Table of Contents

Preface xxv

Volume I

Section 1
Fundamental Concepts and Theories

Chapter 1
Future of Work and Its Implication on Employee Well-Being in the 4IR Era 1
Ethel N. Abe, University of KwaZulu-Natal, South Africa
Isaac Idowu Abe, Cape Peninsula University of Technology, South Africa
Olalekan Adisa, University of KwaZulu-Natal, Durban, South Africa

Chapter 2
The Dynamics of Workplace Relationships, Employee Well-Being, and the Fourth Industrial Revolution: Perspectives of Workplace Relationships and Industry 4.0 22
Isaac Idowu Abe, Cape Peninsula University of Technology, South Africa

Chapter 3
Organizational Well-Being: A New Theoretical Model and Recommendations for Future Research 36
Kalpana Sahoo, Xavier University, India

Chapter 4
Burnout: A Challenge for Companies in the Modern Business Environments 53
Elvira Nica, The Bucharest University of Economic Studies, Romania
Ana-Maria Iulia Şanta, Bucharest University of Economic Studies, Romania
Katarina Valaskova, University of Zilina, Slovakia
Maria Gabriela Horga, "Ovidius" University of Constanța, Romania

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 5
Considerations of the Mental Workload in Socio-Technical Systems in the Manufacturing Industry: A Literature Review 66
Manuel Alejandro Barajas Bustillos, Autonomous University of Ciudad Juárez, Mexico
Aide Aracely Maldonado-Macías, Autonomous University of Ciudad Juárez, Mexico
Jorge Luis García-Alcaraz, Universidad Autónoma de Ciudad Juárez, Mexico
Juan Luis Hernández Arellano, Autonomous University of Ciudad Juárez, Mexico
Liliana Avelar Sosa, Autonomous University of Ciudad Juárez, Mexico

Chapter 6
The Diversity Paradox 85
J. Jacob Jenkins, California State University, Channel Islands, USA

Chapter 7
Workforce Diversity: Gaining the Competitive Advantage 98
Kuda Mupepi, S. James School of Medicine, USA
Tatenda Mupepi, S. James School of Medicine, USA
Clara Mupepi, Grand Valley State University, USA

Chapter 8
Diversity Management Interventions for Enhancing Competitive Advantage: A Synthesis of Current Research and Literature 114
Alamuri Surya Narayana, Osmania University, India

Chapter 9
Antecedents and Consequences of Employee Engagement for a Diverse Workforce 137
Shampy Kamboj, Amity University, India
Bijoylaxmi Sarmah, North-Eastern Regional Institute of Science and Technology, India

Chapter 10
How Does Empowering Leadership Contribute to Organizational Commitment of Millennials? An Indian Perspective 150
Mohammad Faraz Naim, University of Petroleum & Energy Studies, India

Chapter 11
Conceptualizing Causative Factors of Workplace Cyberbullying on Working Women 164
Karthikeyan C., T. John College, Bengaluru, India

Chapter 12
The Prevention of Work-Related Risks: A Fundamental Principle for Organization With Purpose .. 185
Luis Gabriel Gutierrez Bernal, Fundación Universitaria del Area Andina, Colombia
Maria Alexandra Malagon Torres, Politecnico Grancolombiano, Colombia
Helga Ofelia Dworaczek Conde, Fundación Universitaria del Área Andina, Colombia

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Section 2
Development and Design Methodologies

Chapter 13
The Positive Face of Human Capital, Psychological Capital, and Well-Being 203
Olcay Okun, Hasan Kalyoncu, Turkey

Chapter 14
Microfinancial Collaborative Economies Business Models and Strategies for Quality of Life Improvement: Case studies for PROMUSAG and UBER 223
José G. Vargas-Hernández, University of Guadalajara, Mexico

Chapter 15
Lean Production and Its Impact on Worker Health: Force and Fatigue-Based Evaluation Approaches..... 242
Murray Gibson, Auburn University, USA
Beata Mrugalska, Poznan University of Technology, Poland

Chapter 16
How Does Schema Affect Stress and Productivity at the Workplace? Quantitative Analysis of Schema in the Occupational Setting 252
Ko Sugiura, Keio University, Tokyo, Japan
Akiyoshi Shimura, Tokyo Medical University, Tokyo, Japan

Chapter 17
Re-Conceptualizing Diversity Management: Organization-Serving, Justice-Oriented, or Both? 275
Marilyn Y. Byrd, University of Oklahoma, USA
Claretha Hughes, University of Arkansas, USA

Chapter 18
Proposing a Diversity Intelligence Training Framework for Leaders and Managers to Attract, Maintain, and Balance Mature Workers 303
Sheron Lawson, Wayland Baptist University, USA
Claretha Hughes, University of Arkansas, USA

Chapter 19
Employee Wellbeing English Language Proficiency a Key to Knowledge Sharing and Social Interaction 324
Muhammad Khaleel, Universiti Sains Malaysia, Malaysia
Shankar Chelliah, Universiti Sains Malaysia, Malaysia

Chapter 20
Disruption in HR Through Inclusive Emotional Culture: Key to Sustainable Growth in Indian Businesses 345
Nitu Ghosh, REVA University, India

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 21
An Empirical Study of the Indian IT Sector on Typologies of Workaholism as Predictors of HR Crisis 367
Shivani Pandey, Mediterranean Shipping Company, India

Chapter 22
CSR and PSR Diversity Engagement Among Ethnic Minority Businesses (EMBs) Within the UK 390
Carlton Brown, University of Plymouth, UK

Chapter 23
Knowledge Management and Ergonomics Implementation in Manufacturing Systems: Development and Validation of a Questionnaire for Critical Success Factors 415
Aide Aracely Maldonado-Macías, Universidad Autónoma de Ciudad Juarez, Mexico
Cesar Roberto Alferez-Padron, Universidad Autónoma de Ciudad Juarez, Mexico
Jorge Luis García-Alcaraz, Universidad Autónoma de Ciudad Juarez, Mexico
Liliana Avelar-Sosa, Universidad Autónoma de Ciudad Juárez, Mexico

Chapter 24
Knowledge Management of Work Stress in Mexican Manufacturing Environments: Models of the Relationships Between Burnout and the Body Mass Index Among Middle and Senior Managers ... 439
Oziely Daniela Armenta-Hernández, Autonomous University of Ciudad Juárez, Mexico
Aide Aracely Maldonado-Macías, Autonomous University of Ciudad Juarez, Mexico
Jorge Luis García-Alcaraz, Autonomous University of Ciudad Juárez, Mexico
Miguel Angel Serrano-Rosa, Universidad de Valencia, Spain
Liliana Avelar-Sosa, Autonomous University of Ciudad Juarez, Mexico

Section 3
Tools and Technologies

Chapter 25
Employee Welfare Provisions: An Administration Tool to Enhance Employee Efficiency 473
Chandra Sekhar Patro, Gayatri Vidya Parishad College of Engineering (Autonomous), India

Chapter 26
Welfare Programs as a Strategy of Promoting Employees' Economic Growth and Work Productivity 495
Chandra Sekhar Patro, Gayatri Vidya Parishad College of Engineering (Autonomous), India

Volume II

Chapter 27
Factors Affecting Employees' Job Satisfaction and Psychological Health 516
Mateja Lorber, University of Maribor, Slovenia
Sonja Treven, University of Maribor, Slovenia
Damijan Mumel, University of Maribor, Slovenia

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 28
Combined Methods for Physical and Mental Workload: Fatigue Evaluation – A Systematic Literature Review 543
Ángel Fabián Campoya Morales, Universidad Autónoma de Ciudad Juárez, Mexico
Juan Luis Hernández Arellano, Universidad Autónoma de Ciudad Juárez, Mexico
Elvia Luz González-Muñoz, Universidad de Guadalajara, Mexico

Chapter 29
Application of Biomechanics Instrumentation in Occupational Health Research 567
Sanjay M. Kotadiya, National Institute of Occupational Health, India
Joydeep Majumder, National Institute of Occupational Health, India
Sunil Kumar, National Institute of Occupational Health, India

Chapter 30
Exceeding the Recommended Energy Limits Due to Age and Gender in Occupational Aerobic Workloads 585
Cesar Omar Balderrama Armendariz, Universidad Autonoma de Ciudad Juarez, Mexico
Jose de Jesus Flores Figueroa, Universidad Autonoma de Ciudad Juarez, Mexico
Judith Lara Reyes, University of Texas at El Paso, USA
Ludovico Soto Nogueira, Universidad Autonoma de Ciudad Juarez, Mexico

Chapter 31
Ergonomic Bench to Decrease Postural Risk Level on the Task of Changing Forklift's Brake Pads: A Design Approach 600
Arturo Realyvásquez, Instituto Tecnológico de Tijuana, Mexico
Guadalupe Hernández-Escobedo, Instituto Tecnológico de Tijuana, Mexico
Aide Aracely Maldonado Macías, Autonomous University of Ciudad Juárez, Mexico

Chapter 32
An Ergonomic Analysis on Working Postures of Construction Site Workers: A Framework for Construction Site Workers 620
Suchismita Satapathy, KIIT University, India

Chapter 33
Applying Metaheuristics to Minimize Work-Related Musculoskeletal Disorders 643
Arminda Pata, University of Aveiro, Aveiro, Portugal
Ana Moura, University of Aveiro, Aveiro, Portugal

Chapter 34
Opportunities and Challenges of Using Mobile Applications for Workplace Health Promotion: A Qualitative Study 663
Maren Junker, Technical University of Munich, Germany
Markus Böhm, Technical University of Munich, Germany
Frederik Edwards, Technical University of Munich, Germany
Helmut Krcmar, Technical University of Munich, Germany

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 35
Health and Wellbeing as Appreciative Inquiry in a Private University in Mexico 681
Ingrid N. Pinto-López, UPAEP Universidad, Mexico
Cynthia M. Montaudon-Tomas, UPAEP Universidad, Mexico
Ivonne M. Montaudon-Tomas, UPAEP Universidad, Mexico
Marisol Muñoz-Ortiz, UPAEP Universidad, Mexico

Section 4
Utilization and Applications

Chapter 36
People and the Digital Enterprise: Challenges and Approaches 707
Vivek Balaraman, TCS Research, Tata Consultancy Services, India
Sachin Patel, TCS Research, Tata Consultancy Services, India
Mayuri Duggirala, TCS Research, Tata Consultancy Services, India
Jayasree Raveendran, TCS Research, Tata Consultancy Services, India
Ravi Mahamuni, TCS Research, Tata Consultancy Services, India

Chapter 37
Institutionalizing Inclusive Markets as a Prerequisite to Inclusive Growth 742
Fakhri Issaoui, Le Laboratoire de Recherche (Prospective, Stratégies et Développement Durable PS2D), Faculté des Sciences Economiques et de Gestion de Tunis, Université Tunis El-Manar, Tunis, Tunisia
Mohamed Ben Abdelghaffar, Faculté de Droit et des Sciences Politiques de Tunis, Université Tunis El Manar, Tunis, Tunisia

Chapter 38
Who Will Take Care of Me? The Future of Human Resources in Anaesthesiology, Critical Care, and Emergency Medicine in Europe. 752
Cristina Honorato-Cia, School of Medicine, University of Navarra, Spain
Stefan De Hert, Ghent University, Belgium
Edoardo De Robertis, Department of Surgical and Biomedical Sciences, University of Perugia, Perugia, Italy
Ioana Grigoras, University of Medicine and Pharmacy "Grigore T. Popa" Iasi, Romania

Chapter 39
Cultural Diversity, Negotiation, and Organizational Leadership: Their Relationship With the Competitiveness of Colombian Companies in a Global Context 767
Leidy Lorena Piñeiro-Cortes, EAN University, Colombia
Merly Maria Bernal, Universidad de Celaya, Mexico
Tito Francisco Solano, EAN University, Colombia
Adolfo Hernando Hernández Hernández, EAN University, Colombia

Chapter 40
Applying Diversity-Intelligent Organizational Strategies for Competitive Advantage 796
Claretha Hughes, University of Arkansas, USA

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 41
Sustaining and Retaining the Diversity Practitioner 825
Trina Moore-Southall, California Lutheran University, USA

Chapter 42
An Approach to Diversity and Cultural Competence Curriculum in Public Administration 840
Bridgett A. King, Auburn University, USA

Chapter 43
The Interactions Between Cultural Intelligence, Job Burnout, and Task Performance of Expatriates 858
Çağlar Doğru, Ufuk University, Turkey

Chapter 44
Relationships Between Mental Workload, Burnout, and Job Performance: A Research Among Academicians 877
Meltem Akca, Alanya Alaaddin Keykubat University, Turkey
Mübeyyen Tepe Küçükoğlu, Trakya University, Turkey

Chapter 45
Defective Decision Making: Beginning Teacher Early Burnout From Catastrophic Career Choices 898
Unoma B. Comer, National University, USA
Suki Stone, National University, USA

Chapter 46
Association of Occupational Burnout and Nursing Errors With Patient Safety: A Systemic Review 912
Despoina Pappa, Hygeia Hospital of Athens, University of West Attica, Greece
Chrysoula Dafogianni, University of West Attica, Greece

Chapter 47
Burnout and Stressors as Influencers on Work Engagement Among Law Enforcement Agents in Selected Cities 926
Mihir Joshi, Gurukula Kangri Vishwavidyalaya, India

Chapter 48
The Contribution of Neuroscience and Health Psychology to Macroergonomics: Focusing on Workers as Active Agents 942
Miguel Angel Serrano-Rosa, Universidad de Valencia, Spain
Francisco Molins, Universidad de Valencia, Spain

Chapter 49
Industry Process Safety: Major Accident Risk Assessment 960
Ales Bernatik, VSB – Technical University of Ostrava, Czech Republic

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 50
Knowledge Management Influence on Safety Management Practices: Evidence from Construction Industry 996
M.D. Deepak, National Institute of Construction Management and Research, Pune, India
Mahesh Gangadhar, National Institute of Technology, Karnataka, India
Medi Narotham Kumar, National Institute of Technology, Karnataka, India

Chapter 51
Regulating Occupational Health and Safety in EU and China: From a Comparative Law Perspective 1021
Kai Liu, Jiangsu Normal University, China

Chapter 52
Gender Awareness and Women Managers in Tourism: Perceptions of Inequality and What Could Be Done 1043
Inês Carvalho, Universidade Europeia, Portugal
Carlos Costa, GOVCOPP, University of Aveiro, Portugal
Anália Torres, University of Lisbon, Portugal

Volume III

Chapter 53
Women's Employment in Turkey's ICT Sector: An Examination From a Social Inclusion Perspective 1064
Selda Gorkey, Istanbul Kultur University, Turkey

Section 5
Organizational and Social Implications

Chapter 54
Impact of Workplace Diversity on Employee Performance: A Case of Some Selected Private Universities in Ghana 1088
Juliana Serwaa Andoh, Kwame Nkrumah University of Science and Technology, Ghana
Benjamin Ghansah, Data Link Institute, Ghana
Joy Nana Okogun-Odompley, Data Link Institute, Ghana
Ben-Bright Benuwa, Data Link Institute, Ghana

Chapter 55
Cultural Diversity and Performance of Cameroonian Companies 1103
Joel Stephan Tagne, University of Ngaoundere, Cameroon
Jean Pierre Evou, University of Yaounde II, Cameroon

Chapter 56
Measuring the Different Facets of Diversity Using Quantitative Methods 1118
Gargi Banerjee, Xavier University, India

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 57
Employee Welfare Measures: The Impact on Employees' Efficacy and Organizations Productivity 1141
Chandra Sekhar Patro, Department of Management Studies, Gayatri Vidya Parishad College of Engineering (A), India
K. Madhu Kishore Raghunath, National Institute of Technology Warangal, India

Chapter 58
Examination of Quality of Life in Workplace Environments 1161
Lesley Clack, University of Georgia, USA

Chapter 59
Effects on Employee Motivation of Working Conditions in National/International F&B Enterprises: Kirklareli Case 1175
İlke Başarangil, Kırklareli University, Turkey
Emre Altıntaş, Kırklareli University, Turkey

Chapter 60
The Effect of Wellness Programs on Long-Term Contract Employees' Workplace Stress, Absenteeism, and Presenteeism 1196
Desree S. Valentine, United States Army Reserve, USA
Susan Ferebee, Purdue University, West Lafayette, USA
Keri L. Heitner, All Aspects Research, Amherst, USA

Chapter 61
Leisure and Wellness Perceptions of Tourism Workers in Work-Life Balance 1208
Gülseren Yürcü, Akdeniz University, Turkey
Ülker Çolakoğlu, Adnan Menderes Üniversity, Turkey

Chapter 62
Foreign Education, Underemployment, and Wellness: Lived Experiences of African Immigrants in the USA 1222
Joseph O. Otundo, University of Arkansas at Little Rock, USA
Jane A. Opiri, University of Arkansas at Pine Bluff, USA

Chapter 63
Workplace Incivility and Job Satisfaction: Mediating Role of Emotion Management 1237
Rose Opengart, Texas A&M, Signal Mountain, USA
Thomas G. Reio Jr., Florida International University, Miami, USA
Wei Ding, Florida International University, Miami, USA

Chapter 64
Discrimination Against People With HIV and AIDS in the Workplace: A Lagos State Example ... 1255
Chinwe Rosabelle Nwanna, University of Lagos, Nigeria

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 65
Working With Lesbian, Gay, Bisexual, and Transgender People in Care Relationships 1276
Gabriel Aleksandrs, Carers Victoria, Australia

Chapter 66
Gender Discrimination in Tourism Industry 1304
Aslı Albayrak, Istanbul Arel University, Turkey

Chapter 67
Work Role Stress and Employee Outcomes: Mediating Role of Job Satisfaction 1324
Bindu Chhabra, International Management Institute, India

Chapter 68
Mental Workload Assessment and Its Effects on Middle and Senior Managers in Manufacturing Companies 1339
Arturo Realyvásquez-Vargas, Tecnológico Nacional de México, Instituto Tecnológico de Tijuana, Mexico
Emigdio Z-Flores, Tecnológico Nacional de México, Instituto Tecnológico de Tijuana, Mexico
Lilia-Cristina Morales, Tecnológico Nacional de México, Instituto Tecnológico de Tijuana, Mexico
Jorge Luis García-Alcaraz, Autonomous University of Ciudad Juarez, Mexico

Chapter 69
Work Stress and Psychosocial Factors in the Manufacturing Industry: A Literature Review 1367
Mónica Gabriela Gutiérrez Hernández, Instituto Tecnológico de Ciudad Juárez, Mexico
Rosa María Reyes Martínez, Instituto Tecnológico de Ciudad Juárez, Mexico
Aide Aracely Maldonado-Macias, Instituto Tecnológico de Ciudad Juárez, Mexico
Jaime Sánchez Leal, Instituto Tecnológico de Ciudad Juárez, Mexico
Jorge De La Riva Rodríguez, Instituto Tecnológico de Ciudad Juárez, Mexico

Chapter 70
Burnout Among Formal Caregivers and Risk of Violence Against Institutionalized Elderly 1392
Susana Valido, Hospital do Espírito Santo de Évora, Portugal
Ermelinda do Carmo Caldeira, Universidade de Évora, Portugal
Felismina Mendes, Universidade de Évora, Portugal

Chapter 71
The Impact of the Attitude of Medical Staff From Burnout on the Level of Ongoing Medical Services 1408
Anita Wójcik, 10 Military Hospital, Poland

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 72
Burnout and Obesity in Middle and Upper Management in the Manufacturing Industry of Baja California 1435
Sharon Idali Macias Velasquez, Universidad Autónoma de Baja California, Mexico
Yolanda Angelica Baez-Lopez, Universidad Autónoma De Baja California, Mexico
Aidé Aracely Maldonado-Macías, Universidad Autónoma de Ciudad Juárez, Mexico
Jorge Limon-Romero, Universidad Autónoma de Baja California, Mexico
Diego Tlapa, Universidad Autónoma de Baja California, Mexico

Chapter 73
Analysis of Role Stress in the Indian IT Industry 1454
Shubhangini Rathore, IBS Gurgaon, India

Chapter 74
Effects of Human Factors in Process Safety: Analyses of Chemical Industrial Case Studies 1477
Gargi Bhattacharjee, University of Calcutta, India & Prasanta Chandra Mahalanobis Mahavidyalaya, India
Sudip Kumar Das, University of Calcutta, India

Chapter 75
Occupational Health and Safety Hazards in Agriculture: A Study on the Risks Involved for the Sustainability 1508
Debesh Mishra, KIIT University, India
Suchismita Satapathy, KIIT University, India

Chapter 76
Exploring Blue- and White-Collar Employees' Well-Being at Work System: Differences in Indicators of Physical and Psychosocial Conditions of Occupational Groups 1526
Seppo Tapio Vayrynen, University of Oulu, Oulu, Finland
Heli Katariina Kiema-Junes, University of Oulu, Oulu, Finland

Chapter 77
Individual Risk Assessment (ERIN): Method for the Assessment of Workplace Risks for Work-Related Musculoskeletal Disorders 1550
Yordán Rodríguez, University of Antioquia, Colombia

Volume IV

Chapter 78
Prevalence of Musculoskeletal Disorders of Odisha Farmers in Selected Agricultural Tasks: A Critical Analysis During Seeding, Fertilizing, and Weeding of Crops 1577
Debesh Mishra, KIIT University (Deemed), India
Suchismita Satapathy, KIIT University (Deemed), India

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Section 6
Managerial Impact

Chapter 79
Work Leadership, Occupational Health, and Safety 1608
Gabriel Akinbode, University of Lagos, Nigeria

Chapter 80
Corporate Governance and the Future of Work, Work-Family Satisfaction, and Employee Well-Being 1626
Alfred Kent Van Cleave, University of Phoenix, USA

Chapter 81
Management of Intercultural Relations in an Intercultural Organization 1637
José G. G. Vargas-Hernández, University of Guadalajara, Mexico
Jeanne Poulose, Christ Institute of Management, India

Chapter 82
Launching Diversity-Intelligent Strategies in Organizations: A Leadership Development Perspective 1663
Claretha Hughes, University of Arkansas, USA

Chapter 83
Responsible Leadership Behaviour as a Determinant of Stakeholders' Health and Well-Being: A Review and Conceptual Framework 1693
Gloria Macassa, University of Gävle, Sweden
Gianpaolo Tomaselli, University of Malta, Malta
Joaquim Soares, Mid-Sweden University, Sweden

Chapter 84
The Role of the Supervisor in Creating and Maintaining an Emotionally Healthy Workplace..... 1715
Amy Tureen, University of Nevada, Las Vegas, USA

Chapter 85
Engaging Employees With Positivity: The Role of Appreciative Inquiry in Employee Sustainability..... 1731
Shravana Bardhan, George College of Management and Science, India

Chapter 86
The Conceptual Model of Managing Older Employees to Achieve Their Work Engagement..... 1744
Maja Rožman, University of Maribor, Slovenia
Sonja Treven, University of Maribor, Slovenia

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 87
Women Managers and Generations: A Study of Obstacles 1769
Kanchan Chandar Tolani, Shri Ramdeobaba College of Engineering and Management, Nagpur, India
Pritam Bhadade, Shri Ramdeobaba College of Engineering and Management, Nagpur, India
Kavita Patil, Dhanwate National College, Nagpur, India
Archana Shrivastava, Jaypee Business School, Jaypee Institute of Information Technology, India

Chapter 88
Twenty-First Century Issues Impacting Turnover of IT Professionals: From Burnout and Turnover to Workplace Wellbeing 1784
Valerie Ford, ISP Global Communications LLC, USA
Susan Swayze, The George Washington University, USA

Chapter 89
Innovation Through Diversity and Inclusion: A Roadmap for Higher Education Information Technology Leaders 1811
Brenna Deanne Miaira Kutch, Portland State University, USA
Juliana Sayumi Miaira Kutch, Portland State University, USA

Chapter 90
Cultural Norms and Expectations Within the Hospitality Industry 1834
Dalvony Duraes Alkmim Savic, University of West London, College of Comtemporary Arts, UK
Mihaela Dariescu, University of Roehampton, UK

Section 7
Critical Issues and Challenges

Chapter 91
Managing Generational Diversity: Lessons German Companies Can Learn From Silicon Valley 1852
Martin Klaffke, Hochschule für Technik und Wirtschaft Berlin, Germany

Chapter 92
Veterans Should Be Included Too: Strategies for Promoting Diversity of Veterans in Organizations 1866
Yvonne O. Hunter-Johnson, North Carolina A&T University, USA

Chapter 93
Who Engineering Includes Impacts How Engineers Work: Diversity Challenges and Design Thinking Solutions 1884
Stephen Secules, Florida International University, USA
Alexandra Coso Strong, Florida International University, USA
Trina Fletcher, Florida International University, USA

Preface

With previous generations remaining longer in the workforce, and new generations starting to enter, dynamic and varied values are emerging amongst employees that must be maintained by industries to succeed. There is concern that the recent push for developing more inclusive and diverse workforces—an asset to organizational efficiency, productivity, and culture—will be waylaid due to the recent COVID-19 pandemic, while others maintain that the recent push for diversity and equity amongst all industries will lead to greater opportunities than ever before. The recent COVID-19 pandemic has also emphasized the importance of safety procedures within the workplace and called into question organizations' abilities and roles in mandating certain safety procedures while also bringing to light issues of burnout, stress, and the overall mental wellbeing of employees. Ensuring inclusive spaces and a safe workplace environment is essential for a happy workforce and overall business success. It is important that current research is compiled that sheds light on the advancements being made in promoting diversity and safety in the modern workforce.

Staying informed of the most up-to-date research trends and findings is of the utmost importance. That is why IGI Global is pleased to offer this four-volume reference collection of reprinted IGI Global book chapters and journal articles that have been handpicked by senior editorial staff. This collection will shed light on critical issues related to the trends, techniques, and uses of various applications by providing both broad and detailed perspectives on cutting-edge theories and developments. This collection is designed to act as a single reference source on conceptual, methodological, technical, and managerial issues, as well as provide insight into emerging trends and future opportunities within the field.

The *Research Anthology on Changing Dynamics of Diversity and Safety in the Workforce* is organized into eight distinct sections that provide comprehensive coverage of important topics. The sections are:

1. Fundamental Concepts and Theories;
2. Development and Design Methodologies;
3. Tools and Technologies;
4. Utilization and Applications;
5. Organizational and Social Implications;
6. Managerial Impact;
7. Critical Issues and Challenges; and
8. Emerging Trends.

The following paragraphs provide a summary of what to expect from this invaluable reference tool.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Section 1, "Fundamental Concepts and Theories," serves as a foundation for this extensive reference tool by addressing crucial theories essential to understanding the concepts and uses of diversity and safety in a multitude of industries. Opening this reference book is the chapter "Future of Work and Its Implication on Employee Well-Being in the 4IR Era" by Prof. Ethel N. Abet of University of KwaZulu-Natal, South Africa; Prof. Isaac Idowu Abe of Cape Peninsula University of Technology, South Africa; and Prof. Olalekan Adisa of University of KwaZulu-Natal, Durban, South Africa, which discusses the incessant change and unpredictable nature of capitalism that often leads to job insecurity and loss. This first section ends with the chapter "The Prevention of Work-Related Risks" by Prof. Luis Gabriel Gutierrez Bernal of Fundación Universitaria del Area Andina, Colombia; Prof. Maria Alexandra Malagon Torres of Politecnico Grancolombiano, Colombia; and Prof. Helga Ofelia Dworaczek Conde of Fundación Universitaria del Área Andina, Colombia, which presents how security and safety in the workplace, humanistic management, and humanistic psychology have become fundamental pillars for the fulfillment of business objectives and the intervention on social and environmental issues, all the while recognizing human talent as the main axis for organizational development..

Section 2, "Development and Design Methodologies," presents in-depth coverage of the design and development of diversity and safety practices for their use in different industries. This section starts with "The Positive Face of Human Capital, Psychological Capital, and Well-Being" by Prof. Olcay Okun of Hasan Kalyoncu, Turkey, which analyzes the relation between positive psychology, psychological capital, and well-being. This section ends with the chapter "Knowledge Management of Work Stress in Mexican Manufacturing Environments: Models of the Relationships Between Burnout and the Body Mass Index Among Middle and Senior Managers" by Profs. Aide Aracely Maldonado-Macías and Oziely Daniela Armenta-Hernández of Autonomous University of Ciudad Juarez, Mexico; Prof. Miguel Angel Serrano-Rosa of Universidad de Valencia, Spain; and Profs. Liliana Avelar-Sosa and Jorge Luis García-Alcaraz of Autonomous University of Ciudad Juárez, Mexico, which presents a knowledge management perspective to propose a pair of structural models to determine the relationship between burnout syndrome (BS) and body mass index (BMI) among high and middle managers of Mexican maquiladoras.

Section 3, "Tools and Technologies," explores the various tools and technologies used in the implementation of diversity and safety for various workplace settings. This section begins with "Employee Welfare Provisions: An Administration Tool to Enhance Employee Efficiency" by Prof. Chandra Sekhar Patro of Gayatri Vidya Parishad College of Engineering (Autonomous), India, which focuses on determining the various employee welfare provisions adopted by different private organizations and its influence on the employee's satisfaction and effectiveness. This section ends with the chapter "Health and Wellbeing as Appreciative Inquiry in a Private University in Mexico" by Profs. Cynthia M. Montaudon-Tomas, Ingrid N. Pinto-López, Ivonne M. Montaudon-Tomas, and Marisol Muñoz-Ortiz of UPAEP Universidad, Mexico, which discusses organizational wellbeing as both a strategy and a responsibility, especially in recent times, when the line between work and life seems to be blurring, and there has been an increased concern about the role that work plays in the health and wellbeing of employees.

Section 4, "Utilization and Applications," describes how safety and diversity procedures are applied in diverse industries. The opening chapter in this section, "People and the Digital Enterprise: Challenges and Approaches," by Profs. Vivek Balaraman, Sachin Patel, Mayuri Duggirala, Jayasree Raveendran, and Ravi Mahamuni of TCS Research, Tata Consultancy Services, India, examines three representative people-related focus areas for the digital enterprise, enhancing workplace wellbeing, enabling continuous learning and compliance to information security. This section ends with the chapter "Women's Employment in Turkey's ICT Sector: An Examination From a Social Inclusion Perspective" by Prof.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Selda Gorkey of Istanbul Kultur University, Turkey, which examines women's employment in Turkey's ICT sector from 2009 to 2016 from a social inclusion perspective by using various indicators.

Section 5, "Organizational and Social Implications," includes chapters discussing the impact of diversity and safety procedures on organizational and employee performance and wellbeing. The chapter "Impact of Workplace Diversity on Employee Performance: A Case of Some Selected Private Universities in Ghana" by Profs. Ben-Bright Benuwa, Joy Nana Okogun-Odompley, and Benjamin Ghansah of Data Link Institute, Ghana and Prof. Juliana Serwaa Andoh of Kwame Nkrumah University of Science and Technology, Ghana, explores how the milieu of workplace diversity affects the relationship between employee and performance. This section ends with the chapter "Prevalence of Musculoskeletal Disorders of Odisha Farmers in Selected Agricultural Tasks: A Critical Analysis During Seeding, Fertilizing, and Weeding of Crops" by Profs. Debesh Mishra and Suchismita Satapathy of KIIT University (Deemed), India, which provides an extensive review of the literature on the application of cuckoo search (CS) methodology, and its application for the optimization of agricultural pesticide sprayers for maximum efficiency was suggested.

Section 6, "Managerial Impact," presents the strategies and best practices for managers to implement diversity and safety into their workplace culture. Starting this section is "Work Leadership, Occupational Health, and Safety" by Prof. Gabriel Akinbode of University of Lagos, Nigeria, which provides an exhaustive discourse on the relevance of occupational health and safety systems in modern day workplaces as well as the nexus between management leadership and occupational health and safety. This section ends with the chapter "Cultural Norms and Expectations Within the Hospitality Industry" by Prof. Mihaela Dariescu of University of Roehampton, UK and Prof. Dalvony Duraes Alkmim Savic of University of West London, College of Contemporary Arts, UK, which defines and discusses culture and cross-culture management, explains the importance of understanding multicultural perspectives, and discusses the managerial approaches of managing workforce diversity and cultural diversity.

Section 7, "Critical Issues and Challenges," presents coverage of academic and research perspectives on challenges to implementing diversity and safety practices in different industries and workplace settings. Starting this section is "Managing Generational Diversity: Lessons German Companies Can Learn From Silicon Valley" by Prof. Martin Klaffke of Hochschule für Technik und Wirtschaft Berlin, Germany, which discusses United States diversity practices and how they may be implemented within a German setting in the wake of a dramatic demographic change and shifting of workplace values. This section ends with the chapter "A Review of Heat Stress Policies in the Context of Climate Change and Its Impacts on Outdoor Workers: Evidence From Zimbabwe" by Profs. Kwasi Frimpong, Bigboy Ngwenya, Jacques Oosthuizen, and Martyn Cross of Edith Cowan University, Perth, Australia and Prof. Cynthia Nombulelo Chaibva of National University of Science and Technology, Bulawayo, Zimbabwe, which outlines the state of climate and heat stresses in Zimbabwe as benchmarked against other African countries and France. It further summarizes outdoor workers' susceptibility to heat exposure and the need for the Zimbabwean Government to develop policies to ensure the health and safety of an increasing population of outdoor workers in Zimbabwe.

Section 8, "Emerging Trends," highlights areas for future research within this field. Opening this final section is the chapter "Appraising the Future of Employee Health and Wellness Programmes in the Fourth Industrial Revolution: Wellness Programmes" by Profs. John Amolo and Andrisha Beharry Ramraj of University of KwaZulu-Natal, South Africa, which examines and discusses employee wellness as a strategy that deals with enabling employee welfare. A healthy workforce enhances employee wellness. This section ends with the chapter "Trends in Macroergonomics Applications for Improved Work

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Systems" by Profs. Arturo Realyvásquez and Guadalupe Hernández-Escobedo of Instituto Tecnológico de Tijuana, Mexico and Prof. Karina Cecilia Arredondo of Universidad Autonóma de Baja California, Mexico, which focuses on the analysis of subsystems and work processes, which can be assessed both up and down the organizational hierarchy from intermediate levels, and also, up and down some changes may be done to ensure the work system design is harmonized.

Although the primary organization of the contents in this multivolume work is based on its eight sections, offering a progression of coverage of the important concepts, methodologies, technologies, applications, social issues, and emerging trends, the reader can also identify specific contents by utilizing the extensive indexing system listed at the end of each volume. As a comprehensive collection of research on the latest findings related to workplace diversity and safety, the *Research Anthology on Changing Dynamics of Diversity and Safety in the Workforce* provides researchers, human resources personnel, managers, safety officers, policymakers, CEOs, students, professors, and academicians with a complete reference source that highlights the challenges and opportunities for developing an inclusive and safe workforce. Given the vast number of issues concerning usage, failure, success, strategies, and applications of workplace diversity and occupational safety in modern technologies and processes, the *Research Anthology on Changing Dynamics of Diversity and Safety in the Workforce* encompasses the most pertinent research on the impacts and development of a diverse and safe workforce.

ABSTRACT

Capitalist corporations seek ever-new opportunities for trade and gain. As competition intensifies within markets, profit-seeking corporations innovate and diversify their products in an unceasing pursuit of new market niches. The incessant changes and unpredictable nature of capitalism often leads to insecurity regarding job loss. Job insecurity has been empirically proven to have negative effects on individuals and organisations. It associates to reduced job satisfaction and decreased mental health. A longitudinal Swedish study showed an indirect effect of trust on job satisfaction and mental health of employees. The advent of AIs, humanoids, robotics, and digitization present reason for employees to worry about the future of their work. A recent study conducted by the McKinsey Global Institute reports that by 2030, a least 14% of employees globally could need changing their careers as a result of the rapid rate of digitization, robotics, and advancement in artificial intelligence disruptions in the world of work.

INTRODUCTION

Presently, the world of work is experiencing major outcomes from the change process. The speed of change processes and the size of such changes are drawing attention to the need to transform the world of work. Organisations are working hard to understand and react efficiently to the emerging challenges. For instance, the "Future of Work Initiative" (FWI) by the International Labour Organisation (ILO) is one of such efforts. The FWI is designed to assist the ILO to enhance her social justice mandate. Management of proactive organisations need to engage extensive process of deliberations on the future of work as the core of human resource consideration. Discussions and actions on the concept should be broadly based on making the future of work visible and promoting practical political willingness to engage; as well as giving attention and structure to strategies that immediately tackle the diverse and complicated challenges (ILO-DG, 2015). Where these concepts underpin discussions on the future of work, success is expected to be the resultant factor.

In considering the future of work, some pertinent questions to be asked should include but not limited to matters associated with; capacity to create or destroy jobs annually, implications of job creation/ or destruction on existing policies, priorities and controls, repositioning work in societies, income distribution, managing the effect of technological advancement on workforce, with the emergence of humanoids, robotics and artificial intelligence (AIs) – are we expecting jobs disaster or jobs prospect? (Ryder, 2015), and the implications of all these on employee health and wellness.

It is becoming predominantly clear that the advancement of technology and improvement in ways of doing things continue to provide technological reasons why routinised jobs that do not need mental inputs should be automated. In this context, Ryder (2015) asks; *So how do we deal with technologies? How do we deal with the dissolution of the employment relationship?* The answers to these questions could be unsettling; technologies will deal with man in the workplace in both positive and negative ways. It will dictate skills, new skills and need to acquire new skills. Many people will lose their permanent employment and will need to get new skills (reskill) or additional (upskill) skills to be able to engage in part-time employment in the new world of work. Employment relationships will change.

It does not make sense to examine the 4IR and the future of work without looking at the earlier industrial revolutions. The need to improve the way in which work is done efficiently paved way for the revolutions.

Background of the Industrial Revolutions

Over time, men mastered industry by not only depending on mechanical evolution but through the reinvention of the machines as novel resources and using them as tools. By this, industry is promoted through qualitative developments whose outcomes impact mankind overwhelmingly and they named the occasional entrenchment in any given period "revolutions".

The first industrial revolution (era of the emergence of steam engine), denotes the period in the late 18th century (1765) that witnessed the transformation of mainly rural, agricultural cultures in Europe and America into urban, developed and industrialised societies. Handmade commodities totally produced by human effort began to be produced in large quantities by machines in plants as a result of the introduction of mechanised techniques in the textile, ironmaking and other trades. This revolution began in Britain in the early 1800's.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The second industrial revolution (age of science and mass technology) began in the late 19th century (1870) and continued to early 20th century and is reputed to have introduced the most changes into the world. It brought growing cities, sprawling factories and ended the regulation of people's lives by the sun (Freeman, 2018). It birthed fast advancement in the manufacture of steel, use of chemical compounds and electricity to power manufacturing processes including arms and consumer goods produced massive proportions. It created ease in transportation (using train, cars and bicycles); information was spread faster through newspapers, radio and telegram. All these made life and living faster. It was the period when a class of rich businessmen and well-off middle class was created. Migration to the urban areas by workers from all over the world and rural dwellers of America's farming communities and villages was prominent. Work was at the centre of all this and according to Freeman (2018), individuals who had control of their lives and whose work revolved around times and seasons had to work in factories that were fixed, and clock regulated. The second industrial revolution midwifed mass production in industrial and consumer products.

The way information is transmitted, business is done, and people interact was changed by the third industrial revolution (rise of digital technology) via the digital communications technology and internet. This commenced in the 20th century (1969) and witnessed the rise of electronics (microchip and transistor, processors and telecommunications. The 3rd industrial revolution orchestrated high-level automation in industrial production processes through programmes and robotics.

Summarily, the first industrial revolution utilised water and steam to industrialize production, the second made use of electrical energy in creating bulk production while the third revolution utilised microchip and information technology to power production.

The matter of a fourth industrial revolution is a topical issue today. While some people argue that we are now entering it, others question its existence. However, it is a revolution that builds on the 3rd industrial revolution and the digital revolution ongoing since the middle of last century. Expansion in this revolution is exponential featuring an unprecedented integration of technology that distorts physical, digital and biological domains to totally displace industries globally (Um, 2019; Galli, 2018; Bertola, & Teunissen, 2018). This is expected to generally impact production, management and governmental processes. Robots, humanoids, Artificial Intelligence, Biotechnology, Big Data, Cloud Computing and Autonomous vehicles among many others are altering human concepts of life and perception (Tiddi, Bastianelli, Daga, d'Aquin, & Motta, 2019; Vermesan, Bröring, Tragos, Serrano, Bacciu, Chessa, & Simoens, 2017).

Below is a presentation of the four industrial revolutions

Table 1. Industrial revolutions one to four: the level of complexity

Industrial Revolutions	Level of Complexity	Time Period
First Industrial Revolution	The mechanical production facilities using water and steam power	End of 19th century
Second Industrial Revolution	diversified mass production using electric energy	Beginning of 20th century
Third Industrial Revolution	further automation of production through use of electronics and IT	Beginning of 1970s
Fourth Industrial Revolution	cyber-physical systems	Present days

Source: *Spath, 2013*

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

These revolutions impacted transportation and communication, triggered mass migration from the rural to the urban centres, brought banks and financial institutions to prominence, dramatically accelerated industrialisation, creation of labour unions, attendant pollution, violence, labour dissatisfaction amidst so many other things and is today changing the way we relate, work, do things and live generally.

SECTION ONE

The Fourth Industrial Revolution and Future of Work

The 4th Industrial Revolution (4IR) was first announced in 2011 in Germany. It denotes the era when the production of industrial goods is automated. It guides the concept of a smart plant featuring an absolute network of the production processes: actual time control using information technology and the amplified usage of artificial intelligence, humanoids and robots that control themselves; for better productivity and effectiveness (Kotynkova, 2017). The 4IR concept is fundamentally shaping digital conversations globally and debates posing more questions rather than offering answers are on-going. This chapter seeks to explore the implications of the 4IR for the future of work. In the case that the forecasts that automating production processes would result in the loss of millions of jobs are right, what would become of those whose jobs are extinct? What would happen to traditional workplace relationships? Although revolutions could seem magnificent, they also can be damaging, causing professional obsolesce.

The concept is based on the digitisation, cybernation and information exchange in manufacturing processes. The functionality of the 4IR is grounded on the use of IoTs, Big Data and Services for the creation of a "smart factory". Inside the interlinked smart factories, *cyber-physical systems* (CPS) scrutinise physical procedures, produce a cybernetic copy of the real world and reach decentralised decisions (Ghobakhloo, 2019). CPS interconnect and collaborate with one another and with mankind in real time through the IoT. Value chain participants access offered services through the Internet of Service (iOS) (Lu, 2017; Verdouw, Wolfert, Beulens, & Rialland, 2016).

Many policymakers are clueless about what the 4IR is about because there is a notable paucity of data available to answer fundamental questions, for example: what is the extent and level of change of the main technologies, particularly artificial intelligence (AI)? Which technologies are currently eradicating, supplementing or transforming which types of careers? What novel job opportunities are developing, and which policy alternatives could generate jobs in this context? This scarcity of information will result in missed prospects and the worst-case scenario could be terrible. Hence, if the unpredictable outcomes of the 4IR and its automation agenda would be understood, there is an urgent need for observation and tracking of its changes and indicators, preparation, reinvention and guidance of the workforce and workplace in readiness to guide the effects (The National Academies of Sciences, Engineering, and Medicine, 2017).

The discussion on 4IR so far is along two divides, namely; pessimism and optimism. Pessimists argue that the transformation leading to the use of IoTs, AIs, and robots among many others, will result in the end of human labour, while the optimists who are mainly economists, claim that since past technological advancements ultimately increased the demand for labour and earnings, the 4IR will not be different, hence, there should be no room for fear and anxiety. Between the two divides, few or not much individuals, scholars, or practitioners are discussing about employee health in the 4IR

Scholars and industry experts are regularly engaging in discussions on the emerging organisations and ways of guiding the whole value chain which is progressively syncing with customer demands. The value

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

chain encompasses the overall product lifecycle, beginning with the conception of its idea through the development and production processes unto delivery to the customer and possibly, the recycling phase of the product (Stark, 2015). According to Brynjolfsson (2014), increasing automation brings humanity to the "second machine age". However, in the 4IR, data forms the heartbeat (material) operations and processes. Little surprise that the entire universe of work is jittery about the implications of the 4IR on work, future of work, relationships, leadership, strategies and employee well-being among many others.

The results and consequences of the consistent daily activities of transformational changes in the 4IR on the workers and workplaces are difficult to accurately predict or addressed in the short run. For instance, the use of robots and humanoids to perform routinised functions that are otherwise performed by humans will not only cause individual employees to lose their jobs but will also entail that they either upskill to acquire further skill in doing similar jobs or reskill to function in another job area. This will come with its attendant stress on the individual's health and/or his interpersonal relationship at work/ domestic relationships. On the workplace itself, the requisite actions requiring instant policy responses could be challenging, especially where such actions are necessary but demand short-term and precise attention.

What is the future of work in the era of automation? To meaningfully explore the future of work, there is a need to draw have a baseline knowledge by examining the present-day outlook of work. What is the present situation of the world's over three billion labour force? In what areas do we have the most prominent shortages in decent work?

According to the report of the Director-General, International Labour Conference, the 104th Session (2015), the world was enjoying a period of unprecedented prosperity before the global financial glitches of 2008, and the current level of economic development has remained notably lower than the times before since then. Unemployment rate worldwide is recorded at above 200 million, about 30 million in excess of 2008's number. The number of unemployed youths is much more in comparison to that of the total population, and in most cases the rate is doubly higher. Additionally, the inequality in the number of men and women in employment persist by 26% with more men than women, but the participation of women in workforce rose sharply in the last century. However, the latest information show that the salary gap between the genders is still above 20%, showing no sign of reduction soon. Rather, informal types of work and unsalaried domestic work at home are the typical jobs that women are the most participants in.

It is no longer news that the world needs to create approximately 600 million jobs by year 2030 since over 40 million individuals are launched into the labour market annually. The most visible job created these days are in the services sector that already employs about 49 percent of the total employment when compared to agricultural and industrial sectors' 29 and 22 percent respectively. Demographic structure of the present day workforce shows that most of the people at work are young people who will need provide for a rising number of aged people, as the global population shows an increase in the percentage of individuals above the age of 65 from 8 percent to almost 14 percent by the year 2040. According to the ILO (2013) report, inequities are on the rise in numerous nations as the contribution of labour to gross domestic product fell notably from 75 percent in '70's to 65% in the middle of the 2000s in industrialised nations.

With foregoing in mind, one is pressed to ask about the implications of a transformation of the production processes on a workforce that is under the burden of rising unemployment rate, inequalities at work, aging population with the need to be supported, escalating poverty and social injustice? In trying to address the incongruity among the necessary skills needed for the new machineries (including robotics, IoTs, Humanoids, and others), and the extreme rate of automation, will the workforce and workplace

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

relations be able to fit? What will the impact of all these be on employee well-being as they struggle to adapt, upskill, reskill and lead in an unpredictable work environment? Is there sustainable protection, strategies, initiatives to support employees who may lose their jobs (deskill) or need to acquire additional skill (upskill) or learn new skills altogether?

There is no concrete answer to this question in the present. However, unclear and different guesses abound with majority of the scenarios spinning around the complicated associations among humans and machines (Proctor & Van Zandt, 2018; Roblek, Meško, & Krapež, 2016). Using robots to perform jobs erstwhile done by humans will have a displacing effect on labour and the demand for human labour will decrease; conversely, the cost of labour (wages) will decrease too. However, the cost savings derived from decrease in labour and wages will counter these effects through its effect on productivity and result in in an increase in the demand for labour in the tasks not carried out by robots. Additionally, the productivity effect will lead to more capital accumulation and deeper automation and conversely rise in the demand for labour (Acemoglu & Restrepo, 2018).

Although there are benefits associated with the automation of manufacturing processes in the 4IR as seen above, the prediction of its effect on employee wellness has not been made. From the period of transiting from area of traditional skill (de-skilling) to learn a new skill or acquire additional skill (up-skilling), the influence on employee health and wellness through strain, stress and fatigue could be imagined.

SECTION TWO

Digital Technologies and Employee Well-Being

Organisations in the 4IR seek to exploit new and developing technologies to attain higher stages of competence of production and consumption, grow into new markets, and contest globally with new products for customer base that progressively includes digital natives. Nevertheless, management and leadership of organisations in every sector will be required to design holistic human resource strategy to address the challenges of the transformation of the 4IR age.

Although innovative disruptions are essential to organisational development; however, there is a dearth of empirical studies that have systematically investigated the effects of the phenomenon on employees mental and physiological wellbeing. According to Mitchell and Brynjolfsson, (2017) immense difficulties for jobs accompany technological advancements. They report that although the level of productivity in the United States is at an all-time high, earnings of those at the 50% bottom level wage mark has been at a standstill since 1999. This, they say is as a result of technological advancement and the allocation of profits to those at the top of organisational hierarchies.

The National Academies of Sciences, Engineering, and Medicine (NASEM) (2017) marshalled the effects of information technology on employees. It reports that in the next 10–20 years, digitisation will impact almost every career. The introduction of self-driving automobiles for instance, will reduce the jobs of taxi drivers and long-haul truckers, while online training could be of immense value-add as a retraining option to retrenched employees. However, most of the information required to identify, understand and adjust to employee challenges are not collected systematically, or may not be in existence. Ironically, we live in an age of abundant information, but policymakers often do not always have timeously relevant information necessary to tackle the effect of digitization on the workforce.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Organisations that would positively embrace the 4IR in a socially supportable manner, will need to complement their digitization process with training and development line-ups for their employees, in new equipment and technologies that skilled worker uses and by which the operatives are straight-forwardly and indirectly affected. Additionally, new working settings such as the '*cyber-physical factory'* will unswervingly impact the operatives and the nature of work, making new exchanges not only among humans and machineries, but also among digital and material ecospheres. Hence, socio-technical transformation towards the 4IR that integrates innovative strategy and manufacturing philosophies for two prong 'human-centric' and 'cyber- physical' production processes where robotics, artificial intelligence (AI), humanoids, and other innovative manufacturing technologies present possibilities to further enhance and augment human employee's physiological, psychological and cognitive capabilities instead of unmanned, automated factories (Romero, Bernus, Noran, Stahre, & Fast-Berglund, 2016) are required. Romero et al (2016a) suggest that approaching the 4IR this new way will need basic rethinking of job-design such as those utilised in the design of environments where aeroplane pilots, manufacturing operatives and military personnel work. Naturally, this setting would need the supervision and control of situations by humans.

According to the World Economic Forum (WEF) (2018) report, there are signs of rising skills instability resulting from the upsurge in new technologies and disruptive business models, alterations of work outlook arising from job sharing between machine and humans. Furthermore, it reports that employers of labour expect that the requisite skills for the performance of some work tasks will change considerably by year 2022.

Additionally, it is reported that at least 54% of the workforce will need notable re-skilling (obtaining new skills) and upskilling (obtaining additional skills). The skilling programmes needed to attain re-and upskilling are expected to last from six to twelve months or more. The skills that would be highly prominent by 2022 are forecasted as those requiring critical thinking, creativity and innovation, and dynamic learning and learning tactics. Others are thoughtful consideration of details, hardiness, ability to solve complicated problems and flexibility. There will also be incredible demand for leadership, interpersonal skills, emotional intelligence, and networking capabilities (social influence) (WEF, 2018). Hence, when an organisation automates its production processes, the human workforce are likely to face challenges resulting from the need to re-and upskill to perform their jobs, and this will place a demand on their time, energy and mental and physical wellbeing.

In line with Day, Scott, and Kevin Kelloway, (2010), automation is viewed here as both a demand and a resource using the *job demands-resources* model (Demerouti, Bakker, Nachreiner, & Schaufeli, 2001) and Lazarus and Folkman's (1984) transactional model of stress to provide a theoretical framework. Aspects of digitization will be reviewed as promoters or reducers of workers' stress and wellness respectively. The degree to which digitization improves employee productivity, the extent to which it increases an individual's job control and self-development and the extent to which it requires that an employee de-skill, up-skill, or re-skill, all have significant impact on the employee's wellbeing. In this context, this section explores the interface among the employee (individual characteristics) and the institutional/work characteristics in the 4IR.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

SOME PREDICTED IMPACTS OF DIGITAL TECHNOLOGY ON THE WORKFORCE OVER TIME

As the rate of technological advancement continues to rise, so does the impact of the transformations that come with it. Evidently, the cost of digital technologies conversely reduces as they develop in capacity. If these transformations are well managed, they could result in a new era of decent work, decent jobs and enhanced quality of life for everyone, but if on the other hand, they are managed poorly, they will create the risk of broadening skills gaps, more inequity and wider polarization. The likelihood of more of these technologies being acquired by organisations to perform diverse functions is high. These advancements have enabled global development of peer-to-peer (P2P) platforms like Uber, CurrencyFair, Kiva, and Gobi, which cut off the exploiting middlemen and has the potential to basically alter employment designs and arrangements to a 'gig economy' where temporary job-based employment is rampant (Horton, Cameron, Devaraj, Hanson, & Hajkowicz, 2018).

The implications of these on employees across various sectors are enormous. Workforces are contending with numerous major changes for example, prolonged use of digital technology at work and home leading to longer screen-time, end of traditional work arrangements and relationships, fear of job loss, stress arising from new learnings, and boundary blurring between work and family domains. Given the unfolding changes, the main question for employers, management, and human resources practitioners should be the extent to which the present legislation, organisational policies and systems are able to address future workplace and workforce challenges. There is a need to start thinking about plausible futures before they come to pass and plan and strategize wisely.

Some of the trends and effect of digital technology on employees are as follows;

1. **The Spread of Automated Systems and Robotics:** The probability of the costs of advanced automated technologies falling is high while their capacities and broad use will possibly be on the rise. The implication of this is that more jobs will be created and/or lost and the need to re-, up- and de-skill will respond consecutively. To de-skill, will task the psychological, social and economical factors in an employee's life. The employee in this situation will need relevant information and time to process the situation and where this is not properly handled, stress leading to ill-heath could set in.
2. **Rising Issue of Workplace Stress and Mental Health Issues**: Workforce globally is recording increasing levels of stress and mental health issues. There is a possibility of workplace stress and mental health issues to be exacerbated by new and increasing use of digital technologies in the workplaces even though technology itself could also provide prospects of addressing these issues. For instance, Shigemi, Mino, Tsuda, Babazono, and Aoyama, (1997) found that male workers who could not keep up with the rate of technological advancement and those working in automated factories faced the danger of having of mental ill-health. Potential relations were found between high use of digital technology and signs of informed mental health issues among young adult tertiary institution students, although the causal paths were unclear (Thomée, Dellve, Härenstam, & Hagberg, 2010).

Mental health difficulties include anxiety, depression, and sleeping disorders and mood-swings. These have increased among the overall global population over the past few decades, but it is more prevalent among adolescents and young adults (Patel, Flisher, Hetrick, McGorry, 2007). Though the causes of

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

mental ill-health are linked to many factors, use of digital technology has been figured as a main variable in the exposure of young people to the disorder (Thomée et al., 2010).

3. **Growing Screen Time, Inactive Behaviour and Chronic Illness:** Technological advancement and performing routine tasks on computers have increased the level of sedentary behaviours leading to physiological ill-health among both the old and young. Diseases resulting from longer time spent on the screen are on the rise and they include obesity, heart-related diseases (hypertension and heart attack), type 2 diabetes and other chronic ailments.
4. **Distorted Boundary Between Work and Family:** A large population of the global workforce, especially those from developed countries like America, United Kingdom and Australia are engaging with employment arrangements that grant them flexibility at work. Flexible work policies allow employees to work from any location outside the traditional workplace. Blurring of work-family boundary has been indicated as a predictor of work-family conflict (WFC) (Schieman, & Glavin, 2016; Allen, Johnson, Kiburz, & Shockley, 2013). Work-family conflict is a stressor that has been proven to associate significantly with wellbeing ((Kalliath, Kalliath, & Chan, 2017; Nohe, Meier, Sonntag, & Michel, 2015)

SECTION THREE

Future of Work - Deskilling, Reskilling and Upskilling

Introduction

This section examines the unclear impact of technological digitisation and automation of work processes on the cultivation of new skills by the workforce and the future of work in various sectors. Since the 20th century advancement in technology and machine automation which it brought with it, a reduction in the economic value of applied knowledge and skillsets previously acquired by machine operators, artisans, and various highly skilled workers (Braverman, 1974), while also compelling the acquisition of new skills in various engineering and professional careers. Advancement in technology has also been documented as potentially responsible for complicated patterns of d*eskilling*, *reskilling*, and *upskilling*. In this section, the scholars in line with the theoretical contraption of sociological discussions over economic deskilling, highlight a dissimilar potential for technological deskilling/upskilling/reskilling, namely the ability of technological advancement and the automation of the workplace of the future to contribute to the *wellness deskilling* of human workforce, a possibility that exists together with rich but presently underrealized potentials for wellness reskilling and/or upskilling. We explore this general premise by reviewing the extant literature involving automated workplaces, new media practices, and robotics. In conclusion, we posit that since employee wellbeing is a vital requirement for employee optimal productivity and satisfaction, and since technological advancement and uncertainty about the future of work may not be currently synchronised to achieve this in the future, there is a need to pay close attention—and perhaps formulate active intervention.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Future of Work Across Some Sectors

The future of work is not singular. It will vary along sector and industrial axis and impacted by initial situations surrounding the distribution of roles, various financial outlay for adopting new technology, access to skills and the adaptability of the employees. In this context, dissimilar experiences will accompany the structure of new functions and the characteristics of the functions that will no longer be in high demand. WEF (2018) reports that within the period 2018-2022, development in internet as accessed by smartphones and other mobile gadgets will possibly influence the Financial Services and Investment Sector, Aviation, Consumer Commerce, and Travel and Tourism sector. Consumer speedy adoption of recent technologies and the developments in cloud computing will propel fast growth in the ICT sector, while big data availability will widely influence the Financial Services and Investors, Energy Use and Technological sectors respectively. Also, the range of need and type of sector will push the adoption of specific technologies. As reported in WEF (2018), businesses in every sector will possibly implement the use of immobile robots, as opposed to humanoid, floating or subaquatic robots. But, leading organisations in the Oil and Gas sector relatively demand similar level of immobile, floating and subaquatic robots, the Financial Services and Investment sector will most likely adopt humanoid AIs. Spreadsheet technologies will significantly influence the Financial Services sector and the Global Health and Healthcare sector, with the earlier looking very likely to be an early leader in the adoption of the technology. Risk prediction could be easily done by machine learning, thus making it a major disrupter in risk prediction and positioning this technology as an attractive tool to the banking and insurance subsectors, and consumer sector. Machine learning could lead to predictive maintenance and demand modelling in the consumer sector.

Furthermore, many industries will face disruption and changing demand structures from non-technological issues, like the consequences of ageing in the Global Health & Healthcare sector. Competences in healthcare technologies could therefore become essential innovations to address the demographic changes occurring, releasing the time usually spent in management and administrative duties for caregiving occupations (Bughin et al., 2018).

Skills gaps between the local job market are among the vastly given hinderances to suitable technology adoption for some sectors., especially among corporate leaders in the Aviation Travel & Tourism, ICT, Financial Services and Investment, and Mining and Metals sectors. Global Health & Healthcare as well as Infrastructural businesses often quote leadership skills gaps as their most notable barriers, while the Chemical, Advanced Materials and Biotechnology, and ICT sectors report extensive worldwide labour market skills deficiencies. Every sector expects substantial skills gap and reskilling of some duration. In the fore front of this is the *Aviation, Travel* and *Tourism*; *Financial Services and Investors; Chemistry, Advanced Materials and Biotechnology; and Global Health and Healthcare* industries will require some reskilling. Organisations in these sectors propose that their employees will need reskilling for periods lasting for at least one year. Most organisations believe that they will equally increase and reduce some portion of their present staff, with the increase possibly counterbalancing the reduction (WEF, 2018). However, this position seems dissimilar across diverse sectors. Mining and Metals, Consumer, and ICT industries, assume that the reduction in their workforce will rise automation, while Professional Services sector employers assume that the ongoing changes will probably lead to an increase in the number of their employees.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Deskilling

The developing technologies deeply reshaped workplace and human practices around the world; the economic, socio-cultural, environmental, political and physiological consequences of which the workforce still struggles to comprehend. Scholars and practitioners in the area of psychology, sociology, philosophy, and economics, in a bid to understand the emerging changes, conceptualised the term "deskilling" to describe the way in which the 20th century technological advancement resulted in the reduction of the value placed on hands-on knowledge and skillsets traditionally required of machine operators, technicians, and professional employees (Braverman, 1974).

Based on a Marxist consideration of skilled labour as a tool for reducing costs and improving performance and managerial hegemony (Marx, 1990), Braverman's seminal deskilling theory has been criticised considerably (Friedman, 1978). Nevertheless, technological advancement continues to generate fresh causes for worry about deskilling as the value for the core aspects of skillsets of lawyers, teachers, doctors, nurses, pharmacists, machinists, and even librarians are reduced to redundancy status (Roberts, 2010; Davis, 2008; Carey, 2007; Rinard, 1996).

The mental, socio-cultural, and economic effects of deskilling on the workforce, their dependants and communities could be overwhelming. Also, the effect on their mind and body could be arduous on their wellbeing. Still, industrial deskilling is a very disputed and severely *unclear* phenomenon (Spencer, 2000; Wood, 1987), when considering the freedom that the computer transformation offered employees charged with monotonous duties like filing, copying, and collating chances of reskilling and/or upskilling to gain employment in careers in the services and information sectors erstwhile assumed to be the prerogative of skilled and knowledgeable individuals (OECD, 2001; Gallie, 1991; Addler, 1990)

The 4IR faces its peculiar challenges with respect to technological deskilling; just like the previous (1st, 2nd, and 3rd) industrial revolutions. Developments in neurotechnology, biotechnology, nanotechnology, artificial intelligence and robotics are exerting new pressures on established professions and the skillsets that are linked with them. For example, the duties of human surgeons are likely to be further changed by their robotic counterparts. The question is, how will this impact the skills of human surgeons – make them redundant or free them to acquire new and advanced capabilities to give better care to patients? Also, will the advancement in software algorithms lead to the redundancy of skilled humans in the areas of forecasting, actuarial science, and market trading? Or will it simultaneously assist humans to both predict and better comprehend upcoming events as well as their intricate causes? Teaching is also at risk as a result of the efforts to develop automated methods for delivering instructional content, marking essays, and regulating dialogues in the classroom. If robots or humanoids are created to perform these duties, what would be the future role of a human teacher in a classroom? Will teaching become an extra role consigned to supporting robots and AIs; or would they be afforded additional time to inspire and create curricula, or give more care to the mental, growth and emotional needs of individual learners? Scholars in relevant fields are doing their best to trace and ponder on these issues and the vague potentials they create (Heisig, 2009; Ritzer, 2008).

However, this section focuses on an important facet of deskilling that has yet to be voiced in extant literature of the physiological impacts of technological advancement in the 4IR, namely, the potential in various professional and technological contexts for an automation driven deskilling to impact employees positively and/or negatively. It is negative where the human being is extracted from the workforce and not allowed to upskill or reskill and positive where the reverse is the case.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Hypothetically, the potential for deskilling in an era of massive automation is significant, and irrespective of the optimism surrounding this, deskilling is likely to present serious wellness problems in many areas of human living if the present trends persist. Where technological tools completely replace the human beings in the performance of traditional functions that humans used to do, the human employee could be said to have been deskilled. This act is costly in financial terms expressed by loss of earning expectations, cost of reskilling (where the organisation does not bear it); time and energy expended in acquiring new skills, and physiologically, stress and strain on the body.

Summarily, the idea of deskilling has declined in scholarly circles, for some reasons. Primarily, the communication (ICT) revolution has created a problem to efforts to find the simple causal connection among mechanisation of human tasks and the loss or devaluation of human skill. Advanced technology especially computerisation have liberated most employees from comparatively low-skilled employment (OECD, 2001). In this way, upskilling and reskilling address the ambiguity in deskilling by additionally developing human skills needed for the future workplace. The secondary reason for the decline in the use of deskilling by academics is its strong association with past debates about employment, commerce, and socio-economic justice, connoting the concept as politically and ethically biased. Because of this, present day sociologists shy away from using the concept, not willing to stain their work with extreme or normative nuances; deskilling therefore lost some acceptance as an unbiassed tool of scientific analysis.

In conclusion, since reskilling is required for effective performance and earning of wages, and the various costs of deskilling on an employee's finances, time, energy and health may not be in sync with the future shape of technological developments, a concerted effort by practitioners and scholars to systematically appraise these developments and possibly design active and plausible interventions in support of deskilled employees is called for.

Reskilling

There are complicated response rings among new technology, careers and skills. Technological advancement can push growth in businesses, drive job creation and increase demand for expert skills yet depose entire functions when some duties become outdated or automated. Skills gaps—between employees and amongst the management of organizations—could both hasten the trends towards automation in some cases and create hinderances to the adoption of new technologies thereby hampering business growth (WEF, 2018).

The vital reskilling of employees will displace some staff and simultaneously make available for some others, new opportunities. But exploiting the gains and diminishing the losses demands the thoughtfulness of not only the policymakers (organisational leadership), but also the rational reactions from organisations to discover the winning strategies for employees and organisational bottom line.

Employees need to develop a mindset that is alert to learning in their shifting from their traditional roles that were limited to the emerging, erstwhile unthinkable future. Lastly, organisational leadership, government and the academia need to collaborate to find ways of assisting disengaged employees to refocus their skill or reskill to acquire new capabilities, and finance sizable investment in the creation of new learners who are alert in future human resources by addressing enhancements to learning and training structures, modernising employment policies to align to the actualities of the 4IR. Extant literature presents the different effects of technological advancements leading to the automation of work processes, showcasing how jobs are designed and employees ownership (or absence thereof) of skills harmonise

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

with recently launched technologies to influence the organisational and individual performance (Autor, David, Frank Levy & Richard Murnane, 2000).

Reskilling will avail employees with highly in-demand skills capable of being improved upon, the opportunity to earn more and work in more excellent jobs. On the other hand, employees who do not possess the requisite skills to adjust to new technologies and be promoted to more value adding roles could have their salaries and work quality repressed by technology consistently devaluing their work, as it intrudes into their roles (WEF, 2018). These categories of employees need to be augmented to be motivated, alert and armed with compact skills to exploit new opportunities in the future via constant reskilling and upskilling (Shook, & Knickrehm, 2017).

The WEF (2018) identified a major downward trend in the demand for physical skills and manual capabilities as well as a decline in the need for skills associated with managing financial resources and fundamental *installation* and *maintenance skills*. Conversely, logical thinking, creativity and innovation, dynamic learning and training strategies, technology design and programming are gaining rising prominence. Competency in emerging technologies is one side of the skills coin, while person-related skills such as social influence, hardiness, ability to solve complicated problems, and flexibility, mindfulness and attention to specifics will remain or grow in value. Leadership, networking and emotional intelligence (EI), and service inclination is experiencing enormous rise in demand compared to their present importance. Hence, organisations will have to follow various corporate strategies to remain competitive in the face of fast changing human resource skills needs. To achieve this, top management and human resource practitioners will need to transform their skills in order to successfully be in the fore front of the workplace revolution.

It is important that organisations having employees confronted with unstable skills consider the need for reskilling and upskilling, their cost on bottom line and the opportunities that could be harnessed through this approach. The time required, costs to organisation and individuals, delivery mode and success/failure cases may not be the same for categories of employee, and job functions of various organisations undertaking reskilling and upskilling. For instance, some organisations may experience awesome increase in their employee performance, retaining of talented experts, empowerment of frontline employees to maximise the use of recent technologies in performing their duties and improved worker satisfaction through reskilling and upskilling programmes.

Notably smaller sizes of businesses could see reskilling as a way of reducing hiring costs, posting workers in disrupted work functions or as a means of increasing the skills source of their middle- and lower-skilled staff. Summarily, employers have perceived reskilling as a slim approach targeted at specific subcategories of workers, not as an all-inclusive approach to propel staff transformation. Lastly, while it is incumbent on businesses to be in the fore front of creating capability within their organizations necessary to sustain their conversion to the workforce of the future, the challenges arising from the financial and societal nature of these disruptions demand that they progressively become strategic in partnering with other stakeholders to organise the massive reskilling and upskilling needs of the future. Viable partnership opportunities exist in creating alliances with academics to reform learning curricula, collaboration within and among industry players on developing skill pipelines, partnering with organised labour to stimulate cross-industry skill movement. Governmental partnership could be harnessed through the creation of incentives for lifelong education, guaranteeing of standards sharing for reskilling and consolidation of protection (security) for mobile employees (Bughin, Hazan, Lund, Dahlström, Wiesinger, & Subramaniam, 2018). Nevertheless, there is still need for additional guide and good training opportunities.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In order to avoid a situation of overwhelming and undesirable loss occasioned by technological advancement attended by skills shortage, mass job loss and escalating inequality; it is vital that organisations participate actively in assisting their current employees through reskilling, that employees personally take a pragmatically practical route towards their lifelong education, while governments quickly and innovatively provide supportive environment to help all these endeavours.

Reskilling though generally necessary, should be prioritised among employees presently executing high-value functions in order to strengthen organisation's strategic capabilities. Additionally, employees performing major and frontline duties who will be utilising new technologies in their work should be reskilled. Also, highly productive employees, employees performing duties that are mostly going to be affected by new technologies and are at risk of losing their jobs should be prioritised for reskilling.

WEF (2018) suggest that there is a need to comprehensively augment employee potentials in the face of transformation by using automation of certain roles to balance and boost human employees' relative strengths in order to empower them to exploit their full potentials on the long run. Instead of the narrow focus on cost savings through cutting labour cost, the augmentation tactic considers the bigger picture of value-creating events that could be undertaken by human employees usually in harmony to AIs, robotics and possibly humanoids, when they utilise the freedom created for them from performing routinised and monotonous duties for human-centric activities. To derive these benefits, employees need to acquire the relevant skills to enable them to succeed in the future workplace as well as the capability to reskill for as long as they are in the workforce.

The key business imperatives of vibrant organisations are to design in-house permanent training system, finance human resource development and collaborate with all stakeholders in crafting human resource essential to organisation's medium to long term development and contribute meaningfully to humanity and social stability.

Upskilling

The level of skill needed to perform work is becoming higher among industries and within distinct professions. Upskilling, both in relations to the average level of employees' education and the kinds of work that they do is required. Gallie (1991) reports that work with developed technology had connections with higher skill levels when examined with the experience employees had with changes needed in the skill to perform their jobs. Additionally, the skill changes are in the area of those needed to perform the job, instead of changes in the expertise and experience that individuals brought to the same job.

The rapid advancement in technology, among other factors including globalisation and emergence of knowledge economy has brought wide ranging argument about the need for advanced levels of skills. Although there is a growing consensus about the importance of skills as vital to economic development (OECD, 2000a) and the extension of the knowledge economy, there is a far less concensus on which capabilities and skills make the difference. Inside and outside the academia, discussions centre on the attainment of higher academic qualification in general, concentrated on the attainment of broad-based capabilities supportive of lifelong learning. From the job market opinions, a heightened attention is being given to skills such as the capacity to use *information* and *communication technology* (ICT) to address challenges, participate in teamwork, oversee and lead, and engage in continuous learning. Presently, workplace skills in the public discourse is differentiated from the regular or traditional courses given and received in schools and universities.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the foundation of the perception that knowledge and information are the core of advancement and progress is the idea of "knowledge economy" and "knowledge worker". Hence the capability to effectively create and use information in the digital era has become the important source of skills for potential employees (OECD, 2000b). Change and advancement push the growth of the knowledge-based economy as a result of their impacts on manufacturing processes, spending patterns, and economic structures. This implies that certain transformations in the processes of advancement may not have happened without ICTs and similarly, some of the effect of ICTs may not have been perceived outside the systemic transformations (OECD, 2000c). These transformations have impacted the establishments - economy interface, making networking, synergising and the liquid flow of knowledge in and around national borders to come to prominence.

Knowledge-based organisations comprising the superior-ranking technology product manufacturers, high-and-medium-high technology factories, and those service organisations that mainly use technology such as banks and other finance institutions, insurance companies, corporations, communication, social and individual services greatly contribute to national GDP and are developing speedily (OECD, 2000d).

Indicators of Upskilling

In order to adjust and sustain effectiveness while responding to rapidly changing consumer consumption patterns and preferences in an era of technological transformation, corporations require relevant systems, skilled employees, and competent management. With the changes is a need to restructure the workforce and modify the kind of labour needed. This has highlighted the increasing human capital levels shown by the academic accomplishment and as inferred from the rising demand for more vastly educated and expertly skilled employees. The sign that upskilling is going on is indicated by a preference of more educated people in the job market, evidenced by the proportion of people with university degrees in the workforce and the variations in the distribution of their share in the overall working-age population.

The accounting profession has experienced tremendous upskilling. Empirical data shows that in the past two decades, development in the expert, technical, managerial and executive professions known as "white-collar, high-skilled jobs" has risen higher than employment in other working groups. Comprehensive analyses of hiring trends within businesses corroborate a true upskilling process (Steedman, 1998; Berman, Bound, & Machin, 1997; Machin, Ryan, & Van Reenan, 1996). Those scholars propose that work-engagement moves within organisations, rather than between organisations, and represents an actual shift towards higher skills. This is a generalised reflection of the occurrence of upskilling procedure in individual organisations in opposition to a mere shift from sectors typified by low skilled work to sectors typified by high skilled work. The evolution of 'white-collar', expert skilled jobs in the services and manufacturing sectors respectively showcases upskilling, rather than a mere rise in the activities of the service sector. Really, the decline in manufacturing activities in various countries has in fact raised the need for white collar, high skilled professionals in the manufacturing sector. From a different perspective, there seems to be upskilling within professions

In fact, although total manufacturing employment has decreased in most countries, it has increased for white-collar, high-skilled occupations within the sector. From another angle, there appears to be upskilling within occupations Green, Ashton, Burchell, Davies, & Felstead, 1997).

According to Osterman ((1995), jobs within careers now require higher skill levels in the United States' workplace than they did before especially in the technological and professional careers. In addition to upskilling of the workforce in the academic and professional qualification, new and clear need for set of

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

"workplace competencies" and "interpersonal skills" commonly identified with the emergence of ICT and recent work practices (OECD, 2001). Some of these proficiencies and skills include, basic computing skills, problem solving, critical thinking, team-working and communication (Smith, 2016; Fong, Sidhu, & Fook, 2014; Green et al., 2000). Hence, upskilling and a rising demand for various proficiencies are the main characteristics of the future workplaces ingrained in knowledge economy.

RECOMMENDATIONS

This chapter recommends that lifelong strategy to proactively identify and prepare employees whose skills will not be relevant in the future workplace be urgently crafted and adopted by organisations in every sector. There is no way to downplay the psychological effect of deskilling on affected employees. But appropriate preparation and care in displacing them should palliate the physiological and mental employees suffering. Some of the strategies include post-career counselling, financial management counselling, stress and time management trainings and mindset reorientation.

Additionally, those to be reskilled and/or upskilled should be afforded relevant timing to acquire and test the new skills through patient guidance and support. Time should be given to assist employees in planning their self, family and work relationships while they undergo the required reskilling and/or upskilling processes.

Furthermore, as it has become glaringly clear that the advent of the 4IR came with the need for lifelong reskilling and upskilling in the future workplace, organisations need to become responsive to the need to fund these. The skilling needs are expected to be costly both to the organisation (in productivity terms) and the individual employee (in terms of money, energy and time). A new scheme where individual accounts are opened for employees could be funded by an obligatory three-tier contributions being made in small amounts regularly by individual employees, employers and the state. This is because, the skill needs of the future may not be met through public funding alone, because, when the national purse faces recession and funds are no longer spent on skills development, individuals and organisations may not be willing to invest their monies on it. Creating a scheme would afford all individual employees the opportunity to access fund to meet their reskilling and/or upskilling when necessary.

Employee health and wellness programmes usually adopted to address employee health and wellness issues in the classical workplace may not be efficient in addressing these issues in the workplace of the future. Emerging stressors and ailments such as disorders associated with addiction to social media platforms, stress from reskilling and upskilling and mental health, to mention a few, need novel interventions. Human resource strategists need to collaborate with the academia, organised private sector and policy regulators to tactically design initiatives/interventions to tackle emerging stressors and ailments.

GUIDE FOR FURTHER RESEARCH

The future of work, deskilling, reskilling and upskilling in the 4IR are topical issues widely discussed among experts, professionals and policy regulators in the present times. However, there is a need to research on the extent to which the future of work is impacted by the skill needs and the levels of stress generated among employees by the need to reskill and /or upskill. Additionally, scholars should explore

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the effect of these new skills modification needs and how they impact on employee wellbeing and design strategies to address the emerging health issues resulting from automation and new technologies.

Reskilling and upskilling are necessary in the workplace of the future but very costly undertakings. Empirical studies to determine the ways of reducing and /or subsidising the cost of these ventures in order to exploit the benefits that accrue from the process is recommended.

CONCLUSION

The 4IR comes with it bright prospects, changes to the way things are done, changes to the way relationships forged and sustained, changes to the way goods are produced and services rendered. It comes with vision of good things. Nevertheless, to tap into this positive vision, the workforce needs to possess the suitable skills that should empower them to both work and thrive in the future workplace. They need to be enabled to continue to reskill and upskill throughout their lives. Proactive organisations should be able to craft vibrant in-house lifelong knowledge system, invest in human capital development, and massively partner with other stakeholders on human resource strategy as an important business prerogative, vital to organisations' mid- to- long-term development, for meaningful and significant contribution to people and social cohesion. Employees need an alert attitude towards learning as they transit from the monotonous traditional work practices to emerging and awe=inspiring futures. Lastly, governments, top management of organisations and the academia need to basically find ways of assisting displaced employees to refocus their skills or reskill to acquire new ones; and to devote huge financial sums for the development of a new alert mindset for learning among the employees through undertakings to improve learning and training systems, revising workforce policies to align to the actual events of the 4IR.

Chapter 2
The Dynamics of Workplace Relationships, Employee Well-Being, and the Fourth Industrial Revolution:
Perspectives of Workplace Relationships and Industry 4.0

Isaac Idowu Abe
Cape Peninsula University of Technology, South Africa

ABSTRACT

Employees globally are expected to flourish amidst the uncertainty, volatility, and complexities of the muddy waters of Industry 4.0. To identify changes in the perceived workplace relationships and consider initiatives that will improve interpersonal relationships at work in the 4IR. A review of literature will be conducted on the following key variables: 4IR. In the 4IR, provision of interpersonal other than digital means of communicating with employees, effectiveness in intra-organizational information sharing among employees, constant training on new and improved technological tools of working will be useful. Human resource practitioners should focus on designing strategies to improve IR at work, in order to minimize interpersonal conflicts, provide social support and improve organisational performance.

INTRODUCTION

Workplace relationship is the compound word for all interpersonal relationships in which employees engage themselves with in the process of doing their jobs including customer relationships, workplace friendships, supervisor-subordinate relationships, Professor-student relationships, client professional relationships, romantic relationships (Abe & Mason, 2016). Scholars have considered workplace relationships from different perspectives. For example, workplace relationship quality, (Sias, 2015); tradi-

tional and emerging perspectives (Sias, 2008); Bullying in the workplace (Johnson, 2009); Millennial's organizational relationships and performance (Myers, & Sadaghiani, 2010); Innovative behaviour and workplace relationships (Xerri, 2013); Workplace culture (De-Lara, Ting-Ding, 2016). Each perspective is unique in concepts of organization, communication, and relationships, as they draw the attention of practitioners to various essentials in an organization situation (Sias 2008). The perspective that is relevant to this chapter is the communication aspects of workplace interaction in the era of industry 4.0. Bearing in mind that communication and relationships are like two sides of a coin.

Employee wellbeing is not a bad concept, but making the objective benefits of wellbeing a priority, and implementing its promotional policies in an organization is intense resource wise. Previous studies on employee wellbeing has been well documented. For example, employee wellbeing scholars wrote extensively on the circumplex model of affect (Russell, 1980); the components of employee wellbeing (Van-Horn, Taris, Scaufeli & Schreurs, 2004); Mental health, (Keyes, 2005), Subjective wellbeing at work (Warr, 2007); Core of wellbeing (Diener, Lucas & Oishi, 2005); affective employee wellbeing, (Bakker & Oerlemans, 2011); Positive and negative concepts of employee wellbeing (Makikangas, Kinnunen, Feldt & Schaufeli, 2016) and human sustainability and employee wellbeing, (Kobayashi, Eweje, Tappin, 2018).

The Chartered Institute of Personnel and Development (CIPD) defined employee wellbeing as, "Creating an environment to promote a state of contentment which allows an employee to flourish and achieve their full potential for the benefit of themselves and their organization." Employee wellbeing initiative at work is the balancing of the needs of the employee and that of the organization. The CIPD survey of 2018 suggested that the mental health awareness of workers has increased, and stress remain the dominant cause of employee ill health. "Although technology is viewed as a positive step forward, a whopping 87% of HR professionals reported that the most common negative effect is the inability of employees to switch off outside of work ". (Jimoh, 2016).

A new face of development has evolved in the fields of the digital technology, physical technology, and the biological technology. These three technological areas are the drivers of the Fourth industrial revolution. These technologies are impacting the global industrial, economic, and social development (Li, Hou &Wu, 2017).

Globally the labour markets are undergoing transformation as the consequence of globalisation, technological and demographic changes. The transformation is evident in the new forms of employment, different approach to workplace contracts and engagements, facilitated by online platforms which is because of the 4th industrial revolution (Brooks, 2016). Technology has accelerated the level of communication in workplace relationships. Employees are assessable through different forms of technological tools at any point in time. What effect does this have on the employee in a short and long run? Communication has widened the scope of interpersonal relationships among employees at work by the introduction of technology, scholars must search for new theories and concepts for workplace relationships. In this chapter, the initiative positioned to assist the wellbeing of employees in the face of the new industrial revolution is social support. The assessment of the growth in the characteristics of perceived support and the propensity of employee's behavioural interpretation as supportive. The assumption is that social support represents the positive interpersonal relationships among employees (Gibbs, 2017).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Historical Background

Literature on interpersonal relationship have grown over the years. Earlier researchers viewed interpersonal relationships from the role of relations or intimacy (Marwell & Hage, 1970), Socio-emotional and informal relationships, (Wish, 1974). In 1976, the four dimensions of interpersonal relationship was documented (Wish, 1976). The dimensions include, one, perceived equality versus inequality in relationships (Forgas, 1992; Fiske, 1992): Two, Valence of the relationships between positive and negative relationships (Fiske, 1992): Three, the strength or interdependence of relationships, (Forgas, 1991): Four, to determine the fundamentality of the social context of relationship and/or whether relationship relates to work, Haslam & Fiske, 1992). Studies on interpersonal relationship graduated to determine the presence of relationship between leaders and members of an organization (Graen & Uhl-bien 1995). The interdependence in relationship was reasserted in terms of viewing the compatibility between cooperation and competition (Johnson & Johnson, 2011), Power distribution (equal versus unequal power), (Loi, Lam & Chan, 2012),;Task-oriented versus social-emotional relations (Rosh, Offermann, & Van Diest, 2012); Formal and informal intensity of activities in relationship (Chen & Krauskopt, 2013). The focus of these scholars was to establish the perceptions of interpersonal relationships and to determine the context in which relationship occurs.

The scholars that digressed from the earlier view are of the opinion that there are conditions that affect interpersonal relationships which should be considered also. These scholars asserted that individuals spend considerable time at work, and the interaction of employees in the workplace should be given due attention. The suggestion of Song and Olshfski, (2008) was that family ties, class, ethnic background, race, gender, age, experience, interests, and geography influence interactions among people. Many theories support the suggestion that employee's characteristics and condition of living affects the social relationship between individuals (Sacco & Schmitt, 2005). Social categorization Turner, 1982), social identity theories (Tajfel & Turner, 1986; Turner, 1982), they suggested that people should categorize themselves into in-groups and out-groups according to significant characteristics including sex and race. The assumption was that individuals tend to reduce their differences within groups and enlarge their differences between the group members.

From the foregoing, workplace relationships are all interpersonal relationships in which employees engage themselves with in the process of performing their jobs including customer relationships, workplace friendships, supervisor-subordinate relationships, client-professional relationships, romantic relationships. The following conditions have been proven to affect interpersonal relationships at work: One, loneliness which is a situation experienced by the individual where there is an unpleasant or inadmissible lack of (quality of) relationships (Peplau, 1982). Two, exclusion or social isolation is the state or process of being excluded, not allowed take part in a workplace interaction (Baumeister & Leary, 1995). When employees lack positive relationships, they usually experience loneliness, guilt, jealousy, depression, and anxiety (Leary, 1990). Three, organizational justice: which deals with employee's perception of fairness in the workplace. The concept is divided into three dimensions, namely distributive, procedural, and interactional justice. The distributive dimension is the just allocation of resources or rewards. The procedural dimension concerns how decisions are made, reasonably or otherwise. The interactional dimension is the relationship between superiors and employees, essentially, how employees are treated (Colquitt, Conlon, Wesson, Porter, and Yee, 2001). Four, relational justice is defined as "the justice produced through co-operative behaviour, agreement, negotiation, or dialogue among actors in a post conflict situation" (Casanovas & Poblet, 2008). Five, psychosocial working conditions is the psychosocial aspects of the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

working conditions which are mental load or psychological stress. These constitutes not only mental demands in quantitative ways, for example, production rates and time pressure, but also relationships to customers or demand persons (Kristensen, Bjorner, Christensen & Borg, 2004).

Six, individual differences which refers to the degree of variations and similarities among people on intelligence, personality, interest and aptitude or *intelligence quotient* (IQ). Physical factors such as body, age, and sex (Maltby, Day, & Macaskill, 2007). Seven, cultural differences are different individual orientations with social norms that are prevailing which are probably linked with cultural differences in the way people relate to and communicate with one another in interpersonal relationships (Fiske,1998).

Workplace relationship metamorphosized into Leader-Member Exchange (LMX), (Dansereau, Graen &Haga, 1975; Graen &Uhl-Bien, 1995). The theory contended that leaders develop different relationships with their subordinates. The supervisor-subordinate relationship was developed on the premise that the supervisor directs and determines the flow of relationship from introduction to maturity (Sias, 2008). In 2014, a followership theory was developed that highlighted the role of subordinates as important factors in workplace relationships. The theory emphasised two frameworks, one was the role-based approach where subordinates are viewed as moderators of leaders and two, constructionist approach where subordinates are co-creators of relationships (Abe, Mason 2016). All discuss thus far has awaken a salient question. In the phase of recent economic, social, and technological changes, will the workplace relationship still hold water, or should scholars begin to look towards new relationship for employees in the workplace, especially now that industry 4.0 is with us?

Workplace wellness started with the Italian Physician Bernardini Ramazzini (1633-1714). He was among the first writers on the influence of work exposure on employees (occupational diseases). He took interest in the possibilities of applying preventive measures to help improve employee well-being. Ten-hour workday was proposed by welsh in 1810, to protect the wellbeing of the workforces. An aggressive measure of eight hours was later proposed (Lamphier & Welch, 2017). The account of the health problems of industrial worker was first documented in 1832 by Charles Turner. At that same time, Thackrah highlighted that employers often neglect the wellbeing of their employees in the bid to run their organizations Thackrah, in1932 (Murray 1985). Organizations have been moderating employee wellbeing through constant trainings and improvements on working conditions. In 1950s the concept of Employee Assistance Programs (EAPs) was introduced. Organizations began to offer wellness interventions with primary focus on alcoholism and mental health problems (Owens 2006). It was later confirmed that true workplace wellness programs began to have positive effect in the mid-70s (Realdon, 1998). During this time, a shift was perceived in the financial responsibility for health care from government to employers of labour. After which the development of worksite wellness was motivated to consider occupational safety and worksite health of employees. The reasons given for the worksite wellness are as follows:

- A general culture shift that promoted fitness
- Emerging research findings that showed the cost of employees' unhealthy habits
- Newly formed workplace health promotion groups such as the Washington Business Group on Health and the Wellness Councils of America.

Over the last fifteen years workplace wellness programs adopted have moved from providing health information, counselling, and physical fitness to rewarding employees with monetary incentives (Wieczner, 2013). While employers are debating over the high cost of maintaining employee wellness, other organizations with foresight are looking ahead towards meeting the demand of human progress at work

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

in the fourth industrial revolution. Therefore, the question here is, whether a safe, healthy, and productive work environment for humans is an aspiration or a pot of gold at the end of a rainbow that can never be reached? Organizations that have developed employee wellbeing tagged themselves as "the best place to work" will the same hold in the fourth industrial revolution, where almost everything is assuming a new learning?

The advent of the 4th industrial revolution suggested that there have been three major technological advancements. The First industrial revolution started in Great Britain with the introduction of hydraulic and steam machine system. The second was the separation of components and the assembly of products by the division of labour. The third was characterised by wide use of the electronic, automation of manufacturing and information technology. The fourth is the integration of intelligence and networking system (Li, Hou, & Wu, 2017), widespread application of cyber-physical systems in the manufacturing industry (Liu & Xu, 2017). The Cyber Physical Systems (CPSs) represents the understanding of the Fourth industrial revolution (Zander, & Mosterman,2017). The Industrial Internet, which was promoted by General Electric in the USA, is viewed with the same idea as CPSs. The common features of both are that they are enabling technologies which create the integration of the virtual and real (Al-Fuqaha, Guizani, Mohammadi, Aledhari & Ayyash, 2015). This is a network that permits intelligent objects to communicate with each other. The fourth industrial revolution is manifested in almost all aspects of the society, technology (Shwab, 2017), production (Webster, 2015), consumption and business (Gentner, 2016), human genetics (Sackey & Bester,& Adams, 2017).

The term industry 4.0 originated in 2011, at the Hannover Fair in Germany. The name was a strategy to mitigate the increase in competition from overseas and to differentiate European and German industries from other international markets (Wang,2016). The intention of the German Government was to use intelligent monitoring in production processes to support decision making and machine maintenance, thereby reducing costs and increasing competition of German industries. For a clearer understanding of the term industry 4.0, a framework was proposed that was adopted by different governments (Price Waterhouse Cooper, 2017).

The concept of industry 4.0 began in Germany and has been recognized by other leading industrial nations. In United State of America, it is called "connected enterprise" and referred to as the "Fourth Industrial Revolution in the United Kingdom. The expectation of those at the forefront of the industry 4.0 is that it will be more profound, irreversible, and more rapid in development and acceptance than all the other three generational moves.

The beauty of this chapter is captured from the lens that view industry 4.0 and employee wellbeing from the concept of social support. The changes that industry 4.0 drives in the workplace demand that employees be supported through the transformation. The believe is that employees can count on their employers to offer needed support. That employees will be assisted through period of crisis. That information will be made available to employees to cope with the changes in work operations and interactions.

Challenges of Employees

International Labour Organization's (ILO) forecast that 2.3 million workers globally will accede to a work-related disease or accident every year. 6000 deaths are predicted every day. In 2017, 1.3 million work-related illnesses were reported in United States alone. These illnesses are work-related stresses, mental health, and musculo-skeletal cases (HSE, 2018).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Low rates of unemployment and unending demand for productive work has posed a serious challenge. The responsibilities of managing the wellbeing of employees in a multi-generational workforce where almost everything is changing at an unprecedented rate is imperative. Under reporting of interpersonal conflicts at work is not impossible among employees who are trying to find their feet in the technological workplace (Abe, 2015).

An empirical study carried out among 310 employees of four retail companies in South Africa, 2016 further buttress the facts above. 80% of the respondents agree that they have no relationship with their supervisors or co-worker because they work with machines most of the time. Low level of communication, disrespect, low (EAP) Training, low support, lack of friendship was responsible for low interpersonal relationships among employees (Abe, Mason, 2016). Audi motor company stated clearly that no matter how educated an employee is, the future of any employee in the company depends on their level of interpersonal relations at work. The question is, under the present circumstances where organizations have acceded to job cut, what will happen to employees with low interpersonal skills or relations?

Jeffrey Pfeffer, (2018) documented that the number of employees who say they have no close friends at work has increased in the last ten years (Methot, Lepine, Podsakoff, & Christian, 2016). Previous studies on social support about associations and connections in the workplace that an employee can count on during crises, have effect on that individual's psychosocial stresses. Employees with low social support have been linked with high mortality rates (Uchino, Cronan, Scott, Landvatter, & Papadakis, 2020). The difficulties of interpersonal relationships consequently social support have been the workplace characteristics. For example, encouraging unhealthy competition at work, ranking of employees are vices that has reduced collaboration and teamwork among employees. Unconsciously, the fourth industrial revolution and the use of technology has encouraged transactional workplace approaches, whereby employees are seen as tools, factors of production, emphasis are now on trading money for work; this has left many without any emotional attachment to people and workplaces. The assumption is that as easy as it is to hire you, it is easier to fire you. Again, what if the organizational outcome is better performance and productivity, what effect will all these have on the outcome for the organizations?

By the Fourth industrial revolution and emerging use of technologies, the focus of workplace relationship can no longer be on two people as traditionally dictated, but by many simultaneously. This is a complete departure from the status quo. At best relationship at work must assume a new form of learning because of its complexities.

Concept of Workplace Revolution

The concept describes the interactive changes in the engagement of employees globally and in different sectors. Organizations are rapidly evolving their workplace strategies because of the need to become disparate and respond timeously to rapid growth. These establishments are looking forward to innovation and technology as tools that drive competition and productivity. Global employee performance index must assume a new paradigm between value and culture; reduce employee dissatisfaction and disfunction; embrace exponential volume of change in the organization. The factors that underpin the workplace revolution are:

1. Opportunities that the new technology presents drive innovation and collaboration. Globalization and digitization are major challenges for many organizations who need to focus on finding new ways to create value and increase productivity.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. Generational change that creates expectations that are either high or unmet. It has been confirmed that five generations of groups interact simultaneously at work. The leadership of these different generations of employees need to find solutions to their long- and short-term challenges to maintain its position as the best place to work.
3. Creation of organizational agility. The need to be ready for any form of change whether economic, technological, or social, and the readiness must be swift and quick.

Trends in the Workplace

Five reasons have been purported to be the purpose behind industry 4.0 and why it is imperative to be revolutionary in the era of open market operations and information Technology. First, Industry 4.0 reduces the burden of challenges in the manufacturing industry that is in search of flexibility and responsiveness to business trends. The challenges include increase in market volatility, short product lifecycles, higher product complexity, and global supply chains. Second, industry 4.0 facilitates the transformation of modern economies to become more innovative and increase productivity. Modern Technologies like digital chains, smart systems and industrial internet should speed up innovations and business models are implemented at faster. Third, Consumers are regarded as co-producer, and this brings them to the centre of all activities. Product customization is valued as well as product value chain, digitization will ease crowdsourcing and it will result in faster design process. Fourth, Industry 4.0 puts human (worker/employee) in the centre of production. Workers will be assigned where assistance is needed, there will be high demand for skills in managing complex projects, flexible work arrangement will be available. Five, Sustainable prosperity using technology to find solutions to energy, resources, environment, social and economic challenges.

A body of evidence is growing on the connection between measures of happiness, wellbeing, engagement, and productivity among employees in the workplace. Emphasis are on the need to close in on the measures that will serve a universal purpose as the work environment changes (Shwab, 2017).

Scholars are calling for strategies to provide gook work for all, that is fair and decent with a realistic scope for growth and fulfilment. The shift from employer responsibility to government responsibility and accountability should be enhanced.

As progress is recorded technologically, clarification will be needed in several areas that relate to employees. The need to be clear about who a worker is? The need to inform all on new platforms, such as Uber, obligations and accountabilities between platforms and service deliveries to clients. Concerning the worker again, the law should be clear about his/her rights, what the minimum wage should be where the number of hours in engagement are not specified. Increased protection is necessary about the dependent contractor, their description and how organizations pledge to support them.

In addressing work control, job autonomy is required which is built on trust between the employer of labour and the employee at different level. There is the need to clarify what is expected from the employee. Trust between the employer and the employee is important, trust is also imperative between employees at different levels of the organization. It has been reported that the most likely reason why employees leave their work is failed relationship. Therefore, positive relationships across the cadres of employment should be emphasised, without which the organization may not survive despite the efficiency of technology (George, 2015).

In the technological age words that are familiar are assuming changes also. For example, the word relationship has changed to interface. The interpersonal relationships between humans are now being

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

extended to machines. Therefore, machine to machine interface at different levels of process have been developed with the aim of performing human functions at work. Organizations that are at the fore front of change in automation and technology have engaged in the automation of links between different processes. For example, in the manufacturing industry, pre-machining and part measurement automation Has been developed. Exchange of information is faster through automation between planning systems, production machines and measuring instruments without human interference or control. Irrespective of the machines involved, consistent data formats and standardized interface has been achieved to ensure continuous networking throughout the processes. For example, OPC Unified Architecture. In accordance with industrial standards, fully integrated communication solutions are developed with feature robust operational friendly control solutions to implement higher levels of automation. Process steps, range of manufacturing, replication and metrological systems are all interconnected into a network and relates to the corresponding planning systems. Therefore, the scope of interaction of communication activities in the technological age is widened with minimal influence by humans (Shwab, 2017).

RECOMMENDATIONS

Having considered events that are unfolding some of which were anticipated and others incidental, it is important to view relational strategies that the workplace leaders need to put in place as organization evolves. It is obvious that the employees are at the receiving end of the hammer of the 4th industrial revolution, because of the constant threat on their jobs and workplace relationships built over the years which have consequent effect on their wellbeing. The line of recommendations will dough-tail on the factors that affect employee interpersonal relationships at work vis-a-vis the fourth industrial revolution. These factors are communications, teamwork, respect, training, friendliness, listening, sharing information and problem solving (Abe, Mason,2016). Focus here is on the positive contribution of workplace relationships as tools of transformation.

To improve employee workplace relationships in the face of technological changes of industrie 4.0, it was suggested that team accomplishment is imperative (Abe, 2015). However, Iwao Kobayashi, (2018) has documented the following strategies to assist organizations that are developing their teams at work. Practical program for corporate revolution, the quest to clean and organize workplace, rationalization of the system or management of objectives, improvement of team activities, accelerations of changes in technology, minimal supervision in manufacturing, building relationships and corporation between neighbouring processes and empowering workers to improve on their carriers.

Institution of best place to work strategy. This strategy is premised on the policies of long- term engagements and relationships with customers and employees. Organizations need to earn the trust of their employees as caring for their wellbeing. For example, the organization should be able to go the extra mile for employees who dies in active duty; by means of assistance to the relations of the deceased employee.

Organizations that are at the top of their economic and social activities have put in place a culture that is characterized by open communication, high performance, an engaged work environment. Forster the culture of caring both for employees and clients/customers through the following improvements: Learning culture which creates room for both old and new employees to attend classes to be acquainted with the culture of the organization. Employee inclusion is important through engaged interactions in the organization, looking at the goals, mission, and objectives set for achievement (Tian, Deng, Zhang & Salmador, 2018).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Contributing to the assistance of employees through positive interpersonal relationship (social support). When employee needs another employee to count on out of crisis, the organization should fill in the gap for their employee's assistance. For example, the organization may request an employee to apply for financial assistance when such need arises. Commitment to employee's wellbeing can be strengthened when the organization demonstrates its investment in the health of the employees. For example, the health officer of an organization must ensure that employees can always access its health programs and facilities.

Organization should be viewed as assisting employees with contributions outside the payroll. For example, in the event of national or state disaster, a well-meaning organization can demonstrate social responsibility to its environment by contributing to relieve funds to help people suffering from disaster.

Employees are likely to help others with whom they perceived to share unit of relationship that make them similar and unique. The language that can create division among employees should be avoided as best as possible. Especially those languages that can cause noise between the leaders and employees and erode the idea of community and identity.

The need to strengthen common identity and social bond must be encouraged among employees. For example, the organization should encourage programs that celebrate employees' tenure, shared successes, throw end of the parties for employees. The sense of belonging should be promoted now than ever as against the sense of transaction promoted by the industrial revolution.

Heightened the personality coherence of employees through assessing the availability of assistance provided to employees by the organization, each of the components of assistance are generally referred to as sense of social support. Where it is the belief of employee that there are certain others that accept them for their personality, including their best and worst dispositions, such persons are energized when they observe that others are willing to support them. This is called sense of acceptance (Sarason, 2013). The sense of acceptance is also an aspect of coherent personality, that is, constellation that promotes effective coping with demands and challenges, and enhances the ability to receive social opportunities (Hayes, Levin, Plumb-Vilardaga & Villate, 2013).

FUTURE RESEARCH FOCUS

The traditional interpersonal relationships among employees was developed on the premise that it takes two to tangible people of different status to create, maintain and end relationships at work. Through widened communication, the scope of interpersonal relationships has broadened due to the assistance of technology and creation of networks from where interested persons relate and interact with others around the world that they have not seen before. Areas of research interest in the future are, exercise of choice in workplace relationships, exploring the power of reciprocation in relationships developed, maintaining networks and reliance on the information received from interactions with unknown persons.

Many functions of employees at work will be taken over by machines. Modern leadership at work now sees employees as resource tools just as machines. Furthermore, the role of interpersonal relationships has been extended to machines that converse one with another to solve complex problems through system programming. The question that comes to mind is, in the future workplace, who will lead who? Will the man lead the machine or machines will lead the man since they are both resource tools?

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

The progressive knowledge of workplace relationships that was predictable through different theories in the past has assumed a new meaning because of the intervention of the 4IR that is accompanied with unprecedented changes. The tools of technology have affected the way employees interact and relate at work. The scope of interpersonal relationships has widened, what use to be private and confidential information may no longer be classified. The challenges of relating in the workplace takes different turn as changes takes place in the operations of organizations. However, a higher level of support is needed for many employees who may lose their jobs. The need to unlearn, learn, relearn is inevitable under the circumstances that employees find themselves. Some employees may probably be too old to cope with the changes in the workplace. Many employees confess they have lost confidence in their governments for job retention but trust their employers as the last resort.

Chapter 3
Organizational Well-Being:
A New Theoretical Model and Recommendations for Future Research

Kalpana Sahoo
Xavier University, India

ABSTRACT

The aim of this paper is two aspects: to provide an overview of organizational wellbeing (OW) research; to present a new model of OW focusing on successful outcomes and its operationalization of the construct and the recommendations for future. A summary literature review of the OW literature, focusing on organizational well-being and its possible consequences. The literature is used to develop and propose a new model of OW and its success indicators. Testable relationships are proposed between these indicators. The research model has not been tested empirically. It is an external representation, is a new and untested concept in the OW literature. The paper provides a model that leaders, managers and newcomers may find useful to successfully establish the OW process. The model proposed is novel and raises the important issue of appropriate OW success indicators. New propositions are made regarding relationships between antecedents and output variables.

INTRODUCTION

Well-being plays an important role in a variety of ways. It impacts an employer's approach to traditional benefits and HR policies. But just as important, making employee well- being a priority will have a positive return on the organization's workforce availability and performance, labor-related costs, and output — including innovation, customer service, and quality of products and services. Research undertaken in various social science disciplines supports the adoption of well-being — in all its many dimensions — as a concrete, achievable employer goal. Creating a future-ready approach to employee well- being requires a vision of the end-state and a strategy. It should start with an analysis of the employer's expectations and needs and objectives to identify areas of greatest need and the corresponding effort required for success. Using an opportunity analysis enables an employer to prioritize and plan actions that will produce the

best return on investment by using all parameters of wellbeing. To implement wellbeing in the workplace, employers must first understand the nature and process of well-being. First, an individual's experience at work obviously affects the person while she or he is in the workplace. In addition, these experiences also "spill over" into non-work domains. Workers almost spend one-third of their waking hours at work, they don't necessarily leave the job behind when they leave the work site. Indeed, the overlap between non-work and work leads to the observation that a person's work and personal lives are interrelated and intertwined. Second, there is a growing awareness that certain elements in the workplace pose risks for workers. Unsafe work practices, sexual harassment, disturbing supervisor-subordinate relationship, and uncontrolled aggression are such potential threats. Third, health problems adversely affect outcomes. Workers experiencing poor health may be less productive, make lower quality decisions, exhibit higher absenteeism and make consistently diminishing overall contributions to the organization. The need for regulating new business growth is usually prompted by social and psychological perception of the employees. We need to understand the key predictors and the process of well-being.

Now there is a greater awareness on the role of employee's wellbeing in the business organization. But there is less attention has been paid to its ramifications for employee wellbeing. Current research is now demonstrating the benefits of organizational wellbeing which is a strong criterion for business success.

The pursuit of wellbeing is an important goal for many organizations. Few scientific researches have focused on the question of how wellbeing can be increased and then sustained. In the pursuit of happiness, empirical evidence suggests that the ability to be happy and contented with life is a central criterion of adaptation and positive mental health. Lyubomirsky and her colleagues recently complied evidence showing that happiness has numerous positive byproducts that appear to benefit individuals, families, and communities (Lyubomirsky, King, & Diener, 2004; Fredrickson, 2001). Furthermore, Lyubomirsky et al.' analysis revealed that happy people gain tangible benefits in many different life domains from their positive state of mind, including larger social rewards (higher odds of marriage and lower odds of divorce, more friends, stronger social support, and richer social interaction; e.g., Harker & Keltner, 2001; Marks & Fleming, 1999; Okun, Stock, Haring, & Witter, 1984), superior work outcomes (greater creativity, increased productivility, higher quality of work, and higher income, e.g., Estrada, Isen, & Young, 1984; Staw, Sutton, & Pelled, 1995) and more activity, energy, and flow (e.g., Csikszentmihalyi & Wong, 1991).

ORGANIZATIONAL WELLBEING

With the growth of companies, in terms of employee numbers, and in terms of service quality and complexity, they provide the human factor which has become a prime competitive advantage on the market. Organizational wellbeing is a holistic concept. It can be operationalized from multiple variables. It requires the congruence between the needs and values of employees and the organization and enabling conditions include providing a safe and supportive environment for shared meaning-making effective boundary management, and engaging, invigorating and inspiring employees.

A study run by Gallup on 5000 employees proves that individual wellbeing now produces long-term effects on the organization, in year 1 and 2 after the investments, in terms of enhanced engagement at the workplace. These individuals tend to see their workplace as positive, productive and engaging. Moreover, managers will collect the results stemmed from investments in wellbeing in terms of an open

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

organizational culture that challenges and engages employees and will, most keep them loyal to their company. There is a greater need for research in this area.

So, what factors play a role in enabling organizations to thrive in today's world? There is a growing body of literature on the importance of organizational health (Cooper & Cartwright, 1997; Grawitch, Ledford, Ballard & Barber, 2009). Most of research focuses on underlying conditions including programs, policies and practices through which a workplace can be psychologically and physically healthy for employees. There is some philosophical debate about the considerable overlap between health and wellbeing (Ryff &Singer,1998). In support of this view, the WHO (2010) suggests that mental health should be conceptualized as a state of well-being in which an individual realizes his or her own abilities can cope with the normal stresses of life can work productively and can contribute to his or her community.

SCOPE OF WELLBEING

Chronic Happiness Level

Our primary focus is on a person's characteristic level of happiness during a period in his or her life, which is known as chronic happiness level. It is difficult to alter one's happiness level at a moment or on a day. Operationally, one might define a person's chronic happiness level in term of his or her retrospective summary judgments regarding his or her mood and satisfaction during some recent period. People, however, may vary in their "hedonic profiles".

Determinants of the Chronic Happiness Level

There are three primary types of factors that affect the chronic happiness level, namely, the set point, life circumstances and intentional activity. These three factors distinction addresses several important issues and paradoxes. Existing evidence suggests that genetics account for approximately 50% of the population variation and circumstances account for approximately 10% (Argyle, 1999; Diener et al., 1999). This leaves as much as 40% of the variance for intentional activity, supporting our proposal that volitional efforts offer a promising possible route to longitudinal increases in happiness. In other words, changing one's intentional activities may provide a happiness boosting potential that is at least as large as and probably much larger than, changing one's circumstances. Individual's chronic happiness level is in part determined by her or his set point, which is defined as the central or expected value within the person's set range. It is genetically determined and is assumed to be fixed, stable over time, and immune to influence or control.

It is assumed that twin studies (Lykken & Tellegen, 1996; Tellegen et al., 1988), Long-term panel studies (Headey & Wearing, 1989), and studies of the effects of life events on well-being (Brickman et al., 1978) all indicate substantial long-term stability in happiness. For example, Lykken and Tellegen (1996) assessed well-being in twins at 20 years of age and then again at 30 years of age. The cross-twin, the cross-time correlation for the happiness of monozygotic twins was 40 (or 80% of the test retest correlation), suggesting that the heritability of the "stable" component of happiness is approximately .80. In contrast, the cross-twin, cross-time correlation for dizygotic twins was close to zero (.07). Monozygotic twins exhibit considerably more similar patterns of happiness change than do dizygotic twins, providing converging support that the variance in adult happiness is in large part determined genetically.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

So far as the implications of the set point is concerned, the preceding analysis implies that one's chronic happiness during a life period can be increased, but not by changing one's set point, because it is constant. In other words, although it is possible that future scientists will learn how to alter people's basic temperaments and dispositions, at present it appears that focusing on the set point is not a fruitful avenue for happiness increase. Nongenetic factors also influence a person's chronic happiness level, helping to determine whether the person falls in the lower or upper portion of his or her potential range at a time.

Circumstantial factors also include the individual's personal history, that is life events that can affect his or her happiness, such as having experienced a childhood trauma, being involved in an automobile accident, or winning a prestigious award. These factors also include status variables such as marital status, occupational status, job security, income, health and religious affiliation.

Intentional Activity

Individuals are very active creatures, with innumerable behaviours, projects, and concerns to which they devote energy. Intentional activity refers to people can choose to engage may have become habitual. It also assumes that intentional activities require some degree of effort to enact. There is a critical distinction between the category of activity and category of life circumstances. Circumstances happen to people, and activities are ways that people act on their circumstances. This intentional activity can influence well-being.

The research also suggests that the impact of adopting new behaviour on longitudinal wellbeing. For example, faithfully engaging in a new exercise program positively boosts people's mood and vitality and can even maintain the boosts for if 6 months (Stewart et al., 1997). Recent work is also indicating positive effects of prompting people to proactive positive psychological "virtues" such as gratitude (Emmons & McCullough, 2003), hope and forgiveness (McCullough et al., 2000). It suggests that cognitive activity offers many excellent possibilities for happiness interventions (Fordyce, 1983).

After behaviours and cognitions, the third type of intentional activity, recent longitudinal studies have focused specifically on is volitional activity as a producer of enhanced well-being. In such studies, students are asked to pursue self-generated personal goals over the course of semester. High levels of goal progress or attainment consistently predict increased well-being. That means it enhances high positive affect and life satisfaction and decreases negative mood.

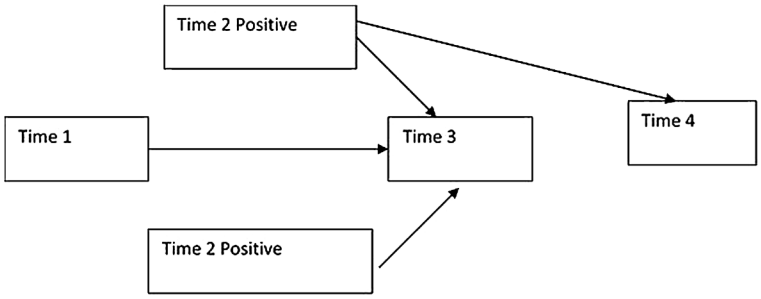
Hedonic adaptation can constrain the happiness inducing effect of intentional activities. Sheldon and Lyubomirsky (2004) recently conducted several short term longitudinal studies in which participant's wellbeing (positive affect, negative affect, and life satisfaction) was measured at Time 1, and positive circumstantial and activity based life changes were measured at Time 2. Well-being was then measured twice more, at Time 3 and 4, These investigations found consistent support for a path model, in which both positive circumstantial change and positive activity change predicted enhanced life satisfaction and positive affect at Time3, but only positive activity change predicted and maintained happiness gains at Time 4, with positive circumstantial change dropping out of the model. In other words, consistent with the present model, only activity based well-being change lasted; circumstance based happiness change did not.

Sheldon and Lybomirsky (2004) randomly assigned participants to report on either activity-based positive changes or circumstantially based positive change in their lives. Relative to those in the circumstantial – change group, those in the activity – change group reported a weaker sense of "having gotten used to the change such that it does not give the same boost as before" and more strongly endorsed the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

statement "the change is something that varies over time, that is something that adds variety to my life" That means the activity changes are characterized by less hedonic adaptation than circumstantial changes.

Figure 1. Longitudinal Path Model
Adopted from Lyubomirsky, Sheldon & Schkade (2005) Review of General Psychology, 9 (2), 111-131.



Intentional Activity Is Episodic

One feature of activities is that they are episodic and transient. People cannot spend all their time doing one thing. So, it suggests that individual may adapt less readily to new activities than to new circumstances. The episodic nature of activity also suggests that an additional way maximize the impact of activity. Thus, people should strive to discover the optimal timing for each activity, that is, a frequency of engagement that allows that activity to remain fresh, meaningful, and positive for a person.

Intentional Activity Can Be Varied

Another important parameter of behavioural, cognitive and volitional activities is that people can continually vary them, both in their foci and in the way they engage in them. If the person counting his blessings varies the domains of life in which he or she counts them in relationships, in work, in health, or in most recently successful domain, then the strategy may remain "fresh" and meaningful and work indefinitely. Supporting this notion, past research suggests that people tend to seek variety in their behaviour, perhaps because change – both in thoughts and actions- is innately pleasurable and stimulating.

Intentional Activity Can Directly Contract Adaptation

Another advantage of intentional activity is that it can directly tackle the problem presented by adaptation. For example, the cognitive practice of pausing to savor the good things in one's life can directly counteract the effects of hedonic adaptation to one's constant circumstances by drawing attention to the features that produced the initial happiness boost and helping to keep them from being taken for granted. For example, practiced mediators frequently report renewed appreciation of the ordinary as a result of their intentional reencounters with the world.

The fact about intentional activity is that it can directly tackle the problem presented by adaptation. It can directly counteract adaptation and hedonic treadmill helps shed further light on the distinction

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

between life circumstances sand intentional activities. The crucial question raised with respect to well-being is whether one exerts intentional effort with respect to the circumstantial category. For example, an individual can engage in a number of intentional activities with respect to the circumstantial category "marriage"; A husband can have the goal of making his marriage work (a volitional activity), he can make the effort to appreciate his wife's positive qualities (an attitudinal activity), and he can try to remember to bring her flowers (a behavioural activity). A person who performs these activities would probably best counteract adaptation to this particular circumstances and derive the most benefit from it. In contrast, a husband who is not intentionally engaged in his marriage, his demographic circumstance would essentially become a background factor. That' why, intentional activity appears to offer the best prospects for increasing and sustaining happiness.

In conclusion, happiness-increasing strategies can be initiated and effectively pursued only with concerted, consistent, commitment and effort.

IMPLEMENTING HAPPINESS-INCREASING STRATEGIES

The strategic issues proceed from the question of how to choose a particular happiness boosting activity to the question of how such activity may be initiated and the question of how the activity can be maintained over time to produce a sustained increase in the chronic level of happiness. The main strategic issues are the role of person activity fit, the role effort, role of habitual activity and the impact of short term versus long term considerations.

Choosing an Activity: The Role of Person Activity Fit

Any repeated activity will not help the person become happier. People have enduring strengths, interests, values, and inclinations that undoubtedly predispose them to benefit more from some strategies than others. For example, extraverts may benefit most from activities that bring them into regular contact with other people, and people high in nurturance motivation may benefit most from activities that afford them opportunities to take care of others. The fit of an activity with a person might be conceptualized in a variety of ways, for example, with respect to individual's motive dispositions, basic needs, core values, signature strengths, personal resources, hedonic profiles, or other individual difference characteristics. There are also a variety of ways that fit might be operationlized, such as in terms of self-reported fit, in terms of consistency between implicit and explicit measures of activity relevant motives, or in terms of informant-rated-person-activity fit.

Role of Effort

Engaging in an activity requires at least two different kinds of effort. First, the effort required initiating the activity and second, the efforts required to carry out and maintain the activity. For example, exercising in the morning, making time to work on at least one important project during the day, or pausing to count one's blessings at the end of the day can have significant benefits, but only if the person can "get off the hurdle" of remembering to do them and overcoming any obstacles to initiating them. This kind of self-regulatory effort requires considerable self-discipline and will-power. In Muraven and Baumesister's (2000) terms, self-regulatory will is like a "muscle" that has limited capacity in each unit of time and

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

must be used strategically to avoid fatigue. Some activities will appear intrinsically more appealing and will be easier to jumpstart which is one advantage of selecting an activity that fits one's personality.

Maintaining an activity is the second type of effort. If an activity is to yield sustained happiness change, the person must keep performing the activity over the long term. For effective happiness - enhancing activities, the task will probably be inherently interesting or rewarding and thus will probably be "autotelic" in nature (Deci & Ryan, 2000). That is self-reinforcing and self-sustaining. The person always shifts attention among several projects at work, explores new trials in the state park etc. This is known as "flow" experiences (Csikszentmihalyi, 1990).

By emphasizing the importance of one's intentional activity, it does not mean to imply that people should seek out only "fun" activities. Sometimes choosing to endure boring or even aversive experiences in the short term can have considerable positive effects on chronic happiness in the long run. For example, a naval officer candidate is playing a short-term cost to receive a longer-term benefit (a career as an officer).

Role of Habitual Activity

Habits appear to present a conundrum for our model. We assume that hedonic adaptation occurs only with respect to particular experiences, and not with respect to the decisions that give rise to those experiences. Thus, making a habit out of deciding to initiate an activity is not problematic but may instead help people to keep getting "over the hump". Sometimes it is problematic when people make a habit out of how they implement the activity. When this happens, the flow experience produced by such a habit is likely to remain relatively constant.

Impact of Short-Term vs. Long-Term Considerations

We assume that happiness originates from two sources. First, people make global well-being judgments in part regarding emotions associated with their recent experiences (Kahneman, 1999). If they can recall number of recent affectively positive experiences, then they report being very happy (Sheldon & Elliot, 1999).

Accumulations of need-satisfying daily experiences over time (such as competence, relatedness, and autonomy; Deci & Rayn, 2000) lead to enhanced global well-being at the end of that time. Furthermore, Sheldon and Lyubominsky (2004) found, in their comparison of the sustained effect of circumstantial changes and activity changes on changes in well-being among students, that the more enduring activity-based effects on happiness were mediated by the greater feelings of competence and relatedness associated with activity changes during the semester.

It is meaningful and important to pursue happiness and it is also crucial to find out how this can be accomplished. Simply, happiness seekers might be advised to find new activities that fit their values and interests. They should make a habit out of initiating the activity while at the same time varying their focus and timing in terms of the way they implement the activity. People might be advised to avoid basing their happiness on the acquisition of particular circumstances or objects because they will tend to habituate to such stable factors. Again, one can deter, or delay, such adaptation to positive circumstantial changes by engaging in intentional effort and activity with respect to them. Only life changes involving intentional activity can be expected to lead to sustainable changes in well-being.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In sum, happiness-increasing strategies can be initiated and effectively provided with consistent, commitment and effort. In addition to the construct of intentional activity, another framework that has been developed in the context of employee happiness involves the model of flow experiences.

THEORETICAL FRAMEWORKS

The purpose of our paper is to find out a series of human resource management policies and practices to improve wellbeing of employees who work in project based organizations, which is a neglected research topic in the field of project management. To achieve the research purpose, firstly we review related theories to explain employee wellbeing and project based organization.

While a number of factors have been identified as correlates of subjective well-being a basic research gap exists with respect to specific theoretical framework. Of course, a few researchers have directed their alternation to integrate empirical findings with the help of a theoretical construct. Although all the diverse findings cannot be accommodated within the scope of a single theory, their relative relevance requires a close examination. Psychological theories related to happiness are telic theories, pleasure and pain, activity theories, top-down versus bottom-up theories, associationistic theories and judgment theories.

Telic Theories

Telic or endpoint theories of subjective wellbeing maintain that happiness is gained when some state, such as goal or need, is reached. One theoretical postulate offered by Wilson (1960) is that the "…satisfaction of needs causes happiness and conversely, the persistence of unfulfilled needs causes unhappiness…"

Alternatively, the theories derive from different origins of the striving. In need theories, there are certain inborn or learned needs that the person seeks to fulfill. The person may or may not be aware of these needs. Nevertheless, it is postulated that happiness will follow from their fulfillment. In contrast, goal theories are based on specific desires of which the person is aware. The person is consciously seeking certain goals, and happiness results when they are reached (Michalos, 1980). Goal and needs are related in that underlying needs may lead to specific goals. Needs may be universal, such as those postulated by Maslow (1954) or they may differ markedly from individual to individual such as those proposed by Murray (1938).

Goals and desires are usually thought of as more conscious than needs. Most individuals had the experience of feeling happy when they achieve some important goal. However, a key question is whether goal fulfillment leads to long-term differences in SWB between persons rather than just short-term mood elevations.

According to telic approaches, there are several things that can interfere with SBW. First, individuals may desire goals that bring short-term happiness but have long-term consequences that are deleterious to happiness because they interfere with other goals. Second, people's goal and desires may be in conflict and thus it is impossible to satisfy them fully. Third, individuals could be bereft of happiness because they had no goals or desires. Finally, people may be unable to gain their goals because of poor conditions or skills.

There are several shortcomings to the current telic approaches. They have rarely been formulated in a clear way and then tested. Many of these approaches are not falsifiable. Needs or goals are sometimes

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

described in a circular way, depending on the observations. Clear measures of needs and goals are needed and longitudinal methodologies would help indicate whether achieving the goals actually heightens SBW.

Pleasure and Pain

The idea that gaining goals or needs leads to happiness raises a theme that is pleasure and pain are intimately related. An individual only has goals or needs to the extent that something is missing in that person's life. One assumption in these approaches is that the greater the deprivation (and hence unhappiness), the greater the joy upon achieving the goal. According to the present formulation, if an individual's desire and goals are totally fulfilled, it may be impossible to achieve great happiness.

Another theory that suggests pleasures and pains are intimately connected is the opponent process theory of Solomon (1980). According to this formulation, the loss of something good leads to unhappiness and the loss of something bad lead to happiness. In addition, specific predictions are made about the magnitude of affect. A person will habituate to a good or bad object and thus it will bring happiness or unhappiness with repeated exposure. However, the crucial component of the theory is that opposing affect when the object is lost will be greatest after habituation. This is an addiction type of model which states that with repeated exposure, good items lose their power to produce happiness, but after repeated exposure their loss will produce unhappiness. Initial studies on this theory of happiness have not been supportive (Sandvik & Diener, 1983).

Activity Theories

Activity theories maintain that happiness is a by-product of human activity. Aristotle was a major proponent of one of the earliest and most important activity theories. He maintained that happiness comes about through virtuous activity, that is, from activity that is performed well. According to Aristotle's theory, there are certain human abilities and happiness arises when these are performed in an excellent manner. In contrast, activity theory in modern gerontology refers to activity in more global terms. For example, hobbies, social interaction and exercise are all considered to be activities.

One frequent theme in activity theories is that self-awareness will decrease happiness and there is some empirical evidence for this (Csikszentmihalyi & Figurski, 1982). This is consonant with the popular idea that concentrating on gaining happiness may be self-defeating. According to this approach, one should concentrate on important activities and goals and happiness will come as an unintended byproduct. These ideas have not yet been rigorously formulated or empirically tested.

The most explicit formulation about activity and SWB is the theory of flow (Csikszentmihalyi, 1975). Activities are seen as pleasurable when the challenge is matched to the person's skill level. If an activity is too easy, boredom will develop; if it is too difficult, anxiety will result. When a person is involved in an activity that demands intense concentration and in which the person's skills and the challenge of the task are roughly equal, a pleasurable flow experience will result. Surgery and mountain climbing are offered as prototypes of this pleasurable experience. Unlike goal theorists, activity theorists propose that happiness arises from behavior rather than from achieving endpoints. However, the two ideas are not necessarily incompatible and thus could possibly be integrated.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Top-Down vs. Bottom-Up Theories

Bottom-up theories maintained that happiness is simply the sum of many small pleasures. According to this view, when a person judges whether his or her life is happy, some mental calculation is used to sum the momentary pleasures and pain. A happy life in this view is merely an accumulation of happy moments. In contrast, the top-down approach assumes that there is a global propensity to experience things in a positive way and this propensity influences the momentary interactions an individual has with the world. In other words, a person enjoys pleasure because he or she is happy, not vice versa. In the top-down approach to happiness, global features of personality are thought to influence the way a person reacts to events. For example, a person with a sanguine temperament might interpret a large number of events as positive.

Associationistic Theories

Many theories are based on memory, conditioning or cognitive principles that can be subsumed under the broad rubric of associationistic models. Cognitive approaches to happiness are in their infancy. One cognitive approach rests on the attributions people make about the events happening to them (Schwarz & Clore, 1983). It might be, for example, that good events bring the most happiness if they are attributed to internal stable factors. Another possibility is that events that are perceived as good lead to happiness, regardless of the attributions made.

One general cognitive approach to happiness has to do with associative networks in memory. Bower (1981) has shown that people will recall memories that are affectively congruent with their current emotional state. Research on memory networks suggests that persons could develop a rich network of positive associations and a more limited and isolated network of negative ones. In such persons, more events or ideas would be happy ideas and affect. Thus, a person with such a predominantly positive network would be predisposed to react to more events in a positive way.

A related type of theory is based on a classically conditioned elicitation of affect. Research has shown that affective conditioning can be extremely resistant to extinction. Thus, happy persons might be those who have had very positive affective experiences associated with a large number of frequent everyday stimuli. Zajonc's (1980) contention that affective reactions occur independently or / and more rapidly than cognitive evaluation of stimuli is compatible with a conditioning approach to happiness.

There is some evidence that a person can give conscious direction to the affective associations in his or her life. Fordyce (1977) offered evidence that a conscious attempt to reduce negative thoughts can increase happiness. Kammann (1982) found that reciting positive statements in the morning leads to a happier day. Goodhart (in press) has found that positive thinking similar to that recommended by Norman Peale is correlated with SWB. Thus, explicit conscious attempts to avoid thoughts and to think of happy ones may to some extent increase happiness.

Certain individuals may have built up a strong network of positive associations and learned to react habitually in positive ways. These individuals are characterized as possessing a happy temperament. A person with a Pollyanna approach to life is perhaps the prototype of a person who has formed positive associations to the world. Several studies have found a relationship between happiness, a cognitive bias towards positive associations and high Pollyanna personality scores.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

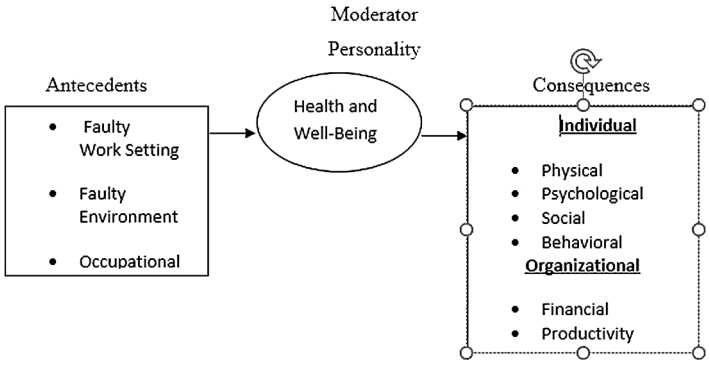
Judgment Theories

Judgment theories maintained that happiness results from a comparison between some standard and actual conditions. If actual conditions exceed the standard, happiness will result. In the case of satisfaction, such comparisons may be conscious. However, in the case of affect, comparison with a standard may occur in a nonconscious way. Although judgment theories usually do not predict what events will be positive or negative, they do help to predict the magnitude of affect that events will produce.

In social comparison theories, proximal others are usually weighted heavily because of their salience. Will (1981) showed that downward comparison with less fortunate persons can increase SWB. Kearl (1981-1982) found that believing others live in poor circumstances can enhance one's life satisfaction. Easterlin (1974) argued that the amount of income that will satisfy people depends on the income of others in their society. One shortcoming to social comparison theories is that they do not make clear when a person will need to make comparisons with others..

One popular form of judgment theory is aspiration level, which maintains that happiness will depend on the discrepancy in a person's life between actual conditions and aspiration

Figure 2. An organizing framework or model



The concept of well-being is the broader and more encompassing construct. Specifically, well-being is viewed as comprising the various life/non-work satisfactions enjoyed by individuals (satisfaction with self, family life, social life, recreation, spirituality, and so forth), work/job-related satisfactions, and general (psychological) well-being. General health/well-being is a state of equilibrium at the physical, mental, social and spiritual domains (World Health Organization).

The Wellness Councils of America (WELCOA, n. d.) reports that 81% of companies with over 50 employees have implemented at least some kind of health promotion program. These programs range from comprehensive wellbeing programs to smoking cessation, back care programs, stress management, exercise, and nutrition programs. For some companies, over half of the company profits are spent toward employee health care expenses.

At the operational level, behavioral scientists have stressed three aspects of the construct definition. First, well-being includes total life satisfaction. It provides an overall assessment of person's subjective well-being. Second, well-being denotes "feel good" component. Majority of Psychologists view that frequent experience of moderately positive affects (emotion) is a more reliable indicator of well-being

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

compared with infrequent experience of strong positive emotions. Third, satisfaction in several domains of life (such as work, family, social relation, and so forth) is also an essential component. A comprehensive measure includes an integrated composite index of these three components.

MEASUREMENTS

Well-being is not a unitary construct. There are several components of subjective well-being (SWB): life satisfaction (global judgment of one's life), satisfaction with important domains (e.g., work satisfaction), positive affect (experiencing many pleasant emotions and moods), and low levels of negative affect (experiencing few unpleasant emotions and moods).

In early research on well-being, researchers studied only a single self-report item for measurement. For example, Andrews and Withey (1976) asked participants about the feeling of life as a whole on 7-point scale ranging from delighted to terrible. Current measure of well-being includes multiple items. For example, the *PANAS (Positive and Negative Affect Scale)* assesses both positive and negative affect, each with ten affect items. The gap score between positive affect experience ratings and negative affect experience rating is indicative of wellness or illness.

In the past, researchers have used additional types of assessment to obtain a better gauge of long-term feelings. One such measure in *Experience Sampling Method (ESP).* Considering the view that one-time self-report life satisfaction scale is inadequate, ESM measures life satisfaction and memories of positive and negative life events.

On the basis of World Value Survey –II (World Value Survey Group, 1994) three components of well-being have been recognized: life satisfaction, pleasant affect, and unpleasant affect. The life satisfaction score is based on respondents' answers to the question: "all things considered, how satisfied you are with your life these days?" This was used with the help of number from 1 (dissatisfied) to 10 (satisfied). Later many researchers have adopted this format, but have usually included multi-item scales.

Other physiological measures, reports by informants, memory and reaction time measures are included in order to make measurement complete. Though each of these measures has its limitations, the merits of different kinds of measures are complementary to each other. For example, in the memory measure, participants are asked to generate as many positive and negative events from their lives as they can during a short span of time. With the help of this method, researchers can measure individual difference in the relative accessibility of memories for good and bad events and structure of respondent's recall of their lives.

Diener argues that the frequency count of intense positive emotion is not proper indication of well-being. He viewed that how much of the time a person experiences well-being is a better predictor than positive emotional intensity of how happy the person reports being. Intense positive moments are rare even among the happiest individuals. Instead, happy individuals report mild-to-moderate pleasant emotions most of the time whether they are alone or with others, at work or in free time.

Few other researcher view quality of life (QOL) is an aggregate of objective and subjective components. Each component is divided into 7 domains:

1. **Material Well-Being:** Measured by income, quality of house and possessions
2. **Health:** Measured by number of disabilities and medical consumptions
3. **Productivity:** Measured by activities in work, education and leisure

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

4. **Intimacy:** Contact with close friends, availability of support
5. **Safety:** Perceived safety of home, quality of sleep, worries
6. **Place in Community:** Social activities, responsibilities, being asked for advice
7. **Emotional Well-Being:** Opportunely to do/have things wanted, enjoyment of life

Overall QOL is measured by using a point system. Objective QOL uses simple scores and subjective QOL uses satisfaction with domains. Finally, all these scores are added. But limitations of these remain as sum scores fail to give justice to the functional relationships between qualities of life. The value of environmental opportunities depends on personal capabilities. When human capacities fit environmental demands, these needs are satisfied. This manifests in good mood and a satisfaction with life as a whole. So, well-being is both merits in itself and indicative of good of life chances.

In sum, there are various approaches to measurement. The contemporary researchers are adopting multi-measure approach. For example, Sahoo (2006) has developed a multi-measure technique that comprises mainly three parts. The first part denotes overall life satisfaction (global judgment of total life satisfaction). The second part measures domain- specific satisfaction. The third part determines positive affect experience minus negative affect experience. A composite picture of well-being is derived based on these three interrelated scores.

APPLICATION OF WELLBEING IN HRM RESEARCH

The First Research Challenge in HRM is to establish Link between external and internal fit of the organizations. Then deciding on the model of HRM and determining sources of information. The Second Research Challenge is Measuring Outcomes that includes focus has been mainly on performance or output. In the case of performance, need to distinguish proximal and distal outcomes need to broaden to consider a stakeholder perspective. The third research challenge is to understand and explore the implementation of HRM. There are three elements involve in implementations: extent of implementation, influences on implementation, key actors in implementation. Next, we choose qualitative research type and case study research method to collect data.

Gallup scientists have been exploring the demands of a life well-lived since the mid-20th century. More recently, in partnership with leading economists, psychologists, and other acclaimed scientists, we began to explore the common elements of wellbeing that transcend countries and cultures. So, to construct a comprehensive measure of individual wellbeing, Gallup designed an assessment composed of the best questions we have asked over the last 50 years. Upon completion of the research, five distinct statistical factors emerged. These are the universal elements of wellbeing that differentiate a thriving life from one spent suffering. They describe aspects of our lives that we can do something about and that are important to people in every situation we studied. These elements are the currency of a life that matters. They do not include every nuance of what's important in life, but they do represent five broad categories that are essential to most people.

- The first element is about how you occupy your time or simply liking what you do every day: your Career Wellbeing.
- The second element is about having strong relationships and love in your life: your Social Wellbeing.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The third element is about effectively managing your economic life: your Financial Wellbeing.
- The fourth element is about having good health and enough energy to get things done on a daily basis: your Physical Wellbeing.
- The fifth element is about the sense of engagement you have with the area where you live: your Community Wellbeing.

While 66% of people are doing well in at least one of these areas, just 7% are thriving in all five.

KEY TERMS AND DEFINITIONS

Design/Methodology/Approach: A summary literature review of the OW literature, focusing on organizational well-being and its possible consequences.

Findings: The literature is used to develop and propose a new model of OW and its success indicators. Testable relationships are proposed between these indicators.

Originality/Value: The model proposed is novel and raises the important issue of appropriate OW success indicators. New propositions are made regarding relationships between antecedents and output variables. This testable model is a valuable resource for researchers. Further, for human resource managers, the model provides a framework for considering what they are aiming to achieve and how they might experience it. Most employees assume wellbeing or happiness is a state of mind. But it is not. There is substantial amount of research to show that the meaning of wellbeing shifts in very systematic ways over the due courses and even throughout the day.

Practical Implications: The paper provides a model that leaders, managers and newcomers may find useful to successfully establish the OW process.

Purpose: The aim of this paper is two aspects: to provide an overview of organizational wellbeing (OW) research; to present a new model of OW focusing on successful outcomes and its operationalization of the construct and the recommendations for future.

Research Limitations/Implications: The research model has not been tested empirically. It is an external representation, is a new and untested concept in the OW literature.

This research was previously published in Statistical Tools and Analysis in Human Resources Management; pages 220-241, copyright year 2018 by Business Science Reference (an imprint of IGI Global).

Chapter 4
Burnout:
A Challenge for Companies in the Modern Business Environments

ABSTRACT

The present paper deals with burnout as a challenge of our modern business world, given the phenomenon of heavy work investment in our society. The present article is emphasizing the strong connection between business, psychology, and medicine when dealing with people working in a modern, international business environment. The research methods are multi-disciplinary, combining elements of business, corporate culture, psychology, and even medical issues that are relevant in this context. The research methods used in the present paper are qualitative methods, metadata, and interviews (the questionnaire as a qualitative method) completed by the assessment of data and by proposing appropriate indicators ensuring the monitoring of burnout tendencies in companies. The paper proposes an interdisciplinary approach, bringing together aspects of business and economics, psychology, life sciences, sociology, ethical issues, and cultural issues related to work. A tool for detecting burnout is analyzed. The research results can be relevant for managers and human resources departments.

INTRODUCTION

In former times, jobs were meant to ensure an income for the employees. People did not really assess the tasks they were performing, their job satisfaction or the fulfilment achieved by the job. It was only important to have an income to cover the costs of living. Nowadays the values when choosing a job have changed. Employees do not only want to earn money, they search for the right job, which suits them best and that helps them develop their skills. For many employees, jobs are nowadays a form of validation. This change of values related to the working culture has a strong impact on employers, on human resources departments and on the job culture within a company.

In modern times, people spend more time in the office than in former times. The work investment increases, people invest their energy and their time in working and in achieving good job-related results. A consequence of this development is the phenomenon of "workaholism". People seem to be dependent on their jobs and they cannot leave their job tasks when arriving home. Even in their spare time, they are thinking about their job and their tasks. The work-life balance is difficult to achieve and to keep, given these circumstances. Some companies used to have extremely high expectancies about work investment, an approach that encouraged people to work extra-hours to have a better performance. Some of the employees could not face these long working hours and collapsed. Other employees did not collapse, but they suffered several disorders. One of these modern times disorders is burnout. Burnout can be described as a state of fatigue due to work overload. Employees are often not aware of such a disorder. They believe it is a temporary state of mind of sadness or of dissatisfaction with their job or a temporary exhaustion that will disappear after a few days off. But the disorder does not disappear, it becomes visible at somatic level. Employees start to feel sick. At this point the employee has difficulties in performing his tasks and in cooperating with his colleagues.

The present article deals with the topic of burnout illustrated as a challenge of our modern business world. The occurrence of this phenomenon is related to the heavy work investment in our society, aimed to fulfil job expectations. The present paper analyses the impact of burnout within a company, considering its impact on employers and employees. It further deals with the topic of finding the right balance related to the proper workload. Too heavy work investment may cause burnout, but underload at work may cause "bore out", which is another disorder at psychological level. The present paper addresses the question how to deal with these challenges of the modern business world, what measures should companies, managers and human resources departments consider given this development and the change of values in job culture. Case studies illustrate these issues. Metadata is considered, such as the 6th European Working Conditions Survey (EWCS) – 2015 and 2017 as well as the specific literature. Interviews are used as a qualitative research method. The qualitative approach is complemented by quantitative analysis of data and indicators provided by European Union institutions and OECD and surveys such as the European Values Survey. It is nevertheless difficult to find comparable data, as there is a research gap in analyzing burnout at cross-national level. This is why metadata is being considered.

As an aspect of novelty and originality, the present article presents a tool that could be implemented at company level to detect burnout or to detect when employees have reached too heavy work investment. Such a tool could be useful in organizations, so that the research results can be used by human resources managers.

The topic is analysed using an interdisciplinary approach, considering elements of business, economics, psychology, life sciences as well as sociological, ethical and cultural issues related to the work environment.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Given the negative consequences of stress at work, burnout and related depression, work-life balance has become a key-issue of corporate culture, which shows the relevance of the present research. The present article is emphasizing the strong connection between business, psychology and medicine when dealing with people working in a modern, international business environment.

REVIEW OF THE SCIENTIFIC LITERATURE

A consequence of heavy work investment, a common phenomenon in our modern working environment, is work overload which can lead to psychological disorders of the employees, such as burnout. It is interesting to address the question whether burnout is a problem of our modern society and of our current working culture or if it existed already in former times. This question is researched in the scientific literature. The present paper creates a bridge between already studied issues and new challenges of the modern business environment.

Burnout as an independent diagnosis is a relative new issue in our business environment and therefore, there is a research gap of cross-national studies regarding this topic at European Union level. Burnout was often diagnosed as a preliminary phase before depression and was not necessarily treated as an independent topic to be researched, but it was treated together with other subjects related to depression. Nowadays the approach has changed, as burnout might be a problem for companies, for employers and for employees and measures at corporate level and at the level of the human resources department might be necessary. In the light of these recent developments and given the identified research gap, it is a subject to be researched in the future.

The problem why there are no clear statistics about people suffering from burnout is that such people are afraid of being stigmatized if they are diagnosed with a psychological disorder and they are afraid of losing their jobs if they speak about their problem (Wolf, 2016, p 8).

The topic was first approached in Graham Greene's book "A Burnt-Out Case" that appeared in 1960 (Greene, 1960), presenting the life story of a famous, successful architect who lost the joy of working and decided to leave Europe and move to Africa in order to look for people in need. This story shows the fact that burnout is not a brand-new issue in our society, as the psychoanalyst Herbert Freudenberger and the social psychologist Christina Maslach researched and identified it in former times (Melchers and Plieger, 2016, p.13). The fact that burnout is related to modern times can be described as a myth, because it actually appeared as well in the past.

According to the psychologist Christina Maslach burnout is a state of fatigue, correlated with low performance at work and a need of distancing to other co-workers as well as to the job tasks (Melchers and Plieger, 2016, p.13).

People affected by burnout have headaches, they do not care about accomplishing their job goals any more, they feel tired all the time, they suffer from insomnia, they are not motivated at work (Melchers and Plieger, 2016, p.14).

Some specialist diagnose burnout as an individual illness, some other specialist see it as a preliminary state prior to depression, so there are no clear research findings yet in order to implement a clear delimitation between these two disorders (Melchers and Plieger, 2016, p.13).

People who feel they have control over their life and activities suffer more if they make mistakes, it is difficult for them to accept failure and they feel guilty for this failure. This leads to the tendency of blaming oneself for each failure and to burnout due to failures in the tasks at work (Burisch, 2014;

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Melchers and Plieger, 2016, p.14). In conclusion, being confident that you can solve every problem and that this attitude will keep you safe from burnout is only a myth.

Another myth regarding burnout, which is treated in the specific literature, is the fact that bad working conditions are the cause of burnout. This is not proven, as more responsibility and more decisions to take are rather factors encouraging burnout than performing tasks given by your superior, for which he has bears the responsibility (Melchers and Plieger, 2016, p.16).

Another factor which is important is the change in values regarding job culture in our society. It is important not to choose a job only for having the best salary, but to choose a job that suits you best. Social aspects, like the positive attitude towards helping colleagues and the assessment of employees according to their willingness to help their colleagues can be measures used by companies in order to minimize burnout (Twenge et al, 2010, p. 1117-1142; Melchers and Plieger, 2016, p.17). The change in values related to job culture is illustrated as well in the European Values Study, 2020 (European Values Study, 2020). Another survey analyzing values related to working culture is the 6th European Working Conditions Survey (EWCS) (Eurofound, 2020).

A difference between burnout and depression is the fact that burnout is strictly related to work and to the working environment (Plieger, T. et al., 2015, pp. 19-24). This idea supports the importance of the working environment when researching burnout.

For managers and human resources departments, burnout is a challenge, as they have to find the proper balance of workload for their employees. Too heavy work investment can lead to burnout, while work underload and lack of activity can lead to boreout (Melchers and Plieger, 2016, p.15).

Another aspect treated in the specific literature is perfectionism as a feature of working culture and as a feature of personality of employees. Too much perfectionism can lead to burnout, as there is a heavy work investment correlated to the expectation of being perfect when carrying out job tasks (Flett, 2007, pp. 255-277; Altstötter-Gleich, C., 2016, p. 74).

What companies and organizations can do in order to minimize burnout is to be reasonable in demanding performance from the employees and to consider mindfulness as a value of corporate culture and of the working culture (Ducki, A., 2016, p. 82). The implementation of such measures can help organizations to face the challenges of the modern business environment, such as burnout.

RESEARCH METHODOLOGY

The present paper proposes a multidisciplinary research method, showing the strong interaction between business, economics, psychology and life sciences in the working environment.

The article presents how the topic of modern challenges of the business environment, such as burnout, boreout and work-life balance, which are connected to the phenomenon of work investment, are illustrated in the specific literature.

Qualitative research methods, such as the structured interview are complemented by the assessment of quantitative data provided by European Union institutions and international organizations dealing with this topic.

Data used is available in the Sixth European Working Conditions Survey conducted by Eurofound, an Agency of teh European Union. Another source of analysed data is the European Values Study.

Metadata and meta-analysis are used in the present research. A limitation of the present research is given by the fact that there are not yet cross-border studies related to the topic of burnout. These will for

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

sure be needed and will for sure be conducted, as this is a challenge for many employers, dealing with the problem that their employees suffer from burnout. Metadata is considered as a research basis, as it is difficult to find comparable data on this topic, which would be helpful in analyzing burnout at cross-national level at European Union level and would fill the identified research gap.

The structured interview is used as a qualitative method in order to investigate the opinion of respondents related to dealing with failure. The research was conducted in March-April-May 2020, having 102 respondents enrolled at the Bucharest University of Economic Studies in Human Resources Programs. This qualitative research method is used, as the respondents will the future human resources managers dealing with the challenge of modern working environment, such as burnout.

The structured interview is used as a qualitative method in order to research working habits and the working culture of employees within multinational companies or companies acting as international players.

Case studies from companies are as well used in order to illustrate the impact of burnout as a challenge of the modern working environment in organizations.

It is important to point out the importance of the topic burnout as a challenge of the modern working environment, as it affects more and more people nowadays. Awareness rising in this field might help to achieve prevention of this syndrome.

As an element of originality and novelty, a tool for detecting burnout is analysed in the present paper. The research results can be relevant for managers and human resources departments.

Aspects of psychology, business, economics, corporate culture, values related to working habits and to working culture, even medical aspects are being considered in the present paper, analysing the topic from various perspectives, in an interdisciplinary manner.

RESULTS AND DISCUSSION

Burnout – A Challenge of the New Working Environment

A famous architect can no longer work, as he does not find any joy or satisfaction in his job (Greene, 1960). The decides to quit and no longer works as an architect.

An employee has insomnia and cannot focus on his job tasks. He has headaches, gastrointestinal complaints and feels tired. So tired that writing an e-mail is a challenge for him.

An estate-agent with bad results during the financial crisis thinks he is the only person responsible for his failure. He is not good enough. The context does not matter for him.

All these examples are patients suffering from burnout. They are case studies showing that this syndrome can affect any of us.

Burnout is not new, but it is new to deal with it as a challenge in the modern working environment. Burnout-cases are not isolated cases of people performing a job that does not fit them. It becomes a common situation, which is difficult to solve both for the employer and the employee. The situation developed in this direction when people wanted to earn more, not just to cover the current costs of living, but to be validated by their job. On the other side job expectations from employers became more and more complex and difficult to fulfill. Employees had to work extra-hours in order to finish their tasks. At the beginning, this was not seen as a real problem. But with health issues becoming a problem for more and more employees, burnout become a common disorder for people with heavy work investment.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The problem is that people are afraid of being diagnosed with burnout, as it is a psychological disorder. They are afraid that they will lose their jobs or that they will be isolated by other colleagues, knowing they have a psychological problem. But burnout is not a temporary state of mind, it is a biochemical disequilibrium in the brain that will persist. The next step is depression. Without taking action, without the proper treatment, things will only get worse.

The lack of consensus is as well on the medical side, as some medical doctors find burnout as an independent diagnosis, while some other see it as a step before depression. This is why it is difficult to find accurate statistics and data related to burnout. Some of the cases are covered in the statistics related to depression, so that it is difficult to gain a clear image only over burnout affected people.

Researching how burnout became a challenge in companies, a change of values and of habits related to the working culture has to be considered. A job is not only a form of ensuring income. It is a form of validation. Employees need to feel that the job is THE ONE for them. If it does not fulfil their expectations, they are disappointed. If the job is not the right for them, but it brings them a lot of money, they try to keep it, working against their talents and their skills. Pressure to fulfil job-tasks combined with the disappointment of not fulfilling them well enough or quick enough, correlated with low job performance despite high efforts bring a state of fatigue and job-related dissatisfaction. The way to burnout is open.

Nowadays, people do not only fulfill job tasks – they have to convince other people, they have to be the image of the company they represent, so that the emotional involvement of the employee in fulfilling his tasks is higher than it was in the past. But the question is, which is the price they have to pay for this involvement and whether a heavy working investment would bring them benefits or not.

People suffering from burnout tend to become cynical and to distance themselves from their job and from their colleagues. This affects working relations. This type of behaviour has negative consequences on the abilities to work in a team and to solve job related issues. Distancing from co-workers and being cynical or feeling worthless are behaviours with a negative impact on the job performance. In a first stage, the cause of this behaviour must be identified, or the behaviour can be misunderstood or taken personally by other colleagues. At this point in time, the human resources department must take action.

Measures to be Taken by Companies for Dealing With the Challenges of Our Modern Working Environment

Companies must be aware of this real problem which is burnout. They should try not the have too high expectations regarding the job performance of their employees. Human resources managers and managers generally should accept the idea that employees need some time to relax, that they sometimes have a bad day, when their performance is not so good and they should get over this situation. They should try to be empathic and they should try to share values like mindfulness as a value of corporate culture. Moreover, managers should try to understand the needs of the employees and to be reasonable when asking constantly high performance from them.

Employees need time to relax, time to meditate and to regenerate. This is why some companies, especially from the United States of America have chosen to rethink the design of the working place. Case studies in the literature show that some of them offer spaces for relaxing for their employees. Some offer couches for employees, as a space to relax for a few minutes after performing a difficult task or when having a difficult day. Even the 20 minutes nap has proven to be a regenerating means of increasing productivity at work accepted by some managers. Other companies offer the possibility for sports and even organize contest between the employees, encouraging the employees to benefit from these opportunities.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Events organized after work are as well measures taken by companies in order to help their employees relax and to consolidate the teams. Empathy at work is easier to be achieved if there is as well empathy at personal level, at human level. Trying to be human, not only to perform job tasks is a way of dealing with challenges pf the modern working culture.

Unlike in former times, employees working extra-hours are not at all appreciated. Working extra-hors is not encouraged and people choosing to work extra-hours are not necessarily well assessed. If an employee works extra-hours, this does not mean that he is very ambitious, but it rather means that he has a problem with time management and with being efficient. There is a change of paradigm in expecting employees to work extra-hours, compared with former times. Of course, habits differ from one field of work to the other. But especially multinational companies encourage their employees to finish their job tasks within the regular working hours.

On the other hand, if burnout is already a challenge within the company, managers should revise their attitude and try to be reasonable in re-integrating people suffering from burnout after their treatment. Managers have a problem with reintegrating an employee who suffered a burnout syndrome, as this employee is extremely sensitive, and it is possible that his affection reappears.

A Tool for Detecting Burnout

When burnout is installed, there is need to act and to treat it, as it is not just a temporary mood. It is a psychological disorder. Human resources managers should be aware of this issue as well as mangers of companies. It is easier to prevent burnout than to treat it. In order to identify people suffering from burnout in early stages or even to identify them at all (as some cases remain hidden all the time), a tool for detecting burnout via an interview would be very helpful for managers and for human resources departments. Periodical assessments of employees focused on identifying burnout risks would be extremely helpful to prevent or to treat burnout, if already installed. These assessments could focus on the aspects presented in Table 1.

This tool may be used as a check-list in a periodical interview with each employee, organised by the human resources development or organised by each manager wishing to find out if his employees have burnout symptoms. If the above mentioned symptoms are confirmed by the employee, it means that the employee has a high rish to develop burnout syndrom. It may also be used as a self-assessment-tool by the employee.

Finding the Proper Balance Between Burnout and Boreout – A Difficult Task for Employers and Employees

Burnout is a challenge in companies in the context of heavy work investment and work overload. But the other extreme – work underload is as well a challenge and can have a negative impact on the job performance of the employees. How to find the proper balance between these two extremes is a question that managers and human resources departments have to think about.

Boreout is a psychological syndrome caused by too much boredom at work. This can occur if the job tasks are not interesting enough, too easy or simply do not suit the employee. Although the consequences in terms of health issues are not as bad as they are in the case of burnout, boreout might as well affect the psychological well-being of the employee. The employee feels demotivated and there is obviously no joy or passion related to his work.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. A tool for detecting burnout

Symptoms	Do I Have Burnout?
Fatigue	→ I feel very tired while working → I am tired already at the beginning of the working day → Writing an e-mail is for me a difficult task that makes me tired → I find my job exhausting
Lack of interest in work	→ My job is useless → I am useless → I am not interested in the quality of my performance, it does not matter anyway → I find my job frustrating
Isolation from co-workers	→ I do not care about cooperating with my coworkers, it is anyway useless → I do not understand and I do not want to understand my co-workers → I do not care about the problems of my co-workers
Tension	→ I feel a permanent tension related to my job → I find my job stressful → Small problems related to job-tasks make me angry → I cannot control myself
Guilt	→ I am guilty for my weak performance at my job → My supervisors blame me for the failure of the company
Somatic level	→ Headaches → Lack of capacity to focus → Gastro-intestinal problems → Insomnia

Source: Own research based on Maslach, C. et al, 1996, cited in Falkai, P., 2016, p. 23.

The difference between burnout and boreout is that burnout is a severe syndrome which can be a preliminary stage of depression. Demotivation caused by boreout may in time as well lead to depressive episodes, but the symptoms are less violent than in case of burnout.

3.5. Solutions to Fight Against Burnout and Boreout

What companies could implement in order to find the proper work life balance and thus avoid both burnout and boreout, is to promote innovation within the company and to encourage the employees to try new things, if they feel like their job does not suit them well. Not being afraid of failure is an attitude that can be trained and that could lead to more job satisfaction. As well is the positive attitude towards new ideas, new jobs or new job tasks. Encouraging employees to try new things will make them confident and will increase their job satisfaction.

A company studied in the literature tried to motivate its employees to try new, innovative ideas by promising a failure bonus. For that company, it was important that the employees come with new ideas to innovate, even if some of them were not successful. Being afraid to try something new was considered to be a bad option, as it would inhibit people to innovate due to fear of failure.

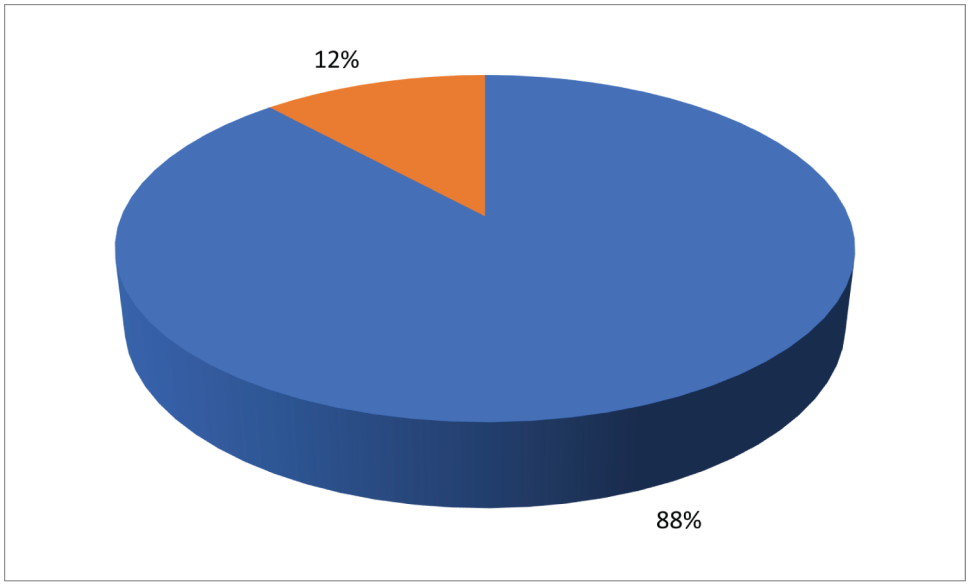
In order to find out how young people position themselves related to this concept, an own research was conducted among students enrolled at human resources programs at the Bucharest University of Economic Studies, by means of a structured interview used as a qualitative research method. These students were chosen as respondents, as they will be future managers in human resources departments, having to deal with the challenges of the modern working environment. The research was conducted in March-April-May 2020. There were 102 respondents participating in this research. The results of the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

research show that the vast majority of the respondents (88%) find the idea of a failure bonus a very good measure for improving innovation within the company and for promoting an innovation-oriented attitude within the company.

The results of the own conducted research are illustrated in Figure 1.

Figure 1. A Failure Bonus – A Good Idea for Promoting Innovation within the Company?



Source: Own representation based on own conducted research

At a first assessment, the idea of a failure bonus leads to the conclusion that it could be used as an instrument to enhance innovation within the company and thus to avoid bore out among the employees.

Nevertheless, when asked if they would be motivated by such a bonus, only 37% of the respondents would be happy to receive such a bonus. The idea is thus considered to be good in theory, but the fear of failure still exists at personal level, which makes people avoid failure. In other words, the idea of a failure bonus is good in theory but no one really wants such a bonus.

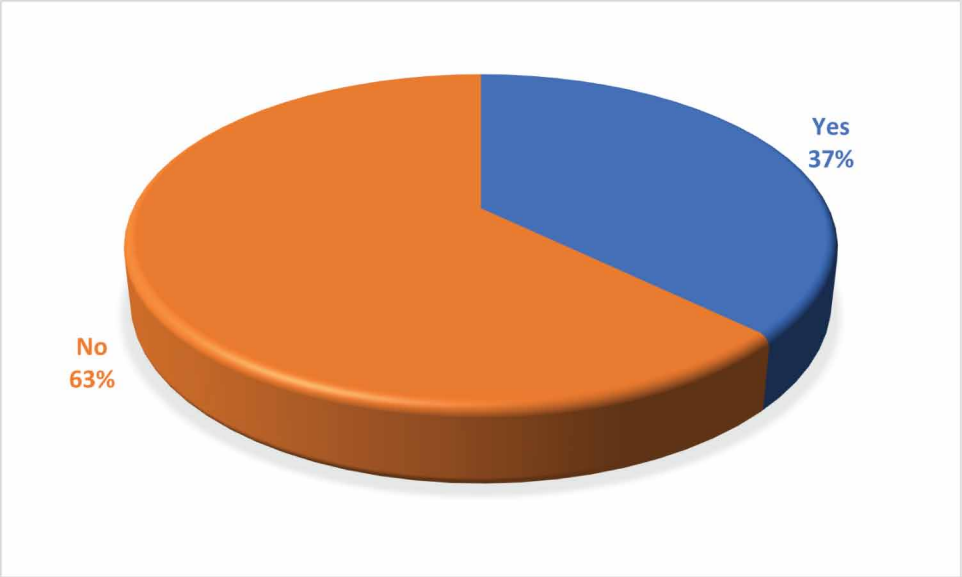
These results of the own conducted research are illustrated in Figure 2.

The use of such a tool in order to avoid boreout among the employees has thus its limitations, due to the fact that there is no clear attitude yet towards the acceptance of failure. It is in principle all right to accept failure, but this remains a theoretical acceptance, it is not truly felt be the employees. As a research result, a change of culture regarding the acceptance of change, with its positive and negative implications, still has to take place.

Between the illustrated two extremes regarding work investment, which are burnout and boreout, most companies try to find the proper balance in work investment, which means as well supporting work-life balance and promoting it as part of the corporate culture.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Would you be motivated by a failure bonus?



Source: Own representation based on own conducted research

The fact that work-life balance is an important aspect when assessing a job is the result of the development of a mindful, reasonable attitude towards work of both employers and employees. The change of values related to work and working culture needs to be considered when trying to find the proper balance in work investment.

As pointed out in the studied surveys, work intensity is an important factor for assessing job quality and it refers to the physical workload as well as to the emotional workload related to the job (Eurofound, 2017, pp. 36-37). Work-life balance is as well an indicator for job well-being and for evaluating job quality (Eurofound, 2017, p. 40).

A good indicator for monitoring and preventing burnout is the Work Intensity Index, promoted in the Eurofound survey (Eurofound, 2017, pp. 48-51). If this indicator would be periodically assessed and a monitoring of the employees with risk to burnout would be ensured, then the burnout cases in companies could be kept under control or could even be reduced.

Burnout is directly connected to long working hours. At least once in a month, 32% of the respondents of the survey performed by Eurofound had a long working day, with more than 10 hours a day (Eurofound, 2017, p. 57.) This result at European Union level is illustrated in Figure 3.

In the European Union, men work on average about 3 long days per month, while women work 1,5 according to the survey (Eurofound, 2017, p. 57.) This research result is illustrated in Figure 4.

CONCLUSION

As a conclusion of the present research, finding the proper workload when assessing work investment is a key issue in order to deal with the challenges of the modern working environment, such as burnout and boreout. A proper work-life balance can help employees to prevent burnout.

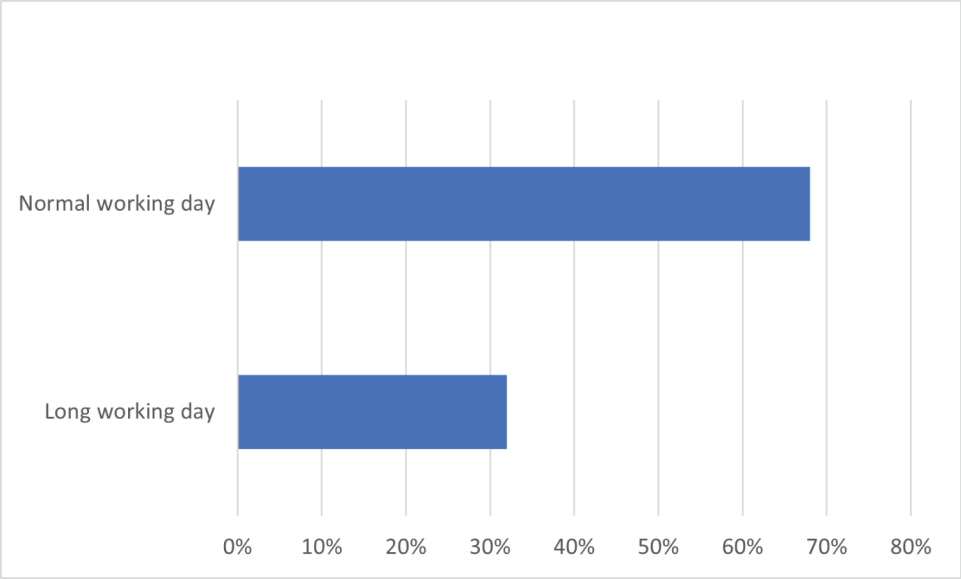
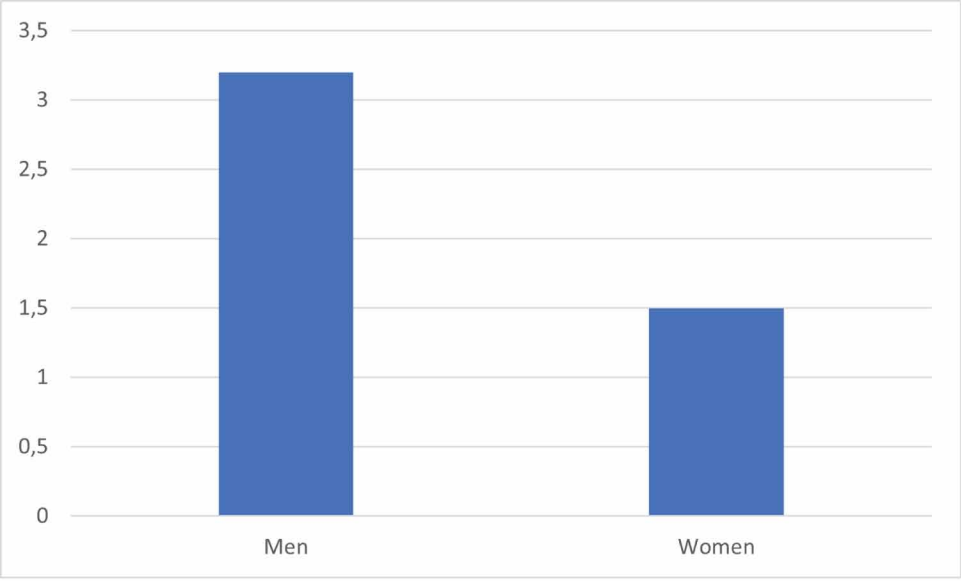
Figure 3. Working days in the European Union



Source: Own representation based on Eurofound, 2017, p. 57.

Figure 4. Long dasy per month – men versus women in the European Union



Source: Own representation based on Eurofound, 2017, p. 57.

The present research gives an interdisciplinary perspective on the topic of the challenges of the modern working environment, such as burnout and boreout, considering aspects of business and psychology.

A limitation of the present research is the fact that there are no cross-national studies on burnout at European Union level yet, so that it is difficult to find comparable data.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The topic of heavy work investment is one of great interest in the current business world. Dealing with burnout as a challenge of the modern working environment is a challenge to be faced by companies. With more and more employees suffering from burnout, it a topic of great interest that will need further research. The research results of the present research can be used by managers or human resources departments, they can be improved and developed in further research projects. As a research gap was identified in this field, further research will be more than welcome.

ABSTRACT

As cognitive tasks have displaced physical tasks in today's manufacturing industry, this sector can demand high levels of mental workload from workers. In certain situations, there is a high cognitive load, which affects operators reducing their attention to the task and causing them mental fatigue and distractions, resulting in errors that generate economic costs or even injuries to workers. This literature review aims to provide a comprehensive understanding the use of mental workload in the manufacturing sector. The methodology consisted of conducting a search in four databases. In the search, a combination of keywords was used, classifying each journal according to the mental workload evaluation means, the type of evaluation, and the area of application. Articles not focusing on the manufacturing area were discarded. Of the total of 3839 articles found, 12 have been selected. Regarding the methods used for mental load assessment, the analytic techniques were found to be the most frequently used.

INTRODUCTION

Currently, due to industries' growing automation, this sector's modern socio-technical systems feature great complexity (González Munõz & Gutiérrez, 2006). Despite such automation, there are still tasks in industry where people are necessary and even indispensable (Autor, 2015). For example, whenever automation has been viable, simple tasks which previously required several workers with a low level of qualification have turned into complex tasks requiring fewer workers with a higher level of knowledge, that is, with complex cognitive skills that involve decision making, improvisation, handling of information, and failure diagnosis, among others (Beaudry, Green, & Sand, 2013), so as to complement the automated systems. On the other hand, there are also tasks that have not been automatized successfully, but where, ironically, the level of complexity has increased (Mital & Pennathur, 2004). This has occurred in tasks that require people's mental abilities, or in cognitive tasks such as those mentioned above, which cause workers' mental load to tend to increase and exceed their capacities and limitations to perform their work efficiently and safely. On the other hand, a low workload level is also undesirable as it can cause workers to fall into complacency (González Munõz & Gutiérrez, 2006) and to generate errors derived from distractions or lack of attention.

Based on the foregoing, it can be said that mental workload evaluation is a key point in research and, in general, in all those activities that seek higher levels of comfort, satisfaction, efficiency and safety in the workplace (Rubio, Díaz, Martín, & Puente, 2004).

Therefore, the main objective of this work is to determine the state of the art of the assessment and consideration of mental workload into modern socio-technical systems of the manufacturing industry by means of a systematic literature review. Additional objectives of this work are to analyze important characteristics of actual available mental workload evaluation and assessment techniques such as training time, administration time, tools needed, advantages and disadvantages, among others. Also, once some selection criteria are established among the articles found, the most frequently used and widely applied techniques must be identified. Finally, to offer recommendations about the pertinence of the use and evaluation of mental workload in the manufacturing environment and operations is convenient to propose future research trends.

BACKGROUND

Whenever any type of work is done, the body undergoes two types of loads: a physical one and a mental one. The physical load is constituted by the biomechanical, physiological and caloric requirements that the worker's body demands, while the mental load refers to the cognitive processing requirements necessary for good performance at work (González Munõz & Gutiérrez, 2006) although currently there is no consensus as to which factors are most closely associated with mental load (Rubio, Díaz, & Martín, 2001).

Mental Workload Evaluation and Assessment

There are different techniques for evaluating mental work load. According to various authors (Dalmau & Ferrer, 2004; González Munõz & Gutiérrez, 2006; Stanton, Hedge, Brookhuis, Salas, & Hendrick, 2004; Stanton, Salmon, & Rafferty, 2013; Young, Brookhuis, Wickens, & Hancock, 2015), these techniques can be grouped into:

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Analytical.
- Primary task performance measures.
- Secondary task performance measures
- Physiological measures.
- Subjective-rating techniques.

Analytical techniques are those that are carried out through mathematical models and computer simulation. Because of modern computerized systems, this type of techniques has seen a boom over the years.

Primary task performance measures involve measuring the worker's ability to perform the primary task being analyzed. The expectation is that a worker's capacity decreases as the mental work load increases. Some of the advantages of this type of measurements are: their sensitivity to variations in the workload and their ease of use. Some of the disadvantages, on the other hand, are that performance can be affected during low workload tasks and that the level of mental workload can be affected by the worker's experience and skill.

On the other hand, Secondary task performance measures focus on analyzing the worker's ability to perform an additional task to the primary. This type of measurements is based on the assumption that as a worker's mental load increases, his/her ability to perform the secondary task will decrease due to the reduction of the remaining mental capacity, so that the performance of the secondary task will be affected. The main advantages of this type of measurements are the following: it features greater sensitivity in evaluating the mental load during short periods, since secondary tasks, unlike primary ones, are executed in short periods of time; also, it allows for the evaluation of a reserved mental capacity. Its main disadvantage lies in the lack of sensitivity to minor variations in the mental workload.

Next, physiological measures are based on the fact that certain cognitive activities have been associated with physiological variations in people, that is where the variation in heart rate, eye movement and brain activity can be affected by an increase or decrease in the mental workload. The main advantage of these measurements is that they do not interfere with the performance of the primary task. The disadvantages are that this type of measurement is affected by the worker's health and that the equipment needed to carry it out is costly.

Finally, subjective-rating techniques analyze the worker's perception of the complexity of the task. The techniques are generally carried out after the task has been executed and can be classified as one-dimensional or multidimensional, depending on the workload dimensions that they evaluate. When one-dimensional techniques are used, the data obtained are easy to analyze, whereas multidimensional techniques entail a higher level of diagnosis. The advantages of this type of techniques are its ease of use, its speed of application and its low cost. One of its main disadvantages is that, often, the mental work load ratings correlate with the worker's performance in the task under analysis. Also, participants are likely to forget certain parts of the task where variations in their workload may have occurred. Lastly, this type of techniques is the most widely used for evaluating mental workload.

To evaluate the mental load perceived by the subject, one-dimensional scales are used, which contemplate a single load factor, or multidimensional scales, which break down the load factor into other factors. Also, the scales can be classified into absolute or relative. The first ones are based solely on the task under study, while the second, on their comparison to another standardized task in which the assessment is relative or multiple. These scales are usually administered immediately after the completion of the task.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Criteria for Mental Workload Assessment

According to Eggemeier, Wilson, Kramer, and Damos, cited in (Rubio et al., 2004), there are several criteria that any mental workload evaluation technique must meet:

- **Sensitivity:** Refers to a technique's ability to detect changes in the levels of difficulty in the task or in its demands.
- **Diagnosticity:** An index should identify not only when a load varies, but also the cause of this variation. The diagnostic power of a technique results from its ability to detect the type of attentional resources that produce the mental load in a specific task. It is this information that makes the implementation of better solutions possible.
- **Selectivity / Validity:** The index should be selectively sensitive only to differences in the capacity demands and should not reflect changes in factors such as the physical load or the emotional stress, which may not be associated with the load.
- **Intrusiveness:** The index should not interfere with the completion of the task whose load is being evaluated.
- **Reliability:** Like any other behavior measure, a load index must be reliable. If the mental load is evaluated at different times (i.e. changes in mental load that occur during the course of a task or operation), it is important for the index to offer a reliable and consistent estimation of the mental load.
- **Implementation Requirements:** Includes aspects such as the time, the implementation and the software necessary for data collection and analysis, as well as the degree of operator training required to obtain valid results.
- **Subject Acceptance:** Refers to the perception that subjects have of the validity and usefulness of the procedure.

Mental Workload Assessment Techniques

Among subjective techniques, those that stand out are:

- Modified Cooper-Harper (MCH) Scale.
- Bedford Scale.
- Subjective Workload Dominance (SWORD) and Pro-SWORD
- Subjective Workload Assessment Technique (SWAT) and Pro-SWAT
- NASA-Task Load index (Nasa-TLX)
- Workload Profile (WP)
- Multiple Resources Questionnaire (MRQ)
- Subjective Mental Workload Scale (SCAM)

Modified Cooper-Harper (MCH) Scale

It was developed by Cooper and Harper (1969) and modified by Wierwille and Casali (1983) and is the oldest one-dimensional, subjective evaluation technique. It was originally developed to evaluate the mental load associated with aircraft piloting tasks and other related activities through a scale scored from

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

1 to 10, along with a decision tree that would help the operator estimate the mental load. Originally, this scale was used to obtain pilots' subjective ratings on the level of control of an aircraft; therefore, the result of the scale was based on the capacity to control the aircraft and also on the level of entry required by the pilot to maintain adequate control. The Modified Cooper Harper's scale is based on the assumption that there is a direct relationship between the level of difficulty in controlling the aircraft and the pilot's workload (Stanton et al., 2013).

Bedford Scale

Like the MCH, it was developed for piloting tasks and related activities (Ellis & Roscoe, 1982; Roscoe & Ellis, 1990). It is based on the assumption that the mental load of a pilot is determined by the integration of the mental and physical efforts required to meet the demands of specific elements of the piloting task. Essentially, it analyzes the remaining attentional capacity and involves the use of a hierarchical decision tree to evaluate the participants' workload through evaluating the available capacity while performing a task. The scale is usually filled in after the task has been completed, but it can also be administered during its execution (Stanton et al., 2013).

Subjective Workload Dominance (SWORD) and Pro-SWORD

This technique was introduced by Vidulich (1989) and is a derivation of the Analytic Hierarchy Process (AHP), which is a technique used to deal with complex decisions. SWORD uses task comparison by means of pairs, in order to obtain mental workload ratings for individual tasks. The SWORD technique is performed after the execution of the task and calls for participants to rate the predominance of a task over another in terms of their mental workload. Pro-Sword was developed from SWORD by Vidullch, Ward, & Schueren (1991) to be used in predictive environments. When used predictively, tasks are classified according to their predominance before and after the test begins to check the sensitivity of the predictions (Stanton et al., 2013).

Subjective Workload Assessment Technique (SWAT) and Pro-SWAT

Developed by Reid and Nygren (1988), this technique was used originally to evaluate the mental workload in the US Air Force, evaluating mainly pilots in the cabin environment. It is based on the assumption that the mental workload is a multidimensional construct, which is why time load, mental effort load and stress load are all taken into account. It is administered at the time of completing the task. After an initial assessment procedure, participants are asked to rate each dimension using a scale of 1 to 3. Next, a score is calculated for each dimension and a global score for mental workload of between 1 and 100 is obtained. On the other hand, Pro-SWAT is a derivation of SWAT which is used in a predictive way. Pro-SWAT requires evaluators who are knowledgeable about a task to create a mental projection of the operation of the defined system, imagining themselves performing the task, and then reporting on the magnitude of the workload "experienced" at specific times (Eggleston & Quinn, 1984).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

NASA-Task Load Index (Nasa-TLX)

NASA TLX is a multidimensional, subjective evaluation technique presented by Hart & Staveland (1988). According to several authors, it is one of the most widely used subjective techniques in evaluating mental workload (Bommer & Fendley, 2018; Rubio et al., 2004; Stanton et al., 2013; Young et al., 2015). It identifies six dimensions of subjective load: mental demand, physical demand, temporary demand, effort, performance, and frustration level. In general, this instrument involves two steps in sequential order. During the first step, a comparison is drawn, by pairs, among the 6 dimensions that make up this technique; then an assessment is made, on a scale of 1 to 100 with intervals of 5 each, of the role that each dimension has played in the evaluation. In general, this technique is performed immediately after the task has been performed.

Workload Profile (WP)

This technique was elaborated by Tsang & Velazquez (1996) based on the Multiple Resources Model (MRM) proposed by Wickens (1984). It is a multidimensional, subjective technique that makes use of the following dimensions: perceptual/central processing, response selection and execution, spatial processing, verbal processing, visual processing, auditory processing, manual output, and speech output. Before its application, participants must be instructed regarding the dimensions that the MRM handles. Afterwards, once the task has been performed, participants evaluate the resources used during the execution of the task, using a range from 0 to 1, where 0 means that there is no demand for resources and 1, that the task uses up all available resources.

Multiple Resources Questionnaire (MRQ)

The MRQ was developed by Boles & Adair (2001). According to Phillips & Boles (2004), it is based on the Expanded Multiple Resources Theory (EMRT), an evolution from the MRM which was proposed by Boles & Law (1998). It is a multidimensional technique whose dimensions, based on the available processes, include: auditory emotional, auditory linguistic, facial figural, facial motivation, manual, short term memory, spatial attentive, spatial categorical, spatial concentrative, spatial emergent, spatial positional, spatial quantitative, tactile figural, visual lexical, visual phonetic, temporal visual and vocal. For its administration, it is required that the participants be instructed on the principles of the MRQ before executing of the task. After task execution, participants are to evaluate each one of the dimensions, based on a scale of the 0 to 4, thus indicating the level of resources they used for each dimension evaluated.

Subjective Mental Workload Scale (SCAM)

The SCAM is a subjective evaluation technique developed by Rolo González, Díaz Cabrera, and Hernández Fernaud (2009) in 2009. The development of the scale was based as well on the review of the theoretical literature as on the analysis of other instruments in use, taking into consideration three major dimensions or sources of mental load: temporal demands of the task, processing resources demanded by the task and aspects of an emotional nature. The scale developed is characterized by being multidimensional and subjective, based on the approach of the high relevance of the worker's perceptions, competence, and

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

training, which may affect his assessment of the difficulty or level of effort of the task, or what is also known as "workload experience".

Each of the abovementioned techniques has a number of advantages and disadvantages, all of which are shown in Table 1 along with several characteristics of the various techniques.

Table 1. Characteristics of the mental load evaluation techniques

Technique	Training Time	Execution Time	Tools Needed	Advantages	Disadvantages
Primary task performance measures	Low	Low	Simulator, computer	1) They provide a direct performance index. 2) They are particularly effective measuring the workload in long-duration tasks. 3) They can be easily used along with secondary task performance, subjective and physiological measures.	1) They do not always distinguish between workload levels. 2) They are not a reliable measure for isolated measurements.
Secondary task performance measures	Low	Low	Simulator, computer	1) They are sensitive to mental load variations whenever these go undetected by performance measures. 2) Ease of use 3) Indentifying the secondary task is slightly more difficult.	1) They have been found to be sensitive only to big changes in mental load. 2) They are intrusive in measuring the performance of the primary task. 3) Special care must be taken when designing the secondary task in order to maintain the same resources used in the primary task.
Physiological measures	High	Low	Heart rate monitor, follow-up of eye pupil, EEG	1) Several physiological measures have proven to be sensitive to mental load variation. 2) Data are recorded continually during the test. 3) They can be used in real-world applications.	1) Data can be affected by external interference. 2) Equipment is temperature-sensitive and hard to use. 3) The measuring equipment is physically uncomfortable.
MCH Scale	Low	Low	Paper and pencil	1) Quick and easy to use; it requires little training and has a low cost 2) Widely used in various areas 3) The data obtained are easier to analyze than multidimensional instruments.	1) It measures low sophistication loads. 2) Limited to manual tasks 3) Not as sensitive as TLX or SWAT
Bedford Scale	Low	Low	Paper and pencil	1) Quick and easy to use; it requires little training and has a low cost.	1) More complex than one-dimensional techniques 2) The data are collected after the tests. There is already a certain amount of problems due to correlation with performance.
SWORD	Low	Low	Paper and pencil	1) Quick and easy to use; it requires little training and has a low cost. 2) Very effective when comparing the mental workload caused by two or more interfaces.	1) More complex to analyze tan one-dimensional techniques 2) The data are recorded after the tests. There is a certain number of problems due to correlation with performance.

Table 1. Continued

Technique	Training Time	Execution Time	Tools Needed	Advantages	Disadvantages
Pro-SWORD	Low	Low	Paper and pencil	1) Quick and easy to train for and administer 2) Wide validation levels	1) Based on data which are approximations of mental load 2) Not widely used
SWAT	Low	Low	Paper and pencil	1) Quick and easy to use; it requires little training and has a low cost 2) Multidimensional 3) Subscales are generic, allowing their use in various areas	1) More complex to analyze tan one-dimensional techniques 2) Several studies suggest that TLX has greater sensitivity to mental load variations 3) MWL classifications may correlate with task performance
Pro-SWAT	High	High	Paper and pencil, software	1) Simple and efficient method to predict mental load 2) May be applied to any task.	1) It is in its first stages of development and has yet to be validated. 2) Little sensitivity to mental load
NASA-TLX	Low	Low	Paper and pencil	1) Quick and easy to use; it requires little training and has a low cost 2) Better performance than SWAT 3) Features a generic scale, which allows it to be administered in any environment.	1) More complex to analyze tan one-dimensional techniques 2) Weighing procedure is painstaking 3) Suitable for individual mental load only.
Workload Profile Technique	Medium	Low	Paper and pencil	1) Quick and easy to use; it requires little training and has a low cost 2) Based on a solid theoretical foundation	1) More complex to analyze tan one-dimensional techniques 2) Data ae collected after the tests. 3) More complex than other mental load techniques
MRQ	Medium	Low	Paper and pencil	1) Quick and easy to use; it requires little training and has a low cost 2) Based on a solid theoretical foundation	1) More complex to analyze tan one-dimensional techniques 2) Data ae collected after the tests. 3) More complex than other mental load techniques
SCAM	Low	Low	Paper and pencil	1) Quick and easy to use; it requires little training and has a low cost 2) Features a generic scale, which allows it to be administered in any environment.	1) It is in its first stages of development. 2) More complex to analyze tan one-dimensional techniques. 3) Not widely used

Issues, Controversies, and Problems

Failure to take the mental workload into account for design within the industrial sector can generate some problems which can impact both the worker's health and the company's economy.

Workers exposed to a high mental load tend to lose concentration, which results in lower levels of attention and an increase in their risk levels (Chen, Song, & Lin, 2016) so that accident rates also tend to increase. Having jobs where workers are exposed to high mental workloads, can influence the organization, affecting the relationship between employees and administrators (Bowling, Alarcon, Bragg, & Hartman, 2015).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In light of the above, mental workload has been found to have effects on physical health, causing symptoms or general health complaints that are indicators of coronary heart disease. The reason is that mental workload has effects on the variability of the heart rate. As the load increases, the heart rate decreases while at the same time, the respiratory rate increases. In addition, the effects of mental workload on musculoskeletal disorders have been demonstrated by various studies and manifest mainly in discomfort in the neck and shoulders (González Munõz & Gutiérrez, 2006).

On the other hand, both overload and a sub-load can have effects on workers' mental health. That is because each individual has an optimal workload band. Constant upward or downward deviations from this band will probably cause stress (Dalmau & Ferrer, 2004; González Munõz & Gutiérrez, 2006).

Fluctuations in workload can also result from an irregular flow of work, which is not under the worker's control. This is not only restricted to the pace in the production lines; many times, it depends on the climatic conditions; also, a great variety of jobs are governed by the work station demands or the production needs. Finally, certain workers, such as air traffic controllers, firefighters and pilots, must undergo long periods of inactivity, yet suddenly, they must take action when a crisis occurs. This is potentially harmful if the employee fails to respond appropriately in an emergency (Rubio, et al., 2001).

As was already mentioned, the impact of the mental load on workers can generate health problems or economic losses both for the worker and for the companies. According to Ayaz et al. (2012), the lack of evaluation of the mental workload in the industrial sector impacts mainly on the workers' performance and can result in a series of errors that can, in turn, trigger catastrophic losses.

According to Stanton et al. (2013), there is a great variety of methods to evaluate the load, but their implementation is complicated as there is no defined unit to measure the level of mental load (Rolo González et al., 2009). There is also the fact that most mental load-related jobs were originally developed from models used in the aviation sector (Vidulich & Tsang, 2012); thus, for other sectors, it is necessary to adapt and/or validate mental load evaluation differently.

METHODOLOGY

The methodology followed by this work includes four stages: selection of databases, selection of keywords, depuration of results and final selection.

Selection of Databases

To select the databases where the search would be conducted, those that showed a greater number of indexed journals were searched, focusing mainly on the areas of engineering and manufacturing.

Keyword Selection

Once the databases were identified and based on the advanced search characteristics of each of them as well as on the number of quality results, a series of words were selected which would be used to perform the searches.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Depuration of Results

After the results of the advanced searches in the selected databases were obtained, they were exported to various files for depuration. Once these results were obtained, they were classified according to the following criteria: the mental workload evaluation used, the type of evaluation (physiological, subjective, etc.), and the sector of application (aviation, manufacturing, health centers, education, others), and the number of participants. Items that did not meet at least three of these criteria were eliminated as were those that were duplicated.

Final Selection

After this first depuration, those articles that focused on the manufacturing area were set aside. Once the articles were pre-selected, their entire content was analyzed. The following final criteria for selection was used: each article had to be a peer-reviewed, research article, and its application and/or development had to target manufacturing systems.

RESULTS

Below are the results obtained during the four stages described in the methodology.

Selection of Databases

The databases selected for this study were: ACM DL, IEEE Xplore, ScienceDirect and Web of Science. They were chosen because they met the criteria of number of indexed journals and focused primarily on the engineering and manufacturing sectors.

Selection of Keywords

Because the advanced searches for articles are different in each database, in order to obtain quality results, searches were conducted using different keywords. For the ACM DL and IEEE Xplore databases, the selected keywords were: mental and workload. For ScienceDirect, and in order to reduce the number of articles obtained in the search, the logical operators AND, OR and NOT were used; thus, the keywords were: mental, workload, evaluation, design, manufacturing, industry, nurse, medical and driver. The relationship in which these words and the logical operators were used is shown in Figure 1. Finally, for the Web of Science database, the logical operators AND, OR and NOT were also used. However, due to the databases' characteristics, the keyword "TS =" was added, by means of which it was specified that the search would be conducted within the fields of Abstract, Title or Keywords of a registry. Additionally, it was specified in the search options that the search ought to include scientific articles only.

Depuration of Results

A total of 3839 articles were found in the first searches. In the column "First Search" in Table 2, are shown the number obtained from each database. All search results were saved in spreadsheets for analysis.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Relationship between keywords and logical operators used for the ScienceDirect database

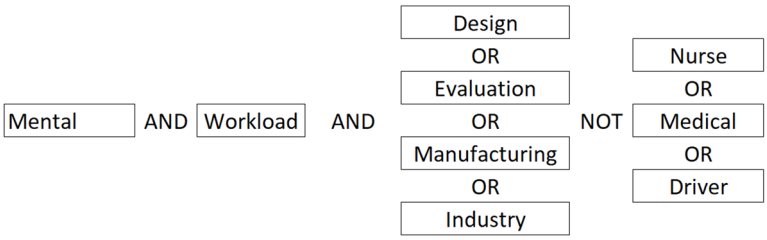

Table 2. Number of articles found by database

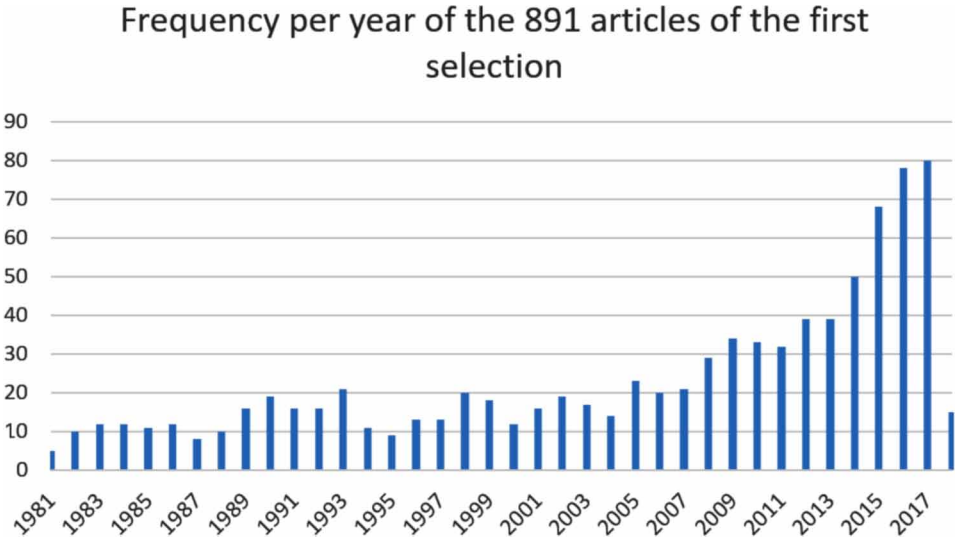
Database	Number of Articles			
	First Search	First Selection	Second Selection	Final Selection
ACM DL	56	5	0	0
IEEE Xplore	362	86	4	0
ScienceDirect	3065	658	85	9
Web of Science	356	142	16	3
Total:	3839	891	105	12

Once the articles were classified based on the mental workload evaluation used, the type of evaluation of this (physiological, subjective, etc.), the area of application (aviation, manufacturing, health centers, education, others), and the number of participants, and based on the aforementioned inclusion criteria, the number of articles was reduced to 891, this is shown in the column "First Selection" in Table 2. The Figure 2 shown the frequency, by year, of the articles selection. Figure 2 shows the frequency of the first selection of elements, in which you can observe a trend towards the increasing publication of articles of mental workload.

Figure 2. Year of publication of the articles of the first selection



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

For the next stage, out of the 891 articles obtained from the previous stage, a pre-selection was made of those articles that met the criteria of being focused on the manufacturing sector; thus, the number of articles was reduced to 105. The column "Second Selection" in Table 2 shows the number of preselected articles per database.

Final Selection

For the final selection, in the articles where it was available, the total content of the article was analyzed; this included the Abstract, the introduction, the literature review, the methods, the discussion and the conclusion. At this last stage, 12 articles were selected. The number of articles selected per database is shown in the column "Final Selection" in Table 2, while Table 3 shows the general characteristics of the selected articles.

In five of the articles, various analytical techniques were used; in three of them, NASA-TLX was used; in one, the MCH was used; in two, they did not specify which technique was used; and in another, two techniques were used, one analytical and one subjective (NASA-TLX), this is showed in Table 4. In terms of seniority the oldest article was from the year 1999, while two of them were published this year (2018). Figure 3 shows a graph that contains the year of publication of the articles and where you can see that it is only in the last few years that there has been the greatest interest.

Regarding the area in which the 12 selected articles are focused, it was found that in seven of them the operator's performance is analyzed, in 3 of them is considered the mental workload in the design of the manufacturing systems, 1 is focused on the training area and 1 is focused on planning.

DISCUSSION

Mental work load evaluation has undergone a great change in recent years. It has been gradually incorporated into various sectors, without leaving those where it originally began (aviation sector); thus, its full implementation in the industrial sector's socio-technical systems is now a reality.

During the conduction of this work, only 12 of 3839, which is (approx.) 0.31% percent of the articles analyzed, focused on and/or had been implemented in the manufacturing industry. Returning to Figures 2 and 3, it can be observed that although there has been an increase in the number of articles published per year relating to the mental workload, the application in the manufacturing industry has been marginal. This leaves a research opportunity where assessment and evaluation of the mental workload in the socio-technical systems of the industrial sector can be implemented in a practical and reliable way.

As for the mental workload assessment instrument, and regarding the subjective techniques, these were used in 5 of the 12 selected articles, the most widely used is NASA-TLX, which was used in 4 on these articles. According to the authors of these articles, NASA-TLX was selected because it is the most widely known and used subjective assessment technique (Bommer & Fendley, 2018; Brolin et al., 2017; Sealetsa & Thatcher, 2011; Tang et al., 1999) which is in line with the opinions of recognized authors (Rubio et al., 2004; Stanton et al., 2004, 2013).

It can also be observed that the use of subjective techniques in the assessment of the mental workload is one of the most commonly used, since, as can be appreciated in Table 1, they present a low level of complexity in their implementation, because it is practically only necessary to use paper and pencil.

Figure 3. Year of publication of the final articles selection

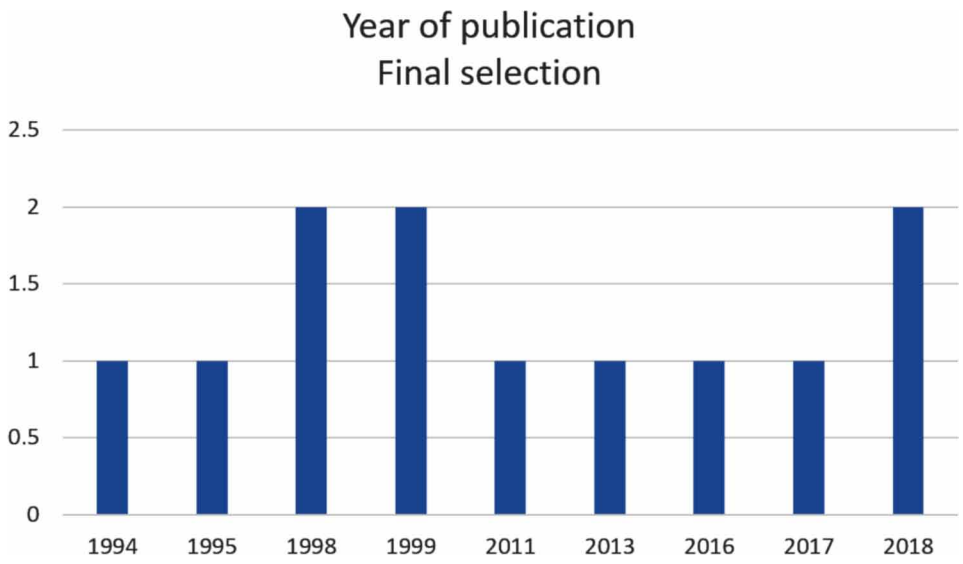

Table 4. Type of evaluation used in the selected articles

Type of Evaluation	Qty	Reference
Analytical	6	(Bi & Salvendy, 1994; Ding-Yu & Sheue-Ling, 1998, 1998; Ntuen, 1999; Tang et al., 1999; Zhao et al., 2016)
Subjective (NASA-TLX)	4	(Bommer & Fendley, 2018; Brolin et al., 2017; Sealetsa & Thatcher, 2011; Tang et al., 1999)
Subjective (MCH)	1	(Bevilacqua et al., 2013)
N/A	2	(Nachreiner, 1995; Oah et al., 2018)

In the case of analytical techniques, these are the most commonly used and are used separately for each case and are presented to support a particular model. Also, they are focused mainly on predicting the mental workload, and only one case of study (Ntuen, 1999) use a subjective technique to validate their model.

FUTURE RESEARCH DIRECTIONS

As mentioned in the results section, half of the articles selected in this review were published within the last five years, and two of them were even published as this work was being prepared. Thus, it is necessary to note that mental load evaluation focusing on the manufacturing industry is gradually incorporating the mental workload and that due to the time constraints on the article's search, some articles may have been overlooked.

It should also be kept in mind that, although many of the items discarded in this work were not directly related to manufacturing, in many of them the techniques and methods can be adapted to the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

socio-technical systems of the manufacturing industry. For example, many of the case studies carried out in the fields of transportation or medicine can be carried out within the industrial sector as well.

CONCLUSION

Due to the various problems derived from the lack of consideration of mental workload in several fields, the relevance of its incorporation into the design and evaluation of current manufacturing systems and processes is highlighted in this chapter. Moreover, the risks of having mental overload or sub load during tasks execution have an impact on workers' performance that tends diminish incurring in work stress, human error, poor quality of life at work and reduced productivity.

As a result of the comprehensive literature review, the number of research articles found in 4 of the main databases is insufficient. In this manner, the field of mental workload research in socio-technical systems is a challenge and represents an opportunity for researchers working in the area of cognitive ergonomics, industrial engineering, industrial psychology among other emerging fields. At the moment a concrete approach for its measurement and evaluation is still pending and represent the most important obstacle for including mental workload assessment and consideration in work and process design in manufacturing and sociotechnical environments.

Additionally, among the articles found for the subjective techniques, the NASA-TLX is distinguished as the most widely used for mental workload and present advantages for its easiness of use, its sensitivity, non-intrusiveness, its diagnosticity, its validity, its subject acceptance and relatively low cost of their implementation.

ACKNOWLEDGMENT

We thank the Autonomous University of Ciudad Juárez (UACJ) and the National Institute of Science and Technology (CONACYT) for the financial support granted through project CONACYT - INS (FRONTERAS CIENCIA) 2016 – 01 - 2433. We also thank Leslie Yaratzed Cedeño Castillo for her outstanding support in the translation and improvement of this paper.

KEY TERMS AND DEFINITIONS

Cognition: The activity related to the acquisition of knowledge.

Cognitive Ergonomics: The branch of ergonomics that is interested in mental processes such as perception, memory, reasoning, and motor response, to the extent that they affect the interactions between human beings and the other components of a system.

Database: In the academic field, they are repositories of information that may contain references to books, journals, conference proceedings, and theses, among others.

Mental Workload: Refers to the set of strains inflicted on a person by the demands of the mental work that he/she performs.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Socio-Technical Systems: Refers to the integration in the company as it consists of a technical system (equipment and production methods) and a social system (a group of men) that interact with and complement each other.

Stress: Associated with the state that results from events that generate anxiety or overwhelmingness. When a person receives demands that are excessive, he/she will begin to feel anxiety and to experience various symptoms.

Subjective: In the field of mental load assessment, subjective instruments are those in which the mental workload is not measured directly, but indirectly.

Chapter 6
The Diversity Paradox

J. Jacob Jenkins
California State University, Channel Islands, USA

ABSTRACT

The diversity paradox is an organizational emphasis placed upon one potential understanding of diversity which, paradoxically, deemphasizes alternative expressions of individual difference. An organizational focus on representations of gender, for instance, synchronously moves the focus away from sexual orientation; an focus on sexual orientation synchronously moves the focus away from age; and so on. The diversity paradox commonly manifests via six interrelated tenants. First, organizational discourses promote a fractionated understanding of what it means to be a diverse organization, resulting in a visible hierarchy of difference and the sense of false attainment among its leadership. Among organizational members, this false attainment results in neglected representation for certain minorities, as well as diminished alternatives for organizational life and an increased level of potential tokenism. The present article explores the diversity paradox in more detail, including its background, six primary tenants, and future recommendations.

INTRODUCTION

The diversity paradox is an organizational emphasis placed upon one potential understanding of diversity which, paradoxically, deemphasizes alternative expressions of individual difference. An organizational focus on representations of gender, for instance, synchronously moves the focus away from sexual orientation; an organizational focus on representations of sexual orientation synchronously moves the focus away from age; and so on. This article explores *the diversity paradox* in more detail, including its background and six primary tenants: fractionated understanding, visible hierarchy, false attainment, neglected representation, diminished alternatives, and potential tokenism. The article concludes with recommendations for both researchers and lay leaders alike whom hope to cultivate healthier organizational milieu.

The diversity paradox is an especially significant phenomenon in today's increasingly diversified society. Perhaps nowhere is this phenomenon more salient than within the United States. The percentage of Americans who self-identify as white has been in steep decline for decades, and this diversification is

only projected to continue in the coming decades. Today, approximately 60% of those living in the United States identify as white, 17% as Latinx, 12% as black/African American, 5% Asian, and 1% American Indian/Alaskan Native. Yet by the year 2055, the percentage white Americans is predicted to decrease by nearly 15 percentage points, resulting in the United States no longer having a single racial/ethnic majority (Pew Research Center, 2016). This trend in increased diversification is mirrored elsewhere as well – fueled by political alliances in the European Union, immigration policies in South America, international trade agreements in North America, and so on (Rice, 2010).

Despite the increased diversity in countries like the United States – or perhaps because of it – issues of racial/ethnic inequality continue to plague our world. This reality is evident whether measured by income inequality (Glazer, 2005), health disparities (Dillon, Roscoe, & Jenkins, 2012), education levels (Closson, 2010), or incarceration rates (Ward, Farrell, & Rousseau, 2009). For these reasons, it is more important than ever for contemporary organizational leaders and scholars to learn how to engage with culturally diverse voices, perceptions, and taken for granted assumptions. The diversity paradox contributes to this need for increased understanding by revealing specific ways that diverse members manage tensions and limitations, thus, holding promise for improved racial/ethnic relations within intercultural contexts, organizations, and society writ large.

BACKGROUND

The diversity paradox first emerged as a theoretical framework during Jenkins' (2013, 2014a, 2014b, 2014c) four-year ethnography of Central Community Church (pseudonym) – an intercultural congregation located in Tampa Bay's urban corridor. In reference to Christian Scriptures that depict a culturally diverse body of believers (see Matthew 28:9; Acts 17:26-27; Revelation 7:9, New International Version), Central Community strove to "reflect and impact the specific realities of [its] surrounding community" (Jenkins, 2014a, p. 7). Thus, Central Community actively promoted diversity via church literature, congregational events, and communal outreach efforts. A majority of sermon topics addressed the need for organizational diversity, and the church's website described itself as "a multi-ethnic community… transforming the world through Jesus Christ" (Central Community, 2015, par. 3).

After 48 months of fieldwork, which yielded over 300 hours of observations, 140 pages of notes, and 30 semi-structured interviews with organizational leaders and members, Jenkins (2014) found Central Community's organizational emphasis on diversity to have several unintended consequences. Although admirable on the surface, the church's limited view of diversity as physical representations of racial/ethnic difference was found to paradoxically diminish the opportunity for alternative expressions of individual difference (see Jenkins & Dillon, 2014). Minority members' attempts to conform to Central Community's white normative practices unintendedly resulted in forced assimilation and self-disciplining; consequently, the church's emphasis on cultivating a diverse congregation actually served to limit possibilities of organizational life – a phenomenon hereto referred to as *the diversity paradox.*

The diversity paradox has since been observed in additional contexts across the United States, including both religious and secular organizations. A study by Santis, Graham, and Jenkins (2019) of Central Faith Church in the greater Los Angeles area, for instance, revealed a similar tension surrounding the notion of organizational diversity. Such additional studies not only evidence the diversity paradox's prevalence, but also its potential to help inform a wide range of religiously and geographically diffuse settings.

PRIMARY TENANTS

The diversity paradox is shown to manifest itself via six interrelated tenants: (1) fractionated understanding, (2) visible hierarchy, (3) false attainment, (4) neglected representation, (5) diminished alternatives, and (6) potential tokenism. First, organizational discourses promote a *fractionated understanding* of what it means to be a diverse organization, resulting in a *visible hierarchy* of difference and the sense of *false attainment* among its leadership. Among organizational members, this false attainment results in *neglected representation* for certain minorities, as well as *diminished alternatives* for organizational life and an increased level of *potential tokenism*. The present section further outlines each of these six tenants in turn.

Fractionated Understanding

The notion of diversity has become a normative reference for many organizational leaders and members when discussing racial, ethnic, and cultural equality. Diversity is exalted by nonprofit and for-profit organizations alike as being a central priority (Bunn & LaCour, 2009), key source of strength (Richard, 2000), and present-future goal (Unzueta & Binning, 2010). As a result, many organizations go out of their way to publicize the value they place upon creating and maintaining diversity via advertisements, job calls, promotional materials, and formal mission statements (Kidder et al., 2004; Kochan et al., 2003). In 2001, the United Nations Educational, Scientific and Cultural Organization (UNESCO) went as far as to declare that "cultural diversity is as necessary for humankind as biodiversity is for the nature" (par. 12).

Despite an increased value and emphasis on diversity, however, its meaning is still not clearly defined among the general public (Bell & Hartmann, 2007; Unzueta & Binning, 2009). Such ambiguity affords a broad understanding of diversity's potential role and definition: variations in age, gender, religion, nationality, marital status, economic income, education level, able-bodiedness, sexual orientation, political affiliation, or linguistic disposition, to name but a few (see Coalition for Cultural Diversity, 2010). Because of this broad range of possibilities, organizational leaders commonly focus on one potential expression of the term. Rather than embracing diversity's broad range of possibilities, they choose to extol one fractionated understanding (Mill, Pinnegar & Polunin, 2007).

Originating in the field of chemistry, the term *fractionation* initially referred to the separation of an isotope into smaller quantities (O'Neil, Clayton, & Mayeda, 1969). Fractionation has since been used as a theoretical framework to describe the subdivision of large, complex concepts within social science into smaller, more palatable ideas. Thus, by subdividing an issue like diversity into smaller parts and focusing upon only one potential understanding, organizations are able to make sense of a potentially overwhelming topic. This process has also shown to alleviate the emotional load associated with resolving controversial issues, and to facilitate a better working relationship between organizational members.

Although useful in many instances, such a fractionated approach to diversity is problematic because it inherently neglects opposing perspectives. Jenkins' (2014a, 2014b, 2014c) and Sabrina, Graham, and Jenkins' (2019) aforementioned studies of Central Community and Central Faith respectively found organizational leaders to value difference; yet as a result of their fractionated understanding, they each expressed this value exclusively through differences in race/ethnicity. This reality was evidenced via racially/ethnically diverse band members, promotional materials featuring stereotypical phenotypes, and even frequent challenges by the lead pastor of Central Community for congregational members to interact with others who "looked different" than themselves. Thus, organizational leaders within both

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Central Community and Central Faith came to overlook alternative conceptions of diversity. Such a fractionated understanding also discounted the way differing expressions of personal identity intersect with one another (i.e., intersectionality), while simultaneously creating a visible hierarchy of difference.

Visible Hierarchy

A fractionated understanding of diversity commonly results in the valuation and devaluation of particular types of difference. In the same way that organizational metaphor inherently emphasizes one insight while simultaneously deemphasizing others, an emphasis place upon one aspect of diversity simultaneously deemphasizes alternative aspects. As Hamburger and Itzhayek (1998) write: "Metaphor… determines the way people perceive, remember, and analyze information they receive. However, any single metaphor limits people's perception by blocking and distorting the information encountered… They are like people speaking in different languages" (p. 383). Hence, by focusing solely upon one understanding of diversity, organizational leaders can come to view this form of difference as being more valuable than other potential forms.

This visible hierarchy created by *the diversity paradox* typically serves to elevate visible manifestations of difference within a given organizational context. Said differently: organizational hierarchies of difference are usually based on physical and visual representations of racial/ethnic diversity (a.k.a., *marked bodies*). This emphasis on visible representations of race/ethnicity seems due, in part, to external differences being the easiest forms of diversity to observe and quantify. Phenotypical markers such as skin color and hair texture can be confirmed at a distance, in a matter of moments, and without the need for personal interaction. Alternative expressions of difference, such as nationality or linguistic disposition, are much more difficult to detect and require a greater investment of both time and energy. As a result, these unseen markers of diversity are commonly devalued within organizational discourses – or else overlooked entirely – resulting in a false sense of attainment among its leadership.

False Attainment

By communicating a fractionated and hierarchal view of diversity, organizational leaders not only tend to perpetuate a limited conception of this term, but also decrease their ability to recognize ways in which this understanding actually renders their own organization less diverse. Although a relatively equal number of men and women attended Central Community, for example, its leadership was entirely male (Jenkins, 2014a). This reality was echoed in the later study Central Faith outside Los Angeles (Santis, Graham, & Jenkins, 2019). Despite such lack of diversity, the leadership staff of both congregations remained convinced of their organizations were in fact diverse. Thus, the inability for Central Community or Central Faith to fully recognize or value alternative expressions of diversity resulted in a false sense of attainment among its organizational leaders.

Taken one step further, Jenkins (2014b, 2014c) and his colleagues (Santis, Graham, & Jenkins, 2019) observed that the diversity paradox allowed leaders to celebrate and promote their organization's one-dimensional view of diversity through promotional materials highlighting race/ethnicity. Ultimately, such a false attainment of diversity can lead to several consequences commonly faced by minority members within organizational contexts – namely that of neglected representation, diminished alternatives, and potential tokenism – each of which serve as the diversity paradox's final three tenants.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Neglected Representation

As a result of fractionated understanding, visible hierarchy, and false attainment, *the diversity paradox* can also result in neglected representation for certain minority members. Such individuals might be allowed to fully take part in the organization outwardly; however, they are often not considered part of the organization's diversity quotient. As a result, they are not valued or celebrated in the same way as visually diverse members.

Although several minority participants in Jenkins' (2014a, 2014b, 2014c) longitudinal study of Central Community desired to hear more gospel music, for instance, music choice was not an organizational discourse used to measure diversity. DeYmaz (2007), a prominent leader in the Multi-ethnic Church Movement, characterizes variations in musical style as a "hallmark" of healthy intercultural congregations. Yet according to Central Community's leadership, changes in musical rhythm, tempo, song selection, or instrument choice would not affect its level of diversity; thus, grievances against such a "minor" detail as music were neglected by leaders and other members as merely personal preference. At other times, these grievances were seen as something worse: grumbles of discontent, and an affront to the organization's superordinate goal of creating a diverse organization (see Driskill & Jenkins, 2019).

Santis, Graham, and Jenkins' (2019) observations within Central Faith found similar instances of neglected representation, as leaders overlooked calls for alternative approaches to time management by adhering to a strictly monochronic understanding. Rooted in Western society and stemming from the Industrial Revolution, a *monochronic* view of time is defined by precise and regimented scheduling. By dividing time into precise units, it becomes a tangible commodity that can be "spent" or even "wasted," hence, the adage "time is money." In contrast, a *polychronic* view of time is less rigid and more fluid. It focuses on relationships over scheduling, and is largely associated with Asian, Arabic, African, and Latin American cultures (Cohen, 2004).

Because of Central Faith's adherence to a monochronic view of time, Santis, Graham, and Jenkins (2019) found congregational members were pressured to arrive on time for church related events – especially Sunday morning services. This expectation was evidenced by a digital countdown in the sanctuary used to mark the start of each service, the repeated suggestion by organizational leaders to arrive on time, and even the strategic use of musical guests to encourage punctuality. In the end, such a narrow focus on their monochronic view of time management inhibited congregational leaders from recognizing alternative possibilities of neglected representation – namely, alternative approaches to time management.

Diminished Alternatives

Because of *the diversity paradox*'s tendency to devalue and neglect unseen markers of difference, certain minority members are often unable to express their diverse views and approaches to organizational life. Hence, the organizational emphasis Central Community and Central Faith placing on visual and physical representations of race/ethnicity not only devalued alternative understandings of difference, but also devalued alternative ways of *being* (Jenkins, 2014a). Specifically, the value these organizational leaders placed upon visual representations of race/ethnicity devalued representations of female leadership, sexual orientation, able-bodiedness, nationality and linguistic disposition, as well as age, marital status, economic income, education level, and political affiliation.

On an organizational level, other potential examples of diminished alternatives include white normative approaches to service structure and choice of sermon topics. African American and Hispanic/Latino

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

church services, for example, are usually longer in length than white church services, lasting as long as four hours (Nelson, 2005). In contrast, church services with predominately white members average a mere 65 minutes in length. In addition, African American and Hispanic/Latino church services typically focus the majority of its time on communal singing and dancing; white church services typically reserve a majority of Sunday morning for the pastor's sermon (Thumma, 2007). The choice of sermon topics also differs between predominately African American and predominately white churches. Stemming from the African slave trade and rooted in the Biblical account of Moses leading his people from bondage, African American congregations generally view salvation as the deliverance from present-day hardships and oppression: racism, financial inequality, institutional oppression, etc. Due to its emphasis on social and religious collectivism, Hispanic/Latino churches share a similar focus on the here and now. Conversely, white congregations generally view salvation as the deliverance from eternal damnation, focusing upon its spiritual and enduring dimensions in the afterlife, rather than its physical and temporal implications (Pinn, 2006).

Despite each of these potential alternatives, Jenkins (2014a, 2014b) and his colleagues (Santis, Graham, & Jenkins, 2019) found congregational discourses to be decidedly white in their approach to church processes and practices. Each service rarely lasted longer than 60 minutes. Services were also organized around the lead pastor's weekly sermon, and although the churches routinely focused on present day hardships and oppression within their local communities, organizational discourses still framed conceptions of salvation in strictly spiritual terms.

Potential Tokenism

Finally, via neglected representation and diminished alternatives, *the diversity paradox* reveals a potential danger for intercultural organizations to consign minority members to that of token status. First defined by Kanter (1977) during her study of gender representation in the workplace, *tokenism* is a perfunctory gesture toward the inclusion of minorities within an otherwise majority group or organization. Such inclusion is typically used to create an artificial façade of diversity, while averting any potential accusations of discrimination (see also Kelly, 2007).

Kanter (1993) divides the process of tokenism into three categories: *heightened visibility, assimilation*, and *exclusion*. Token individuals are often appointed to highly visible roles within an organization, yet are granted limited influence or capacity for organizational change. Due to such heightened visibility, tokens commonly experience an increased level of pressure and expectation placed upon their personal performance. Meanwhile, the uniqueness of token individuals is often overlooked by those within the dominant group, resulting in their assimilation into one collectively inferior grouping, characterized by erroneous and exaggerated stereotypes. Tokens often accept these flawed stereotypes for fear of exclusion, yet feelings of isolation and segregation are still commonplace among token individuals.

Consistent with Kanter's (1977, 1993) characterization, *the diversity paradox* reveals a risk for tokenism within intercultural contexts because of the possibility for organizational discourses to become focused upon one specific (and visibly apparent) view of diversity. For this reason, the mere presence of organizational members whom fulfill that view could be interpreted as enough to "satisfy" an organization's diversity quotient. Furthermore, these members run the risk of being made highly visible within the organization, while simultaneously granting those same members limited influence or capacity for organizational change.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Understood in yet another way, *the diversity paradox* also reveals the potential for the phenomenon of *attributional tokenism*. That is, a garish emphasis placed upon one particular trait of an organization's culture, norms or practices that promotes a desired image or appearance, while overlooking cultural norms and practices to the contrary. As a theoretical extension of tokenism, attributional tokenism does not grant any particular person or persons that of token status, but rather a particular organizational feature or characteristic.

Attributional tokenism is not limited to the notion of diversity, nor is it limited to intercultural contexts. Rather, this concept can be recontextualized to any number of organizational settings. It can pertain to any organizational quality or idiosyncrasy of an ambiguous and indefinite nature. If an organization seeks to appear "innovative," for instance, leaders and members might emphasize one inventive feature of the organization (e.g., its dynamic office design), while deemphasizing a multitude of other organizational features that remain utterly conventional (e.g., its dress code, salary schedule, hiring process, promotion procedures, management structure, advertising and growth strategies, etc.). Similarly, if an organization seeks to be perceived as "desirable," it might emphasize its high number of employee applicants, while deemphasizing its exorbitant rate of employee complaints or turnover; if an organization seeks to be perceived as "youthful," it might emphasize the young age of its CEO, while deemphasizing the elevated age of its managers and employees; and so on.

The act of attributional tokenism is not inherently negative. It could be argued that *branding*, which has become a buzzword in personal and organizational development, is a form of attributional tokenism (see Lair, Sullivan, & Cheney, 2005). Howard Schultz, for instance, highlights the specific value of *brand awareness* (i.e., the ability for a consumer to recognize a brand under differing conditions) and *attitude branding* (i.e., the ability for a brand to evoke a particular emotion or sentiment). His observations also stress the ubiquitous nature of branding in contemporary society, as well as its ability to influence everything from fitness to coffee (Daye, 2006, par. 1). During Jenkins' (2013, 2014a, 2014b, 2014c; see also Jenkins & Dillon, 2012) and his colleagues' (Santis, Graham, & Jenkins, 2019) longitudinal studies of intercultural congregations in Florida and California, however, the organizations sought to be perceived (a.k.a., branded) as "diverse." As a result, organizational leaders were able to emphasize the racial/ethnic composition of their congregations, while deemphasizing their organizations' absence of female leadership, as well as its complete lack of LGBT, disabled, international, and non-English speaking congregational members. Such a discursive move served to create a façade of increased diversity via attributional tokenism.

SOLUTIONS AND RECOMMENDATIONS

The diversity paradox highlights a need for intercultural leaders and members to recognize alternative expressions of difference. A broadened view of diversity would positively correlate with organizational leaders' and members' ability to express their unique views, perspectives, and approaches. Through a broadened understanding of diversity's potential meaning, additional alternatives for organizational life would also emerge, decreasing the probability of personal or attributional tokenism. A broadened understanding of diversity alone is not enough for lasting change, however, as the socially constructed categories of difference are ever-changing. For that reason, organizational leaders and members must also remain continuously receptive to understandings of diversity beyond those presently held by the organization and society at large. Rather than merely adopting a broadened view of diverse communities,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

intercultural organizations must employ an *ever-broadening* definition. In other words, an organizational view of what it means to be diverse must be viewed as ephemeral: fluid and ever-changing. Any formal or informal classification of terms like "diversity" must remain living documents, open to perpetual change.

In order to actualize such ever-broadening definitions, it is essential that organizational leaders and members adopt reflexive mechanisms of change (see Senge, 2006). *Reflexivity* is defined as the recursive turning-back of personal experience upon itself. Soros (1994) further characterizes the concept of reflexivity as a two-way feedback mechanism that helps shape the participants' thinking; in turn, the participants' thinking helps shape reality in a recurring loop (p. 2). Such a view of reflexivity draws obvious comparisons to the *observer effect* (Furuta, 2012) and *uncertainty principle* (Heisenberg, 1930), which illustrate the way certain measurements cannot be made without affecting the very object in question. As a theoretical physicist, however, Heisenberg dealt with external observations of complementary variables, while reflexivity deals with the role of cognition as a generative tool for observable phenomena.

Reflexivity is also embedded within – while drawing upon – our current perceptions of reality. In this sense, reflexivity is both a result and limitation of our communicative encounters with others: "Reflective understanding is an integrating process that draws upon understandings gained from the body's interaction with the world and from the accumulated wisdom of the culture" (Polkinghorne, 2004, p. 151). A researcher can only be understood in terms of those whom s/he seeks to research; those s/he seeks to research can only be understood in terms of the researcher. It is only together that we mutually specify our own conditions of existence, hence, reflexivity is "relational-in-a-context" (Steier, 1995, p. 64).

Due to its pensive and recursive nature, reflexivity is often illustrated as a set of mirrors doubling back on themselves. Like the Place of Versailles' great Hall of Mirrors, this recursive aspect of reflexivity can be visualized as an infinite set of loops that fail to reflect or generate anything beyond itself. Such recursivity has prompted certain scholars to disparage reflexivity for its narcissistic nature (e.g., Steier, 1995). Other scholars, however, have venerated reflexivity for its ability to challenge patriarchal knowledge production (Haraway, 1991) and its promise for social change (McLafferty, 1995). Pels (2000) further addresses this issue by offering a potential solution for contemporary scholars: "I…defend a view of reflexivity which I call 'one step up.' … It ties just one loop, adds one level of self-exemplification, in order to bend the rectilinear story into a curvilinear or elliptical one" (p. 3).

By nurturing this reflexive, "one step up" culture among its leaders and members, intercultural organizations can learn to reflect-in-action upon organizational practices and structures. In the end, rather than merely addressing the organizational issues highlighted by *the diversity paradox*, such reflexive mechanisms of change will ultimately provide organizational leaders and members the ability to address their own faulty assumptions about the organization's current level of diversity – or lack thereof.

FUTURE RESEARCH DIRECTIONS

Continued research on intercultural organizations is severely needed – particularly within racially/ethnically diverse congregations. The need for such research will only increase in places like the United States as its racial composition continues to diversify (US Census Bureau, 2008). Suggestions for future research include ethnographic studies of other racially/ethnically diverse congregations beyond Florida and California in order to identify additional manifestations of *the diversity paradox* – added ways in which an organizational emphasis on one potential understanding of diversity (e.g., age, gender, nationality, sexual-orientation, etc.) serves to deemphasize alternative expressions of difference.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Given that less than 8% of American congregations are intercultural (Emerson, 2008), future research should also extend this study's focus to monocultural congregations. Rather than focusing on a racial/ethnic outliers like Central Community and Central Faith, organizational communication studies are needed to examine how religious leaders and members constitute community within homogenous populations. Similarly, future organizational studies should explore faith traditions beyond Christianity alone. Indeed, nearly two-thirds of the world do not identify with the Christian religion. An estimated 21% of the world's population self-identify with Islam, 16% self-identify as "nonreligious," 14% Hinduism, 6% Buddhism, and 6% Taoism or Confucianism (Central Intelligence Agency, 2013). In light of these numbers, and fact that Islam is also the world's fastest growing religion (Zein, 2007), it is becoming increasing vital for organizational communication researchers to examine the organizational complexities surrounding race/ethnicity within other religions as well.

Additional areas for research involve the intersection of community and race/ethnicity within secular contexts. Even though the majority of Americans attend church at least once per year and more than one hundred million Americans are involved in church to some degree (Emerson, 2008), these numbers indicate that approximately two hundred million Americans are *not* involved in a religious or faith-based organization. Consequently, it is vital to explore the way community is co-constructed and maintained by racially/ethnically diverse populations within nonreligious milieu: health settings, educational institutions, governmental organizations, etc. Research within these organizations is needed to identify manifestations of *the diversity paradox* within secular contexts as well.

CONCLUSION

The diversity paradox reveals the propensity for intercultural organizations to promote one potential understanding of diversity in a way that diminishes alternative possibilities of organizational life for certain minority members. This paradox has been shown to occur in six interrelated ways. *Fractionated understanding* refers to the way organizational leaders make sense of a potentially overwhelming topic by subdividing the notion of diversity it into smaller parts and focusing upon only one potential understanding. *Visible hierarchy* refers to the increased value organizational leaders routinely place upon certain subdivisions of diversity, namely physical and visible representations of racial/ethnic difference. *False attainment* refers to the way in which leaders can become self-convinced of their organization's diversity – because of the increased value they place upon their own subdivided understanding – without ever considering the multitude of ways in which it is not. *Neglected representation* refers to the way certain minority members can be overlooked in regard to an intercultural organization's diversity quotient. *Diminished alternatives* refers to the way these members often feel unable to express their diverse views and approaches to organizational life, and *potential tokenism* refers to the risk of appointing minority members to highly visible roles within an intercultural organization in effort to create an artificial façade of diversity.

In light of the racial/ethnic inequalities that continue plague our world, it is vital that organizational leaders and members continue in their pursuit of building culturally diverse communities. Considering the ambiguous nature of diversity, however, it is equally imperative for leaders and members to remain mindful of the ways in which they seek to build those communities. Thus, *the diversity paradox* offers a theoretical understanding for how organizations can serve to stem racial/ethnic inequality in our world writ large.

KEY TERMS AND DEFINITIONS

Attributional Tokenism: A garish emphasis upon one particular trait of an organization's culture, norms, or practices that promotes a desired image or appearance, while overlooking cultural norms and practices to the contrary; a theoretical extension of *tokenism*.

Fractionation: The separation of isotopes into smaller quantities.

Marked Bodies: Physical and/or visually apparent representations of difference.

Reflexivity: The recursive turning-back of personal experience upon itself; the process of thinking about thinking.

Tokenism: A perfunctory gesture toward the inclusion of minorities in a group or organization.

White Normativity: A view of whiteness as the default culture in society; the unspoken norm.

Chapter 7
Workforce Diversity:
Gaining the Competitive Advantage

Kuda Mupepi

S. James School of Medicine, USA

Clara Mupepi
Grand Valley State University, USA

ABSTRACT

The growing acceptance of marrying across racial and ethnic lines (as reflected in US census statistics) together with the growth of demographic changes across workplaces is fueling fears among some who see their culture being threatened and react by engaging in overt discrimination. One concern regards employers having access to databases containing talented individuals who are ready to work. Their choices hinge on the abilities required to further their enterprise. Paradoxically, a business's culture's greatest strength could be its greatest weakness when not consistent with sound business strategies. Moreover, when such a culture prevents a firm from meeting competitive threats, this can lead to the firm's stagnation and ultimate demise. Diversity has never been thought of as a strategy until now. This chapter explores workforce diversity.

INTRODUCTION

Workplace diversity refers to the similarities and differences among people employed within an organization. Aspects of workplace diversity may include age, race, gender, personality, religion, sexual orientation, and education. When the coal mines closed; when the factory jobs disappeared; when Bessemer Road and Petticoat Lane and other high street businesses began taking down signs and logos; when the population started a steady decline; and when the healthcare industry was on the brink of bankruptcy; the residents of Tottenham, London, England or Hazelton, Pennsylvania, USA flocked downtown for

their annual Funfest regardless of age, race, age, gender, religion, or education (Norris and Laub, 2018). The Tottenham, London festival brings together a diverse population ranging from African, Americans, Asiatic, Caribbean, European, Hispanic, and many other peoples who claim the British Isles as their home. In Hazelton, Pennsylvania, the festival attracts all those who are fascinated with aspects of American culture including beer, wine, music, and fancy attire (Norris and Laub, 2018).

BACKGROUND INFORMATION

Symbols of the Cities

Each week, in Tottenham City, the Hotspurs Stadium on White Hart Lane hosts live national and European football/soccer matches attended by more than 100,000 fans, with millions more watching the games on television. The crowds include Africans, Asians, Indians, Pakistanis, West Indians, and native Europeans. London demographic data show the presence of minorities in the workplace and in the school system. The demand for healthcare impacts children and adults from all races and ethnic groups.

Today's youth are of a different complexion than the youth of 50 years ago. Norris and Laub (2018) show that in America, the color of non-Hispanic whites is less than 50% of the youth population in 632 of America's 3,142 counties. Most of these are in southern and coastal states. It implies that employers have a wider selection of talent. Norris and Laub suggested that by 2020, 50.2% of American children will be from today's minority groups. By 2044.5, 50.3% of Americans of all ages will be from those same groups.

Organizational Culture

In Schein (1992), organizational culture encompasses values and behaviors that contribute to the unique social and psychological environment of an organization. According to Needle (2004) organizational culture represents the collective values, beliefs and principles of organizational members and is a product of factors such as history, product, market, technology, strategy, type of employees, management style, and national culture; culture includes the organization's vision, values, norms, systems, symbols, language, assumptions, environment, location, beliefs and habits. In later research, Edgar (2013) asserted that a chronic issue in conceptualizing culture is whether to think of it as a static property of a given organization…its shared customs, beliefs norms and values and tacit assumptions or whether to think of principles as a dynamic human process of constructing shared meaning. Culture creation is one of the unique human characteristics of humans, being based on our capacity to be self-conscious and able to see ourselves and others from each other's points of view. It is this reflexive capacity of humans that makes culture possible. Schein suggested that given these human characteristics, it was then clear that culture was both a process and a state.

In Freiberg and Freiberg (2013), it is suggested that for many years companies have relied on employee surveys and gone are those days. The people doing the job need to be far more than satisfied. They essentially should be enthusiastic about the company. They must to continue to learn and improve their disposition to produce the goods demanded by the customers.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Flamholtz and Randle state that: A strong culture is that people clearly understand and can articulate. A weak culture is one that employees have difficulty defining, understanding, or explaining. Strong culture is said to exist where staff respond to stimulus because of their alignment to organizational values. Discrimination in the workplace can be viewed as signs of a weak culture where individuals possessing the brashness to effectively work are oppressed because of their race, ethnicity or gender. In such environments, strong cultures help firms to focus on integrating talent to increase productivity.

A Historical Perspective: Black Brown and White

In Conway (2005), most British people of West Indian origin were born in the United Kingdom as opposed to the West Indies themselves. Geographically Jamaica belongs to the group of islands known as the West Indies and include the Dominican Republic, Puerto Rico, Cuba and Haiti. The West Indies are a group of islands in the Caribbean called the Greater Antilles. Jamaica is the biggest of the islands and the United Kingdom Office for National Statistics estimates that in 2015, some 137,000-people born in Jamaica were resident in the UK. In Clark and Mezzofiore (2018), Jamaicans are said to have come to help rebuild Britain after the devastation of World War Two. They were invited by the UK government to lay roads, drive buses, clean hospitals and nurse the sick. Clark and Mezzofiore suggested that the Jamaican immigrants were known then as the Windrush generation -- the first of their numbers came on the Empire Windrush passenger liner in June 1948 -- they were the first large group of Caribbean migrants to arrive in the UK. The *Windrush* was nicknamed the *Banana* boat because part of its payload were bananas and other fruits from the West Indies. The West Indians came to symbolize the seismic demographic changes that took place in post-war Britain, when hundreds of thousands of people came to the United Kingdom from former British colonies, known as the Commonwealth. According to the National Statistics Office (2018), the number of Jamaican nationals is estimated to be significantly lower, at 49,000 in 2015. Today they are part of the workforce in the United Kingdom and Europe.

In contrast to the US, Africans came as slaves who possessed no assets except their intellect. In Berlin (2004) slavery in the United States was the legal institution of human chattel enslavement, primarily of Africans and African Americans, that existed in the United States of America in the 18th and 19th centuries. Slavery had been practiced in British America from early colonial days, and was legal in all Thirteen Colonies at the time of the Declaration of Independence in 1776.

The Africans enter the new world in captivity. In colonization the institution of slavery was deployed as the workforce to build the colonies. After the Emancipation 1863, the Africans were freed and have been referred to as African -Americans or Blacks (Cromwell, 2014). However, many incidents of racial conflict have been experienced since the Civil Rights 1964 Act such as the Trayvon Benjamin Martin 2012. In Robles (2012), Martin was walking back alone to the house of his father's fiancée after purchasing candy and a soft drink at a nearby convenience store. The neighborhood had suffered several robberies that year. Zimmerman, a member of the community watch, saw Martin and reported him to the Sanford Police as suspicious. Moments later, an altercation between the two individuals took place and Zimmerman fatally shot Martin in the chest.

Robles suggested that Zimmerman who could have been injured during the encounter, claimed self-defense in the confrontation, and was not charged at the time. The police said there was no evidence to refute his claim of self-defense, and that Florida's stand your ground law prohibited law-enforcement officials from arresting or charging him (Robles, 2012).

WORKFORCE DIVERSITY

Talent Is Unevenly Distributed Within the Population

Sports talent, such as in basketball or football, is unevenly distributed – either in the US or anywhere else. Bell (2017) proposed that diversity in the workplace was increasingly being embraced among US businesses. Recognition that diversity is often a foundation for innovation is gaining momentum among businesses and leaders. Bell (2017) suggested that corporations were recruiting from varied talent pools to attract potential employees from various backgrounds. Advertising showcasing diversity is also on the rise; and employers have included induction and multicultural assimilation in their training and development offerings. These courses help the workforce to transition into a more diversified workplace. On-line courses are very handy and effective in developing the knowledge and skills required in effective organization. The people doing the work can continue to learn any time rather than waiting for classroom course offerings during a semester. Mupepi Sorensen and Tenkasi (2013) argue that different strategy to organizational learning could be focused on improving the workforce's brashness to produce goods to meet demand.

Equal Opportunities Regulations

In the European Union, human rights are protected by various laws. If one's employer is a European public authority, they must follow the principles of the Human Rights Act. The Human Rights Act is based on the European Convention on Human Rights and adds protection for workers' rights and freedoms. In the US, the Civil Rights Act of 1964 frames the workforce rights and the obligation of the employers to protect the interest of employees regardless of race, color, sexual orientation, or creed. In Wright (2005), the Civil Rights Act of 1964 was recognized for being a landmark civil rights and US labor law in the United States that outlaws, discrimination based on race, color, religion, sex, or national origin. It prohibited the application of unequal voter registration requirements; the practice of racial segregation in schools; and the provision of unequal access to employment opportunities and public accommodations.

Discrimination Based on Class Divisions

Fifty years ago, in Washington DC, a historically Black township called Shaw – ten blocks from the White House – was ablaze because of racial tension. As discussed in the *Economist* (April 7-13, 2018), the spark had been lit on April 4th, 1968, by the assassination of Martin Luther King in Memphis, Tennessee. After the murder of the civil rights leader Martin Luther King, riots gripped more than 100 cities throughout the nation. President Lyndon B. Johnson set up the Kerner Commission of Inquiry to investigate the race riots. The inquiry founded that the nation was moving towards two societies—one for the Blacks (in which there was endless poverty and unemployment, because of discrimination), and one for the Whites, an explanatory contrast. Blacks were discriminated against in all facets of life including employment, education, and business. Black women, too, faced their own unique challenges of being denied equal opportunities in the workplace. There are numerous forms of discrimination—and all are forbidden under the umbrella of civil rights legislation. For example, three methods of discrimination (with regards to money lending) are:

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. **Overt Evidence of Discrimination:** Occurring when a lender blatantly discriminates on a prohibited basis;
2. **Disparate Treatment:** Occurring when there is evidence that a lender treats applicants differently based on one of the prohibited facts; and
3. **Disparate Impact:** Occurring when there is evidence that a lender applies a practice uniformly to all applicants but the practice has a discriminatory effect on a prohibited basis and is not justified by business necessity (Title VII of the Civil Rights Act of 1964).

With respect to disparate treatment, the Policy Statement provides that disparate treatment ranges from overt discrimination to subtler disparities in treatment and, importantly, does not require any demonstration that such treatment was motivated by prejudice or a conscious intention to discriminate against a person beyond the actual difference in treatment itself (Comptroller of Banks, 2010).

Accommodating Diversity

The problems confronting workforces include racism sexism and ethnocentrism. These three are the most powerful forces impacting productivity in organizations. For example, White majority people dominate organizations in North America and Europe as being superior to minority races, women, and other ethnic groups solely because they are White. Culturally they were the first landlords which gave them ample time to create real wealth as compared to the African-Americans who were only freed as slaves in 1863 with no equality in society and employment until Civil Rights Act 1964. This law prohibits unequal application of voter registration requirements, racial segregation in employment or public accommodations. The basis for workforce diversity is language. Accepting diversity means much more than being able to look at another employee whose skin is an unusual color and feeling comfortable with that employee. It can mean accepting people who dress and eat differently. Change will be necessary to the food available in cafeteria.

In the US the workforce can include adherents of the African Traditional Religions, Christians, Muslims, and Jews, among many others. Changes will be needed in conditions of service to enable the Muslims to pray privately, allow the Seventh Day Adventists to work Sunday through Friday, and so forth. Introducing pluralism workshops could be helpful. Mupepi and Mupepi (2016) suggested that items such as job specifications and job descriptions could be used in diversity workshops to emphasize how the job should be done and explain the organizational structure to understand who is who.

Age Discrimination Amidst Shifting Demographics

The Age Discrimination in Employment Act (ADEA) forbids age discrimination against people who are age 40 or older. It does not protect workers under the age of 40; although some states have laws that protect younger workers from age discrimination. It is not illegal for an employer or other covered entity to favor an older worker over a younger one, even if both workers are age 40 or older. Discrimination can occur when the victim and the person who inflicted the discrimination are both over 40 (EUAFR, 2018).

Fernandez (1991) argues that in Europe there is tremendous bias against older workers and that there are few laws to protect them. The key factors influencing demographics in Europe are its aging population and its low birth rate. In 1990 the birth rate among EC countries on average was 1.58. Only Ireland had a rate slightly above 2.1. Fernandez argues that Europeans are aging at a very fast rate compared to

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

North Americans or Australians. The US population is aging at a slower rate than other industrialized nations because immigrants gained are much younger. People have been retiring earlier for the past two decades; the average retirement age for men is 62 years. The percentage of workers retiring before age 65 rose from 62 percent in 1978 to 84 percent in 1986. The following are some of the demographics for the older population:

- In 1987, the median age of Americans was 32.7; in the year 2000, it was 36; by 2010, the median age was estimated at 39
- In 2010, 25 percent of the U.S. population was estimated at 55 years' old
- In 1890, only 2 percent of people lived to be 65 years of age; today 65 percent do.
- In 1900, 40 percent of the US population was 17 years of age and under, 3 percent was 65 years of age or older (Fernandez, 1991).

People have been retiring earlier for the past two decades; the average retirement age for men is 62 years. It implies that there will be elderly workers in the workplace in America.

Race/Color Discrimination

Race discrimination involves treating someone (an applicant or an employee) unfavorably because he/she is of a certain race or because of personal characteristics associated with race (such as hair texture, skin color, or certain facial features). Color discrimination involves treating someone unfavorably because of skin color/complexion. Race/color discrimination can also involve treating someone unfavorably because the person is married to (or is associated with) a person of a certain race or color. Discrimination can occur when the victim and the person who inflicted the discrimination are of the same race or color (EUAFR, 2018).

Discrimination and Harassment

In Spencer (2012), pluralism is a term used in philosophy, meaning doctrine of multiplicity, often used in opposition to Monism ("doctrine of unity") and Dualism ("doctrine of duality"). The term has different meanings in metaphysics, ontology, epistemology and logic. Pluralism exists in many workplaces to configure resources to minimize risk. For example, management policies are pluralistic in nature to accommodate the practices and procedures necessary to create the competitive advantage.

In the United States, the EEOC laws prohibit discrimination and harassment—practices which can include, for example, racial slurs, offensive or derogatory remarks about a person's race or color, or the display of racially-offensive symbols. Although the law doesn't prohibit simple teasing, offhand comments, or isolated incidents that are not very serious, harassment is illegal when it is so frequent or severe that it creates a hostile or offensive work environment or when it results in an adverse employment decision (such as the victim being fired or demoted). The harasser can be the victim's supervisor, a supervisor in another area, a co-worker, or someone who is not an employee of the employer (such as a client or customer).

Are Women Better Managers Than Men?

As reported in the *Department of Labor Report 2010*, Asian women and men earned more than their White, Black, and Hispanic counterparts did in 2009. Among women, Whites (with weekly earnings of $669) earned 86 percent as much as Asians did ($779); while Blacks ($582) and Hispanics ($509) earned 75 percent and 65 percent as much, respectively. By comparison, White men ($845) earned 89 percent as much as Asian men ($952); Black men ($621) earned 65 percent as much; and Hispanic men ($569), 60 percent as much.

The differences in earnings between that of women and men were widest for Whites and for Asians. White women earned 79 percent as much as their male counterparts did in 2009, while Asian women earned 82 percent as much. By comparison, Hispanic women had earnings that were 90 percent of those of their male counterparts, while Black women earned 94 percent as much as Black men did.

Across the major categories of Blacks Whites and Hispanic ethnicity, women's inflation-adjusted earnings grew significantly from 1979 to 2009. Growth in real earnings for White women, however, has outpaced that of their Black and Hispanic counterparts. Between 1979 and 2009, inflation-adjusted earnings for White women rose by 32 percent; while the growth of earnings among Black and Hispanic women was 25 percent and 18 percent, respectively. In contrast, real earnings for White men edged up by just 3 percent over the 30-year span; those for Black men showed no growth; and Hispanic men's earnings fell by 6 percent (US Department of Labor Report, 2010).

Gender and Jobs

Table 1. Distribution of women in selected science professions

Profession	Percentage of Women
Engineers	15
Physicists	18
Earth scientists	23
Chemists	32
Mathematicians	43
Biological medical scientists	53

Clancy (2018) conducted a longitudinal study in the harassment of women in selected science professions ranging from engineers to medical scientists and found that women accounted for half the United States' college-educated workforce in 2015 but only 29%of the workers in science and engineering occupations. There was rough gender parity in some science and engineering fields, but many remained disproportionately male. The study conducted by Clancy found that:

- Both sexual harassment and sexual assault were reported by more women than men---mirroring the situation in society at large.
- Women's experiences of sexual misconduct during scientific fieldwork were not just quantitatively higher but also qualitatively worse than men's. Women victims were more often targeted by

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

perpetrators above them in the hierarchy and felt they could not fight back or say so. Few individuals had any awareness of a sexual harassment policy or reporting mechanism; even fewer dared report their experiences.

- Scientists who are harassed face significant career consequences, ranging from having to make lateral career moves to not feeling safe enough to attend professional events…or even stay in the field.

The Story Is the Same

Clancy (2018) argued that too often the story was the same: a man sexually harasses a woman, the woman reports it, and she gets told that's just how it is. There are variations on this theme: women harassing women, people harassing those they don't think conform to their gender well enough, women of color receiving a toxic blend of racial and gender harassment. Clancy's research found that the following cases resulted in dismissal of the offenders:

Astronomer at the University of Berkeley California after investigations were concluded resigned in 2015. The astronomer for a decade was harassing women students. In another case, Paleoanthropologist resigned from the American Museum of Natural History in 2016 for admitting to sexual misconduct of women for many years.

The LGBT Community's Impact on Urban Business

Hofstede (1992) viewed gender differences as being cultural differences and argued that these impact roles in a group. Gender roles continue to change rapidly in most progressive countries around the world. In Raley and Lucas (2006), the LGBT activists and sociologists view LGBT community-building as a counterbalance to heterosexism, homophobia, biphobia, transphobia, sexualism, and conformist pressures that exist in the larger society. The issue of sexual orientation is an emotionally charged one; it arouses feelings like, yet very different from, those aroused by other diversity issues. Mupepi, Essila, Opoku, Mensah, and Mupepi (2018) consider sexual orientation as being a phenomenon present in all races and ethnic groups in the world, not just the United States. The discussion seeks to contrast the leadership of men, women, or those of a chosen sexual orientation, as an antecedent to the creation of situational management practices. An example of situational management is drawn from urban geography where astute leadership welcomes people of different sexual orientations bringing their intellectual capital and settling in multicultural populations such as those of San Francisco, US or London, England.

In Mupepi et al (2018), the out-of-closet practice and discussion of gender identity's underlying relation to sexual orientation is related to employers' appreciation of the paradigm shift towards embracing talent and recognizing the practicality of hiring talented people (regardless of their gender identity) in advancing organizational effectiveness and the 'bottom line' results in a successful enterprise. The practice of gender underlies sexual orientation. The discussion progresses the notion of accepting the sexual identity of men and women who choose to progress their careers. Emotional intelligence draws managerial appreciation of such inclusion's impact on managerial controls and performance. Mupepi et al. assert that top managerial positions in enterprises have been regarded as being male or female enclaves in many cultures around the globe. The trend towards reflect gender as a possible social construct continues to increase in enterprises that value diversity. Change management technology is examined to understand

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

how entrepreneurship that is exercised by women (as compared to men) can impact profitability; and to comprehend whether there are any traits attributed to any specific gender. The perspectives are applied to model an organization acquiescent to the possibility of increasing productivity in a variety of settings.

Are Gay Business People Better Entrepreneurs?

When Joel Simkhai came out of the closet at age 18, he was worried about what kind of professional future he could have as an openly gay man. "One of my problems was I thought I couldn't be as successful," Simkhai says. "That's partially because I didn't have any gay role models who were very successful and in high-profile jobs" (Lapowsky, 2018). Now, as founder and CEO of the location-based gay social network, Grindr, which has more than 4 million users in 192 countries, Simkhai has become the very example of success that he says he never had. Maclean adds: "The fact is: Sexuality remains a sensitive subject in big corporate environments, especially among C-suite executives." Recently, the *Wall Street Journal* reported that there's not even a single openly gay CEO on the Fortune 1000 list. Even those who are widely reported to be gay, including Apple's CEO Tim Cook, have never publicly admitted it—a phenomenon often referred to as "the glass closet" (Lapowsky, 2018). Faced with so much secrecy, it comes as no surprise that promising gay business leaders are finding entrepreneurship a comparatively more attractive option. Additionally, some research indicates that openly gay people might even be better suited to the job (Lapowsky, 2018).

The Hofstede model highlights three elements of diversity:

1. The first element is the presence of a set of beliefs, values, and symbols which constitute cultural components shared by an identifiable group of people.
2. The second element is the presence of an individuated culture that values individual needs and goals more than group needs and goals.
3. The third element is the presence of a collectivist culture that values group needs and goals more than individual needs and goals

What Are the Characteristics of a Successful Diverse Enterprise?

Researchers such as Kohler (1929), Von Bertalanffy (1950), Lewin (1951), and – much later – Mupepi, Tenkasi, and Sorensen (2013), suggest that nothing has more impact on successful operations than a multi-talented diverse team. Kohler (1929) made it possible to examine diversity in a group and renamed it the "holistic system"—implying the deployment of talent, technology, and explicit practices to increase productivity. In today's modern production systems, a holistic technology is an approach to IT management that is concerned with viewing and treating a complex computer system as a single entity. It embraces the talent employed to play a significant part in increasing output. In Von Bertalanffy (1950), a feature common to all living systems, including diverse groups, is asserted to be the feature of complexity. Many factors combine to produce one outcome. For example, continuous learning, improvement, assessment, and evaluation can be combined to ascertain the configurations necessary to increase output. A related principle characteristic of groups is that there is usually more than one appropriate way to reach a goal.

Spencer (2012) argued that pluralism was the multiplicity of metaphysical models of the structure and content of reality, both as it appears and as socially constructed logic dictated that it might be.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In Mupepi, Tenkasi, and Sorensen (2013), systems such as diverse groups are viewed as being dynamic processes with inherent moments of stability and change. A living system's primary objective is survival; but at some point, stability can be impossible or difficult—leading to the system's demise. Mupepi, Tenkasi, and Sorensen (2013) propound that much of the work in corporate organizations is done by small, interlocking, diverse groups representing a series of interconnected ideas.

Mupepi, Tenkasi, and Sorensen (2013) argue that the links can also be viewed as sociograms linked by stakeholders whose safeties are associated with profit maximization. For example, the management is depicted as a self-management work team made up specialists from a diverse background intent on looking after the interests of stakeholders. Other teams, such as production or sales teams, ensure that the organization produces the goods and services demanded by customers.

Multiple Languages

The British Council (2018) is an international organization focused on promoting the many facets of British culture such as the language, sports, or democratic governance of the British Isles. It implies that multiculturalism in Britain means understanding English and other languages spoken in the British Isles (see Figure 4). A great deal of ethnocentrism is centered around language. Language issues are becoming a considerable source of conflict and inefficiency in the increasingly diverse workforce throughout the world. According to Mupepi and Mupepi (2015), language makes it easy to socially construct the existence of an enterprise. Language is at the heart of any business and it makes possible the abstractions that govern people's behavior and their beliefs values and attitudes and this makes business possible within a culture. To go global implies to be able to find mutual understanding of what those abstractions mean in other languages and other cultures. Mupepi and Mupepi (2015) asserted that the as the workforce grows it will mean more people will be speaking English as a second language.

The Gaelic and Welsh languages have radio and television channels of their own audiences and listeners throughout Europe. Sports such as cricket, rugby, soccer, and tennis are pervasive on television and radio and are broadcasted in many languages such as West Indian Australian, South African, or Zimbabwean versions of the English language. This demonstrates multiculturalism, as does the diversity of places where the 4'clock (BMT) tea represents a ritual where artefacts of teapots and kettles are used to boil Earl Grey Tanganda or Lipton tea leaves. The brew has specially associated cutlery comprising tea strainers, erns, cups, sauces, teaspoons, and sugar basins – and even knitted teapot covers to keep the brew hot. The inclusion of hot cross buns or scones with butter and marmalade spread characterizes the ritual. Quintessentially British culture is a unique culture shared by many in what constitutes a fluid British Empire. For example, manufacturers of marmalade jam have not shifted drastically away from the original Paddington recipes because the traditional recipes make sense in terms of sales. Likewise, beer, tea, and coffee beverage sales notably increase during winter and during sports games.

On its 2018 website, the British Council has a brochure in which it gives voice to its position that multiculturalism in the workplace involves more than just talking in different languages. It includes the need for managers to appreciate all their customers—people who are willing to buy goods and services produced by the business. Multiculturalism means that the companies must create databases that can be exploited to increase productivity. The databases can show consumers' location and race; and the company's share of the potential market.

The databases can be utilized in creating targeted adverts for television; or for creating huge billboards on the freeways or banners/posters for display during live sports games such as for soccer matches at

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

White Hart Lane or for rugby in Arms Park Cardiff. Such advertisements can result in an upward surge in sales during a given period.

It is important to articulate that corporations rooted in the British Isles do business locally as well as globally—and that, as such, the leaders of these entities must embrace multiculturalism from all angles. Like culture itself, multiculturalism comes from many different people and can be practiced in many ways.

Metaphors for Multi-Vocal Populations Living Together

In Bell (2017), race and ethnicity are viewed as different voices representing individuals and groups in a diversified workforce –all of whom must be heard. Bell suggest that changing demographics and changing views compel organizations to appreciate diversity when making efforts to increase work output. Diversity has its roots from creation, as exemplified in the building of the Tower of Babel. The story of Babel has a common interpretation in our collective minds as being mankind's first defeat in attempting to cope with a plurality of languages. Ever since the building of this divine construction ended in a Babylonian confusion of tongues, polylingualism was viewed as being problematic and something to be prevented. In his book *La Recherche de la Langue Purfaite dans la Culture Europeenne*, Umberto Eco (1992) retraces the search for a universal language throughout European literature and tries to show the implications of this search for how Europe can cope today with its polyglot situation. In Eco's research, the story of the Tower of Babel plays a prominent part. Historically, it is the symbol of the *confusion linguarum*—a symbol of the transition from a universal language used by Adam and Eve to a melting pot of languages. After Babel, the world was doomed to live with linguistic confusion and misunderstanding. Eco questions this interpretation of the Babel story: *Pourquoi interpreter la confusion comme un Malheur?* (p. 24). He tries to show that the solution to this confusion is not to find a universal language but rather to recognize an original polylingualism. The multiplication of languages is socially positive instead of being destructive and conflictual.

An Advantage of Learning Another People's Culture

During WW2, Britain and its allied forces recruited women and men who could understand many languages, especially German and Japanese. The Mormon Church is one of the fastest-growing organizations because it sends thousands of missionaries throughout the world to propagate the Gospel. The missionaries, learning in a custom-built language school in Salt Lake City, are taught about the cultures of the places where they will be deployed. Imparting the knowledge and linguistic skills they need in the field has led to many people in distinct parts of the world embracing the Gospel and becoming baptized.

Barriers to Overcome

In Shafer (2013), barriers to diversity can include: policies and practices perceived as not valuing people over-reliance on technology and process change, under-investing in training and development, emphasizing only on cost and performance measures, restructuring without reasoning, and dragging on diversity. A company can have all the technology available but is people make the difference.

THE FOCUS OF THIS CHAPTER

The discourse presented here shows that human beings are highly gregarious animals that can reorganize themselves to suit the environment in which they draw the energy needed to grow. The problem of diversity in the workplace is primarily concerned with integration of the talent needed to progress organization. Diversity is a reality in the Western world—and certainly everywhere else. Games people play can be exploited to create customized products and services demanded locally and globally. Organizations must embrace multiculturalism to effectively increase productivity. They must create appropriate databases which can be exploited to increase market share. Multilingualism is an opportunity for different people to communicate effectively in their mother tongues. It is an advantage to learn another people's culture. It is critical to understand the problems confronting women, minorities in the workplace which include racism, sexism, and ethnocentrisms three of the most powerful forces affecting the ability of organizations to have efficient and effective enterprises.

LIMITATIONS

Life under different governments around the world is not necessarily as free as one might experience in the United Kingdom or the United States. In fluidly communist countries, freedom is a scarce commodity – even though the Cold War ended in the 1990 with the end of Michael Gorbachev's administration. In such a climate, not all organizations are ready to expand operations globally – while some are, others are quite satisfied with keeping their enterprise operating locally.

THE WAY FORWARD

High performance standards depend on having staff who are proud of the company. This is where the interests of the people doing the job comes in. In the end the long- term interests of the shareholders are damaged by giving them superficial short-term priority.

Building an Integrated Diversity Strategy Fit

Anderson and Anderson (2013) proposed that there were two important cornerstones for strategic change and these include understanding the executive's significant role in creating new business. However, announcing about a new business strategy is not enough to accomplish it. It must be executed in a way that delivers its intended business results. Anderson and Anderson posited that the creation of a fitting diversity strategy leaders must comprehend the type and scope of change their business strategy requires. The second point they make is that the mindset of the entire organization needs to be changed. The leadership must attend more thoroughly to the human dynamics at play. The organization's mindset must be shifted to perceive the talent needed to advance the enterprise. The mindset is causative. For example, it is the causal factor of behavior and more importantly business results.

An important and often avoided dimension of organizational life is the diversity of its members. Diversity includes many attributes, characteristics, and identity group memberships such as the following:

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Gender,
- Sexual orientation,
- Physical ability,
- Race,
- Age,
- Language,
- Nationality, and
- Ethnicity among other dimensions.

These identities add both potential complexity and richness to the organization's work. Ignoring these identities reduces a group's effectiveness—thus creating tensions in communications and reducing access to member resources.

Given their potential value to the organization, diversity awareness models should be explored and implemented to increase productivity. When worked effectively, differences among people 'in the room' can be the substantive basis for an opportunity for profound learning for all present. There are several theories of diversity, including the Dimensions of Diversity or Path to Competencies, which future research could explore.

Flamholtz and Randle (2014) state that: A strong culture is that people clearly understand and can articulate. A weak culture is one that employees have difficulty defining, understanding, or explaining. Strong culture is said to exist where staff respond to stimulus because of their alignment to organizational values. Discrimination in the workplace can be viewed as signs of a weak culture where individuals possessing the brashness to effectively are oppressed because of their race, ethnicity or gender. In such environments, strong cultures help firms to focus on increasing productivity.

The formulation and implementation how human practices and procedures and how a workforce can develop positive attitudes about their co-workers. Racism sexism and ethnocentrism can be nurtured by the entire organizations using the technology of positive scholarship to advance organizational culture.

CONCLUSION

According to population dynamics in the US and UK, future organizations will be more diverse than those of ten years ago. Cultural difference represents a major form of diversity in a group. Groups of the future will continue to be increasingly more multicultural than before. Organizations should view diversity as an opportunity to maximize output by producing goods and services needed by specific consumers in the market.

KEY TERMS AND DEFINITIONS

Change in Complexion: Change in complexion in humans is the changes in natural color, texture, and appearance of the skin, especially on the face.

Cultural Diversity: Cultural diversity is the quality of diverse or diverse cultures, as opposed to monoculture, the global monoculture, or a homogenization of cultures, akin to cultural decay.

Demographic Changes: Demographics are the quantifiable statistics of a given population. Changes such as the numbers of females or males categorized in age groups characterize the populations of any given geographic region.

Ethnicity: The state of belonging to a social group that has a common national or cultural tradition.

Ethnocentrisms: Cultural ideologies that characterize dominant race men and specific ethnic groups as being inherently superior to minority races, women, and other ethnic groups.

Multiculturalism: The presence of several distinct cultural or ethnic groups within a society or organization.

Polylingualism: Polylingual implies multiculturalism expressed in the ability to use several languages.

Windrush Generation: The West Indians who arrived in the United Kingdom in 1948 to reconstruct war-torn cities and work in the healthcare transportation and hotel and catering industries.

Workforce Diversity: The similarities and differences among people employed within an organization. Aspects of workplace diversity may include age, race, gender, personality, religion, sexual orientation, and education.

Chapter 8
Diversity Management Interventions for Enhancing Competitive Advantage: A Synthesis of Current Research and Literature

Alamuri Surya Narayana
Osmania University, India

ABSTRACT

Diversity and diversity management is a new organizational paradigm and a business imperative. We already have a vast and rich literature base on these two. Many and varied empirical findings are also available from earlier qualitative and quantitative research studies. An attempt is made in this chapter (1) to examine various theoretical concepts and constructs used in diversity and diversity management, (2) to come up with a synthesis of management research and current literature on diversity and diversity management, (3) to develop a theoretical framework, and (4) to suggest directions for future research as well. This chapter lists some of the challenges faced by firms, the major issues to be addressed, potential research directions, and themes in the Indian context before finally coming up with a conceptual model detailing the antecedents and consequences of diversity and diversity management.

INTRODUCTION

In the face of the global meltdown, focus has shifted from expansion to consolidation. The organizations have concentrated on quality of hires instead of their number. This has revealed the shortage of talent in many regions. The hunt for talent has transcended the regional and national boundaries. The firms with a multi-racial, multi-ethnic, and multi-cultural work force have to tune themselves to the workforce diversity. They have to galvanize the diverse work force to a cohesive productive force to align with their organizational culture. Astounding progress of internet, coupled with fast communication system

has brought the world close geographically. Despite geographical proximity, cultures prevalent in various parts of the world with divergence in individual orientation, tastes and preferences, attitudes and philosophies towards life and contrasting life styles have posed serious problems in integration of the varied and different national cultures with one organization culture.

Diversity of workforce means inclusion of people with different human qualities and from different cultural groups. Dimensions of diversity are both primary, such as age, gender, and race, and secondary, such as education, marital status, and income. Acceptance of diversity is becoming important because of socioeconomic changes and the changing workforce. Increasing diversity means that organizations must develop programs to deal with global as well as domestic diversity and with potential conflicts that arise. Two recent approaches to supporting and leveraging the power of diversity are *multicultural teams* and *employee network groups*. Many companies are now finding innovative ways to integrate diversity initiatives into their business. The list of HR initiatives that MNCs can use to manage workplace diversity is quite long and varied and their HR Managers need to understand the phenomenon of diversity and its causes and consequences before they effectively deal with the challenges through different organizational approaches and responses. They are required to create an environment that welcomes and values diverse employees in an effort to enhance the competitiveness of firms.

Effective management of a diverse workforce through appropriate interventions is critical for organizations that seek to obtain, improve, and maintain their competitive advantage. To celebrate diversity is to appreciate and value individual differences. This point became increasingly apparent and was also amply established through various research studies in the last two decades. It is not just a nice idea to focus on diversity and look for more and more ways to make an organization truly inclusive in its character. After all, it pays to make full use of the contributions of all employees. It is also good business sense as it definitely yields a competitive edge through greater overall organizational productivity. Diversity awareness training helps people become aware of their own cultural boundaries and prejudices besides learning to communicate with people from their cultural contexts.

It is no exaggeration to state that diversity has evolved from being *important* and the *correct thing* to do to being the *essential thing* to do as an imperative over the years. Progressive firms think of a company restructuring, an expansion, a merger, a corporate takeover, or any other similar episodic event in very highly businesslike manner. Diversity issues are no exception to this list and are expected to be addressed in the same manner before coming up with realistic action plans and solutions.

Building the business case for diversity in any given company will necessarily vary, but in general it can be stated in two compelling arguments: (i) For both large MNCs and small companies these days, the neighborhood in which they sell is the entire world, so it is essential that their workforces look and think like the world, in all of its ethnic, racial, and behavioral variety and (2) The demographics of almost every nation are changing so dramatically that over the coming decades it will be impossible for employers to fill their ranks with members of the traditional workforce. Diversity and diversity management is a new organizational paradigm. There is already a vast and rich literature base as well as empirical findings that are available from earlier qualitative and quantitative research studies.

In this context, an attempt is made in this Book Chapter (i) to examine various theoretical concepts and constructs used in diversity and diversity management (ii) to come up with a synthesis of management research and current literature on viz., diversity and diversity management, (iii) to develop a theoretical framework, and (iv) to suggest directions for future research as well.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

DIVERSITY: CONCEPT AND MEANING

Diversity refers to differences among members of the group or organization on any characteristic. Diversity offers many benefits and organizations lose no opportunity to invest their resources in taking advantage of them. They do this strategically only to outperform their rivals who may fail to make such wise investments. Translating diversity into positive results requires its managers to focus on building and shaping an organizational culture. It also calls for suitable HR practices, the necessary supporting managerial competencies, and appropriate skills in group processes to derive benefits at the level of the organization, the work group, and the individual.

Today, we are in a position to make a persuasive business case for diversity. Moreover, available research evidence also suggests that there are few direct positive or negative effects of diversity on business performance in terms of productivity, quality of work life, and the bottom line. Some researchers even suggested that a more "nuanced" view of the business case for diversity may be more appropriate. Of late, in Human Resource Management (HRM) domain, diversity has assumed a top priority and a dominant theme for several reasons. They are as follows:

- Globalization of markets for most of the products and services.
- A perceptible shift from primarily manufacturing to a service economy.
- Increasing incidence of Mergers and Acquisitions that demand the synthesis of different corporate cultures.
- Formulation of newer business strategies requiring more teamwork.
- Ever evolving and changing labor market.

Diversity: Some Definitions

Kreitz defined diversity as "any significant difference that distinguishes one individual from another, covering a wide variety of factors that might be obvious to other individuals or hidden under the surface." One perspective argues that diversity results in better group functioning, group cohesion, and also in better team, group, and organizational performance. And then the other perspective argues that diversity results in conflict and collision.

As per Robbins, Judge and Vohra (2013), there are different bases of diversity such as age, sex, race, gender, ethnicity, religion, disability status, sexual orientation. While these demographic characteristics constitute *surface-level* diversity, others like personality, attitudes, and values represent *deep-level* diversity. Diversity is complex as it includes both (i) explicit and observable biographical characteristics and (ii) implicit factors that are within the individuals and not explicitly expressed. Diversity, therefore, is a wide, varied, and a manifold construct because there are different forms of diversity such as (i) Customer diversity, (ii) Supplier diversity, (iii) Diversity in the composition of the Board of Directors (BoD), and also (iv) Workforce diversity. It may be remembered here that diversity in organizations does not always bring about positive outcomes. Researchers have drawn on social categorization theory (Tajfel & Turner) and similarity-attraction paradigm (Byrne) to suggest the negative effect of diversity via such processes as conflict and reduced cohesiveness (as cited in Olsen & Martins, 2012). Hence, diversity has mixed consequences or repercussions in organizational functioning.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Diversity vs. Concepts of Inclusion and 'Field'

Another construct similar to diversity is *inclusion*. Shore *et al.,* (2011) argue that the construct of inclusion has remained nascent without consensus on the nature of this construct or its theoretical underpinnings. Building on Brewers' Optimal Distinctiveness Theory (ODT), they define inclusion as the degree to which an employee perceives that he or she is an esteemed member of the work group through experiencing treatment that satisfies his or her needs for belongingness and uniqueness. For the distinction between these two, Robertson (2006) suggests that they may not describe separate types of work environment but different approaches to Diversity Management (DM). As a corollary, though diversity and inclusion are used as two distinct concepts, benefits from the two might however be similar.

Diversity and DM draw support from Bourdieu's concept of "field" where fields are "contested terrains" in which actors compete for appropriation of different forms of capital (Tatli & Ozbilgin, 2012). Further, according to them, relating this line of argument of Bourdieuan concept of capitals into the study of workforce diversity is based on the premise that limitations of the dominant *etic* approaches in the current diversity research can be overcome by using the emic approach suggested by Bourdieu. Hence, they propose *emic (ex post)* approach to researching diversity at work than focusing only on pre-established (ex-ante) or *etic approach* to workforce diversity. *Emic* perspective identifies emergent and situational categories of diversity, as embedded in specific time and place. However, there are few research studies which have tried to operationalize diversity using the *emic* approach (Tatli, 2011).

This suggests that situational antecedents to diversity relatively need more exploration than other antecedents. While suggesting different approaches to diversity, Podsiadlowski *et al.,* (2013) contend that diversity strategy, diversity orientation, and diversity perspective are often used synonymously. Moreover, strategic response to diversity can be episodic, freestanding, or systemic (Dass & Parker, 1999) or can range from "not doing anything" to having a full blown diversity strategy that integrates various interventions into an organization-wide general framework (Bhawuk, Podsiadlowski, Graf & Triandis, as cited in Podsiadkiwski, et al., 2013).

DIFFERENT APPROACHES TO DIVERSITY MANAGEMENT IN THEORY AND RESEARCH

As there are different concepts of diversity, so are there different concepts of Diversity Management (DM). DM has been a subject of popular discourse for management practitioners ever since it was started first in 1980s. DM has remained prime agenda in the twenty first century as today's organizations are required to deal with diverse workforce more than ever before. Effective DM allows organizations to get access to the widest possible pool of skills, abilities, and ideas. DM has been defined as "enabling every member of the workforce to perform his or her potential" (R.R. Thomas, as cited in Olsen & Martins, 2012).

Cox defines DM as the sum of organizational practices for managing people to maximize potential advantages and as policies for recruiting and retaining talent from different backgrounds (Cox & Blake, as cited in Podsiadlowski et al., 2013).

Olsen and Martins (2012) defined Diversity Management broadly as "the utilization of Human Resource (HR) Management practices to (1) increase or maintain the variation in human capital on some given dimension(s), and/or (2) ensure that variation in human capital on some given dimension(s) does not hinder the achievement of organizational objectives, and/or (3) ensure that variation in human capital

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

on some given dimension(s) facilitates the achievement of organizational objectives." In this definition, though the focus is on demographic characteristics, they are taken as a proxy for other deeper level diversity.

White (as cited in Ollapally & Bhatnagar, 2009) uses a metaphor and defines DM as "creating a level playing field"—an environment where each individual has the same opportunity to score.

Cox and Beale (as cited in Curtis & Dreachslin, 2008) conceptualized DM as a three-stage developmental process: awareness, understanding, and action. They argue that action or behaviors are required to translate awareness to reality ranging from diversity training, education, mentoring, and Organizational Development (OD) activities. DM interventions have been found to affect outcomes at the individual, group, and the organizational level.

Bassett-Jones (2005) defined Diversity Management as "the systematic and planned commitment on the part of organizations to recruit and retain employees with diverse backgrounds and abilities."

Current Corporate Approaches to Diversity

In order to effectively manage workplace diversity, a HR Manager of an MNC needs to change from an ethnocentric view ("our way is the best way") to a culturally relative perspective ("let's take the best of a variety of ways"). This paradigm shift in philosophy has to be very much ingrained in the managerial framework of the HR Manager in his/her managerial and operative functions performed towards the organization's diverse human resources. The role of the HR manager must parallel the needs of the changing situations in businesses. Successful organizations are becoming more adaptable, resilient, quick to change direction, and customer-centric. Currently, MNCs face a three-fold challenge while dealing with workplace diversity.

1. Enable the heterogeneous workforce to work together harmoniously toward their common goals
2. Maximize the contributions of each member of what is in fact a large team. And,
3. Ensure fair treatment for all, irrespective of their background.

Today's MNCs are searching for inclusive practices that go well beyond affirmative action to confront the obstacles that prevent women and minorities from advancing to senior management positions. In addition, to prepare for and respond to an increasingly diverse business climate, managers in most companies are expanding the organization's emphasis on diversity beyond race and gender to consider such factors as ethnicity, age, physical ability, religion, and sexual orientation. Once managers create and define a vision for a diverse workplace, they can analyze and assess the current culture and systems within the organization. Actions to develop an inclusive workplace that values and respects all people include three major steps: (a) building a corporate culture that values diversity; (b) changing structures, policies, and systems to support diversity; and (c) providing diversity awareness training.

The underlying culture of an organization should change or else, all the other efforts to support diversity will fail. Companies are addressing this issue by using surveys, interviews, and focus groups to identify how the cultural values affect other groups. Others can set up structured networks of people of color, women, and other minority groups to explore the issues they face in the workplace and to recommend changes to senior management. Organizations' policies designed to fit the stereotypical male employee should be changed. For example, a good way to revitalize the recruiting process is for the company to examine employee demographics, the composition of the employee pool in the area, and the composition of the customer base before working toward reflecting the same in the latter.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

One of the most successful structures to accomplish elimination of glass ceiling is the mentoring relationship, wherein a mentor, a highly ranking, senior organizational member is committed to providing upward mobility and support to a *protégé's* professional career. Many organizations are struggling with generational diversity, striving to meet the needs of employees at different ages and life cycles. Changing organizational structures and policies is important because it demonstrates a concrete commitment to supporting diversity. If managers talk about the value of diverse workforce but do nothing to ensure that ensure diverse employees have opportunities and support in the workplace, employees are not likely to trust that the company truly values diversity.

Diversity Management as a Pragmatic Business Strategy

Over the past two decades DM has become a major competitive factor for many companies and even something they are proud of. Yet others remain to be convinced. They want the business justification for diversity to be sound and demonstrable. To do that, it's necessary to address at least five major issues. They are: how does diversity (i) help an organization expand into global markets, (ii) help build brand equity, (iii) support the organization's human asset/resource strategies, (iv) build corporate image among our consumers, and (iv) enhance operational efficiency? In an equitable work environment, no member or group of members of an organization should have an undue advantage or unfair disadvantage.

The essence of diversity management is establishment of a heterogeneous employee force and making it to perform to its maximum potential. Any business strategy would become pragmatic only when it meets the needs of the diverse consumer/customer groups by focusing on maximizing the creativity, commitment, and productivity of the employee force. Diversity Management is a pragmatic business strategy that focuses on maximizing the productivity, creativity, and commitment of the workforce while meeting the needs of diverse consumer groups. However, overall challenge is to create a work setting where in everyone would be performing to his full potential in the long-run. It is a situation where all employees would be competing for incentives, rewards, and promotions only on the basis of merit alone. An examination of the factors that have contributed significantly for the effective management and successful performance of companies at once reveals that such organizations do the following much better than the rest. They are as follows:

- They purposefully focus on attracting and brining in the best possible talent.
- They are not interested in just meeting the numerical goals.
- They believe in establishment of mentoring programs among employees of same and different races as well.
- They ensure that management is held accountable for meeting all diversity-related goals.
- They conceptualize, design, and develop career plans for employees as part of their performance reviews.
- They consciously make it a point to promote women and minorities to important and significant decision-making positions in the organizations instead of confining or relegating them to mere staff jobs.
- They even go to the extent of making the composition of the Board of Directors also highly diverse.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

These are all the compelling reasons for making the workforce diverse and managing it. They all represent sound business principles and have the potential to contribute to the shareholder value and make it more and ever increasing.

Diversity and Linking HR Practices to Business Practices

An organization's capacity to learn as to how to manage diversity effectively gets stunted and limited should it fail to link HR practices to business performance. Any company's claims for diversity as a strategic imperative would remain hollow and shallow if it doesn't justify the same through suitable supporting financial investments. There are many factors that affect the relationship between diversity and measurable business outcomes. This is precisely the reason for the difficulty in identifying and establishing a simple and direct cause-effect relationship between these two. Diversity can always be made as an input and a resource for learning, change, and organizational renewal. However, managers attempting it are bound to face challenges and experience difficulties in their efforts in this direction. To surmount these impediments, HR managers need to promote cultures of mutual learning and cooperation among the members of the employee force with the help of enabling management practices. Maximizing the overall returns to shareholders i.e., increases in stock prices as well as in dividends continues to remain the basic objective of profit-making businesses. Company earnings have a direct bearing on this objective. In this context, management has to determine the degree to which diversity interventions, like any other management programs, do impact the bottom line.

In reality, organizations, however, have a tendency to measure the success of such programs not by looking at the bottom line but by watching other indicators. Diversity awareness and implementation initiatives like affirmative action programs definitely entail costs but with *no* or *little* financial benefits to the company that commensurate with the expenditure making the critics to strongly oppose them. For this reason, they can be justified only on moral or philosophical grounds.

A SYNTHESIS OF MANAGEMENT RESEARCH AND CURRENT LITERATURE ON DIVERSITY AND DIVERSITY MANAGEMENT

From the time the concept was popularized, the process of conceptualizing and coming up with a generic model monopolized the interest of scholars for a very long time. Diversity as a concept, by and large, has a strong theoretical root in various related concepts giving different perspectives about it. Diversity and Diversity Management concepts were found to have evolved and expanded overtime. Lorbiecki and Jack (2000) identified four major overlapping turns in ideas of DM labeled as demographic, political, economic, and critical. And each turn represents a shift in the way thinking gets changed about DM. Historical evolution of DM can be traced through the report "Workforce 2000" prepared by Johnson and Packer in 1987. They indicated that by 2000 North American workforce would comprise of African-Americans, Hispanics, Native Americans, women, and other minority groups. Triggered by this news, organizations and academicians started taking note of the changing demographic situation to consider the effect of demographic in the workplace.

Konrad (2003) reviewed six articles on workforce diversity and suggested that diversity in the workforce is an extension of Heider's Balance Theory. He even argued that balancing among conflicting

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

parties cannot be attained until the individuals sharing important identity group memberships achieve supportive relationships among themselves.

Resource-based Theory is concerned with performance heterogeneity among organizations based on variety of resources: physical capital, financial capital, human capital, and corporate capital. It is also suggested (Richard, 2000; Richard, Barnett, Dwyer, & Chadwick, 2004) that diversity can be valuable, rare, and inimitable resource that enhances a firm's competitiveness (as cited in Yang & Konrad, 2011). They provided empirical evidence that racial diversity and cultural diversity are positively related with financial performance. It was found that firm with more diversity management practices witnessed less turnover and more innovation. Resource-based Theory is concerned with firms' competitive advantage. So, dynamic DM programs and policies can be a competitive asset for a firm which is difficult to copy and hence ensure sustained competitiveness. Organizations are likely to adopt workforce diversity management practices for social legitimacy and to gain resources needed for survival as per Institutional Theory perspective which is concerned with firms' homogeneity. The theory, in itself, comprises of regulative forces, normative forces, and cognitive forces promoting or ensuring homogeneity and act as antecedents for diversity and Diversity Management.

Person-Organization Fit Theory is yet another theoretical perspective for diversity. It is concerned with the congruence between individuals' values, beliefs and personal characteristics on one side and those of the organization on the other side. Generally, women and minorities would perceive organizations to be very attractive employers if they provide opportunities and a work environment that is free from discrimination. This feeling is in consonance with the literature available on Person-Organization Fit Theory.

Olsen and Martins (2012) theorized diversity from value perspective. Some organizations treat DM as an instrumental value as it is responsible for achieving favorable business outcomes. It becomes a terminal value for organizations that view diverse workforce itself as an objective and an end result. The value-in-diversity perspective argues that diverse workforce is generally beneficial for business. The benefits include but are not limited to corporate profits and earnings. The dynamics of labor and consumer markets were altering because of demographic changes and this became a crucial argument in favor of diversity programs.

Inclusive philosophy was seen as an attractive alternative to affirmative action initiating the political turn. Affirmative action former was designed as a temporary measure to redress past discrimination and was eventually got replaced by DM. The political interest turned 'economic' through various articles that were published warned organizations that the performance and image of the organization would be in jeopardy if they did not pay immediate attention to manage diversity.

The domain of DM turned critical when problems were encountered in its implementation. For instance, Gilbert, Stead, and Ivancevich (1999) argued that negative perception combined with poor implementation at the organizational level has resulted in more ineffective and unjust society and not due to the goal of affirmative action to ensure equal opportunities for all. They also proposed a Model for effective Diversity Management. They contend that the CEO's initiation of diversity movement and its continuation as a prerequisite for effective DM. They believed that it would finally lead to and result in transformation of HR functions (mentoring, recruitment, friendly policies, diversity councils and more), individual level outcome (integration, organizational attachment, and psychological dissonance), and positive attitudes towards diversity (acceptance, appreciation of differences, and multiculturalism).

This would benefit the organization in terms of better decision making, representation of qualified minorities, retention of qualified minorities, business with diverse and multinational customer base,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and product line development. It is contended that the above stated benefits would be instrumental in achieving positive organizational outcomes (profit, market share, stock price), and public recognition.

Today, diversity has been conceptualized with different terminologies providing a modified and an expanded view. The expansion was guided more by the need of the time rather than any other thing. The rhetoric of diversity has been shifted from affirmative action to DM. Of late, the focus of DM has been shifted towards inclusion. The aspects of inclusion demand organization to reduce problems associated with demographic diversity and create environment such that individuals from all background are fairly treated, valued, and included in decision-making (Nishii, 2013).

It is the essence of decision making that makes the concept of inclusion totally different in the context of DM. Prior to that, DM was concerned only with treating each employee fairly and equitably by choice rather than compulsion. Inclusion, as a new concept or as an expansion of DM concept, focused on all aspects associated with DM with additional decision-making feature.

Bassett-Jones (2005) in their conceptual analysis included range of factors associated with diversity. This might include a range of differences in ethnicity, nationality, gender, functions, ability, language, religion, lifestyle, tenure, culture, or intellectual capacities.

In its primitive form diversity in the organization was concerned with demographic aspects but globalization and organizational complexities have enhanced the domain of diversity from mere demographic to cultural diversity.

Prasad and Mills (1997) argued that the notion that traditional monoculture organizations cannot function effectively in the context of today's and tomorrow's workforce and has embedded the same within the philosophy of managing diversity.

They broadly conceptualized diversity as a corporate asset that contributes indirectly towards the performance of the organization. The authors viewed that the concept of diversity signifies different things to different groups and individuals within organizations and society. For some, diversity means demographic representation and for others, it may involve overcoming cultural prejudice and instilling new values about difference in the organization.

Kersten (2000) argued that racial equality through DM differs from previous approaches to discrimination in four aspects. First one advocates for systematic transformation of organization by changing the culture in such a way that it becomes an open, welcome, and supportive environment for all people. Second approach is concerned with the presentation of diversity which advocates it as positive and voluntary effort on the part of organization rather than negative and external mandated. As per the third aspect, difference is justified with economic rather than legal arguments. Lastly, diversity is defined in the form of inclusive definition in which any and all differences are considered as part of the diversity project.

Majority of the conceptual work concerning diversity was more towards labeling diversity as necessity rather than choice by generating positive outcomes. Many scholars viewed diversity and its management in the workplace as valuable assets for sustained competitive advantage. Contrary to these conceptualizations, Lorbiecki and Jack (2000) argued that DM initiatives have increased rather than decreased inequalities. They emphasized the need to get involved in more critical and reflexive debate before theorizing diversity in a philosophically and socio-politically different manner.

There isn't one single best way for DM in the workplace. The approach of the organization towards diversity depends on the degree of pressure for diversity, the type of diversity in question, and managerial attitudes. In the larger context, the practice of diversity is more guided by legal compliance rather than choice. So, people from disadvantaged groups act as diversity champions. DM is similar to marketing for

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

many organizations. Organizations with global presence tend to promote and preserve diversity within their organizations by appealing towards larger stakeholders including customers.

The general understanding that can be derived from the conceptual review will be that planned and systematic diversity management can yield positive outcomes for the organization. One should not be involved in affirmative action in the name of diversity. Such actions would discourage qualified and capable pool of candidates from entering the organization. DM can also be an indicator of economic condition for organization and to a large extent for the nation. Diversity movement emerged from developed economies and the effort helped them achieve the greater global market share.

India, as a nation is still struggling with the affirmative action perspective of diversity, providing quota for diverse population, and ensuring their representation. In doing so, representation from political to organizational level is more guided by constitutional requirement and such representation was found to be less meaningful.

RESEARCH STUDIES ON GENDER, AGE, AND RACE AS THE BASES OF DIVERSITY

Gender

Among other forms of diversity at the surface level, *gender* has been associated with positive outcomes. If we look into the vast and varied literature that is available on diversity, compared to other bases of diversity, gender as a basis looms large and figures out to be more prominent than others. Gender as a base for diversity has garnered worldwide attention as the number of females joining the workforce has increased significantly in the current era compared to the earlier times. Most researches have examined as to how the inclusion of female workforce in the BOD has resulted in increased financial performance (Campbell & Vera, 2007). However, not all the studies suggest consistent findings with gender and firms' performance. Dwyer, Richard, and Chadwick (2003) posit that the effect of gender diversity at the management level is moderated by a firm's strategic orientation and organizational culture in which it resides. Hence, they suggest that a supportive environment needs to be put in place to reap the benefits of gender diversity.

In similar lines, Smith, Smith, and Verner (2006) found that proportion of women in top management jobs had positive effect on firm's performance while keeping firm's other characteristics constant. Of course, the positive effects, however, depend on the qualification of female top managers. Francoeur, Labelle, and Desgagne (2008) found that firms operating in complex environments generated exceptionally positive and unusually significant returns when they have higher proportion of women officers in the employee force. Though women in positions of directors made no difference but women working in management and governance system generated enough value to keep up with stock market returns.

All the research studies provide consistent findings with regard to effect of gender and performance though these effects cannot be measured in isolation. Hence, possible role of moderating variables must be taken into account.

Cumming, Leung, and Rui (2015) studied the impact of gender diversity and securities fraud and found that the former can reduce the likelihood and severity of fraud.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Effect of gender diversity was compared across full samples in male-dominated and female dominated industries and found that the presence of women was more effective in reducing frequency and severity of fraud in male dominated industries.

Research on gender has explored whether gender has made progress with regard to management and leadership over a period of time (Broadbridge & Simpson, 2011; Embry, Padgett, & Caldwell, 2008). Braodbridge and Simpson (2011) in their purely conceptual paper discuss how gender over the period of 25 years to the current stage has now reduced to gender denial and gender concealment. This has led to both disadvantage and privilege. Embry, Padgett, and Caldwell (2008) found that men using *gender inconsistent* (feminine) style were evaluated more positively than men using a *gender consistent* style. In addition, a perceived female leader who used a gender-inconsistent (masculine) style was evaluated more positively than a perceived male leader who used a masculine style, but only by female participants.

Another study by Powell, Butterfield, and Parent (2002), suggested that though there has been a significant increase in the proportion of women managers, there was no significant change in the perception of women managers and leaders. A good manager is considered as predominantly masculine. Atwater, Brett, Waldman, DiMare, and Hayden (2004) found that some sub-roles were found to be more masculine while others were found to be more feminine.

Allocating resources, networking, problem-solving delegation, and strategic decision making would be perceived as more masculine, while supporting and consulting others were perceived as more feminine. Additionally, male respondents saw most sub-roles as masculine than female respondents.

Nishii (2013) found that within inclusive climates, interpersonal bias is reduced in a way that gender diversity is associated with lower levels of conflicts. All these research studies on gender and management, or gender and leadership suggest that these are largely influenced by stereotypes or perceptions.

The purpose of postmodernism is to make us aware about the connections among meaning, power and language, and that constructivist view of gender theorizing in contemporary psychology reveals gender as a continuum of psychological differences (Hare-Mustin & Marecek, 1988). Constructivist view challenge an idea of single meaning of reality and concern themselves with the way meaning is represented. Gender has its theoretical root in many other theories. Sex role theory explains gender pattern by appealing to the social expectations that define proper behavior for women and men. This theory has been criticized on the ground of intellectual weakness as it does not consider the issue of power, violence, or material inequality, misses the complexities within masculinity and femininity and that it offers very limited opportunities for change.

Categorical theory treats women and men as pre-formed categories. This approach though it addresses the issue of power, does not consider gender complexities. Feminist Theory has often been critical of naturalistic explanations of sex and sexuality that assume that the meaning of women's social existence can be derived from some fact of their physiology and distinguished sex from gender, feminist theorists have disputed causal explanations that assume that sex dictates or necessitates certain social meanings for women's experience (Butler, 1988). Masculinity refers to male bodies but is not determined by male biology and thus it is perfectly logical to term masculine women.

Masculinity studies view gender as unstable and fluid whereas feminist perspective views gender as a social practice that involves creation, negotiation and maintenance of difference in specific social and institutional context that created ground for conceptualization of gender identities (Broad Bridge & Simpson, 201). Most of the quantitative research approaches to gender and performance have used correlations, descriptive statistics, and regressions to study the impact of gender diversity on organizational

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

level outcomes (Dwyer, Richard, and Chadwick, 2003; Smith, Smith, and Verner, 2006; Francoeur, Labelle, & Desgagne, 2008).

Cumming, Leung, and Rui (2015) employed robust measures to study the impact of gender diversity and security fraud. They used control firm approach to create group of control firms (non-fraud firm). They came up with empirical models to test their hypotheses while controlling firms' characteristics like age and governance factors. They took 742 control firms out of a sample of 1484. Logistic regression was employed with two stage estimates of determinants of fraud. The findings were subjected to robustness by bootstrap technique. They also addressed the endogeneity between likelihood of fraud and number of female directors on board.

Age

Apart from gender, age is also one of the demographic measures of diversity. Kunze, Boehm, and Bruch (2011) examined the effect of age diversity and age discrimination climate on performance. They found that age diversity seems to be related to the emergence of an age discrimination climate in the organizations, which negatively impacts the overall performance. Sluiter (2006) argued that in high-demand jobs which can be physical, mental, or psychological in their origin are more likely to overtax the capacities of older workers than those of younger workers. This calls for a shift from 'no diversity thinking' to 'diversity thinking' in the context of deciding about the work ability of ageing workers in high-demand jobs.

Contrary to that Walker (2005) proposed that promoting age diversity and providing an environment in which each individual is able to achieve his or her potential without being disadvantaged by their age should be the policy and that employees should not be discriminated by their age. Limited work on age has contradictory findings which place sufficient doubt over age as probable researchable construct that would be of interest to researcher.

Riach (2009) put forward and interesting argument in regard to considering old workforce as diverse and found that there is difficultly in translating age diversity as an abstract managerial concept into policies and practices. Moreover, particularly age and gender has been taken as control variables in majority of the studies that has diminished its actual relevance as a potential variable of interest. More studies taking age and gender as influential variables in the studies would increase its relevance and expand its domain. The conceptual work on the area of diversity needs to be backed by sufficient empirical studies, mostly quantitative, in order to validate the conceptualization under this theme.

Race

Herring (2009) has identified racial diversity to be associated with increased sales revenue, more customers, greater market share, and greater relative profit. Avery, Mckay, Wilson, and Tonidandel (2007) studied whether racial discrimination is associated with absenteeism. They found that underprivileged group within a given race tends to be more absent than the privileged one. And it was more significant on two occasions: first, when the supervisor is racially similar and second, when diversity has no value in the organization. Paug, Dietz, Brief, and Wiley (2008) found that when few racial minorities live in the community within an organization's periphery, workforce diversity has an impact on employees' diversity climate perceptions. Whenever the share of minorities increased, the workforce diversity loses its significance. Richard (2000) studied the interface between racial diversity and business strategy and found that it is important in determining firm performance measured in three different ways viz.,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

productivity, return on equity, and market performance. Like age and gender, the association of racial diversity has been studied with more of the hard measures of performance than others.

Diversity as the Source of Competitive Advantage: The Empirical Evidence

Bassett-Jones (2005) argued about the two facets of diversity in the workplace. Diversity can be a source of competitive advantage as it promotes creativity and innovation in the workplace. It can also be a cause of misunderstanding, suspicion, and conflict in the workplace that can result in absenteeism, turnover, poor quality, low morale, and loss of competitiveness. A need for diversity arises because of discrimination. If an employee is perceived to be discriminated because of his/her demographic or any other difference in identity, the overall performance of the organization deteriorates. As was found out by one research study, employees who grew up in a favorable culture tend to have a less degree of perceived discrimination and thereby leaving a positive impact on employee outcomes. Further, the effect of perceived discrimination on organizational commitment, job satisfaction, and work tension was moderated by superior culture, salary, and work experience.

In their research study, Ng and Burke (2005) found out diversity management to be important when accepting offers of employment by women and ethnic minorities. In the same study, new immigrants rated organizations with DM initiatives as more attractive as their potential employers.

Nishii and Ozbilgin (2007) identified several outcomes of effective global workforce DM practices. They are: effective global knowledge creation, sharing and dissemination of information, lower level of backlash, more commitment, greater satisfaction, and perceived fairness, improved organizational performance and innovation, and employee engagement.

Nishii (2013) found that relationship and task conflict were significantly lower in gender-diverse groups with high scores on *climate for inclusion* than in diverse groups with lower scores on *climate for inclusion*. Similarly, they also observed that any negative association between relationship conflict and satisfaction disappears when climate for inclusion is high. Herring (2009) identified that gender diversity is associated with increased sales revenue, more customers, and greater relative profits.

Curtis and Dreachslin (2008) discussed that the measurable effectiveness of organizational performance through diversity interventions has not been researched adequately. Moreover, the limited work on this issue lacks rigor as there was a total domination of quasi-experimental designs, qualitative methods, and self-reported data. There is a need to investigate the relationship of DM interventions with various performance indicators in more objective ways rather than through the ongoing subjective ones.

It was evident from literatures that men are most likely to use task-oriented and autocratic style of leadership than women, and women are more likely to use interpersonal and democratic leadership styles than men. Based on this premise, Embry, Padgett, and Caldwell (2008) conducted one study and found out that males using a feminist style of leadership were evaluated positively than males using masculinity style. On the contrary, a female leader using a masculine style was evaluated more positively by female participants when compared to a male leader using a masculine style.

Powell, Butterfield, and Parent (2002) carried out a study and its results indicated that a good manager is one who predominantly possesses masculinity characteristics giving support to the stereotype associated with gender. But some other pieces of evidence suggested that women bring a different set of personal characteristics in the managerial roles than men. This would help in changing the stereotype based on bookkeeping and also the conversion models of stereotype change. In today's competitive era of business, the role of managers has shifted towards good communication, coaching, and people skills

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

from the erstwhile competitiveness, aggression, and task orientation. The former is more associated with feminist characteristics. Now, the demand for managers with such characteristics is growing and is becoming instrumental in shifting stereotypical paradigm.

Managerial roles, allocating resources, problem solving, delegating, strategic decision-making, disciplining, and punishing were perceived as more masculine in nature. On the contrary, supporting, mentoring, recognizing and rewarding, communicating, and planning were seen as more feminine in character indicating that management is not entirely a bundle of masculine roles. Francoeur, Labelle, and Sinclair-Desgagne (2008) carried out a research study concerning corporate governance and top management. They found out that organizations with relatively more female officers generate positive and significant much more than normal returns in the complex environments while those with high proportion of females in management and governance systems generate good value to keep up with normal stock market returns.

Cumming, Leung, and Rui (2015) revealed that gender diversity has influence on the effective operation and fraud minimization in the organization. Similarly, women in top positions broaden the talent pool and pave the way for more talented Board. Providing for a diversity of views encourages constructive discussion. Gender diversity also gives rise to more conflict and less trust among Board members, and hence increases scrutiny and less fraud from organizational perspective.

The research work concerning gender and diversity in general is more towards a qualitative inquiry. The limited quantitative work under this domain was more concerned towards objective measures of performance. Subjective measurement of diversity was found to be insufficient as it is still one of the emerging concepts in behavioral sciences domain. Hard measures of performance have been found to be tested with diversity whereas more of the soft measures like the effect of diversity on satisfaction, commitment, engagement, and so forth have not been adequately considered for research work. Further, not much of moderating or mediating tests concerning DM have been performed. This trend provides sufficient doubt over the reliability of diversity as a concept in the organizational setting. Limited empirical work on DM lead us to believe that diversity is more guided by political agenda and interest rather than academic and/or organizational interest.

METHODOLOGICAL APPROACH

Both quantitative and qualitative research has been conducted in the domain of diversity and DM. Yang and Konrad (2011) reviewed relevant extant literatures on antecedents and outcomes of diversity management practices. They developed a research model by applying institutional and resource-based theories. Olsen and Martins (2012) conducted proposition based qualitative inquiry for formulating conceptual framework. Bassett-Jones (2005) came up with a conceptual and discursive paper. Prasad and Mills (1997) research studies were reviewed for a Book Chapter. Kelly and Dobbin (1998) performed exploratory study on the concepts of evolution and dissolution. Gilbert, Stead, and Ivancevich (1999) carried out qualitative narrative study where a model for effective diversity management was proposed.

Likewise, the study conducted by Lorbiecki and Jack (2000) was based on a narrative inquiry. Miller and Rowney (1999) study was exploratory in nature where the extent of adoption and implementation of DM initiatives in organizations was examined. Kersten (2000) performed a critical examination of DM by using Habermas model of dialogue. Nishii and Ozbilgin (2007) study was a paper review with a purpose of formulation of conceptual framework for Global Diversity Management. Also, the study of

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Dass and Parker (1999) was concerned with conceptual review and framework design. Hare-Mustin and Marecek (1988) performed qualitative inquiry on the study of post-modernism approach in gender. The study of Sluiter (2006) and Walker (2005) was a study in the form of conceptual paper. Riach (2009) carried out a conceptual inquiry with in-depth interview as a research tool. Curtis and Dreachslin (2008) carried out integrative literature review.

Curtis and Dreachslin (2008) adopted a unique methodology in this context. They took an integrative approach by means of going through 26 relevant portions from the available literature on diversity intervention programs by means of training, education, mentoring, and organizational development activities. They find that most of those interventions were carried out using experimental, quasi-experimental, case study, descriptive, and developmental methods. Majority of the intervention programs employed quasi-experimental research designs. Pre- and post-test surveys were also carried out among participants who attended diversity course.

Self-reported measures were carried out to assess the change in attitudes of the participants that attended the diversity course. Similar kinds of study designs were adopted for education, mentoring, and OD interventions. Most research on gender and leadership as well as gender and management have taken more of a qualitative approach for studying the progress of the latter over a period of time (Broadbridge & Simpson, 2011).

Embry, Padgett, and Caldwell (2008) have used surveys among undergraduate business students and it is alleged that their sample is not an appropriate one as they do not mention whether the students are working or full time students. If the students are not working, their perception of the leader will be far from reality and may not give the accurate result. The major problem with the methodology is the simulated situation where the leaders and subordinates were fictional characters, which might have led to biased findings and stereotypes. Also, there was no clue over the composition of perceived leaders in terms of male and female. Hence, this study was subjected to a number of methodological lapses and the sample size was also small.

Similar problems in methodology were found in another research study on gender and stereotypes where the sample consisted of undergraduate and part time students (Powell, Butterfield, & Parent, 2002) there by missing the context. Relying on student samples can be taken as drawback for this study as well. Methodology was not rigorous as they carried out mean analysis and basic descriptive one. It lacked robust measures of data analysis. Atwater, Brett, Waldman, Di Mare, and Hayden (2004) used Yukl taxonomy of 14 managerial roles. It used non-parametric binomial tests. Though the results were tested by means of means score, z-tests, and chi-square values, in terms of methodology, they could have employed other rigorous methods than simple descriptive and comparison checks by means of chi-square. Despite the fact that samples drawn were students and 75% of them had supervisory experiences, there is no proper justification for the choice of sample.

Sanchez and Brock (1996) study was cross-sectional in nature with quantitative hierarchal regression analysis and questionnaire as a tool to gather data. The study of Ng and Burke (2005) was hypothesis testing mean significance study. Kunze, Boehm, Bruch (2011) study was cross organizational quantitative study by using SEM as a technique for data analysis.

Herring (2009) study was based on determining racial diversity through racial index of diversity and then performing regression analysis on the data. Avery, Mckay, Wilson, and Tonidandel (2007) dealt with questionnaire survey with hierarchical multiple regression analysis as a technique to analyze data. Richard (2000) carried out logistic regression analysis for the data acquired from secondary sources. Francoeur, Labelle, and Sinclair-Desgagne (2008) performed a model-based multivariate analysis where

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

comparison of average monthly returns, average return on equity, and average monthly abnormal returns between high and low representation of women was carried out.

Powell, Butterfield, and Parent (2002) performed quantitative inquiry using chi-square test to determine the difference in samples for different time periods. Cumming, Leung, and Rui (2015) conducted a model-based logistic regression analysis with 'fraud' as a dependent variable and 15 other independent variables. Samples were divided into control group and treatment group for comparison purposes. Atwater, Brett, Waldman, DiMare, and Hayden (2004) used non-parametric binomial test and chi-square test to see the difference in the perceptions of male and female employees about the manager roles. Nishii (2013) performed confirmatory factor analysis on the data and ran SEM program. Paug, Dietz, Brief, and Wiley (2008) performed simple regression analysis.

The research work by Embry, Padgett, and Caldwell (2008) was a quantitative inquiry with business students as respondents among whom 81% were having prior work experiences. The responses from 19% with no work experience couldn't be validated as they were not exposed to the leadership style in organizational settings.

The methodological approach on diversity and diversity management was more inclined towards qualitative inquiry. Various conceptual models on diversity management have been formulated and many of the studies on this domain were guided towards enriching conceptual understanding. Only limited quantitative inquiry to test and validate the proposed conceptual framework was initiated. In the quantitative front, the studies were more focused towards measuring hard performance measures. In majority of the quantitative studies, data were collected from secondary sources and one can witness the use of logistic regression for the data concerning this domain. In many studies, financial models for measuring the effect of one variable on other were presented. This showed that diversity management has been more an area of interest within finance domain rather than that of behavioral science. In order to incorporate diversity within behavior science there is a serious need to conduct more quantitative studies to be able to establish the effect of diversity management on behavioral science variables.

Potential Directions and Research Issues in Indian Context

The issue of diversity is more prominent in Indian society. Diversity is so much into Indian society in the form of gender, ethnicity, religion, and language that the slogan *"unity within diversity*" is being promoted to ensure societal and cultural harmony. Diversity in Indian context is much more a political agenda than an organizational agenda. In this regard, diversity is much more driven by affirmitive action rather than meaningful inclusion. Diversity has been found to be encouraged and promoted especially in the development sectors. Research to explore and identify whether (i) diversity in the development sector is because of the mandatory requirement and is limited to affirmitive inquiry or (ii) is it really following the norms of inclusion in the workforce, can be carried out. The perception of employees from marginalized domains (female, dalits, and religious minorities) can add valuable insights in the diversity movement as it has been practiced by developmental sectors. The probable research issue is: What are the reasons that force the firms to claim that their organization is forcefully or willingly practicing diversity management within the organization?

It is evident from the review of literature that very limited work on examining the impact of demographic variables (age, gender, tenure, and ethnicity) on outcome variables (job satisfaction and organizational commitment) has been performed in the Indian context. In this regard, quantitative inquiry to examine the above mentioned relationship can be carried out. The findings from this study will enrich the domain

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of diversity management and enable organization to formulate diversity strategies on retirement schemes or continuing benefits concerning age and tenure, and formulate selection policies in regard to gender and ethnicity. The research can be carried out for banks and financial institutions because banking sector till date has not been forced to recruit employees on the ground of diversity management. Hence, this sector can carry out diversity management practices as per their requirement based on the findings of this study. The probable research issue is: *Do age, gender, tenure, and ethnicity affect job satisfaction and organizational commitment in Indian Banks and Financial Institutions?*

As there has been not much published work in the area of gender and diversity management in the Indian organizational context, this is a potential research area requiring in depth investigation. The issue of *inclusion* has garnered significant attention starting from government organizations to development agencies. The fact that NGOs have been recruiting employees from marginalized communities and minorities including women suggests that diversity will be more of a rule than exception in the days to come. In this regard, it would be meaningful to explore the perceptions of workforce diversity and inclusion among the employees from the development sector.

A pertinent research question to be raised for seeking a meaningful answer is to come up with a universally acceptable definition for the concept of diversity such that it includes the concept of *inclusion* as well. It is no denying the fact that the number of females joining the workforce especially in the post-economic reforms era in corporate houses continues to witness an upward swing. In this backdrop, it would be meaningful to study if the participation of women in the workforce leads to increased corporate financial performance in general and sectors like banking and insurance in particular that have more women representation compared to other formal sectors.

Diversity, of late, has become a major competitive factor for many companies. However, others are yet to be convinced about it and they want the business justification for diversity and expect it to be sound and demonstrable. To do that, it's necessary to address five *major issues.* They are:

- How does diversity help an organization expand into global markets?
- How can diversity help build brand equity?
- How does diversity support the organization's human asset/resource strategies?
- How does diversity build corporate image among its consumers?
- How does diversity enhance operational efficiency?

In the context of diversity management, some of the *challenges* the firms face are:

- What is the objective of building and managing a diverse workforce?
- Can firms make a persuasive business case for diversity with compelling arguments in their respective contexts?
- What could be the possible direct positive or negative effects of diversity on business performance in terms of productivity, quality of work life, bottom line, etc.?
- How can managers take a more "nuanced" view of the business case for diversity?
- Is there additional information beyond the five issues that we need to feel is necessary to make the business case for diversity?
- What steps can one take as a manager to become more effective in a work environment that is more diverse than ever?
- Does diversity management conflict with maximizing shareholder's value?

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- How can a company come up with a list of suggested actions that managers can take to deal with and manage effectively the multiple and varied changes taking place in the internal organizational environment now and in the future?
- What are the implications of diversity management when it is seen from more closely?

FINDINGS FROM EARLIER RESEARCH STUDIES AND EMPIRICAL EVIDENCE

There is good amount of qualitative and quantitative research on the theme of diversity and Diversity Management. The qualitative research is concerned with defining or operationalizing the construct of diversity, diversity strategy, diversity discourse, and DM practices. Review of available literature shows that single category diversity dominates the multi-category diversity. Also, there is no meta-analysis carried out by considering all aspects of diversity. Meta-analysis on demographic diversity and team performance suggested that specific demographic variables (functional background, organizational tenure, etc.) had small positive relationship with team performance as well as team creativity and innovation (Bell et al., 2011). Literature considering the antecedents and consequences of diversity is also minimal. The focus of most of the studies on diversity has been only at the surface level. Also, vast literature on diversity and DM has focused on the positive outcomes than compared to the negative outcomes. Moreover, research studies have considered diversity as an antecedent in most cases. There is sparse literature on diversity as a moderating variable. In one study, diversity strategy was found to moderate the relationship between racial diversity and organizational performance (Cunningham, 2009).

Diversity Management: Some Practical Examples From Corporate World

Many MNCs are now finding innovative ways to integrate diversity initiatives into their business. These initiatives teach current employees to value differences, direct corporate recruiting efforts, influence supplier decisions, and provide development training for women and minorities. Some managers value diversity and enforce the value in day-to-day decision making. Now organizations recognize that everyone is not the same and that the differences people bring to the workplace are valuable. Rather than expecting all employees to adopt similar attitudes and values, managers are learning that these differences enable their companies to compete globally and to tap into rich sources of new talent. Although diversity in India has been a reality for some time now, genuine efforts to accept and manage diverse people begin in right earnest. Managers must take a proactive approach so that differences are valued and capitalized upon. Diversity will turn into an opportunity and enhance the organization's market presence and market share by prudent and pragmatic management practices.

A number of World famous MNCs like Coca-cola, Xerox, AT&T, Proctor & Gamble, and 3M strongly believe in the positive aspects of diversity and attuned their managers to utilize the diversity to the utmost advantage of their organizations. Experience of these businesses suggests that diverse workforce broadens customer base and helps managing customer service more efficiently and effectively. In fact to be successful, MNCs must continue to look forward to the future, not the past. The CEOs, senior line and HR management, and diversity leaders play a key role in that process. If MNCs are to address the complex issues of child and eldercare, the emerging issues of multiculturalism, tolerance of religious practices, and full inclusion of people with disabilities in the workplace, then diversity professionals must lead from the front. They alone must lead as MNCs cannot get there by themselves. In this context,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

MNCs have developed many HR practices in order to improve the efficacy of the approach they adopt while managing diversity.

CONCLUSION

More Recent Approaches to Diversity Management

- Constitution of employee-initiated and employee-funded *caucus groups* based on the various dimensions of diversity to sponsor activities such as training workshops, conferences, and mentoring programs for their members.
- Designing and keeping in place a *Management Resources Planning*, a company-wide formal succession planning process for identifying, developing, and tracking the flow of women and other disadvantaged groups through the company. This is done to ensure their upward mobility while making the business unit leaders responsible for the process.
- Adopting a *balanced workforce strategy* wherein we set numerical targets, based on employee market demographics that specify the percentages of these diverse groups to be hired and promoted into each major job category. Incentive pay and promotions of managers are to be explicitly tied to their achievement of balanced workforce goals.
- Provision for *work and family programs* to include financial grants, alternative work schedules including job sharing, flextime, and compressed workweeks, and a variety of family friendly benefits.
- Tracking and *monitoring Workforce demographics* at all levels and within all units of the company
- Conducting *Annual Employee Surveys* to include questions that assess satisfaction with all aspects of work life, and analyzing the results to assess whether satisfaction differs by gender or ethnicity.
- Organizing *community outreach and development* and stimulating interest in science and technology among all members of the future workforce and to combat early gender and ethnic occupational stereotyping.

The list of HR initiatives that MNCs are currently using to manage workplace diversity is quite long and varied. Managers need to target specific efforts and set priorities for implementing them. An organization's choice of specific efforts will reflect the nature of diversity that is important for the organization, the goals set, the actions of other organizations in the industry, and so on. The rise in consumerism has led to a management style quite divorced from the traditional paternalistic organization. Even the psychological contract between the employer and employee has changed over the years.

On the other hand, there have been perceptible shifts in the individual perceptions of what the main springs of human actions are and what motivates them at workplace as well as in their personal lives. Both the management and the individual employees need to play a positive role in managing diversity. Any attempt to resist the change that comes with it is only self-defeating and fool hardy. Perceptions have an important role to play in diversity management and the role of Personnel practitioners becomes imperative. Various tools such as brainstorming etc. can be used effectively here. Challenging the deep-rooted stereotypes is the crux of the matter in managing diversity. Collaborative and cooperative workplace behavior, training, communication and other such related practices need to be modulated to achieve management of diversity. The imperativeness to review, measure, and reinforce and the steps

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

taken by the organization in this direction on a continuous basis and their importance need not be overemphasized here.

Chapter 9
Antecedents and Consequences of Employee Engagement for a Diverse Workforce

Shampy Kamboj
Amity University, India

Bijoylaxmi Sarmah
North-Eastern Regional Institute of Science and Technology, India

ABSTRACT

In the recent years, employee engagement has become a hot topic of discussion among popular business press and consulting firms. This topic has created interest in various stakeholder groups ranging from scholarly human resource practitioners to policy makers or government agencies. The interest in employee engagement has progressively increased, however, in academic literature: the concept of employee engagement has been studied rarely and comparatively less is known regarding its antecedents and consequences. Recently, a number of researchers have argued that the challenge of engaging the employees is mounting. Although it seems to conceptually overlap with existing constructs, for instance, job involvement, organizational commitment, still some empirical research confirms that engagement is a separate construct. Therefore, this chapter aims (a) to shed some light in this respect by assessing the association between workforce diversity, specifically in terms of their age and employee engagement, and (b) to provide a variety of precursors and outcomes of employee engagement.

INTRODUCTION

The notion of employee engagement is a relatively new one, one that has been heavily marketed by human resource (HR) consulting firms that offer advice on how it can be created and leveraged. (Macey & Schneider, 2008, p. 3)

In the recent years, employee engagement has become a hot topic of discussion among popular business press and consulting firms (Anaza *et al.*, 2016). This topic has created interest in various stakeholder groups ranging from scholarly (*e.g.* Kahn, 1990; Schaufeli *et al*., 2006, 2002), Human resource practitioners (e.g. Harter *et al.*, 2002; Masson *et al.*, 2008), to policy-makers or government agencies (*e.g.* MacLeod & Clarke 2009). On the one hand, the interest in employee engagement has progressively increased (Anaza *et al.*, 2016), however in academic literature, the concept of employee engagement has been studied rarely and comparatively less is known regarding its antecedents and consequences. Recently, a number of researchers' have argued that the challenge of engaging the employees is mounting (Fleming et al., 2005; May et al., 2004; Pech & Slade, 2006). Although it seeming conceptually overlap with existing constructs for instance job involvement, organizational commitment, still some empirical research confirms that engagement is a separate construct (Hallberg & Schaufeli, 2006).

As per a survey of 656 CEOs hailing from the countries across the globe, employee engagement is fourth significant management challenge, following reducing costs, creating loyal customers (Wah, 1999). Indeed, the Gallup Organization found recently that approximately twenty percent of US employees were disengaged and fifty four percent were successfully impartial regarding their work (Fleming et al., 2005). In addition, study conduct by Gallup and Towers Perrin (Seijts & Crim, 2006) advocates that disengage employee is equally challenging in other countries also. Thus, collectively the influence of these two trends - diversity in workforce and the rising challenge of employee engagement could prove problematical for various employers (Avery *et al.*, 2007).The work force diversity will increase the chances of different diversity present in most of the work settings.

Although researcher has connected work force dissimilarity to various outcomes for instance organizational commitment and intention to stay (Riordan, 2000), still the effect of this divergence on employee engagement is uncertain. Understanding regarding this association is important as (a) meta-analytic evidence and the other findings have revealed employee engagement to predict the key outcomes, for instance customer satisfaction, customer loyalty, employee turnover, productivity, safety, and profitability (Harter *et al.*, 2002; Salanova *et al.*, 2005), and (b) because employee engagement has a direct influence on performance, while the influence of job attitudes for example organizational commitment are indirect in nature (Harrison *et al.*, 2006).

Employee engagement has become a broadly used and famous term (Robinson *et al.*, 2004). However, majority of writings about employee engagement can be found in the practitioner journals, where this concept has its base in practice instead of theory and empirical studies. Robinson *et al.* (2004) noted there has been shockingly little empirical and academic research on a subject that has become so famous. Consequently, employee engagement has the emergence of being something called as, "old wine in a new bottle".

Several definitions have been provided for this concept in the academic literature. Initially, Kahn (1990, p. 694) firstly conceptualized work engagement or personal engagement or employee engagement as "the harnessing of organization members' selves to their work roles; in engagement, people employ and express themselves physically, cognitively, and emotionally during role performances." Rothbard (2001, p. 656) defines engagement as "psychological presence but goes further to state that it involves two critical components: attention and absorption. Attention refers to "cognitive availability and the amount of time one spends thinking about a role" while absorption "means being engrossed in a role and refers to the intensity of one's focus on a role."

Schaufeli *et al.* (2002, p. 74) define engagement "as a positive, fulfilling, work-related state of mind that is characterized by vigor, dedication, and absorption." They further state that engagement is not a

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

momentary and specific state, but rather, it is "a more persistent and pervasive affective-cognitive state that is not focused on any particular object, event, individual, or behavior" (p. 74). *Vigor* refers to "high levels of energy and mental resilience while working, willingness to invest effort in work, and persistence in the face of difficulties"; *dedication* represents "a strong psychological involvement in employees' work combined with a strong identification with their work and encompasses feelings of significance, enthusiasm, inspiration, pride, and challenge"; and *absorption* refers to "being happily engrossed in work, whereby time passes quickly and one has difficulties detaching" (Schaufeli *et al.*, 2002, p. 74).

In the literature in academic, engagement is shown as related to but different from the other constructs of organizational behavior. Such as, Robinson *et al.* (2004, p. 8) state that, "engagement contains many of the elements of both commitment and OCB, but is by no means a perfect match with either. In addition, neither commitment nor OCB reflect sufficiently two aspects of engagement – its two-way nature, and the extent to which engaged employees are expected to have an element of business awareness". To sum up, although the meaning and definition of engagement in the practitioner literature repeatedly overlaps with the other constructs, but in academic literature engagement has been defined as a different and distinctive construct, which include cognitive, behavioral and emotional elements that are related with a persons' role performance.

The main appeal of organization management is based on the fact that employee engagement drives the bottom line outcomes. One of the HR consulting firm (Hewitt Associates LLC, 2005, p. 1) point out that "they have established a conclusive, compelling relationship between engagement and profitability through higher productivity, sales, customer satisfaction, and employee retention.'' According to Macey and Schneider (2008, p. 4), "employee engagement is a desirable condition, has an organizational purpose, and connotes involvement, commitment, passion, enthusiasm, focused effort, and energy, so it has both attitudinal and behavioral components". The antecedents of such behaviors and attitudes are placed in settings under which individual work, and the consequences are reflection to be of value to organization effectiveness (Erickson, 2005).

Therefore, this chapter aims (a) to shed some light in this respect by assessing the association between workforce diversity specifically in terms of their age and employee engagement and (b) to provide a variety of precursors and outcomes of employee engagement.

JOB DEMANDS-RESOURCES MODEL AND EMPLOYEE WORK ENGAGEMENT

Job demands-resources model (JD-R model) is a main theoretical model, which describes the development of employee work engagement. As per Crawford et al. (2010) JD-R model, in a work environment there are two specific working conditions for an employee one is job demands and another is job resources. These two working conditions contribute to either employees' well-being or their stress level, and lead to affect their level of work engagement.

According to Demerouti *et al.* (2001, p. 501), "*Job demands* refers to, "the physical, psychological, social, or organizational aspects of the job that require individuals to exert sustained physical and/or psychological effort and, hence, have certain physiological and/or psychological costs (e.g., exhaustion)". Whereas, according to Schaufeli and Bakker (2004, p. 296) *Job resources* refers to, "those physical, psychological, social, or organizational aspects of the job that either/or (1) reduce job demands and the associated physiological and psychological costs; (2) are functional in achieving work goals; (3) stimulate personal growth, learning and development".

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Therefore, job resources can reduce down the job demands and are equally important in their own right. While job demands can hamper employees' work engagement by rising their stress levels during a health-injury process, and job resources can enhance employees' work engagement by rising their intelligence of well-being via a motivational process (Bakker *et al.*, 2003 and Crawford *et al.*, 2010).

The JD-R model is a conceptual framework, which is used to describe employee engagement in the workplace (Bakker & Demerouti, 2007). This model states that resources are what an organization gives to its employees; these resources may include supervisory support, supervisory feedback and autonomy. These resources are expected to (a) "lessen the strain of the

job's demands and the psychological and physiological costs that a company these arduous demands", (b) "be instrumental in the achievement of employee work objectives", and (c) "motivate and stimulate personal growth, development, and learning" (Demerouti et al., 2001). The model attempts to discuss how resources can be utilized to improve engagement and how the interplay among various resources influences engagement. The model also asserts that organizations' engaged employees will provide customer-oriented behaviors and such behaviors will be reflected in their assessment of service employee performance (Yoon & Suh, 2003; Young et al., 2009).

DISCUSSION OF ANTECEDENTS TO EMPLOYEE ENGAGEMENT

Although there is dearth of empirical research in the literature regarding the factors that can predict the employee engagement, from Kahn's (1990) and Maslach *et al.*'s (2001) model it is possible to identify several possible antecedents. The antecedents might vary for both job and organization engagement as a part of employee engagement. These antecedents consist of job characteristics, rewards and recognition, perceived organizational, procedural justice and supervisor support.

The literature has identified conceptual and empirical linkages towards the development of employee engagement although often in disconnected and disparate conversations. Mainly, engagement is mentioned as a behavioral outcome (Shuck & Wollard, 2010)and small attention is given towards the antecedents, which potentially drive the *emotional and cognitive* states of engagement that are believed to facilitate the behavioral manifestation of what can be seen as employee engagement. The subsequent sections discuss the extant literature on employee engagement antecedents starting with the individual antecedents to the organizational antecedents.

Individual Antecedents

Employee engagement is mainly an individual-level variable but it is measured at the organizational level (Shuck & Wollard, 2010). Considering the significant role of employee's individual factors and personality, little is known regarding employee engagement's individual antecedents and other variables that may contribute towards the overall development of employee engagement. In the literature, there are some associations reported; but this issue is not without critique and debate. Such as, the workplace environment and involvement of an employee's in contextually meaningful work is considered to be linked to employee engagement (Rich et al., 2010). Similarly, the perception of culturally, physically safe environments, emotionally, and individual factors, are also related to the employee engagement development as antecedents (May et al., 2004). Work–life balance (Singh, 2010), corporate citizenship

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

behaviors with personal involvement (Glavis & Piderit, 2009), and the linkage in an employee's work to organizational goals (Harter et al., 2002) are well addressed in the existing literature.

Research by European researchers' Schaufeli and Maslach depict that a number of variables for instance dedication, absorption and vigor in work are considered as individual antecedents to the employee engagement development. All of these variables are operationalized in the "Maslach Burnout Inventory" (MBI-GS; Maslach & Leiter, 1997) as the burnout opposite state, other individual variable with its individual antecedents set (e.g., cynicism, ineffectiveness; exhaustion, Maslach & Leiter, 1997) and "Utrecht Engagement Scale" (Schaufeli et al., 2006). Another work by Shirom (2007) and Shagra (2007) depicted a linkage between vigor (i.e., engagement; Maslach et al., 2001) and the extroversion and openness factors of the "Big Five personality variables" (Extroversion, Conscientiousness, Openness, Neuroticism, and Agreeableness). Their work also reported that "*Openness*" predicted engagement and that "*Extroversion*" predicted engagement levels at different points of time.

Other research work regarding individual antecedents is conceptual, and also adding important thought to the current conversation, but a little in contexts of evidence related antecedents. Such as, in a study by Macey and Schneider (2008) revealed that an auto-telic personality, conscientiousness and proactive personality traits positively influence employee engagement development as individual-level antecedents. Their work, based in Maslach et al.'s (2001) and considered that work environment perception of an employee's would lead to organizational outcomes (Maslach & Leiter,1997; Maslach et al., 2001), stated salient cues of an individuals' personality could be a influencing factor in employee engagement development.

Others have suggested that family and work status, a readiness to direct personal energies, emotional connection and stress are connected to the employee engagement development, although these associations are ripe for research and not yet empirically driven. Additionally, various workplace antecedent models have revealed the several individual antecedent variables for instance curiosity (Reio et al., 2006), self-efficacy (Macey & Schneider, 2008), self-esteem, self-perceptions (Xanthopoulou et al., 2007), all contribute an important role in the work-oriented variables development at an individual level. Although any research has not explored these associations and engagement (Maslach & Leiter, 2008), a number of researchers' has demonstrated a relationship between all personality traits like those discussed above and widely researched organizational variables such as involvement, job satisfaction, and commitment (Judge et al., 2004).

Organizational Antecedents

Organizations are always complex and complicated mazes for the employees to navigate. However, when discussed regarding employee engagement, antecedents that drive the engagement development at organizational level take place around basic human needs. Thus, the identification and meeting of basic human needs depicts complexity lack, yet outlines the difficulty of creating organizational situations for engagement to take place. This may resonate for anybody who has tried to internal motivation work teams, which involved different personalities and perceptions at organizational level.

Empirically, the managers' role has been investigated in extant, most considerably from research using the "satisfaction-engagement approach" (Shuck, 2011). Such as, research has suggested the manager self-efficacy role (Arakawa & Greenberg,2007), managers' role in establishing a supportive climate (Kroth & Keeler, 2009;Plakhotnik et al., 2011), mission and vision implementations on a local level (Fleming & Asplund, 2007), and perception of manager expectations (Bezuijen et al., 2009) research has also

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

stated that managers using non defensive approach (Shuck et al., 2011) positively influence employee engagement. Additional, the culture role (organizational and local micro cultures) have been investigated as an important antecedent variable (Brown &Leigh, 1996; Shucket al., 2011).

In addition, research has revealed that supportive workplace climates, positive and authentic all work to increment conditions positively affect engagement. Similarly, positive workplace climates (Dollard &Bakker, 2010) have been mentioned to involve the supportive management perception, recognition, in-role tasks role clarity, organizational success, self-express ability, and job challenge and control at appropriate levels (Brown & Leigh, 1996). In addition, as an organizational variable, Culture, is mainly a force which is outside the employee's direct control but always within manager's or a leader sphere of influence, stating a conceptual relationship between engagement and leader behavior(Shuck &Herd, 2011). Moreover, manager conscious choice for team to emphasize on increasing engagement is consider to be a positive antecedent to engagement development; a type of self-fulfilling prophecy effect in workplace. Lastly, organizational initiatives for instance CSR programs that include service work and employee volunteerism have been investigated as an empirically driven antecedent (Lindorff & Peck, 2010).

Cross-cultural literature, which emerging conceptually has depicted that hygiene factors external to the employee contribute potential conditions for their engagement at the organizational level (Schaufeli et al., 2008; Shucket al., 2011). Thus, hygiene factors are operationalized as reasonable working conditions, a reasonable degree of security, including fair pay and trust at low level with the leader (Herzberg, 1959,1968). When these hygiene factors are not fulfilled, employee engagement is not likely to develop. Research regarding providing resources, job control, setting clear expectations support this idea(Harter et al., 2002).

Additionally, a number of authors suggest that learning opportunities (Czarnowsky, 2008)and talent management (Hughes & Rog, 2008) that consist of organizational development and employee initiatives are antecedents to employee engagement. Unfortunately, no empirical work could be identified that emphasized mainly on human resource development role, human resource management and organizational development practices as antecedents to employee engagement, although it is a highly recommended antecedent.

Finally, rewards for instance monetary incentives and pay-for-performance have been examined in the extant literature and connected somewhat to the hygiene discussions and Justice, fair pay issues. Moreover, internal motivations that take place from extrinsic feedback sources in term of job encouragement and sincere recognition have been conceptually associated as antecedents to employee engagement, but no empirical support exists on the association. A number of evidence does state that poorly appropriated monetary structures may underestimate organizational engagement efforts (Demerouti & Cropanzano, 2010; Sparrow & Balain, 2010).

Summary of Antecedents

Varying types and levels of antecedents have been explored and examined with the concept of employee engagement, some empirical and others conceptual. What is clear from this review is that antecedents are not process dependent, but rather functions in the conditions for the state of engagement to develop. Different organizations will come to create an employee engagement culture in different ways, using different strategies and methods that are unique to their organization. In no literature did a one process model fit across all antecedents or strategies. Furthermore, it is also clear that antecedents related to each organization must be in place, but processes to facilitate the development of an engagement culture

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

are also in play. A detailed discussion of the processes for the development of employee engagement is however outside the

primary research question used to guide this review and is suggested for further research and scholarly inquiry.

CONSEQUENCES OF EMPLOYEE ENGAGEMENT

The motivation behind the attractiveness of employee engagement is that it has a number of positive outcomes for organizations. As specified earlier, there is a common belief that there is a association between employee engagement and organization results (Harter *et al.*, 2002). However, engagement is an individual level constructs and therefore, if it does cause organization results, it should first have an effect on individual level outcomes. Thus, there is reason to suppose employee engagement to be associated with individuals' intentions, behaviors and attitudes.

Kahn (1992) suggested that engagement resulted into both individual outcomes (i.e. work quality and work experiences), and organizational outcomes (i.e. organizational productivity and growth). In addition, the Maslach *et al.* (2001) model considers engagement as a mediator for the association between work conditions and different outcomes of work (such as burnout, increased withdrawal, job satisfaction, lower performance, organizational citizenship behaviour and organizational commitment (Maslach *et al.*, 2001).

Once employees become more engaged, they usually find their own work more meaningful, inspirational and self-fulfilling, accordingly they become more concentrated, engrossed and dedicated in their works. This motivated and positive mind stay should continue to how they serve and treat customers. As such, a number of research has depicted that engagement affects not only "in-role behavior" but also "proactive behavior" (Sonnentag, 2003) and employee extra-role behavior for instance organizational citizenship behavior (Rich et al., 2010). It seems that an engaged employees have an elaborated view regarding their work role and have a wider set of activities in their jobs. This states that, employee engagement will have a positive effect on how they handle their duties, involving providing superior customer services.

Harter et al. (2002) suggested that engagement is positively associated to significant business performance metrics for instance profitability, customer satisfaction, productivity and loyalty. The similar results in engaged employees will work out of excitement and sheer joy of rendering superior service to customers. Some researchers believed that engaged employees to be friendly, prompt in service delivery, motivated to recommend appropriate products as per customer needs and attentive to customer problems(Young et al., 2009). There are a number of consequences of employee engagement including, first, *Intent to quit*, i.e. workers who have lower levels of dedication revealed greater intentions to quit. Second, *Job satisfaction*, i.e. employees working in larger properties has higher levels of Dedication, Absorption, and Vigor with more job satisfaction. Third, *Employee voice*, i.e. employees who supervised others and usually worked in larger properties depicted high levels of Vigor revealed engaging in more voice behaviors among employee. Fourth, *Work-family conflict*, i.e. employees who supervised others and occupied top levels in organization they usually displayed high levels of Vigor depicted less work-family conflict; employees depicting high levels of Absorption depicted enhanced levels of work-family conflict. Fifth, *Family-work conflict*, i.e. employees who supervised others, occupied top organizational levels, and worked in larger properties, depicted high levels of Vigor and low levels of family-work conflict; workers showing high levels of Absorption also depicted more family-work conflict.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Some other observations are also worth to be noting. First, personal demographic factors were particularly unrelated to employee work outcomes. Second, work situation characteristics responsible for a significant increase in explained variance on their work outcomes. Thus, surprisingly, employees at top organizational levels and supervising others, depicted high favorable outcomes at work in some cases. Third, work engagement also responsible for a significant increase in explained variance on their work outcomes. Interestingly, Absorption and Vigor had an important but different linkage with the two family-work and work-family conflict measures.

Chapter 10
How Does Empowering Leadership Contribute to Organizational Commitment of Millennials?
An Indian Perspective

Mohammad Faraz Naim
University of Petroleum & Energy Studies, India

ABSTRACT

This chapter explores the influence of empowering leadership on organizational commitment of Indian millennials. Also, the mediating effect of trust in the leader is examined. Primary data were collected from the sample of 440 IT employees working in Delhi/NCR. Structural equation modeling (SEM) was used to test the proposed relationships based on model fit and standard path coefficients. Findings indicate that empowering leadership has a significant positive effect on organizational commitment and trust in the leader, which also has a significant positive effect on organizational commitment, and trust in the leader has shown to have a partial mediating effect on the relationship between empowering leadership and organizational commitment of millennials. The chapter contributes to the limited empirical literature on the linkage between empowering leadership and organizational commitment in a generational context, specifically millennials in Indian context. The chapter provides a leadership-based approach to bolster organizational commitment of millennials.

INTRODUCTION

In today's dynamic business environment characterized by competition, technological changes, and increasing quality demands; classic leadership theories have become insufficient and the emphasis in leadership has shifted from *command and control* to leadership *as a source of employee development and innovation* (Yukl, 2006). Also, such an environment calls for organizations to invest significantly

to attract, select and retain employees with high levels of commitment (Schneide *et al.*, 2009). There is, therefore a need for research directed toward identifying the organizational factors that promote positive employee attitudes particularly, organizational commitment. In the same vein, organizations design strategies to empower their employees in a bid to foster commitment and retention rates, to stay competitive. This is drawn from the past research that supports hat empowered employees are associated with higher levels of job satisfaction, commitment, and performance. However, among the many enablers, one of the determinants of to infuse empowerment is leader-follower relationships (Kozlowski & Bell, 2003; Spreitzer, 2008).

The extant scholarship suggests that effective leadership plays a key role in influencing employee positive attitude and has, therefore, been the subject of extensive research. Yukl (2006) defines leadership as "the process of influencing others to understand and agree about what needs to be done and how to do it, and the process of facilitating individual and collective efforts to accomplish shared objectives" (p. 8). With the evolution of the leadership domain, other forms of leadership such as empowering leadership have attained academic attention. Empowering leadership encourages sharing of power, authority, and responsibility to the followers (Zhang & Zhou, 2014). Past evidences have shown a positive significant impact of empowering leadership on employee positive attitudes. However, most of this literature is related to team-environments and has not explored the IT work setting (Srivastava & Bertol, 2006). Research on empowering leadership, however, has not examined the mediating mechanism that determines the leader's influence on employee organizational outcomes at individual level.

In response to concerns about the lack of commitment and intention to stay among Indian Millennial employees, several studies have identified this challenge and called for strong leadership and trusting environment to create an engaged and committed workforce (Bhatnagar, 2007). Empowering leadership is viewed as behaviors that generate trust and organizational effectiveness (Avolio, Gardner, Walumbwa, Luthans, & May, 2004). This approach of leadership underscores the importance of fostering employee self-directedness achieved through sharing of power, and its positive implication on follower attitude and performance (Carson Tesluk, & Marrone, 2007; Srivastava & Bertol, 2006). The extant literature on leadership provides support for the mediating effects of trust in the leader and leadership influence on followers. Trust is considered the foundation of positive organizational cultures and, in essence, defines healthy workplaces (Khatri, Halbesleben, Petroski, & Meyer, 2007). Trustworthy leaders instill a willingness to put extra efforts and deep level of emotional attachment with the organization. The objective of this study was to examine the relationship between empowering leadership, trust in the leader, and organizational commitment using a Millennial employees' sample. The model incorporates trust in leadership to explain the mechanism by which empowering leadership, influences organizational commitment.

LITERATURE REVIEW AND HYPOTHESES DEVELOPMENT

Empowering Leadership and Organizational Commitment

Empowering leadership is defined as the extent to which supervisors express confidence in their employees' abilities, emphasize the significance of their employees' work, involve their employees in decision making, and reduce or remove bureaucratic constraints on their employees for better execution of tasks (Ahearne, Mathieu, & Rapp, 2005; Zhang & Zhou, 2014). http://www.emeraldinsight.com/doi/full/10.1108/13673271111119709 It is comprised of five dimensions: "leading by example, referring

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to a set of behaviors that show the leader's commitment to his or her own work as well as the work of his/her team members; coaching, referring to a set of behaviors that educate team members and help them to become self-reliant; participative decision making, referring to a leader's use of team members' information and input in making decisions; showing concern, referring to a collection of behaviors that demonstrate a general regard for team members' well-being; and informing, referring to the leader's dissemination of company wide information such as mission and philosophy as well as other importation information" (Arnold et al., 2000, in Xue, Bradley & Liang, (2011), p. 302). Empowering leadership can be viewed, therefore, as essentially an approach that offers prescriptions to leaders for arranging the distribution and exercise of power. Literature on empowering leadership is focused on two perspectives. The first is based on leader actions such as sharing power or decision-making discretion, and autonomy to employees, in order to motivate them (Kirkman & Rosen, 1999). The second perspective emphasizes on employees' response to empowerment, specifically employees' motivation to empowerment (Thomas & Velthouse, 1990).

Organizational commitment is defined as "the relative strength of an individual's identification with and involvement in a particular organization" (Mowday, Porter, & Steers, 2013, p. 27). Past evidences suggest that work experiences, personal and organizational factors are the enablers of organizational commitment (Eby, Freeman, Rush, & Lance, 1999; Meyer et al., 2002). Leadership has been considered one such key organizational factor, which serves a strong predictor of organizational commitment is (Mowday et al., 2013). In the same vein, there is substantial evidence to support the association between leadership styles and organizational commitment in a variety of work context (Avolio et al., 2004; Bono & Judge, 2003; Lok and Crawford, 2004; Walumbwa & Lawler, 2003). The extant scholarship indicates that leaders that encourage responsibilities, provide opportunities for decision latitude, challenges, listen attentively and promote teamwork, are expected to evoke positive attitudinal response in followers manifested as higher levels of commitment to their organizations (Avolio et al., 2004; Kark & Shamir, 2002; Liden *et al.*, 2000; Seibert *et al.*, 2004; Wayne, Liden, & Sparrowe, 2000).

Therefore, we argue that through their empowering behaviors such as power sharing, decision making authority, autonomy, employee development; empowering leaders create a perception among followers, of being more capable and able to influence their job and organizations. If so, then they would also be expected to exhibit higher levels of commitment (Spreitzer, 1995). This is because employees who feel more empowered are more likely to reciprocate by being deeply committed to their organization (Eisenberger, Fasolo, & Davis-LaMastro, 1990; Kraimer, Seibert, & Liden, 1999). Further, past research indicates that empowered employees are focused; initiative-takers, and resilient, which in turn bolster their organizational commitment. In other words, employees' level of commitment is influenced to the extent to which they perceive their organization and the leader to acknowledge their contribution and care about their well-being. Importantly, leaders enhance employees' commitment by providing a supportive work environment characterized by concern for employees' well-being, adequate information sharing, and well-defined goals (Cheung, 2000). Further, this is consistent with the transformational leadership theory, which asserts a key role of role of empowerment to generate employee organizational commitment (Avolio, 1999; Yukl, 2006). Thus we hypothesize-

H1: Empowering leadership behaviors is positively related to employee organizational commitment.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Empowering Leadership and Trust in the Leader

Over the years the concept of trust has been the subject of wide academic attention in organizational behavior research (Dirks & Ferrin, 2002). Various scholars have suggested different definitions of trust. In broad terms, trust is defined as "a psychological state comprising the intention to accept vulnerability based upon positive expectations of the intentions or behavior of another" (Rousseau et al., 1998, p. 395). However, interpersonal trust, specifically, between a trustor (the subordinate) and the trustee (the superior/leader) has been the focal point in organizational behavior literature. Interpersonal trust is conceptualized as "a belief about a set of particular characteristics of another specific individual(s)" (Hassan & Ahmed, 2011, p. 164). While, leadership trust refers to leader-member relationship based on mutual respect, cooperation, commitment, reliability and equity (Dirks & Ferrin, 2002).

The extant literature indicates a strong effect of leadership on follower trust (Goodwin et al., 2011; Norman 2006). Empowering leaders generate follower trust through their empowering behaviors including encouraging participative decision making, removing bureaucratic barriers, exhibiting confidence and belief on them to resolve problems, leading by example, sharing information, coaching, demonstrating concern for them, treating them with respect, and recognizing their contributions (Ahearne, Mathieu & Rapp, 2005; Zhang a& Zhou, 2014). Though leaders are instrumental in developing the followers' trust, little research has examined the specific leadership styles which evoke trust. However, past scholarship acknowledges that transformational and authentic leadership are more effective in generating trust by demonstrating individualized concern and respect for followers (Jung & Avolio, 2000). Drawing from social exchange perspective, social relationships are formed, sustained or severed based on the perceived cost-benefit analysis. A sense of reciprocity develops when leaders exhibit concern for followers by providing them emotional and informational support, in turn, evoking positive psychological responses of trust (Cropanzano & Mitchell, 2005). In other words, in response to leader's empowering behaviors, employees feel more comfortable and willing to trust their supervisor. Thus we hypothesize-

H2a: Empowering leadership influences employees' trust in the leader.

Mediating Role of Trust

Despite being given considerable scholarly attention, trust has not been empirically tested for its mediating effects on leadership outcomes (Bartram & Casimir, 2007; Jung and Avolio, 2000). Like in any other social relationship, apart from certain behaviors there must be a mechanism that acts as s glue to keep the parties committed to cotniue the relationship. Therefore, followers must perceive trust in the leader in order to feel positively about the leader and the organization. This is based on the notion that trust plays a key role in productive interpersonal relationships including leader-member relationships. Leadership is considered trustworthy based on leadership's vision, strategy implementation, focus on followers' interests, and ability to communicate. Therefore, if followers develop a perception that the leader is not taking keen interest in their learning and welfare activities, it will dampen the level of trust in the leader and therefore it has deteriorating effect on their satisfaction, engagement, and commitment with the organization. In this regard, the leader's integrity, competence, and benevolence, is crucial as it has bearing on the decisions taken by leader, which directly influence followers future. If the leader scores highly on these trust-building factors, then it will signal a profitable future of followers in the organization, thus resulting in higher commitment (Dirks & Ferrin, 2002). Thus, we expect trust in lead-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ership be associated with followers' positive attitudes, which in turn will be related to positive behaviors. Specifically, empowering leadership behaviors such as participative decision-making practices, supplying organizational support, and ensuring that expectations are met were related to greater trust in leadership.

Evidences from past behavioral research reveals that leadership trust is necessary for effective leadership (Barey, 2002; Morgan,and Zeffane, 2003). It has been empirically shown that leadership trust acts as mediator in influencing empowering leadership effect on organizational commitment and empowering behaviors are instrumental in generating trust (Laschinger, Finegan, Shamian, & Casier, 2000). Although, several scholars notes the association between trust in the leader and employee attitudinal outcomes such as satisfaction, commitment, leading to increased performance (Bartram & Casimir, 2007 Dirks & Ferrin, 2002; Korsgaard, Brodt, & Whitener, 2002). In particular, the past scholarship suggests a positive relationship of empowering leadership and organizational commitment in different work settings (Bono & Judge, 2003; Seibert *et al.*, 2004; Liden *et al.*, 2000; Walumbwa & Lawler, 2003). Further, Avolio, et al. (2004) corroborated that organizational commitment was higher for employees whose leaders display empowering behaviors such as participative decision-making, relationship building, teamwork, and avenues for followers' growth and development. Also, empowering behaviors have been shown to be linked with trust generation. Therefore, it is logical to argue here that empowering leadership will indirectly influence follower commitment through the development of trust in leader, which serves as the mechanism through which empowering leadership impacts employee organizational commitment. This is in agreement with the extant literature, which demonstrates a positive impact of empowering leadership on trust, which in turn, mediates its relationship with employee attitude (Bobbio, Bellan & Manganelli, 2012). Other studies reveal that in the presence of trust, empowering leadership leads to a positive attitude change. Thus the attitude of the employee towards an objective tends to change when the empowering leadership is exercised in the presence of trusting behaviors (Goodwin et al., 2011; Zhang & Zhou, 2014). In the similar vein, this study hypothesizes that trust mediates the effect of empowering leadership with attitude as an outcome. Thus we hypothesize-

H2b: Trust in the leader influences employees' organizational commitment

H3: The effects of empowering leadership on organizational commitment will be mediated by trust in the leader.

Figure 1. Theoretical Framework

METHOD

Sample Description

The last decade or so has witnessed a spurt in IT industry in India. Consequently, the work setting for this study is a top-notch IT organization in Gurgaon, NCR. The organization operated 24 hours-a-day to provide IT solutions for clients from different countries. Although, management of IT organizations has traditionally been command and control type with stringent rules and deadlines, however, of late, there is a transformation in the management strategies highlighted by growing interest in employee empowerment (Gofton, 1999).

A cross-sectional survey design is used to gather primary data. The sample for this study is comprised of software programmers who belong to Millennial population i.e. born in between 1981-2000. The line managers were deemed fit for assuming leadership roles as they directly supervise their immediate subordinates. We made personal contact with HR Managers to persuade them to contribute in this study. We administered 650 questionnaires from October 2015 to December 2015. In all, 440 completely filled questionnaires were collected with a response rate of 67.69%. The average age of the executives was 23.2 years (S.D.=5.6), and they, on average, had worked in the organization for 3.5 years (S.D.=4.2). Out of this sample 54% are males and 46% are females, with an age group of 20-24 represented by 45% respondents, 25-29 by 32% and 29-34 by 23%, with an average working tenure with their immediate supervisors for 1.6 years (S.D.=1.7).

Instrumentation

Questionnaire items were adapted from pre-existing validated scales. The five-point Likert scale (1=strongly disagree, 5=strongly agree) was used as the measurement method.

Empowering leadership- We used the 12-item ($\alpha = .94$) scale developed by Ahearne et al. (2005). A sample item is ‘‘My supervisor expresses confidence in my ability to perform at a high level’.’ Responses were measured on a 5-point Likert scale ranging from 1 (“strongly disagree”) to 5 (“strongly agree”).

Trust in Leadership: A 6-item ($\alpha = .83$) scale by (Podsakoff et al. 1990) was used to measure trust. An example item is ‘‘I have complete faith in the integrity of my manager/ supervisor’’.

Organizational Commitment: It is measured by Mowday et al.’s (1979) 15-item ($\alpha = .86$) organizational commitment questionnaire (CQ). An example is “I really feel as if this organization’s problems are my own“.

Controls

To avoid potentially misleading relationships between our study’s variables and to enhance the validity of the study, the probable influence of age-group, gender, education, and experience were controlled. The coding schemata for the categorical control variables are shown in Table 1.

Employee commitment	2.224	.958	.963	.986	.070

Results

Preliminary Analysis

Data analysis for the present study was done using SPSS 21.0 and AMOS 7.0 softwares. Hypotheses testing were carried out through correlational analysis and regression technique. Reliability estimates, correlations, and descriptive statistics including standard deviations for all the variables under study are depicted in Table 1. Before proceeding for hypotheses testing, firstly the measurement model was examined for dimensionality, convergent, and discriminant validity through Confirmatory factor analysis.

In agreement with the extant research, CFA reveals that the five dimensions were significantly loaded on the empowering leadership construct (b= 0.86 to 0.95; a= 95 percent). The fit indices indicates the acceptable fit measures (χ^2 */df* = 3.284, p= 0.000, GFI= 95, CFI= 0.98, TLI= 0.97, NFI= 0.98, RMSEA= 0.073). For trust in the leader, scale fit indices show an adequately acceptable fit (χ^2 */df* = 3.112, GFI= 0.93, CFI= 0.97, TLI= 0.96, NFI= 0.96, RMSEA= 0.041). CFA reveals that the six itmes were significantly loaded on the trust in the leader construct (b= 0.84-0.91; a= 95 percent). While, the fifteen items assigned for measuring organizational commitment were averaged to one score of organizational commitment. Conducting CFA reveals that the scale fitted the data adequately (χ^2 */df*= 2.224, GFI= 0.95, AGFI= 0.92, CFI= 0.98, TLI= 0.96, NFI= 0.97, RMSEA= 0.070). Furthermore, results show that the fifteen items significantly loaded onto the organizational commitment construct with(b= 0.86-0.94; a= 95 percent).

Structural Model

As depicted in Table 3, the proposed model of empowering leadership, trust in the leader, and organizational commitment is found to exhibit acceptable fit indices (Hair et al. 2010). Findings of CFA reveal that the hypothesized model acceptable fit (χ^2 */df* = 2.01, GFI = 0.95, AGFI = 0.92, RMSEA = 0.078, CFI= 0.97; TLI= 0.97; NFI= 0.95). The value of coefficient paths were statistically significant ($p < 0.01$). Overall, the model explains 29 percent of the variance in organizational commitment.

Test of Hypotheses

Findings reveal that the standardized coefficient between empowering leadership and organizational commitment was significant (β =.70, $p < 0.01$) thus providing support for H1. Also, the relationship between empowering leadership and trust in the leader was found to be positive with the standardized coefficient was significant ($\beta = 0.59$, p<.01) that strongly supported H2a. Also, trust in the leader was positively related to organizational commitment. The standard path coefficient was significant ($\beta = 0.63$

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

. p<.01) supporting H2b. Finally, the direct standard path coefficient between leadership empowering and organizational commitment was significantly reduced to ($\beta = 0.36$, p<.01) in the mediated model. Therefore, the result suggested partial mediation effect of trust in the leader between empowering leadership style and employee organizational commitment and thus partially supporting H3. Furthermore, the result reveals a 38% explained variance, which was well within the prescribed limit of 50%, the minimum threshold in accordance with Harman's single factor test (Podsakoff et al., 2012), thereby indicating that common method variance has been death with effectively.

DISCUSSION AND IMPLICATIONS

This paper aimed at examining the impact of empowering leadership on organizational commitment through the mediating role of trust in the leader. As proposed, the direct relationship between empowering leadership and organizational commitment was established, thus supporting H1. In other words, the findings demonstrate that Millennial executives supervised by empowering managers are more likely to be committed. The findings are consistent with previous research (Albrecht & Andreetta, 2011; Laschinger, Finegan & Shamian, 2001). Second, this study identified that empowering leadership positively influences perception of trust in the leader among Millennial followers, thereby supporting H2a; and that trust in the leader is shown to predict organizational commitment, thereby supporting H2b. Finally, the results of H3 lend support to a partial mediation of trust in the leader between empowering leadership and organizational commitment of Millennial employees. These results are in agreement with the empirical support driven from past literature that interpersonal trust has a positive significant impact of on organizational commitment (Dirks & Ferrin 2002; Nyham, 1999; Song, Kim & Kolb, 2009; Yang, 2005). Therefore, this study further confirms the findings of earlier studies and explains the impact of empowering leadership on organizational commitment.

The present study is significant for both managerial as well as theoretical perspective. From theoretical vantage point, the study contributes to limited empirical literature on the relationship between empowering leadership, trust in the leader, and organizational commitment. Although, substantial evidence is available for the influence of transformational and authentic leadership on trust and organizational commitment, still there is lack of studies on empowering leadership's impact on these outcomes. To the best of our knowledge, no study has examined the impact of empowering leadership on followers' trust in the leader Indian IT industry. Importantly, this study addresses the call for research to explore the mechanism underlying the impact of empowering leadership on organizational commitment (Dewettinck & Ameijde, 2011).Further there is an exigent need to enhance the IT Millennial employees' organizational commitment levels, given the present higher attrition rates in Indian IT industry especially among young generation employees i.e. Millennials (Naim & Lenka, 2017b). Recent estimates suggest Indian IT industry has experienced roughly 30 percent executive-level attrition rates in the last fiscal year (The Times of India, 2014).

From managerial vantage point, this study presents a strategy for HR managers to bolster employee organizational commitment rates. In this view, organizations should offer training and workshops to line managers or supervisors to improve their empowering behaviors to achieve reciprocal positive response from the executives. This argument is based on the notion that it is possible to impart empowering leadership behaviors through training interventions (Nielsena & Munir, 2009). These interventions would enable line managers or supervisors realize the significance of aligning Millennial executives' targets in

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

alignment with their personal objectives. In addition, leveraging empowering behaviors fuel committed workforce, which is a sustainable source of competitive advantage in contemporary business landscape. Also, committed employees have higher likelihood of staying forth with the organization (Naim ^ Lenka, 2016). This is highly important in context of Indian IT industry, which registers high attrition rates in the Indian economy (Naim & Lenka, 2017a).

Limitations and Future Scope

This paper has some limitations, which could lead to directions for future research. Firstly, the relatively small sample size and cross-sectional nature limits its generalizability and causality. Secondly, as it was carried out in an IT organziation, empirical findings of the study could be more applicable in Asian countries as compared to Western ones Future studies should explore industries like IT, retail, or pharmaceutical. As quantitative research design has its obvious limitations so future studies should employ qualitative methods like focus interviews to further examine the results of this study.

Chapter 11
Conceptualizing Causative Factors of Workplace Cyberbullying on Working Women

Karthikeyan C.
https://orcid.org/0000-0002-2018-8245
T. John College, Bengaluru, India

ABSTRACT

This chapter conceptualizes workplace cyberbullying, with special reference on workplace cyberbullying perpetrated on working women. It shares various causative factors that lead to workplace cyberbullying on women. The situation across the world and with special reference to Indian situations on the social menace of workplace cyberbullying on working women and the traumatizing causatives are discussed in detail. Research reports and survey reports conducted across the world and in India related to workplace cyberbullying are discussed in detail. The psychological issues, socio-psychological triggers that induce bullying on women is discussed with the methods the bullies are inflicting on the victim across the world and with special reference to Indian working situations are analyzed in detail.

INTRODUCTION

Conceptualizing cyberbullying in the context of working women is gaining attention across the world (O'Neill & Dinh, 2013), and the technology, structure, technical infrastructure, and the physical proximity are inducing cyberbullying amongst women (Ybarra, Mitchell, Wolak, & Finkelhor, 2006). Workplace cyberbullying is common and it is evolving in subtle ways that makes it difficult to explain (Callaghan, Kelly, & Molcho, 2014). According to the National Crime Prevention Council (NCP) of the U.S., cyberbullying is understood as perpetrators using digital modes like the Internet, cell phones, or other digital devices to send or post text or messages to hurt or embarrass another person (Baynes, 2018, p. 138). The act of workplace cyberbullying is an act of aggression, or an act, which is intentional to harm a group or

an individual, using electronic forms of contact repeatedly overtime against a victim (Ybarra & Mitchell, 2007, pp. 319-336). According to the Department of Education and Mental Health, workplace cyberbullying is an act of unwanted physical or verbal aggression inflicted by the perpetrator on the victim, that goes repeated for a long time, and it also involves an imbalance of power between the bully and the victim (Hinduja & Patchin, 2007, p. 89-112; National Children's Home, 2005). Workplace cyberbullying is also characterized by the bully using their higher social status over the victim to exert power to hurt (Ybarra & Mitchell, 2007), harass, name-call, gossip, spreading out rumours, threats or other forms of intimidation to the victim in the workplace (Duggan, 2017). In the case of workplace cyberbullying on women, it is increasing phenomenally in the digital age, wherein the mobile phones, social media platforms, and use of digital platforms to threaten through emails, or blogs over the Internet (Kowalski & Limber, 2007). Workplace cyberbullying on women can also be understood as a situation, wherein over a period, a woman employee is purposely and repeatedly subjected to negative actions like bullying or harassing women. The act usually happens by verbally, or digitally abusing them through gadgets or e-platforms (e.g, phone, email, web sites and social media) related to their work (Farley, Coyne, Sprigg, Axtell, & Subramanian, 2016), because of this situation, the working women face difficulty in defending themselves against these actions and feel embarrassed and are broken psychologically (Farley, Coyne, Sprigg, Axtell, & Subramanian, 2016).

There are several types of workplace cyberbullying inflicted on working women by the bully, that impacts them psychologically (Hertz & David, 2008). These include verbal bullying with the use of words to hurt, harm or damage the morale of the employee (Patchin & Hinduja, 2006) and it includes name-calling or insults by making sexual or bigoted comments (Mehari, Farrell, & Le, 2014). Workplace cyberbullying also includes harsh teasing such as indirect taunting and mimicking, or verbal threats in the workplace (Lehr & Bechrakis, 2018). The mode of relational bullying is by excluding any one person, usually the targeted victim, from a peer group of working women, as well as a bully through verbal threats or spreading rumours to intimidate the victim, which brings down the morale of working women (Surdin, 2009). In the reactive bullying mode, the bully usually picks up a former victim and perpetuates the negative act of cyberbullying (Primack & Johnson, 2017). Workplace cyberbullying is highly prevalent in the context of organizations as well as in the family system across the developing countries in the world, including India, that usually victimize women victims in a subtle manner which often goes unreported. For instance, one of the unique ways of bullying women is by damaging their personal property; as a result, victims lose their property legally, even when the women own it. Also, when the property becomes damaged beyond control, it makes the women feel helpless. Another frequent mode adopted in the organizations includes cyberbullying women by taking away their organizational role, or removing their names from an important listing related to the organizational task, and, deliberately ignoring their views and opinions even in the context of work (Smyth, 2010). It also includes removing the details about them or concealing information that is important for the women employees that is sensitive to their career development, and denying vastly important official communication (Walther et al., 2010). Apart from the above, bullying by an allocation of stiff, unrealistic, and unattainable targets pushes their workload beyond manageable limits (Alexandra & Ellen, 2013). This subtle way of humiliation on the women workers by spreading malicious rumours, or intentionally delaying, or stopping promotion, or training opportunities to prevent them from their career growth is another mode that is highly prevalent across the countries in the world, including India (Deniz, 2015). The above methods are used in organizations in a very subtle manner, and the methods often go unnoticed as an official routine, where women victims may not get an opportunity to stop the behaviour, and as a result, resent it.

BACKGROUND ON WORKPLACE CYBERBULLYING ON WORKING WOMEN

The cyberbullying on working people including women predominates with three most common forms of cyberbullying that include the cyberstalking, Internet trolling, and hazing through the use of digital gadgets. These methods of cyberbullying are relatively easier for the perpetrators to inflict psychological damage on women, which at times goes unreported (Binns, 2013). Technological advancements, which came as a boon to the working life in the form of digital working platforms have created parallels of online harassment options in the hands of perpetrators. The digital platforms are now handy for the perpetrators with multiple supporting options as well as the advantages of switch over methods to bully women workers by posting electronically during working hours, and which is called as the act of cyberstalking (Spitzberg & Hoobler, 2002). The cyberstalking is an act of using online connectivity to repetitively harass another person with the intent to control, coerce, intimidate, annoy, or threaten others. Cyberstalking is a form of cyber harassment, which refers to engaging in an act to torment, terrorize, or offend an individual online to harm the female victim (Nobles, Reyns, Fox, & Fisher, 2014). The victims experience a continual state of anxiety or fear that affects their quality of life and that could compel them to alter their offline and online habits. At times when searching for new friends, many young women workers are likely to become victims of cyberstalking (Nobles, Reyns, Fox, & Fisher, 2014). This kind of cyberbullying impacts working women psychologically. In the case of Internet trolling, it happens over the Internet and it usually starts with the online community or group of people in an online gaming environment (Polsky, 2010). Internet trolling is a negative marked online behaviour (Chancellor, Lin, & Munmun, 2016) that makes trouble for a discussion forum, which includes flaming, griefing, swearing or personal attacks, including behaviour outside the acceptable realms, defined by several community forums from time to time (Chang et al., 2016). The Internet trolling is done with the only intention to elicit a reaction rather than disrupt or end with a personal amusement, and it is usually is very mild (Berson, Berson, & Ferron, 2002). On the other hand, cyberstalking is used for threatening a victim (Burgess-Proctor, Patchin, & Hinduja, 2009). The intention to cyberbully female workers with these two methods is to give peer pressure and to pull in the perpetrator as well as the women victims on a common digital platform, to establish a relationship, even if it is unwanted (Keith & Martin, 2005). Because it is done one-to-one, especially in an organization setting, or in a working relationship (i.e., a known colleague in the workplace or a supervisor or any superior), these offences are forced upon the victim. Thus, the victim must report to this person from the nature of the bullying at work, or for the offence. The victim must communicate directly through the email (Hinduja & Patchin, 2008), which can make the veracity of the damage much higher than other forms of bullying (Hinduja & Patchin, 2009), which is considered as the most dangerous form of cyberbullying against working women as it involves a credible threat to their life safety (Patchin & Hinduja, 2006). The modus operandi starts with a perpetrator, who may be a working colleague, supervisor, or a senior boss, who at times directly, indirectly, or sends repeat messages to intentionally harm the victim psychologically, or threaten their existence. Perpetrators at the worst may ask other colleagues to join him, or her, to repeat the perpetrating behaviour (Tettegah, Betout, & Taylor, 2006), either explicitly or by impersonating the victim, or may also involve other employees under them by connecting them or coercing them to get involved (Wolak, Mitchell, & Finkelhor, 2006).

In the case of trolling in the workplace, trolling is done by the perpetrator with intentions to provoke or offend the women victims to elicit a reaction. Unlike cyberstalking, trolling is usually done for disrupting either for the perpetrator's amusement or to combat an unknown enemy (Ybarra & Mitchell, 2004). The male supervisors do this especially on women victims and tend to look for a chance to undermine

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

competent women workers or demean their official position (Ybarra, 2004). The perpetrators make a very subtle move while involved in the workplace cyberbullying of their victim employees (Ybarra & Mitchell, 2004), especially when they are women workers, in a way, because it looks like a task-related instruction or direction to get a job done for the organization. Besides, the perpetrators execute in a way that may not be easy to be classified as workplace bullying, and it looks like a reprimand, but usually, it consists of public verbal abuses (Bartlett & Bartlett, 2011). For instance, bullying the workers in public, with the only intention of humiliating them, and setting an unrealistic standard, keeps women employees' self-esteem low in their own eyes (Nielsen & Einarsen, 2012). Since every time she misses the target, she is questioned on the same, this makes the women feel unprofessional by making them feel the humiliation when not completing unrealistic and large targets (West, Dawson, & Topakas, 2011). After humiliation, perpetrators create a contract manipulation by devaluing the positions and threatening the employees in terms of job loss.

Hazing is the third kind of workplace cyberbullying. Hazing is an act of initiation from the victim into a group, and it involves hurtful behaviours between people who are equal in power, such as in social spheres (Sourander et al., 2010). Hazing can happen in the following situations, as it happens through cursing or yelling at the victims by the supervisors or managers in an organization (Sperry, 2009). Some of the hazing acts go to the extent of requiring victims to perform binge drinking, and even in the glamour industries are forced to gratify the people who are reporting or recommending to an immediate boss. Conceptualizing the consequences of cyberbullying and damages to working women is important (Lawrence, 2015). Currently, cyberbullying is now a declared social menace, which is pervading as a socio-psychological problem (Barlett, 2015). The advent of advanced technology (Coyne, Chesney, Logan, & Madden, 2009) and digital workplaces with seamless connectivity, enables cyberbullying to cross boundaries, and its pervasive effects are mindboggling with the support of social and digital media (Sarkar, 2015). Cyberbullying is now prevalent across the communities and has pervaded to all kinds of organizations or to the workplace, which is taking everyone to the culpable risk of experiencing cyberbullying (Snyman & Loh, 2015). In the workplace, cyberbullying predators often undermine women's actions when dealing with their clients by creating the false impression of their inability to help in advising them (Weatherbee, 2010). There is a needless discussion on the hours of work done by the supervisors in delaying the paperwork, making the deadlines to take away the opportunity, and by blowing up on the slightest mistakes, and not listening to the statements of defense from the employee, and picking on the different workers at different times (Cooper et al., 2014). The online harassments, with the advent of technology, are creating new ways for the perpetrators to bully, harass and abuse workers, have increased phenomenally (Djurkovic, McCormack, & Casimir, 2008). The use of information and communications technology in the digital platforms created for work are utilized in negative acts like hostile attempts to hurt, upset or embarrass working women, and this issue is on the rise (Woodrow & Guest, 2014). The harassments include cyberbullying through offensive emails, email threats, and indirectly implying with threatening messages (Beirne & Hunter, 2013). Perpetrators may bombard them with more work than they can handle (Dollard & Karasek, 2010), ill-treating them by posting defamatory gossip on blogs and social networking sites (Lutgen, Tracy, & Alberts, 2007), and issue threats through SMS, text messages, phone calls, and by posting personal details to unauthorized sites.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Increasing Physical and Mental Health Hazards on Working Women

As a result, female employees face unwanted consequences like the feelings of fear (De, Baillien, & De, 2009), intimidation, stress, low morale, higher mental strain, and lower job satisfaction, and have no control over who witnesses the abuse (Bowling & Beehr, 2006). Workplace cyberbullying, especially on women, causes physical and emotional consequences in the victims including physical and emotional consequences such as stomach trouble, sleep disorders, anger, fear, confusion, distress, anxiety and finally depression (Acquadro et al., 2017). The mental health gets affected severely with consequences to women's' health and well-being. The common symptoms of bullying include headaches, nausea, ulcers, contemplating suicide, sleeplessness, skin rashes, irritable bowel syndrome, high blood pressure, and tearfulness with loss self-confidence. At times, these helpless women employees even try to adopt strategies to stop the perpetrators like being avoidant, coping, and ignoring the perpetrator, but due to official reasons, the perpetrator being the superior boss, women may have to tolerate the behaviour or move on (Acquadro et al., 2017).

The Mode of Workplace Cyberbullying Post Working Hours on Women

Controlling cyberbullying or taking any preventive measures to prevent women, victims, from cyberbullying or harassment at the organizational level becomes difficult, as cyberbullying continues post working hours, and often happens outside the working hours due to their connectivity online (Hauge et al., 2011). The user-friendly electronic gadgets, with the continuous support of connectivity (Baillien, Neyens, & De Witte, 2011) have a sophisticated technological infrastructure that catalyzes online bullying or cyberbullying (Hodson, Roscigno, & Lopez, 2006). The menacing culture is now widespread on working women (Ferris et al., 2007; Smith, et al., 2008). The perpetrators, usually the working colleagues or immediate supervisors, post rumours, threats, sexual remarks (Hinduja & Patchin, 2009), upload personal information including photographs, and create prerogative labels against victimized women (Hu, 2010). To inflict mental harassments, hate speech may be used against the victim, and as a result, victims experience low self-esteem (Chapin, 2014), increased suicidal ideation, and a variety of negative emotional responses, which increases their fear, anger, frustration, and finally pulls them into depression even while at home (Hinduja & Patchin, 2008).

PREVALENCE OF WORKPLACE CYBERBULLYING ON WORKING WOMEN ACROSS THE WORLD INCLUDING INDIA

Research studies recently done across the world on the ethnicity of online cyberbullied women by UNISON of UK in 2011 reported that 52 percent of Caribbean, 56 percent of black Africans, 51 percent of UK-born black employees were bullied online (cyberbullied) compared to 33 percent of white employees (Diaz, 2016). While taking the country-wise stance, 61 percent in China, 53 percent in India, and 53 percent in Pakistan, were cyberbullied, and developing countries including India have a higher rate of cyberbullying on women than any other country. Cyberbullying on working women increase their fear of coming to work, lower their self-confidence and self-esteem, and in extreme circumstances, can lead to self-harm, and even suicide. In developing countries like India, bullying causes physical and mental health and gives work-related stress because there are no preventive measures supported by legal aid,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and with limited job availability, women do not like to lose their jobs, and hence tolerate the menace. It affects both the performance and the morale of the workforce who witnessed the bullying (O'Keeffe & Clarke-Pearson, 2011).

Trivializing Workplace Cyberbullying Increases Cyberbullying on Women

Working women employees need to tackle the risk of workplace cyberbullying when bullying or cyberbullying is accepted as a part of the work culture (Ramasubbu, 2015). In 2011, Unison survey found that nearly 23 percent of the women witnesses felt that they may be the next target and this fear made them quit their job (Hasebrink et al., 2009; 2011). Retaining women employees becomes a challenge and the cyberbullying culture in the workplace becomes difficult to handle (Moreno, 2014). Tackling workplace cyberbullying needs to be immediately resorted, since it becomes stressful, and neglecting it may escalate it into a big problem (Phillips, 2012). Accepting it as an incident at the workplace increases stress in the victims beyond their control, and it becomes harder to be resolved, which makes victims suffer silently (Pettalia, Levin, & Dickinson, 2013). Women employees, in particular, develop a fear of letting others know since they have a consistent feeling of insecurity in them. The feeling of insecurity is more a psychological issue, and it increases their self-doubt, which often is trivialized due to organizational resistance to accept complaints from the victims since many of the perpetrators happens to be the employees of the organization (Boyd, 2014). This organizational resistance keeps cyberbullying on working women increasing consistently.

EVIDENCE OF WORKPLACE CYBERBULLYING ON WOMEN WORKERS

Technology has influenced the workplace (Hobfoll & Shirom, 1993) and has brought in innovative ways to conduct work (D'cruz & Noronha, 2013). Exposure to working related matters and other legal provisions required for workplace operations are known even to the women employees working in the lower hierarchy, which has elevated the thinking about work, and hence, managing women employees is getting cumbersome (Giumetti et al., 2012). Any aspect of the workplace has an upside, but it also has a downside, and, it is cyberbullying (Madan, 2014). The working population, especially women, who use digital spaces feel embarrassed quite often due to the menace of online abuse, and this abuse is put off by women easily while taking part in political or online debates (Perreault, 2011). Impersonation and exclusion occur by excluding or cruelly discarding someone from an online group to cause mental harassment in the victims (Gorgievski & Hobfoll, 2008; Hobfoll, 1989). Predators may continuously send emails or text messages to harass the victim, despite resistance, and they may repeat threats or sexual remarks to the victims (Matthiesen & Einarsen, 2007). Predators may also intentionally use pejorative labels (i.e. hate speech) or defamatory false accusations such as ganging up or ridiculing the person in online forums (Tuckey & Neall, 2014). The methods become very intensive after posting false statements with the fact aimed at discrediting (Tuckey et al., 2009), or humiliating a targeted person intentionally to destabilize the victim's self-confidence. Posting rumours about the victim to bring hatred in others' minds or to convince others to dislike or participate in online denigration of the target victim, often extends to the level of personally identifying the victim of the crime and publishing-related materials to defame and humiliate them (Finne, Knardahl, & Lau, 2011).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Doxing is the publishing of private or identifying information about (a particular individual) on the Internet, typically with malicious intent, and this is another way to harass the victim by disclosing victim's data including their real name (Nielsen & Einarsen, 2012), home address, workplace address, and other data on websites or forums. Finally, they become an expert to even do impersonation by creating fake accounts (Hoel, Rayner, & Cooper, 1999), posting comments or creating sites to publish material in their name that defames, discredits or ridicules the victims (Balducci, Fraccaroli, & Schaufeli, 2011). The mode includes texts or instant messaging facilities through digital devices or platforms that have taken different shapes (Notelaers, De Witte, & Einarsen, 2009). With a recent rise in smartphones and apps, more accessible forms of cyberbullying have emerged (Skogstad, Torsheim, Einarsen, & Hauge, 2011). The cascading effect on cyberbullying happens when users in the social media, pass on the information negligently or with the assumptions that the requesting source is said to be true, based on information on what other users are doing (Harold & Holtz, 2014). The tendency to use users' previous interests is what is called information cascading and it occurs quickly over social media. Nevertheless, it may be harmless too, but the bullies can make use of these search engines, and use the term Google Bombs (a term applicable for any search engine), to get the favoured posts sorted out by the most popular searches (Schat & Kelloway, 2003). Cyberbullying that uses search engines makes cyberbullying more severe to the victims (Rhoades & Eisenberger, 2002).

PSYCHOLOGY OF WORKPLACE PERPETRATORS AND BULLIES HARASSING WOMEN EMPLOYEES

The psychological makeup of a bully is very complex, precise and subtle enough to mislead the victims (Ferris et al., 2007), and the organization that assesses them cannot identify any of the negative traits in them since they can exhibit a normal personality in public, including when they work or interact towards their victims (Hodgins et al., 2014). Bullies believe they can force their way in and can get what they want, and they believe that since they lack basic social skills. They cannot perform any of the tasks related to even official work without harming others and believe that only bullying coworkers or workers working under them can help them to establish their social status as well as dominance. Most of the time, bullies may have ulterior motives, or have the aim to inflict pain on others. The personality characteristics of the bullies are very different and varied, and research studies across countries like Scandinavia, England, Japan, Netherlands, Canada, and United States found that bullies are a special breed with a specific set of conditions that is available for threatening or intimidating a peer (Einarsen, Hoel, Zapf, & Cooper, 2011). Research studies from various parts of the world have found that bullies learn their aggression very naturally (Polzer-Debruyne, 2014), to define a person as a bully is very difficult (Perreault, 2011).

Olweus in the year 2012, in his research for developmental psychology, found three core elements of bullying involving a pattern of repeated aggressive behaviours with negative intent directed from one child to another (Privitera & Campbell, 2009). Olweus (2012) states that the bully's aggressive behaviour is intended to cause distress and the chronicity of bullying (Hobfoll, 1989), and this is one of its intriguing features. The need to dominate, derive satisfaction by injuring others is evident, and this occurs usually from a lack of prosocial skills due to never learning attitude skills or how to relate well with others (Gorgievski & Hobfoll, 2008). The bullies often do not feel anxiety, a very important emotion that disables extreme emotions, but anxiety can be a milder form of human restraint (Tuckey & Neall, 2014), which is present in a normal human being (Tuckey & Neall, 2014). The bullies avoid

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

picking on anyone randomly, but rather they select their prey, as per the Toronto Psychologist, Debra Pepler states that they develop a relationship and relatedness over time (Finne et al., 2011). The bully starts with a glance and comment. This leads to setting up a terrifying sequence of emotions, like the anxiety, then the submissiveness signals to the bully that his or her aggression is working, and once victims are selected for aggression (Nielsen & Einarsen, 2012), the victims surrender to the attackers with submission. The other method is to pester the victim, and no two bullies do the same approach at any point in time (Hoel, Rayner, & Cooper, 1999).

Various aggression levels of bullies provide strong clues as to how aggression differs from one bully to another (Balducci, Fraccaroli, & Schaufeli, 2011). The bullies are out-and-out aggressive, and they do not need situations of conflict to set them off and are called "proactive aggressors" and "effectual aggressors" (Notelaers et al., 2009). The behaviour by these bullies is motivated by future rewards, like to obtain something, fulfill goals, and increase their arousal levels (Skogstad, Torsheim, Einarsen, & Hauge, 2011). They also do not possess any pro-social relationship. Schwartz found that aggression is a marker of every negative outcome that there is, and the bullies get locked into the patterns of aggressive and hostile responses with these rewards (Skogstad et al., 2011). The bullies often get outcaste from a normal lifestyle due to their hostile cognitive style of overt behaviour, and the ever-increasing contempt for the values of others (Harold & Holtz, 2014). Self-gratification, pro-sexual behaviour, drugging, and boozing usually are the habits that keep them busy, and their bullying social style drives their downward drift through life (Eisenberger, Huntington, Hutchinson, & Sowa, 1986). The women bullies usually involve in a subtle way than what men do. Their form of aggression is unique to girls and women, and it is usually termed as relational aggression, such as hurting others through manipulating relationships by spreading vicious and dangerous rumours in the peer group so that the other person rejects them. It can also include telling others to stop liking them to get even with their chosen person by trying to control or dominate a person using retaliation or social exclusion. The higher levels of bullying are threatening through the withdrawal of friendship, getting one's way to control another person's behaviour, or hurting someone via rejection, or using the exclusion of retaliation like removing their names from a party, etc. (Rainie, 2006).

HOW WORKING WOMEN CAN HANDLE THE BULLIES AND PREVENT THEMSELVES FROM BULLYING AT THEIR WORKPLACE

Women workers need to become more vigilant and use their intuition to safeguard themselves rather than relying on hearsay information about bullies. The bullies do influence the workplace very subtly (Hobfoll & Shirom, 1993) and they intimidate any victim (Hauge, Skogstad, & Einarsen, 2007). And, with women employees, they become more aggressive and severe (Leymann, 1996). It was found by Cillessen that group dynamics have a hidden purpose, and groups can fan the fire and keep the bullies and the victims fixed up in their roles, and carried away with a self-fulfilling prophecy (Polzer-Debruyne, 2014). The bullies often carry themselves with proactive aggression, by which if they make a women employee or any targeted victim feel pain, they feel victorious and it is self-fulfilling for them. Every small victory fulfills their ambition of being victorious with their aggression and it perpetuates in them, and this becomes their main self-fulfilling prophecy. Corrective actions do not heed to any actual correction in them nor can influence to change their thought process. Teaching victims social skills and assertiveness can evoke interest, but that alone is not sufficient (Van Laer, 2014). Hence, Madan (2014) recommends a few steps

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

for working women. Some of the strategies include reporting the matter to their colleagues and taking proactive steps and taking the support of their immediate colleague or friend to control the aggression of the bullies (Gorgievski & Hobfoll, 2008). Preventive actions in the UK for the women employees include the legal prevention methods, which are the inception of the Malicious Communications Act of 1998 (Eisenberger, Huntington, Hutchinson, & Sowa, 1986). This act refers to penalizing offenders for sending indecent, offensive, threatening letters through electronic communication that under section 43 of the telecommunication Act 1984 (Harold & Holtz, 2014). The protection from Harassment Act 1977 also works against making repeated threats of violence, and it leads to imprisonment up to 6 months.

A joint policy on the bullying menace needs to be drafted for dealing with the complaints and procedures so they can be adopted (Hinduja & Patchin, 2007). The policy needs to address the unwanted behaviours at all levels. Also, the approach needs to recognize the fact that all people who bully are not malicious, or do so knowingly, as a disguised part of commanding at work to get results, and this needs to be understood clearly (Hertz & David, 2008). The policy shall be developed to take care of a statement of commitment, which demonstrates a clear commitment on the part of the employer to tackle the menace of bullying. The policy should be made clear to the public that any such issues will not be tolerated or compromised, and the staff needs to be treated with dignity and respect at work at all times (Ybarra & Mitchell, 2007). It shall place and state clear definitions that cyberbullying is deemed unacceptable to narrow down on the mistakes committed (Patchin & Hinduja, 2006). The framework of the policies is to be outlined in a very clear manner so that the employers understand it to be used for preventing workplace bullying (Duggan, 2017). The organizations need to take steps to reduce the factors that are catalyzing to workplace cyberbullying or bullying, like increasing stringent actions against bullying and creating a safe work culture with a clear expression of zero tolerance for workplace harassment, especially on women. A step to curtail shady management practices and unethical leadership styles is required at all levels in any kind of organization (Hertz & David, 2008). The policies on the duties and responsibilities of the front line working people need to be strengthened to take adequate precautionary measures to prevent bullying in an organization (Kowalski & Limber, 2007; Mehari, Farrell, & Le, 2014). The organizational policies related to work culture need to state the trade union involvement and issues on the safety-related matters of the organizations. Policies need to include members who can educate the aspect of bullying as well as dealing with the complaints of working women, especially related workplace harassment. The organization requires partnership from volunteer working people to be part of the team who can be part of building confidence among the staff (Mehari, Farrell, & Le, 2014). Setting up a hierarchy of contact numbers, offices with different officers, especially women officers for women workers is important, and it can yield results. All the women employees must be assured of confidentiality and mental support by encouraging them to come forward to complain about the workplace cyberbullying or bullying, since many times the workplace harassment like bullying or cyberbullying goes unreported. The workplace needs to have a very professional women grievance cell so that any women employee can freely discuss the matters related to her concerns to the counsellor without fear because it can reduce concerns about bullying. Finally, organizational procedures need to have a state of the art training programme with the help of occupational psychologists to demonstrate how to convey the information to concerned people on the issues of workplace cyberbullying. The policy related to the reporting structure of all the existing staffs needs to be brought to the attention of all kinds of employees with varying designations like contractors, agency staff, patients, clients, visitors and so on to make matters transparent on the procedures available and that can caution the bullies too (Berson, Berson, & Ferron, 2002). The legal provisions can throw light on the outside contractors to comply with

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the policy requirements. The organizations should make the policy statements amply clear and should contain all the contract specifications (Burgess-Proctor et al., 2009). Hence, the training program on related policies needs to be included in the syllabus of the training, and all the women employees need to be included in the training to make them learn to go against the issues of workplace bullying (Keith & Martin, 2005). Matters related to health and safety from the training induction of the entire staff will generate positivity to combat cyberbullying issues (Hinduja & Patchin, 2007).

The training program shall be tailor-made with the following prerogatives like the details of the policy and its purpose of implementation (Patchin & Hinduja, 2006). It can also state the reporting procedures and the mode of reporting to concerned higher authorities (Ybarra, 2004). It needs to train on the procedures that are to be followed for raising complaints on the bullies and any kind of workplace cyberbullying for taking up the grievance handling procedure immediately as per the organization policy, and in case the necessity exists, to go further to file legal proceedings against the organization too (Bartlett & Barlett, 2011). The policy also needs to implement the components of formal and informal procedures for dealing with the complaints of bullying and the opportunity for the change in the behaviours are to be made clear along with informal and formal procedures for dealing with bullying complaints (Nielsen & Einarsen, 2012). All the departments are to make an appropriate reporting system for representation (Rodriguez et al., 2015), and if the person being bullied and the alleged bully is from the same department or section, they cannot both be represented by the same person, and they both should develop an appropriate system for representing the bullying cases (West et al., 2011).

FACILITATING COUNSELING FOR WORKING WOMEN ON WORKPLACE BULLYING

Facilitating counseling procedures in organizations need to be very specific to provide remedial procedures for identified and deserving cases of workplace bullying (Baillien et al., 2011). Accessibility to counseling and related psychological help is a must for every victim of bullying since bullying can affect any person's mental and physical well-being, and it needs to help workers cope better with the stress of being bullied (Hodson et al., 2006). The access to an independent professional counselling service provided by the trained counsellors needs to be kept strictly confidential and the counselling procedures related to referrals needs to be included in the policy and publicized (Ferris et al., 2007). The vulnerable groups among the women shall be identified and appropriate counseling against the risk from bullying and harassing needs to be offered (Hinduja & Patchin, 2009). The risk is very high on the young workers, those with work experience, and with mental health conditions (Smith, 2008). At times, these bullied women have the chances of suicidal intentions, and at times may keep away from work or may suppress all the suffering due to high level of fear, anger, stress, anxiety and depression (Hu, 2010). The next initiative shall be estimating the likely chances of any other harm and taking preventive actions to avoid or reduce the risk (Chapin, 2014). The employers need to strategize by tackling measures like the level of psychological impact that can happen to the women employees and the risk, with the levels of harm that may come on them (Hinduja & Patchin, 2008). When the bullying goes longer, the greater will be the risk of harmful impact and the vulnerable women may not be in a position to cope with them and may suffer from serious harm (Diaz, 2016).

Another part of the measure shall be controlling the problem after it has occurred, however, this is not an appropriate strategy (Smith et al., 2008), rather the most appropriate measure will be to prevent

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

cyberbullying from happening and reducing its consequences before anything happens (O'Keeffe & Clarke-Pearson, 2011). The measures could include providing information or training to the staff on the issues related to bullying, and clarifying what is acceptable as well as what is not (Ramasubbu, 2015). Improvising workplace culture and making a life of women workers shall be by taking proactive prevention measures (Pettalia & Dickinson, 2013). Recording and applying the findings related to cyberbullying on women in very critical for the employer, and an assessment needs to be done (Phillips, 2012), and it should have all the important findings and details of any group particularly at risk. Any other required step to prevent or reduce the risk of bullying needs to be applied (Görzig, Lara, & Frumkin, 2013).

The system needs to encourage mental support to seek support, and it needs to be clear with the counseling and rehabilitation of the victims. Additionally, it needs to include possible corrective actions on the bullies too (Kowalski, Schroeder, & Lattanner, 2014; Yang, 2013). This will be useful for the bullies to correct themselves if they are not aware of the chances for availing support from the organization (Sourander et al., 2010). The policy needs to be broad enough to accommodate any person to avail the facilitating factors associated with services giving mental support for the women workers, and since the social stigma does intervene (Einarsen et al., 2011). Also, women need to be counselled and encouraged to come forward to report and reinvigorate their self-confidence (Barlett, 2015).

CONCLUSION

The problems of workplace cyberbullying are manifold for working women in developing countries like India, which is an ever-ending part of behavioural research study for many researchers and organizations that are developing with a global vision. The ubiquitous presence of the Internet in recent years, especially in the workplace has indirectly influenced the act of cyberbullying; especially on the women employees, it has caught the attention of many researchers. The entire matter cannot be given in a single chapter, and it is not easy for any single side research to grab the intricacies inside the psychological problems that women undergo. The development of communication technology has augmented every kind of the workspace with digital platforms, which has improvised the speed and accuracy in the work but added certain work-life issues especially on women employees. Cyberbullying on female workers at the workplace generates negative implications related to the health of the victimized women, and with digital communication in place, this menace from the office is traveling with women to their home after work as well. The features of the executed methods of cyberbullying on working women through the digital devices like the smartphone, laptops, emails, texts, SMS, and other social media are readily available. Working women not only face this ill treatment during working hours, but face it through via email, and other social media platforms, and it occurs more than one time even in the method of status updates. Hence, now cyberbullying is considered a social epidemic. Workplace cyberbullying is an escalating process and often goes unrecognized by the victim. As it continues unabated by the victim due to helplessness, the intensity of the aggression increases and leads to many psychological hazards in the victim that even takes them to the level of committing suicide. Many such incidences have happened across the world, for which the statistical evidences are available at various authentic websites and peer-reviewed journal articles. The organizational culture and climate at times does contributes to increased workplace cyberbullying on women employees. The culture of cyberbullying as a social climate in the organization permits the escalation of workplace cyberbullying owing to perpetrators being not punished, or goes on without check, then the fear of coming to work increases in the victims, and it can even bring

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

down the productivity of the organizations. Some of the prominent reasons include the lack of social support for the women employees in the organization. Across developing countries of the world including India, where the lack of social support is what is considered the highest risk factor, social support needs to be rectified. Strong, vibrant, and dynamic social support systems have authentic and powerful legal provisions to curb this menace and to control workplace cyberbullying across organizations around the world. Some of the other reasons that working women suffer more than others are due to being the minority at work, and even in the management positions, they have the chances of facing horizontal bullying, or in other words get cyberbullied by their own colleagues. The new workplace cultures and styles of working practices emerging from the digital communication influence such as direct connectivity in the networking sites are making cyberbullying effortless especially on vulnerable women employees. Considering workplace cyberbullying on working women as a social malice and as a new phenomenon, intensive research from all the professional organizations are needed. The legal provisions to support women development needs to be stronger and more stringent from any kind of infiltration. The laws enacted needs to be implemented expeditiously and diligently, to the existing power structures in the organizations across the developing countries, as developed countries have almost sorted that in their organization structures. The most important preventive measure for protection of working women is the framing of stringent anti-bullying provisions that supports women employees and that can ensure rights to challenge for women victims against the offensive behavior.

Every country can have a national plan for Equality, Gender, Citizenship, and Non-discrimination and raise awareness for workplace sexual harassment and other forms including the cyberbullying, including provisions of measures like setting up internal dispute resolution mechanisms to curb differences among the working members, and, rule regulations related to conduct of employees including the employment law provisions. The effective coping strategies included in the syllabus needs to be introduced, adopted, which also requires support groups composed of victims sharing their experience that evolves into a case study from which others can learn. Hence, conceptualizing cyberbullying in the context of working women across the world may protect women employees in the organizations.

KEY TERMS AND DEFINITIONS

Cyberstalking: Kind of bullying that happens when any form of bullying or harassing with the use of electronic communication and it is used for threatening a victim.

Doxing: Is a kind of cyberbullying in the workplace or any place where the bullies search for and publish private or identifying information about a particular individual on the Internet, typically with malicious intent.

Hazing: Any action taken or any situation created intentionally that causes embarrassment, harassment, or ridicule and risks emotional and/or physical harm to members of a group or team, whether new or not, regardless of the person's willingness to participate.

Impersonation: A workplace harassment that the bullies use as an act of pretending to be another person for the purpose of entertainment or fraud.

Intimidating: Psychologically creating a situation to make the victim frighten or overawe (someone), especially in order to make them do what one wants.

Reactive Bullying: This kind of workplace bullying involves the bully responding to being a former victim by picking on others.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Relational Bullying: One way of bullying in the workplace, when a working women is purposefully excluding someone of a peer group, usually through verbal threats, spreading rumors and other forms of intimidation that brings down the morale of women in work.

Work Ethic: These are the moral principles that are used in the job, the working people needs to use in their job which can be strong, weak or mediocre, which embodies certain principles of work culture that can guide the workers, and control worker behavior to a certain extent, and can lead to high quality outcome, and makes workers to be on track.

Chapter 12
The Prevention of Work-Related Risks:
A Fundamental Principle for Organization With Purpose

Luis Gabriel Gutierrez Bernal
Fundación Universitaria del Area Andina, Colombia

Maria Alexandra Malagon Torres
Politecnico Grancolombiano, Colombia

Helga Ofelia Dworaczek Conde
Fundación Universitaria del Área Andina, Colombia

ABSTRACT

The goal of this chapter is to present how security and safety in the workplace, humanistic management, and humanistic psychology have become a fundamental pillar for the fulfillment of business objectives and the intervention on social and environmental issues, all the while recognizing human talent as the main axis for organizational development. For this purpose, the authors rely on two main axes: the first, the prevention of occupational hazards abiding by the guidelines established by different international organisms, including the implementation of governmental policies for the management of occupational safety and health in Latin America and mainly in Colombia; the second, the point of view of business administration, starting with their evolutionary process and leading to the new tendencies in administration such as B companies and businesses with purpose, all of which focus on an economy where success is measures by the wellbeing of people, societies, and nature.

INTRODUCTION

Organization with purpose seek to redefine the meaning of economic success and wish to develop sustainable capitalism. These companies intend to be not the best in the world, but rather for the world, that is to say, for their stakeholders and, above all, for their employees, facilitating not only their development as people but also caring for their health and seeking their integral wellbeing. For this, it is necessary to intervene in the work environment, the characteristics of the task, and the administrative conditions, all of which are determinant to the health of employees. In general terms, people with a job are in better health than those without and good workplace conditions are associated with better levels of health and wellbeing, not only in employees but also within their families and in society as a whole (ISTAS, 2013).

The above is represented in companies that transcend the traditional version of management; rather than focusing on control and orders, they work on inspiring as well as redefining control, and passion for what is done (Largacha, 2019).

Organization with purpose work on and internalize the dimensions established by Largacha (2019) as follows: social impact and exclusive practices transcended traditional administrative and management practices and had a reflective attitude toward life and companies where dignity and authenticity are guiding lights. This is where the prevention of occupational hazards becomes important in the development of an employees' quality of life, framed in sustainable development goals number 3, Health and Wellbeing, and 8, Decent Work and Economic Growth (UN, 2015) as well as in the II Latin American Strategy for Safety and Health in the workplace 2015-2020 (OISS, 2016), creating purpose not only outwards, but toward the interior of the organization using its most important tool, human talent.

One of the instruments that allows companies to integrate the aspects described above is the management system for Safety and Security in the Workplace, which, according to the ISO 45001:2018 guidelines, is understood as the compilation of connected elements within an organization that interact to establish policies, objectives, and processes to reach these objectives. This management system is characterized by providing a method to evaluate and improve results in the prevention of work-related incidents or accidents through efficient management of the dangers and risks (ILO, 2011).

This chapter aims to establish that, for companies in general and particularly for those titled with purpose, it is of vital importance to assume dignity and human values as fundamental pillars, becoming actively interested in the development of each person's potential within the organization in order to generate a balance between mission, vision, objectives and caring for employees. This is achieved by understanding occupational health and safety (WHO) as a principle that looks out for the wellbeing of employees and, through this, giving solutions to current social and environmental issues.

METHODOLOGY

Several documentary sources were used to find bibliographic resources, developing a search in academic databases such as Scopus, ScienceDirect, Dialnet, Redalyc and Scielo; as well as a search using the "google academic" tool using the descriptors: Organizations with purpose, B corporations, Business Administration, Humanist Psychology, Humanist Management, Work Safety, and Work Health. The records obtained after searching with the different descriptors, ranged between 95 and 23. In the same way, an analysis of the evolution of standards related to health and safety at work in Colombia and at

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the international level was carried out, establishing features that accomplish as the basis for achieving the objectives proposed by Organization with purpose.

The development of this topic is sustained by two theoretical components: 1) Safety and Health in the workplace and 2) Business Management and Organization with purpose.

OCCUPATIONAL HEALTH AND SAFETY MANAGEMENT SYSTEMS - OHSMS

Throughout many years profitability has been the main objective of businessmen and investors (Izquierdo 2016), who, through the management of administrative, productive, financial, technological, and market processes seek to shape an efficient productive system, where the human factor is presented as just one element more for the achievement of this purpose. This is how the interaction of human beings with these processes has generated working conditions that greatly influence the creation or risks that affect the safety and health of employees (ISTAS 2020). Therefore, the protection of employees has become a challenge for governments and institutions on a global scale (ILO 2019), all of which must address this issue based on a series of parameters and strategies within the field of occupational health and safety (OHS), with the goal of working for dignified working conditions.

OHS Global Context

Currently, working conditions are causing an impact with important accident figures: according to the International Labor Organization - ILO, on a global scale there are 374 million lesions every year caused by non-fatal incidents in the workplace and more than 2.78 million people lose their lives due to work related sickness or accidents. It is estimated that 1,000 people die every day in the world due to work related accidents and another 6,500 die due to work related illnesses (ILO 2019), implying economic costs due to missed labor days, interruptions in production, formation and reconversion of personnel, and medical expenses, amongst others; all of which may come to represent 4 to 6% of the global GDP and that, in turn, generate intangible costs related to the resulting human suffering (ILO 2020), The Federation of Colombian Insurance Workers (FASECOLDA by its acronym in Spanish), indicates that by the year of 2019, 655,570 work related accidents, 564 work related deaths, and 9,690 work related illnesses were presented in Colombia. Likewise, by the year of 2017, 189,112 work related accidents, 95 work related deaths, and 3,686 work related illnesses were reported in Bogota.

Since the creation of the ILO in 1919, a system of policies and guidelines has been established on a global scale, with the goal of improving the conditions of human beings by promoting decent labor and safe working conditions, thus constituting a frame of reference for other countries. Currently, this organization has 187 member states and its tripartite structure congregates representatives for governments, employers, and employees with equal voice and vote to discuss topics related to labor and share experiences through social dialogue to generate different action strategies from the technical, academic, political, and economic (ILO 2020).

For the World Health Organization (WHO), healthy workplace is defined as:

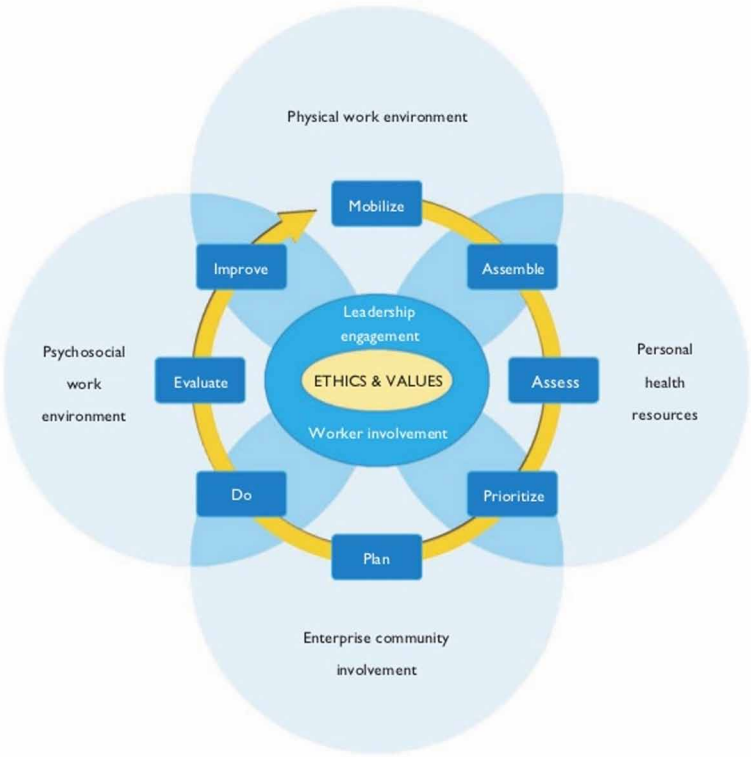
"...One in which workers and managers collaborate to use a continual improvement process to protect and promote the health, safety and well-being of all workers and the sustainability of the workplace by considering the following, based on identified needs:

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- *Health and safety concerns in the physical work environment;*
- *Health, safety and well-being concerns in the psychosocial work environment, including organization of work and workplace culture;*
- *Personal health resources in the workplace; and*
- *Ways of participating in the community to improve the health of workers, their families and other members of the community".*

For this purpose, the organization seeks to implement a model through flexible and adaptable theoretical frameworks in different countries where, through practical guides, it aims to reach sectors, companies, and cultures for the improvement of health in the workplace (WHO 2010).

Figure 1. WHO healthy workplace model: avenues of influence, process, and core principles
Source: WHO Healthy workplaces: a model for action



Another determining international parameter is that established by the United Nations when they formulated the Sustainable Development Goals (SDG), within which objectives 8 and 3 are raised and take into account specific topics related to decent work, health, and wellbeing (UN, 2015).

Likewise, on a regional level, the Pan American Health Organization (PAHO) considers that workplaces constitute a priority environment for the promotion of health, where productivity is favored equally to motivation and satisfaction in the workplace and, therefore, quality of life as a whole (Barrios & Paravic, 2006). On the other hand, the Latin American Organization for Social Security (OISS, by it acronym in

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Spanish), decided to adopt the Latin American Strategy for Safety and Health in the Workplace (EISST, by its acronym in Spanish), which is created as a possible strategy, adapted to the reality of the region and consensual in a tripartite agreement by governments, business organizations, and syndicates (Guzmán, Oceguera, & Contreras, 2017). It was elaborated in accordance with the Strategic Framework of the European Union in matters of Social Security in the Workplace 2014-2020; the Promotional Framework for Safety and Health in the Workplace by the ILO; the International Action Plan concerning the Health of Workers 2008-2017 approved by the WHO; and the Development Objectives of the Millennium beyond 2015; and has taken as a baseline the International Declaration of Human Rights; the International Pact for Economic, Social, and Cultural Rights; the Regional and Sub-regional Pacts (UN 2020).

Given the above, the OISS proposes that it is through this strategy that those interested in Safety and Health in the Workplace may have access to prevention and protection policies concerning occupational hazards and guaranteeing the continuous improvement of labor conditions.

Figure 2. Institutions that govern OHS on a global scale
Source: Own development

In Latin America, leading companies seeking a good reputation on a local and international scale with the goal of being socially responsible, have adapted important strategies related to OHS, starting from the basis of complying with requisites established by each country and by their own labor conditions. Due to this, constant challenged arise that must be surpassed in order to achieve efficient OHS management systems like the ones evidenced below in different countries:

The table above discusses different characteristics and points of view in Latin American countries, where the common element for the implementations of an OHSMS is that there must be commitment and culture from all business levels, particularly management. Likewise, it is highlighted that in order to achieve prevention of work related accidents and illnesses, it is necessary to consider OHS as inseparable to productive processes and responsibilities on a hierarchical scale, a fundamental aspect to achieve dignified labor conditions allowing for the fulfillment of objectives set by all the interested parties.

As a Latin American country, Colombia has been distinguished for generating a regulatory development, an administrative structure in OHS, and a series of strategies to transform the system of occupational hazards into something more fair, equal, and efficient (Min. labor 2020). This is how, through the participation of different actors of the OHS, such as the National Committee for Occupational Health and Safety, the academy, investigation centers, Labor Risk administrators, companies that promote

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

health, government entities, sectors, employers, syndicates, and employees, the National Plan for OHS 2013 - 2021 was formulated, contemplating the alignments of international organizations as well as the particular needs in the country.

Table 1. Perspectives on OHS - methodologies

Country	Description
Colombia	Despite the fact that there is a legally approved OHSMS in Colombia, Vega-Monalve (2016) states that the reasons that do not allow for its fulfillment are related to organizations and may be surpassed if synergetic work takes place amongst the interested parties. It is established that, in order to incite the culture of safety in all levels of a company, the core change is based on the levels of commitment in the high management.
Cuba	Céspedes and Martínez (2016), completed an analysis on OHS in the Cuban business system and found that deficiencies due to limited systematic control are related to the lack of configuration within internal processes of the companies, given that the responsibility of an OHSMS falls on the person in charge of OHS and not on the businessmen and directors of the companies. This is due as well, in part, to low business culture.
Spain	Fernández (2006) proposes an organizational model in Spain that is focused on safety integrated in the productive process and the hierarchical levels of the company by conceiving labor safety as inseparable to the processes of production and its functions are transferred to the hierarchical line. It is considered that the organizational, cultural, and management elements have a crucial role in the causation of accidents and incidents, in detriment to technical factors.
Ecuador	Villacrés, Baño, and García (2016), a year after developing and applying a model for the implementation of an OHSMS, observed that the integration of the management system from hierarchical levels allowed the whole organization's comprehension of the raison d'être of the system and the impact it had on safety and the workplace environment. Likewise, this implementation allowed them to validate the procedures of the OHSMS and, finally, to improve the indicator of efficiency in the system at a general level, thus diminishing the index of occupational hazards.
Dominican Republic	Durán (2016), designed a model for the formulation of OHS programs in small and medium sized enterprises - SMEs; coming to the conclusion that there is a high cost involved in completely complying with the requirements of the OHS Program given the regulations in this country. It is shown in the analysis that the support of the government is focused on supervision and vigilance rather than in technical support for the prevention of occupational hazards.

Source: Own development

From this, four strategies are established:

- Promotion of Occupational Health and Safety as transversal to public policies.
- Strengthening Occupational Health and Safety on an institutional level.
- Strengthening the promotion of safety, health of employees, and the prevention of occupational risks.
- Optimization and warranty regarding recognition of benefits for the employee within the general system of occupational hazards

The aforementioned strategies are focused on promoting the structuring of OHSMS with the goal of achieving better results in the prevention of work related accidents and illnesses, working for dignified labor, health, and wellbeing.

The Occupational Health and Safety Management System - OHSMS in Colombia has markedly evolved in recent years due to regulatory changes that have Decree 1562 of 2012 —wherein the structure of the General System of Occupational Hazards was modified, transforming the Occupational Health Program, with a mainly documentary development, towards an OHSMS framed within a continuous

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

improvement cycle— as a baseline (Gutiérrez and Malagón, 2017). However, all these legal, institutional, and administrative efforts have presented multiple challenges for their implementation, as evidenced by the low development levels of OHSMSs in companies and therefore in the true impact of employee health (Gutiérrez,. Ortiz, &. Malagón,, 2019).

The OHSMS is a logical process in stages that includes policy, organization, planning, evaluation, audit, and improvement actions (Colombia, Presidency of the Republic, 2015), and, according to the Single Regulatory Decree of the Labor Sector 1072 of 2015, a compilation of related elements that interact through a process based on continuous improvement that includes four phases: planning, doing, verifying, and acting designed to anticipate, recognize, evaluate, and control risks that can cause work related accidents and illnesses as well as the improvement of conditions within the work environment, all of which implies the promotion and maintenance of physical, mental, and social wellbeing of employees in every occupation, in such a way as to be able to complete their functions in accordance with the purpose of the organization and the society.

Risk management is one of the main activities for the coherent development of an OHSMS. Risk management is understood as the process of identifying the vulnerability of different populations (employees, in our case) before a threat and analyzing the possible consequences (Gómez, 2014). On a general level, risk management references methods and principles established for the control and prevention of risks faced by employees on a daily basis, given that they find themselves immersed in working conditions within which they go about their functions, conceiving these conditions as any aspect of the job that might result in negative consequences for health, which also includes technological and environmental factors as well as organizational work aspects (ISTAS, 2020).

Hereafter, we will describe the evolution that has taken place within business administration from its origins up to the concepts and new tendencies that are currently being developed on a global scale.

EVOLUTION OF BUSINESS ADMINISTRATION

Kootz and Weinrich (1998) have established that, since the origins of humanity, people have sought the formation of groups with the goal of reaching goals that are impossible to achieve on an individual scale. In this process, administration has always been of vital importance, given that it allows insurance that all efforts, resources, and activities will be developed in a coordinated manner in order to achieve the effective fulfillment of planned goals.

The term "Administration" has its origin in the Latin *ad minister*, where the **prefix** *ad* references "taking direction toward" or "tendency toward"; *minis* refers to "realizing a comparison" or "indication of inferiority"; and the **suffix** *ter* determines "a character of subordination or obedience". All of this indicates that the term, in its origins, signaled the function or activity that is completed under the instructions or orders of another. Additionally, the Latin term *ad manus* may also be cited as an origin of "Administration", given that it means to manage or operate.

However, the origin of the word that is now understood as Administration must not be understood merely by the literal definition of origin. All the synonyms that reflect or have a relation with the idea the term refers to must be taken into account (Torres and Mejía, 2006). Keeping this in mind, from its Spanish origins, Administration comes from the term *ministro*, which is derived from the term *menester*, which, in turn, descends from the Latin *ministerium* and is related to service, employment, or task to be completed; or the Latin *minister*, which means official server (Corominas and Pascual, 1984).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

From the studies specifically regarding the administrative area, Administration references the management of operative aspects in a company or organization and, if we keep the term's translation in English in mind, the interchangeable use of *administración*, *gestión*, *dirección*, and *gerencia* with the English terms Management and Administration.

From the study of Administration, the theoretical bases for Contemporary Administration come about by the end of the XIX century, motivated mainly by the need to find methods that responded to the organizational needs of the time.

The apparition of monopoly-type capitalism, in turn, lead to the increase of importance in Administration, generating an interest for the study of practical as well as theoretical issues in organizations (Domínguez, 1989).

Scientific administration also has its bases in the management problems faced by Administrators in the new industrial complex. The first approximations to administrative theories where divulged in the book The Cost of Manufactures and the Administration of Workshops, Public and Private, which is considered the precursor of administrative science (Calleja, 1990).

Throughout the first years of the XX century, administrative science originated the Classical School of Administration, which developed under the context of the complexity experienced by the industry in that time. Due to this, the focus of administration was ser on the simplification of tasks and complex activities, turning them into routine and standardized processes through the hierarchization of the structure of the organization, establishing supervision processes and achieving, thus, the improvement of results. Two different, but complementary, facets come out of that period: on one hand, Frederick W. Taylor's School of Scientific Administration and on the other Henry Fayol's Anatomic and Physiologist School. (García, 2009).

Thus, Ordways Tead's statements (Art of Leadership, 1935) begin to become popular and the interest for administration surges with a physiological focus, which developed an interesting focus on leadership in organizations (Chiavenato, 2001). Fruit of the pragmatism and based on the basic studies of experience and observation, with the goal of finding what is working in companies, the Empirical School comes to be at the beginning of the 40s. Its prime representatives were Peter Drucker and Ernest Dale (Marx and Hillix, 1974).

The crisis of the 30s in the XX century highlighted the importance of having organizations that are effective, provoking a complete revision of the core administrative fundamentals that had been considered dogmas and seen as pre-established thus far.

By the 50s the School of Structuralism was born, which carried with it a re-conceptualization of the elements of Bureaucratic Theory, characterized by being formal but keeping a sort of relation with the focus of the School of Human Relations, which had a more informal character.

In the first years of the 80s, Participative Administration is initiated, which brings the client to the center of studies, generating important innovation processes in all areas of an organization. Authors Peters and Waterman (1982) publish their work In Search of Excellence while Peters and Austin (1985) publish A Passion for Excellence, both of which focus on the challenge organizations face when responding to challenges and needs regarding changes in the environment (García, 2009).

In the 90s, organizations were transformed from pyramidal and hierarchical structures into structures that are more similar to flexible nets; as a part of this change, administrative functions were delegated to lower levels, obliging the high management to fulfill duties regarding organizational leadership. All of this was propelled by a need to be more flexible as well as more competitive in a more complex and dynamic competition (Payne, 1999).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Reaching the close of the XX century and the start of the XXI century, human capital and knowledge have begun to dominate in production and physical capital is regarded as an important complement. Globalization has added new levels of complexity to decisions and, those that are capable of managing that complexity are more often individuals with a good administrative formation. In the world today, almost everything becomes obsolete at a surprising speed: business concepts, product designs, competitive intelligence, capital equipment, and every type of knowledge have increasingly diminishing intervals. Companies and individuals rarely triumph when they are static and attempt to live in the past. The era of industries with a poorly qualified labor force is over and we have entered the era of highly specialized industries, which implies that economic, individual, business, and national success depends on specializations.

Currently, we are living in a so-called Fourth Industrial Revolution (Revolution 4.0), which brings about not only new opportunities but also new challenges that must be faced. Big changes in production systems; new technologies that allow for the acquisition, treatment, and mass use of data; the internet of things; 3D printing; big data; artificial intelligence; collaborative robotics; and virtual reality are the fundamental advances upon which the new industrial model's development will pivot (Alfaro, Belloví, & Pérez, 2018). Parallel to the above, administrative models must continue their evolutionary process much like companies are realizing that success does not depend only on the accumulation of profit (Barroso, 2018) but on the contributions the company makes to the improvement of the environmental and social conditions of humanity.

Taking all of the above into consideration, the category of Organization with purpose, B Companies, or Companies with a B certification known in the U.S. as Benefit Corporation (B Corps) was created. These companies use the power of the market to give solutions to environmental and social issues through the development of solid administrative models, which allow them to increase the probability of sustaining themselves over a long period of time and managing risks in an efficient manner. A revision of 200 academic studies found that "86% of the sources revised establish that companies with practices geared toward sustainability and care for human resources show better operative performance, which eventually translates into cash influx; likewise, 80% of them show that these sustainability practices have a positive result in the performance of investment" (Benefit Corporation, 2020).

Organization With Purpose

According to the 2020 conference on conscious capitalism, there is a belief that business is good because it generates value, is ethical because it is based on voluntary exchange, is noble because it can elevate our existence, and is heroic because it brings people out of poverty and creates prosperity. Free Enterprise Capitalism is the most powerful system ever conceived for social cooperation and human progress. It is one of the most convincing ideas humans have ever had. But we can aspire to even more.

Currently, the realities of Society 5.0 which contemplates technological, economic, geopolitical and mental changes (Gallardo, 2020) and fourth industrial revolution make companies face different challenges, amongst them, technology; however, it becomes essential that these processes be oriented toward the strengthening and protection of the human being. This is how Organization with purpose are born, constituting themselves as an emerging phenomenon with the potential of pushing transformations toward sustainability and operating with high standards of management and transparency; these companies are known as B Companies, which propose transformational models that point towards a paradigm shift. The existence of a considerable number of companies that could prosper within this model will be a

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

practical demonstration that the private sector may perform a constructive role in the solution of social and environmental issues (Correa, Abramovay, Gatica & Van Hoof, 2013).

B Companies

These companies were born in 2006 in the United States of America, where it is certified that businesses have the improvement of society as a goal. This movement that rose in the U.S. extended, later, to Canada, Latin America (known as B system), Australia, New Zealand, and Europe (where R4S is the main partner of B Corporations in Spain). It is now present in approximately 43 countries, 130 economic sectors, and 1,609 certified companies (bcorp, 2020).

Honeyman (2015) defines B Companies as a new market identity that is expressed through a collective brand, which creates public and common goods using the force of the market and maintains the goal of profitability while generating a positive impact in society by worrying about the interests of all partners, employees, providers, clients, community, and environment. B Companies are recognized by the slogan "Not only being the best in the world, but the best for the world".

According to the Sistema b movement (2020), the main compromises of B Companies are:

- Purpose: create a business model with a positive impact that outlines activities for the benefit of society and/or the environment along with high standards of compliance.
- Legal responsibility: starts with the company's statutes, where it defines a positive impact on society and the environment through specific responsibilities, which must be updated every two years when the B Corp certification is updated.
- Transparency: they must publish an annual report certified by an external and independent entity that endorses performance in diverse operative areas according to the business model that was proposed. Additionally, they must publish in their institutional web page the specific score received in each evaluated area.

The NGO called B Lab, headquarters in Pennsylvania U.S., is in charge of the certification process of B Companies on a global scale; however, given recent growth, it has required the help of sister organizations such as Sistema B (South America), B Lap (Europe), MaRS (Canada), and B Lab (Australia). The "B Corp" certification guarantees organizational sustainability, the company's commitment to comply voluntarily to elevated social and environmental standards through a self-evaluation related to governance, an environmental protection policy, attention to all employees, a relationship with the community and stakeholders, and an evaluation of the social purpose of the company along with its positive impact. Likewise, a certification implies the acquisition of commitments to transparency and the measurement of impact (compromiso empresarial, 2020). Of all the aforementioned standards, attention to all employees is highlighted, as they must be able to count on all the health and safety conditions to be able to be a part of productive processes and quality services that respond to clients' needs as well as social and environmental requirements.

In the words of Pablo Sánchez, B Corps coordinator in Spain (2020): "The B Corp certification becomes something like the seal of fair commerce, but for the company as a whole and not a specific product. B Corp values the totality of a company: that it is well managed, that it has an impact on society, and that it is a good corporation".

Humanistic Psychology

The administrative processes and management strategies regarding human talent have been going through a large transformation that can be noticed whilst revising literature that refers to the evolution of humanistic psychology. Humanistic Psychology can be found starting in the 30s with Allport (1937) and Murray (1938), both of whom confronted behaviorism by conceptualizing personality and motivation as specifically human needs.

By 1940, the concept was reformed by Rogers with the use of new therapeutic tendencies for employees and Maslow with the theory of human motivation. Additionally, in 1950, Maslow expressed his 10 principles for self-realization. This is how the 60s saw the union of different authors under the label of "humanists", amongst them: Allport, Maslow, Murray, Kelly, Rogers, and May, all of whom believed in the union between humanism and scientific psychology (Smith, 1982).

In summary, Rogers (1986) states that humanistic psychology produces an impact in the socio-cultural spectrum, in learning, and in experiential knowledge. In this order of ideas, the pragmatic principles described by Buhler and Bugental reinvented for principles of Buda as follows:

- Focus attention on the person that experiences, in experience as the primary phenomenon of the study of man. Both theoretical explanations and manifested conduct are considered subordinates of experience itself and its meaning to the person.
- Emphasize specifically human qualities such as choice, creativity, assessment, and self-realization, as opposed to the conception of human beings in mechanistic and reductionist terms.
- Remain loyal to the criteria of meaning in the selection of problems and procedures in investigations, as opposed to emphasizing primarily objectivity.
- Commit to values and human dignity and become interested in the potential development inherent in every human. The core of this vision is the person as they discover themselves and relate to other people or social groups.

Humanistic Management

Humanistic management, which conceives the employee as the central axis, is one of the elements contemplated by new tendencies in administration and is characterized by business sensibility. According to Llano (2012), humanistic management is framed in four main principles:

- Gradualism: through observation and discovery, organizations must perceive the human reality described in a large variety of diverse elements, aspects, and nuances; wherein communication is essential before technique and what matters most is action and participation in processes.
- Complementarities: it is necessary to adopt new ways of thinking that are bases in sensitivities toward the plurality and diversity that defines current reality. By developing spaces for complementarities as well as proactively, synergy, collaboration, and solidarity practices the company generates gain for all involved through the active exercise of humble and appreciative communication that multiplies on the basis of respect.
- Integrity: developing intelligence processes that give way to management of the complexity of the human being by focusing the business vision on creative potential, emphasizing where the company aims to reach, with whom, and how.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Solidarity: business reality requires forms of interaction, coexistence, and interpersonal relationships that create favorable conditions to offer stability, solidity, and collaboration while enhancing the wellbeing of humanity and society.

Additionally, Del Grosso (2000) presents the need for close collaboration between organizations and interdependent human resources that promote development and mutual benefits. Thus, labor knowledge furthers experience, multidisciplinary abilities, and collaborative learning that share knowledge in strategic networks of information or communication, boosting opportunities. These actions generate constant learning, based on commitment, collaboration, and excellence, achieving the strengthening of creativity and innovation.

In this context, Melé (2003) presents the human condition as oriented to the development of all human virtues in diverse forms and extensions.

In the same vein, Pérez (2010) presents ethics as the element that strengthens the positive concept of humanity, holder of reason, goodwill, and a great capacity for collaboration in a context of personal and social development through interrelations created by the company in accordance with modes of labor and the values that intervene in decision-making.

According to Kimakowitz, Pirson, Spitzeck, Dierksweier and Amann (Humanistic Management in Practice, 2011), humanistic management is based on:

- Unconditional respect for human dignity, humans are perceived as a resource and not as an end to comply with tasks.
- Incorporating ethical aspects in administrative decisions, decision making based on respect for human values due to the individual's contribution to the achievement of organizational goals.
- Dialogic extension of a business ethical reflection, management of shared responsibility by the manager where spaces for argumentative dialogue are consolidated to give people a feeling of satisfaction regarding decisions taken.

In 2015, Novoa presented the three moments of study focused on humanistic management and recognized:

- Elton Mayo and Abraham Maslow, who focused their studies on human motivation for the achievement of better results.
- Deal and Kennedy (1982) and Shein (2001), presented the study of organizational cultures and their impact on business results.
- Melé (2003), who focuses his study on social structures, relationships, and a sense of unity as higher purposes and concrete objectives that mobilize society,

Gorrín (2017) defines humanistic management as the dignifying of the human being in business administration posts, entrepreneurships, and diverse groups. Additionally, he evidences the transformation of structures for the improvement of managerial processes, orientation based on competencies, knowledge management, mental models, team learning, and complete quality amongst the main ideas exposed by this author.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Given the above, a clear posture from administration and humanistic management is recognized, which relates directly to the purposes of OHS, where the employee is conceived not as a resource more for the achievement of goals, but rather as a human being with potential, creativity, and expectations that can be developed in the best way via granting the possibility of developing their work in dignified work environments.

RECOMMENDATIONS

It is fundamental in the development of Occupational Health and Safety Management Systems to have considerations related to humanistic management and humanistic psychology as bases within organizations, keeping in mind that for both of those ideologies the employee is the center of attention as it should be for any OHSMS, given its primary objective of guaranteeing safe and healthy working conditions that lead to the prevention of work related accidents or illnesses.

Thus, Organization with purpose or B companies may execute their intentions of intervening positively on the environment and society; in other words, the external sector. However, it is fundamental that these companies maintain an introspective vision of their own work conditions, concerning themselves not only with the interests of their partners, providers, and clients but with their human talent, ensuring the provision of a dignified working environment, without which corporate sustainability and success would be difficult to obtain.

Regulations should exist in different countries to incite the effective intervention of labor risks as well as the creation of organizations with purpose, given the benefit that these generate for employees, their families, society in general, and the planet.

CONCLUSION

Knowing the relationship between the principles of safety and health at work and the objectives established by companies with purpose, mechanisms must be developed to promote their appropriation by all organizations, focused on the well-being of its workers and the solution to social problems and environmental all together.

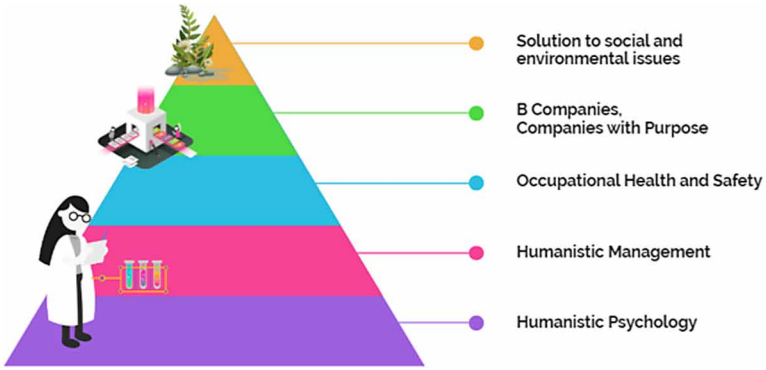
Taking the theoretical concepts exposed above as a starting point, a high level of interrelation between B companies, humanistic management, and humanistic psychology and risk management and safety in the workplace is evident. This, keeping in mind that humanistic psychology is based on the behavior of the employee, on the unconditional respect for his/her dignity, and in conceiving him/her as an active and integral part of business decisions. On the other hand, humanistic management appears as a medium through which this human talent may be administered while maintaining the consideration of it as just that, a human being. Understanding the potential, experience, and initiative of human talent makes it possible to achieve goals and, what is more, the improvement or solution of environmental or societal issues that affect communities.

B Companies aim to work for an economy where success is measured by the wellbeing of people, societies, and nature (bcorp, 2020). Companies that follow this philosophy obtain benefits such as: continuous improvement, diffusion, recognition, knowledge exchange, talent attraction, and possibility of sales to other B Companies, amongst others. Likewise, the businesses that implement OHSMS in

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

a conscious manner have the possibility of obtaining economic benefits sustainable from the perspective of the social responsibility of the business (Silva, F., 2016). This is how these initiatives represent advantages to businessmen that develop them in their organizations, but they require high levels of managerial commitment.

Figure 3. The employee as a base for organizations with purpose
Source: Own development



Cifuentes, Blanco, Gutiérrez, and others (2017), through a diagnostic of the development in OHS in large private companies in Bogotá, Colombia, found that 79% of organizations implement risk management systems oriented toward accomplishments complimentary to the OHSMS such as, maintaining institutional image, ensuring the continuation of the business, preventing economic losses, and complying with regulations. Thus, companies relegate the fundamental principle of these management systems, the protection of the employee, to an afterthought; they take prevention as a marginal and discretionary responsibility that depends on the goodwill and solidarity of managers, taking it on reactively in the case of work related accidents or illnesses. Zamora (2011), demonstrates that, in many cases, the implementation of this type of initiatives —such as prevention of occupational hazards and the intervention in environmental and social needs— arise more as the consequence of coercive and regulatory actions by the countries than as the conviction of a company that believes in the benefits as Organization with purpose do.

Chapter 13
The Positive Face of Human Capital, Psychological Capital, and Well-Being

Olcay Okun
https://orcid.org/0000-0002-7096-5794
Hasan Kalyoncu, Turkey

ABSTRACT

This chapter analyzes the relation between Positive Psychology, Psychological Capital, and Well-Being. Positive psychology pursues information that flourishes on life. Positive psychology improves the quality of life and investigates the paths towards positive individual characteristics and developing communities through actions that increase well-being and prevents discomfort in situations where life is vicious and meaningless. Psychological capital is associated with many positive results for employees and the organization and promises to increase productivity in today's workplace. In this chapter, the transformation of positive psychology into the concept of psychological capital is explained in the field of organizational behavior, and the state of well-being and psychological capital are examined from a theoretical perspective. Besides, it is explained how psychological capital improves employee wellbeing. Psychological capital and well-being are very effective concepts on employee workplace performance, and there are strong relationships between them.

INTRODUCTION

Today's organizations need resources to differentiate themselves from other organizations and provide a sustainable competitive advantage in an increasingly competitive environment. So, traditional approaches no longer suffice in creating sustainable sources of distinct advantage (Kraaijenbrink, Spender, & Groen, 2010). The resources and capabilities of an organization include all the financial, physical, human, and organizational assets that an organization uses to develop, produce, and deliver products or services to its customers. Economic resources include debt, equity, retained earnings, and similar resources. Physical resources are machines, production facilities, and buildings. Human resources include all experience,

knowledge, judgment, risk-taking, and wisdom of individuals associated with the organization. Organizational resources include the firm's formal reporting structure, open management control systems, and compensation policies, as well as the history, relationships, trust, and organizational culture that are the characteristics of groups of people associated in a firm (Barney, 1995: 50). The most crucial resource in the field of organizational management is human capital and Unlike traditional financial capital and tangible assets, social capital, positive psychological capital can be developed at relatively little monetary cost (Luthans et al., 2004).

Organizations derive their competitive advantage from organizational culture, history, and routines that are difficult to emulate, beyond financial or strategic tools. Today, physical and organizational resources can be copied and imitated by benchmarking and "me too" strategies. Information technologies, which have been the primary source of competitive advantage until today, have reached the same level in almost all companies with decreasing costs and reverse engineering. These developments indicate that traditional sources of competitive advantage are no longer sustainable (Luthans & Youssef, 2004).

Psychology has long been fascinated by the dark side of human existence. During this period, psychology students were given necessary information about human weaknesses, and the pathology model attracted the attention of young, creative minds that shaped the academic and applied branches of psychology. In this process, negative psychology was accepted and studied, and until the last half of the 20th century, psychology made a limited contribution to understanding human virtues (Snyder & McCullough, 2000).

The American psychologist Martin Seligman is seen as the founder of today's positive psychology movement. A few years after Seligman were elected President of the American Psychological Association (APA); in the early 2000s, the APA published a special issue on positive psychology. Within five years of the publication of this special issue, a movement called the positive psychology movement emerged. Along with this trend, many publications, special issues, and books on positive psychology have been published. Conferences bringing together researchers from many parts of the world have been organized, and many aids and awards have been created to facilitate the work of young researchers. Positive psychology courses started to be given in universities and high schools. Those interested in positive psychology have been amazed at how quickly this train is progressing (Gable & Haidt, 2005). Seligman and Csikszentmihalyi (2000) defined the goal of positive psychology as to focus on psychology, to stimulate a change that focuses on creating positive qualities rather than just repairing the worst things in life.

Positive psychology is a discipline that focuses on developing positive traits of individuals, having positive experiences, and preserving their mental health through programs that increase their subjective well-being. Positive psychology has attracted the attention of researchers since the 2000s and has become a positive psychology trend. Under the leadership of Seligman, the well-known research-oriented core group such as Ed Diener, Christopher Peterson, Rich Snyder tries to direct the goal of positive psychologist psychology to focus on the strengths rather than focusing on weaknesses, improving and enhancing well-being instead of focusing on weaknesses in humans (Luthans et al., 2007b) . Positive psychology aims to improve the quality of life, to investigate paths to positive individuals and developing communities through actions that improve well-being, and to prevent discomfort in situations where life is barren and meaningless (Seligman & Csikszentmihalyi, 2000).

Positive psychology has evolved into two interrelated movements that are positive and power-based management practices in the workplace. The first is Positive Organizational Science (POS) (Cameron et al., 2003; Cameron & Caza, 2004), which is based on the efforts of University of Michigan's academics to maintain a positively focused presence that can be measured, developed and managed to improve performance in the workplace in crisis and adverse conditions. The second movement is the Positive

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Organizational Behavior (POB) applications of Luthans and colleagues (Luthans, 2002a, 2002b; Luthans and Youssef, 2007; Luthans et al., 2007b; Wright, 2003), which investigate the human resources power and psychological capacities in today's workplace. Although this definite emphasis on organizational behavior has traditionally been based on the theory-building process and research methodology, it is a research initiative with a positive psychological resource capacity specific to the workplace (Luthans & Youssef, 2004). The two approaches complement each other. POS focuses on macro and organizational levels, while POB focuses on micro and individual levels. While POS works on constructs such as compassion and virtue with or without an impact on development and performance, POB works on state-like, developable and performance-impact constructs.

In addition to empirical studies with a solid theoretical background, self-help books devoid of adequate research have addressed this magical concept and spread it to all parts of life and thus business life. Luthans (2002a, 2002b) stated that a more positive approach to organizational behavior was needed, and he expressed this understanding as POB and carried positive psychology to work. POB is defined as the application and study of positively focused, psychological capacity, and human resources that can be measured, improved, effectively managed to improve performance in the workplace. What distinguishes positive organizational behavior from other positive approaches is its concentration on measurable and developable psychological capacities. Positive psychology found its equivalent as POB in the study of organizational behavior and defined as a concept that can be measured and developed within the core structure of psychological capital (Luthans, 2002a, 2002b). In management research, it has been empirically determined that psychological capital is associated with many positive outcomes in terms of employees and organizations. In this context, the development of psychological capital is a positive human-resource capital that is underway and studied with its potential components. Avey et al. (2010) provide that PsyCap may be a positive resource used to enhance employee well-being.

In this chapter, the relationships between positive psychology, psychological capital, and employee well-being are explained theoretically. Economists historically have treated psychological capital as both unobservable and unmeasurable, heretofore little evidence has been available on the contribution of psychological capital and well-being to real economy and, hence living standards (Goldsmith et al., 1997).

In line with these theoretical relationships, it has been demonstrated that productivity and many more organizational positive results will be achieved by improving psychological capital and well-being(Jessica Pryce-Jones, 2010).

PSYCHOLOGICAL CAPITAL?

Psychological capital is defined as studies and practices on the strengths and emotional capacities of human resources to improve the performance of work environments. Although a standard economic theory takes no account of feelings, emotions do matter. They affect your investment, effort, and therefore, your output too (Pryce-Jones, 2010). Psychological capital, open to change and development, is relatively unique in the field of organizational behavior (Luthans, 2002b).

Psychological capital has four components. They are defined as (1) to make the necessary effort to succeed in challenging tasks; having confidence (self-efficiency) (2) making positive references to succeed now and in the future (optimism) (3) determining towards goals and finding new ways to achieve the goal when required (hope) (4) endurance and flexibility to achieve success when surrounded by difficulties and challenges (resiliency) (Avey et al., 2008). Luthans and colleagues (Luthans et al.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

2007a) found that the four psychological capacities (hope, efficacy, resilience, and optimism) with a synergetic effect formed a higher structure (Psychological capital). Psychological capital has more effect than each of its component on the positive results obtained in the workplace. Psychological capital is a human-resource power that can overcome the challenges of today and the future with its openness to development as a high-level positive structure with four components. The theoretical foundations and research of each of the four components contribute to the development of an integrative academic basis for psychological capital.

Although there are different concepts, there is considerable synergy between psychological capital, human capital, and social capital. For example, individuals with high self-esteem and self-confidence are more successful both academically and at work and develop healthier cultural relationships (social capital). Healthy social relationships (social capital) increase the value given to himself (psychological capital) (Cole et al., 2009).

Hope

The hope dimension of psychological capital was mainly imported from the research, theory, and literature of the positive psychologist Rich Snyder (1995, 2000, 2002). Hope is defined as the ability to motivate oneself with the thought of using the paths to produce the right paths to the desired goals (Snyder, 2002).

In formulating the theory of hope, Snyder (1995) began with the assumption that people are often target-oriented. People act to achieve something. As Snyder describes, there are two dimensions that makeup hope. Agency-perseverance /determination/willpower and Pathways-planning ways to achieve goals (Snyder, 1995: 355). Hope, which is defined by these two dimensions, differs from the expression of hope which we frequently use in our daily lives as a psychological capacity of psychological capital.

Hope is a positive motivational state based on a sense of success derived interactively with the agency (goal-oriented energy) and pathways (planning to achieve your goals) (Snyder et al., 1991). Hope is a cognitive state in which an individual can set realistic but challenging goals and expectations and reach these goals through self-directed, energy, and internalized control perception. The primary element of hope is the positive expectation of achieving the goals considered as achievable in the individual (Snyder et al., 2006). Hopeful employees are creative and resourceful individuals who can think independently. Hopeful workers may appear problematic or risky when viewed superficially. Such employees are successful entrepreneurs.

Self-Efficiency

Self-efficacy is an essential concept in Bandura's (1977) Social Learning Theory (Social Cognitive Theory). The concept of self-efficacy was imported from Bandura's (1977) comprehensive research and theory into psychological capital. Self-efficacy is an individual's belief in their ability to activate their motivation, cognitive resources and to take the necessary actions within the conditions given to carry out a particular task successfully (Stajkovic & Luthans, 1998a: 66; Wood & Bandura, 1989: 408).

Perceived self-efficacy is not about what an individual has, but about what decisions an individual can do with what she has. An individual's lack of ability to cope with difficulties reduces fears of perceived self-efficacy (Bandura, 1983). Self-efficacy is also the belief in the capacity of individuals to produce the desired level of performance that can influence the events that affect their lives. Self-efficacy determines how individuals think, feel, motivate, and behave. These ideas produce different results through

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

four main processes. These results include cognitive, motivational, emotional, and selection processes (Bandura, 1994).

The determinants of self-efficacy are obtained from four primary sources: performance accomplishments, vicarious experience while watching, verbal persuasion, psychological and emotional arousal (Bandura, 1977). Applying performance accomplishments to the practice, by performing challenging tasks, increases the belief in self-efficacy. The employee learns from his past performance and increases his next performance. Vicarious experience is the learning of the worker while watching qualified people in the social environment. Verbal persuasion is the strengthening of the self-efficacy of the employee by someone whom she considers to be competent. By increasing the talent and ability of the employee, his belief in himself increases. Psychological and emotional arousal be an energizing factor in the effective working psychological arousal while reducing excessive stress performance (Stajkovic & Luthans, 1998a, 1998b).

While individuals avoid activities that they think are above their capacity to struggle, they are loaded and do activities that they can achieve (Bandura, 1977: 194). Self-efficacy theory argues that when individuals perceive that their inability to perceive their effectiveness in coping with events will cause fear, they can give control over events that may have harmful consequences, fear is eliminated. This perception of control reduces the pressure on performance expectations to be shown in the face of events (Bandura, 1983: 465). Self-efficacy affects individuals' choices in important decision-making moments. By choosing the environment in which they are located, they determine who they will be. The idea of self-efficacy can determine the life in which an individual will live (Bandura, 2008).

Optimism

Like hope, optimism has been theorized as both characteristic and psychological capital conceptual infrastructure. Seligman (1998), the pioneer of positive psychology, explains the developmental nature of optimism with the concept of "learned optimism." Optimism is a tendency to mediate between external events and the individual's interpretation of them. There are cognitive, emotional, and motivational components of optimism. Optimistic individuals tend to be physically healthier, more successful, more determined, and in a better mood (Seligman & Csikszentmihalyi, 2000). Optimism is a positive expectation of future success. Optimists tend to process events and results differently from pessimists. Although the optimists do not consider themselves fully responsible for the outcome of an event, they see any difficulties or failures temporarily and expect a right exit again in the long run. Optimists concentrate on the external causes of negative experiences; they do not perceive results from personal character flaws or weaknesses.

Psychological Resiliency

In a certain but straightforward term, psychological resilience is the capacity of positive psychology, defined as difficulty, uncertainty, conflict, failure, even stretching after positive change, recovery, increased responsibility, and development. As a component of psychological capital, psychological resilience is an individual's ability to deal with a significant change, problem, or risk successfully. Today's managers and employees resist the fast-changing and stressful work environment with psychological resilience (Luthans, 2002a).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Psychological resiliency is defined as many cases classified as good outcomes despite threats and improvements to adapt. Research on psychological resilience is about how good results emerge. Psychological resilience does not arise from rare and special qualities, but from the magic of mediocrity, the normative sources of the brain and mind of the individual, the body of the individual, the family, relationships, and society. Psychological endurance includes daily skills and psychological forces that can be defined, measured, maintained, and fed in individuals of all ages and psychological conditions. Psychological resilience is explained according to the results and the reasons for these results (Masten, 2001).

When the biographies of leaders around the world are examined, it is seen that despite the failures, they do not give up the goals they are trying to achieve for themselves, their organizations and the whole society. Leaders such as Nelson Mandela, Mother Teresa, Winston Churchill, and Abraham Lincoln have demonstrated their capacity to recover in the most unusual situations. A concept of positive psychology, psychological resilience, is to move a little further as a component of psychological capital, beyond just recovering from stressful situations, to go beyond normal and equilibrium at the end of highly challenging events (Luthans et al., 2007b).

WHY PSYCHOLOGICAL CAPITAL?

Psychological capital has a positive relationship with desired attitudes and a negative relationship with unwanted attitudes. Those with high psychological capital except that good things will happen at work (optimism), believe that they will produce their success (hope, self-efficiency) and are more resistant to difficulties (psychological resiliency). This is the most basic mechanism explaining the effect of psychological capital on working attitudes (Avey et al., 2011).

Concentrating and accumulating traditional resources, such as economic, financial, advanced technology, and patented information, which was once vital for the success of organizations, are insufficient to achieve sustainable competitive advantage. Compared to traditional physical, structural, and financial capital-based approaches, human capital-based types provide more important opportunities for organizations in terms of competitive advantage and return on investment. This approach makes human capital more valuable. Today, for sustainable competitive advantage, it is necessary to turn to content-specific, cumulative, renewable, and difficult to imitate resources. In this context, investing, developing, and managing psychological capital will provide competitive advantages to organizations.

DEVELOPMENT OF PSYCHOLOGICAL CAPITAL

Today, while global competition is increasing, investment in human resources is increasing in order to keep up with this competition. The return of these investments should be analyzed. Within the framework of the theoretical foundations of psychological capital components, a scale has been developed, which provides valid and reliable measurement of psychological capital. (Luthans et al., 2007b). Psychological capital is a core concept that creates a more significant impact than its constituent components. It has been found that the training to develop each component show a synergistic effect and further develop psychological capital. It is claimed that a 2% increase in the level of psychological capital can generate

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

an annual income increase of more than $ 10 million, based on the Forbes middle-class top firm data, based on the formulas used in human resources today (Luthans et al., 2006; Luthans et al. 2010).

Psychological capital development training is based on a human capital-based perspective, with the dimensions of hope, self-efficacy, psychological resiliency and optimism, techniques and programs used in clinical, developmental positive psychology, and tried and actual human-resource development techniques such as goal setting and group learning processes and exercises (Luthans, 2012: 3). It has been proven that psychological capital can be developed through a short web-based training program that includes focused and short-term training to provide a positive performance development for the business.

The positive internal conversation is encouraged in the process of developing psychological capital. Focusing on the objectives, creating the paths to the target, and overcoming the obstacles will be emphasized. Emphasis is on how these processes will be implemented in the workplace. These studies raise the level of hope of the participants (Snyder, 1995, 2002; Luthans et al., 2006).

In developing self-efficacy, the participant learns and model success by acting by seeing the group members experience success as well as experiencing success in the goal-setting process. During the training process, participants become aware of their values and learn how to use them in case of difficulties. The training process focuses on teaching the participants how to avoid the obstacles and risks that they may face now and in the future (Bandura, 2008; Luthans et al., 2008).

Self-efficacy and hope studies also improve the dimension of optimism. It is suggested that optimism can be improved by changing the pessimistic descriptive style or by enriching the optimistic descriptive style dimensions. To develop realistic and flexible optimism, three perspectives are presented: satisfaction for the past, satisfaction for the present, and opportunities for the future. Satisfaction about the past does not mean rejecting events or avoiding responsibility. On the contrary, it is a positive re-drawing technique that accepts the realities of the situation in line with realistic optimism. It adopts a problem-centered coping approach to reposition the uncontrollable aspects of the situation in the best possible way towards the controllable aspects of the situation. In the perspective of satisfaction for the present day, it is possible to reflect the positive aspects and benefit from the positive aspects, no matter how negative the situation. One should learn to be satisfied with the positive results despite the difficulties. If the employee acknowledges that her unit and organization are making progress, she is not only satisfied for the present but also the future with all opportunities and optimism (Snyder, 2000; Luthans et al., 2007b).

Development of psychological resilience focuses on changing and improving the participant's perception of cognitive, emotional, and behavioral processes. Strategies focused on the three main components of resilience; asset factors, risk factors, and impact processes are targeted. In asset-centered strategies, the aim is to focus on increasing the level of human capital (good education, experience, knowledge), social capital (networks, relationships) and other positive psychological capital components (optimism, hope, self-efficacy, and psychological resilience) that can increase the likelihood of positive outcomes. Risk-centric strategies focus on avoiding what appears to be risky to avoid unwanted consequences. For example, although an actual event appears to be promoted, in some cases, it can be seen as a high-risk, very intense and repressed situation. In this case, the risk-centered strategy may be to reject the promotion. Another risk-management strategy to suit this situation may include a developmental approach based on increasing self-efficacy in the new impact area after promotion. Impact process-centered strategies are based on identifying, developing, and implementing a mix of appropriate asset factors to manage risk factors (Masten, 2001; Luthans et al., 2007b).

WELL-BEING

Well-being is related to cognitive processing of events and situations, perception and emotional explanations, rather than actual conditions and coincidences (Youssef & Luthans, 2007). The individual acts with neither an autonomous factor nor a situational effect; the well-being of the individual is a product of the interaction of personal, environmental, and behavioral factors. These three factors serve to become an individual's WB (Bandura, 2008). Well-being is acknowledged as umbrella-like contexts, which is working under the roof of positive organizational behavior and psychological capital. Well-being embodies psychological well-being, subjective well-being, and workplace well-being. It is suggested that well-being can be applied to many parts of life and measured over these areas. Well-being tends to be seen as a potential component of PsyCap, can be developed and measured. (Diener, 1984; Luthans et al., 2013).

Well-being is a subjective experience; the individual is as happy as he believes to be happy, positive effects are more than adverse effects, and well-being is a general assessment of life. Positive well-being is the affective and discerning reaction shown to positive progress in time of the perception of adequate personal traits and performance, strong interaction with the world, and social integration. Negative well-being can be expressed as a cognitive and affectional response to perceived deficiencies in the subject areas. Positive well-being includes elements such as life satisfaction, positive mood and energy, Negative well-being distress, negative mood, and extreme arousal (Karademas, 2007).

POSITIVE PSYCHOLOGY AND WELL-BEING

After the Second World War, the science of psychology, which focused on eliminating the deficiencies in human psychology, started to build positive capacities in addition to eliminating the deficiencies by changing direction with the positive psychology trend. The study of psychology on extremely negative concepts has led to the omission of positive concepts that make life meaningful and livable. Positive psychology has assessed that an inefficient and meaningless life is the cause of various pathologies and has initiated a change that focuses on having positive qualities rather than attempting to change the individual's negative aspects. In this context, the area of interest of positive psychology is expressed in three levels as subjective, individual, and organizational. At one of these three levels, subjective level (valuable subjective experiences), well-being, satisfaction and satisfaction (in the past), hope and optimism (in the future), flow and happiness (in the present) is studied. One of the concepts of this approach is well-being (Seligman and Csikszentmihalyi, 2000). In this context, positive psychology focuses on both subjective well-being, in which hedonistic approaches are concentrated, and psychological well-being, on which functional (edamonic) approaches are concentrated.

Positive psychology contributes to too many disciplines while continuing its development. Fred Luthans (2002a, 2002b), who introduced the concept of psychological capital under the umbrella of positive organizational behavior, acknowledged the importance of psychology, sociology and other basic behavioral sciences, but stated that mental disorders and dysfunctional behaviors were studied too much and that there was not enough research on well-being (Youssef-Morgan and Luthans, 2015). Well-being of the employees can be improved, which is also related to positive psychological skills according to psychological capital (Manzano-García & Ayala, 2017).

The interest in well-being in organizational studies is increasing. The main reason for this is the fact that western society has reached a certain level economically, which leads individuals to search for a

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

better life just by moving ahead of the idea of survival. People have become interested in the quality of life beyond a life of prosperity. Besides, well-being is becoming popular because it is a democratic concept. Respects how individuals look and feel their lives. The important thing is the evaluation of the individual's own life; there is no point in evaluating an individual's life. Also, the increasing tendency of individuality plays a role in the popularization of the concept, as the individual's self-assessment is central (Diener et al., 2012).

The hope of the sub-dimensions of psychological capital reflects the motivation of an individual to conceptualize goals, develop strategies to achieve these goals, and use strategies. Hope, working and many positive organizational results can be associated, one of these positive results is well-being Snyder (1995, 2002). Werner (2012) found a positive relationship between well-being and hope and suggested focusing on developing hope to improve well-being.

High self-efficacy increases well-being and success. Instead of avoiding strenuous tasks, individuals with high self-efficacy capacity see them as a challenge to be overcome. Such an effective perspective provides superiority in activities and provides immediate recovery after failures. Workers approach threatening difficult situations with self-confidence that they can influence. This overview reduces stress and the harmful effects of depression and produces success. Individuals with low self-efficacy quickly believe that any attempt will result in failure and will stop experimenting. Belief in self-efficacy determines the level of stress and quality of emotional life of an individual. An individual who believes in the competence that he will recover quickly after difficult situations return to the well-being more quickly (Bandura, 1994, 2008).

HOW DOES PSYCHOLOGICAL CAPITAL WORK ON WELL-BEING?

Positive psychological capital includes self-efficiency, hope, optimism, psychological resiliency. Many theories and research support psychological capital because it is an emerging issue and its relationship with positive outcomes on an individual and organizational level. There is an increasing awareness of the importance of the well-being of employees in achieving the desired results of today's organizations. Today, exceptional performance rather than the average performance of the employees is expected for competitive advantage. Well-being can also improve the performance of the employee. Organizations that understand the importance of a positive approach and well-being will be able to achieve these results. It is considered that psychological capital can increase the well-being and positivity of employees and increase their performance to an exceptional level. PsyCap can present a unique approach to leveraging employee positivity and well-being toward that exceptional level of performance. Unlike the narrower focus of the more problem-oriented psychological and organizational research, positivity also emphasizes a broader, whole-person perspective, which is particularly relevant to well-being (Youssef-Morgan1 & Fred Luthans, 2014). Bonding and maintained social capital could play the crucial mediating role in shaping users' perception of well-being (Hua, 2018).

Positive organizational behavior and psychological capital express a rigorous theory of rigorous research and valid metrics, unlike unproven and anecdotal, personal development literature. Similarly, well-being researchers empirically research to distinguish their scientific work from extreme perspectives such as Pollyannaish positivity and hedonism. This concept model links psychological capital and well-being in the context of evidence-based research and practice and meeting controlled standards (Youssef-Morgan & Luthans 2015).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Both concepts are similar in that they are research-based and developable workforce capacity and provide positive improvements in working and organizational performance and outputs. Besides these similarities, it helps us to understand the relationship between variables in some conceptual frameworks better.

A person's predispositions, assessments, memories, goals, and motivations are tools to increase the impact of positive events. This positiveness buffers the effects of negative events. In other words, positivity gains more importance on life satisfaction and general well-being than actual life events and conditions (Luthans et al., 2013: 119). While psychological capital increases constructive emotions, it reduces destructive emotions and buffers, thus increase well-being.

Well-being is primarily shaped by cognitive and emotional evaluations of life, events, and conditions. Well-being manifests in individual behaviors and gives concrete results at many levels of analysis. The working principle of psychological capital and its components is to create a positive assessment of past, present, and impending events. Optimism, positive reading of the past, self-efficacy, psychological resilience, and hope support motivation, effort, and prospective goals for the present. When psychological capital factors interact together, these positive assessments provide a higher state of well-being (Bakker & Oerlemans, 2011; Youssef-Morgan & Luthans 2015; Diener et al., 2012).

The second conceptual framework builds on the mediation, stretchability, and social mechanisms of psychological capital, extending the role of psychological capital to health and relationships beyond the workplace. Each segment of life affects the other. Satisfaction from important areas of life is an integral component of well-being. Life satisfaction from the workplace, relationship, and health areas lead to general well-being.

The basic principle of the theory of conservation of resources (Hobfoll, 1989) is that individuals strive to protect, build, and maintain their valuable resources against the threat of potential or real loss. Cognitive assessments of resource availability are used as indicators of well-being. The well-being of the individual depends on the acquisition and protection of these resources. In this context, it is a psychological resource in psychological capital, and its protection improves its well-being. This connection is consistent with Fredrickson's (2001, 2002, 2003) theory of "Broaden and Build". Psychological capital creates a pool for psychological resources and is used to deal with difficulties and negativities. Refreshing resources with the development of psychological capital balances and optimizes positivity and negativity, leading to higher well-being.

WELL-BEING AS POTENTIAL PSYCHOLOGICAL CAPITAL COMPONENT

The expression of psychological capital with four components in the researches does not mean that these four concepts represent all of the psychological capital factors. The enriching research and knowledge in the field of positive psychology offer new individual, group, and organizational forces and virtues as a potential psychological capital component. Many of these positive structures appear to be highly promising both in terms of their theoretical basis and potential applicability in the workplace. It is considered that the potential components of psychological capital will direct future psychological capital studies.

In most of the last century, psychology focusing on improving psychopathology has overshadowed the promotion of well-being and personal development. However, starting from the 1960s, a change began to take place, and when researchers found that financial security and luxury did not provide happiness

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

for those who were economically advantageous, positive psychology, well-being, and the growth and development of human potential became more noticeable and studied (Ryan & Deci, 2001).

In a study conducted on 7204 people from 42 countries, when individuals were asked what they wanted most in their lives, happiness was the leading answer (Diener, 2000: 34). The search for happiness, combined with avoidance of unhappiness, is considered the basis for human motivation. The basis of many theories of motivation is the belief that people seek pleasure and avoid painful things (Sullivan, 1989).

Aristotle said that the greatest result that people can achieve as a result of their behavior is happiness (eudaimonia). Diener (1984) states that the translation of the word eudaimonia may be more accurate as of the accompanying of emotions that are compatible with the actual potential of the individual. Here, Aristotle underlines the individual's real potential realization.

Being happy does not just make you feel good; happiness is good. Happy individuals have more solid marriages, stronger immune systems, and more creativity than less happy individuals. Studies show that there is a strong relationship between success and happiness. The aspect of this relationship is not only that success produces happiness, but happiness produces success (Lyubomirsky et al., 2005). Happiness means many meanings. When we define an individual as happy, we mean at least two things. First, happy individuals tend to feel positive emotions more than unhappy individuals. Second, happiness is a general concept, and being happy expresses satisfaction from all life. Concepts such as wealth, happiness at work, peaceful family life are just a few of the many components of happiness (Wright & Cropanzano, 2004:254). Happiness becomes operational in four ways as job satisfaction, presence of positive effects, lack of negative effect, lack of emotional exhaustion, psychological happiness on the worker. Some of these effects have significant relationships with the performance of the worker, while others do not. Positive and negative effects, lack of emotional exhaustion, and psychological well-being (increasingly present and predicted future direction) are noteworthy. More specifically, although there is a reasonable consensus on the conceptual definition of happiness (Diener, 1984), there is less agreement on operational definition (Cropanzano & Wright, 2001; Davis-Blake & Pfeffer, 1989).

From the studies conducted in the positive psychology research literature, it is estimated that objective life events and conditions (including demographic variables) have a 10% effect on happiness. Life events include being rich or poor, healthy or unhealthy, being married or single. Genetic susceptibility is thought to have a 50% effect on well-being. Conscious activities determine 40% of their well-being. These activities are the sections that we determine with our choices. With this perspective, 40% of well-being is open to development and growth (Lyubormirsky, 2007). Conscious changes in thoughts and behaviors can increase happiness rapidly (Lyubomirsky & Layous, 2013).

Well-being is often used with happiness. Although there are many definitions of happiness, well-being in the academic world, psychological well-being (self-acceptance, purpose of life, environmental dominance, autonomy and positive relationships with other people, personal development), emotional well-being (positive and negative effects, life satisfaction and happiness), social well-being (social acceptance, realization, acceptance, consistency, integration), physical and mental well-being is used as an umbrella concept (Youssef-Morgan & Luthans 2015). Ryff (1995) states that well-being is not only an achievement of pleasure but an "effort for excellence that represents the realization of the individual's true potential."

In ancient civilizations, well-being was seen as a value and ideally, the most valuable asset to be possessed in life. Well-being means not only an end but a continuation of the development of society and civilization. Today, health is not only seen as diligence and productivity but also as a major source of growth and development of the abundance of the nation (Keyes, 2006).

Diener (1984) suggested that the definitions of well-being and happiness can be grouped under three groups. The first of these definitions are normative definitions that consider the state of well-being as an external criterion, sacredness, or virtue. In these definitions, it is emphasized that the state of well-being is not based on subjective thoughts, but has a desired set of qualities. In the second definition, the factors that cause the individual to define her life in positive terms are pointed out, and the cognitive definition including life satisfaction and the evaluation of life as a whole is adopted. The third group is the experience of positive and negative emotions and the emotional definitions that emphasize the time interval in which these emotions are experienced.

There are positive structures (eg creativity, wisdom, prosperity, fluency, humor, gratitude, forgiveness, emotional intelligence, spirituality, originality and courage) There are positive structures that have not received the attention they deserve in the literature of organizational behavior and these structures need further study (Luthans et al. 2007b). One of these structures is well-being.

Well-being is related to cognitive processing of events and situations, perception, and emotional explanations rather than actual conditions and coincidences (Youssef & Luthans, 2007: 783). The individual does not act with either an autonomous factor or a behavior determined by a situational effect, but the individual's well-being and skills are the product of the interplay of environmental, personal and behavioral factors. These three factors serve to the individual's well-being (Bandura, 2008: 11).

Bradburn and Caplovitz (1965) suggested that well-being can be demonstrated in two dimensions by being under positive and negative effects. Well-being is expressed as the balance between these two effects.

Positive and negative aspects of well-being are interrelated but two independent structures. Positive well-being, perception of adequate personal traits and success, strong interaction with the world, and social integration are the affective and cognitive responses to positive progress over time. Negative well-being can be expressed as a cognitive and affective response to perceived deficiencies in these areas (Karademas, 2007).

Well-being is studied under the framework of psychological capital. Although happiness and well-being are often used interchangeably, well-being is an umbrella concept that includes psychological well-being, subjective well-being, and workplace well-being. Well-being is the presence of positive effects, absence of negative effects, absence of emotional burnout, and psychological well-being (Wright, 2015). Well-being is a multidimensional phenomenon that includes both hedonic and functional (edamonic) well-being (Ryan & Deci, 2001).

Well-being is one of the working topics of positive organizational behavior in the context of working and workplace predecessors and successors. Positive organizational behavior and psychological capital are concerned with well-being. Unlike self-help or self-help books based on anecdotes and unproven claims, research on positive organizational behavior and well-being of psychological capital focuses on a solid theoretical background, rigorous research, and valid criteria. The relationship between positive psychological capital and well-being has been demonstrated by previous studies (Avey et al., 2010; Avey et al. 2011; Luthans et al. 2013; Çelik et al., 2014, Roche et al., 2014). In this context, well-being in psychological capital literature is seen as a potential psychological capital component. Well-being is a concept that can be developed and measured. It is suggested that well-being can be applied to many parts of life and measured over these areas (Diener, 1984; Luthans et al., 2013). The development of well-being also has many positive returns for the working and the workplace, as in psychological capital.

FUTURE RESEARCH DIRECTIONS

Organizational behavior aims to understand and direct the behaviors that work by blending the information obtained from many disciplines due to its nature. Organizational behavior researchers work with complex and exploratory aspects of human psychology. The well-being and psychological capital that improve the productivity of the employee, the understanding of the positive psychological resources, and the interaction between them will bring many positive results in the context of the working and organization. In this context, some suggestions for researchers are given below.

Although it seems like an acceptable hypothesis in the first place, the fact that the state of well-being will increase as the increase of the financial opportunities provided to the employee, there is no causal path to the relationship between income and well-being (Diener et al., 1999). In the study, a similar result was obtained, and the low-income group had higher well-being. In this sense, the advancement of financial means alone is not sufficient. Organizations need to find different ways and methods to improve well-being. The study of other potential positive psychological capital structures by researchers will contribute to the literature.

Today, psychological capital development training are not differentiated according to demographic variables. It should be noted that groups with unlike characteristics may have different educational needs. In this context, it is worth examining how psychological capital differs between demographic variables, what differences mean, and whether psychological capital training can be transformed into different programs in the context of demographic variables.

Studies to improve well-being practices will contribute to enterprises and organizations. It is suggested that psychological capital and well-being should be investigated in other positive results where business and organizations are precursors.

CONCLUSION

Up to this section, the theoretical relations of positive concepts such as positive psychology, psychological capital and well-being have been examined and suggestions have been made to improve employee well-being.

Psychological capital, the third generation of human and social capital, is associated with many organizational behaviors that offer a competitive advantage to organizations. Positive psychological capital and its sub-dimensions are promising structures for businesses and organizations. The understanding of these structures by today's managers, professional support when necessary by developing the positive and strong aspects of employees and psychological capital to be raised along with the increase in the well-being of the employee and many more positive results will bring.

There are positive structures with high potential for future incorporation into positive psychological capital. These dimensions are positive, theoretically based, measurable, developable, and meet positive psychological capital criteria because they are related to performance. One of these structures is the state of well-being. Further research is needed to incorporate these concepts into positive psychological capital components.

Today's organizations that struggle with ethical problems, financial crises, and intense global competition do not only increase human and organizational resources with those who work with high positive psychological capital in this context but also survive and survive in this current stormy environment

(Avey et al., 2012). Rather than thinking of employees as a tool of organizational productivity, the mission of positive organizational behavior should be in pursuit of improving employee well-being, happiness, health, and working conditions (Wright, 2003). Psychological capital and optimism, hope, self-efficacy, and psychological resilience have positive effects on employee well-being. Developing each aspect of psychological capital will also increase the total well-being of the employee by increasing the total psychological capital by making a synergistic effect.

In essence, methods of developing each psychological capital component are emphasized. The methods and diversification of psychological capital that provide opportunities for organizations and businesses to offer a unique competitive advantage is a broad and imaginative issue worthy of research.

Psychologists, personal development specialists, and parents work to make their customers, friends, and children happy. However, most individuals have higher levels of happiness than neutral, and this raises the question of whether higher levels of happiness have a more effective function than lower levels. Analyzes examining large survey data and long-term study data show that individuals with higher levels of happiness are successful in close relationships and voluntary work, but those with slightly lower levels of happiness are successful in income (Oishi et al., 2007). It is suggested that higher levels of happiness may not be a desirable goal and that psychological well-being is more important than higher levels of happiness.

KEY TERMS AND DEFINITIONS

Hope: Ability to motivate oneself with the thought of using the paths to produce the right paths to the desired goals.

Positive Psychology: Discipline that focuses on developing positive traits of individuals, having positive experiences, and preserving their mental health through programs that increase their subjective well-being.

Psychological Capital: Studies and practices on the strengths and emotional capacities of human resources to improve the performance of work environments.

Psychological Resilience: Individual's ability to deal with a significant change, problem, or risk successfully. **Optimism**: Individual's positive expectation of future success.

Self-Efficacy: Individual's belief in their ability to activate their motivation, cognitive resources and to take the necessary actions within the conditions given to carry out a particular task successfully.

Well-Being: Subjective experience; the individual is as happy as he believes to be happy, positive effects are more than adverse effects, and well-being is a general assessment of life.

Chapter 14
Microfinancial Collaborative Economies Business Models and Strategies for Quality of Life Improvement:
Case studies for PROMUSAG and UBER

José G. Vargas-Hernández
https://orcid.org/0000-0003-0938-4197
University of Guadalajara, Mexico

ABSTRACT

The present chapter analyzes two cases of a joint venture stage to determine the successes and failures undertaken by the PROMUSAG and Uber as a model and strategies of collaborative economies to improve the quality of life. First, it is analyzed PROMUSAG as a program to finance women entrepreneurship aimed to improve the quality of life and the second case aims to analyze the different strategies taken by Uber to join the global market successfully, positioning itself in different countries. The analysis concludes that the empirical knowledge of entrepreneurs, in this case were not sufficient to direct the business to success, and that the lack of structured knowledge and adequate scientific support for this project strongly directed towards the non-permanence on the market. Taking terms as work global, it is considered Uber as a technology-based company and sees it from an overall, same strategy refers to a strategy that follows the company having a worldwide standardized product, another issue that would revise the importance of the theory of institutions.

INTRODUCTION

The Mexican government through the Ministry of Agrarian Reform supports rural entrepreneurship projects. One way is PROMUSAG (program for women in agriculture). This is a support program for rural women entrepreneurs, seeking their integration in the productive sector to earn income to help in the fight against poverty in this rural environment. The support consists of a sum of money to start up the business to undertake, which is repayable, but it is considered at lost funds. In 2009, hundreds of projects have benefited from PROMUSAG, one of which has been analyzed for this report. This case is featuring nine women in the municipality of San Martin de Hidalgo, Jalisco. In that year, nine women was PROMUSAG order required for each project. The team for this project consisted of women with little or no preparation in business, but the team had a leader with knowledge and skills acquired empirically that gave the project some routing to success. PROMUSAG central requirements requested to be eligible for funding to the various proposals were teams of nine members, all participants should be female, a project to undertake the business detailing emphasizing the distribution of grant money, it is sent to be developed by an engineer in the agricultural area and the last requirement was to have an area of land sufficient to carry out the purpose of the enterprise activity. The venture was marked by the fall in leader's illness, which conditioned the project to a resounding lack of profitability, this, coupled with the lack of scientific preparation and support scientists generated a mismanagement of resources and capabilities that had the project, bringing this to its final termination in six months.

For decades the transfer of people from one place to another in large cities has been using public transport, taxis, or those with better economic position and resource allows them to move in their own car. That was the traditional way going from one point to another, but with the different changes that occur in society today, technological, economic or related to the environment issues have been marking new ways of moving from one point to another. These new forms also have to do with issues of passenger safety, comfort and other factors.

As a result of these new ways of moving emerges UBER, which for several years start to mark a new trend in moving people from one point to another, especially in big cities around the world. It has its origins in a revised class concept of Strategic Management as it is born global that refers to those companies that are born in global or international markets and are marking a new trend in the way of doing business, taking advantage of the technological changes that have occurred in the world in which today we live. This company considers having a relationship with the technological-based firms that are characterized by being innovative, enough reason to learn more about the same as it was able to study from approaches such as the theory based on institutions and global strategy.

Uber has its origins in 2008 as it tells the story in its page when Travis Kalanick and Garrett Camp could not get a taxi in Paris, which led to an idea to create an application where with just one button, could have a trip. What started with this simple idea is now changing the way people are transported in large cities? According to the Uber definition, it is the smartest way to move and luxury at low cost.

THEORETICAL BACKGROUND

Entrepreneurial Ventures and Life Quality

Quality of life is considered as the set of factors which contribute to the general well-being of people in terms of personal satisfaction with happiness, health, safety, intellectual and cultural preferences, financial security, family life, job satisfaction, etc. Quality of life has been defined as the level of satisfaction with an individual´s conditions, relationships, and surroundings relative to the available alternatives (McGregor & Goldsmith, 1998).

The Business Dictionary defines quality of life as "Daily living enhanced by wholesome food and clean air and water, enjoyment of unfettered open spaces and bodies of water, conservation of wildlife and natural resources, security from crime, and protection from radiation and toxic substances. It may also be used as a measure of the energy and power a person is endowed with that enable him or her to enjoy life and prevail over life's challenges irrespective of the handicaps he or she may have…" Quality of life has different manifestations, ranging from improvements in health, standards of living, education, work life, etc. Quality of life can be described as a multidimensional phenomenon that cannot be reduced to a few quantitative indicators. Explanations of quality of life include psychological, social, political environmental, economic, issues. Quality of life profiles or analysis of the correlates are different only in the emphasis of the human development approach to social welfare.

Existing concepts of quality of life are wide enough to overcome multidimensional social concerns such as exclusion and poverty explanations that cover much the same territory. However, the improvement in the provision of social services to a specific community or to a specific segment of population, can raise the indicators of quality of life of that society, but fail to deliver services in geographically remote areas or to socially disadvantaged groups as an unfocused goal. The consensus that narrows measures of consumption and quality of life is inadequate and a broader view is needed. Economists concerned with quality of life recognize the importance of income and consumption derived from sources provided by the State, social and private sectors. There are some policies and synergies contained on this approach to quality of life. Economic growth may increase the living standards, benefit the quality of life and reduce poverty. The approach to income and the level of consumption as a quality of life can be criticized when having access to resources by other means. A case is the improvement of the social services, education and health provisions, etc., and taking advantage of opportunities offered by the growth of safety groups and social networks.

The best known of these influences on improvement on quality of life as national welfare strategies derived from postindustrial growth, state structures and economic geography. This institutional welfare state approach focuses more on the content of policies, more universal and less directed social programs at target groups, the requirements to be eligible beneficiary and the quality of the services. These welfare programs benefit the quality of working life and employment, rather than social spending. Thus, it improves the societal quality of life. Societal quality of life is defined as the general state of well-being experienced by society's members (Morris & Lewis, 1991). However, the decline in the terms of quality of life and socioeconomic characteristics of the working class as well as the dismantling of the welfare state, are taking place already.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Entrepreneurship has been found to have an impact on life quality (Morris, 1998b; Pennings, 1982; Sirgy, 1985). The relationship between entrepreneurship and life quality is being studied by the family and consumer sciences focusing on societal and environmental trends (American Association of Family and Consumer Sciences, 2004; Horridge & Craig, 2001; Key & Firebaugh, 1989; Kim, Sharpe & Kim, 2002; McNabb, 2004). Morris (1998b) contends that entrepreneurship has an impact on quality of life dimensions. The perception level of the entrepreneurial efforts has a significant impact on dimensions of quality of life. Entrepreneurs' quality of life and a positive perception of impacts on their families, customers and community sustain their business. Thus, lifestyle entrepreneurship benefits family´s quality of life and community development (Marcketti et al., 2006). Peters, Frehse and Buhalis (2009) continue the analysis of the relationship between entrepreneurial quality of life and tourism business growth. The quality of life perceived motivates and sustains lifestyle and economic status more than growth. Entrepreneurs may be emotionally motivated by their families and quality of life more than workload factors depending upon individual wants and characteristics and personality traits (Marcketti et al., 2006).

Peters, Frehse and Buhalis (2009) have analyzed the relationship between entrepreneurial quality of life and profits and have derived some propositions. Life quality and leisure time decrease determined by entrepreneurial factors during the time of financial risks and expectations for establishing the new business. Lowering or heightening quality of life expectations may be necessary to meet the profits requirement despite that the lifestyle entrepreneurship may have positive effects.

Social Entrepreneurs contribute to enhance the well-being and quality of life (Baden, 2006). Social entrepreneurship at national business system level has an impact on the societal quality of life. At regional/national business system level, social entrepreneurship improves the objective and subjective indicators the quality of life. Social, organizational and individual interactions and complex inter-organizational relationships at regional/national business system have an impact on quality of life (Koponen, n.d.). Small businesses are formed to improve quality of life conditions by meeting the family's needs and demands (Brush, 1992; Stanforth & Muske, 1999). Social entrepreneurship contributes to the general well-being and societal quality of life balancing social change and social capital in a certain regional or local level. The model of Koponen (n.d.) proposes that the objective parameters of quality of life are sustained on social entrepreneurship, considering social value vs. market mechanism which in turn is the base of business model with its value proposition and exchange. The dimensions of quality of life are the social, material, physical, productive and emotional quality of life. Entrepreneurship has an impact on quality of life economic, physical and mental health, social, technological, job satisfaction, institutional, and ecological dimensions (Morris, 1998b; Rice, 1985).

The objective parameters are the numbers, percentages, total sums, etc. The subjective parameters are the society´s experience, opinion, social norms, traditions, etc. These objective and subjective parameters have social and business effects on the general well-being, the national business system, social capital and change. The economic model of any society is related to the improvement of a societal quality of life (Jordan, 2008). However, there is no unified conclusion on how to achieve a greater level of quality at local, regional or national levels. Few studies have examined the relationship between lifestyle entrepreneurship and life quality (Henderson, 2002; Mhango, Marcketti, & Niehm, 2005; Scarborough & Zimmerer, 2003). From the systems theory, perspective lifestyle entrepreneurship bridges with quality of life. Lifestyle entrepreneurship has an impact on life quality for individual small business owners, their families, and communities. Successful lifestyle entrepreneurs enhance the perception of a better quality of life driven by a mindset and values affecting their families, customers and the community.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Life quality of the business owner perceived as an entrepreneurial venture may provide quality of life to employees, consumers, and the community.

Still it is not clear how to measure entrepreneur's quality of life and the effects on new ventures. When creating a new venture, the entrepreneur's quality of life may lower while workloads increase by many personal barriers, worries and financial risks (Shaver et al., 2001; Weiermair & Peters, 1998b) until he reaches a breakeven point where both qualities of life and profits are maximized. As a consequence of this new venture that entrepreneurial effects on quality of life may be positive, although sometimes when creating a new venture, individual quality of life may start to decrease. After lifestyle entrepreneurs reach this breakeven point, they diminish activities and depending of several variables of life quality, their effects start to decrease and to become negatives. The, the lifestyle entrepreneur does not have economic motivations and hinders growth. Although he contributes to economic welfare (Weiermair & Peters, 1998a) he does not lower quality of life.

An exploratory study conducted by Marcketti; Niehm, and Fuloria (2006) found a relationship between lifestyle entrepreneurship and life quality for business owners, families and communities involved. Also, some elements of entrepreneurship such as creativity, innovation, and personal life experiences have long-term effects on the life quality of business owners, their families and communities.

Despite that quality of life is a relevant factor for the location of new business; it is one of the most neglected by policymakers. However, regional variables have an impact on entrepreneurial decisions and policy makers on quality of life, although some variables cannot be controlled such as the impact of weather and geography on quality of life. Quality of life is a livable factor that attracts business and individuals (Endeavor Insight, 2014; McCann, 2000; Pennings, 1982). However, quality of life is not always the main factor in deciding to start a business.Many of the policies that address these concerns at local levels that link quality of life to economic growth may lead to the central dilemma. This dilemma can be represented on an advanced society that may be opposed to materialism. The elevation of a post-industrial expansion of quality of life is related to multi-site decision making on well-being. Also, it is related to a long tradition of social, political and economic welfare policies as much attention to subnational spatial conditions of the economic policy and market geography, rather than simply eliminating territorial influences make them relevant in new ways.

Quality of life is an intangible and subjective variable difficult to measure objectively because individuals have different priorities. The quality of life (QOL) index is an objective measure compiling a variety of objective factors ranging from life expectancy, public education, public safety, recreation, etc. to the share of childhood welfare and poverty. The level of entrepreneurship has a causal effect of the societal quality of life. Morris and Richard J. Lewis (1991) examine the relationship between entrepreneurship and societal quality of life. Morris and Lewis (1991) identified seven quality of life dimensions in terms of costs and benefits produced by entrepreneurship: economic, health, social, technological, work, institutional, and ecological. For example, they found that entrepreneurship may have a positive effect on the ecological dimension of quality of life.

Research has shown that there is significant correlation but not perfect within specific regions. Comparison of QOL measures on regional bases can correlate entrepreneurial decisions and quality of life. Quality-of-life variables can explain new-business formations across the regions, although may not indicate causation. All these variables contribute to increase the standard of living that influence entrepreneurship, new business startups, and decisions of local policymakers. A high quality of life means that people get increased power. The decline in the terms of quality of life and socioeconomic characteristics of the working class as well as the dismantling of the welfare state are being shaped by the advance of

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

economic globalization processes and the deepening of capitalism that benefit from the intensive exploitation of labor. From a public management perspective, it is intended to view government from the bottom up focusing more on quality of life and work in public organizations and seeking to understand and improve organizational elements such as leadership, strategic management, organizational climate, service quality, innovation, performance and customer satisfaction.

Quality of life has been related to satisfaction with management decisions regarding individual goals, physical and emotional improvements and betterment of self, family and community (Edwards, 1991; McGregor & Goldsmith, 1998; Morris, 1998a). Decision-making and management may result in satisfying outcomes and better life quality. The human development index is an indicator of a set of minimum values of the quality of life of a person, such as his educational, health, economic and other. The first concern is with human services agencies being established which provide care, money, education, shelter and support to people, often with significant personal interaction between the agency and the individual client user. A high quality of life for people is the goal of sustainable development. Policies fostering the post-industrial growth have focused increasingly on the economies of cities and regions, and sub national elites have emerged as sectors in these policies. At the same time, space policies explicitly targeted the urban environmental problems with a main impact on local quality of life in general that has proliferated conditions. Especially in the post- industrial urban arrangements, local social movements and parties regularly mobilize people around these concerns on a better quality of life. Women employment contributes to improve the overall quality of life through the formulation of more sustainable development policies.

To determine the relationships between entrepreneurial motivations and realities and the enhancement of quality of life is important to consider for a comprehensive framework for policy making and to design the incentives to motivate entrepreneurs. Incentivizing external growth instead of internal growth of business is required to achieve and breakeven point with the higher rates of quality of life and profits.

An Institutional Approach

One of the aspects that fit for this work was the subject where the importance of institutions is played and whether it can reach affect or influence strategies that take companies to conduct their operations. An aspect that Uber considered is the adaptation to the current legal framework, which call as the theory of institutions, and in this category, it is found in a definition of the Nobel laureate in economics, North (1990) defined an institution as humanly planned restrictions that structure the interaction of people, which is popularly known as rules of the game.

Likewise, the same author classifies 2 different types of institutions and classifies them as follows (North 2005) formal and informal institutions. In the former are the laws, regulations and standards, and on the side of informal talks about rules, culture and ethics, including different ideas, values and attitudes of people in their behavior in society. Moreover, it is possible to distinguish three aspects the authors belonging to the first generation of institutionalisms, neo institutionalisms and the new institutional economics (Urbado & Hernandez, 2007). Moreover, Veblen (1965) also talks about the institutions and gives us another definition that by the end of this work is also acceptable. It is defined as common and predictable patterns of behavior in society, including the habits of thought and action generally shared. One area where have failed Institutions are flaws in the regulations for these type of companies, i.e. not governments had considered the new e-business, category where Uber is characterized. Canals (1994)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

states that the objective of internationalizing a company are the opening of new markets, lower production costs, and a more efficient structure of production and distribution of the company.

The business model of this type of business is focused on a specific sector of the population and from this part gives a new way to operate, which is not available for all people who want to use the product or service this type of companies offer. The overall and global strategy adopted by these firms have advantages over competitors as it refers to how to compete and focuses on providing standardized products and services worldwide (Peng, 2000). Within the theory of institutions see different regulations that have occurred around the world to allow the application to offer their services. For example, in the United States in the city of Chicago a new category of transportation calls service transport networks, just as in Mexico City was created have made regulations for the operation of the service, in New Orleans you will have to pay the city by permits, something similar happened in New York where the council of citizenship and Uber reached an agreement to set the number of vehicles that can circulate in the city.

Just as there are cities where they operate without any regulation of institutions, there are cases like the above where they operate with certain regulations by the institutions and authorities of the city, but is also the case of Florida in the United States because it does not operate in this city for failing to meet the requirements of city tax. On the other hand, the phenomenon of globalization (Peng, 2012) refers to the close integration of people and countries around the world, and today this concept is applied in different sectors and industries.

Within the theory of institutions are seen different regulations that have occurred around the world to allow the application to offer their services. For example, in the United States in the city of Chicago was created a new category of transportation called service transport networks, just as in Mexico City was created, both have made regulations for the operation of the service. In New Orleans the customer has to pay the city permits. Something similar happened in New York where the council of citizenship and Uber reached an agreement to set the number of vehicles that can circulate in the city. Just as there are cities where they operate without any regulation of institutions, there are cases like the above where they operate with certain regulations by the institutions and authorities of the city. But, it is also the case of Florida in the United States, because it does not operate in this city for failing to meet the requirements of city tax.

On the other hand, the phenomenon of globalization (Peng, 2012) refers to the close integration of people and countries around the world, and today this concept is applied in different sectors and industries.

Collaborative Economies Business Model

Bostman and Rogers (2010) argue that firms like UBER are part of a classic model of collaborative economy, being a disruptive innovation (Christensen & Raynor, 2003) that occurs when individuals share common interests and a common philosophy of life. In this case, they aim to rent cars in shared taxis or whole taxis through a social search and management system (Bostman & Rogers, 2010). So, the emergence of this phenomenon is possible as the evolution of technology allows imitate the exchanges that usually or used to give face to face, on a larger scale thanks to the internet, together with the ability to create trust between strangers. Rifkin (2014) points out that the decline in marginal costs, which tends to be near zero, is resulting in a dichotomous economy, partly capitalist market and on the other hand, collaborative commons gradually drawn out a new economic paradigm. Interian, (2016) argues that the sharing economy is credited with reducing transaction costs, increase efficiency and promote accountability and competence. This model does not require a centralized entity that should have an inventory

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and therefore is free of logistics, costs associated with maintaining inventory, product and geographic expansion for these purposes.

This model by allowing individuals to take advantage of the ability to take advantage of an asset that already possess, collaborative business model eliminates in an efficient and convenient way transaction costs. The specific characteristics of collaborative consumer of passengers and commuters are little known, although generally, it may try to travelers connected and experts, likely to responsible consumption, characterized by a high level of trust in the other members of the community and familiarity with internet and online commerce, demanding about the quality of its transport and commuting experiences (Russo & Quaglieri, 2014).Despite its purported benefits, companies of collaborative economies have been strongly criticized for the way they operate, and in some cases have been forced to shut down operations. Critics argue that the laws are evading created precisely to regulate certain practices in which their companies are engaged; users sharing platforms become "prosumers" people who consume, like produce (Streitfeld, 2014).

Blurring the line between consumer and producer collaborative economy breaks with the traditional business model that companies own and people consume. On the other hand, the concept of sharing erodes the disinterested public regulation, substituting private regulation or leaving unattended regulated transactions. Because of this, business creation becomes more widespread and may even lead to displace their regulated and established counterparts some time ago. An example of this is Uber, which has become a ubiquitous service in major cities around the world (Interian, 2016). The most important cities in the United States and Europe have begun to implement regulations regarding share or rent cars and have initiated investigations with the goal of bringing the collaborative economy in accordance with existing laws (Chafkin, 2016).

On the other hand, information technologies have facilitated the exchange of user experiences, enabling the comments and product valuation objective and transparent manner. These valuations are perceived in the market as certain and are changing consumer behavior and redefining the role of influence during the buying process by providing more realistic expectations (Cañigueral, 2015). That is when the consumer can know the costs and perceived by others who have commented and valued their consumer experiences, which later will help to make a decision with some confidence, even if the consumer never had before contracted this service, reducing significantly benefits the perceived risk (Wen, 2009).

PROMUSAG PROGRAM: WOMEN ENTREPRENEURSHIP TO IMPROVE THE QUALITY OF LIFE

The Secretary of Agrarian Reform (Secretaría de la Reforma Agraria, SRA) is the institution of the Federal Government that serves women and men who live and work in the rural communities and ejidos or community´s owned land across the country. The SRA provides legal certainty for the owners of the land and promote comprehensive rural development social justice. One of the ways the SRA supports rural development is through the promotion of entrepreneurial and productive projects in ejidos and communities through its programs Support for Productive Projects in Agrarian Nucleolus Fund (Fondo de Apoyo para Proyectos Productivos en Núcleos Agrarios, FAPPA) Program for Women in the Agricultural Sector (Programa de la Mujer en el Sector Agrario, PROMUSAG) and Young Rural Entrepreneur and Land Fund (Joven Emprendedor Rural y Fondo de Tierras, JERFT). PROMUSAG is aimed at women

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

who are organized to develop a productive project that allows them to earn an income and thus help fight poverty in rural areas (PROMUSAG 2012, SAGARPA, 2016).

Within PROMUSAG program, projects can be installed in various areas, such as ecotourism, cattle fattening, rural stores, food production or various services. Women living in the countryside can access the program PROMUSAG women's groups of 3-6 members, over 18 years old, who inhabit agrarian and rural areas owners of community land. The financial support is of $30,000.00 per member provided it does not exceed the amount of $ 180,000.00. Women may be benefiting from the support of PROMUSAG until they have been supported in the past five fiscal years by himself or by the FAPPA PROMUSAG (Fund for supporting productive projects in agrarian).

METHODOLOGY

The methods employed are the analytical and descriptive. The first aims to analyze the case and identify failures and successes which led the company for the ensuing year and the descriptive method to detail the situations experienced by the venture.

Case to Analyze

The history and details of the case were provided by one of the women who undertook this business which in turn is a daughter of the initial principal leader of the enterprise. To gather the information, a personal informal interview was conducted on May 2012. What more motivated the business venture was the fact that the main entrepreneur has a great taste an innate ability for this type of business, her personal qualities and characteristics mostly agree with those of a successful entrepreneur. The main obstacle for this business venture was the lack of funding, which it once existed, the project was launched.

In 2009 the entrepreneurial principal, was blessed with a support of $ 100,000.00 in cash, with the advantageous feature called "sunk" to the implementation of a rural business in the town of San Martin de Hidalgo, Jalisco, which consisted of raising and fattening cattle. Support was received from the government body called Agrarian Reform Secretariat by rural support program to women entrepreneurs "PROMUSAG". PROMUSAG central requirements requested to be eligible for funding to the various proposals were teams of nine members, all participants should be female, a project to undertake the business detailing emphasizing the distribution of grant money, it is sent to an agricultural engineer to develop the agricultural area and the last requirement was to have an area of land sufficient to carry out the purpose of the enterprise activity.

The selection criteria for the formation of the task force were: being female is the PROMUSAG prerequisite required and indispensable, belonging to the family, time available for the project and interest in it. The skills and / or abilities that have the formed team made are the leadership, expertise in law, some livestock knowledge and empirical knowledge of small business management. The way in which it was given the work distribution between women entrepreneurs was by making meeting arrangements, where they defined their roles. The "lady" was the project leader, his daughter is bachelor-in-law and has the role of administrator of financial resources, and the other members would act as support staff, i.e. performing operational tasks of supplies purchase, cleaning stalls, feeding cattle and attention to situations that may arise in the production area.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The business plan prepared was paid before the monetary benefit was granted, it just detail issues relating to investment in equipment and production inputs such as instruments, equipment, food, young livestock, among others. Therefore, only was useful to structure the production plant and neither for business organization or healthy finance to sustain within inside. The way to get to the end customer and more convenient for the type of business, existing resources and the region where they conducted the enterprise, was to sell the product at a much larger broker to sell the product it the final consumer. The project lasted only six months from commissioning to decommissioning, which corresponds to a period of fattening cattle.

Application of the Theories to the Case

It is necessary to analyze the internal aspects of the company to find the main successes and failures committed in undertaking this business, as the main reasons for the success of a company are brewing inside of it. A business venture begins with the idea and the desire of an individual undertaking, which must have certain qualities and characteristics. In this case, for the entrepreneur's main business was a success in life, as she is a person who has the characteristics and qualities of a successful entrepreneur, which are constancy, sense or business opportunity, knowledge, personal responsibility and leadership skills.

The monetary resource was, together with the decision of entrepreneurship, the main trigger of the business. This financial resource was needed for the purchase of instruments and appliances for conditioning the production plant. These acquired assets would be tangible resources with which the company would have to begin to build a road and build competitive advantage. Unfortunately, these were not innovative or special characteristics that could lead the company to take advantage of some sort as cost leadership, differentiation or focus. It really was the most common for a company to take from this type of business. The fact that there was no proper business plan to guide this enterprise in the formation of a solid organizational structure led to the existence of a variety of situations, which the organization was not in a proper way as there is no basis for internal coordination. That is, the organization did not develop intangible resources, neither knowledge nor skills, and also did not took advantage of the existing resources in good way, and there was no strategic plan to guide the company towards a goal through proper orientation of each of the actions to be undertaken. This due to the existing empirical knowledge and not theoretical basis exists. When it happened the disease of the entrepreneurship leader in the early stages, when the project did not even started to run was one of the situations for which the organization had no way to handle properly.

The lack of evidence document-based to guide the integration of the existent resources and capabilities propelled an unsuitable an inadequate knowledge management tied to hand and feet to the organization in terms of the creation and development of competitive advantages. There were three reasons why the venture was short-lived for only six months:

1. Failures in the leadership capability, the main leader fell ill soon after received financing and abandoned the project, not permanently but did not have enough contact to conduct business to success, being at the head of the project the daughter of the main leader. Her daughter is Bachelor-in-Law as a profession, but without certainty in knowledge about business management and effective leadership skills. This created an atmosphere of des governance, which brought conflict among team members and discouragement to work and / or continue in the project.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. Lack of capacity in the area of procurement, equipment and supplies were bought at high prices, which were not covered by the investment project. This situation created a debt in addition to the already acquired through funding from PROMUSAG, turn in a few days unviable the business that was being undertaken, as the rate of return on investment would hardly be necessary for the project to survive in the short term.
3. Lack of marketing capacity to market the product, at the time it was possible to have a finished product, feedlot cattle in optimum conditions, the price at which it was sold was low. However, it was not possible to recover the investment in the production stage; the money raised was used to pay debts owed to suppliers and creditors, leaving the project without resources and women without encouragement to continue. This happens due to a lack of capacity in the area of negotiation and the lack of market intelligence to analyze the situation and to anticipate future price to implement the actions that were relevant.

UBER STRATEGIES FOR TRANSPORT INCORPORATED PRIVATE MARKET

Background of the Problem

Today globalization plays an important process, because by this concept can be eliminated some barriers between countries. Through technology has been a way these barriers have been eliminated, since technological innovations often come equally to different countries and at different times around the world, so it can be seen different products with similar characteristics, which is called as a standard product, regardless of whether they are produced in different cultures.

The story so before it started this century tells that the common way to establish a company along the story is that the company or the plant reached the place where he would have operations, had a physical place, and was established formally. Now it is seeing a new trend in strategies and ways of doing business in enterprises as a platform generated by its operations, profits, sales and everything related to business dedicated activity. Which have started with this simple idea is now changing the way people are transported in large cities, according to the Uber definition is the smartest way to move and luxury at low cost.

Technology and innovation play an important role in the process of globalization. Adopting a comprehensive strategy for technology companies is essential and addressing new ways of doing business. Nowadays have been emerging these new companies of successful technology-based, born in markets international companies like Netshoes, Netflix, Google, Amazon and many other technological changes that have been created and have managed to be successful in their business segment. The creation of these new companies has diversified options that consumers have to purchase the good or service that require, with new technology and not in the common traditional form.

One problem faced by companies that wanted to provide the services of private transport in the country, were the unions of taxi drivers that prevent or put barriers to companies that wanted to provide these services faced, and who would provide the service had to join the unions of transportation in addition to the permits they had to acquire by the authorities to provide the service. Thus, the institutions were an impediment to a company that wanted to be in this area. But also, an advantage of same weaknesses they could have the same institutions, they have created companies like Uber and reaching nations that did not consider these businesses in their regulations. Taking advantage of those holes is how they have

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

succeeded in entering the global market.Within technology and new ways of doing business in the globalization process, it can be found different definitions and ways in which this process is changing. One of these definitions is that of Friedman (1970) and for example he says that globalization is a phenomenon characterized by technological innovation and its appearance in the world has been consolidated in stages. The initial stage of economic globalization, for some authors, is the industrial revolution the event that gave rise to this phenomenon. Most authors state that consolidation was given to a process of trade integration (Carbaugh, 2005).

In recent years this type of technology-based companies has increased their presence around the world and have led to the emergence of more of this type and have seen more and more not only born but become successful, not only in a nation but in the global market place. A technology-based company can differentiate itself from other companies with the main feature innovation processes, either in the product or service offered. They base their activity on technological research, having scientific and technological knowledge.

For purposes of this research, the case of Uber is studied from the side of the strategies used to enter the global market, and succeeding in many countries, taking into account that each country and culture is different, the use of concepts as work global, technology-based companies, global strategy was considered a factor for growth and establishment of industries or companies of this type. The technology-based companies like Uber have achieved their positioning in the limited control of institutions to such companies, in the absence of regulatory schemes both Uber and other companies have used this to establish their operations. Some features that make them different companies like Uber is that they have fewer staff operating or working for the company, since by creating the online platform and working and operating costs are lower than in a company established in a physical place also presented in the world with a standard or homogenized product. Companies like Uber generate an advantage for users or consumers and have achieved different countries or states to consider making changes to their laws to fit the modus operandi of these companies. States allow or block entry of Uber and other companies in their type, having a power in the region where they arrive with their operations, thus having influence on decisions or regulations made in the laws for operation.

The research of these report wants to answer is on How technology-based companies with a global strategy have succeeded in entering and being successful in the new way of doing business?

The importance comes to have this work of serious research to understand the impact of the strategies of technology-based companies taking specific case of Uber. This is done using the theory of institutions and by applying the concept of global strategy came to succeed. Overall, a case of Uber especially as famous as the raised here in this chapter case where the company has already been established in at least 20 countries, albeit with some adjustments as the nation where the product offering remains standard worldwide reaches, and despite having problems in some cities where he settled.

These problems especially with local competitors, called taxis are mainly due to fact they think it is unfair competition and with innovation that the company Uber made in the product achievement that many people with common form move from side to side in public or private transport, now do differently and have changed the way they use the shuttle. While we know that the group of people or consumers who can access this service is limited, because people who use it so far require at least two basic things to make use of the product. One of them is to have a cell phone where downloading the application, then also required to have a bank account as a credit card or debit card with which to pay the service they have. These basic elements are essential of this new business model and so far, it is fundamental to acquire a service like what Uber offers, because without them they cannot access the transfer from

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

one place to another. Thus, this is being a limiting factor that not all people can consume this good or service, so the service is intended for a specific sector of the population which operates the platform.

In the case of Mexico, so far is not entirely clear the legal fulfillments that must have this company. Mexico is working on making changes to laws, regulations roads and adaptations of the legal framework of the relevant institutions to consider Uber and companies of its kind in formal enterprises. In this case, some state laws are working to make adaptations to their traffic laws, such as the state of Jalisco and Mexico City that having already advanced and concrete proposals as to how to resolve this issue. However, at the time of writing this report, some of the proposals were being approved or published to make them official.

Moreover, companies offering the same service as Uber, in this case the taxis see it as an illegal and unfair to the service competition that for years have been offering and operating in some form as a monopoly. They do not pay taxes and have adopted certain aggressive strategies to try to reach the market to Uber through intimidation or aggression towards users or drivers of the business. Taking advantage of technological changes and the weakness of the institutions not considered. Also, with the emergence years ago of other technology companies and carrying out a global strategy have been incorporated to market, different companies.

One of these technology-based companies with a comprehensive global strategy that has carried out these concepts in a successfully way is Uber because today it is seen with these strategies that has-been established in the market. After seeing this case have emerged more companies with the same features and offer the service of private transport, as are Cabify and City drive to name some of the same sector. Even its operations are similar to the case analyzed in this work. These firms are technology-based companies that offer a private shuttle service to their users through a platform. Although not all companies operate as such in the same cities, their strategies are like. On the other hand, if it is seen the part where it operates each company taking the case of Mexico. For example, in Guadalajara operates Uber and City drive but not Cabify, leading to the conclusion that even with global strategies are not present in the same cities or arrive at the same time. Uber is in Guadalajara and 379 cities worldwide and is aimed at a specific segment of the population that is people with bank account, credit card or debit card to pay for the service they purchase, as well as having the application installed on their cell phone.

Within its business model, Uber does not accept payment in cash so far, this being an important innovation in the model, and this aspect is also part of the diversification of the service. Another important issue is quality standards for these keep the user since the end of each trip it can rate the service and the driver, this being another innovation in the service provided how had offered traditional way. An important issue in such companies as already mentioned is the diversification of product or service offered, as it has been key to succeed and companies like Netshoes, Netflix, Amazon and the company analyzed in this case Uber. These technology-based companies have in common is that they are based on diversification and innovation in what they offer which is considered the most important to have successful operations in a globalized world. Another important segment is the population that has access to the good or service that is launched. when somebody wants to buy a product like shoes, food, books or any other product only they go to the market place where the product is sold and with money in hand it is acquired and anyone who can pay the price can buy it.

In the case of service Uber, this simply fact does not apply because it is a service that only is acquired it from a strict sense by people over 18, who are the people likely to have a bank account to pay for the service. Thus, the target population or that can be client f Uber, are people over 18 years with bank account. Uber on its website states that offers the service in five municipalities of the Metropolitan area

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of Guadalajara (ZMG), that is Guadalajara, Zapopan, Tlaquepaque, Tonala and Tlajomulco, taking a total of 2,745,260 potential customers broken down as follows the municipalities, and displaying data as much as by men and women.

Table 1. Total population of the metropolitan area of Guadalajara

Municipality	Population 18 and Over	Masculine Population 18 and More	Feminine Population 18 and More
Guadalajara	1,031,902	482,713	549,189
Tlaquepaque	376,022	182,406	193,616
Tlajomulco de Zúñiga	235,703	115,015	120,688
Tonalá	289,679	147,418	142,261
Zapopan	811,954	388,501	423,453

Source: Prepared with data from INEGI 2010 census

According to data from the Metropolitan Transportation Institute Jalisco, taxis continue to maintain market power and Uber is positioned in second place in service of private transport as it is concerned. An advantage of Uber, considered by users is mainly the price and greater security.

Analysis of Results

Today many companies seek more customer satisfaction or give greater importance to this issue. Therefore, they carry out different strategies to accomplish this and satisfy their customers. According to the sector where companies unfold will make the appropriate innovations to the product or service offered by adaptations according to geographical area, with strategic advertising, by price or by improving product quality. Sometimes what the customer is looking for comfort, closeness or facility to acquire the asset or service. This is what UBER has done to offer its service. Uber implements innovations in the business model.

In finding that customer satisfaction, Uber relies to implement its innovations both in service and customer experience that maximizes utility when using the service. One of those innovations was the automatic payment. Also requesting service by an application installed on the user's phone that easily and at the touch of a button is the means to obtain the service. So, consumers identify this innovation in service and thus the company could exercise monopoly power over its competitors once started. Uber to operate the platform seized market share by displacing the service that for years has been given in different parts of the world called taxis that were intended to transport people who had no car or prefer not to use it.

With all the technological changes that have occurred in recent years, it is common that most of the population have access to a cell where through download the application and use the platform can request their transportation service, regardless of whether they bring cash. Uber main advantages over its competitors and by its strategies just identified the customer, are:

1. Innovation in the way of providing the service.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. No need cash (automatic payment).
3. The customer requires a cell with the application and a bank account where he will be charged by the service.
4. Cheaper than a taxi fare.
5. Provide a standard or homogenized product.
6. They offer a bonus in addition to transportation, like listening to the music the customer wants during the trip, water, air conditioning in the car.

An important aspect to consider is that many innovations and changes that a company has made if the service or product offered does not meet the quality standards of its customers would not be accepted. Bringing the theoretical aspects to the practice when technological innovations, prices and product quality were bad, Uber would not have achieved success that has today. In this way, it can be seen how by implementing a comprehensive and global strategy, a standardized product and application of technology in its service, Uber achieved to implement a new business model in the field of private transport service, and how this has given rise to emerging technology-based companies in different industries or sectors.

These technology-based companies begin to take an important role by having greater technological resources in their operations, with so many changes that have occurred in the way business enterprises have had to adapt to these technological changes and because of this have emerged companies like Uber.

CONCLUSION AND RECOMMENDATIONS

Empirical knowledge of entrepreneurs, in this case, was not enough to route this business to success and the lack of structured knowledge and appropriate scientific support to this project strongly directed towards not stay in the market.

The recommendation for PROMUSAG is that it needs to call for a strategic plan as a requirement to be eligible for financial support. To start a business, the entrepreneurs should also count on empirical knowledge, a scientific basis, either by the project members, or by external consultants. One of the advantages of technology-based companies like Uber is to reduce costs and adapt to the new way they are giving businesses through different mechanisms and strategies that were studied for this case. It can be concluded that through a global strategy and technological adaptations companies like Uber have been successful and also taking advantage of the gaps that institutions not considering such firms have adapted to the country coming through a standard product offering in the world.

Companies of its kind have well defined characteristics as that base their operations through the use of technological resources, maintains a standard or homogenized product regardless of the region or geographical area and implements global strategies. However, a weakness that can have companies in their type and it is necessary to assess the institutional aspects, as in some countries are making changes to allow operation through restrictions or in some cases block and not allow its operation. It is important to consider carrying out a successful global strategy.

Another advantage that can have the technology-based companies over their competitors is that their operations are based on the use of technological resources, so it can be concluded that through technological innovations and through a global strategy, it is shown that there is an emerging new type of economic system or a new business model that emerged a few years ago and through successful cases like Uber. This new model begins to change the course of business. The elements that the company included and

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

considered fundamental are the implementation of automatic payment, request the service by installed on a cell application because without it cannot access the transfer from one place to another, thus being a limiting so that not all people have free access to the service.

Finally, it should be mentioned that innovations do not reach at the same time to all places. Where the technology-based company starts operations, a company is critical to have a successful experience away from and continue to apply the strategies used to bequeath to success in its home and then expand their horizons.

KEY TERMS AND DEFINITIONS

Business Model: It is a conceptual structure designed as a system to support the methods of business viability, the means to fulfill its purpose and goals, financing, resources, operations, customer base, generation of revenues and profits.

Collaborative Economy: It is a set of initiatives based on horizontal networks with the participation of a community and formed by individuals who have something to share and others who need them with the purpose of giving, swapping, borrowing, trading, renting, and sharing products and services based on distributed trust and decentralized power.

Private Market: The structure of transactions that are negotiated directly between two parties and can take any form the parties agreement.

Strategy: It is the orientation and delimitation given to resources and capabilities of a firm in relation to complex and uncertain competitive market environments in order to accomplish the vision and mission of the firm.

Technology-Based Company: Also known as tech company, it is a firm focusing on the development and manufacturing that uses leading edge scientific and technological knowledge systematically and continuously to produce new goods or services with high added value.

Transport Incorporated: The act or process of moving people or things through different means of transport from one place to another subject to a patronage or ridership refers to the number of people using a transit unit.

Uber: It is an acronym to mean ultimate, best for above in German. It also has the basic meaning of over, beyond, extremely good. As the trade mark and global brand of a private transportation incorporated company, Uber has been changing inner-city transport structure.

Chapter 15
Lean Production and Its Impact on Worker Health:
Force and Fatigue-Based Evaluation Approaches

Murray Gibson
Auburn University, USA

Beata Mrugalska
Poznan University of Technology, Poland

ABSTRACT

Lean is currently applied successfully in many industrial sectors. However, its value and impact on human health is not fully understood. To gain a better understanding, this chapter explores how ergonomics force and fatigue evaluation methods can be applied in a manner to enhance lean initiatives. These methods incorporate ergonomic-related variables of force type, force duration, force frequency, and degree of awkward posture, and incorporate the recommended cumulative rest allowance (RCRA) model as a practical fatigue-based metric. These methods and their application are discussed.

INTRODUCTION

In today's global competition, successful companies focus on diversity and inclusion as a source of competitive advantage. The organizations use diverse methods and techniques to improve their productivity, quality, and profitability. In order to achieve this, the work organization system of lean production has been widely adopted throughout the industrial world. Lean originates from the Toyota Production System and has been recognized as doing more with less. Thus, it is oriented toward reduction of unnecessary variations and steps in the work process by the elimination of waste, which can be thought of as a non-value-added aspect of a product or service. Originally, the focus was paid to the elimination of wastes such as defects requiring rework, unnecessary processing steps, movement of materials or people,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

waiting time, excess inventory, and overproduction. But today Lean systems impact a wide-range of manufacturing related systems including the initial stages of product life cycle such as product development, procurement and manufacturing over to distribution (Womack & Jones, 1996). The most common practices associated with lean production are the following: bottleneck removal (production smoothing), cellular manufacturing, competitive benchmarking, continuous improvement programs, cross-functional work force, cycle time reductions, focused factory production, just-in-time/continuous flow production, lot size reductions, maintenance optimization, new process equipment/technologies, planning and scheduling strategies, preventive maintenance, process capability measurements, pull system/Kanban, quality management programs, quick changeover techniques, reengineered production process, safety improvement programs, self-directed work teams, and total quality management (Shah & Ward, 2003).

It should be clearly pointed out that the misusage of lean techniques can lead to overlooking issues that lead to health problems, injuries, or even accidents. All these consequences lead to the need to spend money on compensation claims, which may be the best example of waste (Pai et. 2009). The awareness of the relationship between worker health and lean among lean practitioners is not always visible. There are some studies which show such an impact in the areas of occupational injuries and illnesses, or job characteristics related to job strain and linked to hypertension and cardiovascular disease (Landsbergis et al., 1999). Furthermore, it has been investigated that lean production can empower workers (Shah & Ward, 2003; Taj & Morosan, 2011) as it requires intensified work pace and increased job demands. Decision authority and skill levels can increase modestly or temporarily, while decision latitude is kept at low level which can lead to job strain and finally, musculoskeletal disorders. In jobs with ergonomic stressors, intensification of labor appears to lead to increases in musculoskeletal disorders (Landsbergis et al., 1999). Lean may result in raised stress levels and therefore increase worker turnover and absenteeism with a negative impact on manufacturing performance (Gill, 2003). However, further studies revealed that this approach in fact increases the stress levels. But not on the shop floor as it was previously suggested, but rather on the managerial level (Sangwan, 2013). Furthermore, when lean was tested against such work organization models as: Taylorism model, human relations model and socio-technology models, on the two dimensions central or decentralized orientation and human factor orientation; it turned out that it outperforms both the Taylorism model and the human relations model (European Foundation Report, 2001).

Ergonomics is defined as the application of theory, principles, data and methods to design a system which accommodates both the human operator's capabilities and limitations in the work process (Wickens, 1992). Ergonomics enables us to better understand the interactions among humans and other elements of a system, allowing the optimization of overall system performance (Naranjo-Flores et. al, 2014). Ergonomics continues to become more and more important in industry due to the positive influence on productivity and efficiency as well as its modern-day focus to reduce or prevent work-related injuries. It should be appreciated that ergonomics and lean are highly inter-related. Ergonomic risks are strongly associated with lean-related wastes; and lean transformation should naturally lead to ergonomic risk reduction (Aqlan et. al, 2013). Despite these facts, many companies have implemented lean-related systems to control productivity and quality, without a clear understanding of the potential of ergonomics to contribute to the objectives of lean.

The purpose of this research is to better understand and communicate the application of modern ergonomics force and fatigue evaluation methods in lean initiatives. To achieve this objective, a systematic search of the literature was be carried out using the following electronic databases: MEDLINE, PubMed, Scopus, Clarivate Analytics (former Web of Science) and Science Direct. All databases were searched

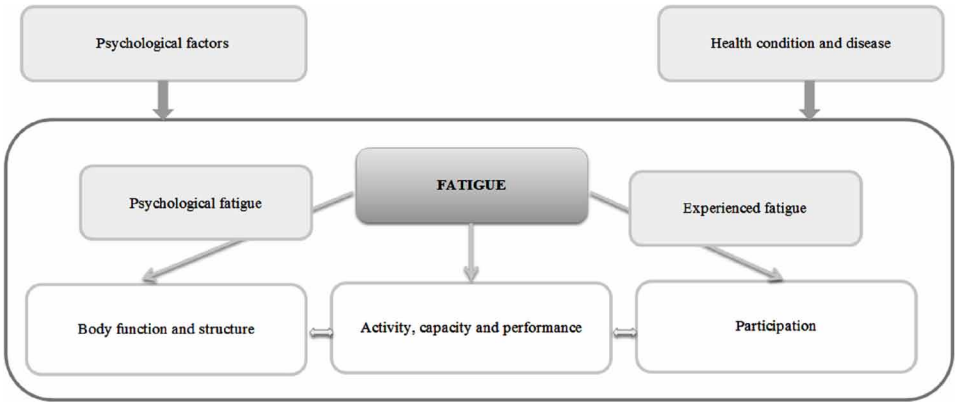
EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

from their inception to April 2018. Keywords used in the search strategy were: "lean" AND "force" AND "fatigue" OR "fatigue" AND "calculator" OR "fatigue" AND "calculation" OR "muscle" AND "fatigue" OR "grip" AND "force" AND "fatigue" OR "pinch" AND "force" AND "fatigue" OR "press" AND "force" AND "fatigue". In order to find the supposed papers while reading the titles and abstracts the reference was made to human. This search was supposed to reveal better insight into approaches for the quantification of ergonomic related muscle fatigue, particularly those utilizing calculations-based models.

BACKGROUND

Fatigue is commonly perceived as a non-specific symptom that refers to health conditions of human beings. It is defined as an overwhelming sense of psychological and psychical tiredness, lack of energy and feeling of exhaustion which results in the perception of difficulty performing tasks (Gruet et al., 2013; Tran et al. 2010). If it is accumulated and not resolved, it can cause overwork, chronic fatigue syndrome, overtraining syndrome, and even endocrine disorders, immunity dysfunction, organic diseases and a threat to human health (Wan et al., 2017; Larun et al., 2017). It can be perceived as a multidimensional concept which can be integrated within the World Health Organization's Classification of Functioning, Disability, and Health (WHO-ICF). Following it, the effect of disease on body function and structure, activity and participation of the patient can be shown (Figure 1) (World Health Organization 2001, Vries et al. 2010).

Figure 1. Multidisciplinary concept of fatigue
Source: Adopted from (World Health Organization 2001, Vries et al. 2010)



Diverse fatigue classification can be found in the literature; however, the most general approach is to differentiate between objective and subjective fatigue. Objective fatigue is the observable and measurable loss in performance due to the repetition of a physical or mental task, while subjective fatigue is a feeling of early exhaustion, weariness and unwillingness to exert effort (Staub & Bogousslavsky, 2001). Moreover, when we refer to its duration, we can differentiate between acute fatigue and chronic fatigue. Acute fatigue can be quickly relieved by rest or life-style changes, whereas chronic fatigue is a persistent tiredness lasting months, and not ameliorated by rest (Norheim et al., 2011; Silverman et al.,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

2010; Kroenke et al., 1988). On the other hand, it can also be classified as mental fatigue, which refers to the cognitive or perceptual aspects of fatigue; and physical fatigue, which is related to the performance of the motor system. It is also possible to refer to different levels of the motor pathway and differentiate central and peripheral fatigue. Central fatigue originates at the central nervous system (CNS), which decreases the neural drive to the muscle. Peripheral fatigue is produced by changes at or distal to the neuromuscular junction (Gandevia, 2001; Bigland-Ritchie et al., 1978).

Two types of fatigue commonly associated with the application of industrial ergonomics are cognitive (mental) fatigue and whole-body fatigue. Methods of quantifying cognitive fatigue are not widely adopted by ergonomics practitioners in the field. Cognitive fatigue is often "measured" by administering subjective rating scales, resulting in metrics/outputs that are apt to be perceived as "highly subjective" by management. Due to cognitive fatigue being highly dependent upon individual perception, it is difficult to establish reliable (and credible) metrics for cognitive fatigue across jobs and tasks (Beurskens et al., 2016; Montalvo et al., 2016).

Whole body fatigue on the other hand is associated with energy consumed by the body during performance of a physical activity (i.e., materials handling, walking, running, etc.) (Kim et al., 2016). Whole body fatigue can be measured indirectly by measuring oxygen consumption by the body (i.e., ml O_2 per kg of bodyweight per min.). Then oxygen consumption is converted to energy consumption of the body (i.e., 1 liter of $O_2 = 5$ kcal). Direct measurement of oxygen consumption can be cumbersome, requiring workers to wear equipment that is somewhat invasive. This method is not commonly relied upon in the application of industrial ergonomics (Thomas et al. 2016).

Another method of quantifying energy consumption in the evaluation of whole body fatigue is by table lookup. Using this method, work is classified by distinct type/category of effort such as Light Work (consuming 1-2.5 kcal/min), Moderate Work (consuming 2.5-3.8 kcal/min), etc. Then by measuring or estimating the time spent performing each type/category of activity, a cumulative value of energy consumption is established.

Measuring whole body fatigue is not utilized to a significant extent in the mainstream application of industrial ergonomics. This may be due to most modern jobs not requiring high levels of whole body physical exertion. For example, strenuous materials handling tasks today are likely performed with the assistance of mechanized equipment rather than performed manually. For whatever reasons, reduction and prevention of musculoskeletal disorders are the primary focus of today's ergonomics initiatives rather than whole body fatigue.

A form of fatigue that lends itself to a higher specificity of measurement and practical application is localized muscle fatigue. Localized muscle fatigue concerns the fatiguing of active tissue associated with force applications by the worker. When muscles and other soft tissues become fatigued, this can be detrimental to the performance of physical work. This is depicted in Figure 2.

The authors prefer a practical definition of localized muscle fatigue:

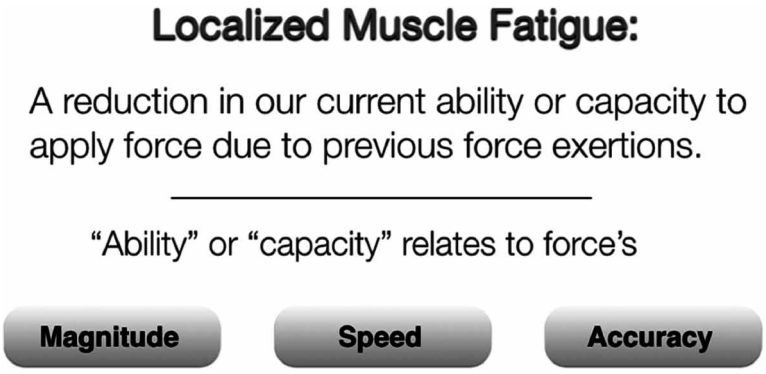
A reduction in human current ability or capacity to apply force due to previous force exertions.

This reduction in ability or capacity to apply force can result in the worker using a higher percentage of his/her maximum strength toward the end of the shift (fatigued state) than was necessary at the beginning of the shift (non-fatigued state). This can also be a reduction in speed (velocity or time duration) at which a force is applied, or similarly a reduction in the speed of bodily movement (i.e., requiring more time to reach, bend, perform a movement sequence, etc.). This is particularly detrimental at a bottleneck station,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

potentially negatively impacting the productivity rate of the entire line or process when the employee in a bottleneck station becomes fatigued. Or the reduction in ability or capacity to apply force could be a reduction in movement accuracy, resulting in increased quality defects for tasks requiring high levels of precision and accuracy. All these things can negatively impact work from a performance perspective.

Figure 2. Localized muscle fatigue's impact on human performance



FORCE AND FATIGUE EVALUATION IN LEAN APPLICATIONS: INDUSTRIAL INSIGHTS

Based on the authors' observations in industry, it is common for organizations to implement lean, yet experience considerable difficulty achieving the performance levels predicted by the lean tools of standard work, line balancing, etc. For work with a high manual work content component, it is a common occurrence for visual factory performance boards to display satisfactory productivity levels for the first 2-4 hours of the work shift, but then mysteriously record drops in productivity over the remainder of the work shift. In a similar fashion, it is common to observe satisfactory productivity levels during the first part of the work week, but then observe productivity decline (unexplainably!) toward the end of the work week. The authors believe this breakdown between "model productivity" and actual productivity may be due to lean approaches failing to adequately account for worker fatigue.

Worker fatigue can manifest itself in multiple forms. As previously outlined in this paper, commonly recognized categories of fatigue are cognitive fatigue, whole body fatigue, and localized muscle fatigue. Of these 3 categories of fatigue, the authors believe that the category most readily applied with significant benefits in a lean environment is localized muscle fatigue.

Localized muscle fatigue can be readily modeled within the lean initiative. Lean's standard work breaks jobs down into a sequence of defined tasks and subtasks. These task and subtask times are then used to calculate the cycle time of the job (projected time to complete one work cycle). Standard work can utilize predetermined time systems (such as MOST, MTM, etc.), but it is commonly accomplished through simple stopwatch time study. In the simple stopwatch method, a "representative worker" is selected for observation. Then a number of observations are recorded, and averaged to estimate the job cycle time. Most of these time study methods include fatigue allowances (allowances developed decades

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ago), but these standard work fatigue allowances do not incorporate modern methods involving the quantification of localized muscle fatigue.

After standard work's breakdown of jobs into tasks and subtasks, all that remains to quantify localized muscle fatigue is to identify a the additional ergonomic-related variables of

- **Force Type:** Pinch grip, hand grip, press with thumb, etc.
- **Force Duration:** How many seconds the force is applied – 1.2 s, 3.4 s, etc.
- **Force Frequency or Force "Count":** # times the force is applied per job cycle
- **Documentation of Degree of Awkward Posture:** Wrist flexion, ulnar deviation of wrist, etc.

This detailed ergonomic evaluation detail can be readily collected during the development of lean standard work. The next step is to process this data using an ergonomics evaluation model. An emerging model for evaluating localized muscle fatigue is the Recommended Cumulative Recovery Allowance, RCRA (Gibson & Potvin, 2016).

For a given segment of the worker population (often 25th percentile female strength), the RCRA can be used to calculate the recovery time necessary for muscle groups to recover from individual force exertions. For similar force types (hand grip, pinch, one-arm push, etc.), the recovery time for the task as a whole can be calculated by summing the individual task and subtask level recovery times. If the calculated total model recovery time is greater than the actual in-task recovery time, then in-task recovery is insufficient … and muscle fatigue should be anticipated. On the other hand, if the total model recovery time is less than the actual in-task recovery time, then the worker's muscles have (based on model calculations) sufficient recovery, and the worker should be able to perform the job without experiencing undue muscle fatigue over the course of the work shift.

SOLUTIONS AND RECOMMENDATIONS

RCRA based offshoot models and ensuing macro-ergonomics solutions have tremendous potential to benefit both lean and ergonomics. These lean-benefiting solutions include:

- **Line Balancing:** Utilizing RCRA calculations enable us to better assess localized muscle fatigue in traditional line balancing. Line balancing is a methodology for distributing tasks amongst stations to balance work content. Line balancing utilizes time-based metrics (values developed through standard work); but using the RCRA, it is possible to assign/distribute tasks among workstations in a manner to also prevent (or at least minimize) localized muscle fatigue. This approach can be thought of as "fatigue balancing", where tasks are assigned to stations in the optimal manner to prevent localized muscle fatigue.
- **Ergonomics Risk Assessment:** RCRA metrics complement traditional ergonomics risk assessment methods, helping identify jobs posing significant musculoskeletal injury risks. In additional to injury prevention, keeping job demands within RCRA-based limits also prevents localized muscle fatigue, positively impacting productivity and quality metrics.
- **Individualized Ergonomics Evaluation:** Incorporating individual strength levels (measured directly or estimated with predictive equations) into RCRA-based evaluation models enables ergonomics evaluation with respect to the individual. Instead of a one-size-fits-all approach to ergo-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

nomics evaluation, individualized evaluation offers greater "fidelity" in our efforts to identify jobs and job groups where physical job demands are misaligned with individual worker capabilities. These individualized evaluation approaches have the potential to promote increased diversity and inclusion through more effective work assignment, accommodation, and thoughtful job rotation considering persons with strength limitations (i.e., elderly employees, employees with strength reduction resulting from a prior injury, some female workers with limited upper body strength, etc.).

- **Job Rotation:** Aid in design of more effective job rotation plans, either designing for a specific strength percentile (i.e., 10^{th} percentile female strength, 25^{th} percentile female strength, etc.), or rotation plans utilizing individual strength inputs in the job rotation model logic.
- **Simulated Ergonomics Evaluation:** Once job demands are measured/documented, simulation approaches can be used to predict the impact to RCRA metrics of equipment or process changes (i.e., reducing cycle time, changing to a part design requiring higher assembly force, changing the mix of models run on an assembly line, etc.).

The above force and fatigue based macro-ergonomics solutions, incorporating RCRA-based fatigue evaluation models, have tremendous potential to enable lean practitioners to make better decisions with respect to design of physical work, employee work assignments, work scheduling, etc.; thus enabling lean practitioners to both optimize traditional lean objectives and positively impact ergonomics and the physical wellbeing of workers.

FUTURE RESEARCH DIRECTIONS

The authors believe that future research should explore the application of modern force and fatigue-based macro-ergonomics solutions for the purpose of positively impacting productivity and quality-related metrics, in addition to the long-standing role of ergonomics as a tool to prevent or reduce work-related injuries and associated costs. Macro-ergonomics solutions having such potential are line/"fatigue" balancing, individualized ergonomics evaluation, and simulated ergonomics evaluation. Advancements in this area require both empirical and theoretical research.

CONCLUSION

Lean and ergonomics go hand in hand. Successful integration of ergonomics into lean initiatives results in competitive advantages for companies … predictable productivity levels, prevention of workplace injuries, etc. Besides these obvious benefits, emerging force and fatigue evaluation approaches have tremendous potential to positively impact workforce diversity and inclusion, through better measurement and management of physical work requirements.

KEY TERMS AND DEFINITIONS

Ergonomics: Process of adjusting surrounding to human.
Force: Strength generated by muscle.
Health: Condition of body, mind, and spirit to perform tasks effectively.
Lean: Create more with less.
Lean Thinking: Management approach how to deliver more while eliminating waste.
Muscle: Fibrous tissue which lets to contract, moves, or keeps the position of parts of the body.
Physical Fatigue: Temporary impossibility of muscle to perform tasks optimally.

Chapter 16
How Does Schema Affect Stress and Productivity at the Workplace?
Quantitative Analysis of Schema in the Occupational Setting

Ko Sugiura
Keio University, Tokyo, Japan

Akiyoshi Shimura
Tokyo Medical University, Tokyo, Japan

ABSTRACT

Maintaining mental health has become a great concern not only for one's well-being, but also for companies' management, while one's personality trait has gained its popularity as a cause. In this article, the authors then investigate how worksite productivity loss is accounted for by stress response accompanied with schema. To this end, the conventional stress model is extended so as to include schema. The pivotal idea of the extended model stands in that both stressor and strain are associated with schema. The result of multiple regression analysis showed that workplace productivity loss is most largely affected by irritability, fatigue, and depression. In addition, the result of hierarchical regression analysis revealed that schema affects stress reaction both directly and indirectly, and that there exists a so-called buffering effect between job control and coworkers' support. These findings suggest that work productivity may be improved by intervention regarding schema or by promoting the buffering effect.

1. INTRODUCTION

Handling and tackling psychological stress are pivotal issues from both humanitarian and economic viewpoints (Lerner et al., 2001). The term stress is now associated with various academic fields, including psychology, psychiatry, and physiology (Bamber, 2006). Particularly in the vocational setting, it is mostly often linked to cognitive theory. This article also highlights the cognitive approach for workplace stress reaction; more precisely speaking, this plugs into the existing cognitive framework for occupational stress reaction another concept of cognitive theory, namely, schema. To this end, this article consists mainly of three concepts: occupational stress, worksite productivity loss, and schema. These are briefly reviewed respectively as follows.

1.1. Stress

An increasing amount of attention has been paid to mental stress at the workplace (Kivimäki, Vahtera, Pentti, & Ferrie, 2000; Theorell et al., 2003). Stress is now viewed in relation to physical, physiological, and psychological health, e.g., musculoskeletal symptoms (Boström, Dellve, Thomée, & Hagberg, 2008), sleep (Van Laethem, Beckers, Kompier, Dijksterhuis, & Geurts, 2013), depression (Mutkins, Brown, & Thorsteinsson, 2011), and so forth. Not until the adoption of cognitive theory was that promising pathways have been laid for occupational stress modeling (see (Staal, 2004), for review). One typical example of such models is the Job Demand-Control Support model (JDCS model), which delved into the causation of mental stress (Johnson & Hall, 1988; Johnson, Hall, & Theorell, 1989; Karasek, 1979). Karasek first presented this model, which characterizes psychological strain by the latitude of job demand and job control (Karasek, 1979). This model defines a stressful situation as the case where one has heavy job demand but has only a limited control over her/his task. Later, this idea was extended by adding a dimension of social support (Johnson & Hall, 1988; Johnson et al., 1989). This refined model postulates that one feels psychologically strained when s/he has greater job demand despite less latitude of control and support. This conceptualization is quite general and thus malleable enough to provide a basic framework for other later works (Häusser, Mojzisch, Niesel, & Schulz-Hardt, 2010).

One of the well-known stylized facts in the theory of stress reaction is the so-called *buffering effect* or *exacerbation effect*. These are generally the effects that the association of stressor with human relationships reduce or enrich with respect to their influence on stress outcomes (Cohen & Wills, 1985; Rook, 1984). In the context of the JDCS model, for example, the negative correlation of stressor and stress response is degraded by social support, which is the case where social support is buffering the stressor. The research on these phenomena has arguably been developed (Sapp, Kawachi, Sorensen, LaMontagne, & Subramanian, 2010), and the conclusions are often mixed (de Lange, Taris, Kompier, Houtman, & Bongers, 2003). Then, it is worthwhile investigating the existence of these effects and actually the present study shall contribute to this discussion to a certain extent.

1.2. Productivity

With a view to financial coping of companies, practical interest in stress assessment also entails its economic impact, or simply, productivity (Donald et al., 2005; Faragher, Cooper, & Cartwright, 2004). Although this term has various dimensions of definition (Cocker, Martin, Scott, Venn, & Sanderson, 2013), ranging from individual (Kessler, Greenberg, Mickelson. K. D, Meneades, & Wang, 2001), to

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

business (Murphy & Cooper, 2000), to nation (Evans-Lacko & Knapp, 2016; Kessler et al., 2006), the research scope in the context of personal healthcare can plausibly be restricted to the workplace, which means we only need to consider the individual-level productivity and/or its loss (Chapman, 2005). The productivity loss at the worksite, by and large, consists of absenteeism and presenteeism (Chapman, 2005; Gosselin, Lemyre, & Corneil, 2013). Most commonly, the former is viewed as financial loss stemming from not being able to attend to work due to sickness or injury, and the latter is regarded as loss caused by an employee trying to work while s/he is unable to do so efficiently enough, due to her/his ill health (Aronsson, Gustafsson, & Dallner, 2000). Although absenteeism seems to be more costly to companies, a large body of existing studies has revealed that presenteeism is actually a heavier burden to companies in the long run (Chapman, 2005; Collins et al., 2005; Goetzel et al., 2004). Being consistent to this, some recent researches based on the individual level surveys also show the negative effect of depression on work productivity (McTernan, Dollard, & LaMontagne, 2013; Uribe, Pinto, Vecino-Ortiz, Gómez-Restrepo, & Rondón, 2017). To measure both or either of these workplace productivity losses, numerous questionnaires have been proposed (Mattke, Balakrishnan, Bergamo, & Newberry, 2007). In our study, we particularly focused on presenteeism.

1.3. Schema

When it comes to stressors, it is hypothesized that one's subjective evaluation of her/himself and others plays a remarkable role (Paterniti, Niedhammer, Lang, & Consoli, 2002; Stansfeld, 2002). The self-evaluation is, in most cases, characterized by the notion of *self-esteem*, which is explicitly considered in the Effort-Reward Imbalance model (ERI model) (Siegrist, 1996; Tsutsumi, Kayaba, Theorell, & Siegrist, 2001). This model identifies stressful conditions as imbalances between high effort exerted and low reward obtained. More specifically, reward is subdivided into three major aspects, namely, money, career opportunity, and self-esteem. Since this model can also treat explicitly the effect of the monetary aspects of occupations, it is particularly utilized for the study of job-related well-being (van Vegchel, de Jonge, Bosma, & Schaufeli, 2005). Regarding the evaluation of others, it may be useful to introduce the concept of *social capital*. This term can be traced back to several works (Aghion & Durlauf, 2005), and has been made use of in a multitude of research areas, such as crime rate and longevity (Putnam, 1995), education (Coleman, 1988), health and economy (Wilkinson, 1996), and so forth. In addition, the idea has certainly gained popularity in the field of psychological stress (Akram & Qayyum, 2014; Gächter, Savage, & Torgler, 2011; Sapp et al., 2010). Due to such a great availability, there has been no consensus reached on the definition of social capital. All literature, however, refers to something of *interpersonal relationship*, or *structure of community* (Aghion & Durlauf, 2005), which is indispensable to crystallize the notion of evaluation of others.

Meanwhile, some cognitive scientists ignited a discussion on *schema* in relation to mental disorders (Beck, 1979; Teasdale & Barnard, 1993). Schema is, in this context, defined as a relatively stable belief or attitude which is molded during childhood (Beck, 1979; Uchida et al., 2012) and which is, in turn, a deeper cognitive structure than automatic thoughts (Padesky, 1994). This was scrutinized and decomposed into four factors, namely, positive-self/others and negative-self/others (Fowler et al., 2006). The former two represent the positive belief towards oneself and others, respectively, and the latter two the negative ones for each (Fowler et al., 2006). When, for example, a person has greater negative schema, s/he, in general, tends to feel everything in an unfortunate way (Beck, 1979). In light of the above arguments, the positive and negative schemas on oneself can be viewed as an expansive definition of self-esteem,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

while the schemas on others are situated within the framework of social capital. Moreover, the notion of schema has quite recently been incorporated explicitly into the research about depressive symptoms (Friedmann, Lumley, & Lerman, 2016; Liu et al., 2014).

1.4. Motivation and Goal

As reviewed above, the concept of schema itself is not a recently developed concept. However, only a limited amount of literature has introduced this into the occupational context, and, if at all, they considered the conceptualization at best, lacking model-based quantitative examination (Bamber, 2006). In addition, despite the demand of measuring the worksite productivity, a paucity of literature has dealt with the productivity loss by means of model-based approach. Motivated by such circumstances, the present study constructs a model that includes both occupational stress and schema and emphasizes their quantitative analysis. Furthermore, in view of practical interest, this study assesses the extent of workplace productivity loss accompanied by psychological stress and schema. Moreover, the arguable existence of buffering/exacerbation effect is also tested.

Therefore, the objective of this study is to examine quantitatively the effect of schema on the worksite productivity. The quantitative analysis is composed of two parts: (1) to examine how worksite productivity loss is accounted for by stress response and (2) to extend the conventional stress model so as to include schema, and even elucidate its effectiveness on the model as a whole. In this process, we investigate specifically how schema affects stress responses, and whether there exists a buffering effect in the worksite stress model. The pivotal idea of our model stands in that both stressor and stress reaction are associated with schema.

2. METHOD

2.1. Study Population

In this study, we made use of data from a survey carried out at the site of "Dialogue in the Dark" in Japan. (The "Dialogue in the Dark" is a workshop starting from Hamburg in Germany and is now taking place in Japan, Singapore, Hong Kong, and other Asian countries as well as in many European countries. This workshop provides a training program for companies to foster good human relations among their employees. In particular, it is said that this program ferments one's positive feelings to both her/himself and others.) We adopted the data that was approved to use for academic purposes and eliminated the cases with missing values. The dates of the data ranged from 12 December 2016 to 25 April 2017, and the population size amounted to 198. The population mainly consisted of white-collar workers, those who work sitting in front of desks for a large portion of the daytime.

2.2. Instrument

Our model is largely composed of three factors, namely stress, productivity, and schema and we thus need to consider the operationalization of these. The most commonly used operationalization of the JDCS model is suggested as the Job Content Questionnaire (JCQ) (Karasek et al., 1998) and the questionnaire

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

by the National Institute for Occupational Safety and Health (NIOSH) (47) (Hurrell & McLaney, 1988). These days, another measurement encompassing both of these was developed as the Brief Job Stress Questionnaire (BJSQ) (Inoue et al., 2014a; Inoue et al., 2014b). The BJSQ consists of three components, namely stressors, stress responses, and social supports, which are subdivided into 17 questions, 29 questions, and 11 questions, respectively. Each question was evaluated by a 4-stage rating. The stressors of this scale comprise 9 subscales (quantitative job overload, qualitative job overload, physical demands, job control, skill under-utilization, interpersonal conflict, poor physical environment, suitable jobs, and intrinsic rewards), while the stress responses consist of 6 subscales (lack of vigor, anger-irritability, fatigue, anxiety, depression, and physical complaint). The social supports are classified into three subscales according to the subjects who give support, which are supervisor support, coworker support, and support from family and friends. We draw upon this measurement in our study. As for worksite productivity loss, or simply presenteeism, this was assessed by the Work Limitation Questionnaire (WLQ), which had been developed by a research group from the Center for Health Solutions of the Institute for Clinical Research and Health Policy Studies at Tufts Medical Center (Amick, Lerner, Rogers, Rooney, & Katz, 2000; Lerner et al., 2003; Lerner, Reed, Massarotti, Wester, & Burke, 2002). The research group approved our use of the eight-item version of this questionnaire. This questionnaire is composed of four categories: time management, physical tasks, mental interpersonal tasks, and output tasks. For each category, respondents are asked two questions by a 6-stage rating, one meaning "does not apply to my job." Schema was calculated by the Brief Core Schema Scales (BCSS) (Fowler et al., 2006; Yamauchi, Sudo, & Tanno, 2009). This is available without any permission required and measures one's schema by four sections: Negative-Self (NO), Positive-Self (PS), Negative-Others (NO), and Positive-Others (PO). Each has six questions with a 5-stage rating.

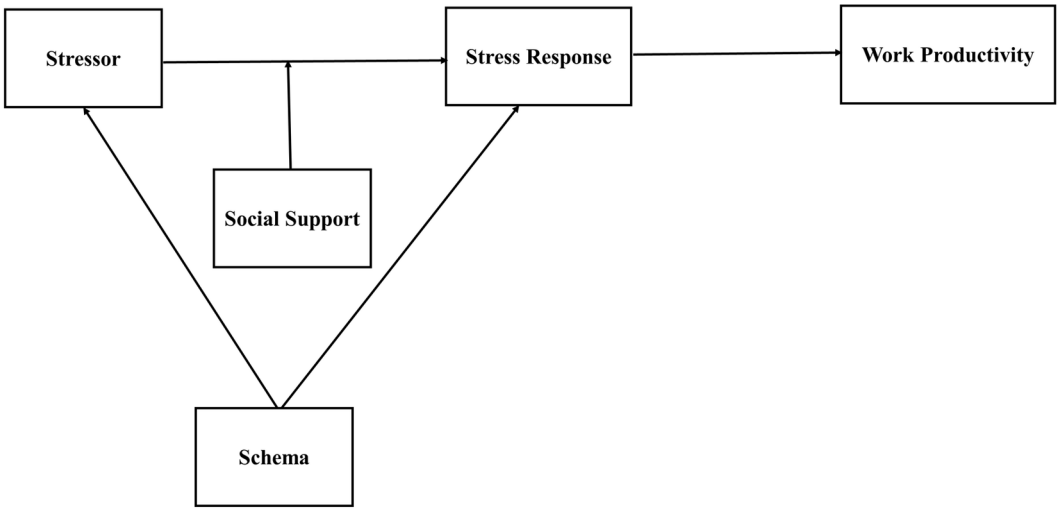
2.3. Proposed Model

Our research interest lies, as mentioned before, in the association of mental stress, schema, and work productivity. Since our measurements were all self-administered questionnaires and since stress reactions are highly complicated psychological activities, one's feelings may well be influenced or even biased by their preconceived ideas about human relations. As a matter of fact, many cognitive factors, such as self-criticism, and self-assurance, are known to be predictors of stress reactions; see (Bamber, 2006) for a review of recent developments on this topic. We first hypothesized that one's self-assessment of mental stresses may vary depending on the degree of schema, which is characterized by one-way arrows from schema to stressors, stress responses, and social supports. As for worksite productivity, despite some other research hypothesizing that work productivity is related to stressors and/or stress responses (see (Yang et al., 2015), for instance), we postulated that it is determined solely by stress responses, which is represented as a one-way arrow from stress responses to worksite productivity. We believe it is not an unreasonable assumption because the stressors and worksite performance in our scope seem to be unrelated to each other. This proposed model is encapsulated in Figure 1. From a practical viewpoint, of greatest interest is to measure how much the schema affects productivity directly and indirectly through the stress model. To this end, it is pivotal to distinguish the existence of the buffering effect or exacerbation effect. (In our model, we only cared about the buffering effect. The examination of the other was left to future work.) Thus, we also considered these effects by means of interaction terms of stressors and social supports.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the present study, we selectively employed the following subscales from each instrument; (1) two stressors (psychological workload and job control), six stress responses (lack of vigor, irritability, fatigue, anxiety, depression, and physical stress reaction), and three social supports (supervisor support, coworker support, and support from family and friends) from the BJSQ, and (2) the overall WLQ index from the WLQ, and (3) all the four subscales (NS, PS, NO, and PO) from the BCSS. To sum up, our hypothesis on stress responses can be operationalized as follow: six stress responses (lack of vigor, irritability, fatigue, anxiety, depression, and physical stress reaction) may respectively be determined by two stressors (psychological workload and job control) and three social supports (supervisor support, coworker support, and support from family and friends) with four subscales (NS, PS, NO, and PO) being covariates. Similarly, our hypothesis on the worksite productivity can be operationalized as follow: the overall WLQ index may be determined by six stress responses (lack of vigor, irritability, fatigue, anxiety, depression, and physical stress reaction).

Figure 1. Conceptual Framework of the Proposed Model



2.4. Statistical Analysis

Our analysis comprised mainly two steps. In the first step, to explore the relation between worksite productivity and stress reactions, we regressed the productivity scores (WLQ) on various stress responses (BJSQ). More precisely, we carried out a multiple regression analysis of the WLQ with the six stress responses (lack of vigor, irritability, fatigue, anxiety, depression, and physical stress reaction) being simultaneously independent variables. The purpose of this step is to drop ineffective variables from our model, and thus to reduce the number of the variables to be further investigated. The variable selection was waged based on (adjusted) coefficient of determination.

In the next step, we studied the causation mechanisms of the stress responses that were proved, in the previous step, to be significant to work productivity. To this end, for each significant stress response, we conducted a hierarchical regression analysis, using the BJSQ and BCSS. Thus, we conducted a multiple regression analysis of each of the significant stress responses with the two stressors (psychological work-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

load and job control), the three social supports (supervisor support, coworker support, and support from family and friends), the four schemas (NO, PO, NS, and PS), and the interaction terms of them being simultaneously independent variables. This analysis is composed of eight models as described below. We first examined the influence of schemas on stress response by regressing stress responses on schemas (Model 1). Letting these schemas be covariates, we added job demand and job control into independent variables (Model 2). Into the regressors of Model 2, we assimilated supervisor support (Model 3) and coworker support (Model 4). Moreover, for the sake of investigating the interaction effects of stressors and social supports, we explored four other models. Model 3 was extended by being integrated with the interaction effects of job demand and supervisor support (Model 5) and with the interaction of job control and supervisor support (Model 6). Similarly, Model 4 was broadened to encapsulate the interaction terms of job demand and coworker support (Model 7) and to include the terms of job control and coworker support (Model 8).

In addition, when the analysis above unveiled the existence of interaction terms, we furthered this by mean of analysis of covariance (ANCOVA) letting schemas be covariates. In this analysis, we compared the scores of stress response of higher social support with the one of lower social support with respect to high and low values of stressors. Here, the data were grouped according to their values; the data higher than median value are labeled as "higher" and the ones lower than the median as "lower."

Throughout our analysis, we regarded each score as a continuous variable, and adopted a reverse scoring so that every variable means "the higher it is, the worse the situation is." Moreover, these variables were all centered to deal with multicollinearity. Calculation of each score and relating data screening was carried out by the statistical computing software R, and all the other computation in our analysis was conducted by the statistical tool SPSS version 24 for Windows. We set the level of significance basically at $p<0.05$ but in view of the smaller size of our data, we occasionally admitted the level at $p<0.10$.

3. RESULTS

To begin with, we regressed the score of WLQ on six stress responses, i.e., lack of vigor, irritability, fatigue, anxiety, depression, and physical stress reaction. We also selected variables so as to maximize the (adjusted) coefficient of determination of the models. As a result, we found valid, with $R^2=0.258$, $\Delta R^2=0.247$ the three variables irritability, fatigue, and depression.

Before moving on to the main analysis, let us review briefly the summary descriptive statistics of the data exploited. Table 1 compares the levels of each stress response between the high score group and the low score one in terms of schema and other stressors. The table illustrates a consistent trend that the groups with higher score of schema and stressor tend to experience significantly higher stress. The observations on correlation coefficients are presented in Table 2. The table reveals that the positive schema for oneself is positively and relatively highly correlated to that for others (r=0.478). The same feature holds true for the negative schemas (r=0.411). In addition, both negative schemas witnessed relatively stronger positive correlation with the other variables. Without any surprise, stress responses had high correlations among them.

Afterwards, for each of these three stress outcomes, we conducted a hierarchical regression analysis with independent variables being schemas, stressors, and social supports. As a result, for all three responses, the BCSS terms have, more or less, the positive coefficients being significant. Only irritability, however, showed a remarkable result in terms of the existence of interaction effects (Table 3-5). Here, we illustrate the details of our analysis taking irritability as an example. In our analysis, model 1 revealed that the main effects of negative-self schema and negative-others schema were significant and their standard partial regression coefficients were both positive, which means the more negative belief on oneself and/or others is, the more one may feel irritated. In model 2, job demand and job control were shown to be significant at the significance levels of 5% and 10%, respectively. Since the standard partial regression coefficients for them were both positive, it can then be said that the higher the job demand is and/or the less the job control is, the more one may feel irritated, which is consistent with the conceptual definition of the JDCS model. The coefficient of determination actually improved (ΔR^2=0.033, F(2,191)=4.247, p<0.05). Model 3 and model 4 were used to examine the effectiveness of supervisor support and coworker support, but neither of them turned out to be valid. The buffering effect was investigated in the other models as interaction effects. Only model 8, which included the interaction term of job control and coworkers support, was significantly improved. As a matter of fact, the degree of model fit improved (ΔR^2=0.023, F(1,189)=5.931, p<0.05).

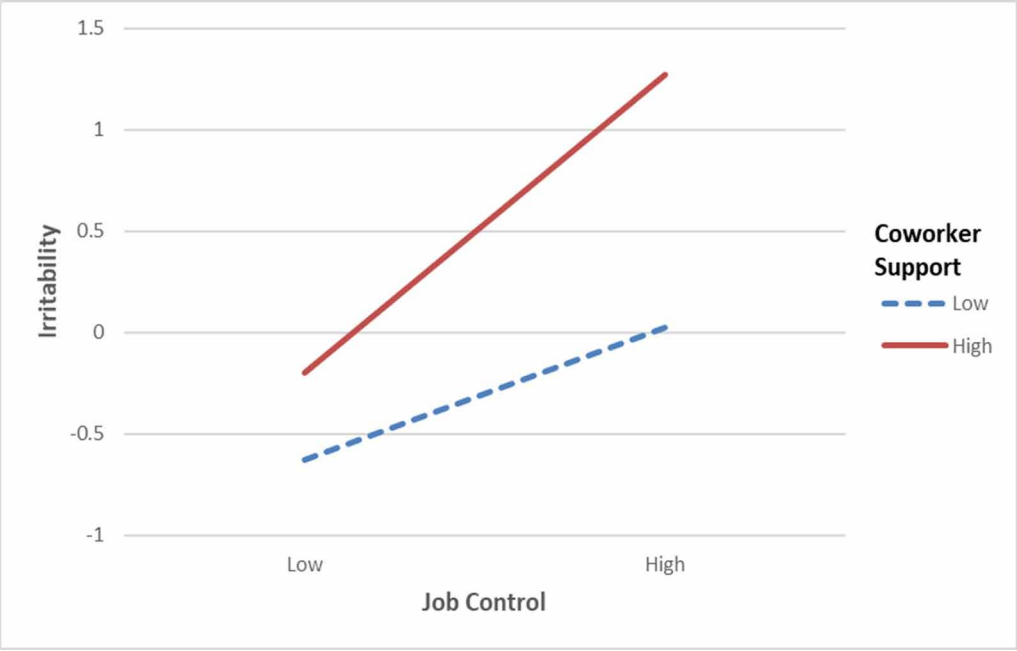
To see the effects of the interaction terms in detail, we used analysis of covariance (ANCOVA), letting schema be covariates. In this analysis, we compared the scores of irritability with higher social support to the ones with lower social support with respect to the level (high or low) of stressors (see Figure 2). As a result, regardless of the degree of job control, those with high score of coworker support tend to have significantly higher scores of irritability comparing to those with lower score of coworker support ($p<0.05$). This suggests that the people with insufficient assistance from their colleagues feel mental stress, that is to say, feel irritated, more seriously than those with sufficient coworker support. (Note that we applied reverse scoring to our data, and thus our data need to be understood as "the higher the score is, the worse the situation is." For instance, the higher value of stress score means that one is feeling more stress, and vice versa). Moreover, within the same group with the high score of coworker support, the score of irritability for the participants with the higher value of coworker support was significantly greater than that for those with the lower value of coworker support ($p<0.05$). This means that among the people receiving less support from their colleagues, the ones who do not have enough control over their jobs are likely to feel much more mental stress than those who have plentiful resources on their job. These findings considered altogether, it might safely be concluded that there is a buffering effect as far as our analysis is concerned.

Figure 2. Interaction Effect of Co-workers Support



4. CONCLUSION

This study presents an in-depth investigation of the JDCS model in relation to worksite productivity and personality trait. Integrating our findings, the conclusions made in this research add some insightful implications to the existing knowledge on stressors and their responses. One thing is that worksite pro-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ductivity loss is most largely affected by irritability, fatigue, and depression. Another is that the schema affects stress reaction not only directly, but also indirectly, i.e., through a buffering effect. Combining these findings, one can possibly improve work productivity by intervention regarding schema. To the best of our knowledge, this is the first study to not only discuss simultaneously occupational stress, schema, and worksite productivity loss, but also to carry out their qualitative analysis.

First of all, our results of the multiple regression analysis highlight that the loss of worksite performance is mostly explained by the three stress responses irritability, fatigue, and depression. It is true that the association between mental stress and work productivity loss is not a new topic for the study of occupational health. As a matter of fact, our result matches the previously reported ones, which state that depression, or simply mental stress, is the major driver of worksite productivity loss (Rost, Meng, & Xu, 2014; Simon et al., 2001; VanWormer et al., 2011). Yet the strength of our study is that we considered various types of stress responses as well as depression. Moreover, this specification may be beneficial especially when we assume the variables or covariates behind the stressors and stress responses do not directly affect workplace productivity loss, since in this case we wish to distinguish each association between stress-related variables and covariates. Otherwise, we would not be able to tell whether the loss is driven mainly by stress-related variables or by covariates.

Second, the hierarchical regression analysis revealed that the schema (Negative-Self and Negative-Others in particular) affects the stress responses (irritability, fatigue and depression) in direct or indirect way. Remarkably, the coefficients for these schema variables are all positive, which means that the more one holds the negative belief on oneself and others, the more s/he feels irritated, fatigued and depressed. Moreover, our results found the buffering effect of job control and coworker, although there is much literature contradicting our results. For example, completely opposite results to ours were reported by stating the significance of the buffering effect of job demands and supervisor support (Vanroelen, Levecque, & Louckx, 2009). This difference is possibly accounted for by the type of population, i.e., the population of their research was blue collar workers, while ours was white collar workers. This sort of inconsistency, in general, has various possible reasons. One candidate is that since the data are usually obtained from multiple providers, the results of analysis may fluctuate (Cranford, 2004). Another explanation is attributed to the poor reliability of measurement and the deficiency of statistical analysis (Cohen & Wills, 1985).

Besides, from a theoretical point of view, this is partly because the notion of social support itself is vaguely defined. Social support can typically be viewed from two different standpoints; one view regards it as structural and the other functional (Beehr, Jex, Stacy, & Murray, 2000). Regarding the former, social support may be situated within a wider conceptual framework, namely social capital (Sapp et al., 2010). Borrowing the dimensions of social capital, the structural aspect of support can be discussed from horizontal and vertical dimensions. The horizontal dimension refers to the support from the same hierarchical level (coworkers), whereas the vertical one refers to the support from a different or most likely higher position (supervisors) (Kouvonen et al., 2006; Lindstrom, 2008; Oksanen et al., 2008; Sapp et al., 2010). When it comes to functional social support, two types of function have been discussed, namely, helping colleagues to have their tasks accomplished (instrumental support) and providing sympathy (emotional support). As an example of emotional support, communication between stressed employees and other workers at the worksite was investigated (Fenlason & Beehr, 1994), and it actually was found that there may be a buffering effect from coworker support.

Although the buffering effect from social support was confirmed in our analysis as well, ours still underlines the role of schema, which is a stable belief about oneself and others. To make this point clear,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

we regressed stressors, stress responses and social supports on schemas (Table 6). Consequently, almost all the significant regression coefficients for the stress-related variables turned out to be positive as expected, meaning that negative appreciation about oneself and others lead to higher stress. Therefore, our results may possibly suggest that we need to take into consideration not only the type of supports, but also the type of the receiver's personality, i.e., schema. In other words, one can hope to improve stress responses and even reduce worksite productivity loss by an intervention concerning schema. Furthermore, when dropping the schema from independent variables, none of the hierarchical regression analyses for each stress response observed significant interaction terms. This fact tacitly implies that the schema interferes with the buffering effect. Then, it may potentially be quite fruitful to construct models to examine in a more explicit manner the effect of schema on stress reactions, i.e., the buffering effects of stressor, social support, and positive schema, and the exacerbation effects of stressor, social support, and negative schema.

All in all, this study demonstrated the following three findings: (1) the worksite productivity is explained mostly by irritability, fatigue and depression, (2) these three stress responses are, in some ways, affected by the negative schema for oneself and others, and (3) the irritability is influenced by the buffering effect between job control and coworkers support. Combining these findings, it seems fair to claim that schema affects the worksite productivity through stress responses. Also, it can be safely deduced that one's mental health and productivity in the occupational setting can be improved through two ways; increasing buffering effect and decreasing the coefficients of the schema variables to the stress responses. That is, one effective way is to organize the situation where employees enjoy better support from their coworkers. This is especially important for those who have only a limited control over their tasks. Another possible intervention is to ameliorate the sensitivity of stress variables to schema, which may be quite challenging. We unfortunately have so far no evident idea to realize this, and leave it open to future work. Nevertheless, we firmly believe that the findings established in our study provide practical implications and contributions.

Finally, we should note that this study entails some limitations. Since this research was based on a cross-sectional design, we need to implement longitudinal design analysis to enhance and even extend the present study. Additionally, data were collected through self-reported questionnaires, and thus they might be contaminated, more or less, with one's preconceived ideas, that is to say bias. Although this was inevitable since our interest lay in personal perceptions about each component, this can be somewhat compressed by considering the participants' features, e.g., which company they belong to, what is their age/gender, and so forth. Another shortcoming of the present study is that we based it on a relatively small number of samples, which leads to reduced statistical credibility and reliability. Overall, to guarantee the accuracy of the findings made in this study, it would be necessary to enlarge the survey scale and to enrich the variables therein, which are left to a future direction of our research.

Chapter 17
Re-Conceptualizing Diversity Management: Organization-Serving, Justice-Oriented, or Both?

Marilyn Y. Byrd
University of Oklahoma, USA

Claretha Hughes
University of Arkansas, USA

ABSTRACT

This chapter highlights how diversity management, a widely practiced management philosophy, has emerged from an original focus of equal opportunity and representation to a focus on a strategic and competitive business opportunity for organizations. However, the adverse, lived experiences that socially marginalized people experience are concealed within business goals despite having their "difference" marketed as a competitive advantage. The aim of this chapter is to conceptualize diversity management as having mutually inclusive, intersecting goals rather than mutually exclusive, competing goals.

INTRODUCTION

Diversity management is a widely practiced management philosophy but in praxis, it is a relatively ill-defined, ambiguous term (Foster & Harris, 2005). In the academic community, scholars have contributed various perspectives of diversity management that have positioned the concept as an organization-serving philosophy that is in direct opposition to safeguarding and protecting the socially marginalized workforce from unjust and uncivil treatment. Socially marginalized refers to a state of reality that exists for some groups of people whom society has categorized as not being the standard by which society recognizes as being the accepted norm (Byrd, 2018); and as result impacts the everyday, lived experiences of the work environment.

Lived experiences can produce incidents, episodes, and events that socially marginalized people endure and interpret as being demeaning, demoralizing, disrespectful, and prejudicial to their image in the workplace. Consequently, these experiences can be detrimental to self-esteem, self-worth, job satisfaction, and job performance which are all variables that can be career altering and impact career satisfaction.

Lived experiences can occur in any context that an individual performs meaningful work. These types of behaviors and incidents are often perceived as being directly related to an individual's social location (race, sex, age, ability, religion, or other similarly social constructed categories). Therefore, a necessary function and goal for diversity management is recognizing demoralizing behaviors and taking the appropriate steps to expose, correct, and eliminate the source(s) of the behavior. Problematic is that a business opportunity case for diversity fails to capture the everyday, lived experiences of socially marginalized members of the workforce.

As a derivative of the management process, the idea of diversity management or managing diversity underscores the socially constructed meanings of who is categorized as being diverse and incorporates a business rationale that is often antagonistic and sometimes inimical to genuine equality and diversity concerns (Gotsis & Kortezi, 2015). Combining the term diversity with management conjures up the image of historical realities of dominance and subjugation. In this sense, diversity management is a continuance of power over. Furthermore, given the managerial inclination towards control, order, and regulation, the ambition and practices of managing diversity contradict the stated goals and result in less, rather than a more diverse (which is understood to be heterogeneous), pluralistic and varied organization (Risberg & Just, 2015).

In this chapter, two dichotomies of diversity management are highlighted: promoting diversity as a strategic business opportunity to gain a competitive advantage and operationalizing diversity management principles that respond to the lived experiences of socially marginalized groups. The lived experiences of socially marginalized people is a relatively unexplored area of diversity management. Moreover, the ethical, moral, and social obligations of diversity management have received scant attention. In bringing to light this omission, another goal of this chapter recognizes social justice as a necessary outcome of diversity management.

The objectives of this chapter are to:

1. Explain the influencing rhetoric of diversity in the evolution of diversity management;
2. Discuss philosophical assumptions of diversity management;
3. Discuss the dichotomized views of business opportunity and a justice-based perspective;
4. Recognize foundational models, worldviews, approaches, and contexts for applying diversity management;
5. Discuss criticisms that have challenged the application of diversity management;
6. Explore social injustice as a less recognized concept associated with diversity;
7. Present theoretical foundations fruitful for bridging the gap in diversity management studies; and
8. Discuss future research directions for achieving business goals and justice-based outcomes.

Through examining the varying definitions and models of diversity management, and reviewing relevant literature, this chapter will present a social case for diversity and offer how the lived experiences of socially marginalized people has been neglected and left behind in pursuit of an organization-serving philosophy.

BACKGROUND

The Influencing Rhetoric of Diversity

Diversity has become a ubiquitous term within multiple contexts and is often attached to the concept of inclusion (Lumby & Morrison, 2010). Although diversity research "has become more theoretically rigorous, fuzziness remain around uses of such terms as discourses, rhetoric, and practices in relation to diversity management" (Hearn & Louvrier, 2015, p.24).

In order to conceptualize diversity management, it is helpful to have clearer insight on the term diversity. Simply applied, diversity implies difference. Pointing out difference can actually have the effect of excluding, isolating, and relegating a person or group to a substandard category. A diversity management philosophy suggests difference but it does not necessarily represent or make a call for social justice (Deem & Ozga, 1997). Preference for the term diversity implies a lack of emphasis on social justice or social change which could actually serve to "conceal the operation of systematic inequalities under the banner of difference" (Ahmed, 2007, p. 236). Diversity is now applied in a more popularized, generic way of thinking rather than a conceptualized approach to organizational reality.

The initial application of diversity was in response to legal mandates for equal opportunity. After the Civil Rights Act of 1964, organizations began to implement and organize a variety of programs and initiatives as compliance measurements. Over time, diversity has shifted from equal opportunity for protected status groups (race, sex, religion, national origin, color; and later age, disability, and pregnancy) to incorporate a range of criteria (values, beliefs, education, lifestyles, perspectives, creativity, etc.). The Hudson Institute's Workforce 2000 study (Johnston et al, 2000) predicted that the composition of the workforce would shift toward a minoritized workforce in the 21st century; a prediction that businesses and organizations seized upon. In response, workforce sectors began implementing diversity strategies that would attract and retain this workforce population. Among those strategies were efforts to manage diversity.

Since its initial application to equal employment in the workplace, both researchers and practitioners have sought to understand the concept and strategies for managing its effects (Roberson, 2019). Critics of the concept of diversity suggest how the notion has entered institutions like higher education through the management philosophy in a way that valuing or managing diversity seems to regard diversity as if it were a personification of a human resource (Ahmed, 2007). From another perspective, policymakers or others delegated to write statements or documents on diversity initiatives and the like may find difficulty in effectively doing so without exposing or bringing to light organizational undiscussables. "Organizational 'undiscussables' such as sexism, racism, patriarchy, and violence receive little attention in the literature yet have considerable impact on organizational dynamics" (Bierema & Cseh, 2003, p. 24).

Organizational leaders and members use the term diversity in a generic or non-committal sense partly due to the failure of the term equality to achieve its purpose despite legal mandates. The failure of the term equality can be attributed to the continued and persistent existence of inequalities in work environments and the failure of organizations and institutions to take proactive steps towards social change (Ahmed, 2007). Ahmed says that:

Words such as 'diversity' might allow the organization to accumulate value, by re-branding itself as being diverse or even as being committed to diversity without, as it were, doing anything. Or they might not. They might yet cause more trouble. (p. 254)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Problematic is also how the term diversity is applied; particularly because "diversity can be defined in ways that can reproduce rather than challenge social privilege" (Ahmed, 2007, p. 240). Generally speaking, diversity is all the ways that people differ (Kandola, 1995; Kandola & Fullerton, 1998). However, when coupled with the term management, diversity becomes ambiguous and even more problematic. Managing implies controlling or being controlled and implies a process that does not allow freedom from constraints. Although the act of managing is a common practice in work environments, combining the term with the term diversity (particularly when it is assumed diversity refers to socially marginalized people) conjures up a manipulative image of those in power or control needing to direct the actions of those in a lesser status. Therefore, diversity management suggests different or varied approaches are needed for individuals or groups in order to achieve positive organizational outcomes (Morrison, Lumby, & Sood, 2006).

For example, is diversity being used as a noun, referring to people who look different? If that is so, diversity management should include actions taken to support socially marginalized groups. Perhaps diversity management refers to the actions that are taken to ensure difference is represented in connection with human resource practices (Stamper, 2012). If this is the case, diversity management or managing diversity could mean ensuring a wider and more representative diverse labor pool to support the overall organization's system. Or diversity management could refer to initiatives and supporting programs that assist minorities in developing realistic self-actualizing goals. If the latter is the case, building a manager's cultural knowledge and understanding of the socio-historical background of diversity and the implications of marginalization, domination, and exploitation using concepts including diversity intelligence (Hughes, 2016) is critical.

The flip side of diversity as an organizational goal (beyond representation) is drawn from the perspective of people experiencing difference. From this perspective, diversity takes on a different meaning and tells a more compelling story:

Left alone, diversity might simply exist with or without our approval, our tolerance or our enacting it. All people have their uniqueness, their differences in thinking, acting, behaving, or being. We as a larger humanity, do not really choose to be diverse, we simply are. History teaches us that left alone, diversity may exist, but inclusion may not. This is our rationale for pushing the meaning of diversity from an adjective, something that describes another object or idea, toward an action. (Winkle-Wagner & Locks, 2014, p. 4)

The term inclusion has emerged as a popular representation of the work environment. The move from diversity to diversity and inclusion represents the degree to which a person feels accepted by the organization's members—the degree to which the sense of being an "outsider looking in" does not exist (Pelled, Ledford, & Mohrman, 1999). Adopting inclusion into statements of diversity implies that organizations are giving employees more autonomy over decisions about their work; employees are kept well informed; and employees have a sense of job security (Roberson, 2004). While the literature reflects the shift toward inclusion in diversity management philosophy, it is questionable as to whether or not organizational actions reflect the same. Diversity management emerged with a legalistic emphasis in response to the Civil Rights Act of 1964. Broadly interpreted, the Civil Rights Act of 1964 prohibited discrimination in employment on the basis of race, color, religion, sex, and national origin and was later amended to include age and disability. Hence, diversity management evolved in a post-civil rights movement era when goals were centered on equal opportunity and representation.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

According to Cross (2000), a pioneer in the diversity literature, diversity management should be concerned with changing cultures that are non-accepting to the changing demographics and the changing roles of people who are perceived as different. With this goal in mind, managing diversity is defined as:

A term which has become widely used to refer to initiatives aimed at helping U. S. organizations come to terms with the rapidly changing demographic of the workforce. The most common, but unacknowledged, connotation of the term is to 'manage white women and people of color' since they are an increasingly larger percentage of workers, the underlying attitude is that it is these new and 'different others' who are 'the problem.' A more appropriate goal is [social] change---that is ameliorating racism, sexism, and other forms of discrimination and oppression in order to create organizations and a society in which all people have equal opportunity. (Cross, 2000, p. 224)

The term managing diversity and diversity management are used interchangeably in the literature to denote a management philosophy that is intended to reflect differences of people within the workforce. There are numerous and varying definitions of these terms as described in Table 1. Notably absent from these definitions is recognition of human respect and dignity.

Table 1. Selected defining constructs of diversity management from academic literature

Arredondo (1996)	A strategic organizational approach that represents a shift from affirmative action assumptions towards inclusive management practices that reflects the diversity of the workforce and its potential.
Cox & Blake (1991)	Managing HR systems in hiring, training, compensation, promotion, and performance; greater career involvement for women; issues emerging from heterogeneity of the workforce; education programs; cultural differences; and mindsets about diversity.
Cross (2000)	Ameliorating racism, sexism, and other forms of discrimination and oppression in order to create organizations and a society in which all people have equal opportunity.
Dessler (2012)	Maximizing the potential benefits that diversity represents and minimizing the potential barriers and biases that can hinder organizational performance.
Foster, C.	Diversity management is a means of managing customer and employee differences for the benefit of the organisation.
Mor Barak	Voluntary organizational actions directed toward inclusion of people from various and diverse backgrounds into the organizational structure through planned policies and programs.
Snell & Bohlander (2013)	Awareness of characteristics common to employees; managing the individual as well as the employee; supporting, nurturing, and utilizing individual differences to the advantage of the organization.
Thomas (1991, 1993)	The process of creating and maintaining an environment that naturally enables all participants to contribute to their full potential in a focused pursuit of organizational objectives.

For the purposes of this chapter, Cross' (2000) definition will be the fundamental guiding construct for diversity management.

Philosophical Assumptions of Diversity Management

Philosophically speaking, the expression diversity management lends itself to contradicting interpretations. While diversity management is an established managerial ideology, the underlying philosophical

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

assumptions associated with the issues that emerge from human difference in work environments remain unexplored (Costea & Introna, 2008). Particularly since "human difference is not manageable in the sense in which managerial ideology conceptualizes it in diversity management" (Costea & Introna, 2008, p. 1). Furthermore, capturing human difference under the sphere of a managerial ideology circumvents and dilutes the achievements gained from decades of civil rights advocacy.

According to the philosophy of Heidegger (1975), human difference informs the way that people are situated in the world. In the context of work, human difference can control, exploit, and serve as a prejudging criteria by which people are treated. As a result, lived experiences can be a direct outcome of one's socially marginalized status. From this philosophical reasoning, human difference is a given, and should not be treated as a problem or process that needs to be managed. Cherwin (2010) notes that managing diversity should also consist of understanding how to relate to differences and how to relate to people who are different.

Ignoring the problems that can develop from human difference is counter to the purpose for which diversity management was conceptualized. Consequently, the philosophical assumptions of diversity management and its critical role of accountability in countering the lived experiences of the social injustice in the workforce is generally silent. This lack of recognition and maintaining silence on the organizational "undiscussables" (racism, sexism, ableism, etc.) (Bierema & Cseh, 2003) is either intentional because it is good business sense; or unintentional because there has been a lack of social justice education to supplement knowledge of legal mandates.

A diversity management philosophy implies difference but it does not necessarily represent or make a call for social justice (Deem & Ozga, 1997). Preference for the term diversity implies a lack of emphasis on social justice or social change which could actually serve to "conceal the operation of systematic inequalities under the banner of difference" (Ahmed, 2007, p. 236).

Given that diversity management has undergone conceptual meanings and applications, the workplace would be better served by listening to those who are having the experiences in order to gain a more informed meaning for this management philosophy (McDonald, 2010). In view of the variations of definitions and models of diversity management, there needs to be greater insight of how diversity management is applied in practice.

DIVERSITY MANAGEMENT FOR BUSINESS OPPORTUNITY

Diversity is viewed as organizational discourse that favors economic goals at the expense of societal and workplace issues (Gotsis & Kortezi, 2015a). Since the inception of diversity as a response to the Civil Rights Act of 1964, organizations, institutions, and businesses have begun to sell diversity as a marketing tool, placing greater emphasis at the organizational level and capitalizing on diversity as a competitive advantage and the benefits derived from diversity as human capital. From this perspective, diversity management can be considered an economic stimulator.

Mapping the evolution of diversity management from its historical conception through more contemporary business representations, McDonald (2010) concluded that diversity management philosophy has not remained grounded in the social and historical essence of diversity or difference. One possible reason is the need to retain a positive thinking approach to difference. Recognizing that difference should be portrayed as valued, appreciated, celebrated, and promoted served as the beginnings of the business opportunity aspect of diversity management.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Managing diversity became a business necessity, not only because of the nature of labor markets, but also because a more diverse workforce was thought to produce better business results. Exploiting the nation's diversity was viewed as key to future prosperity. Ignoring the fact that discrimination limits a society's potential because it leads to underutilization of talent pools was no longer practical nor feasible. (Herring, 2009, p. 210)

This emphasis on diversity management as a business opportunity is in direct opposition to the initial focus on equal rights in employment as mandated by the Civil Rights Act of 1964.

Implemented during the Johnson Administration in 1965, the original impact of affirmative action legislation served to make forced adjustments to the number of underrepresented groups in the workforce. The consequences, however, have served to stigmatize diversity management and placed negative perceptions upon why the diversity management is practiced. Although some aspects of affirmative action are no longer enforced in several states (California, Texas, Michigan), the question is whether or not non-enforcement has assisted or hindered the progress of diversity management in the United States (Scott, 2014)? Emphasizing diversity management as a business opportunity also projects an organizational image that appears to promote diversity by recycling ideas and practices (strategic, organization advantage, performance, culture, strategic, organizational structure, organizational objectives) (Costea & Introna, 2008). While diversity of ideas and practices are important, they do not adequately or appropriately capture the lived experiences and realities that socially marginalized people encounter in the workplace. Cross (2000) says that the practice of diversity management should include:

...an understanding of the sociopolitical and historical realities of discrimination and oppression; knowledge of how organizations and systems work, and how they can change; competence and experience in helping adults learn; and personal understanding of one's self in relation to others, especially across differences of race, gender, sexual orientation, and ability. (p. 140)

Janssens and Zanoni (2005) refer to diversity management as highly contextualized. The "way in which work is organized strongly affects the company's understanding of diversity as well as its approach to diversity management" (p. 312). The demographic composition of an organization's workforce also plays an influential role in the way diversity is managed. Consequently, diversity is relevant and actively managed to the extent in which the nature of work and socio-demographic differences contribute to or hamper attaining an organization's goals.

Diversity management now plays a strategic role in formulating policy in human resource functions like recruiting, training, career development, performance appraisal, mentoring, and coaching (Bassett-Jones, 2005; Prasad, Prasad, & Mir, 2011). However, vital parts of the process such as the context, language, and culture that are specific to each organization significantly influences the way managers and employees interact and engage each other in these functions. Furthermore, it is the "aggregate effect of the attitudes, skills, and behaviors of individual managers that determines the extent to which organizations are able to sustain high commitment within a diverse workforce" (Bassett-Jones, 2005, p. 170). In recent years, managing diversity has represented a strategic attempt to integrate organization-level strategies to leverage diversity as a competitive advantage (McDonald, 2010). The trend towards a competitive advantage is in sharp contrast to the original legalistic focus of equality and anti-discrimination. In essence, the diversity management philosophy continues to be contested terrain (Linnehan & Konrad, 1999).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Missing from the various ways of defining and thinking about diversity management are ethical, moral, and social principles that convey accountability for behaviors, attitudes, and uncivil treatment that can be demoralizing, demotivating, and devaluing. This raises the question, what is the role of diversity management in addressing social problems—problems like racism, sexism, ableism, ageism, and all those other biased ways of thinking that hinder and impair an individual's ability, capacity, and endurance to perform and create meaningful work? Are organizations choosing to ignore the ugly side of diversity management because it does not fit their business opportunity model? These are dilemmas that do not fit neatly into a business opportunity model. Diversity management as a business opportunity does not provide a focused agenda that emphasizes human dignity and respect. Failure to do so articulates a managerial philosophy of diversity that is inconsistent with what the purpose for which the idea evolved (Costea & Introna, 2008; McDonald, 2010).

While the business opportunity case for diversity makes good sense for attracting, retaining, and developing a diverse workforce, an ethical, moral, and social responsibility should not be disregarded (Mor Barak, 2013). Finally, the idea that diversity has to be managed as a business opportunity is exploiting and demoralizing to human dignity and self-worth. The reality is, however, that as long as diversity sets people apart as being "different" and different produces perceptions of "not equal" the diversity dichotomy will continue. For this reason, a diversity management philosophy grounded in social justice is needed (Gilbert, Stead, & Ivancevich, 1999). "The social justice perspective calls for addressing discrimination and oppression head on; identifying what they are, where they are, how they work, what mechanisms perpetuate them, and how to eliminate them" (Miller, 1994, p. xxvii). Although it is unlikely that the term diversity management will become obsolete in the coming years, a social justice perspective captures ethical, moral, and socially responsible principles of a diversity management philosophy. Hearn and Louvrier (2015) insist that diversity and diversity management discourse should be examined more broadly and not through arguments for or against a business case or a social justice case. Rather, studies should be open to identifying the various ways that diversity and diversity management discourse produces new knowledge beyond the current debate of opportunity versus justice.

Diversity Management: An Ethical, Moral, and Justice Based Perspective

Diversity scholars have expressed disappointment with the business opportunity case for diversity based on the assumption that diversity improves the bottom line and argue that this philosophy does not capture the organizational culture and principles of business moral reasoning (Wallace, Hoover, & Pepper, 2013). Business moral reasoning applies to values and moral principles; providing a foundation and rationale for managing problems that relate to people. Managing problems that relate to people in organizations means that executive leaders and other decision makers will be confronted with issues that emerge from issues such as racism, sexism, ageism, ableism, etc. It means that executive leaders and other decision makers will be faced with making fair decisions in terms of hiring, recruiting, training, promoting, and advancing the careers of all of an organization's members. Furthermore, it means executive leaders and other decision-makers' personal morals and values will play an integral role in the shaping the decision-making process (Hughes, 2018).

Ethical, moral, and social frameworks provide executive leaders and other decision-makers with a specific set of guidelines to draw from in order to make more informed decisions about managing problems and people. If organizations (through actions of the people) truly value diversity, diversity management principles will be centered around an ethical, moral, and social responsibility. For this

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

reason, a diversity management philosophy needs to be built upon ethical, moral, and social frameworks for doing the right thing through showing socially marginalized employees that their contributions are valued within organizations. Ethical frameworks help explain how organizations apply values (Wallace, Hoover, & Pepper, 2013).

Traditional ethical frameworks commonly discussed in the managerial literature are: ethics of utility (utilitarian); ethics of rights, ethics of justice, ethics of virtue, and more recently, the ethics of care. For the purposes of a diversity management philosophy, the ethics of utility is rejected, as it offers a contradictory rationale for promoting and valuing the differences of people. The ethics of utility (utilitarian) framework supports the "greatest good for the greatest number" principle. However, for executive leaders and other decision makers, applying this principle in terms of socially marginalized groups may undermine the intent for equal representation unless they value and reward the difference of socially marginalized individuals and reward them at the same level as others who are different. Socially marginalized employees are not promoted to executive leadership positions and with the changing demographics in society, the greatest number is changing. Therefore, for the purposes of this chapter, the ethics of rights, ethics of justice, ethics of virtue, and the ethics of care will be considered as appropriate frameworks for a diversity management philosophy.

Resolving problems, issues, controversies, and dilemmas that emerge from managing diversity requires an appeal to values (Velasquez, Andre, Shanks, S. J., & Meyer, 1996). First, the ethics of rights, with roots in the philosophy of Immanuel Kant, is based on the principle that every individual have basic fundamental rights and as such have the right to make their own choices. Second, the ethics of justice, with roots in the philosophy of Aristotle, asks the moral question, "How fair is this action? Does [this action] treat everyone in the same way, or does it show favoritism and discrimination?" (p. 3). From a values-based perspective, a decision made that shows favoritism and discrimination is unethical. Third, the ethics of virtue, considers the personal traits, qualities, and values that cause a person to act in a certain way. From this perspective, the good values that a person prescribes to that causes that person to act in a way that is good as opposed to vices that cause that person to act in a way that is not, plays a critical role in decision-making.

Finally, the ethics of care, emerging from a feminist perspective, is grounded in valuing relationships (Gilligan, 1982/1993).

Moral problems are problems of human relations…relational ethic transcends the age-old opposition between selfishness and selflessness, which have been the staples of moral discourse. The search on the part of many people for a voice which transcends these false dichotomies represents an attempt to turn the tide of moral discussion from questions of how to achieve objectivity and detachment to how to engage responsively and with care. (p. xix)

Of the aforementioned frameworks, the ethics of care grants a new way of thinking about diversity management. At the individual level, care is demonstrated by granting voice, empowerment, and the courage to act; thereby evoking the potential for social change. At the larger organizational level, care should be enacted and accepted "with an understanding of the particular views and needs of all parties and a concern for their safety and well-being" (Wallace, Hoover, & Pepper, 2013, p.320). To be ethically, morally, and socially responsible, social justice should become an intended and expected outcome of a diversity management philosophy. Furthermore, a diversity management philosophy that is not grounded in an ethics of care for all people, fails to achieve a goal of business opportunity or equality.

FOUNDATIONAL MODELS, WORLDVIEWS, APPROACHES, AND CONTEXTS FOR APPLYING DIVERSITY MANAGEMENT

It is unrealistic to view diversity management through a single lens. Managers face situations, challenges, problems, etc., that require multiple ways to critically analyze and respond. In this section, foundational models, worldviews, approaches, and the role of context for applying diversity management are discussed.

Foundational Models

Cox' (1991) multicultural organization is a benchmark in the managing diversity philosophy. Cox pointed out that as the workforce becomes more diverse, this diversity will substantially benefits organizations in terms of decision-making, creativity, innovation, and more successful strategies for marketing. However, he predicted that greater diversity yields greater potential for conflict. According to Cox, a multicultural organization is "characterized by pluralism, full integration of minority-culture members both formally and informally, an absence of prejudice and discrimination, and low levels of inter-group conflict"(p. 46). If these conditions are met, whereby all members can contribute to their maximum potential, valuing diversity can be fully achieved. Although Cox did not explicitly identify social justice outcomes, the implication is subtly implied.

Another early diversity model that was designed as a management response to the workforce demographic shift was the Managing Diversity Intervention model (Cross, 2000). The model was designed as an organizational intervention for business leaders who were trying to cope with the demands of the changing demographics as well as the changing nature of work. The goal of the model was to "provide vision, direction, and a sense of purpose and meaning to the amelioration of racism, sexism, heterosexism, and other forms of oppression" (p. 2). Similarly, leading diversity practitioners during the early days of diversity management responded to the growing needs of management and leaders in understanding how to effectively "do" diversity (Morrison, Ruderman, & Hughes-James, 1993).

Worldviews

Jack (2000) identified four overlapping, continuous perspectives of diversity management that created distinct schools of thought: political, economic, critical, and demographic perspectives. From a political perspective, diversity management was viewed as a politically correct alternative to affirmative action. The economic perspective sought to sell the idea of a competitive advantage for representing organizations in a global marketplace. Diversity management turned to a critical focus when problems were encountered as organizations sought to implement diversity related initiatives, in particular, diversity training. Majority group members, white males in particular, responded with resentment, antagonism, and even frustration—feeling subjected to unwarranted accountability for the plight of social groups in the organization (Peterson, 1999). Finally, from a demographic perspective, the Workforce 2000 (Johnston & Packer, 1987) report created a startling awareness for business and academics that the workforce was undergoing a dramatic demographic shift which would call for the appropriate management response.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Approaches

Lloyd-Jones and Worley (2014) suggest that diversity management can be best understood by considering four approaches: assimilating, accommodating, celebrating, and educating. Assimilation is characterized by organizations efforts to correct imbalances within diverse groups. Accommodation uses a neutralizing approach and promotes ideals such as the color blind effect. Celebration of difference using a minimizing effect; celebrating difference has the effect of overlooking the issues emerging from difference. Education is a process of discovering the organization's unique needs and applying methods for what works best. Central to the process of education is not simply acquiring information but what is done with the information after it is acquired.

The Role of Context

While the literature appears to provide an abundance of definitions, instructions for acting upon and bringing these goals to fruition in various organizational, institutional, and workforce contexts is not clear; particularly because diversity management may have different meanings in institutional settings (universities, etc.) as opposed to organizational settings (corporate), and workforce (public service) sectors. Although defining constructs of diversity management are prevalent in academic literature, diversity management goals are represented in various contexts of work that are not universally representative. The diversity management literature implies that application of diversity strategies are universal throughout organizations, thereby neglecting the role of context. Syed and Ozbilgin (2009) suggest that "effective diversity management is most likely to be realised in contexts where there is multilevel structural and institutional support" (p. 2436). Moreover, professional contexts often recognized for achievements and progress toward diversity and inclusion goals (MAPI, 2016a). Contexts such as manufacturing and retail are often under-represented in the diversity management literature. While the manufacturing sector does recognize the strategic importance of diversity efforts, one possible accounting for under-representation in the diversity management literature is that competing priorities in this sector diverts attention from diversity (MAPI, 2016b). In the retail sector, diversity management includes managing customer and employee differences for the benefit of the organization (Foster, 2005) which re-directs diversity management outcomes.

Table 2 represents various organizational contexts that market diversity and diversity management as part of their industry goals.

A silent topic that is not within the scope of this chapter, but has merit to mention in respect to context, is that of occupational segregation. Occupational segregation is grouping or categorizing of minoritized populations into domestic, service, or undervalued work roles (Solomon, Maxwell, & Castro, 2019). In these contexts, it is questionable how diversity management applies: is diversity managed for the purpose of expanding opportunities or is diversity simply acknowledged but to do, maintains the historical, servitude role of minoritized individuals and groups? Social injustice in these contexts is an enduring consequence.

Table 2. Selected diversity management goals in various contexts

Context	Goals	Source
Corporate	Talent development, leadership, commitment recruiting efforts, supplier diversity	DiversityInc www.diversityinc.com
Government	Government Process intended to create and maintain a positive work environment when the similarities and differences of individuals are valued, so that all can reach their potential and maximize their contributions to an organizations strategic and objectives.	U.S. Department of Veteran's Affairs Office of Diversity & Inclusion www.diversity.va.gov
Healthcare	Commitment at all professional levels through an awareness of diversity issues and hiring practices that are essential to attracting a diverse workforce.	American College of Healthcare Executives www.ache.org
Military	Focus on emerging talent to ensure, attract, recruit, develop, and retain a highly skilled military force capable of meeting mission requirements	Office of Under Secretary of Defense www.diversity.defense.gov
Retail	Organizational approach that recognizes, values and harnesses a broad range of individual differences in customers and employees and by treating people differently according to their needs business advantages can be realized.	Foster, C. (2005). Implementing diversity management in retailing: exploring the role of organisational context. *The International Review of Retail, Distribution and Consumer Research*, *15*(4), 471-487.
Manufacturing	Modern manufacturing is a diverse and inclusive community, embracing and supporting the creativity that each individual can bring to building something bigger than themselves. Strategies designed to recruit, engage, and retain a diverse workforce.	Be You in Manufacturing: https://www.creatorswanted.org/be-you-in-manufacturing/manufacturing-workforce-diversity-inclusion

Criticisms of Diversity Management

There have been several criticisms of the diversity management philosophy. First, diversity management is applied to four key areas that are evaluated in relation an organization's diversity efforts: talent management, talent development, leadership commitment, and supplier diversity (DiversityInc, 2014). While these areas are key for creating an organization that demonstrates a responsibility for supporting diversity, a commitment to social justice is absent (Byrd, 2012). Lacking are actions to address discrimination, prejudice, bias, disrespect, and experiences of social injustice towards marginalized groups.

Second, from a reformist perspective, diversity management has been criticized for failing to represent opposing viewpoints of multiculturalism and meritocracy (Prasad, Prasad, & Mir, 2011). While these principles are necessary, diversity management in practice needs to be "understood as a product of not only of reformist elements and impulses but also of a distinct institutional field with well-defined dynamics and facing multiple forces and pressures" (p. 719).

Third, diversity management has been conveyed as a management function that can be a challenge to managers (Mor Barak, 2013). Addressing diversity management as a challenge conveys the message that it is problematic or difficult, which conveys a contradictory meaning. For example, if diversity is a challenge, organizations that promote diversity, embrace diversity, celebrate diversity, and appreciate diversity convey the message that it is a challenge to enact these objectives.

Fourth, early advocates and supporters of diversity management had hoped the movement would improve the experiences of marginalized groups. To an extent, diversity management has succeeded in raising awareness of diversity related issues. However, the new language and rhetoric of diversity

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

is shifting from the original mission of equal opportunity and improving the workplace experience of historically excluded social groups (Mor Barak, 2013).

Fifth, indicators are that diversity management has been a trend-setter as organizations seek to replicate popular trends. A study of diversity management practices in six organizations revealed that organizations were quick to mirror and imitate what is cutting-edge in diversity management practices rather than pursue meaningful organizational change (Prasad, Prasad, & Mir, 2011). In view of the uniqueness of organizations, imitating and replicating the latest trends is ineffective and has little perceived value. While organizations have demonstrated trend-setting tendencies, less attention has been given to assessing diversity efforts (Comer & Soliman, 1996). Recruiting and hiring minorities is generally highly favored for statistical reporting purposes; however, following up after hiring and evaluating how diverse groups are acclimating to the new culture, or assessing needs for developing skills does not generally take priority in diversity management programs (Hughes, 2018).

Kanter (1977) advanced a different perspective of diversity management. The push for diversity also meant a push for more diversity among managers—in particular, women and minorities. However Kanter was advocating for more representation rather than the resistance to accepting a new wave of leadership which created a new interpretation. Managers who were themselves diverse had to "manage" a heterogeneous workforce amid the discrimination, bias, and prejudice that was directed towards them based on their social identity. According to Kanter (1977) critics argued that human resource approaches should have been directed more towards affirming diversity rather than affirmative action.

Instead of finding slots for women and minorities and helping them adjust themselves to fit the dominant style, the argument run, companies should acknowledge and embrace a range of styles. Companies should learn to value difference, not suppress them. (p. 315)

Acknowledging there are social and other influencing factors that limit representation of minoritized groups, using the concept of diversity from an equality perspective may be risky if people are not ready for higher managerial roles. The counter argument might be that diversity management in this respect is accountable for preparing minoritized groups from advancing to top management positions. Yet, while preparedness to assume top managerial jobs should be a goal of diversity management, "new concerns about hidden diversities (for example sexual orientation) …means that occupation, roles, and career trajectories that were once restricted to a single group (i. e. white males) are now open to many" (Baruch, 2004, p. 66).

Another less understood and discussed aspect of diversity management and the lived experiences of socially marginalized people is the perception of presumed incompetence that is connected with affirmative action (Heilman, Block, & Lucas, 1992). The perception being that if an individual is truly qualified, they could be hired without benefitting from affirmative action. The real problem is that organizations have marketed themselves as being equal opportunity employers without realizing how this might affect the way people are perceived. Hence diversity management goals have not been forward thinking in making sure the organizational environment is ready and is maintaining readiness through specific actions and requirements of those in power.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social Injustice: The Dark Side of Diversity

A prerequisite for effective practice of ethical, moral, and socially responsible diversity management is accountability for maintaining a non-hostile work environment. The Federal Communications Commission (FCC) (n. d) defines a hostile work environment as harassment that "occurs when unwelcome comments or conduct based on sex, race or other legally protected characteristics unreasonably interferes with an employee's work performance or creates an intimidating, hostile or offensive work environment" (www.fcc.gov). Although diversity management goals promote diversity, contradicting this claim in practice is evidenced by the growing number of lawsuits handled by the EEOC (Hughes, 2012). These lawsuits depict work environments as hostile locations where socially marginalized people are subjected to cruel remarks, uncivil treatment, and other indignities that can destroy self-worth. Typically, litigation brings into question diversity management mechanisms as a remedial solution. This is the dark side of a diversity management philosophy that is concealed in the business opportunity model. It is also a less recognized perspective of diversity management that forces those in power to be accountable for social injustices that can limit performance and career satisfaction. Satisfying (or unsatisfying) lived experiences of socially marginalized people are often dictated by those in leadership positions with power. Compounding these experiences are situations whereby those in in leadership positions with power cause the problem or contribute to the problem. Nonetheless, management is responsible and accountable for being aware of situations and conditions that could impede top performance of people who are socially marginalized. There is a tendency for diversity management programs to continue to represent their goals from a representation perspective (which ties it to affirmative action) (Pitts, 2009) or performance (Fernandez, 1993) with less attention to fair treatment and social justice. However, diversity and diversity management are directed more towards representation rather than minimizing unjust behaviors, attitudes, and (mis) treatment of socially marginalized groups.

In reality, more diversity among the workforce translates to more experiences of marginalization; hence social injustice through discriminatory actions. Socially marginalized people face social injustices that can be detrimental to their psychological and physical well-being which places substantial accountability at the organizational level. Social injustice is a violation of one's civil rights that could inhibit the ability to realize full potential and ultimately impede one's career success. As an organization serving philosophy, diversity management has failed to uphold an ethical, moral, and social obligation to the dignity and self-worth of socially marginalized people.

Defining constructs and principles of diversity management should include and respond to the challenges, dilemmas, and the lived experiences of the socially marginalized. A troubling example is the Court findings of racial discrimination and abuse at the University of California at Los Angeles (UCLA). An investigative team found that the university was not practicing anti-discrimination policies which were vague and remedial processes were not clearly defined (Pleasant, 2013). Most appalling was the disrespectful treatment of a Black American surgeon/faculty member whose face was photo-shopped onto the body of a gorilla with his boss, a White man, sodomizing him. This picture was displayed at a graduation party with faculty as well as students in attendance. Prior to this incident, the doctor had complained about harassment and mistreatment by his supervisor, a woman of Asian descent, who was reported to have referred to the doctor on several occasions as an affirmative action hire.

The continued mistreatment of socially marginalized people articulates the need for diversity management programs to integrate goals that recognize organizational social justice. Organizational social justice is the "ideology that organizations operating through a representing agent seek to achieve a state

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

whereby all individuals feel included, accepted, and respected, and whereby human dignity as well as equality are practiced and upheld" (Byrd, 2012, p. 120). In doing so, diversity management emphasizes the experiences of the individual. Placing diversity and hence diversity management within a framework for social justice centralizes the purpose and outcome. Diversity management in this sense is not simply a management action; it is a shared action that allows socially marginalized people to give voice to their issues. Diversity, and hence the management of diversity, is more powerful when placed within the stories of those having the experience.

Diversity management goes beyond valuing and appreciating a diverse workforce, it includes being respectful of the person. "The reasons for implementing diversity management include having to adapt to the new reality of a workforce that is increasingly diverse, doing the right and moral thing, and gaining a competitive advantage" (Mor Barak, 2013, p. 235). Therefore, diversity management efforts should represent a responsibility to do the right thing and be accountable to people being treated with dignity and respect.

SOLUTIONS AND RECOMMENDATIONS

Bridging the Theoretical Divide

While diversity management has become an established managerial ideology, the underlying theoretical and philosophical assumptions of issues and problems emerging from human difference remain unrepresented (Costea & Introna, 2008). Resolving this tension between the two dichotomies – recognizing the business opportunity or responding to the lived experiences of socially marginalized groups—could be achieved through more integrative theoretical approaches (Shore, Chung-Herrera, Dean, Ehrhart, Jung, Randel, & Singh, 2009).

An example of an integrative approach is linking dignity and respect for human issues and the human experience with organizational values. Current approaches to management studies acknowledge underlying management values and interest rather than gaining knowledge of reality (Alvesson & Willmort, 1996). Although companies use formal policies, statements of values, diversity statements, etc. "the evidence is unambiguous that these types of actions are only starting points for creating positive organizational environments for diverse people" (p. 128). On the otherhand, using imagery (photographs) with textual content that is easily accessed demonstrates an ethic of care that conveys a relational message between people and the organization (Wallace, Hoover, & Pepper, 2013).

Critical management studies have advanced research and theory of diversity management by disrupting and countering the superficial claims of valuing and embracing diversity by emphasizing the historically constructed relations of dominance and subordination, as well as the ensuing experiences of the socially marginalized (Gotsis & Kortezi, 2015a). Klein, Tosi, and Cannella (1999) say that:

Multilevel theories begin to bridge the micromacro divide, integrating the micro domain's focus on individuals and groups with the macro domain's focus on organizations, environment, and strategy. The result is a deeper, richer portrait of organizational life—one that acknowledges the influence of the organizational context on individuals' actions and perceptions and the influence of individuals' actions and perceptions on the organizational context. (p. 243)

Critical theory is useful for explaining why management studies would benefit from acquiring a justice-based case for diversity as well as a business opportunity case. Critical theory offers an epistemological worldview of power structures and is aimed at decreasing domination and increasing freedom. Moreover, critical theories (e. g. Critical Race Theory) have emerged in association with social movements (e. g. Civil Rights movement) and have been significant in explaining the pervasive nature of social injustice (Yee, Ying, & Khin, 2014). Fundamental to the study of diversity and the application of diversity management, critical theory "examines and criticizes societal issues such as exploitation, asymmetrical power relations, distorted communication and false consciousness" (p. 19).

Diversity management is typically situated within specific types of human resource functions (e. g. recruiting, selection, training, mentoring, promoting, networking, etc.). Human resource practices operate within an organization's formal system. As a subsystem of the formal system, diversity management can be understood as a "formalized organizational system, process, or practice developed and implemented for the purpose of effectively managing a diverse workforce" (Yang & Konrad, 2011, p. 7) as appropriate to specific functions. Janssens and Steyaert (2019) advance a theory of practice based on five principles:

- Diversity as a social phenomenon is relationally constituted.
- Social life in a diverse organization is produced through practices, not only diversity management practices but also other management practices.
- A diversity practice is accomplished through connecting bodies, tools and artifacts, and discursive resources.
- A diversity practice is situated in time and space since actions and practices are connected in a nexus.
- The social order of a diverse organization is explained through observing and witnessing the practices in action. (p. 524)

As an application of management practice, Byrd and Sparkman (manuscript, submitted) propose that the business case for diversity and the justice oriented case for diversity, are not competing goals, but rather intersecting goals. These authors suggest that in pursuing business goals, an ethics of rights and an ethics of care should be exercised to maintain a social order of dignity and respect. Furthermore, given that social injustice is enacted as discrimination, bias, prejudice, stereotyping, incivility, and the like, that are ultimately viewed as pervasive acts to the social order, it is reasonable to consider business goals and justice outcomes goals as mutually inclusive.

FUTURE RESEARCH DIRECTIONS

Social science scholars/researchers and management scholars/researchers pursue studies of diversity and diversity management within the scope of their respective disciplines. Integrated perspectives are needed to explain how diversity (in terms of representation) can, at the same time, create consequences that are demeaning, unjust, and disrespectful to those who are categorized as being the diverse workforce. To ease the tension and perhaps bring clarity to the ambiguity of diversity and diversity management, "researchers must gain a critical understanding of the different kinds of paradigms that inform [diversity] research" (Broom & Willis, 2007, p. 28) through greater collaboration. Collaboration among researchers speaks to the ubiquitous presence of diversity and its application across multiple contexts.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Equally important is the increased understanding of organizational leadership to the socio-historical and political implications that stem from human difference. To achieve this, incorporating social justice within leadership and management development programs is fundamental to bridging the gap in diversity organizational goals. The challenge is developing the mindset of leaders and managers in organizational settings towards humanistic as well as opportunistic goals (Byrd & Sparkman, manuscript submitted). An emerging concept that speaks to organizational leaders' need for historical and cultural understanding is diversity intelligence (Hughes, 2016). A basic assumption of diversity intelligence is that mainstream literature recognizes emotional, cultural, and intellectual intelligences as indicators of a leader's effectiveness. Absent from these common assessments is the leader's knowledge and competence of the historical background of social marginalization or the lived experiences stemming from social injustice in the workplace.

Furthermore, a diversity management philosophy speaks to the social location value of the socially marginalized (Hughes, 2012). Combined with the different experiences and perspectives, "social locations hold promise for generating a better understanding of social systems, especially systems of social oppression" (Robertson, 2013, p. 299). Given that diversity management has been informed by multiple conceptual meanings and applications, advancing knowledge and perhaps eventually theory is better served through collaborative research and professional development for organizational leaders.

CONCLUSION

This chapter explained the evolution of the diversity management philosophy; identified varying definitions of diversity management; examined criticisms of diversity management; discussed diversity management as a business opportunity; recognized ethical, moral, and social obligations of diversity management; discussed current models, worldviews, approaches, and contexts of diversity management, explored the dark side of diversity through a discussion of social injustice, and explored future research directions in diversity management. The goal has been to represent diversity management as an organizational serving philosophy that has failed to uphold an ethical, moral, and social obligation to the dignity and worth of a socially marginalized workforce. Hence this chapter has sought to coalesce diversity management and social justice.

Embedded within discussions of diversity management are the adverse lived experiences that socially marginalized people endure as they go about their attempt to perform their jobs. In many cases, despite having earned impeccable credentials, having earned a quality education, and having invested years of experience at one's place of work, socially marginalized people continue to face disrespectful treatment despite having their "difference" marketed as a competitive advantage. True competitive advantage must reflect valuing all diverse employees for all of their contributions to the workplace not just their visible presence (Hughes, 2019).

Varying definitions of diversity and diversity management were presented in this chapter. The guiding defining construct for diversity was grounded in the work of Cross (2000), an early pioneer in the study of diversity, who identified social change as an appropriate goal for diversity work. When combining the terms diversity and management, it challenging, at the least, to ignore the social injustices endured in the pursuit of business goals.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Organizational leaders are either uninformed of social justice problems or have chosen to ignore the dark side of diversity as a management priority. A diversity management philosophy seems to be incomplete without some inclusion of social justice. Therefore, diversity management as a guiding organizational philosophy should reflect a more integrative approach to reflecting not only organizational goals but also including values based principles that uphold the dignity and worth of all people.

KEY TERMS AND DEFINITIONS

Diversity Intelligence: The capability of leaders and followers to value all employees and their contributions despite differences based on protected class status.

Diversity Management: Management philosophy that includes "an understanding of the sociopolitical and historical realities of discrimination and oppression; knowledge of how organizations and systems work, and how they can change; competence and experience in helping adults learn; and personal

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

understanding of one's self in relation to others, especially across differences of race, gender, sexual orientation, and ability" (Cross, 2000, p. 140).

Diversity Social Climate: Organizational culture supported by management's proactive stance against social injustice.

Ethics of Care: Moral problems are problems of human relations…relational ethic transcends the age-old opposition between selfishness and selflessness, which have been the staples of moral discourse. The search on the part of many people for a voice which transcends these false dichotomies represents an attempt to turn the tide of moral discussion from questions of how to achieve objectivity and detachment to how to engage responsively and with care (Gilligan, 1983, p. xix).

Ethics of Justice: Asks the moral question, "How fair is this action? Does it treat everyone in the same way, or does it show favoritism and discrimination?" (Velasquez et al., 1996, p. 3).

Ethics of Rights: Based on the principle that every individual has basic fundamental rights and as such have the right to make their own choices.

Ethics of Virtue: Considers the personal traits, qualities, and values that cause a person to act in a certain way. From this perspective, the good values that a person prescribes to that cause them to act in a way that is good as opposed to vices that cause that person to act in a way that is not, play a critical role in decision-making.

Hostile Work Environment: Occurs when unwelcome comments or conduct based on sex, race or other legally protected characteristics unreasonably interferes with an employee's work performance or creates an intimidating, hostile or offensive work environment.

Inclusion: The degree to which the sense of being an outsider looking in does not exist (Pelled, Ledford, & Mohrman, 1999).

Lived Experiences: Refers to incidents, episodes, events, and first-hand accounts that socially marginalized people endure and interpret as being demeaning, demoralizing, disrespectful, and prejudicial to their image in the workplace.

Managing Diversity: An intervention to ameliorate racism sexism, and other forms of discrimination and oppression in order to create organizations and a society in which all people have equal opportunity. The most common but unacknowledged connotation of the term is to "manage white women and people of color" since they are an increasingly larger percentage of workers, the underlying attitude is that it is these new and different others who are the problem (Cross, 2000, p. 224).

Occupational Segregation: The grouping or categorizing of minoritized populations into domestic, service, or undervalued work roles (Solomon, Maxwell, & Castro, 2019).

Presumed Incompetent: Perception that an individual's work is less superior because of their social affiliation and the assumption that they are placed in prestigious or high-profile jobs because of affirmative action.

Social Injustice: A violation of one's civil rights that could inhibit the ability to realize full potential and ultimately impede one's career success.

Socially Marginalized: Individuals who are subjected to unequal (and often unjust) treatment based on their social location without considering their individual knowledge, skills, and abilities (Byrd, 2018).

Chapter 18
Proposing a Diversity Intelligence Training Framework for Leaders and Managers to Attract, Maintain, and Balance Mature Workers

Sheron Lawson
Wayland Baptist University, USA

Claretha Hughes
University of Arkansas, USA

ABSTRACT

The workforce is becoming more diverse with the increasing number of mature workers delaying retirement and working beyond the legal retirement age. Retaining mature workers in organizations can be challenging. Training leaders and managers in diversity intelligence (DQ) has the potential to lead to better and more effective supervision of diverse employees. Competent and skilled managers and leaders who are trained in DQ will be more able to help in the attracting, retaining, and balancing mature workers. The chapter proposes using the three learning processes of enactive, iconic, and symbolic from Bruner's discovery learning theory to teach leaders and managers DQ. The learning outcome is that managers will become mentors and coaches who are equipped to use goal-oriented and transformative processes to supervise the independent, motivated, and proactive adult workers.

INTRODUCTION

Researchers indicated that diverse and multicultural intellectual human capital assets within organizations are more effective at producing higher performance (Nelson, 2014, Chen, Liu, & Portnoy 2012, Moon, 2013 & Bogilovic & Skerlavaj, 2016). One diverse characteristic is that of workers over the age of 40 who are considered to be mature workers in many workplaces. These workers are protected from workplace discrimination by the Age Discrimination in Employment Act (ADEA) of 1967 (US Department of Labor, n.d. a). There has been a significant increase in the number of workers who have chosen to remain in the workplace beyond traditional retirement ages in the workplace. Brandon (2018) purported that full retirement age will continue to increase to about 67 years of age for workers born in 1960 and later. Increased life expectancy, financial necessity, and improved health of older Americans are all factors that are contributing to retirement-aged people delaying their retirement (Orszag, 2018). Pew research and the U.S Bureau of Labor Statistic both reported that some employees are uncertain about retirement and expressed delaying retirement until after age 65. Statistics from these two organizations confirmed employment of 65 and older employees has increased significantly over the past 30 years (Pew Charitable Trust, 2018, Toossi & Torpey, 2017).

As workplaces become more diverse, especially with older adults deciding to retire later or to work through retirement, leaders must become more adept at leading diverse employees. Having the knowledge and the understanding on how to lead diverse employees (Hughes, 2016, 2018c) and manage diverse intellectual human capital assets is important in keeping an organization's competitive advantage. According to Wiig (1993), knowledge management is fundamentally the management of corporate knowledge and intellectual assets that can improve a range of organizational performance characteristics and add value by enabling an enterprise to act intelligently. Since the early 1990s knowledge management has been a critical factor for organizations looking to increase their productivity and effectiveness (Delong & Fahey, 2000; Drucker, 1999; Zack, 1999; Inkpen, 1996). According to Koulopoulos and Frappaolo (2000), knowledge management is a critical business strategy, which enables an organization to leverage its most precious resources, collective know-how, talent and experiences to accelerate the rate at which it handles new market challenges and opportunities. Inkpen (1996) propounded that organizations' failure to create and manage knowledge as a critical asset may account for their declining performance.

Using Diversity Intelligence (DQ) to Train Leaders and Managers of Mature Workers

The workplace has become a very diverse environment, and leaders and managers are called upon to direct and supervise employees from various backgrounds and cultures. Yet, many leaders and managers are ill-informed of diversity intelligence (DQ) (Hughes, 2016; Hughes & Brown, 2018) and how to effectively manage and supervise a diverse workforce. DQ covers all protected class groups and categories in the American workplace. Age is a protected classification for all workers aged 40 and over. Although workers who reach the age of 40 are in a protected class, it does not automatically signify that they are mature workers. Mature means different things to different individuals. In the context of this chapter, we are going to define a mature worker as any worker at 40 years of age and older. We are simply acknowledging their age as a stage at which maturity should begin if it is not already present and hopefully continue if it is the beginning. We are also acknowledging that these protected class workers

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

are aware of their protective workplace status and may be working within the context of that protection from discrimination based on age.

Leaders and managers who are trained in DQ will be more apt to help in the attracting, retaining, and balancing mature workers. McVey & McVey (2005) stated that competent, skilled leadership is the key to engaging staff at all levels. Leadership must be inclusive as they develop goals and strategies for maintaining and retaining employees. They further stated that staff who have a sense of confidence and trust their careers in the hands of organizations' leaders will be inspired to seek professional growth. Rackleff (2002) stated that knowledgeable correctional officers' recruiters were effective in recruiting new staff because they were well-spoken and were able to explain the job to applicants. The recruiters' enthusiasm, optimism and positive attitude were instrumental in filling the vacancies with the best applicants.

DQ is defined by Hughes (2018a,) as "the capability of individuals to recognize the value of workplace diversity and to use this information to guide thinking and behavior" (p. 260). Kahl and Schmitz (2010) construed that many leaders have surface appreciation but do not have deep knowledge of dialogue that is critical in examining the aspects of diversity. Hughes (2016; 2018c) and Hughes and Brown (2018) also found similar results where leaders do not apply deep knowledge to examine diversity. Chrobot-Mason and Leslie's (2012) empirical evidence indicated that organizational leaders with skillsets in managing multicultural workplaces are more successful in achieving cooperating employees and getting mutually satisfying job performance.

In contrast, Moon (2013) stated that although several researchers have found significant positive link between diverse teams and job performance, several other researches have highlighted conflicts that have hampered successful performance. Organizations with diverse and multicultural teams have had mixed results on job performance (Robert, Dennis, & Ahuja, 2018). Training leaders and managers in DQ has the potential to lead to better and more effective supervision of diverse multicultural employees and older workforce (Hughes, 2018c).

The purpose of this chapter is to explore DQ and adult learning theories in the context of mature workers and propose a framework on how to train DQ to leaders and managers. The ability of leaders and managers to better lead and manage all of their diverse employees, who provide human capital knowledge assets to their organizations, is the ultimate goal of DQ.

BACKGROUND

Theoretical Background

Bruner's (1961) Discovery Learning theory was be used to propose a framework to train DQ to leaders and managers. Discovery learning is a method of inquiry-based instruction and suggests that it is best for learners to discover facts and relationships for themselves. It is a constructivist learning theory that takes place in problem solving situations where the learner draws on his or her own past experience and existing knowledge to discover facts and relationships and new truths to be learned (David, 2017). The three systems of processing knowledge referred to by Bruner (1964), enactive, iconic, and symbolic, will be used as the building block elements for the proposed framework. The three systems are defined as follow:

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. Enactive representation – "A mode of representing past events through appropriate motor response" (p. 2). This is acquiring knowledge through actions.
2. Iconic representation – "Summarizes events by the selective organization of percepts and of images, by the spatial, temporal, and qualitative structures of the perceptual field and their transformed images" (p. 2). This is internalizing and enhancing knowledge by developing visual images to retain information.
3. Symbolic representation – "A symbolic system represents things by design features that include remoteness and arbitrariness. A word neither points directly to its referent here and now, nor does it resemble it as a picture" (p. 2). This is classifying, coding, organizing and storing the information and knowledge.

Bruner (1961) posited that discovery in learning not only enables learners to acquire information for themselves but also to get information that is necessary for learning a variety of techniques for problem solving. Bruner (1964) wrote that cognitive growth is both from the outside in as well as from the inside out. Learners develop techniques to use the recurrent features in the complex environment to aid in understanding the learning material, which is the enactive representation. The learners also process information through action, imagery, and language utilizing both the iconic and symbolic representations. Bruner (1977) suggested that the objective of learning is to cultivate excellence by helping learners to achieve optimum intellectual development. Four conditions that can aid the learning process suggested by Bruner (1977) are:

1. Structure in learning - that is, exposing learners to the fundamental structure of the course and the subject matter. Understanding the structure of the course and what to expect can increase the motivation and the self-efficacy of the learners.
2. Readiness for learning - which is using a spiral curriculum to repeatedly state and build on foundational information until learners fully grasp the content of the course.
3. Nature of intuition - which is using intuitive thinking to arrive at plausible formulations without the analytical steps. Most adult learners have good intuitive knowledge from their vast life experiences, so this should be harnessed in the learning process.
4. Desire to learn- is to stimulate the interest in subject matter and material rather than external goals such as grades. Most adult learners put more interest in learning the material over getting good grades.

Many adults, today, receive tuition assistance that is dependent upon the grades that they receive, so grades may be as important as subject matter and material knowledge.

Discovery learning theory is a stimulating tool to use to develop DQ in leaders and managers because it is an inquiry-based instruction system. The three processing systems of enactive, iconic, and symbolic are instrumental in providing a foundation for the enhancing and blossoming of their cognitive understanding of issues relating to mature workers. Discovery learning is a constructivist theory that posits relationship building and problem solving in learning structure. Utilizing these elements leaders and managers will be able to hone and upgrade key managements techniques that can advance their skill sets in organizing and coordinating programs for the furtherance of balancing and maintaining a mature workforce.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Diversity Intelligence (DQ) and Retaining Employees

DQ is how leaders and managers in organizations use the knowledge of the workforce's composition and leverage the organizations' workforce inter-personnel diversity (Hughes, 2018d) to effect positive attitude and behavior change leading to constructive outcomes. Workforce inter-personnnel diversity focuses on the ways that individuals differ in personal characteristics despite having the same position classifications in the workplace (Hughes, 2018d).

DQ can aid leaders and managers in attracting, maintaining and balancing valuable employees, especially mature workers. Fajčíková, Urbancová,& Fejfarová (2018) said to overcome the challenge of declining labor market organizations need to change their recruitment strategy by developing and training their current staff. Siegfried (2008) postulated that organizations are offering targeted leadership training to ensure managers gain relevant information on the organizational dynamics, employees' composition, and broad functional and geographic exposure within organizations leading to the maintenance of key talents. Leadership training programs coupled with manager mentoring, Siegfried (2008) claimed, helped to prepare junior employees for future roles in the organization by keeping staff challenged and emotionally invested in the company's success.

Talent Intelligence

Carey (2007) offered three strategies that can aid in retention of employees. The first strategy is to consider education as a business strategy. The author said the "Grow your Own" philosophy can directly impact an employer's diversity recruitment challenges by hiring diverse talent and providing educational assistance or advanced training for both recruits and managers. Not only is it a cost-effective mechanism, but it also addresses future talent needs. Another strategy is to tap into the talent that exists everywhere and reach out to diverse job seekers by using talent intelligence.

Talent intelligence, according to Carey (2007), is research and information that speaks to an organization's current recruitment needs and supports strategies for workforce planning. Equipping recruiters with knowledge about diverse markets will help build broader and deeper knowledge around what prospective employees, especially mature job seekers, lack in their current jobs so that recruiters can offer the right incentives for them to join the organization. The third strategy is to offer an innovative workplace. The challenge, Carey (2007) stated, is not for managers to adopt new people management ideas, but for them to clear out the outmoded and ineffective old ideas around managing people. Managers learning about diverse workers can institute innovative offers in the organization to retain workers. Holly (2019) suggested by training managers to provide targeted ways to engage key matured talents can build the strength of the workforce and the commitment to the organization at the same time.

Working Conditions and Retention

Levin (2008) concluded in his analysis on how to retain teachers, that skilled and supportive principals, opportunities to learn and improve skills, and strong collegial environments are among the working conditions that matter most to teachers. Leadership development is a particularly important element in the retention of qualified teachers which is also related to improved student outcomes. Everyone benefits when school systems help all staff understand how to build strong collegial organizations that support people while also helping them improve (Levin 2008).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

McVey & McVey (2005) agreed that personnel should be valued, respected, and invested for the future success of the organization. They further stated that internal mechanism for attracting and retaining competent and committed workforce is directly related to the leadership and how they lead, direct, develop, and manage their employees. Bridger & Johnson (2005) proposed that driving continuous improvement ultimately becomes a training exercise to support the identification of alternative practices, procedures, policies, and expected behaviors. A focus on training can begin to alter an organization's culture that can lead to continuous retention, balancing, and maintaining of a talented and diverse workforce.

Propositions

Designing a framework to teach DQ to leaders and managers can allow leaders and managers to become better and more effective supervisors to diverse and adult multicultural workers. The proposed outcomes from educating leaders and managers in DQ are:

Proposition1: Leaders and managers with high DQ will be more effective at managing diverse and adult multicultural workforce.
Proposition 2: Diverse and adult multicultural learners that are led by managers with high DQ will have higher job performance.
Proposition 3: A structured framework based on discovery learning will be instrumental to developing DQ.

Propositions one and two align with Hughes' (2018b) research suggestions.

MAIN FOCUS OF THE CHAPTER

Characteristics of Adult Learners

Chen, Kim, Moon, and Merriam (2008) noted that although most literature portrayed adult learners as a homogenous group, adult learners are a diverse group with variable age, race, ethnicity, education, income, and physical and cognitive impediments. Merriam (2001) reviewed Knowles (1980) five assumptions of adult learners in his andragogy theory. The assumptions describe the adult learners as having independent self-concept, reservoir of life experiences, learning related to social roles, problem-centered with interest in immediate application, and motivated to learn by internal factors. Scanlon's (2009) research highlighted a complex world of adult learners that is segmented, but the segments are not discrete because the boundaries between them are permeable. The learners revealed a multifaceted understanding of their own learning needs and know the ways in which teachers and other students could support or distract them. They were in accord to the kinds of structures required for them to effectively learn and sustain self-concept transformation. Chen et al.'s (2008) review of literature found that older adults, with a few exceptions, are highly motivated and proactively participate in diverse educational activities.

Roberts, Gustavs, and Mack (2012) determined that adults with postgraduate experience are independent and self-directing, have valuable experience, value learning that integrates with everyday life, are problem centered, and are motivated by internal drivers. Patterson (2017) indicated that participating learners had higher self-rated leadership ratings than control learners which positions them for program advocacy roles. Compared with control learners, they were in fact slightly more involved and had slightly

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

higher scale scores in reasoning and information processing. Hashim, Tan, and Rashid (2015) found that the adult students were motivated by career development, job security, upward mobility, and re-careering. Their future professional endeavors were usually aided by their life experience, and their reflections and actions were integral components of the adult learning process.

Relationship Between Diversity, Cultural Intelligence (CQ), and Performance

Edwards (2016) postulated that cultural intelligence (CQ) can be valuable tool for education and training. It has been established that a diverse workplace with high cultural diversity exhibits increased work performance (Nelson, 2014, Chen, Liu, & Portnoy 2012, Moon, 2013 & Bogilovic & Skerlavaj, 2016). Several studies have also indicated that mature workers, not only increase the cultural diversity of the work environment, but they are motivated and hard workers who impact the performance and effectiveness of the organizations (Roberts, Gustavs, and Mack, 2012, & Chen et al.'s, 2008). Nelson (2014) purported that diverse teams are more effective and produce better results in financial and innovative endeavors. They further stated that diversity also create a cognitive and social environment which is a positive indicator for increased performance. Moon (2013) investigated the relationship between cultural intelligence and performance in multicultural team. The results indicate that cultural intelligence moderates the relationship between cultural diversity and team performance. The results also demonstrate that multicultural teams with higher levels of cultural intelligence and cultural diversity exhibit higher rates of performance over time. Bogilovic and Skerlavaj (2016) provided empirical evidence to show that creativity is stimulated within culturally diverse environments. They further stated that individuals with high metacognitive and motivational CQ can be creative when collaborating with individuals from different cultural backgrounds. Chen, Liu and Portnoy (2012) also provided empirical evidence to confirm the relationship between individual motivational cultural intelligence and firm diversity climate and increased performance.

Establishing the link between diversity and increased workplace performance and also highlighting that mature workers are delaying retirement; it is critical that managers are knowledgeable in leading and supervising mature workers. Educating managers about DQ can impact the retention of mature workers leading to more effective organizations. Strasser and Seplocha (2005) wrote that educating university professors in multicultural education can bring great value by providing a context for various types of adult learning activities to address the range of learners and move beyond tolerance of differences to ward affirmation and solidarity.

Barriers to Adult Learning

There are some barriers to adults learning and advancing in the workforce. Flynn, Johnson, Brown, and Rodger (2011) grouped barriers into three categories: situational, institutional, and dispositional. Situational barriers relate to a person's life situation such as living situation. Familial support may limit or prevent access to supportive technology with limited places to study. Negative attitudes about education held by family, friends, or one's partner are also associated with lower participation and training completion rates. Having a teacher, guidance counselor, or family member who cared about them and their education would have helped some adult learners to stay and complete their educational endeavors. Institutional barriers include educational programs, teachers, and government policy. There is evidence that a poor curriculum that is irrelevant to adults' everyday lives or is uninteresting discourages some

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

adult learners from completing programs. Dispositional or motivational factors include the influence of past experiences; community perceptions; and personal, academic, and job-related motives. A troubled education history, lack of engagement in learning activities at earlier ages, and poor performance in previous schooling can be negatively associated with participation in adult students. Individual characteristics such as gender, education level, and socioeconomic status can also be barriers in adult learning. Fewer programs are available for workplaces with large numbers of women than for male-dominated workplaces, so women may be at a disadvantage compared with men when it comes to attaining basic training. Conversely, men may reject adult education programs as a feminine activity and may be reluctant to participate in programs perceived as female oriented. Men also exhibit higher dropout rates from programs than women (Flynn et al., 2011).

Jacot, Frenay and Cazan's (2010) findings revealed that adult learners end their educational endeavors for extrinsic reasons because they had to cope with many obstacles in different life spheres. Learners' age and elapsed time from their initial training constituted a negative influence on their expectancy of training completion. The adults who completed their educational programs attributed intrinsic motivation for their perseverance using coping strategies in their life contexts.

Elements that Foster Success in Adult Learning

Marmon (2013) explicated that providing small goals, specific feedback, encouraging creativity and using authentic materials that address the adult learners' needs helped to foster good learning habits. The contextualization and personalization of assignments, using real world examples, and explicit strategy instruction enabled instructors to directly connect with learners. Also, creatively embedding technology within instruction empowers adult learners by fostering digital and technological literacy. Bolliger and Shepherd (2018) noted that internet-enabled devices are now widely used in education and even in wilderness areas, but cautioned that although they are valuable to instruction, they might interrupt connectivity to direct experience. The study revealed that some learners desired a boundary between internet-enabled devices and training.

Quinlan and O'Brodovich (1996) found that including learners in planning projects and giving them a meaningful role in identifying ways to assist themselves and other learners in their transitional stages of learning can be instrumental in their gaining the employability and occupational skills necessary for entry to the new workplace. Napan (2002) used choice theory and adult learning theory in tertiary education and posited that interactive learning and self-evaluation are two important tools in adult learning. Quinn, Foote, and Williams (2012) professed that one of the tools for success in teaching adult learners is for Christian instructors to reflect deeply on their own faith assumptions and how those assumptions influence their instruction and development of courses. The instructors should model and facilitate the kind of behavior that is necessary for a transformational learning experience.

Jackson (2009) corroborated the work of Merriam, Caffarella, and Baumgarter (2007) on the social cognitive and constructivist theories in the study on adult learning experience. Using the two models of socially interactive interchange and the superior/subordinate relationship, Jackson (2009) indicated that adult learners will have greater acceptance of training when they are involved in the process. Dae Joong (2007) propagated a theory of rhizoactivty on adult learning. Rhizoactivity involves past choices in decision making. It takes into consideration emotions, intuition, and bodily feeling to help in rational decision making. Adult learners tend to past experiences and intuition to aid them in making decisions in the learning process.

Conceptualizing Learning Programs for Adults: Education and Training

Education and training are different. Learners, during education, acquire knowledge that is most often used in the future while, during training, they acquire knowledge and skills to perform tasks and activities in their current job. Newland (2008) explained that training "gives us the opportunity to undertake instruction that allows skills to be practiced in order to bring about a desired standard of performance or behavior" (p. 36).

Education

Merriam (2008) declared that learning is not just a cognitive activity but a multidimensional phenomenon. Merriam (2001) specified that learning is not situated in a particular context but can be examined through race, gender, class, power, and oppression. The more that is known about how adults learn the better it is to structure learning activities that resonate with adult learners and enable them to become more empowered and independent. Karmelita (2017) revealed that adult transition education programs should seek to relate the curriculum to real-life experiences, integrate technology, remediate, foster effective relationships, connect students to support each other, and provide a genuine college experience.

Merriam (2001) reiterated that andragogy is a learner-centered educational program and the training should be a program planning model that has an atmosphere that embodies acceptance, respect, and support for the adult student. Herbold (2011) corroborated adult learning theory from the perspective that when students are intimately involved in customizing their educational activities that they are more successful in the course. Merriam (2001) stated that the learning process is very comprehensive and is much more than the systematic acquisition and storage of information, but involves making sense of lives by absorbing, imagining, intuiting, and learning informally with others.

Merriam (2008) further posited that the spotlight on the understanding of adult learning has shifted to a learner in context. A broad context linking individual's learning process to the context of the learner, making for a richer holistic understanding of the learning in adulthood. Chen et al. (2008) postulated that researchers indicate that adult educational programs are influenced by the impetus of the life context of older adulthood and factors such as greater access to disposal time and developmental position.

Merriam (2008) reviewed andragogy and self-directed learning and stated they are about the individual adult learner and are conceptualized for transformational learning, therefore instructional strategies should be employed to foster adult learning. Scanlon (2009) indicated that interaction with significant others was particularly important for adult learners and supportive teachers who provided activities such as, treating students with respect, having pedagogical content knowledge, and engaging in effective communication have positive influence on the leaners.

Merriam (2008) revealed that encouraging reflection and dialogue, whether with the self, another, or a group, enables learning to take place. Critical reflection is essential for transformative learning, for engaging in social movements, for developing brain capacity, and for confronting power and politics in workplace learning. Connecting new learning with learners' previous experience is a longstanding strategy of processing new information. Merriam (2008) also recommended expanding the repertoire of instruction to include creative and artistic modes of inquiry such as folklore, myths, symbols, music, dance, and even dreams as sources of knowledge since adult learning is a multidimensional and holistic phenomenon. Scanlon (2009) signified that students also identified informal mentoring relationships as a principal form of support within the college from distractions that came from students who made

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

others feel insecure through overt displays of their own competence, engaged in negative dialogue, or were disruptive in class.

Autonomous learning is a significant component of adult learning. The curriculum structure encouraged student autonomy in setting their own goals. However, student autonomy can be severely restricted by teachers who are not always receptive to students because it is the teachers who determine the learning environment in the classroom. The students will only approach teachers if they felt the teacher was prepared to negotiate.

Training

Cox's (2015) research on coaching adults stated adult training programs need to have a learner's agenda, not the curriculum-based or institutional agenda. Utilizing a learner's agenda, Cox (2015) declared, uses nonjudgmental listening and open questioning that builds on the learner's experience and the needs arising from that experience. Kelly (2006) posited that life experiences affect the ways adults learn and what they bring to the training atmosphere and how they accept the information presented. The adult learners expect more from their educational sessions because they have other roles that counterbalance the significance of their role as learner.

Roberts et al. (2012) applied some important concepts of adult educational theory to explain how they connected to four strategic areas in the development and implementation of the vocational training programs. The strategic areas were the learning needs of trainees, educational methods best that address those needs, assessment methods that best test the acquisition of the desired learning outcomes, and the needs of supervisors and teachers. Roberts et al. (2012) concluded that formal and informal training should involve adult learners in planning their needs in curriculum, controlling their own learning, supporting them in carrying out their learning plans, and involving them in evaluating their own outcomes.

Online Learning

Hashim et al. (2015) corroborated other researchers that for the online learning process to be successful, adult learners should be able to interact with the course materials, discuss, and collaborate between instructor and other students, and integrate their past experience with the course content or assignment. Morris (2019) said to actively engage adult learners in online learning, the program should be able to encourage them to discuss, argue, negotiate ideas, and to collaboratively solve problems. Hashim et al (2015) indicated that adult learner learning context require them to integrate their rich life and employment experiences in learning. The research findings revealed that adult learners' attitude, cognitive, affective, and social needs have a positive influence on their intention to adopt m-learning. Although employment experiences may be desired to be integrated by students, the educators must ensure that students are not integrating their experiences out of context of the course content. Every work experience is not applicable to all course discussions and can be a distraction to the course's learning objectives and purpose and to the other students in the course.

Adult Learning Models for Education and Training

Roberts et al. Four Models

Several researchers have devised various models for adult learning. Roberts, Gustavs, & Mack (2012) spoke to four types of learning models for adult training program which evolves into a life-long practice of continuing professional development and are centered on self-directed learning where trainees accept responsibility for their own learning. The four models are: discipline-based learning (DBL) which involves self-directed learning and is instructor centered; problem-based learning (PBL) which is thought to be effective and have positive effects on competency after graduation; workplace-based learning (WBL) which is an apprentice type model focuses on developing competencies; and critical reflective learning (CRL) directs learner to evidence-based learning to ensure thinking and learning.

DBL is critical to develop a trainee's insight and ability to reflect on their performance and behavior. It is typically taught in lectures to groups. The problem-based learning model differs from the discipline-based models as it requires trainees to work through a combination of learning strategies to discover the nature of a problem, understand the constraints and options leading to a resolution, and the viewpoints involved. It organizes training around work topics and everyday problems encountered in the work sphere so that the trainees focus on learning relevant to their work. Workplace-based learning includes sociocultural elements where learning is framed as an activity involving increased access to participating roles in expert performance and teaching needs to be planned and can occur in short-term. Critical reflective learning combines critical analysis and reflective learning to train the learners to evaluate information from unexpected problems and to ensure they are from authoritative and reliable sources (Roberts et al., 2012). Nielsen (2015) offered implications for effective training of adult learners by noting that strategies that support student motivation and persistence are effective practices for improving learning outcomes.

Toulutiene (2013) revealed critical elements for successful adult learning programs. Programs that address cognitive, affective-motivational, psychosocial problems encountered by adults in the learning process and offer respect, tolerance, trust, communication, and the pursuit of communicating and consensus provided important assistance to the learner by helping them to avoid learning difficulties. They help the adult learner function, promote the adult independent learning, and also help to overcome the gaps in knowledge, abilities and skills, fear and stress during learning process.

Reinforcing and Adaptive Models

Morris (2019) proposed two learning models for adults. The reinforcing model with modes of instruction and performance without inquiry works best for adult learners who may become accustomed to habitual patterns of perceiving, thinking, judging, feeling, and acting that represent a lack of need to adapt to social contextual changes or a lack of motivation for self-directed learning. The adaptive model with the modes of instruction and performance with inquiry may facilitate learners to be adaptive in their performance by potentially enhancing learners' motivation for self-directed learning.

Four-Lens Model

Kiely, Sandmann, and Truluck (2004) devised the four-lens model which included the learner, process, context, and educator which offers a holistic understanding of learning in adulthood. The learner lens examines the learner participation and motivation patterns, learning styles, role of experience, mind-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

body connections in rich learning environments that involve complex and novel situations. The process lens examines the learning processes such as interactive, reflection, dialogue, and transformational and experiential learning. The educator lens examines the instructor's beliefs and assumptions, philosophical orientations, teaching style, behavioral, liberal, progressive, humanistic, and radical approaches to adult learning. The final lens, the context lens, examines learning communities, interactive and structural power, situated cognition, critical pedagogies, and multiculturalism. Kiely et al. (2004) found the four-lens model of learner particularly helpful as it accounts for most of the influences on the diverse adult learners and can be used in planning instruction or in analyzing and diagnosing problems as they occur. The learners will have highly successful experiences as they pursue and complete their training and integrate dimensions of learning in their personal and professional lives.

Booth and Schwartz's Learning Model

Booth and Schwartz (2012) designed a learning model to establish a suitable physical and psychological climate for adults as learners and educators to involve adult learners in the planning and assessment of their own learning. The model includes mutual respect, collaboration, supportiveness, openness, and fun. It identified four specific strategies for effectively and deliberately navigating boundaries with adult learners. The four strategies are practicing the mindful pause; setting mutual expectations, engaging in empathy with strength, and monitoring the relationship; and are described as follows:

1. **Practicing the mindful pause** which helps the teachers to create clarity around relationships with the adult learners and also helps them be aware of their own needs and ensure that they are not relying on a teacher–learner relationship to address them.
2. **Setting mutual expectations** by using intentional and explicit language with adult learners which is the inclusion of their voice and their choice in the learning process.
3. **Engaging in empathy with strength**, which is maintaining rigor, evaluating critically, and being the holders of the relationship.
4. **Monitoring the relationship** which is the monitoring and reflecting on the relationship to continually ensure that the changes to the relationship over time are based on the student's readiness and that the relationship continues to serve the student's learning and development.

McLaughlin's Model

McLaughlin (2015) combined two models to elucidate the compatibility of transformative learning theory with Christian spiritual renewal. The Glisczinski (2007) model examines transformative learning phases of disorienting experience, critical reflection, rational dialogue and action. Kolb (1984) Experiential Learning Cycles model examines concrete experience, reflective observation, abstract conceptualization and active experimentation. The findings revealed there was positive correlation between transformative learning and spiritual renewal.

Introduction to the DQ Training Model Framework

The review of empirical research indicates that Bruner's (1964) three learning processes of enactive, iconic, and symbolic can be used to train leaders and managers in DQ. Developing and enhancing DQ will lead to more effective managers and a more comfortable and engaging work environment. Leaders

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and managers who are trained in DQ will gain competencies to construct knowledge about the mature workforce members' capabilities and needs. Using prior experiences, they can construct useful knowledge structures for purposeful activities.

When leaders and managers are fully trained and vested in DQ, they have capabilities and skills to develop, maintain, and retain a mature workforce. The findings of the review explicate the several characteristics of adult learners that are needed to be considered in attracting, maintaining, balancing, and retaining them. Adult learners are a diverse group of learners with varying cognitive and physical capacities. They are motivated, independent, self-directed learners with a reservoir of life experiences to draw upon. They exhibit multifaceted understanding of their own learning needs and are aware of what support they need from instructors and others. They proactively participate in educational activities that advance their career development and job security and have positive attitudes towards learning and advancement. If managers captured these elements and use them in their management strategies continuous retention of mature workers is possible. Two conceptual model frameworks are proposed here to elucidate training for DQ and how trained leaders and managers in DQ can supervise and develop mature workers for future retention.

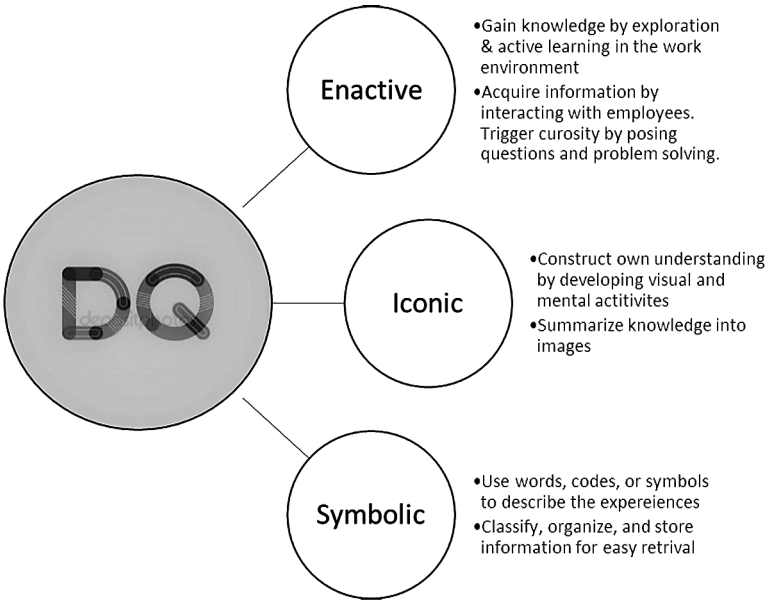
Conceptual Framework for the Training DQ to Leaders and Managers

Leaders and managers can increase and enhance their knowledge of diversity in the workplace, and especially as it relates to mature workers, by using Bruner's (1964) discovery learning three systems of processing: enactive, iconic, and symbolic. Through inquiry-based methods leaders and managers can discover facts about mature workers and themselves to build relationships leading to rapport that can help to solve problems. Using the constructivist approach the leaders and managers can draw on their own past experiences and existing knowledge to discover facts and new truths to recognize the value of workplace diversity and to use this information to guide thinking and behavior (Hughes, 2016) that can lead to attraction and retention of mature workers.

Figure 1 illustrates how the three learning processes can be used. The enactive process directs leaders and managers to participate fully in learning about the mature workers and their environment. They should partake in active discovery by posing questions to the workers. This will trigger the curiosity of both parties and will boost engagement and cultivate a collaborative work climate. The second step is the iconic process where the leaders and managers develop images of the captured information and summarized them using visualization. Constructing images of the knowledge helps to internalize the information that will lead to capabilities in mastery and manipulation of knowledge. When leaders and managers develop mastery skills, they are better able lead a mature workforce. The symbolic process is where the managers learn to use words, codes, and symbols to classify, organize, and store captured knowledge. When leaders and managers learn to organize knowledge, they can easily retrieve it to use in building organizational capabilities that can lead to attracting, maintaining, balancing, and retaining mature workers.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

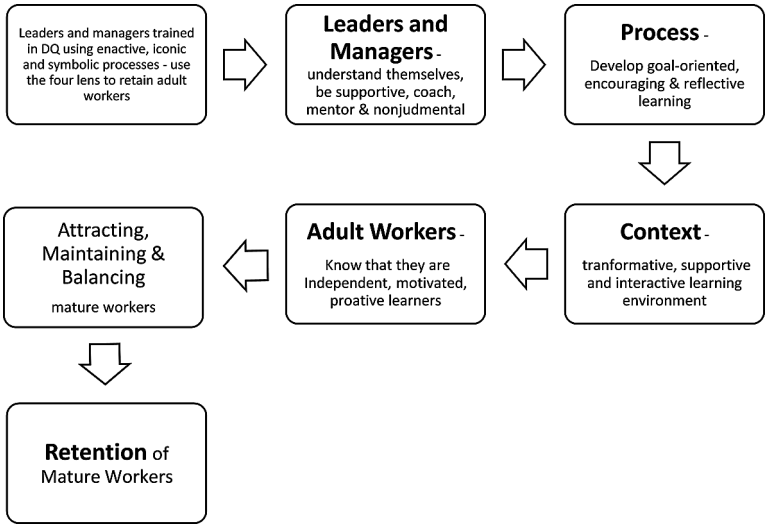
Figure 1. Framework to learn diversity intelligence



Four Lens Model Using DQ for Effective Development and Retention of Mature Workers

After leaders and managers are trained in DQ, they will be better able to supervise and develop mature learners. Figure 2 framework highlights how DQ leaders and managers can supervise and develop mature workers leading to their retention. The Kiely et al (2004) four lens model was used to devise the framework which incorporated the salient findings from the review of the literature on adult learning.

Figure 2. Framework on supervising and developing a mature workforce



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The literature review findings revealed the elements that must be included in supervision programs for them to be beneficial to the adult worker. Several elements must be included for successful and effective maintenance of adult learners. Some of the elements that were indicated to be included in management training programs are real life experiences of adult workers and interactive sessions with remediation. Leaders and managers should foster collaborative relationships between themselves and their workforce which embody acceptance, respect, and support. Leaders and managers must involve the mature workers in management processes by providing direct goals, specific feedback, and encouraging reflection and dialogue. Other elements that are essential, for maintaining the mature worker, include creative and artistic modes of inquiry; mentorship and coaching relationship; and autonomous learning and negotiation. The findings are combined and presented in Table 1.

Table 1. Four lens model using DQ for effective development and retention of mature workers

Lens	Information That Leaders and Managers Need to Know to Develop and Retain Mature Workers	Diversity Intelligence (DQ) (Hughes, 2016)
Adult Workers	• Past experiences must be incorporated into the learning and supervision process • Are self-directed and do self-evaluation • Use past choices in decision making • Are independent, motivated, proactive with positive attitude • They are aware of needs • Need autonomous learning • Know what support is needed • Use emotion and intuition in rational decision making	• Knowledge of the federal government protected class laws • Intellectual capital • Broadened employees' thoughts and actions • Protected class group integration • Diversity knowledge applied to improve organization goals and efforts
Process	• The process should be more self-directed with minimal instructor-led • direct goals, specific feedback, • Include Discipline-based learning (DBL) involves critical reflective learning • Remediation should be provided to enhance basic knowledge • Include Problem-based learning (PBL) and workplace-based learning (WBL) which focus on developing competencies. • Support the learners needs • Use the Reinforcing model help adult learners with habitual patterns of perceiving, thinking, judging, feeling,	• Training and Education of DQ through in-house and external training systems and programs using proposed frameworks.
Leaders and Managers	• Should do regular self-reflection • Set mutual expectations by using intentional and explicit language • Be nonjudgmental in listening • Use Open questioning • Offer Interactive sessions • Engage in empathy with strength while maintaining rigor, evaluating critically, and being the holders of the relationship. • Use Coaching • Use Mentorship • Practice Mindful Pause • Monitor the relationship.	• Cognitive and behavioral perspectives • Willingness to change incorrect thoughts and actions • Diversity knowledge applied to improve organization goals and efforts • Dedicated time and effort to become diversity intelligent to lead all employees
Context	The environment should have a climate of: • Supportiveness, openness, respect and fun • Infuse collaborative model for transformative learning • Curriculum with real experiences • Adaptive model to potentially enhance learners' motivation for self-directed learning • Rational dialogue, creative and artistic modes of inquiry • Programs that address cognitive, affective-motivational, psychosocial problems • Offer tolerance, trust, communication and consensus	The workplace that is governed by federal laws.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

FUTURE RESEARCH DIRECTIONS

These proposed frameworks are but two examples of the potential ways to training leaders and managers in the use of DQ. The frameworks proposed in this chapter can be used to train and educate leaders and managers about DQ. Extensive evaluation of these frameworks are needed to ensure that the methods are applicable to today's adult learners as they seek to include their experiences in the workplace. Online training and learning are very prevalent today and can be tested to see how DQ can be effectively communicated to mature workers via technology.

CONCLUSION

An assessment of adult learning theories, training, and education can be used to integrate DQ into the proposed frameworks to enhance the performance of leaders and managers of mature workers in the workplace. As their performance improves, they are more apt to remain working within the organizations. Mature workers want to know that their work efforts are appreciated and valued. They often want to share their experiences for the betterment of their organization and their peers. Training leaders and managers in DQ will help them to help mature workers better interact with all employees and strengthen the organization.

KEY TERMS AND DEFINITIONS

Cultural Intelligence: The capability to relate and work effectively across cultures.

Discovery Learning: A method of inquiry-based instruction that allows learners to discover facts and relationships for themselves.

Diversity Intelligence: The capability of individuals to recognize the value of workplace diversity and to use this information to guide thinking and behavior.

Enactive: Acquiring knowledge through actions.

Iconic: Internalizing and enhancing knowledge by developing visual images to retain information.

Multicultural: Relating to several cultural or ethnic groups within a society.

Symbolic: Classifying, coding, organizing and storing the information and knowledge.

Talent Management: Organization's commitment to recruit, hire, retain, and develop the most capable and superior employees.

Chapter 19
Employee Wellbeing English Language Proficiency a Key to Knowledge Sharing and Social Interaction

Muhammad Khaleel
Universiti Sains Malaysia, Malaysia

Shankar Chelliah
Universiti Sains Malaysia, Malaysia

ABSTRACT

This chapter discusses the significance of employee wellbeing at the workplace and self-perceived English language proficiency as a predictor variable. The importance of employee wellbeing has been recognized all around the world. To generalize the findings of previous literature this study has examined the proposed model in the context of telecom MNCs in Pakistan. This chapter starts with what is wellbeing at the workplace? And moves towards it significance in the context of developed and underdeveloped countries. Further, this chapter explains the empirical findings of the proposed model. The results revealed a strong correlation between self-perceived English language proficiency and dimensions of employee wellbeing at the workplace. This is a very important chapter for both researchers and managers.

INTRODUCTION

The key objective in this chapter is highlighting the challenges of employee wellbeing at workplace in telecom MNCs in Pakistan. In the same time will also explore how human capital able affect MNCs to be successful in international business with the international market's environment, there is full of uncertainty impact that may affect the telecom sector's international performance, with comparing with example from other country. The last part of this chapter will be able to have clear idea how to handle human capital and outcome all challenges. The chapter enable manager and student to discover more

about Pakistani culture, value and firm behaviour. Over the last few decades, many changes have been taken place in the working environment. However, the most fundamental development is the increased psychological work load. The growing international competition and globalization that organizations are facing now days have compelled them to increase their interest in core elements of the organizational success such as human resource. That is why employees are the most valuable assets for their organizations. Employees who are not satisfied from their work or lives tend to decrease their job performance, job commitment, and devotion to their work and family. Numbers of studies have connected employees' well-being with: decline in turnover; high performance and improved physical health. Low level of employees' well-being adversely affects worker and their organizations; a clear identification of workers well-being predictors is needed in order to frame an effective theoretical framework for understanding employees' well-being at workplace. Constantly growing competition in the telecommunication industry in Pakistan has compelled the companies to focus on every aspect that contributes in the success of the company. For instance, human capital plays important role for the organizations. Therefore, it is important for the telecom MNCs operating in Pakistan to be aware of the psychological demands of their human capital. This chapter tries to extend the knowledge on employee wellbeing and English language proficiency by including empirical studies from telecom sector of Pakistan.

BACKGROUND: EMPLOYEE WELLBEING AT WORKPLACE

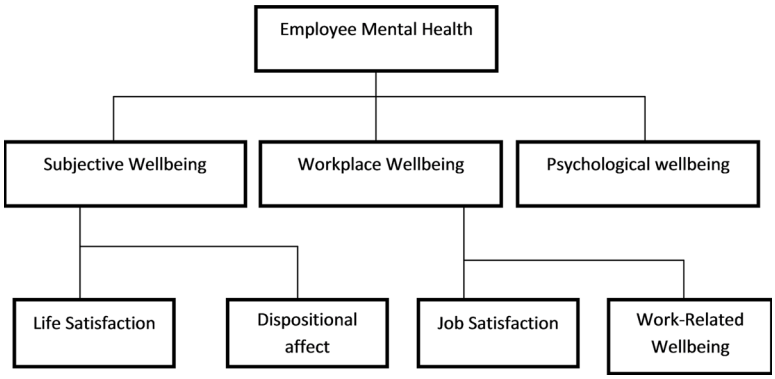
Employees' well-being is also an important constituent for an employee to make decision for his future in the organization. Thus, there is extensive amount of evidence to point out the correlation between employees' well-being and performance. Meanwhile, importance of employees' well-being is also noticed by the policy makers in Pakistan. They have highlighted the importance of employees' well-being by ensuring the welfare of the worker, job security and good working conditions as key element in the Fifth Labor Policy, 2010. It is argued that environments should be created in a way, in which employees and employers are dedicated in enhancing the labor productivity (Fifth Labor Policy, 2010).

Definition

The term employee well-being refers to *"the mental and physical health of the workers"* (Currie, 2001; Eatough, 2013). Which means that employee should be working in such environment where he feels safe both physically and mentally. Mental health refers to the presence of wellness rather than the absence of illness. Well-being is a broader topic that covers so many organizational and workplace factors. Page and Vella-Brodrick (2009) operationalizes employee wellbeing and covers all the aspects of employee's wellbeing including psychological wellbeing, subjective wellbeing and wellbeing at workplace. Figure below explains the idea of Page and Vella-Brodrick. As shown in Figure 1.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Model of Employee Mental Health



SIGNIFICANCE OF EMPLOYEE WELLBEING AT WORKPLACE

This chapter on employee wellbeing at workplace will promote:

- The health and safety of work, working methods and the work environment.
- Employees' physical, psychological and social well-being.
- The meaningfulness of work.
- Healthy and safe ways of organizing work.
- Risk assessment and management.
- The control of exposure, strain and stress.
- The development of occupational health care and rehabilitation.
- The balance between work and leisure.
- The role of occupational health and safety at work as a productive factor, and its role in business.
- Information and influencing attitudes.
- The impact of work as a health-promoting factor.
- The dissemination of good practices.

GLOBAL OVERVIEW OF EMPLOYEE WELLBEING AT WORKPLACE

The topic of employee wellbeing at workplace has been under discussion since many decades. Number of authors and managers have emphasized on employees' wellbeing and related it to the world's economy. It is represented by the topic and the study included in this chapter is based on the employees working in developing country like Pakistan. It is needed over here to discuss the global perspective of employees' wellbeing at workplace. As discussed earlier, human capital is the backbone of business organizations and wellness of employees is favorable for both business and the employees themselves. Starting from the developed countries, HR departments have mainly focused on the development of healthy labor including front line employees to top management. Not only the companies themselves, Government have also put emphasize on the companies to recruit and maintain the healthy staff. For example, The Ministry of Social Affairs and Health (Finland) has started a Forum for well-being at work in order to

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

expand co-operation in the promotion of wellbeing at workplace. The Forum provides a natural and reliable foundation for extensive co-operation by all actors. Social partners, insurance and research organizations, and ministries are all represented in the steering group of the forum. It provides a platform to which these and other organizations can bring their ideas and proposals and promote new initiatives.

MAIN FOCUS OF THE CHAPTER

Employee Wellbeing at Workplace in the Context of Pakistan

Employees' well-being is also an important constituent for an employee to make decision for his future in the organization. Thus, there is extensive amount of evidence to point out the correlation between employees' well-being and performance (Bryson & Stokes, 2014). Meanwhile, importance of employees' well-being is also noticed by the policy makers in Pakistan. They have highlighted the importance of employees' well-being by ensuring the welfare of the worker, job security and good working conditions as key element in the Fifth Labor Policy, 2010. It is argued that environments should be created in a way, in which employees and employers are dedicated in enhancing the labor productivity (Fifth Labor Policy, 2010) . But even after five years, desired goals set by the fifth labor policy and favorable conditions for the workers are not achieved. Decrease in the well-being of the employees directly and indirectly effect the performance of the organization. Evidences shows that due to less productivity and profitability, multi-national telecommunication companies are pulling out their business from Pakistan. It is needed to maintain the well-being of the existing employees through well-organized strategies to overcome such organizational hazards. Therefore, this study provides the predictors of workers well-being that helps in making well planned strategies to overcome the situation if the employees' well-being is low.

Dimensions of Employee Wellbeing at Workplace

Employee wellbeing at workplace is a broader topic; many scientists have worked on this particular construct using different dimensions based on the context and theories. There are no empirically proved common dimensions of employee wellbeing at workplace. For example studies from 1998-2016 authors have conceptualized the construct wellbeing with different dimensions whereas job satisfaction is considered as most common dimension of employee wellbeing at workplace. As shown in Table 1.

Warr (1990) has conceptualized employee wellbeing at three axis as shown in the figure 2 below. This chapter has utilized Warr's (1990) model as a basic foundation in understanding employees' well-being at work. This model operationalizes employees' well-being at work as it comprises of three main axis pleasure - displeasure, depression – enthusiasm and anxiety – comfort. Warr's model provides a comprehensive over view of employees' well-being at workplace, including job satisfaction as a key element of employees' well-being at work (Sparr & Sonnentag, 2008). His model includes cognitive and affective judgments of the individuals that show the overall employees' well-being at work appropriately to the aims of this study investigation.

Four dimensions have been extracted based on the model and prior studies. Job satisfaction from pleased-dis pleased, job depression from enthusiastic-depressed, job anxiety from anxious-contented and turnover intention is selected as it is behavioral outcome of negative effects at the workplace.

Job Satisfaction

Job satisfaction of the individual has both intrinsic and extrinsic aspects. The intrinsic components are work with colleagues, task accomplishment, educational opportunities, social support and personal need of recognition. The extrinsic aspects include promotion and salary given by the organization.

Spector (1997) has given the most comprehensive definition of the job satisfaction. He describes that job satisfaction is comprise of nine aspects: promotion, benefits provided, operating procedures and policies, pay, supervision, contingent rewards as a means of recognition and appreciation, dealing with coworkers, nature of the work, communication within the organization and nature of the work (Spector, 1997). As per those nine aspects, job satisfaction is considered strongly associated with individual and organizational outcomes.

Job satisfaction has influence on individual's life satisfaction. The researchers have examined three possible relationships between job satisfaction and life satisfaction: (1) spillover, where work life influence individuals non work life or vice versa; (2) Compensation, where dissatisfying job is compensated by looking for happiness in his or her non work life and vice versa; (3) segmentation, where job and life involvements are separated and have no concern with each other (Saari & Judge, 2004).

Klassen and Chiu (2010) have conducted a study on educators in which they have mentioned low level of self-efficacy produces high level of job stress and decreases the job satisfaction. Another study examining constant predictors of job stress, job satisfaction, and employee retention between New Zealand Customs Services workers also supported these factors and gathered that satisfied employees enjoy decision-making latitude or autonomy (Mansell, Brough, & Cole, 2006). There are number of factors of job satisfaction have been recognized in previous studies. They are job security, organizational reward systems, centralization, and power distribution, the need for achievement, job resources and self-esteem. Various studies have observed job satisfaction along with other variables, therefore job satisfaction is normally considered as critical outcomes construct. Job satisfaction has a negative relation with absenteeism, and has a positive relation with productivity. For that reason, it is very effective to know which job provisions and characteristics raise job satisfaction.

Studies showed that job satisfaction produces high consumer satisfaction and decreases hiring and training costs. Fleet Boston Financial Corp. assessed in 1999 that only 1% increase in employee commitment could produce $11 million a year and reduce over expense for hiring and training up to $15 million to $19 million a year (Costanzo, 2003). In past few decades, researchers have found various variables that contribute to job satisfaction. Glisson and Durick (1988) roughly organized thee variables in to three groups: (1) variables that explain characteristics of the organizations; (2) variable that explain characteristics of the task; (3) variables that explain characteristics of the worker.

In determining the job satisfaction and evaluating the level of satisfaction of the individuals, three different approaches are proposed. First approach explains the job characteristic and known as "Information Processing Model" (Hackman & Oldham, 1976). As per this model, individual gather the information related to their work place and task and by these elements, they perceive their job satisfaction (Jex, 2002).Second approach explains that job satisfaction depend on the mood or characteristics of the individuals. These moods and characteristics of the individuals are generally associated with genetic heritage or experience or on both. Third approach explains that the evaluation of job satisfaction based on "Social Information"- how other thinks about the workplace. This approach is called "social information processing model".

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Job satisfaction has been distinguished as an important predictor of critical work outcome thereby researcher's interest in this variable is higher than any other. Highly motivated, loyal and satisfied workforce is the element of success for the organizations to compete in the corporate world. Job satisfaction is a key component in maintaining high performance and efficiency of the work which directly influences the productivity of the organization. In order to increase the job satisfaction of the individuals, they should be trusted and provided with autonomy to their concerned departments. Leaders from successful organizations understand that to create positive work environment employee's job satisfaction have a great importance.

EMPLOYEES' TURN OVER INTENTIONS

Job satisfaction have significant role in turnover of the employee and is main factor in most of the turnover models (Farooq & Farooq, 2014; Naumann, 1993). Turnover of the employee is among great interesting topics for organizations, professional and researchers in the discipline of economics, management and organization behaviors (Chan & Mai, 2015; Koh & Goh, 1995). Tett and Meyer (1993) have defined turnover intention as the deliberate readiness to leave an organization. Most of the studies showed, that turnover intention is developed as dissatisfaction of; (1) individual from organization; (2) organization from individual. Turnover intention develops when an employee interested to leave his current job, based on his own desire (Khatri, Budhwar, & Fern, 1999). No matter the size of organization, turnover intention is the main concern for every organization. However part time working industries such as hotels and fast food does not have issue with turnover intention (Cascio, 2006).

Turnover intention is considered as an element of determining actual turnover. Turnover theory develops from attitude – behavior theory by supposing intention to carry out certain behavior defines that behavior. Intentions to leave the organization show the level of dissatisfaction from the current job. Generally, people believe that if someone gets dissatisfied from his job he or she starts finding alternatives, compare the other options with their job and then use the decision power to quit or not to quit (Chan & Mai, 2015).

There is a strong relationship between turnover intention and turnover (Udo, Guimãrães, & Igbaria, 1997). Researchers recommended studying turnover intention instead of actual turnover as it is difficult to calculate the actual turnover (McBey & Karakowsky, 2001). It is likely to ask individuals regarding to their intention to leave than to find and ask individuals on their actual turnover by longitudinal study. Turnover intensions have relationship between commitment, job dissatisfaction and work- life conflict. The significance of studying intentional turnover is based on several organizational consequences that are financial, reputational, loss of customer and scheduling difficulties (Lee, et al., 2004; Mishra & Morrissey, 1990). High rates of turnover intentions provide alarming situation to organizations so they can discourage intentions to leave organization by providing training and compensation to the employees (Wong, et al., 2001). There is no specific reason or goal for the turnover and turnover intention (Percy & Kostere, 2006).

Those employees who want to leave can be costly to the organization. Halpern (2005) in his study found that individuals whom intention is to leave the organization reduce their efficiency prior to quitting. The cost incurred due to turnover can be high containing cost of temporary help or overtime to complete certain project, loss of productivity, sign-on bonuses, time spent in orientation, lost business and hiring costs. Hom, Caranikas-Walker, Prussia, and Griffeth (1992) distributed the cost incurred

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

due to turnover in to three categories: cost of separation, cost of replacement and cost of training. Cost of separation includes paper work and leaving interview; cost of replacement comprises of filling the vacancy by new candidate; cost of training includes training of newly hired candidate.

Turnover is a problem for the organizations but not all turnovers are problem for the organizations. If low performers leave the organization, it is in the beneficial of the organization. As the main concern is to retain the high performing workers. Previous studies recommend that one way to retain and reduce intentional turnover is to offer individual for work life balanced practices. Offering reduced hours, flexible scheduling and onsite daycare are important in reducing turnover.

To be successful in today's era of high competition, the retention of skilled and competent employees are significant for the organizations (Shah et al., 2011). Keeping the high quality skilled employees are more important today than ever before (Holtom, et al., 2008). Without valuable workers, a business cannot be successful and prosper. Every individual has its own importance and share in achievement of the goals, elimination of one individual makes difficult to achieve the desired results. Retaining the workers is the key target for the organization because sometimes high salaries and designations cannot successfully retain the employees that is, what happening in the telecom industry of Pakistan (Shoaib, et al., 2009).

JOB DEPRESSION

In clinical settings depression is defined as a period of intense, often continuous feeling of hopelessness and sadness followed by somatic and cognitive symptoms that usually require treatment (Wells & Sturm, 1995). There are various clinical and non-clinical symptoms of depression. Usually depression affects the way one eats and sleeps, the way a person perceive about things and the way a person thinks about himself (Shani & Pizam, 2009). According to Nolen-Hoeksema and Girgus (1994) most common symptoms of depression are lessen interest in daily activities, depressive moods, feelings of worthlessness, significant increase or decrease in weight, fatigue, sleep problems, and loss of energy, indecisiveness, less focus, and suicidal thoughts and in extreme case suicidal attempts.

Job related depression is defined as intense feelings and depressive moods originated from work environment. Work related depression produces serious economic consequences for the organization. US faces $23 billion loss due to depressed work force. The direct costs of depression comprises of primary care, hospitalization, pharmaceuticals, outpatient care and rehabilitation. Still, the major financial loss due to depression stems from indirect costs, which include loss of productivity and absenteeism.

Sometimes outcomes of work related depressions are not directly observed. With the increase in competition around the world organizations are focusing on creative and innovative workforce. Dunnagan, Peterson, and Haynes (2001) argued that this creativity and innovativeness "can be stymied if the individual's mind is clouded with maladaptive stress, anger, and depression." The work environment itself is the common element in developing depression among employees. Zagorski (2007) associated several work environment aspects such as low level of social support within the workplace, increased psychological demands, high job strain and low employment security with the development of job related depression. One of the prominent cause of workplace depression is job related stress which develops from negative work climate, culture or both.

Most of the studies on depression have been conducted on clinical settings. Moreover it has also been studies in organizational settings but they are very few in numbers. For example Kahill (1988) and Maslach, Schaufeli, and Leiter (2001) in their studies have examined antecedents of workplace

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

depression, they found burnout, a state of physical, mental and emotional exhaustion and resulting from interpersonal and chronic emotional stressors on the job as the main predictors of job related depression. Warr (1990) and (Sparr & Sonnentag, 2008) in their studies have conceptualized job depression using depressed, gloomy and miserable situations at workplace and related it with the individual's wellbeing at workplace. Thus job depression is the key component of individual's wellbeing.

Shani and Pizam (2009) conducted a study on 151 hotel employees. The results of the study show that job burnout, work related stress are positively related to job depression whereas job satisfaction is negatively related to job depression. Similarly Wang et al. (2012) has also examined job depression by commencing study on 1436 employees, he found that effort reward imbalance, job strain and work family conflict are strongly associated with job related depression. In another study by Cho et al. (2008) shows that organizational injustice, job demands, inadequate social support and job control are the significant predictor of job depression. In line with Warr (1990) this study further examines job depression as a dimension of wellbeing at workplace.

JOB ANXIETY

Anxiety is part of everyday life. It is the provocation of inferiority feelings. Job Anxiety refers to a psychological state that arises when a person feels threat towards his job (Mishra & Yadav, 2013). Negative and positive responses are followed by the anxiety on the job. It can leads to the productive and motivated behavior of the employee. However, anxiety may also result in to harmful effects such as physical, psychological and emotional problems like heart diseases, infection, and depression(Jones, et al., 2011). Mishra and Yadav (2013) argued that job anxiety is an anxiety towards one's job, anxiety which is described as an extremely threatening sensation of danger. It is such a common trend in the world that almost everybody has experienced it at times, at least to a mild degree.

The workplace is an important part of individuals' lives and thus exerts a strong influence on general wellbeing and health. Muschalla, Heldmann, and Fay (2013) observed the significance of job-anxiety in workplace settings and found it related to the sickness and the absence from the workplace. Furthermore they collected response from 249 employees working in different organizations and distinguished between job anxiety and trait- anxiety. Also Muschalla and collegues (2013) suggested to researchers and practitioners to identify the difference among both forms of anxieties. Thus, work can be a source of potentially anxiety-provoking stimuli and because of its complexity different dimensions of anxiety can be provoked at work.

Most of the studies on job anxiety have been investigated in clinical studies. Whereas Warr (1990) has conceptualized job anxiety as dimension of wellbeing at workplace. Data from 1686 employees revealed that job anxiety is negatively related to occupational levels and positively related to work load and job uncertainty. There are various organizational factors that are influencing job anxiety in the workplace. For example Sowmya and Panchanatham (2014) examined job anxiety by conducting study on 100 public bank employees in Chennai. Results of the study showed that organizational politics is the predictor of job anxiety. De Jonge and Schaufeli (1998) studied Warr vitamin model using three dimensions of employee wellbeing at workplace (job satisfaction, job anxiety and emotional exhaustion) and job characteristics (Job demands, job autonomy and workplace social support). It was found in the study that job anxiety is negatively related to job characteristics.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

To the best of present study authors' knowledge whether and to what degree job-anxiety occurs in a non-clinical working population, and whether job-anxiety is influenced by the organizational factors. Similar to Sparr and Sonnentag (2008), the present study examines job anxiety with the organizational factors as one of the dimension of employee wellbeing at workplace.

PREDICTORS OF EMPLOYEE WELLBEING AT WORKPLACE

Various studies have examined various predictors of employee wellbeing at workplace. These predictors are both from positive stand points and negative stand points. For example Ibrahim (2012) has conducted a study on Malaysian manufacturing company employees and considered organizational justice as a predictor of employee wellbeing at workplace. Results from the study showed that if there is high justice in the organization employee's wellbeing at workplace will be also high. Similarly other scientist has chosen trust, organizational support, workplace deviance, workplace flexibility, leadership styles and etc. as strong predictors of employee wellbeing at workplace. In this chapter the main focus of the study is on employees' wellbeing in telecom MNCs in Pakistan. MNCs are facing global challenges due to various challenges and on the top of those challenges is demographic issue. Pakistan is a country where different cultures are combined together. MNCs who are interested to do their business in Pakistan face many demographic challenges. Language is one of the most common issues that are faced by MNCs. Now a days 4 telecom MNCs are operating in Pakistan. These companies have been working since 10 years and even after high competition in the market these companies reaches the revenue of more than 500 billion. It is because of managing all the issues faced by these MNCs. This chapter discusses the role of English language proficiency on employee wellbeing at workplace.

SELF-PERCEIVED ENGLISH LANGUAGE PROFICIENCY

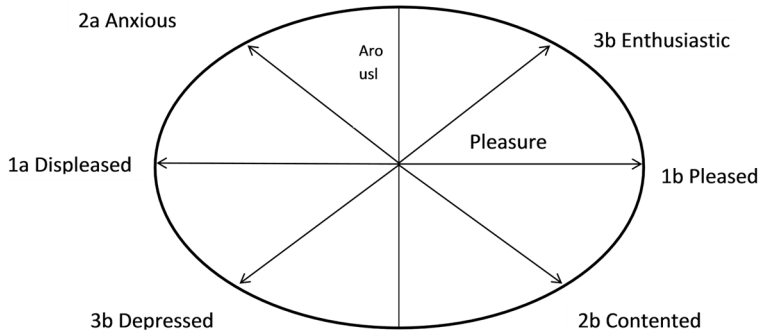
Globalization and increased level of a firm's involvement in exchanging goods and commodities, information, finance, and personnel across national borders (Rugman & Verbeke, 2004), creates challenges for its employees. One such challenge is an increased use of a foreign language at work (Marschan-Piekkari, Welch, & Welch, 1999). Adopting a foreign language in an environment where this language is not the native language of the majority of the local people and where the local language is the predominant. In such an environment, the levels of foreign-language proficiency by employees tend to vary increasingly, which becomes an obstacle for interpersonal communication and may affect an individuals' task performance (Fredriksson, Barner-Rasmussen, & Piekkari, 2006; Harzing & Pudelko, 2013).

Language is considered as the most common aspect to categorize the group of people than any other acquired characteristic in the people and hence considered as a powerful sign for identity of individual (Linguists Giles & Johnson, 1981). Keeping in the view of Linguists and Johnson (1981), a French author said *"In the universal process of cultural homogenization, the role of language will remain intact as a key cultural differentiator, while other sources of cultural differentiation will progressively disappear."* (Usunier, 1998). According to Anxiety and Uncertainty Management theory (1995), interpersonal interaction is positively associated with the language capability and increases the propensity to over-estimate the significance of group members on the behaviors (Gudykunst, 1995). Gudykunst (1995) also argued that uncertainty in the relationship leads to negative consequences in the relationship between people.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

English is the de facto global language (Crystal, 2003) and it is often recognized as the global business language for firms involved in international business (Crystal, 2003; Harzing & Pudelko, 2013). There is significant pressure and motivation for employees who speak English as a foreign language to improve their English language proficiency. Indeed, a number of studies (e.g., Harzing et al., 2011; Neeley et al., 2012) have reported negative emotional responses by non-native English speakers toward their English native colleagues' sense of superiority and their complacency for learning foreign languages. Harzing and Pudelko (2013) developed a model proposing the competency of English language in multinational subsidiaries around the world. In his model he has distributed the regions on the basis of language speaking in the subsidiaries as shown in the figure below. Asian countries have less English speaking labor and are characterized in to low English speaking zone. Multinational organizations in this region usually operate in the local language (Harzing & Pudelko, 2013). See the Figure 3 below.

Figure 2. Warr's Vitamins Model



Among the educated individuals in Pakistan, only one out of 10 can read write and speak English proficiently remain 90% cannot even speak or write 2 sentences of correct English (Dar, 2013). In such environment where individuals are not proficient in English tends to misunderstand the information provided to them in English. Present study explores the effect of English language in the employees working in telecommunication industry in Pakistan.

Based on self-efficacy theory, the self-perceived English-language proficiency of employees who speak English as a foreign language influence their commitment to their organization. Self-efficacy is essentially about a person's confidence in their ability to achieve a goal in a given circumstance (Bandura, 1977, 1982). Self-efficacy is known as a buffer for adverse conditions at work and it is an important predictor of the attitudes of employees to their jobs (e.g., (Saks, 1995) including turnover intention and job satisfaction (Tojjari, et al., 2013; Troutman, et al., 2011).

Applied linguistics research on foreign language acquisition suggests that self-perceived foreign-language proficiency influences a person's confidence in coping with an environment in which the foreign language is used. For instance, recent empirical studies has suggested that the higher a person's self-perceived foreign-language proficiency, the less anxious he or she becomes when communicating in this language (Dewaele, et al., 2008). Therefore, employees who are proficient in speaking English as a foreign language may be more committed to their organizations.

Language is considered as most significant way of communication as (Charles, 2007) said: "only language can enable individuals and companies (and countries) to communicate". Now days multinational companies are using not only local languages but also single corporate language to communicate with the headquarters, subsidiaries and other stakeholders in information sharing (Feely & Harzing, 2003; Lauring & Selmer, 2010). However all employees are not capable to speak the corporate language effectively, which lead individual to avoid to communicate in the organization. Different authors have explained language barrier as obstacle in effective communication (Tenzer, et al., 2013). Impediments in communication also depend on the language differences. Jablin (1987) have anticipated communication factor as antecedents of several individual responses in the organization (i.e. job satisfaction and organizational commitment). Communication avoidance is topic of interest by numerous researchers in psychology and communication literature. Communication avoidance can be defined as unwilling to verbally communicate with other people (McCroskey, et al., 1985). Communication is also antecedent of job satisfaction and turnover intention. There is direct and indirect relationship between the communication, job satisfaction and turnover (Mohamad, 2008).

SELF-PERCEIVED LANGUAGE PROFICIENCY AND EMPLOYEE WELLBEING AT WORK

English language proficiency is referred as the competencies in general English and professional English (Xu & Du-Babcock, 2012). Barner-Rasmussen and Aarnio (2011) in his study mentioned that lack of language proficiency leads to negative consequences in the organization such as low density of communication, lack of information sharing and trustworthiness. Therefore presence of English language proficiency in individual working in the multinational organization in Asian countries (such as Pakistan) leads to effective communication, proper information sharing and trustworthiness. For example Jablin (1987) in his study showed that communication is antecedent of job satisfaction and organizational commitment.

As discussed earlier language differences produce negative consequences in the organization such as isolation and disconnection of the subsidiary manager with the head quarter (Björkman & Piekkari, 2009). Since there are very few reports available on English language proficiency, this study explores whether this is issue in organizational settings. Language proficiency is part of effective organizational communication system. So the presence of self- perceived English language proficiency may influence employee well-being at workplace.

English language is highlighted as an issue in multinational organizations in Asian countries (Harzing & Pudelko, 2013). Procedures defined to the employee working in multinational organizations in Pakistan are in English. Individuals, who have good expertise in English, understand the procedures more effectively than those who have less proficiency in English. Individuals who can effectively speak foreign language influence their commitment to their organization (Yamao & Sekiguchi, 2015). Furthermore a recent study conducted by Shafaei and Razak (2016) revealed positive relationship between psychological wellbeing and self-perceived English language proficiency Therefore presence of high perceived English language proficiency produces positive consequences in the organization. Hence based on prior studies this chapter explores the relationship between self-perceived English language proficiency and employee wellbeing at work.

WHAT IS ROLE OF SELF-PERCEIVED ENGLISH LANGUAGE PROFICIENCY ON EMPLOYEE WELLBEING AT WORKPLACE IN TELECOM MNCS IN PAKISTAN?

To test the role of self-perceived English Language in Pakistan, a quantitative survey based study was conducted. Managers working in telecom MNCs were selected as the respondents of the study. The results from the study revealed that self-perceived English language Proficiency is significantly related to employee wellbeing at workplace.

A total 300 survey questionnaires was distributed to the respondents and 240 questionnaires were returned. Only 5 out of 240 questionnaires were unusable. The final usable questionnaires were 235 with a response rate of 78.3%. most of the respondents of the study were male participants 68.5% whereas female participants were consisted of 31.5% out of overall total respondents of 235. Majority of the respondents fall under the age range between 26 to 30 years old 42.1%. Respondents at the age of 25 and less years old were 20.4% followed by the age group of 31-35 years old 18.3%. Only 6.0% of the respondents were more than 41 years old. Further for the educational background, most of the respondents had degree 86.0% followed by the diploma holders 12.3%. There was no respondent under diploma level or form high school degree. In terms of respondents' organization, majority of the respondents were from Mobilink 35.7% followed by respondents working in Zong 32.3%. Respondents working in Telenor were 17.9% and the least were respondents working in Warid 14.0%. As per experience, majority of the respondents had 1 to 5 year experience 67.2%. Respondent with 6 to 10 year experience were 19.1% followed by the respondents with less than 1 year experience 7.2%. Only 1.3% of the respondents had more than 15 year of experience. With regard to organizational position, all of the respondents were managers.

PLS is generally used for the prediction, the goodness of theoretical model is acknowledged by the variance explained (R2) of the indigenous constructs and the substance of all the path estimates (Hair et al. 2014). After estimation of the path estimates in the structural model, a bootstrap analysis was used to measure the statistical significance of the path coefficient. Chin (1998) advocates 500 re-sampling when operating bootstrapping to estimate a parameter. Therefore, in this study the bootstrapping procedures with 500 re-sampling was used.

The bootstrapping results of the study revealed that all the direct hypothesis are supported in this study. Self-perceived English Language Proficiency is a significant predictor of employee's wellbeing at workplace. As shown in the Table 2.

Table 2. Hypothesis Testing

Hypothesis	Path	Std. Beta	Std. Error	t-value	Result
H1	Self-Perceived Language Proficiency -> Job Anxiety	-0.1713	0.0861	**1.9894**	**Supported**
H2	Self-Perceived Language Proficiency -> Job Depression	-0.055	0.0792	**1.6944**	**Supported**
H3	Self-Perceived Language Proficiency -> Job Satisfaction	0.3612	0.08	**4.5163**	**Supported**
H4	Self-Perceived Language Proficiency -> Turnover Intention	-0.1396	0.0738	**1.8921**	**Supported**

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Review of the literature suggests that self-perceived English language proficiency is a significant predictor of various job outcomes such as job commitment and psychological wellbeing (Yamao & Sekiguchi, 2015). In line with previous literature, it was found that there is a strong relationship between self-perceived English language proficiency and employee's wellbeing at work place (i.e., job satisfaction, turnover intention and job anxiety). English language proficiency is the key job prerequisite in most of the telecommunication companies because most of the verbal communication is processed in English language. Employees with high proficiency in English language are able to understand and communicate in English language leading to a positive job outcome such as job satisfaction, commitment and less anxiety. Also, employees who are proficient in English language understand their job roles and perform accordingly that makes them satisfied, less anxious and committed to their organization. See Figure 4.

Moreover, Yamao and Sekiguchi (2015) explained that self-perceived English language proficiency is one of the key components of an individual to survive in his organization by showing a strong commitment with his organization. The results of this study support the findings of Shafaei and Razak (2016). They have argued that individual's wellbeing at the job is correlated with self-perceived English language proficiency. Therefore, the findings of this study showed a strong correlation between self-perceived English language proficiency and wellbeing at workplace.

CONCLUSION AND RECOMMENDATION

Employees' wellbeing at workplace is critically significant for the organizations, to survive in highly competitive market. In connection with the point mentioned what organizations should do to enhance employee's wellbeing at workplace is limited in research. How to enhance employee's wellbeing at workplace must be a focus of the organization since it specifies organizational responsibility for workers' health. Furthermore, organizational efforts to enhance wellbeing at workplace will increase its reputation to use human capital for business operations. Though individual research effort was made to identify the predictors of employee's wellbeing at workplace, research based on these grounds is still limited in the developing countries such as Pakistan, particularly in telecommunication sectors. Thus, this study explored four dimensions of employee's wellbeing at workplace in telecommunication MNCs in the context of developing countries.

English language is not the first language in Pakistan, but the official communication in the multinational organizations in Pakistan is carried out in English. Individuals who are proficient in English language shows positive attitude towards their organization. That is why, this study has found that employees' perception of their English language skill has a key role in their job satisfaction, turnover intention and job anxiety.

KEY TERMS AND DEFINITIONS

Anxiety: Is an emotion characterized by an unpleasant state of inner turmoil, often accompanied by nervous behavior, such as pacing back and forth, somatic complaints, and rumination.

Comfort: (Or being comfortable) Is a sense of physical or psychological ease, often characterized as a lack of hardship.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Depression: Is a state of low mood and aversion to activity that can affect a person's thoughts, behavior, feelings, and sense of well-being.

Displeasure: Or pain in a broad sense, may be an experience of unpleasantness and aversion associated with the perception of harm or threat of harm in an individual.

Enthusiasm: Is intense enjoyment, interest, or approval. The word was originally used to refer to a person possessed by a god, or someone who exhibited intense piety.

Human Resource: Are the people who make up the workforce of an organization, business sector, or economy.

Turnover Intention: Is the act of replacing an employee with a new employee. Partings between organizations and employees may consist of termination, retirement, death, interagency transfers, and resignations.

Well-Being: Is a general term for the condition of an individual or group, for example their social, economic, psychological, spiritual or medical state; a high level of well-being means in some sense the individual or group's condition is positive, while low well-being is associated with negative happenings.

Chapter 20
Disruption in HR Through Inclusive Emotional Culture: Key to Sustainable Growth in Indian Businesses

Nitu Ghosh
https://orcid.org/0000-0002-5744-1670
REVA University, India

ABSTRACT

Diversity in workforce has demanded the need to develop inclusive culture that suffices the needs, interests, and emotions of all equally. High-performing organizations have incorporated emotions in their mission, creating an emotional culture that accentuates emotional intelligence of their talent force rather than suppression of emotions. The chapter explains how and why organizational cultures are transforming into inclusive emotional cultures. Through an analysis of cases of Indian multinationals, the antecedents and outcomes of Inclusive emotional culture is described through Inclusive Emotional Culture Framework model. Views of HR managers are expressed through content analysis qualitative technique. The chapter provides a key to sustainable development of Indian businesses amidst the doldrums of global business environment through inclusive emotional culture integrating values of long-term sustenance and development.

INTRODUCTION

Sustainability through inclusiveness, emotional intelligence capabilities and values- driven business processes are the main agendas of sustainable development in the twenty-first century. The present era has seen a revolution in the science of emotions and sustainability through emphasis on emotional culture and emotionalytics. Although there have been fast advancements in technology and digitization, yet organizations shifted focus from perfect rationality organisational culture to bounded rationality-oriented culture. Massive disruption in HR practices and composition of organisational culture has been characterising

organisations under the influence of global integration over the last two decades. Building an inclusive emotional culture has been the trend in the 21st century in order to achieve the goals of sustainability. It is not just the cognitive culture (shared intellectual values, norms, artefacts, and assumptions that serve as a guide for the group to think and behave), but importantly the emotional culture (the shared affective values, norms, artefacts, and assumptions indicating which emotions people have and display at work and which ones are been suppressed) that governs how innovative, team-oriented, customer-focused, or competent the employees are supposed to be (Barsade & O'Neil, 2016). Robust transitions in structure, culture and climate of business organisations has brought about shifts in demographic and psychographic trends of the workforce including their motives, emotions, expectations and work engagement levels.

Workplace dynamics constituting diversity in terms of gender, age, culture, emotions, innovative and motivational drives have called for a re-emphasise on aspects related to human capital management practices and crafting of an inclusive emotional culture, which caters to the needs of the highly diversified workforce. Inclusive culture that recognises, addresses and appreciates the emotions of every employee on an everyday basis can be instrumental in building engagement, leadership, ownership, innovation and high performance at every level of the organisation. High performing organizations such as Google, Apple, Coca Cola, PepsiCo, Southwest Airlines, HCL Technologies, Whole Foods Market, The Container Store, Zappos, Happiest Minds, Mahindra, Sap Labs India, Intuit India, Adobe India and many others have incorporated emotions in their mission statement. Some others like Cisco Finance, Ubiquity, C&S Wholesale Grocers, Camden Property Trust, Vail Resorts and many start-ups, emphasize the importance of fun to innovate and succeed. By doing so, they create an emotional culture that not only appreciate their emotions and feelings but enhances the Emotional intelligence of their talent force rather than suppressing.

A lot of disruption in HR practices has been happening in the new millennium in most organisations. To sustain, grow and remain competitive, it is crucial to retain talent force. However, the question arises, what exactly is the sustainable solution for talent acquisition, retention, high engagement and performance? Despite the hefty investments into HR strategies for accentuating employee satisfaction, commitment and productivity, engagement levels across the United States' workforce have remained stagnant and those worldwide considerably low. Survey reports state that the United States witnesses $450 billion to $550 billion of lost productivity and labour turnover due to low satisfaction among employees every year (Head, ACC, & Freedman, 2014). Hence the question arises- Why are employees detached from their jobs, their bosses and each other? How can organizations re-design their HR practices so as to build high performance work teams and a culture of commitment? How is it that the Indian businesses are soaring high despite the global slowdown? What is the secret behind the sustainable growth of Indian businesses?

Shaver P. et al. (1987) found that people can reliably distinguish among 135 emotions. But understanding the most basic ones like-joy, love, anger, fear, sadness is the initial step for any leader to manage his team and build a positive emotional culture. Thus, the present chapter presents a detailed literature review on the concept of emotional culture, dimensions of emotional culture and how to build positive emotional culture. The constructs of emotional intelligence and emotional labour have been thoroughly dealt. Through case based and content analysis qualitative study, practices building a sustainable emotional culture in Indian organisations have been discussed.

India is the fastest growing economy with a GDP rate of 8.4 percent in 2018. According to the World Bank, India overtook China to become the fastest-growing major economy in the world as of 2015 (ET, 2015). The robust growth in India's economy, businesses, literacy rate, technology, research, socio-cultural factors and the demographic dividend has placed this country in an envious position on the world map.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

India's rise to power and speculations of 'soon to become superpower', has raised expectations about how it is going to change the global order. As per a report by Ernst and Young, India's workforce population is going to rise to an estimated 900 million level by 2020, while American population (third largest in the world) is just 160 million people (Chris Matthews, Oct 30, 2017). Hence, hopes and speculations are increasingly placing a lot of importance on the fast growth and sustainability of Indian businesses, industries, economy, and society. Researchers have started focussing on understanding the organisational practices, culture and ethos in Indian businesses that have enabled them to sustain in economic recession and growing throughout. This study plays a significant role in understanding the organisational culture and people management practices that focus on accentuating the workforce strength and making these businesses stronger over the long term.

WHY SUSTAINABILITY?

In 1987, United Nation's Brundtland Commission's report stated sustainable development to be "development that meets the needs of the present without compromising the ability of future generations to meet their own needs" (Brundtland Commission, 1987). Sustainability is a universal approach that is based on the three pillars of ecological, social and economic sustenance and growth, realizing the need to drive all the three together for lasting prosperity. In 2010, the Office of Sustainability at the University of Alberta proposed a more comprehensive view of sustainability that included the existence and role of people. The report defined Sustainability as "the process of living within the limits of available physical, natural and social resources in ways that allow the living systems in which humans are embedded to thrive in perpetuity" (Sustainability Summary Report and Recommendations, 2011). Sustainability is rather a value that is commonly shared by many individuals (of different types) and organizations who demonstrate this value in their policies, systems and culture.

Sustainable development of people, planet, prosperity, peace and partnership are the SDGs identified for universal development in the United Nations General Assembly with the 2030 Agenda for Sustainable Development (Wilkins, Hugh, 2008). Sustainability of economy, businesses and society revolves around effective diversity management, which has to be built on principles, embodied as pillars of an inclusive culture. Building on the principle of "leaving no one behind", the agenda puts impetus on a holistic approach to achieving sustainable development for all. Thus, sustainability in business also calls for equal opportunity, equal treatment, accessibility and development of people of all categories. In the polarised business world, sustainability and retaining talent force involves focus on inclusion and not diversity, which implies catering to the emotions, feelings, needs and interests of all types of individuals belonging to different genders, ethnicity, disabled, age, colour, special categories like LGBT (Lesbians Gay Bisexual, and Transgenders) etc. in the work groups. This definitely mandates sustainable HRM (Stefanie App, Marion Büttgen, 2016) and an inclusive organisational culture. To achieve the goals of sustainable development, transformations in individual behaviour patterns and decision-making processes is necessary. Cognition and emotions play decisive roles on sustainable behaviour (Kals & Maes, 2002).

The psychology of sustainability and sustainable development has recently become an upcoming field of research. It mainly emphasizes on the sustainability of interpersonal and intrapersonal competencies of individuals, groups and communities, including aspects of reflexivity, values, purpose, and progress for the sustainability of projects harmonizing the different perspectives (Di Fabio, & Kenny, 2018). The United Nations stated in its recent conference titled "Unlocking Your Emotions" in May 2019 that

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

emotional intelligence is a powerful tool to support the implementation of sustainable development goals. Daniel Goleman quoted while deliberating, "emotional intelligence skills are key to the jobs of the future and a better predictor of workplace success than IQ and other measures of intelligence" (Academic Impact UN Report, April 18, 2019). It was concluded that EI, mindfulness and nonviolent communication are effective tools that could be implemented to help achieve sustainable development and a more peaceful and prosperous world.

Sustainability in the business context describes the ability of the entity (brand, company, or management) to deliver on its promises consistently to all its stakeholders (customers, employees, government, public, etc.) at all levels over time for better employee outcomes (Backhaus, 2004). It can be perceived through different approaches as per various researches. Substance oriented approach towards sustainability emphasizes on the balance between the consumption and regeneration of its human resources for the survival of an organisation (Müller-Christ & Remer, 1999). For such a balance they focus on creating value for their potential and existing employees by investing on their long-term retention and utilisation (through effective health and safety benefits, socialisation, managing aged or special category workers, female employee friendly policies, competency development, culture of lifelong learning). Sustainable HRM facilitates organisations to achieve its goals of fulfilling the expectations of its employees and also to attract, acquire, retain high quality and satisfied workforce (Ehnert, 2009; Jabbour & Santos, 2008). Building and promoting the culture of sustainable HRM and being perceived as a psychological benefit by its users, is very crucial for an organisation to successfully operate, leveraging maximum potential of its committed and competent workforce. This is possible only when a working environment is nurtured that replicates a corresponding image of 'sustainability' in the minds of its employees (Stefanie App, Marion Büttgen, 2016).

IS INCLUSIVE CULTURE REQUIRED?

Inclusivity is the degree to which an employee (with individual differences) is accepted as an insider by the organisation and accepted in all work systems (Pelled, Ledford, & Mohrman, 1999). It is the sense of belongingness, ownership and equal participation in all work processes irrespective of differences (Lirio et al., 2008). The philosophy of 'inclusion' directs the group effort towards the term 'all' equally (April & Blass, 2010). The twenty first century has seen the transition of the discourse on diversity to the concept of inclusion (Nair & Vohra, 2015) with a purpose to create a culture that perceives, appreciates, manages and utilises each person's emotions, values, beliefs, cognitions in a manner that seems equitable to all. Inclusion is considered to be a process of change as well as an affective outcome or feeling of belongingness, respect, fairness etc. (Dobusch, 2014). Culture of Inclusion are mainly driven by perceptions of fairness, respect, value, equity and belonging (Nair & Vohra, 2015). Inclusion is required wherever diversity or differences exist. The polarised economy thus calls for inclusion in every aspect of social life, education and business processes.

Building a winning and sustainable culture is always a common vision and fruitful outcome (Smircich, 1983; Schein, 1985). A culture of inclusion depends on the level of individual differences perceived in the group and extent of mutual recognition demanded. 'Inclusion' is a word more important for sustainability than diversity. Organisations such as AT &T, Deloitte, HCL Technologies, Verizon and many other Fortune companies emphasized on hiring people with diversified backgrounds- skillsets, gender, race, ethnicity, minority, disadvantaged and ages. Focus of leadership, management policies and HR practices should

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

be to distribute the diversified workforce evenly and equitably across the company's divisions to create conducive and inclusive working culture, creating opportunities for all (Morais et al., 2014; Lundrigan et al., 2012; SHRM, 2009). Promoting an inclusive culture implies that respect is paid to the plurality of subcultures, and none are exempted from this ethical discourse. Each subculture is provided an equal opportunity to participate in shaping the cultural backbone in the organisation, which includes values, norms, policies etc (Pless & Maak, 2004). Thus, an inclusive culture is empowering, engaging and high performing as each one is heard and involved equitably in decision-making, problem-solving, innovation and moulding the organisational culture towards one that sustainably adds value to the company's performance (Pless & Maak, 2004). A culture of inclusion is said to exist when strategies, processes, systems, values and norms are based on diversified knowledge and perspectives of the overall group (Holvino, Ferdman, & Merrill-Sands, 2004). Open communication channels, diversity-based recruitment, training, promotion, compensation and career growth and planning practices that establishes an aura of 'working climate for one and all' constitutes the building blocks of an inclusive culture (Daya, 2014). The feeling of one-ness, respect, fairness, belongingness, tolerance, empathy and commitment results in creating psychological contract and engagement, which eventually leads to sustainable development of people, practices and organisations. No doubt, Inclusivity is essential to achieve the sustainability goals and also to create sustainable values and HRM practices in organisations.

As per a Deloitte report (2012), a workplace where just 10% more employees feel 'inclusive', the company would be able to increase work attendance by almost one day per year per employee. In addition to this, the business performance is higher in terms of people innovation, responsiveness, customer service and team collaboration. As per the monthly Labour review of the United States Bureau of Labour statistics (Dec. 2015), the projected workforce is expected to reach 163.8 million in 2024, would include more aged workforce, more women with a share of women in the workforce projected to be 47.2% in 2024, more educated employees (with technical qualifications), more Asians and Africans, with good representation from the minority LGBT group. The millennial workspaces of present and future, is thus characterised with more diversity, dynamism and soaring expectations, which can be sufficed through inclusive work culture with high emotional intelligence and practices that nurture positive emotions conducive for accentuated creativity and team performance.

Surveys have revealed that employee perceptions about inclusion in Indian workplaces accounted for 43 percent of team citizenship behaviour, which implies that focus on inclusion is essential to harness the potential of diversity (Prime & Salib, 2014). India being a highly diversified country with multicultural teams in its workplaces has been experimenting with a plethora of HR practices right from diversity-based recruitment to mentoring practices that bring in higher inclusivity in organisations. This has helped them to develop sustainable HRM practices and loyal workforce.

Inclusive work culture in Indian organisations have focussed on the core values of mutual respect, tolerance, spirit of integrity and harmony, collaboration, open communication, belongingness, trust and engaging. Emotions rather than cognition has been guiding most of the decisions regarding inclusive people practices in these organisations. Emotions are fundamentally important for sound moral development and healthy interpersonal relationship, which is invariably crucial in building a culture that fosters inclusion and recognizes differences. This has helped Indian industries to function more smoothly that its political environment and also to sustain the global economic recession. Godrej group is one such FMCG company that has brought about a turnaround in its business outcomes through its Diversity and Inclusivity (D&I) initiatives. With a strong belief that passionate, rounded individuals with diverse interests are better performers, they have institutionalised a culture and HR practices that encourage

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

employees to 'bring out their whole self and show their full potential at work'. Their health insurance benefits allow the members to add their 'partners' as a beneficiary not just their spouse, thus bringing in an open outlook in work culture too. Their regular diversity - sensitisation workshops across different geographical locations facilitates employees to share the common belief that integrating openness and inclusiveness begins with people and workplace.

EMOTIONAL CULTURE: A SUSTAINABLE HR SOLUTION

Emotions and feelings are a critical component of an inclusive culture and when that is met, much of the goals of inclusiveness is attained. Studies on Pennsylvania Railroad System employees (Hersey, 1932) and factory employees (Roethlisberger & Dickson, 1939) stated the importance of caring, affection, compassion, and tenderness, and the negative effects in the absence of these emotions, particularly in interpersonal relationships with foremen. As mutual recognition is usually facilitated through emotional recognition and solidarity (Honneth, 1994; Maak, 2006), thus emotional capabilities are critical in any interpersonal transaction. A study on an analysis of 25 common competencies stated that demand for social and emotional skills will grow across all industries by 26% in the United States and 22% in Europe, due to automation, between 2016 and 2030. Thus, companies should gear up to focus on developing emotional and social skills among their employees to help withstand changes, challenges, and progress (Jacques Bughin et al., 2018).

Emotions are crucial in social analysis as they play an impactful role in the process of socialization. Emotional culture is a regime or way of life that favours the perceiving, managing, controlling and utilising emotions of each and every member in an effective manner so as to achieve the overall purpose. It places importance on positive emotional expression, emotional management and satisfaction of desires. Organisational climate that implements HR practices nurturing emotions like joy, satisfaction, respect, trust, appreciation, achievement, compassion, pride etc is always high performing, creative and sustaining, rather than one with anger, frustration, fear and mistrust. Positive emotional culture constituting affection, pride, compassion, empathy, joy and gratitude foster supportive employee behaviours and organisational citizenship among employees. This invariably enhances employee commitment, motivation, engagement and retention. Symmetrical communication and responsive leadership builds a positive emotional culture in organisation (Linjuan Rita Men & Cen April Yue, 2019), therefore promoting sustainable HRM and people development. Thus, it is important to institutionalise an organisational culture that promotes the expression and sharing of positive emotions and does not coercively suppress negative emotions. Moods affects and discrete emotions (satisfaction, trust, joy, pride, anger, fear) have their own appraisal antecedents, subjective experiences, and action tendencies that direct people to respond to their existing situation. These emotions also have intrapersonal impact on the person experiencing them in terms of attention, motivation, creativity, information processing and judgment, and well-being, which drive impulsive or mature expressions as per the ability of the individuals to control them (Cynthia Fisher, 2019).

Alice Isen (1999) posited that a conducive emotional culture in the organization cultivates creativity, mental efficacy, making people efficient at comprehending and analysing information, adopting decision rules in judgmental problems, and in adopting flexible decision-making styles. As Daniel Goleman (2000) in his bestseller 'Working with Emotional Intelligence' explains,

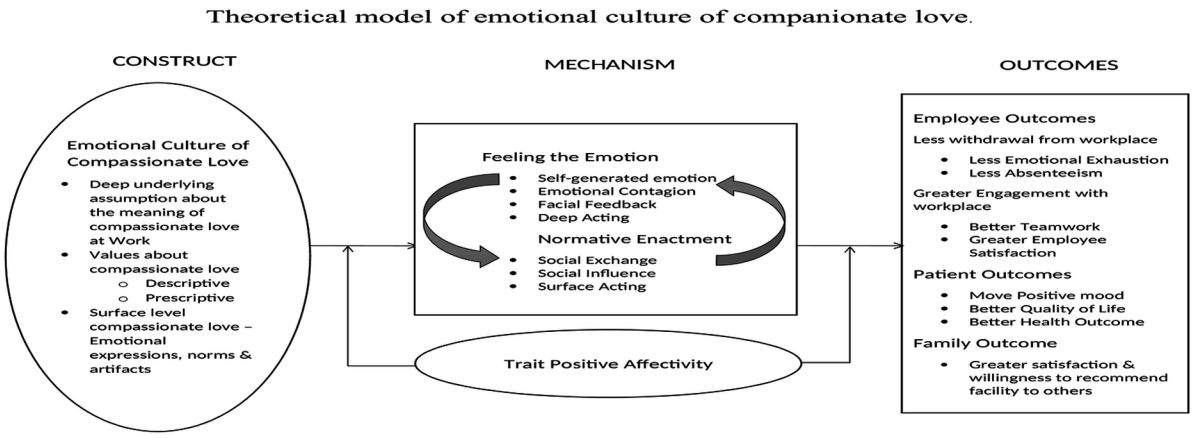
EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

If you see a star performing team, you're seeing a very high group IQ. But what predicts the actual productivity or effectiveness of a team is not the potential—that is, the best talents of every person—it is how people are valued on that team. It is how people feel there's harmony, that we get along, that we surface simmering issues, that we take time to celebrate, that we know each person's strengths and that we step aside when it is time for this person to come forward. In other words, that we are a team that has a high emotional intelligence.

Every job has its affective component and if that is not re-enforced due to weak emotional culture, the effectiveness on job performance declines. For example, healthcare jobs demand compassion and love over impatience and anger while security and investment jobs involve fearlessness over recklessness. Ripple effects of unexpected emotions expressed in workplace are immense and eventually lead to poor interpersonal relations between colleagues and boss, ineffective communication, role conflicts, underperformance, frustration, psychological contract breach, burnout and even high labour turnover. Organisational culture is usually a set of norms, beliefs, values and emotions integrative to the mission statement; and is also often enacted in the 'micro moments' of daily organizational life (Barsade & O'Neil, 2016). These constitute small gestures like acts of kindness, support, enjoyment or sense of achievement rather than bold declarations of feelings. Cultures that are weak in companionate love, expressions of affection, caring, or trust among employees, show indifference and callousness towards each other, due to low intensity and crystallization (Jackson, 1966; Barsade & O'Neil, 2014).

Figure 1 illustrates the variable of emotional culture of compassion, main mechanism involved in creating the emotional culture (through 'feeling the emotion' equivalent to emotional intelligence and emotional labour and through normative enactment) and the outcomes (in terms of employee outcomes and stakeholders' outcomes and better quality of work life and engagement of the employee) (Barsade & O'Neil, 2014).

Figure 1. Theoretical model of emotional culture of companionate love
Source: Barsade, Sigal, & A O ' Neill, Olivia. (2014).



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Various HR practices from hire to exit cycle, emotional modelling (managers consciously enacting expected emotions to display a 'feel good' factor), company interiors, workspace designing, posters, furniture, emotions tracking Apps, etc also makes up the organisational culture, reminding employees and management to adhere to such emotional requirements and help integrate inclusivity in work culture. For example, the Indian company, Religare Enterprises has recruitment and selection practices that assess candidates based on the emotional intelligence and other emotions demanded by their jobs, EI based training and 720-degree appraisal system that appraises employees based on emotions as an important criterion. Jubilant Organosys keeps EI of its employees on the priority list of competency development and routinely checks on the EI levels of its employees. HCL's excite-enthuse-engage HR policy is world famous in turning around the company and building an employee-first culture.

Thus, it is significant to note that every organization has an emotional culture, even if it's one of suppression (Barsade & O'Neil, 2016). Organisations are rapidly moving towards a culture that nurtures its employees' emotions, directs them towards positive emotions, beliefs, values, common vision and utilises those emotions in driving their job motivation, psychological contract and workplace behaviour. Global companies are adopting HR practices to continually develop the emotional competencies of their employees and keep them emotionally connected through an integrated inclusive emotional culture that caters to the needs and interests of diversified workforce. Researches posit that emotional culture influences employee satisfaction, burnout, teamwork, and even hard measures such as financial performance and absenteeism (Barsade, & O'Neill, 2016).

Disruption is happening in the HR space in building an emotionally sustainable culture. Some have included emotions in their mission statement, management principles and organization culture, eg- Coca Cola, PepsiCo, Tata Group, Whole Foods Market, and Zappos have listed 'love' or 'caring' among their corporate values. Emotional artificial intelligence technologies, EI tracking apps and emotionalytics are adopted in work culture to track and measure the moods and emotions of employees on a frequent basis. Training programs and performance appraisals integrating EI and engagement into their system is a regular practice in most organizations. Infosys, Indian Railways, Entropik tech, Tata sky and many millennial organizations are now moving ahead to develop a much stronger emotional culture by fostering the EI of their employees, providing an engaging experience for higher talent retention and performance outcomes.

DIMENSIONS OF EMOTIONAL CULTURE

Emotional Intelligence

Emotions play a pivotal role in almost all actions. People who are able to manage emotions are the best performers and leaders. About seventy five percent of an organization's success can be attributed to the emotional intelligence of its employees. Emotions are the drivers of motivation and attention; identify and facilitate change management, and influence behaviour and actions (Fredrickson, 2001). Emotions have been found to be determining factor in developing the ability of resilience and capacitate people to cope with challenges proactively, build new vision, enhance one's competencies and connect with others for effective teamwork (Fredrickson, 2001; Fredrickson & Branigan, 2005). Emotional Intelligence is an individual's capability to perceive, understand, control and manage emotions of oneself and others leading to better personal effectiveness, interpersonal relationships and social behaviour (Salovey and Mayer, 1990). Emotional culture emphasizes on practising of certain emotions by ensuring the devel-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

opment of high EI (or EQ) and expressing expected emotional labour display acts. EI is defined as an array of noncognitive capabilities, competencies, and skills like intrapersonal skills, interpersonal skills, adaptability, stress management skills and general moods that influence one's ability to succeed in coping with environmental demands and pressures (Bar-On, 1997, p. 14). It is a decisive factor in success of those individuals possessing higher levels of EQ (Bar-On, 1997). The importance of EI at work cannot be understated, as it has been found to influence leadership abilities by facilitating an effective handling of emotions, better ways of handling the needs of colleagues, and motivating them, thus making them feel contended and accomplished at work (Goleman, 1998).

EI has been stated to be a wide constellation of emotion-related self-perceptions and dispositions about self and others, assessed through self-report (Petrides & Furnham, 2003, p. 40). Studies conducted on managers' performance behaviours under two dimensions: "what they accomplish" and "how they accomplish it" through MSCEIT clearly illustrated that EI plays a more significant role in how managers do their work (leadership abilities) rather than in what they accomplish (Rosete, 2005, 2009). Emotions stimulate interest, focus attention, indicate the need for transformations, and direct people to appropriate actions (Fredrickson, 2001). They influence the way people show resilience and cope with challenges, define new goals and means to reach the ends, learn new competencies, build relationships and yield higher outcomes with the support from others (Fredrickson, 2001; Fredrickson & Branigan, 2005). Occupational self-efficacy and commitment is also found to be higher in individuals with increased EI (Rathi & Rastogi, 2009). Extant researches assert that emotional intelligence involves the capacity to reason accurately with emotions and emotional information, and about one's and others' emotions to enhance thoughts, decisions and actions (Mayer, Salovey, Caruso, & Cherkasskiy, 2011).

Therefore, building an emotional culture, where people are encouraged to sustainably develop their emotional capabilities and EI, while also contagiously pursuing positive emotional (beliefs/values) norms, becomes a more fulfilling, enthusing and engaging place to work. Much of the objectives of sustainable HRM and sustainable development of organisations are accomplished through building a high EI inclusive emotional culture. As the 21st century witnesses the transformation of business enterprises to social enterprises with the fast-changing expectations of the millennial workforce, the emotional competencies of organizational leaders are the crucial decisive factors in accomplishing organizational mission and goals, besides building an engaged and valued workplace for all (Barthwal & Som, 2012). Indian companies like ITC, Indian Railways, Whirlpool, GE, Gillette, Jubilant Organosys, Infosys, Coco Cola India, Hay Group India, Pepsico are few of the Indian companies that have realized the need for ongoing EI assessment and training to reap higher ROI in the longer term. Thus, emotional culture is not only defined by the emotions expressed and followed by all, but also the EI of its employees.

Emotional Labour

Impulse is the medium of emotions, seed of all impulse is a feeling bursting to express (Daniel Goleman, 1998). Excessive expression of positive or negative emotions (such as excitement, joy, anger, frustration, etc.) causes an adverse effect on the interpersonal environment, which should be invariably controlled for better performance. Hochschild (1983) introduced a breakthrough concept in organisational psychology called 'emotional labour' in 'The Managed Heart- Commercialization of Human Feeling'. Emotional labour (EL) has been defined as the "the management of feelings to create a publicly observable facial and bodily display" (Hochschild, 2003, p. 7).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Most of the jobs today involve interpersonal interactions for business development especially the service sector jobs that have certain expected norms and standards for display of emotions to their stakeholders. EL is crucial in this context, when most jobs call for a capability to deal with people rather than with machines, for more interpersonal skills and behavioural transactions and fewer mechanical skills (Hochschild, 2003, p. 9). Service employees like educators (Meier et al., 2006), restaurant employees (Hallett, 2003) etc. are required to manage their own emotions in order to manage the emotions of customers (Leidner, 1999) for better work environment, goodwill and high performance. Hence, in order to perform better and fulfil organizational expectations, employees in service organizations frequently regulate and manage their emotions, a process generally called Emotional Labour (Hochschild, 1983; Grandey, 2000). Employees usually resort to four types of emotional labour displays – deep acting, surface acting, genuinely expressed emotions and suppression. During this process of emotional labour and stress, they often develop some negative emotions that contradicts with the organizationally desired emotional display, leading to dissonance, suppression, intrapersonal as well as interpersonal conflict and performance deterioration. This may lead to behavioural and decision-making issues in the employee and may lead to adverse results in terms of employee and organizational performance.

Gosserand and Diefendorff (2005) defined Emotional labor (EL) as the process of regulating one's emotional displays in response to work display rules so that goals can be achieved. The main objective of having pre-determined display rules is to dictate the emotions that employees are supposed to express in order to facilitate the attainment of work goals. (Zapf et. al, 1999) prescribed a high amount of empathy and emotional involvement in order to avoid treating other people like objects in difficult interpersonal situations (specially with clients, customers, subordinates and children). For example – service employees in hospitality sectors like in Café Coffee day, Pizza Hut etc are trained and reminded through smileys, posters and their own work display rules that despite any challenges they always need to smile and be polite. This owes to a great extent in determining the inclusive emotional culture of the organisation.

EL facilitates task effectiveness and self-expressions and is often the major cause for customer dissatisfactions and performance issues at workplace (Ashforth & Humphrey, 1993). Thus, managing EL is an important strategy for building an emotional culture and manage inclusivity. There are usually two perspectives of emotional labour as predictors of burnout and employee ineffectiveness: job-focused emotional labour and employee- focused emotional labour (Brotheridge & Grandey, 2002). Through such EL strategies employees can manage their emotional displays effectively while interacting with colleagues, bosses and customers of diversified backgrounds and struggling with their work pressures, ending up with satisfying transactions. Emotional labour and attributional ambiguity theories have the potential to provide prescriptive understanding about how the communication of emotions and evaluation contribute to the issues like marginalization and emotional costs faced by minority employees in a diversified workforce at the personal and organizational level (Wong, Kathleen, 2007). Indian services and BPO sector have seen a robust boom over the past two decades. Much of the demand for Indian workforce in these sectors is mainly because of the high-grade soft competencies that Indian employees possess in terms of emotional adaptability and emotional labour that suffices the demand for high quality customer service. Emotional culture with right emotional labour displays is responsible for promoting happiness and engagement leading to sustainable development of people and services.

Indian Business Cases of Disruptive HR Through Inclusive Emotional Culture

Companies in majority of Indian industries have integrated disruptive HR practices into their culture to build a sustainable emotional culture. The importance of EI, appraisal of certain emotions and eliminating rather than suppressing certain other negative emotions in workplace has been recognised and applied in Indian companies. Emotions have been aligned in the mission and corporate philosophy, EI assessments and training is a usual activity. Emotions are tracked adopting various types of gamification and emotioanlytics software applications (artificial intelligence software to track and measure the EI).

Indian railways, the country's national railway system operating under the Indian Central government and the fourth largest railway network in the world (by size of 42,988 miles route distance as of April 2019), has adopted a milestone intervention to bring about a turnaround in its decision-making body. In order to bring down the number of trade union strikes and protests, accidents, derailments, train collisions; and improve the job-related behaviour of train drivers, officers, and managers emotional intelligence assessment and training process has been undertaken on a large scale. Around 1800 Railway officers (250 in the rank of additional secretaries, general managers, principal HODs; 150 in the rank of joint secretaries, chief workshop managers and additional DRMs; and 1400 officers of rank of deputy secretary, director, junior administrative) have been identified to undergo the EI testing and EI training workshop to enhance their decision making capabilities and job performance. The benefits that are expected to be accrued from this process which costs 423 USD to 595 USD per employee has a high perceptual value, since the initiative of building a culture of emotional intelligence among its officers is unprecedented in the Indian government. As quoted by Railway Board chief Ashwani Lohani, "the focus is on 'satyanishtha' - a mission for inculcating ethics and integrity among the railway employees. EI is an input in that direction" (Sharma, Dec. 2018). It is believed by the higher authorities of Indian Railways that if emotional intelligence and spiritual intelligence is enhanced, rapport with trade unions would improve resulting in lesser strikes and better IR (industrial relations) as well as customer service. As a result of this initiative focussed on building a positive emotional culture, the world's fourth largest railway network has aimed to improve the quality of its services to customers and accentuate employee engagement.

Happiest Minds Technologies, a next generation digital transformation, infrastructure security and product engineering services company located in the IT capital of India, Bengaluru has adopted positive emotions in its name, mission, vision and values to build a work culture where team spirit, joy, mindfulness, integrity and social responsibility connect employees, leaders, work, clients and customers together. As the name suggests, their mission says- "Happiest People, Happiest Customers". Their vision speaks about being the Happiness Evangelists for each other, customers and society, be recognised for thought leadership, be leader in social responsibility initiatives. Thus, as the name of the company suggests, their ultimate aim is to create happy customers through nurturing happy employees who are highly creative, innovative and empowered to offer the best service. The acronym 'SMILES' describes the company's ethos, and stands for the six core values that every employee proudly imbibe and follow- sharing, mindful, integrity, learning, excellence and teamwork.

The organisational culture has clearly mentioned certain predictive factors that are antecedents of its success and happiness irrespective of the nature of the business. They are organizational factors- fairness, transparency and joy in workplace, and individual oriented factors such as wellness, enriched personal life and giving back to society. The Happiest People Framework is built on the 7Cs of Culture, Credibility, Collaboration, Contribution, Communication, Community and Choice. The organisation has well-crafted

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

wellness program as one of its disruptive HR practices that adds extra value to its happy employees. The Happiest Minds' Wellness Program constitutes the 7Ws of Physical Wellness, Spiritual Wellness, Intellectual Wellness, Professional Wellness, Social Wellness, Emotional Wellness and Environmental Wellness. These are nurtured by aligning activities, logistics, facilities and expertise of the organization through an array of Wellness schemes.

Emotional Wellness programs in Happiest Minds is cultivated through a wide range of activities such as Good Samaritan Network, Buddy programs, Stress Management lessons, Emotional Intelligence training and assessments, Emotions gamification and Mentoring. Programs such as Group activities, Celebrations, Get-togethers, Blood donation camps, Circle of Happiness and Diversity initiatives such as Aura, the Women's council promote social skills, team spirit, trust and joy to work inclusively among all. Competency Building, 360-degree feedback-based Performance Enhancement Processes and rigorous Talent Reviews facilitate in improving professional effectiveness among the employees. Social Responsibility is a core value of Happiest Minds. Such disruptive practices make this company culture the most unique one to foster the feeling of wellness, happiness and sustainability in mankind.

Pidilite Industries Limited, Indian-based adhesives manufacturing company focus on building a culture based on creativity, relationship-building and people friendly HR policies that respect the emotions of all. Pidilite Industries President (HR), Rahul Sinha stated-

At around 8pm every day, we take a round of the office to see if anybody is working late. If we find someone repeatedly working till late, we have a chat with his/her boss and ask them to review the employee's workload. Similarly, if somebody wants to work on a Saturday, they need to take special permission from HR.

Pidilite offers to its employees one day per week as "work from home". These initiatives have emerged from their "listening" culture. The organisational culture emphasizes on trust, empathy, transparency and maintaining high ethical standards as the most critical values to attain sustainability and high performance. Thus, the company boasts of not only being a pioneer in adhesives that create the ever-lasting bonds, but also nurturing ever-lasting relationships with employees.

TCS, the Indian IT giant works with a partner company called 'Courageous Success' to maintain its emotional culture centred around EI building of its talent force. As quoted by TCS manager of HR,

We work with coaches to focus on our own emotions, and also to understand the emotions, feelings and triggers of our closest colleagues. This can be hugely helpful in knowing what pushes an emotional button for someone……We are also piloting a meditation week to help team members work through their emotions at work, how to control stress, anxiety and difficult relationships with colleagues. (Kati Chitrakorn, March 31, 2016)

Organisations are increasingly adopting apps to help individual employees and teams log their emotional reactions to various activities and make the connection between their moods and productivity. Through emotionalytics, the trends in emotions experienced and recorded by every employee is statistically understood and strategies taken to appropriately cater to positive or negative trends in employee emotions. Entropik Tech is India's only Emotions - AI start-up offering a full suite of emotion recognition technology options to its clients for assessing emotions of its customers and other stakeholders. The

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

designers of this Emotionalytics start-up have been nurturing their creativity within a culture of fun, wellness, humour, flexibility, innovation and social responsiveness.

INCLUSIVE EMOTIONAL CULTURE IN INDIAN ORGANISATIONS

Cultivating the right emotional culture, mandates people to feel the emotions valued by the organization or team for achieving their common vision. This may involve emotional modelling, enhancing emotional intelligence to actually internalise those emotional norms or adopting any emotional labour strategies (deep/surface acting, genuine expression or suppression). Through harnessing what people already feel, modelling and imitating the emotions that are required and motivating employees to fake the emotions till they genuinely feel it, a positive emotional culture can be created and sustained (Barsade & O'Neil, 2016).

Recently a survey and focus group discussions of HR experts from three multi-national organizations located in the Silicon Valley of India was conducted. Opinion about existence and structuring of emotional culture has been solicited and analysed by the author. HR experts were identified based on the suitability and position in the company for the study to gather perspectives on certain aspects like-

- Can emotional culture suffice the requirement of inclusivity in workplace?
- How can emotional culture be built?
- What ways do you propose to cultivate an emotional culture in your workplace?
- How can emotional culture actually help the organization to sustain?

Semi-structured interviews and focus group interviews of HR managers were conducted for thirty minutes each and responses recorded. The HR managers belonged to three companies coded A, B and C (actual identity kept confidential) from different industrial sectors. Each HR manager was administered through two sets of interviews – first individual interview and the other, focus group interview. Consistency of the opinions was checked and validated. Thereafter the primary data was analysed and interpreted. Company A belonged to healthcare sector, privately owned, headquartered in Bengaluru, India, with employee strength of 19,000. Company B belonged to IT sector, headquartered in India, with public ownership and employee strength of 225,501 employees, operating in 50 countries and revenue of 11.8 billion USD. Company C belonged to retail sector, privately owned, headquartered in Mumbai, India, employee strength of 55,000 and revenue of US$6 billion. Based on thorough analysis of information recorded from the focus group interviews the following facts about emotional culture and HR disruptive practices were identified. Table 1 shows the analysed interpretations from the interview conducted for HR managers of Company A (healthcare sector), Company B (IT sector) and Company C (Retail sector).

The content analysis of the opinion of HR managers have shown direction to conceptualising a model for structuring an Inclusive Emotional Culture within the organisation. Figure 2 illustrates the Inclusive Emotional Culture Framework (IECF). Based on the opinions sought from the HR managers, the IECF framework has been conceptualised. This framework shows clear direction as to how an inclusive emotional culture can be built to attain sustainability over a longer term.

The IECF framework shows that the first step in the process of determining inclusive emotional culture is understanding its need through the recognition of the extent of workforce diversity existing in the organisation. Based on degree of differences and workforce diversity aspects, goals of inclusion are determined and analysed. Goals of Inclusion become the determinant for building the emotional culture

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

in the organisation. Emotional intelligence of each and every individual influences their emotional labour displays and strategies. EI and EL influence the determination of emotional culture that aligns with the goals of inclusion of the organisation as well as the emotional set up of each groups of employees. Conducive emotional culture can be built by clearly stating positive emotions like fun, trust, creativity, affection, support etc. in the mission statement of the organisation. Values to be followed by each employee should be clearly mentioned in the culture statement descriptively and prescriptively. Goals based on emotions fulfilment to be framed and based on these goals HR practices have to be designed. For example- framing the goal of 'becoming the happiest and emotionally intelligent company within two years". This goal definitely emphasizes on fostering a positive emotional culture with fun, happiness and emotional intelligence at its forefront. Eventually its HR practices are aligned and executed to achieve these goals and the organisational workforce becomes highly productive, contended and engaged. The outcomes of emotional culture are high levels of inclusion, employee satisfaction, happiness quotient (HQ), deeper employee engagement, less absenteeism and turnover, competency development, commitment and higher productivity among employees.

Table 1. Emotional culture in Indian organisations

Company A (Health care)	Company B (Information Technology)	Company C (Retail)
By identifying and expressing emotions as per organisational requirement, we have been able to create a workplace for all without differences.	Respecting emotions of employees and aligning them with organisational vision, we have been able to innovate and work in teams in an inclusive manner	Assessing emotions of employees have enabled in developing a focussed workforce and eliminating them, who could not align their emotions with others and with organisational purpose.
By developing emotional goals and integrating emotions in mission, vision statements	Identifying and defining values to be practiced by every member of the organisation	Creating emotions and value oriented organisational culture. HR policies to be based on emotions pre-stated in the company philosophy.
EI training, Emotions tracking, emotional appraisal, gamification to orient employees about emotions that needs expression/ elimination.	EI training and assessment, Emotionalytics and tracking emotions through apps	HR practices like recruitment, selection, training, appraisal, career growth based on job related emotions/values to be followed in the organisation. Artefacts, interiors of workspace, posters, emoticons, EI tracking apps can help nurture positive emotional culture
Making sustainability development the emotional goal of every employee	Integrating sustainable development and innovation into organisational culture through emotions employees	Sustainability is a goal, that can be accomplished by driving people's emotions in that direction

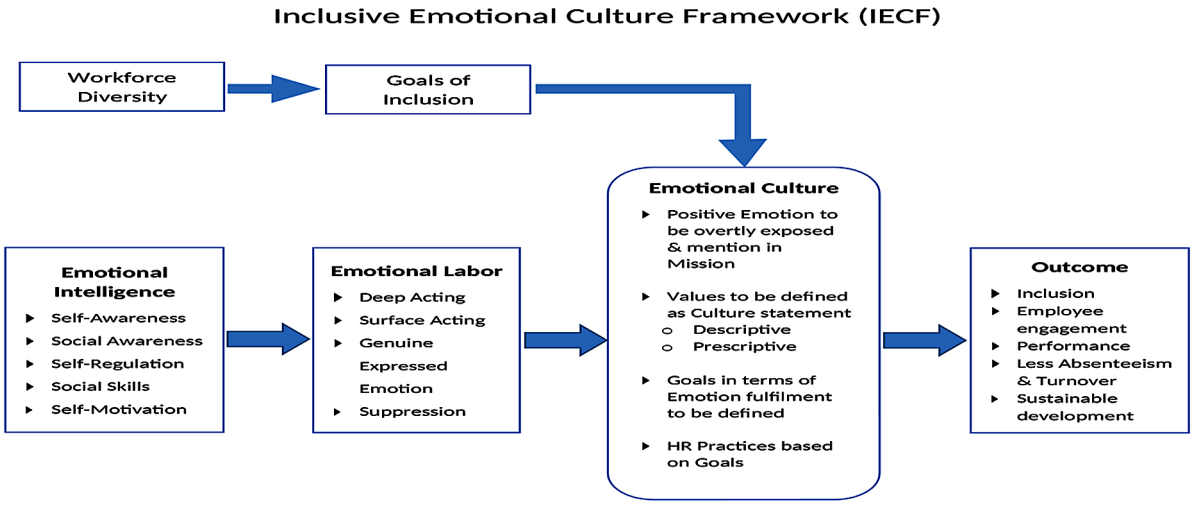
Practical Implications and Future Research Directions

The IECF model provides systematic flowline to HR managers for cultivating positive emotional culture that fosters sustenance of multiple cultures and people together. Diversity and inclusiveness are the precursor of any changes needed. Several studies on organisational psychology have identified the impact of cognitive, emotional and social processes on diversity- inclusion within groups (Kearney et al., 2009; Stockdale & Crosby, 2004; Hobman et al., 2003). In early anthropological studies of group dynamics, strategic emotional expression was found to facilitate group cohesion by dominating individual feel-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ings and synchronizing interpersonal behaviour. Social identity theory illustrated that identifying and managing differences at intrapersonal and interpersonal level when working in groups leads to better performance outcomes (McKay et al., 2009).

Figure 2. Inclusive emotional culture framework (IECF)



Studies on emotional contagion shows that people in groups "catch" feelings from others through behavioural observation and imitation, and subsequent changes in brain function leads to a ripple effect of the same emotions throughout (Barsade, 2002). This can be practically applied in all teams and groups with no investment of money, but with conscious investment of positive emotions, such as a smile or positive greeting. Cognitive re-appraisal, listening and eliminating negative emotions through consulting, artefacts and posters exhibiting positive emotions like joy, fun, excitement, curiosity, respect, trust can spread the required emotions in workplace. Happy pictures of moments with family and team members at workplace develops a culture of affection, care and trust. Emotional modelling by managers gives examples to subordinates that this is how they should behave and work. Integrating emotions in company's mission, vision and values makes the culture emotionally positive and highly creative. Emotional intelligence-based recruitment, training and appraisals practically integrates emotional capabilities in the company's formal people acquisition and management policies. Investing on AI based apps to track emotions and re-enforce positive emotions, gamification etc are additional measures that companies can take to transit towards an inclusive emotional culture. In order to succeed, it is important that the entire team works together as a single entity. This is possible only when the emotions of all are identified, appreciated, fulfilled and re-enforced.

Globalised economy demands high mobility and sharing of resources. Human resources mobility, skilled migrant workers and increasing demographic as well as psychographic dividend is characterising today's labour, which should be taken into consideration in crafting HR policies. Emotions and feelings cannot be isolated from humans. Hence, it is wise to shift from mechanistic structures to decentralized and knowledge-based operational models (Adler, 2001; Cho & McLean, 2009) governed by positive emotions. It is crucial to recognise and appreciate each entity's emotions and feelings to harness their

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

contributions to the maximum. Consequently, the role of talent forces has become critical with an increased drive towards participation in organizational decision making, striking involvement in strategic business operations, higher ownership quotient with strong psychological contract and demand for challenging work context that pays them with a sense of self-actualization and esteem (Burke & Ng, 2006). Another emerging challenge is virtual workforce and virtual organisations. How an emotional culture would cater to the leadership and inclusivity needs of a virtual organisation is still to be answered. This chapter is significant in realizing the importance of emotional culture, its components and its outcomes. Since many organisations are progressively recognising the importance of emotions and emotional culture in organisational productivity and ROI in longer term, the practices should be popularised and further researches should be conducted to know more.

CONCLUSION

Sustainability is an issue in the present context as globalisation has brought about intense competition and hardly any loyalty. Workforce demographics and psychographics are changing with the speed of advancement of technology. Organisational growth and development are constraint due to rising employee turnover and issues of employee commitment, psychological contract, competency development and performance. Sustainability of business depends upon business values, organisational culture and people management practices. Thus, meeting the emotional requirements of people of diverse backgrounds is critical to fostering the feeling of 'oneness' in the workplace. This chapter provides an exhaustive review on the available literature related to sustainability, inclusiveness, emotional culture, emotional intelligence (EI) and emotional labour (EL). Various management practices of how Indian organisations have been able to develop a culture of sustainability through positive emotional culture and inclusiveness has been discussed. Disruption in HR practices have been happening in many ways, some through the integration of technology, AI and bots and other through the integration of the science of emotions in managing people. The cases help in understanding how fostering inclusive emotional culture have enabled Indian organisations to sustainably develop and grow.

Clear communication channels, primal leadership, HR practices that recruit, train, allocate, utilise and retain the employees based on EI (emotional capabilities as per job and organisational requirements), and aligning emotions into the mission and vision are the ways through which positivity can be ensured in the working culture and systems. Business cases of Indian organisations have been described to explain how they brought about disruption in HR practices to manage a positive emotional culture and employee wellbeing. Well managed happy employees eventually yield higher returns on investment through the emotional connect, psychological contract and engagement they develop with the organisation. Based on focus interviews of HR managers of Indian multinational companies in three different industrial sectors, a model has been proposed called as Inclusive Emotional Culture Framework (IECF) that offers systematic guidelines to HR leaders for cultivating a powerful positive emotional culture for 'All' in a highly diversified polarised organisation. The flowline states the identification of inclusion goals, perceiving the emotions of employees, aligning required emotions with the organisational mission, vision, values (descriptively and prescriptively), defining clear emotional goals meant for all, communicating these goals to all and designing HR practices based on the emotion's goals. A continuous process of follow up and re-enforcing the emotions is significant for sustainable HRM in the organisation.

KEY TERMS AND DEFINITION

Cognitive: It is a psychological process occurring in the brain that involves acquisition and understanding of knowledge, experience and senses from the stimuli received.

Culture: It is a set of shared values, beliefs, and behaviours that are practiced, learned, and shared by a group of people.

Emotion: It is a mental state associated with the nervous system brought on by neuro-chemical changes, associated with thoughts, feelings, behavioural responses, and a certain level of pleasure or displeasure.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Emotional Culture: It is a set of shared affective values, feelings, emotions, artefacts, beliefs that are set as a norm and supposed to be followed by every person of a group.

Emotional Intelligence: It is the ability of a person to perceive, understand, regulate and manage one's own and others' emotions.

Inclusive: The degree to which each different individual is considered to be one entity of a group and included within a group.

Performance: It includes the actual output or results of an entity as measured against its intended outputs.

Retention: The process of retaining employees within the organisation and preventing them from leaving due to some or the other reasons.

Chapter 21
An Empirical Study of the Indian IT Sector on Typologies of Workaholism as Predictors of HR Crisis

Shivani Pandey
Mediterranean Shipping Company, India

ABSTRACT

Workaholism, in recent years, has become a regular behaviour pattern among professionals. While self-negligence is assumed as a hallmark of workaholism, empirical data in this case stands to be both narrow and paradoxical. Modern developments like high-speed data connections add more to this belief, as this makes it possible for employees who would like to work at any place and at any given point of time to work. Workaholism is found to affect several important domains of life. With regards to work domain, workaholics commonly seem to have poor associations with their peer/colleagues, most likely on the grounds that they often feel the need to control them and experience issues with delegating work. Given that the amount of time they invested in their work leaves little energy for them for other activities, also the social life outside work gets hampered. This chapter explores the relationship between workaholism, perceived work-related stress, different job conditions, and intensifying anxiety among IT professionals in Delhi/NCR.

INTRODUCTION

With the fast leap of technology innovation and competitiveness, the leisure and comfort among today's employees have also improved. A new 24/7 economy has freed the old work environment paradigm, as never before. As an aftermath, an interminable transformation in working pattern is evidently noticeable. With globalization and the pace of technology change in society, the modern economy organizations have become indeed exceptionally demanding. This also has augmented the need for growth, followed with frequent breakdowns among working employees.

Number of studies (Estes & Wang, 2008; Hooks & Hicks, 2002) have shown that working conditions have changed expeditiously. Ambiguity of clear role expectations at work is high and the balance between work and personal being has become vaguer (Srikanth & Jomon, 2013). Stress rates at work have upsurge in the past decade resulting in psychiatric health problems and turning down of work productivity. It is also evident from numerous reports that a high level of perceived stress at work is related to low level of satisfaction with job and poor mental condition (Dhabhar, et al., 2010). Several researches have also reported significant associations between occupational stress, anger, work-family conflict and psychological and physical health. Henceforth, a great deal of attention is being given to the issues of work-related stress and health (Schaufeli, et al., 2008) which is often discussed in daily conversations.

Stress

Stress, over the years, has been defined in diverse ways. Formerly, it was regarded as some kind of pressure from the environment which later on turned into strain within the individual (Shimazu&Schaufeli, 2007). An extreme mode of stress can hinder productivity and impact one's physical and mental health. It can also threaten the individuals as well as organisations from attainment of goals. Mohanty & Jena (2016) has found in their investigation that job turn out to be less fulfilling under extreme stress and that their expected inherent and outward needs are not satisfied. Tomar (2017) found that IT professionals have long work hours with various time zones, add up to cooperation, undertaking to be finished on due date with flawlessness as per customer needs, which requires relational, specialized, and authoritative. These attributes prompt word related stress and work exhaustion.

How Is Stress Caused?

The workplace is an imperative cause for both demands of job and pressures triggering stress. The factors related to workplace stress cited are dearth of managerial support, low inter-personal relations, demanding job, workplace viciousness, lack of flexibility, low self-esteem and being workaholic (Schaufeli & Bakker, 2004), which further results in HR Crisis (Pandey & Sharma, 2014). HR crisis may be defined as an unstable state of affairs occurring in the organisation resulting in drain or loss of personnel, deterioration of morale, inadequate development of human resources, lack of succession plans and managerial inappropriateness leading to a multiple unhealthy consequence in an organisation.

Few researchers have tried establishing relatedness between personality types with stress proneness. One that includes being persistent and highly involved in work was studied by Caplan & Jones (1975). It acted as a catalyst of workload and ambiguity of role resulting further into anxiety, depression and antipathy. Role ambiguity was found to be positively associated with anxiety, depression, and antipathy, whereas workload was found to be positively associated with anxiety only. Research has further more revealed that these individuals who are mostly in a perpetual struggle mode to get things done in the least amount of time will undergo more stress than individuals who rarely have an urge to succeed. Adding to these personality types, there is another vital personality attribute that has come forth to make pace with the demand of the dynamic economy is "workaholism". This popular corporate buzz word has also created hype among scholars across the world. The emphasis of lately, has been on understanding the diverse aspects that constitute workaholism. For the non-professionals, "workaholism" appears to be working exceptionally hard. It's quite apparent that a person who is a typical work addict would be driven by a strong internal motivation rather than being driven by external aspects, such as organiza-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tional culture, financial issues, pressure from supervisor or a strong yearning for career encroachment. The diverse notion of "workaholism" put forth a requisite to conceptualize the word "workaholism", as its inimitable outcomes and antecedents has emerged as broadly varied and contradictory. Based on the extant literature it is observed that stress, insecurity related to job and job/occupational burnout are the probable roots of career exodus for IT professionals. In several studies, it's depicted that when stress levels surpass the coping abilities of an individual, the results are unfavourable to the organization as the stress related to the employees has been majorly linked to career change intention. A common link found in different studies related to career exodus is that when employees work under lot of pressure which is common IT industry, they start changing careers in order to lessen stress. Based on such evidences, it is expected that overstressed IT professionals may follow suit and change careers (Rathore & Ahuja, 2015). Managers, thus, looking forward and are keen in retaining these IT talent, should work on implementing changes aimed at improving the work/life balance of the employees. Dealing with information technologies for 99% service uptime is very arduous, both physically and emotionally. In an informal interview conducted, it was indicated that this was a principal cause of burnout and stress. In many IT companies, employees are expected to be available on a 24/7 basis, in case of any technical issues. This requires leaving one's home and return to the office during non- working hours to execute backup service or technical maintenance. The most viable solution managers can provide to elude this job burnout is by expounding the boundary between work and home (Ghapanchi & Aurum, 2011).

REVIEW OF LITERATURE

Using Work Addiction Literature to Theorize About Basics of Workaholism

Oates' unique conceptualization of workaholism mirrored an immaculate enslavement point of view as far as both the impulse to work and the level of contention with one's life:

A workaholic is a man whose requirement for work has turned out to be excessive to the point that it makes observable unsettling influence or impedance with his real wellbeing, individual satisfaction, and relational relations, and with his smooth social working (Oates, 1971; p. 4).

Two exceedingly compelling models in our comprehension of behavioral addictions are the disorder model of habit (Shaffer et al., 2004) and the segment model of enslavement (Griffiths, 2011). Though the previous has been most useful in understanding forerunners and helplessness, the last gives a structure whereupon the key basic components of dependence can be caught on. The parts display draws on Brown's (1993) hedonic administration demonstrate and has been to a great extent enlivened by the symptomatic characterization of phobic behavior. As per this structure, a someone who is addicted presentations indications that speak to each of the accompanying segments: subjective and additionally behavioral remarkable quality (i.e., the action commands one's considerations as well as conduct), state of mind change (i.e., the conduct is utilized as an approach to alter inclination), resistance (i.e., the expanding measure of time required to acquire a similar involvement with the action), withdrawal side effects (i.e., feeling contrary feelings when the action is halted or decreased), backslide and restoration, and loss of control (i.e., the need to come back to a similar level of utilization in the wake of attempting

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to stop, and losing control over the utilization), and strife (i.e., the conduct clashes with everything in the individual's life, for example, connections, work, as well as training) (Griffiths, 2005).

Workaholism

The word "workaholism" has been interpreted from diverse standpoints viz. nature of work, working hours etc. Definitions (Buelens & Poelmans, 2004; Harpaz & Snir, 2003; Scott, Moore, &Miceli, 1997) say that workaholics spend more time on their work which leaves them psychologically or cognitively fatigued with passage of time. Moreover, they perpetually keep thinking about work when not even at work, ending up in relatively high level of emotional distress and physical complaints.

"Workaholism" and "workaholic" was first interpreted by Oates in 1971. He defined a "workaholic" as "somebody who is so obsessed with work that it creates conspicuous disturbance to health, personal happiness and social functioning". Several other researchers (Cherrington, 1980) have termed different workaholic types with both positive and negative connotations that are in nature both mixed and conflicting. Some researchers (Schaef and Fassel, 1988) with a broader understanding of the subject have quoted that organizational factor play a dominant role in development of Workaholism traits in employees as it is observed that organizations are keen in rewarding workaholics or workaholic behaviour. Employees putting in long hours at work, spending an extra time on job apart from normal office hours, are remunerated with acknowledgments and better career prospects. The fact also stands true for such organisations where extra working hours or workaholic behaviour are considered as a requisite for growth and innovation and are preferred by executives majorly over being or going back early at home (Dasgupta and Gupta, 2009).

Diverse Working Conditions and Work- Related Stress

Nevertheless, of a huge portion of research on individual types of employee's well-being, for example, burnout, work engagement, job satisfaction, furthermore, workaholism is very less thought about on how they may affect each other after some time. How employees feel at work may affect their conduct at work, and furthermore over the long haul (Vogt, et.al 2016).

For both hypothetical and handy reasons, it is imperative to know the potential outcomes of diverse sorts of employee well-being, and furthermore in examination with each other. Environment at workplace is one of the popping elements of external stress factors. In lieu of this, prior researches have revealed that excessive stress and anxiety at job, job dissatisfaction and high work-family conflict experienced by employees are mainly swayed by contextual components. Such toxic work environment can have catastrophic effects on its employees. It is also seen that workaholics put lot of effort in their work, are very stubborn, look for perfection in everything (not restricting it to job) and do not believe in task delegation that in turn creates a lose- lose situation between him and his co-workers. Former definitions have concerted on the frequent non- work consequences that go with workaholism. Robinson (2000) illustrated the individualities of workaholism as being similar to that of alcoholism, i.e. being progressive in nature, an unconscious attempt to resolve unmet psychological desires which can lead to irrepressible life, fragmentation of family, severe health complications and death too". An important facet of the overall concept is that workaholic behaviours are not driven by external needs rather it is internally based. Relatively to the three-segment approach by Maslach et al. (2001), others have contended that job burnout may best be lessened to an unsocial regular torment, to be specific exhaustion (Sinha, et.al, 2014).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Conversely, the empathy weakness structure characterizes burnout as a unidimensional build including an absence of prosperity, negative demeanours toward work, or an absence of self-acknowledgment (Reddiyoor & Rajeswari, 2017).

Based on available literature and introspection on severe working conditions in today's organizations, the present study has made an appropriate effort in incorporating work conditions and working attitudes to explore the relationships between perceived or appraised work stress and anxiety among IT professionals in Delhi/NCR.

Demographic Variables and Work-Related Stress

Cox (2010), defined stress as a "perceptual phenomenon arising from a comparison between the levels of demand put on a person versus his ability to cope." The degree to which a stress is experienced by an individual in a particular situation will contrast due to personal factors. When talking on the demographic grounds, researches show that young workers are most likely to be less satisfied with their present jobs than older workers (Srivastava, 2011). Stress is an emotional state of fear and threat that has physical, mental and behavioural consequences. It is practically proved that people usually perform well when they are encouraged, challenged and invigorated rather than being threatened by facets of the work environment that are sometimes over arduous in some way. Gender difference similarly has one of the dynamic roles to play in understanding work-related stress and anxiety due to diverse demands rising from job. Men and women account diverse reactions to work-related stress, both physically and psychologically. Number of researchers put forward that though the probability in women reporting symptoms of clinical depression or anxiety disorder related to work-related stress is high, they are doing a better job in connecting and involving themselves with others which at times are imperative as stress management strategies (Shimazu, Schaufeli &Taris, 2010).When compared to men, 80 percent of them who had high psychological job demands were found to be at greater risk of depression and anxiety disorders than the one with lower demands. It was also observed that nearly half of the depression or anxiety disorder cases were diagnosed at age bracket of 30-35, which was directly related to workplace stress and high job demands condition.

Workaholism Phenomenon, Work Related Stress, Job Conditions: Internal Validity

The expression "workaholism" was begat by Oates (1971), who depicts it as "the impulse or the wild need to work unendingly" (p. 11). This early portrayal involves two center components which return in most later meanings of workaholism: working too much hard and the presence of a solid, compelling internal drive (cf. McMillan, O'Driscoll, and Burke, 2003). The previous focuses to the way that obsessive employees have a tendency to assign an excellent measure of time to work and that they work past what is sensibly anticipated that would meet hierarchical or financial prerequisites. The last perceives that compulsive employees relentlessly and every now and again consider work, notwithstanding when not working, which recommends that compulsive employees are "fixated" with their work. Truth be told, these two components—that speak to the behavioural and subjective part of workaholism, individually—allude to the very inception of the term workaholism which was intended to compare to liquor addiction. We concur with Porter (1996, p. 71), who approaches understudies of workaholism to "… come back to the root of the term as a beginning stage for future research". She places that workaholism

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ought to be translated as a habit, that is, as intemperate and industrious conduct with unsafe outcomes, along these lines barring sees that think about workaholism as a positive state (e.g. Machlowitz, 1980; Scott, Moore, and Miceli, 1997; Spence and Robbins, 1992). In our view, compulsive employees work harder than their employment medicines require and they put substantially more exertion into their occupations than is normal by the general population with whom or for whom they work, and in doing as such they disregard their life outside their occupation. Ordinarily, they work so hard out of an internal impulse, need, or drive, and not in light of outer factors, for example, budgetary prizes, profession points of view, hierarchical culture, or poor marriage.

Work related stress or burnout is an analogy that is usually used to depict a condition of mental exhaustion. In spite of the fact that there is some discourse about the idea of burnout, the most broadly utilized conceptualization begins from Maslach (1993), who depicts work related stress as a three dimensional develop that comprises of: (1) depletion (i.e. the exhaustion or depleting of mental assets); (2) skepticism (i.e. apathy or a removed state of mind towards one's employment); and (3) absence of expert viability (i.e. the propensity to assess one's work execution adversely, bringing about sentiments of deficiency and poor occupation related confidence). It has been assessed that more than 90 for every penny of the examinations on work related burnout utilize the Maslach Burnout Inventory that depends on this three-dimensional definition (Schaufeli and Enzmann, 1998, p. 71). The way that reviews on burnout and workaholism are for all intents and purposes lacking is all the more surprising on the grounds that as of now 20 years prior it was proposed that workaholism may go about as the underlying driver of burnout since unreasonably and quickly working representatives go through their mental assets, abandoning them exhausted and "wore out" (Maslach, 1986). Plainly, this dispute suggests that workaholism and job burnout are distinctive constructs that can likewise be separated observationally.

The idea of job conditions evolved from researches on job burnout, to be specific as an endeavour to cover the whole range running from employee unwell being to representative prosperity. Not at all like the individuals who experience the ill effects of burnout in job, drew in representatives have a feeling of vivacious and powerful association with their work exercises and they consider themselves to be ready to bargain well with the requests of their employment. All the more particularly, Schaufeli, Salanova, González-Romá, and Bakker (2002a) characterize work engagement as a positive, satisfying, work-related perspective that is portrayed by: (1) energy (i.e. elevated amounts of vitality and mental strength while working, the eagerness to put exertion in one's work, and determination additionally even with challenges); (2) commitment (i.e. a feeling of criticalness, eagerness, motivation, pride, and test); and (3) retention (i.e. being completely moved and fascinated in one's work, whereby time passes rapidly and one experiences issues with withdrawing oneself from work). Job conditions and job burnout are reasonably adversely related. As of late, it was discovered that fatigue and energy and additionally negativity and devotion each traverse a measurement that may be marked activation and distinguishing proof, individually (González-Romá, Schaufeli, Bakker, and Lloret, 2006). Up until this point, the connection between job conditions and workaholism has not been considered. Be that as it may, interviews with drew in representatives who scored high on energy, commitment, and assimilation recommend that they are not dependent on work (Hallberg, U. & Schaufeli, W.B., 2006). Dissimilar to workaholics, they appreciate getting things done outside work, they don't feel regretful when not working, and they don't work hard due to a solid and powerful internal drive but since for them work is entertaining.

CONSEQUENCES

Workaholism can adversely impact private relations, recreation and wellbeing (Grzywacz, J.G. & Marks, N.F., 2000). The side effects are like what we see in different addictions, including impacts on temperament, resistance and withdrawal. Studies demonstrate that when one encounters stress at work, people with a solid interior work drive report an expansion in subjective stress-related physical and mental manifestations contrasted with those with low scores (Linley, P.A., Joseph, S., Harrington, S. & Wood, A. 2006; Taris, Schaufeli &Verhoeven, 2005). In this way, it is conceivable that adapting style controls the connection amongst workaholism and wellbeing (Shimazu, Schaufeli &Taris, 2010).

Two examinations have looked facilitate into how workaholism identifies with rest. In one investigation, people with the most elevated scores on workaholism were more probable than laborers with low scores to report rest issues, tiredness at work, and challenges awakening notwithstanding exhaustion in the mornings (Kożusznik, M.W., Dyląg, A., & Jaworek, M.A., 2014). In the other investigation, Andreassen et al. (2011) found that high fanatical work drive was related with a sleeping disorder.

Moreover, investigate demonstrates that compulsive workers report all the more work–family clashes and poorer working outside work than non-obsessive workers (Ho, V.T., Wong, S.S., & Lee, C.H., 2011; Robinson, B.E., 1999). Since time is a restricted asset, it is regular that workaholism affects the household front. Barely any investigations, be that as it may, have been directed with a nearer examination of how workaholism influences the work–family relationship. In a current report that separates amongst positive and negative overflow it was discovered that fanatical work drive was connected to negative overflow amongst work and family (Andreassen, Hetland et al., 2012). Much more, the observations also state that workaholics are slanted to contribute their assets (e.g., time, vitality, consideration, feelings) in work, and paying little heed to whether they fall flat or succeed, will keep on doing in this way, frequently to the detriment of their private and family lives. (Hakanen & Peeters, 2015).

Taken together, it appears that the centre component of workaholism, inside over the top work drive, is related with a few negative side effects (Grant, J. E., et al., 2010; John, O. P., Naumann, L. P. & Soto, C. J., 2008; McMillan LHW, et al., 2001). Work drive has likewise been connected to bring down life and employment fulfillment. Furthermore, it has been exhibited that workaholism is related with diminished mental prosperity, saw wellbeing, joy and self-detailed work execution ((Taris, T.W., Schaufeli, W.B., Shimazu, A., 2010; Shimazu & Schaufeli, 2009).

Motivation of the Paper

In line with the aforementioned research and on the basis of prevailing literature on the concept of "workhaholism", the present study aims at exploring the relationship between anxiety and work-related stress among IT professionals in Delhi/NCR in context with the rampant working culture and workaholism. The study also emphases on the data with reverence to particular industry i.e. IT industry and demographical variables.

The Pertaining Issues in the Study

Firstly, the innumerable underlying scope of workaholism, working culture and job conditions that may impact the multifarious dimensions of work-related stress and anxiety as observed in IT professionals still provides a window for exploration. Secondly, whether the notion of work-related stress and anxiety

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

differs in IT professionals based on age group and marital status, or for the reason that they are working in different industries needs to be addressed.

To attain the basic objective of the study, it's important to have a comprehensive view of:

1. The level of association among the factors of workaholism, work culture and job conditions with anxiety (of growing age) and a person's physical appeal
2. The level of association among the factors of workaholism, work culture and job conditions with anxiety at work and unreasonable distress
3. The level of association among the factors of workaholism, work culture and job conditions with health issues
4. The difference in values of work-related stress and anxiety pertaining to certain demographic variables

RESEARCH METHODOLOGY

Aforementioned issues were raised and examined using multivariate background. The sampling technique used was purposive in nature, as the focus was on particular characteristics of a population which would best enable us to answer our research questions. For this, IT professionals belonging to middle and upper level of hierarchy across different IT companies in Delhi/NCR were contacted. The age group of respondents varied from 30 years to 50 years. All participants were informed about the objective of the study. Data and responses were collected through a structured questionnaire which was mailed across to the professionals. Though initially 250 respondents were approached the final sample size came about to be 200 only. The questionnaire constructed was subjected to factor analysis with oblique rotation to identify underlying constructs or factors. This would further help in explaining the correlations among a set of items.

Measures

The questionnaire included the following four aspects- workaholism, work culture, job conditions and work-related stress &anxiety. All measures were well validated. Each measure used was rated on a 5-point Likert scale (1= do not agree, 5= absolutely agree).

- **Workaholism:** The scale consists of five subscales (a) Obsession for work, (b) Self-sufficiency with no socialization, (c) Exhaustion from work (d) Timeliness (e) Recognition. The alpha coefficient of the scale results in .880.
- **Work Culture:** The scale consists of two subscales (a) Rewarding long working hours and competitive work culture, (b) Fast Growth and organisational culture of competition. The alpha coefficient of the scale results in .760.
- **Job Conditions:** The scale consists of four subscales (a) Disproportionate Job Responsibilities, (b) Unforeseen work (c) Work pressure with no substitute, (d) Travelling. The alpha coefficients of the scale results in .696.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Work-Related Stress and Anxiety:** The scale consists of three subscales (a) Anxiety due to growing age (b) Anxiety due to work evolvement, (c) Health issues. The alpha coefficients of the scale results in .848.

Demographic features of the respondents included age, gender, years of service and marital status as mentioned in Table 1.

Table 1. Demographic information

S. No.	Demographic Characteristics	Number
1	Average age of the respondents	36
2	Percentage of respondents (male)	88
3	Percentage of respondents (female)	12
4	Average working hours (per week)	64
5	Hierarchy in the company - Middle Management (%)	60
6	Hierarchy in the company - Senior Management (%)	40
7	Married (%)	80
8	Unmarried (%)	10
9	Divorced (%)	10

RESULTS AND ANALYSIS

To explore the associations between fundamental dimensions of workaholism, Work Culture and job conditions with the multifarious dimensions of work-related stress and anxiety observed in IT professionals, certain research questions were constructed that were further analysed through step-wise multiple regression analyses. The independent variables were (a) Factors of Workaholism, (b) Work Culture and (c) Job Conditions. The dependent variable was (a) Work-related stress and anxiety.

Correlation Results

Correlation Analysis which is applied to quantify the association between two continuous variables was run on the data collected as shown in Table 2. The means, standard deviations, and correlation coefficients resulted in factors of Workaholism showing significant positive correlations with factors of work culture and the factors of dependent variable work-related stress and anxiety (with low values). Work culture is significantly correlated to work-related stress and anxiety (though the value of the coefficients is low). Factors of severe job conditions show both positive and negative correlations with work-related stress and anxiety.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Regression Analysis

In the next step, we conducted an additional analysis, Stepwise regression Analysis to see the pattern of associations among the factors of workaholism, work culture and job conditions with the factor of dependent variable i.e., anxiety (with the growing age) and a person's physical appeal. Stepwise regression adds or removes variables based on the t-statistics of their estimated coefficients. Table 3 depicts the variables that resulted as significant predictors of dependent variable.

With the first regression analysis, the variables that came out as the significant predictors for Work-related stress and anxiety are - Obsession for work, Exhaustion from work, Promoting competitive work culture, Disproportionate job responsibilities and Unforeseen load of work. The variables shared 28% variance with criterion variable 'Work related stress & anxiety.' The result depicts that the factors of Workaholism among the independent variables are the stronger predictors of work-related stress and anxiety than the factors of work culture and job conditions. The beta weights of the two significant predictors of Workaholism are .356 and .351, followed by work culture and job conditions. With negative beta weights (-.178 and -.184) of factors of job conditions it illustrates that there exists an opposite relationship between extreme job conditions and anxiety due to growing age and a person's physical appeal.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Stepwise regression-anxiety at work and unreasonable distress as dependent variable and factors of workaholism, work culture and job condition as independent variables

Variables	Standardized Coefficients		
	Beta	**T**	**Sig**
Obsession for work	.356	3.917	.000
Exhaustion from work	.351	4.283	.000
Promoting competitive work culture	.213	2.738	.006
Disproportionate job responsibilities	-.178	-2.398	.014
Unforeseen load of work	-.184	-2.275	.021
R2	.284		
F	9.879		

The second intent of the research was to analyse the level of association among the factors of workaholism, work culture and job conditions with the dependent variable, anxiety at work and unreasonable distress. Another multiple regression was run to get the result. Table 4 illustrates that only two factors of workaholism emerged as the predictor of anxiety at work and unreasonable distress amongst all the independent variables. Further, obsession for work came out as a stronger predictor with beta as .289than self-sufficiency with no socialization with beta value being.184. R^2 is .191that shows the variance shared by both the variables is 19%.

Table 4. Stepwise regression-anxiety (with the growing age) and person's physical appeal as dependent variable and factors of workaholism, work culture and job condition as independent variables

Variables	Standardized Coefficients		
	Beta	**T**	**Sig**
Obsession for work	.289	3.508	.001
Self-sufficiency with no socialization	.184	2.279	.023
R2	.191		
F	14.178		

To have a comprehensive view of the strength of association between the factors of workaholism, work culture and job conditions with the dependent variable, health issues stepwise MRA was run on the data available. Obsession for work having the highest beta value (.511) emerged as strong predictors for dependent variable "health issue" followed by the factors of job conditions. Yet again, the factors of job condition "Travelling and Disproportionate Job Responsibilities" emerged as negative predictors of 'work-related stress and health issues.' Another job condition dimension - Unforeseen work demand has emerged as the positive predictor for DV 'health issues'. All the independent variables showed 45% (R^2=.451) variance with the dependent variable- Table 5.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 5. Stepwise regression: Work-related stress and health issues as dependent variable and factors of workaholism, work culture and job condition as independent variables

Variables	Standardized Coefficients		
	Beta	T	Sig
Obsession for work	.511	6.712	.000
Travelling	-.287	-4.451	.000
Disproportionate Job Responsibilities	-.234	-3.419	.001
Unforeseen work demand	.189	2.511	.012
R^2	.451		
F	26.032		

T-Test Results

To have an understanding of the difference in values of work-related stress and anxiety pertaining to certain demographic variables T-test was applied on the data. Table 6 shows the t-test result in terms of marital status of the employees which reveals a significant difference in terms of perception of work-related stress. Work-related stress and anxiety was seen to be significantly higher among unmarried IT professionals compared to married IT professionals. Further, a dichotomous split of employees in the age group between 24 and 35 and 36 to 55 years was done to find the difference in terms of age group. This split was made on the basis of meta-analyses of age in the applied psychology literature (Thomas & Feldman, 2009). The result showed that work-related stress among employees belonging to 24 years to 35years was significantly high as compared to 36 years to 55 years' age group.

Table 6. Comparison of marital status and age group of employees on work-related stress and anxiety

	Marital Status		Age Group	
Variables	Married (N=170)	Unmarried (N=30)	24-35 yrs. (N=90)	36-55 years (N=110)
Work-related stress & Anxiety	M=23.12 S.D.=8.56	M=25.52 S.D.=9.72	M=25.87 S.D.=8.97	M=23.74 S.D.=7.65
T value	-4.954 P<.000		2.45 P<.023	

DISCUSSION

It is important to know the sampling technique used in the study as it makes the findings understand better. This study is based upon purposive sampling, wherein a researcher chooses to what is to be known and then selects the sample that can provide the exact information by his experience or knowledge (Tongco, 2007). As the objective of the research was in studying IT professionals who work in extreme job environments in Delhi/NCR, purposive sampling was the ostensive choice.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The study provides a perspective wherein workaholism with a definite work-culture and job conditions takes a toll on IT professionals. It entails the workaholic behaviour pattern that cropped up as (a) Obsession for work, (b) Self-sufficiency with no socialization (c) Exhaustion from work (d) Timeliness (e) Recognition is associated to work-related stress and anxiety among IT professionals. Simultaneously, the work-related stress and anxiety scale emerged with three major elements (a) Anxiety due to growing age (b) Anxiety due to work evolvement, (c) Health issues. The result demonstrates that high obsession towards work if reaches an exhaustion level, has the tendency to influence the perception of anxiety about approaching old age or growing age. Even the factor of work culture of the organization i.e. fast growth and organisational culture of competition has its say on increasing anxiety due to growing age and drooping personal looks. If we put together, the second and third regression addressing the workaholic behaviour representing obsession for work, self-sufficiency and no socialization, included with the type of work that leaves a person with mental and physical exhaustion is yet again linked to work-related stress and anxiety among IT professionals. There is a difference in working hard and being addictive towards work and it becomes all the more unlike when signs comprise of being negligent of personal activities, austere conditions of health and excessive qualms for future prospects. Researchers have found that excess of workaholism has negative impact on a person's health leading to too much work stress and job burnout (Chen, Chang & Ching, 2004).

The preceding academic literature shows that workaholic behaviour pattern along with prevailing work culture in the organization have been influencing the stress perceived by IT professionals. Organizations generally set standards for working hence stimulating a work culture wherein the philosophy revolves round rigorous competition thereby takes its toll on employees. The big run today is to be on the top which has become vicious as the positions vacant are now limited than what used to be a decade and a half formerly (Joseph, Gautam & Bharathi, 2015). To stay ahead and competitive, organizations are promoting a culture of hard work and encouraging employees to go that extra mile. Though academic literature is full of evidences (Vansteenkiste et al., 2007) about the negative impact that competitive work culture has on both physical and mental health, one staggering finding has emerged in this study as well. The study resulted in two factors of job dimensions being negative predictor of a particular type of work-related stress (anxiety due to growing age and changing looks). This explains that extreme working conditions in corporate world, disproportionate job responsibilities and unforeseen work do not affect IT professionals with regard to anxiety due to growing age and changing physical looks. People also take travelling with ease (for work) till they do not find it distressing their overall health. Employees especially from service sectors work for long hours and with the augmented usage of highly developed technology it requires one to be available 24*7 even after duty hours. In lieu of this, other studies too have ascertained that although these jobs have high rewarding structures but employees with such demanding jobs are more susceptible to job burnout.

The Dangerous Allure of Extremes

Some findings that stand contrary to considering extreme job conditions as negative are depicting a change in the social phenomenon of perception of work-related stress. Working for more than 60 hours a week has become a typical norm. Employees take pride and feel exalted in working late in the office and are happy in extended travel for office work. The reasons probably could be being highly achievement oriented; believing in the philosophy of being "extreme" and being under competitive pressure (Shahnaz, Zickar & Michael 2006). Though competitive pressures in corporate world are making "extreme" jobs

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

necessary, there has been an upsurge in regard of activities that increases the adrenaline produced in high-stress situations. Second motivating element found stimulating workaholism was the allure of the job. A culture that promotes "extremes" is not surprising as employees strongly endeavour for such passionate jobs. They do not consider these jobs as exploiting them rather they consider these jobs as honourable, appropriate and much wanted. It's surprising that the drift heading extreme is been considered as an advantage to competitiveness. The organization to some extent by trending towards extreme might gain competitive advantage but then putting excess stress on job would crop a contrary effect too.

The study shows that employees in IT sector have comparatively a higher level of work- related stress and anxiety compared to other sector (Bolhari, Rezaeian et.al 2012).The reason perhaps could be the major push been faced by the service sector in Indian that is high compared to other sectors. Studies previously have shown that IT professionals often agonize from job burnout due to extremely arduous and hectic job conditions (Sonnentag, S. et al, 1994). Marital status and age level as key factors correspondingly make a difference while perceiving stress and anxiety level. The possibility maybe at the earlier stages of career, expectations and desires being high, individuals do not get easily satisfied. Hence, unmarried and younger age group employees go through more stress and anxiety from work compared to married employees. Research shows that being married conveys support and firmness to personal lives of employees with older adults also being able to regulate their temperaments and exhibit an advanced level of emotional intelligence (Goodman, 2011).

Workaholism: Nature, Sources, and Outcomes in the Global World

Workaholism involves (a) disproportionate spending of time and energy on work (b) difficulty in disengagement from work, eliciting negative emotions (c) obstruction and anxiety (d) restricting oneself from socialization (e) leading to low self-esteem, career dissatisfaction, ill-health and job burnout. This has been further described in form of typologies in Table 7. A workplace that puts forth excess work pressure especially business services is found to be moderately related with higher level of drive for work and low level of work enjoyment. On the contrary, a system with supervisors providing flexibility at work is related with relatively less work-family conflict and more job satisfaction among enthusiastic workaholics. Findings have revealed that regardless of gender, work-related stress and work-life conflict or imbalance is correlated with workaholism (Kumar & Siddique, 2011) which meant that gender did not moderate the associations between workaholism with work-related stress and work-life conflict.

The following conclusion of the researches has persisted to be constant across nations, i.e. respondents with a high level of work-orientation worked comparatively more number of hours per week than respondents with low level of work-orientation. The working hours for men stands out to be more per week than for women. Married women spent comparatively fewer hours per week on work than unmarried women, however married men's working hours were than unmarried men per week. Employees of private sector tend to spend more time on work per week than employees from public-sector. It is also observed that employees in the IT sector, particularly women don't remain with a similar association for a long time because of prolonged working hours/odd planning (Patwardhan, 2014). Subsequently, keeping in mind the end goal to maintain a strategic distance from the strain emerging because of tedium, rebuilding of occupations should be possible to suit the people's attitudes and interests by giving some sort of incitement, by limiting distressing perspectives a presenting development arranged settings, enabling representatives to have control over the occupation and accept choices on the position with confined authority.

CONCLUSION

Even though the word "workaholism" has turned into a piece of our ordinary vocabulary, regardless we know minimal about the logical reason for it. Reasons why a few people move toward becoming obsessive workers are most likely various and complex. For the most part, studies demonstrate that workaholism is likened with negative results. To date, no recorded handling mechanism for workaholism exists. The field is in extraordinary need of longitudinal examinations including target parameters of conduct and wellbeing.

The present study aimed to examine the relationship of workaholism with work related stress, work culture and job conditions amongst IT professionals in Delhi/NCR. The results of the current study indicated that workaholism and its components were significantly and positively related to IT professionals' work-related stress. The results of stepwise multiple regressions demonstrated that workaholism could envisage IT professionals' stress towards work. These findings were in line with the results of Kumari, Joshi, & Pandey (2014), Haq (2015). To substantiate these discoveries, it could be noticed that workaholism forced an incredible pressure on employees, the outcome of which was work related anxiety and as the aftereffect of work related anxiety, the individual's physical and mental vitality masticated. This further led to strain, weariness, and burnout and diminished employment fulfillment. IT professionals had various undertakings and because of high workload and a wide assortment of obligations they had, they bear an abnormal state of working pressure. Obsessive worker IT professionals invest a large portion of their opportunity and vitality at work and oblige little time to their life and different issues. Truth be told, these individuals disregarded their need to rest and overlooked different issues identified with their day by day life which may prompt occurrence of some negative feelings affecting one's conduct and development.

Other findings of the current study indicate that workaholism and it components were significantly and positively correlated with IT professionals' work related stress, work culture and job conditions. To justify these outcomes, it can be noticed that workaholics oppose on attempting to enhance themselves and to wind up plainly fulfilled and they look for satisfaction and delight in their work. These individuals have solid inborn inspiration to work, against which they can't help it. This autonomous inspiration may be because of ecological conditions including monetary situations, environment of the organization, pressure caused by one's manager, work advancement and additionally getting away from the family. These individuals invest a little energy to rest and after some time, they end up noticeably depleted cognitively and inwardly. Since they largely are involved in work, notwithstanding when they are not at work, they encounter thoughtful excitement and turn out to be candidly exasperates and accordingly, they for the most part report different mental issue and physical objections. At the point when a man experiences burnout, he/she is for all time worn out, forceful, skeptical, and irate. He/she has negative musings and is irritable and exhausted. He/she ends up noticeably irate with the smallest uneasiness, and is disappointed and feels misery. IT professionals who are anxious to invest a great deal of energy at work enter their work lives into their own lives unintendedly and more often than not misfortune the harmony between their work lives and individual lives. Because of this extreme weariness which is caused to the idea of educating, IT professionals are confronted with burnout manifestations including lessened viability, exhaustion, and investing a great deal of energy at work. Accordingly, obsessive worker IT professionals end up plainly depleted speedier and this thus, may influence the quality of their administration and may prompt disappointment from work. Workaholism is a sort of enslavement

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

which can be charming and in the meantime monotonous and risky to such an extent that a few scientists considered this state as an illness.

In the interim, since workaholics are not willing to delegate their oomph and obligations, they are in struggle with their colleagues and subsequently, their work turns out to be considerably more confounded. At the point when workaholics invest a considerable measure of time in doing their work, their vitality is debilitated and they experience the ill effects of work related stress. In an investigation, Jansi & Anbazhagan (2017) showed that individuals who are associated with their work are more inclined to mental and physical injuries contrasted with others, since they dedicate a ton of mental vitality and time to their work. This implies they disregard their own issues and invest the greater part of their energy at work. Subsequently, the more the force of the work and the more the occupation's requests, the more the employees' exhaustion.

Overall, results showed that with increasing IT professionals' workaholism, they experience more work-related stress and job burnout. Considering the results of the current study, holding training courses for IT professionals to become familiar with the phenomena of workaholism, stress, job burnout, individual and organizational outcomes, methods of dealing with them and managing time effectively (aiding at devoting time to work, family and oneself) is of great importance. It is recommended that other researchers conduct studies to investigate other sectors and also examine the relationship of workaholism with other occupational consequences based on demographic characteristics (gender, age, marital status, level of education, etc.). These studies can be conducted using a qualitative method or both qualitative and quantitative methods. Moreover, since the questionnaires used in this study were developed in other countries, developing such questionnaires in accordance with the condition of our country is highly recommended. Since this study was carried out on IT sector in Delhi/NCR, hence, generalizing its results has its own limitations. Therefore, when generalizing these results to other group of employees and sectors, great caution should be taken.

Inferences of the Study

The outcome of this exploratory study offers some interesting understandings of the variables that shares employees' perception of work-related stress and thereby suggests prospects for future research. The sampling technique was purposive and was drawn from IT companies located in Delhi/NCR, as Delhi/NCR being a metropolitan city and remarkably attracts people from all part of the world. The sample drawn had their work experience not only in Delhi/NCR but also in various parts of Indian cities as well as world. Thus, the findings of the study are supposed not to be just constrained to IT professionals working in Delhi/NCR but also to other employees working under related conditions. Though the concern towards increasing work-life imbalance has been taken up widely by Indian researchers, there still lies a gap in the empirical research concerning workaholism and its influence on Indian IT industry for a competitive business environment. Also, there is a large gamut of literature related to "workhalism" but it remains varied and conflicting till date. Therefore, there is a dire need to comprehend the phenomena of Workaholism and address the attributes of workaholism in depth. Considering Work-related Stress, Job Conditions and Work culture as main predictors of HR Crisis, with increase in work-related stress HR crisis in the organisation increases which means the predictor is positively related to HR crisis and with increase in job conditions and work culture (i.e. improvement in both the predictors) decreases the probability of occurrence of HR crisis which means the predictor is negatively related to HR crisis. Future research may also try and understand the mindset of the current generation with their choice of job and

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

that what kind of training strategies companies follow to cope up with different types of job stress, if any. Studies, by and large, related to attributes of workaholism holds paucity of data in Indian IT context, which further drove the researchers to deep dive and understand the association between workaholism, job conditions, work culture and work-related stress and anxiety. It is generally observed that employees from IT & ITES sector seem to tussle with work-related stress and anxiety comparatively more; thus, organizations predominantly from this sector need to assess their nature of job and the prevalent work culture. Organisations should give an extra effort in development of skills at individual level, to cope with work-related stress and reducing depression and anxiety levels.

CONTRIBUTION OF THE STUDY AND DIRECTIONS FOR FUTURE RESEARCH

Workaholism, being a derogatory term, much of the literature has covered only the external effects of workaholism which therefore calls for further consideration. This study further summarizes its contribution in (a) categorizing the essential dimensions of workaholism, work culture and job conditions (b) determining the association among predictors and outcome variables. (c) Interpreting the difference in work-related stress and anxiety of IT professionals with respect to their age group and marital status. Present study is valued for its uniqueness in examining an imperative occurrence in the context of contemporary realities catering to Indian IT context specifically. The IT sector is frequently pigeonholed with high role stress (Karad, 2010), as the life expectancy of software products and programs keep waning each year, and the stress on employees keeps intensifying due to distinctive environmental pressures (Colomo-Palacios et al., 2014a). The irony is that it is rarely seen that the organizational culture helps employees in dealing with such stresses and its related problems. Research by Colomo-Palacios et al. (2014b) shows that stress also leads to IT career abandonment as the IT industry is more susceptible to prodigious and increasingly prompt changes. In such a scenario, the employees are thus expected to develop skills to learn fast, stay updated to new things, develop skills to work in team and problem solving and reasoning skill. This research thus, endeavours to recognize the working conditions and Workaholism behaviour along with the varying social milieu. Though there are quite a few limitations of this study but this can open a pathway for other researchers to explore other related factors in continuation to the present research. The results generalization as is restricted due to purposive sampling should therefore be treated with cautiousness. This study lost out on a substantial part of the working professionals as it did not include IT population belonging to the lower hierarchy of the organisational chart. Since this research was purely based upon the authors' own observation, it therefore proposes future scope of substantiating the data across industry or sector and including other population sample to the research (family, friends and associates). Generalization of the present study results to other sectors or industries as well as in other countries awaits further empirical examination.

Chapter 22
CSR and PSR Diversity Engagement Among Ethnic Minority Businesses (EMBs) Within the UK

Carlton Brown
University of Plymouth, UK

ABSTRACT

This chapter attempts to comprehend the complexity, nuances, and inherent challenges that exist amongst corporate social responsibility (CSR) and purchasing social responsibility (PSR) in the public and private sectors, within the context of ethnic minority businesses (EMBs) in the UK. As noted by Carter and Jennings and the Institute of Supply Chain Management, there is now a need to discuss ethnic minority businesses in the same context as human rights as there are such inequalities in both fields.

INTRODUCTION

This Chapter will address the challenges posed by corporate social responsibility (CSR) and purchasing social responsibility (PSR) amongst corporate organisations within the UK, contextualised among the ethnic minority business (EMB) community.This continues to be a topic for debate with an increasing emphasis on the need for further research to deal with the broader economic, social and ethical implications of business practice (Gereffi & Lee, 2012). New (1997) contends that researchers have a duty to take a wider view, as it will have greater social, economic and ethical ramifications, and that it is therefore imperative and incumbent upon researchers to adopt a broad standpoint when addressing this subject area. Smallbone (2005: p.432) describes EMBs based upon whether the businesses' ethnic minority (EM) owners are 'different' from the rest of the small business (SME) community in terms of their behavioural characteristics and in relation to the type of problems that they encounter.

This conceptual Chapter presents an exploration of the critical issue relating to diversity and supply chain engagement within corporate organisations, which will bring this debate into sharp focus. The Chapter begins with an overview of the construct of Corporate social responsibility (CSR) and Purchasing social responsibility (PSR) within the supply chain. It then proceeds to examine the discourse relating to diversity engagement within EMBs in the UK and to understand what makes this issue different from other SMEs and potentially more problematic than other aspects of CSR.

At the start of 2015, there were 5.4 million businesses in the UK, and 99 per cent of them were categorised as SMEs (National Audit Office, 2016). The clear majority of these were identified as micro-businesses, employing fewer than ten people. The Office for National Statistics estimates that SMEs create around £35 of gross value added to the UK economy for every £100 of turnover, while larger companies create around £24. The European Commission defines an SME as an entity engaged in economic activity that:

1. Employs fewer than 250 people;
2. Has an annual turnover less than or equal to 50 million euros (£39 million);
3. Has a balance sheet total of less than or equal to 43 million euros (£33 million)?

A recent Minority Supplier Development UK report (MSDUK, 2017) indicated that there were over 300,000 ethnic minority-owned businesses in the UK, representing over seven per cent of the total of SMEs within the UK economy. EMB businesses within the UK operate in an eclectic mix of different business sectors and they have been urged to diversify from unfavourable 'low value' niche markets and businesses (Ram & Jones, 1998), to gain greater engagement within the public and private sectors. However, despite the size of this business community a disparity still exists between CSR objectives, PSR performance outcomes and the degree of engagement within the EMB community.

There is still an under-representation in both public and private sector supply chains of EMB engagement. This not only encumbers the wide-ranging PSR supply chain but also inhibits businesses from developing organic economic growth. However, it also deprives purchasing organisations of an alternative supply chain option that may bring new, creative and agile commercial solutions (MSDUK, 2017). This position is consistent with Carter and Jennings (2002) and the Institute of Supply Chain Management who have postulated that there is a need to discuss black minority enterprises in the same context as human rights, because of the inherent inequalities that exist in both (Carter & Jennings, 2004),

The Road to Procurement Report, published by MSDUK (2014), noted that the perception of unequal treatment has continued to infiltrate many organisations, resulting in a reluctance of EMBs to tender for large contracts. This may be on the grounds of size discrimination with assumptions that EMBs are not capable of delivering large contracts. The MSDUK (2012) Impact Assessment found that 36 per cent of corporate members expected EMBs to be slightly behind the standards of their existing suppliers in their ability to deliver large contracts and in the industries, that are represented by the ongoing supply chain.

This assertion is in contrast with Alsop's (2002: p.81) observation which contends that socially responsible behaviour can lead to greater customer loyalty and increased revenues. A survey by the Reputation Institute of over 21,000 consumers suggests that 'almost unanimously, the public assert that they require information about a company's record on social and environmental responsibility to help decide which companies to buy from, invest in, and work for'. This position is consistent with Katz (2011) who maintains that manufacturers who have implemented supplier diversity programmes contend that the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

payoff has come in the form of stronger relationships with their supply base, new business opportunities, and a more agile supply chain.

The UK government Department for Communities and Local Government (DCLG, 2013) suggests that there are an extraordinary appetite and aspirations for start-up businesses amongst ethnic minority groups within the UK, most notably amongst Black African (35 per cent) and Black Caribbean (28 per cent) groups, contrasted with 10 per cent for White British counterparts. However, the conversion rates to start-ups remain relatively low. Creating a successful business requires ambition, skills and aptitudes. It demands innovation, creativity and a strategy to take the business proposition to market. Ethnic minority businesses are already highly successful and contribute £25 billion to the UK economy (DCLG, 2013), yet some minorities, particularly those from a Black African and Caribbean heritage, are underrepresented in this success and the question is: Why is that the case?

It is anticipated that the insights which will be gleaned from this Chapter will be relevant to both the private and public-sector firms, particularly those that engage with EMBs within the context of CSR and PSR frameworks.

In the recent review by Baroness McGregor (2017) titled Race in the Workplace, the Business Minister, Margot James, was quoted as saying that 'It is very wrong that, so many barriers lie in the way of people from ethnic minority backgrounds. Outdated attitudes or lack of awareness about ethnicity in the workplace must be challenged.' She was referring to employees within the workplace, but these same outdated attitudes and lack of awareness prevail within organisational culture, purchasing supply chains and the confines of CSR, both consciously and unconsciously.

Problem Definition

The broad purpose of this Chapter is to tie together the issues relating to the various concerns about CSR, diversity and supply chain management regarding corporate organisations within the UK. It attempts to explore and evaluate the notion of unconscious bias, cultural nuances and idiosyncratic behaviours exhibited by corporate organisations, to unearth whether a dichotomy exists between corporate CSR policies, PSR, and diversity engagement amongst ethnic minority businesses in the UK. According to Shah and Ram (2006) there are a multitude of policy stakeholders in the UK who are converging on the terrain commonly referred to as 'supplier diversity'. This Chapter addresses the following research questions:

1. How does CSR shape diversity supply chain practices?
2. Does a disparity exist between EMBs and Non-EMBs with supply chain engagement?
3. What are the social and economic benefits of EMBs' engagement as part of their CSR/PSR policies?
4. Are CSR, PSR and diversity engagement a corporate philanthropic conceptual misnomer to satisfy stakeholders?

Corporate Social Responsibility (CSR)

Corporate social responsibility (CSR) is a construct that has been described as the corporate pursuits that impact on different social groups (Sethi, 1995). Wood (1991) states that 'the basic idea of corporate social responsibility is that business and society are interwoven rather than distinct entities'. Other studies have often contextualised CSR within the construct of the stakeholder theory (Freeman, 1984). Stakeholders comprise customers and suppliers as well as employees, communities, and investors (Donaldson

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

& Preston, 1995). While there are close links between stakeholder engagement and the dynamic nature of CSR, there is a non-specified or undefined stakeholder, social or environmental engagement process addressed within the CSR paradigm (Pedersen, 2006: p.140). CSR has been described as a nebulous concept cloaked in ambiguity regarding the precise definition of this hypothesis (Okoye, 2010; Scherer & Palazzo, 2007). However, the concept of CSR as a phenomenon contextualised within a contemporary setting has come into force within the last 35 years (Sethi, 1995). Furthermore, while there is an inherent lack of a consistent definition regarding CSR, it neglects to provide a framework or model for the systematic collection or needed analysis for this construct (Clarkson, 1995).

Davis (1973: p.312) defined CSR as 'the firm's consideration of, and response to issues beyond the narrow economic, technical and legal requirements of the firm'. This contrasts with Carroll (1979, 1991) who outlined a framework which asserts that CSR comprises economic, legal and ethical responsibilities, along with voluntary or philanthropic responsibilities which are steered by an organisation's discretion as opposed to legal or more explicit requirements. It is within the confines of social, ethical, economic and legal responsibilities that the level of engagement within purchasing social responsibility amongst EMBs within the context of CSR presents an inherent challenge.

Similarly, Sethi (1975) presents a taxonomy in which social activity includes social obligations as well as more altruistic social responsibility. Other dimensions and activities have been identified within the literature, most notably diversity (Clair et al., 1997), human rights (Jennings & Entine, 1999), environment (Shrivastava, 1995), safety (Wokutch, 1992) and philanthropy (Clarkson, 1995).

When addressing the issue of CSR within the context of economic theory, the return on investment (ROI) becomes an instrumental part of the discourse in relation to how CSR fits into a firm (Scherer & Palazzo, 2007, Margolis & Walsh, 2003). Organisations have a responsibility to stakeholders to maximise their profits and business leaders have a fiduciary responsibilities to the shareholders (Sundaram & Inkpen, 2004). Jensen (2002: p.235) has termed this strategy as 'enlightened value maximisation', which suggests that profit realisation is a prerequisite for CSR participation and is only pertinent if it advances the long-term value of the business (McWilliams & Siegel, 2001). Heal (2005) argues that when corporate and social interests are not aligned, markets do not do such a good job.

According to McWilliams et al. (2006), economists are not opposed to CSR, but they need to understand the economic benefits and the value-creating contribution of CSR.

Friedman (1962) held a juxtaposed economic view regarding the purpose of business, arguing that the management of a business has one sole responsibility and that is the maximisation of profits for its owners or shareholders. He posited that social issues were not a concern for business owners and that social problems should be determined by the unencumbered workings of the free market economy.

It has been argued that CSR is an out-of-date concept and organisations should be characterised as 'corporate responsibility' (Foster Back, 2005). Companies should build cultures of trust, where honesty and integrity are at the nucleus of the business. This view implies that businesses have a responsibility to demonstrate integrity in their purpose, processes and practices. But the idea of 'CSR' expresses more than simply the requirement that business should be conducted ethically. It refers to the notion of responsibility for the impact of corporate activity on the wider body of stakeholders, and it is this attribution of responsibility that underpins the willingness of society to legitimate business (Gray et al., 1996).

Heal (2005) asserts that there are numerous areas attributable to financial benefits derived from CSR policy integration, most notably: (1) Reducing risk, (2) Reduced waste, (3) Improving relations with regulators, (4) Generating brand equity, (5) Improved human relations and employee productivity, and (6) Lower cost of capital.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Reducing Risk

The ability to moderate potential discord between organisations and stakeholders, particularly regarding the management of cash, is perceived to be a potential cause of conflict. Heal (2005) suggests that the avoidance or reduction of conflicts is indeed a major contribution of an effective corporate CSR programme. Within a cost and risk reduction standpoint, Crane et al. (2008) contend that there is an optimal level of social and environmental performance, after which the firm will accumulate costs additional to those required and reduce their level of profitability. McWilliams and Siegel (2001) propose that organisations will only perform to the level of responsibility that is demanded to maximise profitability.

Risk management addresses the issue of analysing potential risks and identifying ways to mitigate or accept those risks as part of doing business. Kytle and Ruggie (2005) present a three-step aggregation of the risk management process:

1. Establish a causal relationship between a risk/threat and an undesired outcome;
2. Identify the business elements that are exposed to the risk;
3. Act to eliminate or reduce the identified risk factor.

In the first instance, businesses as part of their due diligence have a duty of care to mitigate potential risks that may impact upon their brand through transgression via their supply chain. Within the context of PSR there is an inherent risk that organisations will be held liable for the absence of environmental and socially responsible practices by their suppliers.

There are a multitude of examples which underpin this assertion, notably Apple (Xiaoping, 2011). Heal (2005) cites Nike as an example where their market dropped off considerably when low wages that were being paid to their supply chains in developing countries were publicised. In the case of H&M, public perception and brand equity maximisation were negatively affected and could potentially have had a negative fiscal impact (Siegle, 2012).

The adoption and integration of appropriate accreditations, certifications and qualifications are determinant factors that may mitigate financial, environmental and social risks within the supply chain (Beske et al., 2008).

Health and safety accreditations such as safe contractor, construction line, ISO14000 and ISO9000, are the types of accreditations that may aid the mitigation of commercial risk.

Organisations are placed in a dichotomous position. Whilst they can insist that supplier organisations have the appropriate policies and accreditations in place, they cannot determine the validity and robustness of their suppliers' integrity and ensure that they are fully compliant with said policies. Porter and Kramer (2006) suggest that organisations are not capable of solving every issue in the community and broader society, but they can leverage PSR activities that are aligned with their business model.

Reduced Waste

The reduction of waste is a critical component in underpinning CSR policies. The reduction of greenhouse gas emissions, toxic waste and chemicals usage is continually being discussed (ibid.) and is a key issue within the structural context of CSR and protection of the environment.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Regulatory Relations

Organisations' interaction with watchdogs or regulators can create distinct competitive advantages, particularly within heavily regulated sectors. A reputation for being 'green' can be a major benefit to oil and gas companies when negotiating contracts for access to new oil reserves within ecologically problematic areas (ibid.). Requests for exploratory permits are quite often robustly opposed by environmental groups, and this means that organisations that have a track record or are perceived to be environmentally considerate may be able to mitigate the reservations raised.

The perceived wisdom suggests that regulatory decisions will be more favourable towards organisations that exhibit greater socially responsible behaviour, in contrast to those organisations which may flout the law or have a poor track record, and it is in this context that influence amongst regulators will be leveraged (Heal, 2005).

Brand

Prior to addressing the issue of brand equity, a brief synopsis is required to contextualise the concept of branding. Rampersad (2008: p.35) suggests that branding is more 'powerful and sustainable than marketing and sales and is an effective way to eliminate your competitors'. According to Fombrun (1996) and De Chernatony (1999), corporate branding is the intangible asset of a company. A brand is formed by impressions that are based upon observations of what and how organisations do things and by the standards to which they do them. Van Riel and Balmer (1997) define corporate identity as the organisation's ethos, aims and values that create a sense of individuality which differentiates one brand from another brand.

A brand is perceived to be a clear, powerful and compelling public image which conveys and communicates who you are as an organisation and what you specialise in doing. Organisations benefit from developing strong brands in a variety of ways: they offer businesses the opportunity to extend their product or service range; companies can charge a premium for their products or services; they increase their market valuation; they enable the brand to thrive during tough economic times; and they enable the organisation to attract and retain quality stakeholders, both customers and employees (Arruda, 2003).

Brand Equity

The American marketing association (AMA, undated) defines brand equity as 'the value of a brand, from a consumer perspective … brand equity is based on consumer attitudes about positive brand attributes and favourable consequences of brand use'.

A strong brand presents consumers with a consistent and positive message that differentiates one brand from another. The strength of a brand occurs in the minds of consumers, in what they perceive, have learned or experienced during their interaction with the brand. Consumer knowledge is really at the heart of brand equity. It also acts as a stimulus within the consumer's decision-making process. Heal (2005) contends that competition and homogenisation of technology, products and service has diminished any form of competitive advantage from operating within a competitive marketplace. Positive brand image can become the 'tipping-point' within the customer's decision-making process. Brand equity will enable organisations to derive a competitive advantage over their competitors when goods or services alone are no longer enough to retain or attract new clients (Gobe, 2001).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Heal (2005) cites Nike as an example where their market dropped off when the low wages paid to employees in developing countries were publicised. Maloni and Brown (2006) asserted that non-governmental organisations (NGOs) were very critical of apparel companies such as Nike regarding sweatshop labour issues at their overseas suppliers. Nike's initial reaction was negative and combative regarding their social responsibility obligations within their supply chain; however, this entrenched view changed when the weight of public opinion shifted, and they were subjected to consumer pressure (Zadek, 2004). Consequently, the clothing industry in its entirety has adopted a more diligent approach to supply chain engagement, congruent with their CSR policies with attention to supplier labour codes (Emmelhainz & Adams, 1999).

In contrast, SeaWorld's public image was tarnished when CNN's 'Blackfish' documentary brought to light their less-than-desirable habitat for their Orca whales, and the company's stock traded down by 33 per cent (MarketWatch.com). The BP 2010 oil spill significantly harmed the company's reputation, and Shell suffered a loss of sales in Europe at the time of the dispute over its disposal of the Brent Spar oil buoy. Starbucks was pursued by NGOs for not providing fair trade prices to coffee suppliers, and as a result introduced fair trade coffee within their stores (Maloni & Brown, 2006). The brand reputations of Starbucks, Google and Amazon took a severe blow in Britain during 2012 because of criticism over tax avoidance. All three entities have admitted to using extremely favourable European jurisdiction laws to mitigate or avoid tax. Whilst this is not illegal it is perceived as unethical and not in the spirit of the law or in the spirit of their CSR policy.

According to the BBC (2012), Google's UK business paid circa £6m to the Treasury in 2011 on a UK turnover of £395m. Starbucks reportedly paid just £8.6m in corporation tax in the UK over 14 years and Amazon generated sales of more than £3.3bn in the UK last year but paid no corporation tax on any of the profits.

Organisations may unwittingly cause irreparable damage to their brands equity by operating within confines of a CSR framework that harms the citizens that it proffers to serve, through their use of discriminatorily CSR policies which become counter-productive, and may well hinder their competitive advantage.

Improved Human Relations and Employee Productivity

Whilst CSR has been described as a nebulous concept cloaked in ambiguity (Okoye, 2010), the contribution and benefits derived from engaging within a CSR environment are evident and multifaceted. There is a growing body of evidence that suggests that organisations employing CSR policies yield stronger financial performance (Orlitzky, Schmidt & Rynes, 2003). Enhancing their corporate governance in this respect strengthens their reputation and increases their competitive advantage. This assertion contrasts with Maloni and Brown (2006), who contend that the financial success of Starbucks has been constrained as they have found that their customers' appetite for fair trade coffee was relatively subdued and that certified suppliers often lack consistency in volume and quality (Schrage, 2004). This highlighted the fact that although fair trade offerings may help appease adverse public opinion regarding financial impartiality amongst their suppliers, they may not be profitable, in this instance for food companies.

Firms that have been able to demonstrate that they are committed to good employee relations through CSR because of their organisational culture and leadership have found a strong correlation between employees' commitment to their organisation based upon how they rate its social responsibility (Orlitzky, Schmidt & Rynes, 2003). This assertion is underpinned by the Reputation Institute, which found that

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

on average, 75 to 80 per cent of those polled in over twenty-five countries would 'prefer to work for a company that is known for their CSR'.

Smith (2005) affirms that employing CSR practices, relating to equal employment opportunity (EEO) policies and procedures, engenders long-term shareholder value by reducing costs and mitigating risks. He argues that unequivocal EEO declarations are essential to demonstrate an inclusive policy which decreases employee turnover through improved staff morale. This is juxtaposed to the Gallup Employee Engagement Index chapter (2010), which stated that 33 per cent of employees were characterised as being engaged by their companies, 49 per cent were not engaged, and 18 per cent were actively disengaged.

Davis (1973) argues that businesses are not equipped to control social activities. He contends that managers are focused on the financial and operational aspects of the business and do not possess the necessary expertise and social acumen to formulate socially oriented decisions.

Other studies have highlighted that in organisations which have a significant level of corporate social responsible culture it has manifested itself as a motivational driver for employees. This was particularly evident in the USA in contrast to India and South Africa, where employee motivation transpired to be even more prevalent (Mivis, 2012).

McKinsey's Diversity Matters report (2015) analysed data from 366 companies situated throughout the United Kingdom, Canada, Latin America, and the United States. The research was geared towards diversity within leadership teams and within the general workforce. However, this Chapter asserts that the results can be contextualised and extended to the supply chain management, as the employer and the supplier enjoy a symbiotic relationship in the same way as an employee would be perceived to have. The suppliers to the organisations can be perceived as enablers for firms to deliver a competitive advantage and as such offer additional benefits to an organisation.

This postulation is consistent with Christopher (1992) who argues that supply chain management is concerned with achieving a more cost-effective solution for consumer requirements through greater buyer/supplier process integration and engagement. Christopher and Jüttner (2000) suggest that there is a greater level of interdependency amongst stakeholders within the supply chain, and this assimilation has come as a realisation that cooperation and partnership are essential prerequisites for the achievement of long-term mutual business benefits. This repositioning towards a more cooperative and integrated environment within the supply chain will produce considerable competitive advantages, to the extent where the supply chains compete and not companies, and as such offer additional advantage for the firm (ibid.).

Economic Enhancement

Heal (2005) maintains that CSR programmes are imperative, particularly where there are disparities between corporate profit objectives and social goals. He states that where competitive markets are robust and CSR policies are fully engaged, organisations will tend to yield greater fiscal outcomes, and where this is achieved the benefits are equitable for both the organisation and society at large.

McKinsey (2015) published a report that continued the discourse regarding diversity and economics, attempting to understand the relationship between diversity and performance in relation to the levels of profitability. Their research revealed that there was a statistically significant correlation between diversity and financial performance. Companies within the upper quartile of ethnic diversity engagement were 35 per cent more likely to have greater financial yields comparative to their national industry average. This relationship was also present when considering gender. The more ubiquitous and embedded an organisa-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tion was in relation to diversity engagement, the greater the level of yield was derived, and this would suggest that higher levels of diversity engagement lead to better financial outcomes. Organisations also benefited from greater BME engagement in other multifaceted ways ranging from the political, social and economic, in addition to the human capital enhancements that were derived because of increased levels of motivation. Augmented performance then led to better staff retention rates whilst optimising their competitive advantage.

Organisation Culture

When considering an organisation's culture, values and desire to be good citizens, complexity arises because there is an inherent dissonance between organisations and their employees' values, which may be incongruous with those of the organisation. Companies will fail to persuade stakeholders that they are serious about CSR unless they can demonstrate that their policies are consistently attained and the desired social, environmental and ethical outcomes are realised (Collier & Esteban, 2007). Diversity has become a business slogan catchphrase in recent times, with numerous C-suite executives viewing it as simply a tick-box exercise, as noted in a recent article by Oliver Pickup in the latest edition of Raconteur (2017).

It could be argued that it is extremely difficult for an organisation to determine the extent to which it has the undivided support from their employees in implementing their CSR agendas and policies. As noted by Mivis (2012), what organisations can do to ensure that their employees are motivated and committed to attaining their objective culture is influenced by their degree of employee engagement.

Collier et al. (2007) contend that compliance and code of conduct activities can potentially stimulate the kind of employee 'buy-in' necessary for companies to deliver their CSR agenda. However, they also argue that employee commitment to CSR is a complex and multifaceted phenomenon that will be influenced both by corporate contextual factors such as organisational culture and by their employees' perceptions. Within the United Kingdom, circa 90 per cent of FTSE 100 organisations and 60 per cent of FTSE 350 companies have adopted codes of conduct, but their importance and use fluctuate from one organisation to another. The Institute of Business Ethics (IBE) survey of 196 major UK companies suggested that having codes of conduct would ethically underpin organisations' CSR. Webley and LeJeune (2005) suggested that since the last survey in 2001 there has been a growth in the use of codes of conduct as a benchmark for employee behaviour. Yet there still appears to be a widening gap between a company's stated values and principles and their bearing on organisational practice, and it is this type of disparity that will continue to be a cause of concern for CSR and PSR diversity engagement.

An organisation's culture or climate permeates throughout the entire organisation, and this determinant may well transcend ethical considerations or legal obligations (Collier & Esteban, 2007.) When considering culture and climate in theoretical terms the difference between the two concepts may be stark, but when they are observed from a pragmatic perspective they both form part of the organisational context, so there will be parallels and commonalities as well as disparities (Trevino et al., 1998).

Within a large proportion of organisations, there is an inherent belief about how things should be conducted, acceptable practices, degrees of formalisations, and how people should be managed (Handy, 1993), which manifest into organisational norms that can be described as culture. Culture is described as homogeneous attributes that distinguish one human group from another, which provides a context in relation to norms and values that underpin how organisations manage relationships (Griffith & Myers, 2005).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The concept of culture is both broad and multifaceted, so it is therefore necessary to define what organisational culture means within this context. Schein (2010: p.18) defines culture as:

A pattern of shared basic assumptions learned by a group as it solves its problems of external adaptation and internal integration, which has worked well enough to be considered valid and therefore to be taught to new members as the correct way to perceive, think and feel in relation to those problems.

This is consistent with Hofstede's (2003) postulation which states that culture is a collective phenomenon shared by people who operate within the same social environment where the culture is learned. This is what he describes as the 'collective programming of the mind' (2003: p.5) which differentiates followers of one group or type from another.

It is this shared pattern of behaviour, norms and nuances which exists within an organisational climate that will shape CSR and PSR practices, and may well have a bearing on EMBs' engagement within the supply chain because of their unconscious nature.

The term 'climate' implies some form of climatic characteristics such as temperature, or it can be categorised as a distinguishing condition that can influence the inherent values and disposition that an organisation might display. The organisational climate may also be responsible for the ubiquitous mindsets that perpetuate within an organisational setting (Collier et al., 2007).

According to Downey (1986: p.7) corporate culture:

… in fact flows from and is the consequence of corporate identity. The fundamental style, quality, character and personality of an organisation, those forces which define, motivate, and embody it. Its unique history, business mix, management style, communication policies and practices, nomenclature, competences, and market and competitive distinction.

Culture is both visible and invisible. An organisation's culture is detectable from their operating norms and values which permeate throughout and remain stable within it (Schein, 2010). It is this permanency of cultural identity within an organisation that gives rise to its longevity within its customs, practices, norms and values. These cultural characteristics may be juxtaposed to those prescribed within CSR policies, with reference to engagement with EMBs.

At a visible level, culture manifests itself through the practices, patterns of behaviour and pervasive methods exhibited by members of an organisation. The norms inherent within an organisation will permeate throughout an organisation, and they will be introduced and taught to new members of the team through shared values, training and practices (Kotter & Heskett, 1992). At this level, culture is easier to change and embed within an organisation.

In contrast to visible culture, invisible culture is concerned with the values and goals that are shared by its members. This value persists over long periods of time and remains stable and intact within an organisation even when the group membership changes (Kotter & Heskett, 1992; Schein, 2010).

Invisible culture is deeply ingrained within the organisational mindset, which implies that it is harder to change. Schein (2010) argues that culture is the deepest and most unconscious part of an organisation, and when something is deep-rooted it offers endurance and immovability. The question that arises relates to unconscious bias and its existence within organisations, and whether this impacts on CSR and PSR relative to EMBs.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Schein (1984: p.10) asserts that:

Culture serves as a function of stabilising the external and internal environment of an organisation, it must be taught to new members as it would not serve its function if every generation of new members could introduce new perceptions, language, thinking patterns and rules of interaction. For culture to serve its function it must be perceived as correct and valid, and if it is perceived that way, it automatically follows that it must be taught to newcomers.

Hatch and Shultz (2001) maintain that to build a strong corporate brand there must be congruency between its strategy, culture and reputation, and where there is alignment between the organisation's values and ethics this will aid the performance of the organisation.

Unconscious Bias

Unconscious bias may possibly be considered as one of those deep-rooted components that exists within the confines of organisation culture, which transcend legal and ethical considerations; it denotes an individual's lack of awareness of the effects of their exploits and the impact on other people, social institutions and organisations. When unconscious bias is contextualised within this environment, it attracts attention of the unintentional behaviours in which one's actions promote racial disparities. The MSDUK (2012) impact assessment stated that 36 per cent of corporate members expected EMBs to be slightly behind the standards of their existing suppliers in their ability to deliver large contracts, based on a perception without any first-hand quantifiable evidence to support this assertion.

Such unconscious bias has been defined in sociological terms as institutional racism (Carmichael & Hamilton, 1967). There is widespread discourse suggesting that unconscious bias is both prevalent and compelling within contemporary societies (Munar, Villesèche & Weidemann, 2016). Researchers have also postulated that an individual may retain one set of conscious attitudes that support racial tolerance and another set of unconscious attitudes that are racially biased (Banaji, 2001; Greenwald et al., 1998) and it is this paradox of incongruity that may manifest itself within the construct of PSR and CSR.

This type of perception ambiguity is prevalent within the confines of the perception literature. Research suggests that people might be influenced by a person's race but might fail to recognise this influence for themselves. Researchers also submit that social stereotypes occupy voids in meaning when the consequences of one's action or an episode are vague, thereby initiating a biased reaction and translating this into a rational objective and justifiable cognitive process (Kunda & Thagard, 1996). According to Dovidio and Gaertner (2004), people have the capacity to hide their true beliefs from themselves and others through intellectual reasoning.

The role of perception was further bolstered by Devine's (1989) study, which employed a computer-based orientated task to 'subliminally prime' participants with words associated with black stereotypes. The task was designed to activate stereotypes beyond the individual's level of conscious awareness. There were various words presented for micro-seconds and then intermittently mixed in between other words. After being exposed to different primed and non-primed words, the participants were required to read a short passage regarding an actor who was engaged in an indistinct activity. The race of the individual was not revealed, nevertheless after being primed with racially biased words the participants' interpretation of the behaviour was perceived as more probable to be hostile, thereby reinforcing the construct of unconscious bias.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Such behaviour highlights how individuals and or organisations can unwittingly become entrenched with inherent bias, to such an extent that they are unaware that they fail to recognise how their implicit and explicit compliance with the accepted social cultural norms unintentionally reinforces existing inequalities. This interpretation of unconscious bias is akin to the unwitting actor portrayed in the theory of symbolic racism (Sears & Kinder, 1971).

Within the construct of social psychology, it has been recognised that human behaviour intellectually tries to rationalise and categorise people like entities, and according to Green (2003) the consequence is that cognitive biases can ensue, thereby propagating an individual's cerebral thinking which in turn engenders an implicit reliance on stereotypes.

According Lee's (2005: p.483) social cognition theory 'stereotypes are a person's prototypes'. These stereotypes then function as innate belief mechanisms that interpret and distil forthcoming data and they also govern how information is retained.

The emergence of stereotypes causes discrimination by influencing how individuals process and recall information about other people (Lawrence, 1987), quite often based on limited or no information. Hence this is why when a recipient has stored information in this manner the memory becomes distorted by stereotype, which is the retained memory, as opposed to the unprocessed incoming communication (Lee, 2005)

Lawrence (1987) argues that once a person has developed stereotypical beliefs, they retain and remember them within their subconscious and retain stereotypically congruent behaviours regardless of the determining event not actually occurring; furthermore, stereotypically incongruous behaviour that has occurred is stored in a more distorted and understated way and consequently has a less profound recall effect on the memory-bank of the decision-maker.

In recognition of social and racial inequalities the UK government launched a toolkit for employers in support of the Equality Act 2010. The toolkit was labelled 'Know Yourself Unconscious Bias Toolkit' and offers generic advice on how businesses can be compliant with the Equality Act. The introduction of an 'unconscious Bias toolkit' is both recognition and substantiation of the inherent challenges faced by EMBs within private and public sectors in the UK. The introduction of legislation is further confirmation of the inherent inequalities that exist within the supply chain. It was initiated to mitigate the risk of unconscious bias and to prevent long-term structural incongruities.

The literature supports the assertion that unconscious bias exists in the form of an inability for an individual to separate out their own beliefs and values from those of the organisation. CSR and PSR have racial implications for both the organisation and the individual. Blanton and Jaccard (2008) contend that organisations may be subject to the following: (1) the subjectivity of an individual's own unconscious bias may affect purchasing decisions; (2) institutional racism demonstrates how actors embedded in a culture might fail to see the racial implications of their actions; and (3) a person's perception reveals how social factors can produce unconscious racially biased behaviour. Lawrence (1987) attests that where most of a group's members have little or no contact with EMBs, stereotyped perceptions of BME groups manifest in the form of illusory correlations between minority groups which become the 'triggers' for negative behavioural events.

Lee (2005) postulates that unconscious bias is an emerging form of discrimination that limits employment opportunities for both women and ethnic minorities. However, this Chapter would argue that unconscious bias not only relates to employment but also extends to the supply chain and is an influencing determinant when making purchasing decisions, which has a negative effect on EMB engagement within the supply chain.

Purchasing Social Responsibility

Within the context of the supply chain, Carter and Jennings (2000) assert that procurement managers within socially responsible organisations are the custodians of the management of that supply chain. This concept is categorised as purchasing social responsibility (PSR), which consists of an eclectic assortment of behaviours that largely fall into the dimensions of environmental management, diversity, ethics, community, safety, human rights and quality of life.

To understand PSR and diversity further within the supply chain, a review of the drivers and barriers will need to be undertaken. CSR has been defined by Carroll (1979) and Wartick and Cochran (1985) as 'meeting the discretionary responsibilities expected by society'.

This definition has encapsulated various activities relating to (1) diversity, (2) the environment, (3) human rights, (4) philanthropy and community, and (5) safety. The definition is consistent with the PSR conceptualisation and empirical findings of Carter and Jennings (2000, 2004). They coined the term purchasing social responsibility (PSR) as consisting of a multitude of different behaviours which extensively drop into four taxonomies: (1) environmental, (2) management, (3) safety, and (4) diversity.

Within this context, Blowfield and Frynas (2005) have provided a framework to understand the various theories and positions that characterise CSR:

1. Companies have a responsibility for their behaviour toward others with whom they do business;
2. Businesses need to manage their relationships with the wider society;
3. Companies have a responsibility for their impact on society and the natural habitat; this is sometimes beyond the confines of the law, regulations and compliance.

While PSR and CSR can be perceived as separate and standalone entities, they can also be regarded as co-dependent. It is important that supply chain managers are cognisant of CSR, as they are are both the transmitters and the interpreters of organisational CSR policy and stakeholder engagement. They are often perceived as the vanguard intermediaries in relation to external stakeholders, which include suppliers, customers, and regulatory bodies (Carter & Jennings, 2000). This part of the chapterwill examine PSR, ethical considerations, legal responsibility, philanthropic considerations, and responsible business practice.

The research would suggest that purchasing managers who understand supplier relationships well can develop and enhance their knowledge about the drivers, barriers, and outcomes of initiating activities within areas of CSR, such as sourcing from EMB suppliers. Carter and Jennings (2004) postulate there are at least four significant and direct drivers to PSR:

1. People-oriented organisational culture that espouses values such as fairness and the desire to be a good corporate citizen;
2. Organisational policies that promote social responsibility;
3. Individual employee initiatives;
4. Pressures from external customers.

According to Shah (2014), all forms of procurement pursuit, regardless of its level, whether global, national, regional or local, will stimulate some form of economic reaction. It kindles entrepreneurial tendencies, generates innovation, and supports and creates employment opportunities whilst nurturing

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

growth within local, regional and national economies. There is a rudimentary presupposition that any economic benefits which can be derived from procurement activities can only be realised within their entirety when the inherent sourcing processes and practices of all purchasing organisations are inclusive and involve businesses from under-represented and disenfranchised groups such as EMBs.

The Road to Procurement Report, published by MSDUK in 2014, paid reference to the UK government's contracts finder portal which has been highlighted as a forum that affords greater visibility and opportunities for EMBs/SMEs. However, the paradox is that the portal does not collate any data regarding EMBs' diversity engagement, yet under the UK Equality Act 2010, public bodies must consider minorities within their budgets and expenditure.

Pearson et al. (1993) contend that sourcing minority businesses with the required capacity to supply corporations is often perceived as a significant barrier to supplier diversity. Procurement staff who participated within Pearson et al.'s (1993) survey of US corporations stated that it was the unavailability of qualified EMBs which was a major limiting barrier to supplier diversity engagement initiatives. This assertion was relatively consistent with the findings of Shah and Ram (2006), who assert that suppliers have experienced difficulties in locating minority suppliers who are 'willing, able and competent' to do business, and that this is a major challenge for the recipient organisations within their research. Smallbone et al. (2005) further suggest that one of the most distinguishing features of EMBs within the UK is their tendency to congregate and operate within low-value-added enterprises, which are often perceived as poorly skilled and low paid.

This contrasts with previous research that focused on the emergence of new areas of EMB activity, such as in business and professional services, IT, and hospitality and entertainment, often correlated with a transitional shift due to cultural, generational and social changes (Modood et al., 1995). Ethnic minority groups who were born and educated in the UK will have different social and cultural attitudes and experiences in contrast to their parents (Smallbone, 2005), and as such the historical and entrenched perceived views are somewhat outdated, contradictory and debilitating to EMBs which have the capacity and capability to fulfil potential opportunities.

Shah and Ram (2006) state that EMBs have also been perceived as being hindered because of their concentration in a comparatively small number of industries. Consequently, they were perceived to lack the relevant competence, expertise, specialist skills, flexibility, and sufficient capital. This assertion was based on perception and is not underpinned by any empirical data.

EMBs continued to be challenged by additional inhibitors, which further diminished their opportunities to be actively engaged within the corporate supply chain. Initially, EMBs were inhibited by a shifting trend towards supplier streamlining, as corporations continued opting out of working with smaller suppliers and chose to work with a limited number of larger suppliers, who were perceived as being more responsive and more adaptive to their needs.

The size and capacity of suppliers, particularly first-tier suppliers, have tended to increase. Large firms often streamline their operations by seeking larger first-tier suppliers that can deliver high volumes of the right quality at speed, and have substantial capital resources (NMSDC, 2002) to achieve economies of scale. According to Spend Matters (2016), organisations and their procurement teams have a propensity to operate within their comfort zones, as they continue to make purchases from their existing supply chain, which is often perceived as safer and more robust since it is larger. The same source goes on to assert that large organisations continue to operate with 'clumsy or biased selection processes' that make it difficult for new potential suppliers to penetrate.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The literature reveals that higher levels of PSR engagement can lead directly to improved levels of supplier performance, suggesting that PSR activities are more than just aesthetics that can be used for marketing campaigns which emphasise the firm's social responsibility. Instead, direct, tangible benefits result in the form of improved supplier performance (Carter & Jennings, 2000).

Ethical Considerations

Ethical supply chain management procedures consist of dependability and integrity in purchasing, diminishing packaging and waste, sense-checking the supply chain regarding its environmental performance, and developing eco-friendlier products (Walker, Sisto & McBain, 2008). The key consideration in this context lies with the honesty in making purchasing decisions.

Akhtar (2014) states that the ethical supply chain should locate itself at the nucleus of industrial integrity, sustainability and business excellence for long-term growth. Carter and Jennings (2004) posit that CSR has become synonymous with business ethics. They were also able to empirically categorise the CSR supply chain into specific compartments, notably the environment, diversity, human rights, philanthropy, and safety, but they found that ethical concerns relating to procurement represent a separate issue from CSR (Carter and Jennings, 2002a,).

The Institute for Supply Management (2005) has an expressed set of values which underpin its ethical position in the context of socially responsible purchasing behaviour. It has determined that specific areas, such as the use of confidential or proprietary information, impropriety, conflict of interest, power abuse, deception, influence, responsibility to the employer, reciprocity and special treatment, would be regarded as unethical practices. Any contravention or improper abuse of the supply chain process can impede an organisation's supply chain CSR policy and undermine their core values. Carter (2000a), on the other hand, offers up additional areas for consideration of unethical behaviour, such as bribery, gifts, preferential treatment, obscure or unfavourable contract terms, favouritism and retendering past due dates. In contrast, Cooper et al. (1997) observed that unethical issues relating to purchasing extend to exhibiting preference (bias) to one supplier over another, allowing personality bias to influence purchasing decisions, and failure to provide the same degree of responsiveness to one set of suppliers when contrasted with another. Maloni and Brown (2006) assert that other ethical issues should also be considered, such as professional competence, degree of legal compliance within the organisation, and the degree of promotion of disadvantaged and minority suppliers. To confound procurement issues further, Carter (2000b) found significant differences in perceptions of ethical issues between buyers and suppliers.

As noted by Blanton and Jaccard (2008), organisations may be subjected to an individual's own unconscious bias which may obscure purchasing decision and ethical consideration for EMBs and become an organisational limitation. Carroll (1979) asserts that business was designed by society to contribute to the economic system to satisfy its social function. The path and ground rules were set for the introduction of systems, laws and regulations to underpin the economic model by regulatory controls. However, the absence of ethical consideration for EMBs is a key challenge for EMBs within PSR.

Philanthropy

Business philanthropy is a tool designed within the confines of CSR, to enhance corporate legitimacy and standing. Chen et al. (2008: p.131) postulate that 'corporate philanthropy may be a tool of legitimisation'. They further contend that organisations that have undesirable social competency within the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

context of environmental matters and product safety will exploit philanthropic contributions as a means for building their legitimacy. Kamens (1985) posits that organisations may use philanthropy as a way to bolster their legitimacy through creating trust.

Porter and Kramer (2002: p.59) assert that organisations may well gain a competitive advantage because of the introduction of philanthropic activities, whilst those activities are aligned to causes where there is a 'convergence of interests' between the economic reward and the social benefit. Tokarski (1999: p.34) contends that strategic philanthropy is a process whereby organisations' contributions are directed to serve specific business interests. Whilst also servicing beneficiary businesses, it enables organisations to gain a competitive advantage and as a result enhances their financial position (Seifert et al., 2003). Bruch and Walter (2005) argue that companies will use philanthropy to enhance their competitive advantage through a mixture of external commercial activities and internal competence. Through a market alignment, organisations devise their philanthropic pursuits to meet commercial demands and stakeholder expectations.

Organisations that are able to adopt a competency-based approach for their business and can underpin their philanthropic activities with their core competencies will have a greater capacity to derive competitive advantage. 'In so doing, they avoid distractions from the core business, enhance the efficiency of their charitable activities and assure unique value creation for the beneficiaries' (Bruch and Walter, 2005: p.50). Consequently, firms can improve their competitive advantage through 'improved marketing and selling capabilities, higher attractiveness as an employer or better relationships with governmental and non-governmental organisations' (Bruch & Walter, 2005: p.50).

CONCLUSION

A number of themes have emerged from the analysis of CSR and how it has shaped corporate diversity engagement within the procurement supply chain amongst ethnic minority businesses within the public and private sectors in the UK. We offer up a series of observations and conclusions that can be derived from this Chapter, According to Nwagbara and Reid (2013), in order for organisations to be perceived by other stakeholders as CSR acquiescent, they must habitually continue to revaluate their business models by developing new ways of thinking and learning new methodologies to act in socially responsible ways in congruence with the ever-chainging macro-, micro- and socio-economic environment. CSR can and does play a crucial role in preserving the ethical, legal and political interface between organisations and EMBs, by mitigating this unconcious bias that exists, so that organisations can operate as intended, for the good of the people, profit and the planet.

In addition, it seems evident that a CSR and PSR procedure can enhance the profitable element of corporate strategy, underwriting risk management and preserving relationships that engender long-term economic sustainability.

Economic Performance

This chapter contends that there is a correlation between diversity and the economic performance of corporate organisations that actively engage EMBs in their supply chain. This relationship is likely to gather momentum as businesses continue to operate within a global market economy (Hunt et al., 2015). The chapter also asserts that EMBs are making a significant contribution to the supply chain and for the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

economic prosperity of corporate and non-corporate entities. However, it is evident that there are inherent barriers and constraints that exist for EMBs. These disparities persist despite corporations upholding their positions regarding CSR policies. McKinsey's (2015) diversity report argued that correlation does not equal causation, contending that greater gender and ethnic diversity in corporate leadership does not automatically translate into more profit. Yet the correlation does indicate that companies that commit themselves to diverse leadership are more successful than those organisations that do not.

Whilst there are no guarantees that having an EMB within the supply chain engenders better performance, explicit data and implicit postulations would support this assertion. McKinsey's report states that organisations that actively engage with EMBs within their supply chain are better equipped to win more business, attract better talent and operate seamlessly within a diverse global economy which has inherently diverse consumers. Operating with a global mindset and with cultural alacrity will offer a degree of competitive advantage for companies that can engage EMBs within their supply chain. Operating with a diverse supply chain and diverse employees makes good economic sense. Creating equality within the supply chain will ensure that procurement teams within both the private and public sectors have access to the best available talent pool, resources, flexibility and commercial terms. The imbedding of PSR behaviour will underpin and be congruent with the organisation's CSR policies.

The formation and integration of EMBs in the supply chain will intensify and underpin CSR policy within organisations and enhance their economic prosperity. In addition, it will address the inherent imbalance that exists, help to develop socially and economically challenged communities, and redress this imbalance and disparity of wealth creation and sustainability. This Chapter contends that the adoption of CSR policies will enhance an organisation's brand reputation. It also suggests that there is a correlation between a positive brand image and competitive advantage, through influencing the customers' decision-making process. Brand equity will also enable organisations to derive a competitive advantage over their competitors in a market where goods or services alone are no longer good enough to retain or attract new clients (Gobe, 2001).

Purchasing Social Responsibility (PSR)

This chapter also contends that procurement departments have an ethical, legal and economic obligation to their organisation to ensure that they adopt best practice in relation to PSR. PSR forms part of the symbiotic relationship with CSR and it is important that supply chain managers are cognisant of their CSR roles and responsibility. They play a critical role in the delivery of CSR policies as they are both the transmitters and the interpreters of organisational CSR policy and stakeholder engagement. They are recognised as the intermediaries in regard to external stakeholders, which include suppliers, customers, and regulatory bodies (Carter & Jennings, 2000). Trust in turn leads to cooperation between buyers and PSR suppliers. Eventually, the cooperation between buyers and their PSR suppliers increases supplier performance. When PSR buyers trust their suppliers' activities, they are more willing to cooperate by providing assistance to these suppliers and jointly solving problems as they arise. The analysis suggests that cooperative strategic relationships with EMBs are a precursor for delivering results that exceed those that the buying organisation might have achieved by acting independently and solely in its own best interests. For procurement managers, these findings imply that closer cooperation with EMB suppliers through PSR initiatives can result in improved performance by these suppliers in such areas as product quality and lead times (Carter & Jennings, 2000).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Unconscious Bias

The analysis and the literature reinforce the assertion that unconscious bias exists within organisations despite their endeavour to present a picture of cultural equity and objectivity underpinned by a legal, structural and CSR environment in which they operate. There is an inherent discord between the individual's own beliefs and values and those of their organisation's CSR and PSR policies.

Unconscious bias is a complex, dynamic, psychological paradox which has racial ramifications that impact both the organisation and the individual's wellbeing. It is not improbable to suggest that individual or collective buyers may not have the mental capacity to separate their own unconscious bias, beliefs and values when considering purchasing decisions and engaging EMBs.

Culture has been described as the 'collective programming of the mind' of norms, beliefs and values that distinguish one entity from another. Where an organisation has demonstrated institutional racism, and where racism is embedded into the culture so acutely, employees may fail to recognise the racial repercussions of their actions. An employee's perception will often be influenced by their social interactions, media, peers, family and friends, and these actors will all contribute to the shaping of unconscious racially biased behaviour. Lawrence (1987) asserts that where many of a group's members have little or no contact with EMBs, stereotyped perceptions of EMBs are formed, and these perceptions manifest in the form of illusory correlations between EMBs, which become the 'triggers' for negative behavioural episodes involving distorted stereotypes. As determined within the literature, a stereotype is a retained distorted memory and stereotypes cause discrimination by influencing how individuals process and recall information about other people and EMBs.

Philanthropic Consideration

Organisations that are able adopt a competency-based approach for their business and can underpin their philanthropic activities with their core competencies will have a greater capacity to derive their competitive advantage. 'In so doing, they avoid distractions from the core business, enhance the efficiency of their charitable activities and assure unique value creation for the beneficiaries' (Bruch & Walter, 2005: p.50).

Marketing and Brand Equity

Organisations that actively engage with EMBs can improve their competitive advantage through 'improved marketing and selling capabilities, enhanced image as an employer, and they are able to build better relationships with governmental and non-governmental organisations'. As a result, they generate greater brand equity which in turn affords them a greater level of competitive advantage (ibid.).

Organisational Culture

Strategy and culture between an organisation's sustainability initiatives and its corporate strategy must be closely interconnected, rather than separate philosophical paradigms that co-exist independently of one another (Shrivastava, 1995a). When an organisation is able to align its organisational culture with its strategic objectives in relation to CSR and PSR, it will become the recipient of enhanced social, economic and ethical equity within a wider society whilst concurrently fulfilling their CSR obligations to work with EMBs. Organisations that embrace CSR and PSR policies and integrate them as part of their

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

organisational culture will derive a greater competitive advantage, increase brand equity and improve their economic prosperity.

Today, a mindset-shift is required as more responsible governance and business practice is necessary to mitigate unconscious bias that exists within both the public and private sectors. This will enable businesses to benefit from greater social equity, which will underpin longer sustainability. Whilst CSR, PSR and diversity engagement are legitimate tools that are designed to act as the social organisation's conscience, to be philanthropic, there is a significant risk that they can become a conceptual hallucination that permeates throughout the organisation subconsciously to satisfy stakeholders and the business's bottom line of profitability

ABSTRACT

This chapter presents a knowledge management and Ergonomics implementation in manufacturing systems, through the development and validation of a critical success factors questionnaire. The instrument developed measures the frequency of inclusion of critical success factors for the implementation of Ergonomics and its benefits, validated in the manufacturing industry. The frequency is based on a five-point Likert scale. So far, no instrument able to measure such factors has been found in the literature. The questionnaire comprises 73 questions presented in four main stages: planning, process startup stage, work improvement cycle and long-term development. In addition, it contains a section of benefits regarding health and safety, operational and quality of life at work. The instrument was validated through a pilot test involving 140 participants from seven companies in the manufacturing sector of Ciudad Juárez, Chihuahua, México, through the use of an intentional selective method.

INTRODUCTION

The word Ergonomics comes from the Greek word "ergon," meaning work, and "nomos," meaning law. Thus, Ergonomics means "the law of work" (Bridger, 2003). Today, Ergonomics is an accepted term worldwide. This science focuses on improving the interaction between people and the things and environments around them (Wilson, 2001). Ergonomics includes a large amount of knowledge and techniques and involves the work of professionals such as physicians, engineers, psychologists, sociologists, industrial designers, and others (Karwowski, 2012). The relevance of Ergonomics' lies in that it is focused on the design of products, systems and environments that will cater for human beings' capacities and limitations, thus guaranteeing an effective man-environment integration (Álvarez-Zárate, 2013).

Ergonomics is a science that seeks to achieve balance among work environment, tools, tasks and human beings. It is supported by other disciplines such as engineering as well as other physical, biological, social, and human behavioral sciences (Fernandez et al., 2010). In the industrial sector, Laos et al. (2007) describes Ergonomics as the science responsible for adapting the work to the worker. Its goal is to adequate space, products and systems to people's capacities and needs (Harne & Deshmukh, 2016). Today, corporations are leaning on ergonomics to design *programs* that will decrease or eliminate the risk of musculoskeletal disorders in workers. Such programs will yield benefits such as lowering the costs generated by workers' absences due to sick leaves (Fernandez et al., 2010; Haines & Wilson, 1998). On the other hand, when employees feel uncomfortable or unsafe, conditions such as dissatisfaction, lack of motivation, staff rotation, low productivity, and accidents are likely to occur (Portillo, Gomez, Palacios & Gutierrez, 2009). For all these reasons, implementation of Ergonomics is of utmost relevance within corporations.

PROBLEM STATEMENT

In the twenty-first century, knowledge management is a key topic for companies as it allows them to grow and increase their profit margins (Harrington & Voehl, 2007). Thus, companies have increasingly recognized the value of knowledge management (Yew Wong, 2005). Furthermore, they have placed knowledge management as an essential element to improve and maintain competitiveness in the market (Yew Wong, 2005). Today, success factors are considered part of knowledge management (Alazmi & Zairi, 2003). According to Bullen & Rockart (1981), Critical Success Factors (CSFs) are defined as those key activities in a process, which are necessary for objectives to be reached. Likewise, Gauthier & Lagacé (2015) emphasize that critical success factors are the key elements that make the difference between success and failure in projects.

Currently, it is a common view that companies pursuing competitive advantage need to improve their performance by providing more human-compatible working systems, which results in a decrease in health and safety problems (Fernandez, Marley, Noriega, & Ibarra, 2010). Ergonomics is a good way to provide compatibility between human and working systems. Regarding the CSF concept, several authors have identified factors that lead to a successful implementation of Ergonomics. For example, the management's commitment, rewards to workers, communication and feedback on tasks delivered, and training are all CSFs that contribute to a safe work environment (Vredenburgh, 2002). In addition, investigations have found some benefits of Ergonomics such as a more comfortable work environment,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

a decrease in the accident rate, chronic fatigue, and the related costs of waste and rework, an increase in morale, productivity and good product quality (Beevis, 2003; Rajanen, 2003; Rensink & van Uden, 2006).

One of the principles of knowledge management establishes that all the tools and knowledge needed to make decisions can be available for managers (Flouris & Oswald, 2006). Thus, this research presents the development and validation of a questionnaire as a tool to determine the critical success factors involved in the decision-making regarding ergonomics implementation. The importance of this questionnaire lies in that, through its application, companies will be able to increase their knowledge regarding employees' perception of how Ergonomics is being implemented within the company. It will also allow managers and researchers to see trends in the data and make useful inferences from them. In addition, the results can be used to perform mathematical and structural models between the effects of critical factors, their costs and their benefits. Finally, the critical factors can be of use in spreading results for the elaboration of manuals or in guiding Ergonomics implementation.

OBJECTIVES

The main goal of this research is to design and validate a questionnaire for the critical success factors (CSF) and benefits of Ergonomics programs in the exporting manufacturing industry. The aim of the questionnaire is to collect information regarding the critical factors and the benefits resulting from the implementation of Ergonomics programs.

SCOPE AND BOUNDARIES

The questionnaire was applied to personnel from the exporting manufacturing industry in Ciudad Juarez, Chihuahua in order to be validated. This city is one of the top ten manufacturing cities in Mexico. The city holds the first place in the generation of industrial jobs per capita and it is responsible for 20% of the nation's employment rate. In addition, the industry established in Ciudad Juarez contributes with 1.8% to the country's Gross Domestic Product (GDP), with sales averaging nine billion dollars a month and with 7 billion dollars in monthly imports (*Municipal Institute of Planning*, Instituto Municipal de Planeación, 2014). In addition, it hosts 310 industrial manufacturing companies (INEGI 2010, *Municipal Institute of Planning* 2014, Ministry of Labor and Social Security 2014). This industry is the fourth place nationally in employment generation, occupying 250,577 people (INEGI 2010, *Municipal Institute of Planning* 2014, Ministry of Labor and Social Security, 2014).

About the sample, it comprises only middle and senior managers, as they are key elements in the development and performance of organizations. They possess knowledge about the companies' financial aspects and are responsible for achieving main goals. The questionnaires were administered between May and October 2016. Moreover, while this research focuses on identifying the CSFs, and their resulting benefits, it does not attempt to make recommendations regarding how to establish or implement an Ergonomics program. Instead, it suggests resorting to the professional advice of an ergonomist, a consultant or a specialist in the field.

Regarding the constraints posed by the industries, the confidential nature of the information made the administration of the questionnaire difficult as it restricted the size of the sample; however, the intentional sampling method was used during the investigation to attain an acceptable sample size. Furthermore, in

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

every research there may be errors or falsehoods in the interviewee's response, mainly for two reasons: respondents are unable to give a reliable or valid answer, or they may wish to give a wrong answer (Chica & Costa, 2006). In this manner, procedures for reliability testing of questionnaires are highly recommended. Regarding the participants, they responded to the questionnaire on a voluntary basis and were asked to fill out the questionnaire as honestly as possible. They also signed the due consent so that reliable indicators could be obtained.

LITERATURE REVIEW

Ergonomics Program

According to the Occupational Health and Safety Administration and the American Apparel and Footwear Association (2007), most companies have heard about Ergonomics. However, there is a need for a more complete view of Ergonomics implementation; therefore, it is necessary to learn more about this science and the added value it brings to the operation. The objective of the ergonomist is to develop systems and products that may increase productivity, and minimize the risk of injury and illness in workers (Fernández et al., 2010). It is important that companies design and make programs improve working contidions to prevent workers from being injured (Portillo, Gómez, Palacios & Gutiérrez, 2009).

One of the ways companies have implemented Ergonomics has been through Ergonomics programs constituted by a multidisciplinary team (Snook, 1993 cited by Bolis & Sznelwar, 2016). Implementation of such programs requires of effective planning material, human and economic resources. Several authors have described the methodology that must be carried out in order to implement Ergonomics.

According to Joseph (2003), an Ergonomics program needs to be constantly reviewed and updated. Also, Joseph (2003) identifies the following conditions for improvement:

- Participants ought to receive advanced ergonomics training.
- The ergonomics committee needs to communicate ergonomics. The success of the implementation of Ergonomic lies in a reactive and pro-active vision.
- Participants need to constantly review and improve the process.

The Ohio Bureau of Workers' Compensation (2002), describes that in order to establish an ergonomics program, it is necessary to have the directors' commitment as this will provide the necessary resources to ensure the program's success.

Additionally, Stuart-Buttle (2006) explains that management's commitment and employee participation are essential elements for the implementation of an ergonomics program and when companies present considerable amount of work-related medical cases, it would be important to emphasize this component early in the program's development. Another important activity involved is education about ergonomics at the beginning of a training plan. Finally, once Ergonomic training and education are completed, it would be important to establish an effective system to evaluate the new designs and continuous improvement.

Figure 1 shows a diagram of the elements in an Ergonomics process from the perspective of a small company.

Critical Success Factors for Ergonomics in Industry

Globalization, foreign competition, challenges and changes in technology have affected companies. To stay in the market, many companies have needed to look for information. This information should be simple and clear to help managers in planning and making decisions (Bullen & Rockart, 1981 cited by Lehman & Ruzich, 2016). Similarly, critical success factors provide concise and useful information for these purposes aswell (González & Rodenes, 2007). The following lines present critical factors or key elements for the implementation of Ergonomics in organizations:

- OSHA has identified several factors that influence the correct implementation of Ergonomics; among them are: Management support; Workers' involvement; Training; Problem identification; Early notification of musculoskeletal disorders; Implementation of solutions to control the risks; and Progress evaluation (Occupational Health & Safety Agency, n.d).
- Ip & Rostykus (2014) indicate five key elements: Target cause, Common goal, and Top down approaches. Additionally, accomplish a Familiar system by means of Regular checks.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Payne (2003) explains that the most important factor is workers' commitment. In addition, the same author describes activities to involve workers, for example training, observation and feedback, review of new designs, evaluation of work areas, check the stations and participation in problem solving.
- Alexander & Orr (2006) made a list of success factors that will make an Ergonomics program effective.The study integrates four groups of critical factors:
  - Know the needs of the business.
    - Emphasize business objectives.
    - Avoid too many low value or high cost solutions.
    - Ensure that ergonomics evaluates projects.
    - Maintain tabulation of project costs.
    - Use resources efficiently.
  - Avoid common traps.
    - Identify and overcome barriers.
    - Support training with adequate infrastructure.
    - Avoid the use of "ergo-interference".
  - Create a strong purpose.
    - Be clear about the purpose of the Ergonomics program.
    - Plan the stages of the culture change towards Ergonomics.
    - Create a strategic plan.
  - Maintain the program.
    - Understand the difference between an Ergonomics program and the practice of Ergonomics.
    - Create a tactical plan.
    - Ensure regular quantitative evaluations of the overall ergonomics program.
    - Do not wait for the top management to let the program down.
    - Maintain political support.

Accordingly, the authors describe that critical success factors are activities that can support companies in prioritizing, planning, and managing and allocating resources. However, there is no consensus among success factors.

Benefits of an Ergonomics Program

According to the authors, an Ergonomics program in industry results in greater employee empowerment in the activities they do, increased learning, and an easier acceptance of changes (Hägg, 2003; Vink, Koningsveld, & Molenbroek, 2006 cited by Bligård et al., 2014). Some of the benefits that authors have identified are explained in the following paragraphs.

- Rensink & van Uden (1999) outlined 41 benefits, classified in 8 main areas: 1. organization, 2. maintenance, 3. reliability, 4. safety, health, 5. environment, 6. legislation and 7. staff turnover. The Rensink & van Uden (1999) study was carried out at a petrochemical plant.
- In their study, Rodríguez & Díaz (2007) found that a safe working environment leads to employee motivation and the latter affects productivity. Thus, a motivated employee works more efficiently.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The main benefit established by managers is the reduction of health problems (Jenkins & Rickards, 2001 cited by Dul & Neumann, 2009).

Consequently, the authors have classified benefits according to different perspectives: organization, health, safety, environment, legislation and personnel rotation.

Questionnaires for Safety and Ergonomics

One of the most important resources that are available for research are questionnaires (Hague, 2006). These instruments are commonly used to collect information about a phenomenon (García, 2004; Hernández-Sampieri, Fernández-Collado, & Baptista-Lucio, 2010). Also, they help to measure one or more variables mainly by means of questions (Hernández-Sampieri et al., 2010). The success of a questionnaire depends on the accuracy and easiness of responses. In addition, seven steps must be followed in order to carry out a questionnaire effectively (Hague, 2006):

1. Decide what information to bring.
2. Make a list of the partial questions to be asked.
3. Redefine the planned questions.
4. Make an appropriate format for the questions to be planned.
5. Order the questions.
6. Complete the integral design of the questionnaire.
7. Present and review.

Some authors have used questionnaires to detect problems in aspects of safety and Ergonomics:

- Portillo et al., (2009) conducted a survey with 13 questions through which they detected factors that cause accidents and injuries in the workplace. The factors discovered were related mainly to environmental ergonomics (lighting, noise, temperature and vibration). The instrument was applied in an automotive manufacturing company. The results of the survey indicate that the factors that cause a greater number of accidents are lack of guards (57%), distraction of operators (40%) and lack of training (30%).
- DePasquale & Geller (1999) conducted a questionnaire to measure employees' perceptions of safety, trust in management, accountability, participation in training, and tenure with the organization. In the study, they observed that companies that required employees to participate in safety issues reported increased participation, trust between management and colleagues, work satisfaction and positive behavior.
- Azadeh, Mokhtari, Sharahi, & Zarrin (2015) carried out an investigation to determine relationships between decision styles and the failure of decision making in risk situations. To demonstrate the model, they used a questionnaire which covered aspects such as health, safety, environmental and ergonomic problems. The instrument was administered to operators of an oil refinery. The end result was a model that proposed that successful decision-making was achieved when the best operator was involved in consensus with a team. In addition, the authors stated that this was the first study to identify decision-making styles regarding ergonomics, safety and hygiene factors.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In previous investigations, the authors highlight the usefulness of a data-collection instrument and the methodologies for determining factors. In the present investigation, the questionnaire is an important tool for critical success factors determination and benefits of Ergonomics implementation.

METHODOLOGY

This section describes the methodology that will be carried out throughout this research. Based on the information regarding critical success factors and the benefits of Ergonomics programs proposed by different authors, a questionnaire was devised to gather reliable information in order to determine CSFs from the perspective of the exporting manufacturing industry. The following aspects, described by Martín-Arribas (2004), were considered in order to develop the questionnaire:

1. Definition of the constructs or aspects to be measured
2. Purpose of the scale
3. Composition and number of questions
4. Content (dimension assessment)
5. Definition and ranking
6. Bias prevention
7. Codification of answers
8. Question scoring
9. Validation process

RESULTS

The following results were obtained based on the aspects recommended by Martín-Arribas (2004) for the Questionnaire development and validation.

Definition of the Constructs or Aspects to be Measured

When developing instruments such as questionnaires, the literature review is always the starting step in order to define the variables to be measured. The goal is that the variable (construct) can be defined properly. Table 1 shows a list of the main success factors described by authors. As can be observed, factors such as management commitment, involvement of the operating staff, training and providing feedback of ergonomic process are frequently mentioned in literature. Additionally, conducting risk analysis, implementing solutions, designating a committee and ensuring communication are found to be important factors for a successful implementation of Ergonomics in companies.

Table 2 presents a list of benefits of adopting an Ergonomics program. The authors as one of the main benefits of Ergonomics recognize a reduction in the rate of accidents, injuries or work diseases.

In addition, a reduction in the rate of employee compensation, the elimination/reduction of employees' physical/mental stress, and a decrease in waste and rework are frequently mentioned in literature. Increment in productivity, participation and employee morale throughout the organization can be considered as companies' most wanted benefits as well.

Purpose of the Scale

This section defines the questionnaire's target sector as well as the administration procedure and format. According to the National Council of the Manufacturing Industry of Exports (Consejo Nacional de la Industria Maquiladora de Exportación A.C., n.d.), the manufacturing industry provides1.8% of the Gross Domestic Product and generates a monthly average of 9 million dollars, which is an important reason for the interest in this sector.

Improvement in product quality and equipment maintenance	x					x	x	3
Reduction in errors	x					x		2
Efficient use of work time	x					x		2
Increase in productivity		x	x	x	x		x	5
Decrease in lost days due to accidents, injuries or occupational diseases	x				x		x	3
Reduction of waste and rework	x			x	x	x	x	5
Improvement of Company's image / reputation	x							1
Prevention / Reduction of Warnings / Sanctions by Authorities	x							1
Investment recovery and reduction in delays	x				x			2

List of authors: 1. Rensink & van Uden (1999); 2. Occupational Safety and Health Association & American Apparel and Footwear Association (2007); 3. Occupational Safety and Health Association Oregon (2013); 4. Stanton & Baber (2003); 5. Goggins, Spielholz, & Nothstein (2008); 6. Joseph (2003); 7. Munck-Ulfsfält, Falck, Forsberg, Dahlin, & Eriksson (2003).

The questionnaires were administered digitally through the use of Survey Monkey and Google Forms. They were administered in printed form as well. The questionnaire's format was devised following the stages suggested by Liker & Chaffin (1984). Figure 2 shows the stages corresponding to Ergonomics implementation.

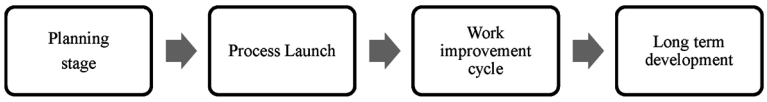
Figure 2. Stages for the implementation of an Ergonomics program
Source: Liker & Chaffin (1987).



Composition and Number of Questions

This section refers to the questions or items under each construct (which is a variable that cannot be measured directly). This section includes the type of question to be used and whether questions will be open or closed-ended. The latter ones were chosen, since answers can be either specifically selected or scale-based (Hague, 2006) and because they fulfill the purpose of measuring the frequency of activities and practices for CSF determination. Finally, the number of questions under each construct must be at least between 3 and 4 questions (Martín-Arribas, 2004). Table 3 shows the stages, the constructs and the number of questions making up each construct.

Table 3. Questionnaire's composition

Stage	Construct	Number of Questions
1. Planning Stage	Planning costs	5
	Prevention activities	5
	Work environment	6
	Management's commitment	6
2. Process Launch	Organization	5
	Work training	5
	Project launch costs	5
3. Work Improvement Cycle	Identification of work priorities	5
	Risk assessment	5
	Solution development	6
	Cost of implementation	5
4. Long-Term Development	Project's cost-benefit analysis	5
	Follow up on health and safety	5
	Feedback	5

Content (Dimension Assessment)

This section refers to the content of the questionnaire where the researcher defines whether he will evaluate a single dimension (unidimensional) or several (multidimensional). In the case of this questionnaire, the content is multidimensional since several dimensions are evaluated.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Definition and Ranking

As for the formulation and arrangement of each question, Arribas (2004) offers some suggestions regarding the construction of questions.

Bias Prevention

Bias prevention is related to the avoidance of tendency-causing errors such as: locating the answers in the center, responding on the basis of what is known as socially acceptable, responding based on previously given answers and finally giving an equal score on all questions.

A consent form was given to the participants so that they could answer the questionnaire in all liberty and assurance. In such form, the respondents are assured that their participation is voluntary, that the answers obtained will be used for academic purposes only, and that all the information that they share will be anonymous.

Codification of Answers

This refers to the type of responses, which can be dichotomous: Yes or No, or True or False; Polychotomous: I am discontented with myself / I do not value myself / I hate myself / I am satisfied with myself; and analogy questions: using scales. Analogy questions were chosen in this case. A score on the Likert scale will be given in order to measure the frequency with which activities are performed.

Question Scoring

This aspect refers to the scoring system, which can be simple or weighted. Simple scoring is obtained through the sum of the correct answers or the sum of the values given to each option. The weighted score or weighted questions refer either to when the value of each answer option vary or the correct questions differ in their value.

With regards to the scoring, simple scoring was selected. Table 4 shows the Likert scale used to answer the questions. This type of scale has been used satisfactorily in other studies (Aromaa & Väänänen, 2016; Yeow & Nath Sen, 2003). In this case, a 1-5 Likert scale was used to measure the frequency of the activities for Ergonomics implementation.

Table 4. Likert scale of the instrument

Value	Frequency of Activities
1	Never
2	Almost never
3	Sometimes
4	Frequently
5	Always

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Validation Process

In this step, Martín-Arribas (2004) suggests conducting a pilot test and an evaluation of the metric properties of the instrument. First, experts who, based on their experience, agreed about the appropriateness of the instrument, questions and scale (Aguirre, 2003 quoted by Vargas-Porras & Hernández-Molina, 2010) performed the validation. For this study, the following actions were performed:

1. The phrasing and the structure of questions were reviewed by three Ph. D degree research professors from the Universidad Autónoma de Ciudad Juárez (Autonomus University of Ciudad Juarez).
2. The content and clarity of the questionnaire, as well as other suggestions were made by experts. One member of the SEMAC (Mexican Association of Ergonomists), two researchers from the Instituto Tecnológico de Sonora (Technological Institute Of Sonora), three college Ergonomics professors from the Autonomus University of Ciudad Juarez and one safety and health consultant with more than 10 years of experience participated in this step.

After a very meticulous review process, corrections were made, and a final version of the questionnaire was drafted for its application.

Pilot Test

A pilot test was performed on a sample of 140 participants using the intentional sampling method according to (De Souza-Lauretto, Nakano, Bragança-Pereira, & Stern, 2012). Missing values were replaced by the median value of the sample according to (Garcia-Alcaraz & Maldonado-Macias, 2016).

Out of those 140 participants, 85% work in the automotive sector, while 12.14% belong to the electrical and electronics sector. These results are shown in Table 5. In addition, the participants' positions results are shown in Table 6.

Table 5. Participants by industrial sector

Sector	Participants	Accumulated Percentage
Automotive	119	85.00%
Electronics	17	12.14%
Home appliances	1	0.71%
Plastics	1	0.71%
Pipe and Hose Systems	1	0.71%
Telecommunications	1	0.71%
Total	140	100.00%

Table 6 shows that participants in an engineering position make up a total of 46.38%, which is highly important due to the interaction they have with Ergonomics.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 6. Participants by position in the company

Job	Participants	Accumulated Percentage
Engineer	64	46.38%
Technician	17	12.32%
Supervisor	15	10.87%
Intern	10	7.25%
Manager	7	5.07%
In charge	6	4.35%
Assistant	5	3.62%
Analyst	3	2.17%
Buyer	3	2.17%
Storer	2	1.45%
Coordinator	2	1.45%
Controller	1	0.72%
Designer	1	0.72%
Coach	1	0.72%
Glider	1	0.72%
Total	138	100.00%

Table 7. Validation of the elements included in the questionnaire

Element	Number of Questions	Cronbach's Alpha
Planning Costs	5	0.733
Prevention Activities	5	0.829
Work Environment	6	0.844
Management's Commitment	6	0.862
Organization	5	0.911
Training	5	0.815
Project Launch Costs	5	0.889
Job prioritizing	5	0.871
Risk Assessment	5	0.828
Solution Development	6	0.867
Implementation Costs	5	0.828
Project's Cost-Benefit Analysis	5	0.882
Follow-up on Health and Safety	5	0.871
Feedback	5	0.885
Health and Safety Benefits	11	0.933
Benefits in the quality of life at work	15	0.983
Operational Benefits	16	0.977

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Elements, number of questions and results of the reliability index are shown in Table 7. The average Cronbach's alpha value index for all elements of the questionnaire was 0.985, which exceeds the minimum acceptable value based on George & Mallery (1995). In this manner, a value greater than 0.9 is excellent, one greater than 0.8 is good, one greater than 0.7 is acceptable, one greater than 0.6 is questionable, one greater than 0.5 is poor, and one lesser than 0.5 is unacceptable. Also, Gliem & Gliem (2003) indicate that a Cronbach's alpha index value greater than 0.8 is a good score. Based on these results, the questionnaire can be a reliable instrument for gathering data for knowledge management of the critical success factors for Ergonomics implementation in manufacturing systems.

CONCLUSION AND RECOMENDATIONS

As conclusions, the questionnaire was successfully developed on CSFs determination and the benefits of Ergonomics implementation. So far, no single questionnaire had been found which combined knowledge management of the success factors with the benefits of Ergonomics. Additional conclusions can be made.

- The questionnaire results show employees' perceptions regarding the way Ergonomics is being carried out within the company.
- The questionnaire allows data collection in order to conduct a statistical analysis and inferences.
- For researchers, the instrument represents a tool to develop mathematical and structural models that combine the effects of critical success factors, their costs and their benefits.
- The results of the questionnaire allow companies emphasize on those activities that truly contribute to the success of Ergonomics implementation and the enjoyment of its benefits.

The following recommendations are given for future researchers and interested parties:

- Include, eliminate or design questions that might improve the reliability index value (Cronbach's alpha) of the constructs in new versions of the questionnaire.
- Administer the questionnaire in a greater number of companies either within Mexico, the United States or other regions.
- Develop models through structural equations in order to explore relationships between constructs.
- Spread the procedures and the CSFs so that more companies implement Ergonomics and enjoy the benefits it brings to the employees, companies and their clients.

APPENDIX

This appendix contains the Questionnaire to determine the Critical Success Factors and Benefits of the application of Ergonomics in the manufacturing industry in Ciudad Juarez.

The content of the questionnaire was integrated by four sections: consent, general information, critical activities, and benefits. The consent explains to the participant that all answers are confidential, including the company's name and that the results will be reported on anonymously and for academic purposes only. The items in the general information are:

- Company sector where the interviewee works
- Position
- Gender
- Salary (monthly)
- Years of experience in his/her position

The third section is the questionnaire. According to the results of the methodology, the questionnaire uses a Likert scale that measures the frequency of activities and is formed by four stages in and three benefits of the Ergonomics program. In addition, Tables 8, 9, 10 and 11 present the critical activities of each of the stages, while Tables 12, 13 and 14 show the benefits.

Table 8. Critical activities of the planning stage

Planning Stage	**Scale (1-5)**
Indicate how frequently the following activities for the implementation of Ergonomics are carried out in the company.	
Planning Costs	
Records are kept and costs are considered in regards to:	
01. Employees' work-related leaves of absence, accidents, injuries or illnesses	
02. Absences of employees on sick leave due to work-related causes	
03. Medical care (internal and external, including specialized care) due to work-related injuries or illnesses	
04. Fines by Social Security, the Ministry of Labor or other agencies	
05. Training of the new employees who replace those injured and/or on sick leave due to work-related accidents or diseases	
Prevention Activities	
06. Creation of adequate and comfortable work conditions for the employees	
07. Appointing employees to a site, area or workstation to accommodate their capabilities and limitations	
08. Arranging the purchase of adequate and safe machines and tools to accommodate the employees' capacities and limitations	
09. Regular medical evaluations of the company's employees	
10. Rest times are scheduled according to the employees' mental and physical weariness resulting from the activities they perform	
Work Environment	
11. Decrease in complaints related to work conditions	

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Planning Stage	Scale (1-5)
12. Improvement of the plant's layout	
13. Identification of ergonomic risk factors in the work environment	
14. Analysis of the implementation of automation in operations which are risky for humans	
15. Decrease in human errors during tasks	
16. Identification and reduction of the task information burden	
Management's Commitment	
17. Frecuency of the Directors' commitment	
18. Encouragement of employee-manager relationships	
19. Appointment of resources to avoid work disabilities, accidents or injuries	
20. Compliance with the regulations and the Law in Mexico	
21. Strengthening of competition in the market	
22. Compliance with new Ergonomics standards (proactive approach)	

Table 9. Critical activities of the process launch

Process Launch	Scale (1-5)
Indicate how frequently the following activities for the implementation of Ergonomics are carried out in the company	
Organization	
23. Development of a work plan for the person or group (committee) in charge of Ergonomics	
24. Documenting of the activities carried out or write Minutes (in the case of a committee)	
25. Implementation of a work plan for the person or group (committee) in charge of Ergonomics: Activities to ensure communication between the person or group (committee) in charge of Ergonomics:	
26. and the management	
27. and the employees	
Training	
Training activities in:	
28. Topics only, (without explaining any real cases)	
29. Real case studies with the person or group in charge of Ergonomics	
30. The writing of Ergonomics manuals or guidelines	
31. The use of Ergonomics-specialized computer programs	
32. Conducting post-training assessments of Ergonomics	
Project Launch Costs	
Records are kept and costs are considered regarding:	
33. The promotion of the Ergonomics program in the company	
34. The time to hold meetings	
35. Buying Ergonomics-specialized software	
36. Training in the use of specialized software	
37. The teaching and training in Ergonomics topics (congresses, specializations, master's and PhD degrees, etc.)	

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 10. Critical activities of the work improvement cycle

Work Improvement Cycle	Scale (1-5)
Indicate how frequently the following activities for the implementation of Ergonomics are carried out in the company.	
Identification of Priority Work	
Priority is given to those departments or stations where:	
38. Employees make repetitive movements in non-neutral postures, extreme temperatures or vibration	
39. There is a higher rate of accidents, injuries and / or occupational diseases	
40. Based on the recommendations of the medical services	
41. There are new processes, materials, equipment, tools and workstation.	
42. Based on comments and employee involvement	
Risk Investigation	
Risk identification by means of:	
43. Tours	
44. Use of questionnaires	
45. Interviews	
46. Analysis by an Ergonomics method (REBA, RULA, OWAS or others)	
47. Use of Ergonomics-specialized software such as Ergonomics Analysis, Jack and Process Simulate Human, among others	
Solutions Developments	
Solutions are developed by:	
48. Person in charge or the Ergonomics group and employees' opinions	
49. Person in charge or the Ergonomics group and area manager	
50. Use of Ergonomics-specialized software	
51. Research (scientific articles, internet files, etc.)	
52. Person in charge and experts (consultants, ergonomics or university experts)	
53. Compilation of ideas and information by comparing aspects within or outside the company (Benchmarking)	
Implementation Costs	
Records are kept and costs are considered:	
54. For the purchase of tools	
55.To buy equipment or machines (either automatic or semi-automatic)	
56. By an expert (consultant, ergonomist, universities, etc.)	
57. When a line or station stops because a finding has been detected	
58. For the purchase of software to identify solutions	

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 11. Critical activities of long-term development

Long-Term Development	Scale (1-5)
Indicate how frequently the following activities for the implementation of Ergonomics are carried out in the company.	
Cost-Benefit Analysis of the Project	
59. Feedback is given to the directors to keep investing in the Ergonomics program	
60. Total investment is compared to the benefits obtained by the program	
61. Records are kept, and the costs associated with implementing the entire project are considered.	
62. Records are kept and costs are considered regarding the Production System before and after the completion of the project	
63. Records are kept, and the costs associated with internal medical care after implementation of the program are considered	
Health and Safety Follow-Up	
Activities are developed to:	
64. Follow up on the culture of prevention	
65. Follow up on ergonomics risks	
66. Follow up on ergonomics risks whose solution has not been completed	
67. Promote the prevention of accidents, injuries or occupational diseases	
68. Compare the rates of accidents, injuries or work diseases before and after implementing the program.	
Feedback	
Activities are carried out to provide feedback regarding the solutions to risks in ergonomics to:	
69. The entire corporate	
70. Employees	
71. The person(s)in charge of helping to solve the problem	
72. The manager of the department affected by ergonomic hazards	
73. The directors regarding the performance of the Ergonomics program	

Table 12. Health and safety benefits

Health and Safety Benefits	Scale (1-5)
Indicate how frequently you consider that some of the following benefits in the company have been obtained	
1. Reduction in the rate of accidents, injuries or work diseases	
2. Reduction in employees' compensation rate	
3. Decrease in employee fatigue	
4. Improvements in hygiene at work (toxicity, noise, etc.)	
5. Reduction / elimination of employees' physical / mental stress	
6. Increase in the comfort level of environmental conditions	
7. Savings in the company and machinery's cleaning costs	
8. Reduction in soil / water / atmosphere pollution	
9. Reduction in the probability of environmental incidents	
10. Reduction in the consumption of electric energy in the company	
11. Reduction in the number of environmental complaints

Table 13. Benefits in the quality of life at work

Benefits in the Quality of Life at Work	Scale (1-5)
Indicate how frequently you consider you have obtained some of the following benefits in the company	
1. Increase in the employees' morale	
2. Reduction in employees' discomfort	
3. Increased participation throughout the organization	
4. Increase in employees' motivation	
5. Increase in managers and employees' positive attitude	
6. Increase in employees' self-esteem	
7. Increase in employees' skills	
8. Increase in the number of employees satisfied with their work	
9. Increase in director-employee communication	
10. Increase in market competitiveness	
11. Increase in the knowledge and experience applicable to problem solving.	
12. Increase in teamwork	
13. Increase in the possibility of employee promotions	
14. Prevention of compensation claims and the related internal debate	
15. Improvement in the performance of older / sick staff	

Table 14. Operational benefits

Operational Benefits	Scale (1-5)
Indicate how frequently you consider you have obtained some of the following benefits in the company	
1. Increase in competitiveness	
2. Improvement in product quality	
3. Reduction in employees' absenteeism because of accidents, injuries or occupational diseases	
4. Reduction in product manufacturing errors	
5. Reduction in lost days due to accidents, injuries or occupational diseases	
6. Increase in productivity	
7. Efficient use of working time	
8. Scrap reduction	
9. Reduction in the cost of employees' internal medical care	
10. Reduction in materials transportation	
11. Reduction in monotony	
12. Prevention of damage / risks of the company's premises	
13. Increase in the quality of equipment maintenance	
14. Improvement of the company's image / reputation	
15. Prevention / reduction of warnings / sanctions by the authorities	
16. Reduction in delays

Chapter 24
Knowledge Management of Work Stress in Mexican Manufacturing Environments:
Models of the Relationships Between Burnout and the Body Mass Index Among Middle and Senior Managers

ABSTRACT

This chapter presents a knowledge management perspective to propose a pair of structural models to determine the relationship between burnout syndrome (BS) and body mass index (BMI) among high and middle managers of Mexican maquiladoras. In developing countries like Mexico there are opportunities to expand burnout study on diversity of contexts and occupations. The Maslach burnout general inventory questionnaire (MB-GI) was used, and sociodemographic data were collected as well as the weight and size of respondents. Instrument shows an acceptable reliability index. Structural equation models are used to determine relationship among variables. From a sample of 361 people, using segmentations of BMI, two segments are distinguished: normal weight and overweight. Model using normal weight participants shows more explanatory qualities about the relationship among burnout dimensions than the one using overweight participants. One can conclude that more factors and variables are needed to explain overweight Mexican managers.

INTRODUCTION

The concept of Burnout Syndrome (BS), was first introduced by Bradley 1969. BS directly affects individuals and is characterized by excessive and progressive fatigue, energy depletion, and motivation loss. Also, according to Freudenberger (1998), BS affects attitudes, modals, and behaviors in general, which is why it is important to study it. Likewise, as Gonzales and Guillermo (2009) argue, research on BS first appeared in 2000. Since then, many studies have been conducted across industrial sectors. For instance, Medellin (2008) reported a study of BS in the automotive industry, whereas Aguirre, Medellín, Vázquez, Gutiérrez, and Fernández (2014) reported the effects of this syndrome in the assembling industry. Likewise, Aranda and Ibarra (2014) discuss BS in the electronics industry.

According to Llaneza (2002), it has been demonstrated that the prevalence of work-related diseases or multi-causal diseases – especially those related to stress – increases exponentially in developing countries. In their model, Serrano, Moya-Albiol & Salvador (2009) prove that occupational stress is at the adaptive stage in human beings. When the adaptive response is not positive, chronic stress appears, along with BS. Both stress and BS are considered to be pathological conditions. In Mexico, BS has been studied only among helping professions, such as nurses, physicians, and teachers (Juárez-García, A., Idrovo, A. J., Camacho-Ávila, A., & Placencia-Reyes, O., 2014), whereas other occupations have been neglected. Although BS research in the industrial context is scarce, it has been demonstrated that BS is present in industrial workers (Camacho-Alamilla, Maldonado-Macías, García-Alcaraz, Hernández-Arellano, 2014; Maldonado-Macías, Camacho-Alamilla, Torres, Alcaraz, Limón, 2015; Armenta-Hernández, Maldonado-Macías, García- Alcaraz, 2015).

The few works studying occupational stress along with BS have found that both conditions are interrelated. Also, Ahola et al. (2012) found that professional efficacy directly reduces overweight, although authors did not find any other relationship between the remaining BS dimensions and stress at work. Similarly, both BS and stress do not seem to be studied together in relation to obesity and overweight, especially in the manufacturing industry. To overcome this limitation, authors (Camacho, Maldonado, García, Palacios & Valenzuela, 2015) proposed a structural equation model associating BS and obesity among middle and senior managers of manufacturing companies in Ciudad Juárez.

PROBLEM STATEMENT

Two mayor aspects were consider in this research, first, the incidence of stress-related disorders in Mexico is increasing; second, available studies on BS have not provided clear results as regards the relationship between BS and the different BMI levels.

According to a study conducted by the International Labour Organization (ILO, 2016), 40% of Mexican workers – that is, 18.4 million people – suffer from stress, and 75% of such people associate their condition to work-related situations. In this sense, stress can represent between 0.5% and 3.5% of losses in a country's (Gross Domestic Product) GDP. Additionally, on a world scale, the WHO stated that while cardiovascular diseases were the first cause of death globally, overweight and obesity were two other major causes.

Health disorders affect an individual's capacity to perform their daily activities, thereby causing low productivity and quality losses, among other repercussions (Forbes, 2011; Marrau, 2009). At the company level, the consequences of health disorders have a negative impact on production costs (Arenas &

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Cantú, 2013; Gestal, 2003; Juno & Noriega, 2004; Valecillo, M., Quevedo, A.L., Lubo, A., Dos Santos, A., Montiel, M., Camejo, & Sánchez, M., 2009; Kim & Han, 2014).

Relationships between BS and overweight or obesity have not been clarified in literature. Authors (Ahola, K., Pulkki-Råback, L., Kouvonen, A., Rossi, H., Aromaa, A., & Lönnqvist, J., 2012) found out that professional efficacy is related to decreasing obesity and overweight, whereas (Nevanpera, N. J., Hopsu, L., Kuosma, E., Ukkola, O., Uitti, J., & Laitinen, J. H., 2012; Proper, Koppes, Meijer & Bemelmans 2013) linked emotional exhaustion to eating disorders and uncontrolled emotions. Similarly, consequences of BS and workplace stress increase the occurrence of cardiovascular, respiratory, and gastrointestinal diseases, among other physical and mental disorders. In addition, the fatality rate among industrial employees increases every year (Ahola, Vaananen, Koskinen, Kouvonen, & Shirom, 2010) and so does the risks of suffering from diabetes, some types of cancers (Dávila-Torres, J., González-Izquierdo, J. d. J., & Barrera-Cruz, A., 2015), and cardiovascular diseases, being the latter the main cause of death globally in 2012 (WHO, 2015). Other studies have related BS with some work related variables; Borda et al (2007) argue that BS can be associated with variables such as the job position and parenthood, other studies claim that such variables are not related to either BS or stress at work (Acosta y Burguillos 2014; Carlotto 2006; De Pablo 2007). In this manner, additional factors can contribute to explaining these conditions and syndromes (Calvo, Sánchez, Rosado & García, 2011). In this sense, the main contribution of this research is to analyze those relationships between Burnout and Body Mass Index to explain in a better way the occurrence of overweight and obesity among senior and middle managers. The dissemination of the knowledge of these relationships among organizations may be helpful to develop organizational strategies for their management and prevention.

Senior and middle managers make important and transcendent decisions. They are responsible for the organizational strategy of the company, have a group of people under supervision, and are directly responsible for what these people do, as well as the impact of their actions on the organization's performance.

OBJECTIVES

General Objective

The objective of this research is to determine the relationship between BS and the Body Mass Index (BMI) for middle and senior managers of the manufacturing industry in Ciudad Juárez.

Specific Objectives

1. To perform a descriptive analysis of the sample.
2. To describe BS prevalence using three forms (average scores, degrees, and levels).
3. To determine the relationships between the BS dimensions and the BMI for senior and middle managers having a normal weight.
4. To determine the relationships between the BS dimensions and the BMI for senior and middle managers having overweight.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

JUSTIFICATION

This research contributes to the body of knowledge on the effects of stress, overweight, and obesity. According to Benevides and Pereira (2006), it is important to have a better understanding of these conditions to improve the quality of life and health of individuals. Determination of the relationships that exist among these variables will offer valuable data on the characteristics of sufferers, and this will support companies in their efforts to implement preventive measures and strategies for the most vulnerable.

To prevent BS, the relationship between BS dimensions and the BMI for both normal-weight and obese participants must be better understood. These findings will help companies involved in this research to improve their knowledge about the prevalence of BS among their employees and not only company performance, but also staff performance, since many authors have described the consequences of BS and overweight at a personal level (Aguayo, C. Vargas, E. De la Fuente, & L.M. Lozano, 2011).

SCOOP AND DELIMITATION

In this research, BS is studied in its three dimensions (emotional exhaustion, depersonalization and low professional efficacy) and the BMI is studied normal weight (18.5-24.9 kg/m^2) and overweight (25-29.9 kg/m^2). Similarly, the sample includes middle and senior managers of manufacturing enterprises, including executives, supervisors, group leaders, manufacturing administrative staff, and office administrators. For such reasons, results found in this research may be valid only for manufacturing companies that have similar organizational structure to the one here discussed.

Sociodemographic variables such as weight, height, gender, age, marital status, number of children, job position, seniority, work schedule, and company name were considered. In addition, as previously mentioned, study was conducted in the manufacturing sector of Ciudad Juárez. According to the association of manufacturers of this city (Asociación de Maquiladoras de Ciudad Juárez-Index Ciudad Juárez, AMAC), in November 2013, Mexico catered for 5,087 manufacturing companies, 326 of which were located in Ciudad Juárez, Chihuahua. Moreover, the region employs about 230,373 industrial workers. These facts were important for conducting a study of BS among middle and senior managers of the manufacturing industry of Ciudad Juárez.

THEORETICAL FRAMEWORK

Occupational Stress

Stress has been defined as a physiological response to specific situations, stimuli, or threats, known as stressors. Melgosa (1999) explains the three stages of stress: alarm, resistance, and exhaustion. The alarm stage is key to recognizing a stressor, whereas the resistance stage occurs when people do not get any relief from the first stage; in other words, it is the response to continuous stress. Finally, the exhaustion stage is when sufferers experience partial or total collapse of the organs. Exhaustion symptoms include tiredness, tension, depression, and stress-related diseases.

Rivera (2013) defines occupational stress as a set of emotional, cognitive, physiological, and behavioral reactions to potentially harmful work-related situations, such as the organization, the content, or

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the environment. Work-related stress is also characterized by high levels of excitement and anxiety as responses to the inability to cope with a given situation. Also, stressed workers are usually not satisfied with their work performance. Finally, as regards its impact on health, work-related stress produces chronic and permanent wear and tear of the biological system, thereby contributing to the incidence of physical, psycho-emotional, and behavior disorders (Calabrese, 2010).

Burnout Syndrome

BS comprises three-dimensional condition characterized by exhaustion, depersonalization, and reduced professional accomplishment among professions directly dealing with clients or patients. From a different perspective, Edelwich and Brodsky (1980) defined Burnout as the gradual loss of idealism, energy, and motivation among helping professions as a result of work-related conditions.

The Body Mass Index (BMI)

Obesity and overweight are two global problems that affect both, developed and developing countries. The World Health Organization (WHO, 2010) considers obesity as an epidemic of a multicausal, chronic, non-communicable disease that starts at an early age. Experts projected in 2015 an amount of 2.3 billion adults with overweight and more than 700 million obese; however, latest data of 2016 have shown that 7 out of 10 adults continue to be overweight with a prevalence of 72.5% percent exceeding experts' projections.

Overweight is an abnormal accumulation of fat, generally from 10% to 20% over an individual's body weight, considering their height. Also, according to the World Health Organization, overweight is a BMI ranging from 25kg/m^2 to 29,9kg/m^2, whereas obesity is a BMI greater than or equal to 30 (Jensen & Ryan, 2013). The leading causes of overweight and obesity are unhealthy eating habits or an imbalance between calories consumed and calories expended. Similarly, the World Health Organization claims that the common health consequences of overweight and obesity include cardiovascular diseases and musculoskeletal disorders; however, there are many ways to prevent and counteract these diseases and disorders. For instance, Klein (2011) proposes to improve the life style by doing exercise and modifying the eating habits.

Dimensions of Burnout Syndrome

According to Maslach (2001), BS is a three-dimensional syndrome characterized by:

- **Emotional Exhaustion:** A state of depletion of energy and resources resulting from working directly with patients and/or customers. It has physical and psychological manifestations and is mainly characterized by fatigue. Emotionally exhausted people feel they have nothing left to give to others.
- **Depersonalization:** The development of a callous attitude, negative feelings, and cynical behavior. It is characterized by increasing irritability, loss of motivation, isolation, and hostile attitudes toward coworkers and customers.
- **Low Professional Efficacy:** Characterized by feelings of inefficacy and incompetence that contribute to a sense of low personal and professional accomplishment. This dimension of BS affects

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the ability to do the job and may deteriorate work relationships. Similarly, there is loss of productivity and low self-esteem, and sufferers are incapable of tolerating occupational pressures. Low professional efficacy is also considered as the inability of a person to properly adapt to their reality (Maslach 2001).

Conceptualization of Overweight and Obesity

Overweight is a main public health concern affecting both developed and developing countries. The World Health Organization considers obesity as an epidemic of a multicausal, chronic, non-communicable disease that starts at an early age. Experts project that by 2015, 2.3 billion adults will be overweight and more than 700 million will be obese. Also, overweight is an abnormal accumulation of fat, generally from 10% to 20% over an individual's body weight, considering their height. According to the World Health Organization, overweight is a BMI ranging from 25kg/m^2 to 29,9kg/m^2 (Jensen & Ryan, 2013).

The leading causes of overweight are wrong eating habits or an imbalance between calories consumed and calories expended. Similarly, the World Health Organization claims that the common health consequences of overweight include cardiovascular diseases and musculoskeletal disorders. However, there are many ways to prevent and counteract these diseases and disorders. Klein (2011), for instance, proposes to improve the life style by doing exercise and modifying the eating habits.

Knowledge Management in Healthcare

The definition of knowledge management is that knowledge must involve an agent, who uses knowledge to perform the actions necessary to reach a goal. Knowledge management is an emerging field that has commanded attention and support from the industrial community. Many organizations currently engage in knowledge management in order to leverage knowledge both within their organization and externally to their shareholders and customers. Knowledge management involves the creation of value from organizations intangible assets (Arroyo & Castillo, 2017; Mazita, Amlus, Kamsidi, & Zaniel, 2016). In this manner, knowledge management about the effects of BS on BMI that could impact overweight and obesity of employees may be an area for growing opportunities for both, the company as well as personnel.

Another potential area, could be found in the development of decision support systems and knowledge management systems regarding psychosocial risks at work and healthcare. Healthcare is a knowledge intensive industry, the importance of medical knowledge has been highlighted in the ongoing initiatives to promote evidence-based medicine and clinical quality. The Agency for Healthcare Research and Quality 2012 cited strong evidence that clinical decision support systems and knowledge management systems can be effective in improving health care process measures across diverse settings using both commercially and locally developed systems. It is likely that these systems will become a key part of the infrastructure of all healthcare organizations over the next few years (Lobach D, Sanders GD, Bright TJ, 2012).

The Manufacturing Industry of Ciudad Juárez

Ciudad Juárez is one of the Mexican major manufacturing regions. Worldwide, it is recognized as a key industrial center thanks to its status as border city. According to the Association of Manufacturers (AMAC, 2013), Ciudad Juárez caters for 329 of the 5,111 manufacturing companies located in Mexico,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

29% of these industries are automotive manufacturers, 7% are electrical manufacturers, 18 are electronics manufacturers, 9% produce plastic or metal goods, 9% are packaging manufacturing companies, and 3% provide customer services.

MATERIALS

This section describes and explains the materials employed to conduct the study.

The Survey

The Maslach Burnout Inventory–General Survey (Moreno, B., Rodríguez, R., & Escobar, E., 2001) was administrated as an instrument for data acquisition; further analyses were made using these data to determine the relationships among work content variables and BS using structural modelling. In addition, a sociodemographic questionnaire was designed to gather information such as age, gender, number of children, marital status, and academic background.

The Maslach Burnout Inventory-General Survey (MBI-GS)

The Maslach Burnout Inventory–General Survey (Schaufeli, W.B., Leiter, M.P., Maslach, C., & Jackson, S.E., 1996) was administered to measure BS dimensions. Unlike the Maslach Burnout Inventory Survey (MBI), the MBI-GS is not exclusive to human service professions. The Spanish version of the MBI-GS by Moreno et al. (2001) was used, which includes 16 items to analyze the three BS dimensions: emotional exhaustion (5 items), cynicism (5 items), and professional efficacy (6 items). The survey had to be answered using a seven-point Likert scale (never, rarely in a year, sometimes in a year, on many occasions in a year, frequently in a year, almost every day, always). In this sense, low scores in *professional efficacy* and high scores in *emotional exhaustion* and *cynicism* indicated existence of *BS*. Two examples of items found in the MBI-GS are the following: *I am able to effectively solve problems at work* (item 5) and *I feel fulfilled when I do something good at work* (item 11). Previous studies confirm the structure of the three factors (Gil-Monte, 2002). Internal consistency indices of the MBI-GS, obtained through the Cronbach alpha, are 0.89 for Emotional Exhaustion, 0.84 for Cynicism, and 0.85 for Professional Efficacy.

To determine BS levels, the methodology proposed by Guerrero and Vicente (2001), previously adopted by Maldonado, et al. (2015).

Software WarpPLS

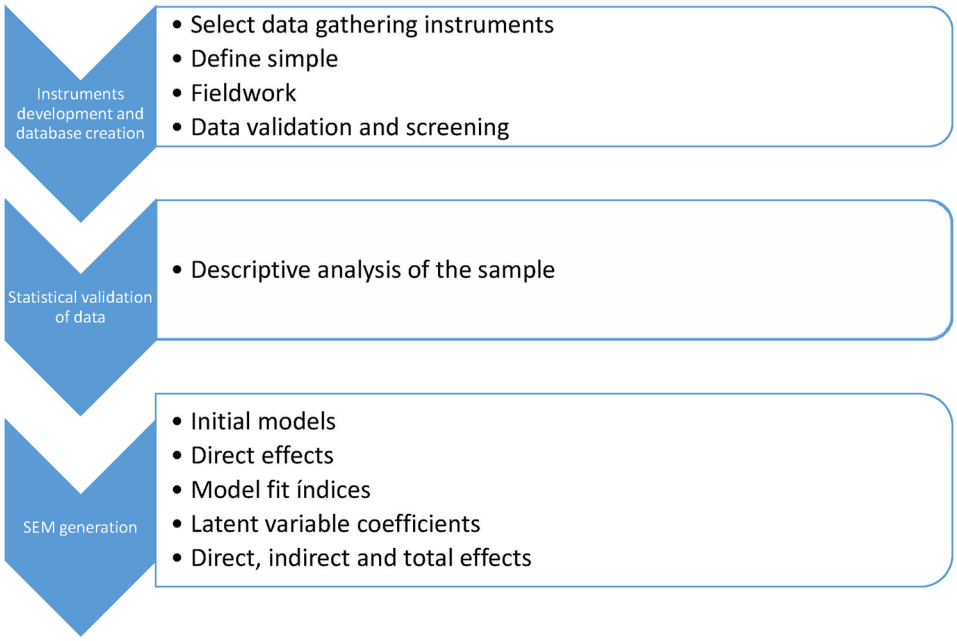
This software uses Partial Least Squares algorithms (PLS) for structural equations modeling (SEM). It provides users with a broad range of features, several of which are not available in other SEM software (Kock, 2013). Moreover, WarpPLS is the first and only to offer classic PLS algorithms together with factor-based PLS algorithms (Kock, 2014).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

METHODOLOGY

This section thoroughly describes each step followed to meet the research goal.

Figure 1. Methodology



Survey Administration

To measure BS, it was used the Spanish version of the Maslach Burnout Inventory General Survey (MBI-GS), validated by Moreno et al. (2001). Some of the advantages of using this questionnaire are that the MBI-GS is not exclusive to human service professions; moreover, previous studies have demonstrated its reliability in the three dimensions (Gil-Monte, 2002) using the Cronbach's alpha index, which showed values higher than 0.7 in all dimensions. According to (George & Mallery, 2003), values above 0.7 are acceptable indicators of reliability. Written consent from participants was collected individually using a proper format and according to the University requirements.

Sample Definition

The sample was non-probabilistic, it was obtained using the snowball sampling technique to select individuals with the desired characteristics. Meetings were scheduled with six manufacturing companies in Ciudad Juárez to present the research among company's doctors and managers.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Fieldwork and Survey Administration

Surveys were administered to manufacturing companies during sessions previously scheduled by their Human Resources departments. As previously mentioned, the sample comprised middle and senior managers.

Database Creation and Screening

An electronic database was created with data collected using SPSS software. The database included information from 361 participants. This sample finally it was classified according to each participant's BMI. For the visualization of data, a descriptive analysis of the sample it was performed to detect missing values and atypical values. In the MBI-GS, missing values and atypical values were replaced by the median value of the items, since the questionnaire collected ordinal data. On the other hand, since the IMC values were ordinal data, missing values and atypical values were replaced by the mean.

Statistical Validation of Data

The descriptive analysis of the sample was performed using SPSS® v.20 software. At this stage, sociodemographic information was analyzed and frequency percentages were provided for the characteristics studied (gender, academic background, marital status, type of employment contract, seniority, work schedule, job position, etc.). Similarly, the analysis provided quartile values for each characteristic and frequency percentages for BS levels: none, low, medium, high and extreme.

Latent Variables Validation

The Cronbach alpha index was calculated to validate the data collected. Cronbach's alpha measures the reliability of the data on a scale. The denomination "alpha" was proposed by Cronbach (1951) and the index represents the average covariance between pairs of articles. It can be calculated using the variations or the correlation between the items. In this investigation, the Cronbach's alpha was calculated taking into account the correlation of the items and using the formula presented below:

$$1.\ \alpha est = \frac{kp}{1 + p\left(k - 1\right)}$$

k= number of itemsp=average of correlation of items

In this formula, the validation ranges from 0 to 1 on a scale that considers 0.7 as an acceptable value, although values greater than 0.90 are more satisfying.

After the data capture process, data were detected by means of the substitution of median and atypical values for the median and mean values (García, 2014). Median ordinal data and mean continuous data.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Occurrence of Burnout Syndrome in Average Scores

Following the suggestions of Vicente (2001), SPSS software was used to calculate the occurrence of BS in average scores. First, each observed variable was analyzed; then, each dimension is examined to obtain the median, as well as the maximum and minimum score of each dimension. Finally, these scores are compared with findings reported in previous studies, such as that of Guerrero, Vicente (2001).

Occurrence of Burnout Syndrome in Degrees

BS levels were defined (high, medium and low) by analyzing whether the mean scores fit the first, second or third tertile. For this, BS was divided into its three grades: low, medium and high with cut points in the 33rd and 66th percentiles (Vicente, 2001).

Occurrence of Burnout Syndrome in Levels

In this part, the level of BS suffered in five categories is presented. To obtain the occurrence of BS in the levels, the data on the occurrence BS in grades were used and the 27 combinations were made to obtain the categories. Readers can consult the section of the appendix to consult the table of combinations.

Structural Equation Models

At this stage, the two models of structural equations were created and validated. These models include the latent variables under study. The first model seeks to study the relationships between BS and normal weight, while the second model analyzes the relationships between BS and overweight. The relationships between latent variables refer to the research hypotheses. These hypotheses were analyzed using WarpPLS 4.0 software, using the P-value as inclusion criterion.

Hypothetical Models

The research hypotheses were proposed by considering findings of previous studies. Such studies have demonstrated significant relationships between the BS dimensions and the BMI. For instance, (Dallman, 2010) found a rapport between emotional exhaustion and anxiety, eating disorders, and emotional dissatisfaction. Likewise, Ahola (2012) found no relationship between cynicism and the BMI, although professional efficacy did seem to be related to the BMI. In other words, the author found that professional efficacy grows as workers increase their physical activity. Figure 2 and Figure 3 depict the two models to be analyzed.

Direct Effects

In SEM, direct effects are represented as arrows directly connecting two latent variables. Direct effects help validate research hypotheses.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Proposed Model: Burnout Syndrome - Normal Weight Relationship

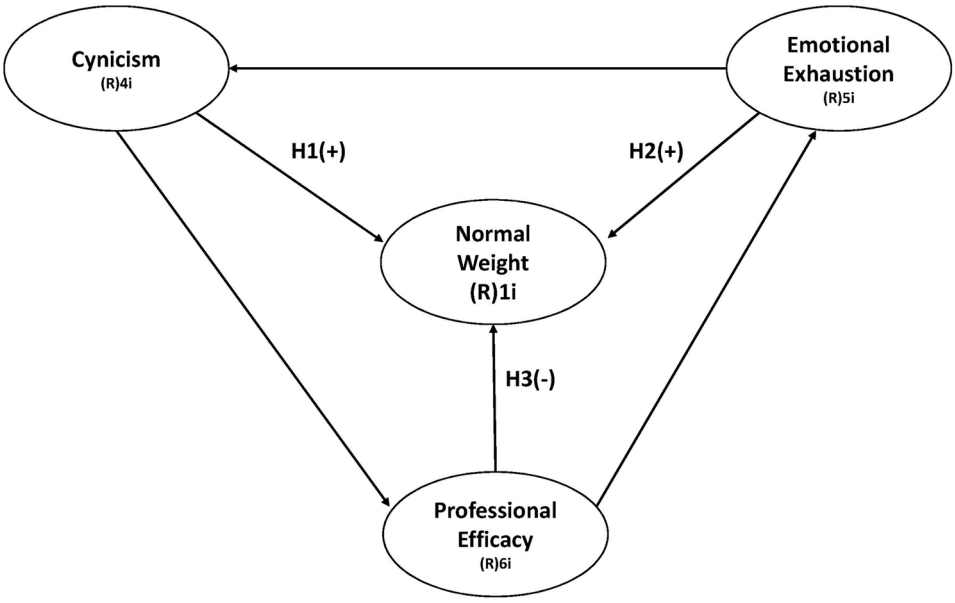


Figure 3. Proposed Model: Burnout Syndrome - Overweight Relationship

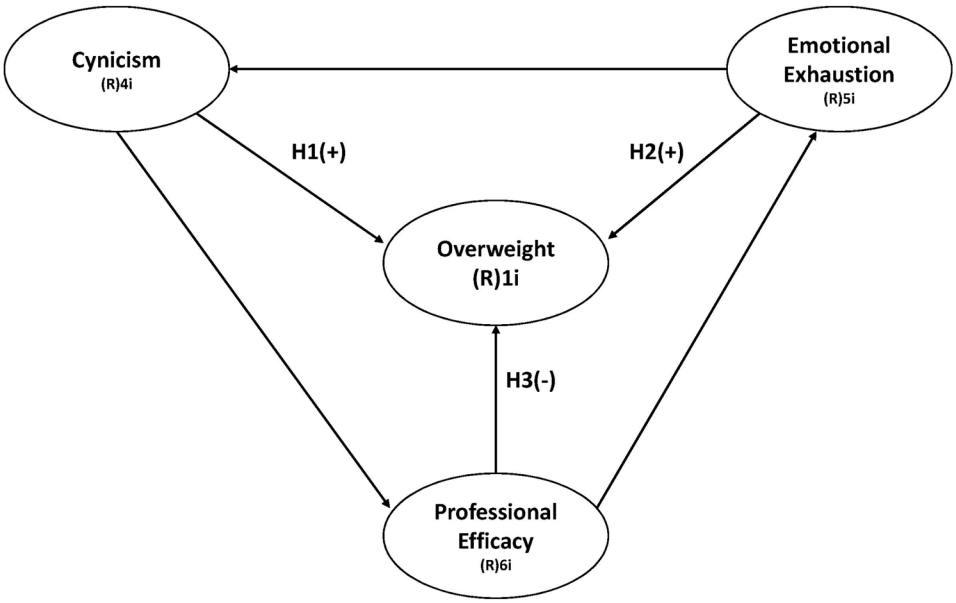


Model Fit Indices

To validate the models, nine indexes proposed by Knock (2013) were calculated: Average path coefficient (APC), average R-square (ARS), average adjusted R-square (AARS), average block variation Inflation factor AVIF) Full Collinearity VIF (AFVIF), Tenenhaus Adjustment Quality (GoF), Simpson

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Paradox Relationship (SPR), R-Square Contribution Coefficient (RSCR) and Statistical Suppression Coefficient (SSR).

Coefficient of Latent Variables

Seven indexes were used to validate the surveys: R-square (R2), adjusted R-squared, Q-square (Q2), composite reliability index, Cronbach's alpha, variance inflation factors (VIF), and average full collinearity FIV (AFVIF)

Sum of Effects

To estimate direct, indirect and total effects we rely on WarpPLS 5.0 software. For the direct effects, the R2 value of each dependent latent variable was analyzed to determine the percentage of the explained variance. As for the indirect effects, they were produced through the mediation of the variables using two or more model paths. The total effects of each relationship were obtained by adding direct and indirect effects.

RESULTS

Survey Administration and Validation

This section discusses how the survey was administered and validated. The study was conducted in manufacturing companies located in Ciudad Juarez, Chihuahua, Mexico. A non-probabilistic sample was selected and the questionnaires were administered during the sessions previously scheduled by the human resources department of each company. Three of the companies studied manufacture automotive parts, two manufacture electric products and produce various products.

Table 1. Surveyed Companies

Company	Frequency	Percentage
Company 1	41	11.4
Company 2	42	11.6
Company 3	53	14.7
Company 4	100	27.7
Company 5	103	28.5
Company 6	22	6.1
Total	361	100.0

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Descriptive Analysis of the Sample

The descriptive analysis of the overweight sample revealed that men suffer more from obesity than women (72.94% versus 27.06%, respectively). As regards age, it seems that 31-40-year old employees are more prone to overweight (38.24%), followed by 41-50 year-old (27.65%), whereas employees under 30 (22.94%) or those older than 50 (11.18%) are less commonly affected. Also, the minimum age reported was 18, whereas 60 years old was the maximum age, 37.65 the mean, and 9.24 the standard deviation. Such results indicate that overweight is more prevalent among young working adults.

As regards the relationship between academic background and overweight, it was found that 66.67% of employees holding a bachelor degree were obese, but only 9.52% of workers with a master's degree suffer from this condition. These results may suggest that employees academically more educated have more tools to cope with stress and reduce the presence of obesity. Likewise, the descriptive analysis demonstrated that 87.5% of the sample holds a contract of indefinite duration, while 9.52% of the surveyed employees works under a temporary contract.

As far as seniority is concerned, the minimum length reported was 1 month, 360 months was the maximum, 102.41 months was the mean, and 83.58 months was the standard deviation. Similarly, it was found that overweight is more prevalent among employees with longer seniority, namely with over 73 months (52.69%). Such results may suggest that for senior workers the fear of job loss makes them more susceptible to the effects of stress and overweight.

Results also indicate that married employees (38.08%) are more vulnerable to obesity than unmarried workers (28.24%) or those living in free union (11.38%). Similarly, it was found that only 1.8% of employees have lost a spouse. As for working hours, it seems that overweight affects more employees with long working hours. In this case, 30.3% of the sample works 48 hours per week, 29.76% work more than 56 hours, 25.45% work 45 hours and only 14.55% of the sample works 42 hours weekly.

Regarding the anthropometric information, it was found a 1.49 meters (m) as minimum height, 1.90 m as maximum, 1.71m as average height and 0.085m as standard deviation. Regarding the variable of weight, the descriptive analysis reported 49 kilograms (kgs) as minimum weight, 100 kgs maximum, an average weight of 80.54 kgs and 8.69 kgs as standard deviation. Finally, when analyzing the departments of the company, overweight is more frequent in the engineering department (34.71%), followed by the production and maintenance department (31.76%), administrative offices (17.06%), and finally the Department of Environment and Security (5.29%).

Results by Average Scores

Table 2 shows the average scores of the three dimensions of BS. Note that emotional exhaustion shows an average value of 10.29, while cynicism or depersonalization shows an average value of 6.0970, and 28.5540 was the average value for professional effectiveness

Results by Degrees

Table 3 shows the degrees of BS obtained from the sample. The mean scores, more specifically the mean values that were used from the above table to categorize the BS grade for each dimension. According to mean scores, the sample provided a Medium degree of BS in all three dimensions.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Occurrence of Burnout Syndrome: Average Score

Average Scores					
Dimension	**N**	**Minimum**	**Maximum**	**Mean**	**Standard Deviation**
Emotional Exhaustion	361	.00	30.00	10.2909	6.31719
Cynicism/ Depersonalization	361	.00	30.00	6.0970	5.51604
Professional Efficacy	361	11.00	36.00	28.5540	5.85121

Table 3. Degrees of Burnout

Degrees of Burnout	Emotional Exhaustion	Cynicism/ Depersonalization	Professional Efficacy
LOW	< 7	< 3	> 33
MEDIUM	8 – 12 (10.29)	4 – 7 (6.09)	28 – 32 (28.55)
HIGH	> 13	> 8	< 27

Results by Levels of Burnout

Table 4 presents the obtained results for the five levels of BS. According to these results, 93 participants do not suffer from any level of BS, whereas the remaining 268 suffer from this condition in any of the four remaining levels: low, medium, high, and extreme.

Table 4. Levels of Burnout

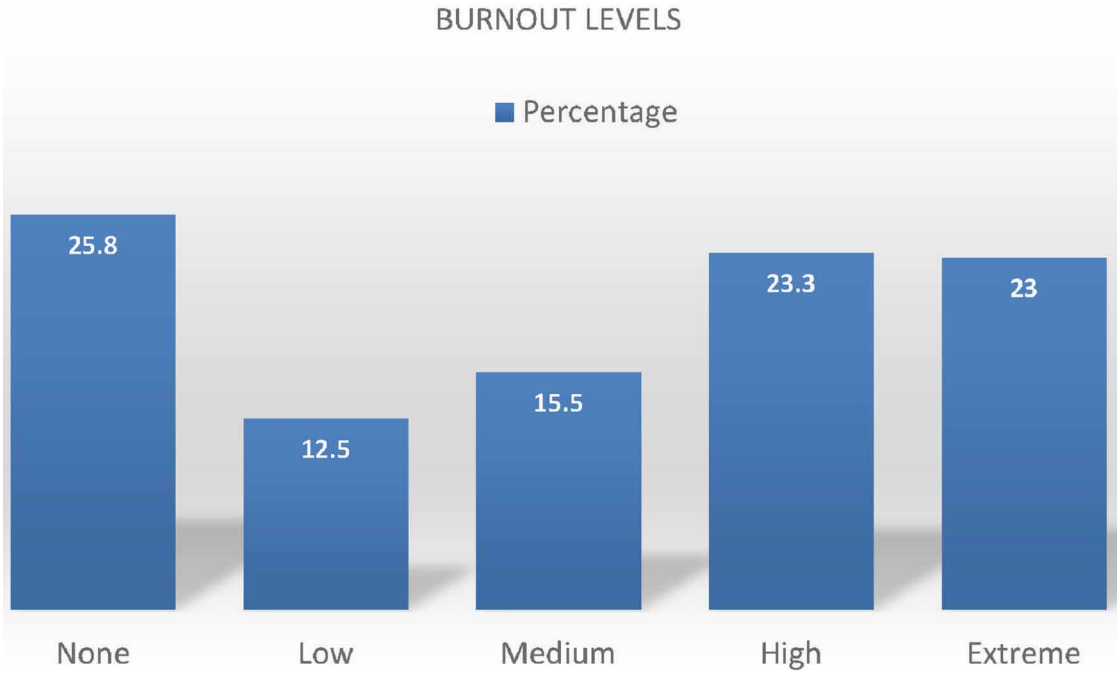
	Frequency	Percentage	Valid Percentage	Cumulative Percentage
None	93	25.8	25.8	25.8
Low	45	12.5	12.5	38.2
Medium	56	15.5	15.5	53.7
High	84	23.3	23.3	77.0
Extreme	83	23.0	23.0	100.0
Total	361	100.0	100.0	

Figure 4 introduces the prevalence of BS expressed in percentages. More specifically, the graph presents the percentage of participants that suffer from BS in any of its five levels.

As can be observed, 98 participants do not suffer from BS representing 25.76% of the sample, whereas 45 participants, or 12.47% of the sample, suffer from a low level of BS. Similarly, 15.51% or 56 participants present a medium level of BS. On the other hand, 23.27% of the sample (84 participants) presents high levels of BS, whereas the remaining 22.99% (83 participants) suffers from extreme levels.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Graph of Levels of Burnout in Percentages



Two Structural Equation Models

The models presented in the following sections take as basis the results discussed above to find any possible relationships among the three BS dimensions and the BMI, namely normal weight and overweight. Such relationships can explain better what causes BS, overweight, and obesity. The models interpret the rapports between BS and normal weight and between BS and overweight as direct/indirect or positive/negative relationships.

Model of the Relationships Between BS Dimensions and Normal Weight

In this model, the three BS dimensions was associate with the BMI of participants with normal weight.

Every path in the model is associated with a β value and a P value; the former represents a measure of dependency between the involved variables, while the latter indicates whether a relationship is statistically significant at a 95% confidence level.

Validation of Latent Variables and Model Efficiency Indices

Table 5 presents the quality indices of every variable forming the latent variables. Note that the Cronbach's alpha and composite reliability values were above 0.7. Only variables with a good reliability index were maintained.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. Model of the relationships between BS dimensions and normal weight

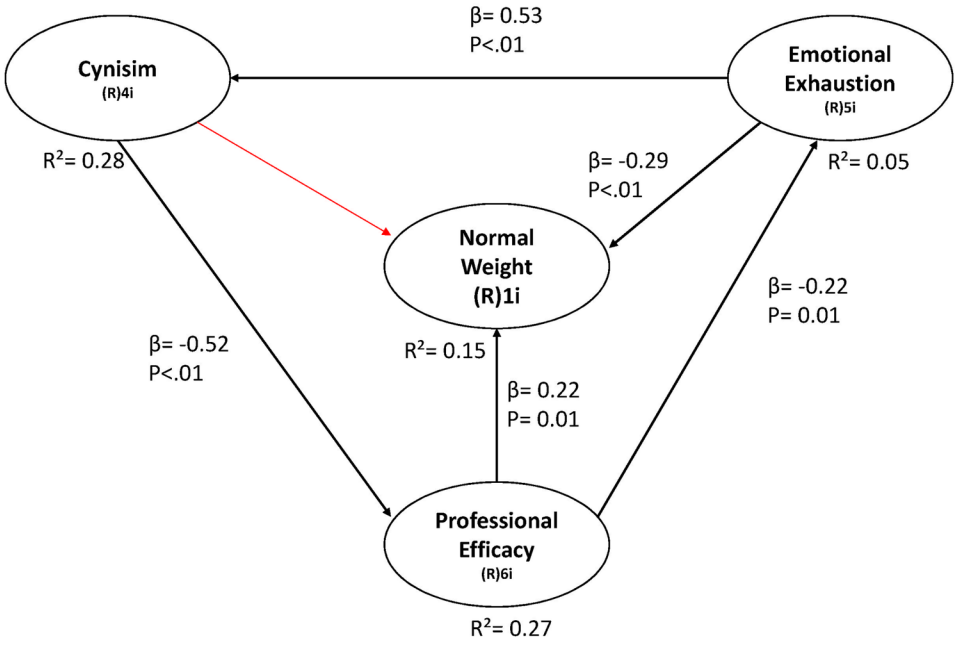


Figure 6. Model of BS dimensions and Normal Weight

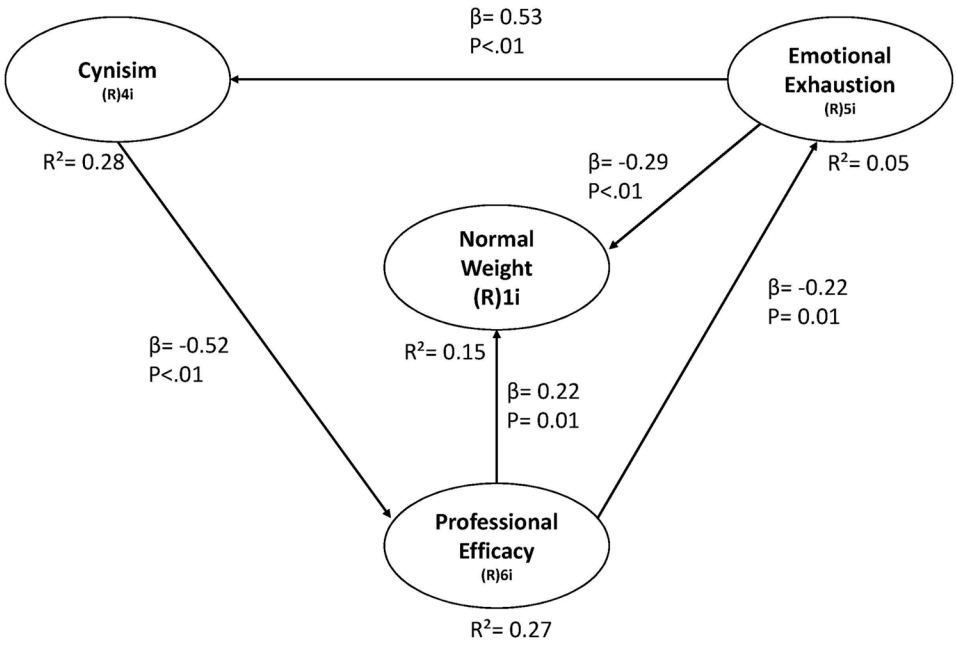

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 5. Validation of Latent Variables

	Cynicism	Emotional Exhaustion	Professional Efficacy	NORMAL
R-Squared	0.284	0.05	0.27	0.146
Adjusted R-Squared	0.276	0.04	0.262	0.127
Composite Reliability	0.939	0.941	0.919	1
Cronbach's Alpha	0.913	0.922	0.893	1
Average Variance Extracted	0.794	0.762	0.654	1
Full collinearity VIFs	1.657	1.342	1.344	1.09
Q-Squared	0.288	0.056	0.27	0.153

As for latent variables, AVE confirmed the survey's discriminant validity, since all its values were higher than 0.5. Similarly, because VIFs values were lower than 3.3, the existence of no multicollinearity was confirmed (Kock, 2013). Finally, all the values of the Q-Squared were higher than 0 and very similar to their corresponding R-Squared values. Such results demonstrated that all latent variables had enough validity from a parametric perspective. Table 6 introduces the loadings and cross-loadings of the latent variables. Such results proved that the P value of every element was statistically significant at a 95% confidence level.

Model Fit Indices

Table 7 presents the model fit indices obtained for this model. Considering the P values of APC, ARS, and AARS, it was concluded that the model was efficient and all the parameters had medium explanatory capacity. Similarly, the Tenenhaus GoF demonstrated that the model had medium explanatory capacity. In conclusion, the model proposed in this section to explain the relationship between BS dimensions and normal weight is efficient.

Direct Effects

Figure 7 presents the effects between latent variables. The ß and P values helped us interpret and explain these direct effects. As previously mentioned, ß values represent the dependency measure between two latent variables, while P values define whether a relationship is statistically significant at a 95% confidence level. For a relationship to be statistically significant, its P value had to be lower than 0.5. As can be observed, latent variables Emotional Exhaustion and Professional Efficacy are directly significant, whereas Cynicism is rather indirectly significant.

Figure 8 shows the effects between latent variables for the final model. In this figure, the relationships that were statistically not significant were eliminated.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 6. Validity of Cross-Loadings

	Cynicism	Emotional Exhaustion	Professional Efficacy	Normal	P Value
Cynicism	-0.885	0.047	0.067	-0.02	<0.001
Cynicism	-0.921	0.115	-0.073	-0.07	<0.001
Cynicism	-0.852	-0.103	-0.051	0.03	<0.001
Cynicism	-0.904	-0.065	0.057	0.062	<0.001
Emotional Exhaustion	0.105	-0.896	0.011	0.069	<0.001
Emotional Exhaustion	-0.139	-0.885	-0.039	-0.036	<0.001
Emotional Exhaustion	0.064	-0.849	0.023	-0.071	<0.001
Emotional Exhaustion	-0.057	-0.855	-0.003	-0.03	<0.001
Emotional Exhaustion	0.027	-0.878	0.008	0.065	<0.001
Professional Efficacy	0.296	-0.019	-0.733	-0.067	<0.001
Professional Efficacy	-0.211	-0.012	-0.772	-0.132	<0.001
Professional Efficacy	0.223	0.147	-0.822	0.129	<0.001
Professional Efficacy	-0.1	0.015	-0.866	0.066	<0.001
Professional Efficacy	-0.167	-0.047	-0.867	0.08	<0.001
Professional Efficacy	-0.008	-0.09	-0.783	-0.104	<0.001
BMI	0	0	0	-1	<0.001

Table 7. Model fit indices

	Value	Decision Criteria
Average Path Coefficient (APC)	0.358	P<0.001
Average R-Squared (ARS)	0.188	P=0.014
Average Adjusted R-Squared (AARS)	0.176	P=0.019
Average block Variance Inflation Factor (AVIF)	1.009	acceptable <= 5, ideally <= 3.3
Average Full collinearity VIF (AFVIF)	1.358	acceptable <= 5, ideally <= 3.3
Tenenhaus GoF (GoF)	0.388	small >= 0.1, medium >= 0.25, large >= 0.36
Simpson's Paradox Ratio (SPR)	1.00	acceptable if >= 0.7, ideally= 1
R-Squared Contribution Ratio (RSCR)	1.00	acceptable >= 0.9, ideally <= 1.00
Statistical Suppression Ratio (SSR)	1.00	acceptable >= 0.7

Figure 7. Direct Effects of the Initial Model

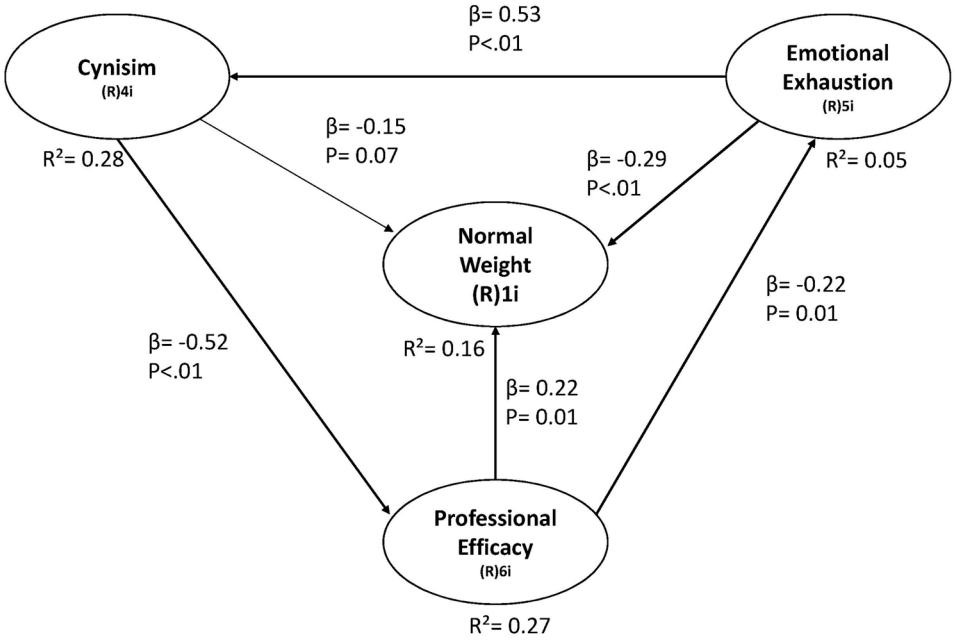

Figure 8. Direct Effects for the Final Model

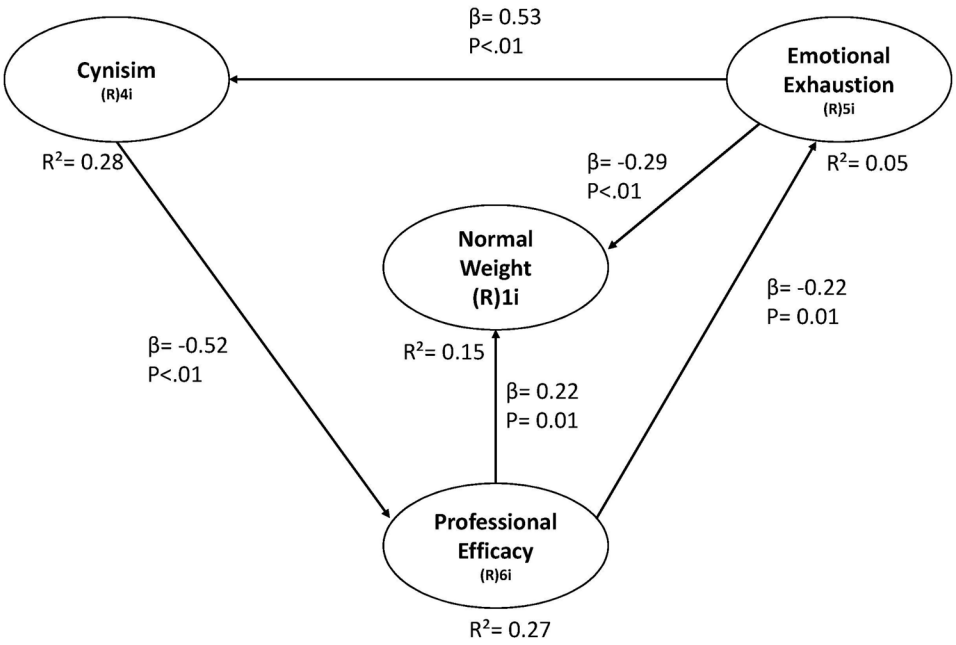


EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 8 presents the conclusions regarding the R^2 values. The table indicates that latent variable Emotional Exhaustion is 5% explained by latent variable Professional Efficacy. As for Cynicism, it is 26% explained by Emotional Exhaustion, whereas Professional Efficacy depends on Cynicism in 27%. Also, the model shows that latent variable Normal Weight can be 15% explained by both Emotional Exhaustion and Professional Efficacy. In conclusion, Professional Efficacy can significantly reduce both Emotional Exhaustion and Cynicism. If a company does not pay attention to the Professional Efficacy of its employees, this may have a negative impact on its productivity.

Table 8. Effect Sizes

	Cynicism	Emotional Exhaustion	Professional Efficacy
Cynicism		0.258	
Emotional Exhaustion			0.05
Professional Efficacy	0.27		
Normal Weight		0.093	0.053

Sum of Indirect Effects

In structural equation models, relationships are not always direct. Table 9 presents the sum of indirect effects for every relationship in the final model. P values higher than 0.5 refer to indirect relationships that are statistically not significant.

Three indirect relationships are worth being highlighted. First, it was found that when Normal Weight increased by one standard deviation, Cynicism decreased by 0.147 units and had a variability of 7%. As for the relationship between Professional Efficacy and Emotional Exhaustion, it was found that when the former increased by one standard deviation, the latter decreased by 0.277 units and had a variability of 5%. Finally, with respect to Cynicism and Professional Efficacy, the results revealed that when Cynicism increased by one standard deviation, Professional Efficacy decreased by 0.119 units and had a variability of 7%. All the remaining relationships can be similarly interpreted.

Table 9. Sum of Indirect Effects

	Cynicism	Emotional Exhaustion	Professional Efficacy
Cynicism	β.062 p=.145 ES=.062		β=-.119 p=.046 ES=.07
Emotional Exhaustion	β=.116 p=.05 ES=.070	β=.062 p=.145 ES=.058	
Professional Efficacy		β=-.277 p<.001 ES=.067	β=.062 p=.145 ES=.058
Normal Weight	β=-.147 p=.019 ES=.07	β=-.06 p=.153 ES=.058	β=.066 p=.178 ES=.071

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Total Effects

Table 10 presents the total effects for every relationship of the model. Total effects are the sum of direct and indirect effects. As in the previous section, P values higher than 0.5 belong to relationships that are statistically not significant at a 95% confidence level.

The two largest total effects involve latent variables Emotional Exhaustion, Professional Efficacy and Normal Weight. In the relationship between Emotional Exhaustion and Professional Efficacy, when Emotional Exhaustion increased by one standard deviation, Professional Efficacy decreased by 0.224 units with 9.6% of variability. As for the relationship between Normal Weight and Professional Efficacy, it was found that when Normal Weight increased by one standard deviation, Professional Efficacy increased by 0.283 units. The remaining relationships can be similarly interpreted.

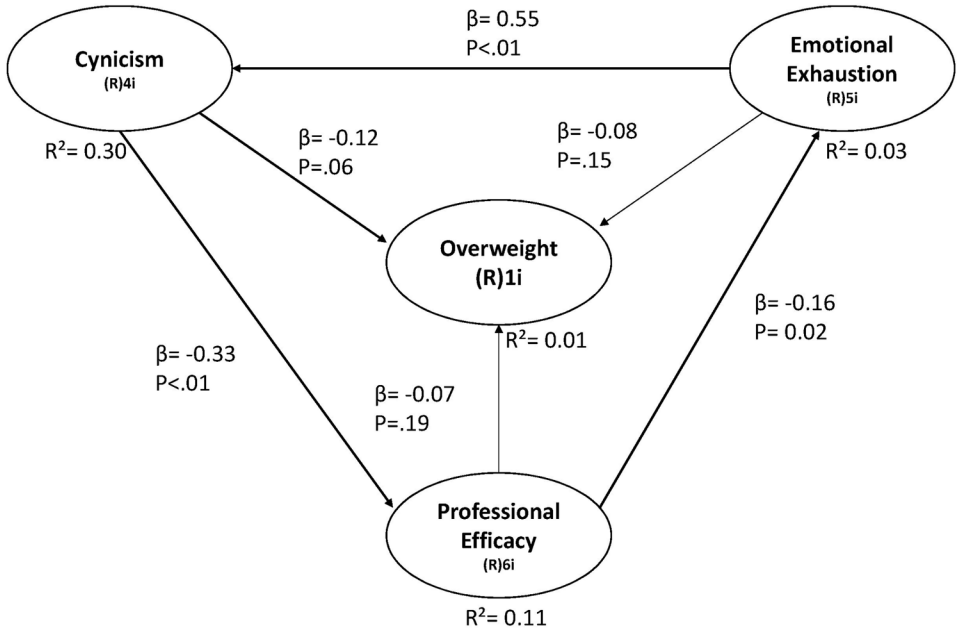
Table 10. Total Effects

	Cynicism	Emotional Exhaustion	Professional Efficacy
Cynicism	β=.62 p=.145 ES=.058	β=.533 p<.001 ES=.088	β=-.119 p=.046 ES=.07
Emotional Exhaustion	β=.116 p=.05 ES=.070	β=.062 p=.145 ES=.058	β=-.224 p=.011 ES=.096
Professional Efficacy	β=-.519 p<.001 ES=.089	β=-.277 p<.001 ES=.067	β=.062 p=.145 ES=.058
Normal Weight	β=-.147 p=.019 ES=.07	β=-.355 p<.001 ES=.093	β=.283 p=.002 ES=.095

Model of the Relationships Between BS Dimensions and Overweight

In this second model, the three BS dimensions are associated with overweight (Figure 9).

Figure 9. Relationships between BS dimensions and Overweight: Initial Model



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

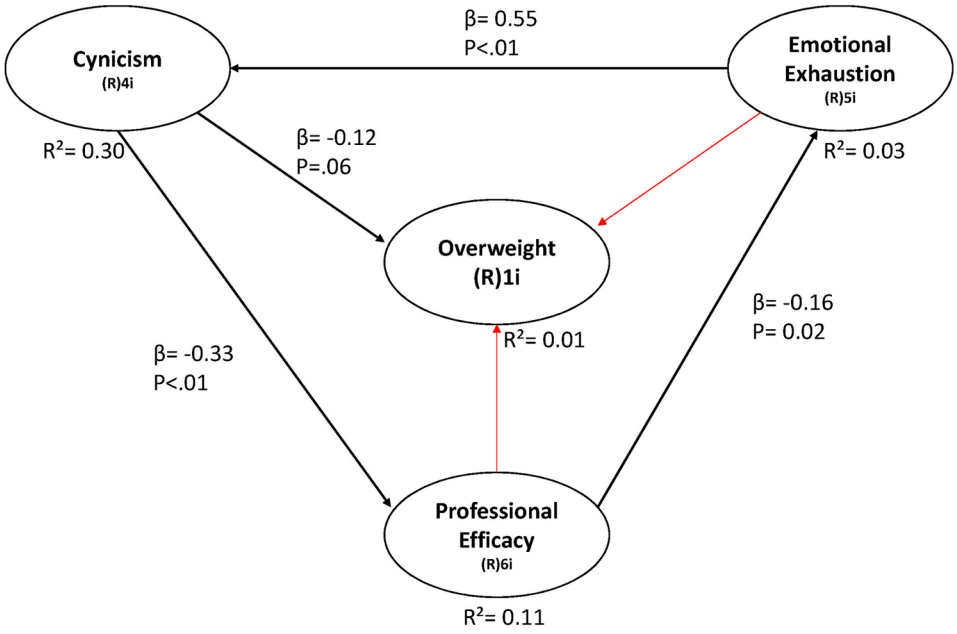
Results and Model Efficiency

Table 10 presents the quality indicators of the observed variables contained in the four latent variables. As can be observed, values of the Cronbach's alpha and the composite reliability index are higher than 0.7, the threshold. Only variables that showed acceptable reliability were maintained.

As for the latent variables, it was proved that all of them had enough convergent validity, since all AVE values were higher than 0.5. Likewise, VIFs values, which were lower than 3.3 in all cases, confirmed the existence of no collinearity (Kock, 2013). Finally, since Q-Squared values were obtained above 0 and similar to their corresponding R-Squared values, it was concluded that the four latent variables had enough parametric validity.

Estimates presented in the table demonstrated the model's efficiency, since all P values were lower than 0.5. Likewise, the values of these indices confirmed medium explanatory capacity of all the model's parameters, whereas the Tenenhaus GoF confirmed the model's medium explanatory capacity. In summary, the model that it was propose to explain the relationships between the three BS dimensions and overweight is efficient.

Figure 10. Relationships between Burnout dimensions and Overweight: Final Model



Validation of Latent Variables and Model Efficiency

Table 11 presents the quality indicators of variables contained in the four latent variables. As can be observed, values of the Cronbach's alpha and the composite reliability index are higher than 0.7, the threshold. Only variables that showed acceptable reliability were maintained.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 11. Validation of Latent Variables

	Cynicism	Emotional Exhaustion	Professional Efficacy	Normal Weight
R-Squared	0.284	0.05	0.27	0.146
Adjusted R-Squared	0.276	0.04	0.262	0.127
Composite Reliability Index	0.939	0.941	0.919	1
Cronbach's Alpha	0.913	0.922	0.893	1
Average Variance Extracted	0.794	0.762	0.654	1
Full collinearity VIFs	1.657	1.342	1.344	1.09
Q-Squared	0.288	0.056	0.27	0.153

As for latent variables, it was proved that all of them had enough convergent validity, since all AVE values were higher than 0.5. Likewise, VIFs values, which were lower than 3.3 in all cases, confirmed the existence of no collinearity (Kock, 2013) among latent variables. In addition, since Q-square values above 0 and similar to their corresponding R-squares were obtained, it was concluded that the four latent variables had enough parametric validity. Finally, Table 12 introduces the loadings and cross-loadings of latent variables. As observed, all P values are lower than 0.05, which implies that both loadings and cross-loadings are statistically significant.

Because the P values of APC, ARS, and AARS were lower than 0.5, it was concluded that the model was efficient and all the model parameters had medium explanatory capacity. Similarly, the Tenenhaus GoF demonstrated that this model had medium explanatory capacity. In conclusion, the model that it was propose in this section is efficient.

Direct Effects

Figure 11 illustrates the effects between latent variables. Every effect was associated with a ß value and a P value. The former represents a dependency measure between two latent variables, and the latter indicates whether a relationship is statistically significant at a 95% confidence level. For a relationship to be statistically significant, its corresponding P value had to be lower than 0.5. As can be observed, Cynicism is the only BS dimension that is directly significant, whereas Emotional Exhaustion is indirectly significant.

Conclusions regarding R^2 values are presented in Table 14. In this analysis, it was found that latent variable Emotional Exhaustion was 2.6% explained by latent variable Professional Efficacy. As for Cynicism, it seemed to be 29.8% explained by Emotional Exhaustion, whereas Professional Efficacy was 11.1% explained by Cynicism. Finally, Normal Weight is 1.4% explained by Cynicism. Such results demonstrated that Professional Efficacy can significantly reduce Emotional Exhaustion and Cynicism. Therefore, companies are advised to provide employees with suitable opportunities to maintain or increase their efficiency at work, otherwise it may affect the overall organization's productivity.

Figure 11. Relationships Burnout - Overweight: Final Model

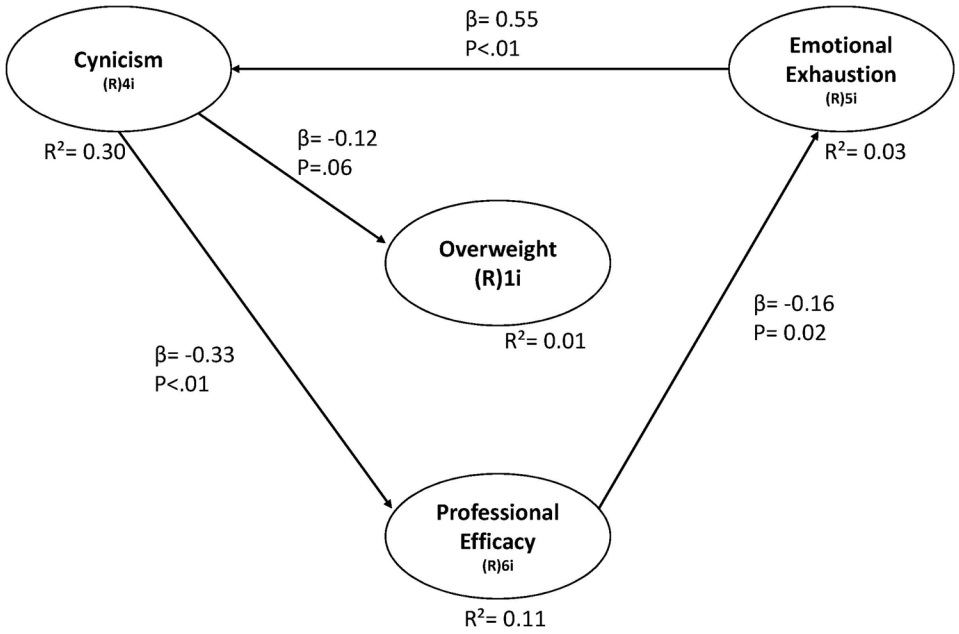

Table 14. Effect Sizes

	Cynicism	Emotional Exhaustion	Professional Efficacy	Normal Weight
Cynicism		0.298		
Emotional Exhaustion			0.026	
Professional Efficacy	0.111			
Normal Weight	0.014			

Sum of Indirect Effects

In structural equation models, relationships are not always direct. Table 15 presents the sum of indirect effects for every relationship in the final model. P values higher than 0.5 indicate that such relationships are not statistically significant. In this table, the relationship between Overweight and Cynicism is worth being emphasized, since the results demonstrated that when Overweight increased by one standard deviation, Cynicism decreased 0.147 units with 7% of variability.

Total Effects

Table 16 presents the total effects for every relationship in the final model. Some relationships are statistically not significant since their corresponding P-values were higher than 0.05. On the other hand, the relationship between Cynicism and Emotional Exhaustion showed the largest total effects. In fact, results revealed that when Cynicism increased by one standard deviation, Emotional Exhaustion increased by

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

0.546 units, with 29.8% of variability. In addition, it was found that when Professional Efficacy increased by one standard deviation, Cynicism decreased by 0.333 units, with 11.1% of variability.

Table 15. Sum of indirect effects

CONCLUSION AND RECOMMENDATIONS

The objective of this research was to associate the three BS dimensions with the BMI among individuals with normal and overweight. To achieve this, a sample of middle and senior managers of the manufacturing industry in Ciudad Juarez, Mexico was studied. The model showing the relationships between BS and normal weight showed a significant explanatory power of 15%. Meanwhile, the model that seeks to explain the relationships between BS and overweight reported only 1% of significant explanatory power. Tables 17 and 18 present the conclusions concerning the hypothetical relations between BS and normal weight and between BS and overweight, respectively.

The results can be compared with previous studies conducted under a similar focus. For instance, according to Koppes, Meijer, and Bemelmans (2013), Emotional Exhaustion as a dimension of BS can be associated with eating disorders and stress, which in turn have an impact on the presence of both overweight and obesity. Also, Montiel (2014) and Barattuci (2011) reported that industrial workers and managerial positions in general tend to skip meals often or replace them by caffeinated, soft drinks, and/or unhealthy foods. Unfortunately, such foods have a strong impact on anxiety and stress. Finally, authors such as Ahola (2012) and Camacho et al. (2015) point out that Professional Efficacy can be directly related to weight loss because individuals are more active. However, Emotional Exhaustion increases the likelihood of suffering from overweight or obesity, since eating habits are usually altered. In other words, as a result of being tired, it is common to skip meals, eat at wrong times, or make poor choices regarding the quality of meals (fast foods, greasy foods…).

Table 17. Conclusions regarding the relationships between Burnout and Normal Weight

	NORMAL WEIGHT		
	Explained Variance= 15%		
Hypothesis	**P and β values**	**Conclusions**	**Decision**
H1: There is a relationship between Professional Efficacy and Normal Weight for middle and senior managers of the manufacturing industry in Ciudad Juárez, Chihuahua, Mexico.	P=.01 β=.22	There is enough statistical evidence to prove that this relationship is positive, since when Professional Efficacy increases by one standard deviation, Normal Weight increases by 0.22 units.	ACCEPTED
H2: There is a relationship between Emotional Exhaustion and Normal Weight for middle and senior managers of the manufacturing industry in Ciudad Juárez, Chihuahua, Mexico.	P<.01 β=-.29	There is enough statistical evidence to prove that this relationship is positive, since when Emotional Exhaustion increases by one standard deviation, Normal Weight decreases by 0.29 units.	ACCEPTED
H3: There is a relationship between Cynicism and Normal Weight for middle and senior managers of the manufacturing industry in Ciudad Juárez, Chihuahua, Mexico.	P=.07 β=.15	No statistically significant relationships were found between Cynicism and Normal Weight.	REJECTED

Table 18. Conclusions regarding the relationships between Burnout and Overweight

	OVERWEIGHT		
	Explained Variance= 1%		
Hypothesis	**P and β values**	**Conclusions**	**Decision**
H1: There is a relationship between Professional Efficacy and Overweight for middle and senior managers of the manufacturing industry in Ciudad Juárez, Chihuahua, Mexico.	P=.19 β=-.07	No statistically significant relationships were found between Professional Efficacy and Overweight.	REJECTED
H2: There is a negative relationship between Emotional Exhaustion and Overweight for middle and senior managers of the manufacturing industry in Ciudad Juárez, Chihuahua, Mexico.	P=.15 β=.08	No statistically significant relationships were found between Emotional Exhaustion and Overweight.	REJECTED
H3: There is a relationship between Cynicism and Overweight for middle and senior managers of the manufacturing industry in Ciudad Juárez, Chihuahua, Mexico.	P=.056 β=-.12	There is enough statistical evidence to prove that this this relationship is negative, because when Cynicism increases by one standard deviation, Overweight decreases by 0.12 units.	ACCEPTED

According to the results, it seems that BS barely explains or does not explain at all the variability of overweight. Is believed that is due to the fact that other aspects, such as a lack of physical activity and/or sleep, unhealthy eating habits, and genetic factors, can have a deeper impact on overweight than psychosocial factors, and therefore, they have a stronger explanatory power. On the other hand, it seems that burnout does have a strong impact on individuals with normal weight. This may happen because such people still have an ordinary life style, especially in terms of eating habits and physical activity, since their weight is not a major concern.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

As for Emotional Exhaustion, the negative relationship between this latent variable and Normal Weight seems to be congruent, since the more emotionally exhausted people feel, the less healthy they eat. Also, the positive relationship between Professional Efficacy and Normal Weight implies that efficient people are more active, and even motivated. Fortunately, both efficacy and motivation contribute a positive attitude at work.

The model that associates BS and overweight is more challenging to explain, since as previously mentioned, in addition to BS-related factors, other variables can explain the prevalence of overweight. Still, the model revealed that Cynicism has an impact on overweight, since cynicism usually entails negative attitudes, which in turn may lead to risk behaviors that can affect the BMI. Such risk behaviors include wrong eating habits, lack of physical activity, and/or unconcern about one's health.

Definitely, such results infer whether BS loses explanatory power as the BMI increases from normal weight to overweight. Indeed, psychosocial factors such as BS affect the physical health but only to a certain extent; then, when we exceed the limits, physiological variables and factors related to the life-style (lack of physical activity and/or sleep, wrong eating habits, genetic factors, etc.) may have a more prominent role when explaining the causes of overweight and obesity. However, it is important to mention that, from a preventive perspective, psychosocial factors and the perception of reality may be the ones which trigger behaviors that can eventually become unhealthy habits.

From Normal Weight to Overweight and Obesity, the line may be too blurred to go back so easily. Therefore, it is important that knowledge management contribution in this research help develop organizational strategies to promote among their employees maintain a normal weight to avoid unhealthy weight gain that compromises the individual's health and organization performance. Also, middle and senior managers must bear in mind that overweight and obesity are chronic diseases that persist, become more serious, and are difficult to eradicate if they are not properly treated and monitored. Fortunately, both conditions can be easily prevented by neutralizing those psychosocial factors that stop us from maintaining a healthy lifestyle.

As recommendations for future research, it is suggested the incorporation of other measuring instruments that can explain more in depth the occurrence of BS. Such instruments should be able to collect information regarding eating habits, physical activity, and stress coping strategies. It is also recommended to include measures of abdominal circumference. Finally, companies are advised to provide employees with personal, social and psychological support to detect indicators of stress and burnout and take the necessary preventive measures. Such strategies would contribute to a healthier lifestyle and work environment.

Chapter 25
Employee Welfare Provisions: An Administration Tool to Enhance Employee Efficiency

Chandra Sekhar Patro

Gayatri Vidya Parishad College of Engineering (Autonomous), India

ABSTRACT

Employee welfare is a prerequisite element for the success and growth of any form of organisation. The provision of welfare facilities improves the relations among the employees and the management of an organisation. These provisions boost the competence levels and value of the employees. The balance between employees' quality of life at the workplace and home is vital, as employees are the pillars of any organisation. The central aim of any organisation in adopting the welfare schemes is to secure the workforce by providing a proper work environment and minimising its hazardous effect on the employees' work life. The basic purpose of employee welfare is to enrich the lives of employees and to keep them happy and conducted. The provision of employees' welfare may be regarded as a wise investment as these would bring a profitable return in the form of greater efficiency. The chapter focuses on determining the various employee welfare provisions adopted by different private organisations and its influence on the employee's satisfaction and effectiveness.

INTRODUCTION

Welfare is a comprehensive term that refers to the physical mental, moral and emotional well-being of an individual (Aswathappa, 2010). Labour is every physical or intellectual activity applied in engineering production and the one who performs it as an employee. The concept of employee welfare is flexible and elastic. It extensively changes with times, regions, industry, country, social values, customs, beliefs, the degree of industrialization, social economic development of people and political ideologies prevailing at that moment. Coventry and Barker (1988) state that employee welfare includes provision of social club and sports facilities, supervising staff, canteens, running sick clubs, savings schemes, dealing with

superannuation, pension funds, leave grants, making loans on hardship cases, making long service grants, assistance to staff transferred to another area, providing fringe benefits, arranging legal aid and giving advice on personal problems.

Employee welfare has two negative aspects and positive aspects. On the negative side, employee welfare is concerned with counteracting the baneful effects of the large-scale industrial system of production especially capitalistic, and so far as India is concerned with the person or family, and social life of an employee. On its constructive part, welfare deals with the provision of opportunities to the employees and their families for a good life (Moorthy, 1968). Welfare measures should be provided by the organizations, whether public or private sector as it raises the morale of employees, reduce the risk and insecurity, eliminate turnover and absenteeism, and increase the production and productivity. Thus, improving the quality of working life by providing the employee welfare facilities would go a long way in achieving the goals of an organization (Patro, 2017a).

Employees have always been central to organizations, and their strategic importance is growing in today's knowledge-based industries. Employee welfare is an important fact of industrial relations, the extra dimension, giving satisfaction to the worker in a way that even a good wage cannot. Employee welfare is an important aspect of any industry. It acts as social security measures that contribute to improving the condition under which workers are employed. Employee welfare facilities in the organization affect the behavior of the employees as well as on the productivity of the organization. The management should provide good facilities to all employees in such a way that employees become satisfied and they work harder and more efficiently and effectively (Choudary, 2017). In the current scenario, the welfare schemes are provided to the employees to retain talented and skilled employees. Thus, employee welfare is very comprehensive and embraces activity provided by employers, state and central governments, trade unions and other agencies to help employees and their families to lead a contented work life. The welfare schemes change the way employees lead their quality life at the workplace as well as at home. The important question is whether the welfare schemes adopted by the companies have an impact on the employees' work life and their satisfaction (Patro, 2017b). Thus, employee welfare is a comprehensive term including various services, benefits, and facilities offered to employees by the employers. Through such generous fringe benefits, the employer makes life worth living for employees. The welfare amenities are extended by in addition to normal wages and other economic rewards available to the employees as per legal provisions. The welfare measures need not be monetary but in any kind/form. This includes items such as allowances, housing, transportation, medical insurance, and food. Employee welfare also includes monitoring of working conditions, the creation of industrial harmony through infrastructure for health, industrial relations and insurance against disease, accident, and unemployment for the workers and their families.

The chapter focuses on identifying the various welfare measures adopted by the companies for motivating the employees. Further, examines the influence of welfare provisions on employees' satisfaction and its impact on the effectiveness of the organization. Therefore, assortments of both statutory and non-statutory welfare provisions that can be provided by the companies according to the industrial acts are discussed for a better understanding.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

BACKGROUND

Employee welfare provision is an imperative facet of organizational relations giving satisfaction to the worker in a means that even a good wage cannot. With the growth of industrialization and mechanization, welfare provisions have gained additional importance in the organization (Monappa, 1995). The report of the Committee on Labour welfare (GOI, 1969) includes the services such as adequate canteens, rest and recreation facilities, sanitary and medical facilities, arrangements for travel to and from work and for the accommodation of workers employed at a distance from their homes and such other services, amenities and facilities including social security measures as contribute to improve the conditions under which worker is employer. An employee cannot survive with the pace of modern life amid minimum available amenities. He needs added motivation to keep body and soul together at the workplace. The management has realized the importance of their role in providing these additional amenities to the employees (Patro, 2012). Many organizations have adopted welfare schemes as a strategy for improving the efficacy of employees since work-related troubles can lead to poor quality of work life and a decline in their performance (Manzini & Gwandure, 2011). Welfare facilities can be adapted to secure the workforce by providing appropriate human working conditions by minimizing the hazardous effect on the life of the employees and their family members. Employees' are the assets of any organization, so, the desires and necessities of the employees need to be satisfied to meet the goals of the organization (Patro, 2016a).

Any organization can operate effectively only when there is a high degree of coordination and cooperation between the employees and the management. The structure of a welfare state rests on its social security fabric. Government, employers, and trade unions have done a lot to promote the betterment of worker's conditions (Joseph et al., 2009). Patro (2017c) suggested that the existing welfare schemes may be improved further as they enrich the employee's standard of living and their satisfaction levels. New schemes and facilities should be added to existing ones to improve the efficiency and quality of work life of the employees by the management of all organizations. Therefore, welfare measures are considered as critical indicators that influence the performance of an employee. Satyanarayna & Reddi (2012) stated that the welfare measures which enrich the employees' standard of living and increase their satisfaction levels are to be necessarily provided by the organizations. Parul & Kumar (2013) concluded in terms of proving that the different welfare provisions provided to the employees working in an organization under the Factories Act, 1948 are having a positive relationship with employee satisfaction.

Patro (2015) in a comparative analysis of welfare measures in the public and private sector found that an employees' welfare facility is the key dimension to a smooth employer-employee relationship. The management provided all the health safety and welfares to the employees that helped to produce better performance in the work and working environment. The companies with strong employee relations initiatives will benefit because their workforce is highly motivated to expend their best efforts it involves providing fair and consistent treatment to all employees so that they will be committed to the organization (Gomez-Mejia et al., 2001). Jain (2016) study revealed that the employees were satisfied with existing welfare facilities like allowances, medical facilities, quality of work life, safety and security. Overtime allowances and canteen facilities were the two main areas where improvements are required. Culpepper (2009) found that implementing a pay for performance system has been shown to resolve organizational problems because it aligns the preferences of firms and employees. Also, creating pay for performance system serves as a sorting mechanism to identify and attract the most capable employees. This type of system has shown that individual pay incentives significantly improve productivity.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Nanda & Panda (2013) stated the Rourkela steel plant has adopted a better class of welfare activities that create an effective working environment and thus, better productivity. There are different kinds of welfare schemes like medical allowance, death relief funds, insurance, housing, transportation, and recreation club facilities, etc., are provided by the company to the employees to maintain better industrial relations. Neetha (2001) focused on the temporal changes in the labor process and the division of labor with a special emphasis on gender in the structure of the knitwear industry. Further, slowly the production relations are becoming more and more informal and the process has led not only to informalization of the workforce but also to the feminization and disorganization of the workforce. Logasakthi & Rajagopal (2013) found that the employees are not only satisfied with their jobs but also enjoyed the various facilities provided by the companies. The employees also extended their maximum support for the improvement of the company and also retain the employees for a long period (Patro & Raghunath, 2016). Sahoo & Sahoo (2018) identified that the variables interpersonal relationships, a safe and healthy work environment, and employee welfare were significant predictors of cordial employee relations.

Patel et al. (2017) found that there is no significant relationship between the satisfaction level of the employee having different age and designation level with welfare measures. There should be more emphasis on employees' welfare and it must be in a continuous manner, such measures will motivate employees and also increased their involvement in the job due to which Industrial growth will possible. Kumar and Yadav (2002) revealed that the overall satisfaction level of workers on welfare schemes was low in both the private and State sugar factories. The key behaviors which included belief in the organisation, desire to work to make things better, understanding of the business context and the 'bigger picture', being respectful of and helpful to colleagues, willingness to 'go the extra mile' and keeping up to date with developments in the field were found to be associated with employee engagement (Robinson et al., 2006). Ahmed (2018) stated that some welfare facilities are better in the public sector and some welfare facilities in the private sector. The canteen facility, latrine, and urinal facility, recreational facility, library facility, gymnasium facility, cultural activity, and training facility are better in the public sector compared to the private sector. On the other hand, restroom facility, drinking water facility, medical and first aid facility, washing facility, seating facility, transportation facility, housing facility, and educational facility are better in the private sector compared public sector organizations.

Motivating employees begins with recognizing that to do their best work, people must be in an environment that meets their basic emotional drives to acquire, bond, comprehend, and defend (Nohria et al., 2008). Sailesh (2012) stated that employee welfare measures increase the productivity of the organization and promote healthy industrial relations thereby maintaining industrial peace. Organizations provide welfare facilities to their employees to keep their motivation levels high. Business houses provide many such statutory and non-statutory things policies to maintain a satisfactory level of their employees. When they get better canteen facilities, good water to drink, clean restrooms, clean and hygienic washrooms, and bathrooms, regular medical checkups, health insurance, employee assistance program, grievance handling department, better facilities to sit or good workplace gives the employee a high level of satisfactory level. Kumar and Kumar (2018) study identified that the majority of the workers are satisfied by the various statutory welfare measures implemented by the organization. There is a relationship between Welfare measures implemented and workers satisfaction.

Patro (2019) stated that a satisfied employee is a key factor, who acts as the organization's ladder for success. Thus, good employee relations help in developing a satisfied, committed and productive workforce that leads towards the overall effectiveness of an organization.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

NEED FOR EMPLOYEE WELFARE PROVISIONS

The Indian companies have greater need and importance of adopting employee welfare provision than any other country. Certain deficiencies in the Indian workforce are not found in other countries. The reason why employees' rights and welfare are very significant is that employees need to work in places where the environment is devoid of tension and rancor to be productive. The welfare provisions should also be provided based on the feeling of care and compassion to the employees considering that some of them will spend the whole of their life working for the organization (Hartman et al., 2004). The conducive, safe and healthy work environment will enable workers to give their best and perform effectively and efficiently (Jaskiewicz & Tulenko, 2012). While some organizations are taking the responsibility to provide welfare facilities and services, others are avoiding them. The perception of those companies not providing welfare facilities for their employees is that it is an unnecessary burden to them. The provision of welfare facilities is however mandatory under most company's law and must be statutorily provided.

Even today in some economies, the employees are not united into a class and the employee union associations are still in its infancy. If the employees' union does exist, there is a lack of enlightened leadership and there is no unity between these unions themselves. In the absence of well-organized employee unions, the workers can place their demands effectively neither before the employer nor can systematically think of their interests. Due to this lacking force, it is essential to focus on the employee welfare provisions by the employers and the Government. Due to the inadequate level of wages, the employees cannot comfortably settle down in one place or region, which may, in turn, give rise to absenteeism. The employees' migratory tendency can be curbed by providing them with adequate facilities and conditions, and this also shows a positive effect over the absenteeism in the organization. Healthy recreation should also be given priority as the efficiency of the workforce is diminished by energy being employed in all kinds of undesirable channels. Hence, it is essential that the recreation and enjoyment of a healthy kind be provided.

As the welfare of an employee at the workplace will not only enhance their work efficiency but also improve the willingness to perform their job involving themselves within the work environment. The welfare provisions help to maintain health and skills, avoids exploitation of the worker by the employer, increases the happiness of workers, and motivates the workers at the workplace. In India, most of the companies are not adopting the welfare measures properly at their workplace. The companies compel workers to work in uncomfortable/ adverse conditions. Their uncomfortable conditions lead to serious damages to the employee. Therefore, maintenance of employee welfare previsions is a must in the identity premises.

CATEGORIES OF EMPLOYEE WELFARE PROVISIONS

Modern and civilized societies contemplate workers as human beings entitled to the protection of the law and government (Steiner, Alston, & Goodman, 2008). The employees are deserved to be treated with dignity and respect irrespective of their position in the workplace. Employees are not slaves but are free born using their skills to contribute to the growth and development of an organization (Drescher, 2004). Therefore, they deserve ample welfare facilities and services which should be provided by the employers in addition to wages and salaries. The committee of experts on welfare facilities for employees categorized welfare measures (International Labour Organisation,1963) as statutory measures (intramural

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

facilities) and non-statutory measures (extramural facilities), and mutual facilities. It is very difficult to classify the welfare activities into certain broad categories. Some of the facilities under statutory and non-statutory welfare measures are shown in Table 1.

Statutory Welfare Measures

Under this category, welfare facilities are provided according to the labor legislation passed by the Government. The nature and coverage of these facilities vary from country to country. These facilities must be provided by all the employers and cannot be ignored. Any contravention of the statutory provisions shall render the employer punishable under the Act concerned. According to the National Commission of Labour, the statutory measures are divided under two distinct heads:

- Facilities have to be provided irrespective of the size of the establishment.
- Facilities are to be provided subject to the employment of a specified number of persons.

The provisions provided inside the premises of the establishments are known as intramural facilities. These facilities include activities relating to minimization of industrial fatigue, provision of safety measures like fencing and covering of machines, good layout of the plant and machinery, sufficient lighting conditions,provision of first aid appliances, sanitary facilities, crèches, rest shelters, canteens, drinking water, prevention of fatigue, health services including occupational safety, administrative arrangements, uniforms and protective clothing, shift allowance, etc. Provisions of such facilities are also obligatory in all industrial establishments all over the world.

Non-Statutory Welfare Measures

Under this category, it is not mandatory for the companies to provide the welfare facilities to the employees. The provision of these facilities is voluntary. Earlier, due attention was not given to the provision of extramural facilities to the workers but now it is realized that these facilities are very important for the general welfare and upliftment of the employees. The welfare provisions offered to the workers outside the establishment are known as extramural facilities. They include better housing accommodations, educational facilities, maternity benefit, social insurance measures, sports, and cultural activities, library or reading room, leave travel facilities, workers co-operative credit societies, welfare programs for women, youth and children and transport facilities, etc. No doubt, the activities under this category ultimately lead to an increase in the efficiency of workers.

Mutual Welfare Facilities

These facilities are usually outside the scope of the statutory facilities. These activities are voluntarily undertaken by the workers themselves for their interests. As such the employer has no say in it.

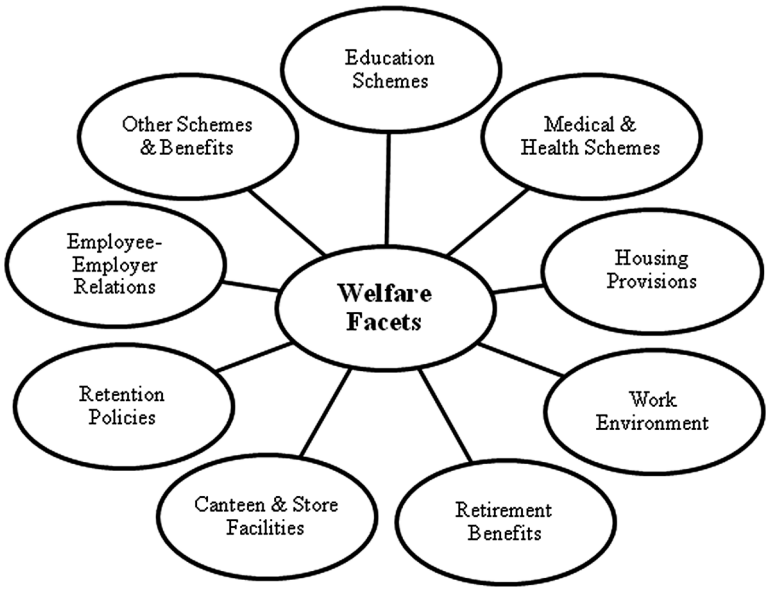
FACETS OF WELFARE PROVISIONS

Employees play an essential role in the development of any organization. Therefore, the management of the companies has to adopt welfare measures to get benefited in accomplishing the objectives. The benefits of employee welfare measures are more direct to the employees than the organization. However, it is important for the company to generate various employee welfare schemes to retain the employees (Patro, 2014). The different welfare facets identified are as shown in Figure 1.

Figure 1. Welfare facets



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. **Education Schemes:** Education schemes play a very important role in motivating and enabling the progress of employees for their mental and physical development. The educational needs in any organization are two-fold i.e., adult/employee education schemes and schools/colleges for their children. The educational benefits that can be provided by the private companies include, sponsoring for employees' higher education or permission for part-time education, reimbursement of children tuition fees, schools or colleges in the organization premises, and training & development programs (Patro, 2017d).
2. **Medical and Health Schemes:** The employees' health should be given utmost importance, as it also results in the development of an organization. Health care for employees helps to reduce the incidence of sickness, absenteeism and increases their efficiency and productivity (Patro & Raghunath, 2018). The organizations can provide medical facilities to the employees and their family members also. The management can offer facilities like medical fees reimbursement, maternity leaves or benefits, provision of emergency services, and frequent medical checkups, to the staff members. These facilities create a healthy work-life for the employees.
3. **Housing Provisions:** Housing facility has a direct bearing on the health and efficiency of the employees. The provision of quarter facilities at low cost with basic amenities such as adequate space, ventilation, electricity facilities, water facility, transport facility, maintenance facilities (roads, lighting, drainage systems, lavatories), and other sanitary arrangements. The organizations may also provide a housing allowance to the employees (Patro, 2017c). These facilities enhance the quality of life of the employees.
4. **Work Environment:** A positive work environment makes employees feel good about coming to work, and this provides the motivation to sustain them in the organization. The management should provide information and resources to assist their employees to make healthy lifestyle choices and to achieve and maintain good health. It promotes work-life balance by creating a healthy physical, social and psychological work environment as a core business goal (Rao et al., 2015). A healthy work environment makes the employees' more satisfied and improves their work efficiency. The companies can provide good environments such as a safe and secure environment, autonomy at work, restroom and locker facilities, workload and Job stress.
5. **Retirement Benefits:** The retirement benefit is one the important welfare scheme, which is to be provided to the employees in any organization. These benefits increase the satisfaction level of the employees towards the organizations and motivate them to achieve the organizational objectives. The companies can attempt to provide benefits such as a pension, gratuity and provident fund benefits, retirement or death compensation, and other post-retirement benefits (Patro, 2017c). These facilities will make the staff members motivated towards the management and in increased efficacy.
6. **Canteen and Store Facilities:** Cafeteria or canteens shall be provided by the employer so, as to provide hygienic and nutritious food to the employees. It is a method of creating more satisfactory working and living conditions for the employees working in an organization. This welfare measure would greatly reduce turnover and absenteeism among workers and improves workers efficiency to a greater extent and also create a permanently settled workforce by making service attractive to the employee (Patro, 2017c). This facet includes the facilities like the subsidized cost of food items and stores, precise and clean drinking water, maintenance of cleanliness and quality of food items that can be made available to the staff members.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

7. **Retention Policies:** Employee retention has become the most critical issue for all types of organizations as a result of the shortage of skilled labor, economic growth, and employee turnover. Retention of employees is an important element in providing welfare schemes. Employee retention involves taking measures to encourage employees to remain in the organization for a maximum period. The retention policy helps the management of the organization in reducing the cost of turnover, loss of company knowledge, interruption of work, regaining the efficiency and increases the productivity of the organization (Patro, 2016b). This policy includes better compensation packages, trust on employees' capability, provide growth opportunities, promotion and incentive Policies.
8. **Employee-Employer Relation:** There is a common saying that 'Employees leave their bosses, and not their jobs', which is true because the relationship with the management and the peers becomes often the reason for an employee to leave the organization. The management is sometimes not able to provide an employee with a supportive work culture and environment in terms of personal or professional relationships (Patro, 2019). The facet includes the factors like transparent and open communication, cooperation by management or superior, recognition and appreciation of hard work, grievance settlement forums.
9. **Other Schemes and Benefits:** The other welfare schemes or benefits must be provided to the employees, which in turn will help them to increase their satisfaction and quality of work life. These facilities motivate the employees towards management and increase their work efficiency. The other benefits may include recreation facilities, post office, and bank facilities, cooperative or credit societies, and group insurance schemes. These facilities also enhance the employees' satisfaction and lead quality work life.

FRAMEWORK AND HYPOTHESES

The welfare provisions change the way employees lead their work life in the companies and as well as at home. The question is would the welfare provisions have an impact on the employees' work life. Therefore, an inquiry into the employees' response to the various welfare provisions adopted in the companies has become essential. The various statutory and non-statutory welfare provisions adopted by the private companies according to the Industrial Acts are discussed in the framework as shown in Figure 2.

For the purpose the following hypotheses are framed:

$\mathbf{H_1}$: Education schemes do not show a significant effect on employees' efficiency.
$\mathbf{H_2}$: Medical & Health schemes do not show a significant effect on employees' efficiency.
$\mathbf{H_3}$: Housing provisions do not show a significant effect on employees' efficiency.
$\mathbf{H_4}$: Work environment does not show a significant effect on employees' efficiency.
$\mathbf{H_5}$: Retirement benefits do not show a significant effect on employees' efficiency.
$\mathbf{H_6}$: Canteen & store facilities do not show a significant effect on employees' efficiency.
$\mathbf{H_7}$: Retention policies do not show a significant effect on employees' efficiency.
$\mathbf{H_8}$: Employee-employer relations do not show a significant effect on employees' efficiency.
$\mathbf{H_9}$: Other schemes & benefits do not show a significant effect on employees' efficiency.

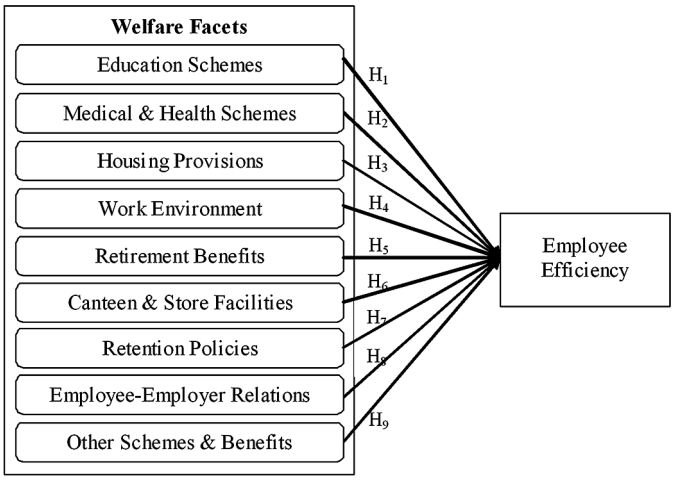
Figure 2. Welfare provisions framework



METHODOLOGY

The chapter enquires into the welfare provisions adopted by different private sector companies and the satisfaction experienced by the employees working in these organizations. The identified welfare facets having an impact on the employees' satisfaction at the workplace and their work life are examined. The required data were collected from both primary and secondary sources. The secondary data was collected from books, journals, magazines, unpublished thesis and institution websites to know the various welfare provisions adopted in the private sector companies. The primary data resources are collected using a survey method from the employees working in different private companies of Visakhapatnam city, India. The survey was conducted for a period of one month during March 2016. To get the required data, a structured questionnaire was designed and distributed to the employees through emails and some respondents are approached personally. The purpose of the survey was explained to the respondents and was assured of the confidentiality of their responses. A total of 290 valid responses were considered for statistical data analysis.

To measure the satisfaction level of the employees, a 5-point Likert rating scale technique was used ranging from Highly Satisfied (5) to Highly Dissatisfied (1). For evaluating the responses inferential statistics are used to make a conclusion based on the results and significance. Descriptive analytical tools such as mean, standard deviation, standard error, and t-values were used to summarize the respondents' opinions. The nine facets were tested for their relationship with employee's satisfaction using correlation and the hypotheses are tested using ANOVA analysis.

STATISTICAL DATA ANALYSIS

To examine the employees' perception towards the welfare provisions adopted by the companies, nine imperative welfare facets like housing schemes, education schemes, medical schemes, work environment, retirement schemes, canteen facilities, retention schemes, employee-employer relation, and other schemes are identified. The descriptive statistic results regarding the employees' satisfaction towards

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

welfare provisions are shown in Table 2. The respondents are 59 percent (172) male and 41 percent (118) female. The mean scores, standard deviation, t-values, factor loadings, average variance extracted, composite reliability and Cronbach's' alpha are computed as shown in the table. The Cronbach's' alpha value reveals that all the variables are having internal consistency as they are above 0.90 falling in the category of superb. The composite reliability values also show the validity of the variables is above 0.80.

The statistics show that the overall mean values are in the range of 2.20 – 3.41 which indicates that the satisfaction level of the employees towards welfare provisions is average. The standard deviation values range from 0.729 – 1.113. In the case of education schemes, training & development programs (3.23) got the highest rating followed by the provisions sponsoring for employees' higher education (2.21), reimbursement of children tuition fees (1.70), and schools or colleges in organization premises (1.68). Regarding medical & health schemes the provisions frequent medical checkups (3.08) secured the highest rating from the respondents followed by the provision of emergency services (2.96), maternity leaves or benefits (2.51), and reimbursement of medical expenses (1.73). Concerning housing provisions, transport facility or allowances (3.40) got higher rating followed by the provisions housing allowances (2.86), hygiene or maintenance services (2.76), and provision of staff quarters (2.03) by the respondents. In the case of the work environment, restroom and locker facilities (3.54) scored the highest rating from the respondents followed by the safe and secure environment (3.34), autonomy at work (3.10), and workload and job stress (2.86).

The respondent's opinion on retirement benefits reveals that the provisions gratuity & provident fund benefits (3.15) secured the highest rating from the respondents followed by retirement or death compensation (2.01), post-retirement benefits (1.91), and pension benefits (1.71). In the case of canteen & store facilities the provisions precise and clean drinking water (3.85) got the highest rating followed by quality of food items (3.50), store facilities (2.83), and subsidized cost of food items (2.79) by the respondents. About retention policies, promotion and incentive policies (2.99) secured the highest rating by the respondents followed by the provisions trust on employees' capability (2.83), better compensation packages (2.76), and providing growth opportunities (2.28). Regarding employee-employer relations, cooperation by management or superior (2.59) got a higher rating from the respondents followed by the provisions recognition and appreciation of hard work (2.53), transparent and open communication (2.29), and grievance settling forums (2.20). In the case of other schemes & benefits, post office and bank faculties (2.76) secured the highest rating from the respondents followed by the provisions group insurance schemes (2.71), recreation facilities (2.51), and cooperative/credit societies (2.36).

The respondents' opinion on the employees' efficiency reveals that welfare provision helps in overall growth of employees (3.96) got the highest rating followed by the variables welfare provisions to increase the competencies of employees(3.86), welfare provisions are effectively adopted by the company (3.15), and satisfied with the welfare provisions of the company (2.65).

Note: All the t-values are significant at the 0.01 level (2-tailed)								

AVE-Average Variance Extracted, CR-Composite Reliability, CA-Cronbachs' Alpha

From Table 2, it can be observed that all the t-values are significant at ($p < 0.01$) significance level (2-tailed). The analysis show that the respondents are highly satisfied with the canteen & store facilities (3.24) followed by the provisions work environment (3.21), housing provisions (2.76), retention policies (2.72), other schemes & benefits (2.59), medical & health schemes (2.57), employee-employer relations (2.40). The low satisfied welfare provisions are education schemes (2.21) and retirement schemes (2.20). The respondents rating towards the employees' efficiency 3.41 shows a positive rating towards the welfare provisions adopted by the private companies. The factor loadings ranged from 0.633 – 0.894 reveal that all the provisions have a positive influence on the employees' satisfaction and efficiency. The average variance extracted (AVE) values shows that employee-employer relations (0.741) got the highest variance whereas, employee efficiency recorded (0.517) lowest variance.

The summary of the t-test indicates that all the welfare facets have a significant relationship with the employees' satisfaction and efficiency. The t-values with the significance levels (2-tailed), mean differences, and a 99 percent confidence interval of difference at the upper and lower level are shown in Table 3. The analysis show that the highly influential welfare facet is canteen & store facilities (35.203) followed by the welfare facets work environment (35.472), employee efficiency (33.851), housing provisions (28.997), retirement benefits (28.727), education schemes (26.706), retention policies (24.298), medical & health schemes (23.984), employee-employer relation (21.839), and other schemes & benefits (21.131).

RESULTS AND DISCUSSION

The statistical significance of all welfare facets was examined to determine the validity of the hypothesized paths. The results of the model summary, ANOVA, and regression coefficient values for the relationship between employee welfare facets and employee efficiency are discussed.

Table 5. Model summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.984[a]	.969	.965	.18663
a. Predictors: (Constant), education schemes, medical & health schemes, housing provisions, work environment, retirement benefits, canteen & store facilities, retention policies, employee-employer relation, other schemes & benefits				

The model summary Table 5 reveals that the linear regression coefficient (R=0.984) indicates that there is a maximum correlation between the dependent and independent variables. In terms of variability R-Square (0.969) shows that the independent variables education schemes, medical & health schemes, housing provisions, work environment, retirement benefits, canteen & store facilities, retention policies, employee-employer relation, and other schemes & benefits can predict 97 percent of the variance in the factor employee efficiency.

Table 6. ANOVAa

Model	Sum of Squares	df	Mean Square	F	Sig.
Regression	76.234	9	8.470	243.193	.000[b]
Residual	2.438	280	.035		
Total	78.672	289			
a. Dependent Variable: Employee Efficiency					
b. Predictors: (Constant), education schemes, medical & health schemes, housing provisions, work environment, retirement benefits, canteen & store facilities, retention policies, employee-employer relation, other schemes & benefits					

The results of the ANOVA test shown in Table 6 indicates that the dependent variable employee efficiency (F=243.193, p=0.000 < 0.01) show a significant relationship with the independent variables education schemes, medical & health schemes, housing provisions, work environment, retirement benefits, canteen & store facilities, retention policies, employee-employer relation, and other schemes & benefits.

The coefficient results shown in Table 7 reveal that the education schemes have a significant positive relationship with the employee's efficiency (β=0.214; p=0.038 < 0.05) providing strong support for the rejection of the hypothesis H_1. Medical & health schemes show a significantly positive influence on employee efficiency (β=0.546; p=000 < 0.01), not supporting the null hypothesis H_2. The housing provisions have a positive significant relationship with the employees' efficiency (β= 0.231; p=0.028 < 0.05) rejecting the null hypothesis H_3. Work environment shows a strong positive significant impact on employees' efficiency (β= 0.129; p=0.026 < 0.05) thus, H_4 is also not supported. Moreover, the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

retirement benefits are having a significant positive impact on employee's satisfaction and efficiency (β= 0.025; p=0.038 < 0.05), hence H_5 is not supported. The canteen & store facilities also have a strong positive significant relationship with the employee's efficiency (β= 0.377; p=0.002 < 0.05), rejecting the null hypothesis H_6. The retention policies adopted by the management also significantly influencing the employees' efficiency (β= 0.691; p=0.002 < 0.05), hence H_7 is not supported. Employee and employer relations were found significantly influencing an employee's efficiency (β= 0.376; p=0.001 < 0.05), so the hypothesis H_8 is not supported. Finally, other schemes & benefits (β= 0.371; p=0.012 < 0.05) also show a significant positive relationship with employees' satisfaction and efficiency, hence not supporting the hypothesis H_9. Thus, the regression analysis results provide a strong support for the rejection of the null hypothesis relating to the relationship between independent variables education schemes, medical & health schemes, housing provisions, work environment, retirement benefits, canteen & store facilities, retention policies, employee-employer relation, other schemes & benefits with the dependent variable employee efficiency.

Table 7. Coefficients [a]

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	.563	.175		3.222	.002
Education Schemes	.290	.193	.214	1.499	.038
Medical & Health Schemes	.569	.151	.546	3.772	.000
Housing Provisions	.271	.154	.231	1.760	.028
Work Environment	.157	.129	.129	1.222	.026
Retirement Benefits	.037	.138	.025	0.268	.038
Canteen & Store Facilities	.457	.142	.377	3.233	.002
Retention Policies	.691	.216	.691	3.204	.002
Employee-Employer Relation	.382	.107	.376	3.555	.001
Other Schemes & Benefits	.338	.131	.371	2.584	.012
a. Dependent Variable: Employee Efficiency					

Note: All the t-values are significant at 0.01 and 0.05 level

The welfare provisions such as housing schemes, education benefits, retirement benefits, medical benefits, retention policies, and the working environment have a strong significant influence on the employees' efficiency. Therefore, the welfare provisions are considered as a critical factor in influencing the work life of the employees. Proper implementation of both statutory and non-statutory welfare measures increases the employees' work efficiency and therefore, helpful in the overall development of the organization.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ADOPTION OF WELFARE PROVISIONS

The theories of labor welfare have evolved over the years. Before, the government had to compel the industrial organizations to provide basic amenities to their employees (Erasmus, 2008). Such compulsion was necessary because the employers used to exploit employees and treated them unfairly. The basic objective of employee welfare is to enable workers to live a richer and more satisfactory life. Adopting the welfare facilities depend on the management of an organization. It is based on the approach of the organization on how best it has organized the schemes to suit and benefit the workers (Cotton et al., 2005). While statutory welfare facilities are compulsory, non-statutory welfare schemes need to be shaped and driven by a very sound company policy that allows employees to have substantial input into what and how the facilities should be provided without conflicting or undermining the organization stance and focus.

The employer and employee need to work together to make sure that the facilities are provided based on mutual respects and understanding. Welfare provisions are desirable for employees but they cannot be substituted for wages. Workers have the inherent rights to living wages as a result of the labor they put into economic and productive aspects of an organization. However, it is pertinent to mention that living wages are not enough and cannot create a healthy work environment (Verdon, 2002). Wages are earned and usually used for social economics activities outside the workplace but welfare is provided for by the organization for a healthy and sustainable environment in the workplace (Portney, 2005). A combination of adequate wages with ample welfare provisions will intensely yield and achieve good results for the organization.

Statutory welfare facilities are products of the laws regulating the provision and implementation of welfare facilities in the workplace (Ridley & Channing, 2008). They are obligatory and imperative. Therefore, there are consequences for failure to provide welfare facilities as stipulated in the statutes. The health and safety of the workers are paramount and the necessary safety gadgets must be provided for the workers in addition to other important facilities and services. If not provided and there is a mishap or accident in the workplace, the victim may institute legal action against the erring organization in courts and punitive damages awarded against the organization if found wanting. Nowadays, an organization is not only considered successful as a result of the profits it has declared but also based on the welfare benefits given to employees that were used to make the profits (Schaltegger & Lüdeke-Freund, 2013). The organizational policy now contains numerous welfare facilities and how they are to be provided for the benefits of the employees. The company's annual reports and financial statements now reflect the amount of money being spent on various welfare schemes to the employees. Welfare schemes are now statutorily enforceable and the company has a corporate social responsibility to provide for them.

The successful adoption of employee welfare provisions depends on the approach which has been taken into account in providing such activities to the employees. Employee welfare is dependent on certain factors that influence the successful implementation of welfare programs.

1. Employee welfare measures cannot be a substitute for salaries and have a right to get adequate compensation.
2. A combination of social welfare, emotional welfare, and economic welfare together would achieve good quality results and make him lead a healthy work life.
3. Programs for housing, education, and training, provision of balanced diet and family planning measures are some of the important facets of welfare which increases the efficacy of the employees.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

4. The development of human personality should be the goal of organizations. Therefore, it is necessary to implement intramural and extramural employee welfare services both inside and outside the company.
5. Co-operation and agreement of employees in the formulation and adoption of welfare services are essential for their growth.
6. Employees develop a sense of pride when they are made to feel that welfare programs are designed and adapted for them.
7. The responsibility of welfare provisions should be shared by different groups such as employers, employees and also trade unions, to implement the welfare programs more effectively and healthily.
8. Assessment or evaluation of existing welfare provisions is necessary on a periodical basis so that one can judge and analyze the success of employee welfare programs.
9. Identify the employees' problems and find out the help required to solve the issues, and provide necessary resources in planning welfare programs. Timely action in the proper direction is essential in any kind of social work.
10. Finally, the fact that employee welfare must aim at helping the employee to motive them and increase efficiency in the long run.

Every effort should be made to give employees some voice in the choice of welfare activities so long as it does not amount to dictation from employees. This helps the employees to become more responsible and lead a healthy quality work life.

CONCLUSION AND MANAGERIAL IMPLICATIONS

The concept of employee welfare has been used by many organizations as a strategy of improving the efficiency of employees, especially in private companies since work-related problems can lead to poor quality of life for employees and a decline in performance. Welfare provisions are essential for the higher efficiency of the employees and their satisfaction. Without getting effective support of welfare provisions from the management, the employees may not be able to balance between work life and family life, as a result, it may lead to low productivity of the organization. The employees are satisfied with the welfare provisions adopted in the private sector organizations but are not effectively implemented. The management should take necessary steps to solve the problems in effectively adopting the welfare measures so that the employees can do their job more interestingly.

The objectives of the chapter have been achieved after going through the relevant analysis. It is encouraged to implement similar welfare provisions as it is useful in motivating the employees in increasing their work efficiency. The facets of employee welfare provisions especially education, retirement benefits, and other facilities are indicative of influencing the employees to work efficiently in private sector organizations. The companies need to take necessary efforts to find out the employees requirements and adopt those welfare provisions for the successful development of the organization. New schemes and facilities should be added to existing ones to improve the efficiency and quality of work life of the employees by the management of all organizations.

The importance of welfare schemes and services are increasingly being agitated for by employees and organized labor. Welfare measures are recognized by international labor organizations and they all enjoin each member state to the organization to ensure its proper implementation. Employees deserve

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

more than only salaries or wages, hence the argument for the provision and improvement of existing welfare facilities in the workplace. The welfare provisions benefit employees as well as serves as an impetus for efficiency and effectiveness in the chain of productive activities in the workplace. The companies will, however, benefit more because efficiency and effective production will lead to huge output which would invariably impact on the profit and margins of the organization and make it a perpetually sustainable venture.

Chapter 26
Welfare Programs as a Strategy of Promoting Employees' Economic Growth and Work Productivity

Chandra Sekhar Patro

Gayatri Vidya Parishad College of Engineering (Autonomous), India

ABSTRACT

Many organizations apply the notion of employee welfare programs as a strategy of improving employee productivity, since work-related exertions could lead to deprived quality of work life for employees and a decline in performance. Welfare schemes promote economic development by increasing the efficiency and productivity with the underlying principle being making workers bestow their loyal services ungrudgingly in genuine spirit of cooperation. The welfare schemes improve the organizational relations and also enhance the productivity of the employees. The main aim of implementing the welfare measures in any organization is to secure the labor force by providing proper working conditions and minimizing its hazardous effect on the life of the employees and their family members. The chapter articulates the various employee welfare programs put into practice by the industrial and service organizations and its influence on the employees' economic growth and productivity, in both public and private sectors.

INTRODUCTION

The concept of employee welfare deals with all activities that the employers are involved in which are directed towards providing employees with certain facilities and services in addition to salaries and wages (Tweddle, Battle, & Torjman, 2013). These welfare facilities are essential for the organisations growth as they have a close association with the employees' productivity. Employee welfare schemes increases the organizational productivity, promotes motivation, promotes healthy organizational relations, maintain organizational peace and reduces labour turnover. Welfare programmes serve as a means

for employee motivation and increases not only the effectiveness of the workforce but also creativity in solving unique organizational challenges. This will eventually lead to attainment of higher levels of economic performance and high service delivery in an organization (Lagat, 2012).

In today's competitive economy, business organizations need to focus explicitly on providing the welfare facilities to the employees as it results in their satisfaction towards the organisation and it results in improved quality of work life (Patro, 2012). Employees are a valuable resource that may contribute in several different ways to an organization's activities if the organization gives them an appropriate chance. Welfare programme is a globally broad concept referring to a state of living of an individual or a group, in a desirable relationship with the total environment - ecological, economic and social. Employee welfare includes both social and economic content of welfare. Social welfare is primarily concerned with the solution of various problems of the weaker section of society like prevention of destitution and poverty. It aims at social development by such means as social legislation, social reforms, social service, social work or social action (Luthans and Sommer, 2005).

Employee welfare is considered one of the corporate commitments to demonstrate care for employees at all levels, underpinning their work and the environment in which it is performed (Srinivas, 2013). Employees are directly influenced by nature and quality of welfare services offered because they compare themselves with their counterparts in other organizations. Organizations should, therefore, bear in mind that for them to achieve their objectives, employee welfare services should be adequately competitive and focused towards solving real needs of employees. Most of the private organisations rarely provide overall competitive packages of employee welfare benefits, which results in low productivity, retention and may eventually lead to high rate of employee turnover (PWC, 2013).

Lack of such welfare benefits not only de-motivate employees, but also results in a high rate of employee turnover, low workplace productivity and affect the overall efficiency and performance of the non-academic staff in private universities (Ernst & Young, 2014).

The success of the employees' welfare programmes depends on the approach which the organization has considered. An organization should have a policy that guides provision of such welfare programmes to employees which include medical facilities, sanitary, accommodation of workers, amenities and industrial social security measures, training and education facilities, HIV and AIDS risk reduction and counselling (Harika, 2012).

Park (2015) argues that work environment should be comprised of issues such as working hours, employment policy, workers' health and welfare, workplace design and the general conduct of workers at the workplace. Employee welfare programmes in both developed and developing society have an impact not only on the workforce but also on the facets of human resources (Mishra & Bhagat, 2007). Welfare schemes should be implemented by all the organisations, whether public sector or private sector and industrial or service sector, as it raises the morale of employees, reduce the risk and insecurity, eliminates absenteeism, and improves the quality of living, which would go a long way in achieving the goals of an organisation. The very logic behind providing welfare schemes is to create efficient, healthy, loyal, and a satisfied labour force for the organization.

In the competitive environment, private sector organizations play a major role in the overall development of the national economy. Therefore, it is essential to focus on the welfare measures which enhance the employees quality of work life and also helpful in increasing the organizations productivity. Generally, in the public sector the funds are organized and provided either by central or state government. Therefore, they are able to provide the welfare measures effectively to their employees without any hesitation (Patro, 2015). In the private sector, large scale organizations can pool more funds and provide

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the welfare facilities as effectively as public sector organizations provide to their employees. But, small scale organizations may have limited funds, so they may not be able to take care of the welfare facilities effectively compared to the public sector. The chapter presents a comparison of the various welfare measures put into practice in both the industrial and service sector in contrast with public and private sector organisations. Furthermore, the chapter also highlights the areas that the management of these organizations needs to consider for improvement in welfare facilities in enhancing the productivity of employees.

BACKGROUND

The chapter provides an extensive background discussion in the area of implementation of employee welfare programmes to develop a thorough understanding of the conceptual constructs and empirical research. Wainaina (2014) studied the relationship between wellness programs and employee job satisfaction and found that the programs boosted employees' satisfaction levels. Maslach, Leiter, and Jackson (2012) stated that welfare schemes include some or all of the amenities provided in or near the organization and related to the working and living conditions. These facilities include canteens and nourishment facilities, transport arrangements, recreational services, housing schemes, education and training of employees, pension, bonus, medical facilities, childcare facilities, personal counselling, and so forth. Welfare schemes are a means to improve the productivity and efficiency of the employees. The employers are motivated to provide these facilities if it favourably affects their prosperity, profits and public image.

Binoy, Joseph, and Raju (2009) points out that the structure of a welfare state rests on its social security fabric. Government, employers, and trade unions have accomplished much to promote the betterment of workers' conditions. Kumar and Yadav (2002) study the satisfaction level from labour welfare schemes in sugar factories revealed the overall satisfaction level of workers from labour welfare schemes was low in both the private and state sugar factories. Furthermore, the workers in both sectors ranked the four labour welfare schemes such as housing scheme, medical scheme, followed by education and recreation schemes. Kuria (2012) studied on the effects of employee welfare programmes on job satisfaction of employees within the flower industry and established the effects of employee welfare programs on job satisfaction of employees in organizations within the flower industry.

Resma and Basavraju (2013) stated the employee welfare is a comprehensive term including various services, benefits and facilities offered to employees of the organization. Robinson, Sparrow, Clegg, and Birdi (2006) identified the key behaviours which were found to be associated with employee engagement. The behaviours included belief in the organisation, desire to work to make things better, understanding of the business context and the bigger picture, being respectful of and helpful to colleagues, willingness to go the extra mile, and keeping up to date with developments in the field. Satyanarayna and Reddi (2012) stated that the overall satisfaction levels of employees about welfare measures in the organization cover are satisfactory.

However, a few are not satisfied with welfare measures provided by the organization. The study suggested that existing welfare measures may be further improved. Such welfare measures enrich the employee standard of living and their satisfaction levels. Muruu, Were, and Abok (2016) demonstrated employee welfare schemes as those measures that aim at promoting physical, psychological and general well-being of the working class. The basic aim of welfare schemes in an industry is to improve the living

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and working conditions of the employee and their families because the employee's well-being cannot be achieved in isolation of the employee from his family. Patro and Raghunath (2016) found that the multiple facets of employee welfare facilities such as education facilities, medical facilities, retirement benefits and others facilities are indicative of the employees' efficiency in both public and private sector organizations. The management should concentrate on welfare facilities outside the work place also, so as to increase the quality of work life of the employees.

A welfare officer can be appointed to solve all the problems of the employees and maintain good relation between the employees and employer. Mishra and Bhagat (2007) found the police service provides essential service to the public in Kenya and thus their labour welfare activities need to be addressed just the same. Welfare services may be provided for matters concerning employees in terms of supplementing the income of the workers by providing services such as housing, medical assistance, canteens and recreation facilities. Indiatsy (2011) made a comparative analysis on the effects of social welfare facilities on employee motivation and found that the facilities provided by the organisation are a strong motivational element that has helped retain employees in the job for a long time and boosting their productivity.

According to Priti (2009), the role of welfare activities is to promote economic development by increasing efficiency and productivity with the underlying principle being making workers give their loyal services ungrudgingly in genuine spirit of co-operation and the general well-being of the employee. Manzini and Gwandure (2011) argued that the concept of employee welfare has been used by many organisations as a strategy of improving productivity of employees especially in the mobile industry since work related problems can lead to poor quality of life for employees and a decline in performance. It is argued that welfare services can be used to secure the labour force by providing proper human conditions of work and living through minimizing the hazardous effect on the life of the workers and their family members. Patro (2012) found that the employees are the assets of every organisation. The needs of the employee must be satisfied to meet the goals of the organisation. Any organisation would be effective only when there is high degree of co-operation between the employees and their management.

A research study in different organisations by Parul and Ashokkumar (2013) concluded in terms of proving that the different welfare provisions provided to the employees working in an organisation under the 1948 Factories Act have a positive relation with employee satisfaction after analyzing the correlation between these two factors. The reason behind this result is that these are the factors that lead to satisfaction and if these facilities are not present sometimes leads to dissatisfaction. Nanda and Panda (2013) stated the Rourkela Steel Plant has adopted a better kind of welfare activities which create an effective working environment and thus better productivity. There are different kinds of welfare schemes like medical allowance, death relief fund, insurance, housing, transportation, and recreation club facilities, etc., are provided by the company to the employees to maintain better industrial relations.

Patro (2016), in a comparative analysis of welfare measures in industrial and service organisations with reference to public and private sector found that an employees' welfare, is the key dimension to smooth employer-employee relationship. These welfare facilities improve the employees' morale and loyalty towards the management thereby increasing their happiness, satisfaction and performance.

EMPLOYEE WELFARE PROGRAMMES

Implementing necessary employee welfare programmes have become a key factor for the overall growth and development of any organization. The organizations provide welfare measures to their employees to increase their efficiency and reduce absenteeism. Voluntary efforts for the welfare of the employees by the management may reduce the thought of government and others parties intervention in future. Organizations provide welfare facilities to their employees to keep their motivation levels high (Tiwari, 2011). The employees' welfare schemes can be classified into two categories viz., statutory and non-statutory welfare schemes. The statutory schemes are those schemes that are compulsory to provide by an organization as compliance to the laws governing employee health and safety. In India, these provisions are provided in Industrial Acts like Factories Act 1948, the Dock Workers Act (Safety, Health and Welfare) 1986 and the Mines Act 1962. The statutory welfare measures include the provisions such as, drinking water facilities, facilities for sitting, first aid appliances, latrines and urinals, canteen facilities, spittoons, proper lighting and ventilation, washing places, changing rooms, rest rooms, and so forth.

The non-statutory welfare measures differ from organization to organization and from industry to industry. The non-statutory welfare schemes may includes personal health care, flexi-time, employee assistance programs, grievances policy, maternity and adoption leaves, medi-claim insurance scheme, employee referral schemes, etc. These welfare measures are not obligatory to implement but these schemes may enhance the satisfaction level of the employees and augment the quality work life of the employees. The Factories Act 1948, as amended by the latest amendment in 1987, makes elaborate provisions in relation to health, safety, and welfare of employees, provisions regarding working hours including weekly hours, daily hours, weekly holidays, regarding employment of young persons, annual leaves with wages and provision regarding employment of women and young persons.

In this act, the provisions are also made in connection with first aid appliances along with a room are to be maintained in every organization. The Government has been empowered to make rules necessitating that in any organization wherein more than two hundred fifty workers are ordinarily employed, canteens, shelters, and restrooms shall be provided and maintained for the use of employees. Finally, the Act makes provision for the employment of Welfare Officer in manufacturing organizations and service oriented organizations also. Thus, it is clear that the Act makes very elaborate and unambiguous provisions regarding the minimum welfare standards to be followed by the management. But laying down the standards alone is not enough; it must also to be ensured that these provisions are implemented successfully, and non-implementation leads to dissatisfaction of the employees working in the organizations.

SIGNIFICANCE OF PROMOTING WELFARE ACTIVITIES

Employees are the primary assets of every organization, so employee needs must be satisfied to meet the goals of the organization. Any organization is effective only when there is a high degree of co-operation between the employees and their management. The welfare facilities go a long way stimulating interest in the employees to produce their full capacity and pay a good return to management in the long-term. Although it is a costly procedure for companies, it is nonetheless needed as it helps in the overall development of the employees (Patro, 2017). Employee welfare is very comprehensive and embraces a multitude of activities of employers, state, trade unions and other agencies to help workers and their families in the context of their industrial life. Employee welfare covers an ample field and connotes a state

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of well-being, happiness, satisfaction, protection and enlargement of human resources and also helps to motivation of worker. The fundamental propose of employee welfare is to enrich the life of employees and to remain them joyful and conducted that helps to development of organization (Choudhary, 2017).

There are certain reasons for which the employee welfare programmes are gaining greater importance in the development of the organizations and promoting employees' economic growth and productivity. In most of the organizations, even today the employees are not united into a class. Keeping in view the numbers, the employee union movement is still in its infancy. Even if the employee unions exist, there is a lack of enlightened leadership, and there is no unity between these unions themselves. In absence of properly organized employee union the workers can neither, place their demands effectively before the employer, nor can they think clearly and systematically of their own interests. Therefore, it is essential that the welfare of employees be efficiently looked after by the employers and the Government.

As the percentage of trained employees are very low, it is necessary to have training facilities for such a vast labour force. Healthy recreation is also at a priority and the efficiency of employees' are diminished by energy being employed in all kinds of undesirable channels. Hence, it is essential that recreation and enjoyment of a healthy kind be provided to the employees. In some organizations the employees are more restless and do tendentious towards frequent migration because life in the town does not provide for his needs, and the atmosphere in general does not suit. Additionally, due to an inadequate level of wages the employees cannot comfortably settle down in one place. This may, in turn, also give rise to absenteeism. This workers migratory tendency can be curbed by providing him with adequate facilities and conditions, and this also shows a positive effect over the absenteeism in the factory.

The welfare programmes motivate the employees and maintains efficiency and productivity. As welfare of worker at work place will improve not only their efficiency, but also improve their willingness to perform their work involving themselves with organizational goals. In India, many of the organizations are not using welfare concept properly at their workplace. The industrialists compel the employees to work in uncomfortable and adverse conditions. Their uncomfortable conditions lead to serious damages to workers. Therefore, promotion of employees welfare programmes is must in the identity premises.

BENEFITS OF EMPLOYEE WELFARE PROGRAMMES

Employee welfare includes the programmes that benefit the employees working in the organisation. Although it is a costly procedure for the companies, yet it is needed as it helps in the overall growth of the employees:

1. **High Competence:** The welfare programmes act as a morale booster for the employee. When the employees get an appreciation for what they do, it helps in increasing the work efficiency of the employees. When the work done is lauded by the management, it proves productive to both the organisation as well as the employees. If the work done by the employees is not appreciated, the output might not come as expected. Therefore, it is essential to practice employee welfare programmes in the organization;
2. **Morale Boost Up:** The employees work only when they are motivated to do the work. If the company wishes to get 100 percent output, then the company has to put in little efforts to encourage the employees. No one else would deliver the expected results. Therefore, in order to boost the morale of the employees, it is essential to offer employee welfare measures;

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

3. **Build a Competitive Edge:** Competition is essential if the organisations want its employees to work well. In order to form a competitive environment at the work place, the company must provide employees with opportunities. The competitive edge in the work environment can only help in getting the required work from the employees. Therefore, if the healthy work environment or the healthy competition is required within the organization, it is vital to provide employees with welfare schemes;
4. **Obtain Well-timed Results:** If the companies want the employees to give the result on time or deliver the work in time, there needs to be some extra effort by the company, so as to encourage the employees to give timely work. This can be done only when the employees are encouraged apart from praising their work and are promoted with some welfare schemes. If the extra work is expected from the employees, they should also be given extra benefits, only then the timely results could be expected by the company;
5. **Improved Industrial Relations:** When the employees are satisfied with the welfare measures provided by the organisations it results in good industrial relations also. Not just the work output is good, but also the amiable relations are built by the employees when encouraged through various schemes. Therefore, various employee schemes are essential to make employees work in a better manner in the company;
6. **Better Mental and Moral Health:** The employees when given different facilities at work will improve the mental and moral health, as well as helps in becoming a good citizen. The growth of an employee is equivalent to the development of the organisation. Therefore, if the companies want to grow, they must help employees with their growth;
7. **Social Benefits:** The employees also get various social benefits which are also advantageous to the company. The social benefits increase the productivity, production as well as the work efficiency of the employees. The good quality work by the employees also helps in increasing the remuneration. Finally, this helps in increasing the standard of the employees which is appreciated and accepted by everyone, indeed;
8. **Helps in Overall Growth:** The welfare schemes are a motivating factor to the employees and helps in enhancing the overall growth and productivity of the employees. Both the common organizational goal and the personal goals are easily achieved by the employees, which benefits not just the company but also the members working in the organization;
9. **Retention of Employees:** The organisations train the employees to get better results. But, if the employees leave the company early, it affects not just the employees but also the company. So, the company has to get some schemes to retain the employees for a longer time period and that is only possible with the employee welfare programs. The employees would not even think of leaving the company, if they will get the required share of appreciation.

The benefits of employee welfare programmes are more direct to the employees than the company. However, it is important for the company to generate various employee welfare schemes.

DRAWBACKS OF EMPLOYEE WELFARE

As every coin has two sides, similarly the employee welfare also has its drawbacks. The schemes, however, help the employees more than the organisations. This is because whatever is the scheme bought

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

by the company must be funded by the company itself. Therefore, this is the reason why the employee welfare schemes are a great disadvantage too. Some of the drawbacks of employee welfare are discussed:

1. **Welfare Schemes Become the Driving Force to Work:** Neither the money nor the schemes should be the driving force to work for the employees. The employees must be motivated through the work done by others. A competitive environment should be the driving force for the employees to work. Only then the expected work can be delivered by the employees;
2. **Financial Burden for the Company:** The company gets burdened financially as more the employees, more the budget will be required by the company to equally distribute the schemes among the employees working within an organization. Therefore, in order to equally distribute the schemes among the employees, it is essential for the company to have proper a financial budget in order to provide employees with the required schemes;
3. **Maintain a Competitive Edge in the Market:** To remain in the market and to keep oneself in the edge, it is essential to keep good employee welfare policy so as to attract maximum skilled employees within the organization. Every company needs skilled workers to work so that they get better output. In order to do the same, the company will have to have an edge over the welfare schemes too;
4. **Difficult to Keep Everyone Happy:** As in an organization the plans chosen are such that are benefited for majority of the employees but some or few employees will not be satisfied with the current chosen policy and with the amount they have to pay for their portion. The packages chosen by the organization are often not too delightful and are meant more for their personal benefit. Plans are often changed every year in different organizations and business which hinders the growth of employee in the company as the insurance plans get along on the annual basis gets affected;
5. **Legalization and Authentication Curse:** Often the benefits create concerns regarding legal complaints against both the employees and the organization on breaking certain policy intentionally or unintentionally. On breaking up of the specific policy and not paying the retention carries legal fees that need to be submitted to get out of trouble which at times becomes troublesome;
6. **It can Make People Dependent:** By allowing people to receive money while unemployed, it can encourage a feeling of dependence. This would create a number of less motivated workers who are used to receiving financial support without doing anything and develop the habit to prolong the process for as long as possible, which would cause their skills to deteriorate;
7. **Difficulty in Switching:** Switching often becomes very difficult to manage and company loses many employees if proper actions are not being taken. The major disadvantage associated with it is that the more the employees in the organization will be, the more the company need to pay to the insurance company to manage the account of different employees;
8. **Difficult to Maintain:** Additional department needs to be established in a company to properly manage the plans in the organization which will turn in hiring additional employees. Some health insurance packages also include help from a lawyer to make sure that the employees are covered and legal fees and other such expenses are added easily. Law suits are again a curse for the organization. Law suits are sometimes extremely expensive and take great amount of time to keep it away from any business. Even if the suit makes it to the court, it can be very expensive to pay the legal feel and pay off the fines for its settlement.

Though welfare programs cannot sustain to help people in the long- term, they are still very crucial in lending assistance to those who really need it. However, there are also definite disadvantages to them. Welfare would still be viable to continue as long as it serves its functions.

WELFARE SCHEMES IN FIVE YEAR PLANS

Employee welfare schemes have gained much importance in the 5-year plans.

In the First Five Year Plan (1951-1956), the Government took considerable effort for the welfare measures of the labour classes of society. During this period, important Acts such as the Plantations Labour Act of 1951, the Employees Provident Fund Act of 1952, and the Mines Act of 1952 were implemented. A subsidy was provided for housing scheme for worker was documented and implemented in 1952. Various state governments also formulated and implemented certain Acts as legislation on housing for labour class (i.e., the Bombay Housing Board Act of 1948, the Madhya Pradesh Board Act of 1950, the Hyderabad Labour Housing Act of 1952, etc).

The Second Five Year Plan (1956–1961) provided impetus for further welfare measures and legislation for labour. New laws were also established to ensure welfare measure for merchant seamen and motor transport workers. The employee's state insurance scheme, 1948 was implemented and to cover more employees in the factories. A comprehensive scheme of Dock workers (safety, health and welfare) scheme was formulated in 1961. In 1959, the state government of Assam passed an act labour working in tea plant known as the Assam Tea Plantation Labour Employee's Welfare Fund Act. In 1956, a New Plantation Labour Housing Scheme was enacted which has provision of a certain amount of loan to be provided for construction of houses for labours. The second five year plan period also witnessed quite a large number of enactments in accommodation and housing by various state governments as labour welfare measures.

The Third Five Year Plan (1961-66) emphasized the requirement of more efficient and effective implementation of various statutory labour welfare provisions and legislation. The plan also talked about establishment of co-operative credit organisations and consumer's stores for industrial workers, and stressed on the role of trade unions and voluntary organizations in managing such co-operatives organisations. There has been enactment of the legislative provisions during this plan period which include the Apprentices Act, 1961; Iron-Ore Mines Labour Welfare Cess Act, 1961; Maternity Benefit Act, 1961 And Payment of Bonus Act, 1965. During this period, co-operative housing organisation also started to make amends gradually.

The Fourth Five Year Plan (1969–1974) was more about the expansion and implementation of the Employees' State Insurance (ESI) Act to provide health related facilities to the families of insured worker as well as labourers working in shops and commercial establishments. To protect the contract labour from exploitation government passed, the Contract Labour Regulation and Abolition Act of 1970. Provision of this Act compels contractors to undertake welfare activities for of contractual workers. In 1972, the Government enacted an important statute as the Payment of Gratuity Act, 1972 (bonuses) for the welfare of retiring industrial employees.

The Fifth Five Year Plan (1974–1979) witnessed the additional provisions for labour welfare in a number of areas. For encouraging the provision of industrial safety, safety cells were established in various states of the country. This 5-year plan period also covered: (1) new additional requirements for the most of the existing training institutions, such as the Central Training Institutes for Instructors, the Foreman

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Training Institute, and Central Staff Training and Research Institute; (2) strengthening and expansion of the Advanced Training Institute throughout the country; (3) Extension of the Apprenticeship Training Programme; (4) Development and establishment of Vocational Training in Women's Occupations; and (5) all other kinds of schemes related to research, surveys and studies to be undertaken by various organisations and institutes.

The Sixth Five Year Plan (1980–1985) was more about effective implementation of the welfare measures of prior legislative enactments, and extension of coverage of Act such as the Employees Provident Fund, Employees' State Insurance Scheme and the Family Pension Scheme. Special scheme also were developed and implemented by State Governments for the welfare of agricultural labour, artisans (skilled craftsmen), leather workers, fishermen, handloom weavers and other unorganised sector workers.

The Seventh Five Year Plan (1985–1989) focussed on enhancement in working conditions of informal sector worker both in the rural areas and also in the urban areas. This plan period witnessed certain major initiative for working women. Thus during this period the stress was on improvement in capacity development, efficiency and productivity.

The Eighth Five Year Plan (1992–1997) witnessed government stressing on the importance of reforms in industrial and trade policies. This five year plan put great emphasis on resource mobilisation from public enterprises. In this period, the great work had been on the aspect of enhancement for the quality of labour work, productivity, skills development, working conditions, provisions for welfare measures and the social security, especially to those working in the unorganised sectors without any socioeconomic security.

The Ninth Five Year Plan (1997–2002) emphasized the enhancement of labour welfare measures, increasing productivity through skills development, and also the adequate provisions were taken for social security of workers. Governmental institutions and resources were directed towards skill development, knowledge sharing on new job opportunities, monitoring and evaluation of working conditions for labour class, creation of industrial harmony through development of infrastructure for better industrial relations, and insurance policy for labour against illness, injury and unemployment and their families.

The Tenth Five Year Plan (2002–2007) given more weight on improving the working conditions, better industrial relations, proper enforcement of Labour Legislations and welfare measures, and also launching various schemes for the welfare activities for all industrial workers and their families. The Labour Department (GoI) worked on implementation mechanism of about two dozen of labour statutes. Their goal was not only in terms of economic benefits (such as minimum wages, overtime, bonuses, etc.) to workers, but also to provide them adequate health and safety facility at the workplace.

The Eleventh Five Year Plan (2007–2012) talked about unemployment and underemployment issue, the promotion and generation of regular wage employment opportunities and addressing the continuing problems of workers employed in unorganised sector all over the country.

The Twelfth Five Year Plan (2012–2017) is more about skill building as an instrument to improve the effectiveness and contribution of labour to the overall production. It has also made skill development as an important agenda for the Governments at Centre as well as States. In this regard, various challenges on skill development identified. Enactments and scheme such as Mahatma Gandhi National Rural Employment Guarantee Act (MGNREGA), Swarnjayanti Gram Swarozgar Yojana (SGSY) and National Rural Livelihood Mission (NRLM) to restructure and strengthened the various employment promotion schemes for the bottom of the pyramid. For enhancing living conditions of the workers and to accomplish higher productivity with higher efficiency, skill development through training is most importance.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Manpower development through skill development will provide adequate manpower of appropriate skills and quality to various sectors is fundamental for express socioeconomic development of country and its people.

OBJECTIVES OF THE CHAPTER

The main objectives of the chapter are:

1. To identify the various welfare programmes put into practice in the industrial and service sectors of both public and private sector organizations;
2. To compare the satisfaction level of employees' on the welfare programmes and also analyzes its influence on their growth and productivity;
3. To suggest measures for improving the overall welfare amenities in both the industrial and service sector organizations.

METHODOLOGY

The present chapter is an enquiry into the employee welfare programmes put into practice by different industrial and service sector organisations with reference to both the public and private sector in the Visakhapatnam city, and the satisfaction level achieved by the employees working in these organisations. The presented data are collected from both the primary and secondary sources. The secondary data was collected from various published sources such as, books, news paper publications, journals, company magazines, official websites of various industrial and service sector organisations, and some other sites are also searched to collect the relevant data.

The primary data was collected from the respondents by distributing questionnaires, through personal interviews, and direct personal observation. The information was collected from the employees who are working in different public and private sector organisations such as industrial organisations (manufacturing, automobile, and others) and service organisations (educational institutions, health centres, software companies, administrative, and financial institutions), individually and taken their views and suggestions. The questionnaire was distributed to 400 employees' personally to know their views regarding the satisfaction level on the execution of welfare schemes from different organizations.

For the purpose, a total of 160 valid and completed questionnaires are selected from various organizations out of which 80 respondents are from Industrial organisations and 80 respondents from Service organisations (both include 40 employees each from Private sector and Public sector). The collected data is used to compare the opinion regarding the satisfaction of the employees on the provision of welfare measures.

To analyze the responses of the employees on implementation of the welfare schemes, a 5-point rating scale technique is used. The scale ranges from Excellent (5), Good (4), Satisfactory (3), Poor (2), and Not In-force (1). The statistical technique mean and standard deviation is used for analyzing the collected data and tabulated wherever necessary, so as to draw inferences based on findings, suggestions and conclusions on employee welfare schemes.

RELATIVE STATISTICAL ANALYSIS

The employees of different industrial organisations and service organizations related to both public and private sector were enquired whether they are satisfied with the various welfare schemes put into practice in their organizations. Based on the questionnaire survey, a relative analysis and interpretation is made on various welfare schemes implemented in these organisations. For the purpose of both, statutory and non-statutory welfare measures are considered. Six important statutory welfare measures are identified, such as canteen and store facilities, medical and health benefits, drinking water and sanitary facilities, restroom and locker facility, workmen compensation, and safety measures. And eight non-statutory welfare schemes such as housing and quarter facilities, educational benefits, transport allowances or facilities, retirement benefits, recreational facilities, grievance settlement forums, retention polities, and other allowances and facilities are identified for collecting the opinion of the employees along with their suggestions. The results and findings regarding the employee welfare programmes that influence the employee's productivity are discussed in the chapter.

The relative analysis of statutory and non-statutory employee welfare measures implemented in industrial organisations with reference to both public and private sector organisations are shown in Table 1.

Table 1. Comparison of welfare programmes in industrial organisations

Factor Perception	Public Sector		Private Sector		Total

Source: Primary Data

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

It is observed that almost all the statutory welfare programmes are implemented in both the public and private sector. The respondents are more satisfied with the provision of 'drinking water and sanitary facilities (μ=4.04)' followed by 'safety measures (μ=3.60)' and 'canteen facilities (μ=3.59)'. The respondents are less satisfied with 'workmen compensation (μ=3.15)' facility provided by the organisations. In the case of both public and private sectors, the statutory welfare measure 'drinking water and sanitary facilities' scored highest mean value of 4.08 and 4.00 respectively. In the public sector, the respondents are satisfied with all the statutory welfare programmes put into practice in their organisations. In the private sector, the respondents are having low satisfaction regarding 'workmen compensation (μ=2.68)' and 'medical and health schemes (μ=2.95)'.

Regarding the non-statutory welfare programmes in the public sector almost all employees' responded positively, whereas in the private sector many of them responded that these facilities are satisfactory in their organisations. The highly satisfied welfare scheme is 'transport allowances/facilities' with mean value of 3.44 followed by 'retention policies (μ=3.38)' and 'educational benefits (μ=3.21)'. The low significant factor is provision of recreational facilities (μ=2.43). In public sector, 'retirement benefits' scored highest mean value of 4.18 and the lowest is 'provision of recreational facilities' with a mean of 2.83. In the case of private sector, the most satisfied welfare measure is 'transport allowances/facilities' with mean value of 3.38.

The respondents are less satisfied with the provision of 'retirement benefits (μ=1.78)' and 'housing/quarter facilities (μ=1.80)'. Thus, it can be concluded that the public sector employees are more satisfied when compared to the private sector employees. The management's of private sector need to put much effort to implement better welfare schemes to their employees as it enhances the work productivity. The public sector can also focus on the better implementation of the non-statutory welfare programmes in their organisations.

The relative analysis of statutory and non-statutory employee welfare measures implemented in service organisations with reference to both public and private sector organisations are shown in Table 2.

In service organisations, it is observed that almost all the statutory welfare programmes are implemented in both public and private sectors and the respondents are also satisfied with these facilities. The respondents are highly satisfied with the provision of 'drinking water and sanitary facilities (μ=3.79)' followed with 'canteen facilities (μ=3.59)' and 'safety measures (μ=3.51)'. The respondents are less satisfied with 'workmen compensation (μ=3.25)' provided by the organisations. In the case of public sector, the respondents are satisfied with all the statutory welfare programmes put into practice in their organisations. The highly significant factor is 'medical and health schemes' with a mean value of 3.88 and the lowest satisfied factor is 'safety measures (μ=3.65)'.

In the private sector, the respondents are having less satisfaction compared to public sector. The respondents are highly satisfied with the statutory measure 'drinking water and sanitary facilities (μ=3.78)' and low satisfaction regarding 'workmen compensation (μ=2.80)'. The non-statutory welfare programmes are fully implemented in the public sector and in case of private sector these schemes are not fully operational. The highly significant welfare measure is 'transport allowances/facilities' with mean value of 3.60 followed by 'retention policies (μ=3.20)' and 'educational benefits (μ=3.05)'. The low significant factor is recreational facilities (μ=2.40). In public sector, 'retirement benefits' scored highest mean value of 4.10 followed with 'housing/quarter facilities (μ=3.80)' and 'transport allowances/facilities (μ=3.73)'.

Grievance Settlement Forums	3.10	1.051	2.68	1.111	2.89	1.099
Retention Policies	3.70	0.933	2.70	1.036	3.20	1.103
Other Allowances/ Facilities	3.43	1.003	2.35	0.969	2.89	1.121

Source: Primary Data

The lowest satisfied welfare measure is 'recreational facilities' with a mean of 2.60. In the case of private sector, the most satisfied welfare measure is 'transport allowances/facilities' with mean value of 3.48. The respondents are less satisfied with the facilities of 'housing/quarter facilities (μ=1.85)' and 'retirement benefits (μ=1.90)'. Thus, from the comparative analysis it can be concluded that the private sector employees are not much influenced when compared with the public sector employees. The management's need to improve these welfare programmes, as it helps in increasing the productivity of the employees. A comparison on satisfaction level of the employees on the implementation of the statutory and non-statutory welfare programmes in both the industrial and service organisations is shown in Table 3.

The employees of both industrial and service organisations are almost satisfied with the statutory welfare programmes put into practice in their organisations. It can be observed that the respondents are more satisfied with the 'drinking water and sanitary facilities (μ=3.91)' followed by 'canteen and store facilities (μ=3.59)' and 'safety measures (μ=3.56)'. The respondents are less satisfied with the 'workmen compensation (μ=3.20)' provided by the organisations. In both the industrial and service sectors, the respondents are highly satisfied with the 'drinking water and sanitary facilities (μ=3.79 and 4.04 respectively)' provided by their organisations. The low satisfied factor is 'workmen compensation' with the mean values of 3.25 and 3.15, respectively.

Regarding the implementation of non-statutory welfare programmes, both the industrial and service sector employees are not much satisfied. Many employees responded that these schemes are not implemented in their organisations. The highly significant welfare measure is 'transport allowances/facilities' with mean value of 3.52 followed by 'retention policies (μ=3.29)' and 'educational benefits (μ=3.13)'.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The low significant factor is recreational facilities (μ=2.41). In the case of both industrial and service sector organisations, 'transport allowances/facilities' scored highest mean value of 3.60 and 3.44, followed by 'retention policies (μ=3.20; 3.38)' and 'educational benefits (μ=3.05; 3.21)'. The lowest satisfied welfare measure is 'recreational facilities' with a mean of 2.40 and 2.43 respectively.

Table 3. Comparison of welfare programmes in industrial and service organisations

Factor Perception	Industrial Organizations		Service Organizations		Total	
	Mean	Std. Deviation	Mean	Std. Deviation	Mean	Std. Deviation
Statutory Welfare Programmes						
Canteen & Store Facilities	3.59	0.864	3.59	0.907	3.59	0.884
Medical and Health Schemes	3.50	0.952	3.46	1.063	3.48	1.008
Drinking Water & Sanitary Facilities	3.79	0.788	4.04	0.681	3.91	0.746

Source: Primary Data

Thus, from the comparative analysis it can be concluded that the service sector employees are much satisfied than the employees' industrial organisations. However, the managements of both the industrial and service sectors need to further improve the non-statutory welfare programmes for enhancing the workers economic growth and work productivity. A comparison on the satisfaction of the employees with the implementation of the statutory and non-statutory welfare programmes in both the public and private sector organisations is shown in Table 4.

The analysis shows that almost all the respondents are satisfied with the statutory welfare programmes practiced in both the public and private sector organisations, whereas they are less satisfied with the non-statutory welfare programmes. With regards to the statutory welfare measures, it can be observed that the respondents are more satisfied with the 'drinking water and sanitary facilities (μ=3.91)' followed by 'canteen and store facilities (μ=3.59)' and 'safety measures (μ=3.56)'. The respondents are less satisfied with the 'workmen compensation (μ=3.20)' provided by the organisations. In both the public and private sectors, the respondents are highly satisfied with the 'drinking water and sanitary facilities (μ=3.94 and 3.89 respectively)' provided by their organisations.

Retirement Benefits	4.14	0.649	1.84	0.875	2.99	1.385
Recreational Facilities	2.71	1.261	2.11	1.087	2.41	1.213
Grievance Settlement Forums	3.00	1.040	2.71	1.042	2.86	1.050
Retention Policies	3.78	0.883	2.80	1.057	3.29	1.088
Other Allowances/ Facilities	3.50	0.978	2.39	0.984	2.94	1.127

Source: Primary Data

The low satisfied factor is 'canteen & store facilities' with a mean of 3.50 in the case of public sector and 'workmen compensation' with the mean values of 2.74 in the case of private sector. The satisfaction of respondents with regard to the implementation of non-statutory welfare programmes in both the public and private sector reveals that they are not much satisfied. Many employees retort that these schemes are not implemented in their organisations. The highly significant welfare measure is 'transport allowances/ facilities' with mean value of 3.52 followed by 'retention policies (μ=3.29)' and 'educational benefits (μ=3.13)'. The low significant factor is recreational facilities (μ=2.41). In the case of both public organisations, 'transport allowances/facilities' scored highest mean value of 4.14, followed by 'educational benefits (μ=3.80)' and 'retention policies (μ=3.78)'.

The lowest satisfied welfare measure is 'recreational facilities' with a mean of 2.71. With regard to private organisations, 'transport allowances/facilities' got highest rating of 3.43, followed by 'retention policies (μ=2.80)' and 'grievance settlement forums (μ=2.71)'. Thus, from the comparative analysis it can be concluded that the public sector employees are much satisfied than the employees' of private sector. However, the management of private sector organisations need to further improve the non-statutory welfare programmes for enhancing the workers economic growth and work productivity.

Consequently, the relative analysis clearly states that in the case of industrial organisations or service organisations, both the public sector and private sector employees are equally satisfied with implementation of the welfare programmes in their organisations. The managements' of these organisations need to put much effort to improve the welfare schemes put into practice in their organisations as it enhances

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the employees' economic growth and work productivity, also increases the overall efficiency of the organisations.

MEASURES TO ENHANCE WELFARE PROGRAMMES

The organisations should make pragmatic efforts to enhance the employees' work life and job satisfaction to increase their overall economic growth and work performance. Based on the comparative analysis and suggestions given by various respondents of industrial and service sector, certain measures can be enacted for further improvement in practicing of welfare programmes in the organisations that could be extremely useful for the management of both the public and private sector organisations to increase the organisational efficiency:

1. The management should update the employees about the different welfare schemes adopted in their organizations and suggest them how to make use of these facilities;
2. The employers need to concentrate on the facilities provided to the employee's outside the work place like quarters, medical benefits, etc., which helps in having better quality of work life;
3. The private sector whether industrial or service organizations need to improve the welfare schemes implemented in their organizations;
4. Proper incentives, allowances, promotions, etc., should be worked out that will fulfill the ambitions and aspirations, which will go a long way in elevating their level of job satisfaction;
5. The management should conduct stress reducing events like yoga and meditation for the employees;
6. The employers of private sector organizations need to identify the needs of their employees and provide necessary welfare schemes that will influence them in getting job satisfaction;
7. Improvements should be initiated in the field of grievance handling, rest room facilities, service awards, and other motivating facilities in both the sectors;
8. Necessary steps must be initiated to conduct job training programmes, seminars and workshops to update and enhance the knowledge of the employees;
9. A welfare officer can be appointed to solve all the problems of the employees and maintain good relation between the employees and employer;
10. The private sector organizations must take initiative to provide retirement benefits for their employees;
11. The private sector organizations must try to initiate necessary steps to provide subsidized canteen and store facilities to their employees;
12. The public and private sector organizations have to provide separate restrooms for both male and female employees;
13. Both the public and private sector organizations must set up a reading room or library for employees to make use of their leisure time and enhance their knowledge;
14. The management can think of formulation of a problem solving committee including the employees and administration, for the better solution of the welfare problems of the employees;
15. The organizations can appoint a welfare officer to solve all the problems of the employees and maintain good relationship between the employee, employer and other departments.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The welfare programmes should be properly implemented by the industrial and service organizations of both private and public sectors. These measures would make an immense contribution towards increasing the welfare, well-being and job satisfaction of employees working in these organisations.

FUTURE RESEARCH DIRECTIONS

Organizations should take necessary steps to solve the welfare problems of the employees and take certain measures, so that the employee can perform more effectively. New schemes and facilities should be added to existing ones to improve the efficiency and quality of work life of the employees by the management of all organizations. This chapter is expected to help other researchers to consider various welfare programmes that influence the employee's performance and overall organizational productivity. Furthermore, research with regards to other industrial and service sector organizations can be considered as provision of welfare schemes has become important in every type of organization.

CONCLUSION

Welfare facilities play an important role in managing the Human Resources in any organisation. The organizations whether private or public sector and industrial or service organisations need to practice the welfare programmes for better employee productivity and organisational development. A satisfied employee is the key element, who acts as the organization's ladder for success. Welfare helps in keeping the morale and motivation of the employees high, so as to retain the employees for longer duration. The thought of employee welfare has been used by many organizations as a strategy of improving the employee's productivity, especially in the private sector, since work related problems can lead to poor quality of life for employees and decline in employees work performance. The welfare programmes improve the employees' morale and loyalty towards the management thereby increasing their happiness, satisfaction and also their productivity.

The relative analysis states that the overall satisfaction of employees on both statutory and non-statutory welfare schemes in the industrial organisations with regard to public sector is good and in private sector is satisfactory. However, in service organisations, the private sector employees are not satisfied with implementation of welfare schemes in their organizations when compared with the public sector employees, who are more than satisfied with these welfare programmes. Therefore, it is suggested that the existing welfare programmes may be improved further as they enrich the employee's standard of living and their satisfaction levels. The private sector organisations has to take necessary efforts to find out what the employees want and practice those welfare schemes for the successful growth development of the organization. An employee welfare facility is the key dimension to smooth employer-employee relationship. The organisations need to take necessary steps to solve these problems and overcome the challenges, so that the employees can do their work more effectively.

KEY TERMS AND DEFINITIONS

Employee Productivity: It is an assessment of the efficiency of an employee or a group of employees.

Industrial Sector: The industrial sector (secondary sector) of the economy is one that makes finished products which can then be utilized viz. construction and manufacturing industry. This sector includes companies involved with aerospace and defense, industrial machinery, tools, lumber production, construction, waste management, manufactured housing, cement and metal fabrication.

Labor Welfare: It includes overall welfare facilities designed to take care of wellbeing of employees and in order to increase their living standard.

Mutual Welfare: Mutual welfare is a corporate enterprise undertaken by the workers themselves or their organizations called trade unions.

Private Sector: The private sector is the part of a country's economic system that is run by individuals and companies, rather than the government. It usually comprises of organizations run by individuals and groups who seek to generate and return a profit back to its owners.

Public Sector: The public sector is that portion of an economic system that is controlled by national, state or provincial, and local governments. It usually comprises of organizations that are owned and operated by the government and exist to provide services for its citizens.

Service Sector: The part of a country's economy that is made up of businesses that provide services. It includes the companies, organizations, and activities in an economy that provide services such as banking, transport, tourism, etc. rather than manufacturing goods.

Statutory Welfare: The statutory schemes are those schemes that are compulsory to provide by an organization as compliance to the laws governing employee health and safety.

Voluntary Welfare: Voluntary welfare includes all those activities which employers undertake for their employees on voluntary basis. These differ from organization to organization and from industry to industry.

Chapter 27
Factors Affecting Employees' Job Satisfaction and Psychological Health

Mateja Lorber
University of Maribor, Slovenia

Sonja Treven
University of Maribor, Slovenia

Damijan Mumel
University of Maribor, Slovenia

ABSTRACT

The aim of this study was to examine the level of psychological health and job satisfaction and to find out which predictors have an impact on nurses' psychological health and job satisfaction. Six hundred forty nurses from surgery and internal medicine departments from Slovenian hospitals participated in the research. Data analysis was carried out by using SPSS 25.0. With transformational leadership style, leaders' characteristics, leaders' emotional intelligence, leaders' communication skills, positive effectivity, and job satisfaction, one can explain 57% of nurses' psychological health. The results indicated that 85% of nurses had good psychological health. And also that more frequent exposure to stress and lack of stress management were associated with poor psychological health. The employees' psychological health does not affect only the individual, but also on the quality of care and on the effectiveness of hospitals. It is important to monitor employees' job satisfaction and take care for employees' health by providing a healthy work environment.

INTRODUCTION

Hospitals play an important role in the health care system. They are health care institutions that have an organized medical and other professional staff, and deliver medical, nursing and related services 24 hours per day, 7 days per week. Hospitals offer a varying range of acute, convalescent and terminal care using diagnostic and curative services in response to acute and chronic conditions, arising from diseases as well as injuries and genetic anomalies (WHO, 2016a).

It is well known that the health-care system in all European and others industrial countries across the world face with a serious shortage of nurses (Boamah & Laschinger, 2016) and that it is facing rapidly increasing needs for patient care in an aging population (Kovner et al., 2016; Leineweber et al., 2016). This situation has made the nursing profession more stressful and susceptible to turnover (Chiang & Chang, 2012) This situation is worsening because of the aging of the working population and the decreasing rates of nurses entering the labor market (Shultz & Adams, 2007). WHO (2010) identified that 57 countries to be in a crisis relative to their health care work force. In the coming decades, the redistribution of the population toward older adults will reduce the relative size of the working population to the non-working older adult population, and also increase the need for workers to provide healthcare services to the ageing population (Hirst, 2019). Demands of nurses at work are high, work conditions change rapidly, and nurses are supposed to ensure high standards of quality (Collin, Paloniemi & Mecklin, 2010) and to effectively handle complex situations (Shin & Kim, 2013). Obviously, there are inherent tensions in nursing, such as time pressure, staff shortages, and increasing demands for high performance (Gartmeier, Gruber & Heid, 2010). The nursing shortage presents challenges for policy makers at all levels of government in countries all over the world. Hirst (2019) noted some of the factors driving the nursing shortage, like inadequate human resources planning and management, the ageing nursing workforce, internal and external migration, and high attrition which are the consequence of poor work environments, low professional satisfaction, low social status, and inadequate salary.

The importance of effective leadership in health care was exposed many times (Giltinane, 2013; Grimm, 2010; Nelsey & Brownie, 2012). Leadership in nursing is pivotal because nurses represent the most extensive discipline in health care, they are also the main working group in hospitals and play a vital role in the caring system of every country (Marquis & Huston, 2009; Sullivan & Garland, 2010; WHO, 2013). The nurses' job assignment as health team members is very important, they must to preserve and promote the quality of care to a standard level (Mohammmadi et al., 2011), but there is a problem because the average age of nurses in developed countries increasing (WHO, 2013). Nursing is a profession that involves interaction with different people (patients, their families, other nurses, doctors and various specialists), emotional and physical work in a very challenging environment (Purcell, Kutash, & Cobb, 2011; Scheick, 2011). According to the progress and development, working conditions are constantly changing, including strategies for increasing productivity and reducing costs and maintaining quality of care (Aiken, Clarke, Sloane, Sochalski, & Silber, 2002). Nursing is an emotional and physical strenuous job, and studies show that work in health care poses a major risk for the occurrence of stress, anxiety and depression (Gershon et al., 2007). Burnout is associated with psychological disorders, physical illness, decrease work productivity and an increase work absence (Ahola et al., 2008). Chronic work stress and burnout in nursing are related to consequences for psychological and physical symptoms (Melamed, Shirom, Toker, Berliner, & Shapira, 2006; Salvagioni et al., 2017). The field of work, as well as age, education (Gómez-Urquiza, Vargas, De la Fuente, Fernandez-Castillo,. &Canadas-De la Fuente, 2017;

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Hatch et al., 2018) gender, marital status and children (Canadas-de la Fuente et al., 2018) play an important role of nurses' burnout.

BACKGROUND

Psychological Health

Psychological health is an integral and essential part of health. Some people say psychological health as "mental health" or "emotional health" or "prosperity", but is just as important as good physical health (Mental Health Foundation, 2016). The WHO (2016b) states: "Health is a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity." An important implication of this definition is that mental health is more than just the absence of mental disorder or disability. Mental or psychological health is a state of well being in which the individual realizes his own abilities, can cope with the normal stresses of life, can work productively and is able to contribute to the community. Psychological health is the successful performance of mental function, resulting in activities, fulfilling relationships with other people, and providing the ability to adapt to change and cope with adversity (National Alliance of Mental Illness, 2011). Multiple social, psychological, and biological factors determine the level of psychological health of a person at any point of time. Poor psychological health associated with rapid social change, stressful work conditions, discrimination, social exclusion, unhealthy lifestyle, risks of violence, physical ill-health and human rights violations (WHO, 2016b).

Psychological health is a significant element of social needs (Zandi, Sayari, Ebadi, & Sanaisanasab, 2011). Good psychological health is a sense of well-being, confidence and self-esteem. Good psychological health enables us, to fully enjoy and appreciate other people day-to-day life in our environment. When we are psychological healthy, we can form positive relationships, use our abilities to reach potential and deal with our life's challenges (Mental Health Commission, 2010). Mental Health Foundation (2016) noted that good psychological health is characterised by a person's ability to fulfil a number of key functions and activities, including with the ability to learn, to feel, to express and to manage a range of positive and negative emotions, the ability to form and maintain good relationships with others and the ability to cope with and manage change and uncertainty.

Psychological health and well-being is considered to be a combination of positive affective states and functioning effectively (Winefield., Gill, Taylor, & Pilkington, 2012). Dodge et al. (2012) argued that psychological, social, and physical resources should be part of the concept of health and well-being, because of that we included job satisfaction and positive affectivity. Negative affectivity, reflected in emotions such as anxiety, sadness, irritability, is considered to be part of psychological distress, which is strongly related with reduced quality and increased use of health services (Lahey, 2009). Nursing is an emotionally and physically demanding occupation and researches indicated that work in nursing entails high risks of experiencing stress, anxiety and depression (Gershon et al., 2007). Mental disorders may result from a variety of workplace, organisational and individual factors. These factors include working environments where nurses have lack autonomy and discretion, and where is limited the access to support and learning (Purdy, Spence Laschinger, Finegan, Ker, & Olivera, 2010); where occur high levels of emotional exhaustion and burnout (Mudallal, Othman & Al Hassan, 2017); where nurses frequently experience workplace stress (Khamisa, Oldenburg, Peltzer & Ilic, 2015), high workloads and low reward (Jasper et al., 2012), and where rotational shift patterns result in poor sleep (Lin et al., 2012). The

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

nature of peer relationships in work environments experienced by nurses can also contribute to negative psychological health symptoms (Way & MacNeil, 2006). A review of studies exploring personal and work stress among nurses suggests that difficulty balancing work with family responsibilities has negative outcomes including depression and suicide (Killien, 2004). Although it is known that work related stress and burnout are associated with poor physical and psychological health outcomes (Sharma, Dhar & Tyafi, 2016), there is limited evidence regarding the relationship between burnout and job satisfaction, especially in developing contexts. Limited evidence suggests that emotional exhaustion is more significantly associated with job satisfaction than general health (Khamisa, Peltzer, Ilic, & Oldenburg, 2017).

Poor psychological health has strongly associated with productivity in nursing (Letvak, Ruhm, & Gupta, 2012), absenteeism and presenteeism (Warren et al., 2011); poor work performance, reduced productivity, workplace errors, decreased quality of patient care and low levels of patient satisfaction (Gärtner, Neiuweinhuijsen, Dijk, & Sluiter, 2012). Physical and psychological health of nurses is in direct relation with providing of patient care. A healthy workplace can result in prevention of depression, anxiety and stress and lead to promotion of satisfaction and efficiency of employees. Also, Breau and Rheaume (2014), Copanitsanou et al. (2017) and Regan and Rodriguez (2011) noted that empowering work environments is associated with positive health outcomes. Nursing is a profession, which requiring a high degree of commitment and involvement.

Leadership Behavior

The achievement of organizational goals largely depends of the leadership behavior which is related with the number of employees and organizational variables (Malik, 2013). Mosadegh Rad (2003) presented the leadership behavior, as a set of characteristics, attitudes, and skills used by a leader in different situations, depending on individual and organizational values. Daft (2005) defined the leadership behavior as a relationship between leaders and co-workers. Different dimensions of the leadership behavior have been developed, and the researchers still continue to discover what contributes to the success of leadership. Leadership behavior depending of leadership style, leaders' personal characteristics and emotions.

Theories of management is often described with different classifications based on personality and behavior, and were used to determine the characteristics and behaviors of an effective way management (Muchinsky, 2006; Spector, 2006). Management style is a construct related to the number of employees and organizational variables. Many theories and leadership styles have been developed, and different leadership styles show how to keep nurses in hospitals (Giltinane, 2013). Huber et al. (2000) explain that the leadership style as a combination of tasks and behaviors that influence employees to achieve objectives. Goethals et al. (2004) noted that the transaction leadership based on the theory that employees are motivated by rewards and discipline, but transformation leadership style focus on the team-building, motivation and participation of the employees at various levels of the organization. Transformational leadership style is based on the active role played by leaders to promote the motivation and objectives in the context of employees, but business management style is based on the mutual exchange between the leader and co-workers (Burns, 2010, p. 425). Leadership style laissez-faire is the style in which the leader gives little or no direction or control, and prefers to make its own decision. Changes occur rarely and improving quality is usually low. Laissez-faire leadership style used mostly new and inexperienced leaders or those at the end of career (Goethals, Sorenson, & Burns, 2004; Skogstad Einarsen, Torsheim, Schanke Aasland, & Hetland, 2007). Already Kouzes and Posner (1997) noted that there is no best leadership style; but leaders must choose the method of management and leadership according to the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

situations and circumstances. All kind of leadership style has advantages and disadvantages (Goethals et al, 2004; Marquis and Huston, 2009).

The leadership style associated with leaders' personality (Brown & Reilly, 2009), personal values (Potočan, Nedelko, Peleckienė, & Peleckis, 2016; Nedelko & Brzozowski, 2017), leaders' emotional intelligence (Spano-Szekely, Quinn, Griffin, Clavelle, & Fitzpatrick, 2016; Downey, Papageorgiou, & Stough, 2006; Vrba, 2007), stress and burnout (Harms, Crede, Tynan, Leon & Jeung, 2017; Zopiatis & Constanti, 2010), job satisfaction (Boamah, Spence Laschinger, Wong & Clarke, 2018; Lu, Zhao & While, 2019), psychological health (Hentrich, Zimber, Garbade & Peterman, 2016; Perko, Kinnunen, Tolvanen & Feldt, 2015; Skogstad et al., 2007), and well-being (Kuoppala, Lamminpää, Liira, & Vainio, 2008; Nielsen, Randall, Yarker, & Brenner, 2008; Skakon, Bielsen, Borg, & Guzman, 2010; Van der Heijden, Mulder, Konig & Anselman, 2017).

Personality is the set of characteristics in the individual that account for recurring patterns of behavior, thoughts, and feelings. Organizations seek to capitalize on individuals' unique habits from their knowledge, skills, and abilities toward improving organizational success. Employees are key to success, and individual personality offers a target for assessing individuals in personnel selection, work motivation, leadership, teamwork, and other key aspects of organizational functioning (Tett, Ragsdale & Simonet, 2017). Leadership style that leader will be adopted in its own way, is selected according to the knowledge, experience and skills from leader's past and depend of the personal characteristics of leader. Musek (1997, p. 242) states that characteristics, such as personal characteristics or physical and psychological characteristics, in addition to knowledge, motivation and other characteristics affect on the achievements and success. Personality characteristics of each individual are permanent characteristics, by which individuals are different. Leaders' characteristics are those, which have a significant impact on leaders' achievements and success in a conflict resolution and task performance (Musek & Pečjak, 2001). Because of that the leadership behavior also depends on the personal characteristics of each individual leader.

Different researchers highlighted different characteristics that leaders should have for successful leadership. Leadership-Toolbox (2008) presents six relevant characteristics of a successful leadership, like empathy, consistency, honesty, communication, flexibility, and beliefs. Holden Leadership Center (2009) noted that every leader should have responsibility, flexibility, good communication skills, trusting, enthusiasm, creativity, openness to change, interests for feedback, and delegating. Prive (2012) noted that honesty, delegating, good communication, sense of humor, confidence, dedication, positive attitude, creativity, intuition, and the ability to inspire are the most important leaders' characteristics for success. Economy (2014) presents that the characteristics of successful leaders are: awareness, assertiveness, empathy, responsibility, trust, optimism, honesty, and inspiration, but Javitch (2014) exposes only team skills, communication skills, interpersonal skills, and ambition. Lorber & Skela Savič (2011) found that leaders and employees in nursing in Slovenian hospitals highlighted next ten characteristics of successful leaders from the set of twenty-five characteristics: honesty, organizational skills, teamwork, decisiveness, reliability, objectivity, responsibility, communication skills, self-confidence, and ambition.

Emotions are fundamental for nursing practice (Brunton, 2005; Bulmer-Smith, Profetto-McGrath, & Cummings, 2009). Researchers (Bulmer-Smith et al., 2009; Obholzer, 2005; Waddington & Fletcher, 2005) noted that emotional labor and increasing workloads effect on health of employees in health care. Emotions play an important role in nursing probably because nursing requires not only technical expertise, but also psychologically oriented care and knowledge of self and others (Landa & López-Zafra, 2010).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Emotional intelligence is the ability to assess and control one's emotion feelings, the emotion of others and plays an important role on an individual and group behavior and performance in the workplace (Goleman, Boyatzis, & McKee, 2002; Law, Wong, & Song, 2004; Sy & Côté, 2004;). Emotional intelligence is a term used to describe the complex ability to regulate our inspirations, understand and share the feeling of others and be able quickly recover from difficult condition (Goleman, 1995). Emotional intelligence is an important asset in professions, like nursing, where understanding people is crucial (Vitello-Cicciu, 2002). Some researchers (Clarke, 2010; Dollard, 2018; Harms & Crede, 2010; Lorber, 2015) found that emotional intelligence is an important ability of leaders for successful leadership. Lorber (2015) found that leaders' emotional intelligence was positively correlated with leaders' quality of communication, teamwork at the hospital unit, interpersonal relationships at the hospital unit, conflict solving, and quality of care. Segal and Smith (2014) noted that emotional intelligence affects on the performance at work, physical health, psychological health, and relationships. Employees in health care institutions, in which leaders have highly developed emotional intelligence have better psychological health, are more satisfied, and have better quality of healthcare (Goleman & Boyatzis, 2008). Emotional intelligence affects on job satisfaction (Coladonato, & Manning, 2017; Spano-Szekely, Quinn Griffin, Clavelle, & Fitzpatrick, 2016; Yan, Yang, Su, Luo & Wen, 2018), organizational commitment (Awais, Malik & Qaisar, 2015), well-being (Karimi, Leggat, Donohue, Farrell, & Couper, 2014, Karimi, Cheng, Bartram, Leggat & Sarkeshik, 2015; Yan et al., 2018) and reduced stress (Karimi et al., 2014, Karimi et al., 2015; Sharma, et al., 2016).

Job Satisfaction

Job satisfaction is one of the most relevant variables in the field of organizational and work psychology. It attracts the attention of researchers who aim to contribute empirically to explain its constructs, as well as to understand what elements and variables act as its consequents and antecedents. Job satisfaction is also a focus of human resources managers seeking to develop internal strategies and policies regarding the promotion of workers. The literature suggests several consequences of job satisfaction both within and outside the organization of employment. Prior research also associates job satisfaction with an increase in affective commitment to the organization, productivity (Jernigan, Beggs, & Kohut, 2002) organizational commitment and reduced absenteeism (Folami, Asare, Kwesiga, & Bline, 2014) and turnover (Zopiatis, Constanti, & Theocharous, 2014). There are also indications that labor dissatisfaction can cause damage to one's physical and mental health, and can decrease one's well-being and happiness (Bowling, Eschlema & Wang, 2010). Each person has their own views of work. Working environment effect on employees, at their level of performance and also on their satisfaction, well-being and health. Work has effect on satisfaction, well-being and health of the individual, because it provides income and means to broader social progress. Because of that job satisfaction is define in many different ways. The most widely accepted theory of job satisfaction was proposed by Locke (1976), who defined job satisfaction as "a pleasurable or positive emotional state resulting from the appraisal of one's job or job experiences". Business Dictionary (2019) define job satisfaction as satisfaction that arising out of interplay interaction of positive and negative feelings of employees towards his or her work.

It is well known that the organizations with satisfied employees are more productive than those with unhappy employees (Hellriegel & Slocum, 2007). Researchers (Al-Hussami, 2008; Aron, 2015; Koy, Yunibhand, Angsuroch, & Fisher 2015), showed that a higher level of job satisfaction in health care, it also increases the organizational commitment of employees and the quality of patient care. The level

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of satisfaction plays an important role at employees' level as their level of health and also at the organizational level as employees' productivity (Faragher; Cass, & Cooper, 2005). Studies (Faragher et al, 2005; Kudielka et al, 2005, Marklund, Bolin, & von Essen 2008; Nadinloyi, Sadeghi, & Hajloo 2013; Thorsteinsson, Brown, & Richards, 2014) have also shown a link between psychological health and job satisfaction of employees. Psychological health and job satisfaction are the key elements of sick leaves and also the crucial reasons for leaving an organization (Coomber & Barriball, 2007). Nurses' poor psychological health is more likely to lead to problems of patients and also the quantity and quality of patient care will be reduced (Michie & Williams, 2002). Physical and psychological health of nurses is in direct relation with the providing of care, therefore a healthy workplace results the prevention of depression, anxiety and stress among nurses and lead to promotion of satisfaction and efficiency (Taghinejad, Suhrabi, Kikhvani, Jaafarpour, & Azadi, 2014). Šarotar Žižek and Mulej (2016) noted that healthy workplace can be built by occupational health promotion, whicj must take place socially responsibility and requisitely holistically. Nurses have higher than normal rates of physical illness, mortality, and psychiatric admissions (Kirkcaldy & Martin, 2000) according to the profession that they work in.

According to the literature review we can expose the importance of effective leadership and healthy working environment for employees. Working environment, together with the leadership have a significant impact on employee health and well-being. With grave impact on work productivity, patient care, staff attrition and turnover rates, a better understanding of existing relationships between work related work environment, stress, job satisfaction and psychological health health of nurses is required. The aim of the present study was to examine the level of psychological health and job satisfaction, and to find the differences between leaders and other employees in health care according to the level of job satisfaction and psychological health.

On this basis, three hypotheses were formed:

1. Increased use of the transformational leadership style affects on employees' psychological health.
2. Well, expressed leaders' characteristics affects on employees' psychological health.
3. Job satisfaction affects on psychological health.

According to hypotheses we want to find out the level of psychological health of nurses, and tested, if leaders' behavior (leadership style, leaders' characteristics, leaders' emotional intelligence) nurses' characteristics (age, years in nursing, work position, presence of chronic disease, the level of stress), and job satisfaction affect on it. We also compared the level of psychological health between leaders and other employees in nursing. The analysis was exploratory, as we know that there is no research to guide the specific hypothesis relating to these two specific work positions. As described above, there is strong evidence indicating a link between the workplace, job satisfaction, and psychological health.

METHODS

Participants and Procedure

The Institute of Public Health of the Republic of Slovenia lists 12 state hospitals with the departments of internal medicine and surgery. The current study included 8 of them. As the research instrument was used a questionnaire of closed type questions. The questionnaires were distributed in the morning shift

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

by the author and by the research coordinator in the participating hospitals. The sample consisted of 1100 nurses (the response rate was 58%), which voluntarily participated in a survey in eight Slovenian hospitals with internal medicine and surgery department. Data of 640 Slovenian nurses from the current study contributed to answering different research questions. First, we received a written permission for the study from the National Medical Ethics Committee of the Republic of Slovenia (No.157/09/13) and from all the participating hospitals. The researchers randomly selected 1100 hospital nurses from eight Slovenian hospitals; all Slovenian regions were included. 85 questionnaires were sent to middle- and unit-level nurse leaders and 1015 questionnaires to other nursing employees. Nurse leaders were not selected randomly; the questionnaires were sent only to those who occupied a leading position in a department or unit which means the purposive sampling was used. 1100 hospital nurses received an application for participation, instructions, guarantee of anonymity, and an envelope with a stamp and researcher's address for returning the questionnaire.

Instruments

In the study, the questionnaire was used which included:

- Demographic and other characteristics of nurses like age, gender, years in nursing, education level, work position, the presence of chronic diseases, frequency of coping with stress in the workplace, and managing stress.
- Multifactorial Leadership Questionnaire (Bass & Avolio, 1994) contains 21 items of leadership style, measured leaders' expression of transformational, transactional and laissez-faire leadership style. The leaders self-assessed their leadership style, while other employees assessed leadership style of their direct leaders. Leadership style assessed on the 6-point Likert scale ranging from 1 (strongly disagree) to 6 (strongly agree).
- Ten leaders' characteristics (Lorber & Skela Savič, 2011). The leaders self-assessed their personal characteristics, while other employees assessed personal characteristics of their direct leaders. Leaders' characteristics assessed on the 6-point Likert scale ranging from 1 (strongly disagree) to 6 (strongly agree).
- Emotional Intelligence Questionnaire developed by Petrides & Furnham (2001). The leaders self-assessed their emotional intelligence, while other employees assessed leaders' emotional intelligence of their direct leaders. Both assessments were made on the 6-point Likert scale ranging from 1 (strongly disagree) to 6 (strongly agree).
- Positive affectivity*:* This scale was developed by Watson et al. (1988) (Positive and Negative Affect Schedule [PANAS]). Participants rated the extent to which they "in general" feel in a certain way. Items were *alert*, *excited*, *active*, *interested*, *attentive*, *determined*, *proud*, *inspired*, *strong*, and *enthusiastic.* All items scored using a 5-point rating scale (response categories: *very slightly or not at all*, *a little*, *moderately*, *quite a bit*, and *extremely*).
- Negative affectivity*:* This scale was developed by Watson et al. (1988) (PANAS). Participants rated the extent to which they "in general" feel in a certain way. Items were *jittery*, *nervous*, *irritable*, *upset*, *distressed*, *scared*, *guilty, afraid*, *ashamed*, and *hostile.* All items were scored using a 5-point rating scale (response categories: *very slightly or not at all*, *a little*, *moderately*, *quite a bit*, and *extremely*). Communication skills were assessed with 10 items, which were developed

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

from Company for transformational leadership (O.K. Consulting). Communication skills assessed on the 6-point Likert scale ranging from 1 (strongly disagree) to 6 (strongly agree).

- Job satisfaction measured with a15-item satisfaction questionnaire prepared by Warr et al. (1979). The respondents were asked to assess their job satisfaction on a 6-point scale from 1 (extremely dissatisfied) to 6 (extremely satisfied).
- General Health Questionnaire (GHQ) (a 12-item version) was used for self-perceived psychological health (Goldberg & Williams, 1988). The items were scored on a four-point Likert-type scale from 0 (more than usual) to 3 (much less than usual). The sum of scores creates an overall image of psychological health. Higher scores indicated more positive (better) psychological health.

Data analysis was carried out by using the statistical software package SPSS, 25.0. P-values equal or lower than 0.05 were considered statistically significant. Exploratory factor analysis was performed on 21 items of the leadership style. The principal component analysis and principal axis factoring concluded three factors, representing the transformational, transactional and laissez-faire leadership style. For further analysis by mean scores represent only the transformational (Cronbach's α was 0.960) and transactional (Cronbach's α was 0.937) leadership as indicators. The exploratory factor analysis on 16 items of emotional intelligence concluded four factors: self-identifying of emotions; identifying others' emotions; use of emotions, and emotion regulation. For further analysis, the mean of the items was used as a score sum to represent the emotional intelligence ability as an indicator (Cronbach's α was 0.974). Exploratory factor analysis on 15 items of job satisfaction concluded two factors, internal and external job satisfaction. For further analysis, the mean of the items was used as a score sum to represent the aspects of job satisfaction as an indicator (Cronbach's α was 0.943). The exploratory factor analysis of 12 items of psychological health concluded three factors, social dysfunction, anxiety and insomnia, and loss of confidence. For further analysis, the mean of the items was used as a score sum to represent the psychological health as an indicator (Cronbach's α was 0.812). Internal consistencies (Cronbach α) for positive affectivity was 0.931 and for negative affectivity was 0.89. Cronbach's alpha coefficient exceeded 0.8 or more in all cases.

Data Analysis

The descriptive statistics, and multiple regression analysis were used to determine the effect of independent variables (transformational leadership, transactional leadership, leaders' characteristics, leaders' emotional intelligence, and job satisfaction) on the depended variable (psychological health). Because we were also interested in differences in the self-assessment of the psychological health according to the presence of chronic diseases, the exposure frequency to stress, coping with stress, level of education, and years of employment in nursing, the One-way ANOVA and Mann Whitney test were used. A p-value of <0.05 was considered to be statistically significant.

Sample Description

The study included 640 employees in nursing from eight Slovenian hospitals. 346 (54%) of them were employed in surgery departments and 294 (46%) of them were employed in internal medicine departments. 75 (12%) of them were nurse leaders and 565 (88%) of them were other employees in nursing. There were 87 (14%) men and 553 (86%) women. 24% of participants were less than 30 years old, 64%

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of them were between 30 and 50 years of age and 12% of them were older than 50 years. On average, leaders spent 8.6 years (from 0.5 to 32 years) in the leading positions. 40 (6%) of them had less than 5 years of experience in nursing, 134 (21%) of them had 5 to 10 years of experience, 218 (34%) of them had 11 to 20 years of experience, 128 (20%) of them had 21 to 30 years of experience and 120 (19%) of them had more than 31 years of experience in nursing.

RESULTS

473 (74%) respondents do not have any chronic diseases, 163 (26%) have one or more chronic diseases. 194 (30%) respondents are always exposed to stress at the workplace, 334 (52%) respondents are often exposed to stress, 109 (17%) of them are sometimes exposed to stress and only 1 (0.2%) respondent was never exposed to stress at the workplace. 525 (82%) respondents are managing stress well, but 113 (18%) respondents do not manage stress at the workplace. Table 1 presents the studied variables.

The average value of expressed transformational and transactional leadership style, personal characteristics, emotional intelligence and communication skills are at the middle level (from 3.42 to 4.36 from 6). The level of job satisfaction of employees in nursing is also at the middle level ($\bar{x}$ =3.17; s=1.755). 47% (301) respondents are satisfied with their job but 15% (96) respondents have poor psychological health. We found a statistically significant difference in the level of job satisfaction (Z=-6.640; p<0.001) and psychological health (Z=-2.219; p=0.026) according to job position. We also found statistically significant difference in positive (Z=-4.187; p<0.001) and negative affectivity (Z=--4.349; p<0.001) according to job position.

To test the influence of the leadership behavior and characteristics on job satisfaction of employees in nursing, a multiple linear regression was performed. Demographic and other nurses' characteristics (gender, age, level of education, job position and years of employment, positive affectivity, negative affectivity), transformational leadership style, transactional leadership style, leaders' characteristics, leaders' communication skills, and leaders' emotional intelligence were entered into the model as independent variables. Job satisfaction was a dependent variable. The regression analysis revealed that 67% of nurses' job satisfaction could be statistically predicted from independent variables, as presented in Table 2.

Table 1. Indicators and descriptive variables in the research

Variables	disagree/ dissatisfaction / poor health	agree/ satisfaction / good health	$\bar{x}$	s
Transformational leadership	339(54%)	289(46%)	3.77	1.354
Transactional leadership	297(47%)	330(53%)	3.63	1.414
Leaders' characteristics	288(46%)	343(54%)	4.36	1.397
Leaders' emotional intelligence	333(52%)	306(48%)	3.42	1.823
Leaders' communication skills	328(53%)	299(47%)	3.49	1.682
Job satisfaction	339(53%)	301(47%)	3.14	1.755
Psychological health	96(15%)	544(85%)	17.1	4.595

Note: $\bar{x}$ =average value; s=standard deviation

Table 2. Regression results for the prediction of job satisfaction

Variables	B	S.E.	β	t	p-value
Gender	0.009	0.042	0.006	0.206	0.837
Age in years	-0.005	0.004	-0.001	-0.007	0.994
Years in nursing	-0.001	0.004	-0.003	-0.034	0.973
Level of education	0.003	0.014	0.007	0.213	0.831
Job position	0.093	0.062	0.058	1.113	0.078
Transformational leadership	0.072	0.022	0.197	3.501	**0.001**
Transactional leadership	-0.083	0.022	-0.236	-1.102	**0.046**
Leaders' characteristics	0.167	0.048	0.167	3.484	**0.002**
Leaders' emotional intelligence	0.162	0.091	0.179	2.117	**0.034**
Leaders' communication skills	0.180	0.063	0.210	2.756	**0.018**
Stress level	-0.110	0.032	-0.150	-3.407	**0.001**
Possitive affectivity	0.127	0.051	0.245	2.471	**0.014**
Negative affectivity	-0.105	0.044	-0.251	-2.419	**0.016**
Adjusted R^2=0.669; F=38.075; p<0.001					

Note: B=unstandardizired regression coefficient; S.E.=standard error; β=standardized regression coefficient; t=t-value of t-statistic; p=p-value of significance; R^2=coefficient of determination

We found statistically significant differences in job satisfaction according to the level of education (F=2.048; p=0.046), years working in nursing (F=1.423; p=0.033), exposure to stress (F=40.905; p<0.001) and managing stress (F=10.538, p<0.001). We have seen statistically significantly higher job satisfaction in those with higher levels of education, those who have been employed in nursing for several years, those who are exposed to stress less often, and those who are managing stress well.

To test the influence of leadership behavior, nurses' characteristics, and job satisfaction on nurses' psychological health, a multiple linear regression was performed. Demographic and other nurses' characteristics (gender, age, level of education, job position and years of employment, positive affectivity, negative affectivity), transformational and transactional leadership style, leaders' characteristics, leaders' communication skills, leaders' emotional intelligence, and job satisfaction were entered into the model as independent variables. Psychological health was a dependent variable. The results revealed that 57% of nurses' psychological health could be statistically predicted from independent variables, as presented in Table 3.

We also have found statistically significant differences in psychological health according to the level of education (F=1.994; p=0.002), years working in nursing (F=1.576; p=0.031), exposure to stress (F=8.727; p<0.001) and managing stress (F=1.610, p=0.025). We have seen statistically significantly better psychological health in those with higher levels of education, those who have been employed in nursing for several years, those who are exposed to stress less often, and those who are managing stress well. We also found that nurses with one or more chronic disease were poor psychological health than those with no chronic disease (Z=-3.062; p=0.002).

DISCUSSION

Mean scores for psychological health demonstrated that Slovenian nurses in this sample had high level of psychological health. The findings indicated that only 15% of employees in nursing were had poor psychological health. This finding is more encouraging according to the previous studies, like Calnan et al. (2001) which indicate that nearly a quarter of the respondents were suffering from mental distress, and studies (Lavoie-Tremblay et al., 2008; Nakata et al., 2004; Suzuki et al., 2004) which indicate that about one third of employees have poor psychological health. Khamisa et al. (2017) found that 60% nurses had experienced poor general health related to anxiety and insomnia in South Africa. Wei et al. (2018) in the systematic review based on the findings of the fifthy-four studies emerged five major theme: Impacts of healthy work environments on nurses' outcomes such as psychological health, emotional strains, job satisfaction, and retention; Associations between healthy work environments and nurse interpersonal relationships at workplaces, job performance, and productivity; Effects of healthy work environments on patient care quality; Influences of healthy work environments on hospital accidental safety; and Relationships between nurse leadership and healthy work environments. Acording to this results we can conclude that leadership have an important impact on psychological health and job satisfaction throught take care for healthy work environment. In the research were found differences in psychological health according to years working in nursing, level of education, absence of chronic diseases, lower presence of stress at the workplace, and good managing stress. Also, Chang et al. (2006) found higher psychological health scores relating to more years worked at the unit, and lower psychological health relating with lack of support, lack of self-controlling and higher workload. Differences in psychological

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

health according to the working position can be explained with varying degrees of autonomy, duties, and decision-making process.

In Slovenian hospitals the level of nurses' job satisfaction is at the medium level. Some other researchers (Chien & Yick, 2016; Gurkova, Harokova, Džuka, & Žiakova, 2014; Jaafarpour & Khani, 2012; Lorber & Skela Savič, 2012; Vermeir et al., 2018) also found that the nurses' job satisfaction is at the medium level. But Sansoni et al. (2016) in Italian study and Khamisa et al. (2017) in South Africa. found a low level of nurses' job satisfaction. Higher level of job satisfaction positively correlated with psychological health. It means that employees with a higher level of job satisfaction tended to have better psychological health than those who with a low level of job satisfaction. Also some other studies have found a close link between psychological health and job satisfaction (Allan, Dexter, Kinsley & Parker, 2018; Faragher et al., 2005; Janyam, 2009; Khamisa et al., 2015; Khamisa et al., 2017; Nadinloyi et al., 2013). Findings of contemporary and some past researches suggest, that the level of job satisfaction has an important impact on general, and also psychological health of employees.

Better expressed leaders' characteristics, also emotional intelligence have an impact on both job satisfaction and psychological health. Behavior of leaders through leaders' characteristics have an important effect on well-being, health, satisfaction, and effectiveness (Lorber & Skela Savič, 2012; Skakon et al., 2010; Sudha, Shahnawaz, & Farhat, 2016; Winkler, Busch, Clasen, & Vowinkel, 2015). Some studies (Chiva & Alegre, 2008; Clarke, 2010; Coladonato & Manning, 2017; Crowne, et al., 2017; Kafetsios & Zampetakis, 2007; Mittal & Sindhu, 2012; Naidu, 2014; Spano-Szekely et al., 2016) describe the importance of emotional intelligence in the context of organizational leadership and job satisfaction.

Based on the six independent variables, the multiple regression analysis indicated that the transformational leadership style had a significant impact on the job satisfaction and also on the psychological health. Also other researchers found the impact of the transformational leadership style on job satisfaction (Atmojo, 2012; Boamah et al., 2018; Brewer et al., 2016; Cummings et al., 2008; Saleem, 2015), and on psychological health (Gilbert, Dagenais-Desmarais & St-Hilaire, 2017; Hentrich et al., 2016; Salanova, Lorenre, Chambel, & Martinez, 2011). Salanova et al. (2011) and Shirey (2017) noted that the transformational leadership style can help to create a more positive and psychologically healthy work environment.

A leadership style, leaders' characteristics, and leaders' emotional intelligence reflecting the leaders' behavior and have an important effect on nurses' job satisfaction and their psychological health. Our results provide a support to previous studies about the importance of nurses' satisfaction and psychological health for the organizational effectiveness and performance. Cyhlarova et al. (2010) and Goetzel et al. (2002) noted that psychological distress is a major cause of absence from work, reduction in productivity, and staff turnover. Employers should take care of employees' psychological health because psychological health affects not only employees' well-being and health, but also on the organizational effectiveness. We agree with Grawitch et al. (2007) that for every organization, it is important to meet the needs of employees, and to recognize the positive and negative effects of job satisfaction and health.

STUDY LIMITATIONS

The study has some limitations. We have studied the influence of some predictors on psychological health. For research instrument were used a multiple choice closed-ended questions, which limited to a list of answers from which the respondents were allowed to choose. The researcher was not always available

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

during the research. The respondents did not get any help in the case that they did not understand the item, and also no additional explanations were provided if they maybe need it. Among the limitations is also incomplete responding for some of the scales, which reduced the effective sample size for some analyses.

SOLUTIONS AND RECOMMENDATIONS

Better collaboration and consultation between leaders and other employees in healthcare is the basis to achieve higher level of job satisfaction better psychological health of employees in every organization, not only inhospitals. The leadership style is important factor, that employees are satisfied, committed, stay at workplace and are in good health. Leaders in healthcare would benefit from initiatives, if they had better prepare on the leader role. Leaders have to learn and also explore the improvement of leadership style. Leaders have to take care about their health, because only healthy leaders can take care for employees' health. When establishing the level of job satisfaction and level of health, we have to focus on what the employees feel about their work, about personal relationships at the workplace and on the way how leaders influence on the employees.

For every leaders it's important to think about employees' wellbeing, and especially understand their preferences, passions and wishes. More that leaders know, about their employees, they will be better equipped to find winning solutions that are optimum and adapted to improve the satisfaction at work. Leaders' success is base on the ability to work with emotions and on motivation of their employees. Below are some tips for leaders, how to create an environment that is adapted to the development of positive emotions:

- Encourage communication - communication is a key element of employees' job satisfaction. An open communication is based on collaboration and on work environment that is encourage exchanges between employees.
- Care about employee wellbeing - wellbeing is often synonymous of a healthy mind. Psychology is an important element to understand effective human resource management. Simple proofs of recognition, such as a smile in the morning or a compliment have a great impact.
- Encourage team spirit - creating a team spirit is as important as employees' motivation because work is collaborative by nature.
- Provide training opportunities - when you offer training opportunities, you give your employees the chance to deepen their knowledge and get specialised in a field they enjoy.
- Involve employees - employees not only need to feel at ease within their workplace, but also useful.
- Provide feedback - good feedback can be defined by promptness, its frequency, and its precision to be effective.

CONCLUSION

In a constantly changing health system, hospitals will have to recognize the importance of satisfied and healthy employees. Hospitals can be successful and achieve organizational goals if their employees are satisfied with work and have a high level of psychological health. It is important that employer monitors

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

employees' job satisfaction and take care for employees' health. That is the only way that organizations are adapt to an individual and to achieve greater efficiency, and better quality. Employees in health care institutions will be more satisfied and will have better health if they get a good example and an appropriate support by the leaders.

The employees with a high level of job satisfaction are more effective, more committed, have bertter psychological health and contribute to better quality. Based on the results and literature review, we conclude that leadership is a complex process which is connected with job satisfaction and employees' psychological health. One of the key challenges for every organization is to maintain job satisfaction and psychological health of employees and increase their motivation for quality. Leaders with good emotional capability, who are aware of their feelings, are good at controlling and understanding others. Promoting the effective leadership through formal and informal training among the leaders in healthcare may lead to more satisfied employees in nursing, better patient care, and effective leadership. The studied topic provides opportunities for further research. This research could be conducted in all healthcare institutions in Slovenia and it is necessary to monitor changes in this area every few years.

KEY TERMS AND DEFINITIONS

Employee: Is a person who works full-time or part-time acording to the contract of employment and has their rights and duties to do a specific job. Every employee has their own skills, knowledge, experience and contribution for the employer.

Healthy Workplace: Is the place where workers and managers collabotrate to constantly improve the health, safety and wellbeing.

Job Satisfaction: Is a employees' pleasurable or positive emotional state resulting from the appraisal of individual's job or job experiences.

Leadership: Is the ability to motivate, support and lead other individuals to accomplish of common tasks and goals.

Leadership Style: Is the way of leaders' communication, think and order to provide direction, implement plans and motivate individuals.

Nursing: Is an integral part of health care system and focused on patients, families, and communities during health and disease, with the aim to achieve the highest possible level of health.

Psychological Health: It is an integral part of the general health of the individual and is also a source of wellbeing.

This research was previously published in Recent Advances in the Roles of Cultural and Personal Values in Organizational Behavior; pages 213-239, copyright year 2020 by Business Science Reference (an imprint of IGI Global).

ABSTRACT

This chapter presents information about the methods that combine physical and mental workload/fatigue during ergonomic evaluation. The methods were identified through a systematic literature review. The search criteria were done through a literature search in databases like SciFinder, SciELO, ScienceDirect, etc. As result, the following methods are described: Global Load Scale, Multivariate Workload Assessment, Subjective Fatigue Symptoms Test, Fatigue Assessment Scale, Scale of Recovery for Exhaustion of Occupational Fatigue, Scale of Estimated Fatigue-Energy Points, Swedish Occupational Fatigue Inventory, NASA-TLX, Combined Cognitive and Physical Assessment, Laboratory Method of Economics and Sociology of Work, OWL Method, Ergonomic Checklist Method, RENAULT Method, Joyce Method, NERPA Method, ARBAN Method, and MAPFRE Method. As a conclusion, it is possible to affirm that there are some evaluation methods that provide better elements for an accurate evaluation, and others lack basic elements, which causes an incomplete/not accurate evaluation.

INTRODUCTION

The changes in job processes and work design happened in the last decades were, predominantly, demographic, economic, political, and technological (Bailey & Iqbal, 2008). These changes have caused that the current work must be performed developing physical and mental efforts in a combined and/or simultaneous way (Gil-Monte, 2012). Currently, modern technology has involved new changes in industrial work, especially in decision-making involving high levels of mental load (Demands & De, 2018). As a result, the mental workload is one of the most researched concepts in ergonomics and human factors and represents an issue of increasing importance (Ayaz, 2012). In work environments, more and more cognitive demands are imposed on operators, while physical demands decrease in tasks, understanding how the mental workload affects performance is increasingly critical (Hernandez Arellano, Serratos Perez, Alcaraz, & Maldonado Macias, 2018; Young, Brookhuis, Wickens, & Hancock, 2015).

Due to high levels of mental load, levels of stress and fatigue are being generated and affecting the worker's performance, organizational productivity as well as health problems (Arce & Silvia, 2012). Stress is shown in the physiological plane altering indexes such as the reactivity of the heart rate and the increase in blood pressure. In the behavioral level, the effects of stress are revealed in problems of smoking, alcoholism, drug abuse, antisocial, and aggressive acts, which leads to a possible tendency to accidents and errors, as well as problems of relationships at work (González Muñoz & Gutiérrez Martinez, 2006).

The physical workload is the set of physical requirements that the person required during his working day (Moreno, 2015). A physical job occurs when the type of activity required by the task is primarily physical or muscular. On the contrary, the mental workload is the amount of deliberate mental effort that must be made to achieve a specific result, and it is linked to the need for information processing and decision making for the execution of the task (O'Donnell & Eggemeier, 1986).

The mental workload is used in tasks involving mainly cognitive processes, information processing and affective aspects (Arquer de, 1999). All jobs require a certain level of physical load and mental load. However, the working conditions can affect the mental load of the people (Ceballos Vásquez, Paravic Klijn, Moreno, & Barriga, 2014). For example, in work on production lines (application of adhesives, sewing, welding of electronic parts, insertion of components, etc.), transport of materials (manual or automated), and manual assembly lines (assembly of harnesses, automobiles, components electronic, etc.), are some of the jobs where there are high levels of physical and/or mental load. To assess the workload, both physical and mental aspects must be evaluated, so there are different techniques for evaluation. Similarly, physiological, behavioral and subjective changes should be considered. Some physiological measures evaluate the effect of the increase or decrease of the workload, examples of these are heart rate, heart rate variability, eye movement and brain activity (Stanton, Hedge, Brookhuis, Salas, & Hendrick, 2005). However, the number of methods that combined both kinds of efforts are limited in contrast to the great number of methods, tools, and techniques to evaluate physical or mental factors during an occupational task.

Ergonomic Evaluation

Over time, ergonomic studies have been carried out on the workload, theoretical discussions, and reviews of past investigations (Hart & Staveland, 1988; Lysaght, Ouellette-Kuntz, & Lin, 2012). A growing number of different approaches and techniques for measuring workloads have been discussed, devel-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

oped, and used. Subjective techniques seem to proliferate, this creates an opportunity and a problem for professionals and researchers of human factors. More recent studies (Hart & Staveland, 1988; Lysaght et al., 2012; Moray, 1979) have taken into account the current situation and perspective of the future on occupational stress, as well as the techniques of study for the workload in laboratories (Piñeda Geraldo and Montes Panice 2014). Studies are still being carried out where a high workload is identified and continuous improvements are sought to reduce the mental workload and improve workers' performance (Kakushi & Évora, 2014).

There are many tools that have been developed for a wide variety of situations, and human factors specialists face the choice of the most appropriate tool or tools to be able to find the information needed to make a choice and consequently causes a problem to choose the right tool (Hill et al., 1992). The ergonomic evaluation aims to determine the level of presence of risk factors in workplaces, which can generate physical health problems in workers. There are two types of analysis: that of working conditions to identify risks and risk assessment if they exist. For each factor, there are different methods that help to evaluate the level of risk associated (Asensio-Cuesta, Bastante Ceca, & Diego Más, 2012).

Combined Physical and Mental Workload

The workload is a concept that involves the capacity of the human being in complex systems considering the equipment, the training offered, the organizational, and environmental constraints. Also, it implies diverse perceptions and responses by the Workers (Jung & Jung 2001). More often, we find jobs that require the individual to attend multiple tasks at the same time, make decisions, and solve problems effectively in stable and emergency situations. The growing role of technology and the use of complex procedures have led to greater demand imposed on the worker (Stanton et al., 2005). The workload produced by an activity that responds to the requirements of a task is composed of physical load and mental load. In the next section, combined methods to assess physical and mental workload are presented in chronological order.

Objective

The objective of this research is, through a systematic review of the literature, to identify and describe the methods to evaluate physical and mental workload in a combined way.

METHODOLOGY

Step 1. Search Criteria

The identification of the combined evaluation methods presented in this article arises from a literature review, using scientific databases and journals such as SciFinder, ScienceDirect, SciELO, Dialnet, Sage Journals, Research Gate, MDPI and Springer. During the search, the selecting area of knowledge was: Ergonomics and human factors. To identify the results, the following keywords were used: "Method, Ergonomics, Combined, Mental, Physical, Study, Scale, Evaluation, Workload, Human, Factors."

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Step 2. Identification of Related Papers

During the literature research using the search criteria, more than 200 related papers where found. All of them were read and separated to classify those that would be useful for research.

Step 3. Selection of Relevant Papers

In the final step, 17 relevant papers we had selected, each paper was used to integrate the information and methods included in this article.

RESULTS: COMBINED METHODS IDENTIFIED

The combined methods in this article were selected based on the most used during investigations and ergonomic evaluations in articles. A total of 17 methods were identified, as shown in Table 1.

DESCRIPTION OF THE METHODS

MAPFRE Method

This method, also called the method of ergonomic analysis of the workplace, aims to be a simplified ergonomic assessment, in which, from a general analysis of the conditions of the position, it can be addressed deeper and specific studies of the aspects considered as negative. This method carries out a triple evaluation: descriptive, of the work position (machines and materials used, description of the tasks that are carried out).

The valuation of each factor ranges from 1 (very favorable condition) to 5 (an unfavorable condition that needs to be corrected). The second part is the evaluation, where the factors to be considered are established, covering aspects related to the physical environment (noise, temperature, etc.), the physical load (manual lifting of loads, main posture, etc.), nervous load (operations mental and level of attention) and psychological (individual autonomy, cycle repeatability, schedules). The third part is dedicated to correction measures, technical improvements to be made in the analyzed jobs, all showed in Table 2. Because it is a mixed-method, in each one of the factors, an assessment of the conditions by the worker is introduced, also in five qualitative grades: (++) very acceptable, (+) acceptable, (●) neutral, (-) unfavorable, (-) very unfavorable (MAPFRE, 1975).

Laboratory Method of Economics and Sociology of Work (LEST)

Aims to evaluate the working conditions in the most objective and global way possible, establishing a final diagnosis that indicates whether each of the situations considered in the position is satisfactory, annoying or harmful. It is a global method that considers each aspect of the job in a general way, providing a first assessment that allows establishing if a deeper analysis with specific methods is required.

The objective is, according to the authors, to evaluate the set of factors related to the content of the work that can have an impact both on the health and on the personal life of the workers. Before the application of the method must have considered and resolved the occupational risks related to Health and Safety at Work since they are not contemplated by the method. To determine the diagnosis, the method considers 16 variables grouped into 5 aspects (dimensions): physical environment, physical load, mental load, psychosocial aspects and work time (Diego-Mas et al., 2015).

The evaluation is based on the scores obtained for each of the 16 variables considered, shown in Table 3. The simplified variables are the thermal environment, light environment, noise, vibrations, attention, and complexity.

Evaluate the mental load based on four indicators:

- Time constraint
- Complexity - Speed
- Attention
- Thoroughness (Guelaud et al., 1977).

RENAULT Method

It aims to make an assessment from an objective point of view. This method has been made from an industrial experience started in the 1950s by specialists in working conditions and production of the R.N.U.R. (Regie Nationale des Usines Renault (National Director of the Renault Factories)) and is mainly applicable to repetitive short-cycle jobs. It intends to make an assessment from an objective point of view. This method has been compiled from an industrial experience begun in the fifties by specialists working conditions and production of the R.N.U.R. and it is mainly applicable to repetitive, short-cycle jobs, as is the case of assembly lines in automobile manufacturing. For this, the analysis of eight factors that are evaluated through 23 criteria is considered, showed in Table 4, to which are added four other factors related to the Global Conception of the Post (Renault, 1977).

Table 4. Items considered in the RENAULT method

Subjective Fatigue Symptoms Test (SFST)

The Subjective Fatigue Symptoms Test (SFST) was developed by the Industrial Fatigue Research Committee of the Industrial Health Association of Japan (Yoshitake, 1978), and it is composed of 30 items showed in Table 5, that explore the presence of symptoms of fatigue. Originally, the SFST classified the items into three groups: physical, mental, and neurosensory (Saito, 1970). However, (Saito, Kogi, & Kashiwagi, 1970) subjected the instrument to factorial validity obtaining three factors: drowsiness and heaviness, projection of physical discomfort, and difficulty concentrating. Yoshitake, (1978) related the first factor with undifferentiated work, the second with physical work and the third with mental work. Additionally, Yoshitake proposed the qualification of the test through the percentage of affirmative answers. In addition, it determined that, if a person answers affirmatively to 6 of the 10 questions of one of the analyzed dimensions, it can be considered that this dimension presents as a symptom of fatigue.

Table 5. Items considered in the subjective fatigue symptoms test (SFST)

Items		
Group A (General)	**Group B (Mental)**	**Group C (Physical)**
1. Feel heavy in the head	1. Find difficulty in thinking	1. Have a headache
2. Feel tired in the whole body	2. Become weary while talking	2. Feel stiff in the shoulder
3. Feel tired in the legs	3. Become nervous	3. Feel pain in the waist
4. Give a yawn	4. Unable to concentrate attention	4. Feel constrained in breathing
5. Feel the brain hot or muddled	5. Unable to have an interest in thinking	5. Feel thirsty
6. Become drowsy	6. Become apt to forgot things	6. Have a husky voice
7. Feel strained in the eyes	7. Lack of self-confidence	7. Have dizziness
8. Become rigid or clumsy in motion	8. Anxious about things	8. Have a spasm of the eyelids
9. Feel unsteady while standing	9. Unable to straighten up in a posture	9. Have a tremor in the limbs
10. Want to lie down	10. Lack of patience	10. Feel ill

ARBAN Method

It is a method for the ergonomic analysis of work, which includes work situations that involve very different postures and body loads. The idea of the method is that all the phases of the analysis process that imply a specific knowledge about ergonomics are taken by the film crew and a computer routine. All the tasks that the researcher must carry out in the analysis process are designed in such a way that they appear as evident using systematic common sense.

The ARBAN analysis method contains four steps: 1. Recording of the workplace situation in video or film. 2. Coding of the posture and the situation of the load in a series of "frozen" situations very close. 3. Computerization. 4. Evaluation of the results. When evaluating the film, the human body is regarded as a conglomerate of functional units, based on the logical coordinated sequence of movements achieved by most human beings while working.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The intervals between the analyzed frames depend on the properties of the work situation and dividing the cycle time into 100-200 equal time intervals is often enough for simple tasks. It provides a representative sample of the working postures throughout the job and allows a quick evaluation procedure. However, the intervals should normally not exceed a few seconds, to avoid loss of information. This method is used to offer a simple and easily handled procedure with a broad field of application. Such methods normally contain two sources of error - the man and the system and is designed to enable both man and machine to do what they can best accomplish, thus reducing the risk of error. Even persons with limited knowledge of ergonomics will be able to use the method after a few hours of training.

The computer calculates the figures for total ergonomic tension throughout the body, as well as in different parts of the body separately, shown in Table 6. They are presented as 'Ergonomic tension/ time curves', where heavy load situations occur as curve peaks. The work cycle can also be divided into different tasks, where the stress and duration patterns can be compared. The integral of the curves are calculated for the comparison of a single figure of different tasks, as well as different work situations. The results of the analysis make it possible to identify critical phases of the studied work and to compare different working conditions. The method allows the analyzer to work in a correct ergonomic sequence so that his efforts produce the best result. Subtasks that do not require the comprehension of the human brain or exceed its capabilities are handled by technical equipment such as video and computers (P. Holzmann, 1982).

Global Load Scale (GLS)

It was proposed by Vidulich, Field & Tsang (1987) for the evaluation of the mental load experienced by individuals. GLS is a bipolar scale from 0 to 100, with intervals of 5 units, where the 0 represents a very low mental load and 100 very high mental load. This scale has been used, for example, in the study by Zeitlin, (1995) whose objective was to evaluate the mental load associated with driving a car under different situations (urban or rural environment) and combinations of additional tasks. In Table 7, it shows two rating scale techniques employing an absolute magnitude estimation method were compared to a relative judgment method for assessing subjective workload. The absolute estimation techniques used was a unidimensional Overall Workload scale and the other was the multidimensional NASA-Task Load Index technique. The techniques were used to assess the subjective workload of various single and dual tracking conditions. Thomas Saaty's Analytic Hierarchy Process was the unidimensional relative judg-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ment method used. The validity of the techniques of this method was defined as their ability to detect the same phenomena observed in the tracking performance. Reliability is assessed by calculating test-retest. The Saaty Analytic Hierarchy Process was found to be superior in validity and reliability using this method. These findings suggest that the relative judgment method would be an effective addition to the currently available subjective workload assessment techniques. An equally used evaluation modality is that of binary comparisons, a method that essentially consists of comparing two to two the mental load associated with the tasks that make up a certain activity, so that for each task it can be calculated in a matrix double entry the load index resulting from the average of the times that people attribute a greater value with respect to the other tasks considered (Vidulich et al., 1987).

Table 7. Scores considered in the global load scale (GLS)

Scores
Overall Workload Scale – OW
Nasa-Task Load Index (TLX)
Saaty's Analytic Hierarchy Process

Source: (Vidulich et al., 1987)

NASA- TLX (Task Load Index)

This procedure developed by Hart & Staveland (1988) distinguishes six dimensions of mental load (mental demand, physical demand, temporal demand, yield, effort, and level of frustration), from which it calculates a global index of mental load. In various laboratory investigations, it has been proven that it is sensitive to a variety of tasks and that each of the six subscales, showed in Table 8 who provides independent information about its structure.

The application of this instrument is carried out in two phases: a weighting phase, at the time prior to the execution of the task and another phase immediately after the execution, called the scoring phase. It is part of the base that the specific sources of load imposed by the different tasks are determinant in the experience of load and the subjective feeling of load, therefore the prerequisite is that the subjects themselves make a weighting in order to determinate the extent to which each of the six factors on each specific task or subtask.

The objective of this phase is to define the load sources. It consists in presenting to the people the definitions of each one of the dimensions in order to compare them by pairs (binary compares) and choose for each pair, which is the element that is perceived as a greater source of the load. From this election you get a weight for each dimension, depending on the number of times you have been chosen.

These weights can take values between 0 (for the dimension that has not been chosen on any occasion and therefore is not considered relevant) and 5 (for the dimension that has always been chosen and therefore is the most important source). The same set of weights can be used for variations of the same task or for a group of subtasks. In Addition, the weights give diagnostic information about the nature of the workload imposed by the task as they provide data about two sources of interpersonal variability:

A. The interpersonal differences in the definition of the workload in each task considered.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

B. Differences in workload sources between different tasks. The second requirement is to award value for each factor, which represents the magnitude of each factor in a given task.

In this scoring phase, people value the task or subtask they have just done in each of the dimensions, marking a point on the scale presented to them. Each factor is presented in a line divided into 20 equal intervals (a score that is reconverted to a scale over 100) and bipolarly limited by some descriptors (for example: high/low and bearing in mind the definitions of the dimensions. One of the main advantages of this method is its applicability in the real labor framework as people can directly and quickly rate the task done either right after its execution or retrospectively. A video recording can be useful to improve the memory of the activity, stop if necessary, in each segment of the task. In experiences carried out on retrospective valuations, it has been found that there is a high correlation between the data obtained and the scores obtained in a way Immediate (Archer & Nogare, 2001).

Table 8. Items considered in the NASA- TLX (Task Load Index)

Items	
Subscales	**Subscales for rating**
Mental Demand	Mental Demand: How much mental and perceptual activity was required? Was the task easy or demanding, simple or complex?
Physical Demand	Physical Demand: How much physical activity was required? Was the task easy or demanding, slack or strenuous?
Temporal Demand	Temporal Demand: How much time pressure did you feel due to the pace at which the tasks or task elements occurred? Was the pace slow or rapid?
Performance	Overall Performance: How successful were you in performing the task? How satisfied were you with your performance?
Effort	Effort: How hard did you have to work (mentally and physically) to accomplish your level of performance?
Frustration	Frustration Level: How irritated, stressed, and annoyed versus content, relaxed, and complacent did you feel during the task?

Joyce Method

It is a method for the ergonomic evaluation of jobs, whose objective is to eliminate or minimize the causes of Damage due to Accumulated Trauma (DTA's) related to work. The method allows identifying the jobs that present or are susceptible to present problems of this type, as well as to determine the associated risk to be able to initiate actions that resolve them. It consists of five steps, shown in Table 9.

The risk estimation is done with the checklist during the data collection and its evaluation, the possible results of this estimation are jobs of low, medium or high risk, which facilitates the prioritization of problems. Once the evaluation list is applied, a list of possible situations that could cause damage to workers' health is made. This method is very complete to detect potentially risky jobs in developing DTA's, but it does not detect physical fatigue or metabolic expense which are important processes in the ergonomic evaluation and the worker's involvement is only done if a detailed analysis is necessary (Joyce Institute Training Design Team, 1992).

Swedish Occupational Fatigue Inventory (SOFI)

Swedish Occupational Fatigue Inventory (SOFI) is an instrument composed of 25 items (expressions) showed in Table 10, that evaluates five dimensions of fatigue: lack of energy, physical fatigue, physical discomfort, lack of motivation, and drowsiness, all of them related to physiological, cognitive, motor, and emotional responses.

Table 10. Factors and items considered in the Swedish occupational fatigue inventory (SOFI)

	Factors of fatigue				
	Lack of energy	**Physical exertion**	**Physical discomfort**	**Lack of motivation**	**Sleepiness**
Items	Overworked	Sweaty	Tense muscles	Uninterested	Sleepy
	Worn out	Breathing heavily	Stiff joints	Passive	Falling asleep
	Exhausted	Palpitations	Numbness	Listless	Drowsy
	Spent	Warm	Hurting	Indifferent	Yawning
	Drained	Out of breath	Aching	Lack of involvement	Lazy

Source: (Ahsberg et al., 1997)

According to Ahsberg, Garnberale, & Kjellberg (1997), the underlying structure of the instrument corresponds to a new qualitative and quantitative description of the physical (physical exertion and physical discomfort) and mental (lack of motivation and sleepiness) dimensions of perceived fatigue. Together with these, the factor ‘‘lack of energy’’ corresponds to a fatigue dimension with both physical and mental characteristics.

The subject must respond to the extent to which these expressions describe how he usually feels at the end of his workday using a scale of the analogous visual type of 11 response points, where 0 is interpreted as “nothing at all” and 10 as “in a high degree”. The first version of this instrument was made in Sweden by Ahsberg et al., (1997) and was subsequently revised by Ahsberg, (2000) using confirmatory factorial analysis, and the number of expressions in each dimension was reduced to four (the questionnaire finally consisted of 15 elements). Previously, in accordance with the information from earlier research, two of the original expressions had been replaced by new ones. Finally, the response scale was changed to one with seven points (González Gutiérrez, Jiménez, Hernández, & López, 2005).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

OWL Method

It was developed to evaluate the level of general workload (OWL) by introducing sets of variables and application of the hierarchical analysis process (AHP) to estimate the external workload imposed on a human operator in systems man-machine. The number of factors considered as potential sources of occupational workload is seemingly limitless. For this, a five-point linguistic variable set scale was constructed, and their hierarchical prioritization procedures were set up (weight of load: 'very light,' 'light,' 'medium,' 'heavy,' 'very heavy,'). Whether the source of an imposed workload is physical or mental in an industrial environment, it may influence an operator's health, performance, or productivity. of the task and the workplace variables (e.g., physical job demand, environmental, postural, and mental demand workloads) which can capture the operator's perception of a workload are introduced as a value of variables.

It must be pointed out that some factors (i.e., task and workplace variables) might be sources of workloads for some individuals but not for others. These differences can arise from various individual characteristics of a physical, mental, attitudinal, or emotional nature. Individual differences in such characteristics might be reflected, for example, in everyone's differences in capacities to adjust or adapt to different external conditions. In addition, a person's perception of his or her own ability to deal with specific job requirements and its external features could cause some people to experience workload but not others.

The task and workplace variables (e.g., physical, environmental, postural, and mental job demand workloads), showed in Table 11, which can obtain the operator's perception of the workload are selected as workload factors and the AHP technique is used to collect different weights. Since there exist various perceptions and responses to a workload by different individuals, the analytic hierarchy process (AHP) is introduced to collect different weighting factors. It organizes basic rationality by breaking down a problem into its smaller constituent parts and then guides subjects through a series of pairwise comparison judgments to express the relative strength or intensity of impact on a subject's workload in the hierarchy. This approach calculates the ratio of the subjective judgment from each type of workload and weighs each workload based on the impact on the subject's perception. Finally, OWL is calculated using a computer-assisted system to determine the level of overall workload impinged on an operator. The OWL was implemented in an actual industrial environment from a physiological and epidemiological viewpoint to determine the validity of the model (Jung & Jung, 2001).

Multivariate Workload Assessment (MWE)

The multivariate workload assessment, which integrates physiological parameters and one subjective parameter through Principal Components Analysis (PCA), was proposed to characterize task-specific responses and individual differences in response patterns to mental tasks (Miyake, 2001). With the aim of integrating in the workload measurement parameters with different origin in a single index, the multivariate workload assessment (MWE) allows to mix physiological parameters, showed in Table 12 (heart rate variability, changes in the sanguine pressure of the fingers of the hands and the perspiration) with subjective parameters (mental demands, temporary demand and global effort) by means of the technique of PCA.

This method employs three subscales: mental demand, temporal demand, and effort out of six subscales in the NASA-Task Load Index were used as subjective scores. These parameters were standardized within each participant and then combined. It was possible to assess workload using this method from two different aspects, i.e. physiological and subjective, simultaneously. As a result of this combination, a workload index with a range of 0 to 1 is obtained (Miyake, 2001).

Fatigue Assessment Scale (FAS)

The Fatigue Assessment Scale (FAS) is a method designed to assess the total fatigue using 10 items showed in Table 13, which is divided into two dimensions: physical fatigue and mental fatigue. The final score of the total fatigue is obtained by adding the values of the 10 items included in the questionnaire. In the same way, the physical and mental fatigue score is obtained.

A five-point Likert scale is used. An answer to every question must be given, even if the person does not have any complaints. Where 1 means “never”, 2 “sometimes”, 3 “regularly”, 4 “almost always” and 5 “always”. Scores on question 4 and 10 should be recorded (1=5, 2=4, 3=3, 4=2, 5=1). Subsequently, the total FAS score can be calculated by adding the scores on all questions (recorded scores for questions 4 and 10). The total score ranges from 10 to 50. A total FAS score < 22 indicates no fatigue, a score ≥ 22 indicates fatigue. All online versions of the FAS calculate the FAS scores automatically: a total score, as well as mental and physical score, will be provided (Michielsen, H. J., De Vries, J., & Van Heck, 2003)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 13. Items considered in the fatigue assessment scale (FAS)

Items
1. I am bothered by fatigue
2. I get tired very quickly
3. I don't do much during the day
4. I have enough energy for everyday life
5. Physically, I feel exhausted
6. I have problems to start things
7. I have problems to think clearly
8. I feel no desire to do anything
9. Mentally, I feel exhausted
10. When I am doing something, I can concentrate quite well

Source: (Michielsen, H. J., De Vries, J., & Van Heck, 2003)

Used in conjunction with other techniques of inquiry, FAS is valuable for the study of the physical and cognitive demands of different types of work processes. This method is now available in more than 15 languages. FAS is quick and easy to complete and not time-consuming. It is also helpful for physicians and other health care workers in the follow-up of their patients in addition to the regular functional tests such as lung function tests. The FAS has proven to be a valid questionnaire to assess fatigue in patients with ILD, but also in many other patients with chronic diseases and it was used few times for industrial use (Cano-Climent, Oliver-Roig, Cabrero-García, de Vries, & Richart-Martínez, 2017).

The Scale of Recovery for Exhaustion of Occupational Fatigue (OFER)

The Occupational Fatigue Exhaustion Recovery Scale (OFER) is a method designed to assess the recovery that a worker requires after their activities, it was developed by Winwood, Winefield, Dawson, & Lushington (2005) in the Netherlands. The 20-item scale showed in Table 14, has been developed and validated using data from three study populations specifically to measure work-related fatigue and possesses robust, gender-bias free psychometric characteristics. The three subscales identify and distinguish between chronic work-related fatigue traits, acute end-of-shift states, and effective fatigue recovery between shifts and analyze fatigue in 3 dimensions (called fatigue states): Chronic Fatigue (CF), acute fatigue (AF), and recovery between work shifts (RT).

The rating scale used in this method is Likert type from 0 to 6, where 0 is "strongly disagree", 1 is "disagree", 2 "little disagree", 3 "no opinion (neutral)", 4 " bit of agreement ", 5" agree "and 6" totally agree." This scale is suggested as a potentially valuable new tool for use in work-related fatigue research (Winwood et al., 2005).

Table 14. Items considered in the fatigue assessment scale (FAS)

Items
1. “I use a lot of my spare time recovering from work”
2. “I often feel at the end of my rope with my work”
3. “I often dread waking up to another day of my work”
4. “I often wonder how long I can keep going at my work”
5. “I feel most of the time I’m living to work”
6. “My head feels dull/heavy a lot of the time”
7. “I often feel exhausted at work”
8. “Too much is expected of me at my work”
9. “My working life takes all my energy from me”
10. “I feel exhausted all the time”
11. “I usually have lots of energy to give my family or friends”
12. “I wish I had more ‘get up and go’ generally”
13. “I have the energy for my hobbies/relaxing activities in my spare time”
14. “I have plenty of reserve energy when I need it”
15. “I can’t recover my energy completely between work shifts”
16. “I fully rested at the start of each workday/shift”
17. “Worrying about work issues makes it hard to relax at home”
18. “I usually recover my energy within a few hours of getting home from work”
19. “I usually feel fully relaxed by the time I go to bed”
20. “I don’t get enough time between work shifts to recovery my energy fully”

Source: (Winwood et al., 2005)

The Scale of Estimated Fatigue-Energy Points (SEFEP)

The Scale of Estimated Fatigue-Energy points (SEFEP) allows relating fatigue with the energy that a worker uses when performing a specific task (Juárez-García, 2007). Whose methodology of application requires the evaluation at the beginning and at the end of the working day; an estimated point (average) is obtained from the objective and subjective items, shown in Table 15.

Table 15. Items considered in the scale of estimated fatigue-energy points (SEFEP)

Items	
Objective	**Subjective**
Simple visual	Yoshitake’s fatigue scale
Auditory	Maslach’s MBI-GS emotional exhaustion sub-scale
Discriminatory time reaction tests	
Precision	
Speed of psychomotor performance test	

Source: (Juárez-García, 2007)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

SEFEP contains 10 levels of punctuation and its interpretation is inverse to the Borg scale (0-10) (Borg, 1985). Consider the score of 10 as the best on the scale, that is, it is interpreted as extremely strong, animated and full of energy and level 1 is interpreted as extremely exhausted and exhausted. As concurrent criteria, several objectives and subjective indicators were used (Juárez-García, 2007).

NERPA Method

It is a novel method for the ergonomic postural evaluation method, fit for product-process design, which was developed with the help of a digital human model together with a 3D CAD tool. NERPA is widely used in the aeronautic and automotive industries. The power of 3D visualization and the possibility of studying the actual assembly sequence in a virtual environment can allow the functional performance of the parts to be addressed. NERPA works as a modified version of the method of rapid evaluation of upper extremities (RULA), showed in Table 16, this tool was developed for use in typical industrial manual assembly tasks in the automotive industry. The effectiveness of RULA and NERPA was compared by a real manufacturing process.

Table 16. Items considered in the NERPA method

Items
Stature
Eye height
Mid-shoulder height
Elbow height
Wrist height

Source: (Sanchez-Lite A, Garcia M, Domingo R, 2013)

The NERPA method, which modifies the evaluation of some joint ranges while maintaining the same evaluation structure as the RULA method, presents significant differences with respect to RULA. For the working conditions in which it was used, this method can detect positions with ergonomic risk and is more sensitive to the detection of an ergonomic improvement than the RULA method. The two methods lead to significantly different results. Under the methodological concept presented in this document, other ergonomic risk factors could be added to the NERPA method, which would allow the development of a general risk assessment methodology for industrial production within the framework of risk prevention (Sanchez-Lite A, Garcia M, Domingo R, 2013).

Combined Cognitive and Physical Assessment (CCPA)

It has a proactive and analytical approach to assess the imbalances in the interaction between the human being and the artifact. The CCPA methodology is based on the methods of cognitive assessment and predictive analysis of human errors. These methods have been further developed into four new methods: enhanced cognitive assessment, predictive use error analysis, predictive ergonomic error analysis, and generic task specification.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In addition to the changes that avoid the weaknesses and deficiencies identified in the original methods, the most important aspect of the CCPA methodology is that it deals with cognitive and physical ergonomics together. The objective of CCPA is to predict presumed discrepancies in the interaction of the human-machine, such as physical and mental workload, use of errors, usability problems and ergonomic errors, using a process that supports the cognitive processes of the evaluators. The purpose of examining the problems of physical and cognitive usability and errors of use in this interaction is to achieve a more comprehensive global assessment. In addition, this results in a more cost-effective evaluation of what would be the case if separate methods of cognitive and physical ergonomic assessment were used. CCPA also has a deep theoretical base in both areas.

CCPA is a task-based methodology that uses a structured and systematic questioning process to look for imbalances at each step of the interaction, as well as at a more general level of the system, showed in Table 17. The methodology was developed during work on product development projects in the industry and the academic world, where it was judged that existing evaluation methods did not provide enough information on interaction problems. The research was driven by problems and was conducted as action research. During and after development, CCPA and its methods were used in a series of evaluations in which the methodology predicted, identified and presented supposed imbalances in a structured manner. The strength of CCPA is that its development was iterative and based on reality, as well as on a solid theoretical basis.

The greatest strength of CCPA is the structured and systematic search for imbalances and the integration of cognitive and physical factors. The main weakness of CCPA is that it is more cumbersome and complicated to learn and use than the original methods, as well as compared to other individual HFE methods. However, CCPA generates a more complete result, which is presented in clear descriptions, than in the case of other methods. CCPA also contributes to consensus and knowledge transfer in the evaluation group in a product development project. To conclude, this thesis has resulted in a methodology to predict, identify and present presumed differences in the interaction between the human being and the artifact. However, more work is needed to evaluate the reliability of the methodology and to develop computer aids to simplify its use (Bligård & Osvalder, 2014).

Table 17. Items considered in the combined cognitive and physical assessment (CCPA)

Items			
Task Demands	Automation Levels	Mental Workload	Physical Workload
Task Type (TT)	Power (P)	Mental Processing Type (MPT)	Force Resources (FR)
Task Category (TC)	Data Collection (DC)	Attention Resources (AR)	Fine Motor Resources (MR)
Performance/Accuracy (P/A)	Data Analysis (DA)	Memory Resources (R)	Speed Resources (SR)
Time Pressure (TP)	Decision Making (DM)	Processing Resources (PrR)	Body Loads (BL)
Performance Shaping Factors (PSF)	Control (CO)	Frustration and Stress (FS)	Body Contact (BC)
Frustration	Execution (EX)	Superimposed Mental Activities (SMA)

Ergonomic Checklist Method

Developed by the International Labor Office & International Association of Ergonomics (1991), the ergonomic risk checklist is a tool whose main objective is to contribute to a systematic application of ergonomic principles. It was developed with the purpose of offering practical and low-cost solutions to ergonomic problems, particularly for small and medium enterprises. It aims to improve working conditions in a simple way, through the improvement of safety, health, and efficiency. It is a particularly suitable tool to carry out a basic level assessment (or initial risk identification) prior to the advanced level assessment.

The ergonomic checklist performs an analysis of ten different areas in which ergonomics influence working conditions. In Table 18, it shows the grouped items who contains from 10 to 20 checkpoints. In its entirety, the list consists of 128 points. Each checkpoint indicates an action. Options and some additional indications are given for each of the actions. In this way, there is the possibility to select the checkpoints that are applicable to a specific workplace and use the action proposals as an adapted checklist.

Table 18. Items considered in the ergonomic checklist method

Grouped Items
Material Handling and Storage
Manual tools
Safety of Production Machinery
Drawing of the Workstation
Illumination
Locals
Environmental risks
Hygienic and Local Rest Services
Individual Protection Equipment
Organization of Work

Source: (Diego-Mas et al., 2015)

The way of using the list is as follows:

- Define the work area that will be inspected. In the case of a small company, it can be the entire work area.
- Know the most important characteristics and factors of the workplace that will be analyzed, such as, for example, the different products and processes that are carried out, the number of workers, shifts, breaks, overtime and any problems or incident that may exist in the workplace.
- Use the checklist to select and apply the checkpoints that are relevant in the workplace.
- Read each item carefully to know how to apply it, in case of doubt, ask the bosses or employees.
- Organize a discussion group using the user-specific checklist as a reference material. A group of people can examine the workplace to conduct a field study.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Mark at each checkpoint, in the section "Do you propose any action?", A "YES", if the checkpoint is being met. If you think it should be fulfilled and it is not, mark a "NO". Use the Observations section if you wish to add any suggestions or locations.
- Once finished, re-analyze the items marked "NO". Select those whose improvements seem more important and mark them as a priority.

During the group discussion, existing information on "preventive actions" and "recommendations" could be useful as additional information to the selected checkpoints. In addition, good working practices and conditions should also be specified, where they are observed (Diego-Mas et al., 2015).

CONCLUSION

Through the review, using the information gathered in the research conducted in the databases, it was possible to conclude that there are combined evaluation methods most used than others because of the wide variety of tasks and the ease of obtaining results of the evaluation of tasks, where some methods quickly allow the accomplishment of the evaluations of the tasks. With the 17 methods explained in this research, it was found the three most used evaluations methods: NASA- TLX (Task Load Index), Subjective Fatigue Symptoms Test (SFST) and Fatigue Assessment Scale (FAS) with 9034, 267 and 204 citations respectively.

There are ergonomic evaluation methods that work differently from one another, some work with questionnaires, others with factors captured from observation or measurement of data, all have the goal to make an accurate assessment. Some methods work quickly, and others work slower, as there are some that in the evaluation does not consider more important items. Where a better evaluation is facilitated using physical load factors, mental load factors and other factors like ambient factors, which over time has been validated in different investigations.

According to this, it is recommendable to determine criteria to do a proper evaluation, using and compare the different methods considering the evaluated task and factors available against criteria for suitability and application of different ergonomic methods to do an accurate evaluation.

Chapter 29
Application of Biomechanics Instrumentation in Occupational Health Research

Sanjay M. Kotadiya
National Institute of Occupational Health, India

Joydeep Majumder
National Institute of Occupational Health, India

Sunil Kumar
National Institute of Occupational Health, India

ABSTRACT

Occupational morbidities during manual material handling operations are routine at workplaces. This is a global burden contributing substantially to the economy. The multifactorial etiology for musculoskeletal disorders (MSDs) along with workplace stressors require multidisciplinary preventive effort. Biomechanics plays a pivotal role in occupational health research quarrying into the root cause analysis of posture, load handling, muscular loading, balance, and stability at work. Sophisticated instrumentation and experimental techniques assist in understanding the biomechanical mechanisms of MSDs and ergonomic principles, etc. Kinetic, kinematic, isotonic, isokinetic, as well as isometric experimental modes investigate body postures and muscular responses. Foundation of biomechanics instrumentation and injury mechanism would aid researchers alongside ergonomists in dealing with identification, assessment, and control of workplace risks through participatory ergonomics approach. Judicious utilization of this discipline would approach a long-term sustainable solution to protect health and safety of workers at the workplace.

BACKGROUND

Biomechanics is the study of the mechanics of a living body, especially of the forces exerted by muscles and gravity on skeletal structure. This discipline is most common in sport science, where the laws of mechanics are applied in order to gain a categorical understanding of athletic performance through mathematical modeling, computer simulation and measurement. In this era of advanced research regime, applied subfields of biomechanics including kinesiology, gait analysis, musculoskeletal biomechanics, ergonomics, human factors engineering and occupational biomechanics have been extended beyond sport biomechanics.

Biomechanics is meticulously close to engineering discipline; as often traditional engineering sciences are used to analyze biological systems (Aström & Murray, 2010). In this advanced research arena, biomechanics has turned on the computerization of the technologies. It would be imperative to mention that this discipline incorporates an integrated series of analysis techniques during a single experimental work simulation. Computational biology approaches in biomechanics and biomedical engineering also open up avenues for the importance of integrating the disciplines of engineering with medical technology and clinical expertise. Such integration is ought to have a major impact on health care in the near future. Researchers focus on two general areas of biomechanics- kinematics and kinetics. In kinematics, human motion during an activity is only monitored; while in kinetic studies, motion along with forces and torques involved in the activity is taken in to account.

Occupational biomechanics emerged as a sub-discipline within the general field of biomechanics that studies the physical interactions of workers with their tools, machines, and materials to improve the working condition, enhance worker performance while minimizing the risk of musculoskeletal disorders/injuries (MSDs). Since, occupational health deals with performance of a worker, sustainable livelihood factors such as anthropometric measurements, individual risk factors (age, gender, inherited genetic characteristic), workplace risk factors (methods, materials, machines, environment, and physical stressors), psychological factors, economic concerns and return to work issues are considered during biomechanics study. Occupational biomechanics research thus provides intellectual inputs as a subsidiary discipline during the development of important ergonomics guidelines.

Musculoskeletal Disorders are one of the major causes of variety of morbidity, and have a significant influence on health and quality of life. It imposes an enormous burden of cost on the healthcare system (Jenkins et al., 2016). Especially work-related MSDs are the commonest source of morbidity among workers in range of occupation, resulting in physical impairment and disability to psychological stress. MSD is considered as a primary contributor to the global burden of non-communicable diseases and the reported global prevalence ranges from 14-42% (Sharma, 2012). In the American workplace too, work related musculoskeletal disorders account for one of the largest category of claims in workers' compensation (Bhattacharya, 2014). Studies in various other countries revealed that the prevalence of MSDs in Malaysia (~21%) (Veerapen et al., 2007), Israel (35%) (Sharma, 2012), India (26%) (Yashobant & Rajkumar, 2014) is substantial and alarming. An ICMR Task Force Study in three centres of India reported a prevalence of 7-11.5% (Sharma, 2012), with functional limitation to 85% people with nearly 10% absenteeism.

Given the multifactorial etiology for MSD and its association with individual and workplace risk factors, their reduction and prevention will require a multidisciplinary effort. The science of ergonomics, biomechanics, epidemiology and medicine together better understand the interdependence of MSD, as

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

well as long-term sustainable solution. Biomechanical intervention may determine safety or solution to these problems. Most work related injuries can be viewed as biomechanical damage to a tissue or organ.

Thus biomechanical hazards may be single or repetitive movements and forces imposing stress on the body with a potential to cause or contribute to injury or disease affecting the musculoskeletal or neurological systems. To identify these hazards and develop effective control measures, it is important to understand the principles of biomechanics as well as relevant physics, engineering and behavioural science concepts. Biomechanics principle helps in machine control and workplace design in occupational setups. Its fundamental principles explore mechanisms of occupational injuries, its interventions and implementation (Van Der Beek et al., 2017; Herman et al., 2009). Applying biomechanics in various industries and work situations helps in prevention and reduction of musculoskeletal injuries in the workplace.

These disciplines vary largely in their contribution to work-related MSD prevention research, ranging from classic injury surveillance and etiological studies to detailed laboratory studies and animal models exploring injury mechanisms, and studies evaluating

BIOMECHANICS IN OCCUPATIONAL HEALTH RESEARCH

In regards to occupational health research, better posture, optimal load handling, muscular loading, balance and stability gets priority when biomechanics studies are planned. Occupational research laboratories use sophisticated biomedical instrumentation and experimental techniques to understand the biomechanical mechanisms of musculoskeletal disorders, ergonomic principles etc. (Nag et al., 2013, Singh et al., 2015). Such research utilizes force platforms to study ground reaction forces and infrared videography to capture the trajectories of markers attached to the workers' body to study 3D motion. Electromyography (EMG) is further studied to understand the muscle activation. Integrating kinematics, kinetics and EMG techniques during a simulative work experiment makes it feasible to investigate the workers' body movements as well as muscular responses to the external forces, simultaneously (Nag et al., 2013). Therefore, both kinematics and kinetic studies along with EMG become essential in occupational biomechanics.

Gait analysis is the study of human motion, using the eye and the brain of observers, augmented by instrumentation for measuring body movements, body mechanics, and the activity of the muscles. Gait analysis has been found to be an efficient clinical tool used in diagnostics and treatment of pathological gait. It provides an objective and quantifiable assessment before and after intervention that aim to improve a worker's gait ability. Further to understand the kinematics, motion capture system digitally records and analyze the movement of a worker performing a particulate task.

This use of kinetics, however, does not result in information for individual muscles but muscle groups. To detect the activity and contribution of individual muscles to movement, it is necessary to investigate the electrical activity of muscles. It investigates the activation time of muscles and magnitude of their activation-thereby assessing their contribution to gait. Further, in occupational health research., it becomes important to look in the time zone of an activity i.e., intermittent or endurance type of work regime, along with the force required to perform it. There, the EMG assist in understanding the indefatigability of the muscles and henceforth the design of optimal time of work can be suggested to avoid overloading of the muscles. Deviations from normal kinematic, kinetic, or EMG patterns are used to diagnose

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

specific postural abnormalities, predict the outcome of investigations, or determine the effectiveness of training programmes.

Further ahead, testing of the maximum allowable human strength (involving a group of muscles) became very essential for designing an equipment, as well as plan a proper work rest schedule. Isometric strength testing in simulative work situation provides the maximum voluntary strength from which limits can be set. In the next stage, improving the performance by training is a most effective tool. Computer-controlled exercise and testing machines are another example of how biomechanics contributes to strength and conditioning. Isokinetic muscle strength exercise, conditions the muscles towards cascade elevation of strength in terms of endurance sustainability.

Many industries nowadays consider poor muscular strength as a potential pre-employment risk factor for workers (Dale et al., 2014). It is strongly felt that quantification of muscular capability can predict susceptibility to many work related disorders. Consequently, health professionals in industries require objective tools to determine whether prospective employees possess the muscular strength necessary to safely meet the demands of the positions at the very pre-employment stage. Muscle strength testing and conditioning provides objective, reproducible measures that can be correlated with the physical demands of different jobs. Such pre-employment testing enables the concerned to assess whether job applicants will become true assets to their workforce or add on to risks of injuries, absenteeism, poor productivity, low morale as well as susceptible to diseases.

FUTURE RESEARCH DIRECTIONS: BIOMECHANICS INSTRUMENTATION

Literature categorically iterates that biomechanical studies complement epidemiological studies to comprehend the complex process between exposures and physical risk factors that result in sprain, strain, injuries or occupational diseases (Keyserling, 2000). Research in biomechanics is dependent on subject knowledge, expertise, instrumentation, data analysis and interpretation. In the recent years, sophisticated instrumentation integrating various dimensions of biomechanics principle has enabled generation of large amount of flawless data. Particularly in occupational health research, the biomechanics studies during actual work activity is grueling. Therefore, classical biomechanics instrumentation assimilating multiple dimensions of movement, balance, muscular activity and strength together gives quality information in less extensive experimentation process during laboratory based simulation studies (Keyserling, 2000; Chao, 2003; Marin et al., 2017). This ultimately assists in excavating out a solution to the occupational problem being researched. Some of the instrumentation are enumerated which caters the research in occupational biomechanics.

Force Platform

Force platforms or force plates are instruments used to measure the ground reaction forces and moments generated by a body while standing, walking, running and jumping. Force plates contribute to research on stability, gait and other parameters of biomechanics. Original workplaces are arduous for measurement of such parameters on sophisticated instrumentation are difficult to be used in such working conditions. Therefore, simulated experimentation especially in occupational health research is the viable option.

It measures the three-dimensional components of the single equivalent force applied to the surface and its point of application, usually called the centre of pressure (CoP), as well as the vertical moment of

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

force (Robertson et al., 2004). It helps to demonstrate relationships between force, acceleration, velocity, and displacement. It is used individually or arranged in a walkway format to collect multiple footfalls. A complete standard system typically consists of a force plate, an amplifier, a computer or data acquisition system, mounting hardware, and interconnecting cables. Force plate with sensors attached to it gives an electrical output proportional to the force applied on the plate called piezoelectric phenomenon. Forces that cause human movement normally act on our hands or feet and exert strain on our entire musculoskeletal system. For example, when a worker carries a load on the head in a construction site, he would have to maneuvre his own body weight and balance; in addition to the balance and stability of the load being carried. Simulating such conditions in laboratory using force platform would provide a detailed view of balance and stability during work by measuring ground reaction forces and CoP.

A load on the plate distorts each pedestal, depending on the direction and location of the placement of load on it. A piezoelectric or strain gauze transducer attached to each pedestal measures the occurring distortion. With the known force plate geometry and pedestal locations, the forces and moments acting on the plate are determined. The strain gauges at each corner deform with loading, causing a change in resistance which is measured by the change in voltage over the strain gauge. On contact with the platform, three forces and three moment components are measured. Fx, Fy, and Fz are the force components acting along the axes of an orthogonal x, y & z coordinates (Fx and Fy are horizontal components, and Fz is vertical force component). Mx, My and Mz are the three moment components, which are rotations around the corresponding x, y and z axes.

While simulating a walking or running activity at constant speed, horizontal force is not required. The front foot pushes forward on the ground, resulting in an impulse equal and opposite to the impulse generated when the back foot pushes backwards. While in the standing or stationary holding mode with both feet on a force plate, the vertical direction register $F = Mg$ (where, 'M' is mass of the individual and 'g' is gravitational force). During bending on knees for lifting or lowering of load, the centre of mass is lowered. Initially the force decreases and then increases before settling back to Mg (Wardoyo et al., 2016). However, while in upright standing position the whole body centre of mass continuously moves. But, the CoP underneath the feet is adjusted, maintaining the centre of mass within the feet. Thus, CoP motion plot (stabilogram) is used to assess the performer's standing/ seating balance during work.

Calibration of force platforms is an essential step before the data acquisition. These platforms are usually calibrated by applying a range of pre-quantified static loads that is the sensors are loaded with a range of known calibration weights at specified moment arms. However static loads can be applied only in one direction, which is a disadvantage. This is because actual forces exerted on force platforms are dynamic in nature and actuated multiple directions. Therefore, researchers while using sophisticated instrumentation go for manufacturer supplied calibration parameters to convert the voltages measured by the transducers into force and moment measurements. It is generally recommended to calibrate these instrumentations at least once in a year. However, it may be noted that recalibration intervals for sensors and measurement equipment may vary depending on the specific application and usage.

Motion Capture System

Quantifying human motion during an activity facilitate the understanding of pattern of work profile at workplace, angular deviation of the skeleton structure beyond normal as well as treatment and rehabilitation on injury. Conventionally biomechanical analysis systems used to capture brief snapshots of the mechanics of movement (Winter, 2009). In the recent era, with latest developments in wearable sens-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ing technologies, biomechanical research has eased out permitting continuous monitoring and analysis (Wong et al., 2015).

Motion capture started as a photogrammetric analysis tool in biomechanics research around five decades back and expanded into education, training, and research as the technology advanced. Since the 20th century, with newer technology, the performer is worn markers near each joint to identify the motion by the positions or angles between the markers. Acoustic, inertial, LED, magnetic or reflective markers, or combinations of these, are tracked, optimally at least twice the frequency rate of the desired motion. The spatial resolution and temporal resolution is considered typically, as motion blur causes almost the same problems as low resolution. Modern systems extract the silhouette of the performer from the infrared motion camera images. Requisite joint angles are then calculated by fitting in a mathematic model into the silhouette.

Motion capture technology consists of motion capture cameras, other hardware and software. It is used in occupational health research to identify and prevent injuries, improve performance as well as aid ergonomists to build better products and increase production efficiency.

There are various types of motion capture systems:

1. **Optical-Passive:** Retroreflective markers tracked by infrared cameras.
2. **Optical-Active:** LED markers connected by wires to the motion capture suit with a battery or charger pack worn by the performer.
3. **Video/Markerless:** Markers are not required to be worn and instead relies on software to track the performers' movement.
4. **Inertial:** Cameras are not required except as a localization tool. Inertial sensors are worn on the performer's body at selective locations and the data from the sensors is transmitted wirelessly to a computer.

Data acquisition is performed by an infrared optoelectronic system and the analysis is based on the detection and three-dimensional construction of the silhouette from passive markers positioned on anatomical landmarks of the body. The labelling of the markers attached to the defined locations of the body is very important for identification of the correct two-point angular deviation within the software. These softwares generally carry out data acquisition and further elaboration of the trial, as well as interpretation of data in fidelity with conventional protocols like Davis protocol, SAFLo protocol etc. (Ferrari et al., 2008). Therefore, when an experiment is designed on the conventional protocols registered within the software, exact anatomical locations on three-dimensional coordinates needs to be recognized and linked to the corresponding real point on the performer. However, self-made protocols can also be used for the elaboration of a simulated work profile and interpreted.

Having said that any postural activity can be simulated, the precision and repeatability of data is dependent on the system calibration. Different systems have distinctive process of calibration. In general, these systems come with active wand, that calibrates both optical and video cameras while accounting for sensor edge distortion at the same time, to ensure synchronized overlay across entire volume. Calibration is performed using a rigid wand on which three markers are mounted and is swept through the volume of interest, in a dynamic acquisition, for simultaneous calibration of intrinsic parameters, and relative position, of the video cameras. Within the experimental overlay, the global frame of reference is determined by a three-axes calibration grid, placed on the ground.

Electromyography (EMG)

EMG is a technique of recording the electrical activity produced by skeletal muscles performed using an instrument called an electromyography to produce a record called an electromyogram. An electromyograph detects the electric potential generated by muscle cells when these cells are electrically or neurologically activated. EMG sensors and systems have been extensively researched and developed over a number of years incorporating the latest design principles and technologies for movement analysis and biofeedback. Understanding the electrical activity of the muscles provides a categorical view of the muscular overloading, limits of load, performers' capacity and sustainability and most importantly the indefatigability of the muscles leading to peripheral or central fatigue (Cifrek et al., 2009). This technology in addition to medical perspective is used in symmetry studies during gait, timing data in biomechanics, work profiling and fatigue, work environment and tool design, work performance and productivity oriented protocol as well as precisely in rehabilitation schema.

Electrical Characteristics of Muscles

When a muscle contracts, electrical activity is generated within the muscle which may be measured using electrodes placed on the surface of the skin. This electrical signal is usually in the order of up to 3,000 micro volts. Measured EMG potentials range between less than 50 μV and up to 20 to 30 mV, depending on the muscle under observation (Phinyomark et al., 2011).

Typical repetition rate of muscle motor unit firing is about 7-20 Hz, depending on the size of the muscle, previous axonal damage and other factors (Lee & Lee, 2008). Damage to motor units can be expected at ranges between 450 and 780 mV. EMG activity is linearly related to the amount of muscle contraction as well as the number of contracted muscles. This implies that stronger the muscle contraction and greater the number of activated muscles, the higher the recorded voltage amplitude.

Intramuscular and Surface EMG

Electromyography of specified muscle can be done in two ways: intramuscular and surface. Intramuscular EMG is a superior technique for the diagnostic examination of voluntary motor activity of the deeper muscles. This technique also comprehends the needle insertional activity. However, this technique is painful, the muscle may feel a little sore up for some post examination days. Depending on the purpose of experimentation particularly in case of measurement of electrical activity of a muscle during a simulative work process, surface EMG is a versatile, state of the art beneficial technique, which is reliable, accurate and easy to use. Its painless, non-invasive and can collect quality signals if the skin surface is prepared well. Therefore, especially for the occupational health research, where workers' posture remains dynamic, surface EMG is a judicious option to collect electrical signal for analysis. Surface EMG can be recorded by a pair of electrodes. More than one electrode is needed because EMG recordings display the potential difference (voltage difference) between two separate electrodes.

Placement of EMG electrodes over muscle groups of interest require a substantial level of anatomic knowledge to be able to get valid and reliable signals of high quality. EMG signal is collected in a bipolar technique i.e., the voltage difference between recording site and reference site. The EMG reference channels is placed on the bony body parts such as metacarpal, elbow, hip or collar bones. The shorter the size of connecting cables, lesser the electrical noise picked up from surrounding power sources.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Maximal Voluntary Contraction

One basic function of EMG is to see how well a muscle can be activated. The most common way that can be determined is by performing a maximal voluntary contraction (MVC) of the muscle that is being tested (Castelein et al., 2015). Several analytical methods for determining muscle activation are commonly used depending on the application. Most studies commonly use the maximal voluntary contraction as a means of analyzing peak force and force generated by target muscles. Researchers suggest that EMG data should be recorded alongside the peak EMG measure when assessing core exercises (Hibbs et al., 2011).

As said earlier, EMG can also be used for indicating the amount of fatigue in a muscle. In such cases, changes in the EMG signal is witnessed which signifies muscle fatigue like, an increase in the mean absolute value of the signal, increase in the amplitude and duration of the muscle action potential and an overall shift to lower frequencies. Monitoring the variability during different frequency changes is the most common way of using EMG to determine levels of fatigue. The lower conduction velocities enable the slower motor neurons to remain active (Cifrek et al., 2009).

EMG Signal Processing

Rectification is the translation of the raw EMG signal to a single polarity frequency. The purpose of rectifying a signal is to ensure the raw signal does not average zero. Half-length rectification deletes the EMG signal below the baseline. In doing so, the average of the data is no longer zero therefore it can be used in statistical analyses. The only difference between the two types of rectification is that full-wave rectification takes the absolute value of the signal array of data points.

It is imperative to note that occupational circumstances at workplace would be typically dynamic in nature. The movement, speed and angle of physical body deviation would resist accumulation of quality EMG data. Therefore, a portable instrument for any simulated laboratory experiment would be most effective for occupational health research. Further portable EMG machine synchronized with wireless position measurement systems to accurately study the amount of muscle activation for different activities such as lifting the arm up or during gait, would be the ideal one. Generally, the new generation devices include powerful software for the elaboration protocol creation by means of an innovative object interface that convert the biomechanics analysis language in a graphical way. In these systems, the user can develop quick and efficient customized analysis protocols. The real time data transmission between the system and the workstation occurs with Wi-Fi net using an access point. The software facilitates acquisition, display, processing, and reporting of electromyographic signals.

Mechanomyography (MMG)

In addition to the general technique of recording of electrical activity of muscles using EMG, the MMG is also used as an alternative to the EMG for monitoring the muscular activity. It is said to produce higher signal-to-noise ratio than the surface EMG and thus can be used to monitor muscle activity from deeper muscles without using invasive measurement techniques. It is a promising research area into prosthetic research and assistive technologies. The mechanomyogram is the mechanical signal from the surface of a muscle, on contraction, wherein the muscle shape causes a large peak in the MMG.

INTEGRATING MULTIPLE DIMENSIONS OF BIOMECHANICS

For the workers, posture at work, workplace design constraints and housekeeping management are important domain at workplace. Biomechanics tools aid in workplace design research, ensuring the safety at workplace as well as optimal posture of the worker for productivity at endurance. The measurements for the above three instrumentation systems (force platform, motion capture and EMG) can be either studied in isolation, or combined kinetic and/or kinematics to understand the principles of locomotion. If a worker makes a standing jump from a force plate, the data from the plate alone is sufficient to calculate acceleration, work and power output. Simultaneous video measurements of leg joint angles and force plate output can allow the determination of torque, work and power at each joint using a method called inverse dynamics. It also allows to perform advanced elaboration of the EMG signals, allowing to state for the muscular exertion as well as muscle fatigue. A customized analysis protocols integrating these dimensions would be a comprehensive advanced multimodal report.

ISOKINETIC SYSTEM

Another important facet of biomechanics study is the human strength quantification particularly for a group of muscles. This has a tremendous impact in the occupational health research in pre-employment screening, physical load handling limits, manual material handling, work rest schedule as well as safe work protocol for injury prevention. Research on human strength is done on three modes: isokinetic, isotonic and isometric mode.

Isokinetic Mode

The maximum dynamic capability throughout the range-of-motion is determined. It is an effective mode to comprehend the localization of pain, weakness and determine the dynamic physical capacity. It is also the most efficient method to improve strength, power in endurance as well as rehabilitation after an injury. The focal point for the experimentation is the dynamometer which functions on eccentric-concentric mode. Hence depending on the size (length) of the attachment/lever the resultant is quantified in torque (Nm).

Isotonic Mode

This mode is used to facilitate neuromuscular coupling improvement with functional isotonic concentric/eccentric resistance coupled with user defined velocity. During concentric contraction, the muscle tension is enhanced due to increment in resistance and remain the same with shortening of muscle. In eccentric mode, the muscle lengthens on account of grater resistance than the force generated by the muscle.

Isometric Mode

This mode of experimentation is typically used for quantification of maximum strength during a voluntary muscular exertion. While the dynamic mode sets the requisite motion for optimal strength and rehabilitation, isometric mode is a static function restricting the length of the muscle to be altered. Apparently the desirable posture during an activity is taken and the subject applies his/her maximum strength on

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the lever, precisely exerting the maximum voluntary contraction. The universally accepted protocol for short duration or intermittent experimentation is 5 second wherein 2 second is for strength build up and 3 second for retaining the maximum strength (Tiwari et al., 2010). For endurance exercise, 1 minute tests are applied; peak strength time, decremental plateau and sustainability of strength is noted.

Load cells of tension-tension type, tension-compression type are used. With the technological advancement, integrated instrumentation with the ability to experiment strength in isokinetic, isotonic and isometric mode are available. One such laboratory based integrated system is Humac Norm Testing and Rehabilitation system to cater the comprehensive experimentation of human strength at workplace.

CASE STUDY-I

A study was carried out to comprehend the balance and stability among young male workers while performing manual materials handling tasks. The excerpts from the study is presented below as a case study involving the principles and instrumentation in biomechanics.

Manual load handling continues to be a concern in everyday activities, particularly in the occupational set ups (Nag et al., 2014). Loss of balance associated with different forms of manual materials handling (MMH) tasks is a crucial factor causing workplace accident and injury. MMH tasks include the lifting, lowering, pushing, pulling, carrying, twisting and turning of materials (Kotadiya et al., 2013). Construction workers, food grain handlers, agricultural workers and labourers in manufacturing industries have frequently been engaged in lifting and other forms of MMH tasks (Deros et al. 2010; Maiti, 2008). With the premise that MMH tasks have potential consequences on postural balance and stability, there is a need to consider the effects of load positioning and magnitude on stability.

Postural control requires the ability for balancing the body in space through the visual, vestibular, and somatosensory systems and makes an appropriate musculoskeletal response to perturbations (Nashner, 2014; Paillard, 2012). The maintenance of an upright posture is a vital motor function and postural control is essential for the maintenance of posture and task performance (Ku et al., 2012). In humans, when the centre of gravity falls outside the base of support, the body has the ability to sense a threat to stability and in such instances, relevant muscles are activated to prevent falling (Ritzmann et al., 2017). Postural control strategies used are dependent on the assessment and control of many variables by the CNS. The strategies used to maintain balance differ according to an individual's goal, the environmental context and the task performed (Horak et al., 2008). Thus identifying a method of load handling which is relatively more stable can prevent falls and injury risks. Changes in postural responses can be identified through the use of EMG by measuring onset latencies, response amplitudes or postural strategies (Visser et al., 2008). Muscle fatigue affects postural control by increasing postural sway (Mello et al., 2007). Thus postural imbalance can be indicated through study of centre of pressure and electromyographic measurements. The simulated laboratory study was carried out with the hypothesis that muscle activity and centre of pressure displacements may be influenced by the changes in methods of MMH tasks and increase in grades of load.

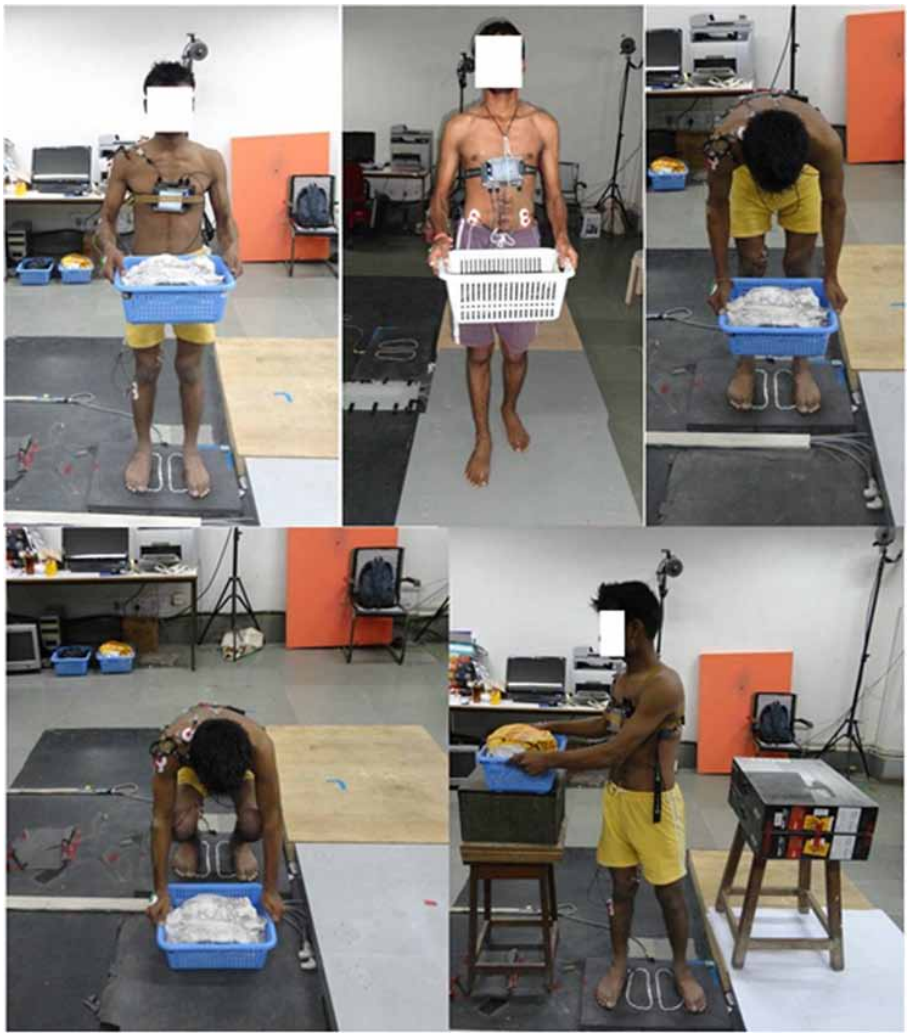
The experimental set up included two large format multi-component piezoelectric force platforms (Kistler, USA) for measuring the ground reaction forces and 16-channel portable and Wi-Fi enabled pocket EMG machine (BTS Bioengineering, Italy) to measure muscular activities during MMH task. The electromyographic recording of neck, shoulder, spinal and leg muscles were examined. Primary MMH tasks viz. lifting-lowering, twisting-turning and holding activities were simulated. The simulated

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

activities with the equipment set up are shown in Figure 1. The sEMG signals of muscles were captured by SMART capture software (BTS Bioengineering, Italy) and analyzed off-line using MYOLAB software (BTS Bioengineering, Italy) Piezoelectric force platform was used for measurement of three forces along the three orthogonal axes (F_x, F_y, and F_z) and three moments around the three axes — M_x, M_y, and M_z, thus ascertaining centre of pressure displacement parameters such as mediolateral CoP (ML CoP), anterio-posterior CoP (AP CoP), radius of the stabilogram and speed of CoP displacement. Postural stability effects were evaluated using SWAY software.

In a designed research protocol, static loads of three different grades (4 kg, 8 kg and 12 kg) were lifted and lowered by the volunteers as a combined activity from ground to knee, waist and chest height at each three grades of load. The twisting-turning and holding activity was performed at iliocristale height. Both lifting-lowering and twisting-turning MMH task were performed for each three grades of load at standard frequency for continuous 10 min of sEMG recording. Holding activity was monitored while performing to hold each particular load for maximum voluntary duration.

Figure 1. A volunteer performing MMH tasks on force platform during simulated experimentation set up



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Results revealed that the RMS values of muscles increased with increase in load from 4 to 8 to 12 kg. However, the trend was insignificant may be due to rest pause given between each trail. When the load was increased to thrice of the initial value (4 kg to 12 kg) significant influence was found on upper extremity muscles. Similar trend was not observed when load increased to twice of the initial value. Study also explained that increase in level (height) of handling the load from knee to waist to chest for each three grades of load, the RMS values of deltoid, rectus femoris and semitendinosus hamstring muscle also increased.

It was noted that median frequency (MDF) values significantly dropped as load level increased. Further, increase in load holding time demonstrated in decreased MDF values of the muscles. The decreasing trend of MDF values starts earlier with higher magnitude load as compared to lower one indicates muscles became fatigued earlier with higher grade of load suggesting any MMH holding activity in endurance would manifest in fatiguing nature of muscles. The response pattern showed that overloading of muscles leading to fatigue and/or injuries can be avoided by selection of appropriate magnitude of load with rest pause i.e. ergonomically designed work-rest schedule.

Interaction of multiple conditions and type of task performed has significant influence on stabilometric parameters included in the study. ML CoP and AP CoP have significant influences on all the MMH tasks with each three grades of load. The relative displacement of CoP was found higher in anterio-posterior direction as compared to medio-lateral direction during all MMH tasks. Carrying and holding tasks did not influence the CoP displacement parameters significantly. Twisting-turning task because of its nature of movement significantly influenced the anterio-posterior CoP displacement. Conversely, as lifting has been done from the forward direction, it significantly influenced the medio-lateral displacement of CoP. As both the MMH task influenced stabilometric parameters in characteristic manner, it indicated relative postural instability during MMH activities.

The study summarized that any MMH activity that involves frequent manipulation of load combined with change of handling level in endurance would manifest in the fatiguing nature of muscles and ultimately result in possibility of injuries. However, proper rest pause between work bouts would alleviate the possibility of injuries to some extent as well as enhance work performance. MMH tasks are also influenced the stabilometric parameters in characteristic manner, indicating relative postural instability during MMH activities. The incorporation of ergonomic principles of work-rest schedule design and limits of safe handling of weights would save the workers in long run.

CASE STUDY-II

Another study was carried out to quantify the human hand finger grasping and force exertion while doing manual drilling and screw-driving activities. The excerpts from the study is presented below as a case.

Forceful grasping, force exertion and prolonged activities, in combination, are common in day-to-day work life. Determination of hand-arm-shoulder force would elucidate the muscular capabilities of workers as well as provide an acceptable limit of operational force, restricting fatigue and consecutive injury at workplaces. Compared to hand-operated controls fixed in a static/dynamic machine, tools with one handle e.g., screw-drivers, drills etc. are usually held and moved in a power grip, requiring more of hand and shoulder muscle movement and less finger muscle movement/motion. In addition, wide-ranging straight translation motions and rotational motions are executed by hand-arm-shoulder system with less precision, but more force (Strasser, 2007). The determination of human strength capabilities

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

is an important consideration in the development of ergonomic guidelines for pre-employment screening of workers performing manual materials handling jobs (NIOSH, 1981). Hand grip torque for the preferred hand in isometric mode among Indian agricultural workers varied between 2-19 Nm (Gite et al. 2009). Depending on the intensity and repetitiveness of the operation, the acceptable limit of force varies providing a safe force limit, restricting fatigue at workplace.

A test setup of screw-drivers and drilling equipment were fabricated and attached with CSMI Humac Norm Isokinetic and rehabilitation system as shown in Figure 2. Two screw-driver handles of dimensions (10 cm X 12 cm; 8 cm X 10 cm) & one drill handle with handgrip breadth 110 mm is fabricated and considered for the study.

Figure 2. A test setup of screw-driver attached with dynamometer of HUMAC Norm System during laboratory experimentation

Isometric strength testing of the preferred hand in concentric as well as eccentric movement is being recorded at 0 Nm torque and ($+35^0$) (-25^0) virtual range of motion. Isokinetic strength testing is being carried out at 500 Nm torque and ($+35^0$) (-25^0) actual range of motion. Volunteers were tested for isometric, isokinetic exercises for short duration (7 Sec) as well as long duration (60 Sec) maximum voluntary force exertion. Physical assessment of muscular strength in both isometric and isokinetic modes provide the maximum capability of the muscles at work.

For isometric pulling and pushing operation, the torque generated depreciated with time. Further, torque generated by the volunteers in pulling operation was found higher (24.3 ± 1.4 Nm) than that in the pushing mode (20.7 ± 1.3 Nm), length of the lever being 0.3 m. This may be due to the distribution of the force in horizontal plane as well as on the direction of gravity during pushing mode (Figure 3).

Comparison with short and long duration experimentation show that the torque generated and held in pulling mode in 7 second experimentation was higher (18.2%) than in 60 second experimentation. For isometric experimentation with screw-drivers (8X10 cm and 10X12 cm grip), the strength generated by 8X10 cm grip is less than that of the 10X12 cm grip. Also, the strength depreciated with time for both the two prototypes (Figure 4).

Such study determines the hand-arm-shoulder force elucidating the muscular capabilities of workers. It is an important consideration in the development of ergonomic guidelines for pre-employment screening of workers performing manual materials handling jobs as well as provide an acceptable limit of operational force, restricting fatigue and consecutive injury at workplaces.

CONCLUSION

Confiscating the occupational health hazards at workplace is impossible in entirety, rather can be controlled. Engineering and administrative controls can substantively counter the probability of inadvertent incidents at workplace. However, the human component particularly the load limits, posture, duration of work i.e., the physical stress in causation of injuries, loss of productivity, absenteeism can be taken care of by biomechanics principles in close association with ergonomic inputs. This chapter has attempted to provide an overview of biomechanical hazards at workplace, with a focus on biomechanics instrumentation. In addressing the issues. Instrumentation in this field are complex, and need knowledge and expertise to gather data, analyze and interpret the results. Biomechanics research can aid in determining the cause of injury, helps to prevent future injuries by determining the safest method for performing a particular task. The goal towards increasing the productivity and decreasing the probability of accidents/injuries through judicious utilization of human resources can be achieved. Deep understanding of biomechanics can play a leading role in the design of work and workplaces that are injury free.

Having said that, acquiring the basic knowledge of biomechanics and mechanism of injury, occupational health professionals in combination with ergonomists can address the identification, assessment, evaluation and control of risks associated with manual efforts at workplaces. Participatory ergonomics can be helpful to develop and evaluate effective control measures in complex vulnerable situations at the work front.

ABSTRACT

The purpose of this chapter is to analyze the physical aerobic work in terms of the metabolic expenditure and compare it with the recommended boundaries of energy found in literature, proposing an alternative to the potential work overload through a compensatory equation introduced in the standard time of the workstation. To support the study, information considering the estimated metabolic expenditure in workers was applied to a novel procedure to reduce the metabolic demand of the task according to age and gender. Results of the study indicated that women older than 30 years exceeded the energy limits from moderate to very heavy load activities, and men older than 40 years exceeded the energy limits in heavy and very heavy workloads. The proposal of compensatory equation statistically reduced the energy loads below the recommended limits of energy. The aerobic workload is a sensitive factor for age and gender groups and can be potential risks for developing cardiovascular diseases as well as some musculoskeletal disorders.

INTRODUCTION

Accurate methods are required to measure and control the efficiency of the industrial processes. Time and motion studies (TMS) provide the necessary information to establish proper time standards and obtain balanced workloads that allow workers to reach production rates. Because of the importance of the manufacturing companies to maintain appropriate productivity levels, standard time (ST) is considered as a key activity to control most of the production processes through the calculation of the work rate. In this respect, an increased work rate can expose operators to an elevated risk of musculoskeletal injury (Gooyers & Stevenson, 2012), and considering the aerobic physical capacity, ST might be inappropriate if it is performed by individuals who do not reach this capacity just because the age, gender or combination of both (Balderrama, Flores, & Maldonado, 2015).

Even though there is a fact of a significant difference to produce energy on individuals, just few evidence to consider age and gender was found in the calculation of predetermined times or some other systems used to determine the ST; Murrel (1965) proposed a fixed relationship to compute rest time considering an energy expenditure of 5 kcal/min for males and a 4.2 kcal/min for females no matter the age of the workers, and Mital and Shell (1984) proposed the use of an energy model to predict rest period as a percentage of working duration to compensate physiological fatigue, but without stablish the application of the rest. Regarding rest pauses and line balancing, some intents to consider individual energy production have been experimented; Ayabar, De la Riva, Sanchez & Balderrama (2015), developed a model to estimate de energy consumption trough heart rate using linear regression and determine ST in moderate workload stations. Unfortunately, the study did not consider age and gender in the calculations.

It is important to remark that gender differences are significant in physiological work; in a longitudinal study during 5 years taking indices of work content, health, work ability, functional capacity, and symptoms of stress in 129 employees, women showed less physically able as men for physical work (due for reasons as the musculoskeletal capacity), and the critical age for women in prolonged physical work resulted in less than 50 years (Ilmarinen, 1988). Job demands could be significate in relation with older employees; lower autonomy and higher job demands increased the association of an array of common chronic health problems with sickness absence. These results were obtained taking in consideration work factors, health and sickness absence, and relative excess risk on 8,984 employees (Leijten, Van den Heuvel, Ybema, Robroek, & Burdorf, 2013). Likewise, a study performed in 2007 with 4 year, and 11 year examinations of 612 men using ultrasonography and the association between five measures of energy expenditure, concluded that high energy expenditures at work are associated with an accelerated progression of atherosclerosis even after controlling virtually all known cardiovascular risk factors, especially among older workers and workers with preexisting ischemic heart disease or carotid artery stenosis (Krause, Brand, Kaplan, Kauhanen, Malla, & Tuomainen, 2007). Workloads are then, an important part in the physical development of the worker; a 16-year follow-up study based on assessments of musculoskeletal and cardiovascular load, resulted in the following conclusión: In general, and contrary to what one might think, aging workers with low workload had better physical capacity than the subjects with high workload (Savinainen, Nygård & Ilmarinen, 2004).

With age, some physiological factors tend to change, for example, a research considering 120 men aged from 23 to 60 years old observed in six different type of work, found that the variation in the relative aerobic strain (RAS) is shown to increase in work tasks and is demonstrated that this increment is mainly related to physical work and the exposure of workers to peak loads (Ilmarinen & Rutenfranz,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

1980). These variations can include the production of muscle forces and the coordination of motor functions (Ilmarinen, 1984). The emerge of fatigue is one important reason for decreasing performance (Öztürkoğlu & Bulfin, 2012). In our experience, consequences of physical fatigue caused by high workloads can be associated with execution mistakes that will end in generation of scrap, repairs, idle time, process delays, and other manufacturing costs related to the personal performance. Also, a decrease in the efficiency and the product quality may appear at a short or long term.

Taking into consideration the metabolic rate needed to perform a job, an experiment is presented to investigate the industrial workloads performed by people of age and gender and compare them with the recommended energy limits at work extracted from literature. In addition, a time allowance equation is proposed in order to reduce the energy consumption in the participants; the equation (explained in section of: Time Allowance Equation) includes nine physiological factors and is introduced directly into the calculation of the ST.

Aging and Work

It is a noteworthy finding in the literature review that there is a decrease over the years to produce energy, as well as there is a difference between men and women in the capacity to consume (O2). For example, on an average, the physical working capacity of women is about 30% less than men of the same age (Astrand & Astrand, 1978). The decline in physical working capacity from the age of 20 to 65 years is about 30%, calculated in terms of mean value. This mean value for a 65-year-old man is of the same magnitude as the value for a 20-year-old woman (Astrand, 1988). Considered to compute physical shape and an accurate tool according to ISO 8996 (±5%), the VO2max (Maximal Oxygen Consumption) decline begins after reaching the maturity age, at least after 30 years of age (Shvartz & Reibold, 1990). Nevertheless, females often dominate jobs where major physical risk factors such as repetitive work, forceful exertions, static work, and awkward postures prevail (Collins & O'Sullivan, 2010).

Shephard (2000) findings, are specific in terms that "aging is associated with progressive decreases in aerobic power, thermoregulation, reaction speed, and acuity of the special senses. These changes can reduce productivity, particularly in self-paced activities where the physical or mental input of the individual worker is the rate-limiting step in production" (Shephard, 2000).

Many years ago, an energy consumption of 5.33 kcal/min for men and 4 kcal/min for women was suggested as a limit for 8 h shift. This represents one third of average consumption in the United States (Bink, 1962) and is still in use to determine energy loads and rest pauses (Bridger, 2003; Groover, 2007; Niebel & Freivalds, 2003). A workload of 5.33 kcal/min generates an increase in the heart rate (HR) of 40 beats/min (Grandjean, 1988). Other studies have recommended that the requirement for a physical activity should be between 30 (no rest available) and 50% (rest available) of the maximum capacity of the worker (Ilmarinen, 1984; Bridger, 2003; Astrand, 1956; Jorgensen, 1985; Rutenfranz, Ilmarinen, Klimmer, & Kylian, 1990).

Half of the aerobic capacity cannot be surpassed because when a demand of energy is involved, it is necessary to design tasks below its consumption level (Farrer, Minaya, Niño & Ruiz, 1997). At intensities exceeding 50%, carbohydrate metabolism increases and therefore, the degree of exertion gradually increases, HR and pulmonary ventilation per liter of oxygen uptake increases, and body temperature rises above 38 °C (Astrand, 1988).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Taking in consideration the information reviewed, is important to define that if there is a significant difference in energy production between women and men as well as a difference in workers of different ages, then an adult woman should not perform a task with aerobic load for the same amount of time than a young man.

Determine the Metabolic Rate in Tasks

There are different methods used to estimate the energy consumption at work. Direct calorimetry is the most accurate method with minimal error but is often expensive and difficult to be used in the field. Similarly, doubly labeled water is accurate and expensive and is applicable for measuring energy consumption over long periods of time. The most recognized and accurate indirect measurement method is through reading VO2. For the ISO 8996 (2004), VO2 measurement is accurate to ±5%, while the methods based on tables, HR, and classifications are accurate to ±15%. The Firstbeat's beat-by-beat method uses the HR also and reports better accuracy against other methods (Firstbeat Technologies, 2017).

By monitoring the HR, we can approximate the metabolic level of a person when executing a task. Taking into consideration the HR in basal state, it can be subtracted from the HR when an aerobic task is performed. VO2 has a lineal relation with HR when an aerobic task is carried out (Groover, 2007; Astrand, 1960; Ilmarinen, 1992; Manero & Manero, 1991; Smolander, Juuti, Kinnunen, Laine, Louhevaara & Männikkö, 2008). HR is acceptable as an estimator of VO2 only when the test work closely resembles the muscle work in the job (Oja, Ilmarinen, & Louhevaara, 1982), and is a good predictor when heat stress is present (Imbeau, Desjardins, Dessureault, Riel & Fraser, 1995). Bouchard and Trudeau suggest good reliability of the VO2/HR relationship at HR usually found in workplaces, regardless of the time of day, is not affected by a day at work in both genders (Bouchard & Trudeau, 2007).

Balderrama et al. (2010) evaluated an electronic HR monitor equipment to estimate oxygen consumption in aerobic activities. The HR monitor records every second and computes the VO2 through neural nets. The software uses a model developed by the company called Firstbeat Technologies (2017). A validation was performed by means of a comparison between a direct measurement equipment of VO2 and monitoring equipment of brand Sunnto resulting in no significant differences using a 95% of confidence level.

In order to determine how demanding is a work task in terms of VO2, there is a general classification presented by Astrand and Rodah (1977), where a workload is considered as a light load when VO2 is between 0 and 0.5 l/min (0–2.5 kcal/min), a moderate workload is considered from 0.5 to 1.0 l/min (2.5–5.0 kcal/min), a heavy work is considered from 1.0 to 1.5 l/min (5.0–7.5 kcal/min), a very heavy work is considered from 1.5 to 2.0 l/min (7.5–10.0 kcal/min), and an extremely heavy work is considered from more than 2.0 l/min (>10.0 kcal/min).

Work Rate

In industry, it is common knowledge that work rate is an important measurement of labor because the number of parts produced per hour or per day is one way to control the intensity of work. Companies use this rate to program their production volumes and determine its maximum capacity in relation to the number of workers and equipment available. ST is used as the basis for estimating work rate and is composed by the normal time and a group of allowances applied according to the work conditions. The normal time is the average time to perform a work task that can be determined by stopwatch, statistical

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

data, video analysis, or predetermined motion time systems. Normally, it is determined from the measure of average skilled operators. In any case, the obtained time represents a mean time of the cycle time without taking worker's age and gender into consideration.

Allowances adding to the normal time are for personal needs (such as washroom and coffee breaks), unavoidable work delays (such as equipment breakdown or lack of materials), and worker fatigue (physical or mental) (Niebel & Freivals, 1998). In some cases, different compensations are added to the normal time of the job that help to reach the estimated time when factors do not allow to carry out the task in the calculated time (Meyer, 1991). Predetermined motion time systems are not suitable for aging workers and middle age and old woman can have problems to reach the ST in terms of energy consumption (Balderrama, Flores, & Maldonado, 2015).

Several factors can be utilized to establish allowances due to fatigue; according to the International Labor Organization (Kanawaty, 1992), the physiological factors are weight, force or pressure, posture, and restrictive clothing. The psychological factors such as discipline, concentration, mental and visual demands, and monotony can also be taken into consideration. Also, thermal and atmospheric factors of the environment such as temperature, humidity, wind conditions, noise, vibration, light, and visual factors are aspects that affect the personal performance when they are out of the comfort limits, which are considered as significant, in order to add extra concession to the normal time of the job. Unfortunately, there are no records or investigations that consider the age and gender differences as a required element within the ST.

METHODS

Subjects

Five companies dedicated to manufacture auto parts were visited, where a total of 149 workers gave authorization to collect data during 8 months of work in accordance with the institutional occupational standards. Their ages fluctuated between 20 and 68 years and were categorized in five different age ranges. Workloads as moderate, heavy, and very heavy tasks were considered according to Astrand and Rodah (section of: Determine Metabolic rate in Tasks). Considering a previous laboratory study (Balderrama, Flores, & Maldonado, 2015) about energy consumption, light tasks were not considered because they didn't affect any age group. A summary of the participants' data is presented in Table 1. Mean and standard deviation is presented considering five age groups to include 149 participants. 59 men and 90 women with a mean of 53.42 and 43.91 years old respectively. VO2 on rest as well VO2 MAX looked very similar comparing average measures for both genders. Due to some activities are time consuming and interfere with production purposes, rest VO2 was computed by equations according to age and gender (Kanawaty, 1992) and VO2max was taken from local tables (Sandoval & Ramos, 1995).

Instruments

Considering that VO2 is one of the most accurate methods to measure the capacity to generate body energy and the need to operate noninvasive equipment to workers, this study use an estimation of VO2 by means of HR using the Firstbeat technology (2017) as a new HR variability-based method for the estimation of oxygen consumption without individual laboratory calibration; it was examined as a good

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

estimator in Smolander et al. (2008), Balderrama et al. (2010), and Uusitalo (2011). This equipment was utilized to obtain VO2 on field and compute time allowances by means equation 1 described in the next section. Also, a Sunnto Team Pod© with chest straps and Sunnto Monitor© software were used to monitor HR and calculate VO2.

Table 1. Participants' data

Age Range	Gender	Number of Participants	Age (Avg)		Weight (Avg)	Height (Avg)	Rest VO2 ml/kg/min	VO2 Max ml/ kg/min
20-29	Men Woman	12 31		26.40 25.31	73.00 66.74	170.92 157.14	3.68 3.89	38.90 35.76

Time Allowance Equation

An equation that considers individual energy production was formulated. The model considers the energy requirement for the task and compare it with the energy available of the worker (according to age and gender). The objective was to reduce the energy consumption below the recommended limits at work adding more time to the execution of the work task. The equation proposed uses the current energy expenditure in work task (GE) minus the resting metabolism rate of the worker (Eir), divided by half the maximum capacity (expenditure limit) of the person according to age and gender (Eid), minus, once again, the resting metabolism rate (Equation. 1).

$$TOL = (GE - Eir)/(Eid - Eir) \quad (1)$$

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The units of the model are relative to body weight in ml/kg/min. The necessary factors for calculating allowance factor (TOL) are as follows:

1. Age
2. Gender
3. Body weight
4. Smoking
5. Physical shape of the individual
6. Metabolic rate (Eir)
7. Capacity in terms of: Maximum oxygen consumption of the individual (Eid x 2)
8. Expenditure in work task (GE)
9. Workload level

The age (A), gender (B), body weight (C), smoking (D), and physical shape (E) were obtained directly from the participant and was fed in the Sunnto software that computes the energy consumption. Because it was not possible for most companies to allow direct measurement of the resting metabolic rate and VO2max of the worker directly, we made use of the equations for obtaining basal metabolism (F) published by the International Labor Office (Kanawaty, 1992); these are based on the age ranges and gender of the people. For VO2max (G) in people of different ages, tables of local statistics were used (Sandoval & Ramos, 1995). The tables mark a difference in VO2max according to age range and gender. In the application of equation 1, it is required that conversion units of basal metabolic rate and the maximum capacity for producing energy be the same (e.g. kcal, VO2, Watts, etc.). The 50% of the VO2max is only considered when rests in the occupational activities are available; otherwise, 33% of the VO2max must be used. The energy expenditure in work task (H) was obtained by direct measure of participants using the Sunnto Team Pod. The workload level (I) was obtained after GE (H) calculation according with Astrand and Rodah classification presented the first section of the document. At least, 20 cycles were taken on each activity.

The factor obtained from equation 1 must be multiplied by the normal time (cycle time) of the workstation in order to obtain the ST of the operation. That is, if the normal time is 80 s and the calculated allowance computed by personal data in Equation 1 is 1.033 then the new ST would be: $80 \times 1.033 = 82.64$ s. It is important to remark that equation variables (Eir, Eid, and GE) can be calculated by different methods according to the data and the availability of the resources. ISO 8996 provides different estimation methods regarding metabolic rate.

Procedures

Measurements were taken on repetitive tasks that possessed an aerobic load from a moderate to very heavy level. Physiological factors such as age, gender, weight, smoker, and physical condition level were collected at the beginning of a shift, as well as an explanation on how to wear the chest strap. In the first part of the experiment, production lines were monitored considering the actual ST with no modification in the process, and information that contained unexpected interruptions to the process was discarded. The first collected data were used to classify the workload level.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Data obtained from chest strap was stored in a laptop, while the VO2 was calculated using the software for the estimation of metabolism, which was validated previously (Balderrama et. al, 2010). Thereafter, the average consumption of the oxygen was calculated for each worker (GE) and then subtracted from the allowed oxygen consumption according to his or her age and gender (Eir). To determine the allowed oxygen consumption, international recommendations were taken into consideration to compare whether work tasks exceeded the 50% of VO2max (33% if rest are unavailable). Thus, VO2max was calculated using the local tables that were published by the Institute of Social Security (Sandoval & Ramos, 1995).

After detection of the workstations that exceeded the recommended limit (exceeded the 50% of VO2max), ST was modified by adding the time that includes the calculated allowances. This procedure was developed to evaluate the proposed equation. To implement the new ST increased in time, some strategies have to be taken to avoid affecting the work rates of the shift; more workers to the production line or more stock were introduced to the workstations. All the activities were performed to meet the requirements presented in Time Allowance Equation section. It should be noted that this study decided to disregard light workload activities due to a previous study (Balderrama, Flores, & Maldonado, 2015) that did not give significance of this level of activity.

Statistical Analysis

A total of five analyses were considered in the experiment: (a) a general linear model of analysis of variance (ANOVA) was carried out using the data of the VO2 in the task; the purpose was to determine whether age, gender, and other factors were significant factors that affect the energy expenditure of the task; (b) a paired t-test was conducted in order to detect whether the workers surpassed the recommended limits of the energy consumption in the workstation according with age and gender. Age groups split in male and females were compared with the average energy consumption on each work station; (c) a similar paired t-test test was developed, but this time, the data of VO2max of men from 20 to 30 years was introduced in the analysis; the reason, to simulate the work performed only by young male workers and figure it out whether they surpass the recommended limits of work; allowances were collected to run (d) a normality test to the results; (e) lastly, a paired t-test to analyze whether the new standard time with time allowances introduced, could reduce the energy consumption below the recommended limits. Minitab Software© was utilized to analyze statistical data including all the figures presented.

RESULTS

Results are presented according to the statistical analysis proposed in chapter 2.5 taking the same letters sub-division:

1. The ANOVA in the first part of the experiment reflects that only the factor introduced as workload level was a significant factor with a p value of 0.017. In other words, the variables introduced as age ($p = 0.067$), gender ($p = 0.567$), physical shape ($p = 0.740$), and smoking ($p = 0.100$) do not modify the response variable when a confidence level of 95% is used. Hence, the worker energy consumption (VO2) in workstation is not significantly different from one person to another and is only affected by the intensity of work.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. The paired t-test conducted to detect whether the VO2 in the task exceeds the allowed VO2, showed information to deduce that there is enough evidence to say that the VO2 required by the task is higher than the allowed limit (exceeded 50% of the person of maximum energy production) of the VO2 with a p = 0.0. The individual paired tests that considered age and gender in the three different workloads reflect that women older than 30 years surpass the recommended energy limits when they perform moderate, heavy, and very heavy tasks (according with Astrand and Rodah, 1977), while men older than 40 years surpass the recommended limits with heavy and very heavy tasks. In addition, women younger than 30 years surpass the limits in heavy and very heavy task, and men older than 40 years surpass the limits only in very heavy tasks. Figure 1 displays the difference of gender, age, and workload level when a limit of energy is considered. Values close to zero represent better energy to perform a task.
3. Results of the conducted simulating the workers having the VO2max of men in age ranging between 20 and 29 years, reflect that statistical evidence exists to deduce that young workers did not exceed the recommended limits of the energetic expenditure in all the considered workloads levels (p = 0.0). Figure 2 presents how the energy consumption can be below the limits if all the participants were younger men.
4. A residual normality test was conducted in order to validate the experiment obtaining a p value of 0.242 indicating normality in data.
5. Paired t-test performed after the application of the allowances indicates that the energy consumption of the workers did not surpass the energy recommended for 50% of their maximum VO2 (p = 0.00). Figure 3 shows a lower tendency of the VO2 after application of time allowances against results at the beginning of the experiment.

DISCUSSION

This investigation confirms that workstations that possess similar workload, have no significant difference in the worker energy consumption in spite of the physiological conditions of the person. In other words, all persons have similar energy consumption in similar tasks, but the main difference is based on the fact that we have different capacity to generate energy during the day. This result matches up with Louhevaara (1999), Ilmarinen (2001), and the definition of ISO 8996, which states that the metabolic rate can vary from person-to-person, about ±5%, for the same work and under the same working conditions. Also, we confirm, and according to the bibliography presented, that men and women have significant differences in energy production as well as the reduction in energy production after the age of 30 years.

Results of this experiment regarding aerobic workloads that are controlled by ST let us to assume that moderate workloads (2.5–5.0 kcal/min) might be unsuitable for women who are older than 30 years. Heavy (5.0–7.5 kcal/min) and very heavy workloads (7.5–10.0 kcal/min) could be unsuitable for women who are older than 20 years. Similarly, men older than 40 years surpass the recommended limits in workstation over the 7.5 kcal/min.

In accordance with the aforementioned information, workloads determined by the ST are not suitable for all ages and gender, proving that they are only be accepted for specified age ranges. The proposed equation applied to ST reduced the worker energy consumption below the recommended limits suggested in bibliography that mention that workloads should be below of the 50% of the worker capacity to produce energy in one day.

Metabolic capacity of young individuals can be significantly different to carry out tasks with high metabolic requirements compared with adult workers. According to our experience, some companies take strategies to not assign high workloads to adults and women or assign breaks according to manager experience to achieve the recovery of worker, where there is nothing normative or mandatory on this respect. Systems in industry designed to introduce brakes or rest pauses do not consider age and some companies assign pauses according to administrative interests and not when the operator needs it. An allowance of time within the standard time could be a good response to high working demands due the manipulation of the rest by worker each cycle time, achieving a recovery rate throughout the workday in better manner than rest pauses.

CONCLUSION

ST is a valuable planning tool for several important production factors; however, it could affect people depending on their age and gender. The addition of time through a ST allowance helps to accomplish manual aerobic work more equilibrated according to the amount of energy a person can produce. To implement compensatory equation, the acceptance of the problem and its implementation willingness is required. Depending on the production process, the allowances can be introduced individually or according to the characteristics of small working groups. The proposed equation differs from other models because it considers the age and gender of the employee and the feasibility of applying it systematically through ST.

The recommendation of this study is to provide opportunities to the workers to keep energy reserves at the end of the shift in order to succeed on their day-to-day life, to enhance the quality of their lives, and to promote an occupational health program to improve the productivity of the manufacturing com-

panies. Inclusion of the aging people must be one of the commitments of this era due the worldwide increment of old people.

ACKNOWLEDGMENT

We would like to thank The Autonomous University of Juarez City for support the project and give permission in the use of the facilities and equipment during this research.

ABSTRACT

Development of musculoskeletal disorders caused by awkward postures are present in tasks performed in small companies. Consequently, this chapter evaluates the postural risk level associated to the task of changing brake pads of a forklift, and proposes the design and the implementation of an ergonomic bench that helps to reduce this level of postural risk. As methods, postural risk level corresponding to the task was determined using REBA, whereas anthropometric analysis was developed, and axiomatic design and TRIZ methodologies were used to develop the proposed design. Results showed a REBA score of 8 (high-risk level). The final design is done of nylamid, and it contains some TRIZ principle, such as copying, extraction, and dynamicity. Respect axiomatic design, the bench meets some functional requirements, such as support the user's weight, avoid unsafety conditions, and be adjustable. With the TRIZ principles and functional requirements, this bench will help diminish postural risk level.

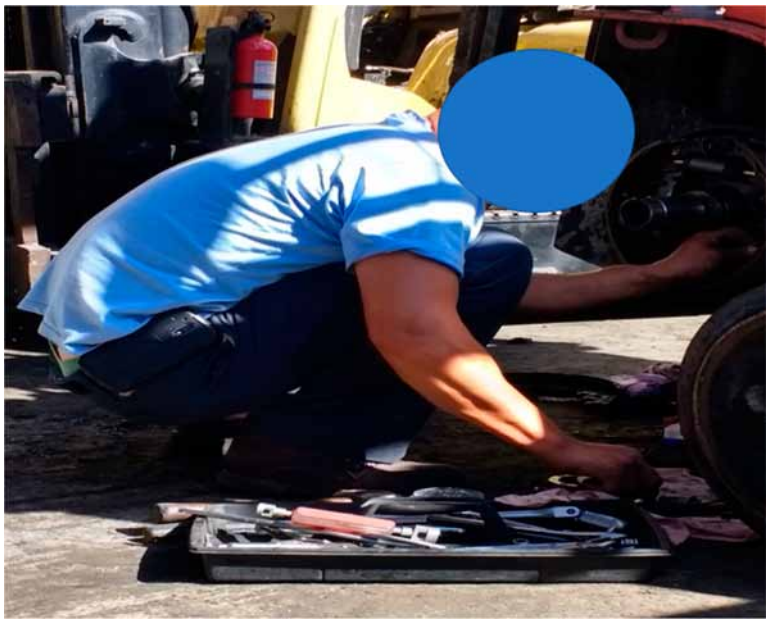
INTRODUCTION

Most of the ergonomic assessment methodologies adopted in the manufacturing industry are implemented to assess ergonomic hazards in the production area (Tompa, Dolinschi, de Oliveira, Amick, & Irvin, 2010), yet other processes, such as machinery maintenance/repairs, material transportation, and/or plant cleaning, require similar ergonomic evaluations to ensure employee safety. To address this gap, this research takes place in a company that repairs and sells industrial machinery.

It is well known that maintenance and repairing tasks force employees to adopt awkward postures (Barros, Marçal, & Soares, 2015; Teymourian, Seneviratne, & Galar, 2016) and apply excessive force. In this sense, the maintenance technicians of the company wherein this study was conducted have claimed to experience discomfort when they change forklift brake pads. This task takes approximately one hour per brake, and to complete it, the technicians usually adopt awkward and long-lasting postures. According to the employees, the main musculoskeletal complaints experienced are in the back, the ankles, and the knees. Even though knee pads are worn, the employees claim these are not an effective solution to pain and discomfort. Figure 1 depicts the typical posture adopted by the employees as they change forklift brake pads.

According to the literature, awkward postures have a negative effect on employee health and performance. They can cause soft tissue injuries that favor the accumulation of metabolites and accelerate disc degeneration, which can ultimately lead to disc herniation (Roffey, Wai, Bishop, Kwon, & Dagenais, 2010). Also, awkward workplace postures can increase the risk of suffering from musculoskeletal disorders (MSDs) – such as osteoarthritis (da Costa & Ramos-Vieira, 2009; Gallagher, Pollard, & Porter, 2011) and fibromyalgia (da Costa & Ramos-Vieira, 2009) – and are strongly associated with low back pain (LBP) and whole-body vibration (Vandergrift, Gold, Hanlon, & Punnett, 2012).

Figure 1. Posture adopted by employees during the task of changing forklift's brake pads
Source: Prepared by the authors (2017).



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

As regards employee performance, awkward postures are less efficient than postures that keep joints near to a neutral posture (Gangopadhyay, Ghosh, Das, Ghoshal, & Das, 2010). Also, it has been argued that awkward postures force employees to apply more force than necessary to accomplish a particular task. Such excessive force in turn affects muscle loading and compressive forces on the internal vertebral disc.

The literature shows the need to improve the working conditions of those who adopt awkward and unsuitable postures to do their jobs. In the context of our research, one alternative to addressing this need is to design a bench, as an ergonomic work tool, to ensure that the technicians can change the brakes safely and comfortably. The importance of this bench relies on its advantages as an ergonomic intervention. Ergonomic interventions do not only reduce workplace hazards and increase employee safety; from a corporate point of view, they provide economic benefits, since they prevent companies from incurring additional costs (e.g. employee insurance) and increase employee retention, since workers feel and are safe.

LITERATURE REVIEW

REBA

The Rapid Entire Body Assessment (REBA) method is a highly sensitive tool for postural analysis. It is employed to assess unpredictable postures within the work environment. According to several researchers, REBA can be effectively applied to evaluate MSDs, since it provides the following advantages (Hignett & McAtamney, 2000; Maldonado-Macías, Realyvásquez, Hernández, & García-Alcaraz, 2015):

1. It develops a sensitive postural analysis system for MSDs risks in a variety of tasks.
2. It divides the body into segments that are individually encoded.
3. It provides a scoring system for muscular activity caused by static, dynamic, rapidly changing, and unstable postures.
4. It provides an action level with an urgency indication to find the kind of ergonomic interventions that must be implemented.
5. It is not time-consuming or resources consuming.

As mentioned, REBA has an action level system to support decision making after performing the postural analysis. This system is detailed in Table 1.

Table 1. REBA's action level system

Action Level	Score	Risk Level	Required Corrective Actions
0	1	None	Corrective actions and further assessments are not required.
1	2-3	Low	Corrective actions and further assessment may be required.
2	4-7	Medium	Corrective actions and further assessments are required.
3	8-10	High	Corrective actions and further assessments are required as soon as possible.
4	11-15	Very high	Corrective actions and further assessments are immediately required.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

REBA is a popular method for postural analysis and MSDs risk assessment. In their research, (Lee, Yu, Choi, & Han, 2011) used this method to evaluate the task of large glass panels installation in the construction industry. Similarly, (Maldonado-Macías et al., 2015) relied on REBA to analyze various tasks of the computer repairing process and identify levels of MSDs risk. As results, the authors found high levels of MSDs risks in every task and proposed a series of ergonomic interventions to address the ergonomic issues. Likewise, a most recent study performed by (Shirzaei, Mirzaei, Khaje-Alizade, & Mohammadi, 2015) evaluated ergonomic factors and profession-related postures with dental students. The authors directly observed the students' postures while treating patients. The analyzed postures were scored using REBA, and the results showed a medium level of risk for most subjects (84%).

Anthropometry

Anthropometry is the study of human body measurement and is used in the engineering sciences to ensure maximum product benefit and capability (Robinette, 2012). The field of application of anthropometry is broad and includes the description, comparison, evaluation, and identification of individuals or groups of individuals. Usually, anthropometry is used to describe the morphology of an individual or a sample of individuals. In addition, it can be used as a comparison basis of a population's sample to other samples or comparisons of the same sample over the time. For instance, the growth status of children that participate in specific sports competitions (Malina, 1995).

Anthropometry has a variety of applications in the design area. For instance, (Madriz-Quirós, Ramírez-Coretti, & Serrano-Montero, 2008) performed an anthropometric study to design ergonomic furniture for school age children in Costa Rica. The study included a sample of 1,293 children from all around the country, and 12 anthropometric measures were necessary to design the furniture. Similarly, (Azadeh, Fam, & Garakani, 2007) proposed a total ergonomic design approach to enhance productivity in complicated control systems. The proposal included performing an anthropometric study. In another work, (Gouvali & Boudolos, 2006) used anthropometry to find the match between school furniture dimensions and children anthropometry. Likewise, (Herrera-Ruiz, 2006) designed an amphibious wheelchair for hydrotherapy. For its design, the author used data from an already published anthropometric table.

Since anthropometric data follow a normal distribution, when a product is designed based on anthropometric data, percentiles and *Z*-scores are used to determine product dimensions (Hernández-Arellano, Aguilar-Duque, & Gómez-Bull, 2018). Percentiles are interpreted in the following way: if the *nth* percentile is determined for a specific body dimension, it means that *n*% are shorter than this percentile in this body dimension (Pheasant & Haslegrave, 2016). For instance, if the 95th percentile is calculated for anthropometric data of the height, it means that 95% of people have a height below than the 95th percentile value. To design the ergonomic bench, the authors had to know the anthropometry measures of the users (i.e. technicians) as well as the most appropriate design material and design methodology.

Nylamid

The bench to be designed must be robust and ergonomic. That is, it must be resistant enough to support the weight of the technicians, but and at the same it must be comfortable, easy to use, and easy to handle. The material that best satisfies these proprieties of the bench is Nylamid®. This material has a breaking strain of 142,559,000 N/m^2 (Martínez-Nopala, 2015), which is above the pressure that any person may exercise; also, it is two to eight times lighter than metals. Similarly, Nylamid® is rigid and has a

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

desired mechanical, chemical, and thermal resistance (Herrera-Ruiz, 2006; Ramírez-Ibanez, 2004). A wide range of products are designed and manufactured using Nylamid®, such as rollers, chains, wear guides, impact parts, gears, pulleys, chairs (Herrera-Ruiz, 2006), vehicles (Martínez-Nopala, 2015), electromagnetic positioning systems, electrical power systems, and wind generators (Magdaleno-Adame, Olivares-Galvan, & Fofana, 2014).

Axiomatic Design

In engineering, Axiomatic Design (AD) sets the scientific and systematic basis of design processes. The main goals of AD are to increase creativity, reduce the random search process, minimize the iterative trial-and-error process, and determine the best designs among a set. Also, AD implies a continuous interplay between what designers/customers want to achieve and how they want to achieve it (Hirani & Suh, 2005; Suh, 1990, 2001). AD is a methodology that support the design of a wide variety of systems (manufacturing systems, software, products, and organizations, for instance) and establishes the customer needs (CNs) that the system must satisfy. Then, the functional requirements (FRs) and constraints (Cs) of the system to be designed are determined to meet such CNs. Next, the FRs must be matched to the design parameters (DPs). This step allows designers to identify and choose the DPs that are necessary to design the system. Once the DPs are chosen, designers must go to the process domain and identify the process variables (PVs) based on the creation of a new process or the use of an existing process (Suh, 1998).

The AD theory is composed of two key axioms, theorems, and corollaries. The first axiom sustains that the independence of the FRs must be always preserved. When there are two or more FRs, one of them should not affect the other. In this sense, the designer has to select the proper DPs to satisfy the FRs independently. This is done one by one in a mapping process between one FR and its corresponding DP (Won & Joon, 2005). Accordingly, the application of this axiom determines coupled, decoupled, and uncoupled designs. An ideal design is an uncoupled design, where one DP can satisfy each FR independently. However, these designs are commonly difficult to achieve, and decoupled designs can be acceptable designs as well. Both, uncoupled and coupled designs satisfy the independence axiom. On the other hand, a coupled design exists when DPs and FRs cannot be satisfied independently. In this case, designers must work creatively to change the product to a decoupled or uncoupled design.

Once the first axiom is accomplished, the second axiom is also required for better designs. The information axiom explains that, in all good designs, information content must be the minimum. This axiom establishes the idea that the success of a design is determined by the probability associated with achieving the FRs. This probability decreases with the amount of information necessary to fulfill the FRs (Lenz & Cochran, 2000).

The AD theory has been applied successfully in many areas. In their work, (Kulak, Cebi, & Kahraman, 2010) presented a literature review of AD applications and identified five application areas: product design (Ferrer, Rios, & Ciurana, 2009; Gumus, Ertas, Tate, & Cicek, 2008; Tang, Zhang, & Dai, 2009), system design (Bang & Heo, 2009; Helander, 2007; Lo & Helander, 2007), manufacturing system design (Durmusoglu & Kulak, 2008; Nakao, Kobayashi, Hamada, Totsuka, & Yamada, 2007; Schnetzler, Sennheiser, & Schönsleben, 2007), software design (Lindkvist & SÖDerberg, 2003; Togay, Dogru, & Tanik, 2008; Yi & Park, 2005), and decision making (Celik, 2009a, 2009b; Celik, Cebi, Kahraman, & Er, 2009). However, despite its multiple applications, some authors claim that AD by itself is not enough to solve design problems, and thus requires the support of techniques and methodologies for FRs determination and creative solutions. As a result, designers now combine AD with tools such as

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Failure Mode Error Analysis (FMEA), Design for Six Sigma (DFSS), the theory of inventive problem solving (TRIZ), and decision support multiattribute methods (Dickinson, 2006).

TRIZ

TRIZ is a Russian acronym for the Theory of Inventive Problem Solving. It was proposed by Altshuller and originated from several technical and patent information studies. The latter showed that only 1% of the solutions were truly pioneering inventions; the rest represented the use of previously known ideas and concepts but in a novel way (Altshuller, 1984; Yang & Zhang, 2000). This led to the conclusion that the idea of a design solution to a problem might be already known. But where and how this idea can be found? Based on a systematic view of the technical world, TRIZ provides different techniques and tools that help designers create a new design idea and avoid numerous trials and errors during the problem solving process (Yang & Zhang, 2000).

According to several authors, TRIZ is a powerful systematic ideation methodology for technical problem solving that leads to the enhancement of existent techniques (Kremer et al., 2012; Savransky, 2000). Moreover, TRIZ is a human-oriented knowledge-based systematic methodology of inventive problem solving (Savransky, 2000). In TRIZ, every factor that affects a system can be defined as a parameter, and there is a dependency relationship among system parameters. TRIZ structures a problem into a "contradiction statement" and derives solutions that address the problem statement both from technical and system perspectives. Hence, the ideality of the design increases as a parameter is improved without worsening the other parameter. In this sense, TRIZ demonstrates its capability as a support tool for original idea creation.

Despite the success of TRIZ in aiding idea generation, if implemented alone, TRIZ falls short in selecting the most appropriate idea. Therefore, using it in unison with appropriate tools – such as AD, in this study – is strongly recommended (Kremer et al., 2012).

TRIZ comprises 40 inventive principles to guide the TRIZ practitioner in developing useful concepts of solution for inventive situations (Yang & Zhang, 2000). Each solution represents a recommendation to make a specific change in a system and eliminate technical contradictions. The literature provides a contradiction table that recommends which principles should be considered in solving approximately 1,250 contradictions. Five of these 40 inventive principles are stated below (Altshuller, 2002; Technical Innovation Center, 2013):

- **Extraction:** Disturbing parts must be removed from an object only if it is necessary.
- **Counterweight:** Compensate for the weight of an object by combining it with another object that provides a lifting force.
- **Cushion in Advance:** Compensate for the relatively low reliability of an object with emergency measures prepared in advance.
- **Dynamicity:** The characteristics of an object or outside environment must be altered to provide optimal performance at each stage of an operation. Then, if an object is immobile, make it mobile, make it interchangeable, and divide the object into elements capable of changing their position relative to each other.
- **Copying:** It is better to use a simplified and inexpensive copy in place of a fragile original object, or an object that is inconvenient to operate.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the last decade, various works have illustrated the advantages of combining TRIZ and AD and have reported how these techniques complement each other. AD analyzes the problem and structures it in the most suitable way, whereas TRIZ can solve the minimum number of design conflicts that are intrinsically present in a case study (Borgianni & Matt, 2016). That said, when TRIZ is combined with AD, it can analyze a complex problem and deduce the most relevant conflicts, since TRIZ uses AD to appropriately structure the problem. Similarly, AD is useful for analyzing the system and its requirements, but it completely lacks means to identify technical solutions. These solutions, according to the axioms that guide the design process, should be appropriately characterized by satisfying performances for each requirement and high controllability of the system. In conclusion, both methods – TRIZ and AD – can be applied jointly thanks to the not contradictory objectives they have.

METHODOLOGY

To design the bench from an ergonomic approach, authors propose a cross-sectional, non-experimental methodology that comprises six stages. The following sections review the used instruments and thoroughly discuss the methodology stages.

Instruments

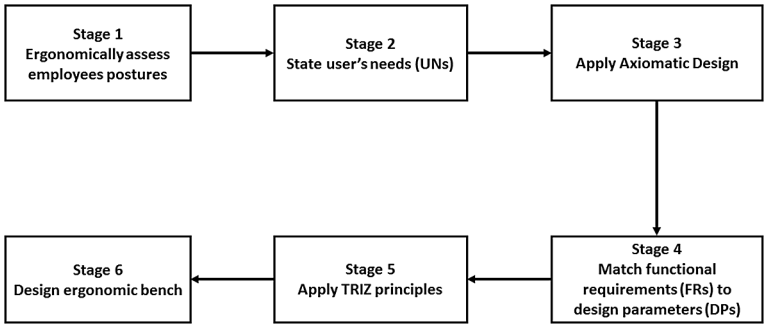
Authors relied on the following instruments to design the bench from an ergonomic approach:

- **Computer Equipment:** Laptop Sony Vaio®
- **REBA, Online Software**
- **Design Software:** Authors initially decided to use SolidWorks® software, but due to a lack of experience, they finally used PowerPoint and Paint. Both programs encourage user creativity.

Method

As previously mentioned, the methodology followed to design the ergonomic bench comprises six stages as depicted in Figure 2.

Figure 2. Methodology proposed to design the ergonomic bench
Source: Prepared by the authors (2017).



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Stage 1 - Ergonomically Assess Employee Postures: The REBA method was implemented to ergonomically evaluate the postures adopted by the technicians in the task of changing forklift brake pads. To this end, authors relied on REBA online software, available on the *ergonautas* platform (Ergonautas.upv.es, 2017).

Stage 2 - State User Needs (UNs): Authors defined the technicians' needs that had to be satisfied by the ergonomic bench.

Stage 3 - Apply Axiomatic Design: Once the UNs were identified, authors defined the FRs of the design that had to satisfy such UNs. Also, authors set the constraints that would limit the ergonomic design of the bench.

Stage 4 - Match FRs to DPs: Each FR was assigned a DP that would allow the bench to meet the said FR. Likewise, authors relied on anthropometry to set the measures of the bench. Since the company has only eight employees, authors used the anthropometric data presented by (Ávila-Chaurand, Prado-León, González-Muñoz, & Muñoz, 2007), which correspond to a sample of 369 male industrial employees, ranging from 18 to 65 years old. That said, authors only used the data of those body segments that would interact with the bench. When designing for extremes, the dimensions of the ergonomic bench were defined by applying the 5th and 95th percentiles, calculated by means of equation (1) (Hernández-Arellano et al., 2018):

$$P_n = \overline{x} + Z\sigma \tag{1}$$

where P_n represents the value obtained for the *nth* percentile, $\overline{x}$ is the average value of the anthropometric data for a specific body segment, Z is the score of the accumulated normal distribution corresponding to the *nth* percentile, and σ is the standard deviation of the anthropometric data. Table 2 shows the corresponding Z-scores of each percentile.

Table 2. Percentiles and corresponding Z-scores

Percentile	Z-Score
5th	-1.645
95th	1.645

Stage 5 - Apply TRIZ Principles: Once authors defined the UNs, FRs, Cs, and DPs, they searched for an existing design that could meet our FRs after performing the necessary modifications on it, following the TRIZ principles.

Stage 6 - Design the Ergonomic Bench: Once the percentiles of the bench were defined, authors built the piece of furniture using Nylamid as the design material.

RESULTS

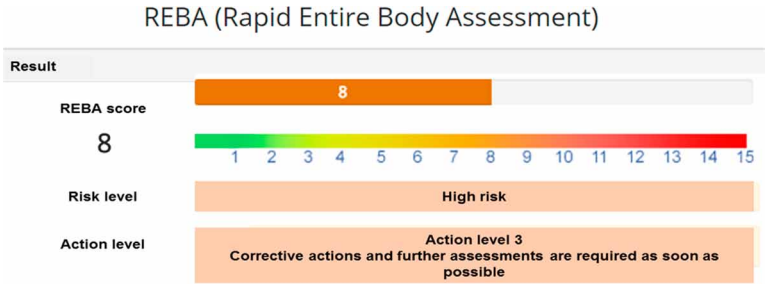
The results of the proposed design methodology are discussed below:

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Stage 1 Results

Figure 3 shows the REBA score, the level of MSDs risk, and the action level obtained for the brake pads changing task. As can be observed, the score (8 points) implies a high level of MSDs risk for this task. Therefore, corrective actions and further assessments are required as soon as possible (Hignett & McAtamney, 2000; Maldonado-Macías et al., 2015).

Figure 3. REBA (Rapid Entire Body Assessment) score for the task of changing forklift brake pads
Source: Adapted from (Ergonautas.upv.es, 2017).



Stage 2 Results

According to the results of stage 1, four UNs were identified: comfort, long-term health, short-term safety, and efficiency.

Results for Stage 3

The FRs that meet the identified UNs are:

- **FR_0 =** Efficiency
- **FR_1 =** Support user weight
- **FR_2 =** Help maintain correct posture
- **FR_{21} =** Adjustable
- **FR_3 =** Avoid unsafe conditions

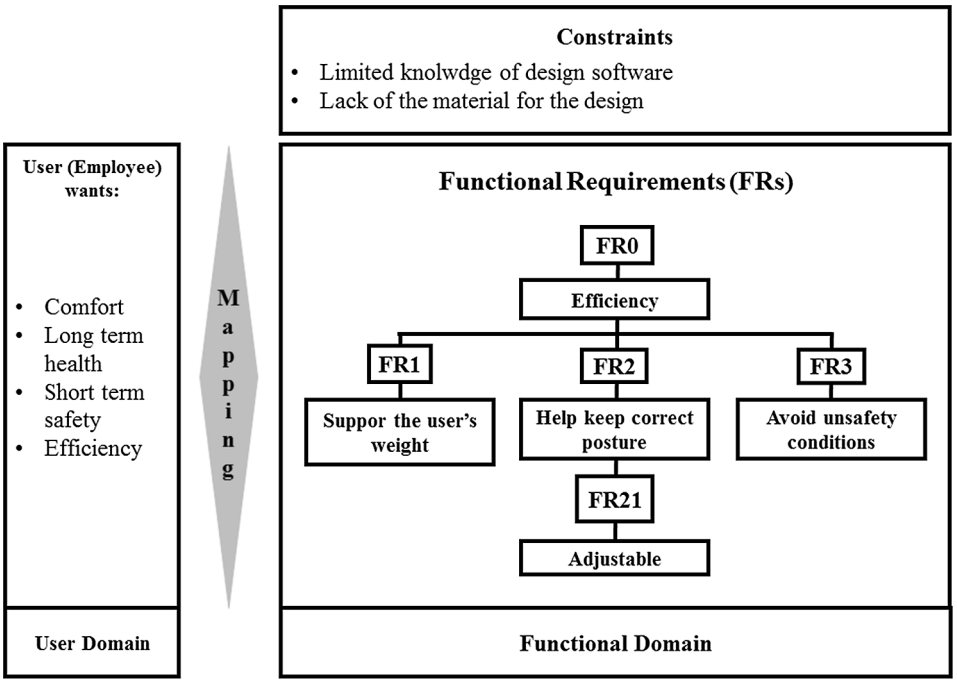
FR_1 will help employees perform the task comfortably, since they no longer will have to support their own weight with the thighs. On the other hand, FR_2 will allow the technicians to adopt a healthier posture if compared with the one they currently adopt. That said, the bench can guarantee a correct posture if its design is anthropometrically adjustable – i.e. the design comprises FR_{21}. Both FR_2 and FR_{21} can improve employee health as they prevent MSDs occurrence. Finally, FR_3 will provide safer working conditions for the task of changing forklift brake pads.

Together, FR_1, FR_2, FR_{21}, and FR_3 achieve FR_0 = efficiency, as they provide comfortable and safe postures for the technicians to reach components without extending the upper limbs. However, designs also imply constraints. In this work, authors identified two constraints that may prevent the design from

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

being carried out: a lack of experience in using design software and a lack of material (i.e. Nylamid). In this sense, Figure 4 shows the mapping between the UNs (customer domain) and the FRs (functional domain) and the design constraints.

Figure 4. Design constraints and mapping from user (or customer) domain to functional domain
Source: Prepared by the authors (2017).



Results for Stage 4

Since the observed technicians support most of their weight with their thighs when they change forklift brake pads (i.e. they squat), FR_1 – support user weight – was related to DP_1 = create a seat. This seat will support most of the technicians' weight. On the other hand, since the employees flex their trunk when they change forklift brake pads, FR_2 – help maintain correct posture – was associated with DP_2 = Create a tilted support for the trunk. This DP_2 will allow employees to flex their trunk without supporting a force to maintain this position. Then, FR_{21} – Adjustable seat – was matched to DP_{21} = Design the seat and the trunk support with an adjuster. The adjuster will help employees fit the seat and the support according to their anthropometric measures. Finally, to meet FR_3 – avoid unsafety conditions – authors considered DP_3 = Design the seat and the trunk support with cotton pads covered with rubber. Cotton pads will cover the seats and the trunk support to offer comfort and protection.

Then, the design matrix is given by equation (2) and equation (3):

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

$$\begin{Bmatrix} FR_1 \\ FR_2 \\ FR_3 \end{Bmatrix} = \begin{bmatrix} A_{11} & 0 & 0 \\ 0 & A_{22} & 0 \\ 0 & 0 & A_{33} \end{bmatrix} \times \begin{Bmatrix} DP_1 \\ DP_2 \\ DP_3 \end{Bmatrix} \tag{2}$$

$$\{FR_{21}\} = [B_{11}] \times \{DP_{21}\} \tag{3}$$

where A_{ij} and B_{11} represent non-zero elements and 0 represents a zero element.

The design equations for the matrix stated above are given by equation (4), equation (5), equation (6), and equation (7) as follows:

$$FR_1 = A_{11} \times DP_1 \tag{4}$$

$$FR_2 = A_{22} \times DP_2 \tag{5}$$

$$FR_{21} = A_{11} \times DP_{21} \tag{6}$$

$$FR_3 = A_{44} \times DP_3 \tag{7}$$

The design is uncoupled since the design matrix is diagonal. Therefore, the information content is zero, and it does not violate the information axiom (Cochran, Eversheim, Kubin, & Sesterhenn, 2000; Kim & Cochran, 2000). Hence, to obtain the best design, the sequence must be the following:

1. Create a seat.
2. Create a tilted trunk support.
3. Design the seat and the trunk support with an adjuster.
4. Design the seat and the trunk support with cotton pads covered with rubber.

The body dimensions used to design the ergonomic bench were the following:

- **Weight:** This dimension was taken into account since the technicians adopt a squatting posture when changing the forklift brake pads. Therefore, the bench is intended to support the technicians' weight.
- **Popliteal Height:** This dimension was used to define the seat's height.
- **Sitting hip Width:** This dimension was used to define the seat's width.
- **Buttock-Popliteal Length:** This dimension was used to define the length of the seat.
- **Seated Shoulder Height:** This dimension was used to define the height of the trunk support.
- Transverse diameter of the thorax.

Table 3 shows the average $\bar{x}$, the standard deviation (SD), and the 5th and 95th percentiles obtained from the anthropometric data for each body dimension that would interact with the bench. The percentiles were calculated by means of equation (1). It is necessary to clarify that these dimensions do not consider tolerances for clothing and footwear.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

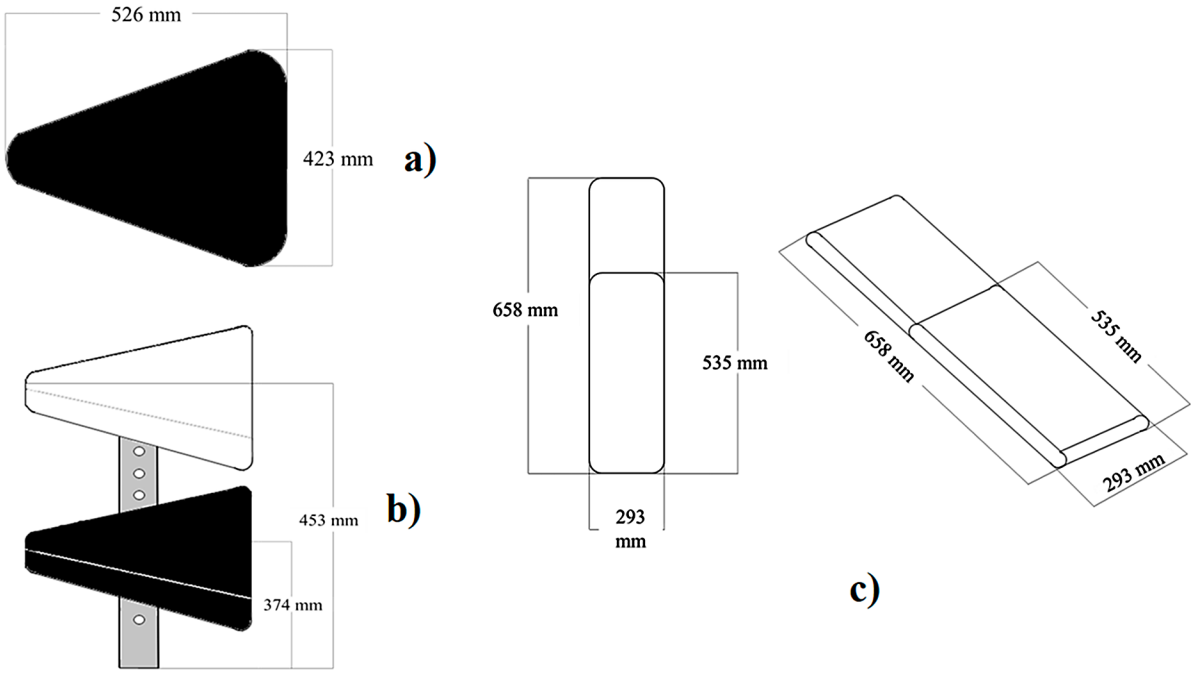
Table 3. Body dimension, bench dimension, and corresponding percentiles

Body Dimension	Bench Dimension	$\bar{x}$	SD	Percentiles	
				5th	95th
Weight (Kg)	Material for seat and support for trunk	73	12.33	55.31	97.30*
Popliteal height	Seat height	412	25.65	374*	453*
Sitting hip width (mm)	Seat width	374	31.26	328	423*
Buttock-popliteal length (mm)	Seat length	476	28.92	432	526*
Seated shoulder height (mm)	Trunk support height	581	27.63	535*	638*
Transverse diameter of the thorax (mm)	Trunk support width	342	34.12	293*	398

* Percentiles selected to design the ergonomic bench.

Figure 5 presents the bench components and their corresponding dimensions. Note that these dimensions correspond to the indicated percentiles of Table 3. The width of the trunk support was designed with the 5th percentile of the transverse diameter of the thorax to allow employees to freely move their arms and easy access their work area.

Figure 5. Bench components and dimensions: a) seat, b) seat height, c) support for trunk
Source: Prepared by the authors (2017).



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Stage 5 Results

After carefully reviewing pre-existing designs, authors selected the one depicted in Figure 6 as the starting point to develop our design. To make sure the pre-existing design could help meet the abovementioned FRs, authors applied the TRIZ principle of copying. Then, our ergonomic bench was designed with the anthropometric dimensions presented in Figure 5.

As can be observed in Figure 6, the height of the original support trunk is not adjustable; thus, authors redesigned this component according to the anthropometric dimensions presented in Figure 5c. However, the support is adjustable with respect to the angle taken by the trunk. Authors kept this DP, since it would help the technicians reach the forklift components comfortably. Then, they applied the dynamicity principle to the original design by adjusting the height and inclination of the trunk support and the height of the seat. Next, they implemented the extraction principle by removing those parts that would interfere with the employees' motions and their work area. Figure 6.b shows the removed parts circled in black. The base was positioned closer to the seat to reduce uncomfortable distances between the technicians and the forklifts. Likewise, the counterweight principle was applied to make sure that the technicians' weight could be supported by the ergonomic bench. Finally, authors implemented the cushion in advance principle by adding cotton pads for the seat and the trunk support. These pads provide a soft and comfortable contact between the users (i.e. technicians) and the bench parts.

Figure 6. Starting point for the design of an ergonomic bench: a) original design, b) removed parts
Source: (Ebay, 2016).

Stage 6 Results

Figure 7 shows the final design of the ergonomic bench. The colored lines represent the design dimensions based on the percentiles introduced in Table 3. Also, note that the trunk support is now height and angle adjustable, whereas the seat is only height adjustable. The solid part is made of Nylamid, which is a light and resistant material (Estrada-López, Vilchis-Martínez, Gutiérrez-Osorio, Arellano-Carmona, & Borja-Ramírez, 2013). Finally, note that the drawing shown in Figure 7 is not necessarily to scale. For instance, the maximum height of the seat is not on scale with the maximum height of the trunk support.

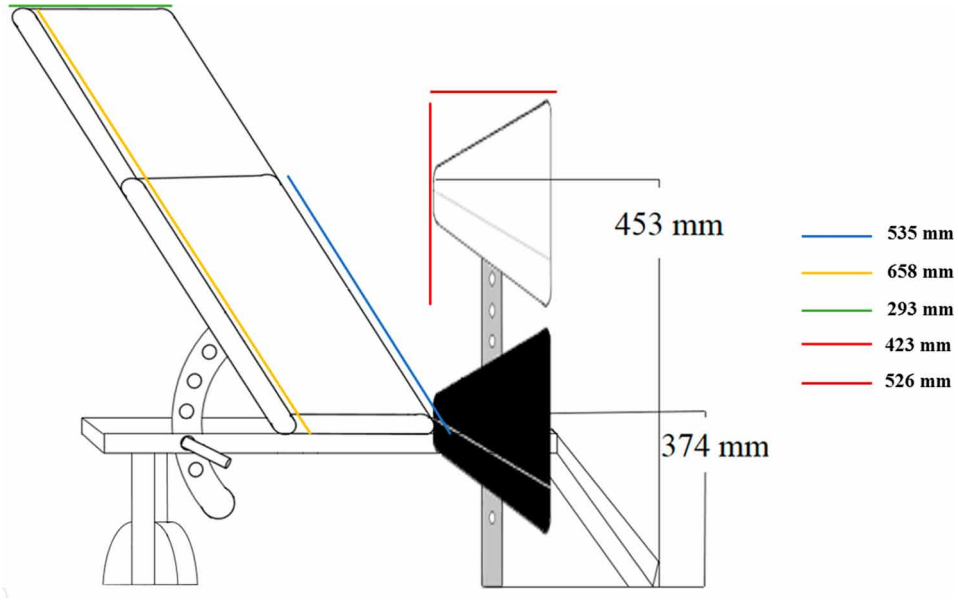
Figure 7. Final ergonomic bench design
Source: (Ebay, 2016).



FUTURE WORK

As future work, authors will seek to actually construct the ergonomic bench and implement it. During the implementation process, research will aim to test the effects of the bench characteristics on factors such as employee performance, MSDs incidence, and manual handling. Then, the obtained results could contribute to a better understanding of employee safety, performance, and comfort. Moreover, since the level of postural risk was calculated by using REBA, it is convenient to bear in mind that to define this variable, REBA takes in into account whether a seat supports user weight, but it does not consider whether the weight is supported by a seat and a trunk support, as in this case. This means that, in the future, if a REBA analysis is conducted in a setting wherein this new ergonomic bench is implemented, the analysis would only take into account the trunk posture, but it would not consider whether the weight of the trunk is supported by the bench, which decreases the postural load on the person. For this reason, authors believe there might be an opportunity to further explore the shortcomings and limitations of REBA and propose an update.

Another ergonomic solution for the task of changing forklift brake pads is an underground elevator, yet the final decision on whether implementing the bench or the elevator might depend on cost-related factors in terms of construction, implementation, and maintenance. That said, the elevator would allow employees to select a comfortable height and restful postures to change the brake pads. Also, the elevator would allow the company to save space, but it must be designed according to the anthropometric measures of its employees. Finally, authors encourage small companies from all the industrial sectors to research on and implement ergonomic tools that can enhance their performance while offering employees health and safety.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

This research argues that anthropometry, combined with AD and TRIZ, is an excellent design tool, not only from an ergonomic approach, but in general. The importance of anthropometry lies in its ability to provide designers with precise design dimensions derived from the very specific characteristics of a sample. This makes anthropometry not only appealing, but also time-saving and resource-saving, since it prevents companies from implementing equipment devised from the characteristics of their employees. As for AD, authors conceive it as a tool that helps designers stay on the right track to reach their design goals. User needs, functional requirements, and design parameters serve as guidelines to the design process. Similarly, when implemented from an ergonomic point of view, TRIZ increases creative problem solving. Finally, as regards the ergonomic bench, authors expect that its implementation could diminish the level of MSDs risk in the task of changing forklift brake pads.

KEY TERMS AND DEFINITIONS

Adjustability: An object's capability to adjust or adapt itself to the requirements and need of different users.

Bench: A piece of furniture in which one or more people can sit to adopt a comfortable posture and decrease muscle fatigue.

Body Dimensions: Distances of body segments measured between two defined points. For instance, the height of a person is the distance measured from the ground up to the vertex of the person in standing position.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Ergonomic Design: Design that applies ergonomic tools, such as anthropometry, and allows objects to be adapted to human capabilities and limitations.

Forklift: Vehicle used in the industry to transport material on pallets, which are supported by two forks of the forklift.

Percentile: In statistics, a position value that indicates the percent of ordered data that are below that percentile. For instance, the 5th percentile is the value under which 5% of data are.

Postural Risk: Risk derived by postural load supported by different body segments when a person adopts an uncomfortable body posture. This risk is proportional to the time posture is adopted, its frequency of occurrence, and its deviation level of neutral posture.

Chapter 32
An Ergonomic Analysis on Working Postures of Construction Site Workers: A Framework for Construction Site Workers

Suchismita Satapathy

KIIT University, India

ABSTRACT

Risk factors related to work activity and ergonomics can enhance the probability that some persons may develop a MSD (musculoskeletal disorder). Usually the MSD develops due to high task repetition, forceful exertion, and repetitive/sustained awkward postures. MSD is also found in some cases where workers are engaged with working in awkward postures, cold temperatures, contact stress, heavy load, static postures, and vibration, etc. Many studies explain the problems for MSD, but in this chapter an effort is taken to rank the maximum body movement and body parts as per the different types of work flow system such that ergonomics design can be planned. Physical disorders can be avoided by finding and ranking the difficult task and the affected body part due to that kind of work. The prioritization of task will help the organization to think of sustainable designs of working procedure or instruments or machines to provide maximum comfort to humankind. It may also help to frame policies for occupational safety and hazards in workplace.
