linearly decreasing CS algorithms. It was found that the CS using exponential increasing switching parameter was more efficient than other CS algorithms.

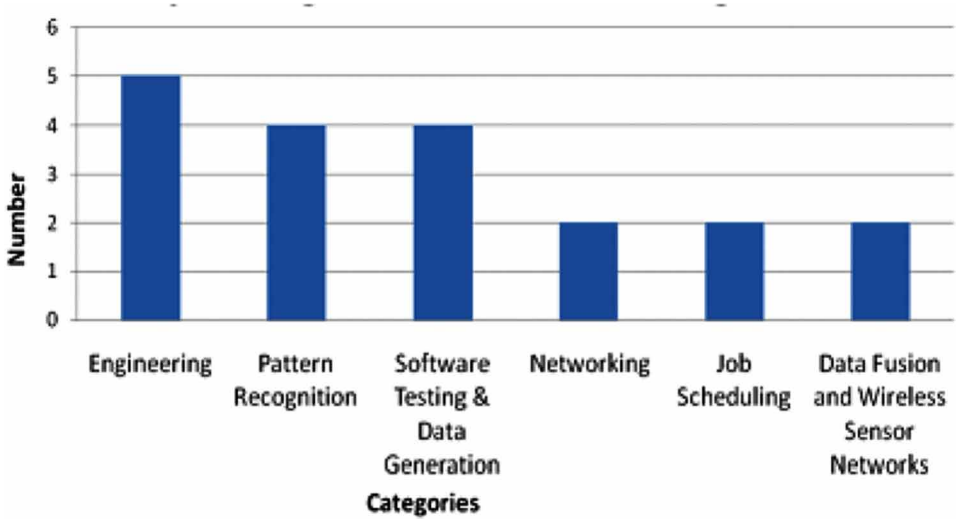
Source: Mohamad et al, 2013



Hewitt (1997) have proposed that the optimal selection of droplet size of spray results in maximum efficiency and minimum drift. As the droplet size influences the spray performance and minimizes drift. So for the available range of nozzles for spray application, it is logical that sprays should be classified according to droplet size. The 'British Crop Protection Council (BCPC)' and 'American Society of Agricultural Engineers (ASAE)', have developed systems to classify the agricultural-sprays by its droplet size.

The spray classification system devised by 'BCPC nozzle classification scheme' in the mid 1980's is of five categories, such as "Very Fine, Fine, Medium, Coarse and Very-Coarse" (Doble et al., 1985).

Figure 3 shows the BCPC Cumulative Volumetric Droplet Size Reference Categories, and Figure 4 shows the cumulative volumetric droplet size spectra for different types of nozzle. As each egg in a nest, is a solution which is represented by one individual in the population, and an egg of the cuckoo is a new solution. So, if the nozzle of pesticide sprayer is considered as the egg and the droplet size is considered as Cuckoo egg with a new solution. And the objective functions as minimum drift. Then, determining the solution for minimum drift for a given nozzle with different droplet sizes and comparing the obtained solutions with previous best solutions, will provide the optimum value finally that will be retained. In this way the CS algorithm can be applied for the optimization and selection of sprayers, with maximum efficiency with minimum drift.

While designing the agricultural tools & equipments by considering its operational environment, it is mostly observed that the ergonomic considerations for user friendly tools are almost neglected. Thus the farmers dealing with the tools and techniques during farming suffer from various musculoskeletal disorders (MSDs) and injuries.

Musculoskeletal Disorders (MSDs) in Farming

It has been reported by many authors and researchers that the farmers engaged in agricultural sectors are highly affected by musculoskeletal disorders (MSDs) which not only cause harms but also is a threat

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to the health & life of them. For instance, lifting or carrying loads by hand and driving tractors were reported as risk factors for agricultural farmers (Parton et al., 1990; Murphy, 1992; Bobick et al., 1995). Most of the studies were carried out considering mechanized work applied in the work places. However the musculoskeletal disorders due to noise, vibrations produced by tractors and incorrect sitting postures of the operators were not considered, when using tractors in farming (Brookhuis et al., 2010). Pinzke et al. (2001) have reported that the body parts which are usually exposed to heavy loads are wrist, forearm, shoulder, neck and lumbar spine. Most of the jobs are designed considering the anthropometric dimensions of men and this result in lowering the productivity, increasing the discomfort level and the energy expenditure for women. Also it was reported that women's working continuously for eight hours, usually suffer from pain in hand, wrist, and neck (Jakob et al., 2009 and Stål et al., 2003). DeLuca (1997) has recommended the procedures to lift objects of unsymmetrical shapes based on his studies made on the musculoskeletal disorders due to handling, lifting, and transporting of objects by handcarts. Singh et al. (2010) have done an in depth literature review on musculoskeletal disorders of women agricultural farmers in India. Based on the conclusion of their study with musculoskeletal disorders with different body postures, they have recommended for ergonomically designed tools & equipments, and to have work rest periods for women. Kuta et al. (2015) have used surface electromyography system and job strain index method to analyze the muscle loads of fifteen farmers during milking, lifting, carrying a full bucket and in moving tractor. It was reported that maximum muscle force and tension occurred in the forearm muscle, while attaching teat cups to udder. Performance of work and associated work setting mainly causes the work related musculoskeletal disorders (Collins et al., 2011 and Punnett et al., 2004). Tinubu et al. (2010) and Smith et al. (2003) have reported that tenderness, disabilities, non-attendance, lower productivity and financial losses to the workers are caused mainly due to the musculoskeletal disorders in worldwide. The prolonged exposure to loads due to variable workloads results in musculoskeletal disorders (Kumar et al., 2013). High rate of doing work, repetitive work, forceful exertion, incorrect body postures and vibrations have been considered as the risk factors associated with the musculoskeletal disorders in the workplaces (NIOSH, 2002 and da Costa et al., 2010). Fabunmi et al. (2008), Schreuder et al. (2008), and Karahan et al. (2009) have reported that work is highly affected by musculoskeletal disorders, though its extent due to work is not clear. Also, the physiological and individual factors are more associated in developing the disorders. Mansi et al. (2013) and Arvidsson et al. (2012) have reported that repetitive movements, more application of forces, high working rates and incorrect postures for longer durations were found for the workers engaged in meat processing and performing various activities. The workers engaged in physical work are more affected by musculoskeletal disorders (Idowu et al., 2005). The hazards such as infection, lung cancer and knife related injuries are reported to be more evident in the case of butchers (Ola et al., 2008 and Corbin et al., 2011). Also, the butchers are more subjected to work related musculoskeletal disorders (Omokhodion et al., 2013). Pollack et al. (2007) have reported fatness and the excessive weight as the risk factors for occupational injuries. Janssen et al. (2011) have reported the natural means of musculoskeletal harms as altered step and stability, high forces in falls, high rate of sleep apneas & fatigues, and more susceptible to co-morbidities. Mishra et al. (2018) have considered ten farm women of Odisha in India and analyzed them while using plain and serrated sickles for cutting crops, and then an improved serrated sickle was recommended which resulted in reduction of the drudgery level in-comparison to the existing plain and serrated sickle. Pickett et al. (2015) have suggested that if the farmers feel inconvenience in their work due to fatness, then being self-employed they have the right and freedom to change or stop some sort of work. Bashir Kaka et al. (2016) have reported of high occurrence of work related muscu-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

loskeletal disorders between the butchers in Kano city and age was found to be the main risk factor. Also very few butchers only found to avail medical facilities. The musculoskeletal disorders (MSDs) was regarded as the most important public health related and work related problem, which varies from 15% to 42% (Hoogendoorn et al., 1999). Gallis (2006) has found that the maximum prevalence of MSDs occur in inexperienced laborers. The risk factors for MSDs were reported as physical, psychological, and socio-demographic characteristics (Devereux et al., 1999, 2002), various postural actions (Reid et al., 2010), faulty working postures (Scuffham et al., 2010), manually handling of materials (Yeung et al., 2002), standing and walking for longer durations (Andersen et al., 2007; Balasubramanian et al., 2009), prolonged shift works (Raanaas et al., 2008), distortion of trunk (Hartman et al., 2005), performing repetitive jobs (Juul-Kristensen et al., 2005), and poor work settings (Saurin et al., 2008). Meksawi et al. (2012) have reported of 52.9% of lower back pain for rubber tappers in Southern Thailand, which was found to be higher as compared to other regions. Ray et al. (2015) have suggested for improving the ergonomic performance of manual material handling tasks, based on their studies on the bio-mechanical assessment of manually material handling tasks of a construction site in India. It was reported that the compressive forces at some disc were above the limiting values for the construction workers. Kabir-Mokamelkhah et al. (2015) have considered the rice farmers in Iran and found the prevalence of musculoskeletal disorders in the lower limbs & the spinal sections. Luangwilai et al. (2014) have reported that MSDs are mainly associated with gender, education level, BMI, smoking habits, farming expertise and disease, if any. It was suggested that proper education and recommendations will improve the farming management system in rice farming. Gangopadhyay et al. (2010) have considered the stone-cutters and found significant work related disorders in the lower back, knees, and shoulders. Pascual et al. (2008) have reported that for assessment of work related musculoskeletal disorders (WMSDs), the National Institute of Occupational Safety and Health (NIOSH) used equations, and rapid upper limb assessment (RULA) or rapid entire body assessment (REBA), the certified-ergonomists used mostly Snook/Mital tables, while the Joint Health and Safety Committee (JHSC) used injury reports, and workers complaint. Dube et al. (2018) have analyzed different working postures of farmers of Odisha in India during seeding, fertilizing, and weeding, in agricultural field using RULA technique, and further it was suggested to give due attention to the present working techniques and methods. Das et al. (2012) have reported of major physiological loads and stresses between the female prawn seed collector of West Bengal in India, because of lengthy working hours in standing postures and more working pressures. Most of them were found suffering from musculoskeletal disorders in the lower back (98%), shoulders (75%), knees (88%), ankles (70%), and feet (67%), respectively. Similarly, the MSDs of the farmers of Kanpur in India were reported as lower back (60%), neck (10%), shoulder (22%), knee (39%), and highly afflicted chronically for nearly a year (Gupta et al. 2013).

Odisha is one of the prominent states in India, where most of the farmers prefer cultivation of rice. The farmers in the rural areas mainly prefer to use the traditional tools and techniques for farming purpose, and very few of them use the modern mechanized techniques. It has been found that most of the farmers undergo the musculoskeletal disorders (MSDs) because of a number of risk factors such as repetitive work, incorrect working postures, improper use of tools and techniques etc. Hence an attempt was made to collect and analyze the MSDs data for the farmers in Odisha while performing specific farming activities.

RESEARCH METHODOLOGY

Materials

The following materials were used for the present study:

1. Standard Nordic Questionnaire
2. Computer (Windows 7)
3. Statistical software (IBM SPSS 22.0 version)

Method

The primary activities involved in rice cultivation process are land preparation, seeding, fertilizing & weeding, harvesting and threshing processes. In the present study the farmers only in seeding, fertilizing, and weeding activities were considered. In Odisha, five villages were selected randomly where more than 60% population were from farming background. For collecting the information and data, a team comprising of three members was formulated and were well informed about the purpose and methods to collect data. Prior consent from the respective village heads or leaders was obtained. Using, a standardized nordic questionnaire the data regarding name, gender, age, other personal characteristics, socio-demographic characteristics, economical characteristics about the requirements, work setting characteristics and tools & equipment characteristics with a five point rating scale i.e. (1 = Very less, 2 =Less, 3 = Nil, 4 = Strong, 5 = Very Strong) as shown in Appendix, was collected from 75 selected farmers and considering 2 years period i.e. from 2015 to 2017.The body parameters which were considered to be associated with MSDs were neck, shoulder, upper back, lower back, elbow, wrist/hand, thigh, knees and ankles, respectively as illustrated in Figure 5.

RESULTS AND DISCUSSION

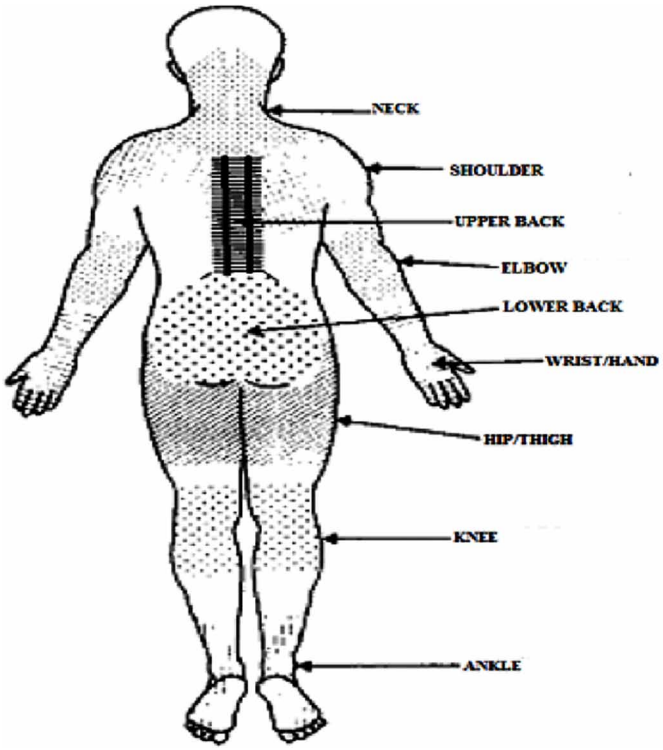
From the socio-demographic characteristics of farmers (Table 1), it was observed that maximum musculoskeletal disorders of farmers were reported in lower back for age groups of <38 & in wrist for age groups of >38, in upper back of male farmers, in lower back and shoulder for female farmers. The disorders in shoulders were reported to be more, irrespective of "education levels, experiences, marital status, smoking habits, eating food habit per day, dominant hand, and previous weaknesses", respectively. The neck, upper back & lower back were reported to be highly affected for less than one year experienced farmers. Similarly, wrist & knee were reported to be more affected for 1-10 years & more than 10 years experienced farmers, respectively. Also, wrist was reported to be more affected irrespective of marital status, smoking habits, eating food habit per day, dominant hand, and previous weaknesses.

Similarly by considering the work-setting characteristics of farmers as shown in Table 2, higher occurrence of musculoskeletal disorders (MSDs) were found in "lower back & knees for sitting postures", and "neck, upper back, lower back, knees and ankles in squatting postures", and "upper back, lower back, wrist and knee in standing postures". The occurrence of MSDs in shoulder & wrist were more significant irrespective of working hours per day, working days per week and working time per day, respectively.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Also it was observed that repetitive jobs produced more MSDs in neck, shoulder, elbow, wrist and knees. However, carrying heavy loads resulted in higher MSDs in shoulder, lower back & wrist, respectively.

Figure 5. Prevalence of MSDs in human body



Factor analysis was done using SPSS 22.0 for the "seeding, fertilizing and weeding characteristics of farmers', "economical characteristics of farmers", and 'risk level of different body parts of farmers by tools & equipments during seeding, fertilizing and weeding processes" to group different parameters under various dominant factors, as illustrated in Table 3, Table 4, and Table 5, respectively. By using the principal component analysis method with rotated component matrix, the variables with factor loading more than or equal to 0.5 were only considered. The "Kaiser's eigen value criteria" with eigen value greater than 1.00 were selected for subsequent factors selection (Kaiser, 1960). Factor analysis of seeding, fertilizing and weeding characteristics of farmers resulted in 6 dominant factors with cumulative % of variance of 72.82% (Table.3). In factor 1, the factor loading is high in "puncture from bamboo stick of seed containers" which was 0.79. Other variables in factor 1 with factor loading ≥ 0.5 included "exposure to loud noise of pesticide applying machines", and "symptoms from pesticide exposure". So the factor1 was named as "expose". Factor loading in factor 2 was high in "injuries from falling of pesticide applying machines", which was 0.93. Other variable in factor 2 was "musculoskeletal problems from seeding by machine". So the factor 2 was named as "machine". The factor loading in factor 3 was found higher in "musculoskeletal problems from incorrect weeding postures", i.e. 0.85. The remaining variable in factor 3 was "exposure to vibration of pesticide applying machines". So the factor 3 was named as

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

"discomfort". Factor loading in factor 4 was higher in 'nasal irritation from pesticide exposure", which was 0.75. And other variable in factor 4 was 'pesticides mixing and spraying processes". Hence, the factor 4 was named as "pesticide exposure". In factor 5, higher factor loading was found in "musculoskeletal problems from seeding by hand", which was 0.68. And the other variables in factor 5 were "exposure to wet and humid soil", "musculoskeletal problems from carrying heavy seed containers", "eye irritation from pesticide exposure". The factor 5 was named as "body". Further, the factor loading in factor 6 was obtained higher in "skin irritation from pesticide exposure", which was 0.84. Remaining variable in factor 6 was "musculoskeletal problems from carrying pesticides sprayer". Hence, the factor 6 was named as "pesticide spray".

Table 1. Socio-demographic characteristics of farmers (n=75)

Sl. No.	Parameters		No. of farmers reported of suffering of musculoskeletal disorders (MSDs)								
			Neck	Shoulder	Upper Back	Lower Back	Elbow	Wrist/Hand	Thigh	Knee	Ankle
1.	Age	< 38	16	20	19	23	15	22	14	15	19

		> 4	15	25	14	12	22	25	15	16	16
4.	Working time(s)/day	Before 8 A.M.	17	25	21	15	18	25	16	19	17
		8 A.M. – 12 P.M.	12	25	13	12	25	25	06	12	17
		After 12 P.M.	11	25	25	25	18	25	16	25	25
5.	Nature of job	Repetitive/forceful	25	25	20	17	25	25	19	25	20
		Carrying heavy loads	20	25	20	25	15	25	15	15	13

n= Total number of farmers

Similarly, the factor analysis for "economical characteristics of farmers" resulted in 2 dominant factors and the factor analysis for "risk level of different body parts of farmers by tools and equipments during seeding, fertilizing and weeding processes", resulted in 15 dominant factors. In the factor analysis for "economical characteristics of farmers" (Table.4), the factor 1 was named as "manufacturing" and factor 2 as "farming", based on the requisite of manufacturer and farmers. In the factor analysis of "risk level of different body parts of farmers by tools and equipments during seeding, fertilizing and weeding processes" (Table 5), the factor 1 was named as "body-joint" as most of the body joint parts were involved. Similarly, factor 2 was named as "movement" as the MSDs in knees, ankles, & shoulder occur mainly due to movements. Subsequently, factor 3 was named as "discomfort" because the MSDs in neck, upper-back, & thigh results discomfort in work. Looking at the pain level of body parts, the factor 4 was named as "upper back pain", factor 5 as "shoulder pain", factor 6 as "wrist-ankle pain", factor 7 which included upper back, lower back & ankle, was named as "joint-pain", factor 8 including knee, ankle, wrist & thigh was named as "hand-leg pain", factor 9 as "seeding pain" which comprised of neck, shoulder, elbow, wrist in seeding process, factor 10 as "weeding pain" comprising of neck & knee, factor 11 as "thigh-ankle pain", factor 12 as "thigh pain", factor 13 as "arm pain", factor 14 as "lower back pain", and factor 15 as "neck pain", respectively.

To illustrate the strength & linear relationship of various variables under consideration, the Pearson Correlation coefficients between various dominant factors in the "seeding, fertilizing and weeding characteristics of farmers" was obtained (Table 6). By using "pearson product moment correlation" in IBM SPSS 22.0 version, the correlation coefficient matrix was obtained. It was found that very high positive correlation coefficient i.e. 0.599 was in between the parameters f-e, which was between "injuries from falling of pesticide applying machines" and "musculoskeletal problems from seeding by machine". Also, very high negative correlation coefficient value of -0.666 was obtained in between the parameters h-g,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

which was between "musculoskeletal problems from incorrect weeding postures" and 'exposure to vibration of pesticide applying machines". It was further found that non-linear relationships with correlation coefficient value of 0.000 existed between the parameters p-b & p-l, which was between 'symptoms from pesticide exposure (skin irritation) & exposure to loud noise of pesticide applying machines", and "symptoms from pesticide exposure (skin irritation) & musculoskeletal problems from carrying heavy seed containers", respectively.

Table 3. Seeding, fertilizing and weeding characteristics of farmers (n=75)

Parameters		Factor 1 (Expose)	Factor 2 (Machine)	Factor 3 (Discomfort)	Factor 4 (Pesticide exposure)	Factor 5 (Body)	Factor 6 (Pesticide Spray)

n= Total number of farmers

The best fit linear regression equations between "innovativeness" and "other economic characteristics" were obtained by using regression analysis for the economic characteristics (Table 7). It was found that the economic parameters such as compliance with cost, and quality, were significant at $p < 0.05$. However, the parameters such as cost reduction of existing appliances, service capability, and innovativeness, were found significant at $p < 0.01$. The value of F indicated that the probability of the null hypothesis for the full-model was true and all of the regression coefficients were zero.

CONCLUSION

There were dual main contributions in the study. In the first phase of study the application of Cuckoo search algorithm for the optimum performance of pesticide sprayer was discussed based on the extensive literature review. As the pesticide sprayer has been frequently used by most of the farmers, hence the optimization and selection of sprayers with maximum efficiency and minimum drift could enhance the yield of crops. The Cuckoo search algorithm can be applied for determining the solution for minimum drift for a given nozzle with different droplet sizes and comparing the obtained solutions with previous best solutions. Thus the optimum value obtained finally will be retained.

* Correlation is significant at $p < 0.05$

** Correlation is significant at $p < 0.01$

In the second phase of study the musculoskeletal disorders (MSDs) of farmers were analyzed. From the socio-demographic characteristics of farmers, it was observed that maximum musculoskeletal disorders of farmers were reported in lower back for age groups of <38 & in wrist for age groups of >38, in upper back of male farmers, in lower back and shoulder for female farmers. The disorders in shoulders were reported to be more, irrespective of "education levels, experiences, marital status, smoking habits, eating food habit per day, dominant hand, and previous weaknesses", respectively. Similarly by considering the work-setting characteristics of farmers as shown, higher occurrence of MSDs were found in "lower back & knees for sitting postures", and "neck, upper back, lower back, knees and ankles in squatting postures", and "upper back, lower back, wrist and knee in standing postures". The occurrence of MSDs in shoulder & wrist were more significant irrespective of working hours per day, working days per week and working time per day, respectively. Also it was observed that repetitive jobs produced more MSDs in neck, shoulder, elbow, wrist and knees. However, carrying heavy loads resulted in higher MSDs in shoulder, lower back & wrist, respectively.

Further, from the correlation coefficient matrix it was found that very high positive correlation coefficient i.e. 0.599 was in between "injuries from falling of pesticide applying machines" and "musculoskeletal problems from seeding by machine". Also, very high negative correlation coefficient value of -0.666 was obtained in between "musculoskeletal problems from incorrect weeding postures" and 'exposure to vibration of pesticide applying machines". It was further found that non-linear relationships with correlation coefficient value of 0.000 existed between "symptoms from pesticide exposure (skin irritation) & exposure to loud noise of pesticide applying machines", and "symptoms from pesticide exposure (skin irritation) & musculoskeletal problems from carrying heavy seed containers", respectively.

Finally from the regression analysis for the economic characteristics it was found that the economic parameters such as compliance with cost, and quality, were significant at $p < 0.05$. However, the parameters such as cost reduction of existing appliances, service capability, and innovativeness, were found significant at $p < 0.01$.

Further MSDs analysis may be carried out considering more number of farmer populations and due considerations must be given in the ergonomic aspects of farming tools and equipment designs, such that the productivity, working efficiency of farmers can be enhanced and the drudgery can also be reduced to a significant level.

ACKNOWLEDGMENT

We would like to convey our sincere thanks to the farmers participated in the present survey and to KIIT (Deemed to be University) for continuous encouragement in carrying out such research work.

This research received no specific grants from any funding agency in the public, commercial, or not-for-profit sectors.

KEY TERMS AND DEFINITIONS

Agricultural Injury: It is the injury which occurs while doing some farm work or may occur while going to or from work.

Disorders: It is the disruption in the systematic functioning that retards the performance level.

Farming: Farming is the process of growing of crops or keeping animals by people for food and raw materials.

Injury: Injury is the damage to the body caused by some external forces. Different causes of injuries include accidents, falls, hits, weapons, and other factors.

Musculoskeletal Disorders: These are the disorders or injuries which affects the human body's movement and/or the musculoskeletal systems of body.

Chapter 79
Work Leadership, Occupational Health, and Safety

Gabriel Akinbode
University of Lagos, Nigeria

ABSTRACT

Occupational health and safety (OHS) systems are designed to identify and minimize risks at the workplace. A thriving business community should seek to create jobs, wealth, good leadership, safe, and healthy working conditions that are essential for production of goods and provisions of services. Therefore, managers have a legal and moral duty to safeguard the health and safety of those who work for them, and the exercise of these duties needs to be seen as central to the role of leadership. There is a growing interest among researchers and organizational practitioners about occupational safety in recent years. The chapter provides an exhaustive discourse on the relevance of occupational health and safety systems in modern day workplaces as well as the nexus between management leadership and occupational health and safety. It highlights the guiding principles to leadership and key issues in efficient administration of OHS. The chapter concludes by recommending the role leaders should play to improve safety and health in the workplace.

INTRODUCTION

The organized workplaces across the global world has in the recent past witnessed tremendous economic, technological growth and enhanced employability except in some developing countries such as Nigeria. This growth has raised serious concerns over occupational safety in virtually all work sectors, particularly manufacturing sector, including tertiary and quaternary services. Managing Occupational Health and Safety (OHS) effectively is a key element in running a successful business in today's workplace. Nowadays, work place safety is considered by World Health Organization (WHO) a priority setting for health promotion in the 21st century (Takala, 1999; WHO, 2010). Therefore, managers have a legal and moral duty to safeguard the health and safety of those who work for them, and the exercise of these duties needs to be seen as central to the role of leadership. There is a growing interest among researchers,

management and organizational practitioners about occupational safety in recent years. This is probably informed by the growing incidence of workplace illness, injury and death which impose large cost on national economies and operational efficiency of organizations. International Labor Organization (ILO) and WHO reports indicated that in manufacturing industries many employees suffer from workplace injuries and property damage resulted in economic crisis (ILO, 2006; ILO, 2010; WHO, 2010). Every 15 seconds, a worker dies from a work-related accident or disease. Every 15 seconds, 153 workers have a work-related accident (Jilcha & Kitaw 2016). Every day, 6,300 people die as a result of occupational accidents or work-related diseases – more than 2.3 million deaths per year (ILO, 2010; WHO, 2010; Jilcha & Kitaw, 2016).

These costs accrue to the individual workers who suffer, their families, the businesses that employ them, and the society at large due to the costs associated with health care and treatment (Gahan, Sievewright & Evans, 2014). Economic analysis of workplace health and safety has for example, consistently shown that jobs or occupations associated with lower levels of workplace safety typically attract a wage premium (Heaney & Irish, 2007; Gahan, Sievewright & Evans, 2014)). Economists have also sought to estimate the marginal costs associated with work related death in different part of the world. For example, using Australian data, Miller, Mulvey and Norris (1997) estimate the economic cost associated with a work-related death to be between $11million and $19million only in Australia. Although estimates vary significantly from country to country, the International Labor Organization (ILO, 2006) has estimated that the cost associated with workplace death, injury and illness is approximately 4 percent of annual global domestic product. In developing countries including Nigeria, the risk of having work-related injury is almost 15 to 25 times higher than that of developed counties. This is because in developing countries (e.g. Nigeria), majority of the workforce is employed in small and medium scale industries that do not meet the minimum standards and guidelines set by the WHO and the ILO for occupational health, safety and social protection (Barling, Loghlin & Kelloway, 2002; Tadesse & Kumie, 2007). Occupational health and safety laws cover only about 10% of the population in developing countries, omitting many major hazardous industries and occupations (see LaDou, 2003; Linhard, 2005). Occupational health remains neglected in most developing countries under the pressure of devastating social, economic, and political challenges (Ahasan & Partanen, 2001; O'Neill, 2000; Christiani, durvassula, & Myers, 1990; Barling, Loghlin & Kelloway, 2003)

Occupational Health and Safety (OHS), also commonly or otherwise referred to as Occupational Safety and Health (OSH), or Workplace Health and Safety (WHS), is a multidisciplinary field concerned with the safety, health, and welfare of people at work. It is a field of healthcare concerned with enabling an individual to undertake their occupation, in the way that causes least harm to their health. As defined by the World Health Organisation (WHO) occupational health deals with all aspects of health and safety in the workplace and has a strong focus on primary prevention of hazards. While "Health" has been defined by WHO as "a state of complete physical, mental, and social well-being and not merely the absence of disease or infirmity. By implication, occupational health and safety is all about promotion of health and safety at work, which is concerned with preventing accidents, harm or injury from any incidental hazards, arising in the workplace.

In recent years however, occupational health and safety of the workers has improved and is relatively satisfactory in developed countries, whereas in developing countries, occupational health receives little attention and comes at low level in the list of national priorities (Perrow, 1984). Studies showed that there are baskets of measures providing information on a range of health and safety performances (HSE, 2001; Yusuf, Moges, & Ahmed, 2014). Nevertheless, the traditional workplace-oriented occupational health

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

has proven to be insufficient in the developing world, and tangible progress in occupational health can be achieved only by linking occupational health to the broader context of social justice and national development (Swuste & Eijkemans, 2002; Joubert, 2002; Michaels, Barrera, & Gacharna, 1985; Mendes, 1985).

The purpose of the chapter is to examine work leadership in managing occupational health and safety issues, problems, and violations in Nigeria. It would also suggest solutions or recommendations and future research direction.

BACKGROUND

Safety and health are constituents of welfare because health is wealth. A healthy worker is a productive worker and an asset to the organization. An unhealthy worker constitutes a liability which infringes on the marginal profit of the organization, due to low productive and marginal input in the overall process of production (Machida, 2009; Onuegbu, 2010; Mokikan, 2012; Ngwama, 2016). Nigerian workers across all sectors of economy recent years, have been subjected to accidents which range from minor to fatal injuries, while some have lost their lives, some loosing vital organs and rendered permanently incapacitated (Ngwama, 2016). An estimated whooping total sum of 159 000 people in the Nigeria die each year as a result of occupational diseases and industrial accidents (ILO, 2012). Despite these entire estimated figure, unlike in the advance nations of the world, it is still very difficult to quantify the health impact of occupational diseases in the Nigeria workplace because there is no consensus on the data. The rate of the industrial accidents and the general lethargy of the employers to respond to the issues of safety and health in workplaces are becoming a growing concern in Nigeria (Bankole & Lawal, 2012; Fajana, 2012; Ahiuma-Young 2012; Ngwama, 2016).

According to Ahiuma-Young (2012) an estimated 2.3 million occupational fatalities occur annually while nothing less than 100 occupational fatalities and some billions of capital losses have been recorded in Nigeria between April 28, 2009 and April 2010 (ILO, 2012; Ngwama, 2016). Not less than 200 cases of industrial accidents occur in the workplaces in Nigeria daily with an equally high rate of fatalities. Available statistics indicates that no fewer than 400 workers have lost their lives in the power sector between 2010 and 2012 while performing their official duties. In the maritime sector, also findings show that since the concession of the ports, over 100 cases of fatal industrial accidents have occurred with over ten deaths, numerous incapacitations and innumerable serious body injuries. Fajana (2012) estimated that at least 50 million Nigerians are at risk of occupational hazards. This group he pointed out includes about 3.2 million Nigerians and children who are involved in economic activities, (even as abused participants) in the labour market.

Occupational Health as defined by the joint committee of the ILO/WHO is the promotion and maintenance of the highest degree of physical, mental and social well-being of workers in all occupation. It is further explained as the sum total of all activities and programs that are engaged upon, aiming to attain and maintain the highest level of health and safety for all people who are engaged in any type of work whatever. It involves the protection of workers' health from any hazard to which they may be exposed to in the work environment. It is a preventive and proactive approach which involves risk assessment, hazard identification, hazard mitigation, hazard elimination and treatment of work-related injuries. There is a plethora of hazards (safety and health hazards) which people are exposed to in their jobs; from the formal industries (banking, oil and gas, textile, agricultural, construction, food and beverage etc.) to the informal (logging and sawmill, roadside mechanic, carpentry, local welders, pepper grinders, market

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

traders etc.). Exposure to these hazards occurs for fairly long hours on a daily basis as the majority of the active hours of the day is spent at work (i.e. at least 8 hours per day). These hazards include chemical, biological, physical, mechanical, psychological and ergonomic hazards. For any person affected, it could be either or a couple of the various forms of hazard.

The risk of death or injuries from fire hazards in the workplace, continue to raise concern, irrespective of the international standards to strengthening of legal and other supporting measures to improve workplace safety and health in all countries, particularly in developing countries. In Nigeria, there is lack of comprehensive data in the area of occupational/ industrial hazards and this has become a great challenge given the atrociousness of industrial accidents which is undermining workers' productive effort in the organizations (Onuegbu, 2010; Ngwama, 2016). Particularly, work-related accidents and diseases continue to be a serious problem in both developed and developing countries including Nigeria. Nigerian workers across all sectors of the economy have been subjected to workplace accidents which range from minor to fatal, as some have lost their lives right in the line of duty, while some have lost vital organs, therefore rendered permanently incapacitated. The issue of safety and health at workplace which once occupied a major place in the programmes and plans of the employers are now treated with levity (Ngwama, 2016). One such case in mind was the fire incident that razed a plastic factory in Ikorodu, Lagos State in 2002 where many workers roasted to death at night because of the negligence of the Chinese owners of the company who locked the workers in the factory without provision for emergency exit (Ngwama, 2016). There are equally other unregistered companies using the incorporation as cover, many of them have worse cases involving health and safety of their workers

The ILO estimates that 250 million workers are involved in accidents every year and out of which 300,000 are killed. There are at least 335,000 fatal injuries caused by accidents at work. Putting accidents and diseases together, the global estimate of work-related deaths amounts to 1.1 million per year, and this according to ILO is grossly underestimated probably because of lack of comprehensive statistical data from many member states (International Labor Conference 87th Session 1999:37, ILO 274th session 1999). The economic losses are enormous and, in terms of shattered families and communities, the damage is incalculable. International Labor Organization (ILO) estimates suggest that 159 000 people in the Nigeria die each year as a result of occupational diseases and industrial accidents (ILO, 2012). Despite the seeming deplorable state of occupational and safety issues in the workplace in Nigeria at present, the policy framework targeted towards reducing the rate of industrial accidents through preventive measures as well as to create awareness on the rights of victims of industrial accidents are weak and hardly enforced (Alana, 2010; Onuegbu, 2010; Fajana, 2012; Mokikan, 2012; Ngwama, 2016). More recently, the World Economic Forum (WEF, 2012) has estimated that cardiovascular diseases alone result in productivity losses of $US389 billion globally, whilst mental illnesses estimated to reduce economic output by $1.6 trillion. Other research suggests that workplace health and safety may have more far-reaching macroeconomic consequences. The ILO (2012) for example, also finds a strong correlation between national workplace fatality rates and the World Economic Forum (WEF) Global Competitive Index, suggesting that inadequate WHS practices place a heavy burden on national economic growth (Gahan, Sieve wright & Evans, 2014).

In the manufacturing sector for example, the frequency of fatal industrial accidents is very alarming. Many times, the managements collaborate with some union officials to conceal cases of industrial accidents and secretly negotiate compensation (Ahiuma-Young, 2012; Ngwama, 2016). The management simply pays out paltry sums as compensation to the families of victims in both deaths and permanent disabilities. Some of the victims who have suffered major injuries like loss of their hands or legs are often

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

dismissed after receiving tokens that the companies give out on "compassionate" ground. The Workman Compensation Act that is supposed to address issues of industrial accidents is inconsistent and lack implementation. The alarming rate of the industrial accidents and the general lethargy of the employers to reduce the rate of industrial accidents through preventive measures demand creation of awareness on the rights of victims of industrial accidents. Ahiuma-Young (2012) observed that the incidence of industrial accidents at the workplace in Nigeria and fatality rate as well as the inherent dangers posed to the socio-economic and political development of the country constitute a serious threat. He notes that the federal government has failed in enforcing industrial safety policies at the workplace and some of the trade unions pay less attention to the safety of their members.

The employers have relegated issues of safety to the background in the country on the premise of the harsh economic environment. Most of the victims of workplace accidents preferred to suffer in silence, because they have been warned by their employers of severe consequences if they try to make any case with the organization. More often than not, most of these companies operate in secluded areas with untraceable addresses and are abound in all part of the country (Ngwama, 2016). In view of the foregoing, this chapter takes a critical look at the OHS issues, problems and trends in the workplace in Nigeria using robust descriptive qualitative analysis of extant literatures and empirical studies in Nigeria and beyond. Particularly, those critical issues threatening the lives of average workers in Nigeria and suggests recommendations that are sufficient anchored on findings from empirical studies. All stakeholders must be mobilized for concerted efforts against unpopular government policies that tend undermine occupational health and industrial safety to protect the employers at the expense of the lives of the workers.

In Nigeria today, it is no longer workers in the factory that are pruned to accidents but those in the white collar jobs are also increasingly exposed to job hazards, they may be unaware of the hazards because of the long gestation of such hazards and those in this category include workers in the financial sector, oil and gas as well as civil service (Fajana, 2012; Ngwama, 2016). However, Fajana (2012) posited that a properly-managed safety culture based on tested principles of workplace safety will produce employees who participate actively in training; these employees will be able to identify and alert one another and management to potential hazards. They develop effective control measures and feel a sense of responsibility for their safety and safety of others. These developments and its attendant fatalities therefore underscore the importance of corporate culture that place value on occupational health and safety in the 21st century Nigeria workplace.

Many definitions of 'leadership' exist in the literature (Yukl, 1989). The term "*leadership*" comes from the Anglo-Saxon word "laedan", meaning to go, and is defined as guiding, conducting, proceeding, or being foremost. Leadership has been defined in terms of individual's traits, leadership behavior, interaction patterns, role relationship, follower perception, influence over followers, influence on task goals, and influence on organizational culture. In organizational psychology it is mostly defined as a group phenomenon (including interaction between two or more people) and an intentional social exertion of influence, which aims at attaining objectives by communication processes (Steger, 2003). Leadership is more than a micro-organizational phenomenon. It goes beyond direct, dyadic relationships between leaders and subordinates; rather, it takes place at all levels of an organisation. It can occur in indirect as well as direct forms. It includes the efforts of the management to reach both short-term and long-term objectives (Gordon & Yukl, 2004). According to Goods (1959), leadership is the ability and readiness to inspire, guide or manage others. Dictionary of Behavioral Sciences (1973) defined leadership as the exercise of authority in initiating, directing, or controlling the behavior or attitude of others, and bring out their consent, those qualities of personality and training, which make the guidance, and control of

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

others successful. According to Hemphill (1945), leadership is the initiation of a new structure or procedure for accomplishing the organizational goals and objectives for changing an organization's goals and objectives.

Tannenbaum, Weschler, and Massarik (1961) explained leadership in terms of interpersonal influence, which is defined as influencing people to co-operate towards some goals, which they come to find desirable. Halpin (1956) stated that a successful leader contributed to group objectives and to group relationship. He describes leadership behavior in two dimensions of initiating structure and consideration. Davis (1986) contended that leadership is the ability to persuade others to seek defined objectives enthusiastically. To Hersey and Blanchard (1988) leadership is a process of influencing the activities of an individual within a group in its effort towards goal achievement in given situation?

Koontz and Weihrich (1990) suggested that leadership is influence, that is, the art or process of influencing people so that they will strive willingly and enthusiastically towards the achievement of group goals. Yuki and Vanfleet (1998) stated that leadership is viewed as a process that includes influencing the task objectives and strategies of a group or organization; influencing people in the organization to implement the strategies and achieve the objectives, influencing group maintenance and identification, and influencing the culture of the organization. In line with this position, Terry (1988) concluded that leadership is, essentially, a continuous process of influencing behaviour. A leader breathes life into group and motivates it towards goals. Keys and Case (1990) defines leadership as the process of influencing and supporting others to work enthusiastically toward achieving objectives consistent with these earlier definitions Yulk (1994) defined leadership as the ability of one person to influence a group of persons toward the achievement of common goals. When comparing leadership styles, the focus typically is on the effectiveness of leaders' effectiveness. Effectiveness in turn, typically is viewed as the extent to which the leader's group or organization performs its tasks successfully or attain s its goals (Ardichivilli & Kuchinke, 2002; House & Aditya, 1997; Allio, 2009).

For several decades, researchers have investigated what constitutes effective leader behaviours, what are the pertinent personal characteristics of leaders, and what leader behaviors best suit particular contexts and conditions. Overall, effective leadership has been shown to strengthen employee commitment to the organization and to improve the work climate, enhance innovation and increase productivity (Bel, 2010; Bramming, Kristensen, & Pedersen, 2009).

A corporate culture and leadership framework that truly values health and safety as much as it values productivity, quality and profitability will generate world-class safety results. Creating a safety culture in your workplace is similar to creating a safe home and healthy habits. That is, employment relationship where leaders are seen to spend time of the "shop-floor" and ask workers relevant safety related questions, follow-up with people who are directly affected by workplace injuries to collect and review all incidents, regularly review safety management matrices, and periodically review safety culture matrices through surveying so as to hold managers and supervisors accountable for safety outcomes in the workplace. It is perhaps in consideration of occupational health and safety practices as a cornerstone of corporate social responsibility (CSR) that the full cost of occupational health and safety failure can be most appreciated (see Smallman & John, 2001; Hart, 2010; Carroll & Shabana, 2010). Smallman and John (2001, p. 231) further argued that, at a strategic level, occupational safety outcomes can be considered a "determinant of firm status, specifically corporate image and identity". In this sense, the case for investing in better occupational safety outcomes may represent strategic value to the business, rather than simply an avenue for immediate economic value.

MATERIAL AND METHODOLOGY

The study employed qualitative research method, involving collection, analyzing and interpreting qualitative data thereby integrating conclusions from those data into a cohesive whole. Qualitative method design was selected to obtain comprehensive information from extant literatures, empirical evidences and from management and employees concerning OHS practices in the Nigerian workplaces. The terms reflecting OHS included like workplace safety, safety management system, relationship between safety and quality, quality and safety, workplace health, industrial health, industrial safety, occupational safety, employee health, safety, work, health, manufacturing safety, working environment, safety committee, and workplace. More than these key terms were utilized in different approaches in line with expected methodologies that any researchers can use. The literature reviewed has attempted to identify related article with occupational safety and health hazards identification or hazards controlling mechanisms. The materials consulted were basically from electronic database and extant literatures. A comprehensive meta-analysis of more than 50 studies, reports, policies, standards and manuals were obtained from some selected databases, research and thematic papers for analysis. Depending on the relevance of the materials, the most important data considering recent publications and reading methodology and results of the papers were considered appropriate. The objective is to focus on how the workplace safety and health hazards are happening, to see current state of the art of the researches summit and to identify the drawback from previously conducted researches. The gaps that exist can be filled by the overall research works considering further research areas.

FOCUS OF THE CHAPTER: OCCUPATIONAL HEALTH AND SAFETY VIOLATIONS AND PROBLEMS IN NIGERIA

According Idubor and Oisamoje (2013) a number of conditions are responsible for the high level of violation of occupational health and safety regulations. These condionalities are identified and explained as follows:

- **Lack of Strict Judicial References:** There is a general lack of strict judicial references and strict human rights compliance is not sufficiently embedded in the national law, such as labor law, non-discrimination legislation, health and safety rights in corporations (HRIRC, 2009). Nigeria, like many other developing countries was subjected to repressive and undemocratic rule for long periods. This perhaps explains the unwillingness and inability on the part of government to enforce compliance to democratic requirements of human rights (Idubor & Oisamoje, 2013).
- **Weak Legal and National Occupational Health and Safety Standard Structures:** The legal structures and policy framework for enforcement of OHS regulations in place in Nigeria are rather very weak, particularly in terms of the interpretation and applications of the law. The standard of occupational health and safety in Nigeria is weak hence even when there is some compliance to safety and health regulations, it is regarded as excessive whereas in reality the compliance is just meeting the minimum requirements. When Corporations violate labour laws, the penalty for such violations is ridiculously liberal for these organizations (Dobro & Oisamoje, 2013). For example, under the Workmen's Compensation Act as enshrined in the 1999 constitution (section 4), the penalty for violating the requirement that an employer must insure every workman employed

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

by him against injury or death is: "on conviction for a second or subsequent offense to a fine equivalent to the premium payable for the year in question in respect of the number of workmen employed by him or the sum of N2, 000 whichever is greater". It is only recently that the labor safety, health and welfare bill of 2012 have upwardly reviewed the rates of some violations to a fine of N500, 000 for individuals or N2m in the case of a corporate organization.

- **Corruption and Bribery:** This is perhaps the biggest problem in occupational health and safety violations in Nigeria. The Factory's act for instance clearly stipulates the criteria that are to be met by a desiring organization but most times the standards are not met yet the company has a license duly issued by the regulatory body to operate. The license presupposes that all the conditions have been met and all needed equipment and facilities provided. During yearly inspection of facilities, some companies that operate under substandard conditions are certified okay repeatedly on the payment of bribes. Another aspect of this is that most of these companies either belong to high-ranking government officials or their friends and relatives. Hence even when the inspecting officer is prepared to do his job the right way, he or she may often have "orders from above" preventing any sanction from being placed on the erring companies.
- **Lack of Corporate Responsibility and Accountability:** Many of the corporations that operate in Nigeria are multinational and they have laws that govern their operations in their parent countries. The usual practice in Nigeria is that such laws and regulations are suspended when operating in Nigeria. Such companies and corporation conveniently forget those laws and operate with a shocking lack of corporate responsibility and accountability. The fact that certain unwholesome practices are tolerated, even accepted in Nigeria ought not to prevent these multinational companies from being socially responsible as if they were in their parent country.
- **High Rate of Unemployment and Low Educational Level of the Workforce:** Unemployment rate in Nigeria is alarming so much so that people are ready to work under dehumanizing and unsafe conditions just to have a job. As a result, more labor-intensive industries like agriculture, mining and construction have large workforces, which are mainly poorly educated. This lack of sufficient education usually prevents the workforce from fully understanding the implications of working in hazardous conditions. Even when they do, they are unable to effectively muster a force that will not only demand for but also obtain safer working conditions. More often than not people count themselves lucky for even having the job in the first place so agitating for safer working conditions is not a priority with them. Job security is a luxury for many as most of these companies hire them as contract staff or as causal workers.
- **High Cost of Doing Business in Nigeria:** The entrepreneur in Nigeria is faced with enormous problems in attempting to run a business. Most often than not, they have to provide power station (i.e. electricity) for their business at a very high cost, provide his own water plants and sometimes construct a motor able road to business place. All these tremendously increases the cost of doing business and after spending so much on infrastructure that Government is supposed to provide, therefore, entrepreneurs begins to cut corners on provision of a safe place of work for his employees.

Identifying safety and health problems in the workplace can be as easy as answering basic questions on hazards propensity at work. To determine if there are health and safety problems that need to be addressed and fixed in any workplace, the following questions requires answers:

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Do you or your co-workers have injuries or health complaints? If so, what types?
- Who has been hurt or is having symptoms of minor or major health issues?
- When do you or your co-workers feel these symptoms?
- Where in the workplace are safety or health problems occurring?
- What are the conditions that are causing the problems?

Nevertheless, the following "Caution Health Hazards" and "Caution Safety Hazards" Tables 1 and 2 provide more information to the various sources of health and safety issues at work.

Table 1.

CAUTION: Health Hazards
Common Types of Health Hazards in the Workplace are: • chemical (asbestos, solvents, chlorine) • Biological (tuberculosis, HIV, hepatitis, molds) • Physical (noise, heat and cold, radiation, vibration) • Ergonomics or Repetitive Strain Injuries (carpal tunnel syndrome, back injuries) • Psychological (stress)
How Health Hazards Enter Human Body • Breathing (inhalation) • Swallowing (ingestion) • Skin (absorption) • Cuts (injection)
Harm Caused by Health Hazards Depends on: • Strength, or potency, of the agent or reagent • amount of the agent that is present • how long you are exposed to the agent • Part of your body that is exposed
Types of Health Effects • Acute: the effect shows up right away • Chronic: problems show up after a long period of exposure and/or long after the exposure ends • Local: only the part of the body was exposed is affected • Systemic: an agent enters the body and affects other parts of the body
Cancer: • Cancer is a term for many diseases in different parts of the body • Carcinogens are agents that cause cancer • There are no totally safe level of exposure to something that causes cancer • Cancer from a workplace exposure may develop 10, 20, or more years after exposure
Sensitization: • People may become allergic or sensitive to some agents they are working with. • Sensitization can develop over time • For example, a health care worker may develop a serious allergic reaction to latex used in gloves
Reproductive Effects • both men and women can be affected by reproductive hazards at work • Reproductive hazards cause miscarriages and birth defects

Table 2.

CAUTION: Safety Hazards
Common Types of Safety Hazards in the Workplace are: • Slips, trips and falls • Being caught in or struck by moving machinery or other objects • Fire and explosions • Transportation and vehicle-related accidents • Confined spaces • Violence
Slips, Trips and Falls • Bad house-keeping and poor drainage can make floors and other walking surfaces wet and slippery. • Electrical wires along rhea floor pose a tripping hazard • People can fall if they are not provided with fall protection equipment, guardrail, and safe ladders.
Caught in or Struck by Moving Machinery/Objects • Machinery can cause injuries in different ways: • People can get parts of their body caught in or struck by exposed moving parts of machines if they are not properly guarded, or not locked out when being repaired • People can be struck by flying objects from machines without protective guards.
Fire and Explosions • Improper labeling, handling or storage of certain materials can pose a risk of fire or explosion • Every workplace should have an evacuation plan for getting people out of a building in case of fire and an alarm or alert system to quickly inform employees of an emergency • Every worker should be trained on what to do in case of an emergency
Transportation and Vehicle-Related Accidents: • Operators of vehicles and equipment can be injured or cause injury to pedestrians if equipment is unsafe or if adequate training has not been provided • People can be seriously injured or killed after being hit by a vehicle while repairing roads of doing other work in traffic zones. This danger exists when traffic is not properly routed and/or adequate barriers are not placed between the workers and the traffic
Confined Spaces: • An area with small openings for a worker to enter or exit and is not designed for regular work. Examples of confined spaces include manholes, sewer digesters, and silos. There are many hazards in confined spaces. • Workers can become unconscious and die from a lack of oxygen • There may be too much oxygen, or other chemicals that can catch fire or explode. • Poisonous gases and vapor, such as hydrogen sulfide or carbon monoxide, may also build up in a confined space • Confined spaces can also pose physical hazards. They can be very hot or cold, very loud, or slippery and wet. • Grain, sand or gravel can bury a worker.
Violence: • Violence on the job is growing problem. • Homicides are the second leading cause of workplace fatalities. Workplace violence includes physical assault as well as near misses, verbal abuse and sexual harassment

SOLUTIONS AND RECOMMENDATIONS

Appropriate Legal and Policy Framework

Promotion and maintenance of highest degree of physical, mental and social well-being of workers in all occupation is majorly a function of government through appropriate OHS regulations and laws, as well as executive wills of leadership in work organizations. Government must do the needful by enacting standard and comprehensive OHS regulations with appropriate legal and policy framework to monitor strict compliance to occupational health and safety provisions in the country (e.g. National Occupational

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Health and Safety Act 85 of 1993 in South Africa; Occupational Health and Safety Administration – OSHA in Unite States of America; Health Safety Executive –HSE regulations in the UK.

Government and management of business organizations can show leadership in preventing safety and health risks at the workplace (EU-OSHA, 2012). In an attempt to seek solutions to modern workplace OHS issues, EU-OSHA (2012) has identified leadership as a key factor, hence, EU-OSHA (2012) have suggested three key underlying management principles for enhancing safety and health. These are:

1. Effective and strong leadership
2. Involving workers and their constructive engagement, and
3. Ongoing assessment and review

These three points are explored in more detail below:

1. **Effective and Strong Leadership:** Leadership is a condition for success. A preventive approach is only likely to be fruitful if it is supported by the management. A strong and visible leadership and engaged managers at all levels can provide direction and input to this preventive approach (EU-OSHA, 2012). This makes it clear to everyone that safety and health are strategic questions within the company. In practice, according to EU-OSHA (2012) this means that:
   a. Management commits itself to occupational safety and health as a core value of the organization and communicates this to the employees. That is, will "collective will" or "Political will" must be present. It is about (the government, employers and employees) wanting to and doing the right things always.
   b. Managers have an accurate picture of the risk profile of the organization, thereby engaged themselves with continuous appraisal and review of OHS regulations and standards.
   c. management leads by example and demonstrates leadership integrity, for example, by following all occupational safety and health rules at all times;
   d. Management and private businesses/agencies must commit themselves to training and development of OHS professionals in various OHS activities
   e. the roles and responsibilities of different actors in preventing and managing health and safety risks at the workplace are clearly defined and planned and
   f. Monitored proactively through active and continuous awareness OHS regulation and also making OHS certification of the criteria to be fulfilled before businesses are registered by corporate Affairs Commission (CAC) or enlisted into and retained on the Nigerian Stock Exchange (SEC).
   g. Occupational health and safety can feature in the company's sustainability and/or corporate social responsibility strategy and may be encouraged throughout the supply chain.
2. **Involving Workers and Their Constructive Engagement:** The two-way process of involving workers and their constructive engagement is important in the success of management initiatives. Employers must consult their employees about health and safety. This includes: provision of information; instruction and training; and engaging in consultation with workers and their representatives (EU-OSHA, 2012). Depending on national requirements, employers may be required to establish safety committees and the post of workers' representative. Worker participation helps to establish a culture of dialogue. Workers and their representatives are encouraged to take part in health and safety decision-making. Some employers have found benefits in going beyond these legal obliga-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tions. They encourage active health and safety involvement on a daily basis and also include workers in additional forums such as working groups on specific topics (EU-OSHA, 2012).

3. **Effective Upward Communication:** Is a recommended panacea for management intervention in health and safety at work — workers are listened to and what they say is acted upon. Equally importantly, workers accept their responsibility to follow the health and safety rules at the workplace, and are engaged with management in a constructive and helpful way (EU-OSHA, 2012). This two-way process creates a culture where relationships between employers and workers are based on collaboration, trust and joint problem-solving. And once established this culture has the potential for health and safety improvements.
4. **Ongoing Assessment and Review:** Monitoring and reporting are vital tools for enhancing workplace safety and health. Management systems which provide, for example, the company board members with specific (e.g. incident-led) and routine reports on the performance of health and safety policies can be useful in raising issues, highlighting problems and ultimately enhancing workplace safety and health (EU-OSHA, 2012). According to EU-OSHA (2012) elements of a good assessment and review system include:
    a. Procedures for reporting major health and safety failures to the company board members and owners as soon as is practical;
    b. Systems for capturing and reporting accurate and timely incident data such as accident and sickness rates;
    c. Arrangements for eliciting and incorporating worker views and experiences;
    d. Periodic reports of the impact that preventive schemes such as training and maintenance programmers have on occupational health and safety;
    e. Regular audits of the effectiveness of risk controls and management;
    f. Assessments of the impact that changes such as the introduction of new work processes, procedures or products have on safety and health;
    g. Effective procedures for implementing new and altered legal requirements.
5. Some Recommendations for the Organizations
    a. Adequate training is needed among the workers, as most of the workforce especially the factory workers lack basic education. Pasting just information on the notice board containing information on the operating standard and procedures are not enough as many of them cannot read or write.
    b. Medical screening should be done periodically to ascertain the state of workers' health. Most of the occupational diseases gradually affect the health of the workers without them knowing, if this could be found earlier enough, a lot could be done to salvage the lives of workers.
    c. Management commitment both to better health and safety performance and participative arrangements coupled with the provision for preventive OHS are strategies for ensuring the quality and efficiency of production Support for workers' representation from trade unions in workplaces, especially in the provision of information and training, most non-unionize organizations leave the issue of occupational health exclusively to the management alone. Workers must be involved in the formulation and implementation of OHS policies.
    d. Trade unions should compel their members to comply with OHS rules, understanding its importance to their life. The issues of OHS should be a collaborative effort and a responsibility of all both the management and workers. Accidents and injuries must be reported the appropriate authority irrespective of the treat of the management.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

e. The Federal Ministry of Labor should rise to their duty for periodic inspection of the work environment and Factories in Nigeria to ensure strict compliance of the factories to factories regulations and also pay appropriate compensation to the victims of occupational hazard (Ngwama, 2016).

6. Some Recommendations for Managers
   a. **Plan:** Set the direction for effective health and safety management by setting long-term organizational improvement targets and develop positive performance indicators at both an organizational and business unit level. Add targets that drive improvements in areas of identified risk and return to work performance for the agency. Make occupational health and safety and injury management a standing item on executive meeting agendas. Consider occupational health and safety and injury management implications when developing organizational change and human resource management strategies. Develop a strategy to address the information and training needs of the agency's managers.
   b. **Monitor:** Arrange for updates to be provided to the agency's management group on emerging OSH and injury management issues relevant to the agency's business. Ensure line managers' report to executive management on workplace injuries, measures taken to prevent further injury and the rehabilitation support provided to injured employees. Allocate accountability for workers' compensation costs to a divisional level.
   c. **Review:** Set baseline data so that performance improvements can be measured. Regularly review OHS and injury management systems and audit tools. Engage suitably qualified professionals to conduct impartial in-house audits or reviews, with appropriate employee and employer involvement. Incorporate the scheduling of these reviews into agency corporate governance or audit plans. Provide comprehensive report of OHS performance in the company's annual management reports. Reward excellence in OHS and injury management performance as part of organizational reward and recognition programs.
   d. **Deliver:** Allocate resources to identify, assess and remedy areas of risk. Clearly specify management's OSH and injury management responsibilities in agency-wide OSH and injury management policies and procedures. Develop and then undertake an improvement program for the agency. Apply adopted work health and safety policies and measures consistently throughout your agency, whether over time or in different operational areas within the agency. Identify agency improvement priorities based on achieving targets and controlling injury risks.

FUTURE RESEARCH DIRECTION

Future research direction would be required on how health impact occupational diseases and injuries workplaces in private and public sectors in Nigeria, using qualitative and quantitative research approaches.

CONCLUSION

Health impact of occupational diseases and injuries in Nigeria workplaces is difficult to assess, because there is no consensus on the data. Despite this difficulty, International Labor Organization (ILO) estimates suggest that thousands of people die each year as a result of occupational diseases and industrial

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

accidents. This understanding underscores the need for more awareness, education, training, advocacy for corporate commitment, legal policy framework and enforcement of occupational health and safety compliance in the country. Occupational Health and Safety systems in developed and emerging economies such as Nigeria are designed to identify and minimize risks at the workplace. Definitely there is more to gain, and nothing to lose from the implementation of OHS in Nigeria. If all the industries (government {federal and states} and private; small, medium and big scale; formal and informal) in the country embrace OHS, then one can imagine how well the health and well-being of the people will be immensely promoted and improved alongside the numerous job and employment opportunities that will be created on the overall. The relative importance of occupational health and safety in emerging economies is of utmost concern bearing in mind the unusual attendant consequences as occasioned by high rate occupational diseases, accidents, injuries and fatalities. Moreover, workplace in uniquely characterizes by large population, low cost/low knowledge workers, poor literacy rates etc. which makes industrial accidents and fatality almost inevitable. Little wonder, in today's workplaces thriving business communities are learning to seek to create jobs, wealth, good leadership, safe and healthy working conditions that are essential for production of goods and provision of services and minimize industrial accidents and fatalities. Organization that will create workplaces of the future, and sustain the blistering economic growth as well as enhancing quality of life as a whole must seek to institute enduring occupational health and safety systems, driven by appropriate leadership. However, there are many issues that need to be overcome in the areas of awareness, education, training, corporate commitment and leadership readiness, as well as legal policy framework for regulating compliance. There is need for political will, and for all the relevant stakeholders to come together in order to seek the actualization of this lofty vision in Nigeria. All these are very much possible, only if the relevant and comprehensive occupational health and safety laws are passed by the various states and national assembly because globally, the practice of occupational health and safety is mainly driven by appropriate OHS policies and legislation.

KEY TERMS AND DEFINITIONS

Leadership: Is defined as the exercise of authority in initiating, directing, or controlling the behavior or attitude of others, and bring out their consent; those qualities of personality and training, which make the guidance and control of others successful.

Occupational Health: Is defined as the promotion and maintenance of the highest degree of physical, mental, and social wellbeing of workers in all occupation.

Workplace Health and Safety (WHS): Is a multidisciplinary field concerned with the safety, health, and welfare of people at work. It is a field of healthcare concerned with enabling an individual to undertake their occupation, in the way that causes least harm to their health.

Chapter 80
Corporate Governance and the Future of Work, Work-Family Satisfaction, and Employee Well-Being

Alfred Kent Van Cleave
University of Phoenix, USA

ABSTRACT

This chapter examines the issues of work satisfaction, employee well-being, and the future of work from the perspective of and as impacted by two prominent and contemporary models of corporate governance. It begins with an examination of work satisfaction and leadership, informed by motivation, leadership, and workplace attachment theories, then discusses how these theories have been impacted by changes in corporate governance. Present-day implications of corporate governance on work satisfaction and well-being are examined, followed by the implications of these considerations for the future of work in the fourth industrial revolution.

WORK SATISFACTION AND LEADERSHIP

This examination of employee well-being and work-family satisfaction starts by looking at the research on motivation, motivation and job design, and leadership. All of these have their roots in the social person era of management and leadership theory, which was ushered in by a series of studies that took place in the Hawthorne plant of the Western Electric Company (Wren, 2004).

The key finding of the Hawthorne studies was that the interactions of people in an organization are important determinants of organization effectiveness and success. These findings led to the human relations movement, which studies the links between productivity and both worker satisfaction and worker wellbeing. It informed motivation theories, leadership theories, as well as workplace attachment theories (Wren, 2004).

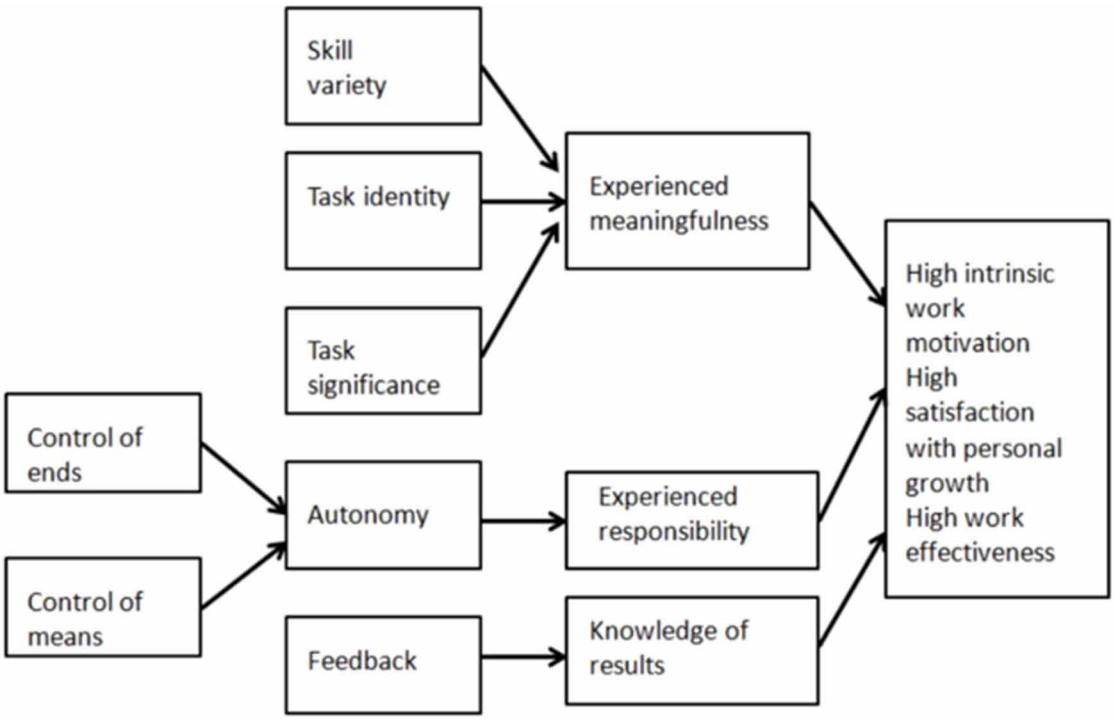
Under the influence of the social person era, motivation theory grew from primarily instrumental-only (extrinsic) to include more explicitly the intrinsic bases of motivation. With extrinsic motivation, there must be either some reward or some punishment on which performance is contingent. It is transactional; essentially, one gets what one pays for. With intrinsic motivation, the actor performs various acts because it is inherently satisfying to perform them; no incentive is required to gain compliance in the workplace because the worker already wants to work at the assigned tasks (Herzberg, 1987).

The notion of intrinsic factors in motivation led to the development of the job characteristics theory (Figure 1), which prescribes what job characteristics need to be present in order for a job to have a high motivational potential (Hackman & Oldham, 1980; Hackman, Oldham, Janson, & Purdy, 1975). Core job characteristics lead to critical psychological states, which lead to worker personal outcomes. High levels of skill variety, task identity, and task significance lead to experienced meaningfulness of work. Autonomy leads to experienced responsibility for the work. Feedback from the work leads to an understanding of the agency of the worker in producing the desired outcomes. Experienced meaningfulness, experienced responsibility, and knowledge of results are the key psychological states that lead to worker outcomes of high intrinsic work motivation, high satisfaction with personal growth, and high work effectiveness. This has led to quite a lot of research and practice regarding job enrichment.

Figure 1. Jobs characteristics model



In the area of leadership theories, the social person era saw the development of relationship-oriented theories (Bass, 1990). Relationship oriented theories posit that the relationship between the leader and follower is an important determinant of the motivation of the worker as well as the degree of affinity

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

that the worker will develop towards the leader. French & Raven's (1960) typology of power broadly demarks the power of the leader as having two sources – positional and personal. Positional power comes from the authority one holds that is attached to the position, as well as the ability to reward and punish; it is extrinsic in nature. But personal power arises from the qualities of the leader and of the relationship between leader and follower. Personal power includes both expert power – the ability to solve problems for the follower – and referent power – the degree to which the follower identifies with the leader and is therefore willing to do just about anything the leader wishes. Personal power is intrinsic in nature.

Progression of the relationship oriented leadership theories has led to the development of transformational leadership (Bass, 1999; Bass & Avolio, 1992) and servant leadership (Greenleaf.org, 2011). Transformational leadership is structured around the leader growing the capabilities of followers and then empowering them to take on higher levels of autonomy and responsibility. Similarly, servant leadership is structured around the leader ensuring that all the needs of the follower are met, so that the follower can perform at high levels. Both leadership approaches entail what is essentially a spiritual, connected relationship between the leader and followers.

Workplace attachment theories examine the linkages between job design, job satisfaction, satisfaction with leadership, and organization commitment (Katz & Kahn, 1978). Organization commitment is basically of two types – continuance commitment, in which the worker stays with the organization because the cost of leaving the job exceed the gains of finding a different one, and affective commitment, in which the individual emotionally identifies with the organization and its vision, and will exert great efforts in order to help the organization achieve its vision. Continuance commitment is extrinsic in nature, while affective commitment is intrinsic in nature. Summing these relationships up, essentially, intrinsic qualities of work, coupled with satisfaction with leadership lead to high levels of job satisfaction, which in turn leads to an affective commitment to the organization as well as high levels of performance.

St. Clair (2000) examines organizational attachment from the perspective of psychodynamic theories of human developmental attachment. She notes that infants who have positive relationships with their caregivers develop a secure pattern of attachment and interaction, in which they seek proximity to the caregiver. On the other hand, infants who do not have positive relationships with their caregivers develop an avoidant attachment, in which they seek to distance themselves from caregivers' particularly when they are experiencing stressors in their personal environments. St. Clair further argues that individual attachment styles persist into adult life, and set the pattern for attachment with other adults, and with organizations. However, the attachment style for the organization is predicated on individual beliefs about the motives and attitudes of the organization; that is, if the individual feels that the organization is reliable, ethical, and concerned for the individual's wellbeing, then the attachment is likely to be secure, fostering an affective organizational commitment.

A related concept is the psychological contract, which consists of the expectations that exist reciprocally between employers and employees (Armstrong, 22006; Katz & Kahn, 1978). Expectations held by the employee reflect what they believe the organization wants from them as well as what they want, in return, from the organization. Similarly, the organization has expectations of what is expected of the employee, as well as the organization's responsibilities to the employees.

Armstrong (2006) discusses the model of the psychological contract developed by Guest, Conway, & Briner (1996), which includes causes, content, and consequences. In their model, expectations, experience, alternatives, organization culture, and HRM policy and practice are viewed as causes or determinants of the content of the psychological contract. Content of the psychological contract includes such issues as fairness, trust, and the mechanisms of enacting the contract, which they term "delivery of the deal."

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The unfolding of the content of the psychological contract leads to consequences in terms of satisfaction and well-being, motivation, organizational citizenship, and organizational commitment. One might add that the consequences of the unfolding psychological contract also include the status of employee well-being. Historically, the psychological contract has included a commitment by the organization to the well-being of the employee, and in return, a commitment on the part of the employee to the well-being of the organization..

Synthesizing the foregoing, high performing individuals work at meaningful, empowered jobs, aided and potentiated by relationship-oriented leaders with whom they identify, and exhibit both a secure affective attachment to the organization and high levels of employee well-being. But all of this takes place in a broader context, which includes organization culture, the strategic objectives of the organization, and the manner of corporate governance, and the manner of governance is critical to worker wellbeing and the future of work.

SHAREHOLDER GOVERNANCE AND STAKEHOLDER GOVERNANCE

In 1976, two economists, Jensen and Meckling, published an article titled "Theory of the Firm: Managerial Behavior, Agency Costs and Ownership Structure" in the *Journal of Financial Economics*. A broad implication of their work suggested that corporate managers were not providing the returns to stockholders that they could provide, the implicit message being that managers should do whatever it takes to maximize corporate profitability. This would seem to mark the beginning point of an explicit focus on shareholder value as a model of corporate governance, in which the focus is on maximizing the rate of return on investment to the owners of the corporation (Ntim, 2018). Nothing else matters, really, in terms of motivation, leadership, psychological contracts, and organizational attachment, because compensation to the top management of the corporation is tied to that metric.

A competing model of governance was proposed by Freeman (1984), who proposed that one must consider the needs and interests of everyone who has an interest in the organization, to include the owners, managers, workers, community, suppliers, and customers (Ntim, 2018). The stakeholder model, he felt, should drive organizational strategy, which should seek to maximize the outcomes of the largest number of stakeholders possible. This would entail, among other strategic concerns, investing in the organization's human capital. Consistent with the philosophies of the human relations movement, this requires that one hire the best people for the job, invest in building their capabilities, and provide a secure and psychologically healthy work environment.

Viewed from the perspective of worker wellbeing, one might put these competing models on a continuum, with shareholder primacy at one end, and with stakeholder primacy at the other. Balance of governance between these models, then, is an important concern. Too much concern for shareholders leaves stakeholders' interests vulnerable, while too much concern for stakeholders leaves shareholders' interests vulnerable. Ho (2010) proposes an enlightened shareholder value model, which, she proposes, transcends the stakeholder-shareholder divide. Under this approach, attention to the interests and concerns of corporate stakeholders is viewed as critical to the long-term creation of shareholder value.

Although the stakeholder model is intuitively appealing and received quite a bit of attention and research after it was proposed by Freeman, many major corporations today, perhaps most, operate within the shareholder value paradigm, within which one way to maximize shareholder return is to minimize the cost of human capital. It seems that this approach is increasingly prominent today.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Minimizing the cost of human capital has taken the form or outsourcing, offshoring, creation of part-time jobs with no benefits to replace full-time jobs with benefits, and the rise of the gig economy. Corporate donations in the political arena have led to legislation to break the unions (euphemistically called "right to work" laws), and stagnate the minimum wage. In most of the United States today, a minimum wage worker cannot, alone, afford the cost of an apartment that will house two people. Increasingly, workers must rely on public assistance in order to make ends meet. Meanwhile, executive salaries have risen to extreme levels, as have shareholder returns, resulting in widespread concern in the U.S. and elsewhere of wealth inequality (Benhabib, Bisin, & Luo, 2017).

Present-Day Implications of Governance for Satisfaction and Well-Being

The bulk of the most influential research on behavior in organizations was done before the shareholder paradigm was predominant. In evaluating the wisdom of the behavior in organizations findings reviewed above, one must take into account the psychological contract between workers and organizations that were present then, versus today. Corporate governance ran more along the lines of stakeholder concern than along the lines of shareholder concern. The psychological contract then was one of mutuality, recognizing that the worker is a valuable asset to the organization that must be protected, nurtured, and developed.

One might speculate that the shift from high stakeholder concern to high shareholder concern would predict an erosion of the mutuality and trust in the psychological contract. Although research in 1998 suggests no significant erosion of the psychological contract (Armstrong, 2006), the psychological contract under shareholder governance, by and large, is purely instrumental. Value is to be extracted from the human resources by any means necessary, including those that are not favorable to the workers. With mutuality out of the picture, this calls into question the generalizability of much of the organizational behavior research that was done before shareholder governance was prevalent.

Armstrong (2006) summarizes three research projects that reviewed the state of the psychological contract, one published in 1997, another in 1998, and a third in 2004. The pattern that would seem to emerge from this research is an erosion of the mutuality and trust of the psychological contract. In the 1997 survey, 90% of workers surveyed felt that they were fairly treated by their employers, while in the 1998 survey that figure was 67%. In the 1998 survey, 88% felt very secure or fairly secure in their jobs, while that figure was 63% in the 2004 survey. In the 1998 survey, 64% felt pay was fair, but in 2004 41% reported that they were either dissatisfied or very dissatisfied, with 26% reporting feeling neither satisfied nor dissatisfied (Armstrong, 2006). this could reflect an erosion of employee perceptions of pay. More recently, a Eurobarometer survey (April 25, 2014) of the 28 European Union states found that 53% of respondent workers felt that their working conditions were good, though 57% of the respondents also felt that their working conditions were not as good in 2014 as in 2009. In the years since, there has been a growing perception, particularly among the U.S. middle class, of growing wealth inequality, as well as an erosion of the buying power of workers' wages.

As stated above, organization commitment is the attachment that a worker feels towards the organization, and that it runs along a continuum, ranging from purely intrinsic to purely extrinsic. At the intrinsic end, it is termed *affective commitment*, while at the extrinsic end it is termed *continuance commitment.* Affectively committed workers are emotionally attached to the organization; they identify with the goals of the organization and want to be an integral component in the organization attaining those goals.

Continuance commitment is purely instrumental. The worker essentially does a cost-benefit analysis of her/his role in the organization, and connection to the organization and its goals is predicated on how

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

beneficial that is to the worker. When the combined intrinsic and extrinsic costs of staying with the organization exceed the cost of leaving, such as loss of pay and benefits an the psychological costs of leaving, the worker is likely to attrite.

Affective commitment, with its intrinsic focus, likely is an implicit assumption behind the research on the relationships between motivation and leadership, as well as research on job design, job satisfaction, satisfaction with leadership, and organization commitment. In organizations with a shareholder focus, the psychological contract is largely extrinsic, which calls into question both the findings of the research on worker satisfaction and wellbeing, and the prescriptive models based on that research.

So, of what value is all that research, if it is not generalizable to shareholder organizations? One may take note of the ideal states which that research describes, retain those ideal states as desiderata, and continue to examine the same relationships via research in organizations with a more shareholder orientation. One may also conduct research in organizations operating under both governance paradigms in order to more explicitly map the impact of governance model on those variables. In the end, noting the convergence of research done with respect to worker outcomes under both paradigms, it will be possible to compare the two governance paradigms in a meaningful, empirical manner.

Implications for the Fourth Industrial Revolution – the Future of Work

The foregoing discussion sets the context for considerations of the impact of the fourth industrial revolution (4IR) on the future of work and worker wellbeing. It is a future with mixed possibilities, with this era posing both threats and opportunities to workers and the future of work. Various possible outcomes are being predicted by expert futurists, including unemployment as high as 80%, stable job numbers but with increasingly unstable jobs (United Nations, 2018), and workers using information technology and social media to mobilize the workforce to mass action (Sourcewatch, 2017).

Overview of the Fourth Industrial Revolution

Philbeck and Davis (2018) afford a cogent overview of the fourth industrial revolution (4IR), noting that it builds off of the data-centric and rapid-communication capabilities developed in the third industrial revolution (aka, the information revolution), but while taking for granted the digital technologies which have enabled it. While the information age gave us knowledge on demand, 4IR gives us technologies and technological applications on demand. At the heart of 4IR lies artificial intelligence, robotics, advanced materials and materials fabrication, neurotechnology that interfaces between machines and the brain, genetic sequencing and modification, all of these "integrated into our physical, social, and political spaces, altering behaviors, relationships, and meaning (p.18)." 4IR poses both threats and opportunities for worker wellbeing and the future of work.

Threats

Threats to workers and the future of work arise in part from the advent of robotics, artificial intelligence, and the interaction between these. The incorporation of these poses a tremendous threat to the future of human work. Robots are already automating many low-skilled jobs, while artificial intelligence is automating many jobs that call for human-like judgment. Soon, a robot will be available for less than the annual cost of a full time human worker, capable of doing the workers' jobs. It will not require be-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ing paid, will never call in sick, can work virtually always without a break or time off. Large retailers like Wal-Mart are rolling out self-checkout kiosks, powered by advanced enterprise database systems, relegating low-skilled cashiers to the unemployment line. Autonomous vehicles are already in operation, and will become increasingly common, displacing millions of people who drive for a living. Artificially intelligent applications read CT scans with a higher degree of accuracy than the average radiologist, for a fraction of the cost. And artificial intelligence has acquired the ability to be self-teaching, and self-programming. This means artificially intelligent systems will soon be able to take over human jobs with high intellectual requirements.

Although estimates of future unemployment due to automation and artificial intelligence vary, it is widely acknowledged that there will be substantial job displacement, particularly for unskilled workers and women (Ugurlu & Pajo, 2019). An additional threat arises from business owners' recognition of these effects on the willingness of workers to work for lower real compensation and in less secure jobs, particularly in organizations that align with the shareholder governance model. And this is visible in the workplace today, via stagnating compensation, loss of job security, and rising concern for wealth inequality (United Nations, 2018). Further erosion of worker security likely would also erode the quality of work, work satisfaction, and even possibly general life satisfaction.

Opportunities

4IR, particularly in communications and social media, reflects among other things a revolution of consciousness, an enabling of the noosphere, or collective consciousness of humankind (Van Cleave, 2012). These technologies bring a tremendous structural fluidity to human interactions in the present, such as the emergence of social media as an instrument of mass human action (The Guardian, 2011).

The labor movement of the late 1800s into the early 1900s were a mass action that brought about workplace reforms that were needed to save workers' lives, and to give workers a decent standard of living. The unions, as well as the gains they won for workers, have been severely undermined over the last thirty years (Adler, 2006). But now, the information technology and social media are enabling mass actions on a scale unimagined by the union organizers of a hundred years ago, in part via a new form of organization, the self-assembling dynamic network (Matai, 2011).

A self-assembling dynamic network is a collective of individuals, sharing a common interest, who spontaneously come together, usually without formal leaders, who enact large scale change, then dissipate. Notable examples of this are seen in Arab Spring (The Guardian, 2011), and in the yellow vest movement in France (Al Jazeera, 2018; Cigainero, 2018). So while there are many threats to the future of work, the technology also offers this important opportunity.

Further, while lower skilled jobs will continue to be eliminated by automation and artificial intelligence, new jobs are being created in the areas of programming, technical support, and systems engineering (Ugurlu & Pajo, 2019). From the perspective of the job characteristics model (Hackman & Oldham, 1980; Hackman, Oldham, Janson, & Purdy, 1975), these will be jobs that are inherently high in intrinsic motivational content. However, unskilled workers will need to be trained (Ugurlu & Pajo, 2019), and not all workers possess the cognitive capacity needed to succeed in the training and on the job.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ONE POSSIBLE FUTURE

Assuming that technology and artificial intelligence do cause widespread unemployment, perhaps in the 40% range predicted by Pistono (2012), it might become necessary to tax automation (Abbott & Bogenschneider, 2018; Gedik, 2018; Zhang, 2019), and from those taxes institute a guaranteed minimum income for all. That minimum would be sufficient to meet most basic needs, but not so much that people would not be willing to work for the additional income. The concept of "working for a living" would become an historical footnote, with people taking on employment in areas in which they have a particular interest, calling, or passion, and in which they find a high degree of meaning and satisfaction. Alternatively, a guaranteed minimum income would free them to serve their communities in various ways. This being the case, the previous research on workers and organizations, predicated on a psychological contract with intrinsic qualities, would regain relevance.

Chapter 81
Management of Intercultural Relations in an Intercultural Organization

José G. G. Vargas-Hernández
https://orcid.org/0000-0003-0938-4197
University of Guadalajara, Mexico

Jeanne Poulose
Christ Institute of Management, India

ABSTRACT

The chapter aims to reflect on the management of intercultural organizational relations. It explains the transition of homogenous organizations into the culturally heterogeneous organization and compares multiculturalism with cross-culturalism in its ability to harmonize the principles of cultural diversity with universal ethical principles. It explores the process of creation of a third culture to foster understanding and acceptance among diverse teams. It attempts to establish the impact of intercultural interactions/relations on the effectiveness of a diverse team of individuals interacting in concert to achieve common goals. The work also underpins some analysis of the creation, development, and management of organizational intercultural capital. Finally, the emergence of the model of strategic management of an intercultural organization focused on learning and training for proper operationalization and implementation is proposed, and some challenges that could antagonize the teams are looked into and proposals are formulated.

INTRODUCTION

In the recent years, economic globalization, increasing complexity in organizations and high levels of uncertainty has contributed to the development and growth of institutions and organizations that are more diverse and multicultural (Cox, 2001, 1993, 1991). While diversity has always been present in organizations, even in those that appear to be homogenous, the level of differences has increased manifold due to

the opening up of international borders and the globalization of the entire production and manufacturing process. Thus, these newly evolved international enterprises have to constantly work on improving their ability to compete in an extremely challenging environment due to globalization, cultural diversity and shrinking of resources. Strategic Management is the key to ensure accomplishment of tasks as diverse teams are now called to perform in the context of globalization (Gardenswartz & Rowe, 1998). This has opened up discussions around the concepts of multiculturalism, with special emphasis on developing higher levels of sensitivity to cultural diversity amongst individuals in intercultural organizations.

The intercultural organization is located in two-way interactions between the reality of society and organizations. It is in this space that the essence of cultural diversity is rooted. The intercultural organization is a resource of culturally diverse individuals in terms of racial and ethnic heritage, gender and sexual orientation, age, physical ability, professional group, etc. The diversity of cultures can be explained from perspectives such as philosophy, emerging systems of complex interactions between cultures and human habitat and in terms of intercultural contacts. Cultural diversity is viewed as dynamic interactions between people of various ethnic-racial, social, religious and cultural backgrounds that are essential to the promotion of intercultural organizations. Religious expression is an important component of the intercultural organization as more often than not an individual's cultural values and beliefs are linked to their religious beliefs.

DEFINING AN INTERCULTURAL ORGANIZATION

The intercultural organization is defined in this analysis as a set of contacts and interactions that often occur among the various members of an organization having different backgrounds and cultural identities, in terms of language, values, attitudes, thoughts, emotions, actions, etc., and these, in turn, define their ways of being, thinking and acting, and developing an understanding of different lifestyles.

To understand the notion of intercultural organization it is essential to understand the concept of subjective culture rather than objective culture. Subjective culture is understood as the intangible part of the culture, which could include a pattern of beliefs, behaviours and values that are maintained by groups of people interacting. An understanding of this subjective culture allows analyzing the interactions between the cultures and offers an epistemological foundation for the differences existing between the local and international culture that goes beyond the historical, economic and political environment (Bennett, 2001a).

Intercultural interactions in organizations are mutually reciprocal between and within cultures. The prediction of the intensity and meaning of the intercultural relationship of the group itself towards its members has been the subject of various studies (Noesjirwan, 1978; Argyle et al., 1986). A study on Intercultural verbal communication relations (Gudykunst & Toomey, 1988) has developed various styles of direct communication. For foreigners, the development of intercultural relations with indigenous people is a complex task (Simard, 1981). This may suggest how the number of links with subjects of the indigenous culture can be an indicator of intercultural adaptation and of the level of intercultural competencies held by the subject (Kim, 1988).

The concept of intercultural adaptation is linked to the intercultural transition phase. The conceptual study of intercultural adaptation can be divided into two large domains, psychological and socio-cultural. The psychological domain revolves around the psychological transition. This refers to the effective and emotional components related to mental health like the general well-being, satisfaction with life etc. On

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the other hand, the socio-cultural domain refers to the behavioural transition. This focuses on the social competence and the ability to interact effectively in the host society (Ward et al., 1999).

The modernization process aimed at imposing homogenization and standardization of behaviours, attitudes, ways of being etc. Intercultural organization moves in exactly the opposite direction by promoting heterogeneous behaviours, attitudes, ways of being, and to assess resulting prejudicial stereotypes and mental structures.

DEVELOPING INTERCULTURAL SENSITIVITY THROUGH CULTURAL INTEGRATION IN INTERCULTURAL ORGANIZATIONS

People in organizations who are perceived to belong to two groups can develop intercultural sensitivity if they recognize that people of both cultures get the same fair deal from the organization and that no culture is considered superior to another. The development of organizational intercultural sensitivity designed to experience the cultural differences provides an understanding of how people construct and live. Intercultural sensitivity in organizations is a relevant component that complements the development of the mindset and the set of required skills of its employees. And it is these competencies that will give organizations an edge over their competitors.

The DMIS framework of intercultural sensitivity, proposed by Bennet is one of the most recognized contributions that delve into the dimensions of intercultural competence. This model tries to explain how people engage with others and react to cultural differences, beginning with denial the individual transitions to the acknowledgement of differences, minimization, followed by acceptance, adaptation and finally integration of differences. Mere adaptation will not ensure intercultural competence. The integration process by which individuals will understand, accept and imbibe in themselves the values from other culture by combining it with their own values will help build effective culturally diverse teams. The method of the Intercultural Development Inventory supports the conceptual, theoretical and methodological framework of Development Model of Intercultural Sensitivity to evaluate the intercultural sensitivity of people in organizations. Intercultural organizations occur because of the structures and behaviours that facilitate their members to act without prejudice or cultural bias (Dubrin, 2003).

In addition to the trials of global economic integration, religious and immigration issues pose a serious challenge to an organization dealing with a multi-cultural environment. It's responses to such challenges, in turn, decides its evolution, growth and the prospects it presents for the development of the society. Corporations seeking to operate in global markets assume that its people should know how to deal with the needs, desires and fears of its stakeholders like employees, customers, consumers, suppliers, governments, etc., in this multi-cultural environment, whereby each of the agents will try to accommodate each other. However cultural differences may most times be the source of confusion and misunderstanding in the Intercultural interactions in organizations. One of the most widely used frameworks to analyze the impact of the cultural differences on the values of members and their behaviourespecially in the work context developed by Hofstede is built around dimensions like individualism/collectivism, tolerance for ambiguity, social roles, time orientation, the distribution of power in the society etc.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

EMERGENCE OF THE THIRD CULTURE THROUGH INTERCULTURAL INTEGRATION

The cultural differences between people of different cultural backgrounds working in the same team or project are an opportunity for synergy. Each of these individuals has a responsibility to adapt and get to model behaviours that are competitive across cultures creating a third culture throughout the organization. The integration process enables creation and development of the hybridized third culture in the intercultural organization. The third culture has a set of new beliefs, values etc that are mutually acceptable and fosters positive relationships among individuals from diverse cultures within the organization (Casmir, 1997).

Contacts and cultural interactions in organizations mandatorily take place on the job and in social contexts, regardless of the interests of individuals from different cultures to meet other people with different cultural backgrounds (Allwood et al., 2007). Such intercultural interactions in the organizations foster comprehensive mutuality, reciprocity and equality. Intercultural contact is as much a condition as a result of the functionality of intercultural relations in organizations that support and strengthen working environments, where members maintain equitably cooperative and socially acceptable relations with the rejection of negative stereotypes (Aneas, 2015). In an intercultural organization, business objectives and universality of ideas come together, leaving room for further cooperation between the organizations.

RELATING INTERCULTURAL CAPITAL WITH ORGANIZATIONAL SUSTAINABILITY

The term cultural capital proposed by Pierre Bourdiew viewed it in an economic sense as the repository of cultural knowledge of individuals in the society. Cultural capital thus consists of the store of social assets like education, skills, attire etc. that helps individuals by giving them mobility in a diversified society. Intercultural capital, however, consists of the stock of forms and types of symbolic capital fashioned from several cultures. Such intercultural capital is represented through the thoughts, emotions, values, experiences, skills and competencies etc. that gets revealed in the ways individuals be, act, think etc. The background and cultural features that shape the identities of the organizations, behaviours, values, attitudes, perceptions, etc., influence the development of organizations. This store of values upon which the structure of each society is characterized and that makes it different from others is referred to as cultural capital (Throsby, 2005). Among the core values that are considered desirable in organizations are integrity, power levels/distances, the purely cultural aspects and respect (Himmelstern, 2007).

Intercultural experiences are internalized in individuals with common meanings to generate organizational synergy and empathy thus positively influencing the performance of intercultural groups. Diversity in organizations and the multicultural diversity in intercultural organizations have an impact on competitiveness and organizational performance (Cox & Blake, 1991; Cox, 1991, 2001; Milliken & Martins, 1996; Thomas & Ely, 1996; Williams & O'Reilly, 1998; Pelled et al., 1999; Bezrukova et al., 2003; Jackson et al., 2003; Joshi & Roh, 2009). Intercultural organizations ensure the mix of individuals with diverse ethnic and racial origin, gender, religion, beliefs, values, etc., with the ability to influence its internal work environment in accordance with the society in which it is immersed. Organizations with a wider range of the population are more sensitive to understand the nature of intercultural organizational needs, desires and fears of prospects and customers and therefore provide satisfaction, services and

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

products of superior quality (Adler, 1983; Griggs, 1991; Gasorek, 1998; Gardenswartz & Rowe 1998, 1994; Susaeta & Navas, 2005).

In this atmosphere of cultural diversity, the interactions among individuals to implement the corporate and business strategies, policies and plans results in the development of joint projects results in tackling quickly, problems that would otherwise require long periods of time to resolve. The cultural capital offers sustainability to organizations by drawing upon the resources; the technical expertise and intercultural competencies that are picked up during the interaction of different national cultures give the organization an edge to compete.

DEVELOPMENT OF INTERCULTURAL TEAMS

The development of intercultural competences is the result of complex processes that require time and abundant resources. Organizations and corporations that will dominate the 21st-century global market are those who are able to realize their full potential of intercultural capital in human resources and group teams. The development of intercultural competencies has implications for people and organizations that have to work in intercultural environments and global contexts.

Distefano and Maznevski (2000) typify the intercultural teams as being destroyers, equalizers or the creators. Destroyers are basically disasters since team members do not trust each other and destroy value. Equalizers do not create any additional value but team members successfully smooth over any potential conflict to meet the objectives of the organization. The creators are the exceptional performers who recognize the explicit differences, appreciate it and to a large extent even nurture these differences. Such intercultural teams benefit from cultural synergy.

The ethnocentric approach wherein the recruitment to key positions in the international organization is almost always from the parent country, contrasts completely with the acquisition of intercultural organizational capital because it is based on prejudices and stereotypes rather than cultural generalizations based on serious research on culture.

The processes of creation, capture, development, integration, retention and administration of this intercultural capital, clearly go beyond the geographical frontiers. It is in this sense that Alcázar et al. (2012) opines that diversity of human capital is a concept formed by demographic attributes such as age, gender, nationality, education, type of training, status in employment, and functional expertise. Hence there is a direct relationship between human capital attributes including knowledge, experiences, cognitive styles & values and demographic distinctions in a team.

The policy-oriented intercultural organizations provide intercultural diversity training programs and other human resource development initiatives to strengthen this area through a process of integration of diversity training into other corporate training programs and inclusion of this content in every sphere in the organization, for instance including questions pertaining to cultural awareness in the recruitment process, discussions on cultural differences and its impact on sales at different times in different regions.

INTERCULTURAL TEAMS IN MULTICULTURAL ORGANIZATIONS

Multiculturalism as a dynamic and dialectical process recognizes the existence and convergence of various cultures in a space between the local and global processes that intersects social and cultural networks

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

articulating personal and collective identities (Hall, 1973). Organizations that promote multiculturalism allow a diversity of individuals from various cultural groups with equal status to function side by side, manytimes though isolated from each other.

In a multicultural organization, tolerance is valued and differences are celebrated in cultural expressions but the deeper differences of power are left untreated and exchange among the different groups only focuses on the representation, i.e., interactions are required only at a superficial and friendly social interaction level (The United Church of Canada, 2011). A cross-cultural organization moves beyond the superficial level and promotes learning and sharing of various cultures. An Intercultural organization works at a much deeper level by helping to forge strong relationships such that they understand and respect each other's cultural backgrounds.

ANALYSIS OF ORGANIZATIONAL INTERCULTURAL RELATIONS IN DIVERSE TEAMS

The theory of social penetration analyzes the dimension of intercultural relations (Altman & Taylor, 1973) as in the case of relational networks from the intercultural perspective that provides feedback to the new environment. This theory also referred to as the onion theory explains how people develop relationships with people across cultures gradually as they involve in self- disclosure at various levels beginning from superficial to the intimate, which is akin to peeling off the layers of an onion to get closer. The rise of electronic media has made it easier and faster to develop economic contacts and cultural interactions in organizations. Individuals in organizations establish contacts, meetings and cultural interactions, facilitated by organizational mechanisms not only of groups and teams but as in other gatherings, joint projects, negotiations, etc. Interactions in social structures are defined by values such as justice, freedom, equality, mutuality, diversity, respect, understanding, acceptance, peacebuilding, etc.

The analysis of the intercultural context of a company or organization must begin by looking at the objective of the verifiable and operative symbols and continue with the subjective and unconscious aspects of the members that share the same cultural background while closely monitoring their social and functional relationships that identify interculturality. Intercultural relations are analyzed from the perspective of the relationships between people of different cultures and between groups of cultural diversity that interact with each other. Likewise, interculturality can be analyzed from the inertia and dynamics as determinants of the relationships between cultures. As the word itself denotes inter meaning between, interculturality is concerned with the relations between cultures and interculturality in organizations can be analyzed by observing the conditions in place to promote the development of relational networks between various cultures.

The analysis of the intercultural organization phenomenon is based on the understanding of the interrelationships in the cultural diversity of individuals interacting in concert to achieve common goals. Intercultural relationships in organizations start with the first contacts and intercultural encounters with people who have a variety of ethnic and racial attributes of color, creed, gender, religion, etc. The analysis of intercultural organization offers tools for strategic management of ethnic-racial, religious, gender and sexual, differences of individuals who are members of organizations. Intercultural organization strengthens when reference frameworks of most universal cultures under trans-disciplinary approaches of sociological research, communication, anthropology, economics, etc., are analyzed because they provide knowledge and methodological tools for analyzing cultural differences and contrasts. However,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the complexity of the analysis of cultural differences in cultural diversity is a limiting factor for inter cultural management organizational groups and teams without having the tools that the precise situations call for in specific cases.

The analysis of cultural interactions are erroneously based on generalizations that do not always have specific applications to culture groups, such as cognitive style that can be concrete or abstract, communication style that can be high and low context, the use of language in the rituals of verbal greetings, nonverbal behaviors in visual contact, etc.

EFFECTIVE INTERCULTURAL INTERACTIONS

There has been very little research done on why and how some individuals are better off in culturally diverse situations. The multidimensional construct metacognitive CQ developed by Earley and Ang (2003) is one among the very few contributions that tries to address this need. CQ is nothing but cultural intelligence and is defined as the ability of individuals to function and manage effectively in intercultural interactions through cognitive, metacognitive, motivational and behavioural components. Therefore, intercultural organization reflects the metacognitive i.e., the mental capacities of the individual members used to acquire and understand cultural knowledge, which also includes knowledge of individual thinking that originates from the culture of the individual (Flavell, 1979).

While the metacognitive CQ focuses on the higher order thinking process, the cognitive focus on development of knowledge of the varied customs, practices and treaties in different cultures that arise due to their varied educational and personal background. People with high cognitive CQ understand clearly the differences in cultures because of their knowledge of the legal, social and economic aspects of various countries and their cultural values. Motivational CQ is defined as the ability of the individual to learn and the attitude developed to manage culturally diverse situations effectively. People with high motivational CQ possess the innate desire and the drive to deal with cross-cultural situations owing to their self-belief, i.e., confidence in their own effectiveness. Similarly, individuals with high behavioural CQ will speak and act in the appropriate manner during their intercultural interactions.

Mono-culturalism and little intercultural interactions in organizations as a phenomenon coupled with prejudice can lead to a variety of dysfunctions and organizational deficiencies. To reach the level of intercultural organization requires moving from an exclusionary mono cultural organization of minorities to an intercultural organization inclusive of all groups and minorities around values-centred in the diversity and intercultural relationships between members.

The various dimensions and components of the national culture are factors that influence decisively in the interactions, relationships and behaviours among individuals and organizations. The determining factors in the intercultural relations of the dominant groups are the expectation of result, intra-group bias, and similarity (Piontkosky et al., 2000). These relational factors can become more important than the technical factors as they affect strategy and management (Trompenaars, 1993), and therefore organizational performance (Whiple & Frankle 2000).

Differences of culture in organizations have an influence on the contacts and interactions of intercultural organization (Hamada, 1989; Garsten 1993). Organizations seeking to reach diverse consumers and markets (Gomez-Mejia et al., 2001) require the creation and development of an organizational culture focused on diversity and plurality that is based on the promotion of values, behaviours, attitudes, activities, ceremonies and rituals that encourage intercultural organizational processes. The organizational culture

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

or corporate culture is rooted in the values of the founders converted into common practices and rules for members of the organization, where differences are understood and valued (Hofstede, 1999, p. 19).

CHARACTERISTICS OF INTERCULTURAL ORGANIZATION THAT FOSTERS INTERCULTURAL RELATIONS

The intercultural organization offers conditions of support and help to its members to adapt socially, to integrate culturally and improve their psychological health and their professional competence by exhibiting a high level of acceptance of differences. Members having an equal status, free of negative stereotypes, cooperative relationships with a high level of acceptance in a climate of social support are necessary prerequisites for improved intercultural relations. The intercultural organization facilitates creating inclusive work environments, to respect and promote its vision, cultural values and sustainability of local communities where they operate, to establish more effective cooperative relations with investors and suppliers, to promote investment in social programs, to meet and satisfy the needs, desires and specific fears of the different segments of prospects and customers.

The intercultural organizations are characterized by sidelining of individual subjectivity, tasks and labour relations, analyses of contextual influence, promotion of learning processes, data analysis and complex decision-making and the integration of cognitive, emotional, attitudinal and behavioural components. The intercultural company has among other elements of its organizational dimension, the activities it carries out, the coordination of its components and its interdependence with its environment. In the specific case of an intercultural organization, the above elements are determinants that foster attitudes of respect, transgression, relativization and negotiation of organizational norms.

Cognitive, emotive determinants and individual aspects are closely linked to intercultural relations. Cognitive determinants refer to the accumulation of information and knowledge that a person has in an intercultural relationship, many of which have a level of uncertainty that affects the same relationship (Gudykunst & Shapiro, 1996). However, in the intercultural organizational processes cognitive and emotional elements overlap. Intercultural processes benefit from the changes through interaction with others (The United Church of Canada, 2011).

The socio-cultural characteristics of the members of an organization are crucial to the diversity of relationships and interactions in intercultural organization, which can identify differences in membership and group memberships that are significantly different in their culture, their characteristics and personal attributes (Cox, 1994; Harrison et al., 1998; Milliken & Martins, 1996). The interaction between people of different cultural groups helps them to learn and grow together, develop interactions, share knowledge and experiences with each other. The personal characteristics that manage intercultural relations influence the adaptation of people to the new culture (Kealy & Ruben, 1983; Caligiuri et al., 2000). Some of the factors that influence the control and management of effective processes for intercultural adaptation are the openness of mind, flexibility and predisposition to change. Flexibility in intercultural relations fosters effective and creative responses. Adaptation to a new cultural environment requires better intercultural relations, particularly good communication (Kim 1988, p. 35).

APPROACHES AND MODELS OF INTERACTIONS IN INTERCULTURAL ORGANIZATIONS

Primarily three different approaches are used to research communication or interactions/contacts in intercultural organizations that include the interpretive approach, the social scientific approach and the critical approach. As per the social scientific approach, the interaction patterns within the organization are studied, understood and explained using some measurement of key variables. The interpretive approach emphasizes the context in which the interactions are manifested. The interactions are explored from the perspective of the employees from various multicultural communities. The critical theory approach analyzes the interactions under historical contexts of power. It involves the collection of data of a qualitative nature to understand the differences that exist.

Research has identified three different perspectives on workforce diversity, the integration and learning perspective, the access and legitimacy perspective and the discrimination and fairness perspective (Ely & Thomas, 2001). Such studies have shown further that organizations that practice intercultural diversity within teams tend to be more effective (Cox & Blake, 1991), while diversity can also reduce effectiveness unless the performance efforts are integrated. Such integration is possible through communication (Maznevski, 1994).

The intercultural organization is expressed in contacts and interactions between people with different cultural backgrounds. The use of intercultural empathy generates an appropriate temporal behaviour to the cultural objective. Intercultural empathy is related to the change of frameworks which involves temporarily removing their own assumptions about global views and temporarily replacing them with a different set of values and beliefs. These intercultural organizational capabilities that emphasize intercultural interactions and exchanges of information among team members working from different cultures, allow questioning the cultural assumptions and make adjustments in mental models (Nelson, 1996) with a high impact on organizational performance.

The model of intercultural relations from the social perspective influences the effectiveness of intercultural relations (Kim, 1989). The process of social relationship that leads to intercultural effectiveness is the cultural adaptation of various components and dynamics of a person that allows them to adapt to a culture that is not their own. The intercultural and interpersonal relationships determined by the proportion of intercultural contacts encourage processes of integration and intercultural adaptation. The evolution of the mood of a foreign person in a situation of interculturality oscillates between the initial euphoria and depression that improves when he adapts to the new intercultural environment.

The interculturality model of Ward (1996) based on the works of Lazarus and Folkman (1984), Ward (1988) and Berry (1994), incorporates personal and contextual variables that show the complexity of intercultural relations between people of different cultural backgrounds that demand answers at cognitive, affective and behavioural levels. Ward proposed the adaptation frameworks of stress and coping, cultural learning and social identification. The model of cultural integration developed by Berry, Trimble and Olmedo (1986) and extended by Berry1994) considers two dimensions in the results of intercultural relations or acculturation: cultural identity and relations with other groups. Assimilation into the dominant culture, separation from the majority culture and maintaining own identity, integration with the dominant culture yet maintaining individual identity and finally marginalization which involves remaining detached from both own and dominant cultures are four acculturation strategies proposed by researchers (Berry1997). In the model of threats to intercultural relations of Stephan, Stephan and Gudykunst (1999: 62) based on the conflict theory of Bobo (1983), distinguishes the real threats from

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the symbolic or perceptual, anxiety and negative stereotypes. Intercultural skills that reduce these factors favour better intercultural relation and globalization processes raises the need for cultural integration that is in contradiction with the model of intercultural organization based on multiculturalism. Intercultural interactions of organizations deepen more in cross-cultural models rather than the cross-cultural models.

MANAGING INTERCULTURAL ORGANIZATIONS

Management of intercultural organizations is manifested in the very nature of intercultural relations in organizations that operate in environments of globalization and the resultant boundary-less competition. This evolutionary process of managing an intercultural organization is expressed in developing and adaptation of sensitivities of a global culture of organizational behaviours, processes, products and services in tune with the communities they seek to serve. Organizational management is an imperative of intercultural organizations, especially companies that are at the forefront of dealing with global intercultural issues. They have already begun work on intercultural management and potential experience in tools to try to accomplish common goals and to work in a global environment. Entrepreneurial collaboration, targeted deliberately, encourages intercultural organizational foundations for peace.

The psychological, social, cultural and economic welfare of the members of an organization are the objectives of an intercultural organization. Stephan, Stephan and Gudykunst (1999) developed the theory of intergroup threat that speaks of the psychological-emotional processes that individuals go through when they perceive another group to be in a position to harm/hurt them. Intercultural organizations distinguish consciously perceived real threats to economic, social and political system symbolic or different perceptions of moral, religious and other values derived from the interpersonal and intergroup relations and negative stereotypes. In managing organizational intercultural relations, psychological health harmoniously integrates cognitive, emotional and behavioural components (Alvarez, 2015). Intercultural relationships are linked psychologically with the anxiety and shock that the person must face and manage (Stephan et al., 1999). The theory of anxiety/ uncertainty management, developed by (Gudykunst, 1993, 1995, 1998) assumes influences on intercultural competences (Gudykunst & Nishida, 1999; Hubbert et al., 1999).

There are numerous initiatives to promote intercultural organizations best practices that are dealing with different aspects of the business environment. Business organizations have a very important role in promoting an intercultural organizational environment to emerge from the operating levels of the organizational pyramid base and connect to the management level for achieving the objectives. Intercultural organizational exchange can be promoted by business organizations in broader communities through investments in social programs, philanthropic support, etc. The management of the intercultural organization has to use available resources to develop the capacities to promote behaviours, attitudes, skills and abilities to facilitate the interrelations between individuals beyond their personal differences of gender, race, religion, lifestyles and social attitudes (Dubrin, 2003). These social programs are aimed at the intercultural organization through managing the impact of their business sensitivity to local cultures and defend their strategic and political decisions that encourage social relationships in the intercultural organization.

The management of intercultural organization can be oriented instrumentally to create a competitive advantage, but its scope would be very limited because of its pragmatism. Managing intercultural diversity in organizations can benefit by offering advantages in marketing, cost reduction by reducing

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

staff turnover and absenteeism and increased job satisfaction. Thus, in this way it has achieved greater cultural diversity with the participation of workers from minority groups (Cox & Blake 1991; Orlando, 2000). As an example, the case of coworkers who are subject to a climate of competitiveness and tension that hinders their relationship despite many years working together and claiming the value of an intercultural relationship understood as satisfactory, fair and symmetrical (Amir, 1976; Pettigrew, 1986; Tzeng & Jackson, 1994).

Therefore, intercultural management organizational moves away from standardization processes of organizational behaviour to develop the knowledge of individuals to be full integration with the rationale of the organization. It is in the connection between the different levels of the organizational structure that processes intercultural organizations have an important role because they eliminate discrimination and stereotypes, demystify privileges through intercultural dialogue processes to build confidence and a sense of common purpose

STRATEGIC MANAGEMENT OF INTERCULTURAL ORGANIZATION

Few business organizations take the intercultural organization approach as a strategic vision of sustainability and philanthropy to support the development of their communities by addressing their critical needs, make social investments that encourage sustainability, working in partnership with government and civil society. Organizations, especially business firms that have greater clarity in their view, have an interest in supporting the efforts of communities to promote the principles of intercultural, cooperative relations, sustainability, tolerance, etc.

It is in this sense that the promotion of the principles and values of intercultural organizations are seen as part of the organizational approach to sustainability. This is reflected in its programs to promote intercultural understanding through sustainable business practices such as human rights, rights in the workplace, business peace, diversity, etc. Such concrete actions are not limited only to the workplace; companies are known to have initiated innovative ideas to promote intercultural understanding even in the marketplaces, the communities and in the society at large. A stable non-polarized economic environment is beneficial to all the stakeholders and intercultural organizations foster the development of such an environment.

The intercultural organization is the source of all creativity and innovation. Among the findings of research conducted in the intercultural organization, it has been found that the most creative and innovative organizations have diversified groups and teams and greater results in reducing racism, classism and sexism (Kanter, 1983). The intercultural organization is created and sustained through knowledge management and experience of unity and oneness of humanity, recognizing its cultural diversity based on respect. These capabilities of mental consciousness experiences and standards for cross-cultural interactions include planning processes, monitoring and review of mental models.

Under this assumption, the intercultural organization is an organizational philosophy that influences the contacts and interactions of individuals in organizations, societies and cultures. In intercultural organizations, diversity and plurality of individuals and groups contribute to complying with the organizational mission under the support of an organizational philosophy. The organizational values of equal opportunities, open communication, gender equality, fraternity group, labour justice, etc., have their sustenance not only in organizational philosophy but in the individual conviction that engenders

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

an atmosphere of diverse intercultural acceptance. An organizational environment where these values are always present reduces polarization and cross-cultural tensions among the employees.

Inclusive policies and citizen participation guarantee social cohesion of civil society. The intercultural organization empowers various actors and stakeholders' ensuring their involvement in the organization with behaviours and attitudes that create an organizational climate and a favourable working environment for carrying out the processes of strategic management, production, distribution and consumption of goods and services. In addition, intercultural organization ensures integration of organizational structures so that all members have the same opportunities of access to the benefits offered by various positions without any benefits accorded on the grounds of religion, ethnicity, race, gender, etc. (Foster et al., 1991).

The intercultural organization face challenges in formulation and implementation of policies. Infact at the core of strategic management in intercultural organizations lays managing cultural difference. This is so because this involves the integration of diverse individuals in organizations who have their own paradigms rooted in values, norms, beliefs, attitudes, emotions, feelings, etc., which are vastly different from others. This diversity of deeply held individual paradigms, in turn, makes the organizational integration processes difficult as here what matter is a collective contribution.

The intercultural organizational environments affect strategic management due to the differences induced by different cultures. Conflicts caused by the dysfunctional management of diversity and intercultural organization generate high levels of stress that lead to attitudes of intolerance, aggression and lack of acceptance of others in the organization. In the strategic management processes of goal setting, strategy formulation and implementation, intra and inter intercultural conflicts arising from cultural differences and diversity are common. They constantly threaten the ability of both local and global organizations (Bendick & Egan 2008). Organizational diversity and intercultural understanding have an impact on the management of intra- and inter-organizational conflicts (Pelled et al., 1999). Innovative business practices promote intercultural relations of cooperation in conflict or post-conflict situations. Risky investments in conflict situations can provide an interface for contacts and interactions between the communities involved, resulting in shifting the focus away from the conflict to business activities aimed at profits.

ORGANIZATIONAL LEARNING AND INTERCULTURAL TRAINING

Intercultural organizations systems have characteristics that are learned transmitted and facilitated through the development of social skills that focus their action on communication patterns to members of different cultures. The most advanced stage of intercultural organization communication is developing the inter-linkages and establishing permanent ties to build a solid organizational reputation. The new media and intercultural organizational communication processes are essential in identifying the collective identities for both the institutional and organizational changes.

The phenomenon of intercultural organizational communication is complex because it involves many individuals who have heterogeneous cultural backgrounds. Every language and culture has distinctively different symbols related to different emotions and feelings. In intercultural communication, language and symbols and representations as not discursive and they are affected if they do not have common codes for representing thought forms, emotions, feelings, ideas, values, etc., and which are common to a community, village or nation.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

There is an increasing need for organizations to manage processes to ensure intercultural learning to value differences in a diverse but globally connected world and additionally form the inclusive mindsets and attitudes among investors, suppliers, employees, customers, prospects, levels of government and other stakeholders in local communities in general. For contacts and interrelationships between cultures to be more effective, recognition of cultural differences is important, under the conditions of having an intercultural mentality, intercultural sensitivity and intercultural skills (Hammer et al., 2003; Bennett, 2001a, 2001b, 2001c; Bennett, 1993).

The discussion on intercultural competition has been around for some time now. In recent years the field of organizational multiculturalism has seen the development and use of the theoretical framework and some methods of intercultural competence that aims to help global leaders learn to learn in intercultural or multicultural situations. It is in the cultural interfaces where intercultural organizational processes are developed and results in the generation of intercultural skills such as mediation, empathic abilities etc.

The intercultural organization is geared more to the creative development of competencies rather than to consider the limitations of traditional academic programs. The intercultural organizational mentality has to be established before the skills and competencies are acquired by individuals. In intercultural organizations, intercultural competence is a valuable skill. This is an outcome of integrating exercise, which according to Aneas (2009) emerges when symmetry conditions are presented in intercultural relations through the psychological, social and cultural integration of all members working in the legal, fair, equitable and cooperative environment for achieving common goals.

The intercultural organization encourages administrators in the development of their intercultural mentality and skills to adapt to situations that require intercultural competence. The leader with intercultural organizational mentality recognizes global corporations that gave origin and administer third cultures that went on to become dominant cultures in the working lives of those organizations (Bennett, 2001a).The intercultural competence is developed in the intercultural organization by integrating cognitive, emotional, attitudinal and behavioural components of all members of the organization and the design of structures, processes and technologies, culture and organizational strategies that interact with the environment. This ensures fulfilment of their duties through intercultural relationships despite an increasingly complex and uncertain environment.

The development of intercultural competencies is essential for the development of intercultural dialogue in organizations. These skills are defined as the complex skills necessary for effective and appropriate performance when interacting with those who are linguistically and culturally different (Fantini, 2007). These skills are added to the curriculum of learning organizations to learn continuously in global environments to think globally and act locally. For example, racial and cultural imbalances of power are treated in such a way that people learn from each other and change. Organizations promoting intercultural structures focus on building deep contacts and relationships between people and interactions for mutual benefit, respect and learning from each other. Managers of organizations recognize the importance of education programs supported by governments and academics for organizational learning and intercultural training. The international BMW Group award for example, given annually rewards contributions in intercultural learning. The prize winners are recognized and rewarded for conceiving and implementing new ideas and projects that are exemplary and deal with issues revolving around learning form diversity.

The importance of intercultural organizational learning cannot be emphasized enough. Learning about other's cultural values, norms, beliefs, learning styles etc. helps employees in such organizations to acquire new skills and knowledge that facilitates shared understanding and knowledge transfer. This

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

will benefit both the individual and the organization by fostering commitment from a diverse group of individuals.

The intercultural organization is an ethical imperative for respect, dignity and tolerance for cultural diversity. The formation and maintenance of organizational values are central to the philosophy of the organization, which serves as a guide to ethical behaviour and pluralistic conduct, which in turn influences the formulation and implementation of strategies and policies that govern action. Experience and positive attitudes of people who exercise an intercultural ethics contribute to the development of intercultural mediator activities in organizations. As a strategy, the intercultural organization requires committed leadership with the formation of behaviours and structures centred on the assessment of organizational culture focused on prioritizing the plurality resulting from diversity. The organizations involved in the exchange of training programs to create organizational intercultural knowledge, build the necessary structures and develop the competencies and skills.

Intercultural organizations consciously develop expatriation policies for executives and employees involving a stay of long duration so that a global perspective is developed. Employees, who are expatriates working in international projects in a subsidiary of the same corporation in a host country with a different culture and diversity, need to adapt to the new culture through support programs of training, including intercultural organizational diversity management and provide them with the plurality of actions in structured experiences (Rubio, 1999).

OPERATIONALIZATION AND IMPLEMENTATION OF ORGANIZATIONAL PROGRAMS TO FACILITATE MULTICULTURALISM

The diversity in the intercultural organization can emerge into a competitive advantage for organizations (Dubrin, 2003) with the implementation of strategies and organizational structures that facilitate behavioural processes, communication and attitudinal change among members. The implementation of programs to promote multiculturalism through dialogue, practical and culturally sensitive activities etc., contributes to improved relations with all internal and external groups of the company stakeholders in the local community.

Due to the scale and scope of operations in intercultural organizations, such programs encounter geographical and cultural differences and challenges. HSBC, for example, promotes exchange programs in the context of an intercultural organization where the core of the brand is the cultural heritage. This is essential in innovative marketing initiatives aimed at different customers, and culturally sensitive to the principles of sustainability with various suppliers' promotional programs. Business organizations can play an important role in the promotion of intercultural organizational values in the area such as corporate social responsibility and organizational sustainability by including intercultural issues such as human rights, labour rights, ethical principles in business, responsible marketing approaches, support for community projects and tolerance in society. Tourism activities contribute to local economic growth and cooperation between countries, facilitating organizational intercultural cooperation for developing joint projects and joint marketing activities.

Representatives of international business organizations such as the Alliance of Civilizations of the United Nations and the Global Compact of the United Nations recommends the development of intercultural organizations to expand collaboration between business, governments and civil society due to their common shared interest of global sustainability. These United Nations programs were inspired by

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the interests exhibited by the business communities' and the support they extended to the creation of groups comprising of people from civil society, businesses and government and providing them with a platform for discussion of common cultural concerns and challenges& knowledge sharing.

The implementation of strategies for the development of intercultural competencies of individuals in organizations is based on the intercultural sensitivity to particular issues that need to be resolved. To achieve intercultural sensitivity in organizations, people require intercultural skills training to recognize and experience cultural differences so that they can adapt well to their organizations. As intercultural sensitivity increases i.e., perceptual organization of cultural differences heightens, the sophistication in the experience of culture increases. Once that is achieved and such sensitivity in intercultural organizations helps acquire the competence to differentiate cultures against generalizations, so that an open and learning approach to cultural differences is maintained. People who achieve the level of sensitivity in the intercultural organization are able to adapt to another culture without degrading either their own culture or the other culture.

INTERCULTURAL ORGANIZATION AND DYSFUNCTIONAL GOVERNANCE

Organizations that are diversified across cultures tend to facilitate the development of the potential of the individuals involved in the various activities and functions. The cultural, social, ethnic, gender, religion, etc., differences represent serious obstacles that can lead to conflicts and intra organizational dysfunctions. In part, this dysfunctional organizational diversity and intercultural organization are due to the lack of a management system that relies on policies and strategies that support governance processes focusing on intercultural organization and organizational diversity.

The interactions and relationships between individuals within organizations are complicated by the complexities of communications arising from the diversity of languages, technicalities, verbal language, idiosyncrasies, etc. These lead to misinterpretation, distortion of meanings, misunderstandings, etc. The oil company Shell has established a set of principles relating to cultural practices through diversity, leaving out those local considerations that are considered dysfunctional as corruption (Shell, 2015).

It is questioned whether the intercultural organization can harmonize the principles of cultural diversity with universal ethical principles thus going beyond the ethnocentric approach. The firm Deloitte emphasizes its shared corporate values underlying the harmonization of both approaches i.e., ethnocentrism and multiculturalism for cultural diversity (Deloitte, 2011; Sandford & Mohlemkamp, 2015).

Some of the barriers to achieving intercultural diversity in organizations (Triandis, 1994) are prejudice, errors in individuals own assessments, in addition to the intercultural approach such as ethnocentrism, which is the consideration that the own culture is the best in the world. Other barriers are created by disorientation, anxiety and tension during interaction in intercultural organizations (Ramirez & León, 2008). Contacts and intercultural encounters between individuals in organizations always involve cultural tensions depending on the value system and the context in which such organizational intercultural interactions occur.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

AUDITS OF ORGANIZATIONAL DIVERSITY

Identifying correctly the causes of dysfunction is the key to success in intercultural organizations. There are a number of methods and tools to perform these organizational diagnoses among which audits of organizational diversity that determines the main causes of the low presence of intercultural sensitivity is perhaps the most significant. Appropriate techniques of organizational development are then used to intervene to improve the situations.

The identification of best practices through such diversity audits will help to foster understanding and intercultural dialogue needed to share the progress with a wide range of organizations. The positive assessment of intercultural relations benefits and maintains the permanence of diversity and intercultural contacts. Responsiveness, compliance and value of the results (Aneas, 2015) are components that promote a climate of contacts and growth of intercultural relationships in organizations.

INTERCULTURAL MANAGEMENT OF ORGANIZATIONS

The intercultural organization can be a company in an environment where the members belong to different cultures. The intercultural organization has processes and dynamics of a psychosocial nature that are generated by the interactions between people of different cultures within an organization, which can be a company. These interactions serve as the basis to conceptualize the answers in terms of intercultural competences among the members of the organization or company. In a company, the group as an object of attention to intercultural relations is relevant, as well as inter-group intercultural relations (Berry et al., 1986; Kim, 1988a, 1988b, 1989). The contact hypothesis establishes that it is the nature of contact that generates favourable attitudes in inter-group relations between groups in intergroup behaviours (Allport, 1955; Pettgrew, 1971).

A member with a positive expectation of intergroup intercultural management relationship in the company and who makes a hypothesis about the outcome of their intercultural relationships has higher expectations of self-efficacy (Blake & Mounton, 1986; Rabbie & Horwith, 1969; Sherif, 1979; Bobo, 1983).

Intercultural integration to a company, for example, is subject to levels of individual social determinants such as cultural and racial origin (Kim, 1988a, 1988b), intercultural sensitivity (Bhawuk & Brislin, 1992; Bennet, 1993), personality attributes (Kealy & Ruben, 1983; Caligiuri et al., 2000; Fiske & Maddi, 1961; Bradburn, 1969; Quisumbing, 1982; Yum, 1987; Kim, 1988a), open-mindedness (Jantsch, 1980; Furnham, 1984; Baldassini & Flaherty, 1982; Cort & King, 1979), and Flexibility (Lazarus, 1966).

Intercultural adaptation refers to the harmonious integration of cognitive, affective and behavioural components, both with their own and the new environment.

The stress generated by intercultural shock frequently manifests itself aggressively.

Interculturality in a company promotes intercultural relations among all groups and members and intercultural competencies are exercised (Bartolomé et al., 1997; Banks, 1997).

The constitutive element of organizational interculturality is the culture of the people that are part of the organization, as well as the influences of social elements, the dynamics and psychosocial processes determined by the environment, people and groups.

Intercultural relations also generate dynamics of a psychological nature.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The intercultural company is integrated by the intercultural interactions of its members in an economic, social, cultural, legal, institutional and labour context.

CHALLENGES FACED BY INTERCULTURAL ORGANIZATIONS

The intercultural organization face several challenges as they tend to employ people from different cultural backgrounds, belief systems, values, languages, customs, etc. Both cultural universalism and relativism point to the fact that diversity in the cultural background of the people is the cause of continuous clashes and conflicts (Donaldson, 1996). Among the challenges facing today's organizations is the need to promote an intercultural organizational platform that supports diverse subcultures of members and encourage processes of cohesion and group integration resulting in the development of opportunities and meeting the needs of those involved.

The intercultural organization is challenged by the emergence of intercultural conflicts arising from the absence of human rights practices in interactions between different actors and stakeholders both within and outside organizations. This lack of exercise of human rights is manifested in actions of unequal access to resources, employment opportunities, promotions, incentives, etc., and expressions of attitudes of intolerance based on ethnic origin, gender, religion, age, functional ability, etc.

Social, economic and environmental sustainability is the biggest challenge organizations face as the vision of sustainable development is relevant to any form of organization. To meet these challenges, business organizations develop concrete and innovative responses that include intercultural organizational orientation to promote intercultural cooperation relations in the business environment. Organizations take the discipline of the intercultural organization as a management perspective of diversity, to respond to challenges and opportunities, business needs evolve resulting in the development of new practices and principles.

Diversity policies in intercultural organizations do not give the required output as the focus is on ensuring that the minorities integrate into the dominant culture (Thomas & Gabarro, 1999). Thus, assimilation leaves a section of the people unhappy and dissatisfied as differences are not understood and celebrated. Pless and Maak (2004) recommend that organizations should embrace diversity, recognize, encourage and value differences. A culture of inclusion where diversity is valued will only unleash the potential of workforce diversity. The additional benefits of intercultural organizations include retention of talent, the cultural inclusion of minority groups and improving quality of life (das Neves & Scrum, 2013).

PROPOSALS

Finally, some concrete proposals for implementing the strategy of intercultural management in organizations are suggested. They revolve around the creation of the right environment; focus on the accomplishment of the task at hand by the development of the required skills, behaviours, values and beliefs amongst the diverse workforce through effective intercultural communication being led from the front by a skilled global leader.

1. Organizations must create a climate of respect for diversity and cultural inclusion that generates appropriate conditions to attract and retain organizational intercultural capital.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. The management of the intercultural organization should have a more strategic orientation to achieve competitive advantage rather than being an end in itself.
3. The management of the intercultural organization should use available resources to develop the capacities to promote behaviours, attitudes, skills and abilities to facilitate relationships between individuals.
4. Organizations should develop programs that promote intercultural organizational integration that celebrates diversity and creates an intention to learn and according to Triandis (2003), this intention is influenced by variables of attitudes, norms and social, cultural and demographic factors. Organizations that compete in global environments need to invest in the development of intercultural competence programs for their staff.
5. These training programs should create intercultural organization and develop values, attitudes and skills in communication processes, motivate and foster intercultural leadership that discourages violence and employment discrimination.
6. The leader of the global corporation should develop intercultural organizational skills to achieve better results with teams that are multicultural in nature unlike the monoculture-based teams in the past.
7. Organizational leadership should promote codes of intercultural communication and intercultural sensitivity to develop the values of a new, more universal and objective organizational culture, free of subjectivity and discrimination, one that is able to strengthen the inter-open spaces for communication free of conflicts and cooperation between different people.
8. Therefore, authentic intercultural organizational processes must be based on humanistic and critical direction; policies and strategies focused on organizational core values of intercultural understanding and acceptance that promote the creation of an environment that encourages the development of all members of the interculturally diverse organization.

CONCLUSION

In conclusion, intercultural organizations are a reality that is emerging rapidly due to globalization and resultant cultural diversity. Given the challenges associated with the intercultural organization, development of intercultural sensitivity, intercultural capital and intercultural competence through training and development, integration of the diverse teams will ensure that the organization remains strategically competitive. Exploring the concept of intercultural organization brings out to the fore the need to strategically manage the various processes amongst the culturally diverse teams to ensure organizational success.

KEY TERMS AND DEFINITIONS

Cultural Capital: Is the stock of values upon which the structure of each society is characterized it as different from others.

Cultural Diversity: Refers to the inclusion of cultural differences among diverse people because of the existence of a variety of cultural and ethnic groups, language, dress, and traditions within a society or an organization.

Intercultural Management: Is an interdisciplinary human resources field concerned with facilitating management in organizational communities where is a deep understanding and respect of all cultures

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

focusing on effective interactions, development of deep relationships and mutual exchange of cultural norms and ideas between personnel, customers and all the stakeholders across organizational borders.

Intercultural Organization: Is the set of contacts and interactions that often occur among the various members of an organization having different backgrounds and cultural identities, in terms of a common understanding of the meanings of language, values, attitudes, thoughts, emotions, actions, etc., defining the ways of being, thinking and acting, and understanding of different lifestyles.

Multiculturalism: Is a dynamic and dialectical process that recognizes the existence and convergence of various cultures as a space between the local and global processes intersecting social and cultural networks articulating personal and collective identities.

Multidimensional Construct Metacognitive: Is the ability of consciousness and alertness that individuals have for intercultural interactions through mental, motivational, and behavioral components.

Subjective Culture: Is a pattern of beliefs, behaviors, and values that are maintained by groups of people interacting.

Chapter 82
Launching Diversity-Intelligent Strategies in Organizations:
A Leadership Development Perspective

Claretha Hughes
University of Arkansas, USA

ABSTRACT

The purpose of this chapter is to provide diversity intelligent strategies that can be used by leaders to eliminate ineffective diversity efforts, enhance effective diversity efforts, and provide new diversity intelligent strategies in organizations. Integrating DQ alongside emotional, cultural, and intellectual intelligences in the workplace can strengthen the effectiveness of leaders' people management efforts. Most employees enter organizations with the expectation of having positive experiences with their leaders and achieving success towards their career goals. Yet, many are marginalized or limited in their opportunities for advancement for reasons of which they have no control. The eradication of ineffective training and development of diversity must occur for effective change to occur. Credible DQ, ethical and legal issues, and workforce inter-personnel diversity training programs must be launched by HRD professionals and organization leaders so that leaders are developed to provide employees with fair and just treatment and successful career development will ensue.

INTRODUCTION

After the election of the 44th President of the United States of America in 2008, the Honorable Barack Hussein Obama, an American Black man, some individuals in America began to speak of a post-racial America. However, since the 2016 election, many Americans are speaking of the regression of diversity achievements throughout the country. They have begun to accept that it was indeed premature to think that one election could change the hearts of individuals who refuse to accept and embrace diversity changes. The world continues to witness resistance, acceptance, and infinite ways in which non-diverse and diverse individuals in America experience diversity.

There is no definitive definition of diversity within society; however, the United States' federal government has provided a definitive definition for organizations. The federal government's definition originated from the 1964 Civil Rights Act legislation, but has evolved through Presidential, Executive Orders to provide protection for individuals who are discriminated against within the workplace. The following list contains the classification by which groups of employees are currently protected within organizations that have federal contracts and are enforced by the Equal Employment Opportunities Commission (EEOC):

1. Age - Age Discrimination in Employment Act of 1967;
2. Disability - Vocational Rehabilitation and Other Rehabilitation Services of 1973 and Americans with Disabilities Act of 1990;
3. National Origin - Civil Rights Act of 1964;
4. Race/Color - Civil Rights Act of 1964;
5. Religion - Civil Rights Act of 1964;
6. Sex - Equal Pay Act of 1963 and Civil Rights Act of 1964; and
7. Sexual orientation – Executive Order 11478. (2014, ¶ 1)

Having federal contracts requires organizations to adhere to federal laws and allows employees to be protected by the EEOC. They are protected from discrimination based on equal pay/compensation (Equal Pay Act of 1963); harassment (Title VII of the Civil Rights Act of 1964, the Age Discrimination in Employment Act of 1967, (ADEA); and the Americans with Disabilities Act of 1990, (ADA)); pregnancy (Pregnancy Discrimination Act); retaliation; sexual harassment; genetic information (Genetic Information Nondiscrimination Act of 2008); and veteran status (Vietnam Era Veterans' Readjustment Assistance Act of 1974, and Uniformed Services Employment and Reemployment Rights Act).

This chapter reveals that, across a spectrum of situations and issues, there is a need to clearly delineate the difference between legal, mandated diversity, and diversity of thought. Organization leaders have permitted and perpetuated the mudding of the waters by allowing the word to, in essence, simply represent difference. This choice has benefitted neither the organization nor the individual. It has resulted in over $8-10 billion spent on ineffective diversity training without evidential, positive change as reflected in the continuous claims, lawsuits, and settlements made through the Equal Employment Opportunities Commission (EEOC) and the United States Department of Labor as a result of discriminatory workplace practices. U.S. EEOC Chair Berrien noted that the EEOC had filed 21 systemic lawsuits in Fiscal Year 2013 securing "a record $372.1 million in monetary relief for victims of employment discrimination in private sector and state and local government workplaces" (Performance and Accountability Report, 2013, vi).

Diversity Intelligence (DQ)

Hughes (2015b) began introducing diversity intelligence (DQ) as the knowledge to understand protected class employees, the legal mandates, and executive orders that were established for their protection. She suggested that DQ is established when leaders obtain an understanding of the history and reasoning for the existence of the Civil Rights Act of 1964, the EEOC, and other adaptations to protect diverse individuals from discriminatory practices in the workplace. She further suggested the questions and comments in Table 1 for employees and organization leaders to begin to take an active role in integrating

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

diversity into their organizations. When employees and organization leaders embrace their role in the change process that is needed to integrate diversity into the organization, there is a better chance that the change effort will be successful.

Table 1. Personal management of self and organization management perspectives of intelligences

	Emotional Intelligence (EI)	**Cultural Intelligence (CI)**	**Intellectual Intelligence (II)**	**Diversity Intelligence (DQ)**
Personal Management of Self	How do you emotionally and mentally balance who you are to yourself and the organization?	How does your behavior reflect your cultural acceptance and understanding of others?	How do you balance your intellect to embrace not only your knowledge but the knowledge of your peers?	In what way does your understanding of other individuals and cultures reflect your perception of others who are different than you?
Organization Management	Organizations must be cognizant of the emotional intelligence of employees and must make it a part of an evaluation system to determine employee performance level.	Organizations must reflect an attitude of embracement and acceptance of different cultures and recognize inter-personnel diversity within cultures.	Organizations must value the intellect of employees but not to the detriment of inappropriate behavior towards those who are different.	Organizations must not only embrace diversity of appearance but also diversity of thought and action.

Hughes and Brown (2018) defined diversity intelligence (DQ) as "the capability of individuals to recognize the value of workplace diversity and to use this information to guide thinking and behavior" (p. 264). DQ allows human resource development (HRD) professionals to understand protected class groups of employees and categories of protection against discrimination in the workplace. Hughes and Brown (2018) explained that DQ gives HRD professionals the knowledge needed to help leaders further understand protected class employees and leverage their understanding to develop diversity intelligent strategies to help leaders help protected class employees integrate seamlessly into the workplace.

The purpose of this chapter is to provide diversity intelligent strategies that can be used by leaders to eliminate ineffective diversity efforts and enhance effective diversity efforts with a better understanding of all of their employees. Integrating DQ alongside emotional, cultural, and intellectual intelligences in the workplace can strengthen the effectiveness of leaders' people management efforts. Most employees enter organizations with the expectation of having positive experiences with their leaders and achieving success towards their career goals. Yet, many are marginalized or limited in their opportunities for advancement for reasons of which they have no control. The objectives of this chapter are:

1. Provide specific diversity intelligent strategies for HRD professionals and leaders to enhance diversity efforts; and
2. Provide specific career development evaluation systems strategies for leaders to help employees develop and attain career goals.

Background

Hughes (2015b) suggested that there were many issues, controversies, and problems that needed to be addressed to successfully integrate diversity into organizations. One suggestion was that leaders needed to acknowledge the paradigm shifts that have already occurred with regard to diversity and career development. Table 2 (reprinted with permission from the *Academy of Business Research Journal*, Hughes, 2015a) provided past and present paradigm shifts and metaphors for change along with implications for future changes within organizations. The implications and recommendations for organization leaders to address diversity were:

1. Formalizing the process to institutionalize diversity and increase the population of diverse leaders within the organization.
2. Recognizing that employees are seeking authentic diversity leadership and no longer want figure heads that represent a minority group who has no power within their positions to affect change.
3. Assimilation to norms is less relevant and employees want their differences to be valued within the organization as evidenced through career advancement opportunities
4. Diversity must be prioritized because it is a strategic priority of the organization and not just because it is legally mandated.

The implications and recommendations for leaders to address career development were:

1. Careers have varying directions and organizations need a career development evaluation process for employees to remain with the organization.
2. Traditional career models are no longer viable and organizations need to develop career management systems to manage the career development process of their employees.
3. Employees are managing their own careers and are willing to change jobs to achieve their career goals. Organizations need to acknowledge that employees have career goals and work with them to reach their career if it is possible within the current organization.
4. Employees want jobs that focus on results and impact towards their career goals. They want positions that have location value that adds to their career development plan and are timely.
5. Employees are now able to assess all factors related to their careers as opposed to having a single option. Organizations need to communicate with employees through their career development evaluation process to learn from the employees.

The implications and recommendations for leaders to value diversity for career development were:

1. The global economy has forced growth and high demand for diversity. The business needs are superseding traditional career plans and policies.
2. Diversity laws are designed to protect the organization and the employee. Understanding the laws reduces suppressive employee behaviors. This can be accomplished if all employees are trained before beginning their job and are provided annual reviews of the laws so that it becomes embedded within the culture of the organization.
3. The culture of the organization must be accepting and open to providing career support for diverse employees.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

4. There must be a change from a focus on singular, exclusive development of a few diverse positions to a cross-functional development of expertise through the four intelligences: emotional, cultural, intellectual, and diversity.
5. Organization leaders must perpetuate an understanding of legal implications of not complying with diversity requirements. Business and moral imperative to understand diversity laws for organization career development.

Table 2. Diversity and career development paradigm shifts and metaphors for change

Past	Present	Implications
Diversity Paradigms		
Serendipitous (Betsworth, D. G. & Hansen, J. I. C., 1996)	Intentional (Young, R. A. & Valach, L.,2004)	Formalize the process to institutionalize diversity and increase the population of diverse leaders.
Superficial (Gilbert & Ivancevich, 2000; Mills, 2008)	Authentic (enlightenment) (Craddock, 2009; Jones, Anand, & Alvarez, 2005; Svejenova, 2005).	Employees seeking authentic diversity leadership.
Fitting In (blending) (Cox, Lobel, & McLeod, 1991)	Adding value through difference (helping others); Focus on results and impact (Barak, Cherin, & Berkman, 1998; Milliken & Martins, 1996)	Assimilation to norms is less relevant. Differences are valued (Purdie-Vaughns, Steele, Davies, Ditlmann, & Crosby, 2008).
System bias (unjust systems) (Gilliland, 1993; Taylor, Masterson, Renard, & Tracy, 1998)	Individual recognition (just systems) Buckley, Beu, Frink, Howard, Berkson, Mobbs, & Ferris, 2001)	Institutional and implicit bias must be eliminated (Jost & Andrews, 2011).
Prioritize through mandates (Dass & Parker, 1999; Riccucci, 1997)	Strategic priority (Richard, 2000)	Diversity was prioritized because of legal mandates as opposed to a strategic priority of the organization. (Guthridge, Komm, & Lawson, 2008; Jayne & Dipboye, 2004)
Career Development Metaphors and Paradigms		
Ladders (Complete dedication) (Baron, Dobbin, & Jennings, 1986)	Jungle gym (Flexibility and necessary sacrifice) (Gunz, 1989; Parker & Inkson,1999; Sandberg, 2013)	Careers are no longer straight up; varying directions. All in at all cost no longer viable. (Hayes, 2000; Kaye, 1997)
Career Models (Buzzanell & Goldzwig, 1991)	Career Management Systems (CMS) (Baruch & Peiperl, 2000; Dreher & Dougherty, 1997)	Evolving away from traditional career models to CMSs. (Baruch, 2004)
Organization or"Company" Man (Gouldner, 1957; Jacoby, 1999)	Free Agent (Nicholson, 1996; Pazy, 1988).	Employees are managing their own careers and are willing to change jobs. (Rousseau, 2004; Sturges, Guest, Conway, & Davey, 2002)
Manage organization & business needs (Hammer & Stanton, 1999)	Manage a career (Sullivan, Martin, Carden, & Mainiero, 2003; Raabe, Frese, & Beehr, 2007)	Integration of personal skills with business needs is essential. (Bridgstock, 2009; De Vos & Soens, 2008)
Face time (hours) (Veiga, 1983)	Quality results (MacDermid, Lee, Buck, & Williams, 2001).	Quality results using time wisely as opposed to being seen. Location value is critical. Focus on results and impact. (Cabrera, 2007; Hughes, 2012; O'Neil, Hopkins, & Bilimoria, 2008; Reitman & Schneer, 2003)
Single career option (Walker, 1976; Hall & Richter, 1990)	Deciding career choice factors (Lent, Brown, & Hackett, 1994; Hall & Mirvis, 1995).	Employees are now able to assess all factors related to their careers as opposed to having a single option. (Baruch, 2006; Helfat, Harris, & Wolfson, 2006; Sullivan & Baruch, 2009)

Table 2. Continued

Past	Present	Implications
Valuing Diversity for Career Development Paradigm Shifts		
Status quo (Geletkanycz & Black, 2001; Brayboy, 2003)	Potential for growth or high demand (Florida & Gates, 2001; Grimes, 2002)	Global economy has forced growth and high demand for diversity. The business needs are superseding traditional career plans and policies. (Herring, 2009)
Anti-discrimination laws perceived to suppress (Dicker, 1998)	Laws that protect (Vega & Comer, 2005)	Laws that protect the organization and the employee. Understanding the laws reduces suppressive employee behaviors. (Dipboye & Colella, 2005; Fuller, Edelman, & Matusik, 2000)
Culture exclusive of diversity (Parkhe, 1991; Thomas, 1990)	Culture inclusive of diversity (Barak, 2000)	Culture that is accepting and open to providing career support for diverse employees. (Nishii & Mayer, 2009; Pless & Maak, 2004; Stevens, Plaut, & Sanchez-Burks, 2008)
Singular expertise (Brousseau, Driver, Eneroth, & Larson, 1996)	Cross-functional development (Brousseau, Driver, Eneroth, & Larson, 1996)	Change from a focus on singular, exclusive development of a few diverse positions versus a cross-functional development of expertise (Arthur, 2008; Lamb & Sutherland, 2010).
Personal opinion application of diversity laws	True understanding of diversity laws	Understanding of legal implications of not complying with diversity requirements. Business and moral imperative to understand diversity laws for organization career development. (Barak, 2013; Bryd & Scott, 2014)

Table 2 remains very relevant to assist HRD professionals and organization leaders as they seek to integrate diversity within their organizations. The role of organization context is critical to integrating diversity into organizations to benefit the career development of all employees. Organizations have cultural characteristics that must be shifted towards valuing diversity (Hughes, 2019). The shift can only occur organizations begin:

1. Internalizing a leadership identity that supports true diversity (Hughes, 2015a; 2015b).
2. Institutionalizing a population of diverse leaders (Nishii & Mayer, 2009).
3. Relying more on the individual rather than on the group identity. "The more you know about an individual, the less it makes sense to rely on general findings about a group of which he or she is a part" (Benko & Pelster, 2013, p. 81).

Hughes (2015a; 2015b) derived and suggested six factors and implications, shown in Table 3, which can be used to develop a tool to evaluate and manage evaluators of diversity efforts. Upon sharing these factors with her colleague, her colleague suggested that this is now "Diversity 2.0 and diversity is participatory". (J. Tavano, personal communication, April, 30, 2014)

These factors remain relevant to the success of diversity integration into organizations. The factors must be implemented through the actions of diversity intelligent organization leaders. Many leaders do not know who the protected class employees are within their organizations and some of them do not even recognize that they, themselves, are within a protected class(es) (Hughes, 2018; Hughes & Brown, 2018).

Table 3. Six Factors influential to organization leaders improving diversity efforts

Factor	Organization Leader
1. Communication of Policy and Standards of Peformance (Murphy & Cleveland, 1991)	Diversity leadership can benefit from better communication of policy standards throughout the organization. Execution of diversity policy must be consistent.
2. Understanding of Policy (Cleveland & Murphy, 1992)	It is difficult to understand a policy when there is no definition and disagreement regarding the terms being used. Legal versus ethical issue of diversity must be delineated.
3. Frame of Reference Training (Bernardin & Buckley, 1981; Day & Suksky, 1995)	Leaders can be trained to use the five values as a common FOR to recognize objective differences amongst employees.
4. Time (Bernardin & Villanova, 1986; Cleveland & Murphy, 1992; Murphy, 2008; Tziner, Murphy & Cleveland, 1991; Viswesvaran, 2001)	Leaders must conscientiously invest the time to understand differences and this time must be valued by the organization.
5. Motivation and Rewards (Cleveland & Murphy, 1992; Harris, 1994; Porter & Lawler, 1968; Vroom, 1964, 1995)	Understanding what motivates organization leaders and rewarding them appropriately may improve diversity efforts.
6. Accountability (Harris, 1994; Jayne & Dipboye, 2004; Mero & Motowidlo, 1995; Murphy 2008; Schreiber, Price & Morrison, 1992)	Accountability reduces EEOC complaints, labor disputes, and lawsuits associated with diversity and unfairness.

Hughes and Stephens (2012) suggested that diversity could be leveraged within organizations through a career development paradigm shift. They offered that career development was essential to talent management based on location value (Hughes, 2010) of the employee. If employees' thoughts are consumed by discriminatory treatment because they are emotionally affected by discriminatory practices within a discriminatory organization culture, the organization will not achieve its goals through all of its employees. The culture of the organization in which diversity is not defined and clarified can negatively impact organizational strategy and competitiveness (Carrell, Mann, & Honeycutt-Sigler, 2006). Hughes and Stephens also suggested that further research was needed on the extent to which organizational leaders can leverage their understanding of diversity to enhance the career development of all employees.

Diversity leaders must be committed to helping employees succeed. Hughes (2012) suggested that the needs of all employees be acknowledged, regardless of differences, through the recognition of inter-personnel diversity. Inter-personnel diversity represents the recognition of each employee's uniqueness (Hughes, 2018c) since not all individuals in a race are the same; therefore, the typical stereotypes associated with the group from which they originate should not automatically be attributed to them.

From a DQ perspective, the location value (Hughes, 2010) of the employee must be considered by examining the context within which the employee is asked to work. The physical placement of the employees, both with regards to the leader whom employees report to and the actual place itself, directly affects their career progression within the organization. There are dead-end jobs, and many protected class employees have been tracked into these career ending jobs or prevented from entering jobs with potential. Placement tests have been shown to be biased against many protected class employees such as women and minorities. Yet, some organizations still use biased testing. Organization leaders must continue to examine the extent to which the cultural environment affects diverse employees (Avery, 2011; Geva 2006; Konrad & Linneham, 1995).

MAIN FOCUS OF THE CHAPTER

Issues, Controversies, Problems

Need for Diversity Definition

Despite more than 50 years of efforts by organizations to integrate diversity into their organizations, there has been limited success from the perspective of diverse employees. The central reason for the limited success is because there still remains no clear definition of diversity. To avoid confusion and institute effective execution strategies within diversity initiatives, organizations must clearly delineate a definition of diversity that aligns with the federal government definition of protected classes (Hughes, 2015b; 2016b).

Within this chapter, diversity is defined as protected class employees within the organization as defined by the federal government. This excludes no workplace employees because all employees are in some type of protected class or category. Federal law protects every employees' pay, and many employees have more than one protected class status. Therefore, organizations are essentially diverse; however, the problems then become acceptance of diversity of thought within the individuals in these protected class groups and hiring enough minorities and women to meet the Affirmative Action standards, as applicable, and to reflect the diversity of communities. Recognizing this definition of diversity leaves organizations with the task of developing initiatives that promote healthy, valuable dialogue between and amongst these groups of employees. This definition needs to be taught to all employees and leaders so that they can become diversity intelligent (Hughes, 2016a; Hughes, 2018b).

Need for Diversity Training

Hughes (2014a) suggests that all diversity training should occur at the same time as all other legally, mandated annual training of employees. This would help infuse diversity into the culture of the organization similar to safety training, sexual harassment, and all other forms of training for which organizations have zero tolerance. Once the organization has established a standard of diversity excellence, the organization leaders will then be able to hold individual employees accountable for their behavior and attitudes towards each other (Hughes & Brown, 2018; Hughes, 2019). Table 1 provides a table of four types of intelligence with implications for personal management of self and organization management. The four types of intelligence are emotional (Salovey & Mayer, 1990), cultural (Konyu-Fogel, 2011), intellectual, and diversity.

Emotional intelligence (EI) is the ability to recognize the meaning of emotions and their relationships, and to reason and solve problems on the basis of them and consists of three mental processes: appraising and expressing emotions in the self and others, regulating emotion in the self and others, and using emotions in adaptive ways. EI is also "the ability to perceive accurately, appraise, and express emotion; … to access and/or generate feelings when they facilitate thought; … to understand emotion and emotional knowledge; and … to regulate emotions to promote emotional and intellectual growth (Mayer & Salovey, 1997, p.10). Cultural intelligence (CI) is an individual's desire to understand differences in political, social, cultural, and ethical issues, and to experience diversity in human relations, work environments, and personal adventures (Mendenhall et al., 2013). CI can be measured through an individual's openness to learning, emotional sensitivity, behavioral flexibility, and cross-cultural under-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

standing (Konyu-Fogel, 2011; 2015). Intellectual intelligence (II) is a gauge of one's cognitive ability to analyze and assess information to produce knowledge and understanding. II has been evaluated through an individual's ability to manage uncertainty, recognize patterns, think globally, and differentiate and integrate complex information (Konyu-Fogel, 2011; 2015).

Need for Career Development Evaluation Systems

Currently, there are no career development evaluation systems used within organizations. There are performance evaluation systems that are often contentious, controversial, and demoralizing for employees who are judged subjectively by their superiors and peers. Most often the annual performance reviews are provided once a year and are not representative of the performance of the employee. For lack of a better alternative and because employees feel powerless to voice opposition to the systems, they endure the ratings and judgments that are detrimental to their careers.

Many employees choose to leave organizations because they know that their performance evaluation results do not follow them to their new employer. They avoid combative and argumentative displays with their superiors because they need a job and want to be considered for future career advancement opportunities. To say that performance evaluations, as currently managed, can be suppressive to employee career development is an understatement, but when it comes to protected class individuals, they can lead to the death of an individual's career aspirations. For career development to work for diverse individuals, it is required that the organization provide a supportive climate, supervisors, and coworkers (Avery, 2011; Banks, 2006a; Bingham, Gewin, Hu, Thomas, & Yanchus, 2005; Deal & Kennedy, 1984; Thomas, 2008).

A career development evaluation system would provide a tool to assess the progress that an employee is making towards an agreed upon career development plan established between the employee and the organization. This system need not be aligned with merit pay as performance evaluation systems typically are. The following steps describe the suggested process of establishing a career development evaluation system within an organization:

Step 1: Organization leader and employee establish a career goal for the employee (not directly aligned with pay incentives). This sometimes occurs in skill-based pay systems; however, since the incentive is pay and there is not an infinite level of pay to continuously motivate the employee, it can hinder the employee's progress towards an established goal if the employee perceives that the employee benefits more.

Step 2: Organization leader and employee create and outline the criteria within a career development plan needed to reach the career goal that will benefit both the employee and the organization. This is a critical step because it must be determined at this point whether or not the leader and the employee have the same goals in mind for reaching the endpoint. Even though they have stated a career goal in step 1, step 2 determines if the employee truly understands what knowledge, skills, and abilities are needed to reach the career goal and what is in it for them as they pursue the goal.

Step 3: Establish, a minimum of a year, an analysis meeting time to determine progress towards career development plan goals. Often employees may have individual development plans to develop skills to do their current jobs to organization standards, but there is not a plan that tells the employees how individual develop plan achievement will influence their career growth.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Step 4: Determine if employee is making needed process towards the goal and enhance and modify strategy for continued success.

The process as described above will only work if there are specific careers established within the organization. The career development plan must include specific internal and external education and training needs that must be accomplished to meet the goals of the specific career path that the employee is pursuing and the organization needs. For example, there is a continual need for science, technology, engineering, and math (STEM) professionals within organizations. How can the organization build career development plans for current employees to meet their needs? Are there employees within the organization who have the desire to move into the current career openings and are being overlooked because there is no career development evaluation plans within the organization?

Career development professionals are compelled to leverage each employee's diversity as a benefit to the organization (Hughes & Stephens, 2012). Evaluating each employee's career development plan will assist with this effort because the differences amongst workers necessitate finding a "fit" between the organization and the individual (Becker, Huselid, & Beatty, 2009; Baird & Meshoulam, 1988; Delery, 1998; Vroom, 1973; Wright & McMahan, 1992).

SOLUTIONS AND RECOMMENDATIONS

To resolve the issue of a definition of diversity and improve results of diversity training, Hughes (2016) suggested the need for DQ training for organization leaders. Hughes also suggested the integration of DQ, diversity, and ethics to improve the integration of diversity efforts into organizations (Hughes, 2019). She further suggested that with DQ, leaders can accomplish organization goals and help employees meet their career goals using workforce inter-personnel diversity (Hughes, 2018). The factors in Table 3 were explored prior to the DQ research that has been and is currently being done by Hughes (2016; 2018a; 2018b), Hughes and Brown (2018), and Lawson and Hughes (2020). The Table has been updated to reflect how organization leader competencies related to the six factors can be accomplished by attending training on DQ, ethical and legal issues, and/or workforce inter-personnel diversity. Applying these strategies can help leaders become diversity intelligent in their knowledge and behavior.

To meet the need of developing career development evaluation systems, organization leaders must have DQ and use their DQ to treat all employees fairly. Hughes (2018c) suggested leaders with DQ could use the workforce inter-personnel diversity as a talent management system. The concept of workforce inter-personnel diversity is a "focus on the ways that individuals differ in (and should be recognized for) their personal characteristics within the workplace despite having the same position classification as a co-worker; this is irrespective of gender, race, or other typical classifications for diversity" (Hughes, 2018c, p. 2). Workforce inter-personnel diversity focuses on differences in employees' job skills based on five values (location, use, maintenance, modification, and time). To optimize workforce performance, organization leaders must distinguish between employees in the workplace. Employers usually focus on understanding employees' personality styles and learning styles and limit employee potential because of biases and other limiting factors. DQ is required because all employees must be diversity intelligent to be able to recognize the strengths and weaknesses of all employees while avoiding any bias towards protected class employees.

Table 4. Six Factors influential to organization leaders improving diversity efforts and training needs

Factor	Organization Leader Competency	Diversity Intelligence (DQ) Training (Hughes, 2016a; 2016b)	Ethical and Legal Training Hughes (2019)	Workforce Inter-personnel Training (Hughes, 2018c)
1. Communication of Policy and Standards of Peformance (Murphy & Cleveland, 1991)	Diversity leadership can benefit from better communication of policy standards throughout the organization. Execution of diversity policy must be consistent.	X	X	
2. Understanding of Policy (Cleveland & Murphy, 1992)	It is difficult to understand a policy when there is no definition and disagreement regarding the terms being used. Legal versus ethical issue of diversity must be delineated.	X	X	
3. Frame of Reference Training (Bernardin & Buckley, 1981; Day & Suksky, 1995)	Leaders can be trained to use the five values as a common FOR to recognize objective differences amongst employees.			X
4. Time (Bernardin & Villanova, 1986; Cleveland & Murphy, 1992; Murphy, 2008; Tziner, Murphy & Cleveland, 1991; Viswesvaran, 2001)	Leaders must conscientiously invest the time to understand differences and this time must be valued by the organization.			X
5. Motivation and Rewards (Cleveland & Murphy, 1992; Harris, 1994; Porter & Lawler, 1968; Vroom, 1964, 1995)	Understanding what motivates organization leaders and rewarding them appropriately may improve diversity efforts.	X	X	X
6. Accountability (Harris, 1994; Jayne & Dipboye, 2004; Mero & Motowidlo, 1995; Murphy 2008; Schreiber, Price & Morrison, 1992)	Accountability reduces EEOC complaints, labor disputes, and lawsuits associated with diversity and unfairness.	X	X	X

Workforce inter-personnel diversity as a component of a talent management system must be evaluated and sustained to remain a viable tool for leaders and employees in the workplace. Managing workforce inter-personnel diversity requires forward-thinking approaches including establishing unity among employees, valuing employees' qualifications, training and developing employees, supporting employee self-development, providing career pathways, providing management systems that support the pathways, and valuing employees' time. Organization leaders' DQ and their acknowledgment and understanding of all employees provides them with the workforce inter-personnel diversity knowledge to enhance and improve organizational performance. When leaders apply this knowledge, they can develop a career evaluation system that employees can trust to be fair and unbiased.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

FUTURE RESEARCH DIRECTIONS

Future research is needed to expand on the solutions and recommendations provided for the issues, controversies, and problems described herein. Specifically, organization leaders and HRD professionals can develop and evaluate training programs for DQ, ethical and legal issues, and workforce inter-personnel diversity to determine if organization diversity efforts improve. Future research can also develop a DQ scale that can be used to assess leaders' DQ and determine specific training and/or education needs of each leader. The suggestion of a career development evaluation system within organizations in addition to or opposed to the current performance evaluation system demands extensive investigation and consideration and is sure to incite debate amongst and between human resource and career development professionals.

The four intelligences can also be further developed into a typology for a career development evaluation system measure. By extending and examining each of these four intelligences from a diversity perspective, organization leaders can extend their roles towards integrating diversity into organizations and applying diversity intelligent strategies.

CONCLUSION

To improve diversity efforts within organizations, requires new ideas and thought processes from leaders. The future is now and organizations cannot afford to wait to launch diversity intelligent strategies. The participation of all stakeholders within the organization is needed to meet global workplace challenges. This has become abundantly clear during the COVID-19 virus pandemic in America. The successful defeat of the COVID-19 virus pandemic requires the participation of every employee in every organization. The virus does not discriminate as it ravages the nation. All who contract the virus are at the risk of dying unless everyone makes a sacrifice to help flatten the curve of the virus by practicing physical distancing from each other. Physical distancing does not preclude communicating effectively with each other in different ways.

There are no easy solutions to the issues, controversies, or problems faced when battling the COVID-19 virus. There are also no easy solutions to resolving issues, controversies, or problems faced when battling diversity in organizations. The potential solutions and recommendations must not only be introduced to organization leaders, but also organization leaders must launch diversity intelligent strategies and remain diligent in their efforts until successful, competitive advantage changes are achieved.

Attaining DQ and applying the definition of diversity as the federal government has defined it will reduce confusion within the organization when launching diversity intelligent strategies. By providing DQ, ethical and legal, and workforce inter-personnel diversity training to all employees, everyone will begin communicating the same definition in the same way to transform the culture from one of suspicion and uncertainty to one of clarity and certainty. Organization leaders will also have a clear understanding and means of effectively evaluating employees for career development purposes thereby meeting the needs of both the employee and the organization.

Enduring negative treatment because of protected class statuses must be eliminated from the workplace. Society is changing and so should the thought processes of employees within organizations. Launching diversity intelligent participatory strategies and efforts will accomplish changes in equity and inclusion. Organizations must capitalize on differences through fruitful intersections of diverse employees executed appropriately and effectively for and by all stakeholders.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

It is understandable that leaders who have never endured discrimination would be unable to imagine what those who have faced discriminated has endured or experienced. It is almost too much to expect leaders, who have no frame of reference for the experience, to be sympathetic or empathetic towards victims of discrimination; yet, that is what many organizations expect without ever, properly, training their leaders. They are then surprised when employee victims seek outside intervention (e.g. lawsuits, EEOC complaints, department of labor complaints, etc…). The eradication of ineffective training and development of diversity must occur for effective change to occur. Credible DQ, ethical and legal issues, and workforce inter-personnel diversity training programs must be launched by HRD professionals and organization leaders so that employees can receive fair and just treatment from leaders and successful career development will ensue.

KEY TERMS AND DEFINITIONS

Career Development Evaluation: Annual evaluation of each employee's progress and development towards her career goals within the organization.

Cultural Intelligence: Desire to understand differences in political, social, cultural, and ethical issues, and to experience diversity in human relations, work environments, and personal adventures (Mendenhall, Osland, Bird, Oddou, Maznevski, Stevens, & Stahl, 2013).

Diversity Intelligence: The knowledge to understand protected class employees and the legal mandates and executive orders that established their protection.

Diversity Intelligent: Having the ability to apply diversity intelligence.

Emotional Intelligence: The ability to recognize the meaning of emotions and their relationships, and to reason and solve problems on the basis of them and consists of three mental processes: appraising and expressing emotions in the self and others, regulating emotion in the self and others, and using emotions in adaptive ways.

Intellectual Intelligence: A Gauge of one's cognitive ability to analyze and assess information to produce knowledge and understanding.

Inter-Personnel Diversity: Recognition of the uniqueness of each individual employee on the basis of their individuality and diversity of thought. Regardless of group commonalities, each individual employee is different.

Location Value: Align with the personal characteristics that the employer assesses prior to hiring the individual.

Maintenance Value: Alignment of employee KSAs with organization needs expressed by job analysis and job description and the alignment with the employee KSAs. Organizations must see potential for employee growth during the hiring process.

Modification Value: Acknowledged through the drive and ambition that the employee expressed with regards to their goals and aspiration for wanting the offered job and experience working for the organization.

Time Value: Seen through the quality of work produced, presence at work, and the amount of work done when presented with work to do.

Use Value: Expressed in the cover letter, resume, and interview responses provided by the individual.

ABSTRACT

Recent corporate scandals have prompted discussion of the role of business in society. Business leaders are increasingly held accountable for their actions and non-actions in relation to all stakeholders, both internal and external. The emerging challenges faced by business organizations today include economic, social, and environmental demands; globalization; rapid population growth; natural resources exploitation; extreme poverty and debt; global migration; unprecedented inequality; global migration; geopolitical and ecological crises; climate change and other environmental issues; competitive pressure; health issues; new information and communication technologies; and sustainable lifestyles. Responsible leadership represents a new type of leadership, which is better positioned to address these challenges through stakeholder consideration and in the context of sustainable development. Building on existing literature, the aim of this article is to present a conceptual framework of responsible leadership as a potential determinant of stakeholders' health and well-being.

INTRODUCTION

In recent years, a variety of corporate scandals have brought about a discussion regarding the role of business in society. Consequently, to this, business leaders are increasingly held accountable for their actions and non-actions in relation to all stakeholders and society at large (Pless et al., 2009). Business organizations today face emerging challenges such as economic, social, and environmental demands; globalization; rapid population growth; natural resources exploitation; extreme poverty (rich–poor gap) and debt; global migration; unprecedented inequality; global migration; geopolitical and ecological crises; climate change and other environmental issues; competitive pressure; health issues; new information and communication technologies; and sustainable lifestyles (Sachs, 2019).

In this respect, corporate social responsibility (CSR) has come to be the vehicle by which businesses and their leaders contribute to society. CSR is a concept whereby business organizations voluntarily integrate social, environmental, and health concerns in their business strategy (policy) and operations and in their interactions with different stakeholders (EU, 2011). The social responsibility of business organizations encompasses the economic, legal, ethical, and discretionary expectations that society has of organizations at a given point in time (Carrol, 1999). However, many scholars argue that in order for business to implement CSR and do good for society, a new type of leadership is required: responsible leadership (RL). Although various definitions of RL have been put forward, there is general agreement that it is "a relational process with the various stakeholders where leaders accept the accountability for socially responsible actions as part of their strategic business decisions and strive to maintain a fine balance between the immediate and extended stakeholders" (Pless et al., 2009; Waldman et al., 2020). Building on existing literature, the aim of the present article is to present a conceptual framework of RL as a potential determinant of stakeholders' health and well-being. First, the article identifies the main theories of leadership behaviour and the emergence of RL according to the literature; second, it explains how RL can be a determinant of stakeholders' health and well-being; and third, it proposes a conceptual framework which links RL to stakeholders' health and well-being and allows for the identification of challenges and opportunities.

LEADERSHIP BEHAVIOUR, EMERGENCE OF RESPONSIBLE LEADERSHIP

Traditional Theories of Leadership Behaviour

Most of the earlier literature on leadership behaviours at the start of the twentieth century highlighted theories that viewed effective leadership styles in terms of the traits and behaviours of leaders. However, researchers later introduced other leadership theories such as transformational and transactional leadership, charismatic leadership, shared leadership, authentic leadership, virtuous leadership, servant leadership, and many more (Flocy,2007; Frangieh et al., 2017). As mentioned above, RL has emerged in recent years within academic and practice circles attached to CSR and stakeholder theory (House et al., 1997; Groves et al., 2011; Waldman et al 2011).

Trait theories tried to understand leadership by identifying characteristics that differentiated leaders from non-leaders or good leaders (O'Boyle, 2015). These theories asserted the view that leaders are born and not made, and were supported by behavioural genetic research (O'Boyle, 2015; Barling et al., 2011). Thereafter, behavioural theories of leadership emerged in an attempt to focus on universally

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

effective behavioural approaches of leaders. A combination of studies (House et al., 1997) showed the relevance of two key concepts related to behavioural theories: structure (task-oriented), where clear guidelines and procedures to achieve goals were specified; and consideration (people-oriented), where the leader's behaviour centred on mutual respect, trust, care, and concern for their followers (Barling et al., 2011). The initial hypothesis of the behavioural theories was that a leader with a combination of structure and consideration would be effective in guiding their followers to achieve organizational goals as well as in providing these followers with emotional support during their journey to perform at their highest capacity. However, these theories were criticized for being inconclusive, and some suggested that it was better to focus on leadership that evolved to include the situational moderators that were cited as critical variables for universally effective leadership behaviour: time pressure, leader dispositions, follower characteristics, and role ambiguity (Barling et al., 2011).

The criticism of behavioural theories of leadership gave place to situational and contingency theories, which argue that leadership is dependent on the characteristics of the situation, including features of the organization, the workplace, and the followers (Barling et al., 2011) Others suggested that contingency theory should categorize leaders as task-motivated or relationship-motivated (Fiedler, 1971), with task-motivated leaders being more effective in extreme situations (e.g. favourable or unfavourable situations) and relationship-motivated leaders being more effective in moderately favourable situations. In the context of this theory, leader effectiveness is seen as a function of the interaction between the leader and the situation in which the leader is operating. However, this theory has been criticized for being based on results from laboratory settings (Peters et al., 1985). For instance, House proposed the path goal leadership theory to address some of the shortcomings, suggesting four categories of leadership behaviours for effective leadership: participative, directive, supportive, and achievement-oriented. Regarding situational factors, House asserted that leader effectiveness was influenced by the organizational environment, follower characteristics, and job design (House et al., 1997).

The relational theory of leadership shifted the focus from the situational aspects of leadership to relational ones. In this context, the leader–member exchange (LMX) theory emerged, focusing on the dyadic relationship between leader and follower, and thus moving away from the traditional traits and behavioural theories. The LMX theory posits that higher-quality relationships (trust, mutual support, and loyalty) between leaders and followers will result in more positive organizational outcomes than lower-quality relationships (social distrust, contractual obligations, and downward influence) (Barling et al., 2011). However, some researchers pointed out that the LMX theory failed to identify whether the relationship between the leader and followers is unidimensional (Dienesch et al., 1986).

Other scholars then suggested the transformational and transactional leadership theories (Burns, 1978; Bass, 1985). Burns, followed by Bass, provided a better understanding of these theories as well as their differences from existing theories (Burns, 1978; Bass, 1985), arguing that management by exception (poor management), laissez-faire management (absence of management), and contingent reward (good management) are aspects that can be classified under the rubric of transactional leadership. However, the literature on transactional leadership throws open the criticism that contingent reward and management by exception are responses to employees' behaviour coupled with the formal powers accorded to the managers dealing with these employees. According to Barling et al., transactional leadership can be conceptualized as management rather than leadership per se (Barling et al., 2011). In addition, Bass (Bass, 1985) suggested four dimensions of transformational behaviour: inspirational motivation (inspiring followers to foster resilience and self-efficacy), idealized influence (acting with integrity and in the best interests of the organization), intellectual stimulation (encouraging followers to be innovative and

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

creative), and individualized consideration (mentoring followers and taking care of their well-being). These dimensions were the basis for the Multifactor Leadership Questionnaire (MLQ) developed by Bass et al., which has been criticized for failing to address whether all four dimensions are equally important in a transformational leader. Nevertheless, other researchers have attempted to improve the deficiencies of the MQL, thus advancing its strengths in the pursuit of new knowledge on transformational leadership behaviours (Alimo-Metcalfe et al., 2001; Rafferty et al., 2004).

Trait theories, behavioural theories, and situational and transformative leadership focus so strongly on the dyadic relation between supervisor and subordinate relation that the narrative has excluded the importance of organizational, social, and environmental variables that can play a role in effective leadership behaviour. However, as mentioned above, the 2008 economic downturn and its consequences for society created a need for a new type of leadership, especially in the era of sustainable development.

The Emergence of Responsible Leadership and Responsible Leadership Behaviour Theory

In today's complex world, with the onset of globalization, societal and leadership challenges will continue to escalate as businesses expand further across national borders. This changing context has contributed to the emergence of specific dimensions of leadership that classify leaders based on their behaviour, actions, or personality (Morrison, 2000). Concepts such as authentic leadership, charismatic leadership, servant leadership, shared leadership, ethical leadership, strategic leadership, and responsible leadership personality have been mentioned by various scholars (Pless et al., 2009; Waldman et al., 2020; Flocy, 2017; Morrison, 2000). RL is a new type of leadership for the twenty-first century, and one that is crucial in the era of sustainable development.

This leadership style is still in its infancy, but various scholars have made valuable contributions to its understanding (Waldman et al., 2020; Groves et al., 2011; Waldman et al., 2011; Maak et al., 2006; Voegtlin et al., 2011; Stahl et al., 2014; Adler et al., 2020). It is argued that existing leadership theories lack the dimensions of responsibility and accountability in their characterization, and that these aspects are critical in our current world of political, social, and environmental challenges (Waldman et al., 2011; Voegtlin et al., 2011; Stahl et al., 2014; Adler et al., 2020). As an expansion of the existing theories, RL can be seen from a normative and relational view. According to Maak and Pless, RL cannot be considered on par with the traditional leadership theories that view leadership from a descriptive approach, but should be viewed from a normative approach (Maak et al., 2006). Maak and Pless posit that RL strongly encourages looking beyond the dyadic relationship of leaders and followers within the organization, to cultivating and maintaining relationships with both followers inside the organization and the various stakeholders outside the organization. In addition, expanding on the social–relational process, Maak and Pless argue that responsible leaders exhibit multiple levels of interaction with different groups, some of which may be in conflict with others: employees, clients, customers, business partners, the social and natural environment, and shareholders (Maak et al., 2006).

The foundations of RL behaviour are thus built on a multilevel interaction process, numerous relational challenges in the dealings with stakeholders, and the mindset to reconcile ethical dilemmas (Maak et al., 2006). It is suggested that responsible leaders build trust, cultivate sustainable relationships, and interact ethically with varied stakeholders and followers to serve the common purpose of building relationships with the various stakeholders. RL requires a strong purpose-oriented leadership style, which is built on

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the solid pillars of stakeholder theory, CSR theory, and the concept of the triple bottom line (Maak et al ., 2006, Stahl et al 2014).Various scholars suggest that RL steps away from the traditional concept of a leader at the top dictating terms and conditions to their followers, and instead focuses on the relational aspect with various stakeholders.

RL also needs to be seen from an economic and stakeholder perspective. Waldman et al. defined key parameters of RL at the strategic level, and suggested that showing responsibility could be the key to leader effectiveness (Waldman et al., 2008). When answering the question of to whom and for what leaders should be responsible, they provided guidelines for individuals who seek to be responsible leaders based on two perspectives: the economic and stakeholder perspective (Waldman et al., 2020; Waldman et al., 2008). The economic perspective is in line with the view of Friedman (Friedman, 1962; Friedman, 1970) that "the business of business is business"; in other words, the moral duty of a manager is to increase the financial return of the business's investors. Waldman et al. further pointed to the principle that an economic-based leadership should be strategic and calculable so as to provide a positive return to shareholders. They also pointed out that RL has a strong sense of values concerning the importance of the needs and interests of a wide variety of individuals who may be affected by the leader's actions and decisions (Waldman et al., 2008). Thus, the decision-making process of a responsible leader involves striking a balance between the various stakeholders of the organization, which may be in conflict with one another. On the other hand, the stakeholder perspective of RL does not really put a calculable value on all actions of a leader, since the accuracy of calculations could diminish over time and changes could occur in the nature of the investment. It is argued that it is not possible to attach a monetary value to cultivating relationships and measuring the strength of each relationship with each stakeholder (Waldman et al., 2008). For instance, Waldman found that CEOs who showed strong economic values were viewed as authoritarian, acting in a commanding and directive manner, while CEOs who adopted a strong stakeholder approach were viewed as visionaries and collaborative in their approach (Waldman et al., 2006). Responsible leaders are expected to lead by example, incorporate stakeholder values into the core purpose, use intellectual stimulation to help followers implement stakeholder values, and demonstrate employee empowerment (Waldman et al., 2008).

In an attempt to explicate how RL differs from related theories, Pless and Maak (Pless et al., 2011) advanced a definition of RL which states that it is a relational and ethical phenomenon occurring in social processes of interaction with those who affect or are affected by leadership and have a stake in the purpose and vision of the RL (Pless et al., 2011). In trying to better understand this new type of leadership, Stahl et al. defined RL behaviour as intentional actions taken by leaders to benefit the stakeholders of the company and/or actions taken to avoid harmful consequences for stakeholders and the larger society (Stahl et al., 2014). The authors posited RL behaviour in two ways — "do good" and "avoid harm" — which they considered to be conceptually distinct categories with different antecedents. They also offered a unified framework linking individual, organizational, situational, supranational, and institutional influences, which has advanced the understanding of how these factors might influence a leader to behave in a responsible manner. In addition, the authors highlighted the moderating role played by situational strength, alluding to organizational culture and performance as well as reward mechanisms that help leaders to do good and avoid harm. Thus, organizations with rigorous and robust CSR strategies should be able to do good actions all the time (Stahl et al., 2014). However, Stahl et al. thought that more needed to be done to further understand what kind of leadership actions fall under the "do good" and "avoid harm" categories (Tomaselli et al., 2019).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Others argue that RL is not about whether organizations act responsibly, but about how individual senior leaders (e.g. CEOs) within the organizations conduct themselves and make decisions (Waldman et al., 2011). Thus, it is of paramount importance to understand that socially responsible organizations may not always have responsible leaders. It is suggested that RL might determine the responsiveness of such leaders during good times and bad times for the organization. It is the actions of the leader during the various phases of the organization that can determine the leader's level of responsibility and accountability.

Looking at RL at a strategic level, Waldman et al. (2011) pointed out several macro and micro issues. For instance, they suggested that RL was more relevant to the top positions within the organizations (CEOs, CXOs, CTOs). Maritz et al. suggested that it is the senior leadership of business organizations that finds itself in the line of fire when it comes to managerial misconduct or corporate ills (Maritz et al., 2011). Furthermore, Maritz et al. viewed responsible leaders as architects and change agents, and highlighted the critical component of governance and stakeholder relationships that needs to be maintained in the process. They also pointed out that certain leaders in the organizational hierarchy are in a position that offers the freedom to make choices for organizational enhancement (Maritz et al., 2011), and argued that these choices need to be aligned with the social and environmental changes that are constantly affecting business.

Regarding RL and CSR, the CSR pyramid proposed by Carroll suggests four responsibilities: economic responsibility (to be profitable), legal responsibility (compliance with the laws of the land), ethical responsibility (the obligation to do what is right, just, and fair and to avoid harm), and philanthropic responsibility (to be a good corporate citizen and improve the quality of life) (Carrol et al., 1991). Thus, according to Carroll, the social responsibility of business encompasses the economic, legal, ethical, and discretionary expectations that society has of organizations at a given point in time (Carrol, 1979). CSR activities in an organization can be classified under social CSR and strategic CSR activities. Social CSR deals with activities that enhance the social value of the organization.

CSR activities are executed with a strategic vision, and can be tied to the business model of the organization. Strategic CSR activities, while ethical and altruistic in nature, can also contribute to the organization's financial bottom line (Waldman et al., 2006). Groves et al. (2011) have raised concerns that the existing literature on leadership is deficient in studies that examine the value orientation of transformational leaders and how they impact RL outcomes. However, Waldman et al. found in their study of transformational CEOs that intellectually stimulating leaders were able to lead strategic CSR activities aligning CSR with the strategic purpose of the organization (Waldman et al., 2006). Furthermore, the study found that charismatic leaders and intellectually stimulating leaders were not really needed for performing simple social CSR activities. Hence, since RL is aligned with strategic CSR, one could conclude that leaders should possess elements of charisma and intellectualism. However, it should not be concluded that all transformational leaders with charisma and intellectualism transition are responsible leaders (Waldman et al., 2006). There are transformational leaders who have engaged in irresponsible leadership practices, calling into question the values of such leaders and their attitude towards driving socially irresponsible actions. Waldman has argued that the outcome of an organization's culture, practices, and CSR policies could be read as characterizing responsibility (Waldman et al., 2011). Moreover, he cautioned that RL cannot be confused with organizational level phenomena where responsible organizations are considered synonymous with RL. McWilliams and Siegel (McWilliams et al., 2001) offered a framework for calculating the level of CSR investment that maximizes profit for a firm while satisfying the stakeholder demand. As businesses expand beyond their home countries,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

responsible leaders need to be equipped with an understanding that allows them to deal with the broader stakeholders and establish mutually beneficial stakeholder relationships. For instance, Voegtlin et al. (2011) defined RL as a continuum that can range from a non-responsible leader with absolutely no interest in CSR actions to the ideal responsible leader who can be a weaver of great stakeholder relationships which embed strategic CSR activities for the organization (Voegtlin et al., 2011).

While leadership influence can help social CSR to become embedded as the culture of the organization, RL is more evident in strategic CSR, where the leader is expected to display the emotional and intellectual maturity to satisfy a wider set of stakeholders and balance the internal and external objectives of the firm. RL should also be seen from the perspective of sustainability initiatives for business organizations. For example, some have pointed out how true responsible leaders are expected to include the strategic use of CSR to benefit the shareholders, leading to sustainability of the organization (Waldman et al., 2006). It is argued that RL needs to include the views of multiple stakeholders while making decisions; an approach that can also include long-term sustainability (Waldman et al., 2006). However, some argue that although CSR actions have an external focus beyond the organization, there is still very little literature on the leaders who have driven these actions on behalf of organizations. Hence, in order to be a sustainable approach, RL needs to be built on the foundation of CSR, with the leader displaying authenticity and consciousness and acting with integrity. Szekely et al. (2005) argue that RL is about building a society that balances the economic, social, and ecological/environmental aims of the business, and that leaders can do this through expanding the economic growth, shareholder value, corporate reputation, and enhanced customer service mechanisms (Szekely et al., 2005). These activities need to be performed by pursuing ethical and moral business actions that bring value to all the stakeholders and elevate the needs of the society and the social processes involved.

As mentioned above, RL is strictly linked to stakeholders, and so must be viewed within stakeholder theory. A seminal work by Freeman (Freeman et al., 1984), posited two important questions regarding the purpose of the firm and the responsibility of the managers in the firm towards their stakeholders, identifying the latter as any group or individual who can affect or is affected by the achievement of the firm's objectives (Freeman et al., 1984). In the context of Freeman's thoughts, it is this responsibility toward the immediate and extended stakeholders of the firm that takes precedence in RL, based on the foundation of stakeholder theory. It is therefore important to deepen the purpose of leadership based on the foundation of CSR and stakeholder theory. These can be linked to the triple bottom line as espoused by Elkington (1997), who advanced the knowledge that businesses should not just be viewed for their economic performance (as espoused by Friedman) but also for their environmental and social impact. This is where the responsibility element in the actions of the leaders is emphasized, and where leaders transition into responsible leaders (Maak et al., 2006). For instance, Maak and Pless argue that the purpose of leadership can be understood as being to build and cultivate sustainable and trustful relationships with different internal and external stakeholders in order to achieve common objectives (e.g. triple-bottom-line goals), business sustainability, and legitimacy, and ultimately to help to realize a good (e.g. ethically sound) and shared business vision (Maak et al., 2006).

Although sparse, there has been research attempting to link RL and CSR outcomes. For instance, Rowley investigated how leaders in organizations responded to the influence of multiple stakeholders, and found that the duty and responsibility of responsible leaders in the organizations was to balance the conflicting and diverse views of the stakeholders and to respond in a manner that brought the best possible outcome based on the principles of doing good and avoiding harm (Rowley, 1997). Moreover, Rupp et al. found that workers reacted positively to the perception that a firm was socially responsible

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Rupp et al., 2013). More specifically, the study revealed that job applicants had a preference for working at a business organization they perceived to be socially responsible (Rupp et al., 2013). Elsewhere, Zhao et al. found that RL was positively associated with organizational citizenship behaviour for the environment (OCBE), and that leader identification mediated this relationship. They also found that the relationship between leader identification and OCBE was positively moderated by the perceived role of ethics and social responsibility (Zhao et al., 2019). This also moderated the indirect effect of RL on OCBE through leader identification, such that this relationship was stronger when the perceived role of ethics and social responsibility was high (Zhao et al., 2019).

Although the understanding of RL has advanced in the past decade or so, there is still a lack of knowledge on the pathways through which it impacts organizational outcomes as well as internal and external stakeholders. The most solid proposal so far was put forward by Doh and Quigley (Doh et al., 2014), in a seminal work which argues that responsible leaders can leverage various stakeholders using a psychological pathway (trust, ownership, and commitment) and a knowledge-based pathway (options, creativity, and knowledge sharing) to influence effective outcomes.

RESPONSIBLE LEADERSHIP AS DETERMINANT OF STAKEHOLDERS' HEALTH

In the past few decades, much research has been carried out on the relationship between leadership behaviour (using the traditional leadership behaviours described above) and employee health and well-being (Schmidt et al., 2014). Leadership behaviour has been associated with sickness, absence (Kuoppala et al., 2008; Liu et al., 2009; Montano, 2016), stress, depression (Perko et al., 1998), health behaviours (Schmidt et al., 2014), and affective well-being (Schaufeli et al., 1998). Other studies have reported that employee health can be promoted through specific leadership behaviours and styles (Kuoppala et al., 2008; Skakon et al., 2010; Haslam et al., 2011). For example, a systematic review spanning three decades of research on leadership behaviour, the quality of the relationship between leaders and employees, and employee stress and well-being, found that positive leader behaviours such as feedback, trust, confidence, support, and integrity were associated with better affective well-being, reduced stress, and improved coping with stress among employees (Skakon et al., 2011). In contrast, the review also found that negative leadership behaviours such as low support, abuse, and control were associated with poor well-being and stress (Skakon et al., 2011). The authors argued that negative leader behaviour was more likely to be exhibited by leaders who are stressed, which in turn affects their relationship with employees (Skakon et al., 2011). Transformational leadership has also been found to be associated with a low degree of employment stress as compared to transactional and laissez-faire leadership (Skakon et al., 2011). Furthermore, Schaufeli et al. (1998) argued that leaders who were supportive, who empowered their employees, and who had a high-quality relationship with their employees contributed to preventing employee stress, enabling stress coping, and improving affective well-being (Schaufeli et al., 1998). More recently, other studies have found a relationship between leader and employee and organizational health (Novotina, 2015; Witt et al., 2016; Inceoglu et al., 2018; Molnar et al., 2019).

Wegge et al. suggested that the relationship between traditional leadership and employee health goes beyond the personal interaction between employee and leader, and pointed out four potential mechanisms that could explain this relationship: system-focused action (e.g. promoting healthy work designs), moderating action (e.g. alleviating the impact of stressors in the workplace), climate control (e.g. cultivating a shared perception of health in the team), and modelling (e.g. acting as role models for health

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and exemplifying a particular health behaviour) (Wegge et al., 2014). For example, one study found that supportive leadership behaviour was associated with self-rated health among employees even after adjusting for other factors including work-related stress (Schmidt et al., 2014). In addition, a Swedish study found a close response relationship between managerial behaviours and ischaemic heart disease among employees (Nyberg et al., 2005). Interestingly, the available evidence shows that the different types of traditional leaderships are related to employee health in their own specific ways (Rowold et al., 2013).

Transformational leadership characterized by high credibility and a leader who motivates followers with attractive visions, stimulates employees to creative and independent thought, and takes the time to provide support and development to individual employees, is positively associated with psychological affective well-being (Liu et al., 2009; Arnold et al., 2007; Kelloway et al., 2013; Tavfelin et al., 2011; Nielsen et al., 2012), personal accomplishment, and work engagement (Vincent-Höper et al ., 2013). In addition, a meta-analysis found a negative relationship between transformational leadership and negative well-being (e.g., burnout, strain) (Vincent-Höper et al., 2013). Transactional leadership is characterized by active management by exception and contingent reward. Active management by exception refers to leaders who actively monitor errors and deviations from the expected norm, in order to take corrective measures before these errors appear (Wegge et al., 2014). Contingent reward is conceptualized as leadership behaviour that sets clear expectations and goals, and rewards employees for goal achievement. While there is good evidence that contingent reward is positively correlated with job satisfaction (Vincent –Höper et al., 2013; Judge et al., 2004) and negatively correlated with stress and strain (Stordeur et al., 2001), there are conflicting results regarding management by exception (Vincent –Höper et al., 2013).

LMX leadership, which is based on the dyadic relationship between leader and subordinate, has been found to be associated with employees' subjective well-being (Rousseau et al., 2008), good mental health (Singh et al., 2009), and job satisfaction (Harris et al., 2006; Hooper et al., 2008; Spar et al., 2008). Other studies have found LMX to be negatively related to depression in the workplace, turnover intentions, psychological distress (Rousseau et al., 2008; Sparr et al., 2008) stress, and burnout (Harris et al., 2006; Gregesten et al., 2014). Despite these associations between different types of leadership and employee health and well-being, some argue that there is a potential overlap between the leadership constructs which needs to be considered Rowold et al., 2013). Many leadership studies on employee health have used single leadership constructs or lacked theoretical reasoning about leadership constructs that might share common elements based on specific dimensions of theoretical overlap (Rowold et al., 2013). For instance, in a study that assessed possible convergence across leadership constructs, Rowold et al. (2013) found that such convergence did exist, and that transformational leadership and LMX included the development of a confidential relationship with the employee, which positively influenced their health (Rowold et al., 2013). However, a meta-analysis by Judge et al. found that transformational leadership was correlated with contingent reward (related to transactional leadership), thus suggesting that transactional and transformational leadership are so closely related that it is difficult to disentangle their unique effects (Frangieh et al., 2017; Gerstner et al., 1997). On the other hand, Strum et al. pointed out that scale contingent reward correlated highly with leadership success, similarly to transformational leadership (Sturm et al., 2011). According to Wang et al., neither transformational or transactional leadership can explain additional variance depending on the specific outcome being studied (Wang et al., 2011). Graen et al. suggested that LMX leadership involves a transformational and transactional process; a dyadic exchange that starts close to transactional leadership, and with time creates an effective LMX relationship (Graen et al., 1995). In testing for convergence of leadership constructs, Gregsten

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

et al. found that LMX leadership predicted employee well-being indicators better than other types of leadership (Gregsten et al., 2014).

Wagge et al. introduced the notion that leadership behaviour should be considered as a determinant of health (specifically employee health) at work because it has a substantial influence on employee motivation, satisfaction, well-being, sick leave, and early retirement (Wegge et al., 2014). Furthermore, the authors argued that there are five pathways through which leadership behaviour influences employee health. The first pathway relates to the ways in which the health of employees is affected by direct actions of the supervisor. This encompasses motivating and supportive behaviour, but also destructive forms of leader behaviour that have a direct impact on the immediate health of employees. The second pathway comprises actions that are aimed less at individual workers and more at the level of the team or organization as a whole. Here, the impact of leadership on health is felt through its impact on contextual variables such as the availability of social or organizational resources within a specific work system that have the capacity to affect employees' ability to cope with stressors at work. The third pathway describes moderator/buffer effects that are specified within a number of stress models. For example, leader behaviour can act as a buffer against high levels of demand at work or as a factor that serves to mobilize existing resources (Wegge et al., 2014).

The fourth pathway is at the team/organizational level, and focuses on shared perceptions and/or actions within teams. The leadership affects employees' collective assessment of work-related psychosocial stress, for example in helping to shape shared perceptions of a situation as challenging, threatening, or rewarding. Finally, the fifth pathway is conceptualized as a bi-directional feedback loop. This points to the fact that leaders can be sensitive (or not) to the health of employees and as a result can engage in specific behaviours to improve their well-being. In addition, the health of employees can be a resource for leaders (and vice-versa) that helps them achieve their own goals and this in turn can have an impact on the health and well-being of all parties (Wegge et al., 2014).

The available research on the role played by the traditional leadership behaviours described above concentrates only on the employees (the internal stakeholders) within business organizations. However, the present article aims to go beyond this, to reflect on the impact of responsible leadership behaviour on the health of stakeholders in general: employees, clients, and society (Macassa et al., 2017). As Maak and Pless stated, RL is geared toward the management of a corporation's interactions with society; and in order to address the corporation's various stakeholder concerns, responsible leaders can contribute to the multiple bottom lines of economic, social, and environmental performance (Maak et al., 2006). In this way, responsible leaders will enable and moderate interactions with the various stakeholders of the company (Maak et al., 2006).

Responsible leaders are also expected to help address current and future challenges such as rising inequality, global warming, global migration, and poverty, as well as putting pressure on governments, international organizations, and business organizations to contribute to a sustainable future for people and the planet (Maak et al ., 2006; Macassa et al., 2017). Because responsible leaders will care about helping to solve global challenges, it is argued that responsible leader behaviour should be seen as a social determinant of internal and external stakeholder health, thus contributing to reducing inequalities in health and promoting equity in health (Macassa et al., 2017). The social determinants of health are defined as the conditions in which people are born, grow, live, work, and age (Solar et al., 2010). These conditions are shaped by the distribution of money, power, and resources at the global, national, and local levels. The social determinants of health are mostly responsible for health inequities; that is, the unfair and avoidable differences in health status seen within and between countries (Marmot et al., 2014;

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

LucyK et al., 2017; Donkin et al., 2017). Thus, taking a social determinant perspective, responsible leaders are also expected to contribute to health promotion across the corporation's stakeholders (Macassa et al., 2017). For instance, in an attempt to relate CSR and health promotion, Monachino et al. argued that corporations are expected to act regarding health protection, health promotion, and the social determinants of health (Monachino et al., 2013). Health protection aims at preventing and mitigating threats to human health through safety standards of goods and services, as well as complying with employee and occupational health standards. Regarding health promotion, corporations are thought to contribute in the process that enables people (in this case internal and external stakeholders) to increase control over their health via distribution and marketing strategies which will impact on consumer lifestyles and behaviours and convey powerful health values (van Dierendonck et al., 2011).

CONCEPTUAL FRAMEWORK: RL - STAKEHOLDERS' HEALTH, WELL-BEING

This article proposes a conceptual framework for understanding how responsible leadership behaviour (through a stakeholder theory and CSR strategies) can affect the health outcomes of internal (employees) and external (consumers and population at large) stakeholders through individual and organizational processes. It offers an adaptation of Doh and Quigley's original model of RL in the context of public health/health promotion (Zhao et al., 2019). Thus, the focus here is not only on the managerial and organizational levels of business organizations, but also on the larger public health and health promotion environment.

The original model by Doh and Quigley proposes psychological and knowledge-based pathways, and argues that RL is more inclusive and more likely to resonate psychologically at the individual level, resulting in high levels of engagement within organizations (Zhao et al., 2019). In addition, it is thought that responsible leaders are willing to engage with varied stakeholders (including those of different cultures) in a meaningful way, creating an environment of psychological trust and respect that promotes positive outcomes among stakeholders. Moreover, in the case of internal stakeholders (employees), an engaged responsible leader can positively influence their creativity, empowerment, and intrinsic motivation.

Responsible leaders are suggested to have a servant behaviour (Waldman et al., 2020). The servant leadership dimension is related to creating value for the community, which is a natural point of integration. According to van Dierendonck, there is support for a positive association between servant leadership and employee satisfaction, commitment, and performance (van Dierendonck, 2011). Van Dierendonck also points out that it is through the development of high-quality leader-follower relationships and a psychological climate of trust and fairness that responsible leaders contribute to positive outcomes at the individual, team, and organization levels. At these levels, responsible leaders might be perceived to contribute to team members' safety, thus creating a good environment for learning and performance. It is also suggested that the inclusiveness fostered by a responsible leader can be considered a key antecedent for the psychological safety of internal stakeholders. At the organizational level, the psychological benefits of a stakeholder-oriented approach creates a virtuous cycle of positive outcomes where internal stakeholders (employees) trust the leader, feel committed to the objectives and vision of the organization, and feel emotional connection to the work and organization, which could also affect individual motivation.

The second pathway proposed by Doh and Quigley is knowledge-based (Doh et al., 2014). They posit that responsible leaders with high consideration for all stakeholders are well positioned to navigate the context in which the organization operates, as well as to encourage knowledge to flow in a functional

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

way within and across the organization and among internal and external stakeholders. A study by Van Dierendonck supported the idea of the stakeholder-oriented approach, noting that leaders who understand the wider society in which their organizations operate are associated with positive individual outcomes through psychological mechanisms such as ownership and trust (van Dierendonck et al., 2011). Doh et al. pointed out that the two pathways are interrelated, and influence all stakeholders' outcomes at the individual, team, organizational, and societal levels through CSR strategic activities (Doh et al., 2014).

In our adaptation of this model (Figure 1), the first block depicts the individual characteristics of the responsible leader (visionary, steward, servant, citizen, change agent/networker, facilitator, expert) as well as leadership style (instrumental or integrative). The individual characteristics of the leader will interact with factors at the organizational and societal levels (second block) via psychological and knowledge pathways, which in turn will influence the health and well-being of internal (employees) and external (society) stakeholders in the third block. The first mechanism involves the incorporation (by the responsible leader) of CSR strategies into the business strategy and organizational processes that contribute to employee health, well-being, and wellness. Based on the hypothesis of Doh et al. (2014), we argue that responsible leaders can use CSR strategic activities to create positive outcomes at the individual, team, and organizational levels, contributing to increased trust, intrinsic motivation, and satisfaction among employees that in turn can improve health and overall well-being.

In relation to employees (internal stakeholders), business organizations would need to go beyond occupational health and safety to also promote workplace mental health and wellness for a sustainable workplace as part of their internal CSR strategy (Doh et al., 2014). The Centres for Disease Control define workplace wellness as activities that help employees to take responsibility for their lifestyle choices, educate the workforce about hazards and opportunities for wellness, enhance employee productivity, reduce absences and idleness, reduce health care costs, and shift the health care paradigm from treatment to prevention (CDC, 2018). Czabale et al. suggest that responsible leaders should use CSR to promote mental health through both skill training and improving conditions at the workplace. Skill training can include knowledge about stress and coping, training of social skills such as occupational stress management, problem-solving, communication, cognitive skills, and progressive muscle relaxation to better cope with stress, while improvements in the workplace may involve the modification of external characteristics of work such as time, work organization, scheduling, and employer-employee relationships (Czabala et al., 2011). The inclusion of psychological risk management in organizational CSR strategies should be seen as a good business practice, as it can contribute to a reduction of societal problems (by preventing the shift of problems to society workers and their families) and increase the productivity of the workforce in terms of less absence and positive engagement (Tomaselli et al 2019; Williams et al., 2003). In addition, responsible leaders will be more prone to take into account human rights and gender equality in the workplace, which has been related to economic efficiency and economic development (Williams et al., 2003).

In our model, we see RL behaviour influencing external stakeholders' health and well-being (the community/population at large) through a societal mechanism (intermediary block, Figure 1). The second mechanism entails the impact of the leader's behaviour on external stakeholders through strategic CSR activities. The leader's behaviour will interact with societal characteristics such as the environmental, cultural, socio-economic, and political context to influence external stakeholders' health outcomes. Again, here, using the psychological and knowledge pathways proposed by Dough and Quigley, responsible leaders are expected to also have consideration for external stakeholders through their servant behaviour (Doh et al., 2014). Servant responsible leaders are expected to better understand and navigate

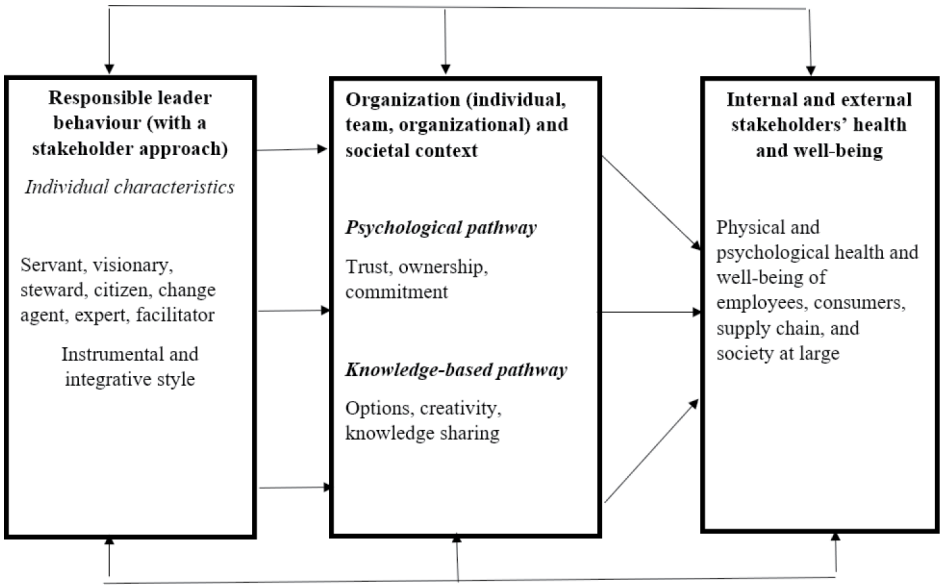
EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the societal challenges within the contexts in which their organizations operate, as well to encourage knowledge to flow in a functional way within and across the organization and among internal and external stakeholders. It is argued that responsible leaders could influence external stakeholders' health and well-being through support of CSR strategies and psychological mechanisms of accountability and trust (Van Dierendonck et al., 2011). For instance, Stahl et al. posit that responsible leaders would apply a stakeholder approach in navigating and managing across cultural boundaries in order to identify and anticipate critical socio-economic and societal problems and trends so that they can respond more appropriately (Stahl et al., 2010).

Our proposed framework includes two extra dimensions among the RL behaviours in the first block (Figure 1), inspired by Voegtlin et al.'s "role models". According to Voegtlin et al., the term "role models" encompasses the various obligations associated with the roles of a leader in a business organization and the correspondingly heterogeneous accountability that leaders might perceive in their roles (Voegtlin et al., 2019). They argue that the roles of expert and facilitator, together with the role of citizen that was already suggested by Doh and Quigley (2014), cover accountability towards internal and external stakeholders and are related to basic human motivation; for example, the motivation to care about one's task, to care about those one is entrusted with, and to care about social welfare (Voegtlin et al., 2019). Furthermore, Voegtlin et al. argue that the expert's role has to do with the fact that leaders structure tasks and engage employees in them. And the facilitator role include leaders motivating employees and helping to integrate within the organization (Voegtling et al., 2019).

The role of citizen translates into a responsible leadership that meets its moral obligations to the environment and to society, including future generations (Voegtlin et al., 2019; Hernandez, 2012). In addition, it is assumed that citizen leaders are positioned to see the importance of sustainability decisions and display citizenship behaviours that seek to create long-term value in society (Hernandez, 2012; Patzer et al., 2018).

Figure 1. Conceptual framework for responsible leadership behaviour and stakeholder health outcomes (Authors' own adaptation from Doh and Quigley, 2014)



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Many business organizations use informal knowledge of contextual culture and norms to develop health and wellness initiatives that go beyond their employees to target the broader population. Such actions allow companies to influence health outcomes across the value chain (Webber et al., 2010). There are those who argue that the increasing role of business and corporation involvement with health initiatives and programmes is a recognition that governments alone may not be able to solve all problems, and that businesses or industries are able to influence employees, local communities, consumers, and business partners that provide critical supplies and services for the general public (Zwetsloot et al., 2008; Zwetsloot et al., 2004).

Concerning why business organizations should care about society beyond the workplace, Zwetsloot et al. argue that societal challenges may enter the enterprise in one way or another, and that the organizations have to cope with them (Zwetsloot et al., 2008). Along the same lines, Webber et al. argue that business organizations need to understand that even if they take care of their employees in the workplace, it is essential to invest in the communities workers come from if their investments are not to be compromised in the long term (Webber et al., 2010). In a study addressing the contribution of the Johnson and Johnson Company in the African context, Chattu reported that the company contributed to fighting the HIV epidemic as well as improving the quality of life among those living with illness (Chattu et al., 2015). In the US, retailers like Walmart provide low-income and disadvantaged communities and neighbourhoods with access to affordable and nutritious food (BSR et al., 2015). A study of CSR across six pharmaceutical companies found that the firms practiced population health related initiatives ranging from mobile health to preferential drug pricing and employee exchange programs in low-income countries (Droppert et al., 2015). All the above examples illustrate that although no systematic name is given to these CSR actions (called philanthropic or charitable actions), many corporations are already taking part in actions to promote health to customers, suppliers, local communities, and the public. Due to these increased actions taken by corporations to improve population health in a variety of contexts, there is a call for closer collaboration between business organizations and public health and health care professionals to identify evidence-based interventions that work, the catalysts and motivators for community health improvement, and the metrics for workforce and community health regarding self-reported health, life expectancy, individual health behaviours, socio-economic factors, and the physical environment (Macassa et al., 2017; Hernandez, 2012). In the proposed model, we add responsible leadership style as a dimension that can characterize the responsible leaders' behaviour in their quest to work for all stakeholders' health and well-being. It is argued that integrative responsible leaders will be more prone than their instrumental counterparts to engage in heath promoting CSR activities aimed at internal and external stakeholders (Macassa, 2019).

CONCLUSION: OPPORTUNITIES AND CHALLENGES

This article proposes a framework linking responsible leadership behaviour to internal and external stakeholders' health and well-being outcomes. To our knowledge, this is the first such proposal. Although the framework does not depict all the potential pathways that might be identified, we hope for it to stimulate a discussion on how the new and ever-evolving concept of RL can contribute to making a business case for internal and external stakeholders' health promotion in the era of the Sustainable Development Goals (SDGs) and Agenda 2030. However, much remains to be discovered and understood regarding what characterizes a responsible leader, let alone how to measure it (Waldman et al., 2020;

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Voegtlin et al., 2019). Waldman et al. recently revisited the concept of RL and argued that probably it should be considered as an orientation or mindset (mental framework) of how people think, feel, and act in challenging situations (Waldman et al., 2020). In another recent study, Voegtlin et al. attempted to measure RL using dimensions from what they called the "roles model" to better understand the impact of responsible leadership within the area of management. There is a need for research to assess how the few available measures of RL (e.g. those suggested by Voegtlin et al. (2019) can be empirically related to stakeholders' health and well-being outcomes. Nevertheless, we believe that amid the current and future challenges and the need for inter-sectorial collaboration in order to achieve Agenda 2030 and specifically SDG 3 (health for all at all ages), public health professionals need to investigate how RL can contribute to health and well-being beyond the workplace.

The conceptual framework presented in this article is an overall attempt to model the potential pathways through which RL behaviour may affect stakeholders' health via CSR strategies at the organizational and societal levels. Thus, it is important to bear in mind that there is no one-size-fits-all approach. It is likely that individual business organizations will decide the scope, level, and type of investments in population health that will suit their situation and context where they operate. However, as shown by the examples above, there are opportunities for responsible leaders in businesses across the world to help promote population health as well as health and wellness in workplaces as a broader stakeholder and value chain issue. This would reflect business organizations changing paths towards a CSR agenda that sees the overall population as being linked to other important social, environmental, and business challenges.

AUTHORS' CONTRIBUTIONS

GM developed the concept and produced the first complete manuscript draft. GT and JS critically reviewed the manuscript. GM, GT, and JS reviewed the final version of the manuscript. All authors have read and approved the final manuscript.

ACKNOWLEDGMENT

The authors thank Thomas Maak and Cormac Mcgrath for feedback on an earlier version of this manuscript. GM is grateful for the support of the Department of Public Health and Sports Science at the University of Gävle, through the CSR-PhAM Program and RELeSH project.

Chapter 84
The Role of the Supervisor in Creating and Maintaining an Emotionally Healthy Workplace

Amy Tureen
https://orcid.org/0000-0003-0974-1676
University of Nevada, Las Vegas, USA

ABSTRACT

Supervisors, be they employed in higher education or in other industries, operate in capacities that allow them to shape organizational cultures within their departments, divisions, colleges, or broader units. Within the higher educational model, this means that supervisors are uniquely placed to counteract negative elements within the culture of academia, which historically has tended to prioritize individual competitive output, with alternative models that may offer improvements to the emotional health and well-being of higher education employees. This chapter seeks to describe the impact of stress on the health of workers, the employment stressors that are unique to higher education, and the processes by which supervisors in higher education can use their positional power to counteract said stressors and improve academic organizational cultures. The chapter includes practical suggestions for supervisors to enhance wellness and decrease emotional harm in scenarios common to the higher education workplace as identified via social media crowdsourcing.

INTRODUCTION

This chapter will explore the roles of supervisors in establishing and maintaining humane and emotionally healthy workplaces within the field of higher education. In doing so, the author asserts that supervisors are, by virtue of their positional power, that is to say their formal authority as granted by both title and their place within an organizational structure, in a position to establish and enforce cultural norms for their immediate employees and organizational units, via both formal power structures inherent to their position and the information cascade phenomenon. Given this, supervisors should (and are indeed obligated to) establish and enforce cultural norms that foster humane and emotionally healthy

work environments that allow employees to maintain a sustainable work/life balance while still meeting organizational needs. Further, supervisors must act mindfully in the workplace, with the full awareness that their choices will be viewed by employees as articulating expectations and norms and may encourage employees to make or avoid similar choices. Put otherwise, supervisors must fully consider that which they celebrate, condemn, and normalize, as these actions may be given unintended weight and could create a culture of expectations that are unhealthy for both individuals and the organization. Additionally, the author asserts that transparency of intentions and expectations, when combined with mindful choices on the part of supervisors, can assist in creating a humane and emotionally healthy culture that does not lionize behaviors and actions that are associated with exhaustion, burnout, and poor work/life balance.

BACKGROUND

The necessity of developing and maintaining emotionally healthy workplaces would seem to be, at first glance, self-evident. It does not take any particularly creative leaps of logic to imagine that healthy, happy workers are more likely to be efficient, productive, and creative than those who are exhausted, overwhelmed, or experiencing burnout. However, despite this seemingly obvious notion that emotionally healthy workplaces are beneficial for both workers and employers, they appear to be increasingly rare. A 2013 study by the American Psychological Association determined that 33% of working Americans reported feeling extreme stress, while 48% of the same pool of respondents indicated that their stress levels had increased in the past five years. A survey conducted in 2017 demonstrated that the uptick in US employee stress levels continued, with 61% of respondents reporting that they felt exhausted and 85% reporting that they felt run down and drained of physical energy (Statista Survey, 2019a, 2019b). More worrying still, despite high rates of stress, burnout, and overwork, 90% of respondents indicated that they felt they were achieving less than they should (Statista Survey, 2019b). This suggests that in addition to the negative emotional impacts generally associated with stress, at least some respondents were also beginning to experience sensations of guilt associated with a perceived lack of progress or industry, which may further exacerbate poor mental and emotional health conditions.

Excessive stress and sustained poor emotional health also impact the body. In his book *Overworked and Overwhelmed: The Mindfulness Alternative*, executive coach Scott Eblin notes a 2014 study by the Benson-Henry Institute for Mind Body Medicine that reported between 60 and 90 percent of visits to the doctor are prompted by stress-related complaints (10). More recently published medical reports, such as those provided by the Mayo Clinic and the Cleveland Clinic, identify a whole suite of physical complaints associated with prolonged stress, including headache, muscle pain, chest pain, depression, anxiety, changes in sex drive, gastrointestinal distress, sleep disturbances, grinding-related tooth damage, weight loss, weight gain, hyperhidrosis, tachycardia, and others (Cleveland Clinic, 2015; Mayo Clinic, 2019; Richards, 2018). Stress management, physical wellness, and emotional wellness are thus necessary priorities for organizations that wish to keep employees both working optimally or, over time, working at all.

Of course, the development of an emotionally healthy and humane work culture involves the participation of many people. Individual efforts must combine with institutional policies and organizational values to ensure the successful prioritization of wellness-friendly behaviors and processes that benefit all employees while still meeting the overall goals of the organization. Within most organizations, whether based in higher education or other industries, those in a supervisory capacity have additional power to

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

build, maintain, and enforce a culture that prioritizes emotional wellness. This additional capacity to influence organizational culture results from the unique positioning of supervisors at the intersection of the seven forms of recognized social and organizational power: titular, coercive, reward, referent, connection, informational, and expert (French & Raven, 1959; Murphy, 2017; Raven, 1992). Titular power is, in effect, the power granted by rank within an organizational hierarchy, whereas coercive and reward power is the power to punish or reward respectively. Referent power, on the other hand, is the power given by others when they perceive an individual is in a position of power and influence. Connection power is perhaps best defined by power born from successful networking. It is related to informational power, which is the power granted by knowledge of organizational or otherwise influential priorities, decisions, discussions, changes, etc. that are not yet known to all. Informational power is related to, but somewhat different from, expert power, which is knowledge developed; as a result of experience that causes others to defer to opinions held by those who are perceived to be more informed or more skillful. While all members of an organization can and do have access to these power bases, the nature of a supervisor's work, responsibilities, and privileges situate them in the nexus of all seven power bases more regularly than those who are not in a supervisory role. By mindfully leveraging these power bases, supervisors can intentionally exert significant influence on organizational culture and tolerance for wellness-friendly behaviors.

Even supervisors who do not intentionally engage in establishing and maintaining organizational norms in the areas of wellness exert impact thanks to the information cascade process. Drawn initially from behavioral economics and network theory, the information cascade model asserts that individuals tend to make the same choices sequentially based on their observations of the success or failures of those who made the same or similar decision before them (Bikhchandani, Hirshleifer, & Welch, 1992). Applied to workplace culture, this means that employees will interpret the culture and expectations based on either the reaction of those in supervisory capacities to the choices made by those whom their organizational power allows them to reward or punish, or by the behaviors and choices modeled by those in supervisory capacities themselves.

The first formulation of the intersection between organizational culture and the information cascade model is easy to grasp, and one in which most employees have engaged to some degree. For example, anyone who has ever seen a colleague be shouted out of an office for asking for vacation time during a particularly pressing deadline knows not to make a similar request, and to plan future leave requests with more strategy. Similarly, employees who have repeatedly seen management approve early dismissal for employees to see their child participate in an after-school sport or other extracurricular pursuits may feel confident enough to assure their child they will be in attendance for the school talent show before formally requesting the time off.

The second formulation is also easy to understand and yet often forgotten or simply underrated. Most supervisors recognize they serve dual functions as a leader and a model but perhaps do not always appreciate the extent of the impact their modeling has on their employees or, perhaps, even beyond the work environment. As Eblin notes:

When you're a designated leader, your rocks roll downhill. If you're generating stress, your people are absorbing it and dealing with it. If you're burned out, stressed out and frantic from not getting enough sleep, not exercising and not getting enough time away from work, then your team or organization is going to reflect that.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The impacts are broader than work really. If you're taking your stress home with you, your people probably are too. From there, your rocks keep on rolling with impacts on the health of your people and their families and the quality of their connections to the broader community.

Wondering if any of that applies to you and your team? An easy way to check is to step back and look at how the people in your team or organization are operating. If they're making poor decisions and running around like their hair is on fire, in all likelihood that's on you and the rest of the leadership team. Your people are just reflecting back what they're seeing from you.

The good news, though, is that the opposite is also true. If you're leading and living at your best, it's much more likely that your people will too. You really can't overestimate your impact (Eblin, 2019).

Eblin's reminder about rocks rolling downhill echoes a familiar, if more obscene, bit of military jargon regarding an entirely different sort of material in a similar downhill slide. Regardless of the formulation, the message is the same: leaders and supervisors have immense power over the quality of their employees' day, week, and/or career experience and, as such, must be continually aware that culture cascades from them.

MAIN FOCUS OF THE CHAPTER

Issues, Controversies, Problems

The function of supervisor as a cultural cascade driver within the context of the higher education profession can be particularly fraught. Within the profession, information silos abound, faculty often function as independent contractors (or actually are independent contractors, in the case of adjuncts), historical whiteness and financial privilege permeate the industry creating a treacherously hidden curriculum that impacts both students and higher education practitioners, and the tenure process builds in a period of extended job insecurity that leaves many exhausted and psychologically damaged (Kinman G. & Wray, S., 2013; Shaw, C. & Ward, L.). These features combine all too easily to create cultures wherein individuals may feel their value is related only to their output. In this model, struggles to cope are cast as examples of personal weakness rather than intrinsic problems baked into the profession and its traditional organization. Those in a supervisory capacity can, however, mitigate these damages by both acting mindfully and by being transparent about the impact higher education employment can have on the overall emotional wellness of practitioners within the field. In discussing how supervisors can leverage their power in this way, a working definition of both mindfulness and transparency is required.

Mindfulness has, in recent years, achieved something of a buzzword status and as such may be viewed by some with doubt or even disdain. This antipathy for the term may be due to its slippery nature and its position within a field of disparate practices and understandings that is vastly broad and can be applied in numerous ways. The multifaceted nature of mindfulness is not a detractor but, rather, a benefit, as it allows the term to be defined narrowly when needed.

Within the context of this chapter, mindfulness will be based on the definition provided by Dr. Jon Kabat-Zinn, founder of the Mindfulness-Based Stress Reduction (MBSR) program housed at the University of Massachusetts Medical Center. Kabat-Zinn argues that mindfulness is "the awareness that

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

arises by paying attention, on purpose, in the present moment and nonjudgmentally" (NourFoundation, 2014). Eblin deconstructs Kabat-Zinn's definition, noting:

Awareness *is another word for noticing what's going on.*

Paying attention on purpose *suggests that we can make a choice to be aware and notice.*

In the present moment *means focusing on what's happening right now, not ruminating on what's already happened or worrying about what might happen.*

Nonjudgmentally *means we don't waste mental or emotional energy labeling events or thoughts as good or bad. We just acknowledge what we're seeing, thinking, or feeling (Eblin, 2014, p.19).*

Eblin continues, explaining more broadly that Kabat-Zinn's definition suggests that "mindfulness is about waking up and being aware of what you're thinking so that you can assess the impact of your thoughts and then make an intentional choice about what to do next. Mindfulness is about managing that gap between your thoughts and your actions" (Eblin, 2014, p.20). To disrupt the aspects of higher education employment that may induce poor emotional wellness, supervisors must develop competencies which permit them to be mindful about their own moods, emotions, and mental state so that they can react, without judgement, to meet both their needs and the needs of their employees while still meeting the goals and needs of the broader organization. Failure to develop mindfulness competencies increases the likelihood that employees feel abandoned to a system that has already demonstrated a lack of concern for individuals and/or individual emotional wellness. A supervisor who does practice mindfulness, on the other hand, better situates themselves to understand concerns shared by employees and to respond thoughtfully, rather than emotionally.

Mindfulness skills can also be applied by the supervisor when assessing their own concerns and needs, ensuring they also benefit from thoughtful reaction rather than knee-jerk first responses. A series of texts from the Arbinger Institute (*The Anatomy of Peace*, *Leadership and Self-Deception*, and *The Outward Mindset*) describe the sensation of failing to be mindful as stepping into "the box." The "box" is an emotional blinder that prevents those within it from achieving their best intentions, instead of placing them at loggerheads with others and trapping both in a continuous exchange of self-deception, irritation, and frustration that prevents genuine and beneficial interaction (Arbinger, 2015, 2016, 2018). Supervisors inside the box (that is to say, those who are unable to engage mindfully) place themselves at risk of causing emotional harm to both themselves and those they interact with. Supervisors within the box also risk contributing to an overall culture that fails to prioritize wellness and that, over time, may result in poor organizational output and chronic inefficiencies.

Transparency within the context of this chapter applies to the process by which mindfulness is brought to bear within an organization. Achieving transparency includes both clearly articulating intentions and speaking honestly, and with vulnerability, about the need for both the processes and the changes they are intended to enable. Supervisors seeking to change the culture within their organizations must be willing to share their own experiences, including sometimes painful ones, to establish context and common humanity with their employees. This may include, for example, disclosing challenges to personal confidence levels during the trials of the tenure process or steps taken to address and correct one's practice after receiving poor teaching reviews. It must be emphasized that this form of transparency does not call on supervisors to disclose past experiences which are unduly personal. Supervisors seeking to be transparent and vulnerable must always take steps to ensure they are not in any way burdening their

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

employees with their own emotional or psychological baggage. Rather, this form of transparency urges supervisors to select moments of vulnerability that work in service to the employee and help them understand that employee's negative experiences are not indicative of lack of belonging or capability, or, worse, are somehow indicative that the employee is unsuitable for employment within higher education. In doing so, supervisors also implicitly invite their employees to be similarly transparent and vulnerable in recounting their own experiences and feelings, which in turn might reduce emotional harm and assist with overall retention of employees within the field.

It is also key that supervisors be transparent and explicit when articulating their goals associated with honoring and prioritizing employee emotional wellness. Enshrining emotional wellness within organizational values alongside other institutional priorities, for example, empowers employees to prioritize emotional wellness within their practice and enables all members of the organization to more productively question arising mandates and processes that appear to be at odds with the pre-existing organizational wellness value. The phrase "productively question" is important here, as it implicitly addresses the tension that sometimes exists between employee wellness priorities and organizational priorities. In formally honoring the emotional wellness needs of employees, organizations are not being asked to discount, reduce, or second-tier the traditional priorities of higher education institutions (scholarly output, the instruction of students, the attainment and completion of grant-funded research, community outreach, cultivation of the arts, etc.). Instead, they are being challenged to establish policies that allow both goals, which are in no way counterproductive, to be obtained simultaneously. Organizations that formalize their commitment to employee wellness enable employees who feel these values aren't being met to address their concerns transparently rather than pushing their complaints "underground." Disgruntled conversations pushed underground can all too easily become trapped in unseen negative feedback loops that permit ill will to fester longer. Sustained ill will may in turn result in intentional or unintentional work slowdowns, decreased morale, and potentially over time, poor worker health and increased illness-related absences.

Where supervisors are unable to enshrine pro-emotional wellness in formal organizational documentation, they can still prioritize emotional wellness, for themselves and their teams, within their philosophy of management. This philosophy should be articulated during both onboarding and regularly throughout normal employment. Supervisors who fail to articulate or otherwise live this value beyond the onboarding process place themselves at risk of being perceived by their employees as disingenuous. Additionally, supervisors promoting emotional wellness via their management philosophy should also have frank conversations with the appropriate human resources and/or organized labor representatives to ensure that their approaches to promoting wellness initiatives do not violate existing agreements and/or policies.

SOLUTIONS AND RECOMMENDATIONS

While numerous resources articulate various leadership philosophies that prioritize mindfulness and transparency (Brown, 2018; Eblin, 2014; Richards, 2016; Arbinger Institute, 2018, McClean, 2019; McKenzie, 2014; Hougaard, Carter, & Coutts, 2015)., there are very few resources that provide specific practical advice to leaders within the higher education context eager to leverage mindfulness and transparency within their organizations. Seeking to address this gap, the author conducted a call via multiple social media platforms to higher education employees of all types (including supervisors) to identify common pain points from their working lives that appeared to pit the emotional wellness of the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

individual against higher education cultural norms. These submissions were then anonymized, edited for length and clarity, and annotated with recommendations for supervisors facing similar concerns. The provided advice is drawn from both the literature and lived experience as a supervisor of both faculty and classified staff employed by academic libraries at both private and state institutions. It is hoped that this offering of practical advice may be useful to supervisors who may either be facing similar scenarios or developing their leadership philosophy. The author extends thanks to all individuals who responded to the call for submissions, only a portion of which have been reproduced here:

We are salaried and expected to work 40 hours per week, but the exact hours of that schedule tend to vary. Because we are not hourly, we do not get paid overtime. There is an unofficial flex time system, but the organization will not define it precisely. When we push for definition, we are first reminded that we do not have 9 to 5 jobs and are then warned that we shouldn't rock the boat. The implication is that in asking for clarity we will risk losing the flexibility we technically have due to a lack of actual policies.

It is not atypical for higher education organizations to claim that faculty roles, or indeed any form of salaried employment, is not a 9 to 5 job. Generally, this statement is meant to indicate that start and stop times are less rigidly defined than those of their hourly counterparts, and that on occasions when they must engage in overtime, they will not be financially compensated. However, the phrase that salaried employment is not a 9 to 5 job is problematic on several levels and should perhaps best be retired from common parlance. The unfortunate reality is that this phrase is generally loaded with an unspoken scorn for those who do engage in more structured hourly employment. Use of this phrase can induce antipathy between salaried and hourly (usually classified) employees, as it often reflects other inequalities, such as compensation, nature of assigned duties, vacation and sick day allowances, schedule flexibility, and perceived status. Tensions between classified and academic faculty are common, due in part to a predominant culture that places a premium on credentials and does not always equally value lived experience. Supervisors should seek to reduce these tensions and avoid language, however commonly used, that may further entrench such feelings.

Another weakness of the not a 9 to 5 job assertion is that it is vague and lacks transparency, which may lead employees to mistakenly believe there are minimal or indeed no limits on the amount of time an organization can demand of them. This misconception can, in turn, erode employee trust in the organization and negatively impact their ability to distinguish their work/life balance and differentials. Organizations where employees are actively being discouraged from seeking transparency, open themselves to accusations of manipulation and mistreatment. While fully articulating policies is time-consuming and onerous, doing so enhances transparency, which can increase organizational trust.

Supervisors should take a proactive role in trying to clarify and communicate uncertain policies, rather than waiting for employees to discover and report uncertainty. In situations wherein the supervisor cannot clarify the situation, the supervisor should forward the inquiry to the correct department or individual, and then keep active tabs on the matter as it moves towards resolution. Updates should be provided regularly to employees, even when there is no resolution yet to be had, to help signal that the matter is both of importance and has not been forgotten.

We are understaffed and have been for years due to budget cuts. Despite this, we are constantly encouraged to add more services we cannot support. The more services we add, the more burnout we experience. Now we do lots of things badly and the new services just keep coming.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Mission creep and decreasing budget expenditures have impacted most, if not all, institutions of higher education (Gonzales, 2012; Gonzales, 2013). The combination of these forces encourages organizations to adopt a do more with less philosophy, which invariably becomes draining over time for even the most vigorous and energetic employee. While most supervisors are not in roles that will permit them to reorganize budget priorities to the benefit of their units, they are in positions that provide some latitude when ordering priorities. Frank conversations may be needed between supervisors and teams, supervisors and individuals, and/or supervisors and administration to identify which current services are still needed, which emerging services are genuinely a priority, and which services may need to be reconfigured or reassigned to avoid overcapacity scenarios.

In many instances, letting go of old duties or services may be more difficult for some employees than taking on new ones. Supervisors should be mindful that when they ask an employee to set aside an old service in favor of a new one, they are ultimately asking employees to step away from an arena in which they have obtained mastery and into one where their skillset may not yet be developed. This process can be intimidating, even frightening, for individuals and empathy on the part of the supervisor is necessary. It may be valuable for supervisors to reflect on their own past experiences of transitioning from expert to novice over throughout their career so that they can remind themselves that such transitions can be anxiety-producing, particularly in the workplace where growth feels more visible and open to judgement and comparison by colleagues, employers, and direct reports. These transitions can be made easier by clearly articulating expectations, including a timeline of increasing competency and providing the level of training actually needed by each employee, rather than the level of training the supervisor imagines they would personally require. Throughout both the prioritization process and the training process, supervisors must make themselves available to receive feedback and avoid accusations of enacting Blanchard & Johnson's seagull management paradigm, in which "managers fly in, make a lot of noise, dump on everyone, then fly out" (pp. 38).

One of the most frustrating things about my organization is the misinformation about tenure. The bylaws are fairly clear, but senior faculty regularly suggest that the bylaws are just guidelines. People also like to talk about their own tenure process "battle scars," then become frustrated when pre-tenure faculty suggest the process might be inhumane and in need of reform.

The tenure process is nearly universally stressful for those who undergo it. The process necessitates review by peers, often in a public or semi-public forum, and is tied in most cases to an ability to retain employment in their current position. With few exceptions, this uncertainty regarding ongoing employment can result in periods of anxiety and stress, sometimes to extreme degrees. It may also have a significant impact on the mental and/or emotional health of candidates (Ball, 2014). Supervisors have an obligation to both discuss fears and cultivate a culture wherein stories of past candidates who underwent extreme stress as a part of the tenure process are not lionized. For example, supervisors might wish to not share the story of a past colleague who spent every weekend for six months preparing their tenure packet and instead work with candidates to establish a unique timeline for their packet process that enables the candidate to both meet tenure requirements and create space to engage in activities that hold personal value for them.

Supervisors are also responsible for modeling behaviors that acknowledge the seriousness of tenure, but which also seek to avoid making the experience seem harrowing. Supervisors benefit from being transparent about this modeling and should consult with senior faculty members to develop approaches

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and strategies that have the potential to make the process less overwhelming for junior colleagues. Where necessary, supervisors may need to speak to individuals who are not being mindful about the effects of their comments on candidates and coach them to be more empathetic and thoughtful about how they share their insights into the tenure process. While not every candidate may achieve tenure, candidates should not be subject to departmental cultures that communicate they are doomed from the start.

It should also be noted that tenure processes that serve solely as guidelines ought to be subject to review. Tenure processes that are uncertain, excessively vague, or otherwise produce reasonable doubt about the legitimacy of the process itself are highly problematic for both the organization and those candidates who are subject to them. The decision to be specific to the point of prescription is, of course, up to individual organizations and their faculties. However, it might be wise if organizations and faculties establishing their tenure process give serious consideration to the cost/benefit ratio of establishing policies that, though flexible, retain the capacity to harm the emotional health of colleagues by their unpredictability.

I am one of the only POC (Person of Color) faculty at my institution. When I tell my white supervisor about the microaggressions I experience, they usually try and explain how I misunderstood or am reading something unintended into the situation. This happens everywhere in PWIs (Primarily White Institutions).

The term microaggressions refers to indirect, subtle, or unintentional incidents of discrimination leveraged against members of a marginalized group. Initially coined by psychiatrist Dr. Chester M. Pierce in the 1970s, the concept has been radically expanded upon in recent decades to include classifications of types of microaggressions such as microassaults, microinsults, and microinvalidations (DeAngelis, 2009). Additional study has further defined common thematic trends, including the assumption of foreign-born status, the ascription of intelligence, white assertions of color blindness, assumption of inherent criminality, white denial of individual racism, the prevalent myth of meritocracy, pathologizing cultural values, endemic white preferential treatment, systematic environmental microaggressions, and common turns of phrase predicated on devaluing a marginalized social group (Sue, Capodilupo, Torino, Bucceri, Holder, Nadal, & Esquilin, 2007). Microaggressions can have a significant impact on the mental health of those exposed to them, radically increasing rates of depression, self-doubt, poor self-esteem, suicidal ideation, and a myriad of symptoms associated with post-traumatic stress disorder (Torres & Taknint, 2015; O'Keefe, Wingate, Cole, Hollingsworth, & Tucker, 2014; Robers & Molock, 2013; Nadal, 2018). The impact and endemic nature of microaggressions within higher education is well-documented (Johnson & Joseph-Salisbury, 2018; Young, Anderson, & Stewart, 2015) and continues to remain prevalent; even in collecting sample scenarios for this chapter, scenarios detailing microaggressions leveraged against ethnic minorities occurred three times as often as scenarios associated with any other theme or topic.

All supervisors, but in particular those who are white, are obligated to educate themselves about how whiteness holds social and institutional power and the impact that power has on nonwhite people. This can be a new and challenging perspective for those who have not historically had to assess how they benefit from their unasked-for association with dominant power structures. As Robin DiAngelo notes in *White Fragility: Why It's So Hard for White People to Talk About Racism*:

White people in North America live in a society that is deeply separate and unequal by race, and white people are the beneficiaries of that separation and inequality. As a result, we are insulated from racial stress, at the same time that we come to feel entitled to and deserving of our advantage. Given how

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

seldom we experience racial discomfort in a society we dominate, we haven't had to build our racial stamina. Socialized into a deeply internalized sense of superiority that we either are unaware of or can never admit to ourselves, we become highly fragile in conversations about race. We consider a challenge to our racial worldviews as a challenge to our very identities as good, moral people. Thus, we perceive any attempt to connect us to the system of racism as an unsettling and unfair moral offense. The smallest amount of racial stress is intolerable--the mere suggestion that being white has meaning often triggers a range of defensive responses. These include emotions such as anger, fear, and guilt and behaviors such as argumentation, silence, and withdrawal from the stress-inducing situation. These responses work to reinstate white equilibrium, as they repel the challenge, return our racial comfort, and maintain our dominance within the racial hierarchy (1-2).

This means white supervisors (or those who hold other dominant identities) must take care to not respond with fragility when employees share their experiences of microaggressions. Responding with fragility can double the negative impact of the event and further degrade the sense of safety and comfort within the workplace environment.

In addition to rigorous self-education, supervisors must also familiarize themselves with the resources available at their institution for individuals who are experiencing microaggressions. The full extent of resources available depends on the institution. Still, common resources include Human Resources, the Office of Diversity, campus Social Justice centers, the Office of the Ombudsman, and employee affinity groups oriented around gender, sexuality, ethnicity, religion, etc. It should be noted that while knowledge of these services and their contact information is necessary, this does not mean that all reports of microaggressions should be immediately referred onwards. How individual employees wish to address a microaggression, if they wish to address it at all, should, broadly speaking, be left up to the employee to determine. Supervisors should serve as supportive sounding boards with an understanding of optional additional resources, rather than automatic pipelines to official investigative or corrective processes.

Supervisors can also seek to reduce the overall frequency of microaggressions by prioritizing cultural humility and bystander training for all employees and articulating values associated with diversity in departmental and organizational guidelines. In addition to hopefully providing individuals with insights and skills to identify and confront bias within both their own behavior and the behavior of others, enshrining these values in the organizational culture itself helps accurately reflect that improving the capacity for emotional wellness and developing a humane workplace is work that all employees are responsible for. Asserting common responsibility for this endeavor reduces assumptions that education related to diversity is the work of marginalized people and reduces the likelihood of associating support services offered by employee affinity groups with deficit thinking models.

I work in Human Resources and the thing that never fails to amaze me is how little people know about the Family and Medical Leave Act. Usually by the time I am alerted of a situation an employee has completely run themselves down trying to maintain their usual work requirements while simultaneously taking care of a critically ill family member, managing their own mental health issues, trying to schedule surgery on a three-day weekend so they are not off work, etc. I do not know why staff do not ask first, rather than use HR as a last resort.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

During the course of their full career, most employees will, at some point, experience a situation that qualifies for extended leave under the guidelines associated with the Family and Medical Leave Act (FMLA). While events qualifying for FMLA leave can be joyous, such as the birth, fostering, or adoption of a child, quite often, FMLA is requested during events that can be both stressful and harmful to emotional health. Because Human Resource professionals are rarely in direct and constant contact with most/all employees, immediate supervisors must be aware of FMLA policies and how they can be leveraged. Familiarity with these policies enables immediate supervisor to assist employees undergoing crisis and accurately refer employees.

Supervisors who prioritize and speak both openly and transparently about the value of maintaining emotional wellness may reduce the likelihood that employees will seek support from Human Resources only as a last resort. Other techniques to stave off the last resort mentality include providing documentation related to emotional resources in a prominent place, discussing emotional wellness services available to employees during onboarding, and keeping the topics of both emotional wellness and available services in the common organizational discourse. Supervisors seeking to establish humane and emotionally healthy workplaces can also collaborate directly with Human Resources professionals to ensure they are providing consistent and accurate information regarding available resources, as well as clearly advertising where these resources are. It is not uncommon for organizations to offer plentiful resources and policy summaries that are simply not easily found by employees.

FUTURE RESEARCH DIRECTIONS

Future research directions regarding the role of the supervisor in creating and maintaining a humane and emotionally healthy workplace are robust and multifaceted. While this chapter contains suggestions regarding possible approaches to help develop and support healthy workplaces in the context of some common scenarios, more significant longitudinal studies are required. Additional scholarship is also needed in assessing the ways in which organizations have successfully added employee wellness to formal organizational values within the higher education context or within a corporate context with distinct recommendations on how such processes can be duplicated within the higher education context. Research on the efficacy of supervisor training in the "soft skills" necessary within a mindful and wellness-focused workplace is critically needed. This research should be paired with recommendations on how organizations can develop and deliver such training in-house so as to reduce the risk of paywall barriers that may otherwise disadvantage both supervisors and employees at institutions with limited funding.

Additional research is necessary within the broader area of the emotional wellness of higher education practitioners in the workplace writ large. While this literature does exist to some extent (Watts, J. & Robertson, N., 2011), it is unevenly applied across both disciplinary and functional capacities. Particularly short-changed are non-academic employees who, while not subject to the additional pressures and job uncertainty associated with the promotion and tenure process, may nonetheless benefit from the establishment of more humane and supportive workplaces. In researching the wide-ranging field of emotional wellness within higher education, special attention must also be paid to the emotional wellness of both higher education practitioners whose personal identities correspond with one or more historically marginalized groups and higher education practitioners who identify as first-generation college graduates. Members within the first group are often required to engage concurrently with the standard trials of higher education employment and the racism, white supremacy, classism, and bigotry

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

inherent to systems that were either were made without them in mind or that have historically sought to actively exclude them. This can result in additional emotional burdens that may negatively impact some individuals and additional research is needed to ensure that approaches to enhancing emotional wellness in the higher education workplace include resources and efforts of value to all workplace community members. Members within the second group, those who identify as first-generation college graduates, face additional barriers associated with hidden curriculum present within the workplace (Margolis, 2001). The presence of hidden curricula and the knowledge gaps they expose may result in enhanced but mistaken beliefs that some individuals are incompatible with higher education as a professional field of practice. Future research in this area must be inclusive and avoid the pitfalls of developing models that only or primarily suit members of the dominant culture and identity groups or communities that have an unspoken advantage when navigating invisible systems.

CONCLUSION

As the industry of higher education continues to make changes that better prioritizes the emotional wellness of employees and, in general, establish a culture that is broadly more humane than the culture currently in place, it must do so with the understanding that such improvements are not solely the work of individuals. Unlike scholarship, which often is the result of a single individual researching and publishing in an area of personal academic interest, cultivating environments wherein emotional wellness is encouraged is a collaborative effort. Miscasting this work as solely the responsibility of the individual whose wellness has been negatively impacted is wrongheaded. Further, it can be dangerous, as this model only further perpetuates the perceptions of isolation and fit that can make higher education employment so problematic. This does not mean that individuals are no longer responsible for making choices that benefit rather than harm their emotional health, or that supervisors are being positioned in such a way that assigns them the bulk of the responsibility for establishing healthy workplace cultures. Rather, the author asserts that individual workers and supervisors must work together in concert to enable wellness-enhancing behaviors and advocate aggressively for the establishment of formal pro-wellness policies within their workplaces. Additionally, the author calls for further research and contributions that outline practical approaches to achieving this goal, as well as those who articulate a broad theoretical overview.

The recommendations found in this chapter are intended to serve only as a start towards developing a multi-voiced collaborative repository of common pain points within higher education as it applies to emotional wellness and, with them, a selection of behaviors, responses, and practices which may address them. Over time, this collection of recommendations can be refined and enhanced, then adapted to meet the needs and preferences of individual supervisory practitioners. Continual reflection on such processes, both successes and failures, in combination with ongoing scholarship can assist, the author hopes, in establishing a culture of higher education wherein employees and supervisors work together in ways that take heed of and honor both emotional and intellectual needs within the workplace.

KEY TERMS AND DEFINITIONS

Coercive Power: The power that enables a supervisor to force an employee to comply with orders or to enact punishment if compliance is not given.

Connection Power: Power derived by influence on, favor from, or acquaintance with a powerful person.

Cultural Norms: The actions and behaviors which are tolerated and/or deemed acceptable, informally or formally, by the majority of members within a given subgroup of people.

Expert Power: Power derived from the perception of others that one possesses superior skills, knowledge, or experience.

Informational Power: Power derived by possessing needed or wanted information.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Mindfulness: A mental state and philosophical practice that prioritizes calm observation of the present moment and non-judgmental acceptance of emotional, intellectual, and physical responses to what is observed.

Organizational Culture: The structure of formal and informal priorities, values, and behavioral expectations in a given workplace environment.

Reward Power: The power of a supervisor to give some form of reward, tangible or intangible, in recognition of service, effort, or achievement.

Titular Power: Power derived from placement within an organizational hierarchy. Generally, this model provides individuals in higher positions with control over those in lower positions within the same organization. This power is sometimes referred to as Position Power.

Chapter 85
Engaging Employees With Positivity:
The Role of Appreciative Inquiry in Employee Sustainability

Shravana Bardhan
George College of Management and Science, India

ABSTRACT

This chapter attempts to find the role of appreciative inquiry in employee engagement and organizational transformation. An attempt has been made to explain the impact of appreciative inquiry on employee engagement, which eventually helps in organizational transformation with minimal hindrances. Employee engagement has turned into an undeniably conspicuous issue in the region of organizational development (OD) likely because of the developing collection of research encompassing the positive connection between employee engagement and organizational development, which also comprises profit margin. Appreciative inquiry is a vision-based approach of open dialogue that is designed to help organizations and their partners create a shared vision for the future and a mission to operate in the present. The main thrust area of appreciative inquiry is to find out what works best for the organization. Instead of focusing on negativity, appreciative inquiry focuses on the positive aspect of the organization.

INTRODUCTION

In recent years, employee engagement has become a very popular topic of discussion. Worldwide, many organizations have felt the need of increasing the percentage of engaged employees and they are taking steps to do so. Google, for example believes in nurturing a transparent culture in their organization in order to ensure engagement among the employees. Transparency ensures empowerment employees as well as creativity and collaboration among employees (Flintand Hearn, 2019). It is believed that by empowering employees, engagement can be achieved. In many organizations, employees are treated as partners. Since the employees are treated as partners, they take part in decision making in the orga-

nizations.(Flint and Hearn, 2019). This is one of the best practices in Google Inc. Full contact, on the other hand provides paid vacation to their employees in order to encourage engagement. They inspire the employees to go on a vacation funded by the organization, but on one condition that they cannot receive any official message or call. These paid vacations will reduce the dependence on any particular employee and at the same time will lead to belief in the efficiency of the coworkers.(Maier,2016).In Virgin, it is believed that to flourish in any business, one has to build an environment where employees will love to work and feel at home.(Flint and Hearn, 2019)But why has employee engagement become a much discussed topic these days? This is because employee engagement reaps many benefits for the organization. Employee engagement leads to enhanced employee performance, reduced absenteeism, job involvement, and many more. Among the many benefits of employee engagement, employee sustainability is one of the important benefits. Employee engagement helps the employees to go beyond just earning a livelihood. Nowadays, employees are not only happy with a handsome salary. They want to be a part and parcel of the organization. Employee engagement helps to balance personal life and work life. It gives them opportunity for learning and develops passion towards work. Employee engagement develops creativity among the employees, helps them to be innovative and in the process, enables the organization to achieve competitive advantage. It also leads to job satisfaction and lower rate of attrition and increased employee sustainability.

To make employees more engaged at work, it is important that the organizations know the strengths of its employees and helps to nurture them. Best productivity can come from instances where employees are able to deliver their potential. From this perspective, one of the organizational development practices that delve into the understanding and exploring the best potentials of the individuals at work and organizations at a whole is Appreciative Inquiry (hereafter AI). In one study it was found that, in two cases, innovative ideas got established and polished through the exceptional contribution of individuals from various backgrounds under appreciative inquiry (Richer, M. C., Ritchie, J., &Marchionni, C. (2009).. The heart of any organizational democracy is talking, exploring, initiating dialogue and inquiry; through this organizational members are engaged in defining better results for their firms.

Some of the building blocks of employee engagement, as research suggests, are as follows:

- **Building High Level of Trust:** The power of trust is often undermined by the leaders of an organization. But, if trust can be built up, it can reap many rewards-engaged employees, retention of top talent, positive work culture, etc. Following are examples of behaviours that can lead to building trust:
  i. Clarity in working of the company
  ii. Prompt dissemination of information
  iii. Giving impartial attention to each and every employee
  iv. Acceptance of failure
  v. Uniform communication
  vi. Uniform practices
  vii. Realistic commitment
  viii. No fault finding
- **Treating Employees Well:** Understanding the employees' actual needs and respecting those needs is crucial for developing engagement. Giving due respect to the employees helps to boost up the morale of the employees which in turn leads to higher level of engagement.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Deliver Promises:** A company's ability to fulfill its promises governs the integrity and truthfulness of the company. If a company can deliver the promises it has made to the employees, it will be able to fulfill the promises made to the customers also.
- **Envision:** It is not only enough to put down in statement a well thought and well explained vision of a founder. In order to realize the vision, it is essential that it is communicated to each and every employee of the organization. Vision should be inculcated within each and every individual.
- **Opportunity for Career Growth:** Most employee engagement surveys put 'career development opportunities' as one of the top most priorities in the minds of most employees. According to research findings of Blessing White when there is clarity in the definition of career success to an individual, it increases both job satisfaction and performance in their present job. It also enables lateral movement of the employees.
- **Design Meaningful Jobs:** Employee engagement can be ensured if both job enlargement and job enrichment is ensured at workplace. This brings variety in jobs as a result of which boredom in workplace reduces. Designing meaningful jobs also bring about creativity among the employees. The result is increased productivity and higher level of commitment among the employees.
- **Breathing Offices, Safe Workplaces:** The 'Generation and Workplace Annual Report' by Johnson Controls in the year 2010 clearly shows a relationship between nature of workplace and employee engagement. Nowadays ergonomically designed workplace is being stressed upon. Ergonomically designed workplace will take into consideration the physical as well as the social environment of the worker. Safer, breathing and ergonomically designed workplace contributes to higher employee engagement and higher productivity. An employee gets emotionally attached to the workplace which helps to boost up the morale of the employees.
- **Collaborate and Involve:** In this world of globalization, employees are spread all over the world. Therefore the need of the hour is collaboration among the widely spread work teams. At the same time, employees should be involved in important activities of the organization. This develops a sense of belongingness and importance among the people. It also enables the employees to use their creative skills at workplace. Both collaboration and participation leads to higher level of engagement.
- **Employee Empowerment:** Empowerment means instilling a sense of ownership among the employees. Empowered employees' takes part in decision making and planning process and the employees are motivated to do what they are best at. Global engagement study by Blessing White has showed empowerment as one of the top prime concern among the workers. Empowerment satisfies the esteem needs of the employees. Workers feel valued in the organization. When the workers perceive themselves as valuable, they will feel passionate about their work. This is turn results in higher level of engagement among workers.
- **Encourage Informal Networking:** Informal network helps in relationship building among the employees. It also develops trust among the employees which results in information and knowledge sharing amongst them. It also helps the organization to identify the negative vibes that may have developed within the organization.
- **Communication:** Communication is an important contributing factor to engagement. One of the ways to ensure engagement is to align the goals of the organization with that of personal goals. This can be ensured through effective communication. Organizational objectives and goals should be clearly communicated to each and every employee. Employees must be communicated about where the organization is headed for. Thus, communication plays a very important role in employ-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ee engagement. In addition, as mentioned earlier, nowadays due to globalization, work teams are spread all over the world. Therefore, developing new and improved methods of communication has become very essential for succeeding in any venture. Thus, communication and engagement is closely linked. (Sengupta,Ramadoss,2012,p.32-51)

EMPLOYEE ENGAGEMENT IN ORGANIZATION

Employee engagement has received considerable attention worldwide. It is being implemented by various companies. American Express for example concentrates on behaviour as measure to engage employees. The company has seen that engagement increases where the behaviour of the employer towards their employees has been on an emotional level. Therefore, American Express since long time has not only given importance to the result but also on how the results have been achieved. (Flint and Hearn, 2019)

Hyatt's employee turnover is very low in contrast to the trend in hotel industry. This is because Hyatt emphasizes on employee development. The emphasis on representative advancement and advancing from inside has a huge impact in this. Another intriguing practice, associated with improvement, is the manner by which they engage their representatives (whom they call partners), to listen cautiously to one another and visitors, to have the option to take care of issues and make new arrangements, instead of following contents of what to do, making the visitor feel unique and heard. (Flint and Hearn, 2019)

Companies that have given importance to employee development have motivated the inner self of the employees which is very much essential in this changing world. Motivation of the inner self helps the employees to welcome change and thereby helps in organizational development.

Wipro operates its employee engagement programs at all level-individual level, unit level and at organizational level. According to Wipro Sustainability Report (2015-2016), the key organizational modifications and announcements are cascaded by emails, internet messages, posters, kiosks, on-floor meetings and through company and human resources teams. Throughout the year, the management team engages with staff through online chat sessions, leader blogs,' Wipro Meets, at organizational level,' All Hands Meets ' at company unit level, round table conversations and functional evaluation meetings and offsets are organized. Another significant opportunity for engagement is to satisfy staff through one-to-one conference and team conversations through business managers and HR teams. In addition, company units use tailored engagement frameworks to satisfy employee-specific requirements in that unit or business or domain.

Wipro has created a broad social platform for enterprises to guarantee connectivity among geographically extensive staff and to allow them to work on cooperative projects without any time limitations or placement. They also allowed employees to provide real-time feedback to interact directly with senior authorities or functional teams through internet surveys.

TCS has an average employee engagement score globally at 73%. The engagement score of TCS in Asia Pacific region increased from 73.9% between 2012 and 2013 to 74.8% between 2013 and 2014. There is a prevalent understanding in TCS of Australia and New Zealand that engagement is characterized as the connection among people and the workforce where the workforce contains co-workers/team members and superiors. TCS has not given a consolidated definition of engagement. It depends on the verifiable understanding of the connection among employees and workforce. The definitions are subsequently remarkable to TCS and can't be embraced nor deciphered by other outer associations. Communication of employee engagement takes place at two levels in TCS of New Zealand and Australia. Pulse Survey

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

conducted by TCS leadership team all over the world communicate the Employee Engagement score from the organizational level to the individual level through intranet and key note speech by the CEO. On the other hand, there is indirect communication of the definition and strategy of employee engagement by the employees and the human resource professionals with the help of programmes like Maitree, Transformers and alike (Boanca,2014).

Reliance Industries Ltd (RIL) has developed with a one of a kind activity to connect with their workers called, "R-VOICE". It is a radio engagement program for the representatives to impart their insights, propose and see the accepted procedures inside the association. This activity will be a stage to comprehend the workers' better, sort out the hazy areas, get a reasonable picture about their idea and feeling about the current authoritative practices. In the present month, "Supervisor Best Practices" topic is going through R-Voice, where the workers can tune in and become familiar with the accepted procedures embraced by a portion of the chiefs over the association.

Reliance Industries Ltd (RIL) has evolved with a noteworthy initiative to have interaction with their workers referred to as, "R-VOICE". It is a radio engagement program for the representatives to impart their insights, propose and see the accepted procedures inside the association. This activity will be a stage to comprehend the employees' better, sort out the grey areas, get a reasonable picture about their idea and feeling about the current authoritative practices. Because of this initiative Reliance has been branded as "Listening Organization".

Companies like Infosys, Accenture and Flipkart have taken inspiration from Reliance and have started their own radio engagement program. This remarkable activity draws in, persuades and connects with employees resulting in lower attrition rate on account of the significant experiences the employees get from over all degrees of association. The mode of radio in employee engagement is infotainment approach to engage the employees through music and in the process enables the employees to subsume the messages and that is the reason it has demonstrated a significantly more successful correspondence mode than emails, pamphlets or posters.

APPRECIATIVE INQUIRY AS A METHOD OF ORGANIZATIONAL DEVELOPMENT

To an appreciable degree, emotions play a crucial role during a change process in an organization. Emotions impact change regardless whether the impact is a favorable one or an unfavorable one. Change generates a feeling of uncertainly, insecurity and threat to their existence in the organization. Radical authoritative change could in this manner be an extremely emotive occasion. The more diverse changes happen, the more negative feelings, for example, disappointment and tension will be experienced. In the event that the emotional involvement in the change procedures is conventionalized as unreasonable or unjustifiable, the change procedure could be difficult and cause solid obstruction. Organizations carry out the mediations during the change procedure with enormous hindrances, when the effect of feelings has been thought little of. Pioneers should carry out the mediations by giving due importance to emotions during the change process. One of the best mediations in this regard is Appreciative Inquiry (AI).

In this changing world, business leaders and managers are continuously faced with various types of challenges. Among the various change management strategies that the leaders adopt, Appreciative Inquiry is a modern one. It is tailored to the needs of the organization. It is a comprehensive tool of change management which empowers organization to engage and motivate diversified and scattered workforce. It also enables the customers and stakeholders to participate in the future of the business.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Appreciative Inquiry also enables the organization to identify their strengths and areas of competitive advantage and expand the same (Whitney and Cooperrider, 2011). Appreciative inquiry suggests that instead of finding faults in employees or what is not working properly in an organization, it is better to focus on the good, the better and best actions that is often not discoverable; if this is done, it will help in organizational development. Appreciative inquiry is a philosophy that stresses coordinated effort and investment of all voices instead of a single voice.

Appreciative inquiry is done to best understand organizational members' values and the peak moments/experiences of what has worked well in the past. The inquiry also includes questions about the core factor that gives life to the organizations' continued existence and wishes for the future. Its internal focus is on strengths.

Appreciative inquiry refers to a process of knowing that draws one to inquire beyond superficial appearances to the deeper life enhancing essentials and potentials of organizational existence.

The fundamental proposition of Appreciative Inquiry can be compared with a glass half filled with water. There are two ways in which an organization can view this half-filled glass of water. If the organization views it as half empty, then it is likely that the organization will be more interested in fault finding activity. They will be more interested to find out what is not working well and who is responsible for the fault. On the other hand if the organization views the glass as half-filled with water, then it can be said that the organization has a positive outlook. They will make an attempt to find out what is working best in the organization and try to enhance it. (Stevenson, 2007)

It is used as a co-inquiry from multiple perspectives to understand organizational effort to create a vision, serve its mission, obtain desired goals and objectives and design the best strategies.

Appreciative inquiry plays critical roles in the strategic planning process. It provides a framework for the organization to compete as strategic assessment, and it emphasizes a collaborative process of open dialogue to help the organization stakeholders to understand what they see happening when the organization is working at its best. As the stakeholders identify and describe the "life giving" forces of the organization, together they can imagine and impart innovation to the future of their organization with energy, vitality and commitment. The positive language and affirmation should fit with the value system of the organization. In addition, the process can be a helpful approach in any strategic planning effort because it requires a strategic vision, collective action, multiple parties and an empowering context for innovation and development.

The change process through Appreciative Inquiry can be described through the Five-D Phase Cycle. The five phases are as follows:

- **Define (Setting the Stage):** Selection of the area of study and investigation is the most crucial aspect in this stage. A key idea of AI is that some positive aspect of the organization will be selected as the focal point of the inquiry. This positivity will help to construct the questions for the second phase i.e. Discovery.
- **Discovery:** In this phase interview questions are framed to find out what works best for the organization. The questions can be related to technology that enables the employees to work without any hindrances or may be any other positive issues. The interview is generally conducted in groups. Members in a group interact with each other to share their positive experiences as well as they share what helps them to remain positive in the organization. Post interview they analyze what resources and facilities have helped the members to achieve success in past.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Dream:** Information collected from the previous phase will help them to design their future course of action. The dream may be expression in written form or in some other way such as posters, drama, songs, etc.
- **Design:** Once the dream has been designed, the members have to decide upon the infrastructural facilities and management systems required giving shape to the dreams.
- **Deliver:** In this phase real time plans are chalked out and the responsibilities are assigned to groups and sub groups to make the plan successful. (Stavros, Jacqueline & Godwin, Lindsey & Cooperrider, David, 2016)

APPRECIATIVE INQUIRY AND EMPLOYEE ENGAGEMENT

Appreciative Inquiry has been variously found to be associated. Various workshops, summits and intervention programmes have found the same. In certain experimental situations as well as research platforms, it was attempted to understand if AI would impact employee engagement. When AI was adopted as an OD tool, the diverse phases of AI allowed exchange and alteration of knowledge into groundbreaking ideas, supporting the premises of the theoretical framework (Richer, Ritchie &Marchionni (2009). When engaged in instituted workshops on AI, it was found that participants enjoyed having a 'voice' at a time when they felt comparatively ineffective in a context where decisions were being made only by their higher level managers (Doggett & Lewis, 2013, Chakraborty, Gupta, & Chatterjee, 2018). In another study it was found that AI demonstrated advanced levels of group identification (Peelle III, 2006).Authors suggested that because of an AI approach at work, creativity, ownership, and accountability increased and that the AI Virtual Summit that they conducted, resulted in many positive consequences (Conkright, 2011). Through appreciation and engagement, the interventions related to appreciative inquiry enabled positive supportive actions towards a new future, that holds the capacity to build and broaden organizational outcomes (Cooperrider & Godwin, 2011). Other researches have also pointed out the connection between AI and work engagement. AI provides adequate resources stimulating personal development and knowledge and development opportunities as a path to increased employee engagement. Culture of employee engagement can be built, and it should be paved through the tenacious efforts of managers and leaders in the organization. Positive work environment leads to positive outcome of performance (Chakraborty & Ganguly, 2019). Appreciative inquiry process practiced at an individual and organizational level, leads to self-motivation, learning and open attitude, enabling self, openness, inquisitiveness for searching strengths and success, optimism and creativity. (Chakraborty & Mishra, 2019).

BENEFITS OF APPRECIATIVE INQUIRY

Appreciative Inquiry is a vision based approach of open dialogue that is designed to help organizations and their partners create a shared vision for the future and a mission to operate in the present. Today's organization can benefit from an appreciative approach of inquiry which invites organizational members to learn and value the history of their organization and its culture. The Appreciative Inquiry approach allows them to:

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Build on their strengths
- Discover profitable opportunities
- Visualize goals and strategic alternatives
- Identify enabling objectives
- Design strategies and tactics that are integrated with their most successful programs and supply chain partners
- Implement a strategic plan that is a dynamic, continuous and living document

ORGANIZATIONAL DEVELOPMENT THROUGH EMPLOYEE ENGAGEMENT

Employee engagement has turned into an undeniably conspicuous issue in the region of Organizational Development (OD) likely because of the developing collection of research encompassing the positive connection between employee engagement and organizational development which comprises profit margin also. Organizational Development professionals, both internal and external, are being increasingly requested by the top brass of the organization to suggest strategies for increasing the level of engagement of the employees. Several OD techniques are available to increase and retain the engagement level, but research has shown none of the techniques to be fruitful. In the past, organizations have tried to increase the level of Employee Engagement through problem solving approach, i.e. to identify the problem first and then devising strategies to solve the problem. But in spite of these change management strategies have undergone a change in recent years as research suggests. Organizational practitioners are no more dependent on traditional methods of change management where the process would begin by identifying the problem areas and then proceeding to solve it. Nowadays, OD specialists rely more on stressing the important on the strength of the organization in order to enable change process. One of these strategies is Appreciative Inquiry which helps to improve the engagement level of the employees.

PRESENT SCENARIO OF EMPLOYEE ENGAGEMENT

Employee engagement has positive impact on the performance of the organization in many areas. Jessen (2014) have researched that highly engaged employees were 87% less likely to quit their job than the disengaged employees. 75% of the employees who quit their job actually quit their bosses (Jessen, 2014). Autry (2019) asserts that 2% of employees are of the opinion that learning and development is the most important deciding factor while selecting a job. Most of the employers think (89%) that employees leave their job because of more money and other benefits. But, the reality is, as research shows, that only 12% of employees leave job due to more money(Jessen, 2014).67% of millennia's are likely to quit their jobs if their present company does not provide them growth and leadership opportunities(Autry, 2019). 2006 ISR survey of 664,000 employees all over the world have shown that higher level of employee engagement actually improved financial outcomes of organizations in terms of operating income, net income and earnings per share. Engaged workers were more likely to exhibit discretionary efforts and improve individual performance (Sengupta and Ramadoss, 2012).

EMPLOYEE ENGAGEMENT THROUGH APPRECIATIVE INQUIRY

A highly engaged employee will reliably beat and set new norms. In the workplace research on employee engagement have time and again asked employees whether they have the chance to do what they excel at consistently. Just about 20% of the workers have answered in assertion. Anyway the individuals who have done that have additionally scored considerably high on execution. It is in this scenario that Appreciative Inquiry comes into play. The main thrust area of appreciative inquiry is to find out what works best for the organization. Instead of focusing on negativity, appreciative inquiry focuses on the positive aspect of the organization. Thus, implementation of appreciative inquiry will help the employees to excel at what they are proficient at.

Implementing appreciative inquiry requires a cultural change in the organization. It should be made applicable for all categories of employees irrespective of their position, gender, age etc. Appreciative inquiry alone cannot bring about any change. Learning and leadership has to work hand in hand with AI to make any change successful. It has been seen that many change efforts have failed because it has fallen into the deaf ears of the leaders. Also, change cannot be brought about in one day. It is a continuous process. As mentioned earlier, it has to be embedded into the day to day practices of the organization. An efficient feedback system should be in place so that any loopholes can be immediately corrected

Table 2. Appreciative inquiry initiatives

Organization	AI Initiative/Award
Avon-Mexico	To address the issue of gender equity and a pilot project for Avon globally. Catalyst award for Best Place to Work in the Country for Women 1997
British Airways North America	To create and sustain delivery of "Excellence in Customer Service'
Cleveland Clinic	To discover what makes the clinic function successfully (first AI initiative)
Mc Donald's	To become the best employer in each community around the world by putting "People First"
Roadway Express	To engage its unionized workforce into strategizing about the company's future
Save the children	To change how the organization could be re-created and led to achieve and sustain its mission
NASA	To create a strategic plan for OHR division to align with larger NASA vision and to work to build a more inclusive participative culture

Source: Adapted from Appreciative Inquiry Handbook by David L. Cooperrider, Diana Kaplin Whitney, Jacqueline M. Stavros retrieved from https://books.google.co.in

Appreciative Inquiry motivates the employees to share their best practices and to interact with each other so that they can delve into the areas where the organization can excel. "Appreciation and connecting" are the two pillars of Appreciative Inquiry. Employee engagement is seen at its best where the employees do not have to compete for resources. Research has shown that organizations which make both job and personal resources available for employees have high level of engagement. Thus, it can be assumed that Appreciative Inquiry supplies the necessary job and personal resources to contend the basic psychological need and intrinsic motivation; thereby contributing towards employee engagement. A higher level of employee engagement refers to a higher level of vigor, dedication and absorption in work. Vigor, dedication and absorption are the three elements that comprise work engagement as per Schaufeli and company. To assure that these elements are present, availability of job and personal resources should be adequate. Implementation of appreciative inquiry ensures that these resources are available in the hands of the employees. Thus, appreciative inquiry paves the way to employee engagement (Verleysen and Acker, n.d.).

Verleysen, B. and Van Acker, F. conducted a survey to find out the relationship between Appreciative Inquiry and work engagement. The study was conducted among 132 employees of Flanders and Netherlands. For the purpose of the survey, they developed a Connecting and Appreciation at Work Scale. Result of the study showed that intrinsic motivation played a mediating effect in the relationship between Appreciative Inquiry and Employee Engagement. The study depicted that intrinsic motivation was displayed at instances when "employees experience positive feelings and enjoyment because of the activities themselves, exploring new frontiers and striving to master new challenges".

Guevara (2016) carried out a research project at an Art and Design University in the South Western Region of the United States. The main purpose of the project was to apply the AI framework as a model for encouraging collaboration and trust between two departments of the University. Hammond (1996) has asserted the role of appreciative inquiry in redefining things. The responses of the participants indicated that Appreciative Inquiry plays an effective role in building up trust between colleagues as well as embracing change through a positive outlook. This development of trust helped to develop collaboration among the team members.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Building trust is the root to building engagement. Development of trust is a time taking phenomenon but once it is achieved it has substantial impact on engagement. Employee feel more engaged when they work in a safe, cooperative environment. Safe in this context means that employees trust one another and are able to quickly resolve conflicts when they arise. Trust could have an enormous effect on organizational effectiveness especially during change. Thus, if Appreciative Inquiry is implemented in organizations, trust may be build up among the employees which in turn will help to improve the level of employee engagement.

The study also showed that Appreciative Inquiry helps to develop collaboration. In a globalized world that we live in today, the issue of collaboration among employees working in various teams across cities, countries and continents has become very significant. McKinsey & Company's report on Mapping the value of employee collaboration(2006) observed the following:

- Falling communication costs, globalization and the increasing specialization of knowledge based work are making collaboration within and among organizations increasingly important;
- Yet few companies understand or know how to manage the intra-company networks
- A few leading companies are beginning to map their networks of relationships, to analyze the economic costs and benefits that key interactions create, and to identify value creating interventions
- Successful interventions help companies to reduce complexity, redefine roles, and allocate financial physical and human resources more efficiently

Facilitating collaboration amongst employees enables a feeling of being connected with company, co-worker clients and changes in the internal and external environment and definitely contributes in increasing their engagement levels. So, it can be assumed that Appreciative Inquiry helps to build collaboration among employees which in turn contributes to higher engagement.

CONCLUSION

Appreciative Inquiry generally yields results which is immediate and pronounced. Not only personal, but the result also leads to organizational transformation too. Successful implementation of Appreciative Inquiry improves organizational performance, productivity and profitability. Results of Appreciative Inquiry can be made sustainable by strategically aligning the core processes of an organization with Appreciative Inquiry principles and methods. AI principles and methods should be integrated with the day to day practices of the organization so that the level of participation and motivation of the employees increase to a considerable amount.

Chapter 86
The Conceptual Model of Managing Older Employees to Achieve Their Work Engagement

Maja Rožman
University of Maribor, Slovenia

Sonja Treven
University of Maribor, Slovenia

ABSTRACT

The purpose of the chapter is to present, on the basis of theoretical starting points, the importance of management of older people for the entire society as well as the problem of older employees and their management as an important branch of human resource management, which presents a major challenge for companies. The main aim of the chapter is to design the conceptual model of managing older employees to achieve their work engagement, which will serve as the basis for understanding the successful ageing of older employees and creating an appropriate working environment favourable for all generations. By promoting active ageing and introducing the management of older employees, companies can achieve an important increase in the work engagement of older employees, a change of generally accepted stereotypes, myths, and prejudices about older people and the reduction of discrimination of older people in the labour market. The appropriate working conditions that should be available in all companies contribute to the improvement of management of older employees and their work engagement.

INTRODUCTION

The European Union is witnessing significant demographic changes due to a reduction in birth rates and an increase in life expectancy that has led to a consequent increase in the older population (Magnavita, 2017). Given the demographic shifts in today's workplace, worker age would appear to be an important individual difference. It is important for at least three reasons. First, with the aging population, it is important to see how jobs might be redesigned to enable people to continue to work successfully. This

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

is especially important as the cessation of work at mid-career is becoming less of an option for many workers. Second, it is important to determine which specific job characteristics are most helpful for different age groups. Third, given the cost of job redesign efforts, it is important to begin to see for which employee populations such efforts may be the most valuable (Zaniboni et al., 2014).

Diversity and inclusion in the workplace are increasingly accepted as fundamental business tools in today's organizations. This is because businesses are gradually beginning to recognize that their potential to achieve better results is increased when people from diverse backgrounds and perspectives are included at different levels of the organization, including in the decision-making process. However, many organizations still struggle with how to effectively implement a robust diversity and inclusion agenda and embed it into their business plan (Sanyal, 2015). In companies should provide that aging at work involves the processes, mechanisms, and conditions that enable employees to achieve favorable subjective and objective work outcomes across the working life span, and particularly at higher ages (Potocan et al., 2018; Nedelko and Potocan, 2019). Extant research on successful aging at work has focused primarily on personal resources (e.g., abilities, motives, etc.) and largely neglected contextual factors that may enhance favorable work outcomes among older employees (Zacher and Yang, 2016).

With regard to job attitudes, job satisfaction and work engagement are two important positive dimensions of work-related well-being (Rothmann, 2008). Indeed, it is becoming critical to understand how to design jobs to keep workers of different ages satisfied and engaged in their work (Truxillo et al., 2012b). Zaniboni et al. (2014) found out that relationship between certain job characteristics and job attitudes may differ across the life span. The creation of a unified approach to diversity and inclusion, which is embedded in the business ethics of the organization, can have a sustainable positive impact on the health and well-being of individuals, business and society (Sanyal, 2015).

Zaniboni et al. (2014) summarized that different job characteristics will differentially affect job outcomes of older and younger employees. According to Kooij (2015) successful aging is closely related to sustainability at work; individual employees age successfully when they are able to preserve and regenerate resources to achieve their personal goals and maintain health, motivation, and work ability, now and in the future. To effectively manage their resources, aging workers should strive for current and future person–job fit (e.g., optimally utilizing current strengths and abilities, without overtaxing and thus exhausting abilities, and also developing skills and abilities needed for future work requirements). Hence, an important question is how to increase current and future person–job fit, and thus achieve sustainable and successful aging at work.

The ageing of the population represents one of the biggest challenges for managing older employees in a company. The first step towards the adequate management of older employees is to create an appropriate working environment that enables the successful result of ageing for employees and thus the achievement of goals, performance and competitiveness of the company. This study provides an important start for further investigations about the role of age in job design. The main objective of this paper is to present the conceptual model of managing older employees to achieve their work engagement. Due to demographic changes, we wanted to create a model which could help to better management of older employees and increase their work engagement. In the paper we used the compilation and descripton method. Model was created based on studies for which we used the compilation method. With the description method we described a single approach in the model of management of older employees to achieve their work engagement.

At the beginning of literature review authors present demographic changes and description of age. The paper continue with description about negative stereotypes about older employees and poor management

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of older employees in companies. At the end of this chapter authors present the literature review about work engagement of older employees. From this theoretical review and their own knowledge about the thopic, authors compiled the findings and based on this built a model of managing older employees to increase their work engagement as a key for competitive advantage of the company. The model is focused on external factors (demographic changes, active agin gof the population, discrimination aginst the elderly, stereotypes about the elderly), internal factors (human resource management, strategic human resource management), managing older employees, approaches to managing older employees and work engagement of older employees. Older people may experience negative attitudes and discrimination based on their age. Creating friendly and healthy environments acknowledges diversity, fights ageism and ensure that everyone has the opportunity to fully participate. Thus, good managing older employees and appropriate working environment for older employees contributes to their engagement at work.

LITERATURE REVIEW

Demographic Change

The world's population is ageing rapidly (World health organization, 2017). Ageing has become a necessary focus of interest in today's society (Aaltio et al., 2014). Worldwide, the proportion of people age 60 and over is growing faster than any other age group. Between 1970 and 2025, a growth in older persons of some 694 million or 223 percent is expected. In 2025, there will be a total of about 1.2 billion people over the age of 60. By 2050 there will be 2 billion with 80 percent of them living in developing countries (World Health Organization, 2002, 2017).

The global workforce is rapidly aging, with large numbers of older workers delaying retirement and remaining at work, leading to a mixing of multiple generations of employees, each with its own set of defining experiences, values and expectations (Roussin, 2015). Given the increase in the percentage of employees over 50 years old in many industrialised countries, and shrinking numbers of younger workers, companies need to rely on retaining older workers (Dabic et al., 2017; Rosi et al., 2018). However, due to raised retirement ages, older workers will have a longer work life than recent cohorts (Stamov-Roßnagel and Biemann, 2012).

Ageing demographics are impacting employers around the world and, for many organisations, there are strong business reasons to develop strategies for managing the age profiles of their workplaces. Societal ageing is not necessarily bad news for business: older workers can be a valuable resource for employers in terms of skills, in-house knowledge and flexibility. Further, as population age, businesses are delivering goods and services to an ageing market, and older workers can be a valuable resource. While ageing demographics can provide opportunities for the business community, there are significant challenges facing employers (Beazley et al., 2017).

Conceptualizing Age

Usually, age is understood in terms of chronological age, referring to one's calendar age. However, the concept of age is multidimensional (Aaltio et al., 2014). Kooij et al. (2008) summarize five different approaches to conceptualize aging of workers:

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. Chronological age refers to one's calendar age. In this approach the distinction between older and younger workers is based on calendar age. As mentioned, the term "older worker" may refer to workers from the age of 40 to those aged over 75.
2. Functional or performance-based age is based on a worker's performance, and recognizes that there is a great variation in individual abilities and functioning through different ages. As chronological age increases, individuals go through various biological and psychological changes. These changes may be reflected in the health, psychical capacity, cognitive abilities and performance of individuals.
3. Psychosocial or subjective age is based on the self and the social perception of age. Subjective age (or self perception) refers to how old an individual feel, looks and acts, with which age cohort the individual identifies, and how old the person desires to be. The social perception of age involves age norms applied to an individual with respect to an occupation, company, or society. Psychosocial definitions have focused on three issues: the age at which society perceives an individual to be older, the social attitudes that are held toward older workers (or the perceived attributes and stereotypes of older workers) and the implications for personnel decisions of labeling a worker as older.
4. Organizational age refers to the aging of individuals in jobs and organizations. The aging of individuals in jobs and organizations is more commonly discussed in the literature about seniority and job or organizational tenure. The effects of aging may often be confounded by the effects of tenure and vice versa. Nonetheless, organizational age may also refer to career stage, skill obsolescence and age norms within the company.
5. The life span concept of age borrows from a number of the above approaches, but advances the possibility for behavioral change at any point in the life cycle. This behavioral change may be affected by three sets of factors: normative, age-graded biological, and/or environmental determinants, which are strongly related to age; normative, history-graded influences, which are related to the age-cohort, and c) non-normative unique career and life changes. To capture the unique impact of the life span approach, life span age can best be measured by life stage or family status.

Many studies refer the term »older employees« to employees from the age of 40 years to those aged over 75 years old (Desmette and Gaillard, 2008). Kooij et al. (2008) also summarize that in studies concerning labor market participation, the term »older worker« usually refers to workers aged 50 or 55 and above. This threshold is chosen because in many countries this age range features a decline in the participation rate in the labor market. Brooke (2003) and Tew (2004) summarize that researchers examining older people in organizations, often put the threshold at 40 or 45, seeing »old« as referring to obsolete knowledge, skills, and attitudes. Zacher and Rudolph (2015) state that as age is a continuous variable, no cut-off exists when a worker becomes an »older worker«, but, for practical reasons, organizations and governments often use cut-offs such as 40, 45, or 50 years.

Ageism and Negative Stereotypes About Older Employees

A workplace age stereotype represents beliefs and expectations about workers based on their age. Prejudice is more affective and attitudinal, involving feelings rather than cognitions. Discrimination represents the behaviors adopted as a consequence of stereotypes and prejudices (Rego et al., 2018). Authors Lazazzara and Bombelli (2011) summarize that the positive contribution of older people at work is often overshadowed by negative stereotypes associated with growing older. These stereotypes

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

influence the strategic choices and generational replacement policies adopted by companies and consequently the proportion of older workers in the labour market. According to Rego et al. (2018) ageism is stereotyping of and discrimination against individuals or groups on the basis of their age. One of the most common stereotypes about older employees relates to poor performance. Several negative stereotypes about older workers are common (see e.g., Finkelstein et al., 2013; Ng and Feldman, 2012, Rego et al., 2018) and influence the outcomes of HRM-related decisions in a variety of settings. Amongst the most prevalent are that: older emplyees are less motivated and have lower performance, are more resistant and less willing to change, have lower ability to learn, and »deserve« less training investment because of their prospective shorter time remaining in their position. Almost all these negative stereotypes are inaccurate. Authors Appelbaum et al. (2016) summarize that the most common stereotypes regarding age are: slower learning, decreased physical and mental ability, less flexibility, less adaptability, less motivation, less innovativeness, and less productivity in relation to wage demands compared to younger workers. These stereotypes all suggest that people perceive old-age workers as less productive compared to their younger counterparts. Fineman (2011, p. 64) argued that there is no consistent effect of age on work performance. Also, Ng and Feldman (2008) argue that older employees typically perform as well as younger employees and outstrip them in many areas. According to Rego et al. (2018) ageism at the workplaces leads to conflicts, misunderstandings, and failures in cooperation and communication between older and younger organizational members. Mainly when it is espoused by managers, ageism also leads organizations to not invest in older employees' training (or to not provide training that fits the older employees' needs and motivations), and to discriminate against older workers in selection processes. Authors also summarize that ageism against older workers also prolongs negative consequences at the social and economic levels, and makes the adoption of good practices of active ageing more difficult. In fact, ageism toward older workers gives rise to early exits and poor re-entry rates, thereby creating imbalances and pressures on social security systems, producing damaging effects on the economy overall.

Poor Management of Older Employees in Companies

Older employees present an increasingly important source of labour for organisations. So, they should be managed properly according to their specialty – age. Many foreign authors (Naegele and Walker, 2006; Robson et al., 2006; Frerichs et al., 2012) define the management of the older employees as a concept of measures and strategies for managing and controlling of aging, planning and implementation of an active aging strategy at the organization level, with an emphasis on retention of older people in the work process and prolonging their active life, also covers part of the human resources management and the introduction of new measures that change under the influence of the aging process or other factors related to the age. As such, management of older employees is a part of human resource management and because of its' strategic value for organisations is included also in strategic human resource management.

Irrespective of age, an employee needs the appropriate skills and knowledge to be productive and to help the organisation achieve its strategic objectives. However, in many organisations, older employees are less likely to be offered training opportunities than their younger compatriots. A person is able to learn at any age and the older worker is capable of adjusting to changes in work (Nedelko et al., 2017). Many people assume that older workers are homogeneous but this is not the case. There are significant differences between older employees and these differences need to be acknowledged and understood (Davis et al., 2017).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Generational differences present a critical new aspect to workplace diversity. The growing number of older employees and negative attitudes regarding them by the younger employees create the need to better understand intergenerational communication, that is, communication between younger and older people in the workplace (Wok and Hashim, 2013).

Desmette and Gaillard (2008) argue that employers have often viewed older employees as liabilities, rather than as valuable resources. Wok and Hashim (2013) summarize that the employer's attitudes have consistently indicated the older employees might cost more or might potentially deliver fewer benefits than younger ones, and thus, they would make less valued employees. Chiesa et al. (2016) summarize some negative perceptions held by managers about older employees: inflexibility, unwillingness or inability to adapt to new technology, lack of aggression, resistance to change, complacency, and the presence of physical limitations that increase the cost of health insurance. According to Weeks et al. (2017) other negative stereotypes include the belief that older employees produce lower-quality work than younger employees, that they are less productive, and that they are resistant to change. A belief among employers and managers is that older employees are not current on required skill sets and that their skills are dated.

As the number of older employees is growing, it is necessary to emphasize the barriers to adequate integration of older employees. Ageism, as mention in the previous chapter of this paper, is one of the most common stereotypes. The consequences of ageism affect and compromise organizational growth and performance. Additionally, this issue makes it more difficult for older employees to perform at their best. Individual work performance does not depend entirely on age, but rather is mediated by different factors that vary throughout life. Nevertheless, some argue that productivity decreases as the workforce ages, though this often occurs due to self-fulfilling biases. Age discrimination in employment undermines the basic human right to work and can have a devastating effect on individuals; impacting on physical and mental health and undermining a person's self-confidence and self-esteem (see, e.g. Appelbaum et al., 2016; Skirbekk, 2004; Engelhardt et al., 2010).

Work Engagement of Older Employees

Banihani et al. (2013) claim that work engagement has positive consequences for employees and organisations. The benefits of being engaged range from positive emotional outcomes to improving organisational performance. According to Pitt-Catsouphes and Matz-Costa (2009) disengaged employees negatively affect their co-workers' engagement. Banihani et al. (2013) summarize that at the individual level, engaged employees perform better than non-engaged employees. There are four reasons that make engaged employees (older and younger) perform better than non-engaged employees: (1) engaged employees experience positive emotions such as happiness, enthusiasm, and joys; (2) they have better health; (3) they are able to create their own job and personal resources and (4) they often transfer their engagement to others. Moreover, work engagement influences the well-being and performance of employees. Also, lack of employee engagement may ruin a company's productivity. Sadly, many leaders still can't keep their employees engaged (see, e.g. Lu et al., 2016; Bakker and Demerouti, 2009).

From the theoretical review in previous chapters, we have compiled the findings and based on this we have built a model of managing older employees to increase their work engagement as a key for competitive advantage of the company, which is presented in the next chapter.

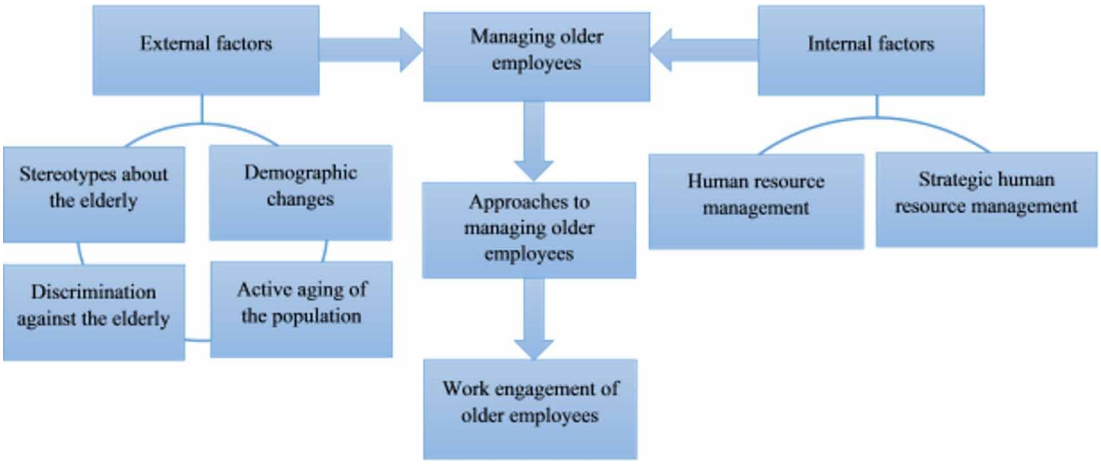
EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Conceptual Model of Managing Older Employees to Achieve Their Work Engagement

Management of older employees and the designing of an appropriate working environment for older people contributes to their engagement at work, while providing an opportunity for older employees to be active and continue to contribute to the success of the company. Achieving the work-life balance of older employees is a key factor in achieving the goals and competitiveness of the company, as older employees are thus provided with a better quality of working life, better health and well-being and a reduction in workload. In this way, employees are committed to work and satisfied, and thus motivated, productive and successful in performing and solving work tasks.

The full range of approaches to managing older employees in the conceptual model is a novelty through which the company can promote and maintain the working ability of older employees, which is reflected in their commitment to the workplace. These approaches affect the improvement of the working environment for all generations, the achievement of common results and the greater social reputation of the employer - in the sense of a "socially responsible company". Work engaged employees is an important factor in achieving the goals, performance and competitiveness of the company. In this way, employees feel connected with their work, but at the same time they feel able to successfully perform work requirements, which helps to increase productivity and well-being at work. Furthermore, the management of older employees as the modern branch of human resources management has a positive impact on improving work processes and creating an organizational climate that will be attractive to all generations. Below we present a conceptual model for managing older employees to increase their work commitment (Figure 1).

Figure 1. Conceptual model of managing older employees to achieve their work engagement



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

External Factors of Managing Older Employees

Among the external factors of managing older employees we included demographic changes, active aging of the population, discrimination against the elderly and stereotypes about the elderly which are described in more detail in the following.

Demographic Changes in Slovenia

The demographic structure is changing. The population of Slovenia is progressively ageing. Despite the expected increase in the population in the coming years, which should reach its peak in 2025, we can expect major changes in the age structure. Life expectancy at birth is constantly increasing; from 1995 to 2015 it grew from 74.1 to 80.5 years and it is projected to extend for a further 2.9 years by 2035. However, the current fertility rate (1.58 children per woman) is not sufficient for the complete replacement of the population in the long term, which should be about 2.1 children per woman. Thus, the median age of the population will grow from 36 years in 1995 to 48.1 years by 2035. This means that the share of children under 14 years will fall by 5 percentage points. Active population between 15 and 64 years will decrease by 10 percentage points, which will largely depend on the reduction of the population of 25–49 year-olds. On the other hand, the share of the elderly is increasing, both those belonging to the older workforce (50–64 years) as well as the even older population (Statistical Office of the Republic of Slovenia, 2016).

Reaching old age is a consequence of a higher quality of life, largely due to great advances in science and medicine. One of the tools to reduce such strong dependence of the inactive, mainly pensioners, on employed persons is postponing retirement. Active ageing and subsequent retirement also depend on good health. Data from SILC show that, based on self-assessment of health status, the share of people who assessed their health status as good or very good is growing. Between 2005 and 2014 the share of people between 55 and 64 years who assessed their health status at least as good grew from 34% to 49%. Likewise, during the same period the share of people aged 65 or more who made the same assessment increased from 18% to 27%. Involvement of the population aged 55–64 in the labour market grew from 31% to 35%, while the inclusion of 65–69-year-olds fell from 12% to 10%. Activity in old age does not mean only later retirement and thereby lower expenditure on pensions, but also the preservation of mental activity and physical health (Statistical Office of the Republic of Slovenia, 2016).

Active Aging of the Population

Population ageing is one of humanity's greatest triumphs. It is also one of our greatest challenges. As we enter the 21st century, global ageing will put increased economic and social demands on all countries. At the same time, older people are a precious, often- ignored resource that makes an important contribution to the fabric of our societies (see, e.g. World Health Organization, 2002; Magnavita, 2017).

Active ageing is the process of optimizing opportunities for health, participation and security in order to enhance quality of life as people age. Active ageing applies to both individuals and population groups. It allows people to realize their potential for physical, social, and mental well being throughout the life course and to participate in society according to their needs, desires and capacities, while providing them with adequate protection, security and care when they require assistance. Active ageing aims to extend healthy life expectancy and quality of life for all people as they age (World Health Organization, 2002).

Discrimination Against the Elderly

For a constructive coexistence between generations it is necessary to maintain a positive interpersonal relationship and solidarity between the young, the middle-aged and the elderly. The Eurobarometer conducted an opinion poll in 2012 on discrimination in the EU. Results showed that in Slovenia 42% of respondents believe that discrimination against the elderly over 55 is widespread, compared to 14% who believe in discrimination against people younger than 30 years. On a 10-level scale of "feeling if someone would occupy the highest elected political position in Slovenia" respondents expressed the opinion that it would be more normal if they were younger than 30 years (value 6.8) than if they were older than 75 (value 5). Even when it comes to equal opportunities in recruitment, the first ranked opinion with 66% was that a person older than 55 years is in disadvantage if the company is choosing among two equally qualified candidates, compared with 14% if a person is younger than 30 years. Similarly, on the impact of the crisis on the labour market persons over 55 were placed in the first place as most discriminated, whereas persons under 30 were placed last. Even on the topic of active ageing, 49% expressed the opinion that people older than 55 are generally viewed positively and only 45% felt that they can contribute to society as paid workers. For this reason, it is necessary to raise awareness of the contribution and potential of each of the following age groups in raising the quality of life and enhancing human capital. Abilities and skills of the elderly are an important part of human capital; mobilization and use of these skills could strengthen the social status of the elderly and relieve the younger generation (Statistical Office of the Republic of Slovenia, 2016).

Rabl (2010) summarize that the popular stereotype among older employers is: "Older employees are unmotivated". Such beliefs about older employees may develop into age discrimination, which brings about many negative consequences for both employees and organizations. Also, author summarize that age discrimination consists of behavior that excludes certain categories of people and disadvantages them relative to others solely due to their age. It occurs when preferential decisions are based on age, rather than on an individual's merit, credentials, qualifications, or job performance. Age discrimination thereby includes refused employment, dismissal from jobs, less payment, or denied promotions, training or other benefits because of age.

Stereotypes About the Elderly

Schulz et al. (2006, p. 43) define age stereotypes as »a simplified, undifferentiated portrayal of an age group that is often erroneous, unrepresentative of reality, and resistant to modification«. According to Dordoni and Argentero (2015) older employees are stereotypically viewed more negatively compared to younger employees, and this stereotyping is at the heart of employment discrimination against them. Schloegel et al. (2018) summarize negative age stereotypes toward older employees: they are frequently viewed as less productive, less creative, more resistant to change, less able to learn, less receptive to new technologies, and less willing to attend training sessions or take risks. Many of these stereotypes do not fit reality. For example, older employees' performance is not generally lower than that of younger employees, but rather is often even higher.

Internal Factors of Managing Older Employees

Among the internal factors of managing older employees, we included human resources management and strategic human resource management.

Human Resource Management

Armstrong and Taylor (2014) define human resource management as strategic, integrated and coherent approach to the employment, development and well-being of the people working in organizations. Human resource management is concerned with all aspects of how people are employed and managed in organizations. It covers the activities of strategic human resource management, human capital management, knowledge management, corporate social responsibility, organization development, resourcing (workforce planning, recruitment and selection and talent management), learning and development, performance and reward management, employee relations, employee well-being and the provision of employee services.

Human resource management has to change as the business environment changes. It has to do this as a mixture of responding to changes in that environment and predicting such changes. The future is unpredictable and it is hard to determine what it will bring. It is important to be flexible and to acquire as much knowledge as possible to help cope with these uncertainties. Successful human resource managers and departments have a significant strategic impact on their organizations (Aghazadeh, 2003). According to Armstrong and Taylor (2014) human resource management is a comprehensive and coherent approach to the employment and development of people. Human resource management can be regarded as a philosophy about how people should be managed. Human resource management involves the application of policies and practices in the fields of organization design and development, employee resourcing, learning and development, performance and reward and the provision of services that enhance the well-being of employees. These are based on human resource strategies that are integrated with one another and aligned to the business strategy.

Strategic Human Resource Management

Strategic human resource management can be defined as the linking of human resources with strategic goals and objectives in order to improve business performance and develop organizational culture that foster innovation, flexibility and competitive advantage. In an organisation strategic human resource management means accepting and involving the human resource function as a strategic partner in the formulation and implementation of the company's strategies through human resource activities such as recruiting, selecting, training and rewarding personnel (see, e.g. Harrison and Bazzy, 2017; Akong'o Dimba, 2010; Chang and Huang, 2005; Das and Kodwani, 2018). Strategic human resource management is designed to help companies best meet the needs of their employees while promoting company goals (Harrison and Bazzy, 2017).

Strategic human resource management is an approach to the development and implementation of human resource strategies that are integrated with business strategies and support their achievement (Armstrong and Taylor, 2014). Schuler and Jackson (2007) stated that strategic human resource management is fundamentally about systematically linking people with the company. Also, authors Armstrong and Taylor (2014) assert that strategic human resource management takes the notion of human

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

resource management as a strategic, integrated and coherent process and associates it with an approach to management that involves adopting a broad and long-term view of where the business is going and managing it in ways that ensure that this strategic thrust is maintained. It is influenced by the concepts of strategic management and strategy.

Managing Older Employees

Naegele and Walker (2006) defined managing older employees or age management as »those measures that combat age barriers and/or promote age diversity«. Authors summarize that age management encompasses: recruitment; learning, training and lifelong learning; career development; flexible working time practices; health protection and promotion, and workplace design; redeployment; employment exit and the transition to retirement; and comprehensive approaches which focus on the whole life-span of the workforce and encompass preventative and remedial measures.

The definition of age management emphasises that age related factors should be taken into consideration in daily management, including work arrangements and individual work tasks, so that everybody, regardless of age, feels empowered in reaching their own and corporate goals. The eight targets of age management are (Ilmarinen, 2012): 1. better awareness about ageing; 2. fair attitudes towards ageing; 3. age management as a core task and duty of managers and supervisors; 4. age management included in human resource policy; 5. promotion of work ability and productivity; 6. lifelong learning; 7. age-friendly work arrangements and 8. safe and dignified transition to retirement.

Approaches to Managing Older Employees

The proportion of older employees will increase during the next few decades, therefore the new approaches to managing older employees are necessary. In this regard, it is important to promote the quality of life and well-being of the population, especially older people, and to promote solidarity between the generations. A good working life is an important platform to promote active ageing. Therefore, occupational health and safety plays a crucial role in securing active ageing through a better and longer work life (Ilmarinen, 2012). Thus, Fuertes et al. (2013) summarize that organisations should consider age appropriate job design, ensure workers are kept flexible, support lifelong learning and better enable the intergenerational transfer of knowledge.

In the following subchapters we present the approaches to managing older employees which are associated with the model.

The First Approach: Changed Attitudes Towards Older Employees

Why are changes in attitudes towards age in society and worklife needed? The answer is simple, because many of companies discriminate on the basis of age. Negative attitudes towards ageing generally derive from ignorance and old myths and beliefs. The collection of information on age management contains a notable amount of “real” information on ageing. The critical false beliefs concern age and productivity, age and mental growth, and age and learning (Ilmarinen, 2006).

According to McMullin and Marshall (2001) older employees believed that their fate was linked to ageismand that their work experience was discounted by management. Managers wanted to be rid of older workers because they commanded higher wages than younger workers. The is-sue was cost reduction,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and age was implicated unintendedly.Still, managers seemed to use stereotypical images to discourage older workers and they did not organize work routines tofacilitate the adaptation of them. Instead, they subcontractedthe easy jobs, relying on the experience of the older employees for difficult work while not adapting the workplace. Ilmarinen (2006) emphasizes that workplaces will ultimately affect how the age challenge is received and how successfully practices will be changed. Together the employer and the worker form a team that can change age practices and methods of operation.

Older employees are the only segment of the labor force projected to grow in coming decades. Every other demographic is shrinking or staying the same. Discrimination and stereotypes about older employees can limit their opportunities to advance, or even stay in the workplace. Older employees received significantly lower training investment than did the other aged employees (Chiesa et al., 2016). Age-related stereotypes about skills and capacities of older workers, that are highly prevalent in work organizations, are a key obstacle for their employability. Negative age stereotypes are harmful and may stimulate increased social distance and avoidance between people of different generations. Companies should eliminate stereotyped beliefs about older employees (Selm and Heijden, 2014; Chiesa et al., 2016). According to Selm and Heijden (2014) management in working organizations should need to remember that age and generation differences in media portrayals, do not correspond to real-life situations at the workplace. Therefore, in order to combat age-related stereotyping at work, and to enhance workers' employability throughout the life-span, key figures, such as HRM professionals, and line managers should increase sensitivity to the possibility of real and portrayed age and generation differences. Managers in working organizations should emphasize positive portrayals of older employees (i.e. positive stereotypes), in order to activate normal and non-ageist behaviors toward them, and, herewith, to increase their life-long employability.

Second Approach: Creating Suitable Working Conditions For Older Employees

The World Health Organization (2002) offers the following recommendations to employers, trade unions, and authorities:

1. Work ability, not age, should be the basis of evaluation when a worker is employed and kept employed.
2. Employers should ensure adequate flexibility in work and the structuring of the work environment so that work environments suit ageing workers of very different kinds. Workers should be able to participate in decisions that affect their work.
3. Work arrangements should be flexible enough to enable work division if needed, part-time work, and periods of absence for personal reasons. Workers should be encouraged to work part-time during the traditional age period when early retirement is common.
4. Training should be part of every worker's job. Workers should be trained in advance with regard to technical changes at the workplace, the training should support workers, and their work needs to be rearranged due to age factors.

Periodic health examinations should be made mandatory for all workers 45 years of age and over. The examinations would have the following objectives (World Health Organization, 2002):

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- To recognize deficiencies in the functioning of the musculoskeletal, respiratory, and cardiovascular systems that can then be rehabilitated with the aid of different physical exercises,
- To recognize age-related changes in vision, hearing, and the musculoskeletal system that would make it necessary to change the work environment and provide aids for workers,
- To recognize physical and mental risk factors that increase morbidity and mortality rates so that appropriate care can be organized and the needed changes in lifestyle made.

Most papers on continuing training of older employees concentrate on their lower training incidence (Zwick, 2015; Chiesa et al., 2016; Ilmarinen, 2006; Addio et al., 2010). Obviously, it is a problem in a greying economy when older employees get less than optimal training because this might negatively affect their productivity and employability. Ilmarinen (2006) emphasizes that age discrimination is visible in the participation in training and applies to people already at the age of 40 years and older. Therefore, companies should provide training for their older employees. Learning is not dependent on age but, instead, on the organization of learning. Therefore, special attention should be paid to the selection of learning strategies and environments suitable for ageing employees. Ageing people learn in their individual way and at their own speed, both of which differ from those that are often natural for younger people. The instructors of ageing employees are required to have special competence related to ageing and learning. Training younger and ageing people together may, in some situations, be appropriate and beneficial, provided that training is not organized on the young people's terms. Good learning results among ageing employees, however, presuppose a suitable learning speed and a relaxed atmosphere. A tight schedule and stress may ruin the learning experience. Therefore, ageing employees need methods, environments, and learning schedules that work for them. Further, Zwick (2015) adds that management has to take into consideration the specific training needs and interests of older employees in order to increase training efficiency and the motivation to participate in training.

Employees also should be motivated to support long-term health education provided at the workplace and to initiate programs related to public health and living habits. Programs to stop smoking, reduce alcohol consumption, and change eating habits or the level of physical activity, for example, are known to sustain health and vitality with age (see, e.g, Ilmarinen, 2006; World health organization, 2017). The purpose of promoting health at the workplace is to promote a healthy lifestyle (improving eating habits, promoting physical activity, smoking cessation), reducing stress at work, improving interpersonal relationships, improving communication at work, strengthening and protecting mental health and improving well-being, increasing employee satisfaction, etc. (Ministry of Health, 2018)

Recommendations for better workplaces for older employees are (Ilmarinen, 2006):

- Exposures in the physical work environment (for example, vibration, noise, air impurities, heat, cold) must still be decreased, especially for ageing employees.
- Physical work demands (e.g., poor work postures, handling of heavy workloads, repetitive work and repetitive movements, static muscle work, peak loads) should be reduced for ageing employees, especially women. Ageing employees work more often in physically demanding occupations than younger ones do, for example, because they have less education. Physical workload and the resulting musculoskeletal disorders are still a significant cause of work disability among ageing employees.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The psychological work environment of ageing employees should be developed in order to support and utilize workers' strengths. Ageing employees also need inspiring and challenging work in which new things can be learned.
- The possibilities of ageing employees to plan and regulate their own work should be improved.
- Ageing employees need good individual supervision and age management.
- Ageing employees need flexible, individual, and ergonomic workhours. Ageing employees need flexible workhours for the health, educational, or other needs associated with their life course (e.g., nursing and care work). Flexible workhours are also a good means with which to equalize the workload. Part-time work is the most common and most popular model used to regulate workload with age.
- The health promotion of ageing employees should be intensified—the employees' own responsibility for their living habits is significant. Also, the affect of illnesses on work should be reduced. The risk of occupational diseases among ageing employees should be significantly reduced and prevented.
- Functional capacity should be supported and developed multidimensionally—physical, mental, and social functional capacity creates the basic prerequisites for good, high-quality worklife and successful ageing. All properties of functional capacity can be improved, but activity seems to decrease with age. The activity theory indicates that active, versatile activities maintain functional capacity, while passivity decreases it, regardless of a person's age. Adjusting activity to one's life situation, searching and accepting choices and alternative forms of activity are ingredients of successful ageing.
- Ageing employees should be offered the possibility for life-long learning, and their professional competence should be developed through the use of appropriate learning processes. Learning is not dependent on age. People of all ages are able to learn, but ageing people learn things differently than younger people.
- The basic values of ageing employees should be taken into account better in the changes and management of worklife.
- The work ability, work well-being, and employability of ageing employees should be supported by holistic, continuous measures whose effectiveness is monitored. The development of the work environment, work community, and management must be combined with the development of personal health, functional capacity, and competence of employees. Together these measures are strong enough to affect both the improvement in worklife and the sufficiency of personal resources with age.

Third Approach: Reducing The Workload of Older Employees at The Workplace

The demographics of the global workforce are changing, specifically with a more age diverse workforce bringing new research questions. It becomes more important to find ways for people to stay satisfied and engaged in their work at different life stages (Zaniboni et al., 2014). Research has shown that job characteristics can lead both positive and negative work outcomes (e.g. Slattery et al., 2010). For example, the research showed that task variety was related to positive outcomes like job satisfaction but also to negative outcomes like job overload (Humphrey et al., 2007). Based on research authors Rumbles and Rees (2013) summarized that managers state that they are aware that employees are experiencing high stress, but managers do not do anything to alleviate employee stress.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

There are certainly benefits to employees from being committed to their work and feeling positive about the organization that they work for, but the long-term benefit for employees "themselves" is closely linked to their personal psychological well-being (Robertson and Cooper, 2010). Therefore, companis should aware of the importance of reducing the workload of their employees (Rumbles and Rees, 2013). According to Robertson and Cooper (2010) the concept of full engagement rests on the principle that the beneficial impact of narrow engagement is enhanced when psychological well-being is also high – and similarly the negative effects of low engagement would be exacerbated when psychological well-being is poor. Authors, from another research also summarized that people with higher levels of psychological well-being are healthier (mentally and physically), have happier lives and live longer but importantly, research also shows that they are likely to take a more positive approach to their work and their relationships with colleagues. High levels of psychological well-being are associated with a range of positive outcomes and behaviours that would support stronger employee engagement. People with higher levels of psychological well-being are less likely to see ambiguous events as threatening.

A fundamental aspect of wellbeing is building resilience particularly in stressful times and these issues can readily be addressed by the provision of training (Rumbles and Rees, 2013). Spreitzer and Porath (2012) defined ongoing learning at work as fundamental to creating sustainable performance. In their research into what makes for a consistently high-performing workforce, they found that happy workers were more productive. They argue that organizations need to create ''thriving'' workers who are not just satisfied and productive but are also engaged in creating the future and are less susceptible to burnout. They believe that learning is a vital component to achieve this because people who are developing their abilities are likely to believe in their potential for future growth. The implications of their research for organizations is to create opportunities for employees to learn and grow by fostering practices that encourage individual and organizational learning. This is important for all age-diverse employees.

The ways by which the risk of workload can be reduced include (see, e.g. Leka et al., 2003; De Silva et al., 2017):

- Primary prevention, reducing workload through: ergonomics, work and environmental design, organizational and management development,
- Secondary prevention, reducing workload through: worker education and training, and
- Tertiary prevention, reducing the impact of workload by: developing more sensitive and responsive management systems and enhanced occupational health provision.

Fourth Approach: Suitable Organizational Climate For Older Employees

Zacher and Yang (2016) stress that research on successful aging at work has neglected contextual resources such as organizational climate, which refers to employees' shared perceptions of their work environment. Based on research authors Vong et al. (2018) summarized that stressful employees working in organizations characterized by unsupportive organizational climate had far less desire to stay with the organization than those working in organizations with supportive organizational climate.

In one study with more than 8,600 employees from 128 companies, researchers showed that age diversity in organizations positively predicted organizational age discrimination climate which, in turn, influenced employees' collective organizational commitment and overall company performance (Kunze et al., 2011). Also, Zacher (2015) summarize that the composition of a company's workforce influence on organizational climate for successful aging. A study from 2011 showed that the more age diversity

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

there was in a company, the higher the age discrimination climate, or employees' shared perceptions of age discriminatory practices. A follow-up study from the same team of researchers showed that the negative effects of age diversity on age discrimination climate are attenuated when companies have diversity-friendly human resource policies in place and when their top managers have low levels of negative age stereotypes.

To create a supportive development climate and retain older workers, employers need to foster older workers' development orientation and ensure that their work assignments provide opportunities to learn new knowledge and skills (Armstrong-Stassen and Schlosser, 2008). Organizational culture and climate can have important influences on the extent to which employees can age successfully at work. Positive cultures and climates impact on older employees' attitudes and well-being, as well as company outcomes such as firm performance and turnover. Practitioners can create organizational cultures and climates for successful aging by training company leaders, implementing age-inclusive human resource strategies, and actively managing their increasingly age-diverse workforces (Zacher, 2015).

According to Zacher (2015) an organizational climate for successful aging has positive effects on older workers' job satisfaction, organizational commitment, work engagement and motivation to continue working after traditional retirement age. At the organizational level, research showed that age discrimination climate has negative effects on employees' collective commitment and firm performance. Moreover, a positive age-diversity climate was linked to higher company performance and lower collective turnover intentions among employees.

Work Engagement of Older Employees

Robinson et al. (2004, 9) define work engagement as "A positive attitude held by the employee towards the organisation and its values. An engaged employee is aware of business context, and works with colleagues to improve performance within the job for the benefit of the organization". The successful ageing of employees in a working environment is crucially connected with their work engagement (Tett and Meyer, 2006). From this perspective a beneficent working environment is extremely important for older employees, since it affects the work engagement of older employees (Rožman et al., 2017). It is important to establish such working environment in which older employees feel well when working. The work engagement of employees strengthens, when employees feel well at work. On the contrary, the work engagement of employees decreases when the level of well-being is low (Robertson and Cooper, 2010). May et al. (2004) argued that engaged employees have high levels of energy and are enthusiastic about their work. Bakker and Demerouti (2008) assert that engaged employees often experience positive emotions, including happiness, joy, and enthusiasm; experience better health; create their own job and personal resources; and transfer their engagement to others. Lu et al. (2016) summarized that work engagement represents a positive working state that improves organizational performance. It is considered a key indicator of organizational health because it significantly influences employees' performance, job satisfaction, turnover intentions, customer satisfaction, organizational success and firm profitability.

The research shows that highly engaged employees are more positive about their jobs and organizations, treat co-workers with more respect, help others improve work efficacy, continually improve work-related skills, are highly active and demonstrate in- and extra-role performance (Lu et al., 2016; Bakker and Demerouti, 2009).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

DISCUSSION

Older employees are an important part of the workforce of modern societies and their numbers will increase in coming decades. They have different skills and competences compared with other generations. Without their participation in working life, a shortage of professional, structural and networking capacities will arise. Also, the transfer of their tacit (silent) knowledge to younger generations is important. The strongest combination of competences in the workplace is based on the different strengths of different generations (Ilmarinen, 2012).

Managing older employees in the company has an impact on creating an effective work environment, changing negative age stereotypes, and dispelling earlier misconceptions and mistreatment. Thus, a changed mindset about older employees in all companies is needed. By encouraging active aging and introducing management of older employees, companies can achieve a significant increase in the older workforce's commitment, a change in generally rooted stereotypes, myths and prejudices about the elderly, and the reduction of discrimination on the part of the elderly in the labor market. The social inclusion of all employees, including the elderly, is necessary for the success of the company and their participation in shaping the future of the company.

In the development of appropriate approaches to managing older employees and their workforce, the following facts should be derived, in particular from the following facts and the awareness that the aging of the employee reduces the ability to perform physically demanding work tasks, which means that the complexity of work tasks must be adapted. It should be remembered that age reduces the ability to cope with psychosocial pressures, which means that the emphasis should be placed on reducing stress and workload, providing a balance between work and private life, and organizing meetings where older people can give opinions on possible improvements in workplace. Old age also increases the ability to perform and solve complex tasks, so older people should be able to work together to solve difficult tasks or problems, as they increase their knowledge and experience with age, and at the same time allow them to participate in important decisions, which relate to the company.

Difficulties in communication and cooperation between different generations in the workplace are inevitable. Ways to overcome these barriers are reflected in the formation of generational mixed teams, the promotion of intergenerational cooperation and the resolution of work tasks, informing employees of differences in personality traits and characteristics between generations and in promoting informal socializing.

To improve the management of older employees and their working commitment the proper working conditions that should be available in all companies are important. These include, in particular, redistribution or adjustment of jobs, adjustment of schedules, different forms of workplace flexibility, the provision of work from home, the burden on older employees with easier work assignments. It is useful if older employees circulate around the company instead of working for many years in the same office and becoming melted. It is also important that companies invest in ergonomic jobs, as older people often face visual impairments or pain in the spine.

In order to manage older employees and their commitment in the workplace, more attention should be given to improving the work-life balance of older employees in the company, as this leads not only to higher productivity but also to greater satisfaction, motivation at work, well-being of employees, belonging to the company and above all to the commitment of employees at the workplace. The company best maintains the work-life balance by setting up various programs and measures, as well as flexible working practices. Thus, it is necessary to determine the complexity of the work, workload, good com-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

munication within the company, promote intergenerational synergy in the company and care for good relations among employees, because only in this way can they achieve together successfully solving tasks and achieving results.

According to Naegele and Walker (2006) recruiting older applicants brings a number of benefits for a company: 1. older applicants are often more skilled than younger applicants; moreover, their skills frequently better match the organisation's needs; 2. hiring older employees can raise the general skills level of the work force. The workforce, and the organisation, also benefits from the older recruits passing on their experience to younger colleagues; 3. the synergy gained by linking the new and existing skills of the workforce can raise the organisation's productivity and capacity for innovation; 4. recruiting older employees leads to greater age diversity both in individual teams and in the company as a whole; 5. in certain age-sensitive trades and companies, older employees can – by virtue of their age – respond more readily to changing customer wishes and needs; such responsiveness can also result in improved turnover; 6. recruiting older applicants can improve the corporate image of the organisation – both internally and externally – and so improve its corporate identity; 7. recruiting older applicants can solve the problems of poor labour supply.

Older employees are an important part of the company and society. Here are a few key advantages in hiring and retaining older employees (see, e.g. Kooij, 2015, 2008; Zacher, 2015; Dordoni and Argentero, 2015):

1. *They have good leadership skills*. Older workers are good leaders because they often have stronger communication skills than their younger colleagues.
2. *They know what they want*. Older people have been working their entire lives and are often not searching for the next opportunity like younger employees.
3. *They're loyal*. Since older employees are typically more satisfied with their jobs, they also tend to stay longer.
4. *They have a good work ethic*.
5. *They have strong networks*. Older workers have been in the workforce longer and they've had more time to meet people and network along the way.

CONCLUSION

Older employees with their treasure trove of knowledge and rich experience bring great benefits to the company. It is therefore important that leading employees and managers put the management of older employees into the forefront as one of the key factors contributing to raising the company's performance and competitiveness. It should also be taken into account that in the management of older employees, human resources management is also of key importance, since the company consists of age-diverse employees with different values, experience, knowledge, personality traits and expectations (Potocan et al., 2016; Potocan et al., 2018). The task of managers is to successfully integrate all the above into the work environment, taking into account that age-diversified employees will succeed and work only in an appropriately designed work environment.

To have workers of all ages satisfied and engaged at work, we need to understand which working conditions are the best for them. Indeed, some characteristics may have more beneficial effects in younger workers but less in older workers (e.g. task variety). For example, it may be important for supervisors

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to challenge younger workers with different tasks, in particular during the organizational socialization phase when they are learning their jobs. In contrast, providing more tasks may actually be detrimental to older workers. Furthermore, considering the aging working population, it is important for organizations to develop jobs that enable people to continue to work successfully. It seems that older workers may not benefit from simply doing more tasks, but rather from opportunities to use their wide range of accumulated skills (Zaniboni et al., 2013). Human resources programs that create opportunities for older workers to use their skills, avoiding (or reducing) requirements to perform more tasks, may be helpful in keeping older workers satisfied and engaged at work. For example, it may be a competitive gain for organizations to utilize the experience and competencies of older workers, and to promote the transfer of knowledge and skills to younger colleagues (e.g. mentoring and coaching programs), by having younger employees perform a wide range of tasks (Zaniboni et al., 2014).

The better health and life expectancy of older employees improve their opportunities to enhance an agefriendly society. However, a good working life is an important prerequisite for older employees to remain active and ensure that society benefits from their strengths and talents. In doing so, they participate actively in building up a sustainable and caring society, where solidarity exists between the generations and productive working life is an important platform for active ageing. Satisfactory employment can help people avoid sickness and physical or mental deterioration, secure good cognitive and physical capacity, and promote positive and active attitudes towards life. The quality of working life has a big impact on all workers, because we spend so much of our time at work. Therefore, investments in active ageing need to be secured during the working years. The investments in occupational health and safety in workplaces are also investments for the rest of our lives (Ilmarinen, 2012).

The paper is limited to the field of older employees and their work engagement which is reflected in the conceptual model of managing older employees.

KEY TERMS AND DEFINITIONS

Active Ageing: Active ageing is the process of optimizing opportunities for health, participation and security in order to enhance quality of life as people age.

Age Management at Workplace: Age management uses a life-course approach and creates equal opportunities for all generations.

Older Employees: Older employees are an important part of the workforce of modern societies and their numbers will increase in coming decades. Older employees have different skills and competences compared with other generations.

Work Engagement: Work engagement is positive behaviour or a positive state of mind at work that leads to positive work-related outcomes.

Chapter 87
Women Managers and Generations: A Study of Obstacles

ABSTRACT

The number of women in organizations is increasing in most countries, but the representation of women in managerial positions is still disproportional. The percentage of women in leadership positions globally is only 29%. Grant Thornton annual survey 2019 reveals that India still ranks the fifth lowest in having women in managerial roles. Thus, though diversity at work is increasing, there are still fewer women in the boardroom. The main reason for this is the hurdles and obstacles that women managers face. The chapter studies the various obstacles faced by women managers. Also, it takes into account the role of generation and aims at comparing the hurdles faced by women managers belonging to Generations X and Y. The study is undertaken with special reference to the banking sector. Major findings reveal that there is a difference in obstacles faced by women managers belonging to Generations X and Y.

INTRODUCTION

The number of women in organizations is increasing in most countries. Women are also entering into those sectors which were traditionally dominated by men. The rate at which women are becoming entrepreneurs is nearly twice that of men (Zellner, 1994). Even the percentage of women in managerial roles has increased across the globe in recent years (Powell and Graves, 2003). But despite all this, the representation of women in managerial positions is still disproportional (Linehan, 2008). The percentage of women in leadership positions globally records to only 29%. Grant Thornton annual survey 2019 reveals that India still ranks the fifth lowest in having women in managerial roles. Thus, though diversity at work is increasing, the number of women in the boardroom level is still less (Hillman, Shropshire, and Cannella, 2007).

Women today are no more willing to be a peripheral part of the workforce. They wish to take up senior positions and are willing to earn a good amount of money. But many researchers found that even if women have a high level of qualifications and the desire to achieve something professionally, not many get to fulfill it. As there are still many barriers that stop women from being successful (Chenevert and Tremblay, 2002). Women mangers tend to encourage employee development and are better than male managers when it comes to team building at work (Chenevert and Tremblay, 2002). Women are believed to improve the company's overall performance when occupying managerial roles. They are considered better managers than their male counterparts (Cristian Dezs and David Gaddis Ross, 2012). As women managers play a crucial role in the development of the organization, companies must find a way to retain these talented and high potential managers. And one way they can do this is by creating a favorable organization culture (Cooper, 2001). As many studies suggest that women consider unfavorable organizational culture and norms as a bigger obstacle than societal and family issues (Lyness and Thompson). Many women managers leave managerial roles because of a lack of support from subordinates and seniors and bad work culture (AgnieszkaLipińska-Grobelny, 2010).

As per (Tolani, Bhadade & Sao, 2018), the issues and challenges faced by women belong to different generations are not the same. The expectations of women brought up in the dissimilar historical background and economic conditions will not be the same. The majority of women manager currently at work belongs to Generation X and Generation Y. Generation X is more adaptive and ready to learn new things. They like to have work-life balance, job stability and prefer to give importance to personal life (Janet Bickel, 2005, FGI, 2004, Santos & Cox, 2000). On the other hand, Generation Y, have very high expectations. They are smart, good at the use of technology, frequently upgrade skills and like to hop job for better opportunities (Kim, 2008, Eddy S.W. Ng, 2010, Sara De Hauw et al, 2010, Ng et al, 2010).

Thus organizations should focus on modifying their policies and practices and aim at creating a culture that is conducive for the advancement and retention of women employees. Companies should make constant efforts to increase diversity across the organization (Cooper, 2001).

The current paper aims at understanding the various obstacles faced by women occupying leadership roles. It also aims at finding the strategies that the companies can adopt to eliminate these obstacles. Several studies in the past have focused on understanding the issues of women managers but there is a very little study conducted considering the role of Age and Generation. A study conducted by Jyrkinen, M, &McKie L, 2012 supports the argument that women belonging to different age groups experience different challenges and their way of responding to these challenges is also different. In this study, we have attempted to compare the obstacles faced by Generation X and Generation Y women managers.

LITERATURE REVIEW

Obstacles Faced by Women Managers

Various studies on women managers reveal that there are various obstacles that women experience at the individual, organizational, and societal level (Karam & Afioni, 2013).

One of the major obstacles faced by women at the workplace which prevents their advancement to the top position is the **"glass ceiling"**. This phenomenon is prevalent in various organizations (Simpson and Altman, 2000). Though many women are acquiring managerial positions today, the glass ceiling still exists (Meyerson and Fletcher, 2000). According to Stroh, Langlands, & Simpson, (2004), Glass ceiling is nothing but a set of barriers at the workplace which are stopping the women employees from setting their foot in the upper management. And even if they get into a top position they find it hard to survive there. Glass ceiling also hinders the career development of women employees. In most organizations, it is the lack of organizational support, mentoring, and networking (Vlado Dimovski, 2010). Glass ceiling as a barrier largely influences the career of women (David, 2001; Mavin, 2000).

Another challenge that women at managerial roles need to deal with is the **''queen bee syndrome''** (Keeton, 1996). It is a condition where women who have reached the upper management are not willing to extend any support or help to the women aspiring to reach the top (Ng & Chiu, 2001). These are those women who are not ready to break the cycle, as they had struggled hard to reach to the top, they want other women to also go through that same set of issues. These women have taken efforts to create their space in the male-dominated culture. Thus they do not let other women enter easily (Staines, Tavris, & Jayaratne, 1974). A study conducted by Belle Derks (2015) suggests that women exhibiting "queen bee syndrome" do three things: 1) Avoiding social contact with other women. 2) Endorsing the current gender hierarchy. 3) Presenting themselves like men. Queen bee syndrome leads to a lack of support for women and creates unavailability of women mentors for aspiring women juniors. (Fox, 2005)…

Among the various obstacles faced by women managers, one most prevalent obstacle is the **gender stereotype** (Karam & Afioni, 2013). This obstacle is considered as most disruptive for women managers. (Claudia Peus, 2015). Women experience a lack of cross-gender support, difficulty in accessing the social network, isolation, clubbism (Kauser &Tlaiss, 2011) and all of these affect adversely women manager's morale and performance (Ikhlas A. Abdalla1, 2015). Gender stereotypes, bad attitudes towards women, and cultural biases are hindering the performance of women managers across all the settings (Vlado Dimovski, 2010). Leadership roles have always been associated with male gender and this trend continues to persist in various places even today (Eagly, 2007; Heilman, 2001; Powell, Butterfield, & Parent, 2002). Women are always considered suitable for a supportive role and are never considered for central activities (Dasgupta & Asgari, 2004).

Work-family conflict is also a major issue that affects women managers (Heilman & Okimoto, 2008). Many women managers are unable to focus on their work effectively as they do not receive support from their family members. A researcher states that family support plays a crucial role in the advancement of women (Karam & Afioni, 2013). Many women managers say that is very hard to balance both work and family especially when you are handling crucial responsibilities at work and there is a lack of organizational and family support (Guendouzi, 2006). They are always trying to figure out whether to put family first or work. This dilemma is created mostly because of the lack of women- friendly organizational policies and lack of support from the family members (Maume, 2006). The Organization

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

must strive to make policies to ensure that women find it easy to carry out all the roles such as women, a mother, a wife, and a manager effectively. (José M. Coronel, 2010).

Few researchers suggest that some barriers to women managers are also **individual-centered**, such as personality traits, attitude, confidence, and risk-taking capacity, etc. (Powell, 2000). Inner drive and self-efficacy play an important role for a women manager to succeed in their career. Women's lack of self-interest, self-confidence, and inclination are considered as major blocks to the career advancement of women employees (Peus & Traut-Mattausch, 2007).

Gen X & Gen Y

People belonging to Generation X and Generation Y have different historical backgrounds, thus the characteristics and attitudes of these two generations are very dissimilar (Reisenwitz & Iyer, 2009). Thus they exhibit different behaviors and expectations at work (Tolani, Bhadade & Sao, 2018).

Generation X born from 1961 to1979 (Gurau, 2012), are also called Baby Busters. It is a diligent and reliable generation (Gursoy, Maier & Chi, 2008). Generation X individuals are also called as Latchkeys generation as it was the first generation, whose parents were working and many of these people had witnessed parental divorce. Because of these life experiences, this generation puts family first and likes to have work-life balance (Janet Bickel, 2005). They give their family and personal life more priority and are not willing to sacrifice it for work (Cole et.al, 2002). This generation is more adaptive to changes and is willing to learn new ways of doing things (FGI, 2004). Though generation X was the first generation to use technological devices such as computers, laptop on a day to day basis, with rapid technological advancement, this generation is not as technologically urbane as the new generations. But as this generation is a highly adaptable, they constantly try to learn the new technology. When it comes to career and job, this generation constantly makes efforts to develop skills and qualifications which can aid in their career development (Santos & Cox, 2000). Thus this generation is result-oriented and highly focused (Tolani, Bhadade & Sao, 2018). Generation X individuals as compared to the new generation individuals prefer job stability, they consider job decision as an important decision and they prefer hopping jobs only if they get better salaries and growth prospects (Tulgan, 2000). This generation has witnessed a major recession and financial crises of the 1980s and 1990s (Galambos, 2014). Thus when making an investment or financial decision, this generation gets very cautious. (Crumpacker & Crumpacker, 2007).

Generation Y born from 1978 to 1994 (Sheahan, P, 2005), are also called Millennials and Eco boomers (Howe and Strauss, 2003). Millennials are poised, smart, and enthusiastic and curious individuals (Kim, 2008). This generation continually upgrades their skills and likes to be successful (Eddy S.W. Ng, 2010). But when it comes to their career, they frequently hop jobs and are always looking for better opportunities. This generation has very high standards and expectations when it comes to the workplace, and job (Sara De Hauw et al, 2010). This generation believes that a good workplace is one where the employees are treated well, and the health and wellbeing of the employee is important (Andrea Hershatter, 2010). According to Millennials, a conducive work environment is one where employees are treated as assets and they should be valued (Diane Randall Andrews, 2013). As this generation is born and brought up in the age of social media, they have high social needs, they like to maintain good interpersonal relationships at work (Ng et al, 2010). This generation of employees prefers working in teams. They are excellent collaborators (Dougan et al., 2008). They like to set team goals and believe in exhibiting team spirit (Gursoy et al., 2008).This generation as compared to the previous generations is more technologically, as they have been using various technological devices right from childhood.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Thus this generation expects technological sophistication at their workplaces. Generation Y individuals put a lot of emphasis on flexibility at work (Iyet & Reisenwitz, 2009). As compared to Generation X, they prefer work-life integration over work life balance. As they are technologically urbane, they believe we can complete our work from anywhere, anytime without compromising on life. As this generation employees are unique and must be dealt with differently than the previous generations.

RESEARCH METHODOLOGY

Objectives of the Study:

Based on identified research gaps from the review of the literature, the following broad objective was constructed.

- To determine various obstacles faced by women managers.

The following hypotheses were formulated and this empirical study tests those hypotheses.

The Null Hypothesis

- There is no significant difference between obstacles faced by women managers at the workplace among the different age groups.
- There is no significant difference between obstacles faced by women managers at the workplace among different marital statuses.
- There is no significant difference between obstacles faced by women managers at the workplace among different years of experience.

Data Collection Method:

This study has adopted an online mode for data collection. The primary data has been collected by using a structured questionnaire for the study. As the study focuses on understanding the various obstacles faced by women managers at the workplace hence the questionnaire for the study is designed on the following parameters.

1. Workplace Ecosystem
    a. Work life balance
    b. Occupational Health
    c. Work values
2. Gender Discrimination
    a. Pay & Promotion
    b. Gender Stereotypes
3. Home & Work Conflict
    a. Children
    b. Family (In-laws)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

   c. Husband
4. Cultural Factors
   a. Societal Norms
   b. Perception
5. Individual Self

Sample Size:

The data for the study has been collected using a structured questionnaire. For the collection of data, a total of 120 women managers working in the banking industry have been reached. Out of 120, 99 respondents have filled the questionnaire and 3 responses were rejected due to incomplete information. Hence 96 valid responses were considered for the study. The random sampling technique is used to sample from the population. The sample comprised of 45.8% i.e. 44 respondents from age group of 30-40, 37.5% i.e.36 respondents from 40-50 and 16.67% i.e.16 respondents from 50-60.

MANOVA analysis is carried out to identify to the impact of various dependent variables on fixed factors i.e. age, marital status, experience vs obstacles.

DATA ANALYSIS AND FINDINGS

To determine the various obstacles faced by the women managers, MANOVA analysis was carried out by taking age, marital status, and work experience as fixed factors. The findings of the analysis have been put in the given below table.

Comparison of Responses Among age Groups

As anticipated and demonstrated in Table 1, the age has a significant impact on all the dependent variables (age vs obstacles; Wilks' Lambda = 0.00, $p < 0.05$).

Table 1. Age Vs. Obstacles

Multivariate Tests[a]									
Effect		Value	F	Hypothesis df	Error df	Sig.	Partial Eta Squared	Noncent. Parameter	Observed Power[d]
Age	Pillai's Trace	1.907	72.355	42.000	148.000	.000	.954	3038.924	1.000
	Wilks' Lambda	.000	439.359[b]	42.000	146.000	.000	.992	18453.066	1.000

There is a statistical significant difference between responses among age groups i.e. 30-40, 40-50, and 50-60. They are significantly different on work-life balance, occupational health, work values, job aspects, pay & promotion, family and societal norms.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Comparison of Responses Among Different Marital Status Groups

As anticipated and demonstrated in Table 2, the marital status has a significant impact on all the dependent variables (marital status vs obstacles; Wilks' Lambda = 0.01, $p < 0.05$)

Table 2. Marital status Vs. Obstacles

Multivariate Tests[a]									
Effect		**Value**	**F**	**Hypothesis df**	**Error df**	**Sig.**	**Partial Eta Squared**	**Noncent. Parameter**	**Observed Power[d]**
Marital_Status	Pillai's Trace	1.833	38.705	42.000	148.000	.000	.917	1625.617	1.000
	Wilks' Lambda	.001	120.662[b]	42.000	146.000	.000	.972	5067.800	1.000

They are significantly different on all parameters. As their marital status is changing they are different on the workplace ecosystem, gender discrimination, home & work conflict, cultural factors, and self as obstacles

Comparison of Responses Among Different Experience Groups

As anticipated and demonstrated in Table 3, the experience at the current position has significant impact on all the dependent variables (experience vs obstacles; Wilks' Lambda = 0.01, $p < 0.05$)

Table 3. Experience Vs. Obstacles

Multivariate Tests[a]									
Effect		**Value**	**F**	**Hypothesis df**	**Error df**	**Sig.**	**Partial Eta Squared**	**Noncent. Parameter**	**Observed Power[d]**
Experience	Pillai's Trace	2.577	22.822	60.000	225.000	.000	.859	1369.316	1.000
	Wilks' Lambda	.001	34.474	60.000	218.627	.000	.903	2038.992	1.000

There is a statistical significant difference between responses of groups having different years of experience i.e. less than a year, 1-5 years, 6-10 years, 11-15 years.

RESEARCH IMPLICATIONS

Women managers today are an important part of organizations, the policymakers thus should try and understand their problems and attempts must be made to resolve them. This study will help the policymakers to understand the obstacles faced by women managers and will suggest to them the ways by which they can help women managers to overcome these obstacles.

FINDINGS AND CONCLUSION

It has been found in the study that the major obstacles faced by women managers which hinders their growth include lack of work-life balance, majority of women managers feel that they don't get enough time to fulfill their family responsibilities or to pursue their hobbies. Women managers often need to sacrifice on their social life, family time, or "me time" to be productive or creative at work. As women managers don't get enough time to focus on their health, many women occupying managerial roles suffer from various health issues such as obesity, hair fall, anemia, anxiety, depression, and stress.

Another obstacle faced by women managers is home and work conflict. The majority of women managers suggest that one reason they can't grow in their career is the lack of family support. Some women managers who are married with children feel very guilty that they are unable to give enough time to their children.

One of the obstacles in the various cultural barriers that women managers face. People at work make perceptions about their character, competence, and reputation the way they like. Also, the lack of enough female managers as role models at the workplace creates issues for women managers.

The Study also reveals that there is a significant difference in the obstacles faced by women managers belonging to Generation X and Y. Obstacles faced by women managers are different for women who are single, who are married, and for those who are married with children. The number of years of experience of the women managers has an impact on the obstacles faced by her.

The Study suggests that some ways by which companies can help women managers to overcome these obstacles are by providing a fair and transparent workplace which is gender-neutral. Providing flexibility to women managers at work such as flexible working hours, work from home facility, crèche facility in the company can help women managers to achieve work-life balance. Some women also feel that mentoring facility and wellness programs for women can also help them in overcoming their obstacles.

LIMITATIONS AND FUTURE RESEARCH DIRECTION

The study is restricted to women managers belonging to the banking sector. Thus further studies can be done to understand the obstacles faced by women managers working in other sectors. The results of the research cannot be generalized as it is limited to women managers of India. Thus research can be carried out on women managers of other countries and a cross country analysis can also be done.

Chapter 88
Twenty-First Century Issues Impacting Turnover of IT Professionals: From Burnout and Turnover to Workplace Wellbeing

Valerie Ford
ISP Global Communications LLC, USA

Susan Swayze
The George Washington University, USA

ABSTRACT

Identifying the precursors of turnover has been the subject of examination for the past four decades. IT professionals are a critical group of employees in the current knowledge-driven economy, and as such, they experience unique job stressors. This chapter explores recent research on the organizational stressors that influence IT turnover intentions. The goal is to provide insights on how organizations can begin to stem burnout, turnover intentions, and eventual turnover while improving work-related wellbeing. A revised model of work-related wellbeing is also presented in this chapter. Another objective is to discuss current issues in the IT domain and provide new research directions. New research for the IT turnover literature will provide information to scholars and practitioners on how they might improve and alleviate the impact of turnover on organizations.

INTRODUCTION

Identifying the precursors of turnover has been the subject of examination and study for the past four decades (Dinger, Thatcher, Stepina, & Craig, 2012; Joseph & Ang, 2003; Joseph, Ng, Koh, & Ang, 2007). Historically, researchers who study employee withdrawal in the form of turnover viewed two variables as key to understanding why employees voluntarily leave organizations: job satisfaction and perceived job alternatives (Hulin, Roznowski, & Hachiya, 1985). Over the last 30 years, however, considerable research has been devoted to developing predictive models of voluntary turnover, with job satisfaction, organizational commitment, and intention to quit among the most commonly proposed reasons for dissatisfaction (Ferratt, Agarwal, Brown, & Moore, 2005; Maier, Laumer, & Echardt, 2015; Moore, 2000a; Weinert, Maier, Laumer, & Weitzel, 2015).

Information Technology (IT) professionals are a critical group of employees in the current knowledge driven economy and as such, they experience unique job stressors (Weinert, et al., 2015). Stressors are stimuli or actions encountered by an individual at work. Stressors might trigger an individual to produce different responses in the form of strain that lead to burnout (Weinert et al., 2015). There is a difference between IT professionals and knowledge workers. Information technology professionals are workers in a technology services organization (Burrell, 2014). They are in occupations that include computer programmers, systems analysts, database administrators, information security, computer support specialists, application developers, network administrators, and team members who support and maintain computer systems, other technology and related activities (Burrell, 2014; Dixon, 2016).

Recent studies have shown that the IT professional's environment – knowledge oriented work and around-the-clock service is prone to creating job stress (Chen & Karahanna, 2014; Shih, Jiang, Klein, & Wang, 2011). Additionally, as organizations continue to ask more from their IT employees (e.g. increased workload), turnover intention and job burnout also are increasing (Zaza & Armstrong, 2016). Job burnout is an extreme or advanced form of job stress and has been recognized as an occupational hazard (Maslach & Leiter, 2016). Job burnout is important to researchers and practitioners because of its association with critical psychological and behavioral outcomes, including productivity, withdrawal, turnover, and employee well-being (Maslach & Goldberg, 1998; Maslach, Schaufeli, & Leiter, 2001; Weinert, et al., 2015). Job burnout has been identified as one of the main consequences of job stress (Maslach & Leiter, 2016; Maslach, et al., 2001).

BACKGROUND

In this chapter, the authors seek to explore previous research and the most recent findings on the organizational stressors that influence the turnover intentions of IT professionals. The goal is to provide insights on how organizations can begin to stem burnout, turnover intentions and eventual turnover. Another important objective of this chapter is to provide new research directions that have not been investigated yet or have been explored less. New research for the IT turnover literature will provide information to researchers on how they might improve and alleviate the impact of turnover amongst staff.

To this end, this chapter will:

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Use previous research by the authors as the foundation upon which to explore new research directions associated with the antecedents of turnover and turnover intentions of IT professionals, such as burnout, work exhaustion and engagement.
- Make recommendations about what organizations can do to reduce stressors in the IT environment, and therefore reduce the likelihood of turnover.
- Discuss how the IT work environment and workers are changing.
- Identify retention strategies that practitioners can use to help prevent turnover as they try to remain competitive in an ever-changing, global environment.

Research presented in this chapter will contribute to scholarship and organizations by providing practical approaches that organizational leaders can use to retain IT professionals. Turnover intention and turnover is complicated, so organizations should avoid developing and implementing retention strategies without taking the time to understand the factors that influence IT employees' intentions to quit (Abii, Ogula, & Rose, 2013; Ferratt, et al., 2005).

RELEVANT QUANTITATIVE STUDY

In the article *An Exploratory Investigation of the Relationship between Disengagement, Exhaustion and Turnover Intentions Among University IT Professionals* (Ford, 2012; Ford, Swayze, & Burley, 2012), the researchers conducted a quantitative study to examine the relationship between these concepts by proposing the following research question: *To what extent is there a statistically significant relationship between disengagement, work exhaustion and turnover intentions among IT professionals in a single higher education institution in a major metropolitan area?* The researchers adapted the Job Demands-Resources (JD-R) Model of Burnout to use as the theoretical lens through which to explore work exhaustion, disengagement and how they influence turnover intentions among the selected population.

Their study and the associated outcomes and recommendations, provided insights into the unique work environment of university IT professionals and how workplace characteristics predict disengagement, work exhaustion and subsequent thoughts about quitting. Additionally, this study discussed engagement as one of the hot topics in the practitioner community. Engagement is of interest because of its perceived link to critical business outcomes like productivity, retention, loyalty and well-being (Bakker, Hakanen, Demerouti, & Xanthopoulou, 2007). Further, engagement is thought to be one of the ways that organizations can forge a path to competitive advantage (Schneider, Macey, Barbera, Young, & Lee, 2006).

Conceptual Framework

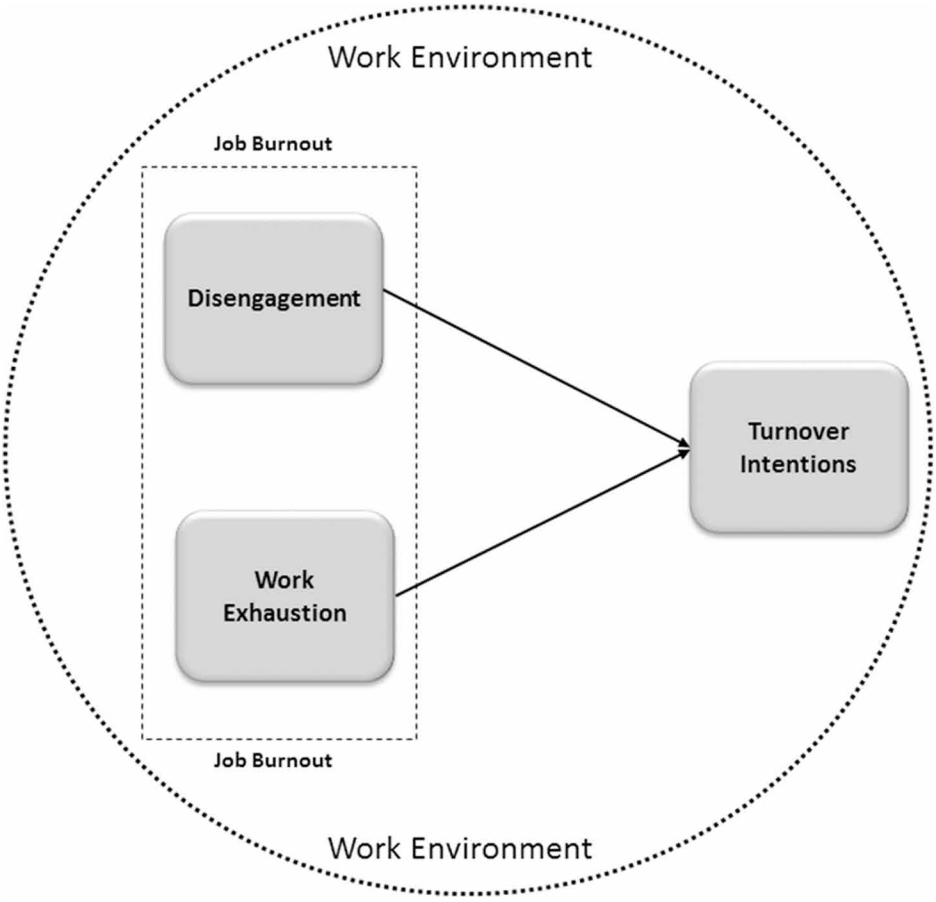
In their previous study, the authors adapted the Job Demands-Resources (JD-R) Model of Burnout as a framework to further understand work exhaustion, disengagement and their relationship to the turnover intentions of university IT professionals (Demerouti, Bakker, Nachreiner, & Schaufeli, 2001). In their quantitative study, the authors asserted that the notion of job burnout is too complex to be studied as a single entity and therefore should be deconstructed into its primary components (Ford, et al., 2012). In the literature, one theory suggests that collective burnout is comprised of two major concepts: work exhaustion and disengagement (Demerouti, et al., 2001). Schaufeli and Bakker (2004), with a sample of nearly 1,700 workers in four different occupational groups found support for the two-dimensional

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

model with the notion that disengagement was related to job resources. However, Schaufeli and Bakker found that both demands and resources were related to work exhaustion.

Specifically, the JD-R model was recreated as depicted in Figure 1 to focus on disengagement and work exhaustion. Further, the antecedents of disengagement and exhaustion were removed from the model.

Figure 1. Revised model of Burnout and Turnover Intentions



A Review of the Research on Turnover and Turnover Intentions of IT Professionals

Although researchers and managers have long explored why people leave their jobs and why they stay, there is not a complete understanding of the problem. Researchers want to ideally understand turnover behavior, but in reality, it is difficult to empirically investigate actual turnover. At the time that an employee leaves an organization it is too late to intervene, prevent or understand how they reached their decision. As a result, researchers study existing employees and ask them about their intentions to leave (Lacity, Iyer, & Rudramuniyaiah, 2008). For this reason, many studies make the assumption that the intention to leave is both a proxy for and predictor of actual turnover behavior (Cohen, Blake, & Goodman, 2016).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Turnover intention refers to an employee's deliberate and conscious intention to look for a new job or to voluntarily leave a current job (Joseph, et al., 2007). On the other hand, turnover is defined as the individual movement across the membership boundary of an organization and is said to occur when an employee voluntarily leaves an organization (Thwala, Ajagbe, Long, Bilau, & Enegbuma, 2012).

The notion of focusing on intentions rather than behavior is rooted in Ajzen's Theory of Planned Behavior (Ajzen, 1991), one of the best empirically supported theories of motivation. In short, this theory focuses on behavioral intentions to understand the link between attitudes and behavior. According to this theory, intention is the cognitive representation of a person's readiness to perform a specific behavior, and is considered to be the immediate precursor of behavior (Ajzen, 1991). Empirical results from turnover studies have supported the assertions that turnover intention is a stronger predictor of actual turnover compared to other antecedents like job satisfaction (Joseph & Ang, 2003).

Turnover has been a problem for the IT workforce since the early days of computing (Chang, 2010). In fact, turnover and retention of skilled IT professionals are still major issues for employers and recruiters of the IT workforce (Zaza & Armstrong, 2016). Since the beginning of the recording of statistics, the turnover of these professionals has been characterized as problematic and has been reported consistently over at least the past 40 years (Chang, 2010). One of the first reviews of IT turnover intentions was completed in the late 1970s (Willoughby, 1977; Zaza & Armstrong, 2016). In his review, Willoughby (1977) examined turnover statistics for IT professionals and concluded that it was a chronic problem (Willoughby, 1977).

Three decades later, Joseph et al. (2007) conducted a review of the literature on the turnover intentions of IT professionals from 1985-2005 to "review and reflect on our accumulated knowledge on IT turnover" and "enhance our understanding of the IT turnover phenomenon" (p. 548). In addition to exploring the direct effects on turnover intentions, Joseph et al. (2007) conducted a moderator analysis to identify possible sources of variation that could affect the direction and extent of these relationships. In their review, Joseph et al. (2007) identified six categories of factors that influence turnover intention for IT professionals. They are: desire to move (e.g., affective organizational commitment, job satisfaction), ease of movement (e.g., perceived job alternatives), job search, demographics (e.g., age, gender), human capital (e.g., organizational tenure), job-related factors (e.g., work exhaustion), and perceived organizational factors (e.g., fairness of rewards).

During the ten years since Joseph et al's (2007) meta-analysis, more than 35 new studies have been published on turnover intentions within the IT field (Zaza & Armstrong, 2016). But the research continues to identify a fragmented set of antecedents. Furthermore, many of the studies have produced inconsistent findings. For example, McKnight et al. (2009) found that work exhaustion did not predict turnover intention, whereas Shih et al. (2011) found that work exhaustion positively influenced turnover intention. Despite the number of studies on turnover intentions in the IT field within the last ten years, there has been only one attempt (beyond the Joseph et al. (2007) study) to analyze the accumulated data (Zaza & Armstrong, 2016). What is clear is that although the research has identified many important pieces in the turnover intentions puzzle as it relates to IT professionals, there is still more work to do to understand how these pieces fit together.

CHANGES IN THE INFORMATION TECHNOLOGY WORKFORCE

Despite the numerous studies on the topic of IT employee turnover and recommendations to organizations on how to retain employees, the general turnover trend for IT professionals remains high (Lo, 2015). During economic downturns, turnover rates naturally decline, but the overall turnover trend for IT professionals has not declined (Lo, 2015). In fact, recent projections show that the computer systems and related services industry will grow by nearly 4% each year through 2020, placing information technology among the fastest growing industries (Henderson, 2012). With projections like these, the demand for qualified candidates will increase. But at the same time, student enrollment in IT-related programs has declined (Lo, 2015). This finding further intensifies the need for organizations to retain qualified and skilled IT professionals.

Living in an Ubiquitous World

Cybersecurity, hackers, around the clock access, and 24x7 data centers are indications of an ever-changing landscape for IT professionals. Furthermore, globalization, outsourcing, and increasing competition, puts IT employees under growing pressure to meet deadlines and reduce response time to customer requests (Syrek, Apostel, & Antoni, 2013). Moreover, ubiquitous and rapidly evolving mobile technologies such as smart phones and tablets (and increasingly wearable mobile devices such as wrist technologies) allow people to work any time, anywhere, and on any task (Reyt & Weisenfeld, 2015). Therefore, people work all the time, everywhere, and on everything (Chen & Karahanna, 2014; Reyt & Weisenfeld, 2015; Syrek, et al., 2013). In short, technology is having the effect of diminishing time and space, rendering the lines between work demands and personal life increasingly integrated, decontextualized, and overlapping (Chen & Karahanna, 2014; Reyt & Weisenfeld, 2015).

IT professionals are likely to experience the pressures of around the clock access more acutely as advances in the connectedness of technology have blurred the boundaries between work and personal life. While the majority of knowledge workers use technology as a way to enable them to be more connected to their work, IT professionals are responsible for creating and supporting the technology that enables the ubiquitous any time, any place mentality that exists in today's society and globally connected world (Chen & Karahanna, 2014). These demands for connectedness may lead to IT employees experiencing increased job burnout, higher turnover intentions and may eventually lead to turnover.

Fear of Becoming Obsolete

Another factor leading to increased job stress among IT professionals is the fear of becoming replaceable (Van Heerden, 2015). Due to changes and advances in technology, the competencies and skills required of IT professionals is always changing. In contrast to the past, today's environment is perceived as the knowledge era where intellectual capital drives an organization's competitive edge (Syrek, et al., 2013). Many of the new generation jobs are more technologically advanced and require employees who can perform these tasks with higher demand and to perform more and varied tasks in parallel thus requiring transitory or disparate skill sets, knowledge and experience. (Van Heerden, 2015).

Information technology workers have an intense desire to keep pace with the latest technology to avoid becoming obsolete (Dixon, 2016). Falling behind technologically could easily result in reduced company marketability, the fear of the company outsourcing the function, and laying off the employee

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

without the skill set needed to acquire another position within the IT field (Dixon, 2016). IT employees must continually learn new skills over their entire career in order to adapt to new technological development and ever changing business requirements (Dixon, 2016; Van Heerden, 2015). The sheer volume of learning required can increase work exhaustion, with a negative effect on turnover (Dixon, 2016). To retain these employees and sustain their competitiveness, organizations should design jobs to create greater autonomy over the pace and process in the hands of IT workers and to offer additional and ongoing training, education, exploration of new and future technologies in preparation for future goals and objectives (Dixon, 2016).

Retention of skilled information technology professionals is becoming increasingly important as technology is introduced into nearly every functional aspect of organizations (Burrell, 2014). Given the growing impact of technology on organizational financial and operational success, organizations depend on technology and the technical and business knowledge of IT professionals to remain competitive (Dixon, 2016; Weinert, et al., 2015). In this context, employee turnover can be a costly problem for organizations. When employees leave, organizations have to attend to the high cost of training and development, burnout of existing staff, and decreased quality of products and services due to the shortage and/or inexperience of staff (Burrell, 2014).

Around the clock access, technological uncertainty and the demands that they create for IT workers is an interesting area for future research. While, around the clock access and technological uncertainty are key stressors in the IT environment, an aging IT workforce is another factor that is contributing to the turnover of IT professionals.

An Aging IT Workforce and the Threat of Lost Knowledge

As a result of the post WWII baby boom, a large number of employees are retiring from the workforce (Van Heerden, 2015). For the information technology sector, this creates a unique issue because as these individuals retire, the knowledge that they take with them creates a void among the remaining employees. This is especially true for long-tenured employees because they create a constraint for the organization by limiting the ability to replace the employee knowledge when they leave (Shumaker, Ward, Petter, & Riley, 2017).

This problem is more serious than it seems because these retiring workers are taking with them knowledge essential to the organization that cannot easily be replaced on the open market. They take with them knowledge that can only be developed internally over a long period of time (Shumaker, et al., 2017). This knowledge is deep, contextual knowledge related to embedded business processes and how information systems are integrated (Van Heerden, 2015). Also included in this knowledge is understanding where knowledge resides within the organization and how to access it (Van Heerden, 2015). Many organizations are not prepared for the loss of this deep knowledge when these IT professionals leave the organization. Because of the aging IT workforce, retention of IT workers is even more critical.

An aging IT workforce simply means that not all turnover can be prevented. The best that organizations can do in this case is to prepare for the departure of key employees by creating succession plans for transferring knowledge and identifying critical skills. In addition, organizational leaders should create a systematic approach to identify which knowledge is most critical and where to focus their energy if several employees are nearing retirement (Shumaker, et al., 2017).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Unfortunately there is a dearth of research on age-related issues in the IT workforce (Shumaker, et al., 2017). Organizations should seek to understand the nature of potential knowledge loss as it relates to retiring employees. This is a consideration for future research.

JOB BURNOUT, WORK EXHAUSTION, TURNOVER, AND TURNOVER INTENTIONS

Previous literature demonstrates that burnout has an impact on the turnover intentions of IT professionals (Moore, 2000a; Weinert, et al., 2015). For example, research in the management and IT literature assert that turnover and turnover intentions can be an outcome of organizational factors such as, workload, time pressure and leadership, along with other antecedents that are specific to the IT profession, such as boundary spanning activities, IT (or professional) tenure, professional obsolescence, professional commitment and workplace characteristics (Demerouti, 2015; McKnight, et al., 2009; Syrek, et al., 2013). In fact, investigators claim that there are many other unmeasured variables that may be present in the IT environment to explain the phenomenon (Joseph & Ang, 2003; Lo, 2015).

Most studies on turnover and turnover intentions make explicit the causal theorizing that has always been implicit in the turnover research. Certain factors (both individual and situational) cause people to think about leaving or actually leaving their jobs (Joseph, et al., 2007; Zaza & Armstrong, 2016). Recent research therefore focuses on understanding these turnover intentions and as a result attempts to provide organizations with details for implementing successful employee retention actions (Weinert, et al., 2015). In this context, several investigations focus on work exhaustion as a source of turnover intention and acknowledge that IT professionals have a high degree of burnout, and accordingly a high degree of intention to quit their jobs (Armstrong & Riemenschneider, 2011; Moore, 2000a; Weinert, et al., 2015). The next section examines burnout and how it influences the turnover intentions and eventual turnover of IT professionals.

A Review of the Literature on Burnout

The IT research literature suggests that information technology professionals are especially vulnerable to burnout (Kalimo & Toppinen, 1995; Maier, et al., 2015; McGee, 1996; Moore, 2000a; Van den Broek, et al., 2017; Van Heerden, 2015; Weinert, et al., 2015). Burnout is a particularly tragic endpoint for professionals who entered the job with positive expectations and enthusiasm. Burnout is defined as a reaction to chronic job stress that is characterized by exhaustion and mental distancing or disengagement (Maslach & Leiter, 2016; Schaufeli, Leiter, & Maslach, 2009). Employees experiencing burnout lose the capacity to provide the intense contributions that make an impact at work (Schaufeli, Bakker, & Van Rhenen, 2009; Schaufeli, Leiter, et al., 2009). Further, research has linked job burnout to a plethora of ailments, including depression, physiological problems and family difficulties (Cropanzano, Rupp, & Byrne, 2003; Maslach & Leiter, 2016). Accordingly, IT research has begun to link job burnout to turnover intentions and eventual turnover (Kim & Wright, 2007; Moore, 2000a; Weinert, et al., 2015).

Burnout Definition and Attributes

The term burnout was first coined in the 1970s by Freudenberger to describe the gradual emotional depletion and loss of motivation he observed among people who had volunteered to work for aid organizations (Bakker, Demerouti, & Sanz-Vergel, 2014; Freudenberger, 1974). The volunteers had worked with dedication and enthusiasm for a period of time before the onset of these symptoms. On the basis of his observations, Freudenberger (1974) defined burnout as "a state of mental and physical exhaustion caused by one's professional life." Thus, individuals who burn out from their work deplete their energetic resources and lose their dedication to work.

At the same time, Maslach (2001) and her collaborators interviewed human-services workers to find out how they were coping with client-related stressors (Maslach & Jackson, 1981). The human-services workers used the term burnout and indicated that they experienced feelings of exhaustion. They had developed negative attitudes toward their clients, and frequently felt that they lacked the professional competence needed to help their clients (Schaufeli, Bakker, et al., 2009). As an outcome of the interviews, Maslach and Jackson (1981) defined burnout as a syndrome characterized by emotional exhaustion, depersonalization, and a lack of personal accomplishment.

Emotional exhaustion refers to feelings of being emotionally drained by contact with other people, and it is the main strain dimension of burnout. Depersonalization refers to a negative or excessively detached or disengaged response toward the people who are the recipients of one's service or care. Finally, reduced personal accomplishment refers to a decline in one's feelings of competence and successful achievement at work (Maslach & Jackson, 1981; Maslach & Leiter, 2008).

Although research has confirmed that burnout is a slow process of progressive loss of energy and enthusiasm (Alarcon, 2011; Demerouti & Bakker, 2008; Maslach & Leiter, 2008; Maslach & Leiter, 2016), the notion that burnout is exclusively found in the human-services area has been rejected, and researchers now have adapted these first conceptualizations of burnout to make it applicable to workers in various occupations, including information technology (Demerouti & Bakker, 2008; Ferratt, et al., 2005; Moore, 2000a, 2000b; Weinert, et al., 2015).

The burnout models discussed in this chapter are shown in Table 1.

Table 1. Burnout Models

Burnout Model Name	Model Description
Conservation of Resources	The conservation of resources (COR) model of burnout proposes that stress and burnout occur when workers perceive a threat to that which they value (resources) (Hobfoll, 2002). That threat may come from work-related demands, the loss of work-related resources (such as unemployment) or the insufficient return of resources following an investment of resources.
Areas of Worklife	This model frames job stressors in terms of person-job imbalances and identifies six areas in which these imbalances take place. The areas are: workload, control, reward, community, fairness and values (Leiter & Maslach, 1999).
Maslach's Three-Dimensional Model of Burnout	This burnout model contends that the three key dimensions of burnout are emotional exhaustion, depersonalization, and reduced personal accomplishment (Maslach, 1982).
Job Demands-Resources	This process model of burnout asserts that burnout occurs when individuals experience incessant job demands and have inadequate resources available to address and reduce demands (Demerouti et al. (2001).

Discussion of the Burnout Models

More recently conceptual models have expanded on theories about job stress, and the notion of imbalances leading to strain. Two developmental models of the demands-resources imbalance are the JD-R model and the Conservation of Resources (COR) model (Halbesleben & Buckley, 2004). The JD-R model focuses on the idea that burnout arises when individuals experience incessant job demands and have inadequate resources available to address and to reduce those demands.

Conservation of Resources Model of Burnout

The conservation of resources (COR) model of burnout follows a basic motivational theory assuming that burnout arises as a result of persistent threats to available resources (Demerouti et al., 2001). When individuals perceive that the resources they value are threatened, they strive to maintain those resources. The loss of resources or even the impending loss of resources may aggravate burnout. The COR model of burnout proposes that stress and burnout occur when workers perceive a threat to that which they value (resources) (Hobfoll, 2002). That threat may come from work-related demands, the loss of work-related resources (such as unemployment) or the insufficient return of resources following an investment of resources (for example, if an employee spends a great deal of time assisting a coworker without any return favor from that coworker). The initial threat to resources is seen as a stressor; however the continued loss or threat to resources, particularly after a great deal of resource investment in work, is said to lead to burnout (Halbesleben & Buckley, 2004; Hobfoll, 1989, 2002). In this way, the COR model extends beyond the notion of stress to increase understanding of how chronic stress develops into burnout (Halbesleben & Buckley, 2004).

A variety of other studies have used the COR framework and found empirical support for the model (Brotheridge & Lee, 2002; Halbesleben & Demerouti, 2005). For example, Halbesleben and Bowler's (2007) study highlights an important strength of the COR model. By specifying the process underlying the investment of resources (that is, when resources become depleted, workers are more careful about the investment of those resources), the COR model provides insights into how burnout leads to such consequences as lower job performance and decreased organizational commitment (Halbesleben & Demerouti, 2005). Grandey and Cropanzano (1999) are among the first researchers to expand COR beyond work roles to examine work-family conflict (WFC). COR theory proposes that "inter-role conflict leads to stress because resources are lost in the process of juggling both work and family roles" (Hobfoll, 1989, p. 352). Moreover, COR allows for predictions about the moderating relationship of individual differences (e.g., self-esteem, positive affectivity, internal and locus of control), which may be viewed as resources. Another study that built on the COR model of burnout is the Areas of Worklife model of burnout.

Areas of Worklife Model of Burnout

A different variation of an imbalance model of burnout is the Areas of Worklife (AW) model, which frames job stressors in terms of person-job imbalances, or mismatches, and identifies six key areas in which these imbalances take place: workload, control, reward, community, fairness, and values (Maslach & Leiter, 1999). Mismatches in these areas affect an individual's level of experienced burnout, which in turn determines various outcomes, such as job performance, social behaviors, and personal well-being. The greater the mismatch between the person and the job, the greater the likelihood of burnout; con-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

versely the greater the match, the greater the likelihood of engagement. Initial empirical support for the AW model has been provided by both cross-sectional and longitudinal studies (Maslach & Leiter, 1999).

Maslach's Three-Dimensional Model of Burnout

The most influential work on burnout was conducted by Maslach and her colleagues in the 1970s (Halbesleben & Demerouti, 2005; Schaufeli, Leiter, et al., 2009). As a result of her research, she found that the three key dimensions of burnout are emotional exhaustion, depersonalization, and reduced personal accomplishment (Maslach, 1982). Emotional exhaustion refers to feelings of being overextended and depleted of one's emotional and physical resources. Depersonalization refers to a negative, callous, or excessively detached response to a variety of aspects of the job. Reduced personal accomplishment refers to a decrease in feelings of competence or productivity at work (Demerouti, et al., 2001; Halbesleben & Demerouti, 2005; Schaufeli, Leiter, et al., 2009).

The significance of this three-dimensional model is that it clearly places the individual strain experience within the social context of the workplace and involves the person's conception of both self and others (Maslach, 2003; Maslach & Leiter, 2008).

Job Demands-Resources Model of Burnout

Demerouti et al.'s (2001) JD-R model is a revised conceptualization of job burnout that extends beyond human services workers into the corporate environment. Their model proposes that burnout is a process in which exhaustion and disengagement are separate but correlated factors that are invariant across sample work populations in different types of occupations (Demerouti, et al., 2001). In the JD-R model, burnout develops when job demands are high and job resources are limited. Job resources refer to those physical, social, or organizational aspects of the job that may: (1) reduce job demands and the associated physiological and psychological costs; (2) be functional in achieving work goals; or (3) stimulate personal growth, learning, and development and are negatively related to burnout (Bakker, Demerouti, & Verbeke, 2004; Bakker, et al., 2007). Job resources either play an intrinsic motivational role because they foster employees' growth, learning, and development, or they play an extrinsic motivational role because they are instrumental in achieving work goals. Job demands require effort and are associated with psychological costs, like burnout (Demerouti, et al., 2001; Halbesleben & Buckley, 2004). In short, job demands predict work exhaustion and job resources predict disengagement (Halbesleben & Buckley, 2004).

The JD-R model is shown in Figure 2.

In the JD-R process model of burnout, burnout has two key dimensions: (1) exhaustion, which resembles traditional stress reactions that are studied in occupational stress research such as fatigue, job related stress and anxiety and attitudinal and behavioral outcomes such as turnover intention and absenteeism and (2) disengagement which is described as a "specific kind of withdrawal or mental distancing from recipients…which may manifest itself as alienation, disengagement or cynicism concerning the job and the work role" (Demerouti, et al., 2001, p. 500). Table 2 describes the two dimensions of burnout as conceptualized by Demerouti et al. (2001).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Job Demands-Resources Model of Burnout (Schaufeli & Salanova, 2014)

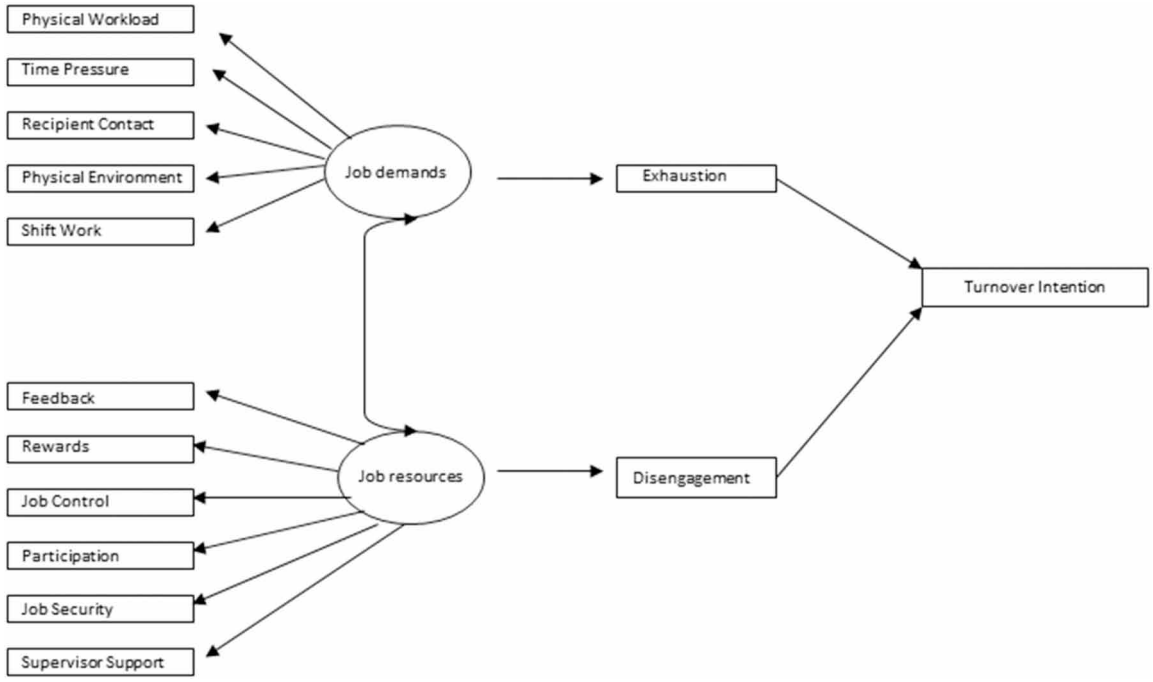

Table 2. Demerouti et al.'s two-dimensional burnout model

Burnout Dimension	Description
Exhaustion	This component refers to general feelings of emptiness, overtaxing from work and a strong need for rest and a state of physical exhaustion (Demerouti et al, 2001).
Disengagement	This component refers to "distancing one's self from the object and content of one's work and to negative, cynical attitudes and behaviors towards one's work in general" (Demerouti et al, 2001, p. 503).

The Oldenburg Burnout Inventory (OLBI) was created by Demerouti et al. (2001) and can be used in virtually every occupational context. This instrument overcomes a major psychometric shortcoming of the Maslach Burnout Inventory (MBI) and the MBI-GS, namely, the one-sided wording of the items (Demerouti & Bakker, 2008). The OLBI includes two dimensions: work exhaustion and disengagement. Work exhaustion is defined as a consequence of intensive physical, affective, and cognitive strain as a long-term consequence of prolonged exposure to certain demands. The OLBI covers not only affective, but physical and cognitive aspects of work exhaustion. This makes it more applicable to those workers who perform physical work and to those whose job is mainly about processing information, especially because there is something more related to feelings of exhaustion than just emotions—even in the service sector (Demerouti, et al., 2001). Over two decades of research on burnout have identified a plethora of organizational risk factors across many occupations in various countries (Maslach, et al., 2001). Six key domains have been identified as mentioned earlier: workload, control, reward, community, fairness sand values. The first two are in the JD-R model.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Indeed, for many IT professionals, interaction with software and hardware is more central to their work than interaction with other people (Pawlowski, Kaganer, & Cater III, 2004). Therefore, in the case of burnout in IT professionals, researchers emphasize that it is unwise to draw upon the burnout literature without first gaining a better understanding of burnout as it is understood and experienced specifically within the IT context (Pawlowski, et al., 2004). Additionally, more recent studies contend that IT environments are so complex that there are many other factors that potentially influence burnout, turnover intentions and turnover.

Employee Engagement as the Positive Antithesis to Burnout

An important development, at the beginning of the 21st century, has been that researchers have tried to broaden their understanding of burnout by expanding their attention to include its positive antithesis. This positive state has been identified as "engagement". Employee engagement is a key business driver for organizational success, is a complex concept and is influenced by many factors in the organization, such as culture, communication, and leadership (Kumar & Pansari, 2015; Maslach & Leiter, 2016). More importantly, research has suggested that engaged employees are more likely to be productive, remain with their current employer and interact positively with customers (Chalofsky & Krishna, 2009; Saks, 2006).

Although there is general agreement that engagement with work represents a productive and fulfilling state within the occupational domain, there are differences in its definition (Maslach & Leiter, 2016). For some researchers, engagement is considered to be the opposite of burnout and is defined in terms of the same three dimensions, but the positive end of those dimensions rather than the negative. By implication, engagement is assessed by the opposite pattern of scores on the three MBI dimensions (Maslach & Leiter, 2016). From this perspective, engagement consists of a state of high energy, strong involvement, and a sense of efficacy (Maslach & Leiter, 1999). In another definition, engagement is defined as the cognitive, emotional, and behavioral energy an employee directs toward positive organizational outcomes (Shuck & Reio, 2014). In yet another study, work engagement is a persistent, positive affective-motivational state of fulfillment that is characterized by the three components of vigor, dedication, and absorption (Bakker & Schaufeli, 2008). In this view, work engagement is an independent and distinct concept, which is not the opposite of burnout although it is negatively related to it (Maslach & Leiter, 2016). The Utrecht Work Engagement Scale (UWES) was developed to assess this positive state, and extensive research has been carried out in the last decade (Bakker & Schaufeli, 2008).

Since the turn of the century, work engagement has emerged as the opposite of burnout, namely a state of mental energy (Schaufeli & Salanova, 2014). From a scientific point of view, the emergence of work engagement has been fostered by the rise of positive psychology, which studies human strength and optimal functioning (Harju, Hakanen, & Schaufeli, 2016; Pfeffer, 2009; Schaufeli & Salanova, 2014). The intention of the positivist approach is to re-direct the focus of the traditional psychology field towards the building of positive qualities and valued subjective experiences reflected in the individual's experiences of well-being, contentment, and gratification (with the past), hope and optimism (for the future), and flow and happiness (during the present) (Van Heerden, 2015). Like burnout, engagement was first used in practice in business settings by human resources professionals and consultants because an organization's mental capital, that is, the cognitive and emotional fortitude and strength of its employees, is of increasing economic significance (Van Heerden, 2015). For modern organizations, employees' mental fitness rather than their mere physical fitness provides a decisive competitive advantage (Rothmann, 2008; Schaufeli & Salanova, 2014).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Employee Engagement and Work-Related Well-Being

Whereas research on burnout has produced thousands of articles during the past three decades, research on employee engagement has recently started to take shape. Because modern organizations expect their employees to be proactive and show initiative, take responsibility for their own professional development, and be committed to high quality performance standards, it only makes sense that the focus on engagement is growing. In the engagement literature, researchers continue to confirm that engagement also can make a real difference for employees and may offer organizations a competitive advantage (Bakker & Schaufeli, 2008). Overall, research has reliably demonstrated that organizations will positively benefit from the development of high levels of employee engagement. Thus, engagement is good for the organization (Shuck & Reio, 2014). The emotional well-being of employees and their satisfaction with their work and workplace affect citizenship at work, turnover and performance (J.K. Harter, Schmidt, & Hayes, 2002).

One area where employee engagement has been studied is as an aspect of work-related well-being. Work-related well-being comprises how employees feel at work (Schaufeli & Salanova, 2014). A greater part of the literature on well-being at work asserts that it is an affective state in which positive feelings occur more frequently than negative ones (Diener, 1999; Taris & Schaufeli, 2015). Further, well-being at work is partially a function of helping employees do what is right for them by allowing them to implement behaviors that positively influence engagement and other positive emotions at work (Harter, et al., 2002). In fact, according to Schaufeli (2012), a promising area of immediate exploration is the identification of the central components within a workplace climate that foster the development of engagement and stimulate well-being. However, engaging employees is just one part of the story. Improving well-being at work implies a more well-rounded approach which focuses on enabling employees to maximize their personal resources (in particular, with regard to creating a healthy work-life balance); creating an organizational structure that enables employees to flourish and take pride in what they do; supporting people to function to the best of their abilities, both as individuals and in collaboration with their colleagues; and producing a positive overall experience of work (Jeffrey, Mahony, Michaelson, & Abdallah, 2014)

Work-related well-being is conceptually grounded in the burnout literature (Maslach & Leiter, 1997; Maslach, et al., 2001; Shuck & Reio, 2014). Iverson et al. (1998) provided a research-based model of individually focused domains of well-being that include the variables of emotional exhaustion, depersonalization, and personal accomplishment. In their well-being model, the three domains represented individual, separate states of well-being rather than subcomponents of a three-component model. As part of their research, Iverson et al. (1998) suggested that employees who experienced negative psychological climates at work were more likely to report higher levels of exhaustion and depersonalization, while those who experienced positive climates reported higher levels of personal accomplishment. For example, employees who experience negative emotions as a result of their work, such as a lack of peer or managerial support, or feeling that their work is taken for granted, are far less likely to experience positive emotion (Shuck & Reio, 2014). These experiences at work are likely to influence a person's sense of psychological well-being (Shuck & Reio, 2014).

This section focused on how an employee's experience of work can positively or negatively affect their well-being. The need for new research on IT turnover has been called for, but much of the literature continues to conduct similar studies using the same search categories, and finding similar results (Lo, 2015).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

RECONCEPTUALIZING THE MODEL ON JOB BURNOUT AND TURNOVER INTENTIONS: A HOLISTIC APPROACH

The study of well-being suggests that organizations are interested in it because of its impact on organizational outcomes, such as job satisfaction, engagement, organizational commitment and turnover intentions (Rothmann, 2008; Shuck & Reio, 2014). In fact, workplace well-being has been recognized as a fundamental characteristic of successful organizations, contributing to desirable results such as retention and increased performance (Harter, et al., 2002). Additionally, employees' expectations about the workplace are expanding, with many people looking for work that provides opportunities for personal development, fulfillment and well-being (Harter, et al., 2002; Jeffrey, et al., 2014; May, Gilson, & Harter, 2004). Employees are increasingly seeking to get meaning, happiness, and social connections from their work in addition to professional learning and development (Harter, 2008).

Job satisfaction, occupational stress, burnout and work engagement are all important dimensions of the psychological work-related well-being of employees (Wright & Cropanzano, 2000). Well-being could be thought of in terms of different life roles, such as marriage, family, work and housing. Work represents an important context for studying the well-being of individuals, especially because work provides a source of income that impact on various life roles, and because it demands a significant part of an individual's time and energy (Rothmann, 2008). Work also ranks high among the determinants of life satisfaction (Schaufeli & Salanova, 2014). Unfortunately, work-related well-being has frequently been narrowly operationalized as job satisfaction (Rothmann, 2008).

Work-related well-being is of interest because of the practical and scientific interest in employee feelings at work (Schaufeli & Salanova, 2014). Historically the interest in employee feelings was solely intertwined with stress and was often defined as a physical, mental or emotional response to events or demands that cause bodily or mental tension (Maslach & Leiter, 2016). Repeatedly, studies have shown that job stress is an important factor in an employee's overall commitment, job satisfaction and decision to leave their job (Sethi, Barrier, & King, 1999). And, the research has demonstrated time and again that the organization's environment influences the psychological well-being of its employees and, as a result, the health of the organization (Vivian & Hormann, 2015). The introduction of well-being into the conversation about work expands the discussion of work to include employees' emotions. And emotions are a topic that employees are often encouraged to stay away from while at work.

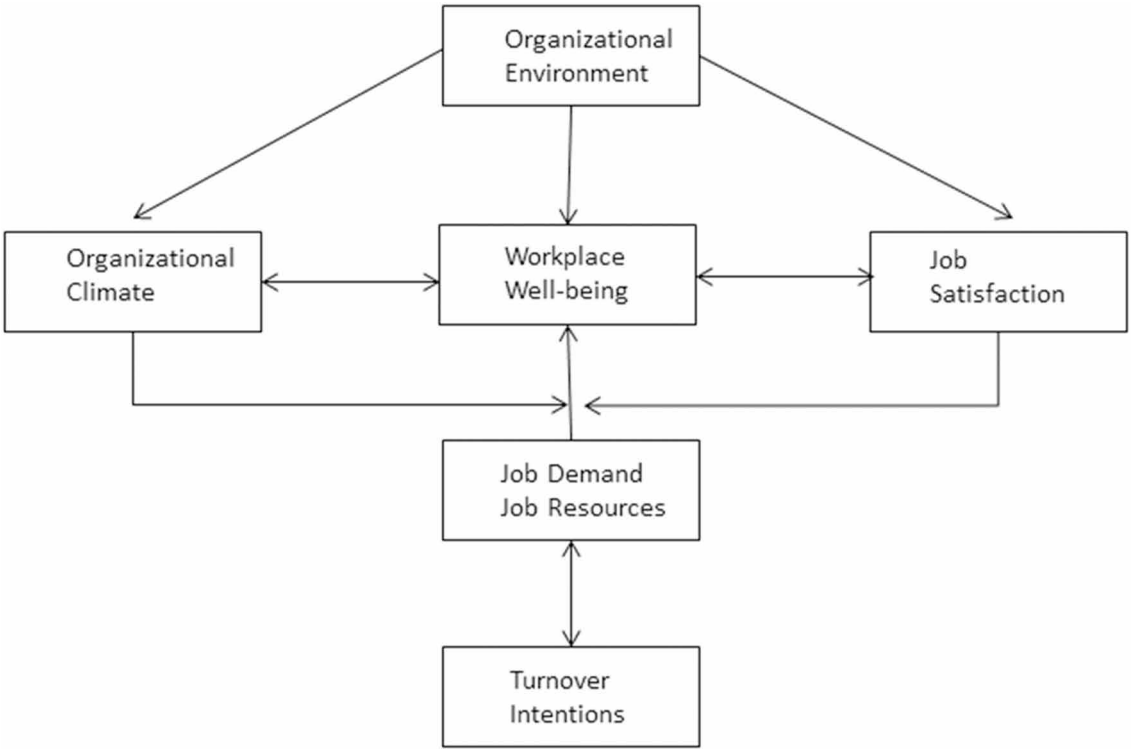
Well-being also plays a central role in creating thriving societies and focusing on well-being at work presents a valuable opportunity to benefit societies by helping workers to feel happy, competent, and satisfied in their roles (Jeffrey, et al., 2014). The evidence also shows that people who achieve good standards of well-being at work are likely to be more creative, more loyal, more productive, and provide better customer satisfaction than individuals with poor standards of well-being at work (Chalofsky & Krishna, 2009; Jeffrey, et al., 2014). For decades, organizations have tried to foster these qualities through employee engagement strategies; however, the evidence demonstrates that engaging employees is just one part of the story (Jeffrey, et al., 2014). Improving well-being at work requires a more holistic approach, which focuses on helping employees to:

- Strengthen their personal resources.
- Flourish and take pride in their roles within the organization.
- Function to the best of their abilities, both as individuals and in collaboration with their colleagues.
- Have a positive overall experience of work.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3 depicts a revised model of job burnout and turnover intentions. In the authors' prior study, the model's focus was solely on the dimensions of burnout and the relationship to turnover intentions. This new, revised model suggests that an individual's physical workplace, organizational climate and job satisfaction are all a critical part of their well-being at work. Thus, well-being is at the center of the model. As job demands and resources change, the employee's emotional state is affected as well.

Figure 3. Revised Model of Burnout and Turnover Intentions to Include Well-being



The value of research on employee well-being is that it takes a rounded view of an employee's work experience to create a state of well-being. Historically, employees have been told that feelings and emotions have no place in the workplace. However, new and growing research supports the notion that people have feelings about work at work, and that these feelings matter because they affect psychological well-being (Maslach & Leiter, 2016; Schaufeli & Salanova, 2014). Hence, issues of well-being have never been more important than they are today (Wright & Cropanzano, 2000). Up until now, the literature has largely ignored taking a holistic view and approach. Burnout and engagement researchers should focus on linking these concepts in the context of a extending the conceptualization of well-being. In Kahn's (1990) seminal work, he talks about bringing the whole self to work. If this is true, then a holistic model is what is required to advance the research—looking at the whole person at work—including emotions.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

FUTURE RESEARCH DIRECTIONS

The research discussed in this chapter demonstrates that quite a bit is known about the standalone concepts of burnout and its dimensions, turnover intentions, and turnover. Since burnout and engagement may have significant consequences for individual employees and organizations, many studies have focused on the antecedents of both concepts. Which conditions in the work environment should be targeted to prevent burnout and encourage engagement? Why are some employees prone to burnout or engagement more than others? Which of these states trigger turnover intentions and possibly turnover? These are all interesting questions for new research.

Future research also should seek to validate the revised framework in this chapter and further understanding of turnover intentions, turnover and their relationship to work-related well-being. Research on turnover as an unintended consequence of seemingly positive organizational life is another interesting research direction. The authors' future research aims to explore work-related well-being in this extended framework and how leadership might facilitate and influence work-related well-being.

Leadership is viewed as one of the "single biggest factors contributing to employee perceptions in the workplace and workforce engagement" (Wang & Walumbwa, 2007, p. 399), which makes it a potentially influential moderator of the relationship between time demands and employees' well-being. Accordingly, Bakker and Demerouti (2007) summarize studies showing that the quality of the relationship with one's leader, leaders' appreciation, support, or effective feedback may act as moderators between high job demands and employees' well-being. Building on these considerations, the authors propose that specifically leadership style is a potential moderator variable that warrants further study.

The authors also included trends and issues that are facing IT professionals in the current work environment in this chapter. One example is the issue of how to address the loss of knowledge that occurs when workers retire is a pressing one that deserves further study. Another interesting question for research is how to address the ubiquitous nature of technology. With all of the convenience that technology access has brought, unintended and often counterproductive consequences have emerged. New and interesting insights will be gained from exploring these consequences and their relationship to burnout, engagement, turnover and overall employee well-being. The fear of becoming obsolete is a real issue for IT professionals. The pace of technology change is making it difficult for IT workers to bridge the skills gap and remain competitive. Future research could identify new and creative strategies for addressing the skills gap.

A final research area is a question about the uniqueness of IT professionals. Lo (2015) asked the question and the authors agree that it is a valid one regarding whether IT workers really are unique. And if they are, in what aspects are they different from other knowledge workers? Future research is needed to confirm whether IT professionals are truly unique and if so, how will approaches to improve IT retention rates be different?

CONCLUSION AND RECOMMENDATIONS

The focus in this chapter was examining two components of well-being: employee engagement and burnout and their relationship to turnover intentions and turnover. Based on the literature, burnout is an important concept because it predicts significant outcomes like turnover and turnover intentions for employees and organizations. On the other hand, research has linked employee engagement to higher

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

rates of profitably, growth, increased staff performance, decreased staff turnover, and improved well-being, and is considered to be an important business driver for organizational success (Rothmann, 2008; Schaufeli & Salanova, 2014; Wright & Cropanzano, 2000). A significant finding in the research is that in workplaces that are set up to nurture well-being, people tend to be more creative, more loyal, more productive and generally perform better (Jeffrey, et al., 2014).

The studies examining IT turnover have helped to cultivate this research stream. This chapter's review of the literature shows that some areas of research have matured, but other domains have yet to be explored. Key findings from the research on turnover and the turnover intentions of IT professionals assert that variables, such as job satisfaction, organizational commitment, and role stress are among the factors that cause IT professionals to leave their organizations (B. L. P. Chang, 2002; C. L. Chang, 2010). Moore (2000a) contends, however that many more factors, some that are related to the work environment and some that are related to the individual, influence an employee's commitment to the organization, and satisfaction with his or her job. Moore's study was completed nearly two decades ago, but the predictions are even more relevant today.

Recommendations

The present research also has a number of important implications for practice. As organizations become more complex and global, and demands on workers increase, fostering employee well-being could help to alleviate IT turnover by addressing key affective aspects of work life. Employees feel different at work, and these feelings matter. In this chapter, three aspects of employee well-being were discussed: burnout, exhaustion and engagement. These symptoms, which can be seen as psychological responses to overstimulation at work, represent the inability and the unwillingness to expend effort, respectively (Schaufeli & Salanova, 2014). Burnout and exhaustion are two negative patterns of employee well-being at work. What preventive strategies can organizations use to prevent burnout, curb turnover and improve well-being at work?

Robak (2013) stressed that in order to appropriately address turnover, organizational leaders must learn to face the truth about it. First, not all employees who leave an organization are unsatisfied. Some employees will leave because of low morale or due to any number of reasons (Robak, 2013). Others will move away, quit because of family concerns, change professions, even start a business of their own or retire (Robak 2013). So, staying vigilant and focused on employees is a way to stay in touch with what is happening with staff and understanding when organizational interventions are necessary. In any case, retention strategies that organizational leaders implement should focus on addressing issues that are within their control. These strategies include opportunities for promotion, creating a flexible work environment and competitive compensation. Other things that may be put in place to assist with employee retention are ongoing training/education/exploration to allow IT workers to keep up with current technologies. Additionally, interactions between IT workers and leadership may impact turnover.

Another reason employees might leave their jobs is to take jobs that allow them to reduce their commute or to work at home. Hence, one recommendation is to enact policies that allow opportunities for employees to take advantage of flexibility through telework. Additionally, providing individuals with regular opportunities to talk about their preferences about working hours with their managers and regular assessment of how working hours fit with individuals' home lives may present a sensible way to nurture well-being through work-life balance (Chen & Karahanna, 2014; Jeffrey, et al., 2014; Reyt & Weisenfeld, 2015). Having an appropriate work-life balance is extremely important when attempting to foster well-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

being at work. Employees who feel they have achieved this balance are shown to feel less stressed, and are likely to feel more satisfied at work, which suggests that getting the work-life balance right is likely to reduce stress and increase positive attributes, such as creativity and productivity (Jeffrey, et al., 2014).

From a global perspective, knowledge workers and IT professionals have become accustomed to new ways of working, playing, and communicating. Mobile devices and applications allow people to be alerted for every incoming phone call, text message, instant message, email, calendar event, status update notification from social networking sites like Twitter and Facebook, breaking news, and so on (Reyt & Weisenfeld, 2015). As a result, technologies create an ongoing stream of disruptions. To deal with burnout and work exhaustion due to the 24x7 connectedness, a strategy that organizations can implement includes safeguarding the boundaries between home and work by making sure that as much as possible employees are encouraged to disconnect after working hours.

A strategy for addressing the fear of obsolescence is to institute methods for improving job security via job design. Research shows that job security is also an important variable in employee well-being in terms of job design. Studies completed throughout the last three decades demonstrate that job insecurity – specifically the prospect of job loss – is associated with reduced overall and job-related well-being, even after controlling for job-related and personal factors (Jeffrey, et al., 2014). Minimizing job insecurity wherever possible is a key recommendation. Also, providing clearly defined job roles and expectations that are discussed and formalized can help in this area. In cases when ensuring job security is not possible, being transparent in communications with staff is important. Doing so will allow employees whose jobs are at risk to plan for the future.

The workplace is constantly changing and organizational leaders must rise to the challenge to ensure that employees fare well. In this chapter, the authors discussed the burnout process, work exhaustion, work-related well-being, current technology issues in the IT context, and preventing or alleviating IT turnover. Finding the balance of scientific rigor and practical application is essential for maintaining the active participation of employees and organizational leaders necessary to gain a greater understanding of these phenomena and an ability to deal effectively with them. As a final note, the authors contend that workplace well-being is a good thing. It is good for IT professionals—the group of interest in this chapter. Hence, IT professionals, their families, communities, and organizations can benefit from improved well-being and as an outcome reduced turnover rates. Additionally, it is the hope of the authors that organizational leaders take the notion of well-being to heart and become inspired to find innovative ways to nurture their employees' well-being as part of the effort to retain them.

KEY TERMS AND DEFINITIONS

Employee Engagement: Refers to the extent to which employees feel enthusiastic about their work, are committed to the organization, and put forth discretionary effort as it relates to their work.

Information Technology Professionals: Workers in a technology services organization, whether it is a standalone organization or an internal department.

Job Burnout: Burnout is a psychological syndrome that results from prolonged exposure to stressors in the workplace.

Job Demands: Aspects of a job that require continuous physical or emotional effort. Examples of demands are workload, job pressures, and emotional demands.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Job Resources: The tools, materials, and other assets that an employee can draw on at work. Examples of resources include management and peer support, training, and so on.

Turnover: The voluntary termination of employment from an organization.

Turnover Intention: Turnover intention refers to an employee's deliberate and conscious goal to look for a new job or to leave a current job.

Workplace Wellbeing: Wellbeing refers to all aspects of work life, including how employees feel about their work, their work environment, and the absence of chronic job stress and strain.

Chapter 89
Innovation Through Diversity and Inclusion:
A Roadmap for Higher Education Information Technology Leaders

Brenna Deanne Miaira Kutch
Portland State University, USA

Juliana Sayumi Miaira Kutch
Portland State University, USA

ABSTRACT

IT leadership involves technology, but it is mostly about people. This chapter discusses how organizational diversity has a critical impact on innovation and the role of leaders to create an environment where everybody feels a sense of belonging and where all kinds of people can flourish through safety, awareness, hiring, mindsets, and listening. Leaders are sometimes unsure how to achieve a more inclusive culture. This chapter provides research, definitions, details, and actionable recommendations for change so that leaders can create an organization where diverse employees can thrive and innovate for the benefit of the university and its community.

INTRODUCTION

University employees help create the next generation of innovators, researchers, and explorers. However, not all departments have the same focus. Higher education information technology (IT) has historically been focused on operational excellence, efficiency, and "doing more with less" while often leaving activities related to exploration and innovation to researchers and academic departments.

But just as universities as a business model start to struggle (Fain, 2017), IT is starting to reinvent itself to become a strategic partner (Gates & Cheverie, 2017). Ubiquitous, easy-to-use, and quickly changing consumer technology raises expectations of students, faculty, and staff regarding technology

services offered by the university. The struggle for IT leaders is how to deliver innovative solutions, help the university navigate change, and meet rising expectations in the context of dwindling budgets and declining enrollment.

This chapter will focus on the ways diversity can contribute to innovation, and examine the particular role that IT leadership plays in making these departmental culture efforts toward innovation, with recommendations on how to start creating and sustaining positive organizational diversity in an IT department. First, some background on diversity and inclusion will be explored; second, detailed information about psychological safety and growth mindsets as they relate to innovation; and lastly, the role of IT leadership in creating an inclusive environment in which innovation can thrive. Most of the existing literature tends to be applicable to a variety of industries, without particular focus on universities. In this chapter the authors present the available research and contextualize it for IT leaders in higher education.

BACKGROUND LITERATURE

Analysis of existing literature on the relation between diversity and innovation shows that while the topic seems particularly popular right now, it has been studied for decades. Diversity proponents defend that more innovative outcomes are achieved through heterogeneous teams incorporating varying points of view. Skeptics of that theory argue that the link between diversity and innovation is not strong enough and that diversity decreases efficiency through an increase in social tension (Mannix & Neale, 2005). To better understand diversity, one must understand the different types (gender, race, age, among many others), how a range of diverse individuals contribute to the group, and how diversity and team environments affect one another.

While there is little research on diversity and its impact on innovation in higher education IT, the following literature review covers research on diversity, innovation, and culture, which the authors connect to IT leaders in higher education.

Types of Diversity

The term *diversity* encompasses a variety of types such as age, ethnicity, gender, cognitive and thinking styles, veteran status, and others (Allegis Group, 2018). These different types of diversity have been grouped in many ways, such as inherent and acquired diversity (Hewlett, Marshall, & Sherbin, 2013); informational, demographic, and diversity in goals and values (Stanford, 1999); and demographic, experiential, and cognitive diversity (de Anca & Aragón, 2018). Similarly to the latter, Gartner groups them in three dimensions of diversity: Legacy, Experiential, and Thought (Logan & Rozwell, 2016). Legacy Diversity is what is traditionally thought of when the word "diversity" is used; these are physical characteristics such as race, gender, LGBTQ+ status, physical or mental disability, et cetera. Legacy Diversity is generally visible and static. Experiential Diversity is comprised of experiences one has in life and includes social identity and behavior, such as job experiences, relationships, and education. Lastly, Thought Diversity looks down to the neurophysiological level, including cognitive styles, emotions, and personality. A diverse range of employees in all of these categories is important to experience the breadth of people, cultures, experiences, and ways of thinking.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

EDUCAUSE's 2016 publication, *The Higher Education IT Workforce Landscape* (Pomerantz & Brooks, 2016), investigates higher education IT demographics. Of note, women make up 40% of the IT staff, 30% of the managers, and only 27% of the CIOs; each of these levels hovers around 85% white (in contrast to the US workforce, 66% white).

Diversity and Organizational Performance

Not just a moral imperative, diversity is a boon to organizations. Diverse organizations are smarter, have better financial returns, higher accuracy, more objectivity, more innovation, and make better decisions (Rock & Grant, 2016). They communicate better (Logan & Rozwell, 2016), understand their customers better (Logan & Rozwell, 2016), have higher commitment among employees in marginalized groups (DelCampo, Rogers, & Jacobson, 2010), and in general have higher performance (Morgan, 2017). Additionally, as the understanding of equity and inclusion issues grows, so does the reputation of organizations that support it; in order to attract and retain top talent, organizations in technology and higher education must commit to supporting diversity (Egen, 2011; Logan & Rozwell, 2016).

Diversity and Team Performance

The effects of diversity on team performance have been studied from multiple angles such as cultural background (Stahl, Maznevski, Voigt, & Jonsen, 2009), different age segments, and genders (Mannix & Neale, 2005). While the results of differences in performance are mixed, the approaches to research help uncover many relevant aspects of the relation between diversity and team performance.

A more optimistic view, inspired by Hoffman's work in the 1960s, suggests that diverse teams benefit from a broader range of backgrounds and perspectives than homogeneous teams (Mannix & Neale, 2005). Therefore, for tasks with high levels of uncertainty, with changing requirements and unclear outcomes - what Edmondson (2016) describes as "wicked problems" - diverse groups are more able to come up with a variety of strategies, explore different approaches to the problem, and theoretically find a better solution.

On the other hand, the more pessimistic view suggests that diversity creates social divisions, often leading to cultural clashes and poor social integration, thus negatively impacting team performance. This can result in lower retention and lower team cohesion. However, it must be noted that more negative effects were observed in teams with diverse *age* range, while mixed results were observed in teams with diverse genders and races. Also relevant to the understanding of these results is the proportion of minority and majority constituents within a group - skewed groups in which minorities represent only 1% to 15% of the constituents perform worse than more balanced groups (Mannix & Neale, 2005).

Overall, the relation of team performance and diversity has a stronger correlation with the type of activity the teams are performing, rather than the type of diversity within the team. For example, homogeneous (similar) teams tend to perform better when the tasks are related to *exploitation* - activities that focus on convergent thinking, driving up efficiencies, improving on existing processes and knowledge, and with low levels of uncertainty. On the other hand, heterogenous (diverse) teams perform better when the tasks are related to *exploration* – activities related to divergent thinking, experimenting with unknown variables and solutions, and with high levels of uncertainty (O'Reilly & Tushman, 2004). See Table 1 for more examples on exploitative versus exploratory activities.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Comparison of exploitative and exploratory activities (Adapted from O'Reilly & Tushman, 2004, p. 80)

Exploitation	Exploration
Convergent thinking - aims to find the best solution to a given problem	Divergent thinking - aims to create many different solutions to a given problem
Emphasis on efficiency and cost optimization	Emphasis on growth and innovation
Low tolerance for risk and failure	Embraces risk with a high tolerance for failure
Activities related to production, execution	Activities related to experimenting, creating new possibilities
Tends to benefit from homogeneous teams	Tends to benefit from heterogeneous teams

EDUCAUSE explains that higher education IT's role is evolving to be interconnected, mission-focused, agile, and enabled by global technology trends including innovative advancements such as artificial intelligence and cloud computing (Steinour, Ravishanker, Basgen, Scozzafava, & Srinivas, 2018). These attributes, along with others which require innovation, require exploratory type activities, not just exploitative. As exploratory activities are enhanced by diverse teams, IT leaders must learn how to create and sustain diversity in their organizations to benefit the future of their departments and of the university. Simply relying on heterogeneous groups to self-organize and self-direct is not enough to leverage the power of diversity to increase innovation - leaders must take an active role to create a successful collaborative environment where diverse people can thrive, collaborate, and innovate.

Diversity and Innovation

Building on the idea of diversity and team performance, research shows that diversity also has a direct impact on innovation helping companies grow their market share and capture new markets (Hewlett, Marshall, & Sherbin, 2013), achieve better financial returns (Smith, 2017), create more patents (Locker, 2018), increase creativity and improve performance (Forbes Technology Council, 2018), and build resilience and adaptiveness, thus empowering their organizations "to survive and thrive when confronted with unknown and unknowable factors" (Tsusaka, Reeves, Hurder, & Harnoss, 2017).

While most of the research on innovation is focused on S&P 500 type companies, there is growing interest in the subject from leaders in higher education (Aldridge, 2018), particularly IT leaders in higher education (Burrell, 2018). According to EDUCAUSE, 88% of higher education leaders surveyed felt their institution needed to innovate, but 51% do not know how to do it (Morris, 2015). This chapter argues that increasing diversity through intentional leadership and an inclusive culture is one important and often overlooked method to facilitate innovation, as diversity benefits innovation on both individual and organizational levels (Egan, 2011; Logan & Rozwell, 2016; Rock & Grant, 2016).

A report published by Forbes Insights (2011) details a morass of benefits that diversity has on innovation. Below are five of the key findings that relate to this chapter:

1. Diversity is a key driver of innovation and is a critical component of being successful on a global scale.
2. A diverse and inclusive workforce is crucial for companies that want to attract and retain top talent.
3. Nearly all respondents reported that their companies have diversity and inclusion strategies in place.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

4. Responsibility for the success of a company's diversity/inclusion efforts lies with senior management.
5. Significant progress has been made to build and retain diverse workforces, but there are still some impediments to companies' efforts.

If 51% of leaders don't know how to innovate, then what are the next steps? Many industry leaders concur that leaders should ensure they are never the smartest in the room, and that they should empower staff to be creative and challenge other ideas (Morgan, 2018). Maybe the question to IT leaders in higher education is not how they themselves should be more innovative, but how to create an environment that fosters innovation from their staff. For that, organizational culture is essential.

The Importance of Organizational Culture

Kochan et al. (2003) present research findings which support that organizational context is essential in determining the effect of diversity on teams. Some of the context variables analyzed were: business strategies (i.e., growth, stability, and customer-oriented), culture (i.e., people or competition orientation), and HR practices (i.e., diversity-focused trainings). The results show that racial diversity was found to negatively impact teams operating in competitive organizational cultures. However, the results also show that these negative impacts can be mitigated by trainings and career development initiatives focused on diversity and inclusion. Furthermore, when the organization emphasizes learning from diversity, the effect is the opposite, with diversity positively impacting team performance. As a consequence, organizations that approach diversity with intentionality and mindfulness and by providing adequate training and environments tend to outperform those that do not.

As discussed above, an explorative culture will favor innovation while an exploitative one will be cost- and efficiency-focused (O'Reilly & Tushman, 2004). In a field of increased competition for shrinking funding, being resource-focused seems like an unavoidable reality in higher education; this is particularly true for IT, a department that did not exist until a few decades ago and now demands significant resources for the daily operations of the university. However, being too cost-focused can lead to a scarcity mindset (passive, reactive, un-inspirational, powerless, and change-adverse), which leads to risk-avoidance (Mrig & Sanaghan, 2017). Instead of battling over resources, leaders should encourage innovation by adopting an opportunity mindset (Mrig & Sanaghan, 2017) and collaborate institution-wide (Burns, Crow, & Becker, 2015). These mindsets must be adopted by leadership and carefully managed to ensure they permeate the department's culture - otherwise, things will continue business-as-usual. IT leaders are paramount to encouraging a culture focused on people, not just technology or resources (Cheverie, 2017; Kelly & Kutch, 2017).

HIGHER EDUCATION IT INNOVATION THROUGH INCLUSIVE ORGANIZATIONAL CULTURE

Up to this point it seems clear that IT leaders in higher education must help create an inclusive organizational culture. As the authors explain below, two crucial aspects of this are psychological safety and growth mindset. Diversity cannot be an integral workplace value (nor provide its benefits) if employees do not feel that they can bring their personal selves to work or feel respected for their differences (Kutch,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

2017). Additionally, an environment with high risk tolerance, including a growth mindset and learning from failure, is essential for exploitation-focused activities that benefit innovation.

Feeling Personally Engaged and Safe to Be One's Self at Work

For innovative ideas to be put forth and grow, employees must feel personally engaged in the work and safe to speak up with new ideas. Kahn (1990) defines personal engagement as "behaviors by which people bring in or leave out their personal selves during work role performances" (p. 692). Employees who are personally engaged can express their "preferred self" in their workplace behaviors, which encourage connections to the work and to colleagues, and in fully performing their role. In an organization that has little diversity and an environment that encourages assimilation or groupthink, many "different" folks may not feel comfortable being their personal selves at work; on the other hand, an environment in which others can bring in their unique selves encourages personal engagement to thrive (see Table 2 for other advantages and disadvantages of high and low personal engagement, respectively). Figure 1 describes the components of this personal engagement: psychological meaningfulness, availability, and safety. While all three components are important, the authors will focus on psychological safety and how it encourages inclusion and innovation.

Table 2. Effects of high and low personal engagement (Adapted from Kahn, 1990)

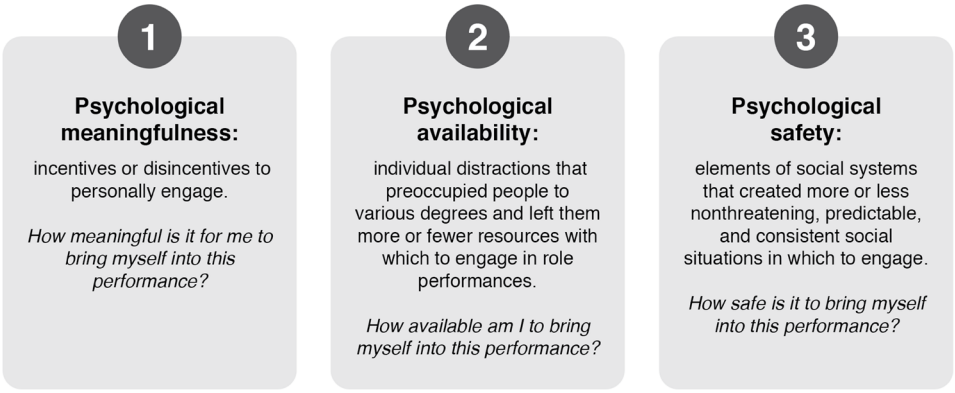
Advantages of high personal engagement	Disadvantages of low personal engagement
Employees express themselves physically, cognitively, and emotionally during role performances.	Employees withdraw and defend themselves physically, cognitively, or emotionally during role performances.
People become physically involved in tasks, cognitively vigilant, and empathically connected to others.	Employees remove personal, internal energies from physical, cognitive, and emotional labors.
Leads to behaviors defined as effort, involvement, flow, mindfulness, and intrinsic motivation.	Leads to behaviors defined as automatic or robotic, burned out, apathetic or detached, or effortless.
Employees can express their real identity, thoughts, and feelings. This leads to personal voice, emotional expression, authenticity, non-defensive communication, playfulness, and ethical behavior.	Employees feel they must hide their true identity, thoughts, and feelings during their work. This leads to defensive, impersonal or emotionally inexpressive, bureaucratic, self-estranged, and closed behaviors.
Personally engaging means connecting one's self to the role in ways that display what one thinks and feels, one's creativity, beliefs and values, and personal connections to others.	Personally disengaging means uncoupling self from role and performing tasks at some distance from one's preferred self, which remains split off and hidden. Roles are performed as external scripts. Acting as custodians rather than innovators.

Psychological Safety Is Essential for Inclusion

One very important way to create a culture that supports "being different" is through psychological safety. While this term has many definitions, Gartner (Leow, Golluscio, & Mann, 2018) defines it as "making coworkers and team members feel that they will not be punished or humiliated when taking interpersonal risks, such as asking for help, admitting mistakes and vulnerabilities, or expressing concerns." These behaviors help others feel a sense of belonging and inclusion, whereas being rejected or mocked will cause feelings of exclusion.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Components of personal engagement (Adapted from Kahn, 1990, p. 703)



What Does a Psychologically Safe Environment Look Like?

Psychological safety requires an environment where people can risk self-expression and engage "the processes of change" (Kahn, 1990, p. 708). A psychologically safe environment promotes trust; is predictable, consistent, clear, and nonthreatening; requires supportive and trusting interpersonal relationships; gives employees control over their work; and requires supportive managers who allow employees to try and fail without fear of repercussions (Kahn, 1990). "Safety is built on trust, respect, and being ready, able, and willing to connect. It is inviting people to open up, be authentic, because they are safe. They are accepted as they are. People believe that their peer's intentions are good and there is no need to be protective or careful around the group. They can venture beyond the narrow-minded protection of the Ego. The space is more 'we' than 'me'" (Bremer, 2018, Kindle Location 5155).

Table 3. Leadership behaviors affecting psychological safety (Adapted from Edmundson, 2004)

Encourages Psychological Safety	Discourages Psychological Safety
Available and approachable: Reduces perceived barriers to discussion.	**Authoritative or punitive:** Others feel that opinions are neither welcomed nor valued.
Inviting input: Others feel that opinion is respected; can also be a positive example of active participation.	**Input discouraged**: Others less likely to express their opinions, fearing potential negative consequences. Discouragement can be verbal or consist of more subtle behaviors.
Modeling openness and fallibility: Others are more comfortable admitting their own mistakes; reduces counterproductive barriers created by status differences.	**Taciturn, mistakes not admitted**: Indicates that certain matters are best not discussed; others will follow their example and not admit to mistakes.

How Does Psychological Safety Benefit Innovation in Higher Education IT?

Innovation challenges are common to many higher education IT organizations, which involve uncertainty and risk management; a few popular examples include modernization of the enterprise resource planning (ERP) system (Riddell & Eide, 2016), learning management system (LMS) (Pomerantz & Brooks, 2017), and disaster recovery (DR) solutions (Joch, 2016). How will the change in ERP affect

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

downstream processes across all campus departments? How will an LMS migration impact integrations and instructors? Is the cloud an ideal DR solution for the institution? If so, which cloud platform should be used and how will the department manage the transition? These problems require a psychologically safe environment to work out better solutions when no single solution exists to satisfy every stakeholder.

Psychological safety is important for seeking help, spanning boundaries, seeking feedback, and speaking up about errors and concerns; it also leads to innovation by enabling risk-taking and a willingness to suggest new ideas without fear of embarrassment (Edmondson, 2004). By creating a psychologically safe environment, leaders are saying it is okay to create and fail, and must model that behavior themselves. An environment in which differences are seen as fertilizer for innovation encourages employees to have those differences. It reinforces that folks who may be different should still feel a sense of belonging and to thrive with their whole selves, instead of feeling like they should hide their differences. This suggests that if a team member who is part of an underrepresented group (of which there are many in higher education IT) has an idea, they will be more likely to share this idea if they feel psychologically safe (Pomerantz & Brooks, 2016). In fact, Grant and Sandberg (2016) in their book *Originals: How Non-Conformists Move the World* say that 85% of bold ideas are never mentioned due to embarrassment of failure or ridicule. If underrepresented and marginalized people are socialized from an early age to stay quiet and avoid a higher instance of doubt or skepticism due to their status, think of the incredible amount of ideas that are going unmentioned due to their status as a member of those groups. Recognizing this and creating a culture that encourages those folks to feel safe and speak up is the job of the CIO and/or other IT leaders in higher education (K. Kelly, personal communication, October 16, 2018).

Psychological safety is not only important for generating new ideas, but for adopting them as well. Old processes are often deeply ingrained into an organization and the muscle memories of its employees. Edmondson, Bohmer, and Pisano (2001) find that psychological safety fosters learning behavior in work teams. Technology implementation requires experimentation and seeking help, which involve interpersonal risk. A psychologically safe environment wherein well-intentioned interpersonal risks are not punished encourages people to voice concerns, ask questions, and experiment - all of which will support the collective learning process necessary for changing routinized behaviors.

Growth Mindset

Higher education is an environment of learning and growth, and psychological safety is an essential partner with Carol Dweck's (2006) extensive research and book on growth mindsets. Her research began with observing children's feelings about failure - they saw it not as a defeat, but a challenge and opportunity to learn and grow. She continues to investigate attitudes towards failure and growth, and explains two different types of thinking about failure. Someone with a fixed mindset may avoid challenges, give up easily, ignore constructive negative feedback, and even feel threatened by the success of others. On the other hand, someone with a growth mindset will embrace and persist in the face of challenges, accept and learn from constructive negative feedback, see effort as part of mastery, and find inspiration in others' success. An environment in which a growth mindset is encouraged is one that sees "failure" as an opportunity, not the typical discouragement that is all too common.

While higher education by nature tends to be risk averse and "slow to move beyond the status quo" (Aldridge, 2018), Mrig and Sanaghan (2017) state that risk tolerance, including some of Dweck's tenants of a growth mindset, is essential for innovation in higher ed. "Setbacks, failures, and mistakes will be

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

inevitable and how our leaders deal with failures and learn from them will determine their effectiveness and their ability to move their institutions forward" (p. 15).

The EDUCAUSE list of Top 10 IT Issues for 2018 clearly shows the complexity that IT leaders in higher education face on a daily basis. Topics range from "Change Leadership" to "Data Management and Governance," all of which involve a multitude of (possibly conflicting) interests and points of view. In order to navigate such issues, a growth mindset approach is essential as no "out of the box" solution exists that will satisfy every single interested party (Grajek, 2018).

A growth mindset will not thrive in an environment that is psychologically unsafe. How can one learn from and embrace failure if one is ridiculed for that failure? In a psychologically safe environment, even someone with the most fixed mindset can observe others' attitude towards failure and experimentation and begin to adopt some of those behaviors. In the dynamic and fast-paced world of technology, it is impossible to know everything about everything. One must be comfortable with what they don't know almost as much as with what they know so they can collaborate with others to find better outcomes. Organizational attitude towards "failure" and understanding blind spots is an important component of psychological safety, and it is important to have an understanding of growth versus fixed mindsets and how they relate.

Leaders must have a growth mindset when it comes to developing their staff as well - including particular focus on their underrepresented staff - says CIO of Portland State University, Kirk Kelly (personal communication, October 16, 2018). Since many underrepresented groups remain minorities in higher education IT staff and management, managers should envision where employees can be in the future with the right amount of mentoring and development and encourage them, knowing that they are working against systemic barriers (K. Kelly, personal communication, October 16, 2018). This includes being hyper-aware that implicit bias is not unintentionally coming into play by assuming that these employees are not "the right fit" for particular jobs, such as with women in STEM or people from collectivist cultures in leadership roles who do not match the "rugged individualism" persona of the American leader.

SOLUTIONS AND RECOMMENDATIONS: THE ROLE OF IT LEADERSHIP IN CREATING SAFETY, INCLUSION, AND ORGANIZATIONAL DIVERSITY

It is apparent that sustaining diverse employees in a psychologically safe environment is a key factor in encouraging innovation. However, this is not as simple as hiring underrepresented minorities. Infusing organizational culture with inclusive and caring mindsets is difficult. Below are tactics that IT leaders can utilize in their own departments and institutions to create an environment that encourages inclusion and innovation. In this section, the authors also include examples of implementation from their current institution, the Office of Information Technology (OIT) at Portland State University (PSU). OIT employs a variety of strategies to cultivate an inclusive organizational culture.

Make Technology Leadership About People, Not Technology

IT leadership isn't about inanimate machines and software - it's about people and culture, and leading innovation is no different. In fact, a Gartner survey shows that 80% of IT leaders believe that the skills and knowledge their organizations will need in 10 years will have little resemblance to today (Robertson et al., 2017). In a decade or two, success will be about adaptation and learning, not using the technology

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

learned in a class. In a time of constant technological growth, where consumer technology is speeding along and morphing regularly and where the demand for innovation is increasing, specific technical skills are not what will determine a successful IT organization - leadership of change, culture, and people is. Success requires a people-first mentality, including developing a people plan; moving from a closed IT department to one that is integrated with the daily life and people of the university; delegating technical management duties to others; and developing a change-ready culture that can adapt to what the future holds (Robertson et al., 2017).

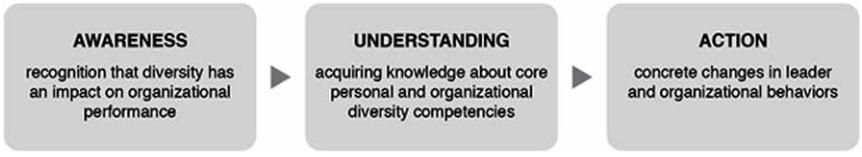
In OIT, "Employees are our number one value" is a saying that employees hear regularly from their CIO and other leadership. While technology may be the purpose of the department, OIT leadership goes to great lengths to let staff know that their experience and engagement are top priority. This includes focusing on an inclusive environment, interpersonal relationships, dedicating staffing resources to organizational culture, and generally focusing on supporting physical and emotional wellbeing via a culture of caring (Kelly & Kutch, 2017).

Champion Diversity and Inclusion

Many universities have Diversity & Inclusion offices, diversity roles in HR, and other departmental positions that manage general campus diversity efforts. As technology has its own challenges (and universities can be very large), a departmental advocate who understands issues around diversity and inclusion in technology can provide valuable insight to the department, such as local hiring challenges for underrepresented groups or online accessibility. However, one person dedicated to the task does not an inclusive environment make. Leadership commitment is the "cornerstone of any successful diversity initiative" (Dreachslin, 2007, p. 152) and the role of the IT leader is to hold diversity as a value for the entire department; otherwise, departmental buy-in will be limited, initiatives will lack the necessary support, and progress will be significantly hindered in this area.

Furthermore, Philips (2018) says that "color blindness is not an effective strategy for dealing with racial differences in the workplace. Rather, our research suggests that acknowledging and highlighting them, along with the related challenges, can go a long way toward kindling relationships." Ignoring differences, and especially the effect that being different has in social and workplace contexts, will only make a less inclusive environment. It is up to leadership to set the stage for acknowledging and embracing differences, and how those differences create stronger and more creative teams.

Figure 2. Becoming an effective leader in the context of Diversity (Adapted from Dreachslin, 2007, p. 153)



In OIT, leadership believes that there must be a sense of ownership by IT leadership towards diversity and inclusion in addition to the central Office of Diversity and Inclusion (K. Kelly, personal communication, October 16, 2018). This manifests in many ways; a few examples include being intentional about

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the gender and ethnicity makeup of leadership teams, dedicating staffing resources to diversity and inclusion initiatives, arranging for trainings such as implicit bias for staff and student employees, and ensuring that position descriptions and announcements are as inclusive as possible to encourage greater diversity and to communicate dedication to inclusion to potential employees. These methods have been effective, as evidenced by new hire diversity and the feeling of inclusion for all staff, which have both dramatically increased over the past few years.

Promote Psychological Safety

Such an environment cannot happen by wishful thinking; like any culture, creating an intentional environment with dozens or hundreds of different humans is far from simple or easy. It is the job of leadership to model, promote, and reinforce a psychologically safe workplace for *all* employees to bring their authentic selves.

First, employees and managers alike must know what psychological safety is, why it is important, and how to create it. Clarity is both an important part of safety (Kahn, 1990) and of communicating expectations. While it may be difficult to initially describe these behaviors, it will provide a reference and guideline for how individuals should act. While technical jargon, acronyms, and performance expectations are often defined and published in a shared space for all technical staff to see (such as an intranet), explicit behaviors or values are defined and communicated far less frequently, yet are more integral to the interpersonal functioning of the department. See Table 4 for examples of explicit behaviors to communicate psychological safety to employees; this concept is based off of "Word Pictures" in the book *Hiring for Attitude* (Murphy, 2017).

Table 4. Examples of explicitly stated behaviors that contribute to safety

Poor	Neutral	High
Safety: Telling coworkers that their ideas are stupid or wrong; rolling your eyes; ignoring or shutting down new ideas by others; getting upset when others express different opinions or challenge your ideas in a respectful manner; making fun of others' emotions.	**Safety:** Participating in conversation but with little enthusiasm; adding new ideas into the conversation; little to no encouragement of others for their ideas; silently letting others express different opinions, ignoring others' emotions.	**Safety:** Being excited about new ideas, building on top of them instead of changing direction to your own; encouraging others to express different opinions or emotions in a respectful way; asking others for their opinions or experiences.
Listening: Talking over others; not listening to their ideas; forgetting what others say even when they have said it multiple times; looking at your computer or phone while they are talking.	**Listening:** Letting others speak but not truly hearing what they have to say; just waiting for your turn to talk; not incorporating their thoughts into your own dialogue; looking at them while they talk but no giving any indication that their words are sinking in.	**Listening:** Setting aside your own thoughts when others are talking; incorporating their opinions or ideas into what you are going to say; making eye contact, nodding, and other active listening cues.
Differences: Telling other people they are wrong if their opinions are different from your own; refusing to change your mind; expecting others to assimilate into the way you want things done; assuming that other cultures or backgrounds are not valid.	**Differences:** tolerating differences but not accepting them as valid; assuming that other cultures or backgrounds should "tone it down" to fit in; letting others speak but not incorporating their alternate opinions or ideas.	**Differences:** Proactively asking others for their different experiences or perspectives; willingly changing your way of doing things if someone else has a better idea; appreciating other cultures and backgrounds even if that means doing something different.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 5 provides ideas from Nembhard and Edmondson (2009) of what leaders can do to promote psychological safety in their everyday interactions with employees. Additionally, leaders should measure and understand levels of safety (through talking to staff and collecting data) and ensure to advertise for this so that new employees understand this cultural expectation.

Table 5. How leaders can promote psychological safety (Adapted from Nembhard & Edmondson, 2009)

How Leaders Can Promote Psychological Safety
• Be aware that those lower in the hierarchy often feel less psychologically safe; just because a leader feels like the culture is safe doesn't mean all employees do.
• Understand that lower hierarchy employees often have valuable front-line perspectives of the department's operations that upper leadership may not have.
• Include others in decisions or discussions in which they might not otherwise have a chance to participate.
• Strongly express both invitation and appreciation for the input of others.
• Be democratic, supportive, and welcoming of questions and challenges.

In OIT, leadership understands the benefit of psychological safety and has made efforts to increase it via leadership development sessions with managers, trainings for all staff that focus on saying yes and listening to others, Crucial Conversations trainings, and soliciting anonymous feedback from staff about the level of safety they feel with their coworkers and managers.

Promote a Growth Mindset

To help reinforce a growth mindset, Dweck recommends complimenting others on their efforts over fixed intelligence attributes. For example, praising a developer for being fast or "smart" incentivizes speed or knowing the answer without trying hard; this can result in doing things quickly, or only doing things that are easy or that they are "smart" at. Working to learn new skills that one is not already "smart" at encourages growth and development. Dweck instead recommends that praise be focused on effort, creative solutions, or trying different options - think of praising iterative improvements and refactoring instead of focusing on a waterfall approach.

Many organizations have some version of "work on a pet project" time, ranging from a certain amount of time each week to a day set aside per year. These innovation days have resulted in inventions such as the 3M's Post-It and Google's Gmail (Pink, 2011). While a university may not be able to provide 20% of each employee's time to "pet projects" as Atlassian does, IT departments can learn from the business world and provide one or two days a year for this activity. In a psychologically safe environment where growth and learning are encouraged, employees can feel okay exploring the topics they care about yet may not get to work on regularly; they can work with others they don't normally interact with, such as team members on a different side of the department, exposing them to different backgrounds and perspectives; and are encouraged to spend time experimenting. This time will help show that a growth mindset is valued, fuel innovation, show employees that their experiences and engagement are valuable, and provide new ideas that will contribute to technological and student success.

In OIT, "AMP Day" is a semi-annual event that was initially spawned by Daniel Pink's Book DRiVE (2011), which focuses on the principles of Autonomy, Mastery, and Purpose - hence the name AMP. This is a day when, as mentioned in the previous paragraph, staff can work on a project of their choice

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(somehow related to the university) that encourages cross-team collaboration, though solo projects are allowed. All staff are encouraged to attend; reserved workspace, activities like stretch or music breaks, and presentations make this a very popular event in OIT.

Acknowledge Bias

Implicit or unconscious bias is the tendency to make unconscious decisions about others based on their association with particular groups, such as race/ethnicity, gender, disability status, and many more. Much research has been done about the effects of implicit bias in the workplace, including interviews, hiring, and discrimination (Jost et al, 2009). Unfortunately, bias comes out when making quick decisions, such as during interview assessments or during conflict (Price & Wolfers, 2007) - situations in which Kahneman (2015) would say our brain is "thinking fast" and bypassing awareness. These deep, unconscious, and often lifelong connections are nearly impossible to eliminate; it takes acknowledgement and practice to interrupt those biases in ourselves or to activate the "slow thinking" parts of our brain that are more conscious, aware, and considerate (Kahneman, 2015). It also requires tact and interpersonal skills to challenge or interrupt these behaviors in others while still providing a safe environment and positive working relationships.

Research has shown that HR trainings focused on diversity and inclusion and bringing awareness to unconscious bias improve outcomes in homogeneous groups. According to Kochan et al. (2003), "when HR practices support the creation of a workforce that has the skills needed to turn diversity into an advantage, diversity is more likely to lead to positive performance outcomes" (p. 7). However, implicit bias is not a problem that can be solved by a simple mandatory training; required trainings can actually correlate with decreased diversity, whereas those that are voluntary have the opposite effect (Dobbin & Kalev, 2016). IT leaders can partner with others on campus (such as the Office of Diversity & Inclusion, communications, or HR) to not only provide trainings, but to figure out how to incorporate equitable and inclusive practices into the daily work and culture of the department. Garner research shows that leaders must practice self-awareness and examine their own biases as well (Rozwell & Rollings, 2018).

In OIT, awareness of the role of bias extends beyond organizing training sessions, though that is an important first step. One way is through trying to address biases that exist in the hiring process and taking action such as changing job posting language (with the input of Textio.com and partners in the Office of Diversity and Inclusion), training hiring committees on bias, and removing unnecessary limitations from qualifications (such as degree requirements). Additionally, OIT has hosted hardware training sessions focused at resource groups to train underrepresented groups in a safe space on the job skills needed to work for the OIT desktop support team.

Proactively Seek Out Varying Perspectives

A willingness to genuinely listen to opposing viewpoints, especially if they are challenging lifelong behaviors, is an important part of creating safety. Another important step is to not just listen when others bring up issues, but to make the effort to seek these issues out. Put in the time and effort to proactively learn instead of waiting for people who are part of these marginalized groups to initiate the topic. Additionally, be aware that many marginalized folks may not want to spend the energy to politely explain something they have likely been explaining or battling for many years. Avoid tokenizing or pressuring

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

employees who do not want to have this conversation, and remember to use the existing resources available, some of which are explained in Table 6.

Diverse perspectives should not be constrained to topics of diversity or marginalization; other topics such as classroom technology, educational policy, or online learning should also be considered. It is important for the opinions of underrepresented minorities to be reflected in business decisions, not just subjects relating to their minority status or inclusion efforts. As student populations are often more diverse than IT staff, these observations can be critical in understanding how to provide technical services to the university and take into perspectives such as cultural responsiveness and accessibility that may have otherwise gone unnoticed.

Proactively seeking out varying perspectives includes an awareness of "groupthink" and being able to find additional viewpoints to avoid this trap. Irving Janis, a leader in Groupthink research, defines this as "a quick and easy way to refer to a mode of thinking that people engage when they are deeply involved in a cohesive in-group, when the members' strivings for unanimity override their motivation to realistically appraise alternatives of action" (Janis, 1972, p. 9). Groupthink acts as a counter to innovation - it encourages individuals to avoid challenging the status quo and rewards thinking like others. While this may seem more harmonious than a group with conflict, it is both detrimental to innovation and to sustaining diversity. However, a group with many differing opinions can be destructive and push folks away if that conflict is not managed well, so IT leaders must be intentional about how this is done. Seeking out diverse perspectives and a willingness to listen will provide a more respectful and inclusive environment for diverse employees, so that the organization can continue to succeed in supporting the university mission. It will also set a good example for colleagues.

Table 6. Examples of how to consciously and proactively seek diverse perspectives

Examples of How to Consciously and Proactively Seek Diverse Perspectives
• Pay attention to the words that are used in social media by marginalized groups to identify themselves (e.g., terms for gender or racial minorities change over time).
• Ensure that trainers and consultants represent a range of diversity; consider hiring someone to come in and speak about equity and inclusion issues in tech or working with the Diversity and Inclusion department to facilitate a training.
• Attend and host events that discuss inclusion and that have a diverse lineup of speakers; ensure that diverse groups speak about technical topics, not just about diversity.
• Know which diversity in tech groups exists in the area and partner with them, such as co-hosting events, sponsoring (e.g., space, food, cash, or A/V), volunteering, or even just advertising to employees.
• Consider seeking out a coach who can provide feedback and recommendations in a confidential setting (Dreachslin, 2007).
• Take a class at the institution or online, such as in civil rights or cross-cultural communication.
• Evaluate the diversity of personal connections; those with diverse personal lives are shown to be more diversity-sensitive than those who do not (Dreachslin, 2007).
• Read books or articles on equality topics such as *Why Are All the Black Kids Sitting Together in the Cafeteria* (Tatum, 2017), how to create gender inclusive events and workspaces for trans and non-binary employees, or websites like ProjectInclude.org that provide a plethora of resources to improving an inclusive workplace. The internet has countless articles, forums, resources, and publications (including through the university library).
• Notice the heterogeneity of project teams, speakers, managers, or forums; there are many diverse experts in higher education and technology who can add valuable insight.
• Play "devil's advocate" to groupthink, and create a safe environment in which staff can challenge beliefs and bring in alternate points of view as well.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In OIT, department leadership is intentional about who is included in providing input or making decisions. This includes seeking diverse perspectives on hiring and project committees, reaching out to those with different backgrounds to solve problems (e.g. incorporating design thinking principles), and ensuring to include introverts in conversations by giving time to reflect and write (such as methods like "brainwriting") before speaking.

Increase Organizational Trust

Trust is an important component of any functioning organization and goes hand-in-hand with safety (Kahn, 1990). Trust can be difficult for marginalized groups who have often experienced colleagues or managers participating in discrimination or being unwilling to listen; however, trust is crucial for their engagement in the work (DelCampo, Rogers, & Jacobson, 2010). Employees must trust that the organization is fair, which ultimately means trusting in its leadership (MacLeod & Clarke, 2009). While creating this environment is imperative for an organization, most employees say they do not trust their management; as trust must first be received in order to be given, leaders must first trust their employees (Brower, Lester, & Korsgaard, 2017). Table 7 covers some of the benefits and attributes of a high-trust organization. Understanding the trust issues that exist in an organization is essential for beginning a positive culture shift that will create a more inclusive environment in which diversity can thrive (Kutch, 2017).

One important component of both trust and innovation is autonomy (Pink, 2011). Micromanaging suggests to employees that they are not to be trusted to do their jobs correctly; unfortunately when managers are promoted for their high technical competency and not trained on good management practices, they do not often know any other way. However, setting and communicating clear goals (not simply assigning tasks), giving employees the autonomy to reach that goal in the way that works best for them, and providing consistent feedback along the way will encourage engagement, productivity, innovation, and trust (Zak, 2017). IT leaders must communicate these principles through the organization to technical managers or their effects will not be felt by all staff. Coworkers are nearly if not as important, as coworker trust has a significant impact on psychological safety as well (Edmondson, 2004).

Table 7. Attributes of high- and low-trust organizations (Adapted from Brower, Lester, & Korsgaard, 2017; Zak, 2017)

High Trust Organization	Low-Trust Organization
• Employees are more engaged, more productive, have more energy at work, collaborate better, and have higher retention. • Employees suffer less chronic stress and are happier with their lives (factors which fuel stronger performance) • Employees feel safe to make mistakes in pursuit of excellence • Employees feel autonomy to think creatively • Organizational climate is understood by leadership • Leadership carefully gives up control • Leadership pushes for needed change • Information is shared and feedback solicited • Leadership is willing to experiment (innovate) and learn • Employee development is an investment	• Employees exert less effort, are less productive, and are more likely to leave. • Management lacks self-awareness • Risk-averse culture • Bottom-line mentality • Leadership ignores discrimination or harassment complaints

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In OIT, leadership knows that trust is complicated and there is no simple solution. Many of the suggestions in this section help build a sense of organizational trust, such as annual one-on-one meetings with the CIO, proactively seeking and responding to feedback, and reporting back on cultural and diversity data. Additionally, leadership has become more flexible with scheduling (e.g., working from home one day a week, encouraging four ten-hour days in the summer to take advantage of long weekends), knowing it is not just important for trust and engagement, but for providing options for a range of employees, such as those with children.

Implement Good Hiring Practices

Hiring managers in particular should be aware of common biases that may exist in their field and consciously ensure they are not falling into these ingrained ways of thinking when making assessments about candidates. For example, a trait such as leadership ability can be judged differently in a woman versus a man, or technical competency differently in a person of color versus a white person. "Résumé tests," which consist of sending out résumés or writing submissions for a variety of jobs with nothing changed but the presumed ethnicity or gender of the applicant, often show great discrepancies in call-backs for marginalized populations (Bertrand & Mullainathan, 2003); similar tests have been done with computer programming as well (Terrell et al, 2017). The results of these tests highlight bias, stereotypes, and assumptions as the hiring managers discount the capabilities of these groups, even if mostly subconscious. Indeed, implicit bias is becoming a known villain for pushing underrepresented minorities out of STEM fields (Williams, 2015).

Position Qualifications

Understanding the historical context of diversity and bias in IT is an important first step for interrupting it. Firstly, higher education itself has historically been a privilege accessible to a majority white population. While segregation practices are no longer legally in place, these roots of higher education have created a lasting effect that benefits white people and supports ingrained systems of oppression. Additionally, poverty and low socioeconomic status disproportionately affect people of color, creating many financial and educational barriers to entering into higher education. Demographically, degrees in computer science have fluctuated over the years, but as of 2018 are still only 18% obtained by women, which was actually a decrease from 2004 (25%) and 1995 (29%) (National Science Foundation, 2017). For these reasons, requiring or preferring candidates with typical technical degrees (e.g., a Bachelor's in Computer Science) will automatically skew preferences towards people who have been more able to acquire such a degree, even if candidates without that certification are just as (or more) qualified.

Employment in the technical field has also historically been for the mostly white, able-bodied, straight, cisgender man. Those who do not fall into this demographic may have had a difficult time entering or staying in the industry, be it from manager bias limiting their career growth, a toxic culture that was too difficult to stay in, or a lack of the education and certifications to get them in the door. Hiring managers should instead focus on abilities rather than years of experience in an industry that many underrepresented groups have been excluded from for many years.

Additionally, the most successful employee is not, actually, just the "smartest" one (Murphy, 2017). A master's degree in engineering or 15 years of experience as a system administrator does not mean someone will be able to learn new technologies, think of or encourage new ideas, create a welcoming

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

environment for new employees, or care about the success of the department and university community. There are many innate attributes in successful employees to assess, while technical knowledge can be trained. A focus on training and mentoring can speak to those with the interest and capacity but low years of experience, and also shows that the organization values the learning process and not just knowledge.

Hiring Committees

When forming a hiring committee, the makeup of the group should be scrutinized. Acquiring a diverse set of committee members is essential for having good representation of the organization and a broad understanding of candidate capabilities. A potentially successful employee is not merely identified by how much technical knowledge the person has. Other attributes are more important, such as emotional intelligence, learning agility, and collaborative skill. A hiring committee should include folks from different teams and preferably, at least one person from outside of the IT department in order to reflect a variety of areas of expertise. Underrepresented minorities should also be included, such as women and people of color. This not only helps to provide multiple perspectives but also communicates information about the organization to the applicant. What does the panel say about the diversity of the department? What type of candidates will be most excited about joining the organization based off of the interview panel?

When selecting committee members, be careful not to tokenize - do not invite an underrepresented individual to the committee so that they may "represent" their demographic's viewpoint on the person. Someone's marginalized status does not mean this person speaks on behalf of all those like them; individuals have valuable perspectives for the committee beyond their demographic status. Also, underrepresented folks possess their own conscious and unconscious biases and aren't necessarily skilled at being aware of them simply because they are part of a marginalized group.

Advertising and Selection Process

Job descriptions, advertisements, and the selection and interview process all leave many opportunities for inequity to sneak in via wording, qualifications, and biased decisions. For example, requiring a bachelor's degree in computer science will exclude many women or groups underrepresented in higher education. A review of the process through the equity lens can help identify possible points of bias. Applicant tracking technology can often be used to review applicant demographics. Understand the target market of advertising locations, and seek out job boards or local groups that cater to underrepresented groups such as women or people of color. Partner with programs that work with placing diverse candidates who are newer to the tech sector such as internship programs or code schools.

Student employees are also an excellent pipeline. Student employee populations can be more reflective of the student body and therefore more diverse than permanent staff, and provide an excellent pipeline of people who are already familiar with the organization (and vice versa). Consider training programs to specifically prepare student employees for staff positions that may be more entry level, so that they may gain experience and grow into other areas of the organization.

In OIT, great care has been given to reducing bias in the hiring process, though this is something that can always be improved upon. As mentioned above, the department has partnered with the Office of Diversity and Inclusion on multiple efforts, such as training managers about bias in the hiring process, specifically in STEM fields. Job descriptions and advertisements have been reviewed through the equity lens and with help from outside sources to ensure they are as inclusive as possible. Hiring

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

committee makeup has changed dramatically - whereas there were commonly committees of 8-10 white able-bodied cisgender men in years past, now committees are kept small and intentionally include a variety of perspectives of underrepresented groups and with various professional backgrounds. OIT has put significant effort into creating an inclusive recruitment and hiring process; partnerships, community best practices, and a willingness to seek out better ways of doing things have all been essential for the improvement process. Because of that, the department has acquired more talent with a variety of backgrounds, has increased innovation, acceptance of different ideas, and the capacity to think about problems in different ways.

FUTURE RESEARCH DIRECTIONS

Little research exists specifically for higher education IT departments when it comes to this chapter's topic, innovation through diversity and inclusion. The authors would like to see further research and/or case studies that focus on how educational institutions are using diversity and inclusion initiatives to drive successful IT leadership, particularly when it comes to innovation. More specifically, the authors recommend case studies of IT departments that have successfully increased the number of underrepresented groups in their staff along with an analysis of organizational culture changes, changes in department performance, and measures of innovative solutions or outputs for the university. These must be measured carefully and intentionally to show correlation between increased diversity, inclusion, and innovation.

CONCLUSION

While the role of the university as a purveyor of information and education remains relevant, in an era of plateauing or declining enrollment, higher education must acknowledge that the way to achieve its goals must change - and technology is often part of that conversation. While IT leadership necessarily involves this technology, it is also largely about people, as they are the ones creating, administering, and interacting with the technology. This chapter has discussed how organizational diversity has a critical impact on innovation. However, it is up to leaders to create an environment where everybody feels a sense of belonging and where diversity (and ideas) can flourish - such as through safety, awareness, hiring, mindsets, and listening. Most people believe in a positive culture, but leaders are sometimes unsure what exactly that means or how to attain it. There is no easy or overnight solution to any culture change, much less a challenge many organizations are facing today; this chapter provides research, definitions, details, and actionable recommendations for that change so that leaders can create a more inclusive organization where diverse employees can thrive and innovate for the benefit of the university and the common good.

KEY TERMS AND DEFINITIONS

Culture: The social norms in an organization that dictate what is accepted behavior, though often not explicitly stated or recorded.

Diversity: In the context of organizations, the state in which many different types of people exist.

Growth Mindset: A state in which people see "failure" as a learning opportunity and believe that humans can continually learn and grow.

Inclusion: The act of including others; a state in which people feel like they belong.

Psychological Safety: An environment in which others feel like they will not be punished or embarrassed when taking interpersonal risks (e.g., asking for help) or making mistakes.

Underrepresented Groups: A group that is less represented in one subset (e.g., employees in a particular sector, such as IT) than in the general population. This can refer to gender, race/ethnicity, physical or mental ability, LGBTQ+ status, and many more. Also referred to as minorities, underrepresented minorities, or marginalized populations.

Chapter 90
Cultural Norms and Expectations Within the Hospitality Industry

ABSTRACT

The business environment differs across nations and throughout industries. The hospitality industry is no different; one managerial approach that functions well in one nation might not be necessarily applicable in another. This suggests that to successfully manage across different countries it is vital that managers acquire the necessary skills to effectively manage employees and guests with different backgrounds and expectations. Hence, the objectives of this chapter are to define and discuss culture and cross-culture management, explain the importance of understanding multicultural perspectives, and discuss the managerial approaches of managing workforce diversity and cultural diversity.

- Define and discuss culture and cross-culture management
- Explain the importance of understanding multicultural perspectives
- Discuss the managerial approaches of managing workforce diversity and cultural diversity

INTRODUCTION

According to the labour migration report released by the British Hospitality Association (2017), up to 23.7% of the UK hospitality workforce market is made up by European nationals, other than British, and 15% are nationals of the rest of the world. The percentage varies based on location, with the highest in London, where the hospitality related workforce come from migrant labour force in proportion of 64%. Moreover, in some businesses the percentage of migrant workers can grow to 98% (National Institute of Economic and Social Research, 2016). As the recruitment needs are constantly growing, and currently a quarter of hospitality related businesses have an average of 38% hard-to-fill vacancies the solution links with the use of the international talent pool. Thus, the success of a hospitality firm relies on the management of both multicultural workforce and multicultural guests. This could be an opportunity as different cultural background could be beneficial to companies in the hospitality industry. However, undoubtedly this can also be a challenge for both managers and operational workers as the differences of cultural background may lead to conflicts, which could damage not only the workflow and the work environment, nevertheless the company image as well. Many issues might be related to communication, they could however be beyond language and might reside in the lack of cultural awareness and sensitiveness to understand the differences in culture.

Meanings of Culture and Multicultural Perspective in Hospitality Industry

"A fish only discovers its need for water when it is no longer in it. Our own culture is like water to a fish. It sustains us. We live and breathe through it. What one culture may regard as essential, a certain level of material wealth, for example, may not be so vital to other cultures" (Trompenaars and Hampden-Turner, 1998, pp:20).

Activity: What does culture mean to you?

The word culture may vary in meaning when used in different contexts; generally, it refers to beliefs, customs, or certain ways of living, which are collective, shared and recognized by people in a given society. It regulates and controls individual's attitudes and behaviours; one culture is not right and the other is not wrong because of differences. Commonly the terminology for culture is applied to ethnic groups or tribes in anthropology for nations and organizations in political science sociology and management.

Numerous experts in the study of this field have strived to devise what they believe would better define the concept of culture. Hofsted (1991), Czinkota and Ron Kanen (1993) and Trompenaars (1993) have demonstrated a common understanding that culture is grounded in religion, languages, economies, values, attitudes, status, social institutions, policies, and customs. Bodley (1994) who worked in the field of cultural anthropology produced a list of definitions of culture constructed based on his analysis of psychological, social, ethnological and linguistic data. Below (Table 1.1) is a summary of Bodley (1994) definitions of culture, which should be taken into consideration from an anthropological perspective.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Definitions of culture

Topical	Culture consists of everything on a list of topics, or categories, such as social organization, religion, or economy.
Historical	Culture is social heritage or tradition, that is to future generations passed on
Behavioural	Culture is shared, learned human behaviour, a way of life.
Normative	Culture is ideals, values, or rules for living.
Functional	Culture is the way humans solve problems of adapting to the environment or living together.
Mental	Culture is a complex of ideas, or learned habits, that inhibit impulses and distinguish people from animals
Structural	Culture consists of patterned and interrelated ideas, symbols, or behaviours.
Symbolic	Culture is based on arbitrarily assigned meanings that are shared by a society.

Source: Bodley (1994)

Activity:

- How would you describe the culture in which you grew up?
- Do you think an individual can change their culture?

According to Bodley (1994) culture is shared, learned and symbolic. This means that culture is a social occurrence that is learnt and implicates subjectively assigned symbolic meanings.

Figure 1.

For instance, the hand sign for "OK" in the USA, used to express that everything is good or agreed has different meaning in other countries: it represents calling a person a homosexual in Russia and Turkey, in Germany means calling a person a lunatic, in Greece it is a symbol for the opening at the lower end of the digestive tract (to which solid waste is eliminated from the body). Hence what is considered to be perfectly acceptable in one country could be perceived as offensive and sometimes confusing in another. The aforementioned examples suggest that being shared learned and symbolic, the culture is neither inherited biologically nor is a peculiar cultural behaviour but it is rather adaptive, integrated and passed on across generations. The culture does not depend on the individual, it precedes and survives any individual, nonetheless is more an abstract reality as viewed by Brodley (1994).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Activity: Think of the meaning of a specific sign used in your culture and use an online research engine to find out if it does have other meanings that the one you know already.

Within the hospitality industry the culture where the activities take place influences the business through religion, languages, economies, values, attitudes, status, social institutions, policies and customs. These factors influence the employee's behaviour, the customer service, and the managerial values and consequently have an impact on the hospitality and managerial decisions making. Culture can be looked at from three levels as shown below.

Table 2. Levels of culture

	Definitions
National	Collective properties that are ascribed to citizens of countries (Hofstede, 1984)
Professional	Focus on the distinction between loyalty to the employing organization versus loyalty to the industry (Gouldner, 1957)
Organizational	The social and normative glue that holds organizations together (Siehl & Martin, 1990)

The **national culture** consists of a set of norms beliefs, behaviours, and customs within a group of people from a sovereign nation, heterogeneous in nature. International hospitality professionals tend to develop managerial practices according to the national cultures they operate in. Tayeb (2003) sees the national culture as a constant thread through our lives, which makes individuals unique and distinctive from those in other countries. However, in Tayeb's vision, the national culture contains sufficient elements ('institutions') that when mixed together enable a national culture to be created. These elements are the family, religion, education, mass media communication and the multinational company.

Table 3. Elements of national culture

a) Family	The basic social unit where 'acculturation' takes place, where the culture of a particular environment is instilled in a human from infancy. *In many countries, the first seven years spent at home, within the family. These first years are considered to be essential for the future adult because they constitute the source of values such as good and bad, tolerance, inclusiveness, hygiene, common sense, politeness, respect, attitudes towards other beings, toward learning and work. These being said, it is easy to guess how the childhood experience could influence a future hospitality employee.* • *The values acquired in childhood from the family could impact on an individual's ability to provide excellent customer service, exceptional organisational skills or cooking skills and the ability to work clearly defined protocols.* Do you agree with this statement?
b) Religion.	Religious beliefs can have a significant effect on a person's view of the world. This does not mean that people need to 'believe', but religion has helped in all sorts of direct and indirect ways to shape the environment in which people live. Religion influences the behaviour, eating habits can strengthen universal values. It is well known that tourist destinations where the majority of indigenous population adheres to a certain religion have specific characteristics and sometimes expectations in terms of tourists' behaviour. The religion influences the local cuisine in terms of eating behaviour and ingredients used. It is also having an impact on expectations: in some destination, tourists are guided to follow up appropriate dressing code and to respect local behaviour norms. • *Can you give an example of a tourist destination where tourists need to follow a particular dress code?*

continues on following page

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Continues

c) Education.	The value system on which education is based and the choices it makes in terms of the curriculum both help in the formation of a culture, particularly where educational institutions are well developed. At the micro-level, the teaching approach used and the manner of learning can also affect future learning and attitudes. This can determine the quality and versatility of human resources in the labour market. • *In your student life, have you ever met a teacher that influenced your attitude? If yes, how?*
d) Mass media communication	Tayeb, (2003) pays particular attention to the effect of recent advances in communication on the development of culture. The ever-increasing presence of mass media has given a new meaning to shared experience: newspapers, magazines, television, and radio, "*bring people closer together irrespective of their geographical locations, but also in terms of spreading values, attitudes, tastes, meanings, and vocabulary – in short, culture"*. (Tayeb, 2003: p20). She does not, however, regard this as being a threat to the distinctive cultural characteristics of a nation. Instead, the mass media have created a new common dimension in which people can share experiences if they choose to. Mass media is a powerful tool in hospitality, an industry where the products have intangible characteristics and where the customer satisfaction is a priority. In hospitality, using mass media to present products and services through 'instagrammable' pictures could and does generate future sales and strengthen the brand image and brand awareness. Not counting anymore that shearing information to a wide pool of possible customers is a huge benefit. • *Have you ever been influenced by a newspaper/magazine article to choose a holiday destination?*
e) The multinational company.	This is a powerful culture-building institution, whose products and services can influence the way people live, whose operations can affect how and where they work. However, the multinational is also influenced by the preferences at national level regarding product taste and form and the promotion of its goods and services. • *Have you ever seen a product being advertised in a different ways in various countries?*

Thinking to globalization and the expansion of hospitality businesses across the borders, the mix of believes and religion in the workplace can be considered a challenge for leaders and managers? Why?

Organisational culture can be defined as, values and behaviour that are shared by a group of personnel, which shape the sense of what is acceptable within the group. These passed by exiting members to new groups, which join the organisation through either formal or informal socialisation (Wilson, 2001).

Many forces, among which religion, political power distribution, strong and charismatic leaders and narrators have indicated that culture provides people with identity, roots, historical background, giving a sense of belonging. The culture has become a significant component of hospitality organisations across the globe in general and the importance of managing cross-culture in the hospitality industry cannot be overemphasized.

Each organisation functions under the auspices of the values recognized within the contemporary business environment, being somehow a reflection of the host community. It can be said that the effects of the factors affecting the community are spilled within the organisation through the employees' behaviour, attitudes, and are reflected in the work efficiency and productivity. Thus, the organisation has its own specific characteristics given by the attributes of all stakeholders, all these characteristics being integrated in the concept of organisational culture. The understanding of the organisational culture helps one to understand the way it functions and the way it is lead and managed. It is argued that elements of culture can affect the way companies determines their strategies, establishes goals and the way the company works. The stronger the organisational culture, the bigger the impact, and it is easier for employees to assimilate and to accept the organisational values. It should not be forgotten that the key employees involved in an organization are influenced by their own cultural backgrounds and shared experience since these have helped shape their own values and perceptions. Glover (1987) noted that management inflexibility towards culture in the hospitality industry might lead to ineffectiveness, whereas developing

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

a strong organisational culture enhances organisational effectiveness. LeBlanc and Mills (1995) state that there is a strong link between performance in the hospitality industry and organisational culture. They identified a variety of factors, which they considered of high importance for executives to control and consequently cultivate a positive organisational culture, essential for organisational development. Undoubtedly, the way employees are managed can determine the level of loyalty to the organisation and influences the quality of the services provided. The view that the organisational culture has a significant impact on performance and long-term productivity is also shared by Cameron and Whetten (1983), Barney (1986), Asree, Razalli and Rizal (2010), Chegini (2011), and Kallarakal et al. (2011).

Organisational researchers have attempted to explain employee behaviours and attitudes in regards to organisational characteristics. A famous researcher who gained international reputation in the field of cross-cultural studies is Geert Hofstede. He developed a framework known as *the Hofstede cultural dimensions*; it helps organisations to identify cultural differences. Thus, this model can help hospitality managers to gain understanding and consequently deal with issues raised from human interactions in multicultural working environments.

Professional Culture

Schein (1996) presented three professional cultures that can be found in management: Professional culture refers to the set of values shared by professionals working together (Hall, 2005).

- **Operators:** those directly involved with the provision of services and the production of goods.
- **Engineers:** those responsible for the designing and monitoring the technology behind the provision of services and production of goods.
- **Executives:** these are the senior managers who share tacit assumptions in relation to business decision-making. Now, the concerns are how professional culture co-exists within the hospitality industry, how the executives handle the operators and what are the best ways to resolve conflicts in a constructive manner. The way employees are handled can determine the level of loyalty to the organization. Hofstede, (1980, 1989 and 1991) identified types of professional culture in different countries which have shown that employees tend to feel more loyal to their profession and their professional code of ethics rather than loyal to the organisation. Therefore "Are hospitality manager skilled enough to build loyalty among its diverse workforce"?
  Activity: Mercosur and European Union historic trade agreement

Spotlight

The Southern Common Market (Mercosur) and the European Union (EU) concluded the negotiation after 20 years of efforts. According to estimates by the Ministry of Economy, the agreement will represent an increase of the Brazilian Gross Domestic Product (GDP, sum of all goods and services produced in the country) of US $ 87.5 billion in 15 years. According to the ministry, this figure could reach US $ 125 billion if it is considered the reduction of non-tariff barriers and the expected increase in total productivity of factors of production. The increase in investments in Brazil, in the same period, will be around US $ 113 billion. With respect to bilateral trade, Brazilian exports to the EU will have nearly US $ 100 billion in gains by 2035. In a joint note from the Ministries of Economy and Foreign Affairs, the Brazilian government highlights that the agreement is a historic milestone in the relationship between Mercosur

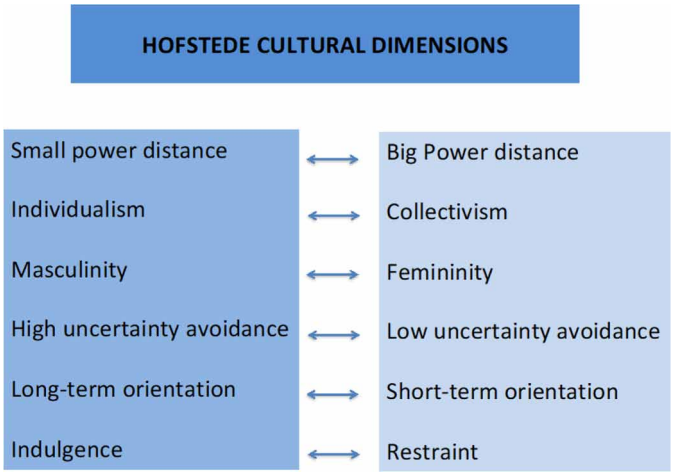
EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and the European Union, which together represent about 25% of world GDP and a market of 780 millions of people. "In times of tensions and uncertainties in international trade, the conclusion of the agreement underscores the commitment of both economic groups to economic openness and the strengthening of competitive conditions," says the note. The agreement between the two economic groups was closed after two days of ministerial meetings in Brussels on 27Th and 28th June 2019. Brazil represented the ministers of foreign affairs, Ernesto Araújo, and of Agriculture, Livestock and Supply, Tereza Cristina, and the special secretary of Foreign Trade and International Affairs of the Ministry of Economy, Marcos Troyjo. "The trade agreement with the EU will be one of the largest free trade areas in the world. Due to its economic importance and the scope of its disciplines, it is the broadest and most complex agreement ever negotiated by Mercosur ", emphasizes the Brazilian government. In a post on Twitter, President Jair Bolsonaro highlighted the leadership of Ambassador Ernesto Araújo and also congratulated the teams of Minister Tereza Cristina and the Minister of Economy, Paulo Guedes, for their efforts to close the agreement. "History!" Wrote Bolsonaro on the social network. "This will be one of the most important trade deals ever and will bring huge benefits to our economy." Source: Adapted from www.noticiasbh.com.br/bolsonaro-fecha-acordo-historico-com-mercosur-e-uniaoeuropeira accessed on 23 August 2019

- Do you think that this historic agreement will affect the hospitality industry positively or negatively?
- Would you say that the South American and Europeans Countries have a homogenous culture? Explain.

Hofstede's Cultural Dimensions

Figure 2.
Source: Developed by the authors



Hofstede's cultural dimensions theory is based on a pioneering study of 160,000 employees from 40 different countries conducted between 1967 and 1973. The study identified four dimensions on which work style differed significantly: power distance (strength of social hierarchy), uncertainty – avoidance, individualism - collectivism, and masculinity – femininity (task orientation – person orientation). Later

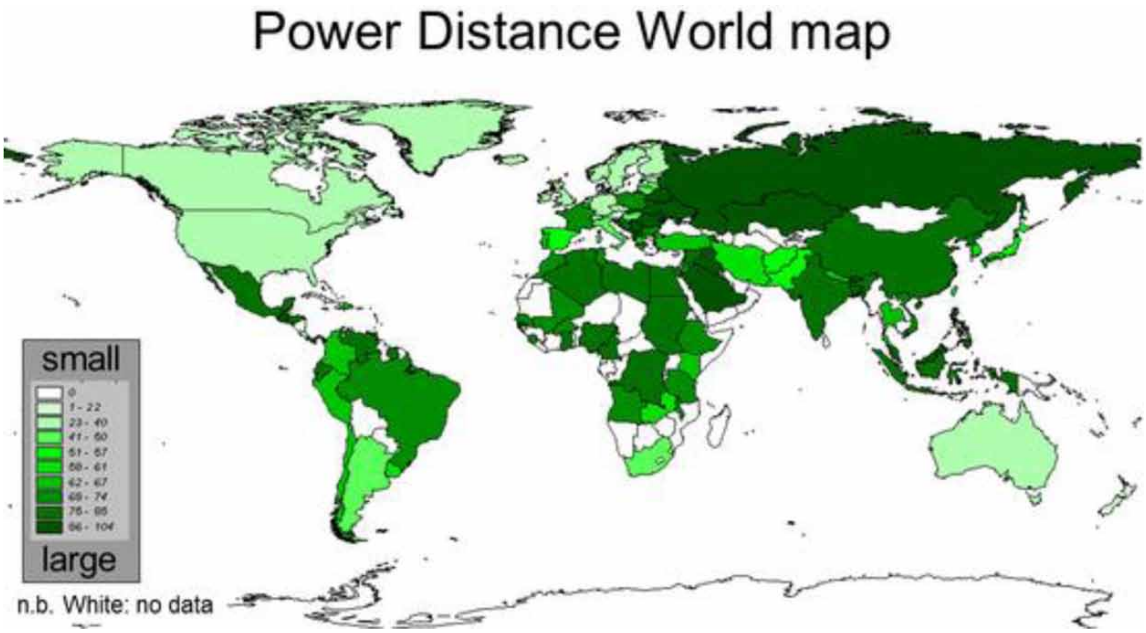
EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the theory was refined, and Hofstede added two more dimensions: long-term – short-term orientation and indulgence – self-restraint.

- **Power distance:** refers to the extent to which a member of organization who has less power expects and accepts unequal distribution of power. This dimension is important for manager as it can reflect the attitude of the employees toward the source of power: do they trust the authority or they question it? The power distance index is correlated with a dimension from Gregg and Banks' (1965) analysis of political systems and also with a dimension from Adelman and Morris' (1967) study of economic development.

A big power distance value will show that the hierarchy is embraced and established within the society/group, while a small power distance value will signify that the people use to contest the authority and attempt to distribute power. The access to this information could help a manager to adopt an appropriate leadership style and to better understand employees' behaviour and attitude.

Figure 3.
Source: https://geerthofstede.com/culture-geert-hofstede-gert-jan-hofstede/6d-model-of-national-culture/



- **Uncertainty Avoidance**: this dimension describes the extent to which people are or are not at ease with the ambiguity. Understanding this dimension is important for a senior manager, especially in the case of change management because it reflects the people's resistance to change and the level of tolerance for ambiguity. Where the ambiguity is not easily accepted (high scores) there is the need to rely on strict rules and codes of conduct, bureaucratic managerial styles could be adopted. An environment with high level of tolerance and ambiguity acceptance is more favourable to a fluid and change.

- **Individualism vs. Collectivism**: refers to individual's preference of being left alone to look after themselves or want to remain in a closely knitted network. The understanding of this dimension is important when planning and managing the facilities and the operations. The authors consider that within hospitality businesses most of the operations and activities are closely linked to collectivism, as the coordination and teamwork are essential in all departments.

Figure 5.

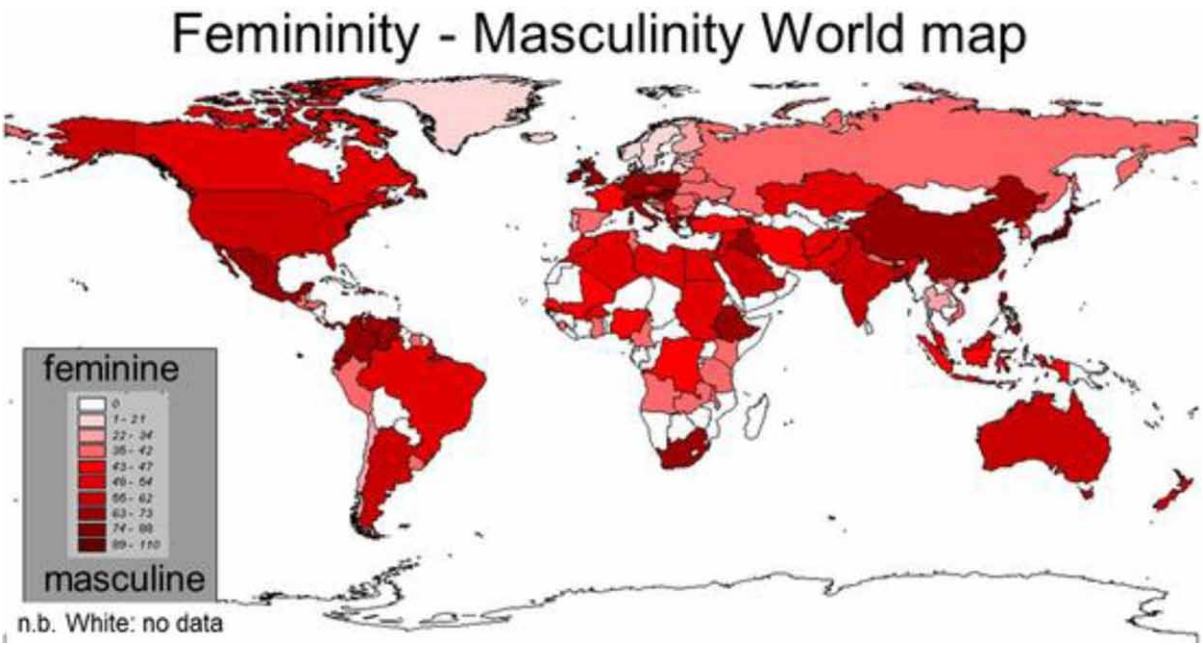
EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Masculinity vs. Femininity**: Masculinity implies preferences in societies for assertiveness, heroism, achievement and material reward for attaining success. Conversely, femininity represents a preference for modesty, cooperation, quality of life and caring for the weak.

Mooij and Hofstede (2010) presented 76 different countries for Masculinity versus Femininity. Masculinity is high in Japan, in German-speaking countries, and in some Latin countries such as Italy and Mexico; it is moderately high in English speaking Western countries; it is low in Nordic countries and in the Netherlands and moderately low in some Latin and Asian countries like France, Spain, Portugal, Chile, Korea, and Thailand.

Do you think that masculinity – femininity dimension could affect the characteristics of the customer service in hospitality? Explain your point of view.

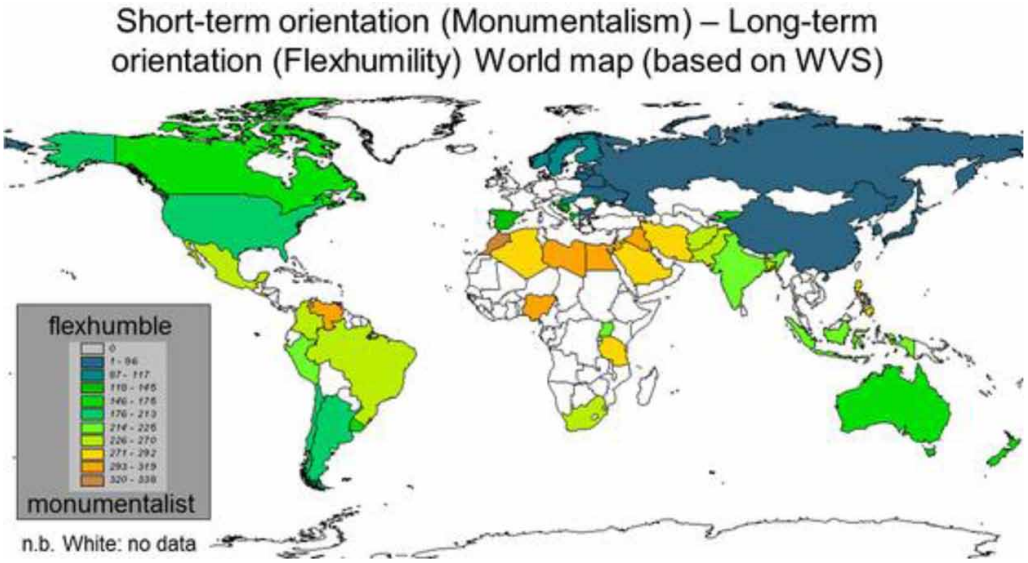
Figure 6.
Source: https://geerthofstede.com/culture-geert-hofstede-gert-jan-hofstede/6d-model-of-national-culture/



- **Long-Term versus Short-Term Orientation**: this dimension refers to the propensity of a society toward searching for virtue. Short-term orientation relates to those societies that are strongly inclined toward the establishment of the absolute truth. This dimension is correlated with past, current and future actions, and traditional values.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

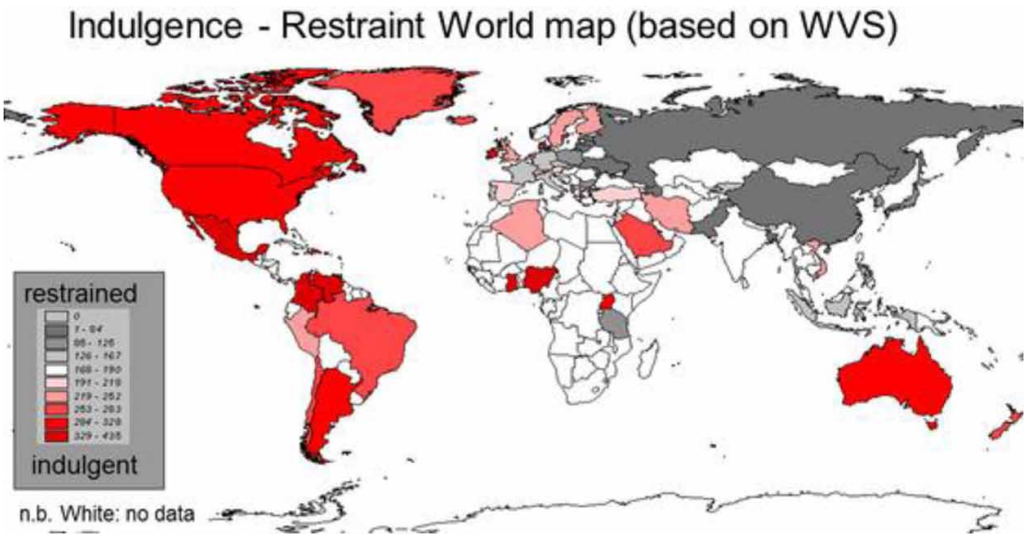
Figure 7.
Source: https://geerthofstede.com/culture-geert-hofstede-gert-jan-hofstede/6d-model-of-national-culture/



Considering the map above do you think there are any correlation between the long-term – short-term orientation and the level of economic development of a country?

- **Indulgence versus Restraint**: refers to the degree to which societies have control over their impulses and desires. This is the sixth and newest dimension added to Hofstede's framework in 2010 after a study focused on how happiness is viewed differently across cultures.

Figure 8.
Source: https://geerthofstede.com/culture-geert-hofstede-gert-jan-hofstede/6d-model-of-national-culture/



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

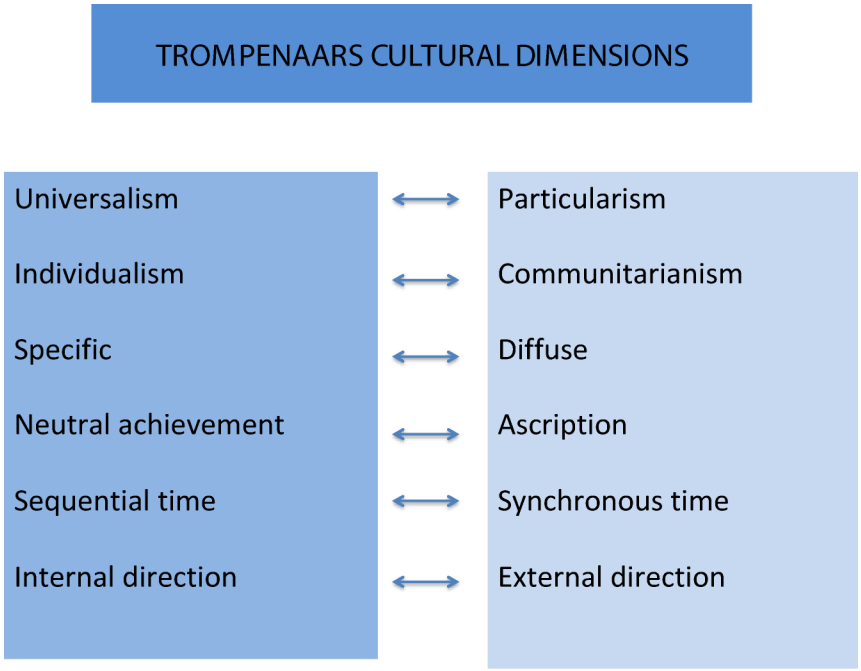
Do you think that the indulgence – restraint dimension could influence the hospitality related activities? Explain.

For hospitality professionals who work internationally and individuals who interact with people from different countries Hofstede's model, although developed many years ago, still is a useful tool to gain insights of how to tackle issues regarding to cross culture management.

Activity: Considering Hofstede's cultural dimensions, what characterises you as an employee?

Trompenaar's Cultural Dimensions

Figure 9.
Source: Developed by the authors



Trompenaars' cultural dimensions is a framework similar to Hofstede's, based on national culture differences and applied to business and management. Fons Trompenaars and Charles Hampden-Turner developed this framework in 1997.

Trompenaars'database covered about 15,000 respondents, some of which were participants in the author's cross-cultural training programs; others were employees in 30 companies in 50 different countries. Among the respondents, 75% belonged to management, while the remainder are general administrative staff, consisted mainly female.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Universalism vs. Particularism

Universalism is regarded to when ideas can be applied anywhere and there is always a definition that can be used to determine the distinction between right and wrong. Standards and values are important and can only be departed from after consultation. It is generally accepted that in similar situations people from different origins receive the same salary.

Particularism is the belief that circumstances and relationships play an important role in determining how ideas can be applied into practice. Salary is linked to reputation and status is important in this.

In cultures with high universalism (USA, UK, Canada, Australia, Germany, Sweden) the business meetings are more pragmatic and professional while in cultures with high particularism (Venezuela, Indonesia, China, South Korea, former Soviet Union) the focus is on relationships and the particularistic environment (Luthans, and Doh, 2012).

Individualism vs. Communitarianism

Individualism perceives human beings as individuals, while communitarianism characterizes humanity as being part of a group. Trompenaars argues that the individualist culture is linked to the ideas of the western world, while the communitarian culture is linked to non-western countries.

However, cultures change continuously. For instance, Trompenaars mentions that Mexico was predominantly communitarian at first, but have been influenced by the global economy and now is moving towards a more individualistic culture.

Neutral vs. Emotional

Neutral culture is characterized by a control of emotions, while in an emotional culture they are expressed openly and spontaneously. For instance, cultures like Japan and Great Britain are neutral where they frown upon being angry in public or displaying any other emotional outbursts. Trompenaars make references to countries such as the Netherlands, Spain and Mexico where people often laugh, talk loudly and greet each other enthusiastically.

What do you think are the challenges of a businessperson originated in a neutral culture doing business/ working with people from an emotional culture?

Specific vs. Diffuse

- Specific: individuals have a large public space, which they share easily with other people. They also have a small private space that they share with good friends and close connections. People often approach each other informally in both the public and private space. Or they are using formalities differently, depending on their public role.
- Diffuse: culture where the public space and the private space tend to be interwoven. People in a diffuse culture will therefore protect their private space because this will provide easy access to the public space. People from a diffuse culture attach great value to formality.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

How do you think that the specific / diffuse cultural background of employees will impact the workplace environment and relationships?

Achievement vs. Ascription

In an achievement-oriented culture a person's worth is determined on the basis of their performances and how well they execute their tasks. Whereas, in a culture in which status is ascribed, the status is based on whom the person in question is. Their position is derived from individual characteristics such as gender, origin, age, career, a person's position or family renown.

Sequential vs. Synchronous Time

The sequential time refers to the specific time measurement (in minutes, hours, days, etc.) while the synchronous time refers to the rhythm of the group and biological clock. The time has a fluid perception in various parts of the globe. A five-minute break could last up to half an hour or more in some countries. In UK if one says, "the meeting will start at noon" everyone will arrive at 12am sharp, while if you are using same expression for example somewhere in Romania, people could arrive at the meeting somewhere between 12am and 2pm because "the noon" is not perceived as a fixed and specific hour. In Italy is most likely that nobody will accept a meeting, because is the time for an important meal. "Time is money" in countries like USA (sequential culture), thus businesswise it shall not be lost in activities which are not productive, and the meetings should have a clear agenda because the time is limited. In other countries (synchronic cultures) such as Italy the time is a more fluid concept; it is perceived as guidance for various activities rather then a time framework. For instance, the lunchtime in Italy is an important family gathering and the lunch break could last up to two – three hours, to allow everyone to have the lunch with the family. In Romania, arriving few minutes later to a meeting is not a problem. In some Asian cultures the time is closely linked with cosmic energies, and each activity to be successful should be done at the favourable time.

Internal vs. External Direction

This dimension refers to one's attitude versus the environment. Many eastern cultures are thriving to find the balance between the inner self and the external environment (internal direction) and it is accepted that there are forces that cannot be controlled. In these cultures, the future is a result of past and present actions. On the other side, in western cultures the individuals seek to control and modify the external environment (external direction), and the future is the result of present actions only.

Criticism of Hosftede's and Tropenaars Models

Since Hofstede's major publication in 1980, he became subject of criticism not only by fellow scholars but also from those who work on a daily basis dealing with issues arisen from cross cultural collaboration among organisations across the globe. One of the many criticisms is that Hofstede only used questionnaires surveys in one organisation (IBM) to measure culture and according to the critics this method is unsuitable and not the most appropriate. Hofstede responded to criticism stating that surveys are suitable

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

however, he accepts that it should not be the only method applied. Even though he agreed that nations are not always appropriate elements of analysis they are the only type of elements available.

On the other hand, Hofstede was a severe critic of Trompenaars' work and mounted an attack on his fellow scholar. He claims that the theory in Trompenaars' book is not supported by data; Hofstede argues that the purpose of research is to replace preconceived concepts with empirical findings. He adds that Trompenaars took two of the dimensions from a book by anthropologists Florence Kluckhohn and Strodtbeck (1961) that to him is acceptable to an extent as the choice of research is influenced by existing literature and preconceived notions. However, Hofstede insists that Trompenaars expose this instrument of responses of a research population; the data collected which would be the means of revising the preconceived notions and formulate a new theory (Hofstede, 1996).

Which culture model do you agree with and why?

How could you use the knowledge gained from studying these theories while working in accommodation facilities, in reception and/or housekeeping department?

CONCLUSION

This chapter have explained the importance of understanding diverse workforce in the hospitality industry and the importance of cross culture communication. In addition it has explained the cultural dimensions of Hofstede and Trompenaars and the relationship between national cultural values and those of organizational cultures. It has also outlined criticisms of both Hofstede's and Trompenaars' research method, particularly the reliability of the findings and finally it discussed the various different approaches related to managing workforce diversity and cultural diversity with significant differences among scholar views.

Chapter 91
Managing Generational Diversity:
Lessons German Companies Can Learn From Silicon Valley

Martin Klaffke
https://orcid.org/0000-0001-6095-3960
Hochschule für Technik und Wirtschaft Berlin, Germany

ABSTRACT

Germany is undergoing a dramatic demographic change that requires its organizations to make workforce talent of all ages a strategic priority. Practitioners in Germany focus largely on Generation Y employees, because this young employee cohort expresses new and different work-related values. However, diverse attitudes and behaviors of employees in different age groups can potentially lead to conflict and have an overall negative impact on organizational performance. Given US labor legislation and media pressure, managing workforce diversity has been on the agenda of U.S. organizations for many years. Consequently, it can be assumed that there are areas in which German organizations can learn best practices from the U.S. experience. Although data collected from Silicon Valley organizations suggest that taking specific action for managing the multi-generational workforce is currently not a pressing issue in the tech industry, setting up innovative workplaces is an action field in which Germany can learn from its U.S. counterparts.

INTRODUCTION

The ability to manage a multi-generational workforce will become a critical success factor in the future. Organizations in Germany are already experiencing more variety in the requests and expectations from their workforce (Bertelsmann Foundation & Mercer 2012). A particular challenge comes from Generation Y employees – people born between ca. 1980 and 1995. Recent surveys suggest that they are exigent and

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

demand, amongst others, more flexibility and autonomy in the workplace as well as more meaningful jobs than previous employee generations (Accenture 2012; Klaffke & Parment 2011).

The expression of concern over the dreadful ways of the young is certainly nothing new. According to a famous quote, often attributed to Socrates, "the children now love luxury; they have bad manners, contempt for authority; they show disrespect for elders and love chatter in place of exercise." If this is a classical and common phenomenon, why do we need to worry about it? The answer lies in the demographic transition and the subsequent change in business conditions. Economic growth potential depends on having sufficient and productive labour. However, as a result of declining fertility rates, most OECD populations are facing a demographic shift with a shrinking and ageing working population.

In managing demographics, German practitioners currently focus on how to change organizational practices to attract Generation Y employees and how to safeguard performance levels of elderly employees through health management. This strategy, however, may not be sufficient given the dramatic demographic change in Germany with a projected decline of its working population by 6 million until 2030. In fact, organizational practices are needed that make talent of any age a strategic priority, allowing organizations to present themselves as employers of choice for every employee generation, while enhancing fruitful collaboration between employees of different ages.

Since workforce diversity has been on U.S. organizations' agendas for quite some time, one can assume U.S. companies to be ahead of their German counterparts in managing generations in the workplace. Therefore, the broad purpose of the present research is to examine generation management at Silicon Valley companies and to suggest areas where German organizations can learn lessons from U.S. experience.

RESEARCH BACKGROUND

More than any other OECD nation, Germany's economy is approaching a demographic shock of a scale not observed since the Middle Ages. By 2030 the German working-age population is expected to decline by 6 m, already skewing sharply older in the coming decade (Robert Bosch Foundation 2013). Due to talent shortage, more than half of Germany's small and medium sized enterprises are expecting a decline in prosperity and growth (Ernst & Young 2013).

To safeguard the employment provision, and thus further ensure Germany's prosperity there are two basic options: a) increase the volume of work performed and b) improve workforce productivity. As immigration has yet been unable to compensate for the loss in labour force, some important reforms have already been put in place to lengthen one's working lifespan. School and academic education were shortened, pension was postponed to the age of 67 and retirement pay was cut thus incentivizing employees to work until the statutory retirement age. Given the implemented changes in both exit age and education system, collaboration time of employees of different age with connected divergent values will increase by roughly 10 years.

Current corporate practice in managing demographics with focus on attracting Generation Y employees and providing health management for elder generations is, for at least three reasons, not sufficient to ensure adequate labour supply. Firstly, preserving physical and psychological health is indisputably the basis for work ability; yet this is not enough for maintaining lifelong high-performance levels. Studies by the Finnish Institute of Occupational Health suggest that organizational work factors, especially team leadership and management practices, are critical elements in productive aging (Ilmarinen 2005). Secondly, we tend to assume that there are advantages associated with age diversity in the workplace such

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

as an increase in problem solving skills, an improvement in decision making capacity or in-depth client responsiveness. But empirical evidence is inconsistent. Diverse attitudes and behaviours of employees of different age carry conflict potential, which might lead to a deterioration of labour productivity that organizations need to tackle with sound leadership (Ries et al. 2010; Wegge et al. 2008). Finally, tensions amongst employee groups affect employer attractiveness in the war for talent and might negatively influence the return on personnel marketing spending. Surveys amongst German young professionals suggest that a cooperative and pleasant working environment is especially important to attract and retain young talent (Hurrelmann & Albrecht 2014; Kienbaum 2010). However, if junior employees discover that employer branding is all tinsel and glitter, and expectations are not met by reality, they might soon leave as they tend to be less willing to endure job nuisance with patience.

According to a survey conducted by Bertelsmann Foundation and Mercer (2012), organizations in Germany expect conflict potential resulting from generation diversity; yet, very little attention is currently given to fostering intergenerational cooperation. Diverging attitudes and behaviours of people from different age groups can be explained by pure age related preferences, career or life cycle aspects or generational differences (Bruch et al. 2010). In his concept of generations, the German sociologist Karl Mannheim (1928) distinguishes social generations from family ties, i.e. blood-related generations. Hereafter, a generational cohort represents a grouping of individuals born around the same time who share distinctive socio-historical life events during adolescence and early adulthood. In this critical developmental period, we are very receptive for all sorts of influence: our values and subsequent attitudes also tend to be coined by the particular time spirit and related conditions in society and economy. Although values might still change over time, this early imprint "stays with the individual throughout their lives and is an anchor against which later experiences are interpreted. People are thus fixed in qualitatively different subjective areas" (Scott 2000, p. 356).

There is no final generation scheme for Germany yet. Often, the US generation archetypes are transferred with modifications as regards the baby boomer cohort (Klaffke & Parment 2011). Whereas in the U.S. the baby boom directly started after WWII, this phenomenon appeared in Germany approximately 10 years later. Consequently, in Germany the baby boom cohort comprises of people born between circa 1955 and 1965. As exhibit 1 illustrates, up to five different employee generations can be found in German workplaces.

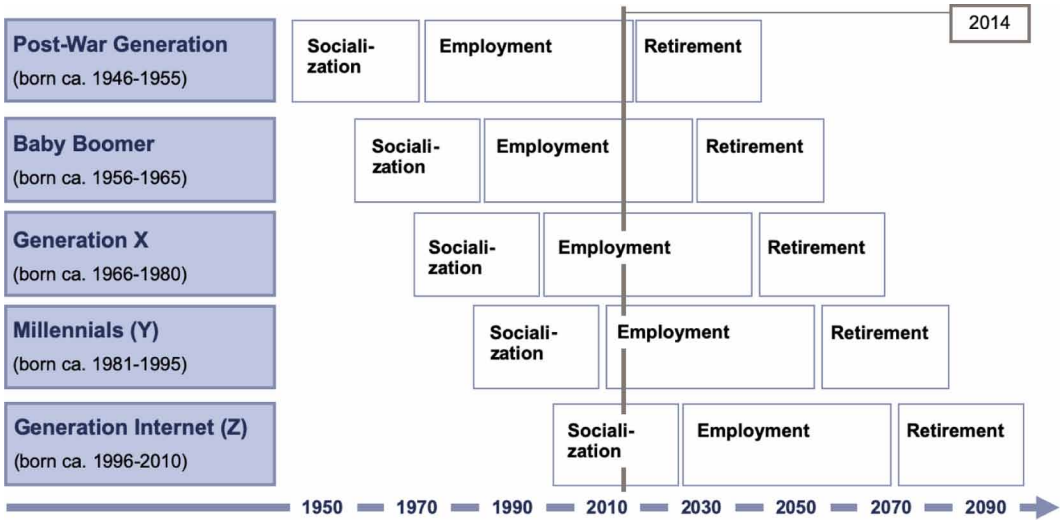
As with any other model, the generation approach has its limitations. There are difficulties in precisely defining age limits for each cohort and estimating the importance of other factors such as race, culture, geography and class in explaining individual behaviour. Empirical evidence for generational differences in work values is still somewhat preliminary. Much of the existing literature bases its argumentation on non-empirical sources, often in form of anecdotal accounts. However, the few systematic studies on generational differences in the workplace suggest there do exist different perceptions and expectations from employees of different age groups (e.g. Twenge et al 2010).

A recent survey by AOK Institute revealed that there is mutual misjudgement amongst workers of different age groups in Germany (Zok et al. 2014). In addition to misperceptions, recent studies with the German car manufacturer Daimler and Germany's leading railway company Deutsche Bahn identified concrete intergenerational issues in the workplace (Klaffke & Schwarzenbart 2013; Klaffke & Von Wedel 2014). On top of the – almost classical – complaint from younger generations about their senior colleagues' insufficient openness for change and new ways of living, lack of both appreciation and feedback turned out to be major fields of intergenerational debate for junior employees. Whereas elder employees expect to be respected for their seniority and lifetime achievements, Generation Y employees

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

are reluctant to kneel before sheer age; instead, they tend to base their praise on current performance levels. Furthermore, Generation Y employees want to be treated on a par by senior colleagues, who often show appreciation for experience and expertise only, which juniors still must acquire. Seniors also do not understand and are unwilling to comply with Generation Y's expectation that a supervisor shall function as service provider, helping juniors to quickly boost their career development and advancement.

Figure 1. Generations in the Workplace in Germany
(Source: Adapted from Klaffke 2014, p. 12)



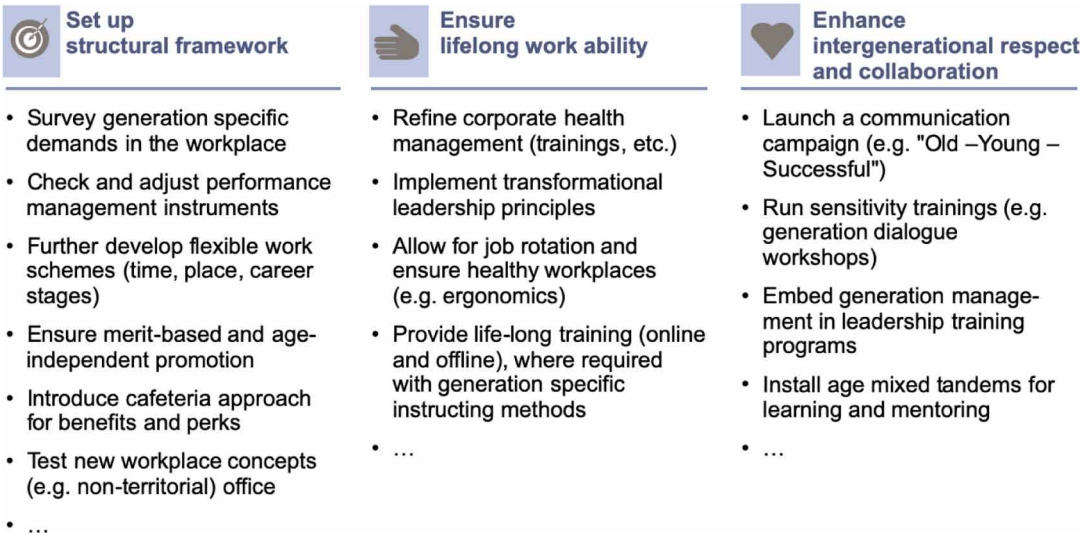
To explain tension amongst employees of different age, there has evolved a set of psychological theories focussing on social interaction processes. Often cited in literature are, amongst others, Byrne's (1971) similarity-interaction paradigm, Turner's (1987) self-categorization model, as well as social identity theory proposed by Tajfel and Turner (1986). People feel attracted to others who are like them (e.g. age, gender, ethnicity) thus resulting in increased communication and interaction. Further, to boost self-esteem, individuals tend to form and join sub-groups and perceive their own groups (i.e. in-groups) as superior to the other groups (i.e. out-groups). In-group/out-group-categorization might lead to stereotyping and even overt discrimination, fostering conflict and less cooperation amongst sub-groups. The emergence of opposing sub-groups is assumed to be more likely, when more rigid attributes for group-formation (e.g. age, gender) impede an individual's movement from one sub-group to another (Bruch et al. 2010).

Although organizations see substantial conflict potential as a result of generation diversity, there is still very little practical and academic attention given to managing generations in the workplace and to fostering intergenerational cooperation (Bertelsmann Foundation & Mercer 2012). Generation management aims at effectively addressing the differences in values and expectations of each employee cohort. Generation management thus represents a facet of diversity management which, as a management concept, focuses on respect and aims at embracing individual differences to turn them into organizational assets (Thomas & Ely 1996). Beyond legal requirements for equal opportunity employment and fair treatment through diversity management organizations can increase their attractiveness as employers amongst each employee generation.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

To empirically identify a framework for implementing generation management in Germany, we have, as a first step, conducted a pre-study with the car manufacturer, Daimler, in the German automotive industry (Klaffke & Schwarzenbart 2013). Figure 2 shows the three major action fields identified in the study.

Figure 2. Action fields for implementing Generation Management
(Source: Adapted from Klaffke & Schwarzenbart 2013, p. 46)



Accordingly, generation management requires a structural framework of Human Resource Management principles and practices that allow accommodating generation specific needs (e.g.: age-independent promotion, choices as regards to perks and benefits, new office concepts.). It should also support lifelong work ability, for instance through corporate health management programs and personnel development initiatives (in both online and offline formats). Finally, and perhaps most importantly, it should create awareness of generational differences and mobilize employees into intergenerational collaboration.

As for diversity management in general, there is no "best way" to manage generational differences in the workplace. To be effective, diversity management must consider business needs and workforce issues, as well as situational factors such as workplace environment or the stage of development regarding workplace diversity. Therefore, diversity initiatives cannot only be different from organization to organization, but also from country to country.

To systematically develop a set of generation management actions that organizations can refer to when designing their individual programs, it is beneficial to study practices in countries believed to be experienced in generation management and to evaluate whether and how their practices could be adopted domestically. In this respect, focusing on U.S. practice is assumed to allow for valuable insights on bridging potential generational gaps and fostering a generations-friendly culture. Managing workforce diversity has been on U.S. organizations' agendas for quite some time, whereas in Germany it is still a relatively new undertaking. The roots of diversity management as a comprehensive management approach in the U.S. go back to the Civil Rights Movement, commencing in the mid-1950s, and consecutive labour legislations. Also, extensive writing on generational differences in work values and consecutive

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

suggestions on how to manage generations at work has emerged in the U.S. (e.g. Lancaster & Stillman 2003; Zemke, Raines & Filipzcak 1999) earlier than in Germany (e.g. Oertel 2007; Bruch et al. 2010).

As workforce diversity can be recognized as a source of creativity and innovation there is reason to assume that, especially in creative clusters such as Silicon Valley in California, it has contributed to prosperity and sustained competitive advantage (Florida 2002). Therefore, Silicon Valley companies were selected to identify areas in which German organizations can potentially learn from the U.S. experience in managing generations in the workplace.

METHOD

As research on generation diversity and associated management practices is still emerging, this project took an exploratory route. Representatives from organizations in the Bay Area were invited for in-depth interviews (cf. appendix 1).

At the same time interview requests to Bay Area companies and organizations were sent out the *San Francisco Chronicle* published an article titled, "Age left out of the diversity discussion" (Brown 2014). It noted that most Silicon Valley companies were reluctant in releasing age related data of their workforce. "Silicon Valley's conversation about diversity has revolved chiefly around gender and race, although the stereo-type of the techie as white, male and young has written out the over-40 set as well" (Brown 2014). Further it was mentioned that "there have been several age discrimination lawsuits against major companies, and frequent reports of employers and funders passing on older workers in favour of younger ones" (Brown 2014). This public debate on ageism in Silicon Valley companies might be a reason why there was hardly any reaction to the interview request: Only five companies agreed on an interview on generation management; Apple, Google, Pixar and Virgin America at least sent regrets. Thus, to explore the topic based on secondary data, additional focus interviews were conducted with Great Place to Work, Inc.[1], The Silicon Valley Leadership Group[2] and Steelcase Research.

In total eight focused interviews of a length of 1 to 1.5 hours were conducted in August and September of 2014. A semi-structured questionnaire served as a guideline for the interview (cf. appendix 2). The interview questions were taken from the survey conducted with Daimler amongst German car manufacturers. They looked at generation specificities in career and competence management, in managing performance as well as in managing the employee-employer relation. One question explicitly explored new approaches in workplace design as in the study with Daimler setting up innovative office configurations was found to be an important and new factor in engaging employees.

All interviews were conducted as face-to-face-conversations at the respondents' offices. During the interviews, notes were taken that were worked up directly after the meeting. The survey data were analysed by content based on the generation management framework developed with Daimler. Findings were discussed, first in a workshop-lecture at UC Berkeley's Institute of European Studies in October 2014, and then they were reviewed with company representatives in Germany.

FINDINGS

The surveyed companies mentioned several Human Resource Management practices, which had been already identified in the study with Daimler (cf. exhibit 1). They mostly concerned generation-unspecific

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

actions that could in general contribute to enhancing employer attractiveness. These included merit-based pay and promotion, as well as offers of individual contributor career paths besides the traditional management track. Management and individual contributor career paths were often handled similarly as regards compensation; yet there were stated to exist fewer senior positions in the individual contributor line. In this regard, it was also mentioned that in companies offering individual contributor career paths, age would less negatively impact promotion opportunities.

Flex-staffing (i.e. adjusting work time to employees' needs), as well as feedback and fun, made up important elements of the work life in most of the surveyed companies. Although per se flexible working hours were allowed, most companies outlined a preference to have their workforce in the office. Therefore, there was rarely a rule specifying a specific weekday recurrently set as a home office day; instead, work flexibility had to be occasionally agreed upon with the respective supervisor. Furthermore, home office allowance often was connected to an employee's commitment to be available. In one company, employees were informed that whenever their attendance rate dropped under 40 percent, their assigned desk would be taken away. As regards leader-follower interactions, some firms monitored through engagement surveys whether employees feel that there was sufficient feedback given. In addition to all-firm events, managers, in many cases, were reported to have a team and management effectiveness budget for fun activities and celebration of success in their respective teams (e.g. team dinner).

HRM provisions considering employee generations' potential needs were yet rarely noted. Where generation specific HRM practices existed, they focused on Generation Y (e.g. the "parent's day" at Google). A cafeteria approach, i.e. accommodating employees' preferences regarding non-monetary incentives, was rarely used.

Flexibility was typically allowed regarding social benefits, e.g. contribution to health care, life insurance or retirement packages. For perks, however, there seemed to be in total very little in place, i.e. an employee typically was not offered to choose between childcare or elderly care as additional fringe benefits.

Also, specific psychological assistance in preparing for an employee's retirement (e.g. with seminars) was not offered; as a reason, one respondent gave the meritocracy approach of Silicon Valley firms being at odds with an entitlement culture. As employees typically received a competitive salary, they were expected to solve their life issues on their own.

Concerning personnel development, all interviewees stated employees could participate in on-the-job training and seminars (mostly online education). No evidence could be found of an uneven distribution of training hours or development budgets based on the employees' age. However, learning approaches, methods and tools were reported not to consider elderly workers' learning preferences and thus, in general, did not cater to an age diverse workforce. In this regard, some respondents mentioned the relatively young demographic structure of their firms allowed them to neglect age effects in corporate education.

To raise awareness for diversity and to enhance mutual understanding, all surveyed companies ran diversity trainings. However, "generation" as a specific facet of workforce diversity or challenges in intergenerational collaboration played a secondary role. If at all present, leadership training on generation management considered potential clashes between Generation Y and Baby Boomers leaving Generation X out of the discussion. One interviewee mentioned some sort of panel discussion, in which Generation Y employees were brought in for dialogue with Baby Boomer executives. Also reverse-mentoring was said to exist in firms.

New office concepts and workplace design were considered in all surveyed companies as an integral element of their workforce strategy. Although interviewees believed that office design per se is not based on generational preferences but on work requirements, they saw it as an important factor in attracting and

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

engaging Generation Y employees. According to research by one respondent Generation Y employees have a preference for open and transparent environments, they are "tuned for constant connection and collaboration", and they want to have autonomy in choosing work time, work location and workplace. Another interviewee mentioned that his company had been losing on Generation Y talent because it had not been offering a fun and state-of-the-art work environment.

All firms had experimented over the last years with innovative office configurations enhancing a culture of collaboration, speed and co-creation; consequently, allowing for substantial floor capacity savings while fostering employees' identification with the corporate culture. In all companies the workplace design had been moved away from the traditional U.S. high wall cubicle configuration to open space offices including walk-in meeting rooms, telephone booths, lounge areas for informal meetings or even yoga and wellness centres. The guiding idea behind office design was to set up an "ecosystem" of different workplace options employees can choose from according to the individual task requirements. One interviewee noted that "sitting [has come] to be the new smoking", most office layouts were reported to be considerate of employees' physical activity needs. For instance, to encourage people to move around, one firm had built an open staircase to connect two floors, implemented different room types on the respective floors and made different snacks available on different floors. Further, in one company, most employees worked in a non-territorial office setting, i.e. they did not have an assigned workstation. Reasons given were to move people out of their comfort zone, to make them tidy up their workplace at the end of every business day and to avoid any sense of entitlement.

According to the respondents, transitioning from a traditional office to an open configuration required substantial change management effort and could not be carried out as a mere facility management project with focus on floor capacity reduction. This included both employee mobilization and change in leadership towards a result orientation. Besides communication about the new office's benefits and the mode of transition, mobilization activities focused on involving employees in co-creating their new office space. For instance, in one firm each team had been given a decorating budget to set up a themed office "neighbourhood" (i.e. an area in between team sections for informal communication) and employees had turned them into a cinema, a spa or a sports bar neighbourhood. As the "no assigned seat concept" requires employees to have access to storage areas, one firm implemented lockers, like those at colleges, and employees were invited for locker decoration contests.

Regarding leadership, executive training, in some cases, was offered and covered topics included how to manage employees without direct and physical supervision. In addition, supervisors were required to act as a role model and to sit in the open desk area. Finally, regular surveys were conducted to learn what employees appreciated in the new office settings and to identify areas for improvement.

Whereas earlier new office concepts focused on moving employees in open space settings to push floor capacity savings, now interviewees observed a trend for more privacy. According to them privacy, however, does not mean having a separate office, but could take on different spatial forms (e.g. have glass walls to separate office zones, install enclaves for focus work, use library spaces for heads-down activities or set up dedicated rooms for recharging in silence). Further, one respondent mentioned that there was a need for a more fluid office arrangement, allowing employees and teams through mobile furniture (e.g. desks and chairs on wheels, movable walls) to quickly change the office configuration. Finally, companies started to cut back on the number of "non-assigned" desks, as they had discovered that people need anchoring and personalization.

CONCLUSION

Given the small number of surveyed companies, the sample composition and its explorative approach, the analysis does have limitations. However, since the Silicon Leadership Group and Great Place to Work with their wide experience and insider's knowledge were included in the study, two main conclusions might be drawn from the findings.

First, at least as Silicon Valley enterprises are regarded, this study does not support the assumption that in managing generations U.S. companies lie ahead of their German counterparts. The survey could not find any specific U.S. practice beyond the actions already identified in the pre-study with Daimler. As there is barely any initiative taken to enhance intergenerational collaboration, the age and generation focus seems to be irrelevant in the Silicon Valley companies interviewed. This finding tends to support the *San Francisco Chronicle's* reporting on age being left out of the diversity discussion.

Further, the survey indicates evidence for a general reservation amongst U.S. employers to offer a menu of voluntary benefits and perks, employees can choose from according to their needs. This, however, conflicts with the general idea of generation management which requires companies to dispose of a variety of HR instruments in order to position themselves as employer of choice amongst every generation. According to one respondent, in the U.S. employee private lives and work are rather disjointed and a company would rather move business to a different location than offering specific perks.

The second conclusion concerns the importance of generation management for future office design. In building the office and the workplace of the future, German companies can learn substantial lessons from the U.S., since in Germany private or shared offices are still prevalent. Many visits of German corporate and governmental delegations to Silicon Valley companies give obvious proof of the already identified learning potential.

From a Human Resource Management perspective, the idea of incorporating the workplace strategy in the workforce strategy is important given Germany's expected labour shortage. However, to use the office as a further strategic tool in talent management, new office configurations in Germany cannot be confined to meet one specific generation group's requirements (i.e. typically Generation Y's requirements), but rather they should be attractive for talents of all ages. Most German Baby Boomers and Generation X employees became socialized in companies with private cells or shared offices, and they still tend to consider a private office as a status symbol like a company car or a meaningful job title. Thus, in managing the multi-generational workforce, it is indispensable to offer employees choices for task execution. This firstly requires acknowledging employees' divergent needs for privacy and then refraining from pushing everybody for non-territorial offices. Furthermore, a staggered approach in transitioning to new office settings could reduce employee resistance and make the office a system for accommodating and fostering both the work and the growth of different generations. In this, according to one interviewee, Generation Y could take on a key role as a trendsetter: "Other generations might observe the young employees' behaviours in the new office and gravitate to the new mode of working".

This, however, needs to be accompanied by thoughtful change management measures such as regular exchanges between first movers and followers and cross-mentoring between generations which will, in turn, enhance mutual understanding in the workplace and contribute to fruitful intergenerational collaboration.

This research was able to identify data from which companies in both the U.S. and Germany can learn in relation to intergenerational management. American companies, specifically those in the Silicon Valley, are altering their workforce environment to give their employees workplace customization

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

in effort to improve interaction and productivity. Given Germany's demographic challenges, German companies, on the other hand, are perhaps more in tune with different generational work groups and focus on employee retention and satisfaction.

Multigenerational workforce management is a complex topic that will undoubtedly further on affect companies in both the U.S. and Germany. Especially with the advent of the tech-savvy Generation Z personnel practices again will have to be reviewed and consequently adjusted. In the view of the growing popularity of mobile apps, for example, online education probably will play an increasingly important role as a vehicle by which companies might train managers and staff in how to effectively benefit from generation diversity in the workplace. Hence, future studies on generation diversity could, for example, shed light on generational differences in online learning and the associated challenges in designing effective qualification formats. In any case, exchange of research data and implementation of studies in multigenerational workforce management between Germany and the U.S. stimulate, as could be shown, transatlantic learning and thus aid in improving current and developing new and effective strategies for managing the labour force of the future.

Interview Questions (Guideline)

A. Career & Competence Management _____
   - A.1 In which way does your company allow and prepare "cohort 50 plus" employees for promotion at a later stage in life (e.g. mentoring women having raised children)?
   - A.2 Which career models do you offer, and how comparable are they in e.g. benefits, perks etc.?
   - A.3 How do your company's leadership/executive trainings cover generation diversity and its management challenges?
   - A.4 In which way does your company consider employees' age in personnel development?
   - A.5 How different are your company's personnel development programs for younger employees from development measures provided to elder staff?
   - A.6 How does your company ensure and manage knowledge transfer between employee generations (e.g. tandems, mentoring)?

B. Performance Management _____
   - B.1 In which way does your company consider generational differences in its performance management?
   - B.2 How does your company's workplace and office design reflect generational differences in working style preferences (e.g. co-working spaces vs. traditional office)?
   - B.3 In which way has your company in the last years adopted a modern office configuration (e.g. flexible workspace, open lounge areas, mobile/home office)?
   - B.4 Which choices is your company offering regarding worktime and work place flexibility; and how does your company manage the challenges associated with mobile and flexitime working (e.g. restriction of home office days)?
   - B.5 In which way does your company allow employees to flexibly choose benefits and perks according to their preferences (e.g. Cafeteria model)?
   - B.6 How does your company allow for "fun" in the workplace?

C. Relationship Management _____
   - C.1 In which way does your company foster intergenerational understanding amongst managers/ workforce (e.g. campaign on specific wants of generation Y, reverse-mentoring)?
   - C.2 In which way does your company offer specific benefits according to employee life stages (e.g. elder care, kindergarten support, etc.)?
   - C.3 What options does your company offer for an employee's transitioning to retirement (e.g. part-time above an age of 60)?
   - C.4 How does your company prepare elder workers for the transition to retirement?
   - C.5 In which way does your company survey need differences amongst employee generations?

Chapter 92
Veterans Should Be Included Too:
Strategies for Promoting Diversity of Veterans in Organizations

Yvonne O. Hunter-Johnson
https://orcid.org/0000-0002-9465-7921
North Carolina A&T University, USA

ABSTRACT

The transitioning of veterans from the military world to the civilian world and by extension the civilian workforce is a critical career transition. Despite their motivation and resilience, veterans still encounter a multiplicity of challenges when transitioning to the civilian workforce, which quite often has a rippling impact on their attainment of employment, job retention, and career development within the civilian sector. An added layer to the transitional challenge for veterans is organizational resistance to promote diversity and inclusion policies and practices, specifically regarding veterans. On this premise, this chapter aims to: 1) Discuss the transitional challenges of veterans to the civilian workforce and 2) Provide implementation strategies at an organizational level to promote diversity and inclusion, specifically regarding veterans.

INTRODUCTION

The management of diversity within the business environment is crucial to success of an organization (Byrd, 2014; Byrd & Scott, 2018; Byrd & Hughes, 2018; Johnson, 2008; Thomas, 2005). If properly managed, diversity can be extremely advantageous Davis et al., 2016; Rice, 1994; Robinson & Dechant, 1997). As posit by Foster and Harris (2005), diversity can create a competitive advantage from an organizational perspective by helping to recruit and retain the best employees. Diversity has increased creativity at an organizational level (Abaker, Al-Titi, & Al-Nasr 2019), and enhanced decision-making

(Foster & Harris, 2005). However, if not properly managed, diversity can be the underpinning for conflict, which has a rippling negative impact on efficiency, quality of work innovation and increased employee turnover (Abaker, Al-Titi, & Al-Nasr 2019).

Within recent years, there has been much emphasis by leaders as it relates to the diversification of organizations. According to Liggans, Attoh, Gong, Chase, Clark, &. Russell (2018) "as diversity within organizations continues to rise, leaders are increasingly focused on integrating the diverse perspectives of various demographic groups into the organization and empowering all individuals" (p.140). Hence, organizations focal point should not be solely diversity but inclusion of all employees. While there is a vast amount of literature as it relates to diversity, organizational diversity, diversity management, related policies and procedures, the concept of organizational inclusion is unparalleled and has not been thoroughly explored (Brimhall et al., 2017; Nair & Vohra, 2015;Liggans, Attoh, Gong, Chase, Clark, &. Russell, 2018). Scholars have described the practice of inclusion in comparison to diversity in differing ways. For example, Ferdman (2014) described inclusion as "creating and embedding organizational, leadership, and interpersonal practices that result in a sense of safety, full belonging, participation, and voice across the range of diversity dimensions, without requiring assimilation or loss of valued identities" (p. 44); and Roberson (2006) described inclusion as the removal of obstacles that prevent employees from contributing. In more recent years, Shore et al., (2011) defined inclusion as "the degree to which an employee perceives that he or she is an esteemed member of the work group through experiencing treatment that satisfies his or her needs for belongingness and uniqueness" (p. 1265). Despite the varying versions of defining inclusion, the common theme that emerged regarding inclusion is the concept of employees being recognized as equals by their organization and opportunities exist that allows them to positively contribute, be fully engaged, and fitting in. Inclusion must occur despite whatever difference may exist at an individual level. On this premise, it is paramount for organizations to have policies, practices, resources, and an organizational culture that promotes inclusion. A misconception is that once organization employees appears to represent diverse demographic grouping, the organization is one that promotes diversity and inclusion. An organization can promote diversity, but the practice of diversity and inclusion is not authentic if there are no interventions or initiatives that support inclusion.

BACKGROUND

The Department of Veterans Affairs Fast Facts (2018) outlined that there are approximately 18.2 million veterans in the United States. According to the Census Bureau, these veterans make up approximately 7.6% of the population in the United States. The veteran employee has often been classified as being equipped with a unique skill set, vast amount of training, experiences, impeccable work ethics, and characteristics (Minnis, 2017) all of which are beneficial to an organization. However, upon entering the civilian workforce, unlike the civilian employee, veterans are equipped with an added layer of challenges regarding social acclimation and acceptability within the "civilian world". Stereotypes as it relates to their personal, psychological, and in some instance, physical abilities, and perceived low educational level often contributes to that division within the civilian workforce. Considering this, veterans are classified as a diverse group that warrants organization not only to put forward diversification initiatives but also inclusion intervention. They are a protected class group within the United States Federal Protection guidelines (American with Disabilities Act, (1990); Uniformed Services Employment and Reemployment Rights Act (1994); Vietnam Era Veterans Readjustment Act (1974); Age Discrimina-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tion in Employment Act (1967). The purpose of this chapter is to: a) Discuss the transitional challenges of veterans as an underpinning of organizational diversity and inclusion in the civilian workforce, and b) Discuss strategies and approaches for promoting inclusion of veterans in the civilian organization.

CHALLENGES OF VETERANS TRANSITIONING TO THE CIVILIAN WORKFORCE

Although there might be a misconception regarding the number of veterans employed within the U.S civilian labor force, the U. S. Department of Labor (2017), provides great insight indicating over 10.6 million veterans employed in 2016 and of which, 3.2 million had served as active duty since September 2001. According to Stern (2017), by the year 2020, more than five million veterans are expected to return to the community and the civilian workforce. Stern (2017) further elaborated that veterans' connection to the labor force affords the quickest opportunity for a successful transition back home. Unfortunately, veterans, indicate that their biggest challenge is finding a job upon their return. McAllister, Mackey, Hackney, & Perrewe (2015), echoed this sentiment and reported that 44 percent of veterans' reintegration into the workplace (civilian workplace) involves great difficulties. As it relates to female veterans, there are higher unemployment rates, 7.3 percent in comparison to 5.1 percent, when compared to non-veteran females (U.S. Department of Labor, Bureau of Labor Statistics, 2016). Such employment challenges can be a direct result of difficulties that are more evident in some veterans compared to civilians such as post-traumatic stress disorder (PTSD) (Kukla, Bofils, & Salyers, 2015), mental and medical challenges and substance abuse problems (Humensky, Jordan, Stroupe, & Hynes, 2013). On this premise, it is imperative that organizations with the goal of promoting diversity and inclusion of veterans, in particular, HRD professionals, are not only aware of but recognize the value and unique skillset veterans possess (Hughes, Lusk, & Strause, 2016). Additionally, it is crucial that HRD professionals are knowledgeable of how to attract these veterans, be equipped with strategies and best practices to maintain, and possess the ability to effectively utilize the veterans (Hughes, Lusk, & Strause, 2016); while diversifying and promoting inclusion of veterans in their organizations.

From an employer's perspective, the overarching challenge regarding attracting and recruiting veterans is the misunderstanding and misconceptions regarding veterans' skillset, and overall military experiences (Davis and Minnis, 2017). More specifically, a challenge exists by employers trying to understand and translate the skillset and experiences presented by veterans on their resume'. This often has a rippling impact, which lends to the misunderstanding of how to adequately align the veterans' skillset and experience effectively within the workplace for the betterment of the organization and the veteran employee. In some instance, this lack of understanding minimizes the veterans' opportunity for consideration for employment. This level of misconception and misunderstanding lends to Hodges' (2018) belief that "while good intentions are laudable…if an individual has a desire to help but does not understand the population they intend to aid, their good intentions run the risk of going astray" (p. 89). This creates a recruitment challenge for the employer as it relates to veterans. Loughran (2014), echoes this sentiment adding one of the greatest challenges of employers when attracting and/or recruiting and hiring veterans is determining, based on their organization, how best to utilize the skills, talents, and potential of diverse individuals and organizational innovation to accelerate the business organization.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Negative Stereotypes and Misconceptions of Veterans

In addition to veterans' skillset, training and experiences being misunderstood, veterans are often faced with the challenge of having to defend negative stereotypes associated with being a veteran to their civilian counterparts within the civilian workforce (Prudential Financial Inc. 2012). This could be more challenging for the veteran who would have spent more time in the service and now transitioning to the civilian workforce as an older employee (Stone & Stone, 2015; Walker, 2013; Johnston et al. 2010). Hence, in addition to veteran related stereotypes, the veterans now have to defend stereotypes associated with being an older employee. Further, there is a misconception that all veterans have mental concerns recently referred to as "invisible wounds" (Aikins, Golub, & Bennett, 2015). This misconception in addition to mental stereotypes makes not only recruitment of veterans but also career transitioning of veterans more challenging. Although there is no supporting evidence that all veterans have invisible, wounds such stereotypes still negatively impacts veterans' opportunity for employment (Hayden & Buzzetta, 2014; Stone & Colella, 1996). According to the Department of Veteran Affairs (2016), it is estimated that only 11-20% of Post -9/11 veterans had some form of service-related illness.

According to Minnis (2017), there is often a misconception regarding training and prior experience obtained in the military by civilian hiring manager. The underpinning for this misconception is the limited knowledge regarding the quality and extent of training most veterans bring to the civilian workforce. More importantly, how to transfer and/or apply the knowledge, skills and abilities obtained in the military to a civilian setting quite often presents a challenge during the hiring process of veterans (Davis & Minnis, 2017).

From the veterans' perspective, the major challenge as it relates to transitioning to the civilian workforce is their ability to articulate skills and qualification obtained in the military to a resume' which can be effectively understood and translated by employers (Sargent, 2014). Veterans often need assistance with translating the skills, training, and experiences from military jargons to a language that can be understood by the civilian employer (Sargent, 2014; Troutman & Gagnon, 2014).) This creates a challenge in the attraction and/or recruitment and selection process of veterans.

While there are a variety of support systems in place for transitional veterans to the civilian workforce specifically through the VA, in some instances, some veterans are not aware of where to receive transitional support (Hunter-Johnson, 2017). Additionally, there are some gender restrictive support systems for veterans (Szelwach, et al. 2011). This creates unwarranted stress and impedes the career transitional process for veterans (Szelwach, et al. 2011). This lack of support coupled with negative stereotypes hinders the transitional process (Hunter-Johnson, 2017).

Considering the transitional challenges encountered by the veteran employee and misconceptions by some employers regarding transferable skills of the veteran, stereotypes and misconceptions by civilian employees often contributes to exclusion of veterans from the civilian workforce (Davis & Minnis, 2017). However, it is paramount that HRD professionals utilize the transitional challenges of the veterans as a foundation to introduce and develop inclusion interventions that create a space for the veteran within the civilian workforce. Some questions that should be considered by HRD professionals as it relates to veterans are: Is the organizations promoting diversity and inclusion as it relates to veterans? Do veterans have a sense of belonging in the organization? Are veterans encouraged to participate and engage? Are organizations equipped to address the transitional challenges associated with the veteran worker? Are there policies, practices, and procedures in place that address diversity and inclusion of veteran employees in accordance with what federal law already requires?

SOLUTIONS AND RECOMMENDATIONS

Strategies and Approaches for Promoting Inclusion of Veterans in Civilian Organization

Employee Socialization and Orientation

The initial workplace learning and development intervention should be the veteran employee onboarding/orientation process. It is paramount to build a strong veteran onboarding/orientation/socialization program to ensure veteran recruitment and hiring initiatives are successful. It also provides an opportunity for the newly hired veterans to feel invested within their new position, team, and by extension, the organization. To promote not only diversity and inclusion but also a veteran-friendly environment which should be a reflection of the organization. The training should take into consideration the transitional challenges with the view of addressing these unique needs. On this premise, before such training intervention, it is paramount that HRD professionals are properly trained and knowledgeable as it relates to military culture, training and development, and language. The Harvard Business Review recommends extending training to all managers, recruiters, and leaders about military culture and language (Eisenhardt, Kahwajy, & Bourgeois, 1997)

As an adaptation to the organization is not only the expectation of the veteran employee, but it is also the expectation that the HRD professionals understand the needs of veteran employees. This knowledge of military culture, training and development, and language would lend to a smoother transitional period for both veteran employees and HRD professionals. It can also serve as a reinforcement for training other civilian employees and should be helpful in the event they may encounter communication gaps with their veteran colleagues. Also, HRD professionals being equipped with previous knowledge regarding the military and other possible skillsets, qualifications, and training of veteran employees would be beneficial with ensuring that veteran employees are properly assigned to the right position, hence promoting the ideal person/environment fit within the organization. This can have a positive impact as it relates to maintaining the veteran workers' development and retention in a specific position.

In addition to prior knowledge regarding the military as the groundwork of this training initiative, it is equally paramount that HRD professionals are knowledgeable about how to provide training to non-traditional adult learners (Werner & DeSione, 2012). Knowles' (1990) principles of adult learning suggested ways to teach adult learners by considering methods of relaying the information i.e. incorporation of technology, amount of information, sequencing of information (space vs. mass learning opportunities); learning environment condition; age related practical examples; age related jargons; learning styles; and prior learning experiences. Additionally, efforts should be made by the HRD professional to promote self-directed learning practice. Likewise, it is equally important to provide training with transfer of training as the underpinning.

The Socialization Process

According to Werner and DeSimone (2012), organizational socialization is defined as "the process by which an individual acquires the social knowledge and skills necessary to assume an organizational role" (p. 257). In this regards, HRD professionals should seek to establish creative strategies, specifically crafted interventions, to ensure that veteran employees, who may initially be considered an outsider by current

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

employees, is provided resources and training to adjust to an accepted employee of the organization. Establishing customized onboarding, socialization, and orientation training for veterans are options for HRD professionals to consider (Saks & Gruman, 2012).

During the socialization process, it is essential that HRD professionals thoroughly discuss organizational roles, group norms, culture, and expectations to assist older veteran employees with feeling welcome and included in the new work environment. It is also paramount during this phase that HRD professionals discuss veteran friendly HR policies and procedures (Werner & DeSimone 2012). They must make all employees aware that Ageism and Disability are federally protected statuses according to the Age Discrimination in Employment Act of 1967. These activities will also assist veteran employees who may be experiencing culture shock in their new civilian work environment.

It will be equally beneficial if civilians, within the organization, are equipped with some background information regarding the military, skills, and training obtained by veterans. They can also benefit from understanding how veterans' experiences apply to the workplace. This may help minimize negative stereotypes and stigmas civilian employees may have regarding veteran workers. Adequate, veteran friendly training initiatives should have already been extended to the general employee population (Stone, Lengnick-Hall, & Muldoon, 2017). During this process, it is equally critical that HRD professionals take into consideration the transitional challenges of the veteran employee and utilize this as a foundational platform for the socialization process of the veteran employee. Additionally, while emphasis is on the veteran employee, it is paramount that employees who may me transferring, whether from one department to another or from one location to another also part-take in this process. Emphasis should be placed on strategies to assist the veterans with the acclimation process to the civilian workforce. For example, there should be training sessions with a focus on the value of veteran workers and the qualities veteran workers brings to the organization (Hardison et. al, 2015). Training sessions can also focus on organization goals, missions, values, strategic plan, and the organization's policies and procedures regarding diversity and inclusion. The training intervention's mode of delivery for this type of training content should not be limited solely to online or computer generated but should be facilitated face-to-face and over weeks and not hours to ensure proper acclimation (Hunter-Johnson, 2018). Additionally, these type of training interventions should include principles of adult learning (Knowles, 1990). Proper socialization into an organization can have possible positive outcomes such as increased organizational commitment (Allen & Shanock, 2013), reduced employee turnover (Yang, 2008), and enhanced employee performance (Beheshtifar, Rashidi, & Nekoie-Moghadam, 2011) regarding the veteran employee. Socialization into the work environment can serve as a great strategy for retention of veterans as civilian employees (Ford, 2017).

Mentoring Programs

Werner and DeSimone (2012), defines mentoring as "a relationship between a junior and senior member of an organization that contributes to the career development of both members" (p. 424). A mentoring program can contribute to the career development and psychosocial needs of the older veteran employee and can mimic an informal or formal approach (Burton Blatt Institute, 2013; Bynum, 2015; Kirchner & Minnis, 2018; Monster, 2016). According to Zachary (2009), mentoring programs can be extremely beneficial to the organization including facilitating the socialization of new employees, reducing employee turnover, minimizing midcareer adjustments, enhancing the transfer of knowledge and values, and facilitating adjustment to retirement. Caution should be given to the approach of the mentoring program

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

regarding whether the program is formal or informal (Burton Blatt Institute, 2013; Kirchner & Minnis, 2018; Monster, 2016) and an examination of the impact of the age difference between the mentor and mentee (Finkelstein et al., 2003). This could be a beneficial strategy for maintaining the development of older veteran employees and civilian employees.

Providing a veteran employee-mentoring program within an organization where veterans mentor other veterans can prove to be beneficial not only to the organization but also to the veteran employee (McLean, 2016). Some benefits associated with a veteran mentoring program include promoting a smoother transition of the veteran employee to the civilian workforce. It can also promote inclusivity in the workplace between veterans and civilian employees. Further, a veteran mentoring program provides an opportunity for veteran employees to network with other veteran employees, provide a potential confidence boost, and could unearth untapped employee skills and potential within the workplace. Additionally, a veteran mentor can assist the veteran employee with career transitional challenges and concerns that cannot, necessarily, be addressed by civilian employees (McLean, 2016) Lastly, a veteran mentor can assist with career opportunities, career advancement and establishing a definitive career path within the organization.

Strategies for Developing a Veteran Employee Mentoring Program

There are some strategies as described in this section that may be helpful to HRD professionals as they seek to develop a veteran employee mentoring program. The strategies are networking, veteran affiliate group formation, and employee counselling and wellness programs. These strategies can all contribute to better inclusion of veterans within the civilian workplace.

Networking

Connecting veterans within the organization with other veteran employees is important. As HRD professionals, it is imperative that consideration is given to pairing of the mentor and the mentee as it relates to the position of authority within the organization. Taking into consideration the veteran employee familiarity and respect for the chain of command/ hierarchical structure, it is suggested that both the mentor and mentee be at similar levels within the organization (Eells, 2017). Pairing a senior employee (position of authority) with a veteran (who may be in a junior position) may create a barrier to the intended learning process between the mentor and mentee. Hence, possibly resulting in negative ramifications and the mentor/mentee relationship. Caution should be given to the age difference of the mentor in relation to the mentee.

Veteran Affiliate Group

Another mentoring approach can be through a veteran affiliate group of employees within the workplace. The HRD professional can facilitate any needs or special needs of this special interest group of volunteers. It is paramount as the HRD professional to ensure that participants of these groups share similar goals and objectives. This will contribute to strengthening that networking among veterans. A veteran affinity group is classified as a group whose focus is to assist new hired veterans as it relates to acclimation, increase morale and a level of comfort (Bell, Harvey, & Freeman, 2016).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Employee Counselling and Wellness Programs

Most major organization invests in employee counseling and wellness services for the overall well-being of the employees from an emotional and physical health perspective (Werner and DeSimone, 2012). Such programs can mirror a one-time discussion with a professional, a myriad of sessions, on-site or referrals. Examples of employee wellness programs, which are also effective of promotion of health and healthy living (a great maintenance strategy for older workers) include: fitness centers, yoga class, pharmaceuticals services, therapy, substance abuse services, health related seminars, care giving and much more Werner and DeSimone (2012). Employee wellness programs can be categorized into six components: a) Problem identification, b) Education, c) Referral, d) Counseling, e) Treatment/Intervention and, f) Follow-Up (Werner & DeSimone, 2012, p. 359). However, as HRD professionals, it is imperative that an organization that is focused on maintaining veteran employees craft a unique employee wellness program that not only addresses the transitional needs of the veteran but also any acclimation needs, physical, emotional and mental needs associated with the previous deployment (Tanielian et al., 2008). Some possible suggestions with regards to employee wellness programs include but are not limited to: veteran transitional programs, veteran support groups, veteran resources regarding transition, workshops and training session in collaboration with the Veteran Affairs, Veterans Employment Center and Skills Bridge, and any other federal resources and programs.

Also, organizations, facilitated by HRD professionals, can establish veteran retention programs which are driven by research regarding best practices coupled with empirical research with a focal point on veteran career transitional challenges, support systems needed, job satisfaction, retention, and acclimation to the civilian workforce culture. An extension of this veteran retention program can be a veteran-centric career map (Ford, 2017) to assist veterans. To track the progress and success of the veteran employee, HRD professionals should incorporate veteran-centric career mapping tracking system with the view of tracking the progress of the older veteran employee success regarding all integration initiatives (Ford, 2017). Last, to promote a deeper understanding of veterans' transition and retention to the civilian workforce, HRD professionals can provide career development, organizational education, and hiring support. This will also contribute to easing the career transition of veterans while contributing to veteran career transition needs (Minnis, 2017) hence contributing to retention and maintenance of the older veteran employee. According to the 2016 Veteran Talent Index, 69% of organizations had established veteran retention programs; a vast increase from 32% in 2014. This is a clear indication of the value of such a program and its positive impact on retaining and maintaining the veteran employee.

Veteran Friendly HR Policies and Procedures

The overarching strategy that should be implemented by organization to support the veteran employee, while balancing the workforce, is ensuring that there are relevant veteran friendly HR policies and procedures in place at the organizational level that would assist in promoting a culture that support veteran employees. They should also consider organizational policies regarding a flexible workplace. Because there are veteran employees within the organization as post-retirement employees, it is important that such workers have the option to work flexible hours, if possible, to accommodate their individual needs. Flexible working hours should not only be considered a workplace practice but should also be supported by organizational policies. Some possible policies and procedures could reflect the inhibition of rigid

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

design and structure of full-time jobs (Werner & DeSimone, 2012), which could give the illusion of only addressing the needs of the younger civilian employees.

Veteran Friendly Inclusion Initiatives and Career Development Practices

Many business organizations throughout the United States that are striving to be classified or classify themselves as military friendly organizations (Kirchner& Minnis, 2018). However, "military friendly standards regarding policies, practices, or characteristics do not currently exist for business organizations supportive of military veterans " Kirchner & Minnis, 2018, p. 2). On this premise, it is suggested that organizations that perceive themselves as military friendly organizations consider incorporating these four military/veteran friendly initiatives and practices. The incorporation of such initiatives should assist with the inclusion of veterans at an organizational level.

1. **Promoting an All-Inclusive Work Environment:** Often within an organizational context, the term promoting an all-inclusive work environment often has a focus on minority or disadvantaged groups (women, employees with disabilities, and some ethnic groups). However, as it relates to promoting an veteran-friendly organization, emphasis should also be placed on strategies and best practices that ensure that veteran employees feel valued and appreciated; are actively involved within the organization; and feel a sense of belonging and value; are involved in decision making processes; and have an overall level of support and mutual respect from employees.
2. **A Multiplicity of Training and Development Initiatives:** It is paramount that there be a myriad of training and development initiatives, with emphasis on diversity and inclusion of veterans. It is equally important that those training initiatives are offered on a consistent basis and include a variation of delivery methods and instructional techniques ensuring to address the specific needs of veteran employees. In alignment with a veteran friendly organization, examples of possible training initiatives can include but are not limited to: diversity and inclusion training, attitude adjustments, person/environment fit (with the view of accommodating employees veteran employees according to federal law), job design as applicable, adjustment practices to address the military employee, promoting employee engagement and satisfaction strategies, and much more (Liggans et al. 2018).
3. **Stigma Adjustments:** Regarding veteran employees there are a myriad of stigmas associated with being a veteran employee inclusive of both positive and negative. However, in most instances, the negative stigmas such as veteran employees creating a financial drain on organizations (Greenberg & Rosenheck, (2007), more of a physical at risk compared to younger workers (Stone, Lengnick-Hall, & Muldoon, 2018), or mental/cognitive challenges (Stone & Stone, 2015) must not be tolerated. Instead, the culture within a veteran friendly organization is one that discourages negative attitudes towards veteran employees
4. Recognizing the overall needs associated with the veteran employees and ensuring that there are strategic plans in place that address these needs while still in congruence with overall business practices and policies. Thereby, promoting an overall supportive work environment for veteran workers.

FUTURE RESEARCH DIRECTION

The infusion of veterans within the civilian workforce is a historical topic in the field of Human Resource Development, Human Resource Management, Organizational Psychology, and Military literature. Veterans have been leaving the military for civilian work for centuries. However, there is still a need for more in-depth empirical research that explores best practices as it relates to veterans transitioning to the civilian work force, inclusion and diversity, and strategies for promoting transfer of training of veterans' knowledge, skills and abilities (KSAs) to the civilian workforce

CONCLUSION

The transitioning of veterans from the military world to the civilian world and by extension, the civilian workforce is a major career transition. To facilitate this challenge, this chapter focused on strategies grounded in diversity management (Byrd & Hughes, 2018) as a foundational platform for developing strategies for promoting inclusion of veterans. Emphasis was placed on inclusion and diversity with a focal point on successfully recruiting, retaining, and career development of veterans. Although veterans are highly motivated to enroll in higher education with the view of credentialing themselves with qualification recognizable by the civilian employer (Hunter-Johnson, 2018) they are encountered with a vast amount of transitional challenges (Hunter-Johnson, 2018). Once relevant credentials are obtained, emphasis is now on the employer and/or organization seeing value in the veteran employees through recruiting, retaining, and career development of the veterans while taking into consideration the transitional challenges of veterans to the civilian workforce.

The transition of veterans to the civilian workforce is a topic that warrants much research with the vast influx of veterans to the civilian workforce. There are still challenges with veterans not being hired in the civilian workforce due to stigmas, age, misconceptions, and lack of knowledge by some civilian employers. In addition, once veterans are hired, there are still transitional challenges, in particular, acclimation to the civilian workforce that needs to be addressed that hinders the veteran employee job satisfaction and retention rate. Veterans are valuable employees that bring, in most instances, the unique skillset that can be beneficial to the organization.

From an organization perspective, it is paramount to strive to be not only an organization that recruits veterans but also one that promotes diversity and inclusion of veterans. This promotion of diversity and inclusion must be evident in both policies and practices. There should be standards, policies, and practices that support the veterans as the diverse employee while promoting inclusion. The organizational culture should be one that supports not only the recruitment and selection of veterans but also job satisfaction and retention of veterans.

KEY TERMS AND DEFINITIONS

Career Transition: Moving from one career (job) to another.

Career Transitional Challenges: Any challenges associated with changing careers.

HRD Professional: An individual employed within an organization (public or private) and task with the responsibilities of human resource development.

Inclusion: Is the concept of employees being recognized, as equals by their organization and opportunities exist that allows them to positively contribute, be fully engaged, acceptance despite whatever difference may exist at an individual level.

Veteran: An individual, male or female, who would have served in any branch of the military and voluntarily or involuntarily departed.

Veteran Employee: A veteran employed within the civilian workforce.

Workplace Learning and Intervention: Structured work experience that provides a firsthand opportunity for employees to receive on the job training and development.

Chapter 93
Who Engineering Includes Impacts How Engineers Work: Diversity Challenges and Design Thinking Solutions

Stephen Secules
Florida International University, USA

Alexandra Coso Strong
https://orcid.org/0000-0003-4988-361X
Florida International University, USA

Trina Fletcher
Florida International University, USA

ABSTRACT

This chapter focuses on the persistent lack of diversity in the engineering profession along intersections of race, gender, and other key demographic categories (e.g., sexual orientation, socioeconomic status). After outlining specific circumstances that have influenced the lack of diversity in engineering, the chapter outlines particular challenges related to this lack of diversity and suggests a design thinking approach to resolving those challenges. Drawing on research from engineering education, design thinking, and workplace practice, the authors provide both familiar and novel strategies for addressing diversity in engineering as well as in other professions.

INTRODUCTION

Although many view engineering as a purely technical domain, it is fundamentally social, as it is always working with and in service of people (Bucciarelli, 1988; Hynes & Swenson, 2013). Every stakeholder connected to a project is a person: the client and organization, the design team, other consultants, impacted members of the public, government regulators, shareholders or other investors, and representa-

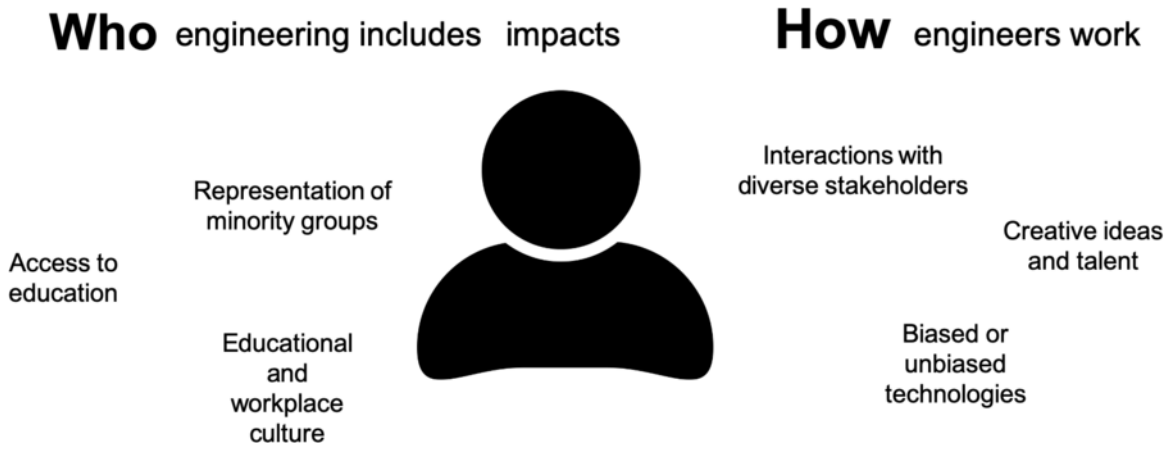
tives of other concerns such as the environment. In an increasingly global and interconnected society, the people with whom and for whom engineers must work have become increasingly more diverse and interconnected. To be an engineer is increasingly to communicate with, empathize with, and design for the problems of a wide variety of individuals spanning diverse demographics and perspectives.

Engineers have largely not increased their diversity parallel to the wider diversity of their stakeholders. Engineering has historically and persistently been a field that is dominated by certain demographic groups (Secules, 2017b). Since its formal organization in the 19th century, engineering has been predominantly white, male, straight, middle-class, and western-centric. This exclusion was formalized through educational pathways and professional societies through the 20th century. In the late 20th century, Civil Rights and Women's Rights movements paved the way for the moral imperative and progress for diversity in professions like engineering. Nevertheless in the 21st century, trends for demographic shifts in engineering have stalled in the United States.

This exclusion of other groups from engineering has meant that engineering solutions are often designed with a bias towards the same exclusive demographics as the engineers themselves. As progress on diversity stalls and the challenges engineers must respond to increase, we see and advocate a set of solutions grounded in design thinking (Brown, 2009) that 1) changes **who** engineers are by designing diversity into the profession, and 2) changes **how** engineers work within their existing and future professional settings (Figure 1).

Figure 1. Changing who engineering includes will impact how engineers work



Authors' Perspectives

The authors of this chapter come from an engineering education research perspective. Each of us have experience with educational and professional engineering contexts, and our perspective is informed by the knowledge that these are interconnected systems. In our current roles as engineering educators and researchers, we are cognizant of the ways that education is creating or reinventing the engineering profession of tomorrow, and the ways that our educational system can be bound up in the current and eventual realities of the engineering profession. By focusing our attention on the lack of diversity and

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

opportunities for change in the engineering profession, we hope to encourage further collaboration and cross-pollination of ideas about diversity challenges from educational contexts to industry work settings and vice versa.

THE ENGINEERING PROFESSION LACKS DIVERSITY

History of the Engineering Profession as Exclusive

When discussing diversity in engineering, historical context helps clarify the particular aspects of exclusion at play that may not be present in other professions (Secules, 2017b). Although the field of inventing and using math and science to solve problems existed informally for several hundred years, the engineering profession was largely formalized in the 19th century (Oldenziel, 1999). Prior to the 19th century, the inventive field (represented in western society by terms like "the useful arts") was largely inclusive. Although women were socially constrained to the domestic sphere, their inventions were recognized as similar to men's in the industrial sphere. Likewise, labor classes constructing a building were seen as part of the engineering work.

The formal organization of the engineering discipline in the 19th century created a professional class for engineers that was exclusive to middle-class white men (Oldenziel, 1999; Secules, 2019). To become an engineer required higher education training that was exclusive to this group. Publicly-funded Historically Black Colleges and Universities were excluded from engineering and science degrees through much of the 20th century and only won access due to legal challenges, some of which still continue today (Fletcher et al., 2019; Slaton, 2010b). In white universities where engineering was offered, a common gender divide separated men as engineers and women as home economics majors (Bix, 2002).[1] Although the sudden need for technological advancement in World War II opened employment possibilities for women and racial minorities, these employment options were temporary and limited as the educational system and professional societies prevented full access to the profession (Bix, 2004; Shetterly, 2016; Slaton, 2010a). Subject to persistent structural exclusion, a stereotype of a straight, White, male middle-class professional came to be synonymous with engineer, creating a system of cultural embodied exclusion (Faulkner, 2007a; Secules, 2019). In the late 20th century, Civil Rights and Women's Rights movements paved the way for the moral imperative and progress for diversity in professions like engineering and created diversity initiatives for workplaces and education. In the next section we take stock of the current state of engineering diversification in the 21st century.

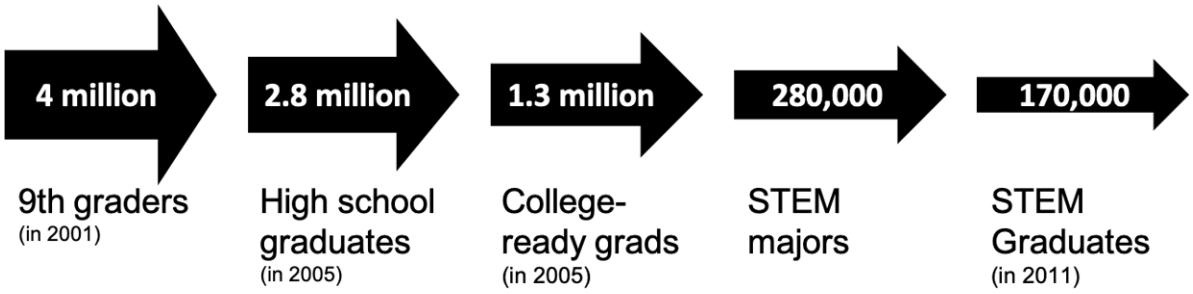
Current State of Engineering Diversification

The current state of diversity in engineering is best reflected by noting diversity at stages of academic and career progression (Figure 2). At the pre-college level (i.e., K-12 schooling and informal learning), racially underrepresented minority (URM) students are just as likely as their majority counterparts to be interested in pursuing Science, Technology, Engineering or Mathematics (STEM) education and careers. However, they are less likely to actually apply, enroll, and complete STEM degrees than their White peers (Gasman & Nguyen, 2016). From a gender standpoint, prior to college enrollment, research shows that female students perform equal to or better than male students in math and science classes, yet in most STEM fields their participation is much lower than their male identifying counterparts (O'Dea

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

et al., 2018). According to the National Center for Educational Statistics (NCES), women comprised only 36% of all STEM degrees awarded in 2017 and only 22% for engineering (U.S. Department of Education, 2017).

Figure 2. The leaky pipeline in engineering and how African American students are impacted
(adapted from President's Council of Advisors on Science and Technology, 2012; Reid, 2014)



Finally, the engineering profession in the United States is overwhelmingly White non-Hispanic (70%) or Asian (16%) and compromised of men (85%) (National Academy of Engineering, 2018). All other racial / ethnic groups and women are underrepresented in engineering relative to their national demographics. For example, women make up 51% of the US population (United States Census Bureau, 2019) but only 15% of the engineering workforce (National Academy of Engineering, 2018). African Americans make up 13% of the US population (United States Census Bureau, 2019) but only 4% of the engineering workforce (National Academy of Engineering, 2018). Thus although some progress is being made in pre-college and higher education spaces, the engineering profession continues to be even less diverse than the stages of educational attainment that feed into it. Table 1 below further highlights the lack of parity across varying racial / ethnic groups and gender when considering all engineering and science occupations.

Table 1. Workers in science and engineering occupations across gender and racial/ethnic groups

S&E Occupations	Race/Gender Population	U.S. Population
49%	White men	31%
18%	White women	31%
14%	Asian men	3%
7%	Asian women	3%
3%	Black men	6%
2%	Black women	7%
4%	Hispanic men	9%
2%	Hispanic women	8%
2%	Other men and women	3%

(adapted from National Center for Science and Engineering Statistics, 2017)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

While the underrepresentation of other minority groups is harder to assess, several scholars have identified issues with representation and inclusion of LGBTQ engineers (Cech & Pham, 2017; Cech & Waidzunas, 2011), low socioeconomic status and first generation college attendees (Smith & Lucena, 2016), disabled students (Groen et al., 2018), and other groups. Further, people at the intersections of multiple systems of inequality / oppression, for example Latina women from low socioeconomic backgrounds, face even greater challenges and are even harder for researchers to assess (Camacho & Lord, 2011; Mitchell et al., 2014; Secules, Sochacka, et al., 2018). In general, the engineering profession has remained stagnant when it comes to diversifying the field for individuals from varying backgrounds.

How Circumstances Prior to the Profession Create the Lack of Diversity

Pre-College Access to Engineering Education for Diverse Populations

While the reasons for the lack of diversity in engineering are many, there are a few well-documented areas we continue to witness related to diverse populations in engineering at the higher education level and in industry. They include (1) inadequate academic preparation for engineering courses prior to entering college, (2) a lack of access to high quality activities and programming to increase interest in pre-college engineering education and (3) a lack of access to mentors and role models within engineering who they can see themselves in.

When considering academic preparation for college-level prerequisite courses for engineering and upper-level engineering courses, studies have shown that heavily URM-populated secondary institutions and high schools in low-socioeconomic status neighborhoods often do not have adequate facilities, labs or qualified teachers for courses students need to enter engineering in college (Change the Equation, 2015; James & Singer, 2017; Smith-Evans et al., 2014). Additionally, research has found that URMs, especially girls of color, are often steered away from math and science classes across all schools and encouraged to take classes that promote and focus more on communication and dialogue, which leads to the underrepresentation of URMs in Advanced Placement (AP) STEM courses and those same students scoring lower on ACT and SAT exams (Smith-Evans et al., 2014). In many of the same neighborhoods and schools, students are less likely to have programs or course electives, in school and out-of-school, which allow them to learn more about engineering education including more known national programs such as FIRST Robotics and Project Lead the Way (PLTW).

Research has shown that a lack of mentors and role models within pre-college educational settings, both formal and informal, have played a role in the stagnant and, in some cases, declining number of URMs pursuing engineering, especially women within that population (Fletcher et al., 2017; James & Singer, 2017; Mondisa, 2015). Mentors and role models play a major role in whether or not underrepresented students believe that they can succeed in STEM professions.

Diversity, Equity and Inclusion and Engineering Education in Higher Education

The previous section focusing on challenges within the pre-college space highlights the eventual underrepresentation we see at the higher education level. According to the National Center for Educational Statistics, as of 2017, women only made up 25% of engineering bachelor's degrees awarded, although they made up 57% of all bachelor's degrees awarded that year (U.S. Department of Education, 2017). Although this number clearly reflects parity issues within the field, it should be noted that that figure is

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

up from 20% in 2015. Additionally, there have been incremental improvements in the number of women within the varying ethnic groups over the years. For example, the percentage of White women obtaining engineering degrees among all White students increased from 18% in 2012 to 21% in 2017. For African American women, their share of their ethnic group increased from 24% to 27%. Similar results were found for Hispanic/Latinx women with their share increasing from 21% to 24% between the same timeframe (U.S. Department of Education, 2017).

Beyond representation, there are also interconnected issues of inclusion in higher education. Students in visibly minoritized populations in engineering, such as women and Black and Latinx students, are often subject to spotlighting by faculty and peers (McLoughlin, 2005) and a feeling of hypervisibility (Blosser, 2019), due to their lack of critical numbers in engineering classes. This experience of hypervisibility can create a sense that each individual is representing their entire population group. The result can be circumstances that introduce and reinforce stereotype threat, which has been shown to decrease students' academic performance (Bell et al., 2003). In addition, majority peers and instructors often form classroom culture and practices around majority cultural norms, and construct narratives about individuals who do not fit into those norms as an individual deficit (Secules, Gupta, et al., 2018). In sum, the many individual mental and interpersonal strains created for minoritized students result in an inequitable educational experience.

The experience for less visible minorities, such as LGBTQ students and first generation college students, in engineering higher education is also difficult. LGBTQ students experience marginalization and feel pressure to pass and hide their LGBTQ identities to fit in with the mainstream (Cech & Waidzunas, 2011). Students who are first generation college students must draw on alternative forms of cultural capital in a system that is less familiar to them (Smith & Lucena, 2016). In addition, as experiences that are relatively hidden from caring instructors and without institutional support structures, these students are often left with less support than other minoritized student groups (Secules, Sochacka, et al., 2018). Similarly, students at the intersection of multiple systems of oppression may experience additional challenges not only with multiple forms of marginalization, but also with university support structures, for example being one of a few Black women or lesbians in a women in engineering support group (Secules, Sochacka, et al., 2018).

Impact of Pre-College and Higher Education Issues on Diversity in Engineering Industry

Ultimately, the net effect of exclusion and inequity in pre-college and higher educational settings compounds in engineering industry. As noted, there is an even greater lack of diversity in the engineering profession, as some diverse individuals who completed engineering degrees will choose to leave the field after completing their degrees. Hiring practices can exacerbate these circumstances, with workplaces choosing individuals who "fit" more easily with a company culture (Rivera, 2012). Given the racial, gender, class, and cultural makeup of engineering workplaces, these forces function as discrimination, whether intentional or unintentional. This process of recreating demographic associations with engineering through cultural processes accords with a theory of cultural reproduction (Secules, 2019; Seron et al., 2015), wherein the culture created by a dominant demographic group creates an unwelcoming environment for non-dominant groups and thereby recreates their own demographic dominance. The process of creating masculine demographic associations has been widely confirmed across several examples of

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

masculine-associated professions and hobbies (Bird, 1996; in engineering, Faulkner, 2007b), and the same likely holds true for other demographic groups.

As a specific example, women of color in engineering experience challenges based on lack of role models (Ross, 2016), thus there is an additional compounding effect from the lack of inclusion of women of color, a specific enacted example where lack of inclusion recreates demographic exclusion. In addition, women of color in engineering note gender and racial bias, stereotypes experienced in the workplace, unfair performance evaluations, and lack of honest feedback (Fletcher et al., 2017; Ross, 2016; Yates & Rincon, 2018). One in four women leave the engineering profession within the first five years, a rate much higher than their male counterparts (Yates & Rincon, 2018).

How Lack of Diversity Causes Problems within Engineering Professional Work

When examining the impact of the lack of diversity in the engineering workplace, it is critical to consider the impact on the actual work of engineers. For instance, in the design of many systems, engineers can fall victim to the practice of assuming that a product design is fine "as long as it works for them and their experience" (Coso & Pritchett, 2015, p. 6). Studies of engineering organizations have illustrated how some engineers assume that they understand the experiences of everyone based only on their own experience (Coso & Pritchett, 2015). The tendency to discount or to not have awareness of the experiences of broader and more diverse user groups is compounded by the lack of diversity within engineering organizations. Engineering teams and organizations, especially those without diverse compositions, become hubs for user perspectives that are limited in their understandings of the broader population.

Homogenous engineering teams can also foster negative attitudes towards individuals from other disciplines who bring different perspectives and ideas (Coso & Pritchett, 2015). These attitudes can impact the decisions made within a product design process and ultimately, the effectiveness of the final product. Within the aerospace industry, for example, an engineering team may not only consist of engineers, but also individuals trained in human factors or psychology. Their role on the team is to identify and integrate the considerations of a diverse set of stakeholders within an aerospace vehicle design. However, when their perceptions are not valued on a team (Coso & Pritchett, 2015; Feigh & Chua, 2011) or their perceptions are not considered due to lack of representation on that team, there can be problems even later in the design process or with the final product. In the case of one aerospace organization, a human factors specialist described:

[human factors]-related research and groups are the first to have funding cut when it comes to the budget...yet...there may be problems two years later in manufacturing that could have been prevented if the [human factors] specialists had been involved at the beginning of the process. (Coso & Pritchett, 2015).

The lack of consideration of diverse stakeholders, whether caused by an n=1 approach to design or the lack of inclusion of human factors and related professionals, can have substantial impacts on the final design of a system and/or product. In some cases, these actions can have unforeseen consequences on individual users. For instance, military aircraft and other vehicles have been traditionally built with the 90-95th percentile male measurements and body characteristics in mind (Weber, 1997). Thus, both women and small-statured men can be placed at a significant disadvantage when piloting those systems (Weber, 1997). The outcomes of this bias in engineering technologies are a result of the lack of diversity in engineering coupled with a lack of strategies to think and design across different populations. In recent

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

years, noted examples of bias have been found in facial recognition software, where products work best for white faces (Garvie & Frankle, 2016). In 2018 a video of a Black person attempting to use a soap dispenser went viral—the soap dispenser worked only for lighter and more reflective materials. Finally, for a period of time, car crash test dummies were designed for an average adult male-sized person, and thus the safety conditions of cars were not tested or designed for the average sizes of women or children (Criado-Perez, 2019). By excluding particular groups in the engineering decision-making process, engineers are creating exclusionary products and systems that have broad societal consequences that are serious and urgent.

SOLUTIONS AND RECOMMENDATIONS

Two Cases for Diversity in Engineering

There are typically two parallel arguments for working to diversify the engineering profession: 1) a pragmatic business case and 2) a social justice case (Tomlinson & Schwabenland, 2010). We name both here because it is important to understand the guiding motivations of yourself and of others who take up this cause.

In the pragmatic / business case, there is a profit-oriented argument for diversifying the engineering profession (Kochan et al., 2003). The typical elements of the pragmatic case are: meritocracy (if we anticipate that merit is evenly distributed across populations, then the best and brightest engineers will come from a cross-section of demographics), creativity (people from different backgrounds think differently and the widest variety of ideas will come from the widest group), public relations (valuing diversity is a positive public relations move in today's society), and ultimately profit (diversity will lead to better work and therefore profit). Many workplaces are oriented primarily by these pragmatic elements of diversity and inclusion (Ahmed, 2012; Tomlinson & Schwabenland, 2010). By understanding that context when beginning to frame and enact solutions, individuals can consider how a business-oriented audience is likely to receive their messaging and what reforms will be considered a priority.

In the social justice case, there is a moral imperative for diversifying the engineering profession (Secules, 2017b; Slaton, 2015). The typical elements of the social justice case are: history (correcting a professional legacy of exclusion), privilege (redistributing the social power of the engineering profession), democracy (creating greater access to the tools of engineering), and ultimately justice (seeking a more equal world). This chapter opened with a historically-situated social justice framing for diversity in engineering, and this is often what orients academics, activists, and critical scholars who work towards diversification. For individuals coming from this perspective, there is typically a moral imperative and an urgency to correcting historical and present-day inequality that can be at odds with proponents of the business case.

Both the pragmatic case and the social justice case for diversity have communicative value-- commonly one or the other framing is more accessible to a particular audience. Yet both of these cases have some drawbacks. The pragmatic case could be considered optimistic and unrealistic about many lived realities of diversity in workplaces. Diversity may have a net social good, but it does not always linearly increase merit, productivity, good will, and a financial bottom line (Leonard et al., 2004). Sometimes increasing diversity causes workplace tensions, tough decisions, and accusations of special treatment. The pragmatic business case can lead to either lip service or naive faith regarding diversity that does

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

not take into account reality (Ahmed, 2012; Thomas, 2018). The social justice case takes on resistant constituents and calls out problems, but may be heard as a critique only and may not take into account the parallel goals and interests of a non-activist, for-profit business. Social justice cases for diversity, while prominent in academia and activism, can be sidelined in professional settings (Ahmed, 2012; Thomas, 2018).

This chapter proposes a third approach to diversity in engineering, one that draws on skills incumbent within engineering work. We propose that engineering is specifically connected to diversity through design. As engineering design helps create the built environment and technology, it has major impact on power, privilege, and justice. As engineering is pursued by individuals, their design is impacted by their individuality and thus their diversity. Engineers, and other professionals, can take a solution-oriented *design thinking* approach to diversifying engineering.

Design Thinking Approach to Diversity

Design Thinking has become a popularized term for describing the activities that an individual may employ to understand a problem and potential user population, generate ideas, prototype and test, and engage in an overall iterative process (Brown, 2009; Brown & Katz, 2011). Moving beyond the term, design and design approaches to problems have been long considered a central activity of engineering (Dym et al., 2005). Engineers are introduced to design activities as early as their K-12 education (Crismond & Adams, 2012) and in the first year of many undergraduate engineering programs (Froyd et al., 2012).

Figure 3 presents some of the key components of the design thinking process, and Figure 4 presents an application of design thinking to aspects of professional diversification. When engaging in Design Thinking, engineers question a problem to understand what a client or customer really want and whether the problem is even the root problem. Before considering a single solution, engineers seek to be divergent in their thinking, generating many possible (and even some seemingly impossible) solutions. Much of these initial design activities are performed with large amounts of uncertainty, such as with incomplete information or ambiguous objectives from the client. The challenges we face to support the diversification of the engineering profession and to enable solutions that consider more diverse user populations are large, complex, and filled with uncertainty. This uncertainty and complexity are at the heart of Design Thinking and are aligned with the skills engineers already use.

Another critical piece of this design approach is prototyping and experimentation. Prototyping is, in itself, a learning process. Engineers develop early state prototypes with the intention of them failing quickly, in other words, enabling them to explore many ideas in a short period of time (even if they fail), rather than spending a significant amount of time on a single idea, especially early on in the process. Prototyping new solutions for recruitment and/or workforce development, for example, would allow HR professionals and practicing engineers to learn more about the problem and the individual groups they are looking to hire. Overall, these design skills (i.e., problem definition, empathy, comfort with uncertainty, collaboration, idea generation, prototyping) have become important components of the engineering profession and engineering education, and many of these skills could be leveraged to improve diversity within engineering practice. The subsequent sections present different approaches for leveraging design skills to improve diversity during pre-college/higher education in engineering, within engineering workplaces, and within engineering professional work.

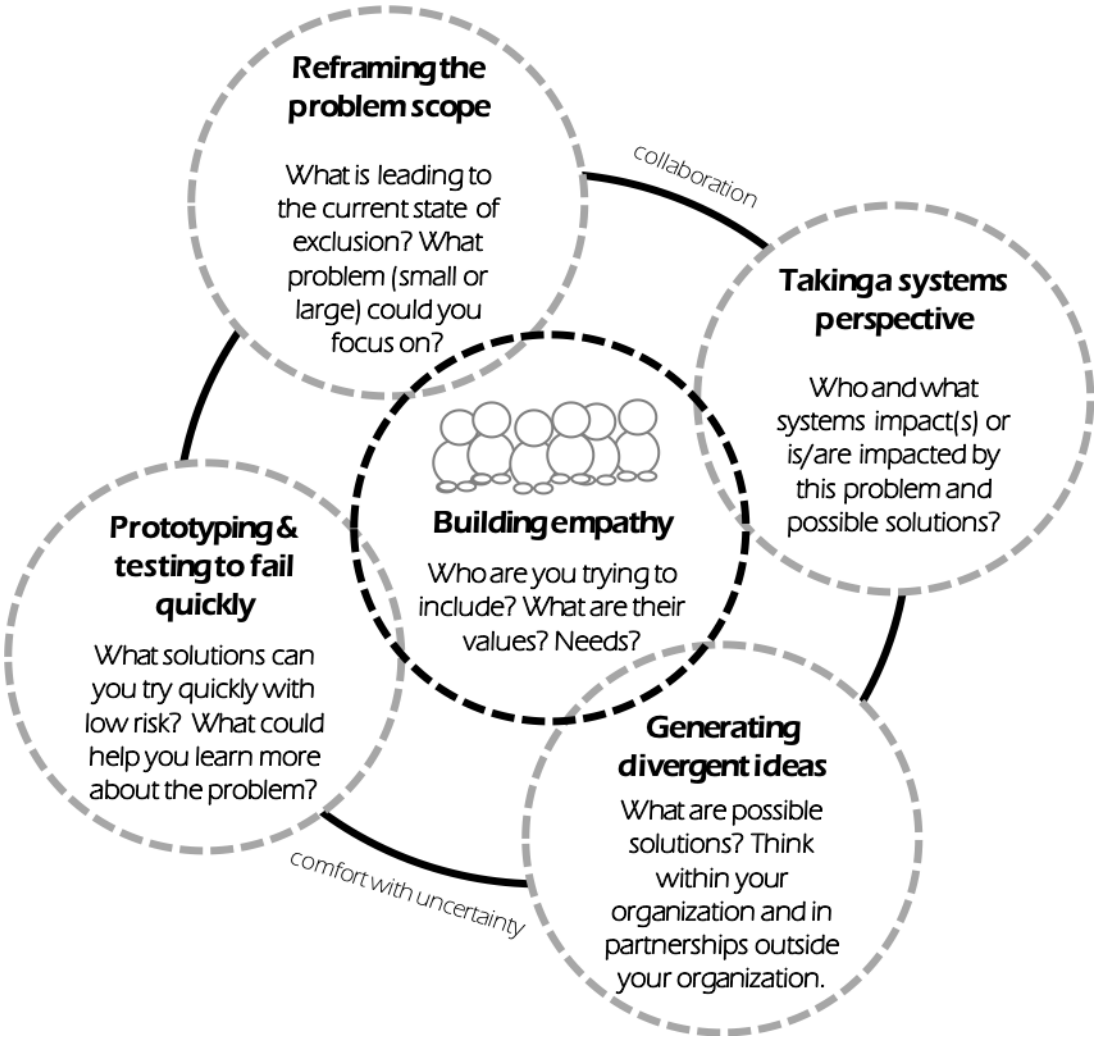
Figure 3. Components of design thinking

Solution #1: Increased Collaborations between Educational Institutions and Industry

Pre-college, higher education institutions and industry should make a concerted effort to better understand the roadblocks and barriers linked to underrepresented students and their quests for access to engineering education. These challenges that essentially creep into the higher education system, should also be kept in mind as the impact then affects the progress industry hopes to have from a diversity and inclusion standpoint within their organizations. When considering the desire to increase equitable access to jobs and inclusion for diverse employees in industry positions, improving collaborations between educational institutions, pre-college and college, and industry is of great importance.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Design thinking focused on diversity, equity, and inclusion



There are several avenues that can help make successful collaborations. First, prioritizing access to high quality engineering education for URMs will provide a level of exposure to the fields that would increase students' chances of being interested in engineering. Industry partners should be involved and engaged so that students can have real-world examples of their careers post higher education. Secondly, collaborators must champion equitable access to and support within engineering education programs for both pre-college and higher education programs. By making entering and remaining in engineering education more equitable, the number of URMs pursuing engineering as an undergraduate student should increase and the number of students who leave undergraduate engineering programs should decrease. Third, training on diversity, equity and inclusion for institutional leadership, faculty and staff at all educational levels should be implemented and fully supported by institutional leadership. This training could be aligned with existing efforts to develop industrial leaders' diversity intelligence, which enables them to value differences in individuals, without seeking to make the same (Hughes, 2016, 2018). Lastly, there should be a concerted effort to spread knowledge on the need and benefits of diverse populations

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

in engineering within the K-12 space, higher education and within industry. Companies that are working with educational institutions should increase their efforts to support student success within engineering not only while the students are in school but also as they transition into industry and throughout their careers.

In general, these groups could work more purposefully towards 1) understanding and building empathy for diverse populations and the value they add to organizations, 2) collaborating together to generate ideas about how to take overall diversity, equity and inclusion efforts to higher levels, and, lastly, 3) experimenting and prototyping ideas in all the spaces (i.e., K-12, higher education, industry).

Solution #2: Collectively Reflecting on Diversity and Inclusion

Engineering professionals can turn to their own organizations and reflect on their current diversity. Diversity and inclusion has been discussed as a "wicked problem" (Zoltowski et al., 2017), or as a complex interrelated problem that is well-poised to be better understood by a design thinking framework. Thinking creatively and iteratively about such a seemingly intractable problem can give people a better appreciation of the realities and constraints, new solution areas, and better regrouping after initial failures. Workplaces can also be conceived of as complex systems with many stakeholders. By thinking of each of these stakeholders as holding useful local knowledge about diversity and inclusion, and uncovering and mapping these perspectives in a safe environment, workshop leaders outside of a workplace have helped trigger reflection, action, and coordination around diversity and inclusion.

In a series of interactive workshops with academic and industry professionals, Secules and his collaborators have run an activity that helps people think about the local knowledge of challenges and strategies for improving diversity and inclusion in aspects of the organization (Secules et al., 2019). After discussing organizational mission and thinking about overlapping issues of diversity and inclusion, the workshop organizers provide a framework for thinking about aspects of a professional organization. For instance, when presenting at Carnegie Institute for Science, the categories co-developed with employees were: Policy, Personnel, Fundraising, Communication, Research & Development, and Outreach. All employees were then asked to create Post-it Note responses with categories of diversity and inclusion 1) questions, 2) known challenges, and 3) possible solutions that fit within each of the categories. They then posted them on large pieces of paper throughout the room, read each other's responses, and built on those responses (e.g., asking and answering each other's questions). The approach typically triggers reflection, conversation, and concerted action related to diversity and inclusion that has otherwise not been thought about or has stagnated. A similar approach was taken in a workshop with Penn State University, specifically around staff and faculty inclusion for LGBTQ and disabled students. The approach draws on Design Thinking approaches to problem scoping and ideation with a large group of stakeholders who have localized knowledge of an issue.

Solution #3: Designing for Diversity within Engineering Practices

Even with increased diversity within the profession, engineering will continue to be impacted by the lack of diversity that exists at the micro-level, particularly within engineering teams. It is practically not possible to represent all intersections of human experience on a single team. Thus, organizations and engineers should consider implementing engineering design strategies focused on human-centered and community-oriented design practice to help engineers engage in and elevate the diverse perspectives of

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

clients or customers. This solution may be implemented in the form of workforce development or become translated into interview questions to search for engineers with a mindset towards these design practices.

Design for Extremes

Grounded in universal design principles (Mcadams & Kostovich, 2011), many organizations design their products with the "extreme" users in mind (e.g., those who are at the extremes physically, those who hold viewpoints at the extremes). For example, one of the most prominent companies for kitchen tools, OXO, was inspired by the experience of a family member with arthritis who was trying to use a vegetable peeler (Wilson, 2018). By considering individuals who face challenges engaging with certain types of handles alongside those who don't, the design team at OXO created an innovative, intuitive, and comfortable handle for what became the Good Grips line that could be used by all (Wilson, 2018). The principles behind universal design enable the development of more accessible designs without the stigma that can be created around designing for a particular 'extreme' of the population. As a result, engineers could leverage this strategy to consider the experiences of those who are not represented within their engineering teams. First, what perspectives and experiences would someone from this sub-group hold? What physical or other characteristics might impact the ultimate design?

Collaborate Across Disciplines

In the same manner that engineers are trained in design, those individuals with a background in human factors, psychology, and/or cognitive engineering are trained to identify and integrate the considerations of a diverse set of stakeholders within a design. Currently some organizations are embedding these individuals within design teams to help those teams consider project stakeholders early and often (Coso & Pritchett, 2015; Pritchett & Strong, 2016). Alternatively, organizations can create opportunities for these specialists to consult on various projects (Coso & Pritchett, 2015; Pritchett & Strong, 2016). For example, a human factors specialist can be consulted to develop and test prototypes with an array of user abilities, constraints, and values. Therefore, even though the engineering team may not be diverse or have the training to incorporate these user considerations, the team has leveraged the expertise in their company to develop a product that can be used by a diverse population. While there are still challenges with this approach, as described in Section 2.3, HR professionals and engineers can promote this collaborative behavior by increasing the awareness of and appreciation for those with human factors or related specialties among existing employees and new employees.

FUTURE RESEARCH DIRECTIONS

There are several prominent research directions for broadening diversity and inclusion in the engineering profession. As noted, the authors of this chapter are members of the engineering education research community. At each stage of the educational and professionalization process, there are untold stories and unexamined issues in problematic cultures that recreate histories of demographic exclusion in the engineering profession. Taking on qualitative, critical, interpretive, or anthropological lenses to look at these cultural processes can help uncover new ways to shift that persistent pattern (Secules, 2017a).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In particular, we call for further collaborations with industry that can foster innovative research approaches. Currently, a group of engineering practitioners and engineering education scholars are working to create a scholarly community at this intersection through the development of an engineering practice research agenda (Brunhaver et al., 2018, 2019). While previous research has explored a series of topics at the intersection of engineering practice and the preparation of future engineers (e.g., experiences of those transitioning into the workforce (Brunhaver et al., 2011), the experiences of underrepresented groups in industry (Cech & Pham, 2017; Ross, 2016)), the resulting research agenda highlights a need to focus on diversity, equity, and inclusion in engineering practice.

Specifically, research should support our understanding of the power dynamics that influence who gets to participate in engineering practice, along with a deeper understanding of the impact lack of diversity has on engineering work and the workplace (Brunhaver et al., 2019). When we, as individuals, experience the societal implications of lack of diversity in engineering, the problem has already gone too far. As researchers, we need to identify the features of an engineering team, engineering design process, and an engineering organization that can prevent these situations from occurring in the first place. In addition, many organizations already work with universities and K-12 schools through outreach, scholarship, and internship opportunities. Yet, questions remain regarding what of these efforts are working, to what extent are they working, and what aspects of their design are influencing their success. Research is needed to explore existing relationships and partnerships between educational institutions and industry to examine the impacts of these partnerships and develop recommendations for achieving the greatest impact on students' pathways into and within engineering.

We note that one of the reasons more interdisciplinary workforce and education research collaboration has not yet taken place is that there are challenges faced by researchers who take on those projects. For example, access to potential research sites can be a challenge for academic researchers focused on industry settings (Stevens & Vinson, 2014). Industry also has more of an incentive for non-disclosure agreements and a desire for control over what is published about the company (Stevens & Vinson, 2014). Thus, we hope this chapter serves as an opportunity to be clear about the challenges and the opportunities that can come with taking on new cross-cutting research approaches, and an invitation for others to help overcome the challenges together.

CONCLUSION

We engaged with diversity in the engineering profession around two central topics 1) **who** engineers are in their demographic makeup, and 2) **how** that impacts engineering professional work. People engage with each of these topics from different perspectives. There are clear arguments for caring about who has access to engineering from a social justice perspective, righting historical inequities. There are also pragmatic reasons for caring about diversity in engineering, since a lack of diversity is directly tied to problems in engineering work, including biased technology and loss of talent. While we each bring our own motivations, we draw strength in fostering collective and interdisciplinary solutions that bring about multiple goals. We propose that the set of solution strategies and the framing of diversity challenges as design problems offer a new language for communication across disparate motivations and a pragmatic yet realistic framework for reasoning about these complex social issues.

KEY TERMS AND DEFINITIONS

Bias in Engineering Technologies: Engineering technologies that create inequity between different groups in society, either intentionally or unintentionally.

Business Case for Diversity: A case for the importance of diversity that is grounded in profit-oriented rationales based on creativity, meritocracy, and diversity of ideas.

Design Thinking: A set of activities that an individual may employ to understand a problem and potential user population, generate ideas, prototype and test, and engage in an overall iterative process.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Human Factors: Components of engineering design that focus on the aspects related to human users and operators.

Idea Generation: A component of design thinking focused on generating possible solutions to a given engineering design problem.

Intersections of Oppression: The co-existence of systems of power and oppression, such as gender, race/ethnicity, sexual orientation, ability/disability, and socioeconomic status.

Problem Definition: A component of design thinking focused on formulating the scope and boundaries of an engineering design problem.

Prototyping: Implementing and testing out ideas in an iterative way.

Social Justice Case for Diversity: A case for the importance of diversity that is grounded in the historical inequities and exclusions associated with a given profession or national environment.

Underrepresented Racial Minority (URM): A racial/ethnic group that is under-represented in the engineering profession relative to their representation in the US national population, e.g., African American and Latinxs.

ENDNOTE

ABSTRACT

Lookism issues have been studied in the fields of economics, social science, physiology, and business. Studies have shown that physical appearance affects employers' judgment about the quality of an employee. The purpose of this chapter is to explore the effects of lookism on career development in organizations. In addition, this chapter discusses the strategies for reducing lookism in the workplace from a human resource development perspective and provides four strategies for reducing lookism. First, legislation should include and address issues of physical attractiveness. Second, diversity education and training should be provided to students, employees, and employers. Third, diversity management should be practiced in the workplace. Fourth, appropriate employment processes should be adopted. Future research should study lookism over a wider range of occupations across different cultures. In addition, future studies should develop theories and conceptual frameworks to support and explain current issues of lookism in the workplace.

INTRODUCTION

Yes, we should not judge a person only according to appearance. But you know, if companies prefer pretty, tall and thin girls, what can I do? I have to put my "studio portrait" on my resume. Sometimes some companies even ask me to write my weight and height on my resume. This is reality!... There are some pretty girls in my class and every year they can easily find part-time jobs because of their appearance. I used to think I could never be one of them. But last year, when I came back after summer vacation, I

found that [the] faces of two of my classmates had changed. Their eyes had become bigger, faces thinner, and noses smaller and higher. One of them has already signed a preliminary contract with a media company, at which I also got an interview. I didn't get the job, but she did. My academic record is much better than hers, and I'm sure I performed better than her in the interview. It's just so unfair that they chose her instead of me! The only explanation is that she is taller than me and also prettier than me with the help of the scalpel...I don't think that a pretty face is everything. But it definitely brings advantages. It's a key to opening the door. (Wen, 2009, p. 98)

Lookism refers to physical appearance discrimination or physical attractiveness bias (Chae, 2019; DeCastro-Ambrosetti & Cho, 2011), by which preferential treatment is given to those who are deemed attractive in a way that discriminates against those who have less physical charm (Sims, 2015). The value has been attached to certain characteristics such as "height, weight, body size, facial features (including eye color and nose size), hair color/texture, skin color, one's attired and hairstyles" (Sims, 2019, p. 1). Beautism has already been acknowledged by social and evolutionary psychologists (Gehrsitz, 2014), and they consider physical appearance to be an important determiner of whether other people like them (Buss, 1989). Nevertheless, the effect of physical appearance is not negligible considering the impact on employment decisions (Gehrsitz, 2014). It is obvious that lookism exists among job hunting because managers prefer applicants whose physical appearance is more socially attractive. Hamermesh (2013) states that lookism exists in the workplace and attractiveness is deemed a social productive quality. Women have paid more attention to body image, styles in clothes, haircuts, and cosmetics as economic growth is increasing (Wen, 2009). Moreover, attractive appearance is viewed as a form of capital that can provide applicants an advantage on the job market.

According to a report from *the International Society of Aesthetic Plastic Surgery* (2017), the total surgical procedures increased by 4% in 2017 compared to 2016. The statistics indicate that there is an excessive concern with physical appearance, and there is a significant tendency for people to undergo surgical procedures to enhance their appearance. It also demonstrates that beauty matters in people's daily lives. It is universally acknowledged that men and women benefit from their attractiveness when applying for most jobs, considering the employment suitability (Johnson, Podratz, Dipboye, & Gibbons, 2010). Individuals with a perceived attractive appearance are more likely to be interviewed and hired, and they are often offered a higher salary than those who are less perceived attractive (Chelcea & Ivan, 2016; Niu, 2018). In addition, perceived attractive employees are more likely to be promoted to leadership positions (Ling, Luo, & She, 2019).

The purpose of this chapter is to explore the effects of lookism on career development in organizations. In addition, this chapter discusses strategies for reducing lookism in the workplace from a human resource development (HRD) perspective. This chapter would increase the awareness of lookism and attract scholars' attentions to raise more effective strategies.

BACKGROUND

Many studies have focused on lookism issues since the 1950s, and it became more common during the 1970s-1980s. The implicit personality theory has been studied since the 1950s by many researchers (Ashmore, 1981; Bruner & Tagiuri, 1954). Blau and Duncan (1967) have analyzed the American occupational structure. The social identity theory was defined by Tajfel (1972). In the social psychology

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

field, Adams (1977, 1982) studied physical attractiveness. The "what is beautiful is good" stereotype (Dion, et al., 1972) and the "beauty is beastly" (Heilman & Saruwatari, 1979) were established during the 1970s. Many studies have been focused on the effect of physical attractiveness on employment decisions (Chiu & Babcock, 2002; Chung & Leung, 1988). In the past decade, there were only a few studies on lookism, and gaps in the literature remain for future researchers to study.

What is Beautiful is Good

"What is beautiful is good" (Dion, Berscheid, & Walster, 1972, p. 285), also known as the physical attractiveness stereotype, is one of the most widely cited theories on lookism. The physical attractiveness stereotype can be explained by the implicit personality theory, which describes the assumed relationships among an individual's traits and characteristics (Bruner & Tagiuri, 1954). When people observe a few positive attributes in others they tend to assume the co-existence of other positive attributes. For example, Abel, Croysdale, and Stiles (2009) suggested that physical attractiveness, as a physical characteristic, could be linked to other dimensions of personality, such as interpersonal relationships, communication skills, career development, and intelligence. Therefore, people considered physically attractive are usually attributed with characteristics such as higher income, better social skills, friendliness, happiness, and health.

"What is beautiful is good" have been supported by previous studies. For example, Quereshi and Kay (1986) indicated that perceived physical attractive individuals were considered to have better social competence than plain-looking ones, so they were more likely to be hired for a job that involved a significant amount of social interaction. Furthermore, O'Connor and Gladstone (2014) found physically attractiveness was positively associated with the ability to establish connections with others, which also influenced others to provide more network opportunities to perceived attractive individuals.

Beauty is Beastly

Most research has provided evidence for the "what is beautiful is good" stereotype (e.g. Niu, Hirudayaraj, Sims, & Kawashima, 2018; O'Connor & Gladstone, 2014; Quereshi & Kay, 1986). However, a few studies have found a phenomenon that opposes this stereotype, which is the "beauty is beastly" phenomenon (Heilman & Saruwatari, 1979; Heilman & Stopeck, 1985). It indicates that a perceived attractive appearance can be a disadvantage for women when applying for traditionally masculine jobs. However, Johnson, et al. (2010) suggested that the "beauty is beastly" effect was limited to the very narrow masculine occupation categories in which physical attractiveness is not important, such as tow truck driver, construction supervision, prison guard, hardware salesperson, etc.

Theory of Circumscription, Compromise, and Self-Creation

Gottfredson's (2002) theory of circumscription, compromise, and self-creation can also be used to understand how lookism impacts career choices. Gottfredson (2002) argued that "forming occupational aspirations is a process of comparing one's self-image with images of occupations and judging [the] degree of match between the two" (p. 93). During this process, it is important to understand "properties of self, occupations and the place of both in the social world" (Gottfredson, 2002, p. 93). In order to decide whether to enter a particular occupation or not, individuals have to consider the following fac-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tors: "availability of the job within the surrounding geographic area, perceptions of discrimination or favoritism, ease of obtaining training for the job, or lack of knowledge of how to enter the job" (Gottfredson, 1981, p. 548). When employers and society send out the messages that physical attractiveness is important to some occupations, individuals who are not considered attractive will not choose to enter those occupations.

Expectancy Theory

The expectancy theory (Vroom, 1964) assumes that individuals act in ways that maximize pleasure and minimize pain. Vroom (1964) argues that motivation can be influenced by three factors: valence, expectancy, and instrumentality. The expectation and level of confidence about physical attractiveness may view as the expectancy beliefs in Vroom's model (Hurley-Hanson & Giannantonio, 2007). Therefore, when an employer and the society of appearance-oriented culture send information about the importance of physical appearance, individuals evaluate their own physical appearance and then make decisions on career choices.

MAIN FOCUS OF THE CHAPTER

Issues, Controversies, Problems

Effect of Lookism on Recruitment and Selection Process

Lookism exists in many aspects of the workplace. For example, lookism occurs in the recruitment process and influences job applicants' opportunities. Niu, et al. (2018) conducted a content analysis of job advertisements in China and found that over 46% investigated nursing job advertisement contained physical appearance specifications, such as age, tall, attractiveness, body shape, and skin complexion. Therefore, applicants with these preferred features have more opportunities for interviews and employment. Similarly, Simorangkir (2013) points out that lookism was found through a great number of job ads for public relations positions in Indonesia, and perceived attractive appearance has already become one of the criteria for applicants. Employers preferred applicants who are considered good-looking while penalizing those who are considered less attractive (Warhurst, Van den Broek, Hall, & Nickson, 2009).

In the labor market, workers with preferred appearances are believed to achieve greater occupational success (Gehrsitz, 2014; Robins, Homer, & French, 2011), so many employers adopt appearance-based hiring as a marketing technique in some Asian countries, where they do not have legislation regarding lookism (Cavico, Muffler, & Mujtaba, 2012). For example, Maurer-Fazio and Lei (2015) conducted a resume audit and found that applicants with perceived attractive photos received higher callback rates across gender, occupation, and location. In addition, Niu (2018) conducted a similar study and found that both male and female raters were more likely to interview and hire the applicants with a perceived attractive photo than the ones with perceived unattractive photos or without photos in the hypothetical situation.

The increased use of social networking sites (SNS) as a tool for recruiting and selecting potential employees has changed the hiring practices (Elias, Honda, Kimmel, & Chun, 2016; Villeda & McCamey, 2019). However, it also brings legal issues and implicit bias. For example, Baert (2018) conducted a

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

study to investigate whether the publicly available information on Facebook about job applicants affects the hiring decisions of employers. The results showed that candidates with what was perceived to be more attractive Facebook pictures obtained more hiring opportunities compared to the ones with the less perceived attractive pictures.

Effects of Lookism on Wages, Promotions, and Termination Decisions

Although the majority of research regarding lookism focuses on the process of recruitment and selection, some studies have investigated other employment effects of lookism, including wages, promotion, and termination decisions. For example, Borland and Leigh (2014) indicate that men with a perceived attractive appearance have a 15% premium in their earnings and the ones with perceived unattractive appearances suffer a penalty of 25%; however, the effect is not significant for women. In addition, Niu (2018) also found that job applicants with perceived attractive photos were more likely to be offered higher salaries than the ones with perceived unattractive photos or without photos. According to Ling, et al. (2019), perceived physical attractive leaders have more chances of promotion. Commisso and Finkelstein (2012) conducted an experimental study and showed that perceived unattractive employees were more likely to be terminated than perceived attractive ones.

Effects of Lookism on Marketing

Having an attractive appearance is viewed as an integral part of the product and service itself (Gehrsitz, 2014), so the employee's appearance affects a customer's attitude toward a company. In addition, Li, Zhang, and Laroche (2019) conducted both experimental and field studies and found a service representative's perceived physical attractiveness affects consumer response, including customer satisfaction, service quality perception, and likability of the service representative. Fang, Zhang, and Li (2020) also indicated that the physical attractiveness of employees affects tourists' customer engagement. Therefore, the recruitment of good-looking employees is viewed as an effective business practice in the service industry (Li, et al., 2019). However, attractive employees are not always beneficial to a service population, because customers who consider themselves as unattractive may prefer to interact with perceived unattractive service representatives (Li, et al., 2019). Therefore, evaluating applicants or employees based on physical attractiveness is not an effective evaluation method. The quality of the workforce pool may be hurt by lookism.

Solutions and Recommendations

Policies and Legislation

In the United States, the Bona Fide Occupational Qualification (BFOQ) allows employers to make employment decisions based on prohibited criteria if it is necessary for the particular occupations. If physical appearance is a BFOQ, employers are allowed to "establish appearance-based BFOQs by showing the trait or characteristic is necessary to the operation of their business, and they are justified in considering particular physical characteristics in the hiring process" (Vo, 2002, p. 358). However, it may be abused in positions that do not require certain physical characteristics. Therefore, it is important to consider adding physical attractiveness as a protected class through legislation.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Title VII of the Civil Rights Act of 1964 prohibits employment discrimination based on race, color, sex, religion, and national origin. Title VII does not explicitly prohibit appearance-based discrimination, and people must make appearance-based discrimination claims fit the protected categories of Title VII to court (Zakrzewski, 2004; Friedricks, 2015). However, it is difficult to prove that physical appearance discrimination can be linked to one of the protected classes in Title VII (Hammer, 2017). For example, there is a strong relationship between physical appearance discrimination and one's gender as a female, so some cases of physical attractiveness were linked to gender discrimination (Friedricks, 2015). However, it is difficult to prove that discrimination was clearly motivated by sex discrimination when men experience lookism or discrimination occurs among individuals with the same gender (Hammer, 2017).

Another suggestion is to extend the Americans with Disabilities Act (ADA) to include physical appearance discrimination (Crow & Payne, 1992). The ADA protects individuals who have a physical or mental impairment or individuals who are perceived as having a physical or mental impairment that limits their major life activities. Currently, common physical attributes are not covered by ADA if they are not caused by a health condition (Toledano, 2013). Crow and Payne (1992) suggested that unattractive appearance is disadvantageous, and it may impair an individual's ability to fulfill major life activities.

The most challenging issue is that it is difficult to define physical appearance discrimination because physical attractiveness is subjective (Corbett, 2011). It is not easy to clarify the qualifications for a claim of physical appearance discrimination (Corbett, 2007). In addition, it is even harder to provide evidence to show a person was evaluated based on their physical attractiveness during the employment process (Corbett, 2011). It is difficult to provide an appreciate solution to address lookism issues from legislation perspectives. Therefore, there is a large space to continue researching what and how to establish and implement legislation for physical appearance discrimination.

Diversity Education and Training

Although the civil rights movement has led to real social change, discrimination still occurs in daily life and in the workplace (King, Dawson, Kravitz, & Gulick, 2012). Diversity training is defined as "a distinct set of programs aimed at facilitating positive inter-group interactions, reducing prejudice and discrimination and enhancing the skills, knowledge and motivation of people to interact with diverse others" (Bezrukova, Jehn, & Spell, 2012, p. 208). Education is an effective way to increase awareness of employment lookism. Therefore, people should be educated that lookism is wrongful and it should be not tolerated. Universities should discuss diversity issues in related classes, such as human resource development, business ethics, and sociology. This effort will contribute to the future workforce. In addition, diversity training should be provided to employers and employees in the workplace, which can improve the acceptance of colleagues with different cultural backgrounds, physical appearance, gender, age, etc.

Previous studies have shown many positive impacts of diversity training. For example, Alhejji, Garavan, Carbery, O'Brien, and McGuire (2016) conducted a systematic review regarding diversity training and concluded that diversity training brings outcomes from three perspectives: learning, business, and social justice. Learning outcomes include enhanced employee knowledge and awareness of diversity issues, enhanced diversity behaviors and skills to handle diversity issues, and changed attitudes toward diversity (Delucio, Ledbetter, & Avellar, 2013; Downing & Kowal, 2011; Gendron et al., 2013; Israel, Harkness, Jain, 2013). Business outcomes include productivity gains, sales increases, enhanced employee performance, enhanced customer satisfaction, and financial performance (Ellis & Sonnenfield, 1994; Ely, 2004; Reynolds, Rahman, & Bradetich, 2014; Stanhope, Solomon, Finley, Pernell-Arnold,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Bourjolly, & Sands, 2008). Social justice outcomes include improved relationships, enhanced tolerance toward minorities, and improved confidence to work with diverse groups (Armour, Bain, & Rubio, 2004; Burch, 2008; Cunningham, 2012; Williams, 2005).

However, previous scholars also found negative outcomes of diversity training. For example, negative outcomes include negative interpersonal attitudes, higher levels of interpersonal conflict, and a lack of managerial skills to create and manage diversity (Harrison & Klein, 2007; Kochan et al., 2003; Pendry, Driscoll, & Field, 2007). In addition, according to Dobbin and Kalev (2018), five problematic features of diversity training were identified. First, it is difficult to change people's minds for short-term educational interventions. Second, diversity training may activate stereotypes. Third, diversity training inspires unrealistic confidence in diversity programs. Fourth, diversity training may leave white people feeling left out. Fifth, people may react negatively to external controls on their thoughts and behavior and perform poorly in their jobs when they lack autonomy. Therefore, it is important to consider those problems to make diversity training more effective.

Diversity Management and Lookism

Diversity management is beneficial to both employees and organizations (Rabl, del Carmen Triana, Byun, & Bosch, 2020). For example, Thomas (1990) suggested that diversity management provides the possibility of anti-discrimination and equality practices into companies in a friendly manner. Creating a diverse, friendly working environment through diversity management is one of the key factors for improving organizational competitiveness and efficiency along with the business purpose and market advantage (Wrench, 2003). In addition, effective diversity management is important to increase organizational efficiency and effectiveness, promote quality, creativity, innovation, and attract and retain talents (Ozbilgin & Tatli, 2008). Kim and Park (2017) have shown that diversity management positively influenced organizational fairness. Furthermore, they indicated that diversity management could build employees' interpersonal trust through improving fairness in the organization.

Lookism is problematic for organizations because it is unrelated to a person's ability to do their job and using ability or service skills as criteria for employment decisions can lead to inefficient or unsatisfactory results (Holtom, Mitchell, & Lee, 2006). Increasing the awareness of employment discrimination has led to the spread of "diversity management" all around the world (Hughes, 2016; 2018; Shore et al., 2009). Diversity refers to "differences between individuals on any attribute that may lead to the perception that another person is different from self" (Van Knippenberg, De Dreu, & Homan 2004, p. 1008). Furthermore, diversity in the workforce is "the composition of work units (work group, organization, occupation, establishment or firm) in terms of the cultural or demographic characteristics that are salient and symbolically meaningful in the relationships among group members" (DiTomaso, Post, & Parks-Yancy, 2007, p. 474). In addition, organizational diversity management is defined as "a set of managerial actions aimed at either increasing diversity, and/or promoting amicable, productive working relationships" (Jonsen, Maznevski, & Schneider, 2011, p. 36).

According to Fujimoto and Härtel (2017), effective diversity management should include the following activities:

(1) inclusion of minority group members in the organizational decision-making process; (2) organizational random and stratified sampling to establish multiple teams that reflect the heterogeneous composition of an organization; (3) equal opportunity and equal turn-taking to speak in each team; (4) enlarging

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and challenging participants' perspectives through interpersonal interaction with different employees; and (5) the final decision is reached in a form of common agreement or positive dissensus. (p. 1120)

In addition, Abaker, Al-Titi, & Al-Nasr (2019) suggested that organizational policymakers should develop and implement policies that 1) encourage organizations to recruit individuals with a diverse background, 2) improve employee retention, and 3) provide fair compensation and benefits systems. Therefore, diversity management is an important human resource practice for reducing lookism in the workplace.

Employment Process and Lookism

Previous studies have shown that employers practiced implicit or explicit lookism in the hiring process (López Bóo, Rosi, & Urzúa, 2013; Niu, 2018; Niu, et al., 2019; Ruffle & Shtudiner, 2014). For example, Chiu and Babcock (2002) found that Human Resource Management (HRM) specialists were influenced by lookism, and they believed that physical attractive individuals had more qualified work experiences and job skills. They tended to screen out perceived unattractive applicants after they reviewed their resume attached to the photo. In addition, López Bóo, Rosi, and Urzúa (2013) found that job applicants with a perceived attractive appearance have more interview opportunities than perceived unattractive individuals. In addition, Maurer-Fazio and Lei (2015) conducted an experimental study across four occupations: administrative assistant, software engineer, accountant, and sales representative. They found similar results with previous studies; a perceived unattractive female applicant had to submit 41% more applications than a perceived attractive one with equal qualifications to get the same number of interviews.

Employers could judge applicants' physical attractiveness through access to their social media profile or during the interview. Therefore, establishing "blind" hiring procedures is a way to reduce lookism by the function of human resource development and management (Behaghel Crépon, & Le Barbanchon, 2015). Research has shown that employment discrimination was decreased by using anonymous applications (Goldin & Rouse, 2000; Krause Rinne, & Zimmermann, 2012). Therefore, removing identifying information from applications and restricting employers from searching for applicants' profiles on SNS are effective ways to reduce employment lookism. In addition, Hammer (2017) noted that job interviews could be conducted via telephone instead of through a face-to-face meeting, which employers can discern work related personality characteristics form the voice. However, linguistic profiling is another issue should be considered in the workplace, when a phone interview is conducted (Hughes & Maimseishvili, 2018). In order to reduce lookism and linguistic profiling, multiple people could be involved in the interview process. The interview could be conducted by people who do not make decisions, and then the interview could be transcribed to text. Finally, decision makers could only review the interview text rather than see or listen the candidates to prevent discriminatory practices.

Automated hiring systems have been increasingly used in recruitment and hiring practices by human resource professionals (Bogen & Aaron, 2018). Shields (2018) reported 98% of Fortune 500 companies were estimated that use applicant tracking systems in their hiring process. The forms of automation help to detect and mitigate discriminatory practices in the process of sourcing, screening, interviewing, and selection. Bogen and Aaron (2018) have shown the evidence that applying automated hiring systems is perceived efficiency evaluations, lower cost, and diversity and inclusion promoting. However, Sánchez-Monedero, Dencik, and Edwards (2020) noted that very few processes of hiring decision were taken

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

without any human intervention. In addition, they concluded a concern about the lack of transparency of automated hiring systems work process, like the approach used to detect the discriminatory practices. Therefore, it is still necessary to discuss how and where the automated hiring systems should be applied.

FUTURE RESEARCH DIRECTIONS

For instance, the influence of lookism should be studied over a wider range of occupations. Also, the influence of physical attractiveness should be measured more precisely across different cultures on both genders. Both qualitative and quantitative studies could be conducted. For the quantitative studies, they could explore the influence and existence of lookism on employment decisions in different jobs and cultures. Experimental studies, such as resume audits, should be with priority consideration because of the high validity. Qualitative studies could explain the influence of lookism on people's perceptions across different cultures because it is important to more deeply understand lookism behaviors.

In further studies, making a difference in the way that qualified applicants are selected would be a good focus. Employment discrimination has been found in previous studies, so it is significant to improve the issues of employment discrimination and help people establish a healthy employment environment. Moreover, researchers could look forward to the benefits of neutral BFOQ standards in the selection process. BFOQ standards have been practiced in the United States; in order to adapt it to other countries, it is necessary to let people understand its benefits.

Studies investigating strategies to alleviate the pressure of lookism on career-oriented women are also needed in the future. These studies would provide resolutions and recommendations for women and help women develop their careers. Mixed methodologies could be a good way to study the topic as well. Specifically, questionnaires supplemented with in-depth interviews could provide greater insights into the topic.

Possible theoretical bases for future studies may include utilitarianism, social identity theory, conflict theory, and resistance theory. Developing theories and conceptual frameworks could support and explain the current issues of lookism in the workplace.

CONCLUSION

Lookism issues have been studied in the fields of economics, social science, physiology, and business. Studies have shown that physical appearance has affected employers' judgment about the quality of a particular employee (Chiu & Babcock, 2002; Simorangkir, 2013; Sims, 2015; Wen, 2009). Employees are negatively impacted by lookism as this could cause them to experience unethical procedures in the workplace (Chiu & Babcock, 2002). However, in the appearance-oriented culture, lookism is a broad issue. Silence seems like the most effective "reasonable alternative" to respond to this issue, but this stifles employees' voices and makes them passive victims of discrimination (Li, Min, Belk, Kimura & Bahl, 2008; Zhang, 2012). At the same time, attractive individuals may support and practice lookism to maintain their priority (Chae, 2019). Therefore, it is important to increase the awareness of lookism in the workplace so that people can gradually realize the risk and harm of lookism, and then express the willingness to eliminate illegal physical appearance discrimination.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

A diverse workforce could lead organizations to expand the talent pool, take social responsibilities, meet the needs of diverse customers, and create a more competitive advantage for company performance (Point & Singh, 2003). Therefore, the issues and effects of lookism should be addressed in different employment stages, such as recruitment, selection, promotion, termination, etc. To establish a diverse environment in the workplace, previous research has suggested reducing lookism through establishing related policies and legislation, implementing diversity training and education, using diversity management strategies, and having a transparent employment process.

KEY TERMS AND DEFINITIONS

Beauty Is Beastly: Indicates that a perceived attractive appearance can be a disadvantage for women when applying for traditionally masculine jobs.

Bona Fide Occupational Qualifications: Allows employers to make employment decisions based on prohibited criteria if it is necessary for the particular occupations.

Diversity Management: A set of managerial actions to increase diversity, and/or promote amicable and productive working relationships.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Diversity Training: Educational activities provided to employers and employees in the workplace, which can improve the acceptance of colleagues with different cultural backgrounds, physical appearance, gender, age, etc.

Explicit Lookism: Refers to that an individual behaves negatively toward members of a disadvantaged group regarding physical appearance through verbal and nonverbal antagonism, avoidance, segregation, physical attack, and extermination.

Implicit Lookism: Unconscious discrimination or bias regarding physical appearance.

Lookism: Refers to physical appearance discrimination or physical attractiveness bias by which preferential treatment is given to those who are deemed attractive in a way that discriminates against those who have less physical charm.

What Is Beautiful Is Good: People considered physically attractive are usually attributed with characteristics such as higher income, better social skills, friendliness, happiness, and health.

Chapter 95
Gender Differences in Quality of Work Life:
An Empirical Study

KIET Group of Institutions, Delhi-NCR, Ghaziabad, India

ABSTRACT

The purpose of this study is to investigate gender differences in the level of the quality of work life between male and female employees in IT industries. The sample comprised of 150 people, out of which 90 were males and 60 were females from IT industries. Quality of work life was measured through a seven-dimensioned quality of work life (QWL) scale developed by Angus S. McDonald. Following data collection, significant differences regarding quality of work life were examined by using t-test. The findings indicated significant difference in the exhibition of most of the facets of quality of work life between the two groups. These insights can be used for the improved level of quality of work life between males and females in IT industries. This paper presents data and provides insights into the level of quality of work life of the employees.

INTRODUCTION

The mantra for creating a sensation in a long run for any organization in the competitive market lies in how it attracts, recruit, retain and motivate its workforce. More and more employees are realizing that like machine and money, **personnel** are a similarly predominant input in the continued existence of an organization in this turmoil world. Organizations require to adopt flexible approach so that they are equipped to develop their labour force. Therefore, organizations are needed to agree to take upon a strategy to enhance the employees *'Quality of work life'* to assure equally the employee needs and organizational purpose.

Work is pervasive in all spheres of life of human beings. As the significance of human resource management, the level of education and knowledge is increasing day by day. It is not enough in organizational context to create flexible schedule, less stressful job and safe working environment, rather employees are more concerned with high *Quality of work life.*

The notion of Quality of work life was first came into the knowledge in early 1960 but it was possibly coined originally in Arden House in 1972 at the first international conference (Louis Davis & Cherns, 1975) and the notion cover a wide range of organizational phenomenon (Loscocco and Roschelle, 1991).

Different scholars have different connotations for the variable "Quality of work life". Earlier Quality of work life was considered from the perspectives of working conditions and their impact on job satisfaction of employees. But now the scenario changes, as it has been viewed from the humanistic perspectives i.e. first considered as a human being and then an employee. Glasier (1976) believes that the term QWL is considered more than a job satisfaction, adequate payroll, and good working environment, more even than an equal employment opportunity. According to Walton (1982), the other important factors except from technological advancement of the economic growth and productivity is the QWL.

In this study, we analyse the growth of the latest economy from the vintage point of employees i.e. QWL which offers a multifaceted assessment for both men and women. Therefore, the study of quality of work life among men and women employees in IT industry is of paramount importance.

Conceptualizing the Variables

The present study has adopted the notion of quality of work life which was propounded by Angus McDonald (2001) and is based upon the two notional approaches given by Nadler and Lawler (1983) and Loscocco and Roschelle (1991). They have defined quality of work life as an "employees' attitude towards, and perception of work and organization", and conceptualized the term quality of work life with the factors as:

(i) **Support from manager:** The workforce can freely talk to their manager. The Employees believe that they have received sufficient supervision and supervisor is having adequate knowledge for the same.
(ii) **Freedom from work related stress:** The workforce believe that their assigned load is reasonable and they are stress free at the workplace.
(iii) **Salary and additional benefits:** The financial benefits in terms of the work and their education, previous work experience and responsibilities at work are adequate.
(iv) **Job satisfaction, challenge, use of skills and autonomy:** The amount to which employees perceived that their work is enjoyable, stimulating, challenging and offering variety and enjoy sufficient autonomy.
(v) **Relationship with work colleague:** The degree to which employees presume that there is good working culture among colleagues and they can develop healthy relationship at work.
(vi) **Involvement and responsibility at work:** The degree to which employees feel they are involved in the organization's work and have opportunities to contribute to decisions at work.
(vii) **Communication, Decision making and job security:** The degree to which two way communications within the organization is perceived. Employees feel the job security and they do not need to look for other employment.

LITERATURE REVIEW

Tabassum, A., et. al., (2011) in the study reported that a significant difference exists in the following factors of QWL between men and women employees. The factors of QWL like adequate and fair compensation, attention to job design, employee relations, job assignment and flexible work schedule,has significant differences in the QWL.

Schoepke, J., et. al., (2004) in the study examined quality of working life (QWL) in a in five companies which belongs to different information technology (IT) jobs. The study revealed that women employees in IT jobs report greater organizational involvement than men employees.

Lad, N. N. (2016) examined the impact of gender and working area of the employees on dependent variable (quality of work life and mental health). The study showed that gender with other independent variable has significant influence on quality of work life of the employees.

Thakur, R., & Sharma, D. (2019) examined the impact of various demographic variables including gender on QWL of employees in Himachal Pradesh Power Corporation Limited (HPPCL). Results revealed that gender has no impact on QWL.

Rama J. Joshi (2007) in the study revealed that women workers show high satisfaction towards QWL exclusively in banking, PSUs, insurance and hospitals.

OBJECTIVES

The main purpose of the study is to assess the significant differences in the Quality of Work Life of working males and females in NCR region.

HYPOTHESES

H1 – There is difference in the dimensions of QWL as Support from manager on the basis of gender (male and female employees).

H2 – There is difference in the dimensions of QWL as Freedom from work related stress on the basis of gender (male and female employees).

H3 – There is difference in the dimensions of QWL as Salary and additional benefits on the basis of gender (male and female employees).

H4 –There is difference in the dimensions of QWL as Job satisfaction, challenge, use of skills and autonomy on the basis of gender (male and female employees).

H5 --There difference in the dimensions of QWL as Relationship with work colleague of on the basis of gender (male and female employees).

H6 – There is t difference in the dimensions of QWL as Involvement and responsibility at work on the basis of gender (male and female employees).

H7 – There is difference in the dimensions of QWL as Communication, Decision making and job security on the basis of gender (male and female employees).

H8 – There is difference in the Quality of Work Life on the basis of gender (male and female employees).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

RESEARCH METHODOLOGY

Sample: The total sample consists of 150 employees working in IT industries at different supervisory levels. Out of which 90 employees are males and 60 are females. Out of 200 surveys instrument were distributed, 168 were received. Out of the received sample, 18 were rejected because of omitted values. Questionnaire was distributed through proper channel (HR of the company) with prior permission from the organizations containing the aim of the research. The questionnaires consist of demographic variables as consist of Name; Tenure; Age; Marital Status; Sex; Educational Qualification; Rank; and Salary (as optional).

Instruments: Following questionnaire was used for conduct the study:

Quality of work life was evaluated by using the scale which was propounded by Angus S. McDonald. The scale consists of seven dimensions and 53items and rated on a 6-point scale. The reliability of the QWLS scale was .94.

***Scoring and Analysis*:** The Scoring of the questionnaire was done as per the given manual instructions. The analysis was done by T-Test which calculates the Mean and SDs by using SPSS v. 20.0.

RESULTS AND INTERPRETATIONS

The objectives of the research were to evaluate the significant differences in the Quality of Work Life on the basis of males and females working in the different organizations of NCR. To test the abovementioned hypothesis, t-test was applied to study the differences by calculating Means and Standard deviation.

To test the differences regarding seven dimensions and total quality of work life of men and women employees, independent T-Test was calculated. The research specifies that there is a significant difference between the male and female IT employees with respect to most of the factors of quality of work life. The resulting p-value of **t-test in most of the cases is lower than the critical value (i.e., .05),** which indicates a significant difference on the basis of gender (male and female) of IT employees from the population.

Table 1 indicates the significant difference in the demonstration of Quality of Work Life ($t= 7.08$, $p < 0.05$). Also the mean score was 183.70, which is greater in comparison to that of male employees ($M= 162.44$), thus exhibit that the female employees have higher levels of quality of work life.

Table 1 indicates the significant differences in the factors of quality of work life. The disposition of Support from manager is higher (t-value$= 6.60$, $p < 0.05$), as the mean score of female employees is higher ($M= 35.93$) in comparison to the mean score of male employees, which is 29.89. There is significant difference in the Freedom from work related stress of men and women employees with the calculated t-value as 3.95, $p < 0.05$. It is also apparent that the exhibition of Freedom from work related stress is higher in case of female employees as $M= 29.52$ and that of male employees as $M= 26.61$. Significant difference has been found in the Salary and additional benefits of males and females (t-value = 2.88, $p < 0.05$), which indicates that SAB is expressed more in male employees with $M = 15.57$ in comparison to that in case of female employees with the mean score as 13.67. The disposition of JSCA is higher in the case of male employees (t-value = 4.67, $p < 0.05$), as the mean score of male is higher ($M=41.18$) in comparison to the mean score of females which is 36.75. Significant difference has been found in the Relationship with work colleague of males and females (t-value = 3.30, $p < 0.05$), which exhibit that RWB is expressed more in female employees with $M = 19.22$ in relationship to that in case of male employees with the mean score as 17.66.Significant difference has been found in the Involvement and

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

responsibility at work of males and females (t-value = 4.51, $p < 0.05$), which shows that this dimension is expressed more in female employees with M = 16.17 in comparison to that in case of male employees with the mean score as 15.83. Similarly, there is significant difference in the Communication, Decision making and job security of men and women employees (t- value = 4.73, $p<0.05$). That is, the exhibition of Communication, Decision making and job security is high in females with the mean score as 36.10, in comparison to the males with their M= 31.78. On the whole, the result table indicates that the Quality of Work Life of female employees is better in comparison to male employees.

Table 1. Gender Differences among QWL dimensions

Variables	Gender	N	Mean	Std. Deviation	Std. Error Mean	t-Value
SMS	Male	90	29.89	8.711	.779	6.60
	Female	60	35.93	4.562	.484	
FWS	Male	90	26.61	5.586	.500	3.95
	Female	60	29.52	4.902	.520	
SAB	Male	90	13.67	4.748	.425	2.88
	Female	60	15.57	4.793	.508	
JSC	Male	90	36.75	7.312	.654	4.67
	Female	60	41.18	6.112	.648	
RWC	Male	90	17.66	3.689	.330	3.30
	Female	60	19.22	2.999	.318	
IRW	Male	90	15.83	4.844	.165	4.51
	Female	60	16.17	7.408	.149	
CDJ	Male	90	31.78	7.042	.630	4.73
	Female	60	36.10	5.862	.621	
Total_QWL	Male	90	162.44	23.245	2.079	7.08
	Female	60	183.70	19.171	2.032	

DISCUSSION

The objective of this study was to evaluate the gender differences of IT employees; the study considers the quality of work life in the work setting, including supervisory support, job security, stress and communication etc. Results from the current study reported that there is significant difference in the exhibition of support from manager of males and females. Consistent with the existing research, we identified that female exhibit more than males in terms of Support from manager (Van der Boon, 2003), Stanford et al.,1995). It is also apparent that the exhibition of Freedom from work related stress is higher in case of female employees (McDonald and Korabik, 1991). The finding of the paper showed that significant difference has been found in the Salary and additional benefits which shows that SAB is expressed more in males to that in case of female employees (Laura M. Crothers (2010)). The disposition of JSCA is higher in the case of male employees in terms of promotion, supervision, work content, pay and co-workers (Vathsala Wickramasinghe, 2009). The results also revealed that female employees expressed

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

more in the Relationship with work colleague as women. Probable reason is that women's are considered as "relations oriented" than "production-oriented". Similarly, significant difference has been found in the Involvement and responsibility at work which shows that IRW is expressed more in female employees (Spence and Robbins (1992)). Furthermore, the exhibition of Communication, Decision making and job security is high in females in comparison to the males ((Powell, 1990)).

On the whole, additional result from our analyses indicates Quality of Work Life of female is better in comparison to males in IT industry. A plausible explanation may be that, men and women assess the same aspects of work but value them very differently. In addition to that, men place greater value on pay, power, results, achievements and status; women place greater value on relationships, recognition, friends, respect, and virtues such as honesty and integrity. So, all the eight hypothesis are therefore, supported.

CONCLUSION

The study concludes and contributes towards the gender differences literature of QWL variables in IT Industry. Results of this study have larger scope for managers and academicians to practically implement quality of work life programmes in the organizations. This research study helps the interested organizations and the practitioners to implement QWL programmes and relish the potential of employees fully towards the success of organization.

The sample size could be increased to have better results which can further be generalized as data collected was from the region of NCR, India. It is suggested to present gender differences of QWL in these findings which can be extended to industries. Further research should be aimed to focus on other industries, which would allow for researchers to gain in-depth insights into the gender differences of QWL. Hopefully, this study will act as a catalyst base for other research.

Chapter 96
Gender and Labor Market: A Review From the Perspective of Insurance Premiums Incentives, Supports, and Deductions in Turkey

Cahide Göğüsdere
https://orcid.org/0000-0002-6088-4595
Gazi University, Turkey

ABSTRACT

Gender is defined as the tasks, functions, and roles attributed to women and men in the public and private areas in society. The concept of gender is important in social state policies. The social state is a state that deals with the economic and social situation of individuals and seeks to ensure a minimum level of living, social security, and justice. In this kind of state disease, disability, death, unemployment, and similar cases, social security and assistance programs are in the foreground. Gender discrimination in the labor market in Turkey is a major problem. Women face a number of obstacles in this market. In particular, gender-based occupational discrimination affects women's position in the labor market. In addition to factors such as inflation, growth, and unemployment, gender roles play a role in the effectiveness of the female labor force in these markets. In this study, labor markets in Turkey will examine on the basis of gender and will be discussed in terms of insurance premiums and tax incentives for the period 2000-2019.

INTRODUCTİON

Women confront with various barriers in their working areas such as education, health, social security, politics and non-governmental organizations (NGOs). There is gender-based discrimination in these areas. Women are disadvantaged compared to men in terms of participation in employment. In patriarchal societies, women have been responsible for household chores and child care. The vast majority of women are therefore far from social production. In fact, these skills provide them with employment

opportunities in occupations and fields of work, which are an extension of their work at home. However, women continue to be a secondary source of labor. With capitalism, women have started to work such as services sector, health, education, textiles, food, etc. in areas. Despite equal pay for equal work laws, women's wages were lower than men's. In times of economic depression, primarily the dismissed are women. For these reasons, they can hardly come to decision-makers, managers, organizing positions. In Turkey, the traditional infrastructure is changing very slowly. Gender-based discrimination and male domination are present in all areas. Therefore, some institutions and organizations try to solve employment problems related to women. It is tried to increase female employment in labor markets. For this, first of all, financial burdens on enterprises should be reduced. There are many ways in reduce financial burdens on enterprises. For example ınsurance premiums incentives, supports and deductions can be used to reduce this burden. In this study will examine supports and deductions in terms of gender sensitivity for the perıod 2008-2019.

Concepts and Basic Definitions

This section describes the basic concepts in the study. In this context, the concepts of gender, gender equality / inequality, labor and employment are explained. Gender was first used in the 1930s and defined. According to this definition, psychological characters is different from sex. In 1972, Ann Oakley first used this concept in sociology. Gender; "Defines the roles, duties, rights, responsibilities and behaviors determined by society and culture for men and women. The roles of femininity and masculinity, men and women presentation themselves, speech, behavior patterns and dress patterns differ from society to society (Connell, 2002). Gender is defined as "the expectations of women and men for social and cultural roles" (Cherry, 2005: 157).

The concept of gender equality/inequality refers to "how determine social, cultural characteristics and norms the relationship between men and women and the power differences between these two genders" (World Development Report, 2012: 4). Gender equality recognizes the different needs and interests of men and women and requires a redistribution of power and resources. The goal of this equality, sometimes called material equality, goes beyond equality of opportunity. Men and women are considered to have different needs, preferences and interests (Reeves ve Baden, 2000: 10).

Usually men work in high status professions, and women generally work at lower wages, in other words, gender-based wage gap, type of occupation and lower wage for part-time workers are examples of gender inequality in employment (UNECE, 2015).

The labor means the part of the population in a country that is productive, that is, participating in economic activity. The labor force refers to the total number of employees in a profit-generating business and population between the ages of 14-65.Eemployment means "participation of production factors (labor, capital, entrepreneur and natural resources) in the production process optimally.

Women's Labor and Employment in the Historical Context of Gender in Turkey

The Republic of Turkey was proclaimed in 1923 and began a contemporary restructuring process. Major reforms have been made in relation to women and women labor. Various changes have been made in the economic and social areas for women.

With the 1924 Constitution, it was made compulsory for everyone to be a primary school graduate without distinction between men and women (Doğramacı, 1997: 81). The Turkish Civil Code adopted

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

in 1926, is one of the biggest changes made on behalf of women. Women have the right to divorce, custody and the right to savings on property. In the political field, the right to participate in municipal elections was granted to women in 1930. In 1934, women were given the right to vote and to be elected (Tatlıdil, 1992: 5). "With the General Health Protection Law enacted in 1930, the first arrangements were made for the protection of young workers and women working in industrial enterprises. In this law, the age, duration, working conditions, etc. were regulated in order to protect the rights of women and children" (TİSK, 1992: 95). "The law on occupational accidents and diseases and maternity insurance" was issued in 1945. In 1950, the law on wage cannot be differentiated according to gender entered into force (Ekmekçi, 2004: 32). After 1950, with the urbanization, women entered the business life actively. "The developments in the service sector in the 1960s have enabled women to exist in the working life. The number of women employed in the cities has increased since 1970. After 1980s, the service sector in the women's job demand has also been inadequate. It is stated that between 1980 and 1985, the rate of dismissed women in the industrial sector was 20% "(Ecevit, 1993: 117-122).

Nowadays, the roles and responsibilities of women in the family life limit their promotion opportunities. These reasons prevent women from taking part in senior management positions.

The Place and Importance of Women in the Labor Market

The employability of women is important for equality between men and women. Employment of women ensures that they are economically independent. Women's employment is very important for sustainable economic growth and development. Increasing female participation in the labor force leads to a decrease in poverty. Thus, there is an increase in gross national product.

The participation of women in the labor force also affects the shares allocated to health and education, fertility and child mortality. The participation of women in the labor force affects household saving habits. In this context, this increase in saving behaviors causes current deficit and insufficient savings. (Günsoy & Özsoy, 2012: 25).

Working life increases women's social dignity and improves their position in the family. Responsibilities within the family cause the woman to make a choice whether to work or not to work. The labor market in Turkey, women's labor force participation levels are low. In particular, non-agricultural unemployment rates are higher than for males. Women have longer working hours than men. As well as paid work, home work and care work carried out by women at home is as important. However, these were not paid and were not considered to create economic value. These activities are equal to one third of the total production in the world (UNDP, 2015). The unequal workload in the household prevents female employment For this reason, women work in the informal jobs at a higher rate in the labor market."In developed countries, it is observed that women spend about 6 hours a day on unpaid work, while men spend only half the time" (Gauthier et al., 2004). Therefore, inequality between men and women increases in terms of household workload.

Characteristics and Barriers to Women's Employment

The first of the barriers to female labor-related demand growth is not creating employment growth in Turkey (Yeldan, 2009). Therefore, women will have little opportunity to find a job. The second is the suitability of sectors for the employment of women. Agriculture is still the first sector in women's employment. However, women have the status of unpaid family workers in this sector. However, the sector

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

in which women are most concentrated is the services sector. Therefore, it is necessary to develop business lines that will increase the employment of women in this sector. Third, the level of development and size of the sectors in which women will be employed. If there is no growth in the sectors such as textiles, food and chemistry where the female labor force is concentrated intensively, employment of women in these sectors will be difficult (Ecevit, 2010: 11). The distribution of employment by sectors is shown in Table 1.

Table 1. Distribution of employment by sectors (%)

Employment	Agriculture	Industry	Services
Woman	28,3	15,6	56,1
Male	15,4	31,4	53,2
Total	19,4	26,5	54,1

Source: TÜİK (Turkish Statistical Institute), 2018.

According to Table 1, total employment rate in agriculture sector is 19.4 percent, male employment rate is 15.4 percent, and female employment rate is 28.3 percent. In the industrial sector, total employment rate is 26.5 percent, male employment rate is 31.4 percent and female employment rate is 15.6 percent. In the service sector, the total employment rate is 54.1 percent, 53.2 percent for men and 56.1 percent for women. In Turkey, with the largest share of female employment in the sector, the services sector. As can be seen in Table 1, female employment is higher in services sector compared to other sectors. In the industrial sector, male employment is about twice as high as female employment. In the agricultural sector, female employment is about twice as high as male employment. In terms of women's employment, the agricultural sector ranks first in the early 2000s. However, over time, the services sector has replaced the agricultural sector. Demand for female labor force in manufacturing and services has increased in countries following export-oriented growth policies.

Informality, which expresses working without affiliation with any social security institution, is one of the most important problems in terms of women's employment. Informal employment rates of women are much higher than those of men. In June 2019, informal employment rate is 34.3 percent and informal employment rate of women is 44.6 percent

Part-time work and the majority of work such as home services and childcare are done by women. Therefore, there is discrimination based on gender. One of the most significant indicators of discrimination is the difference in wages and incomes. Gender-based wage gap is high levels in Turkey (Dayıoğlu and Kasnakoğlu, 1997). TÜİK data show that women earn less than men.

FACTORS AFFECTİNG WOMEN'S EMPLOYMENT

In Turkey, the factors affecting the participation of women in the labor force, women's and spouse's education level, age level, marital status, presence of informal employment, wage inequality, and are effective legal regulations. Factors affecting female labor force participation have cultural, economic and demographic characteristics

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Level of Education

One of the most important factors affecting the female labor force participation rate is education level. In Turkey female labor force participation rate according to education level is shown Table 2.

Table 2. Female labor force participation rate by educational level (%)

Female Labor Force	Illiterate	Secondary School	High School Graduate	Vocational or Technical High School Graduated	Graduated From A Universty
Rate	15,9	27,7	34,3	42,6	72,7

Source: TÜİK, 2018.

According to Table 2, labor force participation rate of illiterate women is 15.9 percent, labor force participation rate of women in education below high school is 27.7 percent, labor force participation rate of women in high school graduates is 34.3 percent, labor force participation rate of women in vocational or technical high school graduates is 42.6 percent and labor force participation rate of women in graduated from university is 72.7 percent.

Labor force participation rate of women whose education level increases is increasing. The rate of illiterate women is decreasing gradually. Women with a high level of education are less affected by economic fluctuations.

The participation of women in the labor force also affects the education level of their spouses. The income of highly educated men will also be high. The spouses of these men will have a lower labor force participation rate. The fact that this situation affects female labor force participation varies according to the qualification level of women and whether they live in urban or rural areas. For example; for high - skilled women living in urban areas, their spouses' education level is not an important factor. For the women living in rural areas, the education level of the spouses is insignificant. For low-skilled women living in urban areas, the higher the level of education of the spouse, the lower the participation of women in the labor force. (Uraz, Aran, Hüsamoğlu, Okkalı, Şanalmış, Çapar, 2010: 11).

Age Level

The labor force participation rate of women also varies according to age. In this respect 15 years and older women's labor force participation rate in Table 3 are shown.

Table 3. The labor force participation rate of women 15 years and over in Turkey

Year	Population 15 Years and Over	Labor Force Participation Rate %	Unemployment Rate %	Non-Agricultural Unemployment Rate %	Employment Rate %
2019	31.245	34,6	17,0	21,4	28,7

Source: TUİK, 2019. http://www.tuik.gov.tr/PreTablo.do?alt_id=1007

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

According to Table 3, as of January 2019, the number of female labor force aged 15 and over is 31.245. Female labor force participation rate is 34.6%, female unemployment rate is 17%, female non-agricultural unemployment rate is 21.4%, female employment rate is 28.7%. While the labor force participation rate of women decreases, it increases between 25 and 44 years of age.

The fertility of women also affects female labor force participation rate. As the number of children increases, women tend to quit their jobs. Women with no children have a high labor force participation rate. It is also seen that women withdraw from business life as long as they have children.

Marital Status

Another factor affecting the participation of women in the labor force in our country is the marital status of women. The labor force participation rate of married women is quite different from that of women who have never been married or divorced. When the data of the recent years are analyzed, the labor force participation rate of women increased regardless of the marital status. Although women are married and have children, they prefer to be in business life.

Other Factors

Inadequacy of institutions for care services, pre-school care and education institutions and lack of full-time schools are barriers to women's participation in employment. Likewise, the number of institutions providing public or private services in elderly and disabled services is extremely insufficient. Other factors affecting women's participation in the labor market are informal employment wage inequality and legal regulations.

Informal Employment

One of the factors affecting the labor force participation of women in Turkey is informal employment. It is known in the statistics that the non-working segment is actually run without registration. It is observed that women are informal especially in the textile sector. The reason for this type of employment is that women with children do not have places to leave their children or they are expensive. This situation may lead women to work or home work such as textiles, knitting and tailoring (Özbay, 1982: 186). When women participate in informal employment they are not able to take advantage of the benefits provided by the insurance incentives.

Wage Inequality

Increasing social and economic differences increase inequalities towards women. Therefore, it is necessary to ensure equality between men and women in political, social and economic life (Kadının Statüsü Genel Müdürlüğü, 2008: 5). One of the criteria that will ensure this is equal pay. Wage inequality appears to be common, particularly in the private sector. It is known that women are employed at lower wages than men. Women, on the average, may receive lower wages, even if they are in the same occupational categories as men (Cam, 2003: 7).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Legal Regulations

Among the factors that determine female labor force participation are legal regulations. Articles such as re the head of the family is male in the civil law adversely affected the female labor force participation rate. The Labor Law prohibits women from working in certain areas. For example; It is forbidden to employ women in underground and underwater works such as mines and cable laying, sewerage and tunnel construction. Although the relevant laws are aimed at protecting women; prevents entry to high-wage jobs (Zeytinoglu, 1998: 193). It is a traditional gender-based division of labor that prevents women from working in income-generating jobs and benefiting from social security rights. Social security rights are very important for women's employment.

HİSTORİCAL DEVELOPMENT OF SOCİAL SECURİTY SYSTEM İN TURKEY

There are no comprehensive regulation related to social security in Turkey until 1936. 3008 with the Labor Law for the first time the establishment of social insurance and the basic principles of social insurance has been determined (Tepekule, 2008: 40). In this law, the state is accepted as the only regulatory authority in the labor-employer relations (Yay, 2014: 154-155). In addition, in the law the subjects such as insurance branches to be established and the scope of social insurance for individuals are regulated under the heading of social assistance. With the law, the risks to be provided for social protection are determined as "work accidents and occupational diseases, maternity, old age, dismissal, illness and death". In this case, being insured is adopted on a compulsory basis (Levent, 2013). In 1950, T.C. The General Directorate of Retirement Fund(with the Law no 5434) was established (Oral et al., 2013: 25).

Apart from these social security arrangements, the most important development is the 1961 Constitution. Article 48 of the 1961 Constitution on social security states that everyone has the right to social security (Oral et al., 2013: 25; Gerek et al., 2013: 205).

In 1965, the Social Security Law no. 506 entered into force. In this context, a new set of rights has been introduced for workers in the status of workers (SGK, 2016). With the new Constitution adopted in 1982, the right to social security is constitutional guaranteed. Unemployment insurance was accepted by the law numbered 4447 in 1999 and was put into practice in 2000 (Yiğit, 2005: 76).

The Social Security and General Health Insurance Law No. 5510, which entered into force in 2008, has made various arrangements in this regard. Birth borrowing is one of these arrangements. Again with this law, agricultural insurance has been made compulsory for all farmers.

The social security rights of women in Turkey can be summarized as follows:

- Birth Borrowing, (Law No. 5510)
- Breastfeeding Allowance. (Law No. 5510)
- Birth Benefit Allowance For Civil Servants, (Law No. 657)
- Temporary Disability Allowance, (Law No. 5510)
- Birth and Breast-feeding Leave. (Law No. 5510)
- Marriage Allowance (Law No. 5510)
- Conditions for Employment of Female Workers in Night Posts, (Law No. 5510)
- Prohibition of Ground And Underwater Operation, (Law No. 5510)
- Death Insurance, (Law No. 5510)

- Rights Provided to Women İnsured with Disabled Children (Law No. 5510)
- Women's Borrowing Abroad (Law No. 5510)
- Female Officer Night Watch (Law No. 657)
- Assisted Reproduction Method (Law No. 5510)
- Insurance of Women Who Do Handcrafts at Home (Law No. 5510)
- Providing Health Service to Women Who Are Violent Against Him (Laws No: 5510 And 6284),
- Regular Cash Aid for Women Who Passed Away Hers Husband (Ministry Of Family And Social Policies, Circulars 2012/6 and 2012/10).

In the Labor Law No. 4857, no discrimination is allowed in employer - employee relations. Discriminatory remuneration for similar work or work of equal value cannot be allowed. In the Labor Law, for women are protective regulations such as work conditions during pregnancy and lactation etc. Employees who have been sexually abused have the right to terminate the employment contract. There are regulations regarding maternity leave and parental leave in working life. All these articles in the law are social security activities for women. In this context, insurance premiums, incentives, supports and discounts are important in terms of gender equality.

The Insurance Premiums İncentives, Supports and Deductions in Turkey for The Period 2008-2019

In order to increase female employment in labor markets, financial burdens on enterprises should be reduced. Insurance premiums incentives, supports and discounts can be used to reduce this burden. Such practices also contribute directly to the development of the country. In Turkey for 2008-2019 period, insurance premiums incentives, supports and deductions are listed below:

- Insurance premium incentive for disabled insured employment
- 5 points deduction for disability, old age and death ınsurance premiums employer's share
- The premium incentive for employment of receiving unemployment allowance
- Insurance premium support for employment of young, women and occupational certificate holder
- Premium support dependent on ınvestment and employment
- Additional six points deduction
- 5 points deduction for insured who goes abroad
- Supporting occupational health and safety services
- İncentives for employment of beneficiaries of social services
- The ınsurance premium support for employment of graduated from on-the-job training program
- Minimum wage support
- Insurance premium support for research, development and design activities
- 4/b (Bağ-Kur: Social security organization for artisans and the self-employed) 5 points incentive
- Additional employment support
- Young entrepreneur ıncentive
- Employer's share ıncentive application of the unemployment ınsurance ın very dangerous category workplaces
- Quarterly fee support

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The listed above insurance premiums incentives, supports and deductions are important practices in terms of equality between men and women.

Evaluation of Insurance Premiums İncentives, Supports and Deductions in Terms of Gender Sensitivity for The Perıod 2008-2019

In this part of the study, the insurance premiums incentives, supports and deductions for 2008-2019 period will be discussed in terms of gender sensitivity. If there are arrangements for women in the related incentives, supports and deductions will be considered as gender sensitive incentives, supports and deductions. If there is no distinction between men and women, will be considered as gender neutral incentives, supports and deductions. If there are incentives, supports and deductions only for men, they will be considered as gender against incentives, supports and deductions

Evaluation of ınsurance premiums incentives, supports and deductions in terms of gender sensitivity for the perıod 2008-2019 shown in Table 4.

Table 4. The analysis of ınsurance premiums incentives, supports and deductions in terms of gender sensitivity (2008-2019)

İncentives, Supports Deductions	Legal Basıs	Scope	Applıcatıon Start Date	Gender Sensitivity
Insurance premium incentive for disabled insured employment	Law No. 4857. Article 30	The insurance premium is fully covered by the Ministry of Treasury and Finance. There is no application for women.	01/07/2008	There is gender neutral incentive. Gender sensitivity in this type of incentive is neutral.
5 points deduction for disability, old age and death ınsurance premiums employer's share	Law No. 5510. Article 81.	The relevant deduction is covered by the Ministry of Finance and Treasury. There is no application for women.	01/10/2008	There is gender neutral deduction. Gender sensitivity in this type of deduction is neutral.
The premium ıncentive for employment of receiving unemployment allowance	Law No. 4447. Article 50.	During unemployment benefit covered by the Unemployment Insurance Fund. There is no application for women.	01/10/2009	There is gender neutral incentive. Gender sensitivity in this type of incentive is neutral.
Insurance premium support for employment of young, women and occupational certificate holder	Law No. 4447. Temporary article 10	For the insured persons employed between 01/03 / 2011 and 31/12/2020, all of the employer's sahare of insurance premium is funded by the Unemployment Insurance Fund. Duration of use varies according to men and women, age and so on.	01/03/2011	There is gender sensitive support. Gender sensitivity in this type of support increased.
Premium support dependent on ınvestment and employment	Law No. 5510. Additional article 2.	Employer's sahare of insurance premium, the part corresponding to the minimum wage will be covered from the budget of the Ministry of Economy. There is no application for women.	19.06.2012	There is gender neutral support. Gender sensitivity in this type of support is neutral.
Additional six points deduction	Law No. 5510. Article 81.	In the disability, old age and death insurance premiums is provided after 5 points deduction, 6 points deduction. There is no application for women.	01/01/2013	There is gender neutral deduction. Gender sensitivity in this type of deduction is neutral.
5 points deduction for insured who goes abroad	Law No. 5510. Article 81.	The relevant deduction is covered by the Ministry of Finance and Treasury. There is no application for women.	01/06/2013	There is gender neutral deduction. Gender sensitivity in this type of deduction is neutral.

Table 4. Continued

İncentives, Supports Deductions	Legal Basıs	Scope	Applıcatıon Start Date	Gender Sensitivity
Supporting occupational health and safety services	Law No. 6331. Article 7.	Dangerous and very dangerous class with fewer than 10 employees in the workplace, specific rate of minimum wage paid to the employer. Financed by SSI (Social Security İnstitution) . There is no application for women.	01/01/2014	There is gender neutral support. Gender sensitivity in this type of support is neutral.
İncentives for employment of beneficiaries of social services	Law No. 2828 Additional Article 1.	The relevant premiums is covered by the Ministry of Finance and Treasury for five years. There is no application for women.	19/02/2014	There is gender neutral incentive. Gender sensitivity in this type of incentive is neutral.
The ınsurance premium support for employment of graduated from on-the-job training program	Law No. Temporary article 15.	All of the employer's share of the insurance premiums is covered by the Unemployment Insurance Fund. There is no application for women.	23/4/2015	There is gender neutral support. Gender sensitivity in this type of support is neutral.
Minimum wage support	Law No. 5510 Temporary article 78.	Minimum wage support will be financed by the Unemployment Insurance Fund. There is no application for women.	27.01. 2016	There is gender neutral support. Gender sensitivity in this type of support is neutral.
Insurance premium support for research, development and design activities	Law No. 5746 Article 3.	Half of the employer's share of the insurance premiums will be covered by the Ministry of Finance and Treasury until 31/12/2023. There is no application for women.	10. 08. 2016	There is gender neutral support. Gender sensitivity in this type of support is neutral.
4/b (Bağ-Kur: Social security organization for artisans and the self-employed) 5 points ıncentive	Law No. 5510 Article 81.	5 point deduction in invalidity, old-age and death insurance premiums is covered by the the Ministry of Finance and Treasury. There is no application for women.	01. 10. 2016	There is gender neutral incentive. Gender sensitivity in this type of incentive is neutral.
Additional employment support	Law No. 4447 Temporary Article 19.	For the insured persons employed between 01/01 / 2018 and 31/12/2020, insurance premium is funded by the Unemployment Insurance Fund. Support period is 12 months. For the women older than 18 years, men between 18 and 25 years and the disabled people is 18 months from the date of employment.	01/01/2018	There is gender sensitive support. Gender sensitivity in this type of support increased.
Young entrepreneur ıncentive	Law No. 5510 Article 81.	Between the ages of 18-29, Insurance premiums of those who open a business for the first time, will be covered by the Ministry of Finance and Treasury for 1 year. There is no application for women.	01.06.2018	There is gender neutral incentive. Gender sensitivity in this type of incentive is neutral.
Employer's share ıncentive application of the unemployment ınsurance ın very dangerous category workplaces	Law No. 4447 Additional Article 4.	Employer's Share Incentive of The employment Insurance will be applied for 3 year at a rate of 1% . There is no application for women.	31/12/2018	There is gender neutral incentive. Gender sensitivity in this type of incentive is neutral.
Quarterly fee support	Law No. 4447 Temporary Article 19.	For insured persons who are employed between 01/02/2019 and 30/04/2019, covered by the Unemployment Insurance Fund. There is no application for women.	01/02/2019	There is gender neutral support. Gender sensitivity in this type of support is neutral.

Source: Related Laws, 2020.

Acording to Table 4. in the insurance premium incentives category, the following results were obtained:

- İncentives Insurance premium incentive for disabled insured employment: There is gender neutral incentive. Gender sensitivity in this type of incentive is neutral.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The premium ıncentive for employment of receiving unemployment allowance: There is gender neutral incentive. Gender sensitivity in this type of incentive is neutral.
- İncentives for employment of beneficiaries of social services: There is gender neutral incentive. Gender sensitivity in this type of incentive is neutral.
- 4/b (Bağ-Kur: Social security organization for artisans and the self-employed) 5 points ıncentive: There is gender neutral incentive. Gender sensitivity in this type of incentive is neutral.
- Young entrepreneur ıncentive: There is gender neutral incentive. Gender sensitivity in this type of incentive is neutral.
- Employer's share ıncentive application of the unemployment ınsurance ın very dangerous category workplaces: There is gender neutral incentive. Gender sensitivity in this type of incentive is neutral.

In the insurance premium supports category, the following results were obtained:

- Insurance premium support for employment of young, women and occupational certificate holder: There is gender sensitive support. Gender sensitivity in this type of support increased.
- Additional employment support: There is gender sensitive support. Gender sensitivity in this type of support increased.
- Premium support dependent on ınvestment and employment: There is gender neutral support. Gender sensitivity in this type of support is neutral.
- Supporting occupational health and safety services: There is gender neutral support. Gender sensitivity in this type of support is neutral.
- The ınsurance premium support for employment of graduated from on-the-job training program: There is gender neutral support. Gender sensitivity in this type of support is neutral.
- Minimum wage support: There is gender neutral support. Gender sensitivity in this type of support is neutral.
- Insurance premium support for research, development and design activities: There is gender neutral support. Gender sensitivity in this type of support is neutral.
- Quarterly fee support: There is gender neutral support. Gender sensitivity in this type of support is neutral.

In the insurance premium deductions category, the following results were obtained:

- 5 points deduction for disability, old age and death ınsurance premiums employer's share: There is gender neutral deduction. Gender sensitivity in this type of deduction is neutral.
- Additional six points deduction: There is gender neutral deduction. Gender sensitivity in this type of deduction is neutral.
- 5 points deduction for insured who goes abroad: There is gender neutral deduction. Gender sensitivity in this type of deduction is neutral.

In the insurance premium supports category, there is gender sensitive supports and gender sensıtıvıty ıncreased only two support types (insurance premium support for employment of young, women and occupational certificate holder and additional employment support). Other insurance premium incentives, supports and deductions; there is gender sensitive incentives, supports and deductions and gender

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

sensitivity is neutral. According to these results, in the social insurance system insurance premiums incentives, supports and deductions are generally not gender sensitive in Turkey.

CONCLUSİON

Technological, sociological, economic development and changes have led to significant structural changes. These structural changes are also seen in the field of social security. Social insurances around the world try to provide services in line with the requirements of the social state principle. In our country, women have various rights within the scope of social security. the proclamation of the Republic of Turkey in 1923 and started a contemporary restructuring process. Major reforms have been made in relation to women and women labor. Various changes have been made in the economic and social areas for women. The employability of women is important for equality between men and women. In this context, gender discrimination is an important problem. Women face a number of obstacles in the labor market. Therefore, a number of studies are carried out to ensure gender equality in social state policy in Turkey. The factors affecting the participation of women in the labor force, women's and spouse's education level, age level, marital status, presence of informal employment, wage inequality, and are effective legal regulations. In the labor market, low level of participation of women in the labor force are outstanding. In particular, non-agricultural unemployment rates are higher than for males. In order to increase female employment in the labor market, first of all, financial burdens on enterprises should be reduced. Insurance premiums incentives, supports and discounts can be used to reduce this burden. The main contribution to the development of Turkey's increasing women's employment is to support socio-economic development and to realize the increase of welfare in a way to provide all segments of the society. In this sense, the overall goal is to create a competitive labor market that creates more and better jobs and can adapt to changing conditions and global markets. The targets set for achieving this goal in the future are as follows: The employment rate will be over 65 percent. Unemployment rate will be reduced to below 5 percent. The female labor force participation rate will be increased to over 55 percent. Unregistered employment rate will be reduced to less than 15 percent. Necessary discounts will be provided on insurance premiums incentives, supports and deductions for the promotion of women's employment. In this study, the incentives, supports and deductions of insurance premiums for the period 2008-2019 are discussed in terms of gender sensitivity. If there was arrangements for women in the related incentives, supports and deductions were considered as gender sensitive incentives, supports and deductions. If there was no distinction between men and women, were considered as gender neutral incentives, supports and deductions. If there was incentives, supports and deductions only for men, they were considered as gender against incentives, supports and deductions.

Chapter 97
Gender Diversity in the Senior Management of Large Technology Companies

Yakira Fernández-Torres
University of Extremadura, Spain

Ricardo Javier Palomo-Zurdo
CEU San Pablo University, Spain

Milagros Gutiérrez-Fernández
University of Extremadura, Spain

ABSTRACT

As a key part of the fourth industrial revolution, technology companies have become the most valuable companies in the world in terms of market capitalization. Surprisingly, however, these companies have been overlooked by studies of gender diversity in corporate governance even though their highly distinctive features may cause major differences in gender diversity with respect to companies in other sectors. The goal of this chapter is therefore to provide the first characterization of gender diversity in the corporate governance of large technology companies—specifically those with the highest market value—and explore the relationship between gender diversity and business performance. To achieve this goal, descriptive statistical analysis is used. Data correspond to the period 2005 to 2017. The findings confirm the under-representation of women on the boards of directors of 162 publicly listed companies. The findings also show that the most profitable companies are those that have the greatest female representation on their boards of directors.

INTRODUCTION

The issue of gender[1] in business is highly topical. This issue is subject to interpretation and, on occasion, biased approaches that often prove controversial. The interest that this issue has elicited from policymakers reflects the firm belief that boards of directors that have greater diversity are more effective and that women are under-represented on these boards of directors. These factors explain the recent tendency to implement actions that promote gender diversity in corporate management. Between 2008 and 2015, 32 countries implemented 42 policies to foster board diversity (Adams, 2016).

Such issues have also been addressed by scholars. Particularly during the last decade, many studies have investigated various facets of the relationship between the representation of women on companies' boards of directors and these companies' financial performance (Terjesen, Couto, & Francisco, 2016) and market image (Al-Shaer & Zaman, 2016), as well as the impact of this representation on decision making (Nielsen & Huse, 2010). However, this literature contains certain gaps. For example, there is a lack of consensus on the role of gender diversity in corporate governance (Isidro & Sobral, 2015). Furthermore, studies have generally focused on large companies, particularly publicly listed companies. This choice of focus results from two factors: the applicability of certain standards and guidelines, especially regarding the proportion of minorities that must be represented on the boards of these companies; and the greater data availability, which enables the analysis of performance, profitability, and financial structure.

It is much less common for studies to examine the issue of gender in senior management from a sector perspective. Sector analyses of the digital economy or the collaborative economy are practically nonexistent. The lack of such research is particularly relevant in today's context, which is characterized by the hyperconnectivity and technological revolution that define the so-called Fourth Industrial Revolution and that exert unprecedented effects on society (Cheong & Lee, 2017).

Consequently, this study focuses on the business sector that contributes the most to shaping the digital economy and that, in a sense, acts as a catalyst for the development of a new digital society, which is replacing the industrial society that dates back to the 19th century. Specifically, this study focuses on large companies, in terms of market capitalization, in the global technology sector. One example of the importance of this sector is the fact that the five largest companies in the world by market capitalization—Apple Inc., Alphabet Inc., Microsoft Corporation, Amazon Inc, and Facebook Inc. (Bloomberg L.P., 2018)—are all technology companies. This list reflects a radical change with respect to the previous decade, when the world's largest companies were banks, oil companies, and retailers.

Technology companies have a number of features that make analyzing female representation in this thriving business sector particularly interesting. These companies are characterized by a high proportion of employees with a background in technology, linked to qualifications or studies in STEM (Science, Technology, Engineering, and Mathematics) subjects. Traditionally, these subjects have been numerically dominated by men (Glass, Sassler, Levitte, & Michelmore, 2013). A priori, this dominance would suggest some selection bias in the senior management of these companies. In addition, the new business models that are adopted in the digital economy differ considerably from traditional models in terms of management and governance. Such differences relate to the profile of entrepreneurs, founders, and partners as well as the profile of customers. These new business models, coupled with the crucial role of technological and business development skills, call for professionals with a broad range of training and experience and, at the same time, a forward-looking and visionary mindset. Technology companies' governance structures are also notoriously flat, and personal leadership takes precedence over hierarchical leadership, with a predominance of young entrepreneurs as opposed to the generally older managers

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

in traditional companies. Finally, technology companies are a magnet for professional talent because of their status and the high salaries they offer. This perspective of analysis of talent has also been considered in the technology sector (Foust-Cummings, Sabattini, & Carter, 2008) under the premise that, in these companies, maximizing talent regardless of gender can reduce gender barriers.

Against this backdrop, the goal of this study is to analyze female representation in the governance of large technology companies and its possible effects on the performance of these companies. Specifically, this study characterizes gender diversity in the senior management of large technology companies, also assessing how it has evolved over time, and explores the possible relationship between gender diversity and business performance. To the best of the authors' knowledge, this is the first study of gender for this sector. To conduct this study, the authors used Bloomberg L.P. (2018) to gather data on the gender diversity of the senior management of the 162 technology companies with the highest market capitalization worldwide as of February 15, 2018. The authors adopted Bloomberg L.P.'s (2018) classification of large companies by market capitalization. These data were supplemented with financial data gathered from the Osiris database (Bureau van Dijk, 2018). The data were gathered and analyzed for the period 2005 to 2017. After drawing the sample, the authors performed descriptive and numerical statistical analyses using measures such as the arithmetic mean, standard deviation, minimum, maximum, and percentiles. These results yield two principal findings. First, women are under-represented on the boards of directors of the analyzed companies. On average, women account for only 11.13% of board members. Second, the most profitable companies are those with the greatest gender diversity. The most significant differences in terms of profitability arise between companies that have no female board members and companies that have at least one female board member.

This chapter has five sections. Following this introduction, the second section reviews the gender literature that examines a range of facets of the role of women in corporate boards of directors. The third section describes the data sources that were used to gather the data for the empirical study and the method that was used to analyze these data. The fourth section presents the results of the analysis. The fifth section provides conclusions based on the study's findings.

THEORETICAL BACKGROUND

It may be hypothesized that gender diversity affects corporate governance and company performance. In the broadest sense, greater diversity in organizations, whether it is in terms of race, age, or gender, may lead to different perceptions of business performance and creativity. Similarly, more diverse groups of workers can arguably develop more innovative solutions to problems given the range of views that are elicited and discussed (Robinson & Dechant, 1997). However, this effect would contradict the hypothesis of equality. The hypothesis therefore requires thorough analysis.

In reference to corporate governance, Carter, Simkins and Simpson (2003) draw upon agency theory (Fama & Jensen, 1983) to argue that gender diversity increases the independence of the board of directors because people of different gender, ethnicity, or culture are able to question things that directors from a similar background would not. Other arguments provide several additional reasons why gender diversity is a determinant of the effectiveness of boards of directors (Adams & Ferreira, 2009). First, gender diversity allows the company to benefit from the greater stock of talent provided by its directors. Second, women's participation in the board of directors differs from that of men. For example, women contribute to improving attendance at meetings and are more likely to join monitoring committees. Har-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

joto, Laksmana and Lee (2015) argue that gender diversity increases the board's ability to recognize the needs and interests of different stakeholders, all of which affects corporate social responsibility because more diverse groups have different knowledge bases, experiences, and social perspectives. Nielsen and Huse (2010), however, note that the impact of women on the board's decision capabilities depends on the type of task, with a positive impact on strategic tasks. It is also important to consider not only women's presence on the board of directors but also the need for a critical mass of female board members. A minimum of three female directors is needed to enhance the contribution of the board of directors in terms of organizational innovation (Torchia, Calabró, & Huse, 2011).

A rich literature discusses the differences between men and women. These differences influence the behavior of the board of directors when it has female members. Notably, leadership style varies across genders (Nielsen & Huse, 2010), as reflected by the characteristics that are embodied more by men than by women (e.g., confidence, ambition, aggression, and independence) and the characteristics that are embodied more by women than by men (e.g., concern for the well-being of others, affection, helpfulness, and friendliness). There are also gender differences in terms of attitudes toward risk. Women are more risk-averse than men are (Bernasek & Shwiff, 2001). Finally, women behave differently from men with respect to debt: Women are less likely to seek external financing (Byoun, Chang, & Kim, 2016). Other such differences also exist.

After presenting these arguments, it is important to reflect on the empirical evidence regarding the influence of gender-diverse corporate governance on business performance. Findings in this area vary, with scholars reporting positive, negative, and neutral effects (Isidro & Sobral, 2015). Examples of studies that have failed to find a causal relationship between gender diversity in corporate governance and business performance include the study by Carter, D'Souza, Simkins and Simpson (2010). To explain their results, they note the likelihood that the increased company value due to gender diversity in the board of directors could be obscured by issues such as conflict or exclusion. They also argue that this relationship may be contingent. In other words, the relationship may depend on the circumstances and period under analysis. Similar results have since been reported by Yeh and Trejos (2015) and Marinova, Plantenga and Remery (2016).

Notable studies that have found a negative relationship include the study by Adams & Ferreira (2009), who report that more diverse boards are associated with more poorly performing companies in terms of *Tobin's Q ratio* and return on assets (*ROA*). They explain their findings by arguing that gender diversity only increases value when additional monitoring would increase company value. Gulamhussen and Santa (2015) report that the participation of women in boards of directors of large banks in OECD countries exerts a positive influence on profitability and a negative influence on risk.

Nevertheless, a greater number of studies have shown the existence of a positive relationship. Notable examples include Carter et al.'s (2003) study, which showed the positive influence of the presence of women or minorities on company value creation. Similar findings have been reported by Rodríguez-Domínguez, García-Sánchez and Gallego-Álvarez (2012) for companies in the energy and petrol sector, Liu, Wei and Xie (2014) for Chinese listed companies, García-Meca, García-Sánchez and Martínez-Ferrero (2015) for the banking sector, and Terjesen et al. (2016) for a sample of companies from 47 countries. Finally, Post and Byron (2015) conducted a meta-analysis of 140 studies of a range of contexts, finding evidence that female representation on boards of directors is important for increasing profitability.

In the technology sector, gender differences are gaping (Cohoon, 2011). Certain studies have corroborated these gender differences, particularly for the case of US technology companies (Ashcraft, Mclain, & Eger, 2016). These differences may owe to the traditionally lower enrolment rate of women

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

in university STEM programs (Glass et al., 2013) or the lack of active gender policies among high-technology companies (Williams, 2014) or problems that women face in achieving promotions (Simard, Henderson, Gilmartin, Schiebinger, & Whitney, 2008). Thus, technology companies also seem to have a glass ceiling (Fernández & Campero, 2012).

METHOD AND DATA SOURCES

Description and Analysis of the Sample

To select the sample, the authors selected the largest publicly listed technology companies in the world in terms of market capitalization in USD over the full study period, subject to data availability. To select these companies, the classification provided by Bloomberg L.P. (2018) was used. This classification identifies small, medium-sized, and large enterprises according to their market value or capitalization. Restricting the selection to companies in the technology sector, the authors selected all large companies, as per the classification on Bloomberg L.P. (2018). The next step consisted of searching for and gathering all gender variables provided by Bloomberg L.P. (2018) for these companies. Of the 173 companies that were initially selected, gender data were available for 163 companies for the period 2005 to 2017.

Once these data had been collected, the authors supplemented the data with financial data gathered from the Osiris database (Bureau van Dijk, 2018). A series of measures were collected for this study. These measures correspond to some of the primary indicators used to explain company performance. These measures are also some of the most commonly used in studies of corporate governance. The activities of one of the sampled companies included financial activities, so the data format for this company differed from the format for all other companies in the sample. This discrepancy would have prevented data comparability across the sample. Therefore, this company was eliminated from the sample. The financial variables were expressed in different currencies depending on each company's country of origin. All values were therefore converted into USD. To convert the values to USD, for each year, the official exchange rate for each currency as reported by the World Bank (2018) was used.

This procedure yielded data on 162 companies. According to their classification in Bloomberg L.P. (2018), each company belonged to one of three industries: technology hardware and equipment (42 companies), software and services (91 companies), or semiconductors and semiconductor equipment (29 companies). This sample had several notable characteristics. First, the companies were based in 19 countries across America, Europe, and Asia-Pacific. Africa was the only continent that was not represented by the sample. Also, several companies were headquartered in Bermuda (three companies) or the Cayman Islands (seven companies) for tax reasons. Second, more than half of the companies in the sample (83 companies) were from the US. The countries with the second and third highest representation were Japan and China. Table 1 shows the number of companies by country and region, reflecting the hegemony of the US and Europe's low representation. At the time of analysis, 18 of the 162 analyzed companies had a market capitalization of more than 100 billion USD (14 of these were US companies), and 17 had a market capitalization of 50 to 100 billion USD.

The variables that were used in this study can be broadly classified in two categories: gender variables and financial variables. The variables can be described as follows:

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. Gender variables gathered from Bloomberg L.P. (2018):
   a. **Wom_Board:** Number of women on the board of directors.
   b. **%Wom_Board:** Percentage of female board members.
   c. **Wom_Exe:** Number of women executives.
   d. **%Wom_Exe:** Percentage of female executives.
   e. **Wom_Chair:** Female president. Dichotomous variable that takes the value 1 if the president is a woman and 0 otherwise. The use of this variable and the following variable is important because there is evidence that the gender of the president and CEO affects the contribution of female directors to the decision-making process of the board of directors (Torchia et al., 2011).
   f. **Wom_CEO:** Female CEO. Dichotomous variable that takes the value 1 if the CEO is a woman and 0 otherwise.
   g. **Wom_Board_1:** Dichotomous variable that takes the value 1 if the board of directors has at least one member who is a woman and 0 otherwise.
2. Financial variables gathered from Bureau van Dijk (2018):
   a. **ROA (%):** Return on assets, calculated as the ratio of ordinary income before tax to total assets.
   b. **Tobin's Q ratio:** Calculated as the ratio of total market value to total asset book value.
   c. **ROE (%):** Return on equity, calculated as the ratio of ordinary income before tax to shareholders' equity.

These three variables were included in the analysis because they are some of the most commonly used business performance measures in studies of gender diversity in corporate governance (Adams & Ferreira, 2009; Isidro & Sobral, 2015; Rodríguez-Ruiz, Rodríguez-Duarte, & Gómez-Martínez, 2016). As reported by Carter et al. (2010), the *ROA* indicates the ability of the company to generate profit using its assets, valued at their historical cost. *Tobin's Q ratio* provides a measure of the wealth of shareholders and creditors. This indicator partly depends on the market value of the company. Therefore, its use in the study of listed companies is essential because it offers a market valuation of the investment opportunities provided by the company (Carter et al., 2010). The *ROE* indicates how well shareholders' equity is used to generate profit (Rodríguez-Ruiz et al., 2016).

Although these three variables are key variables in the literature, other measures are also useful for explaining a company's situation. Therefore, this study used three additional ratios (*Cash*, *Solv*, and *Gear*). The first variable, *Cash*, captures the cash flow of the company. The financial community considers cash flow the primary indicator of the financial health of the company (Llorente & Amador, 2010). Cash flow refers to the inflows and outflows of cash in the company's accounts. Because of the lag between income/expenses and receipts/payments, it is important to go beyond profit to study the company's ability to finance the business and meet short-term debt obligations.

- **Cash (thousand USD):** Cash flow.
- **Solv (%):** Solvency ratio, calculated as the ratio of shareholders' equity to total assets.
- **Gear (%):** Gearing ratio, calculated as the ratio of noncurrent liabilities and loans to shareholders' equity.

One of the pillars of business risk is financial risk, which is closely linked to the company's ability to generate liquid assets (Llorente & Amador, 2010). It is therefore important to analyze the company's solvency, which offers a measure of the stability of the company and its ability to meet its short- and long-term obligations. Therefore, to provide an overview of each company's solvency, the proportion of assets that are financed by shareholders' equity (*Solv*) was included in the study. An indicator of the company's leverage (*Gear*) was also used. This indicator was included not only because of the importance of debt as a determinant of business performance (Pamburai, Chamisa, Abdulla, & Smith, 2015) but also because of the notable differences between men and women in terms of their attitudes toward risk (Bernasek & Shwiff, 2001) and company debt (Hernández-Nicolás, Martín-Ugedo, & Mínguez-Vera, 2015). The gearing ratio is the ratio of the company's most important sources of external financing, such as long-term liabilities and short-term loans, to shareholders' equity.

Finally, the following four variables, some of which have frequently been used in the corporate governance literature, were included in the analysis to provide an indication of the size and characteristics of the firms in the sample:

- **Board:** Number of members of the board of directors.
- **Tot_Ass (thousand USD):** Total assets.
- **Sls (thousand USD):** Sales.
- **R&D (thousand USD):** R&D spending.

Method

This study is based on descriptive and numerical statistical analysis whose goal is to process and extract useful information from the data (Newbold, Carlson, & Thorne, 2007). To conduct the analysis, several types of measures were used: measures of central tendency, measures of variability, minimum and maximum values, and percentiles. For the measures of central tendency, the arithmetic mean was used. The arithmetic mean provides numerical information about a standard observation. A measure of

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

variability (i.e., the standard deviation) was used to measure the dispersion of observations around the arithmetic mean. The goal of this measure was to complement the description provided by the mean.

These measures were used provide an overview of the primary characteristics of large technology firms in terms of gender diversity in the senior management and business performance. The purpose was also to explore the relationship between the two variables, thereby addressing the research goal. First, the mean, standard deviation, minimum, maximum, and percentiles were calculated for the sample (Table 2) and for each industry within the sample (Table 3). The next step was to provide a more exhaustive description of female representation in the senior management of the analyzed companies over the last three years (Table 4). This period was used not only because it depicts the current situation but also because data were available for all companies for these years. Finally, Table 5 shows the arithmetic means of the financial variables for samples under different gender-based criteria. The goal was to identify possible relationships between these variables and gender characteristics.

RESULTS OF THE ANALYSIS

The results of the analysis described in the previous section are presented in this section, accompanied by a brief discussion.

Table 2 shows the values for the aforementioned statistics for the whole sample. The data in Table 2 show that women are substantially under-represented on the boards of directors of the sampled companies. On average, the boards of directors have just one member who is a woman (1.1327), yet the average number of members per board is approximately 10 (9.5890). Similarly, the average percentage of women on these boards of directors is only 11.13%. For 75% of the observations for this indicator, the percentage of female board members is less than 18.18%. The highest number of female members on any board of directors is 6, while the largest board has 27 members. The average percentage of female executives to total executives at the company is also very low (9.59%).

Analysis of the financial data shows that, on average, the sampled firms have a *ROA* of 9.67%. For 75% of the observations for this indicator, the *ROA* is less than 16%. On average, the market value of the sampled firms is more than twice the historical cost of total assets (*Tobin's Q ratio* = 2.21). The average *ROE* is 18.33%, although the highest *ROE* is 631.18%. In general, cash flow is positive and is greater than 92.389 million USD. On average, 53.12% of the assets are financed by shareholders' equity. On average, noncurrent liabilities and financial debt account for around 70% of shareholders' equity. Average total assets are 14.10 billion USD, with high dispersion, reflecting a high degree of heterogeneity. Average sales are 9.94 billion USD. Finally, the majority of firms invest more than 48.22 million USD in R&D.

Table 3 complements this analysis by showing the statistics for each industry. The gender indicators show that, although women are under-represented on the boards of directors of companies in all three industries, the technology hardware and equipment industry presents the worst data. On average, only 8.76% of the board members of companies in this industry are women. This percentage is slightly higher for the semiconductors and semiconductor equipment industry (10.67%). The best data are for the software and services industry (12.53%). Similarly, the companies in the software and services industry also have the highest proportion of female executives (11.67%) and the best financial performance in terms of *ROA* (average of 10.66% versus 8.63% for the technology hardware and equipment industry and 8.28% for the semiconductors and semiconductor equipment industry), *Tobin's Q ratio* (average of 2.68 versus 1.89 for the semiconductors and semiconductor equipment industry and 1.56 for the technol-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ogy hardware and equipment industry), and *ROE* (average of 22.32% versus 15.37% for the technology hardware and equipment industry and 11.04% for the semiconductors and semiconductor equipment industry). Differences also arise for leverage (*Gear*), not only in terms of average values for the gearing ratio (software and services: 81.85%; semiconductors and semiconductor equipment: 61.31%; technology hardware and equipment: 55.18%) but also in terms of the percentiles and maximum values. In all cases, the software and services industry had the highest values.

Table 4 provides a more complete picture of female representation on the boards of the sampled companies. Table 4 shows the number of companies that meet certain criteria in relation to the gender variables at the sector and industry levels for the period 2005 to 2017. To ensure clarity, an explanation of each of these criteria is provided as the corresponding results are presented. First, the number of companies whose boards of directors had no female members reduced year on year (see Criterion 1). Specifically, in 2015, 52% of the companies in the sample (84 companies) had at least one female member on the board of directors (versus 48% of companies with boards of directors formed entirely of men). In 2017, this percentage had increased to 76% (123 companies). Although the number of companies with at least one female board member increased year on year in all industries, there were considerable differences across different industries. Specifically, the largest increase over the period occurred in the software and services industry, where the percentage increased by 29 percentage points. Thus, in 2017, 85% of software and services companies had at least one female board member. In the semiconductors and semiconductor equipment industry the percentage increased by 24 percentage points to 79%. The technology hardware and equipment industry lagged behind, with an increased from 40% in 2015 to 55% in 2017.

Criteria 2 and 3 refer to the number of companies with at least two or three female board members, respectively. The results show a sharp drop in practically all cases with respect to Criterion 1. The largest drop is in the semiconductors and semiconductor equipment industry. In general, these drops grew year on year in terms of both the difference between the number of companies that met Criteria 1 and 2 and the difference between the number of companies that met Criteria 2 and 3. This result reflects the fact that, in virtually no case (across the sample as a whole or in each separate industry), the number of companies with at least two female board members exceeds 50%. The exception is the software and services industry for the year 2017 (53%). This is also the only industry for which, also for 2017, the percentage of companies with at least three female board members is greater than 30%.

These conclusions are particularly relevant given that the average number of members on the board of directors of the sampled firms is approximately 10 and that for 75% of the observations for this indicator, the number of board members is at least 8 (see Table 2; arithmetic mean and 25th percentile of the measure *Board*). Therefore, although a high proportion of the boards of the sampled companies have at least eight members, the number of companies with at least three female board members was just 25 in 2015 (15%), 37 in 2016 (23%), and 39 in 2017 (24%). These findings are supported by Criteria 6, 7, and 8, which relate to the number of companies with a proportion of female board members that is greater than the sample mean, 25th percentile, and median, respectively. Thus, the results show that, in general, more than half of the companies across the sample and in each separate industry have a percentage of female board members that is greater than the mean. In very few companies, however, do women account for at least 25% of all board members (22% of companies in 2015 and 28% of companies in 2016 and 2017). In even fewer companies do women account for at least 50% of the board members (only 4% of companies in 2015 and virtually the same percentage in 2016 and 2017).

Finally, Criteria 4 and 5 refer to the number of companies where the president and the CEO, respectively, are women. The data are more stable for these criteria than for any other criteria. Only minor changes are observed over time, and very few companies meet these criteria. Specifically, in 2017, in only 4 out of the 162 analyzed companies (2%) was the president a woman. Two of these companies are from the technology hardware and equipment industry and two are from the software and services industry. In 2017, only 5 out of the 162 sampled companies (3%) had female CEOs.

Source: Compiled by the authors using outputs from Stata 11. For Criterion 6, the values for a given industry were calculated using the arithmetic mean for that industry.

Next, the data in Table 5 were used to examine the possible relationship between female representation in the senior management of the sampled companies and the performance of these companies. Table 5 shows the mean of each financial variable calculated for different gender-based criteria. For Criteria 1 through 4, the data show that as the minimum number of female board members increases, so does the average profitability of the firms (in terms of both *ROA* and *ROE*) and the market value (*Tobin's Q ratio*). This finding reflects the need to reach a critical mass of female board members so that their contribution becomes apparent. The reason is that majorities exert a greater influence than minorities,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

which are more easily marginalized (Torchia et al., 2011). Notably, the largest increase in these measures occurs in cases where the composition of the board changes from consisting solely of men to including at least one female member (i.e., from Criterion 1 to Criterion 2).

Table 5. Arithmetic mean of financial variables by gender-based criterion

Source: Compiled by the authors using outputs from Stata 11.

The remaining means also indicate the existence of a positive association between the presence of women in the company's senior management and the generation of positive cash flows. This finding is implied by the variation in the average of the cash flow measure (*Cash*), which is more than twice as large in companies that have at least one female board member than in companies whose boards of directors comprise only men. Although the mean solvency indicator (*Solv*) is lower for Criterion 2 than for Criterion 1, it increases as the minimum number of women on the board of directors increases from one to three. Notably, the mean leverage ratio (*Gear*) decreases when there is at least one woman on the board of directors (from 76.41% to 68.24%). This ratio continues to decrease, albeit to a lesser degree, when the minimum number of female board members increases from two to three.

Similarly, Criteria 5 and 6 also reveal differences in the averages of practically all financial indicators. Specifically, Criteria 5 and 6 refer to companies for which the percentage of female board members is less than the sample mean (Criterion 5) and companies for which the percentage of female board members is greater than or equal to the mean (Criterion 6). The results highlight notable differences between the companies in each of the two cases. Companies for which the percentage of female board members is greater than or equal to the sample mean are more profitable (in terms of *ROA* and *ROE*), have higher values for *Tobin's Q ratio*, and generate greater positive cash flows.

The remaining criteria reveal considerable differences between companies depending on whether the president is male or female (Criteria 7 and 8, respectively) and between companies depending on whether the CEO is male or female (Criteria 9 and 10, respectively). On average, the most profitable companies have a female president. This is particularly true in the case of the *ROE*, which is more than twice the *ROE* for companies with a male president. Companies whose president or CEO is male have higher market values and generate greater positive cash flows. If the president or CEO is a woman, the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

company has a lower percentage of assets that are financed by shareholders' equity and, therefore, greater leverage. Both of these variations are substantial.

The findings presented herein show the clear gender differences in the corporate governance of leading technology companies, based on inadequate female representation. On average, women account for 11.13% of board members. Although the number of companies with at least one female board member has an increasing trend, the number of companies that have at least two or three female board members is substantially lower, particularly considering that the average number of board members is approximately 10.

It is also noteworthy that the gender data vary by industry. Software and services has made the best progress in terms of female representation in the senior management. These findings are particularly important given that the data highlight the differences in the performance of companies depending on the female representation on the corporate board. Companies with female board members are more profitable than companies whose boards of directors comprise only men. These findings are consistent with most of the related literature, which emphasizes the need to have women on the board of directors to improve company performance (Carter et al., 2003; Liu et al., 2014; Post & Byron, 2015; Terjesen et al., 2016).

CONCLUSION

The importance of encouraging gender-diverse boards of directors is supported by numerous arguments and studies. Much has yet to be done, however, not only because of the conflicting findings regarding the potential influence of gender diversity on company performance, but also because certain types of companies have received less attention and because the literature contains few sector analyses. Studies of gender in relation to the digital economy sector are scarce, despite the major impact of this sector on the economy and society and despite its unique characteristics, which make analyzing female representation in senior management positions in this sector particularly interesting. In response, this study's goal was to provide a characterization of gender diversity in corporate governance and examine its potential effects on several financial variables. To achieve this goal, descriptive statistical analysis of the 162 largest technology companies in the world in terms of market capitalization was conducted for the period 2005 to 2017.

The primary conclusions, which are based on the results of the analysis, allude to scarce female representation on the board of directors and in the senior management. Second, the software and services industry has the fewest companies with no female board members. Companies in this sector have made the most progress in recent years in terms of female representation on the board of directors.

A notable finding is that the most profitable companies are those with female board members and female presidents. This finding reflects the sizeable task faced by the sampled firms to achieve gender equality in their senior management. This conclusion also applies to numerous other areas and represents an ethical, social, and economic challenge for institutions and society as a whole.

Finally, this study has certain limitations. These limitations fundamentally relate to the fact that the study presents an initial descriptive analysis and does not explore causal relationships between variables using sound econometric methods. This study could be extended by applying more rigorous analyses and by broadening the scope to other samples of interest.

KEY TERMS AND DEFINITIONS

Business Performance: A wide range of indicators that can focus on profitability, growth, or social performance of companies.

Gender Diversity: Usually measurable by the proportions of male and female in companies or institutions. In this work, gender diversity focuses on the percentage and number of women on boards of big technological companies. In the broadest sense, diversity in organizations can be in terms of race, age, or gender.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ROA: Return on assets, calculated as the ratio of ordinary income before tax to total assets.

ROE: Return on equity, calculated as the ratio of ordinary income before tax to shareholders' equity.

Solvency Ratio: Calculated as the ratio of shareholders' equity to total assets.

Technology Companies: Those who are focused on products and services with a main technological component.

Tobin's Q Ratio: Calculated as the ratio of total market value to total asset book value.

ENDNOTE

[1] In this work the concept of gender is used in its differentiating aspect between women and men, following the approach of most of the specialized literature.

Chapter 98
Does a Federal Glass Ceiling Have Differential Effects on Female and Male Technology Entrepreneurs?

ABSTRACT

Glass ceilings are invisible organizational barriers encountered by underrepresented groups in large hierarchies. This chapter empirically investigates the existence and characteristics of an internal, government-wide glass ceiling for female employees using aggregate pay grade and demographic data on nearly 1.5 million U.S. Federal employees between 2001-2011. The external consequences for over 15,000 technology ventures seeking R&D funding from 12 federal agencies is explored. In this context, the researchers analyze over 50,000 grants and find that a unit increase in a novel, government-wide, glass ceiling measure is a meaningful and negative predictor of subsequent Phase II funding outcomes for Phase I grantees. More importantly, the negative external effects of the identified glass ceilings are significantly larger for women technology entrepreneurs when compared to their male counterparts.

INTRODUCTION

The term "glass ceiling" entered the corporate conversation in 1986 when Hymowitz and Schellhardt first coined the expression in the *Wall Street Journal.*[1] The concept continues to gain currency among scholars and is emerging as a core topic in the management literature (e.g., Adams & Funk, 2012; Akande, 2013; Glass & Cook, 2016). Glass ceilings are defined as invisible organizational phenomena in which overt and subtle barriers to managerial advancement exist for women (Ragins, Townsend, & Mattis, 1998). As described in the quote below from Robert B. Reich, U.S. Secretary of Labor, and Chairman of the Federal Glass Ceiling Commission, glass ceilings are perceived to exist and persist in management leadership hierarchies:

"The research [conversation] indicates that where there are women and minorities in high places, their compensation is lower … Nor does the evidence indicate that the glass ceiling is a temporary phenomenon. In fact, the research cited [in the Federal Glass Ceiling Commission Report] finds relatively few women and minorities in the positions most likely to lead to the top—the "pipeline" … In short, the fact-finding report tells us that the world at the top of the corporate hierarchy does not yet look anything like America." --- Glass Ceiling Commission Final Report (1995)

Since publication of this landmark report in 1995, a number of research studies support its basic claims. White males have been found to most likely achieve higher pay and increased promotion opportunities (Judge, Cable, Boudreau, & Bretz, 1995), women are more likely to experience greater challenges when promoted to CEO and then are allowed less room for error when in place as compared to males (Cook & Glass, 2014), and women appear to have less authority than men in the workplace. For cases where women do have authority, it is more likely to be at lower levels and more often than not, it is in the supervision of other women or minorities (Smith, 2002). Research on ethnic minority glass ceilings as the focus are rare. At the beginning, literature on glass ceilings pertained to just gender, but fairly quickly ethnic minorities have been grouped together in the diversity research conversation. The majority of studies do confirm that glass ceilings still exist for minorities, and that stereotyping, biases, and subtle racism still stand as barriers to removal (Wilson, 2014).

Prior research on glass ceilings primarily deal with identification of the phenomenon by considering differences in salary or management level between women and men with similar qualifications. This is extremely useful in measuring progress made in the commitment to improving diversity and equality in the workplace. However, a societal and institutional commitment to change does not necessarily translate into substantial and visible organizational change. According to the *Women in the Workplace 2016* Report produced by LeanIn.Org and McKinsey & Co., the percentage of women in the corporate pipeline shows a modest increase since 2015, but the results also indicate that at every level in the corporate hierarchy, women remain largely underrepresented.[2] While the authors acknowledge that identifying glass ceilings is the first critical step in making progress towards removing these barriers, if scholarly inquiry is limited to the problem of identification, then the results are also limited in ability to recommend strategy shifts and policy changes relevant to improving firm performance, economic, and societal outcomes.

A related emerging stream of research tackles this challenge by taking a functional perspective on the relationship between status and performance. For example, recent work finds that gaps in power such as glass ceilings may persist because women and minority corporate executives are discouraged from performing diversity-valuing behavior (e.g., outreach, training, etc. of minorities and women) (Hekman,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Johnson, Foo, & Yang, 2017). This is corroborated in internal studies conducted by Federal agencies. For instance, the National Institutes of Health (NIH), find that insufficient outreach exacerbates the problem of lower rates of participation of women and minorities in science, technology, engineering, and mathematics (STEM) fields and may explain the lack of research and development (R&D) grant applications from minority-owned (3%) and woman-owned (13%) firms (Gansler & Shivakumar, 2016).

A lack of grant applications leads to a lack of grant funding for R&D which is critical to the commercial success of small technology firms. Many of these firms lack the funding to bridge the technology "valley of death" between proof-of-concept and generation of sales[3]. What happens for many technology firms is that they may be able to produce a minimum viable product or technology, but they do not have the capital required to bring that concept to market. This step is often capital intensive as "bugs" need to be worked out in software or actual products need to be manufactured and held in inventory prior to securing any sales. The purpose of R&D grant funding is to help these firms bridge the gap in capital and survive long enough in operations to generate sales on their own. Without these grants, many large technology firms (i.e., Qualcomm Inc., 23andme, Symantec Corporation, etc.[4]) would likely not exist today because these firms took advantage of grant funding when they were considered small technology businesses.

In FY 2015, over $421 million in new R&D funding was provided to small technology firms in the U.S. Of that, approximately $61 million (or 14%) went to women-owned small businesses and $26 million (or 6%) went to small disadvantaged businesses many of which are minority-owned. These figures are only this high due to notable outreach efforts by all participating Federal agencies which explicitly must demonstrate how they pursue an SBIR goal to "foster and encourage participation in innovation and entrepreneurship by women and socially or economically disadvantaged persons."[5] In spite of these outreach efforts, there is still the general lack of parity between male versus female and minority versus non-minority R&D grantees. Given this disparity, the gender and minority gap will only continue to sustain itself for the foreseeable future; therefore, diversity research must go further than simply acknowledging that glass ceilings exist and determine the societal and economic impacts of existing concerns.

This study contributes to and extends this line of research by introducing a novel proxy for the measurement of a glass ceiling across Federal agencies using the difference between the weighted average composite of the pay grades for male and female Federal employees. The researchers demonstrate how variation in the size of the Federal agency glass ceiling relates to the performance of private technology ventures pursuing Federal R&D funding. The authors specifically seek to answer the research question posed by the title of the study, *Does a Federal Glass Ceiling Have Differential Effects on Female and Male Technology Entrepreneurs?*

SBIR and STTR Programs

The Small Business Innovation Research program (SBIR) is a public R&D funding program which connects small private technology firms with Federal agencies. The SBA oversees the implementation of SBIR for all participating agencies and the program is structured into three phases.[6] The objective in Phase I is to establish the technical merit, feasibility, and commercial potential of the R&D and to determine the quality of performance of the small business. The purpose of the Phase II award is to further develop the R&D efforts from Phase I and to ideally end up with a commercial product, service or process. Phase III is not funded by SBIR, but Federal agencies may use other funds to assist in commercialization of R&D results from Phases I and II, if the government intends to purchase the product.[7]

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Small Business Technology Transfer program (STTR) is largely modeled after the SBIR program with a few noteworthy distinctions. For instance, although the defined mission of the STTR program is identical to the SBIR program, the stated goals are somewhat different. While both programs aim to "Stimulate technological innovation as their top priority," STTR also seeks to "Foster technology transfer through cooperative R&D between small businesses and research institutions" as its next highest priority.[8] To meet this requirement, the small business must establish a formal intellectual property agreement with a partnering research institution during the first two phases of funding. This enables two-way knowledge transfer, with the research institution providing technological expertise and the firm providing commercialization expertise. The anticipated culmination of this knowledge sharing is increased technological innovation derived from Federal R&D funds. The small business firm eligibility requirements and three-phase program structure of the STTR program are similar to the SBIR program.[9]

Hypotheses

The negative effects of glass ceilings on women have been demonstrated in a variety of contexts (Cook & Glass, 2014; Hekman et al., 2017; Judge et al., 1995). However, there is ample reason to believe that these negative effects are not strictly limited to women. Research finds that underrepresented groups like minorities must also overcome systematic hurdles to secure public R&D funding and that factors such as workforce diversity of the grantor agency can help to mitigate these influences (Joshi, Inouye, & Robinson, 2017). Other studies find that employment for minorities and women is concentrated at the lower levels (Daley, 1996) and that white males experience a double advantage in the workplace with regards to having two socially desirable statuses when compared to those who belong to an ethnic minority or a different gender (Browne, Tigges, & Press, 2001). Therefore, it is expected that underrepresented groups such as women-owned or minority-owned small businesses will be affected in a similar manner. As a result, the authors hypothesize the following:

H1a – The size of the gender pay gap is negatively related to the likelihood of follow-on Phase II R&D funding for female-owned, SBIR/STTR Phase I grantees.

H1b – The size of the gender pay gap is negatively related to the likelihood of follow-on Phase II R&D funding for minority-owned, SBIR/STTR Phase I grantees.

The availability of funds is directly related to the likelihood of securing follow-on funding. Federal agency employees who make the decision of whether to fund a grant proposal are in a position which is affected by an effort-risk tradeoff. Research finds that budget levels and effort are positively related until the point where staying within budget becomes too difficult at which point individuals "play it safe" and avoid or sacrifice the potential for reward (a commercialized product) in order to stay within budget (Sprinkle, Williamson, & Upton, 2008). Therefore, it is expected that larger available agency budgets will result in a higher likelihood of Phase I grantees securing follow-on Phase II funding.

In 1963, John F. Kennedy had a famous saying, "a rising tide lifts all boats." This refers to the concept that improvement in the general economy will benefit all participants within it. This concept is generally supported in the research community (Hines Jr, Hoynes, & Krueger, 2001) as a valid perspective in governmental macroeconomic policy. The SBIR program is tied to this. Individual Federal agencies (which have extramural R&D budgets larger than $100 million) are in fact mandated to use 3.2% (in FY 2017) of their R&D budget to fund SBIR programs[10]. SBIR ties the program to the private sector

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and policy forces Federal employees in these agencies to solicit and potentially fund several types of small business concerns (women-owned, minority-owned, etc.). According to SBIR policy, agencies with larger extramural R&D budgets (like the Department of Defense at $71.8B[11]) are forced to allocate larger budgets to funding SBIR/STTR grants than others. These agencies fund more grants and if John F. Kennedy's macroeconomic perspective continues to hold, all types of Phase I grantees are expected to benefit. Therefore, we propose the following hypothesis:

H2 – A larger amount of available funds at the Federal agency level is positively related to a higher likelihood of follow-on Phase II R&D funding for all types of Phase I grantees.

While a larger available budget is predicted to increase the likelihood of follow-on Phase II funding for all groups of grantees, it does not mean that all groups are expected to increase the same amount. The glass ceiling literature often refers to situations where individuals who are more like those at the top of organizations often get selected for mentorship or other opportunities because of those traits. This is referred to as homophily. White men have long been at the top of the management hierarchy and homophily has been found to play a role in creating and maintaining glass ceilings (Purcell, MacArthur, & Samblanet, 2010). If it is assumed that glass ceilings still exist in the Federal government, then prior research indicates that homophily may lead males in decision-making positions to fund business owners who are more similar to them. Therefore, we propose the following hypothesis:

H3 – Male-owned small business grantees will have a higher likelihood of follow-on Phase II R&D funding than for female-owned small business grantees when more funds are available at the Federal agency level.

METHODS AND DATA

The researchers empirically investigate the existence and characteristics of an internal U.S. government-wide glass ceiling for female employees using aggregate pay grade and demographic data on nearly 1.5 million U.S. Federal employees between 2001-2011. Then the external consequences for technology ventures seeking R&D funding from 12 Federal agencies which participate in the Small Business Innovation Research (SBIR) and Small Business Technology Transfer (STTR) programs is explored.

Data Sources and Collection

The analysis utilizes variables constructed from three nationwide online databases provided by the Small Business Administration (SBA)[12] and a fourth government-wide online database provided by the Federal Office of Personnel Management (OPM).[13] An initial sample of 69,771 SBIR/STTR awards (52,286 Phase I and 17,485 Phase II) granted to 14,658 unique firms between 2001-2011 is extracted.

Note that the comprehensive nationwide initial sample represents 69,771 out of 157,528 total awards or 44% of all Federal small business research grants awarded and includes 15,520 out of 28,164 or about 52% of all firms that participated in the SBIR and/or STTR program since inception. After an extensive database validation and cross-checking process as detailed in Appendix Table 1, 160 awards (0.3% of Phase I) are excluded from the sample due to missing or incomplete records. The described process in

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Appendix Table 1 is modeled from prior research using Federal R&D grants (Joshi et al., 2017), and the resulting sample of 52,126 Phase I awards is incorporated into the regression analyses.

Variables

Dependent Variable: The unit of analysis is the award. The dependent variable TRANSITION equals 0 if there is no subsequent Phase II award granted for the original focal SBIR or STTR Phase I award, and equals 1 if there is a subsequent Phase II award granted.

Explanatory Variables: Explanatory variables are defined at the government, agency, and firm levels. At the government-level, GLASS_CEILING is computed as the difference between the weighted average composite of the pay grades for male and female Federal employees. This data comes from the aggregate records of salary information for approximately 1.5 million Federal employees compiled by the U.S. Office of Personnel Management (OPM) and the U.S. Equal Employment Opportunity Commission (EEOC). The Federal government defines a standardized pay scale or General Schedule (GS) for Executive Branch civil service employees. The GS is classified into 15 grades, from GS-1 (the lowest) to GS-15 (the highest). Within each grade, there are 10 steps. Except for the Senior Executive Service, most positions within Federal agencies are associated with a GS level, which is used to establish the salary for a particular position. Thus, the widespread use of the standardized pay scale across the U.S. Federal government when linked with demographic data on Federal employees enables the researchers to quantify the average pay grades of male employees in comparison to female employees. This also enables the quantification of pay grades of non-minority employees in comparison to minority employees.

As shown in Figure 1, and indicated by the blue dots, GSDELTA_GENDER or difference in the weighted average composite pay grades for men and women is nearly 2 GS levels in 2000, decreasing to about 1 GS level by 2013. The government-wide GLASS_CEILING for women is defined as the value of GS_DELTA. GSDELTA_MINORITY (orange dots), or the difference in the weighted average composite pay grades for non-minority and minority employees, is nearly 1.4 GS levels in 2000, decreasing to about 0.75 GS levels in 2013. GSDELTA_MEN (gray dots) shows that the GS level difference between non-minority men and minority men is about 1.3 GS levels in 2000, decreasing to about 0.7 GS levels in 2013. GS_WOMEN (yellow dots) shows that the pay gap between non-minority women and minority women is about 0.9 GS levels in 2000, decreasing to 0.6 in 2013. The shrinking size of the pay gaps between all groups indicates that significant progress has been made towards mitigation of glass ceilings within the Federal government during the period of study. This is an indication that societal and economic pressures have likely contributed to this increasingly egalitarian workforce.

That said, Figure 1 suggests that a glass ceiling exists and persists across Federal agencies in U.S. government from 2000-2013 which is a continued cause for concern. Figure 2 shows the distribution of GS pay grades for male Federal employees and Figure 3 shows the distribution for female Federal employees. The contours and peaks of the two graphs clearly show that larger numbers of male employees hold higher GS level positions throughout the entire Federal government as a whole. Unlike conventional measures of *pay inequality* used in glass ceiling studies, our approach highlights *positional inequality*. The graphs illustrate that the average male employee holds a higher position than the average female employee within the Federal government. Even though the number of female employees is increasing over time, their relative positions within the organizational hierarchy, as defined by GS level, appear to remain consistently lower than their male counterparts which supports prior research (Smith, 2002).

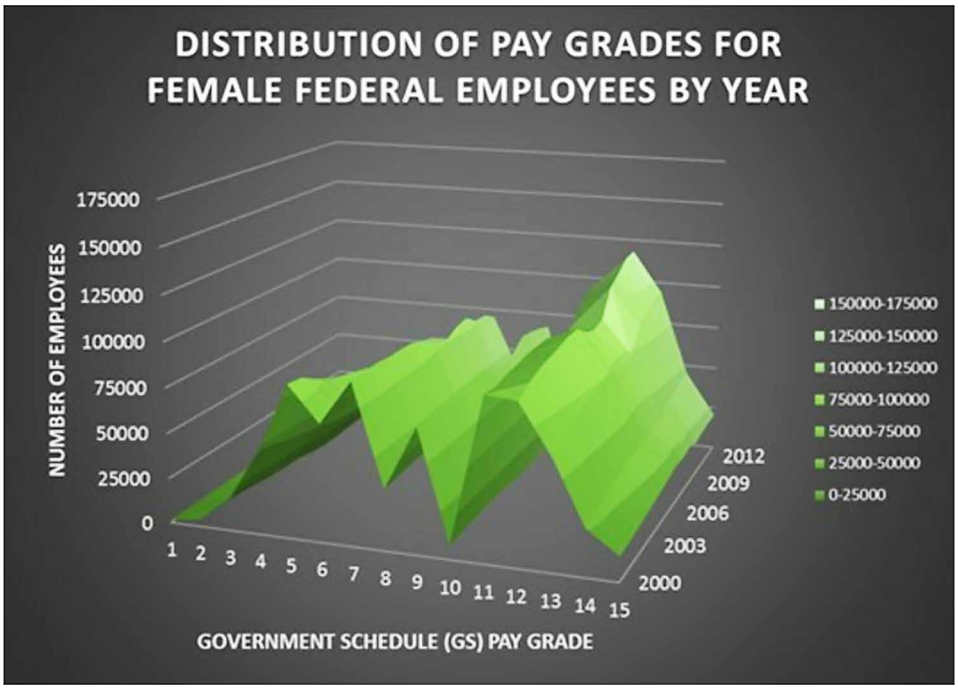
Figure 3. Distribution of pay grades for female employees by year



The total dollar amount of funding allocated to the granting agency's Phase II awards in the relevant program (SBIR or STTR) in the same calendar year that the original focal Phase I award is granted to the firm is also captured. This total dollar amount is a proxy for the granting agency's potential future supply of funds during the timeframe when the firm may be eligible to apply for a Phase II award. The variable BUDGET is computed as the base 10 logarithm of this amount.

Finally, at the firm-level, the researchers define two explanatory variables related to ownership which represent the demographic diversity of grantees. This information is collected by the Small Business Administration (SBA) to determine eligibility for Federal contracting, but is not explicitly considered as a selection factor in making Phase I or Phase II award decisions in the SBIR/STTR programs. WOMEN_OWNED equals 1 if the firm is woman-owned, and equals 0 otherwise.[14] MINORITY_OWNED equals 1 if the firm is minority-owned, and equals 0 otherwise.[15]

Control Variables: Several control variables are incorporated to account for relevant factors which may influence the likelihood of successfully transitioning a SBIR or STTR award from Phase I to Phase II. HUBZONE_LOCATED equals 1 if the firm receiving the focal Phase I award is located in a Federally-designated Historically Underutilized Business Zone (HUBZone) and equals 0 if it is not. The firm-level control variable CERTIFIED8A equals 1 if the firm is a small, economically disadvantaged business under the SBA's 8(a) Business Development Program, and equals 0 if it is not.[16] GRANT_MILL is a firm-level binary control variable which equals 1 for the top 25 firms which received the most Phase I or Phase II grants between 2001 and 2011, and equals 0 otherwise. Each of these firms had at least 100 SBIR/STTR grants. Lerner (1996) notes the existence of grant mills, which are firms that are successful in securing large numbers of Federal grants for initial R&D funding, but appear to generate little to no actual technology commercialization. INITIAL_AMOUNT is the dollar amount of the original Phase I

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

grant. The study also includes two state-level time-varying covariates: (1) KAUFFMAN_INDEX is the state-level Kauffman Index of Entrepreneurial Activity[17] and (2) CLUSTER_STRENGTH is the state-level economic strength of the regional industry clusters present (Delgado, Porter, & Stern, 2014).[18] To account for unobserved heterogeneity associated with the SBIR and STTR awards in the sample, dummy variables are added for the AGENCY granting the focal award, the STATE in which the firm receiving the focal award is located, and the YEAR the focal award is granted.

RESULTS

Descriptive Statistics and Correlations

Figure 4 summarizes the descriptive statistics for variables in the study. About 33% of all Phase I grants TRANSITON to Phase II. The average level of the GLASS_CEILING (the difference between the weighted average composite of the pay grades for male and female Federal employees) is about 1.45 pay grades during the sample timeframe. The DIVERSITY_INDEX (the probability that any two randomly selected employees in particular agency are from different racial or ethnic categories, as formally defined by the OPM) is about 0.52. In terms of firm ownership status, among Phase I award recipients in the sample, 7.1% are minority-owned and 10.2% are women-owned. The average Phase I award amount is $114.7K. No pair of variables in any of the models has a correlation greater than 0.40 ($p<0.01$), which is the correlation between MINORITY and GENDER. A diagnostic check indicates that multi-collinearity is not an issue.

Figure 4. Descriptive statistics

Variable	Mean	S.D.	Min	Max
TRANSITION	0.326	0.469	0	1
GLASS_CEILING	1.448	0.238	1.055	1.893
DIVERSITY_INDEX	0.517	0.083	0.359	0.674
BUDGET	5.296	0.620	3.079	5.889
MINORITY_OWNED	0.071	0.257	0	1

Logit Models

Three binary logistic regression models are specified with TRANSITION as the dependent variable (equals 0 if there is no subsequent Phase II award granted for the original focal SBIR or STTR Phase I award, and equals 1 if there is a subsequent Phase II award granted), and all of the explanatory and control variables included. The results of this analysis are presented in the Appendix Figure 5.

As shown in Figure 5, the researchers find that for every unit increase in size of the GLASS_CEILING, the odds of TRANSITION decrease by 80%. For every unit increase in GLASS_CEILING, the TRANSITION odds for firms owned by men decreases by 74% and the TRANSITION odds for firms owned by women decreases by 98% which supports H1a. The decrease in the TRANSITION odds for female technology entrepreneurs appears greater than for their male counterparts. For every unit increase in GLASS_CEILING, the TRANSITION odds for minority-owned firm decreases by 13% which supports H1b which predicted a lower likelihood that minority-owned firms would secure Phase II funding.

For every unit increase in BUDGET, the odds of TRANSITION increase by 23% in the full model. For every unit increase in BUDGET, the TRANSITION odds for firms owned by men increases by 21% and the TRANSITION odds for women-owned firms increases by 63%. Since the odds of securing Phase II R&D awards increases in all three models, H2 is supported. H3 is not supported. It is hypothesized that male-owned firms have a higher likelihood of securing Phase II awards due to the effects of homophily but instead women-owned firms have a significantly higher likelihood to TRANSITION when BUDGET increases.

DISCUSSION

Overall, as the glass ceiling or average pay grade gap between male and female employees gets larger, the odds of securing follow-on Federal R&D funding become lower for all firms (supporting H1a and H1b). However, the negative impact appears to be substantially greater for women technology entrepreneurs compared to their male counterparts. Thus, after incorporating a range of explanatory factors and controlling for agency, state, and year fixed effects, the researchers find that the existence of an internal, government-wide glass ceiling across grantor agencies is linked to a negative external effect for grantees seeking additional R&D funding.

Based upon these findings, there is one main practical implication for women and minority-owners of technology firms. These firms should take advantage of the outreach services already provided and continue to seek out and apply for Federal R&D grants. As agencies continue to employ a more diverse workforce, and more women and minorities gain access to positions of power, the glass ceiling will get smaller which improves the odds that follow-on R&D funding will be secured. The result of this is that more women and minority-owned firms will commercialize their technologies which will indirectly build the case for increased diversity in the upper echelons of private business and government.

These findings lead to several important implications for policymakers. First, a glass ceiling in the Federal government still exists. While progress has been made, further progress is required to address this going forward. Agencies such as the Department of Defense have made good strides in workforce diversity (Joshi et al., 2017) but this is clearly not enough. All Federal agencies can go further. Increasing opportunities for women to hold meaningful executive positions is the next critical step towards gender equality in government.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Secondly, a significant negative effect in securing follow-on grant funding provides support for the promotion of mechanisms which may help to counteract these effects. Policy which establishes or maintains educational outreach services or experiential grantee training workshops may help to increase both initial applications from women-owned businesses as well as success rates in follow-on funding. Prior research has shown that human capital-related factors like education and experience has a positive impact for women-owned small businesses (Coleman, 2007). Therefore, the increased availability of outreach services for all grantees and especially for women entrepreneurs may help to mitigate some of the observed glass ceiling effects.

Thirdly, it is critical that policymakers come to realize that while a glass ceiling is obviously not desirable, there are also negative implications which may go unnoticed which can work to undermine efforts in other government-related areas. R&D funding like SBIR and STTR grants are considered gap funding. The Federal government provides this R&D funding to support projects that private financial capital sources would not necessarily fund. If the government did not have such programs, the resulting commercial activity and the social benefits from technology spillover would otherwise be lost (Audretsch, Link, & Scott, 2002). For example, less funding due to large glass ceilings mean that businesses may not get the funding necessary to innovate and commercialize technology. As a result, there may be added pressure to maintain job counts in the private sector, there may be less commercialization overall, and the societal benefits of technology spillover will decrease.

In support of H2, the amount of available budget is consistently significant and positive across all models (for male and female-owned businesses). Interestingly, the effect is more positive (63% higher likelihood) when considering women-owned businesses which does not support H3 which predicts that male-owned Phase I grantees have a higher likelihood of securing Phase II grants than women-owned grantees. Prior research on homophily indicates that a white male dominated hierarchy would prefer grantees who are more similar to themselves (other white male-owned business owners). This perhaps does not hold in a highly regulated context like the Federal government or perhaps this finding is some indication that outreach and educational services for women-owned businesses are legitimately contributing to higher performance. It could also be a function of reverse discrimination when there is more funding available. Decision-makers may seek out and promote (fund) proposals from underrepresented parties to balance out the diversity across grantees when excess funds are available. Regardless, it is of great interest that women-owned businesses have a significantly higher likelihood of securing Phase II awards when the available budget increases because it can potentially lead to policy shifts which balance the odds irrespective of the budget.

LIMITATIONS

The authors acknowledge several limitations. First, the context of this study is strictly limited to the Federal agencies which participate in SBIR and STTR along with associated grantees. Generalizability is therefore limited to public/private partnerships similar to these programs. While the U.S. Federal government is enormous and represents the largest civilian employer in the country (2.7 million employed civilians)[19], the authors cannot make claims that results directly apply to private employers. In a similar vein, the U.S. as a developed economy has its own unique policies and structures which means that the results may not exactly conform to other public/private partnerships in other countries, especially those in emerging or developing economies. A third limitation is tied to the sample time frame of the study.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Because multiple databases were used to build the final dataset, at the time of the analysis, complete data was only available from 2001 through 2011. The authors acknowledge that although several years are not included, the sample does represent 44% of all SBIR/STTR awards and 52% of all grantees since inception of both programs. Given the sheer size of the ten-year dataset and the fact that multiple recessions and presidential elections are included in the time frame, the authors believe that the sample is generalizable to current practice.

FUTURE RESEARCH DIRECTIONS

The results of this study leads to possible avenues for future research. Minority-owned technology grantees are 13% less likely to get follow-on R&D funding compared to non-minority-owned firms (supporting H1b). This indicates that race/ethnicity along with gender is perhaps another critical dimension warranting further study. While not the focus of this study, in previous research, women and minorities both are characterized as underrepresented groups in the workplace. Further research in the area of representative bureaucracy (Bradbury & Kellough, 2007) may prove useful in being able to understand how the current governmental body accurately reflects the demographics as well as the diverse views of its constituents.

Future research could also consider how the effects of the U.S. Federal glass ceiling may differ from that of other developed countries where high levels of innovation or technology commercialization take place. Other countries will differ in terms of governmental structure, innovation policies as well as size. These factors could all impact R&D funding in public/private partnerships differently. A country-level comparison by technology innovation or international business researchers could prove useful for guiding cross-border trade policy in addition to providing a better understanding of how diversity varies across country.

CONCLUSION

This study contributes to diversity research by introducing a novel measure for glass ceilings in organizations. The research conducted also pushes the boundaries of the current literature by empirically predicting outcomes of glass ceilings in the U.S. Federal government. The authors believe these findings have implications for practice, for the field of gender research in business, and for policy regarding how outcomes reflect activities at the boundary of governmental entities and the external environment. The hope is that this research will shed new light on the direct (persistence of differential pay) and indirect (gender differential in funding) challenges that women and minorities still face 32-years after the glass ceiling term was first coined.

20 A DUNS or Dun & Bradstreet number is a 9-digit unique identifier for each physical location of a business. Number assignment is free for all businesses required to register with the Federal gov-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ernment for contracts or grants. For details, see: https://www.sba.gov/contracting/getting-started-contractor/get-d-u-n-s-number.

[21] The report is prepared in compliance with the law (5 U.S.C. 7201 and 5 CFR Part 720, Subpart B) and contains information on the representation of minorities within the Federal Government and best practices of Federal agencies. For details, see https://www.opm.gov/policy-data-oversight/diversity-and-inclusion/reports/#url=Federal-Equal-Opportunity-and-Recruitment-Program

[22] Note that the Federal government only required grant recipients and contractors to obtain a DUNS starting in 2003, so not all firms in the sample have a valid DUNS. If a DUNS is not available, then the researchers use a combination of company name, address, agency tracking number, contract, and award title to search for a possible match.

[23] To resolve changes in firm names, addresses, and ownership status, self-reported data provided by firm representatives is utilized. This data is updated via the Federal System for Award Management (SAM) and searchable online in the SBA's Dynamic Small Business Search (DSBS) database. See https://www.sam.gov/portal/SAM/##11.

[24] The years 2001-2011 span the time period after enactment of the SBIR Program Reauthorization Act of 2000, but before the start of the SBIR/STTR Reauthorization Act of 2011, which mandated major policy changes in the administration of these programs across participating Federal agencies. By focusing exclusively on this period, the researchers are able to eliminate the introduction of major new policy directives as an alternative explanation for the observed effects. This timeframe represents a period of increased public disclosure from Federal agencies in providing accurate workforce composition and diversity data which is essential for this study.

[25] The developed algorithm enabled the researchers to automatically link approximately 94% of the Phase II awards to their originating Phase I awards. The remaining 6% were matched by manually searching and checking additional databases on the awarding agency websites. 160 awards were excluded from the sample due to missing or incomplete records.

This research was previously published in Macro and Micro-Level Issues Surrounding Women in the Workforce; pages 109-131, copyright year 2020 by Business Science Reference (an imprint of IGI Global).

APPENDIX

Summary of Data Sources and Data Collection Procedures

Table 1.

Database	Description of Database Contents
Award Listing (SBA)	Contains the phase (I or II), year, agency, agency tracking number, funding amount, award title, abstract, contract, solicitation topic code, company name, DUNS,[20] address, contact name, and ownership status (minority-owned, woman-owned) for all awards (112,506 Phase I and 45,022 Phase II) from the SBIR (1983-2016) and STTR (1994-2016) programs. The researchers collect the entire population of 157,528 Federal small business research grants awarded from the inception of both programs to the present.
Company Listing (SBA)	Captures the company name, DUNS, address, contact name, and ownership status (minority-owned, woman-owned) of all firms that received at least one SBIR Phase I award during 1983-2016 or at least one STTR Phase I award during 1994-2016. This represents the known population of firms that have ever participated in the SBIR or STTR programs as award recipients at any time during the history of either program. The researchers collect the full set of 28,164 firms receiving at least one Phase I award.
Annual Reports (SBA)	Aggregates agency-level data regarding the total number of proposals submitted, the total number of Phase I and Phase II awards granted, and the total funding allocated, by year for the SBIR program (1990-2013) and STTR (2000-2013), respectively. This database summarizes essential implementation differences across agencies over time. The researchers collect this data for all Federal agencies and years for the SBIR and STTR programs.
Workforce Diversity (OPM)	Describes the demographics of the Federal workforce in terms of the race, ethnicity, and gender of government employees by agency and by year. This data is presented in two formats. The Federal Office of Personnel Management (OPM) is also required to annually report to Congress on progress under the Federal Equal Opportunity Recruitment Program (FEORP).[21] The researchers access the 2001-2011 data published in PDF form. Then the text content of the FEORP reports is digitized using optical character recognition (OCR) processing software. After digitization, the researchers consolidate the reports into a single, uniform dataset.
Database Cross-Check and Consolidation Procedures for SBA Databases	
1. Any duplicate entries found in the *Awards Listing* database are removed and the researchers replace any revised awards with the corrected entries found in the same database. 2. The variants of company names are standardized within the *Awards Listing* and *Company Listing* databases separately and then across both databases collectively, to disambiguate and identify unique firms. Wherever possible, the DUNS is relied upon as a database index key to correctly and precisely match unique firms.[22] The researchers account for changes in firm names, addresses, & ownership status.[23] 3. Third, all firms that did not receive any SBIR or STTR Phase I or Phase II awards during 2001-2011 are excluded, which is the focal timeframe of our study.[24] 4. Fourth, using the assigned agency tracking number as a unique identifier for each award as well as the content of the award title, abstract, contract, solicitation topic code, company name, DUNS, and address, the researchers apply a combinatorial text pattern matching algorithm to systematically link each Phase II award with only one originating Phase I award.[25] 5. Fifth, as part of this matching process, all SBIR or STTR Phase I awards made after 2011 are excluded. It is assumed that any SBIR or STTR Phase I award from 2011 or earlier without a corresponding linked Phase II award by 2014 did not transition from Phase I to Phase II during its timeframe of eligibility. The possibility of right-censoring the data is reduced and enables the researchers to later apply a logistic regression analysis to evaluate the binary outcome of transitioning from a SBIR or STTR Phase I to a corresponding Phase II award. As a result of this five-step process, a sample of 69,771 awards (52,286 Phase I and 17,485 Phase II) granted to 14,658 unique firms is extracted for the SBIR and STTR programs.

Chapter 99
Safety of Women Journalists in Nigerian News Media:
Exposing the Hushed Gender-Based Discriminations

ABSTRACT

In recent decades, women journalists' professional safety has attracted an enormous research attention globally and in Nigeria. Interestingly, often similar findings are likely generated by most of the studies highlighting stiff gender-based challenges. This chapter investigated the safety experiences of Nigerian women journalists to identifying the typology of gender-based discriminations and coping strategy affected women journalists used to manage to work in a male-dominated media industry. Employing a semi-structured interview approach, 37 participants (25 women journalists, 10 men journalists, and 2 human resource managers) were interviewed from 12 broadcast media organisations in Northern Nigeria. The data were analysed using thematic analysis and the findings showed that Nigerian women journalists experience different types of gendered unsafety including discrimination in newsgathering and production and sexual harassment; most of the affected women used risky coping strategies such as ignoring; most media organisations lacked policies and frameworks to handle such cases.

INTRODUCTION

Historically, journalism practice in Nigeria is traced back to the late Reverend Henry Towsend of the Presbyterian Church located in Calabar and later relocated to Abeokuta. The first newspaper was published on December 3, 1859, which was written in Yoruba dialect and titled: *IweIroyin Fun Aron Ara Egbaati Yoruba*, meaning a newspaper publication written for the Egba and Yorubas. The primary aim of the establishment of the newspaper was to get people to read (Ajibade, 2003; Tijani-Adenle, 2019). Although the first newspaper in Nigeria was published in 1859, the "emergence of modern Nigeria in 1914" (Omu, 1978, p.39) paved the way for a vibrant media scene, and many nationalists established newspapers for the propagation of self-government, nationalist agitations and to counter the excesses of colonial regimes such as excessive taxation, the repudiation of Nigerian religions, languages and traditional-political institutions, oppression of Nigerians and abuse of their rights among others (Ajibade, 2003). Notable among the nationalists who established early newspapers include Sir Akitoye Ajasa who established *Nigerian Pioneer* in 1914, Ernest Sese Ikoli who established *African Messenger* in 1921, Herbert Macaulay who established *Lagos Daily News* in 1925, Malam Abubakar Imam who established *Gaskiya Ta Fi Kwabo* in 1939 and Dr Nnamdi Azikiwe who established *West African Pilot* in 1937, etc. (Ukiwo, 2005).

In Nigeria, like in other parts of the world, the media industry was dominated by print and broadcast media. However, the development of the broadcast media was not as rapid as the print media. Nevertheless, "its establishment and progress is no less political" (Tijani-Adenle, 2019, p.17). Media broadcasting in Nigeria commenced in 1932 when "Lagos began to relay the British Empire Service from Daventry, England" (Uche, 1989, p.36). However, as soon as the three major geo-political regions (Northern, Western and Eastern) were established in preparation for the country's independence, the indigenous regional governments "swiftly established their broadcasting systems to tackle colonial authority's exogenous broadcasting policies and to project their regional cultures, policies and political parties" (Tijani-Adenle, 2019, p.17; Uche, 1989).

Largely, "the early Nigerian news media were inevitably political" (Omu, 1978, p.11). The news media served as watchdogs to the colonial administrations and sensitised the people on the need to oppose the imperialists and struggle for self-governance. Unfortunately, women were not key players at this critical point in the history of the media because the social and gender norms in colonial Nigeria did not encourage women to practise the "nationalist and agitational journalism" (Omu, 1996, p.13) that was regarded as "too dangerous and daring for women, who were perceived to be weak, needed protection and expected to tend to the home and children" (Bammeke, 2013). However, despite the overarching predominance of men, it would be wrong to assume that women were completely absent from the media industry in colonial Nigeria. Few notable women excelled although "very little information" (Omu, 1996, p.13) is available about them in the literature. For example, there is a record of a Miss F. Ronke Ajayi who edited the *Nigerian Daily Mail* that was published in 1931 (Omu, 1978, p.67). She was known as the friend of the publisher, H. Antus Williams and "who saw her appointment as a joke" (Omu, 1996, p.13) jeered at her. By the 1950s, women had had a considerable footprint in Nigerian journalism however, most of them were writing features, women content and gossip pages. For example, some of the columns or pages were titled "As I see it" by A. O. Alakija of *Daily Times*, "Women's Corner" by Eve, *Pilot Newspaper*'s "Milady's Bower" among others (Falola, 1999).

The era between 1960, when Nigeria gained independence and 1999, when it returned to stable democratic governance after many years of military interregnums was, however, remarkable for Nigerian

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

women as many of them gained entry into the news media, broke glass ceilings and made significant contributions to the journalism profession (Ikem, 1996). The creation of women pages by most newspapers and magazines gave women inroads into the media with many of them becoming women page editors, editors of soft desks and publications and editors of magazines between the 1970s and 1990s. For example, Dr Doyin Abiola became the first female editor of a national newspaper, the *National Concord*, in 1980 (Falola, 1999; Ikem, 1996). A chronology of women journalism in Nigeria cannot be complete without mentioning the Nigerian female journalism pressure group, the Nigerian Association of Women Journalists (NAWOJ), which was created in 1989 (Ikem, 1996; Omu, 1996). Many journalism and mass communication courses were developed in universities and polytechnics, female students became preponderant in the journalism, media and communication departments (Domatob, 1988) and more women (compared to the colonial period) entered the news media (Akinfeleye, 2011, p.35).

However, media scholars have been fast to indicate that this progress, although remarkable, do not indicate that women journalists have achieved equality with their male counterparts in the profession. Because, generally, women were significantly absent from the media scene and even when they were given opportunities, it was on the soft beats where 'critical' and/or dangerous reporting was not perceived to be taking place (Ikem, 1996). The significance of this for the status of women journalists in Nigeria is that women did not join the media as early as men and so they had a late start/entry into the industry. They were also assigned to a low level and less significant beats when they eventually joined. Hence, this can be said to be the foundation of the inferior position of women in the Nigerian news media today, as the industry was established when very few women were involved in governance and the economy, and significantly absent from the public sphere (Tijani-Adenle, 2019).

BACKGROUND

Threatening violence against journalists, especially against women journalists is a worrying global trend. Although both male and female media professionals, as well as other media practitioners, are increasingly targeted for their reporting, yet women journalists face increased safety risk due to their specific vulnerabilities entailed by gender (Jamil, 2019). They are subject to the same types of attacks as their male counterparts – killings, imprisonment, physical and psychological attacks, acts of intimidation, harassment, threats, surveillance, etc. However, violence against women journalists is very often manifested in the form of sexual attacks. They also face risks in traditionally "safe" environments, such as their newsrooms. They are vulnerable to attacks not only from those attempting to silence their coverage, but also from sources and colleagues, and even family members. Cultural norms and stigmas coupled with a lack of faith in their supervisors and the authorities to act upon their complaints discourage reporting of gender-based violence. Unfortunately, in this context, silence prevails (Chocarro, 2019; Tijani-Adenle, 2019). The implications are that when women journalists are restricted or hounded out of the profession, society is denied access to a diverse range of information and perspectives. There is growing international consensus that women journalists face specific threats to their safety and professional development and that integration of a gender-sensitive approach is essential to promoting the safety of journalists worldwide especially in African countries such as Nigeria and ensuring there is diversity among not just media actors but content that sheds light on all aspects of society (Chinwuba, 2016; Chocarro, 2019).

This study sought to contribute toward providing a further understanding on safety-related discrimination Nigerian women journalists experience to promote the safety of women journalists in the country

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and contribute toward building the literature, an area of research that has received little attention so far. Therefore, an attempt was made to provide the answer to the following two research questions (RQs): RQ 1 - In a news media industry dominated by patriarchal newsroom culture, what are the experiences of Nigerian women journalists regarding safety in the light of gender-based discrimination and sexism (sexual harassment)? RQ 2 - What are the safety coping strategies regarding sexual harassment the women journalists adopted to enable them to carry out their duty in a male-dominated newsroom? This study contributes to the growing body of literature on the experiences of women in the Nigerian news media regarding gender discrimination and sexism; it examines the inequalities that exist across the gender divide, explores how such inequalities are produced, negotiated and challenged, and the forms they take in the broadcast media industry in a Nigerian context.

LITERATURE REVIEW

Conceptualising Journalists' Safety Based on Global Legal Frameworks Perspective

The United Nations (UN) strategy on the safety of journalists, the UN Plan of Action on the Safety of Journalists and the Issue of Impunity (2012) (which is the first of its kind ever), declares that it is based on the principle of safety toward a gender approach and calls for ensuring the promotion of the safety of women journalists and the fight against impunity. Additionally, the report in 2012 by the UN Special Rapporteur on the promotion and protection of the right to freedom of opinion and expression, Frank La Rue, highlighted the need for a gender-safety approach when considering measures to address the issue of violence against journalists. Furthermore, in the same year, the first Human Rights Council (HRC) resolution on the safety of journalists acknowledged "the specific risks faced by women journalists in the exercise of their work, and underlining, in this context, the importance of taking a gender approach when considering measures to address the safety of journalists" (Chocarro, 2019; UNHRC, 2017, online).

In 2017, the UN General Assembly passed a resolution on the safety of journalists and the issue of impunity with a strong focus on gender safety. It emphasised the need to take measures to effectively "tackle gender-based discrimination, including intimidation, harassment and violence offline and online, incitement to hatred, inequality and gender-based stereotypes; to enable women to enter and remain in journalism on equal terms with men while ensuring their greatest possible safety, and to ensure that the experiences and concerns of women journalists are effectively addressed and gender stereotypes in the media are adequately tackled" (Chocarro, 2019; UNGA, 2017, online). The latest document related to the implementation of the UN Plan of Action on the Safety of Journalists and the Issue of Impunity in 2017 includes several references to the need to mainstream gender safety into initiatives to tackle violence against journalists. In 2018, the HRC passed a resolution on preventing and responding to violence against women and girls in digital contexts; the resolution condemned acts of violence against women in political and public life, including journalists (UNESCO, OHCHR, 2017; UNGA, 2018).

Generally, international standards regarding gender safety are shaped by the overall human rights framework. Key among these is the Universal Declaration of Human Rights of 1948, in which the right to freedom of expression is enshrined within Article 1934 and the Convention for Elimination of all forms of Discrimination against Women (CEDAW) of 1979, which recognises women's rights and specifically requires states to take appropriate measures "to ensure full development and advancement of

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

women". The Beijing Platform for Action (1995) also identifies media as a critical area of concern and points to the need to promote a balanced and non-stereotyped portrayal of women in the media, and to support women's increased participation and access to expression and decision-making in and through the media and new communications technologies. Also relevant is UN Security Council Resolution 1325 (2000), which affirms the important role of women in the prevention and resolution of conflicts and peacebuilding (Chocarro, 2019; OHCHR, 2017).

From a regional angle, various organisations have addressed the issue of violence against women journalists. In 2013, the Council of Europe (CoE) passed a recommendation on gender equality and media and prepared an implementation handbook. In 2016, CoE's recommendation CM/Rec 2016 on the protection of journalism and safety of journalists and other media actors noted the gender-specific threats that many journalists face and called for "urgent, resolute and systematic responses". In 2018, the European Parliament issued a report on gender and media equality, condemning attacks against women journalists and calling for States and other actors to take responsibility for promoting gender equality in media. The Organisation for Security and Co-operation in Europe (OSCE) Ministerial Council's Decision 3/18 on the safety of journalists condemns attacks against women journalists, including "sexual harassment, abuse, intimidation, threats and violence, including through digital technologies" (CoE, 2016, online; European Parliament, 2017)

In Africa, the African Union (AU) launched a Network of Reporters on Women, Peace and Security in 2016. In 2017, the Nairobi Declaration expressed concern over increasing abuse of women on social media. While it does not make a specific reference to women, the 2017 Addis Ababa resolution on the safety of journalists called for the creation of a working group on the safety of journalists within the African Union. In 2018, UN, OAS, OSCE and the African Commission for Human and People's Rights' (ACHPR) Special Rapporteurs on freedom of expression spoke out against the particular challenges faced by women journalists, including gender-specific attacks, online harassment, inequality within the media, and general societal discrimination against women, all of which pose barriers to working as a journalist (ACHPR, OEA, OHCHR, OSCE, 2018; UNESCO, 2017).

Like the constitutions of many other UN member nations, the Nigerian Constitution upholds the freedoms of the press but is silent on safety issues, which is a lacuna that needs to be addressed. It is expected this study will provide an empirical underpinning toward closing that constitutional void. But despite this demonstrable advance in international standards, commitments and recommendations have not been acted upon by governments. The lack of impact of these documents and mechanisms "raises legitimate questions" about their efficacy and the potential for meaningful implementation by states (Chocarro, 2019; UNGA, 2018).

Gendered News Production and Management

Women have significantly secured entry into the news media the world over, but increased access has not eradicated the persistence of misogynist, sexist, and limiting roles for women. Women are often deemed incapable of handling the rigours of news journalism and thus assigned to cover 'soft' beats and systematically excluded from reaching editorial and top management positions (Byerly, 2014). Arguing in support of this perspective, North (2016a) notes:

Research from around the globe has long emphasised the problem of vertical segregation in the news media where women remain largely absent from key editorial decision-making roles. Horizontal segrega-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tion, however, where there are gendered divisions of tasks associated with reporting, is also an ongoing issue... while more female reporters appear to be covering hard news rounds like politics and business, the majority are still assigned to cover the bulk of the soft news areas of features, the arts, education and health—and most perceive that female reporters remain pigeon-holed in those traditionally female story areas. (p.356).

Several global, regional and national studies have established the clustering of women on the soft beats with scholars noting that it has become "a well-established practice that is hard to change" (Sarikakis, 2014, p.67). Findings from the 2015 Global Media Monitoring Project (GMMP) will be a good example to cite. The GMMP has been monitoring media contents for gender equity every five years from 1995. The 2015 study, which surveyed 114 countries (including Nigeria) across media platforms, notes that "Political and crime news are the two topics least reported by women in most regions" (GMMP, 2015, p.52 cited in Tijani-Adenle, 2019). The report also notes that "the greatest gain for women has been in reporting celebrity, arts, media and sports stories" (GMMP, 2015, p.52). While commenting on the GMMP findings, Mindy Ran, the Gender Council Co-Chair of the International Federation of Journalists (IFJ) notes that "Sadly, these statistics tell us that we are still not being trusted or respected to tell the story, to analyse events, to investigate and to bring the major topics to our audiences and readers" (Njoku, Whyte & Vincent, 2018, p.28; Tijani-Adenle, 2019).

Gendered Remuneration and Motivation

Results from a global study of 16 countries (from Africa, Europe and South America) by the International Federation of Journalists (IFJ) in 2012 indicates that male wages exceed female wages in all 16 countries studied, with gender inequalities reflecting even in employee benefits (Central European Labour Studies Institute and Wage Indicator Foundation, 2012). Carolyn Byerly's Global Report cited in Tijani-Adenle (2019) also finds pay gap for women journalists in most of the 59 nations studied (2011) while contributors' analyses of 29 of those countries in her *Palgrave International Handbook of Women in Journalism* (2013) identify pay gap in a good number of the countries (Njoku et al., 2018). Individual researchers have also published findings that corroborate the results of the reports and edited volumes mentioned above. Pay disparity based on gender in Australian and US news media has also been documented. Most of the contributors to Karen Ross and Claudia Padovani's *Gender Equality and the Media: A Challenge for Europe* (2016) also mentions the existence of gaps in the salaries of women journalists across the continent. Although not exhaustive, these studies reflect how research studies from different continents substantiate one another and entrench the reality of wage inequality for women in the global news media (Ross & Padovani, 2016 cited in Tijani-Adenle, 2019).

There is an interesting twist to available information about wage situations in Nigeria. Previous studies have noted that pay disparity does not exist for women journalists in the country's news media. Carolyn Byerly's Global Report cited in Tijani-Adenle (2019) specifically notes that "In Nigeria, women and men journalists are paid equally or, in some cases, women's salaries exceed men's wages" (2011, p.10). Despite this knowledge, the present study investigated the wage situation in the Nigerian news media and found that equality in remuneration is in theory but not practice because factors like negotiation, nepotism and unstructured promotions sometimes create an uneven wage situation (which is open to both genders) but usually favourable to more male journalists. It should be noted that Byerly's study could not unravel the discrepancies since it was a quantitative study and news company representatives

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

gave responses based on policy and not practice and they are unlikely to provide problematic information about organisational management to researchers (e.g., see Njoku et al., 2018; (Tijani-Adenle, 2014).

Threat to Women Journalists' Safety and Sexual Harassment

From a global perspective, the number of women journalists threatened, harassed and even killed is steadily increasing (Jamil, 2020a, 2020b, 2019). According to UNESCO, in 2012, women accounted for 4% of the 119 media workers killed; by 2017, this had increased to 14% of the 80 victims recorded that year. In 2018, the percentage was 7%. Furthermore, women account for most cases of sexual violence and online harassment. According to a global study by the International Women's Media Foundation (IWMF) and Troll-Busters, nearly two-thirds of women journalists have been threatened or harassed online and offline, while 26% have been physically attacked. The study, entitled "Attacks and Harassment – The Impact on women journalists and their reporting," reveals that close to 70% of respondents indicated that being a woman was a contributing factor in the attacks (Chocarro, 2019; UNGA, 2017).

As well as physical consequences, these attacks have a major psychological impact. One-third of interviewees reported experiencing physical, mental and emotional trauma following harassment. For freelancers, the situation is even more difficult. Surveys show these women feel even less safe. Consequently, one-third of respondents said they had considered leaving the profession, while more than one-third avoids reporting stories that could put them at risk. Despite these worrying statistics, the Dart Centre for Journalism and Trauma reports that only 26% of the safety training for journalists includes gender-specific considerations, while only 8% of women journalists have been subjected to sexual violence. Just 3% had participated in online harassment training (Chocarro, 2019; North, 2016b).

From the Nigerian perspective, the media seem to function with both voluntary and imposed constraints and biases when reporting gender. Nigerian news media use three adjectives; issue-based, intense news coverage and gender-blind. This gendered orientation, may not be unconnected with the male-dominated nature of the Nigerian media industry. Ndubisi (2010) cited in Dunu (2015) notes that in Nigeria, men produce an overwhelming majority of the messages in the media. By 2000, a staggering 90% of the journalist reporting news in the country's radio, television and newspapers were male. Hence, news selection process and the power to define the media agenda are still a male privilege (Dunu, 2015). Nonetheless, no available records have documented Nigerian women journalists getting murdered, but they face tremendous other safety challenges such as harassment and discrimination (Jibril & Abubakar, 2017).

A study was conducted by Chioma, Okere, Alao, Atakiti and Jegede (2015) with 100 female mass communication students on their perceptions of journalism career considerations and the findings revealed that 54% of them perceived that there are fewer career opportunities for female journalists in the journalism than there are for males. Also, 51% of them believed that family responsibility is a "barrier to career advancement for female journalists" (Jibril & Abubakar, 2017, p.113). Furthermore, 42% of them perceived journalism as a risky profession, 15% of them believed journalists are poorly paid, 10% believed female journalists are discriminated against, % believed women journalists lack insufficient journalistic training and low-level entry (Jibril & Abubakar, 2017).

Nwabueze (2013) cited in Jibril and Abubakar (2017) noted that fewer female journalists exist than males across the world. A cross-continental study of media organisations in Asia, the Caribbean, Europe, Latin America, Middle East, North America and Oceania conducted by Ezeilo (2007) cited in Jibril and Abubakar (2017) revealed that the overall representation of all the female reporters in the world was 31% while males made up 69%. In a study on Africa Ezeilo, cited in Jibril and Abubakar (2017) found

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

that only 24% of reporters in both print and broadcast are female. A study of gender representation in the editorial and editorial units of newspapers in Nigeria conducted by Enwefah and Agbalajobi (2011) cited in Jibril and Abubakar (2017) found that only 21% of the newsroom staff are female, only 7% of the editorial staff are female and only 25% of columnists are female.

Theoretical Framework

Gender Role Theory

The theory expounds that gender role predicts differences or similarities between males and females based on the degree of variations in ascribed roles and related evaluations. Gender relations can be analysed from four theoretical perspectives namely, structural-functionalism, biological determinism, conflict school of thought and feminism (Nwosu, 2012). This study is hinged on the Marxist liberal and social feminism perspectives.

Marxists Liberal Perspective

Over time, both overtly and covertly, women have come to be excluded, segregated or marginalised in almost all spheres of life, while men have assumed control of the different sectors as the statutory heads (Chigbu, 2015 cited in Nwosu, 2012). This discriminatory and unjust organisation of the world deprives women the opportunities to maximise their potentials and contribute optimally to the development of their societies (Sarkar, 2006 cited in Nwosu, 2012). This is thus the goal of feminist theorists - to present an approach to understanding the difficult situations and experiences of women in all fields and cultures and to proffer solutions to earn women their true positions in the scheme of things (Njoku et al., 2018; Tijani-Adenle, 2019).

Marxists Social Perspective

Marxist liberal feminism provides a class-based analysis of women's oppression by locating their domination in capitalist systems and private ownership of property (Jaggar, 1983 cited in Nwosu, 2012). It can be argued that this theory applies to the situation of women journalists working for capitalist news media organisations in Nigeria. However, a major deficiency of the theory as it relates to this study is that Marxist feminism is not able to account for how patriarchy is manifest in Nigeria due to the country's peculiar socio-cultural norms which differentiate women's experience of patriarchy compared to those experienced and discussed by Western Marxist feminists. It also seeks to obliterate capitalism, which is the economic system that is operational in Nigeria, hence rendering it inappropriate for the study (Njoku et al., 2018; Nwosu, 2012; Tijani-Adenle, 2019).

Marxists socialist feminism, however, expands Marxist feminism as it identifies more than economic oppression as the basis of women's subjugation in society. Although socialist feminists identify the impact of capitalism on the inferior status of women in society, they are not under the illusion that obliterating capitalism and class struggle will ultimately eradicate gender oppression. Social feminism, therefore, "makes an explicit commitment to the abolition of both class and gender", which are the core challenges that the subjects of this study (women journalists) contend within Nigeria (Jaggar 1983, p.221 cited in Nwosu, 2012).

MATERIAL AND METHODS

Research Design

Regarding the nature of this study (which involves an analysis of the experiences of the subjects of the study, i.e., women journalists), a qualitative survey approach was adopted, specifically, the interview approach. The interview approach was chosen to understand the experiences of their subjects and because interview provided the researchers with the opportunity to understand, first-hand and in their own words, the participants' experiences (Tijani-Adenle, 2019).

Data Collection Technique, Procedure and Research Location

Semi-structured interview (see Appendix 1 for the interview question guides) was used to gather the original data because it offers the researchers the opportunity to ordinarily ask inquisitive questions in friendly and semi-restricted ways (Bailey, 2008). Several interviews were conducted whenever the researchers could gain access to a subject of the research (a woman journalist) that appropriately fit into his sampling frame. Some of the interviews were conducted after the researchers had begun data analysis while others were performed after the writing of this chapter had commenced and figured it out that gaining information from some group of men journalists would enhance my data analysis (e.g., those who are in top management positions).

A total of 37 interviews were conducted between August and September 2019 in media organisations in Damaturu, Dutse, Gombe and Maiduguri cities located in the states of Yobe, Jigawa, Gombe and Borno respectively. The number of journalists interviewed varied per media organisation as follows: Damaturu, 11; Dutse, 5; Gombe 7; and Maiduguri 12 (also, refer to Table A2-a in Appendix 2). Of the 37 participants interviewed, 10 are men journalists (with some of them occupying various editorial management positions), 25 are women journalists and two are human resource management staff (a man and a woman from NTA Maiduguri and GMC Radio). The longest experience interview with the participants lasted for about one hour 9 minutes while the shortest lasted just 11 minutes. The interviews were completed over a period of two weeks (14 days). Only broadcast journalists and management staff of broadcast media outlets were involved; this is because, in the northern parts of Nigerian where these media organisations are located, women print journalists are extremely scarce.

Sample Frame, Sampling Strategies and Sampling Technique

The emphasis of the sampling frame was chiefly to find both women and men journalists who could provide thorough and detailed information about women's safety-related experiences – how those experiences impacted their personal lives, work, safety and sexual intimidation policies in the news media organisations they work. Hence, the researchers focused on interviewing participants who possessed enough experience in journalism practice and have been working for a substantial time in broadcast news media. Because the present study adopted a qualitative research design approach, the purposive sampling technique was used to select the participants (the women journalists and male and female management staff from the Nigerian broadcast media organisations mentioned in Table A2-a in Appendix 2) who are capable of yielding insights and in-depth understanding (Patton, 2015). The purposive sampling technique was chosen because the researchers were convinced it can help in answering the research questions.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Most of the men journalists that were interviewed occupied the middle and top editorial management levels and were believed to have possessed tremendous experience in the job. To select the media organisations in which the participants worked, the Typical Case sampling technique approach was adopted. Typical Case sampling technique helps in drawing the sample of participants that are representative (Patton, 2015). Based on the researchers' knowledge, experience and research, all the selected media outlets except for those in Dutse, Jigawa State characterise typical examples of organised and professional Nigerian news media organisations despite nearly all of them are in the north-eastern geopolitical region of the country. Hence, results from the semi-structured interviews conducted from the selected media outlets portrayed findings that may not be assumed to allow for generalisations in any rigorous sense but present a typical analogy of what is obtainable in an average Nigerian broadcast news media organisation.

Research Ethics, Data Analysis and Data Management

The participants were briefed about the problem and aim of the study. All of them verbally permitted to be interviewed and for the information, they provided to be used purposely for the present study. The identities of the participants interviewed were not made public because of ethical reasons. For data analysis, the thematic technique (e.g., see Clarke & Braun, 2013) was used. All the codes identified in the text were scrutinised to ensure that they related to identified codes. All the codes were checked to ensure that each of the identified themes had enough codes to support them devoid of having to jettison codes that were in disagreement with the broad-spectrum of codes that suggested a theme as recommended by Braun and Clarke (2006) cited in Tijani-Adenle (2019). Eventually, three key themes were identified, namely (i) gender discrimination in news management and newsgathering, (ii) gender discrimination in salary, promotion and motivation and (iii) gender discrimination in sexism/sexual harassment.

To simplify data analysis and coding as well as themes identification, a code was designed to identify each participant in the results. Since the interviewees' names and identities were concealed, the data used to design the codes were (i) the type of interview performed, (ii) the interviewee's serial number, (iii) the interviewee's nature of the job or career rank and (iv) the interviewee's gender (e.g., SSI-09-ML-Female) (as shown in Table A2-b in Appendix 2) given that their identities were not disclosed, and that all their names were listed alphabetically and a serial number from 1 to 37 assigned to each. Further, because the interviews were done using smartphones, all the data were captured in digital electronic format. To ensure the security of the data, all were saved (in separate files) in a passworded memory card. Also, all the hard copies of the transcribed data used in data analysis that contained the identities of the interviewed journalists have been destroyed after writing.

RESULTS AND DISCUSSION

Gender Discrimination in News Production and Management

Research Question 1 asks: what are the women journalists' experiences of gender-based safety in the light of discrimination in the Nigerian news media? Including this sub-section, information in the two other subsections that follow discuss provided answers to this RQ.

Past research has argued that women journalists deliberately opt for soft beats because they are more interested in human angle stories while other studies posit that women are sometimes pressured to cover

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

soft beats. However, the fact that women journalists possess the capability to cover the hard beats has not been questioned. The journalists interviewed for this study were convinced that women journalists, although clustered in soft beats, can cover hard beats effectively if interested or when given the opportunity. None of the journalists interviewed for this study believed that women journalists are incapable of covering the hard beats. They all believed that women journalists who have covered the hard beats or who are on the hard beats (although relatively few) are very competent. However, most of the respondents did not conceal the 'normed' fact that discrimination exists in news management and administration.

When you uncover the list and names of journalists who have won accolades in the Nigerian media industry as a whole, we females, despite seen as inferior and discriminated against, have garnered a large portion. Even though we cannot deny the obvious fact that the males are larger in population than us in the journalism profession and male news managers and editors always have the prerogative to assign a journalist on a beat of their choice, but in terms of performance, I believe we are doing wonderfully well (SSI-02-J-MM-Female).

It is clear from the views of the respondents presented above that women journalists are, for sure, fewer on the hard beats. However, "this is not as a result of ability", given that the 'few' women journalists assigned to beats are formidably performing well. This probably explains why it has not been put to question, nor engaged with, as it was evident that gender does not inhibit the reporting or editing abilities of women. Apart from assigning women to soft beats because they are seen as emotional and better able to handle soft news, women journalists are also assigned to soft beats by media managers because of "the existence of the perception that women are the weaker sex" (Opoku-Mensah, 2004, p.109 cited in Tijani-Adenle, 2019), they are more vulnerable to violence and editors feel the need to protect them from harm. Women journalists are, therefore, shielded from covering riots, protests, conflicts and other events occurring at sites deemed volatile or dangerous.

I don't think I will ever consider attaching a woman journalist to such a hard beat as, for example, a military formation that is fighting the terrorists in the forest. No, I won't...I feel more comfortable deploying a man to that beat (SSI-35-J/R-MEP-Male).

As a woman, even if I was not assigned on a hard beat I don't mind. I'm used to it. Our societal norms dictate that the males lead in almost everything and journalism is no exception (SSI-03-J-MEP-Female).

Under normal circumstances, the likelihood is for the editor or news manager to tend to stereotype women journalists and deploy them to certain beats. For example, if five male and female reporters are sent to an editor, he would ordinarily consider assigning the males on the more serious beats, then the lighter beats he will say a woman will do better. Women are often assigned to cover fashion, women in development, etc. (SSI-29-J-MEP-Female).

Arguably, shielding off women journalists from hard beats can, ironically, be a blessing in disguise for them because media managers have protected them (women journalists) so well by shielding them from hard beats and "hot spots" to the extent that no woman journalist has been reported murdered in the line of duty in Nigeria (Unaegbu, 2017, p.172), these "hot spots", as Unaegbu in her study on safety in the Nigerian media notes, are "politics, conflicts, elections, news, and sports" (Unaegbu, 2017, p.178).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

"Ironically, if well covered, these are some of the beats that earn journalists a promotion to management and editorial positions" (Tijani-Adenle, 2019, p.106).

Although needed to drive patronage from viewers, listeners and readers as well as the much-needed advertisement revenue, soft news is disdained in the news media. Media managers do not value soft news nor its producers and when promotion opportunities come, writers or producers of soft content are not seen as worthy of being promoted to head the highly rated and revered editorial and management positions.

Gender Discrimination in Salary, Promotion and Motivation

One good thing with Nigerian public news media regarding emolument is that it is difficult for journalists in public news organisations to earn more than they deserve because salaries are strictly based on positions. However, if there is going to be a form of discrimination, it is usually done at the point of employment by, maybe, placing a person in a higher level and grade, compared to what is due to them. However, once journalists are employed and placed on specific levels and steps, they all earn the same salaries, regardless of gender. However, some situations may make male journalists eventually earn more than their women colleagues who join the news companies at the same time, and on the same level despite the claims by media organisations that salary differentials are not based on gender. Certainly, not through a direct policy but due to masculine newsroom cultures which favour male journalists to progress faster than female journalists and get to occupy editorial and management positions (with higher incomes) earlier than females.

You know, the nature of the news organisations is such that things favour the males much more than they do females. So, males are often disposed to work well and garner better chances to get preferential treatments and benefits. If you are working well, they will keep promoting you above someone you came in together, this is not the civil service where they just count years (SSI-10-J-MEP-Male)

That comment shows that journalists who work well and impress management can get an accelerated promotion. While this appears fair, the reality of the circumstances of women journalists, however, is that they hardly ever get a better or fair deal; they are often outperformed by the males whom the news media industry nature and structure favour. For example, marriage and/or family commitments do not usually provide them with the opportunities to enjoy such recognition and promotion because they take time out to cater to their families or nurse children.

Yes, based on policy there is a gender-blind salary scale, especially in public media organisations. If you can rise to certain ranks and positions, you earn the salary for those ranks. This is purely an ungendered matter except if, for example, a female is supposed to be a manager but because of her situation [gender], she is made to be an assistant editor and, therefore, [unfortunately,] earns the salary of an assistant editor because she is not where she should be but basically, the salary is based on the company's salary scale. But that would be unfair to do nepotism in media job (SSI-14-J-MEP-Female).

Well, it doesn't matter the position you are, in most media organisations you earn the same salary regardless of your gender. This is good. Where the difference occurs is, for example, if you and I were both reporters and because you are a man, they would make you become an assistant editor and because I'm a woman, they make me be a correspondent. So, because of that, they will pay you higher than me.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

But it's not like both of us are on the same rank, say, assistant editors and they pay you more than me simply because you're a man (SSI-37-RJ-SM-Female).

The reality with the experiences of women journalists regarding emoluments is such that based on policy, they should equally earn what the men on their levels earn, but masculine newsroom cultures overtake this, and their male colleagues end up earning more than them. This is because the men get promoted to higher positions with more income (due to being on hard beats that earn journalists' recognition and promotion) while the women stay in lower positions with lower income owing to masculine newsroom cultures which undervalue their labour because they have family responsibilities and are on soft beats which do not command recognition and esteem. This can be demoralising for many women. Some will become disinterested and just do the needful to maintain their employment and earn an income – making it less likely for them to progress. Others become frustrated and leave the industry, further reducing the population of women in the news media and thus creating a glass ceiling. Only a few continue to work extra hard and increase their sacrifices on the job until their efforts pay off with recognition and promotion.

Gender Discrimination in Sexism

Incidence of sexism, such as men getting considered or preferred above women and the necessity for them (women) to work "extra hard to prove their competence" constitute an array of examples that the participants mentioned. Sexual harassment generally involves making unsolicited and unwelcomed sexual advances to a woman (or man) physically, verbally or through any other means which is discernible to the harassed (Claudia et al., 2018). It entails unwarranted attention or discrimination based on gender which may also link "academic or professional standing or success to sexual favours or that interferes with work or learning" (Wood, 2011, p.295 cited in Tijani-Adenle, 2019). Global studies have documented sexual harassment against women journalists (North, 2016b; Tijani-Adenle, 2019), with research on Africa showing that although it is rarely discussed, sexual harassment does occur in African news companies (Gadzekpo, 2013 cited in Tijani-Adenle, 2019). The responses ranged from ignorance of the existence of sexual harassment, an explanation that such interactions are consensual to a justification that although acts that seem to constitute sexual harassment may occur, media workers know it is the newsroom culture and they are not targeted at undermining women journalists. The following are the views of those who claim to be ignorant of sexual harassment in the news media or do not think it occurs:

In the newsroom we have adults, I think everybody in the newsroom is above 18. So, the few times they joke...there is nothing in it that harasses the female folk or that tend to smear them (SSI-29-RJ-SM-Female).

Jokes are jokes, that's on a lighter note. I don't see them as a form of sexual harassment (SSI-10-RJ-SM-Male).

As far as sexual harassment against Nigerian women journalists is concerned, there has been a culture of the spiral of silence and defiance in Nigerian and other African news media industries until recent decades. Only recently did African nations and establishments started having legal apparatuses "on sexual harassment and gender discrimination" (Tijani-Adenle, 2019, p.138) neither did Nigerian academia focus on researching the scourge that has been affecting women journalists psychologically,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

socially and professionally in the country. Although issues surrounding sexual harassment, sexism and discrimination are is starting to draw attention, social and political awareness are still inadequate. Insufficient regulations and policies are notwithstanding developing despite suffering unfavourable responses such as "ignoring, denying, trivialising and in extreme cases condoning sexual harassment" from societal culture "thereby protecting perpetrators from sanctions" (Tijani-Adenle, 2019, p.370), for example, as this male respondent notes:

Jokes and senses of humour abound in the newsroom but sexual harassment… this is not common in the media. I don't think I have ever come across it or heard about it. I have never experienced it. So, it's not common. You are the first person telling me that and that is the truth (SSI-01-J-MEP-Male).

Responses like the one above, are surprising and, in a way, shocking. This is because one need not do any covert investigation to uncover evidence of sexually harassing behaviour in the Nigerian media. It is obvious in the jokes, discussions, interactions, as well as in the shared experiences of women journalists. It can be assumed that it would be difficult for someone who has stayed long in the media to occupy a senior editorial position (like the respondent above) to be ignorant of it. It could be because she was speaking as a representative of the organisation and wants to protect the image of her company. Equally, her understanding of sexual harassment may be different, thus making her disregard some sexually harassing behaviours as normal. It is vital to note that even when some female journalists develop the courage to file complaints, media organisations with administrative, editorial and management staff who deny the existence of sexual harassment in the industry are unlikely to address these complaints or give the victims fair hearing.

The young woman who wrote the entreaty against her superior officer was dismissed (SSI-21-J-MEP-Male).

Situations like this show that such organisations are unlikely to do anything to protect their female workers from harassment. Other scholars who have studied how women negotiate sexual harassment in the African news media have arrived at similar findings. Barbara Kaija's research on women journalists in Uganda documents that women journalists 'handle' sexual harassment on their own without recourse to management. She notes how a female journalist left the news media because her editor was demanding for sex and she could not cope with it. Yet, "for personal reasons, she preferred not to take the matter up with management" (Kaija, 2013 cited in Tijani-Adenle, 2019, p. 325). Women journalists working in the global North endure the same fate. Same findings resonate in the United States with only two per cent of respondents in a survey conducted by the Associated Press Managing Editors Association [APME] reporting harassment, and internationally in IWMF's global sexual harassment study with less than one-fifth of the 683 women journalists who had experienced sexual harassment reporting to news management (Barton & Storm, 2014). Women journalists in Nigeria and other international newsrooms (where sexual harassment policies are even entrenched) do not have confidence they would get justice when they report harassment.

For the situation to change, people holding editorial positions need to show more responsibility and the culture of denial must be eradicated in Nigerian and international newsrooms. Incidence of sexism, such as men getting considered or preferred above women and the necessity for them (women) to work "extra hard to prove their competence" constitute an array of examples that the participants mentioned. Furthermore, psychologically torturing experiences such as "not being appreciated like the men, having

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

their achievements ignored or even undermined by their superiors because they are women" (De Bruin, 2004; Tijani-Adenle, 2019, p.148) has also been complained by the respondents.

Over the years, some dogged women journalists can develop a thick skin against sexism and sexual harassment.

If a lady finds herself or decides to work in a media organisation...you have signed off that you know that people will harass you and you are ready for it (SSI-02-J-SM-Female).

The comment above is shared by many male journalists in Nigeria and rationalises the persistence of sexual harassment in the country's newsrooms. They seem to think that it is acceptable because it is supposedly a culture of the industry and so see no reason why anyone should complain or refuse to adapt to it. Women journalists have asserted that the newsroom is "not a place for the easily offended" (North, 2016b, p.505) due to the entrenched culture of harassment. This is like Kossan's finding cited in Tijani-Adenle (2019) that sexual harassment endures in male-dominated industries, including the news media because male superiors hold the view that their organisations are part of "unique environments, where sexual harassment can be excused" (p.3). The difference here, unfortunately, is that some women journalists also hold the same views.

In a similar context, many Nigerian women journalists who use social media often get caught in the web of 'flamboyant' self-presentation syndrome where they go berserk sharing their photos and videos with lust-provoking postures and outfits. Comments made by their social male media friends their appearances could be passed for sexual harassment as well. Therefore, to justify what women journalists often point out that "the newsroom is not a place for the easily offended" (North, 2016b, p.505), much sexual harassment and gender discrimination cases against women journalists would go deliberately unreported, self-deniably 'ignored' or ignorantly hushed. These would often make it difficult to draw a conspicuous dividing line between actual sexual harassment remarks and banters.

Sexual Harassment Coping Strategy

Research Question 2 of the study asks: what are the safety coping strategies regarding gender-based discrimination and sexual harassment the women journalists experienced in the newsroom? Information in the following paragraphs provide answers to this RQ.

Despite the seemingly depressing handling of violence against women journalists especially sexual harassment in Nigerian news media, the situation is not all bleak as the resilient woman journalists develop coping strategies to enable them to work despite the irksome masculine newsroom norms. It is vital to note that some female journalists do develop several sexual harassments coping tactics in the newsroom such as developing the courage to file complaints, ignoring, etc. Despite this, however, media organisations and editorial and management staff who deny the existence of sexual harassment in the industry are unlikely to address these complaints or give the victims fair hearing: *They sacked the girl that wrote the petition for writing against her boss (EI-21-RJ-SM-Female).*

During the time I started my career as a journalist...I used to be shocked at the kind of sexy jokes, you know, the insinuations, the connotations and all that… It used to be shocking, but it shocked me into silence. Once they just make jokes that make me uncomfortable, I would just keep quiet or leave the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

place. It took me some time before I got used to it. I don't like teasing people as a person; so, such sexy jokes don't go down well with me despite I now know how to resist it (SSI-02-J-SM-Female).

Over the years, since joining journalism career, I have developed a thick skin. It is either I don't respond or if I don't like it, I just keep the quiet or just smile, or I just generally don't participate in such jokes. So, of course, for a young woman like me who's just coming into the newsroom, you'll find the jokes harassing, if I can use that word, you'll find the jokes can make you feel uncomfortable (SSI-21-J-R-RJ-Female).

Apart from sexist jokes, women journalists also have to endure inappropriate touches all in the name of interactions. Many male journalists ignore the discomfort of their colleagues, (especially junior colleagues) and go-ahead to touch them even when the women show their discomfort. Amidst the outcry over rampaging sexism in the newsroom, a woman journalist out of the 37 interviewed said that she had experienced sexual harassment and she fought it, noting that it stopped after reacting to three occurrences from different men.

One day, I got so angry over somebody doing such unspeakable things to me. I had to slap him in the newsroom. I don't want to mention the place. I was walking into the studio for a pre-recorded show; I was already dressed and made up and everything and I was going. Then the guy he was like "gosh, you're so cute, babe," and he squeezed my thigh. The next thing I knew was I had slapped him. And everybody was like, 'Oh! You slapped a man', and I was like, 'Oh yeah, and so what? I'll do it again if he does it again' (SSI-21-J-MM-Female).

This is a typical case that shows that such organisations are unlikely to do anything to protect their female workers from harassment. Other scholars who have studied how women negotiate sexual harassment in the Nigerian news media have arrived at similar findings. Cited in Tijani-Adenle (2019), Barbara Kaija's research on women journalists' documents that women journalists 'handle' sexual harassment on their own without recourse to management. She notes how a female journalist left the news media because her editor was demanding for sex and she could not cope with it. Yet, "for personal reasons, she preferred not to take the matter up with management" (p.325).

Furthermore, women journalist's coping strategies to being touched without their consent were to ignore the unwanted physical contact and pretend it was not happening. One of the interviewees says, *I take my mind off it (SSI-15-J-MM-Female*). In such situations, women journalists isolate themselves socially to reduce the frequency of unwanted touch by, e.g., *I reduce the number of people I talk to* (*SSI-17-J-MM-Female*) as a respondent explains. This response is like Kaija's record of Nigerian women journalists who "ignored" in most cases "sexist language and inappropriate touches" from male journalists (p.325). Tijani-Adenle's study on the status of women journalists in Nigerian news media also records how women journalists who had experienced harassment "changed their behaviour around others, including not making eye contact, not attending work social functions (when the harassment occurred in the workplace) and not forming friendships with anyone related to work. Several women said they have modified the way they dress for work or try to present themselves as personally conservative" (2019, p.27).

FUTURE RESEARCH DIRECTIONS

Future research should employ quantitative approaches to determine the rates of discriminations and gender-based abuses in the Nigerian new media industry. This chapter believes that the significance of applying a conceptual framework based on the African Feminist approach to the research process and its implications on the findings must be highlighted. African feminism, considering the history, culture, governance and level of development in Nigeria provides the structure that exposes important and peculiar challenges that women journalists encounter in the country – like irregular wages, unfair wage differentials and inadequate infrastructural facilities, absence of gender equality, sexual harassment and maternity policies. Hence, future research should explore this approach. Finally, future research should also explore the perception and perspective of women journalists' media colleagues on discrimination against them in the media.

CONCLUSION

The atmosphere and culture in the Nigerian news media industry largely portend unsafe experiences, gender-based discrimination and abuses such as sexual harassment, sexism and gender-based nepotism against women journalists. Nonetheless, although some media organisations ignore the existence of such gender-based abuses as well as discrimination and unsafety in the newsroom to the extent that they expect journalists to protect themselves, other journalists and media management personnel admit the existence of such abuses and discriminations to the extent that they make efforts to control them. Unfortunately, most media organisations lack any policies and frameworks which take initiatives to manage abuses and discriminations among members of staff based on gender and seniority; only a few organisations manage to have some forms of policy-like guidelines. This situation forces determined women, journalists, to resort to adopting somewhat 'risky' behaviour as coping strategy and resilience measures.

The overarching socio-cultural patriarchy in Nigerian regulates or strongly moderates how sexual harassment and sexism issues are handled, with most women journalists (who constitute most of the victims) seldom complaining and senior personnel management staff fancying to address reported complaints secretly and privately. Generally, the backlash and stigma that come with speaking out or reporting complaints about gender-based discriminations and abuses such as sexual harassment and sexism have sealed women journalists' mouths to speak out. Often, personal and unofficial means of addressing such issues like praying for the victim, seeking advice on how to avert future occurrence and sometimes, resigning are resorted to; hence, giving rise to an unsafe environment for affected women journalists who opt to stay while threatening others to flee the industry. Regrettably, victimised women journalists (those who have experienced discrimination and abuse) hardly get the recognition and support they need and deserve from their female colleagues who luckily did not experience such challenges. They either wish their colleagues' sad experiences away because they did not experience harassment themselves or expect them to 'grow up and handle it' within the "existing structures of patriarchy rather than challenge the structures themselves" (Ross, 2004, p.146 cited in Tijani-Adenle, 2019, p.172).

In conclusion, after interviewing 37 journalists of different career ranks and two human resource managers (a man and a woman), this chapter can confidently say that an array of professional unsafety targeting women journalists such as gender-based discrimination and abuses including sexual harassment and sexism do exist in the Nigerian news media but, unfortunately, are not regarded as such because most

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

women and men journalists have internalised them to the degree that such "anomalies have become the norm" (Palm & Marimbe, 2018, p.27). This chapter believes that skyrocketing rates of unemployment and unfavourable economic atmosphere are some of the key factors contributing toward the vulnerability of early- and mid-career journalists especially women, who fall prey to men 'predators' some of whom sometimes turn out to be their bosses and other senior colleagues. The findings also demonstrate that unsafe experiences such as sexual harassment and gender-based discrimination within the Nigerian news media industry cannot be understood separately from other types of gender discrimination in society. Finally, professional unsafety in the light of gender-based discriminations and sex-related abuse meted against women journalists in the media can be mitigated through gender-sensitive legislation and advocacy that will require news media organisations to have policies and frameworks to address such issues with stiff penalties for defaulters.

KEY TERMS AND DEFINITIONS

Gender-Based Discrimination: An unofficial administrative attitude and practice covertly showing preferential treatment to women journalists because of their gender (sex).

Gendered Journalism: A newsroom culture that is influenced by overarching patriarchal societal norms, preferring men for juicy news beats, perquisites, etc. over women.

Journalist Safety: The ethically and socio-culturally guaranteed absence of psychological and physical harm toward journalists at work or otherwise.

News Media: Media organisations (whether broadcast, print or online) that primarily deals in news production and dissemination.

Newsroom/Newsroom Practices: A newsroom is a typical journalism practice environment or setting in a particular news media organisation where colleagues meet and work together. Newsroom practices are traditional and normed journalism practices commonly seen in a typical newsroom or newsroom setting, for example, news writing and editing, assigning news beats, interaction between male and female colleagues, etc.

Sexism/Sexual Harassment: A behaviour, an action or utterances suggesting sexual or sex-related activity, for example, kissing, touching/squeezing breasts/buttocks, blowing kisses, making sounds with the moth suggesting kisses, or possible of arousing sexual urges, etc.

This research was previously published in the Handbook of Research on Discrimination, Gender Disparity, and Safety Risks in Journalism; pages 319-342, copyright year 2021 by Information Science Reference (an imprint of IGI Global).

APPENDIX 1

Semi-Structured Interview Guides

These are question guides; follow-up questions were asked. Source: Tijani-Adenle (2019, pp.267-268).

Semi-Structured Interview Guide for Women Journalists

1. Tell me about your journalism career; how you got in, when and why?
2. How would you describe the role and position of women in your organisation's newsroom?
3. Are there aspects of working in the newsroom that are gendered or is it a gender-blind newsroom?
4. How do you navigate your personal life as a woman with that of a journalist?
5. How would you describe the newsroom culture in your organisation regarding professional journalists' safety?
6. Does your organisation have gender equality policies on remuneration, maternity leave, sexual harassment and other similar policies? Have you used any of these policies or do you know anyone who has? What implications do they have on the status of women in the news media?
7. How have you been balancing work and life? Which comes first? What do your husbands/families think about your career?

Semi-Structured Interview Guide for Male Journalists/Managers

1. Tell me about your journalism career; how you got in, when and why?
2. How would you describe the role and position of women in your organisation's newsroom, especially regarding safety to work?
3. Are there aspects of working in the newsroom that are gendered or is it a gender-blind newsroom?
4. How would you describe the competence and status of women journalists as a media manager and/or colleague?
5. How would you describe the newsroom culture in your organisation, especially regarding safety to work?
6. Does your organisation have gender equality policies on remuneration, maternity leave, sexual harassment and other similar policies? Have you used any of these policies or do you know anyone who has? What implications do they have on the status of women in the news media?
7. Studies and industry data have confirmed glass ceilings for women journalists in Nigeria, do you agree and what factors do you think are responsible for this?

Semi-Structured Interview Guide for Human Resource Managers of News Organisations

1. What do you do and how long have you been here?
2. I'll like to know the organisation's employment policy as regards to gender. Do you just employ the best or is there any arrangement in place to ensure that there are equal numbers of males and females?

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

3. Is salary structured; do people negotiate for their salaries when they are getting employed; and is it possible for people in the same position or doing the same job to earn the same salary?
4. Are women journalists given preference for training, or is this gender-neutral?
5. What is your maternity leave policy? How is it implemented?
6. Do you have a sexual harassment policy? Has any member of staff made official complaints? How are issues of safety and sexual harassment handled?

Chapter 100
Resident Physician and Medical Academic Faculty Burnout: A Review of Current Literature

Emma A. Omoruyi
University of Texas Health Science Center at Houston, USA

Fehintola Omidele
Johns Hopkins Bloomberg School of Public Health, USA

ABSTRACT

Physician burnout finds its roots in both undergraduate and graduate medical education and has emerged as an important cause of academic faculty turnover. Recognition of the need for resiliency training has led to the development and implementation of wellness programmes throughout the country and world. This chapter examines the causes and potential solutions of combating resident physician and academic faculty burnout in medical education. The authors reviewed current literature on wellness programmes in medical education, including both traditional and curricular approaches and provide a template for creating a well-rounded wellness programme to promote resident physician and academic faculty wellness.

INTRODUCTION

With the pressure of caring for patients, one can understand the importance of physicians maintaining good health, physically and emotionally. However, physician burnout is alarmingly prevalent in the current day with anywhere from 25%-70% experiencing the 'emotional exhaustion, depersonalisation and decreased feelings of personal accomplishment' (Eckleberry-Hunt, Van Dyke, Lick, & Tucciarone, 2009). At one time, burnout has been present in 'one-third to one-half of US medical students and academic faculty' and also been observed with the same prevalence throughout the world in countries such as Japan, New Zealand and Canada (Benbassat, Baumal, Chan, & Nirel, 2011). When dissected, it is clear that physician burnout finds its roots in both undergraduate and graduate medical education.

BACKGROUND

When examining undergraduate medical education, two unique classifications of burnout predispositions have been studied: exogenous stressors and endogenous stressors. Exogenous or environmental stressors include 'adjustment to medical school, student abuse, witnessing and unwillingly participating in unethical behaviour towards patients and exposure to death and suffering' (Benbassat et al., 2011). Of note, the endogenous stressors were often related to qualities identified in one's personality such as neuroticism and contentiousness.

People who chose the field of medicine are often concrete thinkers and interested scientists, looking for evidence to evaluate the strength of a concept. Incoming students are often not prepared for the uncertainty that lies within medicine, so students struggle with an 'intolerance of uncertainty' also known as a 'perception of ambiguous situations as a threat' often comes as an endogenous stressor. Three different types of uncertainty have been described in literature (Benbassat et al., 2011). The first and most common is an uncertainty of one's personal adequacy; students were concerned that they would not learn all they needed to know to be a successful physician. This uncertainty can also be manifested in the competitiveness associated with undergraduate medical education, though newly addressed with curricular changes (Benbassat et al., 2011; Slavin, Schindler, & Chibnall, 2014). The other two uncertainties concerned the limitation of available medical knowledge and lastly, the uncertainty resulting from being unable to distinguish between the other two uncertainties (i.e. uncertainty of personal adequacy and limitation of one's medical knowledge) (Benbassat et al., 2011).

Naturally, when examining graduate medical education (residency), life satisfaction was the lowest and prevalence of mental health problems was the highest within the first year. In fact, 76% of new doctors reported high levels of burnout. Yet again, with a global impact, it was observed that 30% had anxiety symptoms and 15% had depressive symptoms in Switzerland. In Canada, 14% reported they would change specialty and 22% would not pursue medicine if given the opportunity to relive their career (Benbassat et al., 2011). Interestingly, physicians who attended medical school outside of the United States reported lower emotional exhaustion and depersonalisation (essentially, burnout) than United States medical graduates (Eckleberry-Hunt et al., 2009). The reason for this difference is that the general work culture in the United States is thought to be more stressful than other parts of the world due to a variety factors and when it comes to medical training, work hours are more restricted in other countries compared to the United States (Gander, Briar, Gardner, Purnell, & Woodward, 2014). Regardless, given that thousands of new doctors graduate each year, the magnitude of those statistics is astounding. Due to significant variation in schedules as well as the health of patients, certain specialties such as intensive care, emergency medicine and oncology result in lower life satisfaction (Benbassat et al., 2011). Unmet expectations provide a new stressor to new doctors once formal medical education is completed and they are finally practicing. Sometimes, being inexperienced, some new physicians are discovering that the practise of medicine may not reflect what was expected upon applying and entering medical school. To dig deeper in unmet expectations, these doctors also face discrepancies between what is learned in school and what is experienced in practise. These discrepancies revisit and even confirm the stressors of personal inadequacy as mentioned in undergraduate medical education stressors. Overall, personality issues, such as pessimism, perfectionism and lack of coping skills for stress, persist as one common theme in the development of burnout (Eckleberry-Hunt et al., 2009).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Medical students and doctors have higher rates of substance abuse, anxiety, depression and suicide, which are all effects of burnout (Eckleberry-Hunt et al., 2009). With such high rates of burnout and its sequelae, medical education administration is currently paying more attention to wellness programmes, especially considering that physician burnout leads to lower quality patient care (Eckleberry-Hunt et al., 2009). In that sense, physician burnout could very well be considered a public health problem with huge implications for our society's health. Because of those implications, it is now imperative that administration and medical students are educated in the variety of ways to which wellness can be incorporated into medical education and the culture of the institution.

The aim of this chapter is to educate the administration of undergraduate and graduate medical education about the necessity of creating and promoting a wellness culture amongst the health professionals-from medical student to faculty responsible for training future doctors. The chapter includes a review of current data on wellness programmes and pull from these programmes tenets of strong components needed to develop wellness programmes. The review of the literature contains both traditional and curricular approaches, in order to provide a guideline and template for a well-rounded wellness programme. The availability of a template would give widespread access to administration, allowing them to implement programmes in their institutions with ease. With implementation of wellness programmes throughout the country and world, medical education, the health profession and doctors can further ensure the health of communities by ensuring the health of the physicians in those communities.

MAIN FOCUS OF THE CHAPTER

Wellness Programming Across All Levels of Medical Education

Undergraduate Medical Education Wellness Programs

In 1991, the Kirksville College of Osteopathic Medicine launched its pioneering wellness programme, responding to a need that only 20% of current allopathic and osteopathic medical schools had addressed (Gaber & Martin, 2002). The medical school adopted 'I am my own first patient' as the theme of their programme, a very timely and accurate call to action that still applies to all physicians today. The programme is a voluntary initiative that promotes wellness in multiple areas such as physical, environmental, emotional, intellectual, social, spiritual and professional. As of 2002, there were several benefits associated with participation in the programme, including extra points towards the final grade in a course, free aerobic classes, pre-participation physical examination and 6-month fitness assessment. The latter two still exist today. The programme also boasted benefits for mature and older students; second year students could gain clinical experience by performing pre-participation assessments and also learn how to write a 'fitness prescription' and wellness programmes for incoming first year students. The Still Well programme, an earlier model of best practises, still exists today with large participation of the students each year, as previewed from the growth of 41 of the 290 students in 1991 to the 268 of the 290 students that participated in 1998. A strong connection between changing the grading system and lower student anxiety was noted specifically, on the topic of the extra points towards the final grade in the osteopathic theory and methods courses. Comprehensive seminars were provided to the students ensuring participation would yield higher overall scores (Gaber & Martin, 2002). Considering a large amount of stress in medical education comes from academics itself, an investment in wellness as a means to improve grades

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

in any one course is a sound idea. For example, seminar series topics included: diversity in medicine, interpersonal relationship building, test-taking anxiety, high performance nutrition and resume writing. One unique aspect of the Still Well programme was the emphasis on physical health and the access to resources to aid and assess the students' physical health. The pre-participation physical examination was administered within one month of arrival to the school; physical fitness was then re-evaluated at 6 and 12 months. The physical examination was rather comprehensive and included the traditional components of the actual physical examination with vitals, height/weight screening, vision examination and measurement of blood lipid levels. However, the examination had unique components including screening for cardiovascular risk (through waist-to-hip ratio) and cancer as well as resting electrocardiograms and pulmonary function tests. The Still Well programme offers a comprehensive approach to wellness, based on the very simple principle of a 'first patient', yet, targeting burnout in students from physical health to emotional health and everything in between.

Traditional wellness programmes often rely on the individual to seek out improved access to counselling resources and encourage a wellness-focused lifestyle (Slavin et al., 2014). One unique and recent approach, launched at Saint Louis University School of Medicine in 2009, focused on addressing the curriculum in order to 'balance out the negative aspects of medical education' and ensure healthier individuals (Slavin et al., 2014). The first change instituted was the change of the grading system from a 4 -level grading system to pass/fail, a change to which many medical schools are now adhering. The proposed change aimed to decrease competition for grades and reduce overall stress. In addition, it gave students the liberty to focus on topics that they personally found important as opposed to focusing on learning high volume of material at once. Secondly, there was a reduction in course work to allow for participation in other aspects of the wellness programme including learning communities and longitudinal electives. The electives were expanded so that students had access to them during majority of the first and second years of medical school. The electives gave students more time to explore interests, including service and research, as well as. foster relationships with faculty.

Mentorship and generally relationships with faculty who also advocate for wellness has been shown to be an effective method in maintaining wellness in students (Eckleberry-Hunt et al., 2009). Another aspect of the Saint Louis University wellness programme included five specialised learning communities as mentioned-service and advocacy, research, global health, wellness and medical education-which would give interested students and faculty an avenue to share common interests with one another (Slavin et al., 2014). The communities were aimed at tailoring new electives, developing innovative lectures, identifying faculty mentors and expanding service and research. To enhance the breadth of the curriculum, the administration added a resilience and mediation programme to one of the courses which provided sessions on habits from mindfulness cultivation to character strengths to aid students individually. The Human Anatomy course, the most stressful of the first year, was moved to later part in the year, as opposed to the beginning of the year when students already face high levels of stress adjusting to the rigor. The examinations schedules were altered essentially to set students up for higher scores. Lastly, yearlong social events were implemented for medical students; this programmatic change is common across medical education and proves to be highly beneficial for the students and residents. The programme yielded significant decreases in depression and anxiety of students progressively through the years starting from the year of implementation. Another added benefit was the increase in the mean scores of the major licensing examination taken in the preclinical years. Saint Louis University's programme proved that a successful wellness programme must integrate all aspects of medical education, from curriculum

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to social atmosphere, in order to change the culture of the institution. Overall, this curricular approach, though novel, proves to be promising for medical education in years to come.

Graduate Medical Education Wellness Programmes

As described above, prevention interventions like stress management workshops, mindfulness meditation, and wellness curriculums have had documented positive impact on medical education. However, treatment options are important for those who develop significant levels of depression or suicide risk. In one institution, residents and faculty who participated in an anonymous screening of their mental health were more likely to accept a referral to community based counselling after receiving personalised communication (Moutier et al., 2012). The high rates of burnout among resident physicians suggest a significant number would benefit from therapeutic counselling. The United States Accreditation Council for Graduate Medical Education requires that all residency programmes provide psychological services for residents. Barriers to accessing these services include concerns about confidentiality, accessibility, and potential reporting to licensure boards (Givens & Tjia, 2002; Guille, Speller, Laff, Epperson, & Sen, 2010). While higher education is associated with more positive attitudes to counselling (Vessey & Howard, 1993), depressed individuals are often concerned about the risks of treatment (Kushner & Sher, 1989).

Improving the understanding of motivators and barriers to seeking therapeutic help by residents is important in the development of wellness programmes and outreach efforts. Research documents the fact that female physicians are less likely to seek counselling (Dunn, Moutier, Hammond, Lehrmann, & Roberts, 2008), (Moutier et al., 2009) which is concerning given female medical students and residents are at greatest risk to report significant stress compared to their male counterparts. There is limited evidence supporting whether ethnic or racial differences exist within the pool of physicians that seek counselling. Evidence suggests that residents are more comfortable seeking an academic medical centres counselling services rather than an employee assistance programme (Pitt, Rosenthal, Gay, & Lewton, 2004) and typically rate these services as satisfactory (Dabrow, Russell, Ackley, Anderson, & Fabri, 2006). Lowering the barriers to accessing these services would be an important step by any medical training programme.

In a single institutional study, residents and fellows were surveyed to determine differences in perceived barriers and receptiveness to accessing on-site wellness programmes (Ey, Moffit, Kinzie, Choi, & Girard, 2013). The researchers hoped to determine if residents were willing to seek counselling on-site and identify potential barriers. A plan to stratify by demographic information to help identify targeted interventions was a part of the study. The Resident Wellness Programme at Oregon Health Science Centre implemented the access of what was the equivalent of a full-time psychologist or psychiatrist experienced in working with medical professionals available 5 days a week to its residents (Ey, Moffit, Kinzie, Choi, & Girard, 2013). The services were free, unlimited, not documented on the hospitals' electronic medical record, and health insurance information was not obtained. Moreover, resident physicians were told that the 'wellness counselling' was not reportable to medical licensing boards. The Oregon Health Science Centre found that most residents knew how to access the resident wellness programme (88%) and only 13% were 'not at all likely' to access the programme.

Time was the biggest barrier for most resident physicians and female physicians were the most concerned about taking time off to access the programme. These findings demonstrate that even when the barriers of cost and knowledge of available counselling services was removed, a culture may exist among residents that limits the ability to take a break off to address personal health needs. Addressing critically troubled resident physicians that may be concerned about the consequences of seeking treatment is of

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the utmost importance. The same institution, Oregon Health Science Centre, expanded on the results of an earlier study which found that 90% of the residents cited the inability to get off work during business hours as the major barrier to seeking care (Cedfeldt et al., 2015). In July 2010, the institutions' Division of Graduate Medical Education implemented a time off policy that required residency training programmes to provide four half-days off per academic year for health care and wellness. The programme directors were made aware of the policy and the programmes were strongly discouraged from tracking the residents' reasons for use of the policy. The intent of the programme was that directors would assign time off for all residents, this planning was included in a pre-scheduling of each resident's time off allotment.

Upon review of the outcomes of the strategy, it was reported that two years after the policy was instituted almost 90 percent of residents knew about the policy but only 49 percent of resident physicians had actually used it. The majority (73%) of those who took a half-day reportedly used it for preventive health services (Cedfeldt et al., 2015). The most common concern by residents was that their absence during wellness day would impact their peers' schedule (Cedfeldt et al., 2015). Pre-scheduling these days off may have decreased the impact of these barriers and also ensuring that the scheduled days off were provided on rotations where patient care transfers are not necessary.

The impact of residents not seeking wellness days even when assigned means that residents may seek other forms of self-help, some of which are not beneficial. Older literature has looked at patterns of substance use over multiple specialties and found that daily alcohol use was reported in 5% of respondents (Hughes, Conard, Baldwin, Storr, & Sheehan, 1991). Conventionally, anaesthesiology residents are thought to be at highest risk due to proximity and access to potential drugs of abuse (Lutsky, Abram, Jacobson, Hopwood, & Kampine, 1991). Emergency resident physicians are also thought to be at high risk due to shift work patterns of high stress followed by long periods of rest (Hughes et al., 1991). A 2008 large scale study of emergency medicine resident physician substance use and impairment, the researchers found an increasing number of residents reporting substance use as 'self-treatment' or to 'relieve stress' as compared to a similar study done in the early 1990s (McBeth et al., 2008). Paralleling this finding was the significant increases in marijuana use and 73.6% of the marijuana users report using it in order to 'relieve stress'. A large number of residents indicated that the consumption of alcohol increased during residency. One of the more concerning findings of this study was the quantity of residents who initiated substance use during residency, especially those using prescription drugs in a nontherapeutic way; this is another interesting finding that came out of this study and is one that it should make educators rethink the way stress and substance abuse is managed during residency. It also serves as important reminder that simply providing more 'time off' does not equate to 'less stress'. However, time off, especially scheduled time off is an important factor in the successful identification and treatment of an impaired resident.

Time off alone does not create a more resilient resident. Stress management or resilience training may be an important step to mitigate some of the factors that lead to resident burnout. During the period from 2012-2013, Duke University Family Medicine, Psychiatry and Anaesthesiology residents participated in two or three 1 hour sessions of mindfulness-based resilience activities (Goldhagen, Kingsolver, Stinnett, & Rosdahl, 2015). The group sessions were developed by a clinical psychologist and held during protected resident time. The learners were taught about the concept of mindfulness-awareness, meditation, value exploration, and cultivation of positivity. Resident physicians were asked to complete an anonymous survey prior, afterwards, and during a 1-month follow-up of the meditation based training. The survey contained questions that came from the Depression Anxiety Stress Scale, Oldenburg Burnout Inventory, and the Mindful Attention Scale. Results of the survey showed that residents, at baseline, had normal levels of stress, with females having significantly higher levels than males (Goldhagen et al., 2015).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Residents had a very good awareness of when they were stressed and a majority of residents had findings suggestive of a high level of burnout based on the Oldenburg Burnout Inventory. In the short term, the mindfulness intervention, did not affect these stress level but, a trend was observed on later, when residents scored positively time points of lower burnout and stress scores. These results suggest that the residents may have used the new knowledge to ease future stress and become more resilient. Resilience training is not a new concept.

Other research groups have studied stress reduction training during residency. One group looked at the outcomes of medicine and paediatric residents who received resilience training as compared to a group of residents that did not receive such training. The researchers found that the group that was trained had noted improvements in emotional exhaustion and depersonalisation scores (McCue & Sachs, 1991). Another research group found a positive effect on emotional exhaustion when residents were taught a meditation practise which combined breathing and repetition for reducing stress (Ospina-Kammerer & Figley, 2003).

Along the lines of graduate medical education, Troy Family Residency programme started a structured and more 'traditional' wellness programme in 2003 (Eckleberry-Hunt et al., 2009). This programme provided tangible evidence-based results that medical education and administrators can use to develop solid wellness programmes. These points provide a framework useful towards the development of a comprehensive wellness programme template that can be implemented throughout the world. Most importantly, choosing a definition of wellness from which a medical or residency programme would function is critical in the design process. While many examples or definitions of wellness exists, the Troy example considered 'wellness' to be more than a lack of impairment. Instead it was 'a dynamic and ongoing process involving self-awareness and healthy choices resulting in a successful, balanced lifestyle' (Eckleberry-Hunt et al., 2009). Along the pathway of creating a wellness programme, a critical first step was to select a faculty wellness champion per incoming class of residents. To share the responsibility of leading the programme, it would be ideal to have multiple champions especially for larger programmes or larger classes of medical schools. The responsibility of the wellness champion is to 'ensure that wellness is incorporated into the daily operations of the residency programme' (Eckleberry-Hunt et al., 2009). The use of technology may be useful in sending out articles and reminding students/residents and faculty about wellness meetings. Another important component of the programme, which should be key in an ideal wellness programme, is the administration of a 'burnout tool' twice a year. This approach was also used in the Saint Louis School of Medicine programme as students were surveyed twice a year (once in the beginning, once at the end of the year) to determine their anxiety and depression levels in relation to the interventions put in place' (Slavin et al., 2014). The burnout tool used at the Troy programme and across many wellness programmes is the Maslach Burnout Inventory (Eckleberry-Hunt et al., 2009). The inventory measures the definition of burnout, as mentioned above, on a qualitative scale of low to high. Further study and expansion of this inventory could become a reliable measure of burnout and effectiveness of interventions.

Other interventions of note include providing lectures on wellness and burnout as well as writing a mission statement for the wellness programme. Across the undergraduate and graduate levels of medical education, it would be beneficial to provide 'difficult patient' panels twice a year to discuss how to manage difficult situations and interactions as a group. To ensure accountability, 'wellness partners' can be assigned between faculty and students or residents, in order to establish wellness goals: emotional, physical, spiritual and social goals. Lastly, like many programmes, bringing the classes together

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

socially, especially to celebrate accomplishments, always proves to foster healthier and happier students and residents.

The Stanford University Department of Surgery's Balance in Life programme was a response to the loss of one recent graduate to suicide in 2010. The goals of the programme were clearly defined as 'help residents cope with daily stress, provide tools to manage challenges after completing residency and reduce the risk of burnout, depression and suicide' (Salles, Liebert, & Greco, 2015). For professional well-being, the programme created a resident mentorship programme where junior residents are allowed to choose their senior resident mentors; the pairs are then funded via the administration's budget to have quarterly lunch meetings. The idea of this mentorship, a continuous and effective theme amongst thriving wellness programmes is that it provides an informal setting where both parties can talk about personal stressors as well as it gives junior residents someone 'older' who can provide guidance. Another aspect of fostering professional well-being was actually building in physical activities in the schedule to encourage leadership and team building, the ropes course or a maze are examples of activities in this area.

Upholding physical well-being during residency, one example, to bolster healthier eating options for residents, especially on nights and weekends is to offer healthy options. To address this issue, an example of what one programme did was to provide a refrigerator that would be properly and consistently stocked with healthy food options. To address psychological well-being, the programme had an expert clinical psychologist meet with residents weekly on a confidential basis. Consistency was built into the schedule to allow the psychologist to meet with the different classes of residents every 6 weeks. Lastly, to address social well-being, there are programmes or activities available outside of the hospital that encourage life beyond the hospital and give the residents an opportunity to support each other and interact socially. The Balance in Life programme is an exemplar of direct and concrete policies to address wellness on different levels of training during medical education.

Academic Medical Faculty Wellness Programmes

Academic medical faculty face increasing pressure and challenges in their work environments (Goitein, 2014). Faced with higher clinical load and pressures to increase clinical productivity, coupled with the desire to be fully committed to teaching and research. The loss of autonomy at work can create a sense of disenfranchisement and diminished sense of meaning. One study found that faculty who spent less than 20% of their time on an activity that is most meaningful to them had higher rates of burnout and the ability to focus on the aspects of their work that brought meaning diminished the risk of burnout (Shanafelt et al., 2009). A 2006 study that surveyed 3,519 academic faculty members at four United States medical schools found 20% of faculty had significant levels of depressive symptoms, with higher levels in younger faculty. Noted in this research is a major relationship between work-related strain and faculty mental health and job satisfaction (Schindler et al., 2006).

Professional vitality battles burnout and builds resilience. Job satisfaction and engagement are important keys to vitality (Dankoski, Palmer, Laird, Ribera, & Bogdewic, 2012). Faculty vitality has been defined as 'the high levels of satisfaction, productivity, and engagement that enables [a] faculty member to maximise her/his professional success and achieve goals in concert with institutional goals' (Dankoski et al., 2012). Another group of researchers determined that faculty who find meaning in their work create that sense of professional vitality and it is important for Academic Health Centres to pay more attention to strengthening relationships, improving the misalignment between faculty and institutional values,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and improving work–life integration (Pololi et al., 2015). Presently, few training programmes exist that document positive outcomes related to enhanced academic faculty well-being.

A group at Rochester, New York studied whether an intensive educational programme in communication, mindfulness, and self-awareness is associated with improvement in physicians' well-being, psychological distress, burnout, and capacity for relating to patients. The intervention included an 8-week intensive phase (2.5 hour/week and a 7-hour retreat) was followed by a 10-month maintenance phase (2.5 hour/month). The physician's participation in a mindful communication programme correlated with short-term and sustained improvements in well-being and attitudes associated with patient centred care (Krasner et al., 2009).

In 2011, Mayo Clinic Rochester academic physicians were enrolled in a pilot randomised study. In the study, the intervention group received 90-minute training on Stress Management and Resiliency training (Sood, Prasad, Schroeder, & Varkey, 2011). During the intervention groups' time, participation in facilitated small group conversations with peers which concentrated on learning how to use mindfulness and reflection strategies. Moreover, a statistically significant improvement was found for resiliency, perceived stress, anxiety, and overall quality of life compared to the non-intervention group. A group of researchers later expanded this intervention to involve 19 biweekly facilitated physician discussion groups that included features of mindfulness, reflection, shared experience, and small-group learning for 9 months (West et al., 2014). The doctors received protected time, 1 hour of paid time every other week, for their efforts and thus removed the barrier of having to find time in already busy schedules. A compelling finding from the study revealed that the rates of depersonalisation, emotional exhaustion, and overall burnout decreased substantially in the trial intervention stage of the research (West et al., 2014). These optimistic results were sustained up to 12 months after the study.

Such findings from evidenced-based research hold important implications for administrative and department leadership at academic medical centres. The academic physician is a critical resource for these centre of training, scientific discovery, and medical innovation. It can be inferred, that diminishing burnout and increasing resilience are important for long term success of academic health centres and reduction in employee turnover. Academic health centres that encourage faculty mindfulness may help inspire a culture of support for the humanistic needs of health professionals (Pololi et al., 2015).

Increased awareness of these issues affecting the mental health and well-being of medical academic faculty once proactively addressed should ultimately also positively affect students and resident physicians. Thereby, advancing policies to help facilitate an atmosphere that is essential for research productivity, effective teaching and quality patient care.

SOLUTIONS AND RECOMMENDATIONS

The key recommendations on all levels of medical education include an internal review of existing institutional culture surrounding wellness and identifying areas for improvement. Wellness champions and mentors need to take transformative steps with an early introduction of wellness to the medical audience and consider administering self-assessment burn-out tools to aid in monitoring impact of the interventions rendered. Structured wellness events can be incorporated in the form of lectures, retreats, social events and counselling. Most importantly, structures need to be put in place to reduce the barriers (money, time, etc.) that prevent medical learners and medical faculty from accessing these solutions and recommendations. Academic health centre also need to incorporate into the institution's mission statements, policies

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

that promote a culture of wellness assistance for all members of the medical and medicine communities. Inclusive of faculty, staff, administrators, medical students, residents and physicians.

By reviewing current data on wellness programmes, including both traditional and curricular approaches, this chapter concludes with a table created to provide a guideline and template for building a well-rounded wellness programmes. Table 1 presents a summary of current programmes that have been tested and proven successful in fostering wellness among its medical students and residents. Additionally, Table 1 may serve as a template for administration attempting to address burnout within their respective institutions. With this template, one can use key factors to customized wellness programmes to essentially change the culture at each institution for years to come.

FUTURE RESEARCH DIRECTIONS

Medical educators should continue to study the impact that learning environments have on the well-being of their students and resident physicians. Conscious efforts to educate themselves on the consequences and costs associated with these settings is imperative. Using existing knowledge and offering more evidence- based research can be helpful in garnering public support and awareness. Examination of outcomes on various levels (patient, health care delivery, health care cost) and engagement with the multitude of stakeholders in the area to develop informed guidelines is needed. Best practises need to be studied and implemented in a consistent mode for wellness programmes on all levels of medical education from the beginning medical student to more senior academic faculty. To have successful academic reform in medical schools, it therefore would be beneficial to assess and manage occupational burnout among clinical faculty members. Little research has been conducted to investigate role stress experienced by faculty members in medical schools in developing countries. This becomes even more important when the process of reform in medical education has already taken place in many first world countries. Research to understand the impact of academic faculty on physician and resident research is most needed as changes to policies throughout medical education are on the rise.

CONCLUSION

Stress, burnout and lack of vitality in medical training is prevalent. It is certainly not a new problem, but more attention is being paid to its effects on the quality of patient care, learner mental health and faculty turnover. Most importantly, the culture of medicine needs to change. Lack of resiliency on the faculty level spills down to resident and medical student learners and does not model good behaviour. However, it is the authors' hope that as more medical student and resident learners are given the tools they need to combat burnout, they, in turn, will then develop into more vital medical faculty.

Table 1. Wellness programme template

Key Factor of Programme	Support
Internal review of curriculum • Change from level grading system to Pass/Fail • Evaluate 'hardest' courses/rotations and discuss ways to alleviate the stress. Can the order of courses be rearranged? • Incorporation of wellness curriculum (meditation, mindfulness, self -reflection)	Slavin et al., 2014
Prepare for arrival of new class • Delve into new student's interests & career goals to match with student mentor and faculty advisor • Send personalised letter prior to arrival	Drolet and Rodgers, 2010
Introduction of wellness at orientation • Educate on common stressors, realistic expectations for programme, student/resident abuse • Invite established faculty who have faced various forms of distress • Define 'wellness'; expand on 'I am my own first patient' • Administer burnout tool; follow up at 6 months	Gaber et al., 2002 Eckleberry-Hunt et al., 2009 Benbasset et al., 2011
Emphasize mentorship & advising • Faculty mentors • Student/resident mentors • Consistent check ins throughout the year • Confidential space for students/residents to vocalise concerns • Wellness champion	Eckleberry-Hunt et al., 2009 Drolet and Rodgers, 2010 Slavin et al., 2014 Salles et al., 2015
Student leadership & investment • Wellness committees focused to tackle different aspects of wellness	Drolet and Rogers, 2010
Lecture series addressing wellness • Meditation/Yoga • Time management • Financial management • Nutrition • Sleeping habits • Diversity in medicine	Eckleberry-Hunt et al, 2009 Goldhagen, Kingsolver, Stinnett, & Rosdahl, 2015
Designated pre-scheduled wellness days/retreats	Cedfledt et al., 2015 Drolet et al., 2010
Measure physical health • Physical examination and extensive studies done upon arrival with fitness at assessment 6 months	Gaber and Martin., 2002
Scheduled social events • Welcome reception • Colleges & 'College Cup' • Sporting events/ art events • Celebrate milestones (transitions in years, birthdays etc.)	Gaber and Martin., 2002 Eckleberry-Hunt et al., 2009 Drolet and Rodgers, 2010 Slavin et al., 2014 Salles et al., 2015
Breaking wellness down into domains • Mind • Body • Social • Community • Professional	Drolet and Rodgers, 2010 Salles et al., 2015
Reduce barriers to accessing behavioural health care • Offer referrals to community based counselling services • Provide free & easy access to full-time psychologist or psychiatrist experienced in working with medical professionals	Moutier et al., 2012 Ey, Moffit, Kinzie, Choi, & Girard, 2013 Salles, Liebert, & Greco, 2015
Provide time off during weekdays/business hours to ensure time for residents/faculty to seek proper health care & promote overall wellness	Cedfeldt et al., 2015

KEY TERMS AND DEFINITIONS

Academic Medicine Centres: A health care organisation often connected to a medical school and hospital system.

Burnout: Physical or mental collapse caused by overwork or stress.

Difficult Patients: Patients who are troublesome, tedious and/or noncompliant with medical provider instructions.

Intolerance of Uncertainty: A perception of ambiguous situations as a threat (Benbassat et al., 2011).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Mindfulness: A mental state achieved by focusing one's awareness on the present moment, while acknowledging and accepting one's feelings, thoughts, and sensations; it is often used as a therapeutic technique.

Resident Physician: A resident physician or house officer is an individual who has completed medical school. A resident physician practices medicine under the supervision of an attending physician. In many countries, a physician must successfully complete residency training before they can fully practice medicine. Post-residency physicians are referred to as attending physicians or consultants.

Resiliency: The ability to recover quickly from disruptive change without being overwhelmed or acting in harmful ways.

Value Exploration: Process in which individuals examine their values, beliefs, motivations, interests and abilities to help guide education and career decisions.

Chapter 101
(Non)existent Laws of Workplace Cyberbullying: Limitations of Legal Redress in a Digitized Market

Harrison M. Rosenthal
University of Kansas, USA

Genelle I. Belmas
University of Kansas, USA

ABSTRACT

This chapter chronicles the legislative and jurisprudential history of workplace bullying and analyzes new frameworks for applying employee harassment laws to the digital era. Part I considers the sociolegal underpinnings of workplace harassment found in Title VII of the 1964 Civil Rights Act. The authors discuss how Title VII and its legal progeny gave way to "hostile work environment" claims. Part II discusses leading U.S. Supreme Court precedent, the creation of an affirmative defense for employers, and the limitations of that defense, including those developing in state and local jurisdictions. Part III discusses prevailing solutions and raises questions not yet addressed in the legal literature. Findings reveal that American jurisprudence is ill-set to protect or compensate workers injured by bullying—either cyber or physical.

INTRODUCTION

Swedish psychologist Heinz Leymann conducted the first serious academic inquiry into workplace bullying, or what he called "workplace mobbing," in the late 1980s (Leymann, 1990; 1996). This seminal research brought bullying out of the scholastic context and shed light on the psychopathological ramifications of organizational harassment (Nolfe et al., 2007). Workplace bullying has since become an interdisciplinary focal point in fields ranging from occupational health (Quine, 2003), to epidemiology (Einarsen & Skogstad, 1996), to management research (Branch et al., 2013). Topical scholarship

proliferated concurrently with the development of new media. The effects of bullying are generally thought to be amplified through electronic forms of contact for two reasons (Campbell, 2005; Dooley et al., 2009; Tokunaga, 2010). First, the public and anonymous natures that digital bullying pose make people perceive online bullying as worse than in-person bullying (Sticca & Perren, 2013). Second, the ubiquitous nature of new media allows workplace interactions, and by extension harassment and bullying, to extend "beyond the office's 'four walls'" (Gelms, 2012, p. 259). This ubiquity provides bullies with ample time and resources to target victims (West et al., 2014).

Legal scholarship, however, has been slow to study the effects of workplace cyberharassment (West et al., 2014). The recent codification of school bullying laws, promulgated by the out-of-classroom reach new media have on student-to-student interactions, is strengthening the workplace anti-bullying movement and societal acceptance of anti-bullying legislation generally (Bloom, 2007). As state legislatures begin to codify school bullying laws, advocacy groups are successfully building support for workplace anti-bullying legislation. Yet while 29 states and two territories have introduced workplace bullying legislation, no proposal has been codified into law (Workplace Bullying Institute, n.d.-a).

Furthermore, workplace harassment research is rejecting the plaintiff-centered narrative that legal protection from workplace bullying necessarily harms the employer's financial interests. This is not a zero-sum relationship. The law and economics literature, heavily influenced by organizational and industrial psychology, is recognizing adverse ramifications bullying has on human and economic capital (Einarsen et al., 2010). Workplace bullying may lead to individual psychological damages, impaired interpersonal relationships, and third-party distress—for which harmed workers may seek recourse in tort action (Martin & LaVan, 2010). Victim demoralization, in turn, leads to environmental toxicity, which diminishes corporate productivity and organizational efficiency (Vega & Comer, 2005). Thus, the psychological effects that workplace bullying has on an employer's financial situation likely outweighs the potential economic ramifications that workplace bullying legislation would put on industry (Yamada, 2010).

The relationship between workplace bullying and the law has become increasingly complicated. Present common law and statutory remedies provide inadequate redress because such online harassment falls outside the bounds of "traditional workplace harassment" (Coletta, 2017, p. 450). Current harassment law has several key limitations (Paul, 2015). First, legal remedies are only available to harassment occurring in certain protected settings, such as a physical workplace or school. Second, the law assumes that the harassment and resulting harm occur in the same protected setting. With the advent of virtual business and digital communications, the bounds of the workplace have become increasingly blurred such that bullied workers have been unable to find legal recourse for harms occurring wholly or partially online (Franks, 2011).

In sum, workplace harassment has lagged behind the proliferation of digital media. Current legal frameworks necessitate that bullying occur in physical settings, such that cyberharassment often precludes bullied victims from obtaining legal redress. This chapter chronicles the legislative and jurisprudential histories of workplace bullying and analyzes new frameworks for applying cyberbullying laws to the digital era. Part I begins with the legislative underpinnings of workplace harassment found in Title VII of the 1964 Civil Rights Act, which forbids employers from making employment decisions based on employees' race, color, religion, sex, or national origin. The authors discuss how Title VII and its legislative progeny gave way to "hostile work environment" claims articulated by the U.S. Supreme Court in *Harris v. Forklift Systems, Inc.* (1993). Part II discusses the leading Supreme Court precedent on workplace harassment law: *Burlington Industries, Inc. v. Ellerth* (1998) and *Faragher v. City of Boca*

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Raton (1998). These two cases jointly created an affirmative defense for employers who show (1) an exercise of reasonable care to prevent and correct harassing behavior and (2) a plaintiff unreasonably failed to take advantage of preventative opportunities provided by the employer. The Court narrowed the definition of "supervisor" later, in *Vance v. Ball State Univ.* (2013), limiting the types of workers who could transfer liability to their employers. Importantly, the rise of social media has obfuscated the *Faragher/Ellerth* defense because an employee's work environment no longer fits the purely physical definition on which this line of jurisprudence was constructed.

Part III discusses prevailing solutions and raises questions not yet addressed in the legal literature: Is the "patchwork of statutory and common law measures governing discrimination" (Yamada, 2013, p. 400) a sustainable way to deal with workplace bullies? Should employers be vicariously liable for harassment by supervisors, even if the harassment occurs online and offsite (Gelms, 2012)? Should website operators and Internet service providers be held liable for creating hostile online environments (Norby-Jahner, 2009)? Could corporations use school district liability for cyberbullying as a template for managing online harassment (Coletta, 2017)?

PART I: REGULATORY FAILURES

Problem Identification

Workplace bullying has recently come to the forefront of American social consciousness. Excellent interdisciplinary research in psychophysiology (Djurkovic et al., 2003), organizational psychology (Zapf & Einarsen, 2001), and occupational health and safety (Law et al., 2011; Vie et al., 2011) highlight the ramifications of unredressed mobbing. Reduced productivity, increased attrition, high rates of absenteeism, poor customer relationships, and increased medical costs due to work-related stress make bullying a concern not just for victimized employees but also for their fiscally minded employers (Bassman, 1992; Yamada, 2000). The American Psychological Association estimates that U.S. companies lose $300 billion per year on account of the foregoing issues—bullying alone costs employers $19 billion in lost employment and $3 billion in decreased productivity (Daniel & Metcalf, 2016). Amplifying these social and economic implications is workplace bullying's pervasive nature. According to a 2014 survey commissioned by the Workplace Bullying Institute and conducted by Zogby Analytics, 37 million U.S. workers report being subjected to "abusive conduct" (Namie, 2014). That is to say, 27% of Americans have suffered abusive conduct at work, and 21% have witnessed it directly. Of that group, 7% are experiencing abusive conduct in their current jobs. The majority of bullies are men (69%), and the majority of victims are women (60%). Women bullies disparately target other females (68% of cases), making incidences of woman-on-woman bullying disproportionately high. And based on positive correlative evidence between workplace bullying and manifestations of physical health symptoms (Djurkovic et al., 2003), mobbing remains a critical issue. Yet despite well-established primary health effects and secondary economic costs, no state has passed legislation directly related to workplace bullying (Workplace Bullying Institute, n.d.-a). Lacking a clear, legislative route to redress, bullying victims are forced to seek recourse under traditional theories of tort recovery. Tort law, however, is ill-equipped to address mobbing. And, as demonstrated with a sample of cases below, bullying-type behavior, despite serious physical, psychological, and economic implications, does not usually rise to the level of extreme and outrageous conduct that plaintiffs must establish to prove their case (Yamada, 2004).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Intentional Infliction of Emotional Distress

In the absence of topical legislation, victimized employees most commonly seek redress under one of the following theories of recovery: *intentional infliction of emotional distress* (IIED) and *intentional interference in the employment relationship* (IIER) (Yamada, 2004). Courts, however, dismiss the vast majority of these claims because plaintiffs are unable to proffer sufficient evidence to satisfy their evidentiary burdens. IIED requires plaintiffs to prove, by a preponderance of the evidence, that an actor engaged in *extreme and outrageous* conduct, by which the actor *intentionally* or *recklessly* caused a victim to suffer *severe emotional distress* (Restatement (Second) of Torts § 46 (1965)).

Definitionally, workplace bullying falls outside the scope of IIED for three reasons. First, and most apparently, bullying does not usually rise to the level of extreme and outrageous conduct required to meet IIED's first prong (Burga de las Casas, 2018). The American Restatement of Torts (Second), the topic's seminal legal treatise published by the American Law Institute, notes that conduct becomes extreme and outrageous if it goes beyond the bounds of human decency or if a civilized society would regard it as atrocious and utterly intolerable. Common insults, indignities, annoyances, petty oppressions, and rude and insolent conduct do not constitute extreme and outrageous conduct for purposes of establishing IIED: "[P]laintiffs must necessarily be expected and required to be hardened to a certain amount of rough language, and to occasional acts that are definitely inconsiderate and unkind. There is no occasion for the law to intervene in every case where some one's feelings are hurt" (Restatement (Second) of Torts § 46 cmt. d.).

Second, bullied plaintiffs are unable to establish severe emotional distress. Emotional distress rises to a sufficient level of severity when a reasonable person of ordinary firmness could be expected to endure under the circumstances. Thus, if an employee similarly situated to a victim of workplace bullying is expected to endure the distress, the victim is precluded from recovery. There is, however, a deep-seated legal expectation that bullied employees tolerate less-than-savory conduct from their coworkers. In the paradigmatic example *Harris v. Jones* (1977), a staple of every first-year law student's torts casebook, plaintiff William Harris sued his supervisor and their company, General Motors, in Maryland for harassment due to the supervisor's relentless badgering and mocking Harris regarding his lifelong stutter. Harris suffered throughout his life with this speech impediment, and he had been treated for a nervous condition for six years prior to the start of the harassing behavior. A trial court originally found in favor of Harris, calling the actions of the supervisor "malicious" and "cruel," but the verdict was overturned on appeal, and the appeal was upheld by the state's high court. The court said that for Harris to recover under the emotional distress tort, he must prove four elements consistent with the Restatement's requirements: "(1) The conduct must be intentional or reckless; (2) The conduct must be extreme and outrageous; (3) There must be a causal connection between the wrongful conduct and the emotional distress; (4) The emotional distress must be severe" (*Harris v. Jones*, 1977, p. 565).

According to the court, Harris had not proven the fourth element of the IIED test: that the emotional distress was sufficiently severe. As the Court of Appeals (despite its name, the highest court in Maryland) put it, "That element of the tort requires the plaintiff to show that he suffered a *severely* disabling emotional response to the defendant's conduct" (*Harris v. Jones*, 1977, p. 570). Mere humiliation and insults would not suffice, even if, as the court said, the harassment was cruel and insensitive. Most jurisdictions seem to require some objective indication that a plaintiff's stress was truly severe: e.g., socioemotional problems, insomnia, loss of appetite, or episodes of crying (see *Santino v. Columbus Pub. Sch.* (2011) for an example, in which the court listed "traumatically induced neurosis, psychosis, chronic depression, and

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

phobia" (pp. 801-802) as potentially severe enough). And this high evidentiary burden comes on top of a current jurisprudential movement away from imposing IIED liability (Segrist, 2011; Zipursky, 2010).

Third, disagreements in the social science literature on whether to consider a bully's hostile intent, and the victim's perception thereof, when defining workplace bullying (Hoel & Cooper, 1999) complicate a plaintiff's ability to bring a successful action in IIED. At common law, a plaintiff may bring an IIED suit for harm arising from an actor's intent or recklessness. The Restatement defines recklessness as disregard of a high degree of probability that emotional distress will follow some course of conduct (Restatement (Second) of Torts § 46 cmt. i.). Whereas American sociolegal scholarship considers intent to be a definitional feature of workplace bullying (Saunders et al., 2007), European scholarship does not—positing that a requisite showing of malice makes workplace bullying difficult to classify and empowers perpetrators with undue veto power over whether their actions should constitute bullying (Einarsen et al., 2010). The American Psychological Association defines bullying as the *intentional* and repeated aggressive behavior that causes another person injury or discomfort (American Psychological Association, n.d.). The Workplace Bullying Institute, in contrast, defines bullying as the repeated, health-harming mistreatment of one or more persons, using at least one of the following methods of abusive conduct: threatening, humiliating, or intimidating behavior; work interference/sabotage; or verbal abuse (Workplace Bullying Institute, n.d.-b).

With a lack of scholarly consensus over whether bullying should require intent, bullied plaintiffs are unable to base their IIED assertions in grounded scientific methodology. American courts, certainly, are not beholden to the social science community when passing judgment. Even if experts consolidate their viewpoints into a singular mobbing matrix, judges are not required to adhere to scientific best practices. The issue of disparate scholarly understandings regarding the definitional aspects of workplace bullying results in patchworks of legal responses and unpredictable applications of law. Social science ambiguity, to an extent, causes courts to undermine mobbing's seriousness and complexity. Because the concept has not fulsomely solidified out of scholarly suspension, courts have downplayed the gravitas of harm suffered.

For example, courts do not typically permit plaintiffs to bring expert witnesses on bullying or their expertise into harassment trials to help juries understand the definitions and extent of the victim's experience. In one case (*Kearney v. Orthopaedic & Fracture Clinic, P.A.*, 2015), a Minnesota appeals court left intact a district court's decision not to allow Dr. Gary Namie (a researcher and anti-bullying advocate discussed below as one of the proponents of the Healthy Workplace Bill) to testify as an expert on bullying on behalf of the plaintiff. The trial judge's rationale: "workplace bullying 'is not a new or novel concept' and it is 'not beyond the understanding of a trier of fact'" (*Kearney v. Orthopaedic & Fracture Clinic, P.A.*, 2015, p. 10). Unlike rape or battered-woman syndrome, the details of which would not, said the judge, be experienced or understood by an average person, bullying is far more common, and an expert witness would not be necessary to help the jury understand it.

In an earlier Indiana case (*Raess v. Doescher*, 2008), the defendant objected to Dr. Namie's testimony labeling him a workplace bully. He claimed that the "bully" label was both "junk science" and prejudicial to the jury; and moreover, Dr. Namie did not have the requisite qualifications to be considered an expert. The state trial judge ordered the jury that the issue of "workplace bullying" was not the issue on which it should focus but allowed Dr. Namie's testimony. While the judge did not exclude the testimony, and the appellate court upheld that decision (largely on procedural grounds, saying that the issue had not been preserved for appeal), the decision was not unanimous. One appellate judge thought that the defendant was correct: Dr. Namie's testimony lacked definition of the term "bullying" and sufficient context to

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the case at hand, so as a result "the 'workplace bullying' label is nothing more than highly prejudicial name-calling of no help to the jury" (*Raess v. Doescher*, 2008, p. 801). Cases like these demonstrate the difficulty of introducing expert testimony into trials where the common wisdom is "everyone knows about bullying."

Until the academic community can coalesce around a clear definition, judges will continue to prevent expert witness testimony and plaintiffs will continue to have difficulty establishing IIED's constituent elements. From a jurisprudential perspective, including intent within workplace bullying's definitional parameters would benefit injured plaintiffs twofold. First, an intent-based characterization would conform to IIED's scienter requirement and ease plaintiffs' evidentiary burdens. Second, a unified social science approach would give credence to mobbing's psychosocial ramifications, bolstering a jury's need to hear from expert witnesses. Taxonomical or methodological ambiguity generally precludes expert witness testimony because the trial judge reasons a lack of community acceptance or scientific validity—both of which are within her gatekeeping powers (*Daubert v. Merrell Dow Pharmaceuticals, Inc*., 1993). Thus, making intent a requisite feature of workplace bullying will assist injured workers in their abilities to call witnesses and win damages.

In sum, IIED has been an unsuccessful avenue to pursue workplace bullying. As a matter of policy, American tort law presumes that plaintiffs should be able to withstand harsh verbal criticism. While there has been theoretical indication suggesting that common law is on the cusp of incorporating workplace bullying into the IIED framework (Morris, 2016; Wood, 2014), courts are unwilling to blur the line separating severe, emotionally disturbing conduct from harsh verbal aggression. Without some additional factor such as bullying on the basis of race or ethnicity, or deliberately targeting or exploiting a person's vulnerability or sensitivity, plaintiffs are left without recourse. And while some of the aforementioned definitional nuances and psychological aspects of intent exceed the scope of this chapter, it is important to understand the geographical and cultural distinctions because they directly affect the legal landscape and help explain why American courts and legislatures have lagged behind their European counterparts with respect to workplace bullying initiatives (Öke & Yücetürk, 2005; Yamada, 2004).

Intentional Interference in the Employment Relationship

IIER is another possible, yet unlikely, mechanism of tort remediation for harms suffered resulting from workplace bullying (Calvin, 2012). Under IIER, a defendant-supervisor who improperly interferes with a plaintiff-employee's contractual relation is entitled to recover from the pecuniary harm resulting from loss of the benefits of the relation if the employee can prove (1) the existence of a business relationship, (2) the defendant knew of the relationship, (3) the defendant intentionally and maliciously interfered with the relationship, and (4) the defendant's conduct directly caused the plaintiff's damages (5 A.L.R.4th 9).

To mount a successful workplace bullying claim under IIER, a plaintiff must show that her supervisor's abusive conduct was so far outside the scope of his employment relationship, with both the plaintiff and the employer, that the supervisor should be considered a third party as a matter of law (Glynn et al., 2015). Courts, however, are split on whether current employees qualify as "third parties" necessary to invoke this doctrine (Yamada, 2005). And some courts expressly prohibit workplace bullying recovery under IIER under the theory that supervisor-bullies cannot interfere with an employment relationship that they are necessarily part of. Because of its limited application and strict party-based requirements, IIER, like IIED, provides an insufficient legal basis for recovery from workplace bullying.

The Occupational Safety and Health Act

Tort law's failure to adequately address workplace bullying has led some victims to seek redress under two main statutory frameworks: the Occupational Safety and Health Act and Title VII of the Civil Rights Act of 1964. Following the 1970 codification of the Occupational Safety and Health (OSH) Act, Congress created the Occupational Safety and Health Administration (OSHA) with the purpose of providing "every working man and woman in the Nation safe and healthful working conditions and to preserve our human resources" (Occupational Safety and Health Act, 29 U.S.C. § 65 1(b) (1970)).

The law places the onus on employers to mitigate "recognized hazards that are causing or are likely to cause *death or serious physical harm* to employees" (29 U.S.C. §654(a)(1) (emphasis added)). Based on the statute's plain language and underlying policy, it is not suited to address workplace bullying for the following reasons. Substantively, the OSH Act was intended to mitigate grievous workplace injuries stemming from manual labor (Glynn et al., 2015). OSHA has been largely successful in that respect; over the past 40 years, workplace deaths have dropped by nearly 30% (Occupational Safety and Health Administration, n.d.). Yet the bill's sponsors did not intend for the legislation to cover verbal abuse, work interference, or other threatening interpersonal behavior associated with mobbing. Procedurally, the requirement of "serious physical harm" almost always precludes bullied workers from OSHA-based recovery. Even if bullying rises, or should rise, to a level that satisfies OSHA's high evidentiary burden (Harthill, 2011), under-staffed and underfunded OSHA officers would be hesitant to add a new bullying-dimension to their enforcement mechanisms (Yamada, 2013). Furthermore, bullied employees depend on OSHA attorneys to bring suit because the OSH Act does not grant private rights of action (Yamada, 2000). An economically frugal government agency is unlikely to risk the financial and human resources pursuing a legal claim outside the definitional parameters of the act on which the agency is based. Finally, the law neither incentivizes employers to protect employees nor penalizes them from failing to do so (Calvin, 2012). The lack of carrots, sticks, and government resources make OSHA an unlikely avenue to pursue workplace bullying.

Title VII of the Civil Rights Act of 1964

The second main statutory framework under which bullied workers typically seek redress is Title VII of the Civil Rights Act of 1964. Title VII is the legal foundation upon which modern American workplace protection is built. Unlike European countries' statutory emphasis on workplace dignity, which seeks to right sociohistorical inequities rooted in medieval feudalism (Friedman & Whitman, 2003), America's legalistic approach stems from institutionalized racism founded in chattel slavery (Morris, 2016).

Precipitated by the 1960s civil rights movement, and the newfound lens through which American society began to perceive segregation and systemic racism, the Civil Rights Act served as omnibus legislation designed to mitigate discrimination in voting, education, public accommodation, and employment (U.S. Equal Employment Opportunity Commission, n.d.-b). Title VII, specifically, makes it illegal for employers to "discriminate against any individual with respect to his compensation, terms, conditions, or privileges of employment, because of such individual's race, color, religion, sex, or national origin" (42 U.S.C. §2000e-2(a)(1)&(2)). In an era of conspicuous inequality and ethnic bigotry, Title VII served to address invidious discrimination based on membership to a protected group or class (Yamada, 2010). Over time, Title VII has been successfully applied to less-conspicuous forms of discrimination including behaviors related to interpersonal conflicts, workplace abuse, disability, and stress (Stefan, 1998). Col-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

lectively, courts label this type of nonnormative workplace behavior as "harassment." As discussed below, harassment reaches the requisite level of illegality when it becomes a condition of continued employment, or the conduct is so severe or persuasive as to create a work environment that a reasonable person would consider intimidating, hostile, or abusive (U.S. Equal Employment Opportunity Commission, n.d.-a).

Workplace harassment has two categorical requirements to become actionable under Title VII. First, the abusive conduct itself must meet an objective threshold clarified by case law. Petty slights, annoyances, and isolated incidences of bullying do not typically meet this benchmark. Second, the harassment must be founded on membership in some protected class. Despite Title VII's categorical expansion to include prejudice based on pregnancy (Donohue & Siegelman, 1991) and disability (Schwab & Willborn, 2002), harassment only becomes actionable when grounded in a victim's protected group membership (Yamada, 2010). Absent a clear nexus between the hostile act and one or more of the immutable characteristics statutorily or judicially defined, harassment cannot be relieved through Title VII or any state statutory equivalent (Harthill, 2008).

Yet Title VII has become the principal legal instrument through which workers seek bullying-related redress. This is because, as previously noted, the majority of bullied workers are women (60%), the majority of workplace bullies are men (69%), and male perpetrators prefer targeting women (57%) more than targeting other men (43%) (Namie, 2014). While bullying and sexual harassment are not synonymous, these gendered statistics allow plaintiffs to make out colorable arguments that the bullying they suffered is on account of their sex. And while bullying may not be an independent and cognizable action under Title VII, the bullying, if sufficiently severe or pervasive, may become grounds for recovery under a Title VII "hostile work environment" claim (*Ramseur v. Perez*, 2013).

Title VII and its Progeny

As shown above, a female-bullied majority, combined with deficient tort and legislative remedies, has precipitated legal action under Title VII, despite precluding from recovery victims who do not belong to a protected class (Flores, 2019). The chief effort to correct these shortcomings is the proposed Healthy Workplace Bill (HWB), promulgated by Professor David C. Yamada and Dr. Gary Namie of the Healthy Workplace Campaign. Yet the proposed bill is founded on principles drawn from Title VII and its progeny (Yamada, 2010). Thus, it is necessary to walk through key Title VII cases pertaining to gender-based harassment in order to understand the current and future legal landscape of workplace bullying.

Hostile Work Environments: Litigation

In *Williams v. Saxbe* (1976), the U.S. District Court for the District of Columbia became the first federal court to grant a right of action for sexual harassment by recognizing prurient quid pro quos as a form of workplace discrimination under Title VII (Coletta, 2017; Gelms, 2012). Diane Williams, a public information specialist employed at the U.S. Justice Department, refused a supervisor's sexual advance. After being rejected, the supervisor began a pattern of mistreatment including unwarranted public reprimands, refusal to consider Williams' work-related proposals and recommendations, refusal to recognize Williams as a competent professional, and refusal to give Williams adequate notice of her work obligations. Williams' Employment was terminated in September 1972. The court found in Williams' favor, holding that a male supervisor's retaliatory actions, taken because a female employee declined his sexual advances, constitutes sex discrimination within the definitional parameters of Title VII. The

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

court reasoned that the supervisor's behavior created an "artificial barrier" to employment for female employees and granted William's motion for judgment.

In *Meritor Savings Bank v. Vinson* (1986), the U.S. Supreme Court held in a 9-0 decision that sexual harassment resulting from hostile work environments is violative of Title VII. In 1974, Michelle Vinson began working as a teller-trainee at a branch office of Meritor Savings Bank. Over a four-year course of employment, Vinson received several promotions and became assistant branch manager. The fact that Vinson's promotions were based solely on merit was undisputed. During the course of her employment, Vinson's immediate supervisor, Sidney Talor, a Meritor vice president, made a series of sexual advances. Vinson initially refused but eventually yielded out of fear of losing her job. She alleged that Talor fondled her in front of other employees, exposed himself to her at work, and forced her to have sex 40 or 50 times during and after business hours. Vinson neither reported the harassment to Talor's superiors nor filed an official complaint with the bank. In denying her allegations, Talor argues that Vinson's accusations originated from a business dispute. The federal district court judge ruled for the defendants, holding that if Vinson and Talor did have a sexual relationship, it was voluntary, had nothing to do with her continued employment at the bank, and that therefore Vinson was not the victim of sexual harassment. The U.S. Court of Appeals for the District of Columbia reversed in favor of Vinson, holding that the district judge applied the wrong legal standard and should have precluded the "voluminous testimony regarding Vinson's dress and personal fantasies," which the employer offered as a defense (*Meritor Savings Bank v. Vinson*, 1986, p. 63). The appellate court also identified two distinct categories of sexual harassment actionable under Title VII: harassment directly linked to the grant or denial of economic benefits (*quid pro quo*) and harassment that, while not affecting economic benefits, creates a hostile or offensive working environment (non *quid pro quo*).

The U.S. Supreme Court, speaking through Justice William H. Rehnquist, affirmed the intermediate appellate court's holding that sexual harassment allegations under Title VII may include hostile work environment claims and are not limited to tangible loss of an economic character. "[C]ourts have uniformly held, and we agree, that a plaintiff may establish a violation of Title VII by proving that discrimination based on sex has created a hostile or abusive work environment" (*Meritor Savings Bank v. Vinson*, 1986, p. 66). The Supreme Court prescribed the correct legal inquiry for determining sexual harassment: whether sexual advances by a superior are unwelcome by the employee, not whether the employee's participation in the sexual activities is voluntary. Furthermore, the sexual harassment must be sufficiently severe or pervasive to alter conditions of the victim's employment and create an abusive working environment.

In *Harris v. Forklift Systems, Inc*. (1993), the U.S. Supreme Court established a standard for the type of severe or pervasive harassment that a plaintiff needs to show in order to recover under a hostile work environment claim under Title VII. Teresa Harris worked as a rental equipment manager at Forklift Systems, Inc. for over two years. During her tenure with Forklift, Harris was routinely subjected to gender-driven verbal insults and sexual innuendo by company president Charles Hardy. Harris quit and filed suit on the basis that Hardy's behavior created a hostile and abusive work environment in violation of Title VII.

The Supreme Court affirmed its holding in *Meritor* that hostile work environment claims are actionable under a Title VII theory of sexual harassment/discrimination. Reaffirming the "severe or pervasive" standard set forth in *Meritor,* the court clarified that sexual harassment must meet objective and subjective elements. A plaintiff must show that (1) she personally perceived the work environment to be hostile and that (2) a reasonable person in the same position would perceive the environment to be hostile. Looking at a supervisor's behavior under the totality of the circumstances, a plaintiff establishes these standards

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

through a requisite showing of frequent and severe abusive conduct that is physically threatening or humiliating and that unreasonably interferes with the employee's work performance.

Importantly, the justices held that a plaintiff need not show psychological harm to establish a hostile work environment. She must only show that a reasonable person in the plaintiff's position would find the harassing behavior sufficiently offensive. It is into this legal environment that the Supreme Court introduced in 1998 a defense for employers seeking to avoid liability for supervisors' alleged harassment of their employees.

PART II: EMPLOYER LIABILITY: THE FARAGHER/ELLERTH STANDARD

In two landmark companion cases (*Burlington Industries, Inc. v. Ellerth*, 1998; *Faragher v. City of Boca Raton*, 1998), the Supreme Court held that employers are vicariously liable to victimized employees for actionable hostile work environments created by a supervisor with higher authority over the employee. In its holding, the Court outlined a two-pronged affirmative defense for employers where no tangible employment action had been taken.

In *Faragher*, Beth Ann Faragher, a former lifeguard for the city of Boca Raton, Fla., filed suit under Title VII against the city, claiming that her supervisors created a sexually hostile work environment through their repeated unwelcome touching and comments about her body. She accused several of her immediate supervisors of a five-year pattern of unwanted touches on her body, including her buttocks, lewd sexual gestures and pantomimes, and vulgar remarks about the desirability of female lifeguards and beachgoers. While she had not complained to upper management directly about these actions, she had discussed them informally with another immediate supervisor.

The district court found for Faragher, both in the creation of a hostile work environment and in the city's liability. On appeal, the *en banc* (the court's full panel of judges instead of a regular panel of three) sitting of the Eleventh Circuit upheld a three-judge panel's finding against her. Using the three-part *Meritor Savings Bank* test, the court found that although there was indeed a hostile work environment, the city did not have vicarious liability for it because the offending supervisors were not acting in the scope of their employment and the city did not have constructive knowledge of the environment. Because Faragher was not threatened with firing or demotion, the court said that the actions of her supervisors were not facilitated by their employment with the city. Moreover, the knowledge of one supervisor of the actions of others did not, the court said, impute knowledge to the city—and thus, the city could not be liable for failing to stop it.

The Supreme Court, however, reversed the Eleventh Circuit and found for Faragher. In a 7-2 decision by Justice David Souter, the Court said that employers can be held vicariously liable for the actions of their employees under Title VII. Establishing one element of the *Faragher/Ellerth* defense, Souter wrote, "We hold that an employer is vicariously liable for actionable discrimination caused by a supervisor, but subject to an affirmative defense looking to the reasonableness of the employer's conduct as well as that of a plaintiff victim" (*Faragher v. City of Boca Raton*, 1998, p. 780). The actions of the city, Souter said, were not reasonable to prevent a hostile work environment: Not only had the city not disseminated its policy against sexual harassment to its employees, it had not tried to keep track of the behavior of Faragher's supervisors. As a matter of law, Souter added, the city did not exercise reasonable care to prevent the harassment.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the accompanying case, Kimberly Ellerth quit her sales job at Burlington Industries after 15 months, alleging that her immediate supervisor engaged in sexual harassment. She refused his advances and reported that she feared doing so would result in tangible adverse consequences, such as lack of promotion. However, none of these materialized—in fact, Ellerth was even promoted. Nor did she report the harassing behavior to her supervisors. She also brought suit under Title VII. A district court granted summary judgment to Burlington, but the *en banc* Seventh Circuit Court of Appeals reversed the decision in a series of fractured decisions and rationales.

In upholding the Seventh Circuit, Justice Anthony Kennedy, also writing for a 7-2 majority, noted that the Seventh Circuit's reliance on so-called *quid pro quo* assertions (i.e., suggestions that sexual favors will result in tangible work benefits) was incorrect. Rather, he said, "a tangible employment action taken by the supervisor becomes for Title VII purposes the act of the employer" (*Burlington Industries, Inc. v. Ellerth*, 1998, p. 762). However, he added, employers can raise a defense against such allegations if reasonable care is exercised to prevent and correct harassing behavior and if the employee does not take advantage of these preventions to avoid harm.

In sum, employers do have vicarious liability for the harassing actions of their supervisors under Title VII. But they may raise an affirmative *Faragher/Ellerth* defense, which is a two-pronged test, as Justice Souter put it in *Faragher*: "(a) that the employer exercised reasonable care to prevent and correct promptly any sexually harassing behavior, and (b) that the plaintiff employee unreasonably failed to take advantage of any preventive or corrective opportunities provided by the employer or to avoid harm otherwise" (*Faragher v. City of Boca Raton*, 1998, p. 807). An employer cannot, however, raise this defense if there is evidence of the harassment resulting in a negative tangible employment action, such as firing, demotion, or reassignment to a less desirable position.

It is worth noting that in both cases, Justices Clarence Thomas and Antonin Scalia dissented. Thomas, writing both times for himself and Scalia, said that the defense treated workplace sexual misconduct differently from racial misconduct, and he would treat both actions the same. Thomas' rule would be simpler: "An employer should be liable if, and only if, the plaintiff proves that the employer was negligent in permitting the supervisor's conduct to occur" (*Burlington Industries, Inc. v. Ellerth*, 1998, p. 767). In addition, the dissenters complained that the majority did not sufficiently explain how employers could avoid vicarious liability nor exercise the defense, predicting that lower courts would be deluged by sexual harassment cases and that "employer liability very well may be the rule" (p. 773).

The legal community shared some of the dissenters' concerns in the wake of the *Ellerth* and *Faragher* decisions. For example, Franklin (1998) asserted, like Justice Thomas, harassment claims should be uniform and treated similarly to other employer misconduct claims; she also feared that employers would be able to escape liability only by acting with undue (and unreasonable) haste after finding out about alleged harassment. DiLorenzo and Harshbarger (1999) expressed concern that the focus of harassment claims would shift to the presence or absence of a tangible employment action rather than the severity of the alleged harassment, calling this new analysis neither "logical or practical" (p. 15).

In the decades since it was announced, the *Faragher/Ellerth* defense has been used in thousands of cases; in the first year and a half alone, 72 cases resulted in judicial opinions (Sherwyn et al., 2000). In this early analysis, Sherwyn and his colleagues found that employers acting reasonably and responsibly in regard to sexual harassment claims were likely to receive the benefit of the doubt from courts; indeed, in their study, employers won most of the time. In addition, and perversely, they note, employers who exercise less care may fare better in the courts than those who exercise more. Their results prompted their sobering claim that "courts are prepared to conclude that a good policy constitutes 'reasonable

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

care,' and that employers can prevail regardless of whether plaintiffs reported harassment" (2000, p. 1289). A recent study echoed these results: "Most courts do not consider the circumstances surrounding instances of workplace sexual harassment when assessing whether an employee acted reasonably" (Venuti, 2019, p. 560).

The Supreme Court refined its *Faragher/Ellerth* standard in the context of a hostile racial environment in *Vance v. Ball State Univ.* (2013). At issue here was the question, left open in *Faragher/Ellerth*, of who counted as a "supervisor" for purposes of a Title VII harassment claim. The plaintiff, Maetta Vance, was the only worker of color in the Ball State University Dining Services. She complained about racial epithets directed at her and students of color by a white female co-worker, and that co-worker received a written warning against the behavior. However, following a series of additional racially charged incidents, Vance brought suit against Ball State in federal district court, arguing that her work duties and overtime had been reduced, she was forced to work through breaks, and she suffered unjust disciplinary actions. She claimed that the white colleague was in fact her supervisor, and as a result, Ball State was vicariously liable for the hostile racial workplace environment. A university investigation failed to result in any relief.

The district court found for Ball State, saying that because Vance's white co-worker did not have power to fire, discipline or demote Vance, that colleague was not considered a supervisor. The Seventh Circuit Court of Appeals agreed. Rather than using the U.S. Equal Employment Opportunity Commission's (EEOC) broader definition of "supervisor," the court said that to be considered a supervisor, a person must have the power to fire, demote, reassign, or discipline a worker (that is, engage in tangible employment actions). It was agreed that Vance's coworker did not have these powers; thus, she was not Vance's supervisor.

Vance appealed to the Supreme Court. A 5-4 majority sided with Ball State, affirming the Seventh Circuit's definition of "supervisor." Justice Samuel Alito, writing for the majority, wrote that employers could suffer vicarious liability for employee conduct "only when the employer has empowered that employee to take tangible employment actions against the victim, i.e., to effect a 'significant change in employment status, such as hiring, firing, failing to promote, reassignment with significantly different responsibilities, or a decision causing a significant change in benefits'" (*Vance v. Ball State Univ.*, 2013, p. 431). Explicitly rejecting the EEOC's broader definition (which he called "a study in ambiguity"), Alito said that the word "supervisor" did not appear in Title VII but was introduced in the *Faragher/Ellerth* cases "as a label for the class of employees whose misconduct may give rise to vicarious employer liability" (p. 436). Thus, he said, it should be understood in the context of those cases, in which the alleged harassment was done by individuals with the capability to engage in tangible employment actions against the victims.

The dissenters, led by Justice Ruth Bader Ginsburg, lamented the narrowing of the definition of "supervisor," suggesting that this move would limit the ability of some victims of harassment to seek relief. Ginsburg outlined four cases in which the alleged harassers would not meet the Court's narrowed definition and thus prevent vicarious liability. She further called on Congress for assistance: "The ball is once again in Congress' court to correct the error into which this Court has fallen, and to restore the robust protections against workplace harassment the Court weakens today" (pp. 470–471).

As with the original *Faragher/Ellerth* defense, the *Vance* case was not widely applauded by legal scholars. Davenport (2014) called the outcome "ill-fitting" and suggested a new category of employees, called "superiors," to more accurately reflect workplace realities (p. 1454). Grossman (2013), a law professor, accused the *Vance* majority of preferring rules that can be easily applied to those that rely on

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

individual case facts and preferring employers over employee "victims." Perhaps most damning, in a study of Congressional actions over four decades to override judicial interpretations in which five traits of a decision were determined to make it more likely to be overwritten by statutory amendment, the *Vance* majority decision was found to be "furiously waving all five red flags (including an override-inviting dissent)" and "ought to be a prime candidate for an override" (Christiansen & Eskridge, 2014, p. 1413).

Some jurisdictions have expanded victims' rights under the *Faragher/Ellerth* defense or even abandoned it for more robust protections under state or local laws or the unique characteristics of gender-based harassment. For example, in New York, the New York City Human Rights Law ("NYCHRL") has been interpreted as giving more protection to employees than its state or federal analogs. A recent example that demonstrates this breadth is the New York City case *Zakrzewska v. The New School* (2010). Dominika Zakrzewska sued a co-worker and her former employer, The New School, alleging sexual harassment in violation of the NYCHRL, part of the New York City Administrative Code; she did not sue under Title VII. A district court found that there was a genuine question of whether the NYCHRL would permit The New School to raise a *Faragher/Ellerth* defense against Zakrzewska's allegations, which included retaliation claims. The district judge then certified the question (asked a higher court to clarify the law) to the Second Circuit Court of Appeals, which then certified the question to the New York Court of Appeals (again, the highest court in the state despite the name) for a response.

The New York Court of Appeals answered in the negative. The elements of the NYCHRL assign liability for discrimination under three circumstances: where the employee engages in managerial or supervisory responsibilities; or where the employer knew of the discrimination and either acquiesced in it or did not take steps to stop it; or finally, where the employer should have known about the discrimination and failed to act reasonably to stop it. This plain language of the statute, said the state high court, as well as its legislative history, imposes strict liability on employers for harassment and retaliation claims by supervisors. This does not square with the *Faragher/Ellerth* defense, which offers defenses only based on an employer acting with reasonable care (*Zakrzewska v. New Sch.*, 2010). According to scholars reviewing New York labor law, this case will have far-reaching implications for harassment cases in New York (Langan & Ritts, 2011).

In another example of expanded victim protection, the Third Circuit in *Minarsky v. Susquehanna Cty.* (2018) interpreted the timeliness element of *Faragher/Ellerth* more broadly, allowing employees increased flexibility when determining when to report incidents of harassment. Sheri Minarsky suffered unwanted sexual advances by her supervisor for many years before she finally reported the behavior after several other women had already done so. She said she feared reporting his behavior because of her suspicion that her complaint would not be acted on sufficiently and that he would become "nasty" in any confrontation (*Minarsky v. Susquehanna Cty.*, 2018, p. 314). Moreover, she depended on her part-time employment for her daughter's medical bills, and her supervisor knew this.

After Minarsky's and others' complaints, the supervisor was fired. The question then became whether the employer, Susquehanna County (Penn.), should be contributorily liable for the supervisor's actions. The county raised the *Faragher/Ellerth* defense, saying that Minarsky's delay of years in reporting the claim should mitigate in its favor. However, the Third Circuit, cognizant of the difference in circumstances among sexual harassment cases, said that it should be up to a jury to determine whether the delay in Minarsky's case was reasonable. "If a plaintiff's genuinely held, subjective belief of potential retaliation from reporting her harassment appears to be well-founded, and a jury could find that this belief is objectively reasonable, the trial court should not find that the defendant has proven the second *Faragher-Ellerth* element as a matter of law," the court said (*Minarsky v. Susquehanna Cty.*, 2018, p. 314). In this

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

case, the court added, there were sufficient reasons for a jury to determine whether Minarsky's fears of retaliation by the offending supervisor were reasonable enough to justify the delay in reporting his behavior. Although this approach to the *Faragher/Ellerth* defense differs from nearly every other circuit, at least one legal analyst believes that the flexibility offered to victim-plaintiffs in reporting based on the disparate circumstances of each situation is not only fairer to them but also appropriately reflects the defense's underlying policy rationales (Venuti, 2019).

These two cases, *Zakrzewska* in New York and *Minarsky* in the Third Circuit, are examples of ways in which the *Faragher/Ellerth* defense can be modified to better fit the needs of employees or discarded altogether to allow for stronger protections by states and localities. In a somewhat sardonic piece in the *Washington Post*, Somin (2019) points out that this perspective is the reverse of the American tradition, in which those concerned with minorities relied on the federal government's protections rather than those proffered by the states. Here, as in other arenas like drugs, guns, and carbon emissions, the states and cities can, as he put it, "provide valuable protection for vulnerable minorities."

To summarize, *Faragher* and *Ellerth* jointly established vicarious and strict liability for employers if a supervisor (1) creates a hostile work environment and (2) takes tangible employment action against the employee—such as hiring, firing, or failing to promote. If no tangible employment action occurred (and it should be recalled, *Vance* narrowed the definition of "supervisor" to require that the alleged harasser have these kinds of powers over the victim), the employer may proffer an affirmative defense by showing that it took reasonable care to prevent and correct sexually harassing behavior and the victim unreasonably failed to take advantage of opportunities to prevent, correct, or otherwise avoid the harm. States and local governments can create stronger rights for plaintiffs than Title VII, as has been done in New York City.

However, a plaintiff's recovery under Title VII's judicially created hostile work environment is limited. First, the class-membership requirement excludes otherwise meritorious harassment claims that are not founded on a judicially recognized immutable characteristic: race, color, religion, sex, national origin, etc. Second, among other splits, courts are divided on whether to consider evidence of harassment outside the workplace that occurs on social media (Gelms, 2012). Whereas courts traditionally require plaintiffs to show severe or pervasive conduct under the totality of the circumstances to bring a successful hostile work environment claim under Title VII (*Harris v. Forklift Systems, Inc.*, 1993), the issue of whether to allow plaintiffs to establish their burden through social media evidence of "harassment outside the four walls of the workplace" remains to be settled (Gelms, 2012, p. 262).

PART III: CURRENT SUGGESTED RESPONSE TO WORKPLACE BULLYING

The sociopolitical history of American labor law has historically treated workplace bullying as a subissue of workplace harassment. While plaintiff-workers may pursue tort remedies against individual plaintiffs, defendant-employers only become liable under Title VII, and by extension *Faragher/Ellerth*, if a supervisor creates a hostile work environment and takes tangible employment action against the employee such as firing, demoting, or reassigning. In the absence of tangible employment action, employers may proffer an affirmative defense by showing that (1) they exercised reasonable care to prevent and correct harassing behavior and (2) the victim unreasonably failed to take advantage of any preventive or corrective opportunities. Employers will escape vicarious liability if plaintiffs can show that an alleged harasser does not meet the definition of a "supervisor" outlined in *Vance*—that is, with the capacity

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to perform tangible employment. What is more, the digitization of the workplace obfuscates whether evidence of off-site, online harassment can be used to establish discrimination.

A variety of remedies have been proposed to address the foregoing issues. One solution is to incrementally broaden the interpretive scope of existing statutory frameworks. For example, because bullying has the judicially recognized capacity to violate Title VII under its workplace harassment taxonomy (*Ramseur v. Perez*, 2013), some scholars suggest maintaining the legislative foundation but broadening its application to social media as an extension of an employee's work environment. Gelms (2012) suggests implementing a "substantial benefit" test, where employers will be held vicariously liable for workplace harassment occurring on social media if they derive a substantial benefit from the social media forum where the harassment occurred. Under this proposed analysis, an employer is liable for a supervisor's harassing comments if they are posted to the company's Facebook page but not to the supervisor's private Facebook timeline. Whereas the employer receives economic benefits by maintaining company-sponsored social media, as related to branding or advertising, the employer derives no economic or personal benefit from the supervisor's private account. Yet in an era of social media "influencers" and self-branding, where distinctions between corporate advertising and self-promotion are becoming increasingly blurred (Khamis et al., 2017), this type of legislative expansion may need to be reexamined.

A second suggestion involves adopting a *laissez-faire* policy of common law nonintervention. The common law, by design, is an organically fluid legal corpus that shifts alongside the American *volksgeist*. Tort theory, including IIED and IIER, has a certain amount of breathing space that allows it to accommodate shifting moral attitudes. If there is evidence to suggest that courts and juries are beginning to relax the "extreme and outrageous" requirement of IIED, and bullied workers are being awarded damages, the need for new legislative action becomes moot (Morris, 2016). To retroactively legislate on an issue addressed at common law invites frivolous litigation. To capture an unforeseen issue by expanding preexisting legislation, namely Title VII, dilutes the purposes and importance of the protections afforded under the original legislation.

A third solution suggests enacting narrowly drawn legislation that corrects the specific shortcomings of slow-moving tort theory and the out-of-purpose application of existing statutory law. Professor Yamada's HWB seeks to accomplish the foregoing through the following: First, the bill provides a private cause of action for damages and injunctive relief to bullying victims (Yamada, 2013). Whereas the OSH Act requires OSHA to bring suit on behalf of injured workers, HWB directly empowers victims. In so doing, the bill incentivizes employers to take preventative or remedial measures by increasing the likelihood that injured workers will seek compensation through litigation. OSHA attorneys are unlikely to bring suit because of limited government resources and low probabilities of success: recalling that the law was not drafted to remediate workplace conditions less than deadly or physically grievous. Bullied workers, however, are much more likely to spend resources redressing personal harms, especially with higher probabilities of success due to clearly defined statutory terms and conditions.

Second, HWB clearly defines "abusive work environment" and "abusive conduct," providing workers and employers with sufficient notice of actionable claims. An abusive work environment exists when "an employee or employer, acting with *intent* [emphasis added] to cause pain, injury, or distress to an employee, subjects the employee to abusive conduct that causes physical harm, psychological harm, or both to the employee" (Yamada, 2013, p. 176). By including a scienter requirement, Yamada disposes of whether a bully's subjective intent is necessary to fit the definition of workplace bullying. This, in turn, clarifies ambiguity in the literature. Without experts needing to determine whether intent is a definitional feature of workplace bullying, the aforementioned issues related to expert-witness testimony in IIED

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

actions become moot. Professor Yamada's solution aligns with the authors' recommendation: adopting an intent-based definition of workplace bullying, favored by American social science scholarship, to facilitate plaintiffs' recovery. Absent a scienter requirement, courts would be loath to punish unintended maltreatment that turns on workplace context and worker subjectivity.

Abusive conduct is defined as "acts, omissions, or both, that a reasonable person would find abusive, based on the severity, nature, and frequency of the conduct" (Yamada, 2013, p. 177). Here, Yamada builds on the *Harris* (1993) framework, by incorporating the reasonableness standard defining a hostile work environment under Title VII. HWB, like *Harris*, articulates a two-part test to determine whether a hostile work environment is present: (1) the conduct must create an environment that a reasonable person would find abusive, and (2) the victim must subjectively perceive the environment to be abusive. Incorporating a standard of subjective perception further clarifies the definitional discrepancies of workplace bullying which makes proving IIED difficult. For workplace bullying to be actionable under HWB, the bully must act with intent that is perceived by the victim. And building further on IIED deficiencies, HWB does not have a requisite level of "extreme and outrageous" conduct that a bullied plaintiff must prove to win her case.

Finally, HWB imposes strict liability on employers for unlawful bullying conduct in which their employees engage. Drawing from the Supreme Court's twin decisions in *Faragher* and *Ellerth*, the bill holds employers vicariously liable to bullied employees regardless of whether the employed bully is a supervisor with successively higher authority over the employee (thus eliminating the *Vance* requirement of the harasser's capacity for "tangible employment actions" against the victim). And just like *Faragher* and *Ellerth*, employers may proffer an affirmative defense when (1) the employer exercised reasonable care to prevent and correct actionable behavior, and (2) the employee unreasonably failed to take advantage of appropriate preventive or corrective opportunities provided by the employer.

Despite varying legal approaches to address what social scientists and law scholars agree to be an intensifying problem, workplace bullying remains an academic discussion. Since being introduced in the California state legislature in 2003, HWB has been considered and rejected by some 31 legislatures (Workplace Bullying Institute, n.d.-a). And while the anti-workplace-bullying movement has gained support over its 20-year history, the approval has not yet reached a critical legislative mass. If workplace cyberbullying is to gain the legal attention that "traditional" bullying never could, it must be because of digital media's pervasiveness and tendency to exacerbate psychological harm.

CONCLUSION

The anemic legal response to *face-to-face* workplace bullying preempts, to a certain extent, conversations related specifically to workplace *cyberbullying*. Courts are just beginning to recognize workplace bullying's capacity to create distinct and cognizable injuries: psychological, physical, and economic. Despite there being no independent workplace-bullying cause of action, preexisting legal frameworks are beginning to reflect prevailing social attitudes. Yet because legal acknowledgment of face-to-face workplace bullying is still in its infancy, legal acknowledgement of virtual workplace bullying is necessarily *in utero*. While some scholars have foreshadowed the urgent dangers posed by increased workplace digitization and Internet connectivity, the law, as a reactive instrumentality, is not yet positioned to protect or rehabilitate workers injured by bullying—cyber or physical.

KEY TERMS AND DEFINITIONS

Farragher/Ellerth Standard: An affirmative legal defense for employers who show (1) an exercise of reasonable care to prevent and correct harassing behavior and (2) a plaintiff unreasonably failed to take advantage of preventative opportunities provided by the employer.

Hostile Workplace: A subcategory of workplace discrimination that becomes actionable when a plaintiff (1) personally perceived the work environment to be hostile and that (2) a reasonable person in the same position would perceive the environment to be hostile. Courts look to the totality of the circumstances including the frequency and severity of the abusive conduct.

Intentional Infliction of Emotional Distress: A common law tort allowing a plaintiff to recover from a defendant's intentionally extreme and outrageous conduct that caused the plaintiff to suffer severe emotional distress.

Intentional Interference in the Employment Relationship: A theory of common law tort recovery under which plaintiffs collect pecuniary damages if they can prove (1) the existence of a business relationship, (2) the defendant knew of the relationship, (3) the defendant intentionally and maliciously interfered with the relationship, and (4) the defendant's conduct directly caused the plaintiff's damages.

Occupational Safety and Health Act of 1970: A federal labor law, which promotes safe and healthful working conditions in the U.S. The legislation established the Occupational Safety and Health Administration (OSHA), which determines and enforces workplace safety standards.

Scienter Requirement: A defendant's mental state, which a plaintiff must prove to establish liability and recover.

Title VII of the 1964 Civil Rights Act: A federal labor law, which protects employees from discrimination based on race, color, national origin, sex, and religion. Actionable conduct includes discrimination in hiring, promoting, training, disciplining, assigning work, or discharging employees.

Chapter 102
Pesticides as an Occupational Hazard Facts and Figures

Nazia Tarannum
Chaudhary Charan Singh University, India

Meenakshi Singh
MMV BHU Varanasi, India

Ranjit Hawaldar
Centre for Materials for Electronics Technology, India

ABSTRACT

The chapter gives insight into the harmful use of pesticides in different professional environments. It portrays the use of pesticides as the potential risks to the health of users and third parties and a danger to the environment. The use of pesticides has increased at a phenomenal rate. Pesticides and their threat to the biological world have reached almost hysterical proportions. Their residues are found everywhere, particularly those of the so-called "hard pesticides" or organochlorine compounds, DDT. Herein, an attempt has been made to reflect pesticide exposure in different occupational settings and their harmful effects on humans. Excess use of pesticide in agriculture has placed workers in this industry at risk of lethal exposure. Personnel working in domestic pest control service is also from continuous exposure to the pesticide. Further, the chapter highlights various corrective measures to be taken by the people working in different occupational settings to combat the dangerous effects of pesticides in everyday life.

INTRODUCTION

Fungicide, Federal Insecticide and Rodenticide Act (FIFRA) (US EPA, 1947) define "Pesticides are substances or mixtures intended for preventing, destroying, repelling, any insects, rodents, nematodes, fungi or any other forms of life declared to be pests; designed for use as a plant regulator." Pesticides consist of various categories of toxins. Pesticide-related health effects can be acute or chronic. The duration of exposure, the dose of exposure and the route helps in determination of the severity of health effects. The

intention of use defines pesticide validity as per the FIFRA. For example, bleach is used differently in different places, viz as a (disinfectant) in bathrooms (Figure1), floors or tissue culture room (Figure 2) but it is not considered a pesticide when it is used for whitening of clothes. The United States uses over 1/4th of the world's total pesticide. It is the biggest pesticide hub for 4.5 billion pounds of chemicals per year required for the manufacture of 890 active ingredients, which are packed commercially into 30,000 formulations. 75% of pesticides used in agricultural settings and the rest 25% of structural fumigation, homes, gardens, hospitals, etc. In England, indiscriminate use of pesticides caused a reduction in the number of birds in gardens and farmland. An Indian Press Report (http://www.organicconsumers.org/Toxic/pepsi_coke_pesticides.cfm) confirmed the presence of high level of pesticides and insecticides such as lindane, DDT, malathion, chlorpyrifos in twelve popular soft-drink brands. The Food and Agriculture team of Greenpeace claimed that tea sold by some biggest tea brands in India contained pesticides. The team tested 49 samples, out of which 46-tested positive for one or more pesticide. The statistical data collected from vegetable samples of local vendors from different parts of the city Pune, India were inspected. A few samples revealed the presence of residues of banned pesticides such as DDT, chlordane, captafol, and carbofuran. The demands for imported chemicals by developing countries have extensively increased the value of pesticide purchase by Third World countries (World resources, 1986). Pesticide use in public health care and agriculture has impacted the lives of human. Reports from Central America suggested that large-scale spraying of DDT on cotton developed resistance to the pesticide in Anopheles, a malaria vector (Chapin & Wasserstrom, 1981). Further, in recent years, the number of reports of mortality and human poisonings due to pesticides are growing (Foo, 1985). The most glaring problem faced today in developing countries is the presence of organochlorine residues in foodstuffs like in poultry, red meat, and vegetables in Nigeria (Atuma, 1985), eggs in Kenya (Mugambi et al., 1989), and potatoes in Egypt (Lakwah et al., 1989). These residues get detected in human milk. A survey in Third World countries revealed levels of organochlorine residues in milk samples of nursing infants were greater than the acceptable daily intakes proposed by the Food and Agriculture Organization (FAO/WHO, 1988). Apart from the health disaster imposed by pesticide exposure, an environmental disaster is also a matter of great concern. In rural areas, pesticide application equipment or empty pesticide containers are discarded and disposed in fields, on river banks and water bodies. Pesticide contamination reduces the soil organic, matter, changes soil chemistry, and pH. Hence, excessive use of a pesticide also impacts our natural resources like agricultural products, drinking water, air, and land.

Pesticide Exposure-Occupational Settings

- Multiple industries
  - Agriculture/Farms
  - Manufacturer and Transportation
  - Domestic Pest Control
- Variety of workers
  - Applicators, Field Workers, Firefighters, Scientific Research

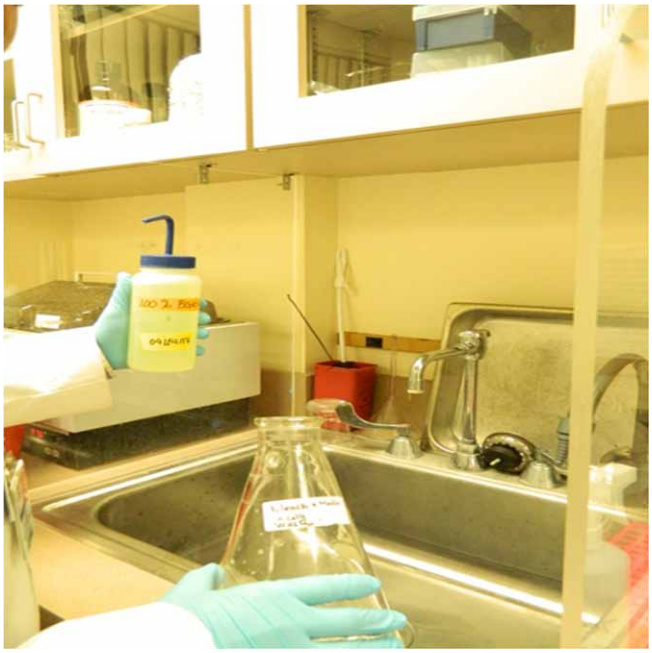
Figure 2. Use of bleach as a disinfectant in cell culture and tissue culture room



Pesticides often spread to vicinity areas beyond their target due to the physical movement of pesticide via air, water, and aerosols at the time of application or afterward, a process known as drift. The drift of pesticide has resulted in 1/4th of pesticide-related illness reported in California in 2000. Schools, hospitals and other settings with sensitive subpopulations could be adversely affected by pesticide drift. Workers working in the field should be cautious as they may bring home pesticide from work through

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

contaminated clothing or containers and expose family members. Secondary contamination of cars, furniture, and carpets at home happens by wearing contaminated clothing from work. Domestic exposure to bleach and other household disinfectants also result in pesticide exposure. Finally, these harmful pesticides enter our food cycle through food and may lead to low-level ingestion exposure, which may be dangerous especially to children. US EPA has set a maximum allowable reference dose for residues of pesticide in food as per the data provided by manufacturers. The recent regulatory decisions regarding concerns for infant exposure to pesticides include the elimination of the use of aldicarb on bananas (Wilson *et al*., 2003).

OCCUPATIONAL HAZARD ON FARMS

In the US, the pattern of pesticide use in agriculture varies from region to region and by commodity to commodity. Pesticides used in high volume in production areas, which require hand labor, like orchards, nurseries, vineyards and raw vegetables. The amount of pesticide use is lower where production is mechanized like livestock dipping and grain agriculture. The workers in the fields are at a high-risk occupation with exposure of chemicals on a daily basis. Many of these pesticides may produce a carcinogenic effect, and some may cause congenital disabilities. California witnessed high rates of organophosphate pesticide poisoning in the agricultural sector during 1982 to 1990. According to the survey, the workers who loaded, applied or mixed pesticides were 35 times more susceptible to illness than the average rate. Further, surveillance data showed remarkable pesticide illness rates among people in the agricultural industry, especially in field workers and applicators (crop protection workers). As per the annual data of the United States, an estimated 5.1 billion pounds of pesticides were invested into plants and adverse health impacts of these chemicals (Figure 1) affected approximately 1-2 million farm workers. Further, the annual data by the Federal government also suggested acute pesticide poisonings among 10,000–20,000 employees in the agricultural industry. Short-term effects of pesticide exposures include nausea, rashes, blisters, stinging eyes, respiratory problems, and headaches. Cumulative long-term exposures may increase the threat of chronic health problems such as neurological impairments, congenital disabilities, cancer and Parkinson's disease for farmworkers, their families, and children. Manifestations of illness include detrimental effects on the central nervous system, causing impaired mental alertness, anxiety, and nervousness, which provoke sleep difficulties with nightmares, impairment of memory, apathy, and depression (Grob & Harvey, 1953; Durhami *et al*., 1965). A medical history of organophosphorus substance exposure in population showed complaints about visual difficulty, forgetfulness, and persistent muscular pains along with a loss of interest in work (Metcalf & Holmes, 1969). Dermatitis and other skin diseases affect farmers handling pesticides (Spencer, 1966). Most challenging protocols in some countries are unrefined Worker Protection Standard. As a result, farm workers lack knowledge of hazardous pesticides used in professional setting and potential exposure to their families. One common occupational risks associated with farm workers include the unsanitary condition and lack of potable water. The farm workers, therefore, are at potential risk of exposure to harmful chemicals and waterborne parasites (Figure 3).

Figure 3. Farm workers at highest risk of direct exposure to pesticides.

OCCUPATIONAL HAZARD IN DOMESTIC PEST CONTROL

In the domestic setting, there are various pests like beetles, lice, garden moths, ants, mites, mosquitoes that harbor home for their survival. Hence, an integrated pest management program strives to minimize pest risk through proofing, hygiene, and environmental management. The use of pesticide in home, gardens, hospitals, schools, offices, etc. leads to chemical exposure. Pest control management team to evacuate the place before fumigating the indented area. But residues of chemicals are left or are being carried by drift in the vicinity area which may contaminate their body, clothes or food they take. Further, the pest control personnel are also at the risk of endangerment due to constant exposure to hazardous chemicals (Figure 2). Several cases of the use of pesticides as a choice for suicide-homicide attempts got reported. Pesticides used in veterinary products for the treatment of fleas and ticks, which results in indirect exposure to the family. A pesticide may recklessly treat in homes for protection against mosquitoes, cockroaches or rodents. Some pesticides are used in schools or playgrounds to destroy weeds. Domestically, certain topical pharmaceuticals directly applied to children's skin or scalp, which may contain an insecticide to control scabies or lice. High doses or long-term exposure to such products may result in acute poisoning. The pharmaceuticals in International Pharmacopeia to treat head lice contain 2% of organophosphorus (Malathion) and organochlorine (Lindane) pesticides. Boric acid, also called hydrogen borate, often used as an antiseptic, insecticide, in house holds. Powdered roach-killing products that contain boric acid is hazardous and could cause acute or chronic poisoning if swallowed by someone (Figure 5).

OCCUATIONAL HAZARD IN MANUFACTURE AND TRANSPORTATION OF PESTICIDES

The manufacturing and transporting of pesticides have resulted into an alarming occupational hazard. The pesticides manufactured in bulk are given by different means to dealers and distributors and finally reach the users. This whole procedure involves many people who directly or indirectly encounter harmful chemicals. Pesticides should be transported, stored and secured properly to protect people and en-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

vironment. Cases of occupational deaths related to ammonia transportation were reported. Workers are exposed to various harmful chemicals for eight to ten hours daily in certain pesticide industries. They become a source of pesticides fragment carriers through their contaminated clothes, shoes, bags, and body to their families. The transportation of synthesized pesticides to the final destination is another challenge and a threat to the society. Accidents and damage by highly flammable or highly toxic pesticides during transportation and storage is alarming. Spills and leaks, which occur while transporting, lead to environmental pollution and menace to residential areas (Figure 6).

Figure 4. Pest Control activity carried out by professionals inside home

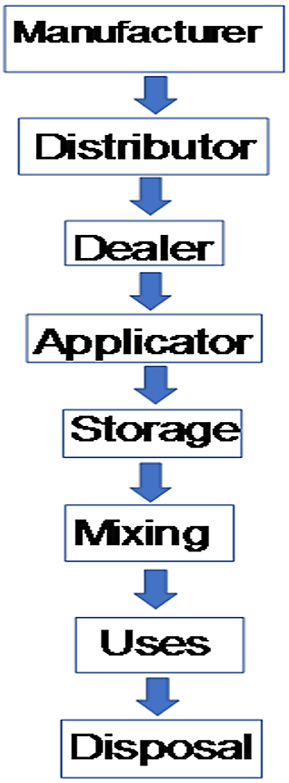
Figure 5. Roach control activity at home by using powdered roach-killing products containing boric acid

One of the terrible incidents related to pesticide manufacturing industry in history is the accident at Union Carbide's carbaryl and aldicarb plant in Bhopal, India in 1985. Over 60,000 pounds of methyl isocyanate, a toxic chemical and over 30,000 pounds of other reaction products spread like a toxic cloud

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

over 15 square miles distance adjacent to the plant. Consequently, victims suffered from various ailments such as eye injury, lung damage, and suppression of immune system, chromosomal damage, and changes in blood chemistry, spontaneous abortions, congenital disabilities and newborn deaths (Mehta *et al*., 1990). Another unfortunate incident happened in The Northwest in 1991 while transportation of toxic pesticides in bulk between manufacturing plant and final users where several gallons of carbamate soil fumigant spilled into Sacramento River, California from a derailed freight train (Garcia, 1992). Similarly, reports reveal a freeway accident, where ammonia discharged from a broken loading valve on a truck. The death caused much panic, and the residents were evacuated, and schools closed for the day. An episode happened during anhydrous ammonia transfer into delivery tank truck from a railroad tank car in a fertilizer supply operation. The death occurred by inhalation when ammonia tank exploded at a chemical plant. Investigations revealed repeated exposure to methyl bromide while manufacturing or transportation led to many deaths. Methyl bromide exposure shows symptoms like nausea, vomiting, chest pain for several hours. The repeated exposure damage lungs, nervous system, and kidneys. Accidental contact with eyes or skin causes skin rashes and severe burns (West, 1964).

Figure 6. Schematic route of the pesticides from manufacture to its disposal



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

OCCUPATIONAL HAZARD VIA VARIETY OF WORKERS

Pesticide exposure occurs in various occupational settings. Besides the enormous use of pesticides in agriculture, farmers in the field or people involved in the transportation of pesticides are subjected to high exposure. Fieldworkers are exposed while pesticides application or picking the treated crops. Emergency response personnel viz firefighters may get exposure to victims soiled with pesticides at an accidental site. The exposure develops through body fluids, such as vomitus or stool, viscera or stained clothing of severely exposed patients. Some airlines treat aircraft with pesticides to control international vector transport. Flight attendants and passengers in cases exposed to pesticides within an enclosed area. Thus, subsequent exposure to pesticides may occur by contaminated victims to health care staff and emergency personnel. Thus, a corrective measure should be taken to control such exposure.

PESTICIDE EXPOSURE IN OCCUPATIONAL SETTINGS: A GROWING HAZARD TO HEALTH

Literature survey carried out so far, report a consistent pattern of health risk on the farmers who are prone to pesticide exposure (Antle *et al*., 1995). The exposure to pesticides may result in acute (Ambridge, 1988; WHO/UNEP, 1990) and chronic health effects in humans. Health impairments of high concern include acute or chronic neurotoxicity (Tayler, 1976; Abou-Donia & Preissin, 1976; Abou-Donia & Preissig 1976; Abou-Doma & Preissig, 1976; Xintaras *et al*., 1978; Savage, *et al*., 1988; Eskenazi & Maizlish 1988; Robinson *et al*., 1993; Kishi *et al*., 1995), lung damage, respiratory failure (Ames, Brown, Mengle, Kahn, Stratton & Jackson, 1989) and infertility in men (Restrepo *et al*., 1990; Rupa *et al*., 1991). Various reports of cancers emerged due to pesticide exposure, such as hematopoietic types of cancer (Guzelian, 1980) and soft-tissue sarcomas (IARC, 1988). Chronic effects such as malfunction of the neurological system, cancer, reproductive disability, reduced growth or congenital disabilities in neonates have been reported due to devastating exposures. Cases of endocrine disruption (Rutherford, 1996; Colborn, Myers & Dumanoski, 1996) and allergic dermatitis sensitization (Adams, 1983) are also observed. Inhibition of cholinesterase results by organophosphates and N-methyl carbamate pesticides depress parasympathetic nervous system (Lopez-Carillo & Lopez-Cervantes, 1993; Miller & Shah, 1982).

Long-term pesticide exposure in different occupational settings leads to a challenging hike in early-onset of Parkinson's disease (Butterfield *et al*., 1993; Gorell *et al*., 1998). Studies on animal brains revealed some pesticides cause lasting behavioral aberrations during a critical period of cell division (Chanda & Pope, 1996; Eriksson, 1996). Agriculture workers are vulnerable to zoonotic infectious disease like methicillin-resistant Staphylococcus aureus (MRSA), avian flu, and West Nile virus etc. Farmworkers face chronic respiratory hazard by bioaerosols, such as organic specks of dust, endotoxins, and chemical toxicants from field agrochemicals (Kirkhorn & Garry, 2000). National Institutes of Health (NIH) investigated that workers using chlorinated pesticides exceeding hundred days developed the risk of diabetes (Montgomery, Kamel, Saldana, Alavanja & Sandler, 2008). Researchers involved with pesticide studies collaborates with industries like Imperial Cancer Research Fund in England and Hans-Olov Adami of the Karolinska Institute, Sweden for health and safety reasons (Hardell *et al*., 2007). Intense exposure to fumigants may produce confusion, sleepiness, poor coordination or unconsciousness. Pyrethrin is extracted naturally from the flowers of chrysanthemum whereas pyrethroids obtained synthetically in pesticide laboratories. Pyrethrins and synthetic pyrethroids affect the central nervous system and may

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

cause convulsions and poor coordination. Paraquat is a pyrylium herbicide, which if accidentally swallowed or inhaled may cause lung fibrosis. Asthma is another common respiratory disorder caused by pesticide exposures in multiple occupational settings (Selgrade *et al*., 2006; Hernandez *et al*., 2011). A case of persistent asthma due to inhalation of the organophosphate insecticide Dichlorvos reported in France (Deschamps *et al*., 1994) while two instances of occupational asthma due to fungicides Fluazinam and Chlorothalonil (Draper *et al*., 2003) observed in the UK. Further, in Belgium, a case of occupational asthma was found due to the chronic exposure to tetramethrin, a pyrethroid insecticide (Vandenplas *et al*., 2000).

CORRECTIVE MEASURES TO CONTROL THE HAZARD

The common pesticides or metabolites detected in the general population are organophosphates, organochlorines, carbamates, herbicides, pest repellents and disinfectants. National Health and Nutrition Examination Survey (NHANES) in 1999-2000 examined blood and urine samples of selected participants for chemicals or their metabolites. The national report on human exposure to environmental chemicals showed bio monitoring exposure data on environmental chemicals for non-institutionalized US civilian population over two year periods. During 1993 to 1996, pesticides graded among main items involved in human exposures. Another common type of pesticide exposure was disinfectant. International treaties on "prior informed consent" and "persistent organic pollutants" aimed to reduce the global burden of hazardous or lethal chemicals that affected US exports. Inadequate law enforcement and lack of regulations in developing countries increased pesticide issues in the world (Calvert, *et al*., 2001; Smith, 2001).

The Environmental Protection Agency (EPA) keeps a check on pesticide use as per Worker Protection Standard (WPS). WPS targets agricultural workers or pesticides handlers to control pesticide poisonings and injuries. WPS protocol compiles importance of pesticide safety training, personal protective equipment beside material and safety notification of pesticide's applications, decontamination supplies, and emergency medical assistance. The US EPA regulates and checks the sale and use of pesticides, and is responsible for health and safety of agricultural workers. A pesticide may be for a general or restricted use, and licensed applicators may use restricted pesticides. USEPA regulates pesticide label information such as pesticide toxicity, registration number, and recommended first aid measures. A pesticide label shows the toxicity category, highlighting "Danger" and "Caution" for high and low toxic pesticides respectively, along with essential precautionary statements (Rosenberg, & O'Malley, 1997). Many commercial pesticide formulations contain hazardous compounds, like piperonyl butoxide, synergist, a constituent in most pyrethrin or pyrethroid formulations. A significant portion of pesticide formulations comprised of "Inert" ingredients. "Inert" ingredients may not be active against the target pest but may cause some toxic effect on exposed personnel. Pesticide inventory is maintained to organize redundant storage. Proper disposal and controlling spillage of pesticide are also significant. Pesticide safety is necessary to limit access to pesticide storage facility to authorized personnel only. Security also includes not leaving pesticide containers or sprayers unattended anytime. Safety is critical, especially during transportation. Accidental pesticide spill can be observed by using specially equipped vehicles during transit. Side rails on trucks keep a check on falling cargo while making turns. Application equipment and bulk tanks, fittings, hoses should be checked periodically for leaks, cracks, or defects. Proper precaution should be taken in the event of pesticide spills, and drivers should be trained accordingly to deal with

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

such a mishap. According to the U.S. Department of Transportation, specialized driver training and a license are mandatory.

Pest control service in residential areas should be used with caution. Items of use especially edibles must be covered or removed from areas to be treated. Pets should be displaced during treatment and until the pesticide is dry. It is critical to sterilize patients with pesticide exposure to prevent any chances of subsequent exposure. The detrimental effect of pesticide exposure depends on the degree of contamination and dose of pesticide. In the case of pesticide contact with skin, the individual should take a shower with soap and shampoo immediately. Spaces under fingernails, scalp, ear, etc. may act as a reservoir for the pesticide. Therefore, careful scrubbing of this area is required. (Reigart & Roberts, 1999) In a severely contaminated patient, body fluids, such as urine and stool, can be saved for residue analysis of pesticide. The infected body fluids of patients should be put in airtight containers in a secure place. Healthcare staff and forensic scientist may be exposed to passing pesticides during analysis. The symptoms of such exposure may vary from short-term eye irritation, headaches, rashes and odor-related symptoms to symptoms that are more persistent.

CONCLUSION

The objective of discussion of this chapter is to assess the health hazards during pesticides handling, storage and use to create awareness to control its exposure. Researchers advise biological monitoring techniques to reduce the intensity of absorption of selected pesticides. The common pesticides or metabolites detected in the general population are organophosphates, organochlorines, carbamates, herbicides, pest repellents, and disinfectants. Indiscriminate use of pesticidal chemicals is responsible for many complications in humans. Pesticides are poisons and should be used restrictively as per instructions. The exposure to pesticides in occupational settings may produce acute and chronic diseases. Employees dealing with pesticides must be aware of chemicals composition, first aid, and medical help in case of pesticide chemical accident. Therefore, taking necessary precautions during the use of pesticide may avoid the risk of diseases in human, plants and animals.

KEY TERMS AND DEFINITIONS

Hazards: A hazard is an agent that has the potential to cause harm to a vulnerable target.

Pest Control: Pest control is the regulation or management of a species defined as a pest, a member of the animal kingdom that impacts adversely on human activities.

Pesticide Drift: Pesticide drift refers to the unintentional diffusion of pesticides and the potential negative effects of pesticide application.

Pesticide Handling: The use of pesticides in farm, forest, nursery, or greenhouse.

ABSTRACT

Record-breaking summer heat events are increasing in frequency in Zimbabwe and 2016 was a particularly hot year with the country experiencing its worst heat wave event in decades. Currently, Zimbabwe has no coordinated public health response to deal with heat wave events and no specific data on heat-related morbidity and mortality. The country has no legislation for protecting workers against environmental heat exposure, particularly those most vulnerable who are employed in the informal sector. These workers are also at risk due to their outdoor work environments. The article outlines the state of climate and heat stresses in Zimbabwe, as benchmarked against other African countries and France. It further summarizes outdoor workers' susceptibility to heat exposure and the need for the Zimbabwean Government to develop policies to ensure the health and safety of an increasing population of outdoor workers in Zimbabwe.

INTRODUCTION

Climate change has been impacting global climatic and environmental conditions over the last few decades and many countries are experiencing extreme high temperatures, which have caused a serious public health issue. Extreme temperatures, particularly in occupational environments, have impacted negatively on humans, increasing their susceptibility to disease and heat-related mortality. Susceptibility among human populations depends on various factors which include social, cultural and /or physical status. Current studies show that the effects of climate change are progressively affecting the cultural and socioeconomic lives of communities (Frimpong, Van Etten, Oosthuzien, & Fannam, 2015). It has been shown that many people throughout the world are frequently exposed to environmental conditions that exceed the capacity of normal human physiological coping mechanisms, placing such individuals at risk of suffering heat-related illnesses (Kjellstrom, 2009). Heat is one of the naturally occurring hazards associated with climate change, and heat waves account for a significant proportion of human mortality (WHO, 2014). Globally morbidity and mortality trends associated with heat wave events have been published in a number of developed countries. The heat waves that occurred in Western Europe in August 2003 exposed flaws in the management of environmental public health risks (Kovats & Hajat, 2008). The extreme heat event that struck Europe in 2003 resulted in 15,000 deaths (Rey et al., 2009). Russia experienced 1,100 deaths in 2011 (Grumm, 2011) and the Chicago heat waves had a reported mortality of 800 in 2010 (Hayhoe, Sheridan, Kalkstein, & Greene, 2010). Research has shown that a lack of intervention plans and coordination between health agencies and social services impacted negatively on the management of these events (Kovats & Hajat, 2008). However, there is a gap in data for Africa, which is particularly vulnerable to the effects of climate change and heat waves. Global average surface temperatures are estimated to increase further by between 1.8 – 4.0°C by the year 2100 (Intergovernmental Panel on Climate Change (IPCC), 2007). Current literature concurs that heat-related illnesses will emerge as major public health issues in the future, particularly in developing countries, including Zimbabwe. Studies have shown that heat waves occur more frequently than any other natural hazard, yet are not generally recognized as a significant cause of mortality, particularly in developing countries (Koppe, Kovats, Jendritzky, & Menne, 2004). Contemporary global economic changes and urbanization in poor countries has further exposed populations to environmental health hazards, including heat waves, with there being very limited policies on heat prevention and adaptation strategies in place. Zimbabwe and the whole of the Southern African Development Community (SADC) region, is facing an increase in the frequency of hot summer days and extremely dry cold winter days caused by climate change. These changes are being experienced in Zimbabwe, greater parts of South Africa, Botswana and Namibia with an increase of between 0.2°C to 0.5°C per decade (Young et al., 2010). Since 1980, Zimbabwe's average annual temperatures have also been increasing. The issue has been compounded by changes in rainfall patterns that have resulted in rainfall becoming increasingly uncertain (United Nations Framework Convention on Climate Change (UNFCCC) zimnc2, 2013). In recent years increasing heat wave episodes have also been experienced in the region. Although people may adapt to higher temperatures, their physiological capacity to cope with sporadic heat events is uncertain (Patz et al., 2000). According to Zimbabwe's National Climate Change Response Strategy (2014), there has been an increase in daytime temperatures between the months of September and November with an average minimum of between 15°C, average maximum of 29°C and a potential peak of above 35°C. During the wet season, the average minimum temperature is 12°C, and the average maximum is 30°C, potentially peaking as

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

high as 35°C. This is coupled with high humidity events. Being a landlocked country, it is predicted that Zimbabwe will also warm more rapidly in the future than the global average (UNFCCC zimnc2, 2013).

In the context of climate change and the assumption that heat waves will be a significant environmental hazard associated with climate change in the future, this article reviews heat stress policies and outdoor occupational health sustainability in the context of climate change in Zimbabwe. Furthermore, the article explores heat exposure and adaptation strategies of a particularly vulnerable group of outdoor informal sector workers, also known as street hawkers/vendors, in urban Bulawayo – Zimbabwe. The City of Bulawayo is the second largest city in Zimbabwe and was the country's industrial hub in the 1980s. The population of Bulawayo is 653,337 (303,346 males and 349,991 females) according to the Zimbabwe 2012 Census. Unemployment in this city has escalated to a point where approximately 80% of the people are working in the streets as hawkers. This is slightly better than the country's national unemployment rate, with is 85% (Mpofu, 2010). Adaptation is viewed as the most effective way to reduce susceptibility of these workers to climate change effects (Frimpong et al., 2015). In assessing their adaptation, coping capabilities and awareness, this article will analyse and inform the development of appropriate government policies aimed at heat stress prevention.

SUSCEPTIBILTY TO HEAT STRESS AND CLIMATE CHANGE IMPACT ON STREET HAWKERS IN ZIMBABWE

Heat waves, which have been experienced globally, present specific public health challenges, particularly for certain sectors of society and different occupational groups, yet there is inadequate research on this phenomenon, particularly in developing countries such as Zimbabwe (Gubernot, Anderson, & Hunting, 2014). The groups most vulnerable to heat exposure include the elderly, children, displaced individuals, those with chronic diseases, low socio-economic status and those in outdoor occupations (Kovats & Hajat, 2008). The population in Africa is also recognized as susceptible due to the high prevalence of poverty and inadequate coping strategies to manage climate change effects (Madzwamuse, 2011). In Bulawayo, street hawkers are unlikely to gain employment in the formal sector due to economic conditions that have resulted in the closure of industries in the city, the previous industrial hub city of Zimbabwe. Through personal observation and informal communication with local residents it appears as if the situation has been further complicated by the influx of rural people into the cities due to the collapse of the commercial agricultural sector, erratic rainfall patterns and recurrent droughts. Street hawkers are exposed to the effects of heat waves as they operate their businesses on street pavements for long hours and with minimal protection from the sun. Most common heat management strategies recommend taking regular short breaks, however, this is hard to enforce as these workers spend long hours in the open, with limited knowledge of the effects on heat on their health. This cohort also has limited choices as open street vending is their major source of income and livelihood (see Figure 1).

The combined exposure to high temperatures, humidity and radiant heat from direct sunlight, as well as the lack of ready access to potable water, means that this sector of the population are at a much greater risk of suffering the effects of heat stress and its related illnesses which can cause death and other chronic conditions such as renal disease. Heat stress can also exacerbate other underlying conditions (Coco et al., 2016). In this article, susceptibility is described as the state of vulnerability of a group of people (street hawkers) who are exposed to the impacts of climate change. Street hawkers in develop-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ing countries are particularly vulnerable as they have less capacity to adapt and there are no heat wave health-related policies that would apply to them (Frimpong et al., 2015).

Studies have shown that extremely high temperatures coupled with air pollution and high humidity contributes to higher morbidity and mortality rates as well as an increase in more general chronic health concerns (Kjellstrom, Butler, Lucas, & Bonita, 2010). The situation is further exacerbated by rapid urbanization that contributes to the urban heat island effect (Corburn, 2009). With the increasing impacts of global warming, these workers are becoming more vulnerable. It has been estimated that outdoor workers have a 20-fold increased risk of suffering heat-related mortality as compared to other occupational groups and this trend is likely to be more pronounced in developing countries with no public health response to heat wave events (Centers for Disease Control, 2008). Heat exposure is likely to impair the physiology, health status and work performance of this group of individuals (Parsons, 2003). Preparing for future heat wave events of increasing severity and duration poses a difficult challenge to governments in developing countries such as Zimbabwe. As a result of economic decline, there are a growing number of hawkers on the streets who make ends meet under the exposure of extreme heat, working with no shade for cooling or resting. The health and livelihood security of this population is at risk as global climate change is intensifying (Mpofu, 2010; Rusvingo, 2015). As temperature is a key driver of climate change in Africa, the susceptibility of outdoor workers is at stake. In the context of climate change and socioeconomic development there is a gap in the protection of this large and vulnerable sector of society and there is a need to develop appropriate policies to ensure the security of this group.

CLIMATE CHANGE AND HEAT STRESS PREVENTION POLICIES IN ZIMBABWE - TAKING INFERENCES FROM OTHER COUNTRIES

Experience gained from the developed world indicates that the impact of climate change can be reduced by the creation and enforcement of targeted heat-related public health policies that are compatible with available financial, human and technological resources (Frimpong et al., 2015). Countries, particularly those located in the tropics and other hot and humid areas, need to develop all-inclusive climate change adaptation policies to protect their populations. Zimbabwe's Initial National Communication to the United Nations Framework Convention on Climate Change (UNFCCC 1998 - 2014) and the Zimbabwe Agenda for Sustainable Social Economic Transformation (Zim-Asset) 2013-2018 were used to evaluate the country's preparedness to mitigate the effects of heat waves and to protect street hawkers who are deemed to be a particularly vulnerable sector of society.

The United Nations Framework Convention on Climate Change (UNFCCC) lobbies individual countries to develop and implement climate change policies and programs as a way to reduce and prevent climate change impacts on the population. Zimbabwe views climate change as an important issue that needs to be tackled. There is evidence of perennial droughts, floods, hail storms, more hot days and heat waves that impact the agro-based economy, natural resources, livestock production and the wellbeing of the population. According to the Zimbabwe's Initial National Communication to the United Nations Framework Convention on Climate Change (UNFCCC) (1998), there is a lack of financial and human expertise within Zimbabwe to embark on climate change research programs. Zimbabwe developed the National Climate Change Strategy to deliver and strengthen climate change and disaster risk management policies. However, this has now been superseded by the Zimbabwe Agenda for Sustainable Social Economic Transformation (Zim-Asset) 2013-2018. The Zim-Asset acknowledges the effects of climate change and this has led to the creation of the Ministry of Environment, Water and Climate which falls under the Food Security and Nutrition Cluster of the Zim-Asset Strategy.

Although Zimbabwe ratified the UNFCCCC approach, it has no separate Climate Change policy legislation. According to the Zimbabwe National Climate Change Response Strategy (ZNCCRS) 2014, climate change is covered in various uncoordinated sector policies, which include the following: National Policy and Program on Drought Mitigation, Draft Disaster Risk Management Policy, Second Science, Technology and Innovation Policy 2012, Agricultural Marketing and Pricing Policy and Small, Micro and Medium Enterprise Policy. Though climate change is recognized, such divisions in policies through sectoral areas are deficient in dealing with the predictable impacts of climate change and the scope of vulnerability. The uncoordinated sectoral approach leaves some areas of the population, like the street hawkers who operate under unregulated conditions, vulnerable as no government organ is responsible for their social protection. The holistic framing of health to cover climate change effects is not clearly articulated in all these different sector policies. This creates a gap in the understanding and implementing action on health impacts. In African countries like Botswana, Ghana, Nigeria, Tanzania, South Africa and Zimbabwe there is a lack of clear regulatory and policy frameworks that have a defined authority to manage the implementation and adaptation issues of climate change, particularly for the informal sector of street hawkers (Chagutah, 2010; Madzwamuse, 2011). In this case, climate change receives inadequate policy direction with inadequate allocation of resources. Kenya has established a national climate change secretariat that is part of the Ministry of Environment and Mineral Resources. This group is responsible for coordinating climate change elements located in different ministries.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Second Zimbabwe Communication (2013) shows that extensive systematic research related to climate change has been conducted on water resources, agriculture and forestry by government institutions and non-governmental organizations. The reason for this focus bias may be that Zimbabwe relies substantially on rain-fed agriculture and climate reliance resources (Chagutah, 2010). Various initiatives are being carried out by government in conjunction with other partners and communities to deal with the effects of climate change on vulnerable communities and ecosystems. The studies, however, are biased towards rural populations and therefore exclude the vulnerable urban population of street hawkers (Brown et al., 2012). Development in Africa also focuses on the advancement of the rural population (Parnell & Walawege, 2011). Research on human health issues related to climate change is focused on malaria and other water borne diseases, however, no studies have been conducted to assess the association between climate change and the health of outdoor workers, particularly street hawkers, who spend most of the day exposed to direct sun. Climate change effects are projected to aggravate the heat-related health issues in developing countries that lack heat prevention strategies and policies. In considering the World Health Assembly's four climate change priorities of 2008: (1) the scale and nature health vulnerability; (2) health protection and promotion strategies; (3) decision-making support, surveillance and monitoring; and (4) assessments of financial and other resources aimed at health protection (WHA, 2008), Zimbabwe has not conducted any occupational health studies that include heat disorders.

Zimbabwe promulgated an environmental management law in 2002 that regulated environmental monitoring functions. Some had previously been carried out by environmental health departments in central and local government authorities. These included monitoring for environmental issues, including air pollution and water pollution which now fall under the Environmental Management Authority. This approach impacted negatively on urban environmental monitoring activities as no monitoring is currently conducted. Consequently, there is a lack of data needed to evaluate services, identify risks and protect the health of the population. Monitoring the risk of heat-related health impacts is emerging as a concern in public health and there is a need for it to be included in the country's climate change strategy (Kjellstrom, 2009). The Environmental Management Act (Chapter 20:27) which embraces climate change effects has not been reviewed since the adoption of the new constitution in 2013.

There appears to be no clear delineation between environmental and climate change related issues administered by different governments departments and no focal sector to coordinate activities. According to the goal of the climate change response strategy, of mainstreaming climate change adaptation and mitigation strategies, Zimbabwe needs a multi-stakeholder engagement approach to develop a national climate change framework that will provide measures to protect the population who include those who are vulnerable, such as street hawkers. Susceptible groups must be identified in both rural and urban settings and be involved in decision making. This will enable social and economic development that will address climate change impacts. The current Zimbabwe Climate Change Strategy does not include adequate heat wave mitigation strategies to protect vulnerable people.

Zimbabwe Change Strategy Showing Overlap and Gaps Compared to France

Western Europe was hit by severe heat waves in August 2003 (Kovats & Hajat, 2008; Rey et al., 2009). The 2003 heatwave in France caused 14,800 deaths in the first three weeks of August leading to a major review of policy. France now regards climate change as a priority target whilst Zimbabwe views it as an issue that needs to be dealt with. Both countries have National Communications to the United Nations Framework Convention for Climate Change. French policies developed to deal with climate change

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

effects, including heat prevention plans, were used as a benchmark to measure Zimbabwe progress in this regard. The Zimbabwe Climate Change Strategy has no heat prevention strategy. Table 1 provides a summary of the gaps that still exist in the Zimbabwe's strategy compared to that of France.

Table 1. Comparison of France and Zimbabwe's Climate Change Strategies with inclusion of heat prevention

	France **6th National Communication on Climate Change** **October 2013**	**Zimbabwe** **2nd National Communication on Climate Change** **October 2013**
National Communication to United Nations Framework Convention for Climate Change	Tackling climate change is a priority target for France. The French Environmental Charter on environmental education for sustainable development is a national priority and is inscribed in the constitution. It emphasises environmental education and training as the core principles of the French Republic towards tackling climate change. The French National Adaptation Plan (PNACC) was developed through a vast consultation exercise that resulted in over 200 recommendations which were used as a foundation basis for its development.	Zimbabwe views climate change as an important issue that needs to be tackled. The Zim Asset's emphasis is on recurrent drought and floods that impact the country due to climatic changes. Global warming affects the country's agro-based economy that depends on rain-fed agriculture, livestock production and natural resources. The Zimbabwe National Climate Change Response Strategy is a response to the effects of the climate. Zimbabwe has a medium term plan (MTP) 2012-2015 to deal with climate change which was superseded by the Zimbabwe Agenda for Sustainable Socio-Economic Transformation (Zim Asset) 2013-2018.
Heat Prevention Policy Inclusion	Heatwave Plans were developed and put in place to manage the immediate effects of this type of crisis. Developed regional and local (cities and inter-municipality) adaptation schemes. All report to the NAP for consistency.	No heat wave plans are in place. Will institutionalise climate change response governance framework at the national, provincial, district and ward levels – still being developed.

While France views climate change and environmental education as a national priority enshrined in the constitution, Zimbabwe recognizes it is an issue that needs to be addressed and their focus is on the impact of drought and floods. France has a sophisticated heat wave management plan that was developed after extensive consultation and Zimbabwe has yet to address the issue at this level. There is therefore a significant difference between the developed country approach, compared to that of Zimbabwe. The French strategy can clearly not be directly adopted in a developing country where people are poor and have no access to resources such as electricity and air-conditioned public spaces. A more regionally appropriate strategy needs to be employed, such as the planting of trees to provide shade and taking steps to educate people and reduce the urban heat island effect.

CONCEPTUAL FRAMEWORK: HEAT HAZARD DUE TO CLIMATE CHANGE, A LINK BETWEEN EXPOSURE, SUSCEPTIBILITY, AND ADAPTATION STRATEGIES FOR A VULNERABLE POPULATION

In developing countries, such as Zimbabwe, there is a lack of knowledge amongst the general population about the health impacts of heat stress and heat exposure management is sub optimal (Phuong, Few, & Winkels, 2013). There is a need to conduct further research on the impacts of heat wave events to

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

inform decision makers and the population about their roles and responsibilities in planning adaptation strategies, raising public awareness and developing policies. Figure 2 outlines a conceptual framework for this approach and incorporates concepts drawn from the Intergovernmental Panel on Climate Change (IPCC), Special Report on Managing the Risks of Extreme Events and Disaster to Advance Climate Change Adaptation (SREX) and Ahmedabad reports (Field, 2012; Tran et al., 2013). This framework outlines heat as an environmental hazard associated with climate change, establishing a link between exposure, susceptibility of individuals and their adaptation strategies. The conceptual framework can apply to different hazards or disasters with a known cause. In this case, it can be used to develop heat stress prevention policies and guidelines.

The theory of susceptibility in relation to climate change has different interpretations. In this paper the concept is assumed to recount the extent to which heat as a hazard affects the human social and environmental system (Reed et al., 2013). In terms of this model, street hawkers are physically exposed to heat as a hazard. Exposure is the state of subjection to and the duration and/or degree to which an individual is in contact with heat. Street hawkers conduct activities in the open, on hot paving in direct sunlight, and they work long hours. Some might shelter under improvised plastic cover, but they remain vulnerable. During summer, these workers experience extreme heat events that can result in heat stress and other chronic health effects.

In this framework, susceptibility is how an individual succumbs to, or is affected by, the effects of heat. The susceptibility of those exposed is dependent on their individual characteristics which include age, health status of individuals and social capital (Tran et al., 2013). In Bulawayo, outdoor workers encompass various members of the population and vending is their primary source of income. These low socio-economic groups include the elderly and children, as well as people with chronic diseases.

The exposed group needs to have the capacity to cope with and recover from heat-related stress. Adaptability in this model refers to the capacity of those affected to respond and recover from the disturbance (Reed et al., 2013). In Zimbabwe, the National Climate Change Strategy should include heat stress prevention policies to reduce health burdens, particularly for outdoor workers. Without government support the adaptive capacity for the street hawkers is limited by poverty, poor public and environmental health and uncoordinated sectoral institutional interventions. There is a lack of infrastructure and development services for outdoor workers, including access to potable water and sanitation facilities. Adaptation strategies for heat stress prevention should be guided by policies formulated through the involvement of outdoor workers as stakeholders. These policies and regulations will influence the design of infrastructure that suits the needs of the outdoor workers in combating the effects of climate change. Some interventions might include public education, health promotion programs, disaster preparedness, environment monitoring and information drawn from research (Tran et al., 2013). Heat stress prevention policies and climate change adaptation strategies are important in minimizing heat stress and other heat-related illnesses and for protecting the vulnerable street hawkers of Zimbabwe.

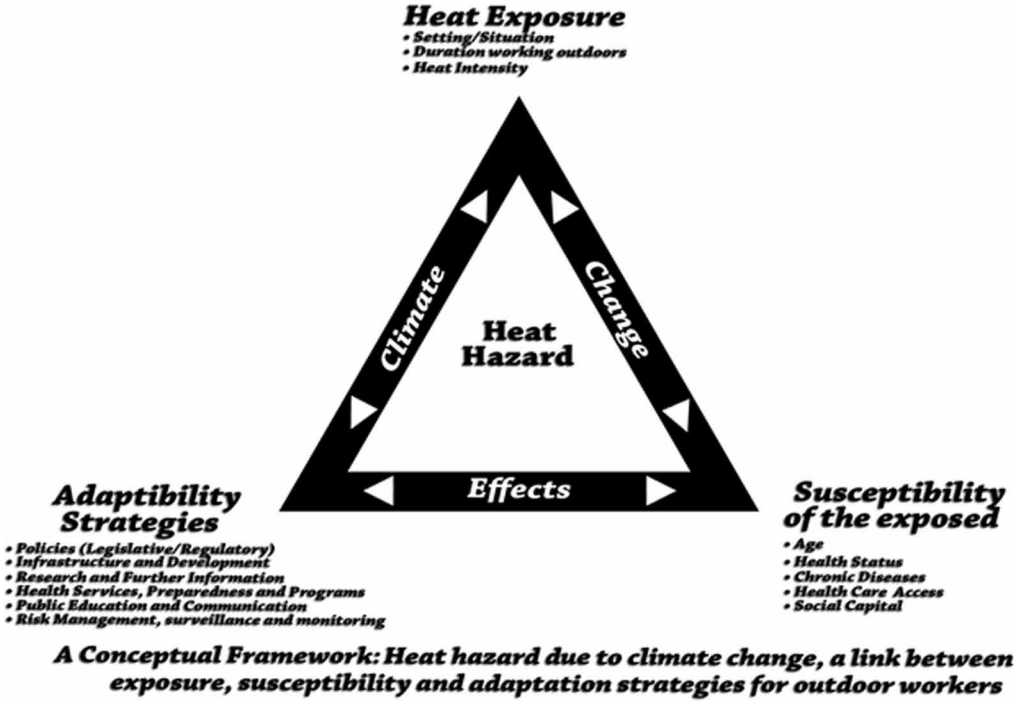
Sustainability of Outdoor Work in the Context of Climate Change and Rising Temperatures

Thermal conditions in urban environments are influenced by urban microclimates (Lin, Li, Zhu, & Qin, 2008). Urban vegetation is a crucial component of the environment that can help to combat high temperatures and enhance thermal comfort in the urban setting (Ketterer & Matzarakis, 2014). Growing trees in urban areas is an effective strategy that can be implemented to reduce direct heat exposure

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

on urban pedestrians and street hawkers (Brown, 2010). In the context of Zimbabwe, and Bulawayo in particular, there are not many trees in the urban setting where street hawkers can set up their stalls areas in the shade of trees. Considering the benefits of trees, such as evapotranspiration, shading, wind speed reduction and radiation, urban vegetation can aid in heat stress management in the context of rising temperature due to climate change. The fact that outdoor work will increase in developing countries, then urban social forestry to cool down the urban environment of cities is imperative, healthy and sustainable. In Bulawayo, tree planting could be a workable measure that could ultimately increase thermal comfort for street hawkers in the future.

Figure 2. Conceptual framework: Heat hazard due to climate change, a link between exposure, susceptibility and adaptation strategies for outdoor workers (Source: SREX and Ahmedabad reports (Field, 2012; Tran et al., 2013))



IMPLICATIONS FOR PRACTICE AND FUTURE RESEARCH

Our research has important practical implications for policy formulation for heat prevention strategies to manage the new public health dilemma of heat-related illnesses using a conceptual framework. Countries that have no policies or policies developed without a conceptual framework run into difficulties of managing heat exposure effects and leave the population prone to heat-related illnesses. The theoretical factor is that of a coordinated approach of managing the exposure effects through identifying and assessing the situation. Controls applied through the provision of resources and from a consultative approach are vital in managing heat-related illnesses. The research finding also gives challenges for further research

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

on heat-related information that concerns the hazardous nature of heat exposure due to climate change in developing countries without policies and strategies. This lack of substantive action on heat prevention has led to a need for research to quantify the extent of the problem and to identify knowledge levels of people in developing countries about climate change, heat-related illness and adaptation strategies.

LIMITATIONS

There is a lack of literature on heat stress policies in developing countries, particularly as this relates to vulnerable groups such as street hawkers. Zimbabwean strategies on heat management are biased to sustainable agriculture and not to illnesses associated with heat exposure.

CONCLUSION

Temperatures in Zimbabwe are increasing due to climate change and this presents a challenge as there are no heat stress prevention strategies. Lessons learnt from heat wave fatalities in France, should be used as an indicator to measure Zimbabwe's heat wave preparedness. Heat wave management policies need to be developed to enable a coordinated response to protect vulnerable groups, including street hawkers. There is evidence of vulnerable groups being susceptible to heat stress due to high temperatures caused by climate change. Social forestation in urban areas is highly recommended to provide cooling systems for sustainability in the context of climate change effects. The conceptual framework above can be used as a guide to developing much needed heat prevention policies. Research to provide empirical evidence on the levels of exposure and vulnerability of street hawkers has to be conducted in line with current climate change trends. There are gaps in the Zimbabwe National Climate Change Strategy on heat prevention policy inclusion when compared with the French National Adaptation Plan. Further research is required on occupational heat exposure and heat-related illness. Currently, there is no evidence that there has been any targeted policy direction directed at the development of strategies to mitigate the effects of heat waves on vulnerable people in Zimbabwe. Lessons learnt by France could be used as a basis to guide the development of regionally appropriate strategies in a Zimbabwean context.

Chapter 104
Appraising the Future of Employee Health and Wellness Programmes in the Fourth Industrial Revolution: Wellness Programmes

Andrisha Beharry Ramraj
University of KwaZulu-Natal, South Africa

John Amolo
University of KwaZulu-Natal, South Africa

ABSTRACT

Employee wellness is an important aspect of human resource management system that has to be considered in the various phases of industrial revolution. It should be noted that during the industrial revolutions work has been transformed from handmade methods to machines. Work productivity improved, yet at the same time the number for those required for manual labour slightly reduced. In each of the revolutions the need to maintain employees remained significant. Therefore, it becomes imperative in the 4th industrial revolution even though managed heavily by machinery and technology to continue with employee wellness for effective productivity within organisations going forward. This chapter will deal with the employee wellness as a strategy that deals with enabling employee welfare. A healthy workforce enhances employee wellness.

INTRODUCTION

In the era of rapid transformation whereby human resource is challenged by substantial changes particularly in the matters concerning jobs and workforce (Rasca, 2017), employees experience difficulties in balancing work and personal day-to-day life. Employees' inability to succeed in balancing their work and family duties has resulted in an increased number of stress-related ill-health in organisations (Ethel, Ziska & Sulaiman, 2016). Globally, the well-being of workers is important for the survival and advancement of any organisation (Zheng, Zhu, Zhao & Zhang, 2015). Hence, the wellness of employees is of immense concern to all stakeholders in the workplace.

Most of the issues impacting employee health and wellness stem from the stress of balancing work and family stressors to achieve meaningful work-life balance (WLB). Though scholars have argued that WLB is a personal matter (Kim, 2014), the challenges arising from its imbalance have both personal and organisational implications. On the personal level, where there is work-life imbalance, employees manifest stress, depression, anxiety, and panic attacks, among many other physiological and psychological challenges. While on the organisational level, absenteeism, poor performance, frequent sick leave and cost of managing it, as well as other attendant costs take their own tolls on organisational outcomes. Because of these, employers have been providing employees with benefits that should help them to meet their needs.

For instance, some companies provide cover for maternity expenses incurred by their employees who have just given birth, while government organisations are compelled by law in some countries, for example South Africa (Abe, Fields & Abe, 2016), to adopt employee health and wellness programmes (EHWP) which provide strategies to address domain-related stressors. Employees tend to perform their duties and tasks well within a workplace when their needs and expectations are met. On the other hand, conflicts tend to arise when employees' needs and expectations are not met within a workplace. Research shows that conflict between family duties and work demands arises because some facets of work and family demands are irreconcilable (Adame, Caplliure & Miquel, 2016).

In the context of the foregoing, this chapter focuses on the future of work and employee health and well-being to understand whether the traditional wellness programmes adopted by organisations will still be relevant in addressing employee wellness issues in the fourth industrial revolution where the workplace is facing unprecedented and rapid transformations in new technologies.

The previous industrial revolutions came with a lot of benefits as well as challenges to the socio-economic status of the people who experienced the transformations (Rabeh-Morrar & Saeed, 2017). For example, in the first industrial revolution, Great Britain led the revolution by discovering the steam engine which transformed the communication and transportation sector, led to the creation of many jobs and facilitated the movements of people and goods from one place to another (White, 2009)

The second industrial revolution witnessed the introduction of mass production in the form of division of labour and it was powered by the discovery of electrical energy. In the early seventies, the third industrial revolution emerged with the introduction of electronics and information technology which witnessed the discovery of types of machinery that would allow production to take place with little or even without human work (Taalbi, 2019).

The fourth industrial revolutioncurrently being experienced is built on cyber-physical production systems {Forum, 2015 #24}{Forum, 2015 #24}(Hirschi, 2018). In the fourth industrial revolution, systems are being transformed rather than specific products or services. Cyber-physical systems means combined communications, information technology, internet of things (IOT), sensor networks, and internet communication infrastructure (IP). It has also brought with it intelligent real-time processing

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and event management (CPUs), implanted software for logic, 3D/4D printing, artificial intelligence or advanced robotics (AI) which can perform any jobs like humans, automated operations, and management of system activities.

Thus, all these discoveries from the fourth industrial revolution put jobs at risk, because industry 4.0 will limit the demand for labour and urges new essentials for education (Prisecaru, 2016). Research shows that in the next few years some jobs will be lost to robots {2016, 2015 #24}(Forum, 2016).

EMPLOYEE HEALTH AND WELLNESS PROGRAMMES

There are a number of definitions of employee wellness. In this section wellness as opposed to well-being is deliberated upon. Wellness has at times been confused with well-being, yet well-being refers to a state of happiness of people, but wellness is interlinked to prevention and management of employee health (Global Wellness Institute, 2016). Kholl (2017) however considers wellness to be related to an employee's physical well-being which is directly linked to employee health. However, a rather broader definition of employee wellness was provided by the International Labour Organisation as "all aspects of working life, from the quality and safety of the physical environment, to how workers feel about their work, their working environment, the climate at work and work organisation" (ILO, 2018: 6). The definition by ILO is supported by Nielson, Nielson, Obonnaya, Kansala and Isaksson (2017: 104), who postulate that employee wellness relates to "the state of individuals' mental, physical, and general health, as well as their experiences of satisfaction both at work and outside of work." Employee health and wellness programmes are interventions tailored to encourage employee awareness of their individual wellness needs in order to make personal mental and bodily adjustments towards stimulating own health in a supportive work environment (Abe et al., 2016).

Healthcare and its impact on performance is expected to impact global operations everywhere in the fourth industrial revolution. The technological progress spanning the digitalisation of healthcare to social media, sensors, wearables, IoT, AI, augmented reality (AR), robotics and 3D printing as well as nanotechnology will break the healthcare systems, increase interconnectivity and transform society radically. This is well exemplified with genetic engineering, in particular the genome editing, tissue engineering, precision medicine, renegrative biology and medicine, cancer genomics and immunotherapy, optical imaging, microbiome, as well as optogenetics and brain machine interface technology. The digital technologies and AI are expected to have a transformatory impact on medicine and healthcare. Cure other than disease prevention will be offered by these technologies. This is further exemplified by the technologies of gene editing, with the potential of curing genetic diseases such as cystic fibrosis and sickle cell anaemia. Along this line is the germline editing which has the ability to help create intergenerational changes, while at the same time the ability to cure as well as control diseases with genome editing (WEF, 2019). Genome editing is one of the interesting developments that has been associated with genetic engineering, which has been noted as working wonderfully in medical applications. This in particular has been known to be able to introduce a functional gene that replaces a defective one (Clarke, Harley, Hubber, Manea, Manuelli, Read & Watt, 2018). In the process, the healthcare which enterprises are supposed to independently take care of at high prices may become more affordable and cheap for organisations or enterprises to undertake. Nonetheless, some healthcare programmes may continue being part and parcel of the enterprise healthcare and welfare programme.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

One of the components of employee wellness and health programmes is that they go hand in hand with technological trends. As technology takes people to searching information on the internet, employees are equally allowed to access health information at all times. Technology also allows wellness data to be collected.

The wellness programme is also adapted to the corporate culture of the organisation. It is something different in different contexts. It is advisable to integrate the organisation's corporate with evidence-based health information. This therefore permits the understanding of a collectiveness by the entire organisation towards workplace wellness.

Examples of workplace wellness programmes include on-site fitness centres. The centres may not be of the same size; some of the organisations offer a large swimming pool, access to personal trainers as well a rock climbing wall. At times cash incentives are offered to the team and much support is given in reaching their goals.

The smoking cessation programme is one of the components of a good health and wellness programme. Smoking cigarettes does cost employers due to health-related problems associated with the habit. It has also been noted that health provision in the form of a smoking cessation programme to members of the team can be helpful. Organisations like Union Pacific offer a cessation programme on smoking, it conducts lifestyle coaching, and also offers pharmacological assistance to members. Union Pacific managed to reduce smokers from 40% in the 1990s to only 17% in 2007.

Good wellness programmes have been known to offer transit options in terms of transportation to employees. The sharing of a bike or giving public transport incentives can prove to be beneficial to the environmentalists and employees. Current employees who value this programme can easily be appealed to by this programme.

Sometimes some of the components of a wellness programme can include a paramedical service as is the case offered by Google to team members. A massage programme manager is employed by Google in the US. It is often understood that a relaxed member is calm and also feels encouraged at the workplace. One of the activities offered is yoga classes and the space for practising this is given. This is known to relieve stress as members deal with deadlines.

Healthy snacks and lunch instead of eating fast foods in 30 minutes is given by the organisations. Organisations like Bandwidth offer a fitness lunch where members can go home and have lunch or go about playing sport or going to gym for 90 minutes. Organisations like Google offer cafeterias with ready-made lunches and snacks for employees. These have even extended office delivery. The lunch offer does appeal to the team since most people eat. Communal eating encourages interaction between people, thus creating one spot for the intermingling of a diverse and large workforce.

Employee assistance programmes should be offered to all employees and this should include the 'mind component' as well. Organisations like Accenture help employees deal with issues like stress, anxiety, substance abuse and depression.. Work-related stress is therefore addressed outside the workplace with the help of guided support. It is through this kind of programme that financial support can be gained for all workers. Incentives are offered to employees for goals of wellness that they have accomplished. It's through programmes like this that organisations offer empathy in supporting their workers, resulting in employee satisfaction.

Some organisations offer after lunch naps to workers to refresh workers. Organisations like Zappos, Facebook and Assana provide nap rooms to workers to catch an afternoon rest. The flexible work schedules allow employees to refresh themselves with a nap thus renewing their energy. Productivity has been improved as a result, which has been clinically proven. This could involve a walk, extra time

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

or even having quiet time to read. It is true that each person gets energised in different ways, so the need to vary the types of refreshment becomes necessary.

Sometimes wellness challenges are provided to the team. Progress is tracked and the employees can win a health-related prize at the end of the month. The drinking of water is encouraged and physical exercise is promoted. Wellness habits are thus encouraged.

Wellness adventures can be offered by the organisation. So far organisations like Zappos do offer subsidies for fitness, wellness reimbursements and health benefits. Wellness programmes are made optional as a way of getting people away from their desks at work. Wellness adventures are done in a fun way and therefore most people enjoy these. It is at this point that people start focusing on the fun rather than the exercise (Staff, 2019). Wellness programmes as exemplified above point out how the well-being of employees are dealt with in organisations, and in the fourth industrial revolution the modification of such programmes will depend on the informed understanding of the organisation towards needs that may impact on employee well-being in the process. It is in the process of using machines and technology that further understanding of how this impacts on employee well-being shall be unveiled, and the policy makers shall amend the present well-being programmes according to the needs. For example, if the use of machines and technology causes workers to develop certain kinds of cancers or tumours, the organisation may develop a medical policy as well as a preventative exercise for the safety of employees. So far well-being programmes can be considered as acceptable, however, additional modifications to the programmes will need to be implemented depending on the need. Therefore the health of an employee may impact the wellness they may realise. Health and wellness are thus interconnected and interrelated (Upadhya, 2017).

FUTURE OF WORK

There is a hushed transformation taking place in work places, whether in the factory, at the airport, at the restaurant, or even if the work involves simple things like washing clothes, taking a shower, or brushing our teeth. New opportunities are being created in different fields of work such as mental, physical and mechanical work.

The rapid transformation of technology is changing the ways we interact, work and communicate, connecting society and workers in more advanced ways and creating new opportunities. Thus, it has become common to hear individuals articulate their need to upskill themselves if they are to stay relevant for a certain job position in the modern workplace (Forum, 2017).

Additionally, research shows that there is a huge mismatch between job seekers' skills and employers' needs, and this mismatch will become even wider since the fourth industrial revolution transforms businesses and jobs at a speed faster than workers can adapt. Studies conducted by Deloitte (2018) suggest that in exactly 15 years, more than two-thirds of today's children who are less than five years old will work in entirely new jobs that didn't exist before, and the jobs that currently exist will not be based where the job seekers stay. Therefore, the future of work is uncertain and there is a need for employees to upskill or re-skill themselves. Rainie and Anderson (2017) stated that some of the skills needed in the future workplace include soft skills, technical skills, entrepreneurial skills, work readiness skills, critical thinking skills, problem-solving and decision-making skills. Klaus Schwab, the founder and executive chairman of the World Economic Forum (WEF), once said there is an uneven distribution of the working population in the world. According to WEF (2017), there is a 1.8 billion working population that is

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

between the ages of 15 and 29, but the population and its future growth are not well distributed among countries in the world. Also, areas with huge population increases are far behind in education, which in the future will have impacts on employment readiness.

Furthermore, research predicts that by the year 2030 more than one billion youth in the world will not have the qualifications or skills demanded by the emerging global workforce, therefore it is crucial organisations start preparing tomorrow's workforce today for the fourth industrial revolution (Deloitte, 2018). Butler-Adam (2018) predicts that by the year 2020 global businesses will witness a shortage of more than 40 million workers who have a tertiary education, another 45 million workers who possess a secondary education, and surprisingly there will be a surplus of almost 95 million less-skilled workers. These shortages and surplus of workers are yet again not evenly distributed worldwide, therefore, this indicates that there is a huge mismatch of supply and demand in the world. Science skills as well as engineering skills are in short supply. Among the lacking skills are creative thinking and data analysis which are essential in most contexts, and the equipping of employees with these skills becomes something significant within the fourth industrial revolution (Bhuiya, 2020).

The following table shows the predicted demand for employees in 2020.

Table 1. Anticipated demand for employees by year 2020 compared to the anticipated demand for employees in 2030 in some countries

YEAR	2020	2030
BRAZIL	8.5 Million	40.9 Million
CANADA	700,000 – 1.1 Million	2.3 Million
CHINA	55.2 Million – 75.3 Million	24.5 Million
ITALY	2 Million	0.9 Million
SOUTH AFRICA	6.5 Million – 7.8 Million	6.2 Million – 9.2 Million

Data source: (WEF 2016)

The table above points out that some countries are likely to have more jobs than others, for example Brazil is expected to have more jobs than Canada, China, Italy and South Africa in 2030 as opposed to 2020. However it can also be noted that whereas jobs shall be increasing for some countries like Brazil, Canada, and South Africa, countries like China and Italy shall be experiencing decreasing jobs in 2030 as opposed to 2020. As jobs increase in a particular context, so shall the responsibility of enterprises as they deal with employee wellness, whereas countries that shall have decreasing employee numbers may have less burden of employee wellness programmes. It is also important to denote that it is possible for countries that have less employees to have a higher burden of employee wellness depending on how they budget on the wellness programmes for their employees. Nonetheless, employee wellness as indicated may improve productivity and profitability of enterprises and this then does not only become a benefit for employees but enterprises, organisations, as well as departments, whether public or private in nature.

The fourth industrial revolution brings challenges to the supply and demand of skills in global business, even as Figure 1 points out, the nature of jobs that require different skills. It is also obvious that there will be a massive use of robots, automation, as well as sophisticated data which will make supply chain easier and smarter, and lastly, AI for decision making. Due to the changes taking place in terms of

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the nature of jobs and the skills demanded, traditional employment will be reshaped by these innovations and a gig-based economy gets created (Rabeh-Morrar & Saeed, 2017).

Table 1 shows countries are expected to create jobs, however in Figure 1 the kind of jobs created are specifically pointed out. The nature of wellness related to new jobs may differ and policy makers may be expected to address this for enterprise success as well as for the comfort of employees. It is also possible that as new roles get created, new health-related issues become apparent and therefore the wellness of employees will have to address these scenarios. Another predicted skills pattern by the WEF is depicted in the figure below. As to whether this skills pattern requires additional consideration regarding how the well-being of employees shall be catered for is cause for consideration. It is important to note that some skills like creativity have been useful in the past centuries and will continue to be in the future. It is true that the well-being of an employee lends credence to their ability to be creative. Wellness programmes are not the same and have different purposes as they address different issues such as stress management, massages, campaigns, portals, incentives, or corporate nutrition programmes, whereas some offer just wellness management services, as pointed out by Aldana (2020). Further study may need to be conducted to realise the level of value of each of these programmes to the enterprise or department as well as the employee in context. Since the nature of risk may well be related to the nature of jobs, as Figure 1 presents, the employee wellness programmes that address such contexts may be developed by organisations or departments. Some however tend to offer a comprehensive wellness programme.

WORK/FAMILY SATISFACTION AND EMPLOYEES' WELL-BEING

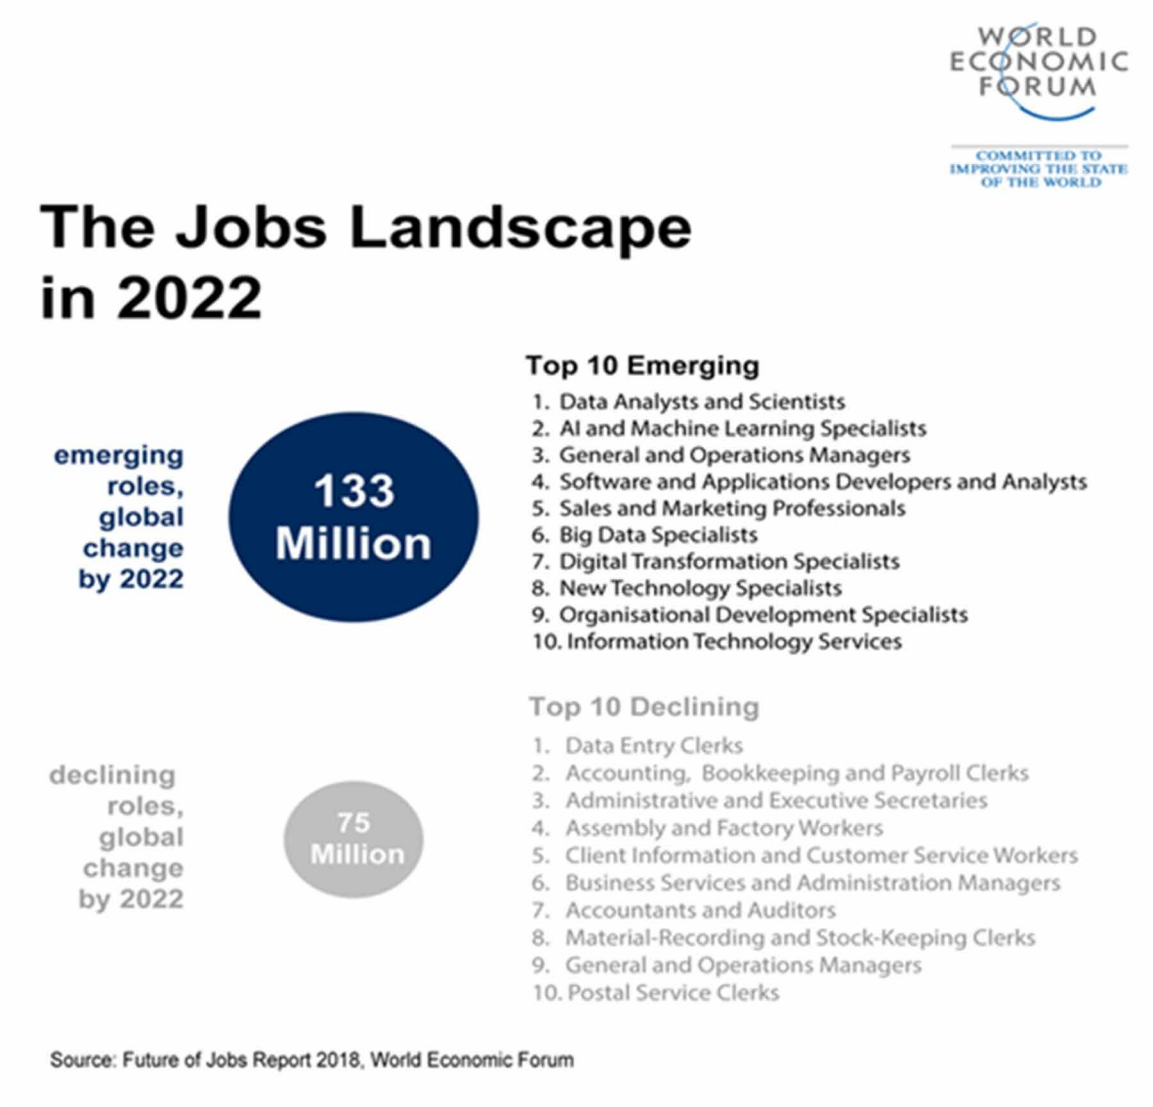
Boxall and Macky (2014) defined employee well-being as a state of being happy, healthy and having all elements of a relationship-oriented person. Some studies show that there are two perspectives when attempting to define employee well-being. The first one is called *hedonism,* whereby it regards employee well-being as happiness-oriented, and the second one is called *eudemonism,* whereby it regards employee well-being as an outcome of personal achievements and the realisation of employees' potentialities and talents (Deci & Ryan, 2006). Diener, Lucas and Oshi (2002) state that individuals' realisation of their life and personal attributes is called subjective well-being (SWB) and it consists of two elements which are life satisfaction and emotional experience. In some cultures, well-being is not examined based on personal attributes, rather it is based on the society in general. For instance, in China, people take into consideration the well-being of the whole society, not just individual well-being (Zheng, Zhu, Zhao & Zhang, 2015).

In the foregoing context, Schultz, Ryan, Niemiec, Legate and Williams (2014) suggested that a healthy workforce enhances employees' well-being and increases organisational performance. Having a job and being able to work is essential for people's health and wellness, nevertheless, a healthy workforce is also advantageous to employers. Employers contribute to the wellness of the employee by creating a good, comfortable and healthy environment for employees in crafting their wellness programmes. In so doing, employees are motivated to perform well in their duties and tasks with increased morale in the workplace. Responsible employers advocate and provide initiatives to encourage their employees' achievement of work-life balance in order for them to achieve positive outcomes in the organisation (Parakandi & Behery, 2016).

Studies show that healthier employees are frequently less absent and are more encouraged to stay at work, they do not easily get sick, and if they do, they recover quicker from their sickness.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. The jobs landscape in 2022
Source: Haanaes (2020)



Some of the benefits of promoting employees' wellness in the workplace are as follows:

- It will improve productivity at work
- It will improve business performance
- It will boost employee morale
- It will increase employees' engagement in duties and tasks within an organisation
- It will also reduce accidents and work-related sicknesses
- It will reduce costs for the business, such as costs of sickness (medical bills, time loss, recruiting temporary staff, among many others).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Shimazu, Schaufeli, Kamiyama and Kawakami (2015) suggested that an organisation that looks after its employees is more likely to succeed. An organisation must prioritise health over work by promoting various wellness programmes in the workplace. These wellness programmes assist employees to maintain requisite physical and mental health to perform well in their duties.

BENEFITS OF WELLNESS PROGRAMMES TO EMPLOYEES

An employer can offer numerous health benefits to employees such as the provision of vaccinations to prevent some airborne diseases like colds and flu.

SOME ELEMENTS OF WELLNESS PROGRAMMES

A study conducted among professional level employees at a metropolitan municipality in South Africa categorised wellness programmes into: a) work strategies - those designed to address work-related challenges faced by employees, and b) family strategies - those that address employee family-related issues. The study found that the wellness programme adopted by the municipality was suited to address family-related issues and not work-related challenges. The study reported as flows: 1) life strategies: domestic relationship counselling, stress management, substance/alcohol abuse counselling, HIV/AIDS counselling, financial/debt counselling, and 2) work strategies: work from home on an ad hoc basis, job share, compressed workweek, telecommuting and career break (Abe, 2015: 432).

However, the following are other examples of initiatives provided through wellness programmes: flexible work arrangements, telecommuting, job share, dependant-relative care and assistance programmes, maternity and paternity leave, straight-forward financial assistance, provision of crèche services in the work environment, counselling and referral services (Bardoel, Tharenou & Moss, 1999; Kramar, 1998; Kossek, Baltes & Matthews, 2011). A number of the wellness initiatives are important but because the fourth industrial revolution shall involve the use of robots and AI, there will be need for humans to develop trust to work with machines and to relate to machines as well (Lewis, Sycara & Walker, 2018). During the fourth industrial revolution, the abovementioned needs are likely to be part and parcel of the system since they address human employees' needs. In a situation where the processes have been automated, then these needs won't be feasible as such, however, the context shall differ as such. Bardoel et al. (1999) recognised 100 kinds of work-family initiatives, showing that several different strategies have been applied within organisations as a means of addressing wellness issues.

The fourth industrial revolution may impact on employee health, and it is reported that America's factory workers' health declined by two thirds yet productivity increased dramatically from 1960 to 2014 (Min, Kim, Lee, WonJang, Kim, & Song, 2019). The use of some of the exercises for workers' health, as pointed out below, may improve a workers' health and organisational productivity as less abseentism due to sickness is realised.

Fitness Programmes

Employers can build a private gym at the workplace or if not, companies may pay for gym expenses. Also, companies can emphasise group exercises after work such as jogging, walking, and rope jumping.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Companies may also do this by establishing sports competitions within an organisation at the end of every month and reward those who win the competitions. For instance, a soccer competition, basketball tournament, swimming competition, a volleyball tournament, etc.

Mental Health Programmes

Mental health is very important to both employers and employees, as stress can trigger various health problems that are serious like heart diseases and diabetes. Companies should establish mental health programmes to reduce depression and anxiety which is common with employees. Mental health programmes like yoga classes and full-body massages will help to reduce stress among employees. Also, companies may encourage employees to leave at a reasonable closing time and not stay behind trying to finish their work. This will improve their mental health and increase productivity. The main cause for withdrawal at work, early retirement, and resignation has been associated to poor mental health (McDaid & Park, 2011).

Social Programmes

Companies should consider offering employees programmes that will help them to get to know each other. These programmes may be conducted far from office environments, for instance, companies may establish a movie night for all employees on the last Friday of each month. Also, a company may organise a night party for all employees to attend. In the process employees get the benefit of first becoming part of a community activity as well as getting to relate with those they would not have related with in the first place.

Community Service Programmes

Some people feel good when they do something great for the community. A company may encourage employees to give back to the community by organising a volunteer day for employees to participate in helping out in the community. For instance, participating in general cleanliness, planting trees or organising a fundraising event that will help to generate funds to solve a certain problem within a community.

GLOBAL TRENDS WHICH WILL ENHANCE AND CREATE WORK/ FAMILY SATISFACTION AND EMPLOYEE WELL-BEING

Various studies have shown that job satisfaction has several benefits. A satisfied employee is more productive, more efficient in his/her work, and performs well, and therefore, improves the firm's profitability (Andrade, Westover & Kupka, 2019) and vice versa. The rapid change of technologies has brought about dramatic shifts like work, quality of work, and job satisfaction.

Job satisfaction has different definitions; various authors define job satisfaction in different ways. According to Azeem and Akhtar (2014), job satisfaction is a situation whereby people describe what and how they feel about their job in various aspects; it's about how people like or dislike the job they are in. Another definition is by Fiksenbaum (2013) who defined job satisfaction as a combination of

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

good and bad feelings an employee has regarding his/her work. Job satisfaction is whereby employees' expectations match with their job rewards. It's where employees feel a sense of achievement in their work.

Findings have shown that the traditional schedule of working from 9am to 5pm creates family conflicts and leads to most employees feeling unsatisfied in their jobs. This compressed work schedule is associated with a decrease in morale and productivity (Honigman, 2017). The traditional working schedule is characterised by strict boundaries that limit employees; it doesn't give employees freedom and flexibility. In this schedule, employees are expected to engage in matters in their own time, therefore, it will lead to work-family conflict and less productivity at work.

WORK-LIFE BALANCE

Work-family balance is a situation whereby an individual is satisfied in his/her area of work and at home with a minimum level of conflicts (Parakandi & Behery, 2016). It is an equilibrium between the amount of time an employee spends at work and time devoted to the family and other personal responsibilities (Greenhaus, Karen & Jason, 2003). Work-life balance enables one to gain freedom on a personal level and also experience liberty from their input at work (Byme, 2005). Work-life balance is necessary in reducing stress and burn out. It is also noted that chronic stress is one of the issues that workplaces tend to have (Kholl, 2018). Therefore the need for work-life balance is an initiative that management needs to ensure exists in the workplace. It is also important to note that as time passes by the demands that need to be considered will definitely differ according to each organisation's context. The organisations definitely will acknowledge the value of enabling their employees to gain a work-life balance as a result. Fredrick (2019) points out 12 examples of work-life balance initiatives that may be valuable for an individual:

- One such example is in the area where policy makers give flexible leave policies in organisations. So instead of limiting particular time off as leave days, they rather consider it as 'paid time off'. This may be an incentive in the fourth industrial revolution as people get more refreshed by getting time away from work. This then could lead to creative abilities that are more heightened as a result.
- Another exemplary initiative that organisations have undertaken is the art of creating an opportunity where employees engage with the community. This has been known to strengthen the team. Indeed one of the things that is necessary in the fourth industrial revolution is corporate social responsibility, since there will be connectivity developed between various sectors and the enterprise.
- The other exemplary activity that some organisations have adapted is the creation of a healthy work environment. It is in the process that organisations not only offer snacks in the workplace but also give employees freedom to choose how they want to arrange the way they sit at work. This freedom is likely to be more prevalent in the fourth industrial revolution as organisations give liberty to workers to even choose a place where they will work.
- Some organisations have also trained their managers to help without necessarily being called. For example they may notice signs of burn out and so they will reach out and help employees. This aspect may not be easy to understand, and whether in the fourth industrial revolution it shall be handled fully given that some of the tasks shall be delegated to machines in the process. This may then mean that humans may receive little attention and could easily feel neglected as a result. This could also cause situations where stress builts up in the process for human workers.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Another example of a work-life balance practice is when flexible scheduling is arranged. This may be slightly different from the routine 8am to 4pm job. However, this is where organisations, departments and entities will give freedom to the employee to finish the task according to the time they can finish it after considering any limitation when it is due.
- One of the examples of a work-life balance is when the organisation is a family friendly environment for employees. In the achievement of this some organisations offer sponsored child care or after school programmes.
- In achieving a work-life balance some organisations end up applying change management techniques. In this case leaders at work are trained how to support their workers during change.
- Another example of work-life balance is when organisations end up offering creative incentives to employees. Offering tangible benefits to the team can boost the morale of employees in the process.
- Another work-life balance example is when employees are given time to nurture their own creativity.
- Providing educational support is one of the ways a work-life balance can be created or enabled to exist. As learning is encouraged, so might productivity be encouraged in the process. In the fourth industrial revolution productivity levels will be heightened and therefore this could be an initiative necessary for the achievement of the goal.
- Creating a fun committee is also necessary for a work-life balance to be achieved. It provides a moment of relaxation in the process.
- Finally it is important to involve the employees in team building exercises. Teamwork strengthens teams and fosters creativity which is a necessary element in the fourth industrial revolution and can boost the company's image in the process.

An individual can meet work and family duties as well as personal responsibilities. Work-life balance involves issues like flexible working time, maternity leave, sickness leave, and parental leave, and time off for dependents. These definitions imply there is a need to establish a good combination between these two issues.

Work-life balance plays an important role in realising employees' performance as well as organisational performance.

The advantages of work-life balance are:

- Reduced turnover in the company
- Improved employee performance
- Bringing about job satisfaction
- Encouraging employees to have an effective commitment to their company, hence creating a sense of loyalty to the company.

THEORETICAL FRAMEWORK

One of the theories used in the area of well-being of employees is the Person-Environment Fit Theory (Caplan, 1987). The theory relates to the employee's well-being, behaviour and how these match the working environment. It is therefore about an individual and how the environmental characteristics match.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

A person's characteristics would include the psychological and biological needs. It is therefore important to note that goals, abilities, personality, value, and needs form the characteristics being pointed out here. While the environmental characteristics do include the extrinsic and intrinsic rewards, the role of the job and the rewards of the job, characteristics of other individuals, collectives in a person's social environment, as well as value and culture help form the integration of the environment. As organisations and enterprises enter the fourth industrial revolution alongside public departments the environment created around the fourth industrial revolution it is likely to dictate the nature of well-being of employees as employees are likely to have lots of work to produce. This work shall be done with technological assistance yet the pressure and need to relax is yet to be revealed as the fourth industrial environment is yet to be studied and understood in its context. Nonetheless, the understanding that organisations, enterprises or public entities may want to accomplish a lot may indicate that pressure to accomplish these tasks, as much as they may be automated this may either positively or negatively impact on the well-being of the employees. It is perhaps too early to give a picture of the environment that shall be available within the fourth industrial revolution. This theory fits in as it deals with environment as well as the individual that is working. In this case the individual can be the employee or worker and the environment can be the work environment involving the use of technology and machinery in enabling productivity to become efficient and productive. The Person-Environment Fit Theory points out the rewards of the job as being part of the environment and therefore in considering the new environment organisations may motivate employees by paying closer attention to their well-being.

Another theory that is useful to deliberate in this chapter is the Conservation of Resources (COR) Theory (Hobfoll, 2001; Hobfoll & Lilly, 1993). The COR Theory is another important theory that places greater emphasis on resources that need to be preserved in the process. These resources can include income. It is true that as technology tends to replace workforce through modifications, thus developed, human employees will have to attain new skills in the process, however in the meantime there can be stress experienced. The loss of income in the case that jobs are lost becomes a crucial concern for those that are affected and as such stress is likely to be encountered. The fourth industrial revolution has untold benefits as well as untold impact that will require detailed study as the revolution unfolds. Nonetheless, the understanding of the fact that stress is one of the issues to be dealt with in the workforce remains to be dealt with, and whether it will be eliminated with the fourth industrial revolution. The two theories pointed out above are related to the well-being of employees or workers as such.

CONCLUSIONS AND RECOMMENDATIONS

Investigating the future of work, work-life balance, and employee wellness is an important task which attracts further investigation of the topic. Promoting wellness programmes in the workplace, encouraging flexibility in work in terms of time flexibility and place flexibility will help in improving work-life balance, achieving job satisfaction, and increasing performance, which will result in the lowering of company's turnover hence increase the company's profitability. In this discussion, the researchers have explained the importance of all these aspects for employees' well-being and the company's future performance. Therefore, a conclusion can be made that work-life balance and job satisfaction are important for the company to generate commitment among its employees. It is concluded that a healthy workforce enhances employee wellness (Haar, Russo, Suñe & Ollier-Malaterre, 2014). Therefore, management support is very crucial within an organisation regarding work-family balance initiatives. Also, globalisation

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and the fourth industrial revolution alerts for immediate measures to be taken to promote workplace flexibility. These call for companies to change the traditional working schedule and adhere to the demands of this era of rapid transformation of technology. This chapter recommends companies to modify their physical and organisational structure and they should target all employees and not only high ranking individuals or executives. It is important for any organisation such as government, NGOs, small-medium enterprises, and big companies to understand the importance of work-life balance and job satisfaction for the future development of these organisations. Research needs to be conducted in investigating not only employees' well-being but also the sustainability of the amount of working experienced by individuals.

Therefore, this study provides a road map for further researches and for organisations to consider the importance of job and life satisfaction of their employees for better organisational and personal results.

Chapter 105
E-Government of Occupational Safety and Health:
Improvement Prospects for a Developing Nation

Marcia Nathai-Balkissoon
The University of the West Indies — St. Augustine, Trinidad and Tobago

K. F. Pun
The University of the West Indies — St. Augustine, Trinidad and Tobago

ABSTRACT

Electronic government (e-gov) has not been implemented as extensively in many developing countries as in developed countries, especially in certain fields, such as occupational safety and health (OSH). This chapter considers e-gov that is effected through the websites of leading OSH bodies in a developing country, Trinidad and Tobago, and two developed nations, the USA and UK. Using a content analysis and comparison exercise, OSH e-gov shortcomings and opportunities in T&T are noted. Improvement recommendations include development of a strategy and strategy execution plan to boost stakeholder recognition of the value of the OSH agency and OSH e-gov in T&T; partnership-building to make resources available for OSH e-gov enhancement; enhanced accessibility and utility via a wider range of media formats to users; better stakeholder responsiveness via engagement with social media and better online support; and increased data collection and analysis in order to drive continual improvement.

INTRODUCTION

It is estimated that almost a third of the US population is comprised of Millenials, a group of youths and young adults who are always connected (Sewake, 2015) to their devices. As a result, this group may also be called the net generation, electronic generation or digital generation (Shih & Allen, 2006), and they have ushered in a communication age that is increasingly online. This group is smart; they use various

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

devices and social media resources to inform their purchasing and other decisions as well as to actually make their personal and work transactions more efficiently.

Indeed, in the past few decades, society as a whole has come to embrace electronic technologies more, so that even older adults have become more digitally competent and more reliant on electronic devices such as smart-phones, laptops, and tablets. In some cases, face-to-face communication has been supplanted by electronic communication as they access social media and online news; upload or download photo, video and audio resources; dash off tweets, blog articles, texts, and emails; post reviews and ratings; and share statuses. Government systems have therefore been increasingly embracing electronic modalities in an effort to reach populations more effectively. Through such e-government or e-gov systems, governments seek to leverage the population's electronic connectivity in order to build their awareness, appreciation, and competence and to encourage sharing of attitudes and access to content (Gil-Garcia, Helbig, & Ojo, 2014).

When it comes to ICT access and use, Losh (2013) reports that a digital divide exists not only due to generation differences, but also due to differences in education, gender, and ethnicity in users. One concern that arises with e-gov systems is the disadvantage potentially created for lower socio-economic brackets, whose constrained access to internet and communication technology (ICT) and lower levels of ICT skill reduce their ability to "access and use ICT to promote well-being and prosperity"(United Nations Department of Economic and Social Affairs [UNDESA], 2014, p. 9). Since developing nations reasonably enjoy lower standards of living than developed nations, these lower socio-economic challenges also apply. Thus, developing nations must aggressively work to bridge their ICT gaps (i.e., updating and leveraging ICT technologies and applications), or there is likely to be a widening economic divide between themselves and the first world, which continues to forge ahead with ICT enhancements (Ndou, 2004).

Over the past several years, The Republic of Trinidad and Tobago (T&T), a developing nation, has actively worked toward e-gov system development and rollout in many areas. A 2014 assessment by Nathai-Balkissoon and Pun (2016) identified several shortcomings in the e-government systems for Occupational Safety and Health (OSH) Management. Their view was that OSH had not been a high-priority area, even if the International Labour Organisation [ILO] (2009) recognised it as a critical field of practice for developing companies. With respect to T&T, OSH has an important role to support the efforts of government and industry to diversify the economy from oil and gas, develop more small and medium companies (Nathai-Balkissoon, Maharaj, Guerrero, Mahabir, & Dialsingh, 2017), and support international and regional efforts to provide decent work (ILO, 2017; United Nations Development Programme, 2017). E-gov systems have already proven their utility in boosting safety: social safety in Brazil, food safety in the USA, fisherman safety in T&T (UNDESA, 2014; 2016), and it remains to be seen whether T&T's OSH e-gov system has advanced significantly since the aforementioned 2014 assessment.

In T&T, e-gov has also begun to expand to include OSH matters but more is needed to be truly effective. Updating the work from Nathai-Balkissoon and Pun's assessment, this chapter reports a content analysis that compares the 2017 incarnation of T&T's OSH e-gov site with those of the United States of America (US) and United Kingdom (UK) and suggests how some of the recognised initiatives may be used for T&T's case. The focus is on answering the following research questions:

1. What approaches are used on primary OSH websites of the UK and the US, two of the world's leading OSH and e-government nations, to enable strong OSH e-government?
2. How does T&T's primary OSH website compare to those of the UK and the US?
3. How should the T&T OSH website be enhanced to practice better OSH e-government?

LITERATURE REVIEW

E-Government

Definition of E-Gov

E-gov is typically defined according to its purpose, but which purpose may vary widely. The World Bank (2011, para.1) provides the following definition:

E-Government' refers to the use by government agencies of information technologies (such as Wide Area Networks, the Internet, and mobile computing) that have the ability to transform relations with citizens, businesses, and other arms of government. These technologies can serve a variety of different ends: better delivery of government services to citizens, improved interactions with business and industry, citizen empowerment through access to information, or more efficient government management.

Though several years have passed since this World Bank definition, e-government seems to have remained focused on similar themes, though there may be more elements of social media and direct interaction with citizens than ever before. According to the United Nations UNDESA (2016), these are the international trends that are now emerging: significantly more countries are using e-government platforms to make services more accessible to the public, to make their public institutions "more inclusive, effective, accountable and transparent" (p. 2) in line with the 2030 Agenda for Sustainable Development, and in particular Sustainable Development Goal 9, and to boost ICT and wireless access to everyone (and especially to those in developing countries).

Areas of Focus of E-Gov

According to the Accenture Institute for Health and Public Service Value (2009), e-gov strategies may be:

1. **Outcome-Focused:** Seeking to bring about social and economic conditions, improving public service efficiency and effectiveness, or gathering customer feedback (see ECOSOC (2015) which highlights the need to study the effects of policies on sustainable development outcomes),
2. **Balance-Focused:** Seeking to measure and ensure reach and accessibility across target sectors or citizen profiles (see UNDESA (2016) reports recommending that information should be comprehensive and balanced so that stakeholders are able to make informed decisions and so that progress takes place across all outcome areas, to maximise synergy),
3. **Engagement-Focused:** Providing networking and education tools to build user connectivity and learning (this was set out by the United Nations General Assembly (2015) in UNDESA (2016)), and
4. **Accountability-Focused:** Enhancing transparency by enabling users to share experiences, results, or track complaints to resolution. This is in line with SDG 16, which calls for institutional accountability among other things. Populations are increasingly having input on the goals and targets to be set and reported upon by governments, and open government data and statistical reports are often made available via e-gov systems (Open Data for Development Network, 2017).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The UNDESA (2014) and the US Department of Labor [USDOL] (n.d.) focus heavily on serving stakeholders with priority placed on such e-gov-to-stakeholder communication types as G2B (government to business), G2C (government to citizens), and G2G (government to government). Other recognised e-gov interactions include G2N (government to NGOs) and G2E (government to employees) (Fang, 2002). ICT enables sustainable development by improving coordination, communication and collaboration in diverse fields (Zelenika & Pearce, 2013). Even as internet-enabled technologies become more pervasive, it is notable that various electronic technologies such as the television, radio, telephone and Short Message Service (SMS) text messaging listed by Boujarwah (2006) still play notable roles in e-gov operations. Government Information Systems (GIS), the Internet of Things (IoT) and open data are some aspects of the newer technological advancements that have the potential to boost accountability and fight corruption, though there is also a need to ensure that data is trustworthy and safe (Liu and Lin, 2012; Gathungu and Mungai, 2013; Levy and Johns, 2016; Mayernik, 2017).

When addressing the issue of engagement, accessibility is a prime consideration. Sutton (2017) highlights that, beyond developing an aesthetically-pleasing presence that meets user needs, websites should pay special attention to accessibility for disabled populations especially when safety matters are being addressed, not only for reasons of convenience but also in order to proactively manage crisis situations.

E-Gov in T&T

In T&T, the National ICT Company Limited (iGovTT) has been tasked to roll out e-gov services and connect key stakeholders (Government of the Republic of Trinidad and Tobago [GORTT], 2011). GORTT (2012, p. 5) has spoken of "the transformative potential of ICTs and the Internet". This derives partly from the potential for enhanced knowledge management, by bringing pertinent and updated information to stakeholders and promoting individual, group, and even organisational learning (Pemberton & Stonehouse, 2000; Pun & Nathai-Balkissoon, 2011). The country's e-gov outreach includes a TTConnect government portal for all ministries, internet service available at schools and national libraries, GovNeTT intranet connecting government to all Ministries, and a single electronic window (SEW) for lodging trade and transport documents via one electronic access point (GORTT, 2011).

T&T ranked 91st of 193 countries on the UNDESA (2014) e-government development index (EGDI) survey, but two years later its efforts to strengthen its e-gov systems were propelling it forward in world rankings so that its rank charged ahead by 21 places, propelling it into the high EGDI bracket (UNDESA, 2016). T&T's EGDI score was 0.5780 (rank 70) compared to 0.9193 (rank 1) for the UK and 0.8420 (rank 12) for the US. T&T's component scores all increased in 2016 compared to 2014: online service (0.5290 from 0.3307), telecommunication infrastructure (0.4973 from 0.4543) and human capital (0.7077 from 0.6945).

In 2014, T&T was among the top 10 small island developing states (SIDS), but it lagged four smaller Caribbean nations, namely Barbados, Antigua and Bermuda, St. Kitts and Nevis, and Grenada. By 2016, Barbados outperformed T&T in two of the three EGDI components, namely telecommunication infrastructure and human capital, but T&T was second only to Barbados in the region. The online service component was T&T's second strongest component, but it was important, as it considered citizen empowerment, online communication and transactions. If OSH e-gov improved in these areas, it may have been a contributing element toward the improved T&T ranking, though this was not specified in the EGDI report.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Importance of OSH E-Gov

If not properly addressed, OSH has severe and costly implications for society, government, and businesses (European Agency for Safety and Health at Work [EU-OSHA], 2014; Elsler, Takala, & Remes, 2017). Indeed, the ILO estimates that 3.9% of global GDP is lost as a result of work-related injuries and illnesses (Safety and Health Practitioner, 2017), and Elsler, Takala, & Remes (2017) caution that the cost of work-related accidents and illnesses is proportionally higher for less-developed countries. While OSH may be perceived as a technical field, its practice is critical to promote the safety of all people. Good workplace conditions, like those that may be achieved through proper OSH implementation, yield significant economic gains (EU-OSHA, 2010; Schwab, 2013). Moreover, the ILO (2009) points out that there is a moral imperative to use resources efficiently and to protect workers by properly implementing OSH.

Safety legislation, coupled with supporting guidelines, codes of practice and standards are commonly used worldwide to establish minimum practices and conditions for safety in the workplace. In T&T, the legislation is referred to as "The Occupational Safety and Health Act (2004), as amended (2006)" (the OSH Act) (GORTT, 2004; 2006). T&T's safety practitioners have noted that safety management system implementation varies from sector to sector, and industries are often extrinsically motivated to comply with safety legislation. Extrinsic motivators include, but are not limited to, the modern need to meet tender requirements or win contracts (Energy Chamber of Trinidad and Tobago, 2007) and the time-honoured concern of avoiding sanctions for non-compliance (Gleason & Barnum, 1978). On the other hand, safety management systems may be weaker in some industries, and reasons for this can include unavailability or inaccessibility of expertise/guidance as a result of lower resource availability (Surienty, Hong, & Hung, 2011).

There is a need, therefore, for OSH e-gov systems that sensitise stakeholders and make resources available to support national OSH development (Nathai-Balkissoon & Pun, 2016).

THE METHOD

In the first decade of the 2000s, many studies and papers were published that focused on evaluating e-government websites that served as central portals to a wide range of government services. However, in the second decade, this type of work has declined as general e-gov portals are more commonplace and the guidelines and expertise may by now be well established. Less focus has been placed on evaluating e-government websites dedicated to narrower functions such as Occupational Safety and Health Administration, which is the focus of this chapter. Since little recent guidance is available to carry out an evaluation, some earlier evaluations are used to guide the exercise addressed in this chapter.

E--gov websites may be evaluated by qualitatively observing and quantitatively measuring the sites' performance. Among the areas typically evaluated are outcomes, balance, engagement, and accountability (Accenture Institute for Health and Public Service Value, 2009). The Australian National Audit Office (2004) evaluated website efficiency and effectiveness by looking at costs, benefits, service delivery, productivity, and return on investment measures. It considered issues like user visit patterns, site traffic data, accessibility, usability, information accuracy and usefulness, and stakeholder satisfaction to assess effectiveness. Included in these issues would be the use of websites, databases, videos, audio clips, and social media such as Twitter and Facebook.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Quantitative data judgements are beyond the scope of the work reported in this chapter, since the focus is on observing how various structural and content elements are being incorporated into the selected websites to promote OSH using e-gov modes. The focus is trained on the uses made of electronic media to ensure site usability (Granizo, Yanez, Ramirez, & Machado, 2011) and accessibility (Abanumy, Al-Badi, & Mayhew, 2005).

Areas of Focus

In this chapter, a simple content analysis approach is used, allowing consideration of elements such as content, intent, messages, and context in order to make judgments about the information sources (Krippendorff, 2004). The judgements made are intended to highlight the similarities and differences between the OSH e-gov site of a developing nation (T&T) and two developed nation sites (the UK and the US). Specifically, the OSH websites' usability and accessibility were evaluated according to three considerations, namely accessibility and support information, provision of technical content for stakeholders, and range and availability of electronic media resources. Figure 1 outlines the sub-elements under the three areas evaluated.

Information Sources

The US OSHA 30-hour general certificate and UK NEBOSH general certificate are among the most popular OSH qualification programmes pursued in T&T, perhaps because many of the country's multinational companies are headquartered in those two nations. In addition, as mentioned earlier, both the UK and the US are highly ranked internationally in the UNDESA's (2016) EGDI. For these reasons, this chapter is structured around comparing the OSH e-gov approaches of the TTOSHA website with those used by the main OSH website of these two nations.

Steps Followed

The actual evaluation followed four main steps, namely evaluation of the UK website, evaluation of the US website, evaluation of the T&T website, and lastly comparison of the T&T website elements to those of the UK and US. The comparison was used to recommend how T&T OSH e-gov could be improved, and to propose further work prospects. Figure 2 provides a summary of the steps followed in the evaluation.

FINDINGS

UK OSH E-Gov

The major OSH legislation in the UK, the Health and Safety at Work (HSW) Act, was implemented in 1974. OSH legislation enforcement, development, and review, as well as some research and statistics generation are performed by the Health and Safety Executive. The UKHSE website (HSE, n.d.), located at www.hse.gov.uk, is briefly evaluated in this section.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. The e-government considerations used to evaluate OSH websites in this study
Source: Nathai-Balkissoon & Pun (2016).

1. Accessibility and Support Information including:
    - Metadata Elements (Site Map/Index/Website Organisation Map/Online glossary)
    - Frequently Asked Questions (FAQ)/Help page/Search feature)
    - Website Accessibility (Catering to Special Needs Users/Inclusiveness/Languages/browser selection/Look and feel of website)
    - Usability (Feedback Gathering/Complaint Filing)
    - Privacy (Registration/Sign-up programmes/confidentiality statements)
    - About Us (History/Background/Focus/Contact Information/National Call Centre)
    - Job vacancies listings/job boards

2. Provision of Technical Content for Stakeholders including:
    - Targeting Stakeholder Categories
    - Treatment of At-Risk Groups
    - Page Links to Law and Regulations
    - Dataset Access/Query Facilities
    - Training Information and Programmes
    - Links to download Free Publications
    - Links to Publications for Purchase
    - Links to other government/non-government bodies in field of OSH
    - Consultations

3. Range and Availability of Electronic Media Resources including:
    - Website URL and Name
    - Sharing/Social media (Facebook/YouTube/Twitter/Google+/Blog/Mobile app/ Rich Site Summary (RSS) feeds)
    - e-newsletters/ e-magazines
    - Posters, PDF documents, and PPT Slideshows
    - Audio recordings/audio podcasts
    - Video recordings/video podcasts
    - Web-based training/virtual seminars
    - A What's New page/Trending topics
    - Currency (Updates)
    - Online Contests

Accessibility and Support

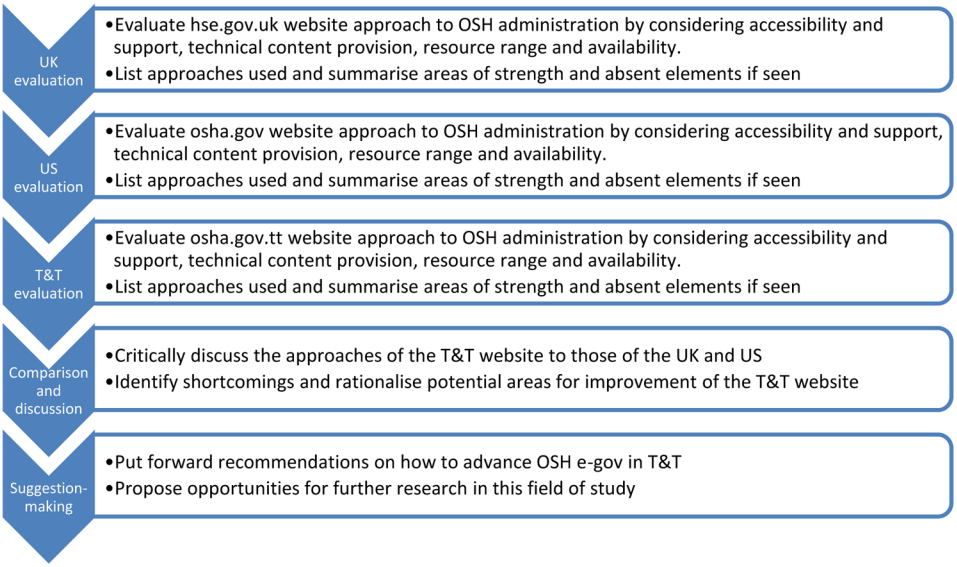
The UKHSE site has a deceptively simple appearance with attractive images on every page and only six main tabs (Home/News/Guidance/About You/About HSE/Contact HSE) separating the content. It is very intricately designed, making broad and deep information freely available to users. Hovering over a tab activates a drop down menu listing several subtopics which the user may select. At the bottom of the homepage runs a ribbon from which support information may also be accessed, including a detailed site map that lists subsections under each tab heading, an A to Z index of topics, and an acronym listing. There are both a search bar at the top of every webpage and a search link built into every page footer ribbon. Additionally, there are search links within some webpages. The "News" dropdown menu appeals to modern access modalities, allowing users to subscribe to e-bulletins and RSS feeds, providing HSE

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

press office links, and archiving HSE press releases. Two features (the "Chair's Blog" and "Health and Safety Myths") are inactive, but remain available as archives via the "News" dropdown menu.

In the "Guidance" webpage, search boxes allow content to be accessed by Industry or Topic. Convenient access to information is also facilitated with a "Frequently asked questions" (FAQ) page and two panels titled "For businesses…" and "For workers…".

Figure 2. The study approach



Meeting the needs of users with disabilities is an obvious priority for the UKHSE. An "Accessibility" tab is prominently placed at the top right of the homepage, and repeated at the bottom right for good measure. The visually impaired and others are able to vary text size, colour schemes, navigate using keyboard instead of mouse, and access captions or transcripts for many videos. There are also tips on improving accessibility when using various browsers. The HSE's Accessibility Policy is shared together with sites such as the BBC's "My Web My Way" (BBC, 2014) and the Web Accessibility Initiative (World Wide Web Consortium, 2012), to provide guidance on how to make the best use of accessibility options for users with communication challenges. The site also allows users to optimise content for viewing on mobile devices. While the website is available in English, the footer bar includes a tool leading the user to information created in 19 other languages. Besides, the site is open access and only requires an e-mail address if a user wants to subscribe for free updates. There is an "About You" panel that appears to the left of the "Accessibility" page. It provides general information that users may seek, such as copyright and disclaimer statements.

A special effort has been made to simplify the process of giving feedback throughout the site; on each page there is a "Rate this page" tool that a user could use to award between zero and five stars to any webpage within the site. This is immediately followed with the option to select a reason for the rating given by choosing from among five options that present themselves. The HSE also seems to value open data sharing, since it makes its website usage statistics readily available as well. The UKHSE site actively

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

encourages user feedback, with a section of the "Contact HSE" page supporting lodging of complaints about HSE services. The complaints handling procedure is also outlined on the webpage. Also, reporting concerns about OSH in the workplace is possible via several online forms.

The "About HSE" webpage provides information about HSE history, work focus, strategy and plans, board and senior management, organisation structure, stakeholder collaborations, and annual reports. Clicking on the "Contact HSE" tab opens a main webpage organised into several boxes, many with attractive graphics related to one of a series of reasons to contact HSE and providing links for reporting and other communications. There is also a "Careers" section that details individual vacancies, and "HSE Jobs eBulletin" updates can be accessed through e-mail updates. The "Ways to contact HSE" link shares telephone contact information and allows use of an online advice form, but an email contact was not readily seen.

Provision of Technical Content for Stakeholders

The site targets workers, employers, and other audience groups through "Are you…" and "How to…" drop down links in the "About you" tab. In the "Guidance" tab, sample risk assessments, interactive tools, and templates provide help that fits SME industry profiles. User targeting is also evident from the provision of materials about protection of at-risk groups, specifically children, young workers, expectant or new mothers, and those at risk of infection. Users are able to access legislation and related content via the website. The "About HSE" tab includes links to all Acts owned and enforced by the HSE, and legislation explanations, news, and supporting information are shared via additional links. Approved Codes of Practice and guidelines to aid stakeholders in complying with statutory requirements are also shared in the "HSE's work" panel, via the "Legislation" link.

A "Statistics" page is available within the "About HSE" page. The links within this page allow users to access annual UK statistics summary reports, search for data, graphs, and reports by topic. In 2014, a "HandS-On" Statistics Data Tool was available for injury and ill health data access and manipulation, but this could not be located in this 2017 review. The HSE also provides a "Shared Research" link on the page, inviting sponsorship and other collaboration to conduct research projects on important health and safety themes. Technical materials abound on the site, and are mainly available through the "Resources" tab. Users may download PDF brochures providing information about duties, as well as implementation guidelines. Links to Government, legal, publication, statistics collection, IOSH and EU-OSHA websites are also provided at various points.

Range and Availability of Electronic Media Resources

The HSE site incorporates several electronic media types. HSE site content (e.g., RSS feeds) is compatible with and accessible via several mobile apps. In terms of HSE-created apps, only one (that supports land use planning) seems to have been rolled out to date. HSE news may also be received by Twitter, e-mail, and third party mobile apps. Sharing of content takes place via the HSE Press Office Twitter account "@H_S_E", and users may also e-mail and print content. The HSE Chair no longer appears to have an operational blog.

Users would find it easy to stay abreast of changes in the field and new materials being shared if they visit the "What's new in free leaflets" page (available via the path "Guidance>Resources>What's new in free leaflets") or subscribe to any of scores of e-bulletins based on user categories, industries, topics,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

resource types, news, and other selections. E-bulletins are available by e-mail, podcast, RSS, or SMS text message to share breaking news and core OSH material by industry category or topic, and even statistics. Archived and current newsletters, leaflets and news feeds are also available by RSS. Links in the "News" tab provide access to press releases and regional press releases.

Some critical leaflets and the health and safety law general information poster are also available in MP3 audio format and are referred to as "Talking Leaflets." Short "WorkSmart" videos have been developed as part of safety campaigns; these and several longer videos are available to tell stories, share first-person perspectives, and create big impact on the viewer. A health and safety law poster, several hazard-recognition and mitigation posters, PowerPoint slideshows and pdf publications are all available for free download. The HSE also makes available a guideline book called the "Health and Safety Toolbox", which may be physically purchased or downloaded free of charge. It is supplemented with free e-learning materials through "the health and safety toolbox microsite." The site uses "How Do I?" and "I work in..." prompts to customise material to users' drop-down menu responses. Many case studies, publications, and research outcomes are shared through the website to highlight poor as well as good practices, and to enhance user understanding and learning.

US OSH E-Gov

In the US, OSH legislation is headed up by an Occupational Safety and Health Act, which was passed in 1970. Through it, the USOSHA has functioned as the agency responsible for enforcement, outreach and several other duties related to OSH. Subordinate to the USDOL, USOSHA uses several electronic manifestations, including its website www.osha.gov (OSHA, n.d.), to support its e-gov efforts.

Accessibility and Support

The USOSHA site has a busy design and is full of content that is largely structured across nine tabs (About OSHA/Workers/Employers/Regulations/Enforcement/Topics/News & Publications/Data/ Training). There is now the ability to hover over tabs to preview subsections as is the case with the UKHSE site, and clicking on a subsection link loads various webpages directly. As this site is very comprehensive and wide-ranging, the focus in this section is to point out some of the main features of the USOSHA site.

While there is no site map, there is an A to Z index of topics. Users may perform searches using a search box at top right of every webpage or, via the "Topics" tab, they may access the site's searchable "Safety and Health Topics Pages". Finally, convenient access to popular query responses is supported through the "Topics" FAQ page, which is also available in the ribbon at the bottom of each webpage. The "Workers" tab also provides a link to "Worker FAQs". At the top left of all FAQ pages, users are given additional options to "Search OSHA" and "Ask OSHA". The USOSHA homepage makes use of a large and prominent image carousel that features four of USOSHA's highest priority, current issues. In a season where heat stroke and extreme stormy weather both challenged the US, two of the carousel issues were dedicated to heat safety and hurricanes. The other two issues were the proposed amendment of a standard and the site's new ability to support electronic reporting of injuries and illnesses. Hovering over an image indicator button pauses the image rotation, allowing the user to review the image at leisure.

The USOSHA site boosts accessibility to users by allowing viewing in either English or Spanish and also provides a few documents in up to 12 other languages. Transcripts are available for many audio and video documents. The site's accessibility notice directs users to the DOL webmaster's email to obtain help

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

with any problems experienced while using assistive devices such as a screen- or Braille-reader. A link to the Freedom of Information Act is also included at the bottom of the page, committing to provide all information requested in writing, subject to certain named, legislated exceptions. No sign in or registration is required to use the site, and only an e-mail address is needed if subscribing to receive free updates.

The "About OSHA" webpage provides plenty of useful information, including mission, organization structure, leadership, and strategy of the USDOL and/or OSHA. On the page, there is a "Contact Us" link that provides e-mail, phone, and postal contact details. A myriad of ways to connect with USOSHA are listed as well, including Facebook, twitter, YouTube, Instagram, Flickr, RSS feeds, and newsletter subscriptions by email. Finally, a "Careers" link redirects to a page of DOL job opportunities. USOSHA provides many options for users to give feedback and lodge complaints. Users who wish to lodge a complaint are specifically instructed to phone OSHA directly. There are also links to report broken hyperlinks and make quality correction requests within the "Contact Us" webpage.

Excellent support is also provided for users who wish to share OSH-related reports. The "Employers" and "Contact Us" tabs allow injuries, illnesses, and fatalities to be reported via phone, fax, or an online form. The "Workers" tab and "Contact Us" tabs provide email, online, and phone/fax routes for workers seeking to file safety and health complaints or even whistle-blower complaints. USOSHA prominently outlines its commitment to workers experiencing employer retaliation after filing a complaint.

It is admirable that USOSHA boosts material usability by presenting a wide range of data and information. Links take users to sites that provide raw/original sources of data, fact sheets, statistics reports, and even visualisations that range from charts, graphs, tables, and even maps in html and pdf formats.

Provision of Technical Content for Stakeholders

The USOSHA website focuses primarily on workers and employers, and also provides material that would be of use to those performing training and consultancy roles. On-site consultation is available free of charge, especially for small and medium enterprises (SMEs) seeking OSH compliance help, and an interactive US map is provided to help employers locate their local consultation offices. There is also a QuickStart compliance assistance tool that focuses on the employer groups of most concern to OSHA – small businesses, general industry, construction, and health care. At-risk groups are the focus of materials provided to address protection of young workers, pregnant women, and those at risk of exposure to bloodborne pathogens and violence.

In terms of legislation and related documentation, the website included links to the OSH Act, Federal Regulations information, and the full range of OSHA Standards. The site encourages public consultation by placing a link to items that are "Open for comment". Via the "Data" tab, downloadable data packets are available by year, and work-related injury and illness data are reported according to various focal areas (e.g. industry, state, and year). Statistics links sometimes connect the user to other government sites, such as the Bureau of Labour Statistics and the US Census Bureau, putting original data and statistics at user fingertips.

Free OSHA and other training materials are available through links provided. Additionally, there are several free subject-specific web-based training tools and checklists. The USOSHA site points users to several USOSHA-administered training programmes, and best-practice information is also shared for OSH trainers to improve their effectiveness. Detailed html and/or pdf publications are downloadable on a wide range of topics and there are also a few downloadable e-books. "New Items" and "Hot Topics" are given prominent blocks on the "Publications" page and there is also a "What's New" page under the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

"News & Publications" tab. The publication listing is searchable and users may order for publications online, by phone, or by mail, if hard copies are desired.

Though not easily located on the site, a search revealed a page that features OSHA international collaborations up to 2015, and links to international organisations such as the ILO, EU-OSHA, and the World Health Organisation (WHO). Hyperlinks are provided to main USDOL and other US government websites, campaign partner sites (e.g. NIOSH), and OSHA training institute education centres.

Range and Availability of Electronic Media Resources

RSS Feeds are available for users who want updates from the Federal Register, interpretations of regulations, news releases and the free QuickTakes newsletter. This newsletter is also available by e-mail. The website's "What's new" page and Twitter account highlight the latest updates and a "News Releases" page provides releases sorted by topic, and fully searchable within the page.

The site's resources support training and awareness, too, using scores of free, high quality items that are available for download via the "Training" and "Publications" webpages. The materials ranged from very impressive training videos (real-life and animated), photos, pictograms, newsletters, slideshows, forms, reports, text documents, and brochures to laminatable wallet cards and QuickCards, bulletins, posters, transcripts, e-books, booklets, and even bookmarks. Electronic materials included an extensive array of mp4, pdf, html, mp3, gif, eps, jpg/jpeg, epub, mobi, ppt, doc and xls formats.

T&T OSH E-Gov

TTOSHA is the national focal point for OSH in T&T. In T&T, there exists a single access point at www.ttconnect.gov.tt to provide e-gov services to the public. The Ministry of Labour and Small Enterprise Development links to TTOSHA, its subordinate agency, through a "Become OSHA Compliant" link on its www.molsmed.gov.tt website. The eGovernment approaches of the TTOSHA site www.osha.gov.tt (Occupational Safety and Health Authority and Agency, 2011) are evaluated in the next section.

Accessibility and Support

The TTOSHA website content is only available in English and is freely accessible by any users. Hovering over some of the site's nine tabs (Home/About Us/OSHA Services/Enforcement/Legal Requirements/ News and Events/Careers/ Contact Us/Resources) activates drop-down menus, while clicking on some tabs opens webpages not included in the drop-down menu. On the homepage, a five-image carousel draws attention just below the main menu bar. The image topics are Refusal to Work (which leads to a one-page document), Request for Proposals (which leads to a page that is also available under the main menu tab "OSHA Services", Job Vacancies (connecting to the "Careers" main menu page), and Protect Yourself at Work followed by Safety and Health (both of which do not redirect the user beyond the homepage). The carousel includes five indicator buttons, but there is no way to pause the carousel. The page does not appear to be updated regularly, as half of the homepage is dedicated to promoting the National OSH Week, which passed over four months ago.

No specific resources have been included to enhance accessibility for different user needs. To find information, users must browse the content or use the search box at the top right of every webpage. There are no FAQ, index, site map, rating tool, feedback link, or online feedback form, but there are OSHA

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

telephone and fax numbers as well as a telephone hotline. Also, there are no e-mail addresses listed on the site so a user wishing to contact TTOSHA can only do so by phone, fax, or in person.

The "About Us" page gives an overview of the focus and functions of both the OSH Authority and its enforcement arm, the OSH Agency. This section presents brief value, vision, and mission statements, and lists executive-level office holders. An entire tab is dedicated to careers, although there are no drop-down items. Copyright, terms of use, and privacy information are located via the webpage footer. Also, a ticker tape runs across the base of the homepage. It features links to some interesting OSH magazine articles available at www.ohsonline.com.

Close to the bottom of the homepage, four pictographs (titled Health & Safety, Hotline, Safety Corner, and Tenders) are prominently placed, though two contain no useful information and do not redirect elsewhere. One pictograph shares TTOSHA's hotline number, and the last redirects to the Request for Proposals page available via the main menu bar and the image carousel (both also on the homepage). It is notable that one of the proposals requested was for development of the TTOSHA website.

Provision of Technical Content for Stakeholders

Under "Enforcement", webpages reflected OSH Act duties and/or rights of four stakeholder categories, namely employers, occupiers, employees, and the final group, importers, designers, and suppliers. No materials specifically focusing on at risk groups were available on the site. In "Legal Requirements", an OSH Act link leads to a short piece about the act and hyperlinks to a few older regulations that are still in force. There is no link to allow users to find and read the OSH Act itself, but excerpts are available under "Resources" to inform users of requirements related to accidents, major construction work, occupational disease, and injury. Clicking the "Resources" tab opens a page that provides links to local and foreign stakeholders as well as the websites of other OSH institutions and related organisations.

Other than the 10 brochures available for download (two others are shown but not downloadable) within the "Resources" tab, there are no training-related materials available. The site has no e-commerce capability, nor does it offer material for purchase in any other way. There is a noticeable absence of statistics on the site, as well. While webpages (namely OSHA Accidents, OSHA Inspections, OSHA Inspections Breakdown, and OSHA Activities) are reserved under the Resources>Research and Data link, these have remained empty since at least 2014. Besides, clicking on the "Resources" tab brings up a page titled "Stakeholders" with links to local, regional and international stakeholder websites. Some additional technical resources may be located by users who take the time to look for them.

Range and Availability of Electronic Media Resources

There are limited resource types in use on the website. Social media buttons are notably absent from the site and TTOSHA does not appear to yet have a presence of its own on social media sites, blogs, mobile apps, or e-newsletters. An RSS icon does appear at the bottom of the homepage within the ticker tape, but this RSS feed links to articles from another organisation, the OHS online magazine. The only available documents are 10 of the 12 brochures mentioned before, and they come in one of either png or pdf formats. Audio and video files, posters, slideshows, and web-based training materials are not yet available on the site either. A search for various file formats did not reveal any other materials as being available on the site.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

A "News and Events" tab leads to a calendar, a short "News and Events" page, and a photo gallery. The calendar is unmarked for every month of 2017, the last news piece advertised the National OSH Week that passed over four months ago, and the photos appear dated, several reflecting the culture of the organisation and T&T, rather than OSH matters. The website does not allow subscription to updates or news.

COMPARING T&T'S WEBSITE TO THE UK AND US WEBSITES

It would be reasonably expected that given their significantly longer years of experience with developing and using their own OSH e-gov systems, as well as their greater resource bases, the UK and US OSH e-gov websites would be considerably more advanced than that of T&T. Thus, value can be derived by critically examining the gap between the TTOSHA site and the other two, in order to identify what improvements could be effected. The TTOSHA website is functional, and undoubtedly offers a beneficial service to stakeholders who use it. However, it is much more basic than the UKHSE and USOSHA websites. In terms of accessibility and utility, both the UK and the US sites appear much more user-oriented and performance-driven than the T&T site, as discussed in this section.

TTOSHA should be aiming to provide its stakeholders with convenient access to useful, relevant information. Currently, even some of the most basic information remains absent from or significantly lacking on the site. Although some improvements to TTOSHA have been noted since 2014, in comparison to the UKHSE site, TTOSHA still uses few pictures to boost site appeal, and too many tabs are being used to span the limited offerings currently available on the site. Further, TTOSHA has not stepped up enough to capture the attention of its stakeholders and prove its relevance/value to them; resource searchability, regular news updates/advisories/press releases and social media modalities are severely lacking, and OSH events are not regularly scheduled and advertised.

According to the HSE (2003), guidelines are necessary to help users interpret and comply with legislative requirements and to give them technical advice that might make legislated requirements better understood. While the TTOSHA site makes some guidelines available as free brochures, these are too limited in topic scope and number to adequately meet stakeholder needs. TTOSHA does not provide users with sufficient information about the OSH Act, interpretations of the intent and mandates of the OSH Act, and standards, codes of practice, or enough guidelines to assist users with understanding and complying with the OSH Act's requirements. Perhaps most surprising is the absence of a link to the OSH Act, even though TTOSHA is the lead body responsible for OSH in T&T. It is not clear why this is so, since the country maintains a hyperlinked repository of all of its laws within its legal affairs website (Ministry of Legal Affairs, 2013). In terms of materials targeted to various stakeholder groups, there are only 10 downloadable brochures and there is no facility for filtering of information depending on the type of user visiting the TTOSHA site.

In comparison, the UKHSE and/or USOSHA provide such a breadth of materials (e.g. legislation, standards, codes of practice, interactive tools, books, videos, audio files, slideshows, pictures, bookmarks, summary cards, maps, tables, graphs, and charts) that there is no doubt that the needs of workers (and especially at-risk groups like young workers and pregnant women), employers, and trainers are more than adequately supported. Choices abound so the developed-nation users can access answers or locate resources using a search bar, site map, index, glossary, or FAQ pages.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Considering that some of today's trends include a convenience mentality and technology assimilation into everyday life, the range of media files shared on the TTOSHA site is far too limited; only pdf and png files were available. TTOSHA must be cognisant of the fact that a large portion of the T&T population are digital natives: tech-savvy users who remain ever-connected via social media and other online modalities (Prensky, 2001; Palfrey & Gasser, 2008). They are likely to be accessing much of their information and connecting with others through their mobile devices rather than face-to-face. Building a culture of safety is critical for the long-term well-being of the workforce (McTernan, Dollard, Tuckey, & Vandenberg, 2016) and the economic stability of the country (EU-OSHA, 2010), and so TTOSHA needs to build lasting connections, especially with the country's younger workers. TTOSHA has no social media accounts, although these may be created at no cost and in short time. In comparison, UKHSE and USOSHA users are able to download files of different types, tap into options available via social media like YouTube, Twitter, Facebook, and email/RSS, and obtain resources by printing immediately or ordering right off the site, for convenience. No mobile apps have been created to enhance TTOSHA's connectivity with the T&T population, though it should be noted that apps would be more time-consuming and costly to create as they must be planned and created as original works. Also it is interesting to note that the three apps that were observed in use by USOSHA in 2014 appear to have fallen out of common use now. Also, if TTOSHA seeks to build a pro-safety culture, it is important that at least some of its materials reflect cultural elements from T&T. This will not be achieved if the only subscribable materials are sourced from developed nations, and no original articles are created by TTOSHA itself.

Tailoring the TTOSHA site to the needs of users also speaks the issue of accessibility for persons with disabilities. The UKHSE has done an excellent job of this, and the USOSHA has also adequately focused on this area, not only designing the site to boost accessibility, but also providing users with ways of reporting and obtaining help with any challenges they may face while using the sites. However, the TTOSHA site does not highlight the extent to which it has considered access by users with disabilities. Given that there is an increasing international focus on equal access for all persons without exception – consider Sustainable Development Goal 10 which targets reduction of inequality, including for persons with disabilities (United Nations, 2017) – this is an area where TTOSHA must do more. The site's lack of special accessibility features would significantly limit communication-challenged users' options to tweak the site's appearance and modes of use, give positive and negative feedback and receive TTOSHA responses online. Also, with only phone and fax contacts provided, and no online feedback or complaint tool available, users may not perceive sufficient interest from TTOSHA in supporting user needs. Ultimately, TTOSHA should be seeking to build pervasive and deep user relationships. According to Maxwell and Carboni (2017), increased social engagement can come about when organisations enable effective two-way communication.

Responsiveness and currency also sets the developed-nation sites apart from the TTOSHA site. According to Vikas (2017), ICT is increasingly being intertwined with on-site operations to notify populations of imminent threats and keep them informed about emergency response actions. The TTOSHA site could have been used in a similar way to the USOSHA site to bring updates related to floods, storms, and hurricanes during the hurricane season. Another concern was the impression that the TTOSHA site is infrequently updated, so that irrelevant information may remain too long on the site, or content may be absent for too long from the site. For example, the site should not be advertising National OSH week many months after the event has passed, and the links within the Data and Statistics tab should not have been allowed to lie fallow for years without either removing the time-wasting links or ensuring that the links would lead to some relevant resources.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Additionally, no materials are available for sale online and the site's lack of e-commerce capability is another way in which it contrasts with the other two sites evaluated in this chapter. As T&T becomes even more resource-constrained in the face of a declining economy (Sorias, 2015), agencies such as OSHA will face greater and greater challenges to do much with little. Generating income for itself is one option that TTOSHA should explore, and selling resources via the TTOSHA site should be the first step in that direction.

Finally, the site does not focus enough on strategy and performance. The site provides a good overview of TTOSHA organisation and roles but little information about its strategies or objective details of its approaches and achievements. Of note, some of the site content reflects a need for TTOSHA to clearly establish what it wants to achieve through the TTOSHA site, relocate photos not related to OSH to an intranet or offsite archive, and regularly update site content so that past events do not remain central themes. These shortcomings erode the picture of competence that should consistently be painted by TTOSHA. TTOSHA clearly intends to focus on OSH statistics since its site already includes research and data links, but the raw data and informational reports that abound on the UK and US sites are still totally absent on the TTOSHA site. As Podgorski (2015) points out, lagging and leading safety indicators have critical roles to play in OSH management. If TTOSHA wants stakeholders to adopt values including accountability, traceability, and currency, then its site offerings must consistently model these.

It is notable that both the UK and the US sites have been in existence for decades longer than the TTOSHA site, and the OSH Act has only been in existence for some 10 years in comparison to the UK's and US' Acts which have been in existence for almost 50 years. Both the UK and the US are technologically advanced countries, given their developed-nation status. Some may believe that the limitations of the TTOSHA site should be accepted simply because of the understandable challenges faced by TTOSHA. This should never be the case, lest the site's lagging state become permanent.

RECOMMENDATIONS TO IMPROVE T&T OSH E-GOV

It is clear from the discussed shortcomings and opportunities that OSH e-gov should be improved in the TTOSHA context. The following recommendations, while geared towards T&T and TTOSHA, could also inform other developing nations who seek to enhance the structure and effectiveness of their own OSH e-gov systems.

Develop a Comprehensive TTOSHA Strategy and Strategy Execution Plan

TTOSHA will be hard-pressed to achieve excellence unless it takes the time to define its values, understand the pros and cons of its current position, craft its long-term strategy, and plan how to roll out that strategy. TTOSHA's e-gov approach must be set within this broader strategy and should play a prominent role. Establishing a list of priorities informed by a consideration of costs and benefits must lead to the development of a phased implementation approach to be faithfully rolled out. This approach will help TTOSHA to convert an overwhelming list to one that is logical and achievable over time.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Take Stock of TTOSHA Resource Limitations and Create Partnerships to Bolster Resources

As TTOSHA plans its approach to improve OSH e-gov, the issue of limited resources must be proactively addressed. Currently, resource shortages seem to constrain the agency's ability to create materials, or perform outreach, consultations, inspections and enforcement as much as it would like. Partnering with NGOs, private sector companies, manufacturers' associations, consultants and trainers, auditors, and other regional and international OSH bodies could prove advantageous. Such partnerships could help TTOSHA to develop a network of experts who could provide useful services to support its work. It could deepen society's recognition of and respect for TTOSHA's purpose. It could facilitate sharing of resources, such as training videos and reports that OSHA could share on its website. Also, collaborations could enhance goodwill and trust, and boost buy-in to OSHA's message.

Boost OSHA's Visibility by Promoting Its Value Proposition

TTOSHA needs to establish itself as the go-to body for individuals and organisations that need to report on OSH occurrences or to obtain OSH guidance or resources. The response of employers and workers to TTOSHA has been lukewarm, perhaps because they have not been able to see any advantages to strengthening ties with the agency. The fact is that certain OSH bodies such as the USOSHA, UKOSHA and even EU-OSHA have become highly relevant to stakeholders. To follow suit, TTOSHA must sensitise stakeholders about why OSH is ethically and economically relevant, shine a light on its offerings and mandates, and underscore its role in voluntary compliance work as well as enforcement efforts.

The agency must use the TTOSHA website to its advantage in carrying out this work. Press releases and news articles must be regularly crafted and visibly posted on the site. Periods of intensive focus on certain industries might be advertised on the homepage, so that companies are encouraged to keep their OSH systems compliant with the legislation. Notices of legal action taken in cases of non-compliance, photos and reports of safety excellence, and safety datasets and statistical reports should be conspicuously available and constantly updated to promote a philosophy of natural justice. Stakeholder partnerships should be developed, leveraged, and publicised to enhance TTOSHA's reach and impact.

Embrace the Digital Age

As Hood & Margetts recognised since 2007, in this digital age there must be increased reliance on modern technology. TTOSHA's success will depend in part on its effective use of its website and other digital media to connect with, engage, and serve its stakeholders. It must become highly creative and responsive in an age where many users expect service providers to cater to every customer need with customisation and excellent levels of responsiveness. As TTOSHA add social media elements to its e-gov approach, it would be important to gauge the success of each new addition. Only those that prove valuable should be retained; there is no need to jump on the bandwagon with every new tool that becomes popular. It is far more important to maintain a current and relevant presence for each of TTOSHA's selected social media faces.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Ensure That TTOSHA's E-Gov Presence Is Relevant, Current, and of High Quality

TTTOSHA's website should be full of content that serves the needs of its stakeholders. To be relevant, TTOSHA must identify who its stakeholders are, as well as what the needs of each stakeholder group would be. Certainly workers and employers must be considered, but there would be certain industries (e.g. construction, small and medium enterprises) that would be more at-risk or more resource-strapped than others, just as there would be certain worker groups (e.g. lone workers, pregnant women, young workers) who would be placed at greater risk. As a minimum, support materials on the TTOSHA website should be varied in format (in addition to brochures/booklets, there should be videos, audio files, photos, guidelines, and analytical reports at the very least) to appeal to different user needs and learning styles and in type (pdf, jpeg, ppt, doc, xls, html, mp3, mp4, and epub are among the very commonly used file types) to offer choice. The website should also encourage users to send feedback in real time, for example by including links so user can lodge complaints, suggestions and even accident/injury reports at the click of a button.

Website content should be regularly updated so that outdated content is removed and older information gives way to interesting new content that keeps users interested in returning to obtain more insights or learn more. Dated content will lead to waning user interest, and less interaction with the site.

Also there must be a focus on applying high quality standards to everything that is posted on the site and to the website's design itself. Resources should contain no errors, and there should be prompt corrective action if an error is seen. The website should have no redundancy and there should be no dead links; these would erode user confidence in the agency itself. A high quality agency must be reflected in high quality operations, even those that are digital in nature.

Focus on Data Collection and Measurement

Data management and analytics must play a huge role in TTOSHA's operations to set targets and track performance of its e-gov system. In line with recommendations from Chen and Hsieh (2014), TTOSHA must determine what it wishes to measure, what sources of data it will use, who might be partners in this undertaking, how to guard against security and privacy risks, and how reporting should be structured. Also, since insightful and responsible data management would have a major impact on the effectiveness of TTOSHA, it should be a priority to recruit a skilled and ethical specialist who would be dedicated to this work. A focus on performance and measurement is also critical since TTOSHA must set the standard that users would be expected to emulate. Podgorski (2015) explains the role of both leading and lagging performance indicators, and TTOSHA should craft an indicator dashboard to report on its achievements and targets.

Guard Against a Digital Divide

Liptrott (2016) cautions that if socio-economic challenges prevent people from developing IT skills, this can hinder their ability to equally access digital resources. Similarly, if computers or internet access are unavailable or less available, the phenomenon of a digital divide will manifest itself, effectively disempowering certain subsets of the population. Thus it is critical that TTOSHA takes action to push against these challenges, through means that could include the creation of local wi-fi hotspots (e.g. in

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

community centres) and/or use of OSH caravans that travel the country to interact with and connect with communities. Also TTOSHA should ensure that users with disabilities are adequately supported, as groups like them may be more at risk for occupational injury and illness than many others.

Develop an Improvement Focus

TTOSHA's e-gov approach, no matter how well planned, will have to be adjusted over time. Embedding continual improvement within the approach to website maintenance will be critical so that the website design and content can be improved incrementally over time. Small changes may not be noticeable when considered individually, but over time, many small changes can deliver meaningful value. In this regard, it is important to encourage online and offline feedback to allow for stakeholder critique and suggestions regarding the website and materials. Feedback from TTOSHA's employees would be especially valuable, given their knowledge of the agency's purpose and challenges.

Aggressively Support OSH Compliance in T&T

Achieving OSH compliance would be a high priority for TTOSHA, so its e-gov approach must aggressively support this. TTOSHA must ensure that its website reflects its philosophy about how to go about the business of boosting compliance. TTOSHA must consider whether T&T's safety culture is one that responds better to encouraging compliance, whether it would only step up when strict enforcement and sanctions are instituted, or whether some well-defined middle ground is to obtain. If certain industries approach OSH compliance with a laissez-faire attitude, TTOSHA may need to consider using a contingency model: stricter approaches used for industries that are less intrinsically motivated to comply, and more trusting approaches used for industries that prove themselves to be committed to compliance.

FUTURE RESEARCH DIRECTIONS

Only qualitative data was used in conducting this study. Sourcing quantitative data about user demographics, usability, accessibility, and user needs could provide insight into the validity of existing site design and the efficiency of site performance. Insight from stakeholder complaints and suggestions would also lead to design improvements focused on improving OSH e-gov effectiveness. Specific to T&T, the collection and analysis of these data would bring about a deeper understanding of the impact of OSH e-gov, and would be instructive in planning further development of the TTOSHA website and other e-gov tools.

The developed-nation evaluation focused on only two OSH e-gov websites. A wider review and content analysis based on additional international OSH governmental and non-governmental websites could also be beneficial. A broader study may recognise additional e-gov best-practices to emulate. Evaluating how practices vary in first- and third-world settings could also enhance appreciation of how practices may vary in different cultures.

While e-gov is popularly studied, only limited research happens within the OSH e-gov sub-field. More research about design and application of OSH e-gov systems is warranted, as this would identify and share varying thinking and approaches in the field. Of particular relevance would be studies that look at the use of mobile systems in OSH e-gov, as populations of most countries are increasingly connecting to webpages and mobile apps for information, communication, and entertainment.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Partnering between TTOSHA and higher education institutions can be beneficial to both parties, as the latter can analyse rich data already held by the former, saving TTOSHA from having to hire analysts, and reducing costs and research timelines for the researchers. In addition to data analysis, researchers with writing competencies may be able to help create training and outreach resources for the TTOSHA site.

CONCLUSION

Work is becoming inherently more risky to worker safety and health, particularly as complex mechanisation increases and people juggle more distractions, work faster, and produce more. As populations grow and resource availability is constrained, the government is rolling out more modern IT-enabled means of connecting with citizens and providing public service access. This study has recognised that, notwithstanding admirable levels of e-government advancement in T&T in recent years, OSH e-government has remained stunted. This shortcoming limits the population's ability to access OSH information, improve OSH practice, and build a symbiotic relationship with TTOSHA.

This study supports advancement of TTOSHA's work. It has evaluated several features of two developed-nation OSH e-gov websites, identifying how value is delivered to workers, employers, and other stakeholders. With these best practices in mind, recommendations for achieving OSH e-gov excellence have been made to TTOSHA. These especially take into account the need for TTOSHA to modernise its approach, clearly define its purpose and values, and develop/tailor/share resources to promote and enhance OSH competence, commitment, and involvement of various stakeholder groups. Developing and maintaining a sustainable OSH e-gov presence would be a very involved task, but a proper roll-out as a phased project would add immediate value.

This work could inform efforts of government and other local OSH organisations seeking to craft a meaningful electronic presence. It could enhance understanding and provide support to employers, employees, employee representatives, and the wider public, weaving good OSH practice into everyday living. Further, the chapter provides good insight into developed-nation OSH e-gov practices to ICT practitioners as well as developing-nation governments seeking to improve their own OSH e-gov systems. Finally, this work has pointed out the need for further study in this area and proposed some ideas for deepening research that can enhance understanding and practice in the field of OSH e-government in developed and developing nation contexts.

KEY TERMS AND DEFINITIONS

E-Government: The use of electronic technology, more commonly called information technology to connect government agencies to stakeholders in order to help government meet its goals related to service delivery, interaction, information sharing, and other aspects of governance.

Image Carousel: A website navigation option that shows a set of pictures in sequence, with further levels of information being revealed about clicked images if they are attached to hyperlinks.

Menu: An array of options offered to users of a website, usually arranged horizontally across the width of the webpage.

OSH E-Government: E-government specifically designed for and focused on furthering occupational safety and health aims in a country.

Ribbon: A narrow (colored) menu bar that offers page options to users on a website.

TTOSHA: An acronym used in the chapter to refer to the primary OSH e-government website of Trinidad and Tobago.

UKHSE: An acronym used in the chapter to refer to the primary OSH e-government website of the United Kingdom.

USOSHA: An acronym used in the chapter to refer to the primary OSH e-government website of the United States of America.

Website Effectiveness: An aspect of website evaluation that could judge elements such as ease of access, ease of use, information utility, and user satisfaction.

Website Efficiency: An aspect of website evaluation that could judge elements related to maximizing resource usage, including productivity, return on investment, costs, and benefits.

ABSTRACT

Macroergonomics is the subdiscipline of ergonomics that is concerned with the analysis, design, and evaluation of work systems. It means, macroergonomics focuses on harmonizing the organizational structure of a company and not only one workstation or one task, as microergonomics does. Macroergonomics is a top-down, middle-out, and bottom-up approach. In the top-down approach, the overall general work system structure may be prescribed to match the organization's sociotechnical characteristics. On the other hand, the middle-out approach focuses on the analysis of subsystems and work processes, which can be assessed both up and down the organizational hierarchy from intermediate levels, and also, up and down some changes may be done to ensure the work system design is harmonized. Finally, the bottom-up approach comprises an extensive participation of employees in the identification of problems. Currently, macroergonomics is considered an emergent subdiscipline, and there is the need to promote current theories and methods and propose new ones.

INTRODUCTION

Traditionally, work systems have been the focus of attention with the aim of increasing productivity. Here, it is principally from the economic perspective and is focused to obtain profits considering a purely consumption approach. However, this has evolved considering human and social aspects in such a way that economic advantages are put at the same level that the promotion of positive changes on individual and collective work environments. It is seen when organizations have adapted the work system conditions to the limitations, abilities and needs of their employees. One result of this view is Ergonomics, which arises supporting the design of products and systems enhancing human well-being and performance (Hassall, Xiao, Sanderson, & Neal, 2015).

Consequently, Macroergonomics, as a nested discipline of Ergonomics, emerges basically with the aim of design a fully "harmonized" work system enhancing the key performance indicators (organizational effectiveness, productivity and satisfaction). Herein the sociotechnical systems theory was the fundamental principle, and the industrial and organizational psychology viewpoints were also included (Lauren A. Murphy, Robertson, & Carayon, 2014). Thus, the macroergonomics approach mostly studies the interaction between the elements (machine, environment, software, job and organization) within the work system.

In this line, Hendrick & Kleiner (2002) identified diverse applications of this approach. For instance, reduction of work-related injuries, use of Information and Communication Technology (ICT) and their changes in work life, management of large scale organizational changes, improvement of some manufacturing aspects, development of training systems, relocation of technologies, increment of aviation safety and cut of large scale accidents are examples of these applications. Five years later, Hendrick (2007) analyzed the research trends on the management and organization of work systems, which acknowledged technology, demographic shifts, value changes, ergonomic-based litigation, world competition and failure of traditional Microergonomics as principal objects of study. These applications were frequently done in contexts as manufacturing, service organizations, healthcare, maintenance, telecommunications, maritime vessels, and industrial accident prevention. On the other hand and in an isolated way were in retail, military, typesetting, aviation operations, schools, and government.

The structure of this chapter is as follows. It starts by considering the historical contexts of Macroergonomics applications from 1994 to 2013, and the challenges that they posed for Macroergonomics. Next, it examines those works that took place from 2014 to 2018 and attempted to address the raised challenges and the emerged trends in the field. The chapter concludes with a set of predictions and challenges for macroergonomics in the near future.

HISTORICAL CONTEXTS

A search in the Scopus database of the word Macroergonomics in the article title, abstract or keywords, and filtering the period from 1994 to 2013 was done. 150 documents resulted from the search and were classified and summarized in 70 conference papers, 64 articles, four book chapters and two editorials. After, the analysis was conveniently limited to only articles and book chapters so that 68 documents were used in this phase. Table 1 presents the recurrent researchers in the field.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Researchers with most published articles from 1994-2013 in the Macroergonomics field

Author	Frequency	Author	Frequency

Alper, S.J.	2		

Source: (Scopus, 2018)

Subsequently, the results were organized using the number of citations obtained during the mentioned period. Therefore, Table 2 summarizes the influential documents serving as a basis to other researchers. Kleiner, Carayon, Hendrick, Robertson, Smith, Alpert, Punnet, Zink and Taveira have been considered the representatives of the Macroergonomics field. It is consequently by the quality and quantity of their publications. They addressed diverse issues as sociotechnical systems, design of work systems, healthcare and occupational ergonomics, manufacturing applications, industrial organization, and public administration.

Particularly, Hendrick & Kleiner (2002) pointed out the increase in the use of communication technologies so that work at home could be recognized as a new way of work. These anticipated and suggested mandatory changes in organizations and specifically, in their structure. They concluded that in the current era there should be developed methodologies, tools and curricula in higher education in order to overcome the challenges implied in the Macroergonomics applications.

EMERGING CONTEXTS

A second search in the Scopus database of the word Macroergonomics in the article title, abstract or keywords, and filtering the period from 2014 to 2018 was done. 48 documents resulted from the search and were classified and summarized in 31 articles, 12 conference papers, two reviews, one book and one book chapter. Similarly, the documents were classified according to the year of publication resulting 8 in 2018, 4 in 2017, 9 in 2016, 11 in 2015 and 16 in 2014. Later, all documents were used to uncover diverse fields that were addressed. The contexts were organized in general reviews; macroergonomics tools and methods; organizational analyzes and corporate strategies; sociotechnical systems approach; applications in home and community-based work and office jobs; hospitals and healthcare; manufacturing, and construction and trucking industry.

General Reviews

This section contains nine documents addressing general reviews of Macroergonomics. First, Berlin, Neumann, Theberge, & Örtengren (2014) compared how the Canadian Industrial Engineers and Ergonomists work to influence the Human Factors and Ergonomics (HFE) issues. It was also considering the implied constraints and strategies on them. They found that the best strategy to show the benefits by HFE improvements should be presented in terms of business profits. Second, Parallel, Karsh, Waterson, & Holden (2014) addressed the Mesoergonomics issue related to how the micro and macroergonomics should be linked and integrated into each other. In order to do so, they defined Mesoergonomics issue as an open system approach in the HFE theory and research. It results on study the relations between variables in which the HFE constructs are the dependent variables. They also proposed a framework for implementing that issue and illustrated its value within the theory through two case studies.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Moreover, Patrick Waterson et al. (2014) analyzed the current and future directions of Macroergonomics and the sociotechnical systems. Principally, their discussion was centered on the effectiveness of the Macroergonomics methods by facilitating the improvements on the workplace design. Specifically, some applications of them took the form of health and safe interventions in community settings in which there were chronically ill patients. Within the same type of contexts, Murphy et al. (2014) examined the relation of safety climate and Macroergonomics and how it affected the safety outcomes. Principally, they identified two subsystems (personnel –methods- and technology –processes-) as major factors affecting the achievement of a safety climate. It was seen in the management commitment on safety and communication highlights. Additionally, they proposed a conceptual model as a framework to guide organizational interventions on this matter. In the same line, Nathanael, Zarboutis, and Marmaras (2015) contributed to the intervention process in the Macroergonomics field with a methodology based on the dialectics notion of contradictions. Their proposal had a particular value on practical means by anticipating the effects and side effects of proposed changes during the Macroergonomics applications.

Furthermore, Kleiner, Hettinger, DeJoy, Huang, and Love (2015) proposed theoretical and practical approaches to identify sociotechnical attributes of safe and unsafe work systems. They also presented a variety of socio technical systems perspectives on intersections between social-organizational and technology-work process factors and the impact on analysis, design and operation of the work systems. In detail, Hassall et al. (2015) defined HFE as fields applying scientific information about human cognition and behavior to support the design of products and systems enhancing human well-being and performance. Their contribution consisted on defining the general concepts of HFE that included human-system interaction, HFE professionals, safety, and productivity, among others. Going beyond, Thatcher et al. (2016) link Macroergonomics and Sustainability concepts arguing that HFE professionals, due to their knowledge and skills) can support problem solving as pollution, climate change, renewable energy and land transformation.

Finally, Thatcher, Waterson, Todd, & Moray (2018) evaluated the impact of the Ergonomics discipline in the last 25 years to face up the global problems facing humanity and considered how Ergonomics might help in the future problems of society. Following this course, Marina Bischoff & Vianna Dos Santos (2018) presented a literature review regarding the Human Factors and Ergonomics and relationships with other areas as communication interactions research line, Macroergonomics, internal organization communication, and the process of communication auditing. To finish this section, Figure 1 exhibits the used keywords in the documents found and the number of them.

Macroergonomics Tools and Methods

Seim, Broberg, & Andersen (2014) studied the learning process for HFE professionals (researchers and practitioners) in an interactive research project. They proposed a new framework for intervention in the processes of workplace design in companies. This frame was based on applying the social learning theory. On the other hand, Lim, Village, Salustri, & Neumann (2014) developed and evaluated a method applying a process mapping as a tool for participative integration of human factors into work systems design within an electronic manufacturer. This process included a map creation, a map application and an evaluation of the mapping process. Similarly, the tools included a definition of the scope and level of detail in the mapping, contained errors, missing information, and map overlap.

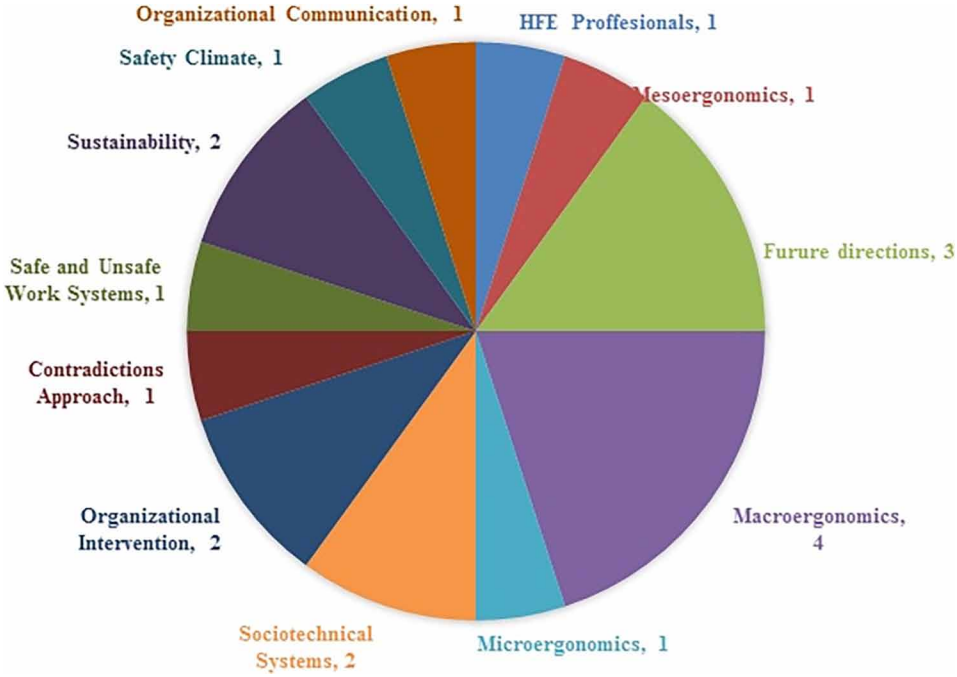
Figure 1. Keywords in general review
Source: The authors



Moreover, Barón Maldonado, Rivera, and Caro (2014) presented the development of a methodology to implement Lean Product Development (LPD) in apparel companies. This methodology incorporated concepts of Integrated Management Systems, Ecodesign and Macroergonomics. Four years after and in the same line, Silva, Nickel, & Dos Santos (2018) provided an evaluation of Macroergonomics methods for the application of organization analyzes in startups. They analyzed eight methods resulting that High Integration of Technology, Organization, and People (HITOP), Analysis and Macroergonomics Analyses of Structure (MAS) methods were only deemed applicable to startups. Also, Macroergonomics Analysis and Macroergonomics Design and Analysis (MEAD) may be applicable only in specific cases of startups. Figure 2 presents the main methods and tools used in Macroergonomics.

Organizational Analyzes and Corporate Strategies

Kluge (2014) studied as object the acquisition of knowledge and skills for task work and teamwork for controlling technical systems since the macroergonomics perspective. To do so, he proposed a theoretical model, which was focusing on how skill and knowledge acquisition for complex tasks was accomplished. In addition, he showed how this model should be used to derive training methods and instructional techniques. He also included the learning process, knowledge structure and skill requirements as fundamental variables of analysis and how they were associated with the effective operation and management of technology.

Furthermore, Valdez et al. (2014) studied the healthcare sector as a work system and this research was focused on how macroergonomics principles and models originally developed within an institutional context may be adapted for the contexts in which patients were embedded. In the study, they considered patients performing many non-paid activities in order to maintain and improve their health. These kinds of activities may be conceptualized as self-care and self-management work. They also focused in lessons related to the conceptual, methodological and practiced-related challenges on understanding and affecting patients' work and works systems that may be subsequently applied by other researchers on other contexts.

Concerning to team cohesion, Salas, Grossman, Hughes, and Coultas (2015) reviewed the literature finding relevant information about cohesion measurement, exploring developing measurement approaches, and providing theoretical and practical recommendations for optimizing cohesion measurements. They also reviewed empirical research uncovering specific information about cohesion conceptualization, measurement, and relationships with performance. This study ended with the current trends on team cohesion providing suggestions and possible solutions to guide future efforts in this field.

To increase the impact of ergonomics in a Colombian organization, Rodríguez Ruíz & Pérez Mergarejo (2016) proposed a Macroergonomics diagnosis, which performed an assessment on five Colombian organizations using the Ergonomics Maturity Model (EMM). The methods under this model were used to assess the capability of an organization by introducing, developing and implementing ergonomics. The results suggested that organizations could be classified in the lowest ignorance maturity level. Lack of trained personnel in the ergonomics field, reactive approach on solving problems and the limited ergonomics risk assessments were found as the main causes of this result.

In a specific context, Village, Salustri, and Neumann (2016) focused on how cognitive mapping links human factors to corporate strategies. Individual cognitive maps were drawn during one-hour interviews with seven senior directors of a large electronics firm. The objective was to harness individual tacit knowledge from senior directors about human factors relating to strategic goals and making explicit their shared managerial thinking with the aim of identifying improvement opportunities using those factors. They concluded on uncovering the strong connection between human factors and explicit strategic goals. Consequently, this connection can help organizations on identifying opportunities to improve human and business performance.

Additionally, Silva et al. (2018), as mentioned in the last section, used an analysis of macroergonomics methods on startups for study performance. It was discovered that methods employed only should be utilized on specific startups based their organizational objectives. As a result, they presented two types of applications of the methods, as explained above. Figure 3 shows the principal presented works in this section.

Sociotechnical Systems Approach

Waterson et al. (2015) provided an up-to-date review of Socio Technical Systems (STS) methods, tools, techniques and case studies focused on methods for workplace safety. They concluded with a roadmap for future work in the field. In the same line, Meshkati, Tabibzadeh, Farshid, Rahimi, & Alhanaee (2016) proposed a framework to ensure regional interoperability for safety, sustainability, and resilience of interdependent energy, water, and seafood sources in the Persian Gulf. They performed the integration of People-Technology-Ecosystem. This integration was built upon the Rasmussen's model, a macro system integrative framework that was based on the broader context of human factors considering as a meta-ergonomics paradigm. In other words, this was developed in order to use a great number of variables.

Applications in Home and Community Based Work and Office Jobs

Coelho, Tavares, Lima, and Lourenço (2017) analyzed the effect of different kinds of work on the psychosocial assessment of workers under the same management and organizational environment. The Copenhagen psychosocial questionnaire was used in a voluntary assessment in a utility company with the participation of 25 office workers and 32 field workers. The results suggested that variables as organizational design, management in system in place and cultural environment were more relevant in terms of decisive impact that specific factors.

On the other hand, Robertson, Huang, & Lee (2017) focused on a macroergonomics intervention in an office workplace. Two principal factors were considered which could produce beneficial effects for office and computer workers and their organizations. The effect of the intervention was stronger when the workers' ergonomics needs were taken into account by the management showing their responsibility on these issues.

Hospitals and Healthcare

Patel and Kannampallil (2014) examined the theoretical and foundational models of human factors and ergonomics (HFE) for achieving patient safety and quality and for evaluation of healthcare systems in the 2007-2013 period. They also investigated the potential of the approaches in biomedical informatics.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Similarly, they discussed the opportunities for better integrating HFE in these contexts. In same kinds contexts, Barzideh, Choobineh, & Tabatabaee (2014) studied the job stress dimensions and examined their relationship to musculoskeletal disorders (MSDs) among nurses of Shiraz University of Medical Sciences hospitals. It was a cross-sectional study in which 385 randomly selected nurses participated. There, 89.9% of the participants experienced some form of MSDs during the last 12 months. The major lower back symptoms were the most prevalent problem reported (61.8%). In conclusion, the nurses were exposed to high levels of job stress. Similarly, Carayon et al. (2014) analyzed the Systems Engineering Initiative for Patient Safety (SEIPS) model. Initially, they described several research and practical applications for healthcare systems and process redesign in which the principles for redesign healthcare systems were included. In addition, Clack, Kuster, Giger, Giuliani, & Sax (2014) presented the case of infection risk associated with syringe manipulation that could easily be solved by introducing user-centered design solutions. Here, the organizational complexity made the implementation of such solutions hardly reachable.

Holden, Brown, Scanlon, Rivera, and Karsh (2015) presented the first study to quantitatively assess the short- and long-term impact of bar coded medication administration (BCMA) information technology on nurses' mental workload as well as on perceived medication safety. Findings raised questions about the achievement of sustainable performance improvement with health information technology and the balance between micro- and macroergonomics approaches for studying technology change. In a parallel way, the industry can learn of this case in the healthcare sector. It is because designers should consider how technology changes the cognitive work including mental work. Similarly and in the same year, Holden, Eriksson, Andreasson, Williamsson, & Dellve (2015) studied healthcare workers' perceptions of lean, a sensitive context, through mixed methods in three Swedish hospitals. They formally discussed strategies for implementing lean in healthcare and the importance of attending the levels, context and worker consequences on those perceptions. Furthermore, they presented some lines of future work on this topic.

McLaughlin, Ward, and Keene (2016) described a new surgical checklist for veterinary cardiologist based on the literature and application of human factors design. Bolis and Sznelwar (2016) also analyzed a case study of the implementation of an ergonomics improvement committee in a Brazilian hospital. This was considering the challenges and benefits. Moreover, Yang and Asan (2016) performed a literature review on how the designs of patient-facing Health Information Technologies (HITs) have been suggested and evaluated, and how they may potentially affect the doctor-patient communication and patient-centered care.

In same line, Holden, Valdez, Schubert, Thompson, and Hundt (2017) analyzed the macroergonomics factors in the patient work system with chronic illness and their informal caregivers. They identified 17 factors across physical, social and organizational domains and household and community levels. Health related activities of patients are embedded in and shaped by levels of the social, physical and organizational context. Finally, Steege, Pasupathy, & Drake (2018) analyzed the fatigue of hospital nurses. Similarly, they explored the relationships between nursing work system components and fatigue and recovery of nurses.

Manufacturing

Heras-Saizarbitoria, Cilleruelo, & Allur (2014) analyzed, from the macroergonomics perspective in the traditional industrial and service subsectors, the influence of the main global management meta-standard. This study was carried out in two Spanish organizations belonging to the subsector of residential care

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

home for elderly persons and was focused on the quality of working life of the direct attention employees. In a parallel way, Sherehiy & Karwowski (2014) analyzed the relationship between work organization and workforce agility in small manufacturing enterprises. A total of 41 managers, 82 office workers, and 52 production workers from six small manufacturing companies participated in the study. The results should be used for optimizing work demands and conditions in the workplace environments in which it is required constant change and adaptation.

Furthermore, de Guimarães, Anzanello, Ribeiro, & Saurin (2015) presented a participatory intervention in a furniture manufacturing company in Southern Brazil. The study indicated that it was possible to balance both ergonomics and production demands. As a result, workload was reduced by 42% and productivity increased by 46%. On the other hand, Realyvásquez, Maldonado-Macías, García-Alcaraz, & Blanco-Fernández (2015) examined the effects of organizational macroergonomics compatibility elements over manufacturing systems performance from four companies in Mexico. Results indicated that macroergonomics organizational elements as organizational culture and organizational communication had different effect over clients and indirect effect over the manufacturing processes and growth of companies. Similarly, Cifuentes & Fulmer (2015) studied the use of treadmill workstations and psychosocial barriers to using them. They found that barriers were related to communication, need for motivation, peer pressure, and adaptation affecting performance. However, effectiveness and efficiency studies demonstrating improved energy expenditure in real workplaces have yet to build evidence to support use of such workstations.

Moreover, Realyvásquez, Maldonado-Macías, García-Alcaraz, Cortés-Robles, & Blanco-Fernández (2016) proposed a macroergonomics compatibility questionnaire that was statistically validated and 158 respondents at four manufacturing companies participated. They analyzed the effects of environmental elements on the psychological characteristics and performance of employees in manufacturing systems using the structural equation modeling. In this sense, Pacholski & Pawlewski (2017) used simulation technology for macroergonomics industrial systems improvement. They analyzed the buses' production process capability after the assembly hall expansion. This project also included the reengineering of the macroergonomics industrial system model for the new work organization, visualization and verification.

On a similar note, Miguez, Filho, Faustino, & Gonçalves (2018) developed a project in a 1,500-employee metallurgical factory, where a multidisciplinary team of certified ergonomist, engineers, managers and direct employees used concepts of Participatory Ergonomics and Lean Manufacturing. As a result, unnecessary activities were eliminated reducing the costs and lead-time and maintained the well being of workers. Finally, Realyvásquez, Maldonado-Macías, García-Alcaraz, & Arana (2018) proposed a Macroergonomics Compatibility Index (MCI) for manufacturing systems in Mexico. Here, the variables used to measure that index were Person, Organization, Technology and Tools, Task, and Environment as Macroergonomics factors.

Construction and Trucking Industry

Tavares et al. (2015) promoted the debate about work at heights in the construction industry. This type of work had been responsible for occupational accidents. In fact, it should be highlighted as a real problem because there is the lack of application of the occupational health and the safety ergonomic approach. In the same field, Zhao, McCoy, Kleiner, Smith-Jackson, & Liu (2016) analyzed fatal electrical injuries in the construction industry. This work contributed to the knowledge body of risk management, electrical safety and research methodologies. It was because the study used a triangulation approach for examin-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ing construction-fatality reports and considering effective risk management through the control over the whole sociotechnical system.

Murphy, Robertson, Huang, Jeffries, & Dainoff (2018) and Murphy, Huang, Robertson, Jeffries, & Dainoff (2018) applied the sociotechnical systems approach to enhance safety climate in the trucking industry. To do that, they developed a methodology to describe the results of the study. This methodology extended safety climate beyond an overall score by using the framework of Macroergonomics by examining the entire system in a more comprehensive manner. Also, it was applied to identify gaps in the specific work system and that information can be used to design interventions to change the safety climate and culture of an organization for reduce negative safety outcomes. Similarly, it included the critical incident technique, contextual inquiries, functional role diagrams, and affinity mapping. Key informants in the trucking industry helped on identifying 19 themes that affected safety. The themes ranged from balancing work and family/personal time, the company's policy vs. practice, respecting the job of the driver, and active listening and meaningful feedback.

FUTURE RESEARCH DIRECTIONS

According to the initial analysis carried out for the period from 1994 to 2014, there was evidence that studies had a greater impact in the actual research. This was based on the number of citations found in the search done in the Scopus database. These citations were related to the analysis of the work systems using the Sociotechnical Systems approach as principal view on the studies in which consequently there were diverse lessons learned. Principally, programs promoting the health and occupational safety, and ergonomic interventions in production systems and public administration were examples of its applications. On the other hand, the second study focused in the period from 2014 to 2018 uncovered different and interesting applications of the Macroergonomics approach.

For instance, the number of studies were proportionally increased in relation to the number of years used in this search. The search also put on manifest the varied interest of researchers on study the approach in other uncommon contexts. They were interested in knowing what is happening in hospitals, health care, manufacturing among other contexts. Moreover, they were done ergonomic interventions in organizations using various techniques and methods in order to prove their feasible on those contexts. Finally and using the information presented, it is concluded that applications of Macroergonomics would be found in diverse contexts using new techniques and methods in order to deal with the actual situations in which systems are immersed.

For instance, it is expected that researchers from diverse countries and continents would use the Macroergonomics approach to investigate topics related to the implementation of manufacturing philosophies, performance indexes, organizational policies and strategies, among others. Similarly, it is predicted the incorporation of theories, techniques, and methods employed in other Ergonomics approaches. Furthermore, the researchers will open those in other contexts in order to fill the gaps of knowledge discovered. In this line, it could be seen with the inclusion of rural contexts on research. In fact, contexts in primary sector is an opportunity of research using the Macroergomics approach, as emerging discipline.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

It is considered that the future of Ergonomics is seen in the health sector and hospitals and manufacturing; however, it is important to highlight the necessity to focus on other aspects of them. For instance, biomechanics, anthropometry and physical chronic and occupational diseases are relevant topics of Ergonomics. These indirectly expanded the opportunity to investigate the mental health associated with the labor relations, teamwork, burnout, among other factors studied into the psychosocial factors provoking stress. As a result of the work, stress is considered a relevant factor, which should be studied to consequently reduce it. It is known that multiple causes obey to multiple variables attributable to organizational factors as structure and culture. This is because psychosocial factors represent a key element to maintain a good performance in each of the hierarchical levels of a company (and therefore at the organizational level).

In contrast, Macroergonomics is currently opening opportunities to research on other labor sectors. For example, a great number of research and applications are being carried out at the macro-ergonomic level in the agricultural sector, the education sector, and aviation, additionally to manufacturing and hospital contexts. Moreover, there is a tendency to carry out research on the mental burden and burnout of workers in the manufacturing industry. This opens the way for replicate the research in different labor sectors, as mentioned before. Furthermore, research is being carried out in the area of work psychology from a macro-ergonomic approach in workers with disabilities. This is in order to determine the behavior of those towards the demands, structure and culture of organizations and co-workers. In all these investigations, although the development and validation of a tool or a macroergonomic evaluation technique is not guaranteed, they could develop models or methodologies that could be applied in future and similar studies but in different contexts ensuring success in any macro-ergonomic research and applications by adopting the sociotechnical systems approach.

ACKNOWLEDGMENT

We would like to acknowledge to the Universidad Autónoma de Baja California, Tecnológico Nacional de México, Instituto Tecnológico de Tijuana and PRODEP for partially funding this chapter. The interpretations and views in this chapter, however, are solely those of the authors.

KEY TERMS AND DEFINITIONS

Ergonomics: Science that studies the best adaptation of the work system to the human.

Human Factors: The human factors (or ergonomics) is the study of how individuals react to certain environments, products, or services in physical and psychological terms.

Macroergonomics: Macroergonomics aims to design a fully "harmonized" work system enhancing the key performance indicators for organizational effectiveness, productivity and satisfaction; where the sociotechnical systems theory is the fundamental principle, including industrial and organizational psychology approaches.

Microergonomics: The Microergonomics approach study the interaction between machine, environment, software, and job with the human.

Organizational Performance: Measure of efficiency and effectiveness, with which administrators take advantage of resources to satisfy customers and achieve the goals of the organization.

Productivity: Production capacity per work unit.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Sociotechnical Systems Approach: It is the approach that recognizes the interaction between individuals and technology in workplaces so that it helps on the complex organizational work design.

Work Systems: It is a natural unit of analysis for thinking about systems in organizations. In organizational settings, work is the application of human, informational, physical, and other resources to produce products/services.

This research was previously published in Advanced Macroergonomics and Sociotechnical Approaches for Optimal Organizational Performance; pages 242-260, copyright year 2019 by Business Science Reference (an imprint of IGI Global).
