Rapid development in industrialization methods and technology demands higher production rates. Modern technology increases the demand for products and makes industries competitive. To survive in the business human race has to deal with sophisticated machines and processes. This interaction between human and machine interaction or ergonomics uses the principle of natural laws of work to solve anatomical & physiological problems between man & machine. Many companies like construction, manufacturing, mining demand more human interactions. Basically, construction companies play a vital role and act as the building blocks for the development of a country. Improper management in the workplace will reduce the productivity of construction company and ergonomic performance of various workers. To study the ergonomic performance of workers in heavy working conditions like construction company a questionnaire-based survey is conducted. The send questionnaires are classified under the following three primary classifications or factors: (a) human/labor related factors; (b) task-related factors; and (c) equipment/tools-related factors based on various age groups and occupations of the construction workers by literature review. Industry practitioners and researchers can use the primary outcomes of this study in developing systems to enhance and improve health and safety of the construction workers for effective management of construction labor workforce and to achieve a competitive level of quality and a cost-effective project. Again, the body parts and various body movements of Carpenter, Plumber, Welder & Masons anthropometric analysis is done to improve worker protection and avoid ergonomic risk factor. Some important physical motions like stress, strain, and overexertion, including vibration, awkward postures, forceful exertions, repetitive motion, and heavy lifting etc are conducted and workers are ranked by studying their body parts and body movement with multicriteria decision-making techniques like fuzzy AHP and a framework is designed by QFD.

LITERATURE REVIEW

Ergonomic design can be achieved but its evaluation can be varied. This varied needs and results can be further experimented and scrutinized in a very controlled environment. But the very big problem is also the relationship between eco-friendly effectiveness and restriction of autonomous values. To carry out a lot of experiments is also difficult. But with the use of new supercomputers and by running direct diagnosis one can find results by running computational experiments with a virtual set up. The basic objective of ergonomics is to fit man and machine together to improve the worker's performance, reduce stresses and fatigue at work. Application of ergonomics is very significant in an area where manual activities directly affect the physical and mental health of the employee (Parkes et al., 2005). Kushwaha and Kane (2016) have discussed that intervention of ergonomics in the workplace reduces the mismatch between man and machine and makes workplace comfortable for work. Ramos et.al.(2016) have developed a model to perform a financial and economic cost-benefit analysis related to OSH projects was developed and it was applied in the case of the prevention of WMSDs in a Portuguese hospital. An analysis of the accidents and corresponding costs has been made in six of the services of the hospital. Financial and an economic cost-benefit analysis have been made and the benefit-cost ratio (B/C) has been calculated. Charles et.al. (2012) have suggested that a brief hazard perception test could potentially be used in the assessment of drivers across the adult lifespan. Ergonomics is not only analyzed for construction, industries but also it is useful for all types of sectors.(i.e.education,health sector etc).Many modifications are also done in

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the workplace, work technique/procedures, equipment for giving the maximum comfort of humankind. Assunção et.al. (2013) have examined the effect on the prevalence of back pain of the mismatch between school furniture dimensions, backpack weight and the anthropometric characteristics of 138 adolescents (1215 years old) with differing maturity levels. These results highlight the importance to study the school environment to establish preventive programmes for back pain in youths.

Habidin et.al. have purposed to explore lean healthcare practice adopted by Malaysian healthcare industry and the relationship between lean healthcare practices and supply chain innovation performance.

Mishra et. al. (2015) have developed a framework and provide empirical evidence to support the conceptual and descriptive statements in the literature regarding the impact of human dimensions (HDs) to improve supply chain management (SCM) performance. Lyonnet et. Al. (2016) have developed a new method based on a multi-criteria approach to identify critical resources. Eight prioritization criteria involved in the company's global performance are proposed. The originality of our method is to take into account both material and human resources of the company.

Sylla et al. (2014) have surveyed PSA Peugeot Citroen factories and figured out that workstation requires high precision which results in manual stress. Liu and Li (2014) have studied the difference which is in between conventional and digital main control rooms in nuclear power plants. Factors were listed as per the task components and complexity dimensions. The study was done on three levels, namely task components, complexity dimensions and individual factors. This study can be used in improving the working standard of people working in nuclear power plant. Mohanty and Mahapatra (2014) have developed ergonomically designed office chair which will improve the comfort level of customer. Ray et al. (2015) have studied about Manual Material Handling tasks like lifting and carrying materials like bricks and heavy jack pipes at a construction site in India. They identified different risk factors and measures to prevent, eliminate and minimize their effects. Dul and Neumann (2005) have come up with a new strategy that ergonomics in addition to occupational health & safety, can also be used to evaluate business performance. Narayanan et al. (2013) have stated that Ergonomics is an important tool for a textile industry. Parida and Ray (2015) have discovered various problems in construction industry sectors like poor management of workforce, working methods, tools, and improper working conditions. Openshaw and Taylor (2006) have written ergonomics is the main factor considered while designing product. Lindroos (2009) has explained that when people deviate from their respective course of work, it results in accidents. Also, sometimes deviation leads to less productivity. Det et al. (2009) have analyzed the ergonomics challenges in minimally invasive surgery (MIS) which produced both mental and physical challenges for operating team.

However, there will be always domains and fields where people will have to perform a certain level of dirty, unpleasant work. Chedi (2015) has discussed the implementation of Ergonomics in Technical and Vocational Education and Training (TVET). Rundcrantz et al. (1991) have compared dentists with and without occupational cervicobrachial disorders with respect to mobility of shoulder & neck and posture of shoulder muscles. Ayhan (2013) has used FUZZY AHP in a Gear motor company for selecting the best supplier. Rouyendegh and Erkan (2012) have used Fuzzy Analytic Hierarchy Process for selecting academic staff by evaluating the suitability of the candidate. Garnaik et al. (2016) have implemented QFD & AHP for optimizing product design of furniture for Pankaj Enterprises, Odisha, India. Only human factor sciences can improve the work environment for such individuals. All these basic processes though driven by factors from science and technology will always have an impact on peoples' lives. Its impact on culture and civilization will come at par with the internet's and mobile telecommunication's

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

impact. Through development ergonomics always has to consider the human side of the communication with machines and other technological artifacts.

RESEARCH METHODOLOGY

To avoid MSDs for workers like carpenters, masons, welders & plumbers in construction sites and for providing occupational safety in the workplace, many theories found in literatures,but still this problem remains un resolved. To find most adverse repetitive work and awkward postures which creates MSD in workers/labors, a survey conducted for construction site works categorically carpenters, masons, welders & plumbers. Their body movements studied and noted and different body parts and various body movements are compared with each other by expert analysis. Then, eventually with the help of FUZZY AHP different body parts and various body movements ranked to find which movement is maximum and the part of the body suffered due to frequent movement. Such that some technology must be developed to help workers in completion of heavy work and occupational hazards can be avoided. Body movements can be categorized to Abduction, Adduction, Circumduction, Dorsiflexion, Eversion, Flexion, Hyperextension, Inversion, Plantarflexion, Pronation, Rotation, Supination as per literature review. To study and analyze body movements of construction site workers a standard questionnaire is designed and distributed among 282 workers(i.e., Carpenter, Mason, Plumber, Welder). By personal contact, the questionnaire is explained to them and their views are collected. It is observed that Body parts involved in construction work are the ankle, arm, eye, finger, foot, knee, knuckle, leg, palm, shoulder, spine, toe, and wrist. The survey conducted particularly for 282 workers (i.e, Carpenter, Mason, Plumber, Welder) in different building construction sites of Bhubaneswar and nearby apartment construction sites among them 207 data are collected. The survey found for workers of age 20 to 40, including women workers. They worked for 8 hrs and some of them doing overtime also. To improve the ergonomic performance of workers, the ergonomics value measured for 30 factors and total performance is divided into three major categories type of workers, as per body movement and body parts. As different types of tasks like repetitive work, continuous work like brick, laying, bending, squatting, standing, stretching, Twisting, Kneeling, Stooping, Suddenly Changing Position even loading and unloading etc. occured in work place So, their body movement is categorized by an anatomical term as follows.

- **Abduction:** It is a type of movement which draws a limb away from the median plane of the body like Swinging the hands from the side of the body up to the shoulder
- **Adduction:** It is the movement of a body part toward the body's midline. A person has their arms straight out at the shoulders and brings them down to their sides, it is adduction.
- **Circumduction:** This is the Joint Movements section about the types of movements between bones at joints in the body. Circumduction is a conical movement of a limb extending from the join.
- **Dorsiflexion:** It is the Backward bending of hand or foot.
- **Eversion:** Motion denoting the movement of the sole of the foot away from the median plane.
- **Flexion:** It describes a bending movement that decreases the angle between a segment and its proximal segment. For example, bending the elbow, or clenching a hand into a fist, are examples of flexion.
- **Hyperextension:** The extension of a limb or other body part beyond its normal range of movement.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Inversion:** Inversion is a movement in which the plantar surface (sole) of the foot rotates towards the mid-line of the body.
- **Planer Flexion:** It refers to extension or flexion of the foot at the ankle.
- **Pronation:** It is the way the foot rolls inward when you walk and run.
- **Rotation:** Rotation of body parts is referred to as internal or external, referring to rotation towards or away from the center of the body.
- **Supination:** It is movement in which the forearm occurs when the forearm or palm are rotated outwards. Supination of the foot refers to turning of the sole of the foot inwards.

Then Fuzzy AHP is implemented to Prioritized the workers as per their body parts movement.

The Saaty Scale is shown in Table 1. According to this method, the criteria were written in columns and in rows too. Then, the comparison was started between each criterion among other criteria. If the column criterion had greater importance than the corresponding row criterion, then the reciprocal of the Saaty Scale was assigned to it. And if the row criterion was of greater importance than the column criterion, then the normal scale was used. For example, in our case, in Table 1, Carpenter had lower importance than Mason, therefore, Mason was given 1/7, 1/8, 1/9 with respect to Carpenter as Mason was in the column and Carpenter was in a row. Similarly, when Mason was in a row and Carpenter was in column, Mason was given, 7, 8, 9 with respect to Carpenter. Let these fuzzy triangular values be known as d_{ij} (where i = no. of rows and j = no. of columns). Table 1 shows the Saaty Scale - Linguistic terms and the corresponding triangular fuzzy numbers.

Table 1. Saaty Scale-Linguistic terms and the corresponding triangular fuzzy numbers

Saaty Scale	Definition	Fuzzy Triangular Scale
1	Equally Important	(1, 1, 1)
3	Weakly Important	(2, 3, 4)
5	Fairly Important	(4, 5, 6)
7	Strongly Important	(6, 7, 8)
9	Absolutely Important	(9, 9, 9)
2	The Intermittent values between adjacent scales	(1, 2, 3)
4		(3, 4, 5)
6		(5, 6, 7)
8		(7, 8, 9)

Table 2. Input of construction site workers

	Carpenter	Mason	Plumber	Welder
Carpenter	1, 1, 1	1/7, 1/8, 1/9	1/4, 1/5, 1/6	9, 9, 9
Mason	7, 8, 9	1, 1, 1	9, 9, 9	6, 7, 8
Plumber	4, 5, 6	1/9, 1/9, 1/9	1, 1, 1	1, 1/2, 1/3
Welder	1/9, 1/9, 1/9	1/6, 1/7, 1/8	1, 2, 3	1, 1, 1

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The comparison was done between the criteria or alternatives via linguistic terms and Saaty Scale by Decision Maker as shown in Table 2-10. Table 2 Shows the fuzzy input for different workers.

Table 3 shows carpenter body movement with the motions of their body in construction site

Table 4 shows carpenter body movement of their body in construction sites.

Table 5 shows Mason body movement with the motions of their body in construction sites.

Table 6 shows masons body movement with the motions of their body in construction site.

Table 7 shows plumber's body movement with the motions of their body in construction sites.

Table 8 shows carpenter body movement with the motions of their body in construction sites.

Table 9 shows welder body movement with the motions of their body in construction site

Table 10 shows welder body movement in construction sites.

Then, the fuzzy weights were found out using the following 3 steps,

1. Vector Summation of r_i was done.
2. The Reciprocal of the summation vector was done and then was arranged in increasing order.
3. The fuzzy weights, w_i were found out

Table 11 shows the geometric means, fuzzy weights and averaged and normalized relative weight for construction workers.

Table 12 shows the geometric means, fuzzy weights and averaged and normalized relative weight for carpenter's body parts.

Table 13 shows the geometric means, fuzzy weights and averaged and normalized relative weight for carpenter's body movement.

Table 14 shows the geometric means, fuzzy weights and averaged and normalized relative weight for mason's body parts.

Table 15 shows the geometric means, fuzzy weights and averaged and normalized relative weight for mason's body movement.

Table 16 shows the geometric means, fuzzy weights and averaged and normalized relative weight for plumber's body parts

Table 17 shows the geometric means, fuzzy weights and averaged and normalized relative weight for plumber's body parts.

Table 18 shows the geometric means, fuzzy weights and averaged and normalized relative weight for welder's body parts.

Table 19 shows the geometric means, fuzzy weights and averaged and normalized relative weight for welder's body movement.

Since we were still stuck with fuzzy triangular values, they were then de-fuzzified by Centre of Area method which was proposed by Chou and Chang. These values were called as M_i (where i = 1, 2, 3 … n). This calculation was done using the following equation:

$$M_i = (lw_i, mw_i, nw_i)/3$$

Then, M_i was normalized using the following function as it was a non-fuzzy number,

$$N_i = \frac{Mi}{\sum_{i=1}^{n} Mi} \cdot M\Sigma_{i=1}^{n} M_i \frac{M_i}{\sum_{i=1}^{n} M_i} \cdot$$

The values of r_i, w_i, M_i, N_i are shown in Tables 11 - 19. In the last and final step, each alternative was multiplied with respectively related criteria and scores for each case were calculated and the one with the highest score was found to be of greatest importance. These values and the ranks are shown in Tables 20 - 21.

RESULT AND DISCUSSION

Though over the years, technology has given many comfort to human being in the workplace due to mechanized or automated technology. Still, the majority of the tasks are still performed manually in different industries.As labors are the backbone of developing industries like India, so their occupational safety is the most important issue. In this research, it is observed from the Table.20 that body parts like spine, shoulder, leg, and knee are most strained body part for carpenters, masons, plumbers, and welders. But among them from Table 20, it was found that for carpenter spine is the more affected parts for Mason's shoulder, for plumber was the shoulder, and for welder was the leg. Table 21 shows that the difficult body movements like Supination, Circumduction, Hyperextension are the dangerous movements for all types of workers. For Carpenter Supination is more, for mason circumduction, for plumber supination, and for welder circumduction are maximum body movements. This paper shows the most harmful body movements and mostly affected body part due to these movements. So proper ergonomic design must be suggested by modifying the workplace and work system. So, the diseases can be avoided and safety in the workplace can be maintained. To avoid or less these body movements new advanced equipment can be designed. Table 20 shows the body parts ranking.

Table 21 shows the body movements ranking.

Designing a Framework to Avoid Health Problems for Construction Site Workers

Fifty useful responses were collected and tested to examine the validity and reliability of the scale so as to obtain a quantitative and statistically proven identification of the responses. The test for the quantitative variable was conducted by factor analysis on 50 responses using the principal component method followed by varimax rotation to ensure that the variables are important and suitable for the model using Minitab 15.0. Twenty-two items were categorized under nine social factors constituting various variables for the proposed instrument to measure the relation between occupational safety management and firm performance of construction site workers as perceived by safety officers and workers. These nine social factors are defined as a Preventive procedure, OHS training, Risk management, Work practices, Periodic plans, Continuous improvement, Injury avoidance, Emergency plans and Healthcare. The items that failed to get loaded more than 0.5 were not considered for further analysis. This was true for refer to items 5, 6, 8, 10, 21, and 22. Percentage of total variance explained was found to be 75% which is an acceptable value for the principal component varimax rotated factor loading procedure. The internal consistency of the actual survey data was tested by computing the Cronbach's Alpha. Table 22 shows the factor's loading.

After getting seven important parameters/items for the improvement of policies of occupational health and safety by interview with experts, QFD was applied to identify system design requirements for occupational health and safety is studied

- **Customer Needs (What's):** A structured list of requirements derived from expert's feedback.
- **Design Requirements (How's):** A structured set of relevant and measurable services/characteristics which are required for fulfilling what's.
- **Planning Matrix (Left Matrix):** Gives customer/expert perceptions observed in surveys. It includes the relative importance of requirements
- **Interrelationship Matrix (Center Matrix):** Gives the expert's perceptions of interrelationships between design requirements and customer needs. An appropriate scale is applied and illustrated using symbols or figures. Filling this portion of the matrix involves discussions.
- **Design Correlation (Top) Matrix:** Used to identify where design requirements support or impede each other in the system or product design.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Customer rating $= Z_i + (1/n\text{-}1(\Sigma^{i}_{j=1} B_{ij} Z_j))$

B_{ij} is i^{th} initial customer rating and Z_j denote the relationship between customer need and customer rating respectively
n number of customer need

B_{ij} $[B_{1ij}, B_{2ij}]$.

The individual rating for each design requirement is obtained from the center matrix using the following relation:

$$\text{Design requirement} = \Sigma^{n}_{j} \sum_{j}^{n} . (_j, X_j)$$

where A_{ij} and X_j denote the relative importance of the i^{th} characteristics with respect to the J^{th} customer need in the relationship matrix and the importance of J^{th} customer needs (customer ratings) and n is the number of customer needs. Table 23 shows the design requirements and Table 24 shows the employee requirements.

Table 23. Design requirement

N°	System Design Requirement for Workers in Construction Site
1	Preventive measure
2	Emergencies plan
3	Injury avoidance
4	Health plan
5	OHS training
6	Periodic plan
7	Risk Management

Table 24. Employee requirements table

No	Employee Requirement/Needs for Construction Site
1	Safety training programs are conducted in the organization on regular basis
2	Instruction manuals being followed before executing any hazardous job activity
3	Immediate medical facilities are provided for personal injuries
4	Alarms/beeping sound/alarming light and emergency lights work effectively when a crisis situation arises
5	A Safety equipments are supplied by the organization to avoid accidents
6	The company readily provides health subsidies when accidents occur in the workplace
7	The employees work in health and safety condition
8	Regular auditing is done by OHS
9	Company undertakes a stress risk assessment in the workplace

A QFD matrix was prepared and the respondents were asked to assign numeric relative importance scores to the various customer requirements, from the lowest to the highest, on a scale from 1 to 9. They were also asked to express, in numeric values, the strong-moderate-weak relationship between what's and the How's as 0.2, 0.4, 0.6, and 0.8 with symbols. After the responses were collected, scores for each of the columns was computed. The design requirements are prioritized as per their importance of design requirement. Figure 1 shows HOQ for Construction site workers.

CONCLUSION

Although technology is changing day by day, man-machine interaction is still the main rule of modernization. Human accidents and health hazards are important points of discussion among many researchers. From the whole analysis, the inference found was that considering all 4 kinds of people, the body

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

movement which did hurt and injured the most and which brought out the maximum discomfort out of all 13 movements was Supination (wrist curling upwards). And the body part which was damaged the most out of all 13 body parts was Spine. The proper ergonomic design can change or modify the adverse effect generating from man-machine interaction. The main objective of this paper is the application of FUZZY-AHP in understanding role of ergonomic development in the construction sites and the reason for the origin of discomfort of people working there. This will eventually help in rising of the Construction Companies. The above analysis will help them in understanding the problems faced by plumber, mason, welder, and carpenter. It may help in reducing accidents and injuries that are very common on their construction sites. The data collected in this study were self-reported; hence, there is a chance of bias and measurement errors. The sample size for certain groups of employees is small; hence this might affect the results obtained. In future, the studies can be done for different workers. A model can be generated and tested to validate the body movement and body parts rank.

FUTURE RESEARCH DIRECTIONS

In future, more data can be collected on construction site workers of industries also. The analysis can be done for skilled and unskilled workers in heavy working conditions. Other sectors like automobiles, mining sectors can be analyzed by studying their workers. Interpretive structural modelling and SEM can be useful for providing relations among design requirements. More surveys can be done to get a better result.

KEY TERMS AND DEFINITIONS

AHP: Analytical hierarchy process is a structured technique for organizing and analyzing complex decisions, based on mathematics and psychology.

ANN: Artificial neural network is a computational model based on the structure and functions of biological neural networks. Information that flows through the network affects the structure of the ANN because a neural network changes—or learns, in a sense—based on that input and output.

HOQ: House of quality is a voice of customer analysis tool and a key component of the quality functional deployment technique.

ISM: Interpretive structural equation modeling is a well-established methodology for identifying relationships among specific items, which define a problem or an issue. This approach has been increasingly used by various researchers to represent the interrelationships among various elements related to the issue.

QFD: Quality function development is a structured approach to defining customer needs or requirements and translating them into specific plans to produce products to meet those needs. The "voice of the customer" is the term to describe these stated and unstated customer needs or requirements.

SEM: Structural equation modeling is a multivariate statistical analysis technique that is used to analyze structural relationships. This technique is the combination of factor analysis and multiple regression analysis, and it is used to analyze the structural relationship between measured variables and latent constructs.

Chapter 33
Applying Metaheuristics to Minimize Work-Related Musculoskeletal Disorders

Arminda Pata
University of Aveiro, Aveiro, Portugal

Ana Moura
University of Aveiro, Aveiro, Portugal

ABSTRACT

This article covers the topic of planning and organization of work, which is one of the biggest problems is to establish the most appropriate allocations between human and technical resources, according to the characteristics that define and characterize each individual. These adjustments to decision-making regarding the characteristics of a new larger workforce is a challenge for human resource managers and researchers working to provide well-being and quality of life improvements for employees. The problem of work-related musculoskeletal disorders, coupled with the aging of the active population, may increase the number of citizens with permanent disabilities. Given the complexity and uniqueness of the problems, a decision support system that uses some metaheuristic approaches is presented. The result is a hybrid approach that gives the best solution according to several parameters defined by the decision-maker. Computational results of real problem instances are presented, proving that in most cases, the optimal solution is achieved.

INTRODUCTION

The planning and work organization of human resources is a dynamic process. The working capacity of a human resource is a reflection of the balance between: the job (e.g. work performed); their individual resources (e.g. strengths and weaknesses); and motivation (e.g. job satisfaction). When these three aspects are reconciled, the work capacity of a human resource is increased, their quality of life is improved and consequently their productivity as well. In work planning and scheduling, the priority is always

given to the capacity and efficiency of equipment and workstations, yet never to human resources. This could lead to some adverse effects on their health. However, some initiatives have been implemented by organizations in order to preserve the health and safety of workers, such as: breaks, gymnastics, health monitoring (e.g. medicine at work), among others. But, work-related musculoskeletal disorders (WMSDs) continue to affect active citizens all over the world (Occhipinti & Colombini, 2016). It is common for companies to sometimes neglect the individual characteristics of their human resources (e.g. limitations, capacities, health condition and capabilities), due to work organization, in order to fulfil their objectives. Moreover, with the average life expectancy increasing and the birth rates decreasing, the labor force will grow older in the coming decades. Thus, the biggest problem nowadays should be allocating the best person to the most adequate workstation, ensuring that WMSDs are minimized. For this type of decision, one must consider the characteristics of the workstation and the capabilities and health condition of the human resource, while ensuring stable productivity. Each person has strengths and weaknesses, regardless of age, which must be leveraged and also taken into consideration in order to ensure the health, safety and quality of life of human resources. In an attempt to provide an active ageing, the main objective of this work is to present a metaheuristic approach, to solve the Work-Schedules Programing and Organizational Resources Integrated Problem (WPORIP) that will establish the most appropriate allocations between human and technical resources, according to the characteristics that define and characterize each individual.

One of the most common and expensive problems of occupational health in the European Union, focuses on WMSDs (OCDE, 2010; Takala, 2007). About 40 million people are affected by these injuries, which are responsible for 50% of occupational absenteeism (with at least three days breaks) and the other 50% of permanent disabilities (Bevan, 2013). Demographic changes, in recent years, points toward a likelihood that in the next decades older workers will become the larger portion of the workforce (Ilmarinen, 2012). There are several works that discuss the inability of companies to adapt to such changes in society (Cappelli & Novelli, 2010). The "Healthy Workplaces for All Ages Campaign 2016-2017" is designed to increase the public's awareness to the importance of good health and safety management at work, throughout an active life and to the importance of adapting the work to the human resource during all his professional career (AESST, 2016). In order to adapt to this new reality, managers will need to not only identify, specify and focus their efforts on changes that characterize the larger workforce, but also to follow this tendency and adjust their actions (Voelpel & Streb, 2010). Scientific researches and developments of new methodologies should be necessary in order to organize the work according to each person's capabilities and characteristics (Castillo & Collins, 2013). The workforce is generally made up of a group of individuals with different characteristics (e.g. lifestyle, skills, training, capabilities and limitations). The lifestyle and adaptability of people at work are some examples of factors that have been ignored over several years by scientific research (Othman, Bhuiyan, & Gouw, 2012). Thus, making quick decisions in line with the individual characterization of organizational resources (human and technics), as well as according to the restrictions and pre-defined objectives by the employers, are some of the essential ingredients to provide workplace safe and healthy and productive workers. Nowadays the development in storage capacity and the increase of computers' processing speeds, can help to automatize the process of making this kind of decisions and improve the solutions (Sheridan, 2014). Organizations and the government should actively promote the values of a focused culture on health and safety, and finally, researchers have the mission to create new flexible working models, which commit to planning and organizing work, according to the individual features of the existing resources. In an increasingly long professional, social and personal life, lifestyle, adaptability to work and the health of

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

active citizens can play an important role in creating a sustainable society. Organizations' obligation to providing a safe and healthy work environment, adjusted to the inherent organizational resources (human and technics), can be crucial to keeping people active. It is always the employer that takes obligations and work organization of organizational resources, and human resources takes care of their health and skills. So both the government and organizations should legislate rules to prevent WMSDs. Researchers and managers have a new challenge: to keep the older human resources active in order to ensure society's sustainability and the national pension system.

In this context the Work-Schedules Programing and Organizational Resources Integrated Problem (WPORIP) arises. The WPORIP consists of building the individual working-schedules taking into account the hypothetical sources that could induce injuries and permanent disabilities in each human resource. In real and complex systems peoples' allocation to workstations is a challenge for management and usually the WMSDs are not considered. The majority of the problems are dynamic, with specific objectives and constraints that usually change with time (Topcuoglu, Ucar, & Altin, 2014). So, in order to consider those aspects and characteristics, this work includes the integration of some problems, arising from three distinct areas of research: Ergonomics; Health and safety at work; and Operations research. In order to prevent WMSDs, workstations and human resources must be characterized and evaluated considering the ergonomics and the health safety aspects at work. Then, in order to build the individual work-schedules for the human resources, a scheduling problem that will allocate the human resources to each workstation should be solved. This is a complex problem, so in order to achieve good solutions in a reduced amount of time, a heuristic approach was developed, based on GRASP (Greedy Randomized Adaptive Search Procedure) and VNS (Variable Neighborhood Search) metaheuristics. This type of well-known metaheuristics usually has a good performance in scheduling problems (Fonseca, & Santos, 2014; Rocha, Oliveira, & Carravilla, 2014). The GRASP was first introduced by Feo and Resende (1989), with random search, adaptive and greedy procedures (Feo & Resende, 1989). After that, it has been successfully applied to different optimization problems, since it is based on a local search and it is relatively easy to implement, with few parameters to be adjusted. Moreover, the VNS metaheuristic was initially introduced by Hansen and Mladenovic' (1997) and is based on the exchange neighbourhood associated with a random algorithm to determine starting points for the local search. Unlike other metaheuristics, also based on local search (such as GRASP), it does not follow a pathway. This approach explores neighbourhood after neighbourhood, more or less distant from the current solution, going from the current solution to a new one, only when there is some improvement (Mladenovic´ & Hansen, 1997).

The remaining work is organized as follows: in the next section, the WPORIP definition and characterization is presented; then, a decision support system and the developed approaches to solve the WPORIP are explained. In order to prove the efficiency of the approaches some case studies and the related problem instances are described and also presented, and an analysis of the computational results is also made. Finally, some conclusions are drawn.

The Work-Schedules Programing and Organizational Resources an Integrated Problem

The frequency and intensity of permanence at workstations, submits workers to the same risk situations and to the repetitive use of the same body parts, resulting in the cause of WMSDs. Moreover, workstations may contain different risk situations and require repetitive use of the same body parts. As such, the WPORIP builds individual work schedules for human resources, according to their training, availability,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

physical capacity, state of health, exposure to risk situations and use of the body parts, while minimizing hypothetical WMSDs, related to the work execution. The task of assigning human resources to workstations that are appropriate to their individual characteristics, should take into account the benefits associated with the assignment, and the main objective is to maximize these benefits. One benefit is a numerical value (from 1 to 7) that depends on the characteristics that defines the resources (human and technics), the risk situations and the use of the body parts that support the work performance. Hence to plan the assignments of the human resources to the workstations, and to quantify those benefits, one should consider:

1. The nature of the risk situations of each workstation, ordered from 1 to 21 and divided into 3 groups:
   a. **Professional Risks:** 1. Extreme body postures; 2. Application of force; 3. Exposure to mechanical elements; 4. Repetitive gestures or movements; 5. Manual handling of loads; 6. Shocks or impacts; 7. Extreme temperatures - heat or cold;
   b. **Individual Risks:** 8. Age; 9. Gender; 10. Weight; 11. Anthropometric characteristics; 12. Health status; 13. Lifestyle; 14. Pathologies;
   c. **Organizational and Psychosocial Risks:** 15. Intense work speed; 16. Monotony of tasks; 17. Interpersonal relationships; 18. Time pressure; 19. Performance assessment; 20. Professional dissatisfactions; 21. Organizational model of production.
2. The body parts used to perform the tasks in each workstation, ordered from 1 to 6 (Table 1).

Performing tasks on a particular workstation involves the use of some body parts. A set of methods were developed for evaluate professional risk assessment. These methods (Table 1) were developed to evaluate specific situations, qualitatively or quantitatively and are periodically used in organizations by senior occupational safety technicians to evaluate work posts.

Table 1. Body parts used to carrying out the workstations tasks

Fields of application	Professional risk assessment methods	References
Whole body	REBA	(McAtamney & Hignett, 2000)
Upper limbs	RULA, KILBOM, HAMA, SI, OSHA, HAL, OCRA	(Christmansson, 1994; Kilbom, 1994; Mcatamney & Corlett, 1993; Moore & Garg, 1995)
Upper limbs and Column	QEC;	(Geoffrey et al., 2008)
Upper limbs and trunk	LUBA;	(Kee & Karwowski, 2001)
Upper limbs, lower limbs and column	OWAS	(Karhu et al., 1977; Matila & Vilkki, 1999)
Upper limbs, lower limbs, head and trunk	PT	(Corlett et al., 1979)

In this work, one use of these body parts and they can be exposed at the sources of WMSDs. Subsequently, it was necessary to assign weights (the benefits previously mentioned) to each risk situation (1 to 21) and to each body part (1 to 6). Those weights will serve to calculate the severity of the accumulated exposure, in the construction phase of an initial solution, in order to prevent hypothetical WMSDs.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In order to quantify the benefits, some specific individual characteristics (SIC) of the human resources should be considered, in order to make the assignments to the workstations: (1) skills; (2) adaptability; (3) lifestyle; (4) contributions; (5) professional and academic training; (6) ergonomics; (7) health condition. Each of these characteristics will receive one score that is computed using the Sidney Katz scale (Katz, et al., 1963). This score varies between 1 and 7, according to this scale:

1. Unfit
2. Minimum
3. Moderate
4. Mean
5. High
6. Very high
7. Maximum

These scores will be the benefits, which will be greater proportionally to the qualification and competence of the human resource to accomplish the work at each workstation. This result gives us a set of matrixes that will be used as inputs, when the working schedules will be computed. These benefits will be used to build the initial solutions for the WPORIP and also to evaluate the final solutions obtained with the metaheuristic approach. With this kind of information, the decision-maker could compare and choose the solution that fits its interests best.

The WPORIP also has several constraints that make it difficult to compute a feasible solution. Some of those constraints are related to the well-known assignment problems. The work load is evenly distributed across the workstations. In addition, each workstation consists of a set of work-posts. In each time period of a fixed time horizon, each work-post can only have one human resource assigned to it and each human resource can only be assigned to one work-post. On the other hand, a workstation can have multiple human resources assigned to it.

In order to solve the WPORIP three problems must be considered in an integrated way:

1. Assignment Problem
2. WMSDs monitoring
3. Work-scheduling programming

The main idea is to always manage the quality of life and well-being of the human resources, preventing hypothetical WMSDs (Figure 1).

The quality of professional life can promote positive and active attitudes towards life, avoiding some of the occupational diseases and preventing physical and psychological exhaustion (Ilmarinen, 2012). There are studies which indicate that retirement can interfere with the health status of people (Uva, Fonseca, Baltazar, & Dias, 2015). Thus, designing new working methods may allow the active life of people in organizations to be extended. As a result, active people are supposed to be able to enjoy better living conditions.

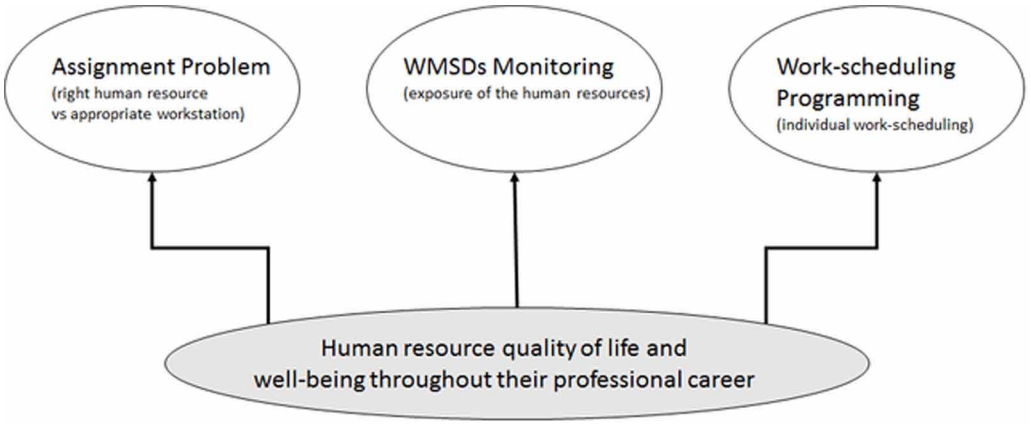
Figure 1. Three areas integration of the WPORIP



A DECISION SUPPORT SYSTEM TO SOLVE THE WPORIP

A significant part of people's life-time is spent in the workplace, therefore it is worthwhile to minimize hypothetical WMSDs in order to ensure the workers' quality of life within organizations. By applying techniques used in optimization problems, one can solve the WPORIP and achieve good and feasible solutions according to the organization's resources (human and technical) and objectives. The objective of this work is to develop a tool that allows, in a real work context, the assignment of people to workstations, while guarantying the company operations planning and the health and safety of the workers. In order to do this, the developed approach is divided into 3 phases:

1. Apt human resource selection and evaluation of its individual exposure in WMSDs risk sources.
2. Organizational resources scheduling (human and technical) and balance of the workload.
3. Individual work-scheduling problem.

The WPORIP has a large amount of data and constraints (as presented in the previous section) and it could be considered a complex problem. Therefore, a heuristic approach to solve it was developed, in order to decrease the computational time needed to obtain a feasible solution. So, the contribution of the present study results in a decision support system (DSS) that can compute individual work-schedules. The main objective of this DSS is to build the work-schedules for a fixed period of time, while minimizing hypothetical WMSDs and maximizing the use of human resources. For the WPORIP resolution, two different metaheuristics were applied, the GRASP and VNS. Each initial solution is built based on GRASP approach (Resende & Feo, 1996) and subsequently, starting from this solution, neighbourhood structures are generated based on a variant of the VNS approach (VNS with a restricted list, VNS-LR). This local search, not only allows to find new and better solutions, but also making it so the decision-maker can choose one of the final solutions that he considers the best one for its particular case. Moreover, this DSS also allows the decision-maker to validate all the classification and evaluation parameters previously defined to the human resources, as well as all the definitions related to the WMSDs.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

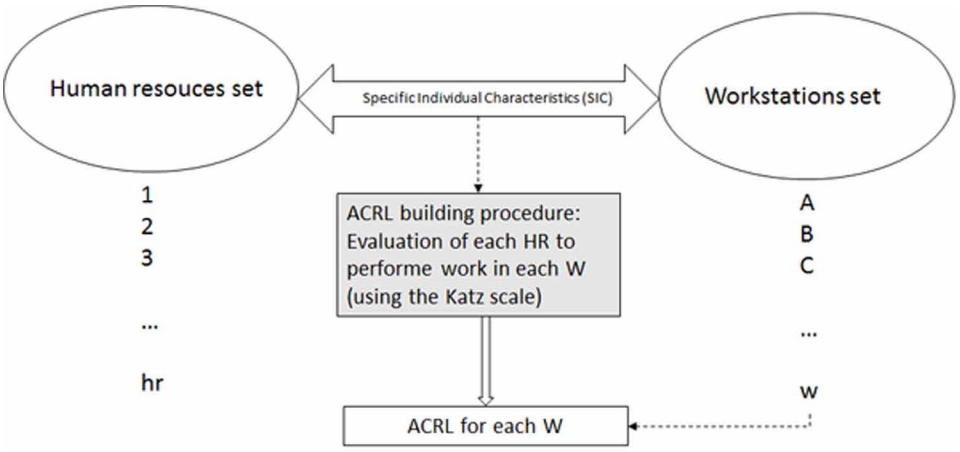
Apt Human Resource Selection and Evaluation of its Individual Exposure in WMSDs Risk Sources

In the first phase of the DSS approach, a list of apt human resources is created for each workstation, named Apt Candidate Restricted List (ACRL). A human resource is considered an apt candidate, based on its specific individual characteristics (SIC), if they can complete all the tasks inherent to the workstation (Figure 2). In order to build the ACRL, an evaluation of each human resource is done for each workstation, using the adapted Katz scale (previously presented) and according to his adaptive capacity, health condition and degree of preference in performing the work at the given workstation. A minimum score is imposed by the decision-maker, and if the human resource achieves an evaluation equal or bigger than this score, it will be accepted and inserted into the ACRL. In the end, all the candidates of an ACRL are arranged in descending order.

After all the ACRL are built (one for each workstation), a permanence time in the risk sources with the potential to cause WMSDs for each human resource is computed. This permanence time, allows for the evaluation and monitoring of each human resource during its labouring scheduling according to its SIC (Figure 3). The workstations also have specific individual characteristics (SIC) that are related to the risk situations of each work-post and the related use of the body parts to perform the work. As such, the permanence time is computed according to the SIC of each workstation (relationship between the risk situations and the use of the common body parts). Some exposure limit values (ELV) are stablished by the decision-maker for each workstation, indicating the permitted exposure of a human resource performing work, according to: time, frequency, incidence and the consequent intensity of exposure. Those ELV are also related to the risk situations and the use of body parts in each workstation.

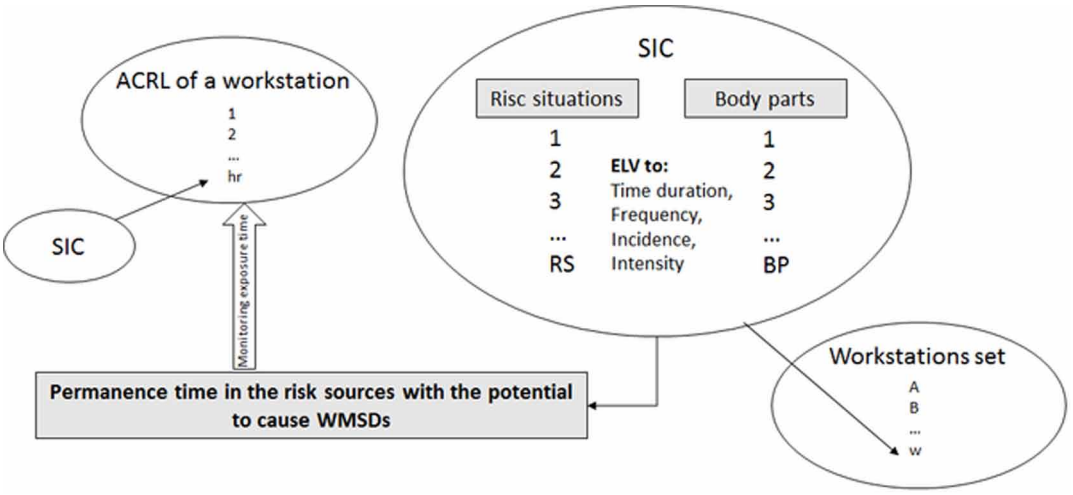
This will be helpful to the procedure that solves the scheduling human resource/workstation problem. In this case, only a candidate that has not yet exceeded the ELV should be associated with a work-post, so that their health and safety will be not compromised.

Figure 2. ACRL building procedure



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

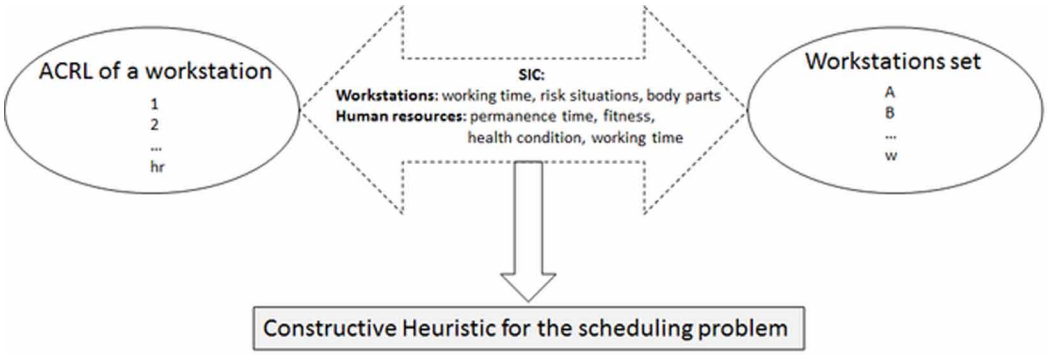
Figure 3. Evaluation procedure of individual exposure of each candidate in WMSDs risk sources



Organizational Resources Scheduling and Workload Balance

According to the previous data and information and with the organization capacity and production planning, the human resources are scheduled to each work-post. (Figure 4). In order to do that, a heuristic approach was developed to build an initial feasible solution (Figure 5). The scheduling is made according to human resource abilities, health condition and preferences to execute the tasks.

Figure 4. Scheduling the organizational resources problem



The main objective of the heuristic, consists of maximize the sum of the benefits that each worker has when scheduled to a workstation, which is based on the GRASP approach. Like in the GRASP, this constructive algorithm can have a greedy character, assigning always the best of the best of the available candidates of a given period of work in the ACRL to each workstation. Or it can be totally random - in this case, each available human resource is chosen randomly from ACRL. This process (from greedy to totally random) is controlled by a parameter α, which will define the size of the ACRL and will define

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the benefit in adding a candidate to the current solution. The parameter α could vary between 0 and 1; when equal 1 it is a greedy choice and when equal 0 it is a random choice.

Subsequently, and assuming that just as in any real problem the scheduling is not ideal (that is, even when a solution maximizes the benefits of the scheduling), there are always exposures that can probably cause WMSDs to workers. This is due to, for example, workers that are in constant subjection to the same type of risk or adopt attitudes and behaviours that are inadequate to their health and safety. Hence, it is essential to make or consider an homogeneous distribution of the workstations by the apt workers. As such, whenever a candidate is scheduled to a work-post, the balance of the workload at the SIC (risk situations and body parts) of the workstation must be evaluated. This evaluation is made using a score to each scheduling. For each assignment human-resource/workstation an evaluation is made, according to an Evaluation Function (EF). This function gives us a score, composed of three parameters, which also depends on the decision-maker:

$$EF = P_1 \times I_1 + P_2 \times I_2 + P_3 \times I_3$$

where:

P_1 is the human resource's ability to perform workstation work
P_2 is the human resource's health condition to perform the workstation work
P_3 is the human resource's preference to perform the workstation work

While, I_1, I_2, I_3, are weights assign to each parameter by the decision-maker and represent the importance given to each of them. The summation of the weights must always be equal to 1.

It is assumed that all the human resources respect hygiene and safety standards, to ensure their well-being.

Individual Work-Scheduling Problem

To a given planning horizon it is necessary to use and integrate the information given by each of the previous problems. The objective is to plan an individual work-scheduling for each human resource according to what defines and characterizes it. The work-scheduling, has the following constraints: a given plan horizon mustn't have empty periods; the permanence time in the risk sources with the potential to cause WMSDs must be balanced; and all the requirements of the organization must also be fulfilled.

In order to solve this problem a hybrid based on the GRASP and VNS-LR meta-heuristics approach was developed. The developed approach includes some conditions in order to build the work-schedules. Some of them are related to the human resources, such as: professional skills, adaptability to work, hours of cumulative exposure to risk situations and use of body parts, etc.; but also related to the workstations, such as: number of work-posts, exposure limit values, periods to carry out the work, duration of tasks, etc.

So, for a given time horizon (set of periods for one or more days), the objective is to obtain a work schedule for each human resource, that guarantees all the production requirements and organization capacity and that minimizes hypothetical WMSDs (or maximize the benefits). Thus, after constructing an initial solution, a local search is performed to improve it and to ensure the complete filling of the individual schedule, while guaranteeing the balance of the workloads (Figure 5).

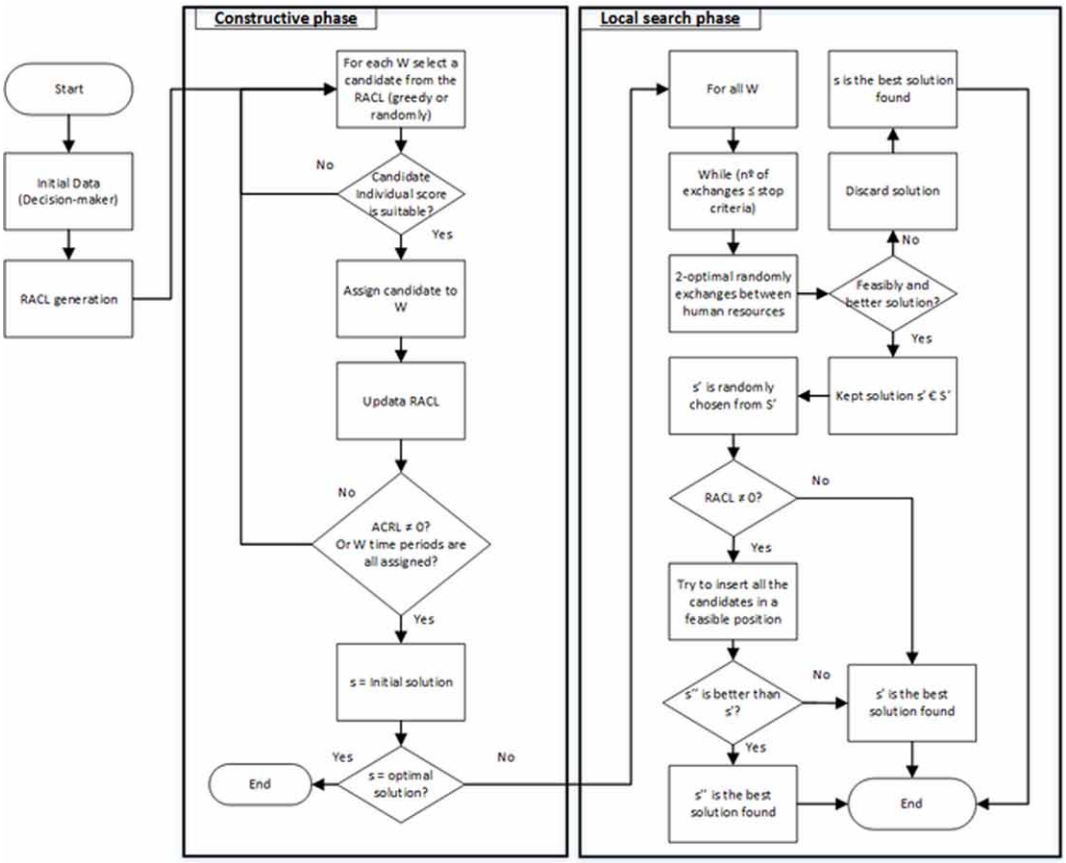
Figure 5. Hybrid approach fluxogram



In the local search phase (Figure 5), new solutions are randomly generated, always creating a neighborhood structure. These neighborhoods are built performing the 2-optimal exchanges of human resources, in a workstation and between workstations, in this order. The stop criteria for the exchanges are defined by the decision-maker, and it could vary between one and the total number of human resources involved in the problem. The human resources to be exchanged are randomly chosen. After the exchanges, a new neighborhood is composed by feasible and better solutions according to a given aspiration criteria (Figure 6). From that set of new and better solutions one is randomly chosen and if there are still some human resources in the workstations ACRL, with free time periods, then some 1-optimal movements will be made. Those insertions movements will be validated and the final solution evaluated in order to see if it is better than the previous one. Those movements are made to guarantee that all workers do not have free time periods in the final work-schedule. The hybrid algorithm ends with the best solution found.

Several test versions of the hybrid heuristic were developed (Figure 6), resulting in five different approaches. Each approach differs in the way that the neighborhood structures are build; due to a given aspiration criteria and the type of constructive algorithm. So, five test versions are proposed that are a conjugation between the two types of the constructive heuristic (greedy or random) and the four types of the local search (type of aspiration criteria to build the neighborhood structures). Depending on the decision maker, the solutions could be built with the aim of optimize the human resources SIC, or mini-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

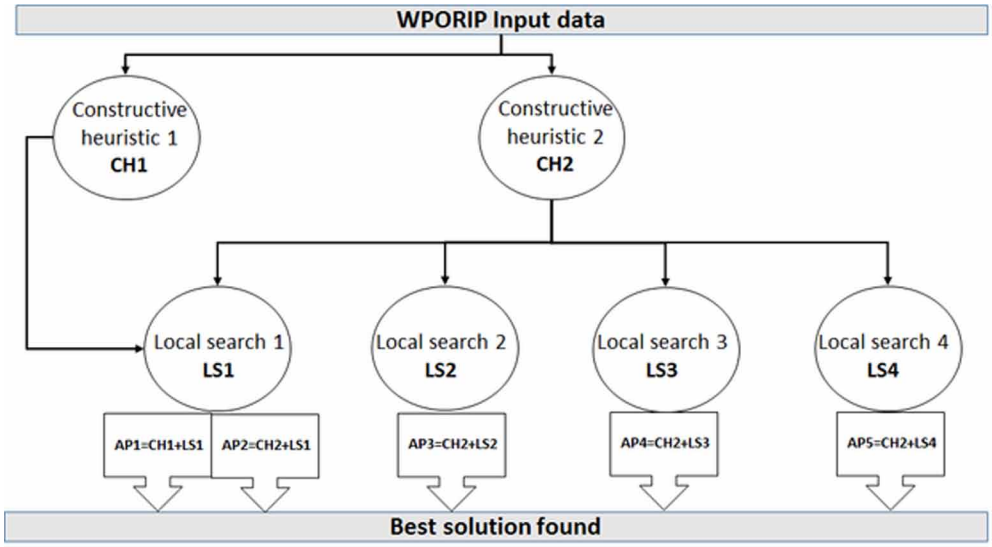
mize three different permanence time in the risk sources with the potential to cause WMSDs, by giving preference to the following SIC:

- The best of the best candidates for each workstation
- Less time exposure in the workstations risk situations
- Less time exposure in the workstations body parts
- Less permanence time in a given workstation

These four options are the aspiration criteria and with these four aspiration criteria and the two types of the constructive heuristic, five types of approaches are applied to solve the WPORIP:

- AP1 – Constructive phase: greedy constructive heuristic; local search phase: 2-optimal random exchanges between human resources in the same workstation.
- AP2 – Constructive phase: random constructive heuristic; local search phase: 2-optimal random exchanges between human resources in the same workstation.
- AP3 – Constructive phase: random constructive heuristic; local search phase: 2-optimal random exchanges between human resources, in the same and in different workstations, that have the smaller exposure time in the workstation risk situations.
- AP4 – Constructive phase: random constructive heuristic; local search phase: 2-optimal random exchanges between human resources, in the same and in different workstations, that have the smaller exposure time in the workstation body parts.
- AP4 – Constructive phase: random constructive heuristic; local search phase: 2-optimal random exchanges between human resources, in the same and in different workstations, that have the smaller permanence time in the workstation.

Figure 6. Five different approaches



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In each approach, all the generated solutions for all neighborhood structures must be evaluated and validated, in order to fulfill all the problem constraints and characteristics. In the end, as presented in Figure 6, for all the solutions generated, the 1-optimal insertion movement will be performed if the ACRL of a given workstation is not empty. This step will guarantee that all the human resources have the individual work-schedule without free periods. To finish the approach, the algorithm has two ways of evaluating a solution:

1. An objective function, that minimizes the hypothetical wmsds - in this case, the optimal value is zero;
2. An evaluation function that should be maximized - in this case, the biggest value the better.

In the end, for all the achieved solutions, those two parameters are computed. The decision-maker has to choose one of the two evaluations and the algorithm ends with the best solution found.

TEST PROBLEMS

The decision support system was implemented in Java language (IntelliJ IDEA software, version 15.0.2). The tests were all performed on a computer with an Intel (R) Core (TM) i7 4510U @ 2.00GHz 2.60GHz RAM, 8.00 GB and 64 bits.

Due to WPORIP being a new problem, there are no published instances in the literature that can be used for testing and comparing results. So, it was necessary to generate some problem instances using real problems data of repetitive tasks systems. Two different sets of problem instances, Case Study (CS1 and CS2), were created, representing two scenarios of heterogeneity of work teams and tasks (Table 2).

1. CS1 – multifunctional but homogenous work team, with simple tasks.
2. CS2 – heterogeneous work team, with complex tasks and skilled workers.

Each case study includes the following information/data:

1. Resources characterization (workstations and human resources).
2. Time horizon of the time-schedule.
3. Workstations scheduling efficiency.

Aside from this information, each problem is also identified by the identification of the tasks performed at each workstation and the human resources able to execute those tasks, as well all the human resources and workstations SIC (Table 3 and Table 4).

According to Table 3, the CS1 is composed of 10 human resources, 25 repetitive tasks distributed evenly by the workstations. The workstations efficiency is 97%, which corresponds to 3% of inactive time and with a total of 7 workstations, in which 3 have two work-posts. In those problem tests there are 21 risk situations according to each workstation characteristics and the use of 6 body parts. It is necessary to compute 10 individual work-schedules each one with 7 days and 2 daily periods (morning and afternoon), for a total of 140 time periods.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Instances used in the validation and testing of the developed work model

Designation	Case Study	
	CS1	CS2
Number of human resources	10	20
Number of tasks, distributed evenly by workstation	25	53
Number of workstations	7	19
Number of work posts	10	20
Number of risk situations	21	21
Number of body parts	6	6
Number of individual time-schedules	10	20
Number of daily periods	2	4
Time horizon of time-schedules (days)	7	21
Total number of periods	140	1680
Total number of minutes of work	33600	201600
Workstations scheduling efficiency	0.97	0.95

Table 3. Description of the Case Study 1

Case Study 1 (CS1)						
Workstation (W)	Tasks	Body Parts	Risk Situations	Number of Work Posts	Number of Apt HR	Human resources apt identification
1	1, 2, 18, 24	1	2, 5, 6, 7, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21	2	10	1, 2, 3, 4, 5, 6, 7, 8, 9, 10
2	16, 17, 19, 23, 25	6	2, 3, 4, 5, 6, 7, 11, 12, 13, 15, 16, 17, 18, 19, 20, 21	2	9	1, 2, 3, 4, 5, 6, 7, 8, 10
3	20, 21, 22	3	2, 3, 4, 5, 6, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21	1	9	1, 2, 3, 4, 5, 7, 8, 9, 10
4	3, 4, 5, 12	2	1, 3, 4, 11, 15, 16, 17, 18, 19, 20, 21	1	8	3, 4, 5, 6, 7, 8, 9, 10
5	6, 7, 13	5	1, 3, 4, 7, 11, 15, 16, 17, 18, 19, 20, 21	1	8	3, 4, 5, 6, 7, 8, 9, 10
6	8, 9, 14	4	3, 6, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21	2	8	3, 4, 5, 6, 7, 8, 9, 10
7	10, 11, 15	4	1, 3, 4, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21	1	8	3, 4, 5, 6, 7, 8, 9, 10

The CS2 is a bigger problem than the CS1 and it is composed of 20 human resources, 53 repetitive tasks distributed evenly by the workstations (Table 4). The workstations efficiency is 95%, with 5% of inactive time and with a total of 19 workstations, in which only one has two work posts. In those problem tests there are 21 risk situations according to each workstation characteristics and the use of 6 body parts. It is necessary to compute 20 individual work-schedules each one with 7 days and 4 daily periods (2 in the morning and 2 in the afternoon), for a total of 1680 time periods.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

For these two problems, there are some constraints that must be respected. Those constraints are categorized as strong constraints and weak constraints. The former must be respected in order to have an admissible solution to the problem. The latter could be violated but a penalty should be added to the objective function. Some of the considered constrains can be summarized as:

- **Workstations and Human Resources Weak Constraints:** The working time (minutes/free periods); the exposure limit values, indicative of the allowed permanence of a human resource; stand-alone workstations in a time-schedule; alternate positioning of workstations in the same individual time-scheduling; number of times that the same human resource is scheduled to the same workstation; etc.
- **Workstations and Human Resources Strong Constraints:** Number of daily periods; task durations; maximum number of human resources needed for a workstation; Maximum number of periods that a human resource could be scheduled to a workstation without induce WMSDs; etc..

ANALYSIS AND DISCUSSION OF THE RESULTS

For each CS1 and CS2, the hybrid approach was executed ten times for 10, 100, 1000, 10000 and 20000 iterations (Figure 5). Tables 5 to 9 show the results obtained using the five approaches (Figure 6). In table 5, the mean value of the initial solution found with the constructive heuristic (CH1 and CH2) and the mean value of the final solution (AP1 to AP5) for each CS (Table 5) are presented.

The objective function selected is the minimization of the hypothetical WMSDs, so, if the value of the solution is zero, one can say that the optimal solution was achieved. As explained before, the AP1 follows the best of the best candidates for each workstation aspiration criteria; this implies that the best of the apt candidates is always chosen. Using this approach, the solutions achieved are always the same no matter the number of algorithm interactions. In the 10 runs and for all the algorithm iterations, the optimal solution was not always achieved (Table 5), but for all the optimal solutions found it was verified that all the individuals' work-schedules are fulfilled and the workstations do not have any free periods. In terms of computational times (Table 6), all the approaches are very fast. For the CS1 the maximum time (for the 20000 interactions) was 3 seconds and for the CS2, where the dimension of the problem is bigger, the longest time was around 14 seconds.

In order to evaluate the solutions, whose value is not optimal, an analysis related to the most critical weak constraints was made. The weak constraints considered critical are the severity of WMSDs risk situations (Table 7) and the severity of excessive use of the body parts (Table 8), inherent to the tasks performing and that are common to different work-posts. Those are occurrences that arise from the realization of the work itself. One can conclude that those values are critical only in the case of the CS2, when solved with the greedy constructive heuristic (CH1). In all the other solutions the achieved values are zero or close to it.

In terms of robustness of the approach, the average number of exchanges (2-optimal movements) and insertions (1- optimal) made in each iteration, during the local search, was analyzed (Table 9). As should be expected, in AP1 the number of insertions is always zero, since the initial solution is greedy. But the number of exchanges is always considerably higher when compared to the other test versions. So, according to the information in Table 9, one can see that there is always a very significant improvement between the initial and the final solution. Analyzing all the solutions, there were no skilled workers without assigned workstations, except for the AP2 and AP5.

CONCLUSION

The active population, in the coming years, will tend to age. Supposing that human resources are exposed to hazards and risks for longer periods of time, health problems can be a result of the work routine and it could increase if no preventive and corrective measures are taken. Regardless of the profession, for a human resource to complete some tasks, they must use certain parts of the body for long periods and consequently can be exposed to various situations of risk. This could cause WMSDs (temporary or permanent) in the human resources. Good practices by management and human resources are some of the key elements to the well-being and proper functioning of a system. However, in spite of the initiatives of organizations in the prevention of the health and safety of workers (e.g. breaks, work exercises, health surveillance), WMSDs continues to affect the average person who perform simple, yet monotonous and repetitive tasks. It should be noted that people are not machines that can be programmed to achieve certain objectives. However, just like a machine, people also suffer wear (physical and psychological) and require maintenance. In processes with monotonous and repetitive tasks, it is essential to integrate a balance of the workload with the monitoring and the exposure limits in sources potential to cause WMSDs. However, this combination may allow the decision-maker not only to monitor hypothetical injuries, but also contribute to the active life of older workers in organizations. For this, it is necessary to dealt with this subject as an integration of three distinct areas of knowledge: Operational Research, Ergonomics and Health and Safety at Work. In order to do that a new problem arises: Work-Schedules Programing and Organizational Resources Integrated Problem (WPORIP).

In this work a DSS using a hybrid approach was developed to solve the WPORIP, based on the GRASP and VNS-LR. In this DSS all the input data and all the parameters (according to each problem and reality), could be adjusted by a decision-maker. Because, the closer the individual characterization of the organization resources is to reality, the more efficient the solution found will be. This approach has proven to achieve good results in a very small computational time, in most cases insignificant, and it can be applied in any real situation.

It is estimated that good practices resulting from the planning and organization of work, using the long-term model presented, can give a better control of the hypothetical WMSDs throughout profes-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

sional careers and subsequent healthy ageing of citizens. The basic limitations found during this study were the absence of references in the literature regarding the integration of the scheduling problems and the prevention of WMSDs. The lack of research in this area leads to three more important limitations related to: risk factors definition; the choice of characteristics and constraints to be considered in the selection criteria for human resources; and establishing the exposure limit values for each risk situation and body parts inherent to work.

It would be interesting if this problem would contribute to the discussion of other scheduling problems and new working methods related to the monitoring of WMSDs and the active ageing of the population. In terms of future work, it would be interesting to apply these approaches to real cases, in order to compare the DSS solutions with those actually practiced. In conclusion, we hope that the contribution of this work may stimulate future and relevant developments in this research area.

Chapter 34
Opportunities and Challenges of Using Mobile Applications for Workplace Health Promotion:
A Qualitative Study

ABSTRACT

Workplace health promotion (WHP) needs be adjusted to the new ways of working and improved in terms of participation rates. As mobile applications (apps) have proved to be effective in various health areas, it might also be a solution for WHP. However, there is a lack of knowledge about the requirements employees would have on such an app for WHP. Therefore, 29 semi-structured interviews were conducted with employees and experts of an IT company. Most employees were rather positive about such an app. Concerns were stated in terms of added value and data security. Variations were found in preferred functionalities. Apps might thus be effective for WHP but would need to add value compared to apps available for private usage. Additionally, clear communication about data privacy would be expected.

INTRODUCTION

In the last decades, employers started to further invest in the well-being of their employees. It is understood to improve productivity, self-perceived health, work ability as well as reduce absenteeism (Rongen, Robroek, van Lenthe, & Burdorf, 2013). Health promotion is one determinant of occupational health that "deals with all aspects of health and safety in the workplace and has a strong focus on primary prevention of hazards" according to the WHO (World Health Organization, 2016). Most programs established at the workplace yet focus on life-style related diseases e.g. lack of physical activity, poor nutrition and unhealthy weight gain (Rongen et al., 2013). For physical activity, a literature review of Malik and colleagues (2014) for instance indicates general effectiveness, even though they argue, that more well-designed studies are necessary (Malik, Blake, & Suggs, 2014). Besides considerations on effectiveness of the program itself, the participation rate in workplace health promotion (WHP) programs is rather low and thus poses a problem for implementations and overall effectiveness. A study reveals a median of only 33% of the employees participated in those programs (Suzan, Robroek, Van Lenthe, Van Empelen, & Burdorf, 2009).

Furthermore, developments such as mobile working, global traveling, and flexible working hours might influence the health of employees (Nijp, Beckers, van de Voorde, Geurts, & Kompier, 2016) and might include need for new health promotion measures. As mobile health (mHealth) is a growing field of research, it can be discussed whether it is effective in ameliorating the low participation rate and including the modern way of working in workplace health promotion (WHP).

However, little is known on the potential effectiveness and usage of mHealth as a means for WHP and more investigations are needed as supported by a literature study on WHP apps (Dehkordi, Breitschwerdt, & Fellmann, 2017). Up to now, some experimental studies have already been conducted on mhealth at the workplace, mainly in the areas of stress management and physical activity, but also among different target groups, such as airplane pilots and healthcare workers. Most of the studies seem to demonstrate effectiveness in decreasing stress and negative effects of shift work and increasing satisfaction (Ahtinen et al., 2013; Guertler, Vandelanotte, Kirwan, & Duncan, 2015; Ly, Asplund, & Andersson, 2014; Paschou et al., 2015; van Drongelen et al., 2014).

However, although most studies demonstrate a high effectiveness, the workplace health apps sometimes do not meet the needs of end-users and participation levels remain low (Muuraiskangas, Harjumaa, Kaipainen, & Ermes, 2016). Still, studies mainly focus on the evaluation of health status improvement as the outcome, whereas the end-user perspective and preferences and eventually the participation rate and reach of the intervention remain unclear.

In order to tackle this lack of information in WHP using technologies, a detailed view of the end-users needs to be evaluated using qualitative research methods (Dunkl & Jiménez, 2017).

In order to provide an overview of end-user's preferences and needs as a guideline for the decision-making process for stakeholders, the following research questions are investigated:

1. What benefits and obstacles do employees see when considering whether to use a workplace health app provided by the employer?
2. What functionalities would employees prefer to have in such an app?

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Background

Some investigations have already been made towards mHealth for WHP and show promising results, but also support the urge for further investigations. So far, studies have been conducted in the area of general health, stress, nutrition, but also weight loss, mindfulness, physical activity and sedentary behaviour and showed mostly positive results (Ahtinen et al., 2013; Bond et al., 2014; Giddens, Leidner, & Gonzalez, 2017; Gilson et al., 2017; Guertler et al., 2015; Lappalainen et al., 2013; Ly et al., 2014; Mattila et al., 2013; Möltner, Leve, & Esch, 2017; Morris et al., 2010; Shahrestani et al., 2017; Simons, Foerster, Bruck, Motiwalla, & Jonker, 2015). Furthermore, besides office workers, airplane pilots, truck drivers and shift workers were in focus (Greenfield et al., 2016; Paschou et al., 2015; van Drongelen, Boot, Hlobil, Smid, & van der Beek, 2016).

A literature review on mHealth studies for physical activity supported the positive findings revealed that most paper report a general positive influence, however often the sample sizes are rather small and thus effect sizes are limited (Buckingham, Williams, Morrissey, Price, & Harrison, 2019). Advantages as the adjustability to the individual needs of the employees, but also the potential integration of different functionalities, health aspects, and preferences present in workplaces are expected (Bardus, Blake, Lloyd, & Suzanne Suggs, 2014; Broding, Kiesel, Lederer, Kötter, & Drexler, 2010). Moreover, studies reveal that the technologies are independent of time and location, are available for usage, and can integrate private and professional lives (Suzan JW Robroek, Lindeboom, & Burdorf, 2012; Simons et al., 2015). This potentially provides a competitive advantage compared to ordinary location-based program for workplace health promotion. Also, even small companies, which usually struggle to implement health and safety measures (Champoux & Brun, 2003), might be able to implement such a mobile intervention with less resources.

However, even though mHealth is theoretically and among pilot studies effective, the general acceptance and participation needs to be guaranteed. Theoretical frameworks were only assessed for general mHealth (independent of the WHP sector) to explain acceptance. One of them is the Health Information Technology Acceptance Model (HITAM); however, it has not been evaluated in the WHP sector (Kim & Park, 2012). Furthermore, only general theories on technology acceptance in health interventions, like the Unified theory of acceptance and use of technology (UTAUT), which is often used in health interventions, can be applied to the field of workplace health. Until now, the UTAUT was used for mobile psychological self-management, for instance (van der Vaart, Atema, & Evers, 2016). Additionally, studies on fitness trackers use the UTAUT/UTAUT2 (Yoganathan & Kajanan, 2014; Yuan, Ma, Kanthawala, & Peng, 2015). However, the acceptance of the general population is yet to be researched (Kenny & Connolly, 2015). General behaviour change theories like the theory of planned behaviour, the health belief model, and the social-cognitive model can be applied.

Whilst only few qualitative studies were conducted to complement that knowledge with WHP specific factors. Dunkl et al. (2017) already quantitatively evaluated the view of employees in leading positions on WHP apps. The study shows that younger leaders in particular support WHP apps, as well as those with a positive attitude towards WHP in general (Dunkl & Jiménez, 2017). This is crucial as they represent the future leaders and people who are used to technologies.

De Korte et al. (2018) have further used qualitative methodologies to evaluate mHealth acceptance in a workplace. They list four main points to be considered: system performance, relevancy and benefits based on characteristics of the users, tailoring to the work context, and privacy and data-related topics (de Korte, Wiezer, Noortje, Janssen, Joris H., Vink, Peter, & Kraaji, Wessel, 2018). Jimenez et al. have

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

further developed a life-cycle for eHealth measures at the workplace. In their study they especially emphasize the need for investigations on quality and regulatory assessment also in terms of privacy of those measures, as well as the involvement of different stakeholders (Jimenez & Bregenzer, 2018).

Still, more qualitative, but also experimental research is necessary in order to comprehensively understand the end-users view (Buckingham et al., 2019). This knowledge is necessary in order to build a practical framework for the implementation decision process and the development of such an app in WHP. Additionally, qualitative research is needed to allocate resources in the most effective way before implementing such an intervention or developing such an app.

Methods

In this qualitative study, semi-structured interviews were carried out based on the grounded theory. Predefined question catalogues were utilized to conduct the interviews and execute qualitative content analysis. This method was chosen based on the lack of knowledge regarding users' preferences, needs, and potential obstacles of the usage of mobile applications in the WHP setting and its potential for gathering deep insights into the opinions of the end users. The study was conducted following the consolidated criteria for reporting qualitative research (COREQ). The study design included semi-structured interviews with employees of a German IT company. In total, 29 open-ended interviews were conducted between September 2016 and May 2019. The interviews were audio-recorded and were afterwards transcribed.

Participants

The study population consisted of potential end-users—i.e. employees in the field of IT. All interviewed subjects worked in the same company. The recruiting took place via a personal email containing information on the approximate interview duration, the general topic of occupational health management, but without mentioning any technology or further information. Except of four candidates that were not able to take part in the interview due to time issues, no one refused to take part in the interview. Therefore, it is expected that no bias is included as non-participation was not explained by having no interest in sharing their opinions.

Eventually, the study group consisted of participants of different age groups, gender distribution, perceived health status, educational backgrounds, and job positions. Furthermore, five external consultants were included to represent the modern working environment, which entails multiple locations and flexible working hours. Further, two company doctors, a recruiter, an IT security expert, and two workplace health experts were included to obtain insights into the professional view of this topic.

The details of the study population, including preferences in physical activity and nutrition behaviour, are shown in Table 1.

Data Collection

The data was collected through semi-structured interviews, which are defined as interviews with a pre-determined catalogue of open questions that builds a framework for the interview. The advantage of this qualitative methodology is to get deep insights into the opinion and preferences of the end-user and stakeholders involved in the decision-making process of workplace health. Within this study, all 29 interviews were conducted in separate rooms at the participants' workplace to make it as convenient as

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

possible for the participants as well as to avoid disruptions, interactions, or group consensus. One female researcher (MSc) with a background in health sciences conducted all interviews. Mostly, a second scientist was present to review and evaluate interview style. In order to give the participants the opportunity to speak freely in their mother tongue and to capture all relevant aspects all, but one interview were held in German. The statements in this paper were therefore translated from German into English by the authors.

Table 1. Demographics of participants

Characteristics	N	%
Age in years (N =29)		
- ≤ 30	7	24.1
- 31-40	8	27.5
- 41-50	10	34.5
- 50 - 60	3	10.3
- ≥ 61	1	3.4
Gender (N =29)		
- Male	18	62.1
- Female	11	37.9
Perceived health status (N =26)		
- Under average	2	7.7
- Average	19	73.1
- Above average	5	19.2
How much do you like exercising? (N =26)		
- Reluctantly	2	7.7
- I like it	9	34.6
- very much	15	57.7
Do you prefer healthy food? (N =26)		
- No	4	15.4
- Moderately	7	26.9
- Yes	15	57.7
Children (N =27)		
- yes	11	40.7
Usage occupational health means (N =27)		
- Never	7	25.9
- I used to use them, but not anymore	5	18.5
- I use a few means occasionally	13	48.1
- I actively participate on a regular basis	2	7.4
Usage health app (N =27)		
- Never	5	18.5
- I tested it, but don't use it anymore	8	29.6
- Sometimes	5	18.5
- Usage on a regular basis	9	33.3

The structure of the interview was equal of all interviews. It started with a short introduction of the people present and the information on the interview procedure and data usage. Prior to the start of the recording, the interviewees signed the informed consent form. The subjects were informed that they can withdraw any information at any time. Detailed information on the study aim and objectives were only provided after the interview to avoid prior influences of the interviewees. After the introductory part, the interviewer mainly followed four main question blocks. These included first some demographic questions,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

as shown above (Table 1). Following that, the second block focused on definition, usage, and opinion of occupational health measures in the company. The third block comprised questions concerning private health apps usage. In details this included questions on initial motivation for download, experiences, and wishes for the future. At last, the topic of using mobile applications for WHP was addressed. The structure was consciously chosen in order to receive some basic information of the usage and background of the participants, before diving into the main topic of WHP apps. Obviously in most interviews, the last part took the most time.

For the latter questions on WHP apps, the interviewer started with broad questions, asking the participants to imagine a poster with a company health app in the entrance hall and requesting their first thoughts and opinions. Afterwards, preferences for functionality, willingness to share data, and potential usage behaviour were evaluated. On average, the interviews took 20–50 minutes.

Data Analysis

Transcriptions of the interviews were done by three different researchers. All transcriptions were again read by the interviewer to complement the transcriptions with notes, made during the interview, about body gestures. Furthermore, participants' names, the company name, or names of health promotion initiatives, if mentioned in the interview, were replaced by anonymous wordings like 'company x'.

The transcriptions and the audio files were imported to NVivo (by QSR International). and coded therein. Coding means that text passages were subordinated to codes or "nodes" e.g. reasons for initial usage of a health app. The nodes were predefined tuned to the interview guide. The node tree is demonstrated in Figure 1. Additionally, cases (interviews) received classifications regarding their demographics and other characterises.

The individual quotes subordinated to the nodes were then analysed by the researchers. The number of coded text passages per nodes differed between 3 and 71.

The targeted goal of the analysis is to identify factors and relations that influence the acceptance of health technologies in WHP, therefore the study is based on the grounded theory.

Due to the limited number of participants and the qualitative focus of the study, no statistical analyses of the results were done, only demographics and the number of quotes were compared.

Results

Based on the coding of the interviews, some main results can be described. In total, 1,124 quotes were coded. In the following section, the findings are structured according to the blocks and codes shown in Figure 1. First, general health status of the participants will be described, followed by the answers on workplace health promotion usage questions and their health apps usage. Lastly, the results of the questions on WHP apps will be demonstrated.

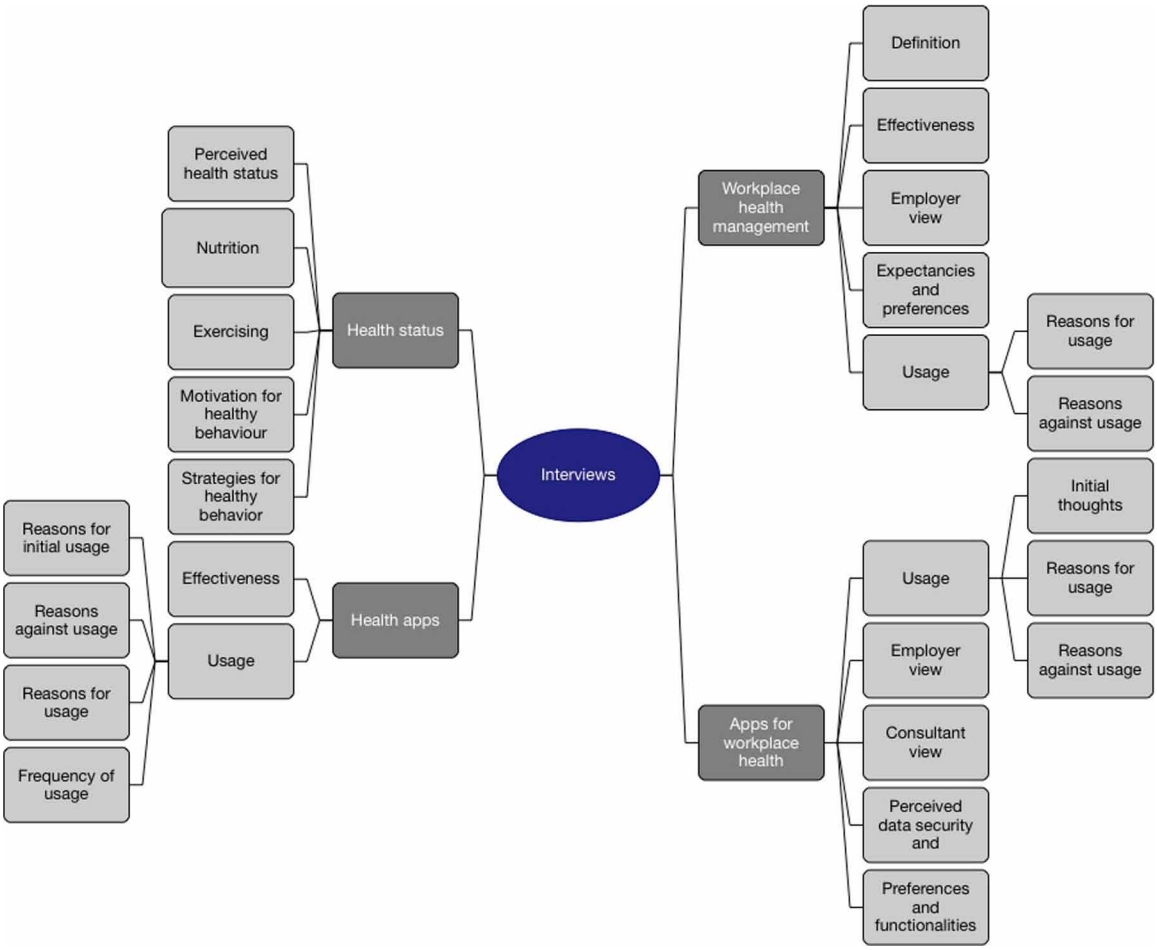
Health Status

In Table 1 a detailed description of the individual expression of the demographic are demonstrated. Most participants described their health status as average and claimed to enjoy physical activity. While 16 stated that their health is very important to them, another four states that its importance has increased over the years as they got older. Two said that they try to be aware of their health but are sometimes not

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

strict about it. Participants' motivation to stay healthy were mainly (in % of participants who mentioned it): to feel fit (44.8%); weight control (27.6%), experiences of health issues in the social environment or past own health issues (13.8%), stress reduction (6.9%), long healthy life (10.3%), increasing age (3.4%). Individual participants also stated the need to have fun, play with their children, feeling bad about their poor health, and wanting to go back to a certain fitness status. Reasons that hindered the participants on investing even more into their health were mainly: time, as also supported by literature as being the most common reason for not participating in health measures (Kruger, Yore, Bauer, & Kohl, 2007), the canteen, unstable weather, not seeing the consequences of unhealthy behaviour immediately, and laziness.

Figure 1. Coding tree



Workplace Health Promotion

The results on the perception of WHP show variations. In total, 18 participants knew about WHP interventions and eight said that they do not know what it is, even though they imagined the right interventions when asked. Still, it became clear that often the individual initiatives were seen separately by the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

participant and not necessary assigned under the umbrella of WHP even though a dedicated name for those programs even existed in the company. As demonstrated in Table 1, only two respondents participated on regular basis in WHP measures, while 13 participants use initiatives irregularly.

Reasons for non-usage of measures were mainly time rosters of activities (34.5%), separation of private and work activities (24.1%), lack of knowledge (17.2%), lack of the right offer (17.2%) culture (10.3%), and not wanting to embarrass oneself in front of colleagues (13.8%). Additionally, lack of communication, information flouting, fear of diagnosis, need for more fun, need for acceptance of others, practical reasons like showering and carrying cloths to work, and mismatch of offers and needs were mentioned. Furthermore, three consultants and a part-time employee mentioned that participation is unrealistic due to flexible working arrangements and new ways of working.

Reasons in favour of the use of WHP measures were time savings, location in general, networking, targeting of the right needs, culture, and cost savings.

From the employer's perspective, represented by expert on the topic, WHP is a means for keeping the employees productive. Further, the company doctor stated that there are governmental regulations to adhere to and any other means are seen as a benefit for the employee. From the point of view of the employer, as represented by the recruiter and the doctors, it is further seen as an important means of image cultivation, which has gained importance over time. The employees responsible for WHP further mentioned that the target group needs to be studied and interventions need to be evaluated regularly.

[…] if you don't have high participation rate in the WHP you have done something wrong […]. Because I think that generally speaking, people have the interest to do something for their health. Either way a majority. Of course, there are those 20–25% whom you can't reach, but I am convinced that you can reach two-third of the employees with the right means.

Participants were further asked to state their expectations for the future as well as address topic most relevant to them. The most commonly mentioned ones were stress management, nutrition, ergonomics, and more communication on the topic to emphasize the seriousness.

What I expect is mostly already provided, general things as for instance ergonomic working places, that we have good chairs, that the monitor is correctly adjusted, that I have modern working equipment, etc. Further that I have sufficient opportunities for healthy nutrition, that the canteen is offering healthy food or some vegetarian days etc. Those things I do expect.

Health Apps

The distribution of the health app usage demonstrates that the participants represented all user habits: Five have never used a health app, eight have used them but stopped, five use the apps from time to time, and nine use it on a regular basis. The used functions were mainly step-counting and activity tracking (34.5%). Six used fitness wristbands and six used apps for nutrition and weight management. Sleep, meditation, and cycling were also mentioned.

Six interviewees state that they used the app for the first time based on the advice of a friend or colleague. Other initial motivators were advertisement, app presence on the phone at time of buying, or just interest in trying it out.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The functions most mentioned as valuable were self-monitoring, individual time schedule, comparison with friends, and integration of various functions in one app. Furthermore, the participants stated the following reasons for usage: self-monitoring and tracking (37.9%), motivation (13.7%), as well as reflection, the possibility to connect with other apps, and the low effort needed. Reasons against usage were tracking and data (24.1%), a lot of effort in individual typing (17.2%) perceived pressure (10.3%), no interest (10.3%), and technical reasons like battery life, storage, and small screens and factors like fear of frustration, disruption in sports due to calls or messages, and having to carry around one's phone.

Workplace Health Apps

As described in the method section, the last and more comprehensive block of questions, included questions regarding the potential of WHP apps. As an introduction, interviewees were asked to imagine a poster at the entrance hall and their first thoughts and ideas about it. Only after that, they were specifically asked on preferred functionality, advantages and disadvantages.

As mostly advantages and disadvantages were discussed, those are demonstrated in Table 2. In total 135 references were coded for advantages and disadvantages. It revealed, that most participants had rather positive associations. One participant even proposed apps as a new means during the questions about WHP in general. Eight further wished to download the app and then evaluate on its value.

I would think it's a good initiative and would be more interested in looking at it and understanding what exactly it checks and if it's beneficial, I would like to use it.

Table 2. Advantages/disadvantages of WHP apps

Advantages (mentioned by N participants)	**Disadvantages (mentioned by N participants)**
- Condensed and fast information provision (9) - Positive social pressure (6) - Great for technically affine people, especially younger generation (5) - Incentives (4) - Independent of location, applicable for home office (4) - Overview on activities (4) - Added value (3) - Integration to other private and professional platforms (3) - Positive image for the company (3) - Possibility of personalization (3) - Low effort for company (3) - Low effort for employees (2) - Enhanced motivation (2) - Easy to use (2) - Competition (1) - Possibility to integrate more functions over time (1) - Cost savings (1) - Usage of technical possibilities (1)	- Data security (11) - No added value compared to private apps (9) - Already flood of information (4) - Social pressure and stress (4) - Blending of work and private life (4) - Short-term usage (3) - Lack of quality checks (2) - No control on the execution of proposed exercises by colleagues (1) - Lack of regulations (1) - Only fit people would be interested (2) - Additional media (6) - Dependence on technical components e.g. battery (3) - Only for technically affine people (1)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Only seven stated their general opinion against the app, even though they would still have a look at the app. Rejection of the app were based on their concern about data security in four cases and because interviewees did not see the value in three cases.

First, I would say uhh great, I like it. And then I would be worried about my personal data

Added values were generally mentioned rather frequently. Even though participants were positive in general, they stated that they would only continue using it if it adds value compared to private apps.

This is relatively easy for both sides, for the company and for the employee. You really have the opportunity, with little effort, to give your employees such a small help and to do something good for them. On the other hand, you as an associate are doing it or you are not doing it or you are interested in it or leaving it. But I think that's pretty cool that way.

Besides general analysis of the quotes, some analysis of the argumentations given were compared among the different demographics' characteristics. These reveal interesting results, even though interpretation is difficult, due to the fact that the number of quotes coded by the research does not include information on the assigned weight of the argumentation by the interviewee. Differences were for instance found among men and women. Whereas for women more quotes were coded as advantages of WHP app usage, for men more disadvantages of mHealth usage for WHP were coded. When comparing the different age groups, the age group of interviewees aged 40-50 and those aged 60 or older stated more disadvantages of usage of WHP apps. The same applied for those, who use mHealth privately on a regular basis (25 versus 19 quotes). Additionally, it seems as those participants with children provided more quotes against usage compared to quotes towards (48 compared to 33).

When evaluating, the functionalities proposed by the participants, further interesting results could be withdrawn. The proposed and preferred topics and functionalities mentioned in the interviews as aspects of interests are shown below, along with the numbers of interviewees who expressed interest (Table 3).

During the interviews, it became obvious that different impressions came to the minds of the participants. Eight explicitly mentioned that the app should be personalized. Six additionally said that it needs to be tailored to the company and job requirements. Furthermore, two suggested that the app should include both a possibility to provide information only and deactivate data gathering and a possibility to make it more sophisticated and integrate more personal data. Therefore, both user groups would be served. Additionally, different requirements were mentioned, including full integration of various tracking functions with information, incentives, bonus systems, benefits, and communities, although some participants also mentioned that they don't like games, reminders, or incentives.

It was further emphasized by the interviewees that the app needs to be easy, intuitive, and lively, so that something is happening daily. Often, the added value compared to other apps was mentioned.

[...] it depends on the functionalities with data tracking, without data tracking in any form. I do have full trust in the company when it comes to data integrity, but often these services are being bought or need to be bought and then[...] it depends on what the topics are […] I actually cannot come up with a health app that the company can offer that does not exist yet.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Proposed functionalities of apps for workplace health promotion

Topic	(mentioned by N participants)
Condensed information on local WHP and health topics	15
Nutrition information	12
Challenges/competitions	7
Physical activity tracking	7
Linkage to company's other portals/ platforms	6
Ergonomics and sitting	6

Further proposals for drinking water, travel information, hints for stress, reminder to take breaks, sleeping cycle, and blood pressure tracking were made. In particular, the wish for aggregated information on the WHP program reflects the previously reported need for more information on WHP within the company. From an employer's perspective, WHP apps might also have a positive effect on the recruiting process. Additionally, it was mentioned twice that it should fit the company values and workers (in this case, an IT Company).

'I personally think, this might not be bad, you would have everything on the app, the most important information and this might make the colleagues more sensitive to the topic. There is always the problem that the bosses also need to support it […] there is no value if there is only the app, but it needs to come from above, a certain approach needs to be lived in the company.'

Contrary to our expectations, the recruiter, employee representatives, and the employees responsible for WHP were rather positive concerning usage of such technologies and personally showed no concern about data disclosure. This might be explained by a gap of knowledge between those working in departments, where they experience data handling, and employees who have never been in touch with the handling and thus assume the worst.

Data Security

Generally, an overall judgment of data security and privacy perception were difficult to grasp. Most participants expressed that their perception is highly dependent on the outcome and combination of data required. Seven claimed to trust the company and to expect only positive outcomes when sharing the data in an app. Interestingly, three participants preferred to rather share data directly with the employer than via an external company.

'I personally think that I have more trust in the company than in any other external provider.'

Interviewees further emphasized the need to make an informed decision, meaning that sharing of data would not be a matter of concern if the process of data analysis and sharing is clearly stated. Participants further often stated that they are personally not worried but could imagine others being worried about misuse. Often, participants were torn concerning the data questions—they claimed to trust the company but were still worried. Most probably, this uncertainty arises from a lack of information.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

With my real name, […], even though I fully trust the company, I would have concerns, but on the other hand, there is so much personal data here about me. They know exactly when I work and when I don't work. There are so many regulations, which is why I think I would still use it.

When considering, the experts on WHP, mhealth, and IT Security all affirmed that the company is generally not allowed to save health-related data of employees; thus, the app would need to be externally hosted and only anonymized information would be provided to employers. Additionally, according to data security expert, the app needs to be adjustable according to the willingness to share personal data in order to integrate most employees. However, they all agree that laws and regulations required to successfully implement it are currently not in place.

Consultants

In order to evaluate the impact of these technologies on the modern way of working, consultants currently working in the same company were interviewed. Of course, they recognized their special situation and had a positive view of technological support to receive more information concerning health issues—especially information adjusted to the needs of a consultant, like information about the current workplace or information which can be used independently from the working slot is considered as important. One participant, however, clearly stated his concern about data.

I mean of course, you would need to find out what the particularities are, when people are often commuting, there are small aids, like 'how can I do something' … for fifteen minutes, something to feel better, … how can I do exercises for relaxation, if I know there will be something stressful ... And thus, a small hint, a small guidance. So, in this direction especially, I am sure that helps.

This information provides a direction for future research and practice, as the increasing global interaction and modern way of working enhance the need for those kinds of measures.

Overall

Conclusively, it was retrieved that employees are generally open for WHP apps, provided they are able to control their data-sharing and the app can be tailored to their own needs and preferences. Experts emphasize the future development of such apps and the formation of habits around technologies and thus believe that the working population will be better at coping with the information flood and the usage of such technologies. The health experts further expressed the need for personal contact and for regulation concerning data and usage during working hours. Further, it became clear that the app would not be the only initiative or measure for cultural change and that a convenient working environment needs to be established. As the last point, the researchers notice no difference over time—especially for data security, which seems to depend on personal opinion.

Discussion

This study is among the first to qualitatively evaluate the usage of mhealth for WHP. Previous studies have emphasized the need for this qualitative evaluation of the perception of end-users (de Korte et al., 2018;

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Dunkl & Jiménez, 2017). Often, the interventions of WHP do not meet the needs of the end-consumers, thus limiting the reach; hence, end consumer evaluations are extremely important (Rongen et al., 2014).

The study comprises 29 semi-structured interviews with employees in order to receive a comprehensive view of the topic in one company. The demographics varied and thus represents a common working force in regards to age, health status, and interest in health technologies. Additionally, the usage of health apps in private lives differed. Most of the employees have tried those apps, but only few used it on a regular basis. As in most other companies, the need for investigations in WHP was supported by the interviews, as most employees were not aware of the program and just knew several independent initiatives.

Barriers to participation were mainly reported to be lack of information, lack of time, and lack of interest as it did not meet their preferences or they preferred doing personal activities without using technology, as already supported by other studies (Bardus et al., 2014; Suzan JW Robroek et al., 2012).

In terms of WHP apps, a high level of interest was demonstrated. Most employees would try the app despite having concerns about the added value and the data security. The overall trust thus seems to play a big role in acceptance, as discussed by Mettler et al. (2019). However, it seems that the app needs to be well-developed in order to convince users (Mettler, T & Wulf, J, 2019). This positive opinion about apps for WHP was reported by employees who had various previous experiences with WHP and health apps. Furthermore, the answers showed no direct links to age, gender, or health status, implying that apps are useful for different characteristics even though differences in the number of quotes including advantages and disadvantages were found.

When considering the proposed functionalities, it became obvious that the lack of information concerning WHP was one of the most important points. Additionally, physical health and nutrition tracking were favoured. Apart from this, challenges and competition were discussed. Many employees were in favour of it, whereas others did not want to share their personal data with colleagues to avoid social pressure. Those kinds of incentives and gamification have already been discussed in the literature and often shown effective results. Although they have not yet been tested in the workplace, their effect can be deduced from contexts like chronic disease management via apps (Miller, Cafazzo, & Seto, 2016). Again, these functionalities would need to be voluntary in order to reduce negative social pressure. A previous study on workplace health apps supports the tailoring to the work context. In our study, however, the added value compared to other privately used apps was more often mentioned (de Korte et al., 2018).

In terms of perceived data security, a lack of research is identified. Even though it seems to be a big issue of concern, little about it is found in the literature. Additionally, an interesting finding during the interviews is that employer representatives—like recruiter, WHP experts, employee representatives, and the IT expert—were less concerned about sharing the data as they had sufficient knowledge about the handling of the data and regulations concerning data handling compared to other employees.

This is further supported by Dunkl et al. (2017), who report positive opinions of leaders towards mhealth apps for WHP (Dunkl & Jiménez, 2017).

In conclusion, it can be stated that providing detailed information on the data handling process might enhance the acceptance of such a technology (Dockweiler & Razum, 2016).

Limitations of the Study

The study is limited by the chosen methodology. First, it needs to be stated that the interviews were conducted in only one company in order to compare results on the basis of the current status of WHP. Furthermore, the interviews only included German-speaking participants, limiting the generalizability to

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Germany, even though the company operates globally. The general positive view of technologies among the participants might also be because they are employed at an IT company. Besides those limitations, common limitations for semi-structured interviews also apply to our study. Due to the small sample size compared to quantitative studies, no statistical tests were conducted. Therefore, results rely on the interpretation of the researchers and the study population rather than on objective results. Besides, the sample cannot be tested for representativeness on another sample. Still, this method allows deep dive insights into the opinions of potential users and thus provided advantages compared to quantitative results. Of course, statistical validation of our found results is desired for the future.

Future Work

Based on the findings described above further investigations into mHealth for workplace health promotion are necessary. Obviously, potential user groups show a general interest in using these media for health measures. Further scientific studies would therefore be necessary to evaluate acceptance factors, potential effectiveness and eventually actual usage of mHealth. In order to complement the methodology utilized in this study, quantitative studies as well as comprehensive field tests or RCTs on effectiveness would be necessary to research that field. As the field of data disclosure seem to be of high relevance among the study group, investigations into that field would further be appreciated.

CONCLUSION

The initial decision to download an app seems to arise from a general interest in technologies, data security perception, perceived value, and support from supervisors.

For a practical implication, it is thus recommended to prepare a comprehensive communication about the app, data usage, and the added value. The app would need to integrate various functionalities and contents, which can be adjusted to the needs and preferences of the end-users in order to add value for many employees compared to private apps. Despite the limitations of the methodology, the study gives directions for future usage of mhealth as WHP as well as research. Generally, most participants were positive about mhealth, even though doubts concerning added value compared to the current market and data security concerns were shared. Additionally, the data security concern seems to arise from a lack of information, as representatives of the employer and experts were less concerned.

Future research should deal with acceptance, preferences, practical testing, and incentives to further increase interest.

ACKNOWLEDGMENT

The authors would like to thank all participants of the interviews for their contribution. This research received no specific grant from any funding agency in the public, commercial, or not-for-profit sectors.

ABSTRACT

Appreciative inquiry (AI) has been used to promote positive change in different areas of organizational life. It is based on the 4D cycle which includes four distinct stages: discover, dream, design, and destiny. Organizational wellbeing is both a strategy and a responsibility, especially in recent times, when the line between work and life seems to be blurring, and there has been an increased concern about the role that work plays in the health and wellbeing of employees. AI is substantially different from other institutional analysis methodologies because it is not focused on solving problems, but on the positive aspects of organizational life and culture. This chapter presents the case of a private university in Puebla, Mexico, which has been promoting holistic programs to improve employees' wellbeing and happiness, reducing stress and other potential health problems through appreciative inquiry on what members dream, long for, and aspire in terms of better overall health. It is a descriptive study that presents a specific case.

INTRODUCTION

The traditional approach to organizational development programs has focused on creating remedies to a variety of problems in an attempt to generate positive change (Cumming & Worle, 2015). By contrast, Appreciative Inquiry is an organizational change method (Cooperrider, & Avital, 2004) that focuses on the positive aspects of an organization rather than on its problems, identifying and valuing what is good, and investigating about it (Reed 2006; Cooperrider & Srivasta, 2017). Appreciative Inquiries are conducted through the analysis of four phases known as the 4 Ds: Discover. Dream, Design, and, Destiny (Cram, 2010).

Organizations are currently facing complex and ever-changing environments (Cooperrider & Srivasta, 2017) in which uncertainty, job insecurity and instability prevail. Globalization, competitiveness, continuous technological advances, increased automatization, and digitalization have led to increased demands resulting in overwhelmed employees living in increasingly stressful settings (Kleber & van Der Velden, 2009). Rewards and development programs have been modified to promote employee happiness and wellbeing (Grant, Christianson & Price, 2007), thus improving all aspects of their lives.

More than ever organizations are becoming centers of vital connections. While life-giving health programs were originally designed to reduce insurance costs (Lockwood, 2003), they have become an important element in business missions and visions to improve employee productivity (Kirsten, 2010) and retention (Sears, Shi, Coberley & Pope, 2013). Healthy organizations develop good practices (Corbett, 2004), and a culture and climate that can promote employee health and safety through actions directed to the individual, the group, the organization, and inter-organizational processes (Di Fabio, 2017), resulting in a positive revolution on organizational development and change management (Cooperrider & Whitney, 2001).

The World Health Organization (WHO, 2019) has suggested that among the risks of mental health, the following can be positioned in the lead: Inadequate security and health promotion policies, inefficient management and communication practices, lack of decision-making authority, lack of control over their working area, low level of employee support, rigid working hours, and lack of clarity about areas and organizational goals. It is precisely in this context that healthy organizations have emerged (Di Fabio, 2017).

Wellbeing programs that focus on strengthening practices have resulted positive in maintaining a healthy environment (Di Fabio & Peiró, 2018). The Pan American Health Organization (PAHO, 2017) has explained that Mexico designed a strategy to promote healthy work settings that are free of violence, that address psychosocial factors, and that promote emotional well-being to generate healthy work habits, and that the strategy is being promoted through active social dialogue, consensus mechanisms, and research and training.

Numerous studies have demonstrated that when experimenting stress continuously, people become less creative and less productive; bad decision are made, and engagement with the organization is eventually lost (Maslach & Leiter, 2008). When this happens, businesses risk their competitiveness (Peterson & Wilson, 2002).

A Higher Education Institution (HEI) was selected for the analysis, since there are very few studies that have been performed in the area of education (Van Straaten, du Plessis & van Tonder, 2016), particularly in relation to the wellbeing of employees (faculty and administrative); and, with no studies of the kind found in Mexico, an interesting area of research has been identified.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

UPAEP is a HEI in which the promotion of human dignity, freedom, solidarity, subsidiarity, congruence, respect, love, and justice are the leading values. The institution strongly believes that the support for successful organizations are the people and the organizational climate (Glisson, 2015); that in a supportive environment workers feel better and are healthier, and that this leads to reduced absenteeism, increased motivation, more productivity, less turnover, a more positive image, and a consistent corporate social responsibility (Berry et al, 2010). In correspondence with these values, UPAEP has developed numerous initiatives oriented towards the consolidation of a healthy organizational culture that increases awareness among collaborators to prevent health risk factors through the practice of healthy habits and a variety of activities that contribute to the improvement of their quality of life.

The "Transform your health" program (*Transforma tu salud*) has been designed to transform the health of all collaborators through healthy habit formation in a prevention culture that will result in better work performance. The objective is to promote a culture of prevention and conscience among collaborators to reduce health risk factors through holistic practices and activities that contribute to the improvement of their quality of life (Ortiz, 2018). It is an integral flexible and friendly program that offers a wide variety of activities, including medical evaluation twice a year, lab tests on cholesterol, glucose and triglycerides, nutritionist evaluation, physiotherapy and dental care.

Evaluation makes it possible to collect data about participants, who establish a personal goal to improve their health and select from different activities that they would like to engage in, in order to achieve their goals. Every activity they participate in adds points, and every year a prize is awarded to the person who took better care of his/ her own health. The program offers a variety of activities that are related to sports, entertainment, emotional support, and preventive health.

APPRECIATIVE INQUIRY (AI)

Appreciative Inquiry (AI) can be analyzed from two different approaches: the first is the AI paradigm in itself, or the principles and theories behind a strength-based change approach; and, the second, AI methodologies and initiatives, or the specific techniques and operational steps that are used to bring about positive change (Cooperrider & Associates, 2019.)

It is a form of action research that originated in the United States in the mid-1980s, with the works of David Cooperrider and his colleagues in Western Reserve University (Cooperrider, et.al. 2005; Varona, 2007; Losada, 2013; Bello, 2010; Bushe, 2012). AI studies the positive attributes of organizations to create new conversations among people as they work together for organizational change (Serrat, 2008). It is a process of collaborative search centered on the positive core of the organization: its competences, skills, talents and best practices (Cooperrider, 2005). Furthermore, Preskill & Tzavaras Catsambas (2006:1) have defined AI as a group-process that inquiries into, identifies, and further develops the best of "what is" in organizations in order to create a better future. It is a knowledge philosophy, a change methodology and a leadership method; a worldview that builds on action research, organizational learning, and organizational change (Trajkovski, Schmied, Vickers, & Jackson, 2013), shifting the focus from a problem-based research paradigm to a positive theory of inquiry based on future possibilities and performance (Koster & Lemelin 2009).

Serrat (2008) has suggested that AI is based on the ideas that organizations are not machines but rather a social reality which is co-constructed, and that the important organizational processes of com-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

municating, decision making, and managing conflict, hinge on how the people involved make meaning out of their interactions.

It is an invitation toward the development of a positive revolution that begins within oneself and that makes it possible to establish a new way of being and acting. It employs the concepts of positive psychology to engage and encourage strengths and overcome weaknesses (Kowlasky, 2008). It is a proposal to establish an organizational culture in which knowledge is created, shared and implemented in an intentional, active and disciplined manner; a methodology to promote social change, in which theory, practice and intervention converge (Varona, 2007).

AI reflects the way in which people inquire together into the infinite potentials and varieties of human organizing, co-constructing the conversation, analyzing the ways in which it is done, and the realities that emerge from it, both individually and collectively (Fitzgerald, Oliver, & Hoxsey, 2010). It has a transformational nature, based on the changes in the identity of a system and the qualitative changes in the state of that system, with observable outcomes including the development of new knowledge, models and /or theories, and which results in a generative metaphor that compels new action (Bushe & Kassam, 2005).

Appreciative Inquiry aligns with critical social theory, therefore supporting an egalitarian form of open dialogue, empowering practitioners to become change agents and to explore innovative practice (Hung et al., 2018); it has been claimed to have numerous applications, such as coaching and mentoring, positive culture change, and service delivery in education, health and the social services (McAllister & Luckcock, 2009). It uses different tools and techniques, including storytelling (Richards, 2016).

The starting point and the basis of AI is the human ability and potential to learn; it aims at stimulating the organizational and teams capability to collaborate, imagine, discover and promote innovation, with an emphasis that does not rely too much on the identification, diagnosis and solution to problems, difficulties and on what the organization lack, but more on the positive: the qualities and strengths of the system, living experiences of excellence as described by its members, the discovery and the development of hidden possibilities, and positive change (Losada, 2013; Varona, 2007; Bello, 2010).

AI facilitates connectedness, promotes resilience, and contributes to professional identity formation in an authentic environment (Butani & Plant, 2016). It has been used in a diversity of sectors and activities; and has been analyzed for career development, decision making and for understanding the realities of the workforce (Schutt, 2018) to develop employees public speaking skills (Mehta, 2018); to cultivate change in higher education (Filolt & Lander, 2013); for responsible evaluation (Haar & Hoskin, 2004); research practice development (Hung, 2017); service learning courses (Jones-Eversley, Harnekhall & Vejar, 2018); collaborative research (Lundgren & Jansson, 2016); to manage different generations (Ohmer, Barclay & Mekel, 2018); and even, professional use of social media (Pereira, Winningham, Moreau, Scherbino & Jalali, 2015).

With regards to health improvement and health care environments (Fitzpatrick, 2016), including care in home setting (Dewar & MacBride, 2017), the AI approach has been used to develop weight management programs for children (Teevale & Kaholokula, 2018); for stress management (Ravalier, McVicar, & Munn-Giddings, 2018); to bridge research and practice in hospital settings (Hung, Phinney, Chaudhury, Rodney, Tabamo, & Bohl, 2018); to improve medical education (Sandars, & Murdoch-Eaton, 2017); healthcare education and training (Rider, Comeau, Troug, Boyer & Meyer, 2019); and in nurse educator's exam practices (O'Rae, Hnatyshyn, Beck, Mannion, & Patel, 2018), among others.

Appreciative inquiry has been randomly analyzed in Higher Education Institutions (HIEs): Van Straaten, Du Pleissis & van Tonder (2016) have suggested that limited studies have been done on the wellbeing of staff at HEIs. In British universities it has been used to incorporate solidarity to mitigate

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

marginalized young people (Inchley, Dar, Pujara & Baker, 2019). It has also been used in order to determine the motives for teacher migration in Africa (Hlalele & Mashiya, 2019), and to understand the connection between teaching practices and students wellbeing in Canada (Lane, Teng, Barnes, Moore, Smith & Lee, 2018).

In HEIs across the world, emphasis has been placed on teaching practices for humanizing and expanding education networks (Rogers, 2019) and to support students' wellbeing (Lane, Teng, Barnes, Moore, Smith & Lee, 2018); tending to disabled students' needs (Dent, 2019); improving management education for future managers in business schools (Peterin & Gravin Pranicevic, 2019); developing business school graduates attributes for future employment (Allen & Simpson, 2019); analyzing burnout in medical school students (Bitran, Zuñiga, Pedrals, Echeverría, Vergara, Rigotti & Puscher, 2019); providing community support (Scmied, Burns & Shehan, 2019), and supporting staff in various factors related to their wellbeing (Field & Buitendach, 2011).

Stages of AI

The model most associated to AI had an interesting evolution. It is based on the assumptions that ways of organizing are limited only by human imagination and the agreements people make with each other. It seeks to create processes of inquiry that will result in better, more effective, convivial, sustainable, and vital social systems (Kessler, 2013).

The original method, developed by Cooperrider & Srivastva (1987), was based on four principles, and called for a collective discovery process using grounded observations to identify: the best of what is; vision and logic to identify ideals of what might be; collaborative dialogue and choice to achieve consent about what should be; and, collective experimentation to discover what can be. In 1995, the notions of Dream and Destiny were introduced, and, in 1997, the Design and the Delivery phases were added (Bushe, 2012).

AI supposes the application of a process that is both rigorous and flexible, and is based on forum stages as shown in Table 1. The first one is about the DISCOVERY of the things that give life to an organization. The second, DREAM, is about what the organization might be; the third, DESIGN, is what should be, and the fourth is DESTINY, sustaining what should be the envisioned future (Cooperrider & Whitney, 2005).

Table 1. Stages in the process of AI

Stage	Goals	Tasks
1. Discover	Identifying what gives life to the organization appreciating and valuing what is best of what is or has been	Conduct appreciative interviews.
2. Dream	Envisioning 'what might be', affirmative exploration	Formulating aspirational declarations (the dream-the vision)
3. Design	Co-constructing 'what should be', the ideal	Formulating provocative propositions (the design of a new organization)
4. Destiny	Sustaining what will be, envisioned future	Define, plan and execute the programs that will make the dream come true- the vision

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Authors such as Mohr (2018); Cooperrider, et.al. (2003, 2005); and Varona (2007) suggest that there is a fifth D, that of Definition, because it establishes the initial focus and scope of the inquiry.

The four stages are described as follows:

- **DISCOVER:** In this stage, all the factors that give life to an organization and the best that the organization has with regards to the topic chosen from the intervention are explored. It is about discovering what people value, expect and desire based on the chosen topic, and identifying the positives within the organization. The method used to discover what an organization has is the Appreciative Interview. This type of inquiry supposes the art of making appreciative questions that stimulate the positive potential that exist in people and in organizations. The appreciative interview is the heart of AI.
- **DREAM**: This stage is about identifying what could be. It invites participants to be creative, and to think beyond the boundaries of past processes and experiences. This is a practical stage, as it is supported on what already exists, and it is also generative, since it expands the organization's potential by creating something new and improved. The realization of this stage should generate collaborative energy and enthusiasm among participants. Furthermore, the power of imagining what is required in this stage is a competency, a gift which is not easy to obtain but which can be developed through practice, specifically when collaborating in teams: It is all about what might be.
- **DESIGN:** In this stage the ideal organization is designed in relation with the world that surrounds it. It is about finding the preferred future, whose design is based on the discovery of positive components and shared dreams; it is based on answering the question: How would our organization be if we designed it in a way in which it could achieve all possibilities and help speed the realization of our dreams? In this stage the goal is to identify the elements (factors) of organizational culture (values, beliefs, rites, etc.), and the elements (factors) of organizational infrastructure (practices, systems, structures, policies, etc.) that support the cultural factors needed to build the dream. The identification of these cultural and structural elements is based on the aspirational declarations that were formulated on the earlier dream stage. The pillars for the construction of the dream emerge from these aspiration propositions that constitute the vision of what is expected based on the selected topic. Once the pillars have been defined, provocative propositions need to be formulated. These propositions integrate the elements (factors) of culture and organizational infrastructure that are essential to make the dream come true.
- **DESTINY:** The goal in this stage is to ensure that the dream can be realized by identifying and planning the programs (projects) and the type of actions (methods) that need to be deployed to implement the provocative propositions from the last stage. In this stage, the underlying question is which programs need to be implemented to ensure that the organization executes and maintains provocative propositions? It relates to the empowering of the creativity inherent in the individuals within the organization to achieve that which has been designed based on positive change.

Finally, the team responsible for the execution, accompaniment and evaluation of the programs is appointed. The plan to communicate the process to the organization and the results of AI is defined. According to Varona (2007), the success of the four-stage process relies on certain essential elements which constitute the spirit and soul that give life to a process that includes a genuine desire to change and improve; participation and commitment of all members; creating a narrative-rich communication;

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

establishing a discipline culture; creating a new knowledge of excellence, and developing appreciative intelligence and perseverance.

AI does not go on without problems or limitations. Oliver (2005) has suggested that a common concern is that a focus on positive stories and experiences during the discovery phase will invalidate the negative organizational experiences of participants and repress important and meaningful conversations that need to take place (Bushe, 2012). Furthermore, Pratt (2002) identified limitations in asking participants to inquire appreciatively in systems with unexpressed resentments, something that might invalidate AI.

ORGANIZATIONAL HEALTH AND WELLBEING

Emotional tiredness, or burnout (Gunderman, 2019) derived from stress, generates a series of negative consequences to the physical psychological working and social-familiar health (Amutio, et.al., 2008). Employees are frequently sick, are less motivated, have a low performance, and there is a high possibility that they abandon their jobs. Besides, organizations with these conditions have low expectations of success in competitive markets (Calderón, et.al., 2017; World Health Organization, 2004). Facing these circumstances, organizational wellbeing acquires relevance for organizations as it has been shown that there is a direct correlation between job satisfaction and the continuous search for better conditions that improve organizational life quality. (Calderón, et.al., 2003).

Organizational wellbeing results from a process in which the individual evaluates the balance between expectations and achievements in his work, as well as the balance between expectations and achievements in his personal life and other contexts (Clark, Oswald & Warr, 1996 in Calderón, et.al., 2017).

The concept of wellbeing has been developing and adapting to new organizational dynamics that have emerged. In the 70s, this concept was associated with the notion of Quality of Work Life (QWL) (Bedoya, et.al., 2016).

QWL refers to the positive or negative character of a working environment. It is aimed to create an excellent environment for employees and to contribute to the organization's economic health (Guízar, 2008; Sirgy, et.al., 2001; Igbaria, et.al., 1994; Subbarayalu, & AI Kuwuaiti, 2019).

Workers are able to become better citizens through adequate work supervision, challenging jobs, harmonious organizational climate, holistic development, work enrichment, acknowledgement, recognition, through developing new skills, through reduction of organizational stress, and by establishing more cooperative relations (Guízar, 2008).

The notion of organizational wellbeing and QWL have become relevant study topics in numerous areas of science in which the most recurrent concepts have been related to management, public environmental occupational health, business, psychology, nursing, industrial relations labor, social sciences, sociology, computer science and information systems, social work, education, ethics, environmental, among others (Web of Science, 2019).

An organization's health includes all factors within an organization that encourage a healthy workforce. Health of organizations improves when cared for, and deteriorates when ignored, thus signifying the importance of employees' well-being for business profitability (De Smet, Loch & Schaninger, 2007).

Healthy organization and healthy business create positive attitudes inside organizations. These organizations have the right balance between their particular situation, sector and culture, and place importance on wellbeing and sustainability. A healthy organization can be defined as being characterized by intentional, systematic, and collaborative efforts to maximize employee well-being and productivity by

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

providing well-designed and meaningful jobs, a supportive social–organizational environment, and accessible and equitable opportunities for career and work–life enhancement (Wilson, DeJoy, Vandenberg, Richardson, & McGrath, 2004).

Different aspects of employees work life, including productivity, performance, job satisfaction and organizational commitment, are influenced by various factors related to their well-being comprising work stress, degree of job control by individual employees, conflict between work and life, and lack of organizational support (Halpern, 2005). Weiss & Cropanzano (1996) have suggested that employee wellbeing is related to specific outcomes such as a decision to remain in the job or resign, absenteeism, distress, job satisfaction and others.

According to Cartwright & Cooper, (2009), the success of an organization is invariably judged on the basis of its financial performance and its ability to provide high-quality goods and services over time. In a changing internal and external environment, the financial health of an organization is increasingly dependent on the extent to which an organization and its members are able to transform and adapt to these changing circumstances more effectively than their competitors. Physical health and well-being are determined by a range of social, psychological, and biological factors and are conceptualized as resources that allow people to lead individually, socially, and economically productive lives.

Health has been identified as a key driver of socio-economic progress internationally (Houtman & Jettinghoff 2007) highlighting the link between the health of individual workers and the overall performance of an organization. The creation of healthy work environments is an ethical imperative of corporate responsibility: treat employees with respect, avoiding harm, and developing their health potential, is doing the right thing, which results in increased productivity and effectiveness (Ibermutuamur, 2014).

The American College of Occupational and Environmental Medicine (ACOEM, 2019) argues that labor welfare programs not only have a positive impact on productivity for its ability to reduce damage from work and to improve the worker's health, but also favor the optimization of technical and medical resources related to health management in a company

Understanding the socio-cultural element in an organization is a responsibility of the people in charge of managing them (Calderón, & Murillo & Torres 2003), since it implies understanding the relationship of the persons with the organization, their attitudes, expectations and aspirations.

The theme of well-being in the working environment can be observed from a particular point of view, stemming from which well-being itself is recognizable as the result of interaction between the characteristics of the individual and those of the working context, contrary to the assumption that well-being in the workplace depends exclusively on external conditions in terms of the working and organizational environment within which the individual operates (Burke, 1993; Lawson, Noblet, & Rodwell, 2009).

As a consequence of globalization, workers today experience greater job insecurity as well as the negative effects of the introduction of information technology, such as long hours of work at visual display terminals, something that can be detrimental to their health. Robots and other computer-assisted technologies taking over tasks previously performed by human beings add to workers' concern about the future of jobs and wages. Both the psychological and physical well-being of workers are thus under threat. The instability and insecurity in today's world of work calls for the promotion of healthy organizations and healthy businesses as part of a primary prevention approach (Kenny & Hage, 2009; Di Fabio & Kenny, 2015, 2016). A major challenge in the 21st century is to create healthier societies by promoting healthy organizations (Di Fabio, 2017, Di Fabio et.al., 2016).

In healthy organizations, culture, climate, and good practices create an environment that can promote employee health and safety as well as organizational effectiveness (Lowe, 2010). From a positive

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

psychology point of view, the four factors in a healthy organization that need to be considered are the individual, the group, the organization, and inter-organizational processes.

A positive primary preventive approach (Di Fabio & Kenny, 2016; Di Fabio et al., 2016) can be fostered in organizational contexts based on efforts to increase employees' resources (Seligman, 2002; Di Fabio et al., 2014, 2016). Primary prevention (Caplan, 1964) stresses the importance of preventing the development of a problem before it starts and of promoting psychological well-being. The focus is thus on building the strengths of employees/workers.

The World Health Organization (2017) has suggested that health is a state of complete physical, mental, spiritual and social well-being. Healthy employees tend to lead a happy and productive life; they can be characterized as vigorous, flourishing, robust, thriving, resilient, and fit (Raya, & Panneerselvam, 2013). A healthy organization leads to a healthy and successful business (De Smet, Loch & Schaninger, 2007). Interest in healthy work organization has grown substantially in the last decades, especially in defining the basic aspects of healthy work organization and the assessment of organizational activities and policies that have an influence on occupational safety and health issues (Shannon, Robson & Sale 2001). Burnout syndrome and stress are among the most common topics (Demerouti, Bakker, Nachreiner, & Schaufeli, 2001).

Healthy organizations need to create the right balance in their particular situation, sector, and culture, highlighting the importance of well-being and sustainability (Di Fabio, 2017). Adkins, Quick & Moe, (2000) have proposed four guiding principles of organizational health:

1) Health exists on a continuum from mortality to vibrant well-being. It is a continuous quest to promote positive health outcomes.
2) Organizational health is not an obtainable state. Constant attention, evaluation, and action are needed to maintain a healthy workplace.
3) Organizational health is the result of interconnections between multiple factors, and it can only be achieved if all of its parts are free from disease.
4) Organizational health relies on fulfilling relationships; therefore, communication, collaboration, and relationship-building are essential.

Healthy organizations are based on different factors. Henry (2005) suggests there are four, the individual, the group, the organization and interorganizational processes. The individual factor includes improvements in psychological health, job enrichment, employment motivation, and feedback, resulting in increased participation; the group factor in a healthy organization is based on the respect for its members, taking time to listen to their views, tolerating different styles and aims for win-win situations. The focus is on team building, group training and positive interactions; the organizational factor includes openness to challenges on making the organization a more efficient and happy place to work with an open culture; and an additional factor, as suggested by Di Fabrio (2017), is the inter-organizational factor, which is based on relations established with other organizations: partnerships, networking and community involvement.

APPRECIATIVE INQUIRY FOR HEALTH IMPROVEMENT AT UPAEP

At the UPAEP, the Organizational Wellbeing Department aims to create a healthy and productive working environment, to promote the physical, mental, emotional, and spiritual health of employees and their families, as well as to increase the sense of belonging to the institution.

Through the years, numerous programs and activities have been developed to improve the wellbeing of employees. The interest in analyzing how to improve the health and wellbeing at UPAEP started back in 2011. Before the first challenges were identified, the university, and particularly Organizational Wellbeing Department, conducted different inquiries. There was interest in promoting better health habits for all members. It was defined that health and personal transformation should be the topic that would lead all efforts for the future. The main objective was to create a health oriented culture that would result in positive effects in commitment to the organization and also in increased productivity.

The first efforts towards a comprehensive health and wellbeing program resulted in a project called *A Challenge for your health,* in 2014. It was a pilot program to encourage members to participate in different physical activities offered at the university.

From 2015 to 2018, three events were held and the name of the program was changed to *Health Challenges.* These initiatives were developed as specific health-improvement projects by the Organizational Wellbeing Department in collaboration with different areas and departments in the university, including Nutrition, Psychology, Medicine, Physiotherapy, Nursing, Odontology, Arts, Physical education and sports, Training and human development, Internal communication, Innovation and development, IT, and the integral health and odontology clinics, in order to develop a program that could be the driver of a prevention and health culture in the university community (UPAEP, 2018b).

The program was developed as a team challenge. Teams of ten members had to be created by the participants, with the additional goal to promote team integration and closer relationships among peers. The problems this program encountered was that the objectives and goals of the members in a given team were not completely aligned and there were also some teams in which all participants were high level athletes, something that created disparity between teams, this left certain groups feeling they were at a disadvantage, and, as a result, the interest and commitment were lost. The efforts led to increasing consciousness about the importance of taking care on one health and how this affects not only our work, but in general the life of each member (UPAEP 2019).

During the three team-based health challenges, the activities offered to all participants were divided as follows: 53% physical activities, 22% emotional health, 15% prevention, 6% nutrition, and 4% family health.

In an attempt to improve the program and to create "something" that would suit personal and organizational objectives, the department decided to conduct a session of AI in order to obtain vital information about what people desire and to identify best practices of the previous projects. The topic of transforming the health of all organizational members was the constant, based on the idea of creating and sustaining a health culture.

With this in mind, the AI inquiry started with the **Discovery stage** looking into the past of the organization and the programs directed to improve personal health and wellbeing. Groups coming from different areas were invited to participate in different sessions. There were focus groups and also individual inquiries which helped collect numerous personal stories about their pathways to improve their health. The participants were divided in groups of 6-8 members. The facilitator introduced the topic, explaining how the groups should proceed, and asked for volunteers in each group to become the reporters.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Each reporter would capture memorable personal stories, quotes, provocative propositions, and all the information about each member's participation.

During the three sessions that were held, the facilitators explained the ground rules for AI, describing the participation required from all members. They were told that they were in a safe space in which all ideas were equally valued and needed to create a general perspective. Rules about respecting others when speaking and about respecting assigned times were also explained. Everyone was asked to keep an open mind.

Questions were launched in a positive manner, and they were done focusing on personal experiences. The questions that started the discussion were the following:

- What are the fundamental factors that give life to the health challenge in the organization and which the organization cannot do without?
- Describe the experience of the health challenge programs in which you felt proud of yourself.
- What do you value the most from the offerings of health and wellbeing promotion at work? Why?
- What are your favorite activities from the health challenge offering?
- What times do you find to be more suitable for activities that will help improve your health and wellbeing?

For the second stage, **Dream,** participants were asked to review the positive core, the best practices, ideas, opinions, and experiences from the last stage, and with that information the group started to build new ideas and the dream of what the ideal health and wellbeing program would be like. Questions addressed the way in which the members expected the program to be for the future, the things it should include or not, whether it should cost, and the time frame for the activities, among other topics.

The most important response towards improving the health challenge was to modify it making it an individual project so that the main problems of not being able to align multiple objectives could be eliminated. Numerous proposals were made about additional activities that could be included: The challenge should go digital; people should be allowed to do certain activities from home; family should also be included; changes in the prizes and awards, including having days off for the winners; activities should be done during work schedule; spaces and furniture should be improved, better equipment was needed, services for those with a specific handicap should also be offered; better offering of healthy food and beverage choices; sportswear and uniforms should be provided free of charge.

For the third stage, **Design**, the university's mission, vision and values were considered, as well as the organizational culture and particular practices. At UPAEP, the person is at the center of all its activities. The institution is committed to their employees' wellbeing. Rules and regulations were considered along with the Institutional Development Plan. The groups were asked to determine the way in which their dream would be directly related to the institutional goals, specifically related to social responsibility and family responsibility. The Organizational Wellbeing Department has as a main objective that employees are in good physical, mental, emotional and spiritual health, and that they are able to obtain personal and family satisfiers, promoting the sense of belonging to the institution.

In the institutional Visions towards its 50th anniversary, it is clearly stated: "We are a fraternal community, congruent, happy and committed" [...]. "That contributes to transformation of society through congruent proposals oriented towards the common good" (UPAEP, 2019). The steering committee statement also considers these aspects: "We envision our institution as a community of people and for the people, as a meeting space, happy, alive and profound" (UPAEP 2017).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The fourth stage, **Deliver**, included other ways in which the design process was integrated, and the best practices that were identified. With the collected information, the program was changed completely, even its name. It became the Transform Your Health program. It is now based on individual goals, and each person competes against oneself, creating achievable objectives and reporting the progress every stage of the way.

A digital platform was created for this purpose, and participants register their personal data and goals, and every achievement, course, and activity they take part in. There is a space where members can upload pictures and other evidences. The web page includes information regarding total points, the general place with regards to all participants, and medical evaluation with a three-level scale, represented by red, yellow and green, which stand for not acceptable, regular and good.

Personal data and vital signs include lab results, physical activities, work activities, entertainment, and dental services. The nutritional evaluation includes weight, body mass index, overall body fat percentage, abdominal perimeter and other observations. The physiotherapy evaluation includes work activities, posture and time in each posture, exercise, posture alteration, flexibility, movement, strength and others.

The digital platform also includes a calendar of activities, both physical and recreational, workshops and other, so that members can select what they want according to their schedule. Every activity is controlled and accounted for. There is also a section of health and wellbeing related news.

The goal is to transform the health of all organization members through the development of habits, establishing a culture of health and prevention that will resonate and positively impact the collaborators' work performance through an integral flexible and friendly program.

The program ended up being developed in three distinct stages:

- **Diagnosis:** It included a scientifically proven methodology developed by the medical academia comprising medical evaluation, screening and testing, individual and corporate health profiles, and the 360º health evaluation; communication strategies and risk groups management.
- **Evaluation:** Based on specific items such as sinistrality, productivity, absenteeism, disabilities, morbidity; risk management including health, nutrition, psychological and sporting support.
- **Preventive and Corrective Measures:** Medical support for risk groups; physical activation and active pauses; conferences and short courses on risk prevention; ergonomics.

PROGRAM RULES AND REGULATIONS

Based on the results from the AI, a robust program was developed based on the following rules and regulations:

1. General Aspects

The Organizational Wellbeing Department offers all employees a program based on the individual; it is permanent and it offers annual recognition to acknowledge the members who have been able to transform their life through healthy habits.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Members are required to register through the employees' website on specific dates that are made public in advance. Different activities are offered, including medical evaluation, health campaigns, workshops, conferences, and physical activities, all of which are offered on campus.

Members who register to the program must pay a very low annual fee, according to their type of working contract:

- Full time $200.00 Mexican pesos (around $12 USD)
- APL: $200.00 Mexican pesos (around $12 USD)
- Professors on an hourly rate: $212.00 Mexican pesos (around 13 USD)
- Security and management personnel: $150.00 Mexican pesos (around 8 USD)

Payments are discounted directly from the payroll in three different installments throughout the year.

With this payment, participants are entitled to a medical scan at the beginning of the program, and another one by the end of the year, every year. The medical scan includes blood samples to identify cholesterol, glucose and triglycerides levels, as well as medical appointments to obtain data that will allow the identification of those who can be recognized as winners of the challenge, based on the improvement on their health (this includes weight loss, exercise, general physical activity, healthy habits). Awards are conferred in September of each year, and recognition is public to increase motivation and interest in the program. Each person establishes his/her own personal challenges: either losing weight, becoming fit, decreasing levels of bad cholesterol and blood sugar, exercise more, reduce or stop smoking, and others.

Participants can also participate in physical activities that are not offered on campus. All they need to do is register them and upload pictures and information about them in their personal profile. Other activities also include cultural events, arts and crafts training, and sports events, both in house and external. Sports offered in house include swimming, track and field, weight lifting, box, dance, cycling, and others.

All the activities included in the program are validated through the Integral Personal Development Plan (IPDP), which is part of the electronic personnel file where all training and development activities in which employees participate are registered and for which they obtain points to increase their salary level. At the beginning of the program each member must sign his agreement with the rules and regulations, and must check the participation list every time he participates in the activities offered in-house.

2. Program Dynamics

The participant earns points according to his participation. Participants increase their points as they take part in different activities related to the program. Registration for the activities is done through the institutional platform. There is an additional section of the platform for external activities in which evidences such as photographs need to be uploaded.

The activities are graded based on the following points (Table 2).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2 Activity points

Type of activity	Points
Clinical questionnaire and medical scan	100
Work stress test	100
Conferences	5
Workshop	5
Physicial activities	10
External activities	5

Source: (UPAEP, 2018a)

On the web page and the app, participants can verify their overall points at any given time.
Participation in medial scans is mandatory.
The procedure for awards and recognitions is the following:

- The five men and five women with the highest points will receive:
  - 1° Place: $5,000 in electronic money plus a gift.
  - 2° Place: $3,000 in electronic money plus a gift.
  - 3° Place $2500 in electronic money plus a gift.
  - 4° Place: $2000 in electronic money plus a gift.
  - 5° Place $1500 in electronic money plus a gift.

3. Program Operation

Once the information has been uploaded into the system, the privacy statement needs to be signed by all participants. The medical questionnaire needs to be filled. All participants need to attend a first medical consultation for initial diagnosis. By completing these requirements participants are awarded 100 points.

Blood work for cholesterol glucose and triglycerides is performed on the university clinics during a two week period. The medical consultation takes around an hour and a half. Blood tests are reviewed and the participants go through full medial consultation that includes nutrition, physiotherapy and dental evaluation.

Participants are able to register on line to all the physical, cultural, information, social and other activities of their choice throughout the year. Points are awarded for their participation.

PROGRAM EVALUATION

The challenge was integrated by internal and external activities, medical evaluations, hospital memberships, healthy habits and prizes. All the information about the program has been collected on the digital platform and can be accessed by participants through their medical file. In order to participate in conferences and short courses, members register selecting each activity in the platform, and each activity will be validated by assistance.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Pictures of external activities that are uploaded should show the participant performing moderate or intense activities. The context in which the activity was performed should be visible. The number of kilometers and or calories burned should also be uploaded with a picture.

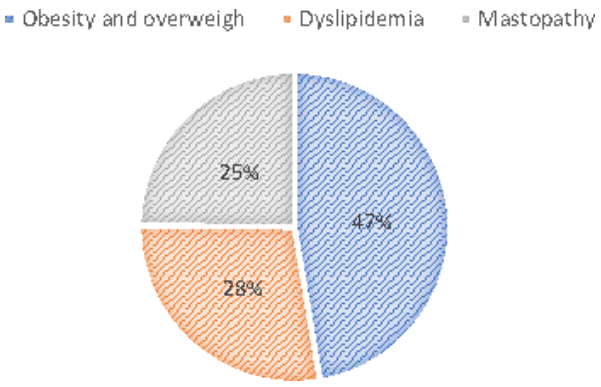
Official apps for the program are Endomondo and Nike +Run Club.

Initial Results From the Checkup

Different studies were conducted to evaluate the success of each program. In 2018

The most prevalent health problems that were detected among employees were:

Figure 1. Main illnesses among participants



As can be observed, obesity and overweight were the prevalent illnesses among the participants.

A pilot test was conducted with 107 collaborators, out of a total of 543 representing almost 20% of all participants. Participation in the pilot test was completely voluntary. They were asked about the activities that they enjoyed the most about the challenge. Participants could choose as many activities as they wanted. The results were the following:

Table 3. Activities that were enjoyed by participants

Activity	Percentage
Relaxing massages	57.9%
Dance	48.6%
Zumba	43.0%
Nutrition courses	42.1%
Food Workshops	38.3%
Talks	38.3%
Insanity	31.8%

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

They were also asked about the activities they would rather have for the next challenge
The chosen activities were the following:

Continuous activities:
- Dance classes
- Zumba
- Varicose veins prevention
- Insanity classes
- Just Dance
- Relaxing massages
- Taiichi & Yoga

Programmed activities
- Wine and cheese bio functionality workshop
- Cycling as a family
- Physical activation day
- Hiking
- Eye and visual health
- Courses such as:
  - Learning to interpret food labels
  - Emotions and food
- Informative meetings about the benefits of hospital membership

Coaching activities
- Online course about the 12 dimensions of human beings (follow-up)

Based on these results, the specific objectives of future programs were to offer all participants a medical examination so that they would understand their integral health state, by:

- Promoting balanced weight
- Developing physical activities
- Achieving adequate stress management

In terms of areas involved, the Faculty of Nutrition Sciences provided evaluations of height, weight, body mass index and other. The Medicine faculty was in charge of the interpretation of results. The CUME supported the program with blood pressure tastings. The Psychology faculty measured participants stress. The Department of Sports and Physical education provided the spaces and coaching for sports activities.

Overweight and obesity were the most relevant problems identified. In order to provide help for people who have a high body mass index according to the Mexican Health Ministry, they were invited to have a personalized follow-up for 8 continuous months where they also participated in additional activities such as nutritionist and phycological follow-up and support groups.

This group also receives incentives like a nutritionally balanced breakfast, sports T shirts and sweat-shirts, bascule spa days, tickets for the movies and others. The winner was the person who reached his health goal and maintained his new weight throughout the follow-up. This subprogram offered as prize a trip to any destination within the Mexican Republic.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Because stress was also a recurrent problem, the program offered different activities including Taiichi and yoga, stress management workshops, massages, and activities to target specific conditions.

The UPAEP has numerous bachelors and postgraduate degrees on health sciences. In March 2018, it inaugurated the Integral Health Center to provide a response to the demands of both students and personnel. This center is part of the social pertinence projects of the university. The center joins numerous clinics, labs and spaces for health and wellbeing in over 4000 square meters that promote interdisciplinary work. The center is based on a University medical clinic that offers medical consultations in general medicine, and specialties such as gynecology, neurology, orthopedics, internal medicine, pediatrics, psychiatry, gastroenterology and others. Other services include labs, medical certificates and medical examinations. It also has a center for psychological, educational and family development, a center for family attentions that provides different types of therapies, a physiotherapy clinic, and a nutrition clinic, among others. As part of the design stage, the members discussed the way in which different university resources can be used for health promotion programs for employees.

LIMITATIONS AND RECOMMENDATIONS

The study had numerous limitations:

- The study was conducted in a single HEI in Puebla Mexico.
- Participation was strictly voluntary; therefore, the group which was studied was limited.
- The Transform Your Health program offered limited services.
- Collected data on other aspects of the program has not yet been made available.

Additional studies should be conducted in other HEIs that have established Appreciative Inquiry to improve employees' health and wellbeing.

At UPAEP, other complementary studies have been planned in order to obtain the perspectives of all participants regarding the way in which Appreciative Inquiry helped improve the Transform your Health program. Once the complete data on the program is made available, different studies can be conducted.

CONCLUSION

As an educational institution, the UPAEP is convinced that a good quality of life is the essence of a successful community. This was the reason behind the creation of the Health Challenge and the Transform your Health programs, created to improve the members health and also to promote a more vibrant and fun working environment. In 2018, a new official norm regarding organizational wellbeing was developed, which will become mandatory. The NOM 035: Psychosocial risk factors in the workplace, is based on the identification, analysis and prevention of different types of risks, creating favorable working environments.

UPAEP strongly believes that a successful business is the result of the people who work in it and its organizational culture. When workers are in a supportive environment, they feel better and are healthier, which leads to lower absenteeism, higher motivation, more productivity, less employee turnover, a more positive image and a consistent social corporate responsibility (UPAEP 2018a).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Appreciative inquiry shifts the focus from problems to be fixed to celebrations of successes while acknowledging the power of dialogue. It helps forge new approaches to human resource issues that will be accepted by staff and lead to positive change.

The UPAEP is a good example of the benefits that using AI in promoting an organizational health program can bring. It facilitated an improvement in the members' lifestyle and health state; the organizational climate and the sense of belonging, increasing satisfaction and commitment. In the 2018-2019 schoolyear, from a total of 1983 employees, 557 participants were registered in the program.

The analysis of all the medical evaluations is still ongoing, and future research will include theses analysis. Additionally, the university has been applying AI in other areas to improve quality of life at work.

ABSTRACT

The transformation of a conventional enterprise from a people-centric model to a technology-centric one has important implications for its human workforce. In this chapter, the authors look at three representative people-related focus areas for the digital enterprise, enhancing workplace wellbeing, enabling continuous learning and compliance to information security. They discuss each of these problems and then look at the technological infrastructure a digital enterprise would require to manage these areas.

INTRODUCTION

A digital enterprise's core functions are technology driven (Araujo, 2016). Technology lies at the heart of things not at the periphery. While the movement towards this paradigm shift has been going on for a long time with early adopters like Dow Corning beginning this journey as early as 2002 (Rosencrance, 2002), this has been accelerated by recent technological advances such as the Internet of Things, mobile technology and AI. We can collect information continuously from a variety of environments, be informed about a situation wherever we may be and have continuous learning and evolution built into the very fabric of a system. Due to this, earlier boundaries between the organization's external functions such as marketing & sales and the internal such as production have blurred and sometimes disappeared (Cemex, 2019).

Now while a newly hatched startup may begin life from day 1 as a digital enterprise, most existent organizations have to go through a disruptive transformation process as they remake themselves from a people centric to a technology centric enterprise. At the extreme end of the transformation journey organizations may even be trying to go from a model where automation existed to assist people at work to one where the people help create and assist the automation at work (Wired Inc, 2018), (Meister, AI plus human intelligence is the future of work, 2018). That is not all. Part of the digital journey involves connecting the parts of the enterprise separated normally either by function or geography. Curiously this has also led to a phenomenon which Bailey (Bailey & A, 2017) calls workforce fragmentation where conventional models of what forms a 'team' (co-located, functionally similar, all team members are employees of the organization) are challenged and reinvented. Given all this, it is natural that the most profound impact of an organization's transformation into a digital enterprise is on its people, its workforce.

This chapter's focus is on the people, the workforce of the digital enterprise.

If this topic is already vast in scope, its scope could be further broadened by the realisation that while organizations are making the digital journey, people too have been making their own digital journeys. Thus, not only do we have a digital enterprise, we have a digital workforce. A study by Nokia referenced in (Colbert, Yee, & George, 2016) showed that the normal American smartphone user checked their phone upto a 150 times a day. The authors also note in the same paper how increased usage of technology has reduced the ability of people to understand another's points of view, something to be concerned about given that most people in an enterprise work in teams and have to factor in each other's views. All these signal that not only must the workforce adjust to the digital enterprise, the enterprise too must adjust to the digital workforce.

But while this two way adjustment of enterprise to people and vice versa is a fascinating topic, we decided that rather than cover every people aspect of a digital enterprise, leading to a shallow treatment of an important subject, we would restrict our focus to three topics that we expect will be important representative focus areas in a digital enterprise. These topics are not new and are prevalent too in non-digital enterprises. However, each of these acquires an increased gravitas in a digital enterprise and furthermore, the digital enterprise paradigm facilitates the creation of technological systems to address these problems in new and powerful ways. The three topics are, enhancing workforce well-being, creating a continually learning workforce and ensuring workforce compliance to organizational norms. Underlying all three is how enterprises manage change though we do not discuss separately but cover it in the context of each of the three sub-areas. We also touch upon a topic of increased importance, both within the organization and without, that of data privacy.

The rest of this chapter is divided into two sections.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Section 1 discusses and details three scenarios which represent some of the people related challenges in a digital enterprise.

Section 2 discusses how a digital enterprise would engage with people and behavioural issues of the sort discussed in Section 1. We present an integrated and multi-disciplinary architecture of methods, tools and techniques to study, analysis, understand behaviour as well as design and deliver interventions. We show how these can tackle the scenarios discussed in the previous sections as well as resultant challenges that remain to be solved. Since the technological movements discussed in this section are very current, we briefly discuss the potential evolution of these solutions in the concluding section.

WORKPLACE WELLBEING

Wellbeing is increasingly viewed as a critical aspect of how well we function, as individuals and as members of social groupings. Wellbeing is an umbrella term that covers a wide spectrum of conditions ranging from the extremely negative to negative, for example, psychotic illnesses, substance abuse, self-harm, burnout, anxiety, depression, etc., to the more positive experiences of gratitude, hope, optimism, resilience, contentment, flow, etc. (Dodge, Daly, Huyton, & Sanders, 2012) Wellbeing research has spanned several decades of research from domains as varied as psychology, sociology, economics, on the one hand to business and management, clinical medicine, public health and epidemiology on the other. These scientific disciplines have sought to unravel the experience of low and high wellbeing, at the physiological, contextual or environmental and psychological conditions.

In parallel, there is growing evidence showing how lack of wellbeing can have individual, business, economic as well as large scale social ramifications. The costs of negative wellbeing and the need to foster positive wellbeing have been recognized by enterprise management worldwide. A recent Deloitte report (Deloitte, 2018) indicates that over 50% of CXO survey respondents listed wellbeing as being "highly valuable" or "valuable".

A report (World Economic Forum, 2011) recently estimated the global economic burden of mental illness between 2011 and 2030 at $16.3 trillion. In the UK, recent evidence (Health and Safety Executive, 2018) has indicated that 1.4 million working people suffer from a work related illness with stress, depression and anxiety accounting for 44% of the total work-related illnesses. In India, 3 out of 4 mental wellbeing problems are due to workplace depression with 46% suffering some form of workplace stress (Bhattacharyya & Vijayaraghavan, 2016). The World Health Organization estimates that in India, the age-adjusted suicide rate per 100,000 population is 21.1 (World Health Organization, 2019). In addition, the same report suggests that the economic loss due to mental health conditions between 2012-2030, is estimated to be around 1.03 trillion of 2010 dollars. A recent study specifically around stress at work estimates that the largest excess healthcare costs were due to high job demands with a total of $46 billion, work-family conflict costs at $24 billion, long work hours at $13 billion and low job control at $11 billion (Denning, 2018).

Across the world, the challenges of wellbeing measurement and management have been termed wicked problems. A recent paper highlights the core dilemmas of wellbeing management at the policy level: reliability of measurement of wellbeing, responsibility of promoting wellbeing and trust in wellbeing data management (Bache, Reardon, & Anand, 2016). Thus in the measurement, intervention and management of wellbeing a multipronged, multidisciplinary approach is required.

Shift to Employee Experience and Integrated Learning Focus

As per Qualtrics (Qualtrics, 2019), only 62% of workers in the US are engaged at work, while the numbers for other countries are even worse, 48% in the UK, 56% in Australia, and Hong Kong – the lowest scoring country with just 42%. Forbes reports that $11 Billion is lost annually due to employee turnover (Forbes, 2013). Enterprises are now realizing such poor engagement may be related to what can be called the employee experience. The better the experience, better the engagement and better the performance. The experience gathering may even precede an employee's entry into the organization and begin from the moment a prospective employee decides to apply to an organization. This aspect covers a wide territory from employee engagement to role fitment to seamless and even pleasurable transition to different roles within organizations.

As technology based forces reshape the workplace, often the only certainty that exists is that the nature of the work done by people in the enterprise is changing and evolving. People have to be constantly on new learning curves as new technological systems and processes arrive. Old job roles are vanishing but new roles are coming into being (Meister, 2018). As many commentators have indicated, your co-worker tomorrow may not be a person but a bot or AI based system (Wired Inc, 2018). How enterprises enable their workforce to both buy into change and how they deliver learning to their employees will be key aspects of the Digital Enterprise.

Enhancing Information Security in Organizations

With the rise of digital enterprises, a significant challenge that organizations face is on the cybersecurity front. The fundamental tensions that arise between the business's need to digitize and cybersecurity's responsibility to protect the organization, its employees and its customers, within existing cyber operating models and practices is invariably noted in many studies and reports (Kaplan, Richter, & Ware, 2019). A significant trend witnessed is that organizations now own a shrinking percentage of the number of devices employees use to connect to corporate assets. Second, organizations control a diminishing percentage of the platforms that house the most critical information assets. The result of these two trends is that corporate IT security policies must shift from controlling how people utilize hard physical assets like computers and networks, to how employees interact with soft organizational assets such as data (Wittkop, 2017). This will also now mean that users have to become more responsible in information use, which requirements are generally laid out in information security policies in organizations

However, a key challenge here is that individuals generally tend to see the convenience or a sense of benefit that may trigger a compromise with information security, rather than think of potential harm from such a compromise. Apathy, ignorance, negligence, lack of awareness, mischievousness and resistance to information organisational policies are the roots of information security incidents in many cases (Safa, Solms, & Furnel, 2016). As per Alex Blau at the Harvard Business Review, (Blau, 2017) while it is not uncommon to think of cybersecurity as primarily a technological challenge, it is really more of a human one, in that most cyberattacks take advantage of human error.

Different forms of threat to information security have made businesses vulnerable to risks, consequently resulting in considerable damage in terms of reputation and money. For example, lost business was the biggest contributor to data breach costs. The average cost of lost business for organizations due to data breaches in a 2019 study was $1.42 million, and it found that breaches caused abnormal customer turnover of 3.9 percent in 2019. While malicious breaches were most common, inadvertent breaches

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

from human error and system glitches were still the root cause for nearly half (49 percent) of the data breaches studied in the report (Ponemon Institute, IBM, 2019). Major security breakdowns have occurred because individuals misplace trust, organizations create perverse incentives, or adversaries discover and exploit design flaws. Increasingly, the approach to dealing with these security challenges which is getting attention is by integrating the social, behavioral and decision sciences with technology based approaches (National Academies of Sciences, 2017).

Thus, an important people related challenge that we focus on is the aspect of compliance to information security requirements by employees in an organization. Within this space, we specifically focus on the problem of insider threat in organizations, defined as the potential for an individual who has or had authorized access to an organization's assets to use that access, either maliciously or unintentionally, to act in a way that could negatively affect the organization (CERT National Insider Threat Center, 2018). Insider threat via a company's own employees (and contractors and vendors) is one of the largest unresolved issues in cybersecurity. It is present in 50% of breaches reported in a recent study (McKinsey, 2018). Organizations are certainly aware of the problem but have not been able to devise successful strategies to overcome them, by and large owing to the nature of the problem in itself which is considered a wicked problem.

SCENARIOS FROM THE DIGITAL ENTERPRISE

In this section we discuss the three problems discussed above in more detail.

Employee Wellbeing

With regard to wellbeing challenges in the workplace, research has highlighted how individual, team and organizational factors act as barriers as well as enablers to specific aspects of wellbeing, and in turn affect key individual and organizational outcomes. Some of the phenomena associated with workplace wellbeing include stress and burnout (Maslach, Schaufeli, & Leiter, 2001), person-job fit (Park, Monnot, Jacob, & Wagner, 2011), worklife balance (Kinman & Jones, 2008), presenteeism (Hemp, 2004), anxiety and depression in the workplace (Haslam, Atkinson, Brown, & Haslam, 2005), etc. These have been shown to have significant adverse impact on not only individual engagement and performance at work (Renee Baptiste, 2008) but also that of business outcomes of revenue and profitability (Huppert & Cooper, 2014).

We now discuss some of the specific forms of low wellbeing of interest to workplace or organizational wellbeing. One big focus area in the workplace wellbeing research is that of exploring workplace stress and productivity. Research has indicated how stress at work affects not only workplace engagement, productivity, absenteeism and other work-related outcomes but can also have adverse impacts on individual physical and mental health status. A range of factors have been associated with stress, ranging from job insecurity, balancing work and family demands and other personal and organizational factors. Workplace stress manifests itself in several ways ranging from anger episodes, verbal abuse even physical violence to other physical symptoms like sleeping difficulties, vision problems, neck and hand pain and an increase in sick leaves for the employee (The American Institute of Stress, n.d.).

In the digital enterprise context the proliferation of collaboration technologies has facilitated a distributed workforce and given rise to the emergence of virtual teams. The digital workplace has on one

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

hand, led to a greater intersection of disciplinary and business boundaries, while on the other, has also led to its own set of challenges and opportunities, which merit deeper research (Riemer & Schellhammer, 2018) . In parallel, the rise of the digital enterprise has led to several challenges associated with wellbeing, most significantly the blurring of work and home boundaries, digital addiction or overload, lower work-life balance, lower attention and lower overall wellbeing (Barrett, 2019). To counter these challenges, there has been recent evidence suggesting the need for digitally enabled organizations and digital leadership to help improve employee wellbeing (Zeike, Bradbury, Lindert, & Pfaf, 2019).

Specific Challenges in Employee Wellbeing: Burnout

Burnout is described as a psychological syndrome involving emotional exhaustion, depersonalization, and a diminished sense of personal accomplishment that occurs in challenging situations (Maslach, 1982). While originally studied in the context of human service occupations, that is, occupations such as emergency medical personnel, fire fighters, physicians etc, burnout as a phenomenon has been now studied for several other contexts such as academia and organizations as well. In the US, medical professionals across the career spectrum, ranging from students and physicians in training to practicing physicians are at significant risk of burnout with the prevalence of burnout exceeding 50% (Rothenberger, 2017). According to some estimates, the physical and psychological costs of burnout result in approximately $125-190 billion annually in healthcare costs (Kraft, 2018) in the US while the cost to US employers is around $150-300 billion annually (Garton E., 2017) . In a 2016 study of HR leaders, 95% of respondents said burnout is influencing workforce retention (Azahar, 2017). Top factors associated with burnout include unfair compensation, unreasonable workload, too much overtime or after-hours work. Employee burnout has therefore emerged as one of the top challenges that HR and business leaders in most organizations must address to improve overall retention and employee engagement. A range of interventions such as improving work-life balance, improved compensation and rewards, better training and development, etc., among others have been suggested as ways in which employee burnout can be addressed in organizations today (CSP, 2018). In the digital enterprise context as mentioned above, the detrimental effects of multitasking, task switching and the ‘always-on’ culture has been shown to lead to poor time management practices and overloading of the most capable employees leading to employee burnout (Garton E., 2017).

The symptoms of burnout span the physical, psychological and the behavioral dimensions. On the physiological side, burnout is associated with chronic fatigue, lowered immunity, back pain, muscle ache, change in appetite, disturbed sleeping, dizziness and palpitations, etc. Among the psychological dimensions associated with burnout, evidence suggests symptoms such as irritability, inability to relax, feelings of helplessness, loss of motivation, pessimism, decreased satisfaction and sense of accomplishment. These factors lead to specific behaviors such as withdrawal from key responsibilities, delay, absenteeism, social and emotional isolation (Bianchi, Schonfeld, & Laurent, 2018) .

Specific Challenges in Employee Wellbeing: Workplace Depression

Among the growing areas of concern within the workplace is the phenomenon of workplace depression. In the US alone, workplace depression costs over $51 billion in absenteeism and lost productivity and $26 billion in direct treatment costs. It is especially challenging since depression tends to impact people in their prime working age and could potentially last a lifetime if left untreated (Mental Health America,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

2019). Symptoms of depression include persistent sad, anxious or "empty" moods, sleep related problems, appetite and weight fluctuations, loss of interest in activities, restlessness, irritability, persistent physical symptoms, concentration problems, fatigue, guilt and thoughts of suicide or death. Its prevalence in the workplace is compounded by the fact that people often do not seek help due to fears that it might influence their job, resulting in job loss and related adverse consequences. Other concerns associated with workplace depression being unaddressed range from lack of awareness of depression as a manageable illness and stigma associated with depression as well as with other mental health conditions such as stress and anxiety (Mental Health America, 2019).

The areas above are a representative description of a wider landscape of research and practitioner challenges in the organizational behavior, HR and management landscape spanning a diversity of topics, methodological approaches and outcomes of interest. Taken together these insights highlight not only the prevalence of wellbeing challenges in the organizational context, but also suggest the need for a greater understanding of these challenges from a business standpoint with the ultimate goal of not only prevention of adverse events for the individual but also promotion of positive mental health outcomes for the employee at work.

The main challenges in managing mental health in the enterprise context range from issues such as stigma, lack of awareness of the importance of mental health as well as low awareness of the resources available for mental health. If detected early, many of the mental health issues at the workplace, whether they manifest as stress, anxiety, depression or burnout can be managed by therapy and / or medication. Early identification of these issues is therefore critical for preventive interventions and management. Another key facet of mental health issues in the workplace are that while symptoms can emerge over time, they can be also be triggered by specific events at work and/or life in general. These might impact both the physical as well as the mental health of the individual; and therefore while the symptoms of low or fluctuating mood or cognition occur, these are often coupled by other physiological symptoms such as fatigue, sleeplessness, loss of appetite, etc., or contextual demands of high work pressure, job complexity, personal issues, etc. Therefore, the need for individual as well as contextual or environmental sensing is needed for preventive strategies for mental health and their management.. These issues are also reflective of wellbeing measurement and management as wicked problems, in that wellbeing in organizations is multidimensional, difficult to measure using a single approach, has issues related to privacy, trust and data ownership. Each of these issues are to be negotiated by a set of approaches that are inherently human-centered but also scalable to reach a wider population facing a growing set of wellbeing related challenges.

The above challenges call for a technology-driven, well rounded approach to longitudinally measuring and enhancing mental health in the workplace, grounded in the context of the organization itself as well as anchored in the individual's own past experiences in the workplace and other contextual events. Another need is that of evidence from past research and practice to suggest the prevalence of mental health conditions as well as evidence of suitable measurement and interventions in mental health and wellbeing. Further, the individual's right to privacy and confidentiality is another key challenge in enabling better adoption to mental health services in the workplace. Reach and scalability of mental health solutions are other priority areas for workplace stress, depression and anxiety. Given the low prevalence of skilled doctors and therapists worldwide, the need for a technology-based approach becomes even more acute.

Associate Learning and Integrated Learning Environment

Emerging Expectations of Enterprises and Associates

With the emergence of what commentators are calling Industry 4.0, today's enterprises are embracing advanced digitalization, bringing smart connected systems, products, and services into the forefront of their customer offerings (Deloitte Insights, 2018) (PWC, 2016). This has resulted in enterprises looking both to hire a workforce who are in tune with these technological advancements as well as the means to train the existing workforce to accept, welcome and leverage these changes so as to bring new products and services to the market by leveraging disruptive innovative technologies. A new-age enterprise expects its associates to be agile in their behavior, be proactive in learning and collaborative activities, embrace calculated risks and harness the power of new-age technologies both for personal growth as well as locate develop new business opportunities for the enterprise (Tata Consultancy Services Limited, 2019). Now the mantra for new age associates is to be an agile and proactive learner on a continual basis. Associates, today, have easy access to information through the internet and social media. They are also well connected with their counterparts across the globe. Having said that, associates prefer enterprises that help them to maintain their personal interests and wellbeing while choosing the destination of work.

The paradigm shift of enterprises towards various versions of Industry 4.0 also compels existing working population to adapt and become capable and competitive given changing job demands and the job market. This requires them to be continually updated with the knowledge and experience of the latest technologies and global practices, and avail mentorship and decision making support for both professional work and personal wellbeing. An enterprise that facilitates career growth, that transparently provides role clarity, enables effective communication between leaders, associates, and clients, and provides recognition is always desirable by an associate. Associates are no more interested in transactional roles or jobs but looking for fulfilling rich experiences, which add meaning to their lives and heft to their resumes. In an arena filled with tough competition, these individual rich experiences are the differentiators. Work culture and how associates are treated by various stakeholders help build their experiences.

Associate Onboarding and Integration Challenges

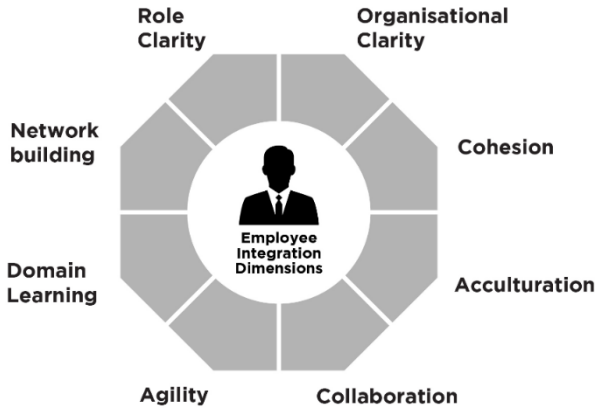
Every large enterprise takes on board a constant stream of new associates joining its ranks either due to a need to bring vital new skills and experience in growth areas or as replacements to existent skilled associates. Each new associate brings distinct aspirations, prior experience, skills, expectations, life situation, culture as compared to other associates. However most enterprises tend to roll out a single non-individualised induction and integration service that is ruthlessly applied to all. This generic service often fails to understand and accommodate the problems, aspirations and needs of the large pool of associates who happen to be from various domains, expertise, experience and roles. Furthermore, one generic integration service often does not embrace the cultural and geographical diversity of its associate pool, which reflects back negatively on the associate's acculturation with the enterprise.

Enterprises have a daunting task of being desirable to digital native, new generation candidates, as well as be innovative to its competition. This requires the enterprise to innovate and enforce massive changes to its training and learning platforms, talent acquisition and resource management services, and offer a seamless journey experience to its associates. Some of the most prominent factors and dimensions for associate integration as shown in **Error! Reference source not found.** are organizational clarity (Lyons,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

1971), cohesion (Chin, Salisbury, Pearson, & Stollak, 1999), acculturation, collaboration, and domain learning (Anderson, 2001). A large enterprise usually has multiple channels, stakeholders and access procedures to offer services to the associate so as to facilitate domain learning activities, acculturation and build organizational and role clarity. Hence, it is important that these services are coherently interlinked and provide an associate a seamless integration journey.

Figure 1. Dimensions of associate integration



The journey of associate learning starts from the point they join the organization till they leave the organization. Learning is an essential part of getting an associate ready for a project or workspace requiring specific skills. However, associates are often required to move from that project or workspace to other projects requiring differing skills spanning other technology domains. It is essential therefore for an associate to continually update their learning with regard to competency in the newer domains where they have to operate as well as competency in interpersonal skills such as being able to communicate efficiently with teams and clients. However, allocating dedicated work-days for learning activities is often a large cost to the company with a loss in project time. To mitigate this, the enterprise needs to offer the associate opportunities, channels, time, and behavioural nudges for regular self-learning activity which an associate can undertake along with day-to-day work. This will not just reduce the time of an associate to be project ready but also facilitate the enterprise to leverage on individual competencies for building creative, innovative solutions. *Figure 1* shows some of the associate integration aspects need to look at while designing the interventions. The challenge within a digital enterprise is how this can be done using a variety of digital means.

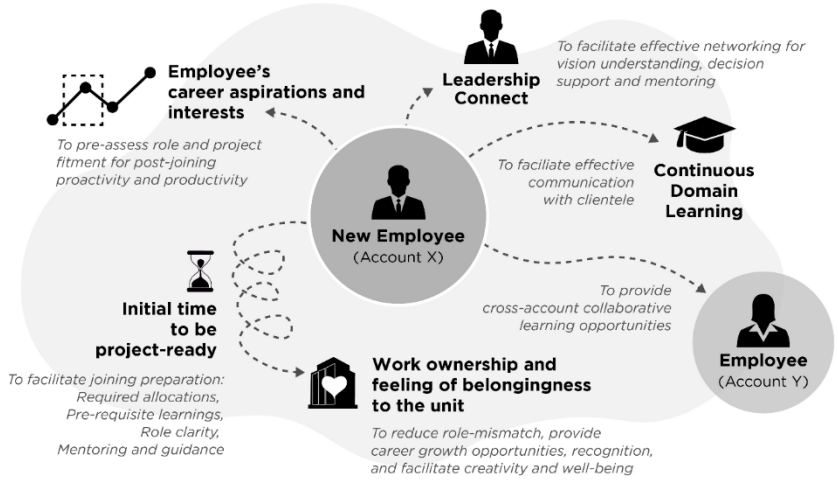
Associate Experience Scenarios

It is being observed that the current associate onboarding and integration mainly focusses on information dissemination. Most times information is provided from the enterprise's perspective without considering the actual needs of individual associates. During a user research study we conducted, it was observed that associates are looking for fulfilling experiences, which are meaningful to them. Associate experiences are formed from all the interactions that one has with the enterprise they are employed in. This often becomes the main criteria of how one perceives their value in the enterprise, clarity of their role,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and their relationship with the employer. By understanding associate goals, challenges, and perceptions, designing a positive associate experience is critical to building long-term relationships with associates and reduce attrition (Dukes, 2019). A good associate experience often etches a strong value perception in the minds of its associates, begetting work ownership, job loyalty, and proactivity towards business innovation and development. It is imperative to say that a good associate experience often reflects directly on the company culture and experiences of the clients and customers in their interactions with the company. Today the role of HR has evolved from maintenance and mitigation of compliance issues to facilitate the creation of an ecosystem that is associate centric (Branson, 2018). HR is now looked upon as a partner in the associate's career development and not as a mere transactional help provider.

Figure 2. Associate integration aspects



In this era, digital technology is playing a crucial role in facilitating and inducing behaviour change as well as making employees ready to face tomorrow's challenges. Design thinking and service design methodologies also serve as a foundation for enterprises to conceive effective and experiential solutions to complex problems in the organizational sector. Training enterprise functions towards developing a holistic view of problems and engaging in systemic design of services will generate low rate of service failures, efficient recovery mechanisms and integrated use of advanced technologies to be constantly and appropriately informed. Thus, a well-designed continual learning environment both for the new employees as well as the existing employees who support enterprise functions is imperative for enterprises to generate higher revenue and share a symbiotic relationship with all the stakeholders in the ecosystem.

Compliance to Information Security

Enterprise Information Security: Problems and Challenges

Detrimental security-related behaviors have been identified in the information security literature from different perspectives. Researchers (Guo, Yuan, Archer, & Connelly, 2011) have consolidated the un-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

desirable behaviors to include computer abuse (e.g. Data theft, unauthorized use), IS misuse (e.g. Use unlicensed software, access confidential information), security contravention (e.g. Software piracy, steal information, crack passwords), unethical use (e.g. Illegal software copying, hacking competitors' systems), IS security policy violation (e.g. Copy sensitive data to USB drives, disabling security configurations, revealing confidential information to outsiders), and security omissive behaviors (e.g. Not changing passwords, not back up, not update security patches. Although a security policy of organization may specify what end users should (or should not) do with organizational IS assets, and spell out the consequences of policy violations, this does not necessarily guarantee security because end users may not always act as prescribed (Turel, Xu, & Guo, 2017).

In aiming at building a resilient workforce that is conscious of a cyber-secure culture, it has been realized that the organization's culture is critical, and its culture must emphasize, reinforce, and drive behavior toward security (Lim, Shanton, Sean, & Atif, 2009) (Chris, n.d.). Building a cultural ecosystem to meet the above requirements will mean creating a judicious blend of various elements of technology, processes, and people to create and communicate policies, inform behaviors as well as design and deploy interventions aimed at desirable and sustainable behavior change.

Specifically in building these tools to measure and mitigate problems of insider threat, there are a number of challenges that remain to be addressed, given the wicked nature of problem as mentioned earlier. The problem intent of detecting insider threat is specifically difficult in terms of arriving at measures that explain antecedents of violation related behaviors. Another significant challenge in this space is that, use of these tools also entails extreme care to assure that individuals' civil or privacy rights are not violated. Thus, solutions developed ought to balance security promotion and privacy preservation at the same time. Apart from technical challenges of continuous unobtrusive measurements, there is also the challenge of communicating the purpose of data collection given the GDPR laws.

Specific Problems in Information Security

Specifically, when it comes to dealing with insider threat two important classes of problems are encountered. One is the prevalence of Non Malicious Security Violations (NMSV), which is defined as a violation which is intentional in nature, is a self-benefiting activity without malicious intent, involves voluntary rule breaking and has the possibility of causing damage or security risk (Guo, Yuan, Archer, & Connelly, 2011). An example of a security violation that is non malicious in nature is a case where employees transfer official content over personal mails or might be using pen drives to transfer data from laptops. The other is a violation that is malicious in nature, where an insider (current to former employee) has intentionally exceeded or intentionally used that access in a manner that negatively affected the confidentiality, integrity, availability, or physical well-being of the organization's information, information systems, or workforce (CERT National Insider Threat Center, 2018).

Information security research has looked at a number of end user security behaviors, presenting empirical evidence on the various behavioral influences that lead to compliant or non-compliant behaviors. Certain reasons as to why violations occur are attributed to factors such as perceived non-traceability of a violation (Chatterjee, Sarker, & Valacich, 2015) or to situations where there are goal conflicts – where it is found that performance goals always take precedence over compliance requirements, and thus violations can take place to address a performance goal (Peter, Nina, Ronja, Melanie, & Vogt, 2017). Biases are also found to play a role, which affect the way we think and act. For example, a bias can influence individuals to perceive benefits of violation more rather than the consequences of it, or can lead indi-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

viduals to engage in excessive risk taking (Kahneman, Lovallo, & Sibony, 2011). Similarly there could also be malicious motives leading to more planned methods to commit a violation for personal benefits (Myyry, Siponen, Pahnila, Vartiainen, & Vance, 2009). On the other hand, aspects such as intrinsic motivation and moral standards that people set for themselves (Pahnila, Siponen, & Mahmood, 2007), Organizational Citizenship Behaviors, (which concerns a person's voluntary commitment to act on the organization's interest) (Ifinedo, 2015) and work group norms i.e. how information security practices are perceived to be followed in work groups (Bulgurcu, Cavusoglu, & Benbasat, 2010), (Guo, Yuan, Archer, & Connelly, 2011) are known to increase compliance in IS context.

Past studies (Beautement, Angela, & Mike, 2009), (Bulgurcu, Cavusoglu, & Benbasat, 2010), (Cram, Jeffrey, & D'Arcy, 2017) also suggest that the key factors in the compliance decision are the actual and anticipated cost and benefits of compliance to the individual employee, and perceived cost and benefits to the organization. Perceived costs of compliance include increased physical load, increased cognitive load, time consumed to meet requirements, missed opportunities and a perceived hassle factor. Perceived benefits of compliance include avoiding the consequences of a security breach and protection from sanctions. External factors that influence compliance include design, awareness, training, and education, the culture of the organization, monitoring and sanctions.

Understanding Information Security Behaviors

If information security violations were to be decoded from a behavioral standpoint, they can be attributed broadly to the following reasons:

- **Inadvertence:** Negligent behavior of employees due to lack of awareness, cognitive limitations including biases and mental models
- **Inability:** Lack of ability to comply due to reasons such as lack of self-efficacy, task ambiguity, or time pressure although there may be awareness and intent to comply
- **Intentional:** Non-compliance with malicious intentions of creating harm to individuals / organizations.

We can also see that information security threats can emanate from different classes of employees - a newly joined employee who is unaware of risks due to violations, or from a careless employee although experienced, or an employee who violate norms for a self -benefit without a malicious intent, or a privileged insider who has access to valuable information and can have a malicious intention for violation of norms. It would be interesting to find patterns in such violations among employee categories in the organizational context to map appropriate interventions, however such research evidence is currently sparse. Different sources of threats would need different detection mechanisms ranging from monitoring to using advanced analytics such as UEBA (User Entity Behavior Analytics) to advanced insider intelligence methods (Litan, 2018)

From a psychological standpoint, workplace disgruntlement and employee dissatisfaction are identified as two key underlying causes of deviance in the workplace and organizational crime (Willison & Warkentin, 2009). When an individual has unsatisfied expectations of the organization, they might be motivated to address the expectations through malicious action against the organization. The findings by (Keeney, et al., 2005) reveal that 85% of the insiders identified in their study experienced grievances

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

before carrying out attacks and in 92% of the sabotage cases the grievance was related to employment. Personality traits such as Machiavellianism, excitement-seeking, and Narcissism were found to relate to insider threats and antisocial behaviour (Shaw & Stock, 2011) (E.T, Sticha, Brdiczka, & Shen, 2013)

Organizations are now are taking one further step to identify groups or individuals early in the threat life cycle: predictive insider-persona analytics (McKinsey, 2018). Organizations can identify the markers of these personas and actively monitor these markers for specific personas, rather than looking for divergence from normal. This analysis can identify a group or individual likely to represent a threat well before the event takes place; companies can then take steps to mitigate the threat.

That said another stream of literature looks at the role of positive incentives with regard to mitigation of insider threat. Instead of solely focusing on making sure employees do not misbehave, positive incentives create a work environment where employees are internally driven to contribute to the organization only in positive ways. There is evidence to suggest that positive incentives such as better job engagement, organizational support and connectedness at workplace can deter insider misbehavior in a constructive way from the outset of the employee-organization relationship (Moore, et al., 2016) . In combination with traditional practices, positive incentives offer the possibility of a more balanced and constructive organizational approach to reducing the insider threat with fewer negative consequences.

Thus, focusing on early-stage detection of at-risk behaviors and moreover, a focus on the prevention of employee alienation by fostering positive attitudes about the organization and the employee's work experience is also seen to add value, for which, necessary interventions that are technology driven are needed and discussed in the sections below.

TECHNOLOGY FOR THE PEOPLE ENTERPRISE

The digital enterprise from a people perspective would be a seamlessly integrated set of technologies that puts people in better control of their lives. A necessary change of perspective is that we need to see technology as a vehicle for people, rather than, for a business or an enterprise. The technologies should serve people by engaging them, providing desirable experiences, helping them work and play together while remaining well aligned to the business goals. This would serve to address the challenges articulated within wellbeing and norm compliance sections as being wicked problems. These problems are inherently unsolvable, however these need constant interventions that will help keep them under check. This necessitates creation of technologies and platforms that cater to different aspects of the problem. Towards this objective, we present the core elements of process and technology components to enable this to happen. To aid a better understanding of the technologies and their role in the enterprise, we classify them into three classes, viz. engage, sense and intervene. A discussion on these classes and the relationship between them follows.

The Engage-Sense-Intervene Cycle

The scenarios discussed in the previous sections have something in common, which is that, a certain behaviour change is expected of people. Whether it is associates wanting to improve their own wellbeing, or someone who is adjusting to a role change or a security officer seeking to improve compliance to policies, all require people to exhibit behaviour change.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Every behaviour change process requires a sense and intervene mechanism. The "sense" mechanism, as the names implies, senses or understands the current state of the behaviour. The "intervene" mechanism is expected to recommend an action that causes the behaviour to change to the target or desired state. It is evident that in order for the "sense" mechanism to get access to the individual and for the "intervene" mechanism to get delivered, it would be necessary to have systems that "engage" the people through the behaviour change process. This forms the third core element of the behaviour change process. The "engage" layer is essentially the front end of the digital enterprise. People interact with this layer.

Figure 3. The engage-sense-intervene cycle

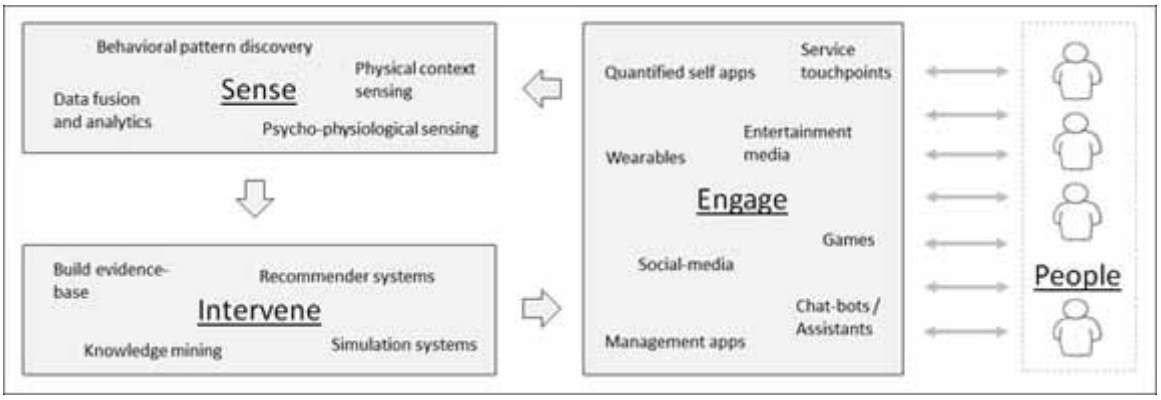


*Figure **3***, is a visual depiction of the three elements. The items mentioned in each of the boxes are examples of the kind of technologies and designs that are being applied to solve problems in each area. We dwell upon the promises, state of the art and open challenges in some of these areas, in the following sub-sections.

Technology Enablers for "Engage"

Human Computer Interaction designers and researchers have been continuously working on making these systems engaging and providing an immersive experience. While there exist newer ways of engaging people like augmented reality, virtual reality etc. this space is largely dominated by designers who create designs that connect with people.

Designing systems that are engaging, transparent and can gather meaningful information from people is critical for the success of the digital enterprise. We discuss two powerful designs viz. purposeful games and quantified self apps that are aimed at this very purpose. We also discuss the overarching space of service design and its role in achieving objectives of all stakeholders of the enterprise. This is followed by a discussion on privacy, its impact on user experience and its implications for design and technology.

Purposeful Games

Purposeful games (also called Serious Games) are designed to have an impact on the target audience, which is beyond pure entertainment. Serious games have seen widespread application particularly in

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

learning. (Bellotti, Kapralos, Lee, Moreno-Ger, & Berta, 2013). For example, In the Dragon Box Elements game players have to defeat a dragon and save Euclid's island. In order to do this however, they have to learn basic geometry and Euclid's theorems. Since the game part of good serious games have a fun and sticky element, players keep returning to the game and through that process absorb whatever the serious part is trying to teach or instruct or get across. By exploiting multimodal interaction they can also provide immersive environments where advanced users can practice knowledge and skills. While several purposeful games have been developed, further research is necessary to investigate in greater detail the real effectiveness of the various types of purposeful games (Bellotti, Berta, & De Gloria, 2010). How would stakeholders know what play-learners have done in the game environment, and if the actions performance brings about learning? Could they be playing the game for fun, really learning with evidence of performance improvement, or simply gaming the system, i.e., finding loopholes to fake that they are making progress? (Loh, Sheng, & Ifenthaler, 2015) are all questions that need further user research. Another category of purposeful games are those used for behavioral data collection. In-game behavior may provide indicators of real world behaviors and mental states of players. In-game behavior has been of great interest and has given rise to a community and sub area of serious game analytics. (Loh, Sheng, & Ifenthaler, 2015)

Quantified Self Apps (aka Personal Informatics)

Quantified Self (QS) or Personal Informatics or Personal Analytics refer to the systems as well as the practice of self-tracking. The prevalence of low cost monitoring sensors accelerated the rise of the Quantified Self movement (Quantified Self, n.d.) (Choe, Lee, Lee, Pratt, & Kientz, 2014). A personal informatics system helps a user to measure, reflect upon and improve a personal behavior. PI systems use collected data for the individual's own benefit and hence are likely to collect data that is unbiased and of higher quality. Initially started among technology enthusiasts, QS has become a community of people practicing self-monitoring and building self-monitoring technology. A large number of apps for self-tracking of various domains of life, such as, work, finances, moods, physical activity and fitness etc. are available for free on the internet and have empowered people to take charge of their lives. Although the value of self-tracking technologies has been widely acknowledged, researchers have also discovered a long list of barriers toward the adoption of self-tracking technologies. These barriers included lack of time, insufficient motivation, unsuitable visualization and analytics tools, poor skills for analyzing data, and fragmented data scattered across multiple platforms (Li, Dey, & Forlizzi, 2010) (Choe, Lee, Lee, Pratt, & Kientz, 2014). Specific areas for future research include exploring ways to provide early feedback, to support designing rigorous self-experimentation, to leverage the benefits of—while easing the burden of—manual tracking, and to promote self-reflection. Once a motivated tracker meets a well-designed self-tracking tool, exciting possibilities will arise for gaining insights for health, wellness, and other aspects of life. (Choe, Lee, Lee, Pratt, & Kientz, 2014)

Service Touch Point Design for Enhanced User Experience

We need to design for experiences that reach people through different touch-points and where these points are human as well as technology, and which happen over time (Live Work Studio, 2013) Newer interfaces such as surfaces, augmented reality interfaces, smart devices not only provide immersive experiences but coupled with artificial intelligence based analytics allows us to deliver services with a

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

personalized experience to employees. An example of how these technologies might transform learning is the newer breed of micro-learning platforms that are being developed. These not only make learning easy to consume but also makes it engaging and fun. For example, mLevel is a micro-learning and gamification solution that aims to boost corporate training efforts and offer employees a gamified, engaging and rewarding way of training (MLEVEL, 2019). This is in stark contrast with the traditional classroom model where the end user experience was not so much in focus. Artificial Intelligence technologies are enabling the creation of bots, assistants and self-service apps that eliminate the need for support staff and empower employees to get the help they need just-in-time and feel fully in charge of their life. An example of such a bot is Cara, a HR assistant that can answer queries about any policy in a leading IT organization. It is backed by an AI conversational agent platform that uses AI and NLP technologies (Tata Consultancy Services, 2016). Such a bot not only reduces the load on HR staff, but also improves the employee experience by providing them information in real-time. While using digital technology extensively, the human in the loop model is critical to maintain the human touch to provide a meaningful and fulfilling experience. Technology access points to collect and disseminate the information along with the personalized multi-channel interventions can play a crucial role in integrating the employees in the organizations (Kulkarni & Rajamani, 2017)It my however be an error to look at service experience as the only end goal. Behaviour change varies from micro in nature such as influencing buying behaviour to large-scale social changes like lifestyle changes. It is evident that usually there are many stakeholders involved in any situation and therefore the question arises as to whose preferences are to be addressed for design intervention. (Mahamuni, Khambete, & Mokashi-Punekar, 2019) have represented this as 'empathy square' (Figure 4) that combines the important dimensions such as perspectives from the service user, society and environment, human touchpoints such as service staff and service organization like governments or businesses. The empathy square comes handy to scrutinize the service designs from the perspective of four prime stakeholders. It also forms the basis of a Behaviour Progression Framework being developed by them.

Data Privacy

In the context of digitizing of an enterprise, a key concern of the engagement layer is that of data privacy. To create an engaging experience, the system needs to gather enough data about the individual so that a personalized experience may be delivered, however such a data collection might compromise the privacy of the user or the security of the user's personal data. Regulations such as the General Data Protection Regulation (GDPR) provide guidelines on building systems that safe guard the user's inherent right to control personal information, however these also add design elements to the system that affect the user experience. For example, users having to go through difficult to understand consent forms, not once but time and time again. Given the criticality of privacy in the digital era, there has been a drive towards the value-sensitive approach of "Privacy by design". (Langheinrich, 2001) develops six principles for guiding system design, based on a set of fair information practices common in most privacy legislation in use today: notice, choice and consent, proximity and locality, anonymity and pseudonymity, security, and access and recourse. Privacy by design calls for privacy to be taken into account throughout the whole engineering process. Apart from designing for user experience, privacy enhancing technologies (PETs) help engineer systems for privacy. PETs include encryption tools, data masking and obfuscation techniques, anonymizers, consent management systems, tools for enforcement of data handling conditions and infrastructure to allow users to inspect, correct or delete all their data.

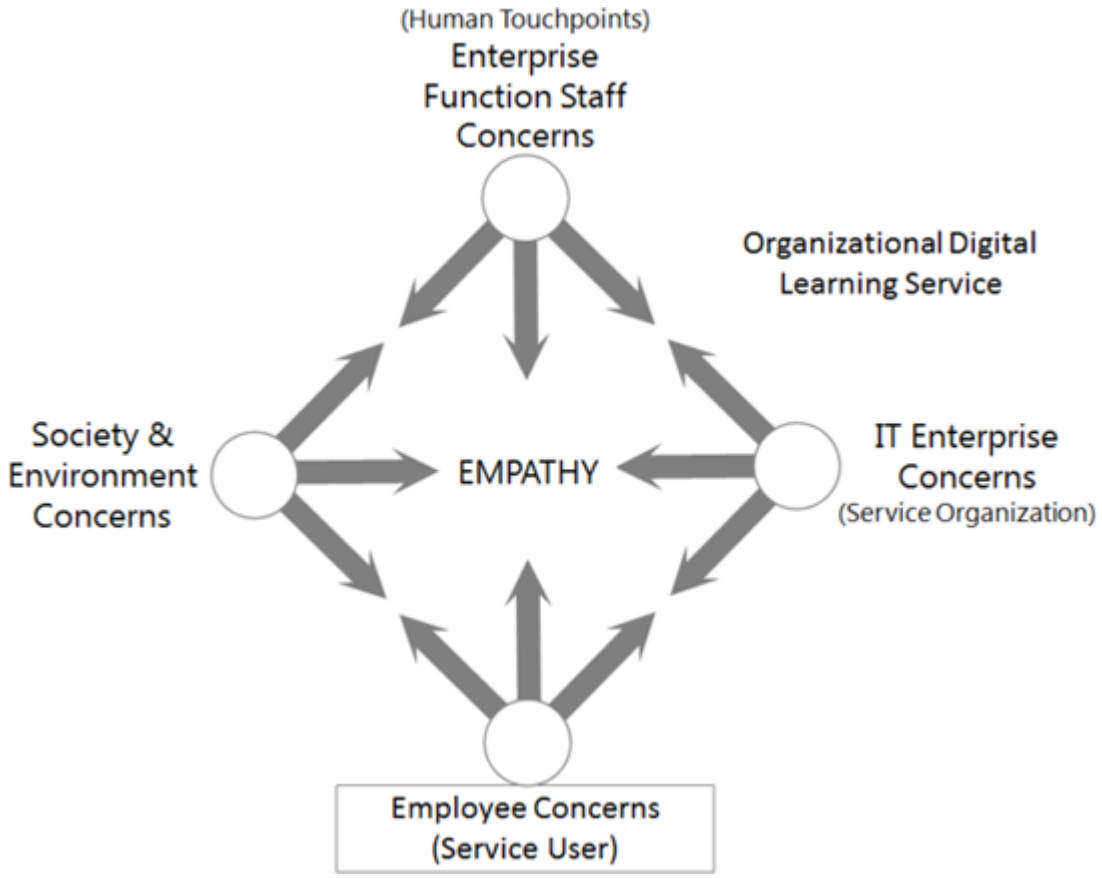
Figure 4. Empathy square (Mahamuni, Khambete, & Mokashi-Punekar, 2019)



Technology Enablers for "SENSE"

The "Sensing" element comprises of the whole process of capturing data, analyzing and interpreting it. This involves the very basic act of measuring the phenomena using sensors, to performing analytics on the data to attaching meaning to it. Data science techniques such as fusion of data from multiple sources, pattern discovery, data analytics are all necessities of this space. Artificial Intelligence (AI) techniques, such as machine/deep learning are used to develop algorithms that can learn and detect various human factors from sensor observations. AI techniques also help discover patterns in data and build predictive models for forecasting/intervention. In this section, we describe how psycho-physiological sensing and physical context discovery enable us to gain richer insights into human behavior.

Psychophysiological Sensing

New developments in the signal processing, physiological sensing and machine learning technologies have enabled the measurement of a wide range of behaviors. Wearables and mobile devices are now capable of measuring physical activity, sleep patterns, heart rates with a fair degree of accuracy. Newer techniques are being developed that will help measure a variety of factors such as stress, fatigue,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

cognitive load and so on. Traditionally self-reports have been used to measure subjective experiences. These involve participant introspection and self-ratings of internal psychological states or physiological sensations, and have the possibility of participants misunderstanding a scale or incorrect recall of the experience. Physiological responses also can be measured via instruments that read bodily events such as heart rate change, electrodermal activity (EDA), muscle tension, and cardiac output. Brain waves (electroencephalography, EEG), fMRI (functional magnetic resonance imaging) provide immense possibility to measure and understand brain activity. Electrodermal activity (skin conductance response or galvanic skin response) has been shown to accurately assess arousal and consequently stress levels. Cardiovascular measures (heart rate, HR; beats per minute, BPM; heart rate variability, HRV; vasomotor activity) also hold potential for measurement of affective states. Changes in pupil diameter with thought and emotion (pupillometry), eye movements have been used to measure phenomena such as attention. (Cacioppo, Tassinary, & Berntson, 2007) These measures are beneficial because they provide accurate and objective data about the mind and body. A survey on psycho-physiological analysis and measurement methods (Baig & Kavakli, 2019), presents a detailed list of studies that use these kind of measures. The survey concludes that the classification accuracy of >90% has been achieved in classifying emotions with EEG signals. A strong correlation between self-reported data, HCI experience, and psychophysiological data has been observed in a wide range of domains including games, human-robot interaction, mobile interaction, and simulations. The downsides, however, are that any physical activity or motion can alter responses, and basal levels of arousal and responsiveness can differ among individuals and even between situations. Many of these sensors are contact based, which means that they have electrodes connected to the body of the subject. This makes the measurement very inconvenient and prone to errors caused by movement. Further, sensor signals could easily be contaminated with uncertain noises or interferences and responses to these signals could also be different for different persons. In such cases, when analyzing sensor measurements, multiple sensors could provide more robust and reliable decisions. In recent years, sensor data fusion is becoming an emerging technology and researchers are applying new methods and techniques to introduce sensor fusion in various domains. (Begum, Barua, & & Ahmed). *Table 1* is a summary of some interesting phenomena that sensors are able to measure.

Table 1. Use of sensors for behavioral measurement

#	Sensor Name	Measures	Behaviours / States
1	Accelerometer	Movement	Physical activity, fitness behaviour, sleep patterns
2	Photoplethysmography (PPG)	Heart rate, breathing patterns	Stress, anxiety, palpitations, fluid retention
3	Galvanic skin response (GSR sensor)	Electro dermal activity	Stress, Restlessness, anxiety
4	Microphone	Speech/Voice	Emotional Valence, Stress,
5	Eye tracker	Pupil movement	Concentration, attention, emotion, cognitive load
6	Electrencephalogram (EEG)	Brain activity	Cognitive load,
7	Camera	Image/Video	Emotion, Activity,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Physical Context Sensing

While psycho-physiological sensing measures aspects of the individual, the context is to do with the situation, circumstances, environment, location the individual is situated in. The ubiquity of computing devices owing to use of mobiles, IOT have enabled a wide variety of contextual factors to be measured. Important sensors used are GPS (for location and speed), light and vision (to detect objects and activities), microphones (for information about noise, activities, and talking), accelerometers and gyroscopes (for movement, device orientation, and vibration), magnetic field sensors (as a compass to determine orientation), proximity and touch sensing (to detect explicit and implicit user interaction), sensors for temperature and humidity (to assess the environment), and air pressure/barometric pressure. (Nielsen, 2013). Fusion of data from multiple sensors holds the possibility of generating new contextual information. For example, an accelerometer in the user mobile may detect the movement caused by a travelling vehicle, while the GPS may provide information on location and speed. Together with the daily activity patterns detected from the devices used by the individual, we would be able to find out if the individual is on his daily commute to work. Authors of (Servia-Rodríguez, et al., 2017) presented an Android app that used physical and software sensors in smartphones to automatically and accurately identify routines. They measured location traces using GPS, amplitude/noise levels using microphone, social activity using messages and phone calls, and survey to measure psychological variables. They demonstrate the strong correlation between these routines and users' personality, well-being perception, and other psychological variables. They were able to use passive mobile sensing to predict users' mood with an accuracy of about 70%. While the promises of physical sensing are immense, there exist some issues with continuous context sensing — in particular that the energy required to sense continuously is high enough that the user notices. This problem becomes particularly difficult when multiple sensing tasks, such as activity recognition and indoor location, need to run concurrently. In this situation, it becomes hard to optimise the energy consumption of the sensing as the benefits gained in one task could be overridden by the higher rate sensing (for accuracy reasons) of another task. (Balan, Lee, Wee, & Misra, 2014)

Detection of Non-Compliance Threats

In cybersecurity domain, current methods and security tools available to help cybersecurity professionals detect and analyze insider attacks include Intrusion Detection and Prevention (IDS/IPS) Log Management and Security Information and Event Management (SIEM) tools. UEBA solutions look at patterns of human behavior, and then apply algorithms and statistical analysis to detect meaningful anomalies from those patterns—anomalies that indicate potential threats (Sandle, 2018). Approaches to detect insider threats also could look at data mining non-security related data in employee records, from enterprise social networks, or from fraud detection networks. That is, data obtained from violations of policy in one area of employment could relate to a propensity to commit violations in information security (Crossler, Johnston, Lowry, & Hud, 2013). Research in this domain categorizes the behaviors related to insider threats into four major classes: biometric behaviors, cyber behaviors, communication behaviors, and psychosocial behaviors (Ko, Divakaran, Liau, & Thing, 2017). A classification of detection mechanism is given below:

It may be noted that each behavior class is further composed of several behavior types and the authors allude to the fact that insider threat detection is not a single research field, but a conglomeration of disjoint ones.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Classification of detection mechanisms, Source: (Ko, Divakaran, Liau, & Thing, 2017)

Behavior class	Detected threat
Biometric behavior Cyber: Mouse & keyboard strokes, User Interface interaction, File search Physical traits: Eye-colour, Face recognition, Thumbprint, Gaze	Masquerading
Communication behavior: Email, Messaging, Telephone, File-sharing / transfers	Collusion
Psycho-social behavior: Friendliness, Attitude against authority, Social media behavior	Sabotage
Cyber behavior: Printing, Web-browsing, Device usage, Login behavior, File access, Download/Upload activities	Information theft

Another lens that can be used to understand an insider's pathway is guided by the substantial body of research in counterproductive work behaviors (CWB) – employee behavior that goes against the legitimate interests of the workplace. Literature in this space points to the fact that the stress that results from negative life events on the job and in personal lives can lead, if unmitigated, to problematic behaviors in the workplace. Some of the emotional states that can be antecedents to CWB include the following: anger aggression, negative mood in general, emotional exhaustion and stress (Moore, et al., 2016). There can be many external events or internal perceptions of such events that can provoke general CWB as a response. Examples of triggers also include the large bodies of literature on job satisfaction, frustration, and perceived stress as predictors of counterproductive behaviors (Marcus & Heinz, 2004) .

While CWB is observed as a predictable phenomenon through analysis of the aforesaid factors, this also suggests that it may be worthwhile to establish an "early warning system" based on a behavioral approach to insider threat with goals of improving early warning of vulnerability (Intelligence and National Security Alliance, 2017). Negative emotions create psychological, physical, and behavioral strains that can result in counterproductive work behaviors and ultimately a major insider act. Sensing of sustained negative emotions among employees in workplace and correlating the same with other metrics such as performance record, incident records etc. can help understand and profile potential insider threats. This entails not only defining behavioral models, but also seeking methodologies and tools that can assist in swift, continuous identification and assessment of risk from insider threat.

The 2017 INSA report also highlights three relevant tools to assess whether an individual may be moving toward a malicious act to include personality mapping, life-event detection, and emotion detection (Intelligence and National Security Alliance, 2017). Employers are seen to recognize the importance of leveraging innovative technology and data sources to monitor and evaluate individuals on a continuous basis towards this. However, it is also to be mentioned that such ongoing scrutiny does not substitute effective personnel security and counterintelligence processes; rather, it provides employers the opportunity to enhance their ability to detect and divert insiders on the critical pathway to dangerous acts.

Technology Enablers for "Intervene"

The most important component in this category is an intervention knowledge-base. Knowledge about interventions exists in a dispersed form in research publications. The infrastructure that enables the digitization of this knowledge and the recommender systems that deliver the interventions to matching profiles together make the intervention delivery possible. Relying on research evidence in one way to decide an

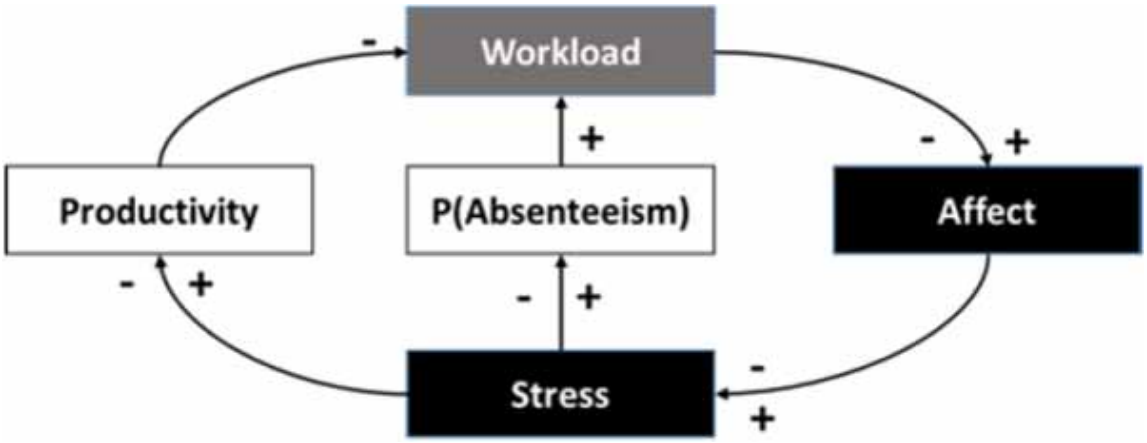
EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

intervention. The other way is to create computational models of people and simulate the effects of an intervention on computational agents. A discussion of these two intervention design approaches follows:

Fine Grained Behavior Modelling and Simulation

Simulation models help us get a sense of the dynamics of an environment, understand both current state as well as implications of changes, whether it be change in an environment or change in the behaviour of individuals. Simulation techniques such as agent based simulation (ABS) have been exensively used, to model the behaviour of human populations at varying scales. However, most of these models have trivial agent behaviour involving just a few behaviour rules and are used either by social scientists trying to understand social phenomena such as the formation of ghettos (Schelling, 1969), norm formation or collapse (Axelrod & Hamilton, 1981) or for policy formulation of various kinds (Hidas, 2002), (Nagel K. S., 1997). However these models are unsuited for environments where a multitude of behavioural factors are at play. For example to understand how various forms of stress impact the performance of a work team, we need to be able to factor in personality, positive and negative affect, forms of stress etc as well as the relationship between these factors.

Figure 5. Fine grained behaviour model



This is challenging since these need to be grounded in behavioural science. The category of models in this space are called Fine Grained ABS (FG-ABS) and methods to build such models have to be precise in order that the constructed model can be justified (Duggirala, Malik, Kumar, & Balaraman, 2017) to how supportive team environments impact outcomes. Figure 5 alongside gives a pictorial view of such a model.

Digital Repositories and Knowledge Mining

The need for repositories as sources of information in a domain has been a critical requirement across scientific disciplines. In medicine for example, the Cochrane Collaboration is the preeminent resource

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

for key stakeholders in healthcare, patients, doctors, nurses etc., to help them make key decisions in healthcare. Like in the physical, material and medical science domains, repositories pertinent to the behavioral and social sciences are also emerging and gaining wider acceptance by the researchers in the management field. The research evidences in the behavioural sciences remain dispersed in the form of research publications. Natural language processing, text mining, machine learning technologies and crowd sourcing platforms are being used to transform these publications into structured behavioural knowledge that can be used as evidences for designing interventions and composing behavioural models for simulation. While these possibilities exist, mining the literature is still a round-about way to generate the knowledge-base. The move towards open science will be inevitable going forwards. Open science is the movement to make scientific research (including publications, data, physical samples, and software) and its dissemination accessible to all levels of an inquiring society, amateur or professional. (Woelfle, Olliaro, & Todd, 2011) This would mean that open and online platforms would exist for conducting research and the experiment progress, data collected, empirical evidence generated would all be accessible to the society and could benefit from the knowledge.

The Behavior Modelling Platform

While the technology enablers presented above have their own applications in the enterprise, we believe that a definition of how these will work together is necessary. In this section, we present the schematic of a Behavior Modelling platform. Various platforms for behavior change exist and are aligned to different needs of people. For example Life Dojo is a platform for behavior change and is targeted towards improving employee health. (LifeDojo: Behaviour Change Solution, n.d.). LifeDojo engages employees in a journey of motivation, planning and weekly action that is both scientific and engaging. This is expected to achieve meaningful engagement and lasting behavior change. Another platform on similar lines, is the Behaviour Change for Good Initiative of the University of Pennsylvania. (Behaviour Change for Good Initiative, n.d.). They are developing an interactive digital platform to improve daily decisions about health, education, and savings.

At our organization we have developed a behaviour modelling platform that aims at supporting the entire behavior change life cycle as envisaged in the engage-sense-intervene cycle. The figure below is a schematic that shows the key components in the platform.

The platform and its elements have been applied to study problems in a variety of contexts. A description of some of the key components and their applications follows:

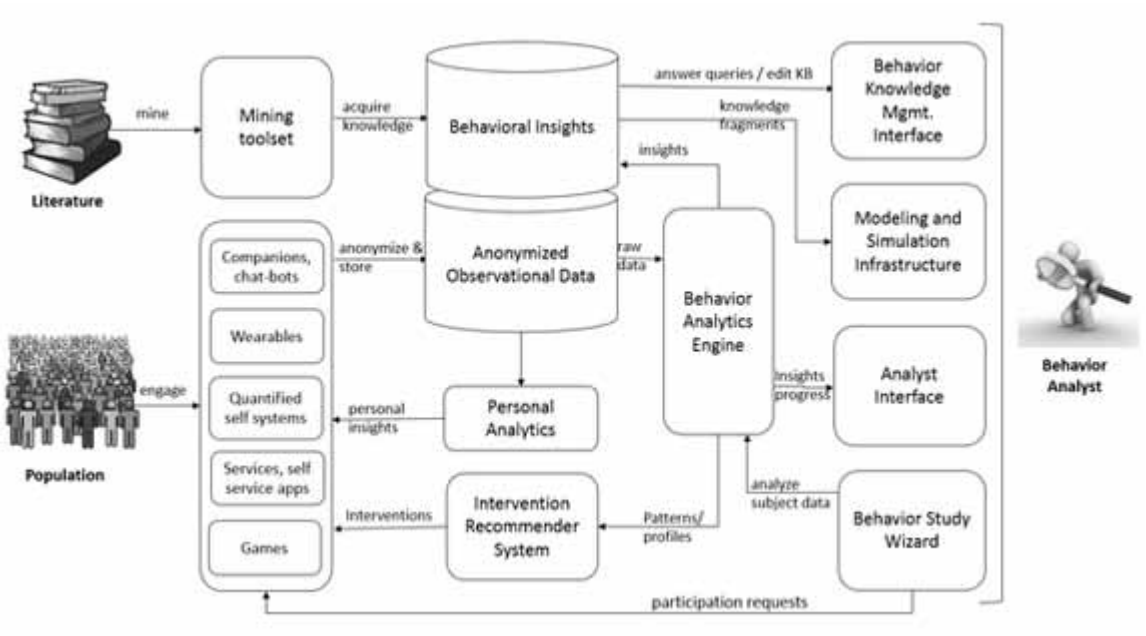
Engage: Digital Pet

The digital pet is a wellbeing companion aimed at engaging people over long durations. The long term engagement is achieved through use of Purposeful Games and Personal Informatics mechanisms. Like any other pet, you have to attend to and take care of the pet. It in turn cares for your wellbeing. It can sense key factors of your wellbeing such as your emotions and physical activity using the machine learning classifiers. The sensing measurements are aided by periodic probes that also assess self-reported states experienced by people. As the pet app detects your emotional states, it also nudges you to perform various activities so as to relieve you of the undesirable emotion. For example, it might ask you to go for a walk, while also measuring your step-count and help you increase your wellbeing score. Both, the player and the pet have their own wellbeing scores to be taken care of. If you score well in the game, you would be

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

rewarded with a trip to an adventure world, where you can have fun playing different games. We have used the pet to study wellbeing of associates. It has also garnered interest as general purpose engagement system that may measure behaviors of different kinds and deliver interventions to the population.

Figure 6. Platform for behavior modelling



Engage: Desktop Activity Tracker

The desktop activity tracker is a personal monitoring system that tracks user initiated activities performed in the computer. We have used it to study routines of associates in the enterprise. The tracker generates a log of activities performed, which are then classified into various categories of work such as, technical, documentation, communication etc. An analysis of these categories revealed routines that people follow, differences in work patterns of associates in different roles and correlations with key metrics such as associate engagement and productivity. The tool protects privacy of associates by allowing only pattern and correlation level information to be accessed by the study administrators.

Engage: Survey System

The survey app is used to measure various psychological and subjective variables that are difficult to sense using external observations. This tool is a mobile app that has a server component that allows different kinds of surveys to be configured and administered to the associates. We have used the survey app in conjunction with other tools to study a variety of problems such as correlates of absenteeism and productivity in support projects, study of financial behavior in pink collar workers, compliance to information security practices etc.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Engage: Personal Wellbeing Portal

The portal serves as an aggregator of data collected by all the systems mentioned above. It presents personal dashboards to the user based on the data collected. These dashboards aid self-reflection and improvement. Various workflows that engage the user are also made accessible through this portal. The portal provides a self-assessment module that helps associates screen themselves for various mental health conditions and also get various personality tests over the platform. This helps build a richer profile of associates and is useful for studying problems in all contexts. The GDPR features such as ability to get a copy of all personal data, withdraw from the data collection, delete all data from the system etc. are made accessible through this portal. The platform enables researchers to design and publish field studies and recruit volunteers for research. The volunteering requests also appear on this portal and can be used to incentivize associates to participate in behavioral research.

Sense: Affect and Activity Sensing

The sensing library comprises of machine learning / deep learning classifiers that analyze observations made from microphones (voice), camera (images/videos) and text (spoken or typed). We have built algorithms to detect emotion from all three modalities mentioned above. There are integrated into the digital pet app and helps it recognize emotion. We have achieved accuracies in the range of 78 to 85% using these. Other algorithms we have built include detection of activities from daily journals of associates, classification of those activities into classes that represent various domains of life, detection of the expression of stress and sources of stress in the daily journal. Thee accuracies achieved in these ranges from 72% to 80% and these will improved as we get more real world data. The text analysis algorithms that are currently being used to analyze daily journals are also now being integrated in analyzing conversations with chatbots. Another set of algorithms we have developed help make the digital pet more fun to play with, for example, we have developed an algorithm that detects laughter from the microphone and is used to play a game with the pet, where the player has to laugh for certain period of time and intensity to gain certain points in the game. The voice based emotion detector has also been integrated with the desktop activity tracker to study emotion and its correlates with activity. This will help get richer insights from the studies in the norms compliance space. Another application currently being developed is a qualitative survey analysis tool where long interviews taken in the process of service design are analyzed using these algorithms.

Sense: Pattern Discovery

As the name indicates this module performs analytics on the measured behaviors to discover patterns of interest. We have implemented the capability of discovering sequential and repeating patterns in the behaviors measured by the digital pet. Some examples of these patterns being: persistently negative emotional states, lack of physical activity over a period of time, too much physical activity along with frequent negative emotional states and so on. The patterns comprise of both healthy and unhealthy patterns. We also have pattern discovery algorithms built on the desktop activity tracker data that help understand routines of associates. Currently work is in progress on discovering patterns in wellbeing data that can help predict chronic conditions such as burnout and depression. Such predictive modeling will help early detection of associates tending towards the chronic conditions and help arrest the condi-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tion in time. Sensing of sustained negative emotions among employees in workplace and correlating the same with other metrics such as performance record, incident records etc. is used to understand potential insider threats. For example, detecting emotional change is critical to understanding the individual's level of stress and can help in identification of an 'at-risk' employee.

Intervene: Knowledge Mining Toolkit

The platform contains a "Behavior Knowledge Base", semi-automatically mined from the behavioural sciences literature. It comprises of behavioral insights mined from the behavioral sciences literature. It also contains evidence for interventions that have been validated in the field. This is a set of software components that enable the creation of the behavioral knowledge base. It comprises of a crawler, a document classifier, section classifier, and NLP routines that mine the target knowledge fragments into the repository. We have mined about 6000 papers from the social sciences literature to build this knowledge base of interventions and behavioral relations.

Intervene: Intervention Recommender

This module is responsible for finding a matching intervention for a give pattern discovered in the data. It leverages the Behavior Knowledge base to choose the intervention. For example, if a user is being sensed to be in a "negative" emotional state for a long period of time, the pattern discovery module would discover this as an unhealthy pattern and would find a matching intervention for such a condition in the repository. If a match is found that intervention would be dispatched to the engagement layer (digital pet or the desktop tracker) and the user would be prompted to perform the suggested action, as recommended in the intervention. If no matching intervention is found, an expert such as a psychologist would be asked to enter an intervention for that condition. This features also has applications that will also potentially help to deliver mitigation strategies before a possible malicious / non-compliant activity can take place thus preempting behavior at the right time.

Intervene: Behavior Simulator

The knowledge repository as well as data collected from the field are used to compose behavioral models which help in understanding dynamics of a situation to predicting future behaviors. The behavior simulator module helps create models of stress and productivity at the workplace and enables a variety of what if analyses around the antecedents of workplace stress, work demands, individual needs etc. and their impact on outcomes of interest (Balaraman, Hayatnagarkar, Singh, & Duggirala, 2016). Such models are useful as a sandbox to test a certain intervention before it is deployed on a large scale.

CONCLUSION

In this chapter, we have attempted to discuss some of the people related challenges of a digital enterprise such as workplace wellbeing, improving associate experience and complying with information security norms as well as the multi-disciplinary set of tools and techniques a digital enterprise can use in addressing these challenges. We also discussed the Behavior Modelling Platform, a computational

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

platform to tackle such people related challenges around the Engage-Sense-Intervene model and take the reader through representative components in each of the Engage, Sense and Intervene modules to give the reader a concrete feel for the function and use of the components and how these come together.

The people challenges mentioned in this chapter are of course only representative of the larger space of such challenges within a digital enterprise. Two other examples of such challenges are role fitment or finding the best fit between role and individuals and assisting employees in maintaining work life balance. Each of these challenges require us to engage with them and see how existing approaches can be used or extended to tackle them. Today as the nature of work is being continually reimagined we can imagine that the list of challenges too will change as well. In particular, the increasing capabilities of AI based automation will require digital enterprises to constantly evaluate the balance of work between human and machine. Old roles will perish and new ones come into being. Opportunities and challenges thus will continue to grow and evolve.

Chapter 37
Institutionalizing Inclusive Markets as a Prerequisite to Inclusive Growth

Fakhri Issaoui
Le Laboratoire de Recherche (Prospective, Stratégies et Développement Durable PS2D), Faculté des Sciences Economiques et de Gestion de Tunis, Université Tunis El-Manar, Tunis, Tunisia

Mohamed Ben Abdelghaffar
Faculté de Droit et des Sciences Politiques de Tunis, Université Tunis El Manar, Tunis, Tunisia

ABSTRACT

This article questions the contemporary definitions given to the concept of inclusive growth, which is assumed to be an effective solution to the problems of exclusion (marginalization, unemployment, poverty, inequality, etc.), without designing new growth models and without putting in place the tools necessary for inclusion (regulation, institutions, capacities, etc.). In the authors' view, the current exclusionary model is far from generating real inclusion as long as it fails to promote the necessary institutions to produce real inclusion and the ability to deal with the different forms of "exclusion."

INTRODUCTION

Since the turn of the 1980s, the world has known a return to classical and neoclassical thought, which consider economic liberalism as the most efficient economic system and the market as the single mechanism able to lead to an efficient allocation of scarce economic resources and production factors. Several factors explain the dominance of this line of thinking.

Firstly, we can mention the political changes that led to the ascension of the Republicans to power in the United States (Ronald Reagan in 1981) and the Conservatives in England (Margaret Thatcher in 1979). Keynesian economic thought, which had dominated since 1936, was called into question and judged to be unable to respond to the various economic crises of the 1970s as well as to their unprecedented economic outcomes, one of which was Stagflation.

Second, the 1982 debt crisis put the public sector (assumed to be relatively less efficient than the private sector) under scrutiny. Social policies were regarded as being unadapted and untargeted as to those who deserved them (the poor and needy).

Third, the fall of the Soviet Union and its Eastern European communist bloc put an end to a 50-year old politico-economic bipolarity. The hegemony of the liberal model and market regulation versus state regulation having emerged since.

Consequently, under the effects of intense and acute socio-economic crises, developing countries have been forced to rethink their development strategies by devising Structural Adjustment Programs (SAPs), which aimed to achieve two main objectives: stabilization and liberalization. In the late 1980s, Africa was undergoing such adjustment programs. However, these SAPs often failed to achieve their expected goals, in particular in those African countries' less developed economies.

Indeed, according to Issaoui (2011), "after 30 years of structural adjustment, African countries reproduce the same dynamics as they did originally and thus reproduce their problems and concerns (social, economic, political, etc.). Poverty, famine, illiteracy, civil wars, diseases, inequalities, and marginalization seem to be their unescapable destiny. Despite the multiplicity of factors explaining such a lack of progress, it seems that the one that best explains underdevelopment is the failure of the adopted development strategies. Implementation of Structural Adjustment Programs (SAPs), despite their relative success in many developing countries, has not enabled most African countries to achieve the expected sustainable development and growth objectives. Still more, in some countries, these programs have directly and indirectly worsened social indicators and reduced welfare distribution. It would thus be legitimate to ask why SAPs have not generated the same success in Africa that they have achieved on other continents. Is this a problem of the inherent inefficiency of SAPs or rather the inadequacy of SAPs to deal with the reality of African countries? Moreover, if SAPs do not meet the needs of Africa then what kind of development is needed for its countries?" (Issaou, 2011)

Generally, in the short term, specific data have shown that SAPs aimed at achieving economic efficiency often result in social losses (downsizing of the public sector, a decline in nominal wages, poverty etc.). However, the social gains of such measures often only appear in the medium and long terms. Welfare degradation resulting from the time lag between the immediate social losses and future economic gains is not always bearable, in particular in countries where the social dimension is already in crisis (as is the case in many African countries). Therefore, a new strategy needs to be thought of to integrate the social actors that have been eliminated by standard SPA structural adjustment strategies.

During the last decade, there has been a virtually unanimous conviction to rethink and revise older development models. In the case of Africa, these models have not achieved their set objectives as the continent is still reproducing its main problems (famine, poverty, inequality, etc.). Behind these problems lies a main major cause, the nature of the growth-oriented standard development model, which tends to exclude most economic actors from value creation. In order to overcome these problems, it is necessary to adopt a new approach that involves the poor, the deprived and the previously excluded population. The new development model should be built on inclusive growth that relies on inclusive markets. The principle is to involve the different economic actors (employees, unemployed, national and multinational companies, government, civil society, institutions, etc.) in the various meshes of added value creation. However, such an approach can only succeed and achieve its objectives if it is institutionalized, meaning that it should be created under the guidance and supervision of an organization that can monitor the implementation of inclusive growth and the mechanisms needed to achieve an inclusive market.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In real terms, the question is how to succeed in restructuring economic objectives so that the disadvantaged population takes full advantage of growth benefits? Achieving real inclusive growth inevitably requires the development of an economic model that promotes the creation of inclusive markets. However, the transition from exclusion to inclusion can only be done efficiently with legal and organizational instruments that establish an appropriate institutional framework for the creation and promotion of these inclusive markets.

CHALLENGES OF INSTITUTIONALIZING INCLUSIVE MARKETS

Inclusive markets represent the starting point for inclusive growth as an economic instrument that embodies the inclusion of poor populations in the value creation process. When implementing these markets, in particular through their institutionalization, is seen as a prerequisite to achieving inclusive growth, a conceptual problem arises as to the nature of the objective itself (A). Indeed, expounding on the concept of inclusive growth would allow us to point to the need of institutionalizing inclusive markets (B).

A. **Conceptual Problem of Inclusive Growth:** According to the OECD, "Inclusive growth rests on the idea that economic growth is important but not sufficient to generate a sustainable increase in welfare, which implies a fair sharing of growth dividends between individuals and social groups. At the same time, it is increasingly admitted that beyond income and wealth, welfare also depends on non-monetary factors such as health and educational achievement. As a result, level and wide distribution of these non-income factors is fundamental to inclusive growth, which attests to its multidimensional nature. Moreover, to be relevant, inclusive growth should lend itself to concrete initiatives, so that public officials can better understand the trade-offs and complementarities between action domains, and identify the tools to be used to achieve improvements in distributing monetary and non-monetary benefits. Accordingly, it is important to examine the various dimensions of inclusive growth simultaneously and not one by one[1]".

According to the IMF (2013) "Inclusive growth is one that must involve a large part of the country's active population and offers equal opportunities to access markets and resources[2]".

However, these definitions of inclusion lack practical and logical outreach. Indeed, they refer to and reproduce the same liberal thinking that largely dominates the actual economy. According to the above definitions, importance is given to the objectives of inclusion without considering the pragmatic dimension that allows for achieving real inclusion.

International financial institutions continue to define inclusion, on similar lines, to those which led later to exclusion, poverty, and inequality. Similarly, these definitions posit that inclusion can only be done through distributive and redistributive economic policies. This means a return to classical and neoclassical thought, which has tried to resolve social problems through market mechanisms.

While inclusion is formally considered as a new concept, we notice that it is explained and treated as a consequence of the old liberal economic policies. More specifically, it seems that IFIs continue to make the same mistakes: defining a new complex socio-economic concept (like inclusion) by a recourse to classical and neoclassical thought. Thus, according to this liberal and institutional approach, we can assume that inclusion is conceived through reference to old policies. Indeed, since 1929 and even before and more precisely in 1917, with the rise to power of the proletariat dictatorship in the former USSR,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

governments invested in the social sectors, in a pure distributive and redistributive framework. Nevertheless, these social policies have not been adopted in an inclusive way. These policies, themselves, have contributed to worsening poverty and inequality levels in developing countries, in particular when these countries wanted to move towards a market economy (Sen, 1981; Sen, 2001).

A priori, the definitions presented above raise many conceptual problems, in addition to the problems of contemporary growth models. To solve these problems using the same old models seems to be a transcendental idea that essentially comes down to economic metaphysics.

Alternatively, we believe that introducing inclusive markets would provide a remedy for exclusion with all its facets. Exclusion, up to now, coupled with the old growth models deprived the poor population of growth's benefits. They bear witness to the passive involvement of these target populations in the economic process. Inclusion is the fact that state institutions act to include the excluded in the growth process by creating inclusive markets in which they can produce and create added values.

However, it seems that international financial institutions continue to define inclusion with the same logic that has led in the past to exclusion, poverty, and inequality. Indeed, with this static and ideological view of inclusive growth, all socioeconomic problems will be eliminated by involving populations in the inclusive growth process.

At this stage of analysis, it seems to be important to distinguish between two types of inclusion: passive inclusion and active inclusion. Passive inclusion assumes that individuals and populations have a passive role in growth creation. In other words, inclusion is temporary and not durable. Individuals find themselves at the same point of departure; exclusion. On the contrary, active inclusion aims at permanently including and integrating poor populations into the growth process.

With the aim of seeking to counteract the problem of eternal unemployment and to redress the inefficiency of various classical solutions, the marginalized and poor population can benefit from an effective state intervention institutionalizing inclusive markets.

B. **Institutional Problem of Inclusive Markets:** With the findings on African economies, the World Bank (WB) and the International Monetary Fund (IMF) were forced to rethink their development strategies to ensure they are in line with the reality of African countries. Indeed, where poverty is most widespread, it is apparent that inequality is striking and unemployment rates are high. It would be difficult for the different liberal economic policies (introduced and implemented by SAPs) to achieve their economic and social goals (such as growth or sustainable development) as long as most economic actors and agents are excluded from the economic process.

However, in order to implement active inclusion, it would be important, at first, to create, develop, and extend the institutions' basis which bear directly on inclusion (whose objectives are to empower the poor). These institutions should exist to design, regulate and control inclusive markets so that they can effectively involve the poor in creating the expected value chains. However, as we shall see in what follows, no action has been taken towards to this end.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

OPPORTUNITIES (OR MECHANISMS) FOR THE INSTITUTIONALIZATION OF INCLUSIVE MARKETS

As mentioned above, inclusive growth is a self-propelling process that can lead to sustainable development. An important question arises: given the importance and centrality of inclusive growth, have African countries yet developed the institutional context through which such growth can be implemented?

The answer lies in establishing the grounds for the institutionalization of inclusive markets (A). Nevertheless, the concepts of inclusive growth and inclusive markets are recently developed and remain poorly known to the various actors. Therefore, it is essential to put in place effective tools to implement these concepts and to promote inclusive projects at continental and regional levels (B).

However, investment is the main and most rapid framework to identify and promote economic policies. Accordingly, the imminent need to share wealth among poor and rich countries has created a further need to regulate investment flows. The latter need resulted in a clear adjustment of international investment law, which now promotes opportunities for the institutionalization of inclusive markets (C).

A. **Neo-Institutionalism as the Theoretical Basis of Inclusive Markets:** Neo-institutionalism refers, to a large extent, to the theory of ownership rights, which played a strategic role in explaining economic phenomena and in determining the concept of "optimal state". This should be included in the appropriate way, which is through its capacity to choose and distribute ownership rights in the most efficient way, i.e., the way that maximizes wealth. This equivalence relationship between ownership and wealth rests on the idea that individuals are more productive and motivated when they operate within an ownership framework that allows them to reward their efforts. Once the optimum form of ownership is reached, the State should validate it at first and protect it in a second stage.

The analysis of North (1979) offers us a second outlook on the size and the interventionist extent of the State. It admits the existence of two production frontiers, the technical frontier and the structural frontier. The first refers to the state of knowledge and accumulation of productive resources, while the second represents the organizational dimension in which legislation, regulation, distribution of ownership rights are ensured. Interaction between the two borders is both undeniable and certain.

Indeed, according to North, developing the techniques used in social production goes hand in hand with developing new forms of exchange and creating new needs to acquire or to share information. If the State is aware of this change and retains the same structural form adopted previously, externalities and transaction costs emerge and risk moving society away from the optimal production frontier. Therefore, in order to avoid this scenario, the State must intervene as soon as possible in order to better define ownership rights and to determine precisely the basis on what those rights are organized and sanctioned.

North went further in his analysis by asserting that, at a given production frontier, different institutional structures may intervene. Each structure determines a different performance. In other words, institutional organization approximates the technical production frontier as long as it is more efficient and gives rise to more wealth.

This analytical framework may provide an elegant answer to explaining the difficulties of the previously-planned economic structures, which played, later, a catalytic role in their collapse. Indeed, in this bloc of countries, there was a misappropriation in the distribution of ownership rights and social production functions.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Similarly, ownership rights were misallocated to the extent that they did not create an efficient scale of incentives allowing for increasing productivity and assuring an economy of scale. There was an information gap between the owner and his delegates, which created enormous externalities. Inability of the organizational structures put into place to approximate the productive structure reduced the efficiency of the whole economic system before giving way to a new system that will trigger, in turn, a new organizational structure whose privatization represents one of their main strategies.

North redefines state intervention by assuming that what counts most is not knowing the timing, extent, and manner of its intervention, but rather to know whether the organization being implemented is optimal or not and whether it allows the society to approach or move away from the technical production frontier. In other words, the State should answer the following questions: is the present organization an impoverishing or a rewarding mechanism? If it is impoverishing, a second question should be raised: which optimal organization that should be maintained?

B. **Promotion of Inclusive Projects:** African States expressed their willingness to commit themselves to the ideals of inclusive growth within the framework of the African Union and this on two levels. The first move is to put in place the constitutional norms introducing a common development process and inclusive markets. The aim is to introduce the concept of inclusive growth into the agreements and protocols linking African States and inciting the establishment of Regional inclusive markets like the example of the Pan-African Investment Code initiated by the African Union Commission, which advocates inclusive growth as a key idea in promoting intercontinental and international investment flows.

The second plan calls for setting up institutional dimensions and aims at creating the African Inclusive Market Excellence Center (AIMEC), which would work to achieve a multiplicity of objectives and offer several services. By way of illustration and while not excluding other possibilities, we can cite:

- Collect, disseminate, exchange and produce the necessary information for and on all economic socio-economic actors (including investors and firms, governments, international and regional organizations, donors, small and medium-sized enterprises, civil society, research institutes). This allows for the offering of the necessary information leading to establishment of the inclusion framework within all economic dimensions.
- Training different actors in the different dimensions of inclusive markets (technical, legal, and innovative dimensions),
- Encourage the different actors to invest (or encourage investment) in the establishment of inclusive markets (promote dialogues, catalytic actions etc.),
- Locate the financing sources needed to build inclusive markets accessible to small and medium-sized enterprises, banks of the poor and patients capital,
- Coordination between the different actors for the implementation of inclusive markets.

Although the center favors a positive conclusion on the institutionalization of inclusive markets, this does not prevent us from stressing that the incentives for the various actors to adopt the concept of inclusive growth remain insufficient. Political and legal efforts should be made to provide an enabling environment for inclusive growth, such as democratic reforms, peace and security, health and education

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

reforms, which reflect the non-monetary dimensions of inclusive growth and to which all actors (led by governments) should contribute. However, if the efforts deployed by African countries in order to succeed in the new economic model have wider outcomes, this is not the case for Tunisia, for several reasons. The first reason that shows Tunisia's non-alignment with the continent's policies is the neglect of the very concept of inclusive growth or inclusive market in the latest reform of its investment law. This leaves the law in total divergence with the future Pan-African code, which will be the optimum institutional framework for investment. The second reason is the public-private partnership law, which, despite the fact that it provides an appropriate framework for the introduction of the concept of inclusive growth, does not show any willingness to promote the creation of inclusive markets under its public-private partnership framework.

However, the opportunities to regain lost ground are indeed real, in particular through the exploitation of the evolution of the African framework in this area, and by aligning with the evolution of international investment law.

C. **Evolution of International Investment Law:** Investments are usually presented and perceived as beneficial or even necessary to the economic development of any country. This idea bears on the main function inherent to investment, which is the contribution to wealth-creation. Thus, the obvious interest of States in devising and supervising the introduction of investments.

However, countries' attention to investment flows differ depending on their position as capital-rich countries or countries disabled due to capital scarcity. The former type aim at exporting capital to conquer new markets, while the latter type solicit the importation of capital to ensure a transfer of wealth. It is under this perspective that the proliferation of bilateral agreements for the promotion and protection of investment takes place[3].

At first sight, the above-mentioned agreements complement the States' efforts of exporting and importing capital through a transfer of wealth, which is favorable to them. However, conflict of interests between the signatory States is visible in the means used for the successful reception of investments. As the name suggests, these agreements provide legal safeguards that host States offer to investors. Protection of foreign investment is thus conceived as the main lever of incentives for wealth transfer[4]. This amounts to considering that investment flow is conditioned by the protection of investments, which represents the counterpart of the imminent capital requirement for investment-hosting countries.

Although investment protection is strongly requested and is a natural consequence of investors' dislocation outside their territories, it should in no case be exorbitant. Importing investment by poor countries is not an end in itself but rather a tool to achieve the goal of economic development. The added value of investing in State-run economies will be suppressed by agreements which burden the State alone and the unilateral rights which benefit investors.

Investment protection agreements are concluded with the aim of protecting the respective investors of the signatory States. In other words, through the agreement, each State theoretically benefits from the obligations imposed on the other contracting State. However, in practice, only investors who are nationals of the State- exporting capital benefit from these agreements. Added to this is the scarcity of capital for capital-importing States and the absence or almost absence of investment to export and to protect. Hence, there might be a dysfunction of the mutual benefits principle in practice, inherent to the nature and content of most investment protection agreements.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

A new generation of investment protection treaties has emerged since 2004, in which the scope of the legal relationship between the State and the investor is broadened by introducing new clauses recognizing certain rights to the host states "Including their right to preserve the public interest in certain sensitive areas such as health and environment"[5].

The recognition of such rights for the benefit of the host Member States is a significant initiative. In other words, the recognition of investors' passive commitment to their hosts not to hamper their policies on certain areas is cost-effective. Such a move requires internal regulation representing the first step towards recognizing the possibility of committing investors to active obligations. It amounts to empowering investment and raising awareness about the relevant economic and sustainable development issues of States, under a new spirit of partnership and efficient complementarity[6].

Partnership means, on the one hand, that the investor benefits from the incentives and the protection rules of their investment, and on the other hand, the State exploits the possibilities of investors' active contribution to economic development. Accordingly, inclusive markets are an appropriate instrument to deploy investors' abilities in terms of capital and know-how in order to develop the capacity of the poor and the marginalized population and optimize the added value of foreign investment.

This new win-win line of thinking about the relationship between the State and the investor is clearly expressed by the drafters of the Pan-African Investment Code (PIC). The latter code is still the model par excellence of integrating the notion of inclusive growth into multilateral conventions, not only on the continental level but also on the international level and this by widening the scope of the PIC project to include the so-called "third States"[7].

The first specificity of the PIC lies in changing the origin of investment rule. African states now draft their own rules governing the flows of African and other cross-border investment, instead of adopting the investment model pre-drafted by capital-exporting States.

The second specificity, which obviously follows from the first, is the creation of a balance between the rights and obligations of investors. The notion of inclusive growth is therefore introduced as part of investors' obligation to promote productive employment and inclusion.

Therefore, as early as the PIC, African states declared themselves to be: "Aware that development takes place through employment and that the expansion of productive and decent employment is the means by which economies grow and diversify and that an adequate supply of jobs is the foundation of increasing prosperity, inclusion and social cohesion; a factor of economic development. ". Similarly, the PIC project puts into effect the integration of the notion of inclusive growth by stipulating that all investors should contribute to the development of infrastructures, services and production capacities[8]. Inclusion is also expressed by inviting member states to encourage employers to invest in workforce training and capacity-building, in particular youth, women and disadvantaged groups[9].

CONCLUSION

The aim of this paper is to show the important role of institutions in any approach to achieve successful inclusive markets. However, despite this importance, Africa has not yet been able to build real institutions able to promote inclusive markets, which risks falling behind the objectives it has set itself.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

It would be important to note that the investment law adopted in Tunisia did not refer to the notion of inclusiveness either implicitly or explicitly, although the underlining base inherent in the said law is supposed to promote incentives and target useful investments. This law could have been an opportunity, par excellence, for Tunisia to formalize and institutionalize the concept.

Indeed, one can deduce the absence of a political will to achieve the active inclusion of the poor and disadvantaged social groups and this by acting on improving their abilities. The law reproduces the old investment incentives without considering inclusive projects to be projects with a national interest and which the State should normally consider as a priority, worthy of incentives and financial benefits. Thus, this missed opportunity has prevented Tunisia from being able to align itself with the new and ambitious African investment policy (enacted by the Pan-African Investment Code draft).

Therefore, as long as the concept remains excluded and not recognized by the laws and regulations of Tunisia and by most African countries, the problems resulting from exclusionary growth can only be repeated indefinitely.

ABSTRACT

Foreseeing the needs and availability of anaesthesiologists across Europe is a challenging task. This is influenced by different factors that include the composition of the workforce and the organization and structure of health services in every country. Some trends call for attention, such as changes in work patterns brought about by an ageing specialist population, the increasing numbers of women in anaesthesia, or cultural and societal shifts towards work-life balance. Anaesthesiology is a challenging specialty with an expanding scope of practice, requiring highly motivated professionals, frequent long work hours, and addressing stressful situations often. To ensure quality anaesthesia provision, the wellbeing of this diverse population of anaesthesiologists should be addressed. Achieving rational and flexible work hours, adequate compensation, and promotion of a workplace culture that fosters safety, motivation to learn, and equal opportunities for leadership or academia positions are challenges to be addressed to make sure that excellence in patient care is maintained.

INTRODUCTION

Foreseeing in advance the needs and availability of anaesthesiologists across Europe is a challenging task. It is a very complex issue influenced by different factors including the composition of the workforce and the different organizations and structures of health services in every country. Some trends call for attention, such as changes in work patterns brought about by an ageing specialist population, the increasing numbers of women working in anaesthesia, or cultural and societal shifts towards work-life balance.

Anaesthesiology is a challenging specialty with an expanding scope of practice, requiring highly motivated professionals, frequent long working hours including nights, and very often addressing sudden stressful situations. To ensure high quality anaesthesia care, the wellbeing of this diverse population of anaesthesiologists should also be addressed. Achieving rational and flexible work hours, adequate compensation, and promotion of a workplace culture that fosters safety, motivation to learn and equal opportunities for (also flexible) leadership or academic positions are key challenges that should be tackled if we want to make sure that excellence in patient care is maintained (De Hert, 2018).

Current Situation in Anaesthesia, Critical Care, and Emergency Medicine

Anaesthesia departments across Europe are facing a higher workload due to their involvement in many hospital areas, which are growing or expanding their scope of practice. Anaesthesiologists are asked to provide round the clock services ensuring quality and safety in critical care, operating theatres, pain clinics, emergency patient care (both in and out of hospital) and palliative care.

The question is, as the population in Europe gets older, demand for specialized healthcare services is expected to keep growing. The burden of disease grows at an estimated 10% per year (Benziger, Roth, & Moran, 2016). Noncommunicable - or chronic - diseases are responsible for more than 60% of deaths on the continent. As average life expectancy in Europe is growing (76.7 years in 2010 to 77.9 years in 2015) (World Health Organization, 2018) so are the health problems associated with age and sedentary lifestyles. Although the obesity rate in Europe is still far from the numbers reported in North America, an increasing number of Europeans are joining the ranks (*Health at a Glance: Europe 2018*, 2018).

One reason for concern is the fact that resources are not growing at the same rate. Socialized health care systems as available in most European countries are closely monitored to optimize spending and efficiency. An estimated 10% of GDP in the EU is directed to healthcare, with countries like Germany, Sweden or France allocating even more than that. Yet, the annual average growth rate in healthcare spending in Europe went from 3.1% in 2005-2009, before the 2008 economic crisis, to 0.7% in the 2010-2015 period (*Health at a Glance: Europe 2018*, 2018). This affects both the material setup and management of the hospital as well as the possibilities to recruit and compensate available workers.

The Demographics of Anaesthesia and Critical Care

Age

A recent review by Giacalone et al (Giacalone, Zaouter, Mion, & Hemmerling, 2016) highlighted the fact that European anaesthesiologists are aging, too. In France, about 50% of the anaesthesiologists working in 2005 will be retired before 2020, and there is no sufficient replacement. The government has suggested an increase in retirement age to 72 years of age to compensate. In the UK it is estimated that

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

up to 70% of the actual medical workforce will not retire before they are 68 years old. A similar pattern is observed in Canada and the US, where in 2013 close to 30% of anaesthesiologists were older than 55 years of age, and 8-10% (depending on source of information) were older than 65 years old. Replacement, again, is not guaranteed, let alone covering the growing demands for anaesthesia services (A. D. Baxter, Boet, Reid, & Skidmore, 2014).

Older anaesthesiologists provide great care and bring their extensive experience into the workplace. But they have their needs and concerns, too. Older physicians have a higher rate of burnout, anxiety, and depression. Their job satisfaction in lower than that of younger colleagues (Katz, 2016). On top of that, age related physiologic changes may reduce their physical tolerance to on-call duties, their ability to concentrate or listen in noisy environments, and the speed at which decisions are made (A. D. Baxter et al., 2014; Giacalone et al., 2016). All these skills apply in the daily work of an anaesthesiologist, and all the more so during nights on call. Of course, the aging process can be very different among individuals, and some older doctors may be performing at the same level as younger ones, but a systematic review from the US showed that quality of care tends to diminish with age, as elderly physicians are less likely to follow guidelines or be up to date in medical knowledge (Choudhry, Fletcher, & Soumerai, 2005). Although this had no effect on outcomes (experience probably acted as a counterbalance), it is certainly something to take into account.

As such, this population can therefore have widely variable needs and expectations. Some doctors may keep working because they love their job and feel fit to practice it; others may lack the financial stability to retire. Some may be happy limiting their clinical time in favour of administrative, teaching or research duties. Others may prefer to work less than full time (LTFT) but take only clinical work, or skip being on call entirely. Their continuing education needs may also be different, and it has been suggested that they may benefit especially from crisis management simulation to keep peak performance in the operating theatre and other acute care scenarios (A. D. Baxter et al., 2014; A. Baxter, Thompson, & McCartney, 2016).

All this adds complexity to an already complex situation; namely, managing an anaesthesia department. But in order to provide the best possible care and not waste the best that every physician has to offer, an individualized and flexible approach sounds like the most sensible option. Some departments already have "winding down" plans, including considering stopping "overnight on-call" at 60 years old, no further high acuity cases at 65, or retirement from main operating theatre practice at 70 (A. Baxter et al., 2016).

Women

As in many other areas in medicine, there is a higher number of female than male physicians in Anaesthesia. This was first highlighted by a 2007 study of the Anaesthesia workforce in Europe, which looked at the future considering the increasing presence of women in the field, and the impact of future medical immigration within Europe (Egger Halbeis et al., 2007). In that study, approximately 47% of anaesthesiologists in Europe were women; in trainees, the number ascended to 53%. In 2018, the European Society of Anaesthesia sent a survey to active and affiliate members, showing percentages of 49.5% for male and 50.5% for female anesthesiologists (De Hert & Honorato-Cia, 2018). Not surprisingly, the biggest net increase per age group happened in the younger cohort (Baird, Daugherty, Kumar, & Arifkhanova, 2015). This is interesting considering the future of the specialty. The trend is likely to keep on growing, as female medical students now account for 50-55% in most medical schools (Leslie, Hopf, Houston,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

& O'Sullivan, 2017). The general situation in the developing world is very similar to Europe (Baird et al., 2015; Leslie et al., 2017)

When studying gender differences in anaesthesia and critical care, the focus has been directed at the higher number of women working part-time, and, consequentially, the difference in compensation (Baird et al., 2015; Egger Halbeis et al., 2007; Haller, Delhumeau, Mamie, Zoccatelli, & Clergue, 2016; Miller & Katz, 2018). The 2018 ESA survey showed that, in Europe, substantially more women than men work part-time (29% women vs 12% men). More men than women are thus in the higher income range (5,000–10,000 € and > 10,000 €). It is difficult to ascertain if this can be solely related to the different work pattern. A recent study from Switzerland (Haller et al., 2016) showed that more women were paid with a fixed salary (59.2% vs 46.6%) as compared to men, and that services carrying an extra compensation were more often taken by men (36.9% vs 22.9%) than by women. This reflects the situation in other European countries.

The general assumption is that most women will be the primary caregivers for children, parents or other older relatives. The demands imposed of them by this effort make them more likely to prefer LTFT work, or at least to be able to have a relatively flexible schedule. But women also seem to be more frequently involved in some work areas more than others, dealing with ambulatory or paediatric anaesthesia, or being more active in pain management. There seems to be an implicit understanding that a woman will fare better in less aggressive and physically demanding areas of the specialty, which is notoriously one that deals with emergencies and complex or critical cases requiring many talents and strengths, and that frequently involves long shifts or night work. It is difficult to ascertain whether these preferences are anecdotal or real, and, in that case, if the proportion is really significant. Also, there is a lack of data on what may cause women to gravitate towards those areas: schedule, flexibility, type of patient, type of work environment?

The Swiss study mentioned earlier (Haller et al., 2016) also highlighted another issue that is widely recognized and that has generated a large amount of interest in the past two or three years: the fact that women are majorly underrepresented in academia, leadership and management positions. A 2017 study comparing Australia, New Zealand, Ireland, Canada, the UK and the US, found that female trainees accounted for 40-50% depending on country, but that chairs of department, academic leaders or board members barely reached 20% in average (Leslie et al., 2017). Another 2017, worldwide analysis in Critical Care diversity showed that the representation of women in conferences, guideline recommendation or clinical practice guidelines was also very low (around 13% of 413 guidelines published between 2012 and 2016) (Mehta et al., 2017). In the 2018 ESA survey the disparity was also very apparent, with twice as many men than women in a position of professor and hospital medical director and even 3 times more men in the position of head of the department (De Hert & Honorato-Cia, 2018).

The reasons behind this situation are varied and complex, and may vary slightly within different areas or countries in Europe. They may not be intentional, but they are not random, either. This situation is not exclusive of the medical field, and as a matter of fact has been extensively documented and researched, especially in the business world. There is no doubt as to the capability, competence or expertise of women in their respective fields of knowledge, so there must be other reasons holding them back. Personal preferences aside (any woman -or man- may choose to prioritize family, health, social work or other aspects of their life, or just not be interested in academia or leadership), many reasons have been researched that may explain the disparity. One is cultural bias, when people implicitly assign gender-specific roles such as caring for children in women or expecting a focus in career success for men (Ibarra, Ely, & Kolb, 2013). This is frequently unconscious and includes gender but also race, country

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of origin, or age. Women´s competence appears to be evaluated using different standards than men and takes personality more into account (assertive women as seen as "bossy" while the same attitude in a man would be acceptable and even expected). These biases affect both men and women, with many successful women falling into what is called a "second-generation bias" in which they tend to minimize the effort and hurdles they had to overcome. This happens partly because women tend to expect their efforts to be recognized while men are apparently more forward and make sure that their hard work is visible (Gravett, 2013; Ibarra et al., 2013).

In the past five years, a considerable effort has been made to educate everyone on those biases and to promote and facilitate the access of women to higher positions (De Hert & Honorato-Cia, 2018; Leslie et al., 2017; Mehta et al., 2017; Toledo et al., 2017). Both the ASA (Leslie et al., 2017) and the ESA (De Hert & Honorato-Cia, 2018) have made it public that they are committed to advocate for changes and have taken steps to ensure data transparency, equality in boards and conferences and to promote workplace change through education. These measures will be discussed later, as they affect some of the other issues in this chapter.

Diversity in the Workplace

Diversity is a very broad term. Currently, and in Medicine, who does it refer to? What is the norm that is not being met? A possible approach would be to consider that most European health care systems were originally designed with one type of physician in mind – the most common one at the time. That would be a Caucasian male, head of a family, culturally close to the community he was serving, and available to put in as many hours as needed as family support was guaranteed. From that perspective, aging physicians and women are probably the biggest "diverse" groups we are dealing with right now.

Over the past forty years, European society has changed beyond recognition, and it is safe to say that that kind of physician is not anymore the norm. There is a different approach to work-life balance, women are currently half or more of the medical workforce, and economic pressures are much higher. The way we work in hospitals has also changed, and anesthesiologists are currently seeing how their scope of practice is growing to perioperative medicine, emergency care, pain management and so on. Training and continuing education are more challenging as new technologies emerge and are incorporated into daily work.

While this is challenging enough for just about anyone, doctors from different cultural or religious backgrounds or that trained abroad and returned may face additional pressure. Medical migration in Europe was first addressed in the 2007 survey mentioned before, and at the time it showed that most of the movement was happening from Eastern to Western Europe, with a small number of anesthesiologists coming from the Middle East or Asia. Some countries such as Estonia or the Slovak Republic lost up to 15% and 20% of their anaesthesiologists (Egger Halbeis et al., 2007). Although this trend seems to have slowed down in recent years, there is still a considerable number of physicians working outside their home countries for a variety of reasons. The needs and concerns of these groups might be hard to reach as they may take some time to become fully integrated in medical professional associations.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

IN SUMMARY

Providing the best possible care to our patients requires well trained, highly motivated anaesthesiologists. To ensure this, it is important to look at the composition of the workforce, both now and in the years to come. Their needs have to be addressed to make sure that they can develop their careers in a balanced, integrated way, and that they stay motivated to deliver good care, do research and teach future anaesthesiologists. A good way to make sure of this is to ensure adequate representation and access to leadership positions; it is well known that diversity is associated with better results in the business world, and there is no reason that suggests otherwise in medicine. This seems to be related to the fact that other points of view are taken into account when making managing decisions, and also to the possibility of finding different ways to solve problems.

Most of the work already done has been in the field of gender equality, but the possibilities and mechanisms affect all groups. Before looking at what has already worked and what else can be done, we are going to analyse the impact of other key influences: how technology (and especially communications technology) affects us and how we work; and the increasing problem of burnout and ensuring physician wellbeing.

LIFE ITSELF

If there is a generalization that a vast majority of us will accept, it is this one: the happier you are, the better professional you will be. This should specially ring true for doctors, whose empathy and compassion towards patients will directly affect the quality of their work. But will also affect their motivation for career development, research, learning, and teaching. And ultimately, their decision to stay in medicine or quit, or to retire early. Satisfaction at work is affected by many variables, and is highly personal. It is affected by cultural background and gender, but also by whether you are a baby boomer, a millennial or belong to generation X. A detailed analysis is beyond the scope of this work, but one issue remains critical: whatever can be done to increase wellbeing will ultimately affect the quality of care.

Technology and Connectivity in the Workplace

Connectivity is changing how we work and relate to others and has had a major impact on how doctors deal with their patients, the hospital workflow, and how and what they need to learn in order to stay current and motivated. Surgeries of about 2h can experience an average of 9 interruptions per hour (one every 7 minutes!) of varying importance (Antoniadis, Passauer-Baierl, Baschnegger, & Weigl, 2014). Some are related to time dedicated to enter data into anesthesia information management systems, and a good number of others to the use of the phone, by talking or by texting. This use is not always work related and it is debatable whether work-only use can possibly be demanded. In a 2012 analysis, the ASA Closed Claims database reported 13 adverse outcomes in 5822 claims related to distractions such as reading, phone use, or loud music. There was no report involving social networks or other Internet uses. These events were labelled substandard care and were associated with payments in 80% of the cases. The median payment was $725,937 (Domino & Sessler, 2012). Clearly, patients consider that doctor´s focus is important.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

It´s not a mere question of whether this affects outcomes, although that is a serious concern. It affects the whole way we communicate and the pressures that we experience. It certainly affects psychological energy and focus. And it requires a high standard of professionalism, requiring an effort to minimize anything that distracts from good care, to facilitate the avoidance of alert fatigue, and of course the inappropriate use of social networks (Cammarata & Thomas, 2014). That is today´s world, after all. If you are in Belgium, you look at your phone an average of 34 times/day. In the US, it would be 52. In Norway and Sweden, 61% of people use their phone at work for personal purposes. In France, this number goes up to 92% ("2018 Global mobile consumer trends. Deloitte.," 2018).

How many times each of us, or someone close, has stated that they use their phones too much but don´t actually know how to change that behaviour? Internet addiction was defined more than 20 years ago (in 1996, to be precise). Technology has many benefits and has changed our lives for the better in countless ways, but we have to own it, not the other way around. More than never, each anaesthesia provider now holds the responsibility for how they provide care, and of what they publish in social media. It´s not just about respecting the privacy of patients – there are some cases of doctors who were fired because of racist or highly inappropriate comments about their (anonymous) patients.

To add another layer of pressure to an environment already loaded with them, in many hospitals in Europe texting through chat apps such as WhatsApp™ has become the preferred way of delivering department alerts or requests. This means that a medical professional may receive his/her week schedule, case list, and any changes in them without actually talking to anyone, be it the operating theatre manager, the department chief or whoever is in charge of organizing and distributing work. It´s practical and easy, but many of the nuances of communication are completely lost. Is that anaesthesiologist all right with a sudden change? How did the last case affect this professional emotionally? Face to face communication may not always be the most practical approach, but it should not be cornered that easily. Healthcare professionals, after all, are notorious for minimizing their own pains and aches in favour of patient care.

How Technology is Shaping the Work Environment

Being constantly connected is not the only way in which technology affects the way an anesthesia professional (or any other medical doctor) works. The development of artificial intelligence (AI) and self-learning algorithms is aimed primarily at the automation of tasks that formerly required a human being, like EKG reading or radiologic and ultrasound interpretation. Mobile apps are being developed for diagnosing diabetic retinopathy or melanoma, and are becoming increasingly accurate. All this technology might not be ready yet, but for sure is not going to take long (Chuchu et al., 2018). Some of them are already available for the general public to download and use. Virtually anyone will be able to diagnose skin cancer or atrial fibrillation. Will be eventually stop needing doctors altogether?

In anesthesia, automated closed-loop systems have been under development for quite a while, guiding drug dosage through processed electroencephalograms, with positive results: lower use of drugs, stable anesthesia depth, shorter recovery times (Pasin et al., 2017). Other physiologic variables such as variability in heart rate or stroke volume have also been used to guide fluid therapy or analgesia delivery (De Jonckheere, Jeanne, Keribedj, Delecroix, & Logier., 2018; Joosten et al., 2016). All this does not yet replace a human anaesthesia provider (for the time being, we are still better than machines at rapid danger recognition and at integrating information). The question here is *when?* (probably sooner than we may think) and also *how?* - and here the answer is: *we don´t know yet*. The way we work is going to change, and sooner rather than later. The way anesthesiologists will work in, let´s say, ten or twenty

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

years from now, may be very different from what we do now. We will still need human providers but they may have a somewhat different set of skills and knowledge. With robots and AI guiding the more technical aspects of anesthesia delivery and physiologic homeostasis, the role of the anaesthesiologist might very well lean towards team coordination, preanesthesia counselling, and a humane, compassionate approach to surgical and critical care patients and their families.

Does this mean we won´t need as many doctors in a few years? It´s difficult to foresee, but it certainly looks possible. What is clear is that there is something no robot can deliver: the human touch. The understanding, the comforting, the compassion – who wouldn´t want a knowledgeable physician providing this, and coordinating our care, in those moments of critical illness or surgery?

Burned-Out Anaesthesiologists

The problem with human touch is that it implies that the anaesthesiologist is capable of this empathy and compassion. There has been for long now a discussion on why doctors seem to stop less by the bedside nowadays. A 2017 review showed that, in UK anesthesia departments, two thirds of patients' complaints were related to the ethics and professionalism of healthcare workers, and only one third to medical or technical issues (Pieri et al., 2016). What´s going on here? There is not one single reason. Anaesthesia is one of the medical fields at high risk of psychological stress. Anaesthesiologists are exposed daily to heavy workloads, stressful situations with patients and colleagues and many responsibilities. They work nights, weekends and holidays. They miss on social life, and may feel isolated. They don´t always have a solid social or institutional support. On top of this, and as a recent article in *The Lancet* stated, physicians become "disillusioned by the productivity orientation of administrators and absence of affirmation for the values of relationships that sustain their sense of purpose" (Epstein & Privitera, 2016). This affects morale, and, when it all together becomes too much, or the individual doesn´t find a mechanism to deal with it, burnout may ensue.

This syndrome seems to have reached epidemic levels in the medical field with a reported prevalence around 50% in all specialties, and well over it in fields related to emergency or critical care (Sanfilippo et al., 2017). Burnout in anesthesia is known to appear in response to chronic stressors, such as poor temporal structuring of work, conflicting interpersonal relations, or lack of control over the activity itself (De Oliveira, 2017). Burnout syndrome is broadly accepted to have three main components: depersonalization (physicians become cynical and detached), emotional exhaustion (loss of motivation and hope) and low personal accomplishment (they feel ineffective and helpless) (Epstein & Privitera, 2016). Who doesn´t know of someone experiencing this to some extent?

The consequences impact the workplace heavily (impaired job performance, poor display of empathy towards patients, a trend to leave the practice); but especially the person, with reports of poorer health (higher incidence of hypertension, sleep problems or gastric disorders), increased interpersonal and marital conflicts, depression and other mental problems, some leading to substance abuse. It may even lead to suicidal ideation or even attempts to take one´s life (Rama-Maceiras, Jokinen, & Kranke, 2015).

To top this, women consistently report higher levels of burnout. This begins early in their careers, and with early we mean *very* early: six months into residency, female residents have higher levels of stress and burnout than their male counterparts (Guille et al., 2017). We have cited before the many cultural reasons and biological factors that have been advocated to account for this difference. Age, on the contrary, seems to have the opposite effect: older anesthesiologists report lower levels of burnout, as they have probably developed adequate coping mechanisms over time (Wong & Olusanya, 2017).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

A considerable effort has been devoted to identifying both risk and protective factors. Developing resilience and coping mechanisms is useful, as are stress management strategies. Individuals are encouraged to give self-care its due importance, establishing the best possible work life balance achievable, identifying specific stressors and trying to change either the setting or the emotion associated with them (Rama-Maceiras et al., 2015).

However, physician-oriented strategies are overall less effective than organization-oriented interventions like reducing workload, rescheduling shifts or organizing multidisciplinary meetings to enhance teamwork (Panagioti et al., 2018). Promoting a positive climate, group cohesion, communication, and participation are also approaches that institutions can take. Engagement can be promoted, and especially in anesthesia, by giving certain extent of control over work schedules, by promoting flexibility and part time schedules that don´t curtail the physician capability to pursue research or teaching. Other way to increase control is to promote clinical pathways designed by multidisciplinary teams.

All this is going to require quite a cultural change. Big academic hospitals with a never-ending workload – how will they avoid rewarding a faster (but chaotic) pace and promote quality? Smaller institutions – will they have the capability to actively measure climate in the workplace and provide counsellor help when needed? Will they have the resources to provide flexibility in work schedule? And all of them, how to deal with the stigma associated with psychological distress? Not to say when things go even further and substance abuse becomes the coping mechanism selected. Anesthesia is notorious for having a risk of addiction 2.7 times higher than other specialties. Opioids addictions (mostly fentanyl) account for 55%, alcohol for 28%, and stimulants for 8% of the substances used by anesthesiologists as a "coping strategy" (Lefebvre & Kaufmann, 2017).

Emotional and medical education since early in medical school, and promoting engagement and a good social support are good strategies to help prevent and deal with psychological distress, burnout or, if it comes to that, substance abuse or any other kind of addiction.

IN SUMMARY

The work environment of anesthesiologists has seen a degree of change in the past 15 years. Technology has provided new ways of working, automating processes and highlighting the human interaction provided by the anesthesia team, and their role in leadership and coordination of care. Connectivity has also made communication easier and faster, although it might also become a distraction sometimes. Anesthesiologists need to be aware and in control of how they use these tools so that they don´t compromise quality of care. This faster pace, along with the characteristics of the anaesthesiologist work, has made apparent the psychological distress that doctors may suffer when hospitals are managed based solely on economic factors. Burnout syndrome and substance abuse to a much lesser extent, are real problems that require action from both the individual and the institution in order to avoid harm for both the medical provider and the patient.

MAKING SURE THE FUTURE LOOKS BRIGHT

There is a general acknowledgement that we need a vast cultural change, both for men and for women, individuals and institutions. This is the workforce that we have, when we look into the future:

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- A significant portion of aging physicians that can offer magnificent expertise and very valuable experience, but that need winding down from the physically challenging aspects of anesthesia;
- An increasingly higher proportion of women whose talent and contribution are currently under-utilized due to cultural constricts and a rigid, outdated work organization;
- A more diverse workforce that values work-life balance.

The way they develop their work needs to change, or we will see a good number of them leaving the specialty or providing low quality care due to burnout. We need to find a way to create better structures that could allow for a more psychologically safe work environment. We need to see how we can develop a work culture that keeps medical professionals highly motivated in staying up to date and developing research; providing safe, high quality medical care, putting the patient at the centre of their practice; and making sure that they can balance their personal and professional lives.

What do we Know that we can Apply?

Of all the issues we have talked about in this chapter, the most extensively researched are gender equity and burnout. There are no strong evidences to support any specific intervention, because there are many factors involved and their complexity is considerable. Not only every country is different, there are also big differences in workplace culture in neighbouring institutions.

Individual Based Strategies

Women physicians, as we have seen, face many barriers is career development. Throughout the past several decades, there has been an increase of initiatives to teach women how to navigate the male-centered work environment, how to negotiate, or how to develop a better work-life balance. This has been best achieved through peer-to-peer networking, mentoring programs (where the mentor can be either male or female), aiming at a better sharing of household responsibilities with partners, and seminars promoted by different organizations. Social support is seen as crucial. Awareness programs aimed at noticing and managing conscious and unconscious bias, and low intensity, often non malicious sexual harassment (such as sexist remarks or behaviours), have also proven very helpful (Mehta et al., 2017; Pfleiderer, Bortul, Palmisano, Rodde, & Hasebrook, 2018; Wong & Olusanya, 2017).

In dealing with burnout, physician directed interventions usually comprise cognitive behavioural techniques, courses on mindfulness, communication skills and coping strategies, like enhancing peer-to-peer networking, or enriching social life outside of work. Physical exercise or hobbies are also encouraged. Again, social support is seen as crucial (Rama-Maceiras et al., 2015).

Institution Based Strategies

Not surprisingly, the biggest challenge lies in changing the workplace environment and burnout than physician-oriented interventions (Wong & Olusanya, 2017). In gender equity, there is simply no other way to promote change.

Many academic hospitals, to provide an example, directly do not have work conditions suitable for a woman of any age, but especially young, trying to juggle family, clinical time, research and teaching. Female physicians tend to choose working environments that are more flexible, work less than full time

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and in average earn less than their male counterparts for doing the same job (Baird et al., 2015; Pfleiderer et al., 2018). Hospital managers need to be aware of this and address the issue accordingly. Human resources management has to be aligned with economic, academic and clinical management. This can only be achieved if the institution takes the problem seriously and commits to find solutions to remove barriers in work scheduling and career progression. Quotas have been long looked at suspiciously, but the fact is that, if you promote gender equality in boards, then women´s problems and needs will be recognized and addressed much earlier, and the solutions will be better fitted for them.

Gender equality in leadership positions is also beneficial as it creates more role models, a more open and welcoming environment, and an increase in visibility. In the short term, specific grants and scholarships can also help younger women establish a research career. In the long term, institutions have to find a way to accommodate the needs and dynamics of female doctors. The magic word here is flexibility.

This is a similar approach to addressing burnout from an organizational point of view. Changes in shift models that allow for reasonable rest time, comfortable on call rooms, varied job plans and planned sabbaticals are useful in improving the work environment and climate. Transparency from management, participation in decisions, team building exercises improve sense of value for the physician. And very importantly, the sense of fairness in work distribution and rewards is an important part of this work climate.

If we look at what these approaches have in common, two things stand out: there needs to be a commitment from top to down to change things; and flexible work plans within the possibilities of every institution should be implemented and actively supported.

CONCLUSION

It is virtually impossible to foresee in advance the needs and availability of anaesthesiologists across Europe. There are many different factors and every country has its own idiosyncrasy in what comes to culture, organization and structure of health services. We have reviewed the impact of some trends, such as the ageing specialist population, the increasing numbers of women working in anaesthesia, or cultural and societal changes in perception towards work-life balance.

Anaesthesiology is a challenging specialty and requires a high degree of engagement and motivation to endure long work hours, stressful situations and often tense work environments. To ensure quality and sustainable anaesthesia provision, wellbeing of this diverse population of anaesthesiologists needs be addressed. There are some individual interventions that are useful, but the biggest impact come from organizational, top to down changes. Achieving rational and flexible work hours, adequate compensation, and promotion of a workplace culture that fosters safety, would be key points to ensure the culture of safety, quality and motivation that will provide, in years to come, the doctor that will care of us.

KEY TERMS AND DEFINITIONS

Burnout: Syndrome comprised of three main components: depersonalization (cynicism and detachment), emotional exhaustion (loss of motivation and hope) and low personal accomplishment (feelings of ineffectiveness and helplessness).

Coping Mechanisms: Set of psychological skills an individual uses consciously to deal with personal, interpersonal or environmental problems in order to minimize and manage stress and conflict.

Diversity: Understanding and acceptance of each individual uniqueness and value; it implies acceptance, respect and recognition that every individual can provide value to a community or organization.

Equality: Assumption that rights, responsibilities and opportunities will not depend on a specific trait such as being male or female, or belonging to a specific race or social group.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Equity: Assumption that there will be fairness of treatment for everyone according to their respective needs.

Resilience: Mental processes and behaviours an individual uses to bounce back from a crisis or manage difficulty.

Second Generation Gender Bias: Practices that may appear neutral or non-sexist because they are applied to everyone, but which end up discriminating against women because they reflect the values of the men who created or developed the setting, usually a workplace. First-generation bias refers by contrast to a deliberate and intentional exclusion.

Winding Down Strategies: Set of strategies developed with the intention of gradually replacing more demanding or physical work by other type of work or work schedule, usually oriented to ageing professionals.

Workplace Connectivity: Work environment in which information and professionals are available constantly and with very little time delay through digital and mobile devices.

Chapter 39
Cultural Diversity, Negotiation, and Organizational Leadership:
Their Relationship With the Competitiveness of Colombian Companies in a Global Context

ABSTRACT

In globalization, the business world is becoming increasingly complex and challenging for small and medium companies in Latin American countries. There are variables that determine the success of a national and international business. In the latter case, one must have a good knowledge of the country's environment with which a commercial operation is carried out (competitors, political, economic, socio-cultural, legal, technological, etc). All these factors are undoubtedly important in the field of international treaties or agreements, as well as the precise information of the negotiating company. However, variables such as leadership and organizational culture and, in particular, cultural diversity are to a small extent considered as decisive factors of business competitiveness. The chapter describes the importance of the three variables as tools for the performance of Colombian companies in an international context and shows the results of the CW Model of the Culture Assistant, where seven key elements of cultural diversity are evaluated in organizations.

INTRODUCTION

In a globalized market like today, the business world is becoming increasingly complex and challenging for small and medium-sized enterprises, especially for those in developing countries such as Colombia. There are several variables that determine the success of a business both nationally, but especially at the international level; in the latter case, one must have an excellent knowledge of the environment with the country that is conducting some commercial operation (competitors, political, economic, sociocultural, legal, technological, among other aspects). These factors are undoubtedly important in the field of international treaties or agreements, as well as the precise information of the negotiating company. Variables such as cultural diversity, leadership and especially the organizational culture are in a little measure considered as determinants of business competitiveness.

This chapter aims to describe the importance of these three variables as tools for the competitiveness of Colombian companies in an international market. Cultural diversity is based on different theories about organizational culture. For Martinez (2010) studies on organizational culture could be divided into two broad groups; on the one hand, "those who try to identify the variables that define the organizational culture and the relationship of these variables with results in the organizational field" (p. 167). The second group is characterized by representing "studies between cultures (cross-cultural), which seek to associate the traits of the cultures of countries or regions with characteristics of organizational cultures. In the latter case, characteristics such as leadership and organizational behavior are taken into account "(Martinez, 2010, p. 167). This second group focuses on the analysis of cultural diversity and its effects on organizational behavior.

The issue of what makes culture different in terms of attitudes, beliefs and behaviors at the level of countries, regions, and organizations has been a case of study and interest to researchers since the late '70s. As a result of these investigations, there are different models. As a pioneer in the development of these studies, Professor Geert Hofstede focused on six categories: distance of power, individualism Vs. Collectivism, avoidance of uncertainty, masculinity Vs. Femininity, long-term Vs. Short-Term orientation, indulgence Vs. Containment. Subsequently, adaptations emerged to the Hosfede model as the Intercultural Awareness Model, ICAM - developed by Dr. Paula Caligiuri, of the Center for Human Resource Strategy of Rutgers University and Caligiuri & Associates. This created a framework of eight aspects for better understanding and appreciation of cultural differences, which are: Hierarchical structures vs. Equalitarian, Formal vs. Informal style, Individual or Group Interests, Interpersonal Relationships vs. Transactional Relationships, Direct vs. Indirect Communication, Controlled vs. Fluid Time, External Control vs. Internal Control. Motivation State vs. Balance.

Dr. Caligiuri's research focuses on the reality that companies live in the world and how managers are incorporating cultural diversity in decision-making. Caligiuri (2013) states that, "it is difficult for CEOs to find talent with intercultural competencies and global leadership" and "organizations are concerned about the difficulty to find talent with intercultural competencies and global leadership, there are not many people, and that there are, does not have the capabilities we seek "(p.175).

In 2010 Drs. Michael S. Schell and Marian Stoltz-Loike proposed the CW Model-Culture Wizard Model, which is an adaptation of the Windham International Model. Solomon and Schell (2010) guide their model with seven key elements of cultural diversity that are: Hierarchy and Egalitarianism, Global approach, Relations, Communication styles, Orientation to time, Tolerance to change and motivation, Life-Work Balance and develop a global mindset. The research was carried out to 40 companies with global competencies in the services, industry, manufacturing and agricultural industry sectors.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

For the development of this particular investigation, the CW Model-Culture Wizard Model was applied to the managers of different Colombian companies. By using a questionnaire instrument of 35 questions, each variable of the CW model was measured within the organizations to determine the different levels of conduct of Colombian companies in relation to their cultural styles. In addition, an interview was conducted to know their perception as leaders facing the importance of intercultural relations in their international negotiations. It is essential to mention that, as we intensify on culture and its manifestations, we will learn to recognize, distinguish and adjust to being more productive and effective when directing through cultural diversity (Solomón and Schell, 2010).

CULTURAL DIVERSITY AND ORGANIZATIONAL CULTURE

Cultural diversity is an organizational aspect that is becoming increasingly important as a result of the globalization of economies, cultural influences, and social changes to which our societies are exposed. Therefore, many companies are aware that the linking of individuals from diverse cultural backgrounds brings new skills and ways of doing things that greatly encourages innovation (DuBrin, 2013). A study by the prestigious magazine Forbes (2011) about the relationship between diversity in the workforce and innovation within companies affirmed that, for multinational and transnational firms, diversity is not only the maintenance of a heterogeneous team of collaborators but to generate strategies to recruit, develop and maintain very diverse personnel that promotes innovation within the organization and use it for the creation of a competitive advantage.

In 1991, Taylor Cox and Stacy Blake from University of Michigan published significant research stating that the commercial trends associated with the growth of the globalization phenomena had the effect of increasing the mobility of different ethnic groups inside large corporations in North America. According to the researchers, the phenomenon of globalization and cultural diversity in companies is leading the attention of top managers towards the management of culture integrated to the administration of human resources in all levels inside the companies. The management literature has suggested that organizations should value diversity to improve organizational effectiveness. Cox & Blake (1991) showed in their study that there is a link between the management of diversity and organizational competitiveness. This is because organizations respond to globalization and labor migration with a focus on "valuing diversity." This results in better management of the diverse workforce, integrating it permanently into the structure of the organization and not simply sponsoring "cultural diversity" programs offered periodically by the human resources areas (DuBrin, 2013).

In their study, Cox and Blake (1991) argue that stimulating cultural and demographic diversity in an organization goes beyond merely achieving social responsibility goals since companies can benefit from cultural diversity in several more ways, such as:

1. **Cost Optimization:** Effective management of cultural diversity can reduce costs. A more effective administration of cultural diversity can increase the job satisfaction of different groups, which consequently reduces turnover, absenteeism and corresponding costs. A diversified organization that welcomes and grows a wide variety of employees will retain more of its minority and multicultural employees. Besides, effective diversity management helps avoid costly demands for allegations of discrimination based on age, race or gender.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. **Recruitment of Top Talent:** Companies that have a favorable track record in managing cultural diversity have a distinct advantage in recruiting talented people. Those companies that are known to welcome diversity willingly attract the most reliable candidates among women and racial and ethnic minorities. A labor shortage has given greater impetus to cultural diversity. During seasons of the low labor force, companies cannot afford to be considered racist, sexist or discriminate on the grounds of age or union membership.
3. **Better Marketing Strategies**: Good management of cultural diversity offers an advantage in marketing, which includes higher sales and profits in new places. A diverse workforce facilitates reaching multicultural markets.
4. **Increase in Creativity**: Diversity in the workforce can provide a company with useful advertising and propaganda ideas. A culturally diversified workforce or the company's advertising agency can help the company be placed in a favorable situation with the cultural groups it wishes to reach.
5. **Increased Exceptional Ability to Solve Problems**: The heterogeneity in the workforce can offer a company an advantage in creativity. The probability of finding creative solutions to problems is more considerable when attacked by a diversified group.
6. **Greater Organizational Flexibility**: The flexibility is that as policies and procedures are expanded, and operational methods become less standardized, the organization becomes more fluid and adaptable. Tolerance to different cultural views should lead to a greater openness to new ideas in general. The most important of all is if organizations succeed in overcoming resistance to change in the problematic area of acceptance of diversity.

Improving cross-cultural relationships requires organizations to understand the competitive scope and success factors related to cultural diversity and to achieve that understanding, companies must be aware of the importance of values, attitudes, and communication as a means of change in favor of multiculturalism. As mentioned above, the impact of culture on the style of management and leadership is another significant cultural influence on the behavior of organizations. Although personality factors are an essential element in management style, culture is also important because it serves as a guide to what constitutes acceptable behavior. Culture establishes the values that guide behavior. Moreover, just as with the dimensions of cultural values, there are also, following the study done by Geert Hofstede (1993), some national stereotypes of management styles in the world. However, the intelligent management of the diversity of cultures that exists in an organization is a powerful strategy to improve the organizational climate, encourage creativity and organizational learning, manage the knowledge of the company and strengthen a solid corporate reputation in today's markets. (Ramírez & León, 2008)

Leadership and Organizational Culture Generators of Value

In the current context of highly competitive markets that characterize the globalized economy of the 21st century, it is of fundamental importance to strive for greater competitiveness of companies. It is essential to recognize the socio-cultural determinants that contribute to the creation of value in organizations such as the establishment of a robust organizational culture intending to guarantee their survival and long-term success. As mentioned by Sarros, Cooper, and Santora (2008), the organizational culture has ceased to be a general issue for organizations, becoming a factor of great importance because of its ability to impact their strategic and operational management, becoming a competitive advantage for many companies today.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

According to Leon (2001), these organizational cultures are characterized by being collective since they originate from the set of behaviors, norms and values that several individuals share. This determines the way in which people interact with each other and with their organizations in situations of high uncertainty. This is dictated by conditions such as high volatility of markets, economic changes and technological advances, leading these interactions to provide their members with tools that help them individually and collectively to face these changing scenarios.

Organizational Culture and Leadership cannot be separated from their study since there is a high level of correlation between them. A productive organizational culture is one that is open and friendly. This is promoted from the top management where it is established what is important (values), how things are done (behavior) and how things work (norms), encouraging individuals to think about problems in new and creative ways and to generate organizational cultures that support individual and collective growth. (León, 2001).

For Chiavenato (2000, p.54) the leadership is "the influence of a person to another or a group according to a certain situation and is applied through the process of human communication in order to reach specific objectives." A leader does not proclaim itself as such and it is the group that determines its influence and recognizes him/her as a guide and example to follow.

In this same way Davis and Newstron (2004) establish that leadership is understood as "the process of directing the work activities of the members of a group and influencing them" (p.17). These authors define leadership as "the process that helps others to work with enthusiasm and towards certain objectives, that is, it is the fundamental act of the success of an organization and its people" (page 61). In order to become the enthusiastic motivator proposed by the different definitions of leadership, it is evident that a leader is a person with a sum of characteristics and capabilities that stand out above those who are not. For the transformational leadership theory of James MacGregor (1978) and Bernard M. Bass (1985) the leader should be: visionary, with strong values, managerial, strategic, motivating, supportive, negotiating, humble, aware of equality, has faith in workers and above all dominates his/her emotional intelligence.

According to the above, it could be said that transformational leadership would be more in line with this new perspective of change since one of its fundamental characteristics is to promote the development of competencies in the organization in which each one contributes to organizational change. The transactional leadership would be more in line with traditional models where the leaders establish the strategies and processes that lead to the achievement of the objectives rigidly, through an instructional and functional style, while the transformational leaders have the ability to change the perspective of its collaborators, motivate and inspire (Contreras Torres & Barbosa Ramírez, 2013)

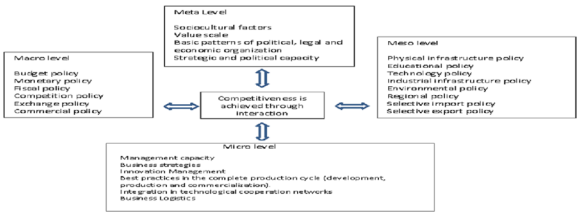
At present, the survival of organizations depends to a great extent on transformational leadership which is directly associated with the organizational culture through the processes of establishment and socialization of corporate objectives and the motivation that workers receive from their executives. To achieve these goals, transformational leaders go beyond tasks that make them more effective in times of crisis and an inescapable factor in change processes as it favors adaptation. The charismatic qualities of these leaders are exacerbated in those moments when organizations are going through critical transformation processes that potentially compromise the survival or development of the organization (Chhokar, Brodbeck, & House, 2013). During times of change and uncertainty, the charismatic leader manages to influence the perception of success by the employees and this, in turn, increases the motivation, dedication, and commitment of the employees, improving the organizational culture.

Esser, Messner, and Meyer-Stamer (1996) (See Figure 1) see the factor of leadership as a concept of systemic competitiveness which has four levels: meso, meta, macro, and micro levels. This research

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

conceives business competitiveness as a set of capacities that integrate different factors that interact to give favorable conditions for the generation of value to both shareholders and customers of the company. For this specific case, it is understood that dimensions such as leadership, negotiating skills and cultural diversity are part of the organizational culture and are part of the micro level in the fields of management skills and business strategies, so they are also contributing factors to business competitiveness. They should be given special attention because people and not companies are who direct, negotiate and create the culture of an organization (Esser, Messner and Meyer-Stamer, 1996).

Figure 1. Determining factors of systemic competitiveness
Source: Cepal (2001)



NEGOTIATION AND LEADERSHIP

Negotiation is a process that is inherent to the human being. Every day is negotiated in different contexts and often without noticing it. However, for leaders in companies, it is essential to be aware of the implications of knowing how to negotiate, developing strategies and tactics that allow them to benefit in favor of the company's objectives.

Various concepts have about what is negotiation. For the Harvard school headed by professors Roger Fisher, William Ury and Bruce Patton, negotiation "is the basic way to get what we want from others" so "it is a round-trip communication designed to reach an agreement when you and the other party have some interests in common, but also some opposing interests "(Fisher, Ury and Patton, 2018, p.10).

For Puchol, L and Puchol, I (2014) a negotiation is "an activity in which two parties, whose interests are partly complementary and partly opposed, try to reach an agreement that satisfies most of the interests of one and the other, while facilitates the realization of new negotiations in the future "(p. 5).

For Acosta Vera (2018) the negotiation revolves around the solution of conflicts where the opposing interests of the parties come together to find solutions where both get something in return, which would imply that "the negotiation is not an end in itself, but a means to achieve objectives in a satisfactory way "(Acosta Vera, 2018, p. 21).

Based on the above, we can identify some of the main characteristics of the negotiation process that will serve as support for the managers of the companies in a context as competitive as the current one:

In addition to the aforementioned characteristics, it is imperative to be clear that whoever handles the most information in any negotiation is who will have the power within it. It must be taken into account that, in order to develop a win-win strategy, at some point in the negotiation, moments will be presented in which value must be claimed. For Malaret (2010, p. 40) "the key technique to claim value is: to modify the perceptions of the other party about their own alternatives and ours", to achieve this task in a successful way, one must have control of the negotiation, and to obtain it the most exceptional possible control over the information is required; of the parties, the context and the problem.

Table 1. Negotiation characteristics

Negotiation characteristics
It is a process that has the purpose of signing or closing an agreement or resolving a conflict
It requires a broad knowledge and respect for the culture of the counterpart.
Confluence of: legal, social, political, economic and cultural aspects
It is based on communication and effective relationships
It feeds on strategies and tactics.
Requires preparation, planning and training

Source: Own elaboration

On the other hand, you must always have clear objectives and interests you want to achieve within the negotiation and what could be the possible objectives and interests of the counterpart. Added to this, it is essential to have clarity about what are the margins of negotiation that are counted so that each objective that is established (not only the price) has a margin of negotiation This is colloquially and in the business world is known as the ZOPA or Zone of Possible Agreement, "Without values that are located within the Zopa, there is no possibility of agreement" (Malaret, 2010, p. 40). This process of establishing objectives with clear, precise, quantifiable and measurable margins will facilitate the satisfaction of the interests of the company and the counterpart in a more objective manner and with benefits for both.

Phases of the Negotiation

For Professor Anibal Sierraalta Rios (2010), any negotiation will be faced with three phases that must be assimilated, perceived and prepared by the leaders who will negotiate. The first phase is the emotional one. Trust is the objective of this phase. It is the first approach with the counterpart where definitive soft, motivating, perhaps personal topics (depending on the culture) should be dealt with. The idea is not to start this phase with issues of negotiation. On the contrary, the objective is to know the other and that the other feels in confidence with the company and the people who are representing it. Before this emotional or initial phase, negotiation planning must be carried out. This implies the investigation and organization of information required concerning the people to be negotiated with, the tactics and strategies to be used, the problem or conflict deal with and the context in which the negotiation will take place.

The second phase of the negotiation is the Reflexive Phase. In this, the interests of the parties should begin to be identified and their motivations will be a key element of this identification. Most of the time the negotiators start presenting their positions that make it very difficult to see possible future agreements. Negotiating based on positions is a characteristic of the old school of negotiation that is also known as Distributive Negotiation. In the modern school or Harvard school, priority is given to knowing the interests of each of the parties, characteristic of the Integrative Negotiation; one of the simplest ways to get to know the interests is to ask, for ¿what? And ¿because? Find out about the real needs of the other party will be a start to present various options on the negotiating table and reach beneficial agreements for both parties.

The third and final phase of the negotiation is the Negocial phase, in which the concessions and exchanges are worked. In it, each of the options is reviewed and adapted to the needs of each one. In this phase, the decisions are made as to whether the negotiation is closed with or without an agreement. In both cases, any decision is valid due to the respect of the margins and the real interests of each one.

Negotiation and Cultural Diversity

Whichever the definition of negotiation, it can be inferred that negotiation occurs for two reasons; in order to reach an agreement between the parties or to solve a conflict between them. In either case, it is necessary to have competencies that allow the leader to achieve the objectives of the organization. This aspect becomes a little more complicated when negotiating with people from different countries. One should try to analyze the alternatives to the negotiated agreement, determine the interests of each of the parties, establish the options and criteria of legitimacy, maintain an effective relationship and communication, but also all aspects of culture (customs, beliefs, set of values, among others) of the counterpart that could in one way or another affect the negotiation.

Companies that work in international markets have traditionally paid great attention to market studies and to the study of aspects such as legal, fiscal, etc. of the countries in which they work or want to work. However, in many cases, they have not paid the necessary attention to the study of the cultural aspect/barriers or to how the people with whom they are going to have to interrelate in these countries act (Fanjul, 2010, p. 13).

Thanks to globalization and the increase mentioned above in the flow of commercial relations, today companies that are immersed in international business must interact with different cultures, suppliers from different countries, and customers with diverse and increasingly complex needs. "Nowadays, it is widely accepted that cultural aspects can significantly affect the way international business is conducted and the international activity of the company" (Fanjul, 2010, p. 7).

To successfully manage through cultural diversity, it is necessary for the business leaders to develop their capacity to recognize and adapt to cultural signals so that they can intuitively identify global opportunities and be effective when dealing with people of different origins (Solomon and Schell, 2010). This is what is known as developing your Global Mentality. "Evidently, the greater their capacity to identify cultural differences and to appreciate them, the more capable they will be of directing culturally different behaviors" (Solomón and Schell, 2010, p. 12).

There are some manuals and international negotiation protocols that have been useful to the managers of companies. However, despite the diversity of behaviors that can be found by the negotiator when crossing borders, it is possible to identify and even measure patterns of different behavior to analyze cultures. This objective can be obtained through the CW Model (Culture Wizard Model).

CW Model (Culture Wizard Model).

The CW Model is an adaptation of the models of Windham International and ICA. It is also linked to the work of outstanding thinkers in this area such as "Geert Hofstede, Fons Trompenaars and Edward T. Hall" (Solomon and Schell, 2010, p. 52).

The CW Model is a cultural model that establishes seven characteristics that will help to understand the behaviors of the people with whom one works in different cultural contexts and even the own behaviors tied to the set of values of the society in which we relate.

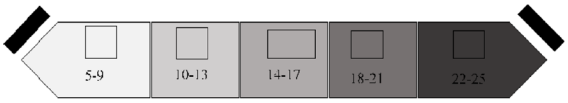
Solomon and Schell state that the CW Model was "designed to be used in the ever-changing business world, where global professionals travel from one culture to another and work in multicultural teams" (2010, p. 52).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

To achieve the purpose of this research, the CW Model was adapted to different Colombian companies in the services, industry, and manufacturing sectors. Two instruments based on the CW Model were applied to 40 process leaders who are immersed in the world of international business.

The instrument contained five questions per dimension with a Likert scale of 1 to 5, where 1 and 5 strongly agreed. Likewise, a score is established according to the final results by dimension, as follows: from 5-9 = Low, 10-13 = medium-low, 14-17 = medium, 18-21 = medium high and 22- 25 = High. See Figure 4

Figure 2. Measurement scale by dimensions of the CW model
Source: Cultural Diversity in Business (2010)



For the case of hierarchy and equality, the closer the result is to 25, the cultural behavior related to this dimension will be closer to the hierarchy (18-25). In this case, people assume the existence of levels with different rights. There is a distinction of classes and symbols of more marked status. In this score, the decision-making focuses on the leader without taking subordinates into account. On the contrary, if the result is closer to the minimum value that is 5, the culture of the company about this dimension will be more related to equality (5-13). This means that people believe in principles of equality. The leader considers the opinions of others decision making. Everyone in the company has the same opportunities and empowerment to achieve the objectives.

In the group approach, the higher the result means that the company or person surveyed is defined at work as part of a group and identify their identity, values, and achievements as a result of teamwork. Quite the contrary, if the result is closer to the lower value of the scale, it indicates that people stand out for individual actions and prefer to work alone for the fulfillment of their objectives.

In the relation's dimension, the lower values in the result of the instrument are associated with transactional behaviors. This means that the relationships are like a transaction, so they can be built and dissolved quickly and easily. In case it is not required anymore, no lasting relationships are contemplated in time to achieve success in business. On the contrary, if the result is higher, it will be understood that the culture is interpersonal. This means that the construction of relationships is crucial and fundamental to reach agreements with the counterpart. There is the opportunity to know the person and establish friendships in their work and business contexts.

For communication styles, two concepts are established: direct and indirect communication. The higher the result of the dimension, the communication style of the company or the behavior of people is understood more indirect what it involves not only verbal communication but body language, gestures, nonverbal signals, among other aspects that contemplate that the way things are said can be necessary for the construction of relationships. If the result of the dimension is lower, it relates to direct communication styles. For this type of people, communication should be concise, and without detours, the nonverbal language generates distrust and induces misunderstandings.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Regarding the orientation towards time, if the results are higher for this type of cultures time is very valuable and it can be measured, saved, and controlled. Tardiness is considered a lack of commitment. This type of people tends to schedule and plan events ahead. On the other hand, if the result is close to the lowest score on the scale, the context of orientation to time will be low, leaving several decisions to improvisation and tardiness is regular and daily. They are characterized by being cultures that easily change plans and can easily breach their commitments resorting to more deadlines for it.

The higher the result of the tolerance to change dimension, the more tolerant to change is considered the organization or culture to which it is being measured. This means that people will tend to be more receptive to new ideas, to innovate and to see different ways of doing things. On the contrary, if the result has a lower score, this supposes aversion to change, they are cultures that like always to do the same, they feel the change like a threat and prefer to continue with conventional methods.

Finally, the motivation/balance dimension between work and life; here the highest scores are related to a higher status. For these people work has a significant place in their lives, they can work on weekends without a problem and it is more likely that work interferes with their personal lives. On the other hand, the lowest scores in this dimension will be related to the balance; for these cultures, success is not only related to work, but also their personal and family development. These people will not work weekends and do not conceive of showing off their achievements in the company nor in their negotiations.

To better understand the dimensions of the model, they will be defined and explained in the following table:

Culture and Negotiation Styles in Colombia

Culture can be defined as the set of beliefs, customs, knowledge, habits, ideas, behaviors, languages, norms, politics and values that people acquire when they are part of society. Authors define culture in different ways, for Schein (2004) refers to: For the case of hierarchy and egalitarianism, the closer the result is to 25, the cultural behavior related to this dimension will be closer to the hierarchy (18-25); in this case people clearly assume the existence of levels with different rights, there is distinction of classes and symbols of more marked status. In this score, the decision-making focuses on the leader without taking subordinates into account. On the contrary, if the result is closer to the minimum value that is 5, the culture of the company concerning this dimension will be more related to equality (5-13). Schein states there is:

A pattern of shared underlying assumptions that the group learns to the extent that it solves their problems of external adaptation and internal integration, which have worked hard enough to be considered valid and, therefore, worthy of being taught to new members as the correct way of perceiving, thinking and feeling in relation to these problems. (Schein, 2004, p.17)

Hofstede defines culture as "the collective programming of the mind that distinguishes the members of a group or category of people from others" (Hofstede, 2019, p.1). Hofstede's national culture model consists of six dimensions. Cultural dimensions represent independent preferences for one state of affairs over another that distinguish countries (rather than individuals) from each other. The power distance index, Individualism vs. collectivism, Masculinity vs. Femininity, Uncertainty prevention index, Long-term orientation vs. short-term normative orientation, Indulgences vs. restriction (Hofstede, 2019).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. CW Model seven dimensions

The 7 key features of the CW Model	
Hierarchy and Equality	• How people see their relationship with power • How casually or formally people relate to each other • If a culture considers all people equal • How much social mobility exists • Who is responsible for making decisions? • The degree of autonomy and initiative that people believe they have
Group Focus	• The importance of the group in relation to the individual • If people want to be distinguished from the group, seen as individuals or considered as part of a particular group. • The idea that group harmony is necessary to achieve business goals • The importance of living and working together in harmony.
Relationships	• The importance of developing a personal relationship before doing business • The expectations and obligations involved in a relationship • If trust is assumed or earned • If the rules are interpreted in the same way or there are special conditions for friends • The value of connections
Communication Styles	• The ways in which societies use verbal and non-verbal language • The amount of information that people need to receive or share in order to understand a message • The frankness or subtlety of the language used by people • The way people use words or gestures to express their feelings or mood.
Time Orientation	• The degree of control that people believe they have over time. Do you control the time or is it out of your control? • The importance that society attributes to relationships in the face of the importance attributed to itineraries • Attitudes towards time management and punctuality • The comfort level with short-term planning compared to long-term planning. • The relevance of assigning start or end times of each social event or business meetings.
Tolerance to Change	• Openness to change and innovation • Willingness to take risks • If people think they control their destiny, or if the environment controls them • Preference for rules and structure • How the organization encourages and rewards the initiative and manages the failure
Motivation, Balance Between Life and Work	• How people identify the means to achieve a status through achievement or personal life; how people define their status in society based on their personal life or work achievements. • What impact does a person's work have on their self-esteem and self-perception? • The motivation for success: why people work and what this means • The value of the balance between life and work • The most motivating: free time or a promotion • What constitutes the status?.

Source: Own elaboration based on Solomon and Schell (2010)

In the study conducted by Fritz, Möllenberg and Chen (2000) test through a confirmatory factorial analysis the instrument that Chen and Starosta developed between 1996 and 2000 the model of competence in intercultural communication that integrates characteristics of both intercultural attitude and models of behavioral skills. For them,

Competence in intercultural communication is composed of three dimensions: intercultural awareness, intercultural sensitivity, and intercultural skills. Intercultural awareness refers to a person's ability to understand the similarities and differences in the cultures of others. Intercultural sensitivity refers to a person's emotional desire to recognize, appreciate and accept cultural differences. Intercultural skill

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

refers to the ability of an individual to achieve communication objectives while interacting with people from other cultures. (Fritz, Möllenberg, Chen, 2000, p.167)

The result though to the authors that the instrument used by Chen and Starosta in the year 2000 in his model was satisfactory but that it could be further improved by measuring intercultural sensitivity through the development of a culture-free scale.

The increase in internationalization shows that companies from all commercial sectors of a country (primary sector, secondary sector, tertiary sector) must be competent when wanting to negotiate with other cultures.

With the above, for Colombian companies to increase their sales, have higher returns and competitive advantages, they must first know the country's culture and negotiating styles. Secondly, be strategic when presenting their products and services. Third, be innovative when becoming known to the national and international client. This depends on the challenge, size, and economic sector they want to venture into.

As defined by De la Vega Vallejo:

Organizational innovation, and particularly strategic renewal, becomes crucial and has a powerful impact on export performance. Therefore, it is clear that managers must dedicate at least as much effort to organizational innovation (strategy, structure, administrative processes and business model) as to technological innovation (products and services and production processes). (Analdex, 2017, p .5)

In order for there to be a thriving and innovative corporate culture that is projected over time, it must begin with the change of mentality that the leaders of the companies have. This is how they adequately transmit their ideas, goals, and projections for the future as well as the influence they have on their subordinates when wanting to substitute activities explicitly and concretely, which is gradually transformed until becoming part of the organizational culture. In the following figure is detailed in a better way what is expressed by Schein (2004) on this topic:

Figure 3. How culture is transformed?
Source. Organizational Culture - Schein (2004)

According to the evolution of the world economies that allow the development of the commercial relations among themselves and with the exposed by the authors mentioned previously, the organizations should be able to handle the cultural differences that they face according to the competencies and needs that the international market requires.

On the other hand, for Subirá and Blazquez (2013) state "the so-called competitiveness of a country is nothing more than the integral competitiveness of its companies" (parr.8) which through appropriate

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

administrative management, constant innovation, projection that they have their products and services, the expansion of markets and the development of their global mentality, manage to generate value and be lasting over time (Subirá & Blazquez, 2013).

Some studies conducted on the culture of the Latin American negotiator assert that the negotiator of these regions is:

He is a friendly and informal talker, who is not very precise in his terms. He prefers to negotiate between friends which is the central basis of his trust in the counterpart. He does not sacrifice the short term to obtain advantages in the long run and prefers immediate satisfaction in each deal. He does not stand out for its punctuality and compliance, but it is very impatient when the other one does it; it is very flexible in the use of time, comes from a polychronic culture. Decisions are centralized at the highest level, and are made by the boss as an individual; the advisory or technical groups participate in the meetings, but the only real spokesperson is the boss (Ogliastri, 2005, p.43).

For Ogliastri (2001) in Colombia, the way is similar to the rest of Latin America, although the author recommends not making generalizations. This is a partial view of how foreigners view Colombian culture when doing business. When making commercial agreements, the Colombian wants to first establish a friendship with the possible client or supplier before starting a negotiation and always wants to take better advantage of it. According to Ogliastri, (2001) "Their conception of negotiating is bargaining: ask a lot and then get off. We are not distinguished by the preparation of the negotiations, but we are brilliant improvisers "(p.6). The Colombian uses different strategies and techniques to achieve what they want in his negotiations. They desire to fulfill the vision of the company to which they belong, focus on meeting the objectives and goals, respect hierarchies and are increasingly aware of the importance of communication and relationships for success in their possible agreements with the outside world.

Making a negotiation in Colombia is a ritual, through the exchange of ideas and customs; Colombian entrepreneurs want to establish empathy with the foreign supplier or buyer. Internationalization represents opportunities for companies to meet needs, market wishes and create lasting business links.

According to what Professor Enrique Ogliastri (2001) identified in a study carried out on fifty-one Colombians and Dutch people who had negotiated in the other country, the opinion of the Dutch culture when negotiating with Colombians is described below:

1. **Non-compliance**: Colombians are not fulfilled; they like to postpone dates; they are not serious with the agreements; they promise a lot, but are not ashamed to not comply with what they say.
2. **The Lack of Punctuality**: Shamelessly unpunctual, they arrive late with some good external excuse to the person.
3. **The Evasion of Responsibility**: Always the person in charge is another person; the bosses blame the subordinates and vice versa.
4. **Vagueness**: They are not precise or direct, they do not recognize when they do not know something or do not have the information, and they camouflage the reality of the negotiation.
5. **The Excess of Kindness**: They try to make friends by negotiating, personal relationships are vital, they believe that it is better to break the ice and that without friendly approaches the negotiations will have no firm foundations (Ogliastri, 2001, p.22)

For this reason, this research based on the application of the CW model helped to understand the behavior of business leaders in the different economic sectors of the country and their degree of organizational cultural diversity. The previous showed advances in the way the Colombian is perceived when

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

negotiating. At present, there is much more awareness in the formation of soft skills to reach successful agreements and as generators of competitiveness in the organization.

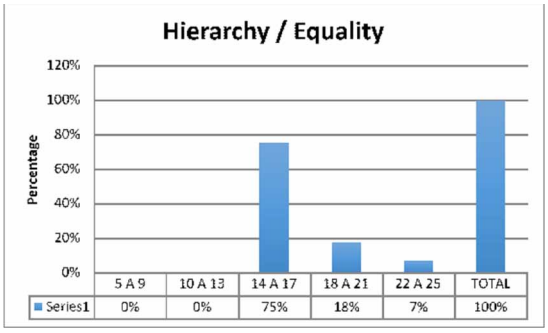
RESULTS

To identify the behavior of Colombian companies on the seven dimensions of the CW Model, a survey was conducted to forty managers from various sectors of the national economy, among which are: services, industry, and manufacturing. The following results are obtained:

Equality/Hierarchical

Therefore, for the dimension of Equality/Hierarchical, 75% of managers of companies in Colombia are in the middle level of the dimension because they consider that their superiors take their opinions into account at the time of making decisions within the organization. There are 18% in the upper middle level at this point. They perceive that the boss determines the priorities of the negotiation and 7% in the high level of the hierarchical dimension. According to the cultural style that these companies handle, people of higher hierarchical level within the company make the critical decisions, without taking into account the opinions of the subalterns.

Figure 4. Hierarchy and equality
Source. Own elaboration (2019)



All people are different in any cultural environment. Solomon and Schell state, (2010) "Within every culture, everyone has their own personal style and behavioral preferences that represent the diversity in that culture" (p.55).

Regarding international business, according to Solomon and Schell (2010) the countries that best manage the rating of this dimension are:

Colombia, according to the results of the surveys, ranks among the middle group between egalitarianism and Hierarchy, where there are countries such as Argentina, Belgium, France, among others.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Group Focus

Regarding this category, 48% of Colombian businessmen are located according to the dimension of the CW Model at the high mid-point of the hierarchy. Regarding the group focus, they agree that the resolution of the challenges should be done in a group manner. There are 43% located at a high level with a strong tendency to work as a team in their organizations. Only 9% of the employers surveyed consider that individual work is what prevails in their organizations and prefer to work towards achieving their objectives, developing their functions alone, even if they belong to a group.

Regarding international negotiations, the countries with greater recognition in the management of the qualification of the group focus dimension according to Solomon and Shell are:

Colombian business leaders are located at a high level of group focus, which translates to styles of countries such as Saudi Arabia, Mexico, Japan and others.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

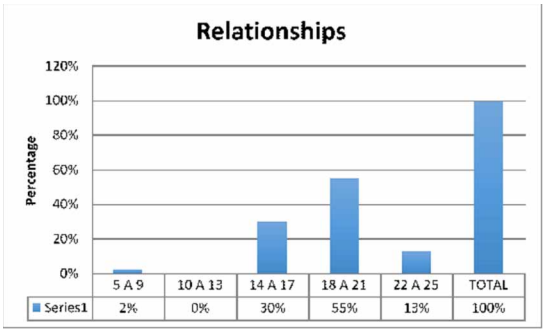
EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Relationships

Based on the relationships, 55% of managers of companies in Colombia prefer that their work team is made up of people compatible with each other, 13% is totally interpersonal, this way they work better, which means that 68% they are in a high level of the Relations dimension.

Figure 6. Relationships
Source: Own elaboration (2019)



For Solomon and Schell (2010) the classification by countries with respect to relationships is shown in Table 5.

In the realization of business and labor relations within companies, Colombian entrepreneurs are located at an interpersonal level, because they are easy to make friends and maintain healthy relationships for the fulfillment of goals within the company.

Communication Styles

To carry out a successful negotiation, one of the important components within it are the verbal and non-verbal communication styles. There are 75% of Colombian managers that focus on indirect communication when detailing the information they want to convey. Within this, only 2% consider the possibility of transmitting information directly clearly and concisely.

Figure 7. Communication

				Turkey		

Source. Cultural Diversity in Business (2010)

The classifications of countries according to this dimension by the authors are shown in Table 6.

The research shows that Colombia is at a high level of indirect communication which requires negotiations with a lot of non-verbal language, perhaps vagueness in the points to be discussed, and tend to concretize their ideas or elaborate wording in communication with their counterparts. This figure is seen in countries like Saudi Arabia, Korea, China, Japan, among others.

Orientation to Time

Based on the Orientation to time, 100% of business leaders consider punctuality as an important factor when carrying out any activity or negotiation. They indicate that the level of responsibility that you have with the schedules of your employees, partners, and customers will avoid inconveniences inside and outside the company.

Source. Cultural Diversity in Business (2010)

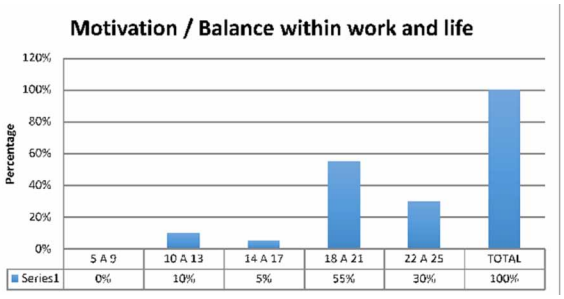
Within this classification, Colombia level of tolerance for change is on a high scale. They are open to changes that bring technology and innovation to remain competitive in the international market. In Table 8 you can see that at this level there are countries like Holland, Australia, and Canada among others.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Motivation / Balance Within Work and Life

Finally, 85% of the managers interviewed agree that the balance between life and work of their employees is not respected. There are 10% that does handle it because they consider that the quality of life depends on the relationship that exists between the family and work so that there is an adequate balance.

Figure 10. Motivation/ balance within work and life
Source: Own elaboration (2019)



The classifications of countries according to this dimension by the authors are shown in Table 9.

In Colombia employers routinely request extra time to their workers without concern toward personal or family activities. It in line with the culture of countries such as China, the United States, Japan, Canada, Australia and others.

CONCLUSION

Through the interviews conducted, it is evident that for the accomplishment of international business, Colombian companies need to understand and appreciate the culture with which they want to negotiate and their environment. There is a lack of knowledge of 50% of the companies surveyed in regards to cultural diversity in their organizations and how to be able to relate to other countries. This impedes them from developing their global mentality and business relations.

Hierarchy / Equality

Analysis: It can be seen that in Colombia the opinion that different managers have about Hierarchy and Equality within companies is divided, in all, there is respect for the levels but wanting a formal and structured work environment depends on the sector to which the organization is focused. The boss always has the final decision and is responsible for the work of his team. However, the managers of the companies interviewed agreed that their employees and peers may feel empowered and consider that their opinions are increasingly heard by the boards of the organization.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the case of international negotiations, respect for the Hierarchy is fundamental when closing an agreement. In Asian countries it is convenient to establish meetings with people who are at the same level in the organizational structure of the participants which increasing confidence and intentions during the process. Managers with senior positions must be reserved for signing the contract.

As expressed by Castro:

Respect for the Hierarchy is fundamental, and negotiation must be established between people who are at the same level in the organizational structure of each of the participating companies; otherwise, the Chinese will doubt the sincerity of the intentions. (Castro, 2014, p.145)

Group Focus

Analysis: The above shows that the place that people occupy within an organization is the result of the differences that exist between them. In the work groups, there are leaders who are the ones who influence or contribute most of the time to achieve the goals in business. You cannot discard the qualities of individuals regardless of whether they participate in a group or individual way to be recognized; each will have a strategic position that benefits the team in general.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

An important factor when negotiating with other cultures is due to what was done previously by the organization's team. They provide the knowledge of each area, interpret and serve as mediators, and facilitate commercial transactions with the client.

According to Solomón and Schell (2010), "The approach describes whether people identify themselves as part of a group or by their responsibility and whether the work should include collective participation or a series of individual contributions" (p.20).

With the results obtained in this dimension, it can be seen that the Colombian culture depends on the group focus. People believe that there will be better results if teamwork is achieved. Colombian companies prefer group recognition than individual and the needs of the group over personal.

Relationships

The surveys suggest that 68% of the companies are focused on a high style of relations. This means that within the Colombian organizations', importance is given to the establishment of relations for the development of their negotiations. Although, Ogliastri (1996) in the investigation How Colombians negotiate with the Dutch, they concluded that the Colombian could become overconfident and that they liked very much to make previous relationships before starting their negotiations. These perceptions, a bit negative, do not differ much from the results of this investigation. However, in this case, the interviewees agreed that the culture in Colombia is amicable. They like to make their counterparts feel good and that joy should be more contemplated as a value and not as an excess of kindness. This is why well-conducted relationships with prior cultural knowledge of the counterpart become a key generator of value for future negotiations.

Companies today are changing their focus towards establishing long-term business relationships with both customers and suppliers. Negotiation is a fundamental part in the development of this relationship and it is necessary to recognize that the negotiator's strategy or style is influenced by culture and the ability to adapt to cultural differences in different markets (Castro, 2014, p.144)

Communication Styles

In relation to the results obtained from research in this dimension, it is observed that the largest proportion of Colombian managers (75%) who have had experience in the negotiation field are characterized by indirect communication. This finding clearly agrees with features of the Colombian culture. The Colombian negotiator tends to be very expressive using his gestures, looks, and everything that non-verbal language implies in his communication. This type of language is more concerned with how things are said than with what is being said. This is unlike cultures with more direct communication such as German, English or even the Americans themselves. This aspect can be clearly explained in what Cerda-Hergel (2006, p.331) states, "one of the most important objectives in Latin America is to strengthen personal contact and create a pleasant feeling of intimacy among the communicators. The way of communicating is as or more important than the message: what is communicated".

Just as for the CW model there are cultures of direct and indirect communication. Professor Edwar Hall (1959) also proposed two scenarios of communication culture: some of high context and others of low context. In this particular case, the culture of Colombian companies is said to be of high context, as well as most Latin American cultures. For this, it is important to mention what Cerda-Hergel raises in his study on the negotiation culture in Latin America:

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Latin American countries should be clearly classified as high context cultures in which much of what is communicated is implicit in the message and can be deciphered in body language, in gestures, in physical distance. In a high context culture, there are a lot of messages expressed but not explicitly stated because there is no need. In a low context culture on the other hand, most communication should be made explicit simply because it is expected that what is said is understood and nothing else. (Cerda-Hergel, 2006, p.332)

Time Orientation

One of the most important findings of this research was related to the time orientation dimension. Although, in most cultural studies of Colombia related to the negotiation, they gave as a result that Colombians see time as something infinite and that they do not contemplate it as a value in their negotiations, the results with this study were completely different. Professor Enrique Ogliastri (2000) in his research on how Colombians negotiate said that they wait for the end of time because that is when reality appears the true limits of the parties. In addition, it has always been considered that the Latin American and especially the Colombian does not consider time as a valuable resource in their businesses so that tardiness can be characteristic of them.

Despite all the above, the results of this study showed that for 100% of Colombian business leaders their time management and respect for this is fundamental in their relationships. This clearly indicates that as the Colombian has entered into international negotiation, in which the country's trade relations have diversified and that companies have begun to interact with other cultures, awareness of time has also increased. Now, as it is well stated by Cerda-Hergel (2006, p.339):

In Latin America, the rhythm of time is marked by social relations. People do not get carried away by the handcuffs of the clock as much as in the United States and in northern Europe. The events begin and end when the people of mutual agreement decide that the moment arrived.

This does not mean that the Colombian who is immersed in the world of international business is not conscious of time. It means that he does it in a different way but as some executives interviewed said; this is an issue of respect and it depends that the stereotypes of untimely and unfulfilled cultural change The development of their soft skills such as leadership, negotiation and the development of their global mentality have been key in this process.

Tolerance to Change

In relation to the tolerance to change dimension, the results of the research showed that 98% of the surveyed businessmen are tolerant to change. At present, there is much more awareness of the transformations that have arisen thanks to advances in communication and information technologies. It is for this reason; leaders with experience in international negotiations are receptive to new ideas such as innovation processes and tend to accept different ways of doing things.

The demands of customers are increasing. They want agility, quality, differentiation and good prices. In order to meet the needs of these clients, companies must adapt quickly to changes. Solomón and Schell (2010) propose, they must see changes and risks as a way to move forward and build in organizations.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

These results contract with a very marked vision that the Colombian culturally is aversive to change. In an investigation conducted by Robles, Contreras, Barbosa and Suárez in 2013, they concluded that:

According to Hofstede's cultural indexes (2001), the highest cultural dimension of Colombia is the evasion of uncertainty, which indicates that it is a society with a low level of tolerance to change and therefore prefer not to assume the risks that the changes generate. (Robles, Contreras, Barbosa & Juárez, 2013, p.400).

Leaders of companies that have experience in international business have a greater vision of the international marketplace. This makes their vision much wider and their perception of change which is a requirement to be competitive and thus achieve survival in the market.

Motivation / Work-life Balance

One of the biggest situations that affect the motivation dimension for most of the interviewed executives is the lack of balance between work and personal life. There are 85% of the interviewees stated that there is no clarity from its organizations regarding the time they must spend to the performance of their functions and the development of projects. This leads to many companies requesting in an implicit way that their managers work long hours regardless of whether it leads to a loss of quality of life reflected in mental and physical exhaustion and the detriment of manager`s interpersonal and family relationships.

The established about is supported by a recent study conducted by the OECD (2019) which states, that Colombians in general work 447 hours more than the average of the OECD member countries and are also well above average of the countries of the region. In contrast the report mentions that when comparing GDP per capita versus hours worked in the countries of the region, Colombia's low productivity can also be seen. Professor Iván Jaramillo interviewed by newspaper the republic states this is due to the fact that in Colombia it is necessary to restructure the labor system in relation to the welfare of the employee. The country companies prioritize the number of hours of the working day on the employee's actual productivity (Bohórquez, 2019). The interviewees translates into a loss of control over their lives and their ability to find a balance between their personal and their work affecting in the long term the competitiveness of companies. Therefore, it is necessary to look for an effective point of convergence between work and non-labor aspects since this leads to beneficial scenarios for both employees and their employers (Lazar, Osoian, & Ratiu, 2010).

In relation to the interviews conducted with Colombian businessmen, the points in which they coincide must be taken into account. According to their international experience to be successful in your negotiations with a global mindset in an intercultural environment are the following:

- You should never start a negotiation without knowing what is expected of it; it must be evident the scope of what is carried as an expectation in the negotiation.
- Know clearly which are the proper limits and the possible concessions, to know how far you can get in that negotiation.
- Think about all the players involved, not only those that are seen at first sight, but consider all the variables and all the actors that are going to participate in that business. Try to find out, within the preparations, everything that would be expected from the part that is being negotiated on this side, that contribute to the negotiation, and what they will ask and demand from the other side.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Be assertive in communication; be very clear to be able to build relationships of trust and long-term.
- Do not make excuses that are doubtful about the commitments to which one is committing.
- Remember that in some moments you have to be flexible in a negotiation because you have to know that at some point in that business you will have to give in, that is, you have to carry that parameter of flexibility to which you can go in a potential situation.
- You have to think that it is win-win business, it is a mistake to think that only the part that one represents will be winning.
- Keep an open mind to think within that negotiating position in new and proactive options that can be efficient for both parties, that is, have the ability to modify and learn, share the negotiation, the thoughts that have been looking for solutions that can be much more appropriate and convenient for both parties.

Finally, all these soft skills such as negotiation, leadership, and the ability to develop a global mindset in business will be definitive for the competitiveness of organizations in Colombia and anywhere in the world. Although the company should be seen as a holistic system of interaction between physical, financial and human resources (Tovar, 2012), it is very important to recognize that it is the people who administer and manage the rest of the resources. The importance of preparation in all these skills will allow companies to adapt to changes in the environment and general value not only to the client but also to all those who participate within the organization. For Tovar (2012, p.25), the success of an organization is:

… Is in the success of its people, directing all their talent, intelligence and ideas towards the improvement of the quality of products and services. We must also recognize that this responsibility cannot fall on a few managers. Innovation has to be permanent and general, this is only achieved with collective leadership, the use of talent and the creativity of all collaborators. This is the only guarantee of survival, growth and sustainability of any organization.

Chapter 40
Applying Diversity-Intelligent Organizational Strategies for Competitive Advantage

Claretha Hughes
University of Arkansas, USA

ABSTRACT

Competitive advantage is attained through talent development and leadership. Talented employees seek career advancement, change, and success. Organization leaders must integrate all employees into their strategic plans and can no longer exclude talented, diverse individuals. Key diversity improvement themes are revealed in this chapter to help leaders focus on areas within the organization to apply diversity intelligent strategies and eliminate institutional barriers that limit the success of diverse employees. Sustaining competitive advantage requires dedicated efforts of executive leaders in organizations.

INTRODUCTION

Extensive research and practical efforts have been dedicated to integrating diversity into organizations. These efforts using diversity management processes and systems within organizations have not been successful (Kalev, Dobbins, & Kelly, 2006). Diversity goals have been measured within teams and individually, but there remains a need for continued focus to achieve organizational diversity goals. It has been suggested that leaders need to develop diversity competencies (i.e. cultural, diversity, sensitivity, etc…) to motivate employees to accept diverse employees within the organization; however, diversity competence development has not previously been promoted using diversity intelligence (DQ). Diversity competencies are needed by all employees to promote diversity initiatives that the organization leadership supports; however, the competencies must first be displayed by the executive leadership of the organization. Executive leaders need DQ to champion diversity initiatives and efforts that they espouse to support.

Kaye (1997) suggested that a diverse workforce poses both challenges and opportunities for an organization. The main organizational challenge is to develop the knowledge and flexibility of its diverse workforce to each employee's highest potential. She recommended that organization leaders ask the following questions to evaluate diversity development:

1. Are we satisfied with the state of the art of this organization's development opportunities for special needs groups?
2. How will each career development stage make our organization more responsive to diversity needs?
3. Are we using the skill identification information developed at the Profiling Stage, to give us a better picture of needs of any underrepresented groups?
4. Are the goals for developing diversity, set at the Targeting Stage, realistic?
5. Is the organization doing all it can to support these goals? (p. 227)

Organization leaders seek to create workplaces where employees from all backgrounds fully utilize their skills (Hughes, 2018c) and feel personally comfortable (Jackson & Joshi, 2001). Pfeffer (1992) noted that "organizations have career systems in place that tend to reward and encourage activities and skills more generously than others…Therefore, those who rise to positions of influence and who benefit from this career system have a particular set of skills and have engaged in a particular set of activities – those favored by the system" (p. 318). Therefore, upon entry into any organizational system, women and diverse individuals must build relationships and develop an understanding of the culture and career system they have entered (Banks, 2006a, 2006b). Pfeffer (1992) also stated that "It is critical that one be able to diagnose the relative power of various participants and comprehend the patterns of interdependence. One needs to know and understand not only the game, but also the players" (p. 49) and that "[d]eveloping and exercising power requires having both will and skill. It is the will that often seems to be missing" (p. 338). He also noted that "there is a greater sin than making mistakes or influencing others – the sin of doing nothing, of being passive in the face of great challenges and opportunities, and even great problems" (1992, p. 300). Executive leaders must display the will to influence greater diversity efforts within organizations. They cannot be passive observers of failed diversity efforts within organizations and career advancement opportunities of their diverse employees. They also cannot be passive aggressive towards protected class employees, themselves (Hughes & Brown, 2018).

There are many, self-imposed challenges faced by organization leaders as they attempt to apply diversity strategies for competitive advantage within their organizations. There are and have been many initiatives and strategies introduced inside organizations to improve diversity. Yet, those diversity strategies and initiatives have been met with resistance from organization leaders and employees (Hughes & Brown, 2018). Their resistance to diversity strategies and initiatives has been tolerated and continues to create diversity equity and inclusion problems for organizational employee productivity and growth (Dobbin, Kalev, & Kelly, 2007). Hughes (2015b) listed the following challenges that organizations faced in their diversity improvement efforts and those challenges remain today:

- The challenge of getting organization leaders to acknowledge the need for a clear definition of diversity that aligns with the federal government's definition.
- The challenge of establishing a culture of diversity excellence within organizations led by executive leadership.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The challenge of establishing diversity change initiatives that benefit all employees as they strive for career advancement.
- The challenge of establishing appropriate diversity training plans that are immersed throughout the organization.
- The challenge of integrating career development evaluation into the current performance evaluation systems of organizations.
- The challenge of embracing change.

Organization leaders must welcome and support change if they want to see their organizations succeed at executing diversity efforts (Duran & Lopez, 2015). The clear problem in all of the challenges above is a lack of executive leadership support for diversity change initiatives. Love (2017) found that the number one problem that trainers faced was management buy-in for training efforts.

Diversity change must begin at the top of organizations for it to be effective. This does not mean that all executive leaders must be diverse especially since not all diverse individuals are the same, even in the same diverse group (e.g. African Americans), nor do they have the same values. One faulty assumption that executive leaders often make is that if they promote someone into a diversity leadership position who looks like some of the diverse individuals in the organization, diversity problems will be solved. This has not proven to be a viable solution as evidenced by the continued diversity issues within organizations.

Often the individuals who are promoted to leadership positions do not have the power to affect change for others who are in similar positions to the position from which they were promoted. Many of them simply may not care about others because they have achieved their career goal and do not want to lose their newly attained, precarious position. They are at the mercy of the individual(s) who promoted them and thus their allegiance is to those individuals and not the group from which they emerged. This chapter is not advocating groupthink, but is providing reasoning of why it is not enough to promote the single, diverse employee to represent the whole group of other diverse employees. One is not enough.

Organization leaders must establish a culture that defines diversity in alignment with the federal government standard and not go beyond that definition when it comes to determining what diversity is within their organization by becoming diversity intelligent. They can become diversity intelligent by learning about the concept of diversity intelligence (DQ) (Hughes, 2016a; 2016b; 2018a; 2018b). Continued confusion regarding diversity cannot be acceptable if organization leaders expect organizations to achieve a competitive advantage through their diverse employees. Limiting the career aspirations of diverse employees also limits the diversity-related organization development goals of the organization.

Without diversity intelligent organizational strategies, organizations will not be able to overcome the challenge of establishing a culture of diversity excellence. Therefore, executive leaders must lead the diversity efforts for their organization by promoting individuals who are diversity intelligent and broadly educated to provide effective diversity leadership for all of its employees and not serve as a figurehead without any formal power. A culture of diversity excellence is achieved when all individuals in the organization understand the need for and/or have diversity, emotional, intellectual, and cultural intelligences and competencies to treat all employees fairly and honorably. Executive leaders must model the ethical characteristics that support the rejection of marginalized treatment for all diverse employees. This can only be accomplished if these leaders have been trained in DQ, ethical and legal issues, and workforce inter-personnel diversity as described in Chapter 1.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Leaders have followers who watch their attitudes and actions and try to emulate them because they want to be like their leaders. Since this has been shown to be true, executive leaders must frankly encourage their followers to embrace diversity and hold them accountable for their attitude and actions (Hughes & Brown, 2018). Executive leaders must become accountable for establishing diversity intelligent change initiatives that benefit all employees. Many organizations present diversity change initiatives and nothing else is ever done to ensure that the initiatives achieve the goals and benefit all employees (Byrd, 2018). The subconscious nature of institutional racism subverts their efforts before they are ever properly implemented (Byrd & Scott, 2018). Employees are placed in the out group before they ever have a chance to participate in diversity change initiatives because of leaders' biases and institutional racism that is embedded in most cultures. Unless organization leaders establish and apply diversity intelligent organization strategies to immerse effective, credible diversity trainings such as DQ, ethical and legal issues, and workforce inter-personnel throughout the organization, the status quo will continue.

Recognizing that institutional racism exists and applying strategies to eradicate it began with the passage of the 1964 Civil Rights Act, which solidified the need for organization leaders to lead the efforts for change; yet, comprehensive change has not occurred in many organizations. The idea that diversity is only occurring because the organization has to do it to keep its federal contracts must come to an end. Organization leaders must do it because it is the right thing to do. DQ, ethics, and diversity must be integrated together within leadership development training programs so that true change can occur (Hughes 2018b; Hughes, 2019). Affirmative Action was the beginning reason for the initiation of hiring diverse employees, but many of these employees have shown that there is no difference in their work ethic, engagement, and commitment to the organization than any other employee. Yet, the stigma is allowed to persist and permeate throughout the culture of the organization to the extent that individual employees can be accused of playing the race card when they ask for equitable treatment within organizations. These types of attitudes and actions can only change if executive leaders make them intolerable by taking diversity intelligent actions (Hughes 2016a; Hughes, 2016b; Hughes, 2018a; Hughes, 2018b).

As long as the behavior of leaders who discriminate against protected class employees are tolerated within organizations, the individual career opportunities of protected class employees will be stifled, marginalized, and cloaked under suspicion despite the hard work exhibited by protected class employees. All leaders should establish career development evaluations that are integrated into the current performance evaluation systems. This would provide an opportunity for all employees to be objectively evaluated only if those who are conducting the evaluations are held accountable by executive leaders to be fair and just. If leaders are not held accountable for their unethical and sometimes illegal behavior, the system will be subjective and deemed irrelevant. This chapter is one resource that provides possible solutions, methods, and examples of how to apply diversity intelligent organization strategies within organizations for competitive advantage. The objectives of this chapter are to:

1. Describe ways that leaders can eliminate self-imposed diversity implementation problems.
2. Describe ways that leaders can apply diversity intelligent organization strategies for competitive advantage.

Background

Hughes (2015b) identified ten themes (see Table 1) related to the impact of diversity on organization and career development. These themes are not the only themes that influence diversity in organizations and

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

employee career development. These are the diversity improvement key themes, highlighted by researchers, that organizations needed to improve if the organizations wanted to achieve a competitive advantage.

Table 1. Diversity improvement key themes

Key Themes	Sources
Clear definition of diversity	Hughes (2015b)
Effective diversity training	Hughes (2015b), Scott and Sims (2015)
Diversity careers	Scott and Sims (2015)
Diversity is immutable	Wittmer and Rudolph (2015)
Leadership development	Byrd and Hughes (2015); Scott and Sims (2015); Konyu-Fogel (2015)
Cultural change	Konyu-Fogel (2015)
Executive leadership commitment	Duran and Lopez (2015)
Affinity groups	Byrd and Hughes (2015); Duran and Lopez (2015)
Diversity competencies	Hughes (2015); Scott and Sims (2015); Konyu-Fogel (2015)
Socially marginalized employees	Byrd and Hughes (2015); Duran and Lopez (2015)

Hughes (2015b) suggested ways for organization leaders to address the key themes identified in Table 1 using updated solutions in Table 2 and the ten solutions and recommendations listed below:

1. Eliminate inconsistent definitions of diversity.
2. Provide Frame of Reference (FOR) and sensitivity training for all instructors (Hughes, 2015a).
3. Ensure that career positions for managing diversity have true power to implement and execute change initiatives. These diversity leaders must also be accountable for measurable results that enhance the careers of diverse employees.
4. Accept individuals as they are and eliminate the need for diversity mandates. Acknowledge and follow current laws and mandates such that employees can showcase their talents without judgment because of their immutable qualities.
5. Focus on cultural and diversity intelligence development for executive leadership.
6. Eliminate institutional barriers (Hughes, 2015a); Executive leaders must provide a supportive work environment.
7. Executive leaders should be unwavering in their commitment to supporting diversity. They must show this commitment by leading diversity efforts and stop passing it down to lower levels.
8. Organization leaders must support true affinity groups, not create diversity groups for superficial showcasing of the number of diverse employees within the organization.
9. Diversity competencies must truly promote diversity of thought. Not all diverse individuals think the same as their racial or ethnic groups. All employees must be accepted and not marginalized because of their differences in thought, appearance, and/or behavior. They must be included in the work environment.
10. There should be only one type or level of inclusion: Full inclusion.

Table 2. Key diversity improvement themes, solutions, recommendations, and sources

Key Themes	Key Theme Identification Sources	Solutions and Recommendations	Solution and Recommendations Sources
Clear definition of diversity	Hughes (2015b)	Eliminate inconsistent definitions of diversity by developing diversity intelligent leaders.	Hughes (2016a, 2016b; 2018a, 2018b); Hughes and Brown (2018)
Effective Diversity Training	Hughes (2015a; 2015b); Scott and Sims (2015)	Frame of Reference (FOR) training for all instructors; Sensitivity training for all instructors	Hughes (2018c; 2019)
Diversity Careers	Hughes (2015b); Scott and Sims (2015)	Careers for managing diversity must have true power to implement and execute change initiatives. They must also be accountable for measurable results that enhance the careers of diverse employees.	Byrd and Scott (2018)
Diversity is Immutable	Wittmer and Rudolph (2015)	Accept individuals as they are and eliminate the need for diversity mandates. Acknowledge and follow current laws and mandates such that employees can showcase their talents without judgment because of immutable qualities.	Hughes (2016a; 2016b; 2018c; 2019)
Leadership Development	Byrd and Hughes (2015); Scott and Sims (2015); Konyu-Fogel (2015)	Focus on cultural and diversity intelligence development for executive leadership.	Hughes (2016 a; 2016b; 2018a, 2018b); Hughes and Brown (2018)
Cultural Change	Konyu-Fogel (2015); Hughes (2015a); Duran and Lopez (2015)	Elimination of institutional barriers; Executive leaders must provide a supportive work environment.	Hughes and Brown (2018)
Executive Leadership Commitment	Duran and Lopez 2015)	Executive leaders should be unwavering in their commitment to supporting diversity. They must show this commitment by leading diversity efforts and stop passing it down to lower levels.	Hughes (2016a; 2016b); Hughes and Brown (2018); Byrd (2018)
Affinity Groups	Byrd and Hughes (2015); Duran and Lopez (2015)	Organization leaders must support true affinity groups, not create diversity groups for superficial showcasing of the number of diverse employees within the organization.	Byrd (2018)
Diversity Competencies	Hughes (2015b); Scott and Sims (2015); Konyu-Fogel (2015)	Diversity competencies must truly promote diversity of thought. Not all diverse individuals think the same as their racial or ethnic groups.	Hughes (2016 a; 2016b; 2018a, 2018b, 2018c)
Socially Marginalized Employees	Byrd and Hughes (2015); Duran and Lopez (2015)	All employees must be accepted and not marginalized because of their differences in thought, appearance, and/or behavior. They must be included in the work environment. There should be only one type or level of inclusion: Full inclusion.	Hughes (2016a; 2016b; 2018a, 2018b, 2018c); Lawson and Hughes, 2020

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

There must also be an elimination of barriers within the work context and environments (Byrd & Scott, 2018; Hughes, 2018c). Organization leaders must change the work context that supports the premise that the diverse person is the problem as opposed to the treatment of or attitude displayed towards the diverse employee as the problem. Both societal and organizational adjustments are needed (Byrd & Scott, 2018) for organizational social justice to occur (Byrd, 2018). Organizational social justice shifts the focus of social justice from fairness and equity in implementing policies and allocating resources to a philosophical principle of human dignity and respect for all individuals (Byrd, 2018). Therefore, organizational social justice is "the ideology that organizations, operating through a representing agent, seek to achieve a state whereby human dignity as well as equality are practiced and upheld" (Byrd, 2012, p. 120). Fundamental to the philosophy of organizational social justice is non-tolerance for demeaning behaviors and attitudes that subjects marginalized work groups to an exclusive and unwelcoming workplace culture (Byrd, 2018).

Language and communication, which are mutable, must be revised when interacting with protected class employees (Robbins, 2013); otherwise, the organization's impact on diversity will be negligible. There is a lack of DQ amongst organization leaders with regards to the plight of protected class employees who seek only to treated justly within organizations. Their continued mistreatment reflects an unwillingness of executive leadership to manage diversity efforts effectively. This lack of executive leadership support for diversity efforts permeates the entire culture of the organization. Without actionable efforts, there is a perception that executive leaders are sending messages that are intentionally confusing to their subordinates.

Organization leaders must eliminate barriers that protected class employees' encounter in the workplace. HRD professionals can help organizations eliminate these protected class barriers through understanding and developing ethical and legal issues training and DQ training within leadership development programs (Hughes, 2019). Table 3 provides a list of the protected class group; some of the barriers they encounter; and how their leaders and peers have exhibited these barriers, through their actions, towards protected class employees within the organization.

Table 3. Elimination of barriers faced by protected class employees for improved organization and career development

Protected Class	Types of Barriers	Exhibited through
Race	Prejudice, behavioral, attitudinal (stereotype, racism); social marginalization	Deliberate exclusion; language and communication style
Age	Stereotype; social marginalization	Language and communication style
Ethnicity		
Disability	Architectural (Thoms & Burton, 2015); Attitudinal; Social marginalization	Social isolation and oppression
National Origin	Prejudice, behavioral, attitudinal stereotype	Deliberate exclusion; language and communication style
Religion	Unfavorable treatment because of religious affiliation including Christianity, Hinduism, Judaism, Islam, and other religious groups	Segregation, harassment, exclusion
Sex	Bias, behavioral and attitudinal stereotypes	Sexual harassment, exclusion
Sexual orientation	Bias, behavioral and attitudinal stereotypes	Sexual harassment, exclusion

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Leaders must acknowledge their personal, discriminatory biases (Hughes & Brown, 2018) and become diversity intelligent. Having leaders and employees know who is a protected class employee and why they are protected is essential for organizations to move forward in their diversity efforts (Hughes 2016a; 2016b; 2018a; 2018b; 2018c; 2019). Most protected class employees are recognizable because of their appearance, but sometimes the diversity amongst employees is not recognizable. These unknown differences can lead to unwarranted biases and unfair treatment. When organizations establish work environments that are comfortable for all employees, unknown differences may be revealed and employees will feel free to be who they are. For example, employees will no longer feel the need to hide their sexual orientation, religious beliefs, or disabilities.

All employees have value (Hughes, 2010) that they bring to the organization and potential for that value to be strengthened within the organization (Hughes, 2018c). One way to strengthen their value is through location or placement within the organization (Banks, 2006a, 2006b; Banks & Nafukho, 2008, Holland, 1973; Hughes, 2018c; Kaye, 1997, Schein, 1975, Super, 2002; Vardi, 1980; Vroom & MacCrimmon, 1968). Employees offer internal and external location value (Hughes, 2012) and "organizations develop rules or policies that impose some control over personnel movements, such as retirement at 65, promotion from within, giving new college graduates a variety of training assignments before assigning them to positions of responsibility and so on" (Vroom & MacCrimmon, 1968, p. 28). Employees and organizations must work together to enhance the employees' value to the organization. Diverse employees also have location value that the organization's leaders must be diversity intelligent enough to appreciate regardless of position, job title, or physical placement.

Talent Development

Talent development is indispensable to organizations achieving competitive advantage through its employees. The Association for Talent Development (ATD) previously stated that "to sustain a competitive advantage in today's knowledge economy, organizations must create a learning culture that supports employee development, a high level of engagement, and opportunities to achieve higher performance" (ASTD Economic Survival Guide, 2008, p.1). Diverse employees' development contributes to the competitive advantage of organizations and must continue to be a focus for organizations to sustain and increase their competitiveness (Hughes, 2018b; 2018c).

Protected class employees must also be engaged in the success of the organization, thus their job attitudes are also important to their development and subsequent performance. According to Holton (2005)

[J]ob attitudes should affect both motivation to learn and motivation to transfer learning…[and] presumes that individuals who have more positive attitudes toward their organization would be more likely to engage in learning that will benefit the organization through improved performance. (p. 41)

Organization leaders must create a diversity inclusive culture that ensures that protected class employees can have a positive attitude towards their organization. The work environment includes transfer climate, social support by supervisors and peers, and opportunity to perform learning and has been identified as a key factor in the transfer of training (Baldwin & Ford, 1988; Burke & Hutchins, 2007; Ford & Weissbein, 1997; Noe, 1986; Noe & Schmitt, 1986; Tannenbaum & Yukl, 1992). Rouiller and Goldstein's (1993) revealed "the importance of positive organizational transfer climate in order for individuals to

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

transfer training from the training program into the work organization" (p. 388). If the organization's climate is not open to receiving new diversity intelligent information and training concepts, it will not be successful in its equity and inclusion efforts.

Facteau, Dobbins, Ladd, and Kudishch (1995) found that pre-training motivation was significantly related to social support and supervisor, subordinate, and senior management support. They recommended factors of support from supervisors, provision of opportunities to use newly acquired training skills, rewarding skill transfer, and providing feedback on attempts to utilize training in the workplace as key factors in the transfer of training. Talent development does not occur if the training is not transferred from the classroom back to the work environment. If the employees do not apply what they learn during training on the job, it is of no use to the organization to invest in training efforts. Leaders who attend leadership development training on DQ, ethical and legal issues, and workforce inter-personnel diversity and do not apply their training knowledge in their work environment are hindering diversity improvement efforts.

Cromwell and Kolb (2004) examined the transfer of training and the work environment relative to supervisors, peers, organizations, and peer networks support and found that employees reported higher application of knowledge and skills learned through the training program if they were supported by their organization and supervisor/peers. Diverse employees must have the support of all stakeholders within the work environment so that they can transfer their skills to the work environment and pursue advancement opportunities to enhance their careers. Leaders must have support of executive leadership to apply diversity intelligent strategies in the workplace.

DIFFUSION OF DIVERSITY TRAINING

Rogers' (2003) diffusion of innovation theory explains how change, an innovation, can be communicated and adopted within organizations. He defined diffusion as "the process by which (1) an *innovation* (2) is *communicated* through certain *channels* (3) *over time* (4) among the members of a *social system*" (p. 11). Innovations are ideas, objects, or practices that are perceived as new to individuals or units of adoption. Communication channels are the tools through which messages are conveyed among individuals within an organization system. The element of time is conveyed through all components of diffusion of an innovation from first knowledge to adoption or rejection, individual adoption compared to adoption of other members, and in the rate an innovation is adopted by members within a specific period of time (Rogers, 2003). The social system is the interaction of the units of groups or individuals engaged in problem solving that is focused on the attainment of a common goal (Rogers, 2003). This is one model that organization leaders can use to diffuse organizations' diversity definition and initiatives throughout their organizations.

The social system of an organization can either impede or facilitate the diffusion of the innovation (Rogers, 2003). Social systems possess norms or recognized behavioral patterns by members of the system, which Rogers's defined as "a range of tolerable behavior and serve as a guide or standard for the behavior of members of a social system. The norms of a system tell individuals what behavior they are expected to perform" (Rogers, 2003, p. 26). Organization leaders can tell their employees through their own behavior how they are to perform towards diverse employees. They have ultimate influence over the systems' acceptable norms.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Included within social systems are opinion leaders and change agents (Rogers, 2003) and opinion leadership is defined as "the degree to which an individual is able to influence other individuals' attitudes or overt behavior in a desired way with relative frequency" (p. 27). Opinion leaders typically possess unique positions that are influential within the communication structure of the system. The position as opinion leader allows them to be instruments for change agents who influence "innovation-decisions in a direction deemed desirable by a change agency" (Rogers, 2003, p. 27). Therefore, if organization leaders want to change the diversity culture of their organization, they must take on the role of opinion leader with a positive opinion of diverse employees and their potential to impact organization and career development within the organization.

Within the time element of Rogers' (2003) diffusion of innovation is the innovation-decision process that is relevant to how diversity training can be transferred or diffused throughout organizations. The innovation-decision process has five stages through which an individual(s), progresses. They are: 1) initial introduction to the innovation (knowledge), 2) development of an attitude regarding the innovation (persuasion), 3) decision to adopt or reject the innovation (decision), 4) implementation, and 5) confirmation of the decision (Rogers, 2003).

With regard to diversity training in step 1, organization leaders can introduce the federal government's definition of who diverse employees are to all employees of the organization. This is an example of using their DQ. During step 2, organization leaders can persuade employees that diverse employees are a positive addition to the organization and not simply token employees who are there because the law requires that there be diverse employees within organizations. In step 3, organization leaders must decide to adopt a culture of diversity excellence that supports all diverse employees. In step 4, organization leaders can implement diversity intelligent initiatives to develop diverse employees so that they can attain career goals within a career management system that is aligned with the employees' potential and the organization's needs (Hughes, 2018c). In step 5, organization leaders can confirm the success of their career development efforts through a career development evaluation system (Hughes, 2015b).

MAIN FOCUS OF THE CHAPTER

Understanding who is represented as protected class individuals within organizations requires leaders to have DQ. The variety of definitions for diversity will continue; however, there must be a clear understanding of protected class employees within organizations. With the convoluted uses of the term diversity, diverse employees are unsure of what message the organization is conveying when they say they are supportive of diversity. Are they supportive of their diverse employees as defined by the federal government, or are they supportive of their diversity of efforts with regards to policies and strategies that they are trying to implement to achieve business strategy goals? The diverse employees must be distinguished from the diverse efforts of the organization. This can be accomplished through DQ training.

Effective DQ training is needed for all employees within organizations and must become a central component of leadership development programs (Hughes, 2018b). Protected class employees are often tasked to lead diversity efforts when they are often the least powerful employees within organizations. Thus, the diversity message is weakened before they ever utter a word. Many protected class employees only have but their physical, immutable diversity characteristic to identify them as a diverse employee. They have had no official diversity education or training to lead diversity efforts. Yet, they are promoted as Chief Diversity Officers, Vice Chancellors of Diversity, and other executive leadership roles and

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

they have nothing to offer to other diverse employees beyond their titles. It is a shameful display and exploitation of employees to suggest that they place their hope in titles of individuals without power to help them advance their careers. A meeting of all diverse employees is just that, a meeting. It is not an opportunity for growth, development, and advancement.

Diversity careers are needed within organizations, but they are of no use, if they have no value to the employees who are dependent upon them for success. Diversity career leaders must be developed to advance career development opportunities for diverse employees organizations not to provide a showcased image of immutable characteristics that no diverse employee can change. They must develop their own DQ to be able to champion diversity intelligent career strategies to assist employees.

To achieve this cultural change within the diversity career positions, the organization must show that there are true career advancement opportunities for diverse employees. Diverse employees cannot be expected to continuously endure marginalized treatment through adverse socialization within the organization. Protected class employees are socially marginalized to the extent that they never have an opportunity to ever feel included within the organization. Executive leadership must be committed to change and support the development of true affinity groups of employees. Diverse employees want safe spaces within their affinity groups when the group's focus is on discussing their struggles. Having others invade the group to share their struggles, which are not the same from the perspective of the diverse group members, is an insult. It is insulting for LGBTQ individuals who do not have the same experiences as African Americans to invade their space. This is different if the LGBTQ individual is also African American. Having diverse employees interact amongst themselves is sometimes self-defeating for the organization when they are not provided the resources needed to advance their careers. Instead, there should be affinity groups developed in which all employees who have similar interests related to their career advancement can come together in ways that are conducive to organization and career development. Leaders must reject the idea of any of their employees being socially marginalized or ostracized within the organization.

ISSUES, CONTROVERSIES, PROBLEMS

Full Inclusion

Full inclusion of protected class employees is the only acceptable level of inclusion within organizations. Organization leaders must understand, embrace, and value full inclusion and understand how the lack of full inclusion affects protected class employees' performance. Limiting inclusion or segmenting it sends the message to protected class employees that they are not truly wanted within the organization. The individuals' knowledge, skills, and abilities (KSAs) may be needed by the organization, but some leaders in the organization do not want to work with protected class employees. They only want the individual's KSAs. Unfortunately, for these types of leaders, they cannot separate employees from their KSAs. Inclusion has been the buzzword when referring to diversity, but if the organization leaders have to be told that they need to include their diverse employees, the message becomes clear that their efforts have been ineffective. The protected class employees are offended that they have been, intentionally, excluded from opportunities to grow and advance their careers within organizations.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Barriers to Career Advancement

Diverse employees continue to face barriers to their career advancement. Workplace environmental conditions remain most critical to the employee's success because it is such a broad barrier, most employees cannot escape its effect on their performance unless they leave the organization. Hofacker (2014) described nine workplace environmental conditions that are detrimental to the success of diverse employees in the workplace. The workplace environmental conditions are: bias, homophily, homosocial reproduction, occupational segregation, social segregation, spatial segregation, stereotype threat, structural segregation, and subtle forms of racism. The condition of bias is manifested by "stereotyping and bias among managers who make hiring and promotion decisions" (Dobbin, Kalev, & Kelly, 2007, p. 23). "Homophily is [demonstrated by] the principle that a contact between similar people occurs at a higher rate than among dissimilar people" McPherson, Smith-Lovin, & Cook, 2001, p. 416). Homosocial reproduction is exposed when "Managers tend to carefully guard power and privilege for those who fit in, for those they see as 'their kind' … reproducing themselves "in their own image" (Kanter, 1977, p. 48). Occupational segregation is exhibited by the channeling of a minority into what is considered to be a minority job (Albelda, 1985; Maume, 1999; Sokoloff, 1992; Tatum, 1999; Thomas, 2005; Vallas, 2003). Social segregation is revealed when "minorities lack access to important workplace relationships that are important in developing one's career" (Thomas, 2005 p. 79). Spatial segregation is demonstrated when occupational segregation occurs through locating minorities in minority jobs together in the workplace (Albelda, 1985; Vallas, 2003). Stereotype threat is revealed when "stereotypes and negative expectations often create obstacles and difficulties for minority employees in U.S. organizations" (Chemers, Zurbriggen, Syed, Goza & Bearman, 2011, p. 486). Structural segregation is displayed when minorities are overrepresented at the lower levels of the organization and underrepresented at the higher levels (Thomas, 2005; Giscombe & Mattis, 2002). Subtle forms of racism are shown when white prejudice is conveyed towards diverse employees through white opposition to demands and resentment at their [diverse employees'] presumed special treatment (Feldman & Huddy, 2005; Thomas, 2005). Many protected class employees can share instances where they experienced at least one, if not all, of these environmental conditions as they have attempted to do their jobs and advance their careers. No employee should have to endure theses type of environments and perform at optimum levels. Leaders must be willing to apply diversity intelligent strategies to solve these problems.

SOLUTIONS AND RECOMMENDATIONS

As organization leaders, career counselors, human resource development professionals, and diversity leaders endeavor to expand diversity efforts within organizations, they need to use relevant tools and resources. HRD professionals must partner with organization leaders to develop ways to apply diversity intelligent strategies for competitive advantage within organizations. In addition to all of the recommendations that have been covered earlier in this chapter, some additional diversity intelligent strategies are:

1. *Develop leaders' DQ.*

DQ needs to be developed by leaders in organizations so that they can work better with protected class employees and develop all employees to their highest potential in the workplace (Hughes, 2016a;

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Hughes 2016b; Hughes, 2018b). When leaders become diversity intelligent, they can apply full inclusion strategies that are present within organizations and ensure a competitive advantage is accomplished through people.

2. *Use HRD communication channels to integrate ethics, diversity, and DQ to develop leaders.*

HRD professionals have many communication channels within organizations to develop leaders. They must use these channels to integrate ethics, diversity, and DQ (Hughes & Camargo, 2019). Ethics and diversity are considered crucial skills that leaders must display when interacting with others and both have no concrete, right answers to solve continuous problems. The addition of DQ to the diversity and ethics conversation only enhances the opportunity to improve communication among different employees regardless of the communication methods used. Combining the two would strengthen both efforts (Hughes, 2019).

3. *Develop new leadership development programs or enhance current leadership development programs.*

There is a gap in what HRD professionals and diversity professionals have taught leaders and what is being applied in the workplace. Therefore, new and or enhanced leadership development programs must be developed that integrate diversity and ethics and allow leaders to use their DQ to solve diversity and ethics problems. Leaders will then be able to distinguish the legal ramifications of not solving diversity problems versus recognizing a diversity problem that may be an ethical concern. Protected class discrimination problems are not ethical problems. Leaders to protect their organizations from lawsuits, EEOC filings, and department of labor complaints must legally address protected class discrimination problems.

FUTURE RESEARCH DIRECTIONS

More research is needed to advocate full inclusion of diverse employees within the workplace and an elimination of all nine of the environmental condition barriers. Organization leaders must begin to question why the money that they have invested in diversity efforts has not produced the desired results. Some questions to consider include:

1. What does diversity mean within your organization?
2. What is the value of diverse employees to the culture of the organization?
3. Why is your organization supporting research efforts that only validate the status quo? Research must be innovative to influence change.
4. Why are employees allowed to be socially marginalized within the organization?
5. To what extent is the culture of the organization a part of the strategic plan?
6. What will the organization gain if it creates opportunities for all its employees?
7. Are there rules for conformity to the status quo that must be eradicated from the organization? (Hughes, 2015b, p. 285)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Organizations have social cultures that must be effectively managed to include all employees. Future research studies can be designed to measure the extent to which the social culture of the organization is designed to exclude diverse employees and why? Why are certain groups infringing on the safe spaces of protected class groups in the workplace?

Another area of research to be explored would be what type of leadership characteristics does a leader who supports diversity efforts exhibit? Do they have DQ? Are they aware of institutional barriers and do they have diversity competencies, cultural competencies, sensitivity, and a frame of reference for successfully interacting with diverse employees? Knowing personal capabilities is critical when trying to lead others. Often leaders do not know their employees' needs; they only know what they want them to do. Future research could assess the extent to which organization leaders know and understand the needs of their diverse employees (Hughes, 2018c).

CONCLUSION

This chapter has revealed key diversity improvement themes. Providing and applying solutions to these themes are paramount to the success of organizations who seek to understand the impact of diversity on competitive advantage. For the ideas in this chapter to be useful and beneficial to organizations, organization leaders must commit to developing their DQ and leveraging all the talent that their diverse and non-diverse employees bring to the organization.

To be competitive organizations must develop diversity competencies and understand that all plans may not be doable within the current constraints. For example, many studies have suggested that women need other women to mentor them in STEM fields; however, they tend to overlook the history of women in STEM. Understanding of the history of women in STEM is needed to prevent authors from suggesting this unviable solution (Hughes, 2016b). Very few women can mentor women in STEM because historically, women were not allowed to pursue degrees in these fields. Older women can provide encouragement, but they do not have a frame of reference for what younger women are experiencing since they have not had the experience.

Dr. Martin Luther King, Jr. stated that "an unjust law is no law at all" and an unjust system is no system at all. Without a system that supports a just culture, an organization will defeat its strategy for success. Stiglitz (2012) suggested that there is a price of inequality and that price can be detrimental to society and organizations. Society is not only divided economically but also racially and ethnically. All individuals must be accepted for who they are, but not necessarily for what they do if it does not align with the organization's goals. Organization leaders have a choice and they need to choose to do the right thing for their protected class employees to sustain their competitive advantages in the global economy and the Fourth Industrial Revolution.

KEY TERMS AND DEFINITIONS

Career Advancement: The ability to move to a higher job within the career management plan of the employee.

Career Change: Movement from one career field to a different career field.

Competitive Advantage: Characteristics of the organization that distinguishes it from its competitive peers.

Diversity of Thought: A thought that is different than the norm or status quo. Uniquely different way of viewing a situation or presenting an idea.

Strategic Plan: Plan developed by organization leaders to achieve organizational strategy to achieve goals.

Talent Development: Development of employees within the organizations. Suggests that all employees have talent that can be developed to benefit both the individual and the organization.

Talent Management: Ability to align talented employees within the strategic goals of the organization so that they produce results desired of the organization.

Chapter 41
Sustaining and Retaining the Diversity Practitioner

Trina Moore-Southall
California Lutheran University, USA

ABSTRACT

The purpose of this chapter is to examine the ways in which an organization or an institution can utilize a diversity practitioner for success. This chapter explores the culture of the organization and what the senior management needs to be mindful of in the hiring process and beyond. The chapter then investigates the practices that should be carried out by the organization that will prompt a practitioner for success. It explores the considerations as the practitioner works in the organization on establishing a quality work environment. With a visible commitment and support of the individual and the expected outcomes, the practitioner will be a critical part of the organization's success. Organizations have to be strategic and intentional about implementing measures to assure the diversity practitioner has the tools they need. The organization has a responsibility to recognize the emotional toll and additional stress of being in the diversity practitioner role. Clear expectations and strategies are offered.

INTRODUCTION

Many establishments, institutions, and organizations have thought deeply and strategically about the hiring process in search of someone to champion areas of DEI (diversity, equity, and inclusion). A job description has usually been thoroughly crafted to recruit a knowledgeable individual with the education, training, and experience necessary to excel in the position. Leadership has already had conversations as to why and how this role will meet the organization's needs. There may be an unspoken assumption regarding how difficult this job will be. The leadership of the organization understands that the diversity practitioner will experience an emotional toll, yet it is unlikely that measures are put into place to cope with this extra burden. Because the diversity professional is in a leadership position, the authority of that position needs to be assessed. The management of the organization may wish to examine the importance and effectiveness of symbolic representation at the elected or senior decision-making administrative level for this position (Murray, 2017). Multiple voices within the organization have been incorporated into the

hiring process to successfully identify a candidate who is reflective of the institution's values, mission, and philosophy. The offer is made and accepted and the diversity practitioner is employed. Now what?

An organization that seeks a diversity practitioner, one who is charged with creating a more equitable work environment, is more than likely to communicate intentionally in their marketing, advertising, website, brochure, and other promotional materials that they value diversity. The hiring of a diversity professional itself may lack genuineness as the institution strives to communicate a value in diversity (Griffin, Hart, Worthington, Belay, & Yeung, 2019). Sometimes their effort to communicate the importance of diversity manifests through the photos that appear in the marketing materials, with blended groups of people by both ethnicity and gender. As prospective employees research the organization, they may make assumptions about the working conditions and the perceived favorability surrounding diversity (Windscheid, Bowes-Sperry, Jens-Mazei, & Morner, 2017). This perception may be real, but it may also be artificial.

The purpose of this chapter is two-fold. First, it examines the ways in which an institution and its leadership can set up a diversity practitioner for success. The employer may have thought about the impact to the organization once the practitioner is in place, but may not have considered what measures need to be in place in order for this to happen. Depending on the circumstances surrounding the hiring of a diversity practitioner, the development of the role may or may not be fully researched and developed. What systems and mechanisms need to be in place to support the work and the role? This chapter explores these necessary components.

Second, this chapter focuses on the practitioner's overall well-being. How is the person in this role sustained? There is usually a high level of emotional distress associated with this role, particularly from people with marginalized social identities and members of underrepresented groups in predominantly White institutions, and additional responsibilities and expectations typically exist outside of the job description. The diversity practitioner may be sought out for any aspect of the workplace that involves marginalized groups. He/she may also be utilized for oral and written communication, conflict resolution, human resource policies and procedures, and overall support for people of color. He/she will probably be expected to be a spokesperson of sorts to speak on behalf of the organization. The diversity practitioner is a public relations representative to help uplift the organization's reputation.

The role of the diversity professional involves many tasks and responsibilities. Part of the role is to problem-solve, respond to conflict, and provide resolution in sometimes contentious situations. Often times, the limited number of employees in underrepresented groups positions the employee to be overburdened in carrying the psychological weight of all people of color. Unfair professional standards can also place an emotional toll (Steele, 2018). This chapter communicates the steps the institution should take in developing culturally proficient employees and ways the institution will be held accountable. It is important for the employer to retain consistency in the retention of a successful practitioner. The building of relationships and the establishment of trust requires time. If the practitioner leaves the position, a new practitioner may need to start from square one and begin the work all over again. It is to the institution's advantage to retain an effective diversity practitioner. Those who do diversity work are undervalued (Ahmed, 2012); they rarely receive a trophy, a banner, or other sign of achievement. It is thankless work. Nonetheless, if the practitioner is not sustained in the work, the practitioner will be exhausted and unfulfilled. He/she will not thrive, nor will he/she achieve the results needed. Often times, people in this role have a personal connection to DEI. They have either experienced a lack of equitable circumstances for their own identification in a marginalized group, or they have recognized they have benefitted from a level of privilege their own identity and experience has brought them (Wilson, 2013).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

However, as this chapter addresses the role of the diversity practitioner, it often reverts to the implication that the diversity practitioner is a member of a marginalized group.

Where Do We Begin?

After employing the new person, the first critical step is for all stakeholders to understand the role of the diversity practitioner. Responsibility lies with the executive leadership to also understand their responsibility in the overall effectiveness of the position.

Organizations can minimize miscommunication with diverse others and build relationships with diverse others by implementing the following strategies, that is, by communicating effectively, working with diverse others, encouraging peers to be open in discussing their personal opinions, and educating employees about differences. These strategies will increase awareness about workplace diversity. (Patrick & Kumar, 2010, pp. 5-6)

The institution should communicate these strategies as methods to make the organization better.

Some diversity positions are created proactively. The organization has a vision and creates the role after examining its needs, coming to the realization that an individual is needed to provide a consistent DEI lens to be sure the best decisions are made. The position is then designed to meet the ongoing and future needs of the organization. The leadership must provide clear communication to the employees to decrease resistance in developing a commitment to DEI in the workplace. In order for people to believe in the effectiveness of diversity measures, they will need a positive attitude. Stakeholders have to believe that diversity initiatives will yield positive results (Windscheid et al., 2017). If the organization is able to make efforts for stakeholders to have faith and trust in the organization, efforts should also be made to have faith and trust in diversity initiatives. Stakeholders have to believe in the value, need, and effectiveness of diversity.

In contrast, diversity positions can also be created as a reaction to circumstances and/or events. An incident occurs that violates a component of identity that results in harm being done, a collision of culture. An action is then taken to address the damage that has occurred. The creation of a diversity practitioner role is part of the perceived solution for this error. Organizational leaders often put diversity practitioners in unfair positions, expecting them to repair injustices that happened in the past rather than creating equity for the future (Ahmed, 2012). For example, in the educational sphere, rise in Chief Diversity Officer (CDO; diversity practitioner) positions in educational institutions is often in response to a significant campus incident. Regardless of the organizational setting or field, it is often assumed that hiring a diversity practitioner will resolve any conflicts or fix any situation where inequity and exclusion have occurred. Rather than undertaking a joint effort by all employees to respond, responsibility is placed on one individual. The organization has most likely not put enough consideration in the implementation of the role in regard to the injury to the community, the hurting within the community, and the healing that needs to take place (Griffin et al., 2019).

The lack of thoughtfulness in the design of the diversity practitioner role is evidenced in frequent news articles describing how, in acts of desperation, major corporations have mandated cultural competency training in an effort to repair acts of racism and other damage to people's identities. For example, in 2018, Starbucks closed over 8,000 stores for racial anti-bias training after an incident in which a Starbucks manager called the police when two Black men were waiting to have a meeting without placing

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

an order. Police arrived and arrested the men. News and social media outlets created national outrage with a video of the men being carried out in handcuffs. Starbucks' 4-hour training that examined bias and stereotypes with 175,000 employees was a response to this incident (Picchi, 2018). In 2018, a Black toddler boy modeled for H&M wearing a green sweatshirt that read, "COOLEST MONKEY IN THE JUNGLE" (Bjerre, 2018, para. 1). The retail giant issued an apology for its insensitivity. In 2017, Pepsi pulled its commercial that showed model Kendall Jenner hand a Pepsi to a police officer at a protest and the crowd cheering with glee. Dove and Nivea (skincare product lines) both removed commercials that featured Black women that messaged lighter, fairer skin as better and more desirable. Gucci's 2018 fashion collection featured predominantly White models wearing turbans (symbolic of religious beliefs) as a fashion accessory. Prada agreed to hire a diversity officer, diversify its workforce and employ racial sensitivity training after figurines in their Soho store window in 2018 were deemed racist and likened to blackface (Ly, 2018).

There are countless examples of universities that hired a CDO after racist incidents in the last 5 years, including but not limited to: University of Oklahoma, University of Michigan, Eastern Michigan University, Syracuse University, and University of Missouri (Parker, 2015). With regard to these incidents and many more, where is the diversity lens and why has it failed? More organizations are seeing the need for someone to champion initiatives in the workplace where people are being treated with equity and valued for who they are. The demand for diversity practitioners shot up 23% in 2019 in the United States and the trend is expected to continue (Gilchrist, 2020). Some organizations and corporations have diversity training included in their regular onboarding and training of employees, whereas others wait until their clientele and/or product have been damaged.

Preparing for Resistance

The creation of a diversity practitioner position can cause problems for employees who do not support the idea of or believe in the need to have one. Wilson (2013) explained that a CDO has a great responsibility and complex challenge to enact change. A CDO's work may be met with threats to effectiveness, including the fact that community members may be unwilling to adhere with the policies, programs, and initiatives that the CDO develops. Wilson stated that:

a backlash over the need for a CDO can result in members of the community becoming hostile to the individual attempts to break down barriers causing obstacles for those within the institution. Resistance can occur because of the perception that little, if any, problems related to diversity exist at the institution; therefore, a CDO, let alone any new diversity policy, is unnecessary. (p. 433)

The organization must commit to ongoing multicultural or diversity training for all of its employees; one-time trainings are simply not effective. Although the evaluation of such trainings can be positive, the behaviors following the intervention are not indicative of change. However, such limited trainings would be more effective if employees received communication and data as to how and why such trainings are necessary and valuable. It is important to establish a tone and climate that is supportive of the diversity practitioner role and the training. There is a correlation between the trainee's readiness for the training and the outcomes of the training. The learning that takes place and the employees' belief in its utility will be increased if trainees are motivated and receptive. A trainee's belief that he/she will be able to use the material learned and that the training is valuable will prepare him/her to be more receptive

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and be engaged. How the skills and content to be developed in diversity training will be used must be communicated to the trainees before the training takes place.

One goal of diversity training is to decrease barriers between coworkers and improve employee relations. The majority of diversity practitioners are people of color, women, or both. Their personal experience in having a targeted identity fuels their passion for equity and justice. Facing inequity related to more than one identity (i.e., the intersectionality of gender and race) sets the stage for multiple ways to understand and respond to such injustices. Employees of targeted identities who experience marginalization and oppression see diversity training as a necessary component of their work. The organization must be purposeful in communicating the importance of having a diversity practitioner to all its employees, but particularly members of the dominant culture. Employees who have experienced acts of discrimination against them are more likely to be open to the training (Chung, Gully, & Lovelace, 2017) because they have experienced injustice.

Welcome to Diversity Work

The groundwork laid before the diversity practitioner begins is essential. Specific steps need to be put into place to lay out a welcome. All constituents should be informed of the practitioner's qualifications and cite specific ways in which his/her expertise and experience will complement and enhance the work in progress. Before the practitioner even begins, organizations must have a plan in place that will set up the practitioner for success. Each employee should be able to effectively answer the question, "What does the practitioner do?"

It is necessary to trust the competence of the diversity practitioner and demonstrate that trust from the beginning. The leadership and/or management must invite this new role into key areas of decision-making. The leadership must also assist in the diversity practitioner's discovery of where and with whom to partner and collaborate. The organization must provide a seat at the table for the diversity practitioner with the Board, CEO, President, Head of School, and any other necessary senior leadership or decision makers. The organization should understand that although DEI is included in the description for the role of the practitioner, DEI is every employee's job. Diversity will not advance without the active support of the leadership, and diversity practices that help to establish a positive, healthy and productive workforce will not be instituted if the senior management (CEO, Head of School, President, or other figure of authority) is not committed to achieving these goals.

A CEO's words and actions matter in setting the stage for the implementation of diversity initiatives, but their HR managers' interpretation of these words and actions also plays an integral role in determining whether diversity management practices are in fact implemented. (Ng & Sears, 2018, p. 10)

If the institution as a whole perceives the senior management's commitment as lacking, there will be a ripple effect in the practitioner's ability to employ diversity initiatives (Ng & Sears, 2018). Who are the allies and the support team? The alliances developed between the diversity practitioner and other key stakeholders help to mobilize inclusive excellence. It is unlikely that diversity and inclusion efforts can be advanced and organizational change can occur without the fostering of coalitions and buy-in of key stakeholders (Griffin et al., 2019). The leadership has to model partnership and what a support team looks like. The leadership can consider the following questions when evaluating their ability to do this:

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- How can I leverage my position and organizational knowledge to benefit others?
- How can I support and promote the agenda of underrepresented groups rather than promote my own agenda?
- How can I be a better listener and maintain the posture of a humble learner?
- How can I consciously de-center myself in my work as a partner to ensure others are centered?

The organization must be intentional about employees' development of cultural intelligence. Earley and Mosakowski (as cited in Slusher, 2005) defined cultural intelligence (CQ) as:

an important aptitude and skill that managers need and use in understanding corporate cultures and subcultures. Someone with high cultural intelligence discerns the defining features of a person or group's behavior. Both cultural intelligence and emotional intelligence share the characteristic of being able to suspend judgment and to think first before taking action. (p. 250)

Individuals can achieve CI through remaining alert, motivated, and poised.

CQ includes cultural knowledge, cultural skills, and cultural metacognition (Thomas et al., 2015. Content knowledge is knowing about one's self and the nature of others in order to successfully navigate different cultures. Cultural skills are relational skills required to exhibit behavior that relates and adapts to different people with different lifestyles, identities, and experiences. Cultural metacognition is the awareness of how one thinks and the biases one holds, as well as having control over one's mind in order to deliberately monitor and regulate one's thinking (Thomas et al., 2015).

Be Responsible

It is the employer's responsibility to examine the institutional norms that offer nuanced social and professional collateral and exclude others from opportunities to gain success. The conscious and unconscious thinking and behavior that has been established prior to the practitioner's onboarding must be reexamined. The practitioner may regularly experience microaggressions and may often need to code-switch in order to adapt to the environment's cultural norms. Code switching is a strategy used by members of the minority identity group to navigate in the dominant culture where certain cultural norms and behaviors are expected. This can be any aspect of culture—including style of dress, hairstyle, language, and other observable behaviors—used to assimilate when necessary; when in a different context, the person can simply switch back. For example, if proper English is the primary language in one's workplace, employees utilize traditional English as they write, speak, and communicate with other nuances (body language, facial expressions, etc.). The same employee may deviate from this standard English when he/she communicates away from the workplace. The employee may adapt their style of language to talk to family members, friends, and others of their shared background.

Hopkins (2010) noted that:

the tendency to adopt the worldview values of the dominant culture, especially by white consultants can be a significant inhibitor in driving change. Biases are embedded in each and every one of us as well as organizational practices, policies and structures. (p. 167)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Hopkins asserted that practitioners must have courage to face themselves and their own forms of resistance; with this courage, practitioners can face inequities and dismantle structure from within the systems themselves. The employer must employ intentional strategies to maintain a quality work experience. Recommended strategies to employ for a quality work experience are included in the next section.

Affinity Groups

In employee resource groups (ERGs), where institutional norms can be discussed, as well as how they align or misalign with one's own value systems and cultural norms. The corporate culture and inherent expectations can be shared and discussions can be held regarding the norms of the institution (Green, 2018). Such affinity groups have the potential to promote self-reflection, create support networks and promote empathy in a historical and cultural context. Steusse, Staats, and Grant-Thomas (2017) stated that "Affinity group work aids participants in coming to terms with stereotypes and discomforts in a 'safe' space and establishing a set of shared values and goals before coming together with others" (p. 255). Their research findings revealed that affinity groups inspired self-reflection, encouraged empathy, and facilitated participants' ability to see another group's humanity.

What resources are available for the employee to be in a productive space with others who share aspects of their identity? Perhaps an ERG and/or a consortium with other diversity practitioners. This space is designed to nourish participants, offering respite from the pressure that the daily tasks of the position put on the individual. Affinity groups create a place of mutual support, offering the opportunity to process incidents that take place. Members of an affinity group can experience aligned positive and negative experiences that can encourage an open, respectful dialogue that is more likely to be free of retribution from those without a shared identity (Tauriac, Kim, Sarinana, Tawa, & Kahn, 2013). Personal connections can be fostered in affinity groups and create a sense of belonging. When members of a shared identity have the opportunity to be appreciated as a group, they can increase their sense of belonging and feel appreciated as individuals. Members of the affinity group will feel less compelled to conform to the norms of the dominant culture if they are recognized and valued in their group identity (Mitchell et al., 2015). In the affinity group, members can not only support each other's experiences, but also help one another by sharing strategies that enable them to navigate the institution successfully (Steele, 2018). This works in favor of the institution to be more effective in their DEI goals.

The employer must communicate openly that the affinity spaces are in alignment with the institution's values while openly encouraging their existence. Formalized support from the organization includes making resources available. ERGs based on social identity factors not only increase job satisfaction, but also contribute to decreased absenteeism and a greater sense of connectedness to the organization. The results of ERGs include increased retention and an overall more inclusive environment. They serve as a natural onboarding for new employees and offer coaching from veterans. Members of the groups can discuss overall DEI in their workplace, as well as how to advance these measures. Participants in ERGs have reported greater job satisfaction and a deeper understanding of how the organization functions. Another outcome of ERGs is the opportunity for managers and organizational leadership to better understand the employee experience, and contribute institutional change. ERGs give voice to underrepresented groups, which can lead to positive institutional change (Green, 2018).

The affinity space will also decrease the frequent isolation and loneliness that can occur when in this role. Employees of color in predominantly White institutions can experience a lack of respect and isolation. Isolation comes with feeling invisible to the majority, or visible only to those who share a

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

common identity. The experience of not being valued, acknowledged, or appreciated also contributes to the invisibility felt by diversity practitioners in this role (Steele, 2018).

Professional Growth and Development

As the diversity practitioner position grows, the practitioner's needs will most likely expand. A plan should be developed early on as to how the practitioner will be able to meet the growing needs of an institution, which may occur through the institution's expansion. If it is a new role, the employees of the organization will have a growing familiarity with how the role complements various departments and initiatives. There will be an increased understanding of what the role is logistically, not just theoretically. This increase in familiarity and understanding will require more time and an increased commitment by the practitioner. Is the plan to expand the team? If so, what does that look like? If the plan is not to expand the team, what is the plan to support the current structure? When the practitioner is hired, ample resources must be available, including staffing and space. Historically, the diversity practitioner role has meant one person who participates in strategic hiring. This role has evolved to one that is multi-dimensional to include representatives that provide a lens of diversity and inclusion in all facets of the organization, including hiring and retention (Gilchrist, 2020). Diversity in the workforce can potentially benefit the organization in economic terms, but it does require a significant amount of resource investment (time and money) before the benefits of workforce diversity materialize (Ng & Sears, 2018).

Another critical component of success is the diversity practitioner's authority to make executive-level decisions and he/she reports to the highest level of administration. The likelihood that an institution will believe in the practitioner's ability to make change and be a person of influence is higher when the practitioner reports directly to the person with the most influence (Wilson, 2013). In corporations, this is often the President or CEO. In educational institutions, this is the President, Provost, or Head of the School.

Support DEI Growth

Institutions often expect more and more from the diversity practitioner without proper and ongoing training to increase and refine his/her skillset. The practitioner needs ongoing identity development. Identity development is integral to DEI work. One's own identity gives him/her an understanding of his/her own otherness. Understanding one's own difference will shape behavior, perception, and understanding. Identity development is not only important for how one sees oneself, but also how he/she engages with others (Holck, Muhr, & Villesèche, 2016). Self-awareness and personal development are critical to the practitioner's success. A practitioner's lack of skill and personal awareness are major reasons why diversity initiatives fail. Diversity practitioners must possess cultural competency, cultural humility, and emotional intelligence. There is a constant need to read, study, and have ongoing learning experiences (Hopkins, 2010).

Additionally, administration must demonstrate ongoing commitment for the practitioner to attend workshops, conferences, speaking engagements, and retreats that focus on diversity, multiculturalism, social justice, anti-bias, and equity. One way that institutions can prioritize this role is to have substantial professional development and travel funds available. If such funding is not available, DEI is not a priority, because where the institution allocates its funding demonstrates its priorities. Such conferences are how the people in these roles build community and receive professional guidance from others. With an office of one or two people, the building of professional networks is essential for problem-solving,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

community building, and expanding the diversity practitioner's role, enabling the representative from the institution to gage the job duties in his/her own work situation and get a sense of how it compares to others' responsibilities. Such professional networking increases the diversity professional's competency and potential efficacy.

Performance Goals

The organization's leader should examine future goals with the practitioner. Is there an opportunity to grow professionally? The practitioner role can expand in its leadership capacity to complement an institution even further. The diversity practitioner's outcomes cannot be the same as the outcomes for the institution as a whole. Diversity practitioners as leaders in management and administration is a relatively new and growing concept. As the goals are set with the practitioner and their supervisor, there should be specificity in goal setting that acknowledges the achievements the diversity practitioner has made. The practitioner's supervisor should highlight the successes that are both individual and institutional.

The weight of an institutional goal should not rely on one individual. Unlike other positions, the diversity practitioner's work is to contribute to a shift in culture. As the practitioner works toward individual goals, there will be ramifications observable to the institution at large. The individual and institutional goals should be acknowledged, but the institutional goals should not be expected to be accomplished alone. A direct threat to the success of a practitioner is bearing the burden of all diversity initiatives. Instead, diversity expectations must be set and included in all departments (Wilson, 2013).

True diversity planning can take place only when diversity is included in the strategic plan, which outlines and focuses on the priorities of an institution. If diversity is important, it will be included in this plan. The plan must not just mention diversity, but rather must purposefully incorporate diversity (Wilson, 2015). Rather than a vague mention of a focus on or a commitment to diversity, the plan will be specific as to how the organization will accomplish this.

Institutional Change

Institutional practices in regard to diversity and inclusion must be in line with the institution's stated values. The diversity practitioner is not the highest level in the hierarchy and therefore is unable to make unilateral decisions that result in significant organizational change; however, the practitioner can successfully navigate the necessary relationships with those in the highest leadership positions to partner together in instituting change. The practitioner's credibility with the organization's leadership contributes to their ability to convince or influence incremental change that aligns with institutionally-espoused values (Griffin et al., 2019). Senior management's documentation of diversity values and initiatives is important, but management's behaviors have the most influence. Leadership must demonstrate pro-diversity behaviors in order for diversity initiatives and practices to take place (Ng & Sears, 2018). As the practitioner commits to diversity development, the organization's leadership must not only articulate their support, but also demonstrate their support.

Mentorship

The benefits of mentorship are plentiful, and are necessary in the role of navigating DEI. For minority and female diversity practitioners, a mentor can serve as a role model for relationships and career

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

advancement. Female mentees are more likely to desire a female mentor and mentees of color are more likely to desire a mentor of color (Bailey, Voiles, Finkelstein, & Matarazzo, 2016). The practitioner needs opportunities to observe the behavior and nuances of a successful leader, whether in their own organization or an outside organization. The organization should provide the opportunity to check in with the mentor. The organization should also support opportunities to connect and inquire about those connections. What is the mentee learning? How is the mentor supporting the work? The manager-employee relationship is critical for retention. The relationship between the supervisor and the practitioner must go beyond performance review.

Job Satisfaction

The longer a person experiences job satisfaction, the longer he/she may stay in his/her role. A healthy work environment contributes to creative, quality-oriented, productive employees. One of the best ways of promoting job satisfaction is offering opportunities for advancement (Laddha, Singh, Gabbad, & Gidwani, 2012). Team members that believe the diversity of the team is respected and embraced in various perspectives, ideas, and opinions are more likely to experience increased success. Leader inclusiveness focuses on the value of the team members' contributions and acknowledges the team's diversity. According to Mitchell et al. (2015), "Inclusive leaders also enhance interprofessional team performance by building team identification. By assuring members that their individual contribution is valued, inclusive leaders facilitate the development of team belonging and the existence of strong, stable team relationships" (pp. 222-223).

People of color may experience a lower level of comfort and less access than their White counterparts in discussions with their immediate supervisors (Steele, 2018). If an employee is not satisfied, he/she will be difficult to retain. The loss of an employee can also lead to considerable financial loss because the organization must then identify new talent. Community diversity shapes an employee's intent to stay with his/her employer. An environment that is supportive of diversity is important for people of color as well as their White counterparts. Employees who believe their organization is supportive of diversity and that they can live and work with dignity are more likely to have positive experiences and believe in the organization's ethical stance. Employees who are engaged in diversity work are more likely to contribute to favorable work conditions if the organization has been intentional about creating a positive diversity climate, which is an essential component of retention. Diversity climate is defined as "the extent to which an individual perceives his or her geographical community values diversity and is acceptable of racial and ethnic differences" (Singh & Selvarajan, 2012, p. 260). Other components of diversity climate include work conditions free of harassment and discrimination, equity among employees, diversity in the workforce, and perceived value of diversity in the institution's decision-making (Buttner, Lowe, & Billings-Harris, 2012).

The organization needs to take proactive steps to determining job satisfaction. A retention survey or audit can be used to not only recognize and acknowledge the practitioner's work, but also determine if the right mechanisms are in place to support the work being done (Buttner et al, 2012). The audit will allow the employer to have clarity on the factors that contribute to job satisfaction as well as those that detract from job satisfaction. A diversity climate scale measures the employees' level of satisfaction with the employer and factors important to retention. According to Buttner (2012), a climate scale should measure three different levels of satisfaction: organizational fairness, organizational inclusion, and fulfillment of organizational diversity promises. Organizational fairness measures how an individual is

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

treated in comparison to others in his/her workplace. Areas to include in the fairness section relate to the institution's decision-making, promoting, evaluation, and access to opportunities. Employees' perception as to what is fair is important. Organizational inclusion describes the evaluation of the organization to implement diversity training, defy traditional standards that favor advantaged groups, and support people of color in their identity. Diversity fulfillment includes support as an employee in their identity and how well the organization includes different perspectives. These areas (organizational fairness, organizational inclusion and fulfillment of diversity promises) are intertwined and meaningful in determining job satisfaction. The perceptions of the experience in regard to the diversity climate for people of color is critical to decisions made around DEI. Employees of color want to see action taken behind diversity initiatives, not unfulfilled institutional promises (Buttner et al, 2012). These areas should be surveyed in order to target areas of dissatisfaction.

Health and Well-Being

Diversity work is intensely personal. Culture plays a critical role in the practitioner's overall mental health. Institutions must consider the energy required to engage in cross-cultural exchanges and the toll of having a culturally acceptable response within an institution that may not accept or tolerate a response that is instinctual to the practitioner. For example, the nuances and norms of a predominantly White, refined, professional workplace in Western society may be very different from the life and culture of a practitioner who is a person of color. The person of color may need to respond to both overt and coverts acts of racism, stereotyping, and microaggressions which are burdensome and exhausting. Stigma and discrimination have a tremendous impact on mental health. Changing institutional culture can be extremely challenging (Griffin et al., 2019). Psychological responses to racism can manifest in physical symptoms and long-term conditions.

Some consequences of racism-related stress may include experiencing depression, headaches, anxiety, low self-esteem, humiliation, upset stomach, chest pains, tunnel vision, ulcers, back pains, nightmares, loss of appetite or overeating, nausea, shortness of breath, weeping, vomiting, fatigue, increased heart rate and hypertension, anger and frustration, difficulty concentrating, lack of productivity and motivation, sleep deprivation, and recounting specific racist situations days, weeks, months, and years after they occur as if they happened more recently. (Truong & Museus, 2012, p. 228)

Diversity practitioners may experience an intersection between their personal and professional identities while working to understand and tend to employees, students, or clients. Practitioners may personalize and internalize experiences due to their own life and family experiences. They may need to put these personal feelings aside in order to provide emotional support for other members of the community (Griffin et al., 2019). In response to activism on her campus, one CDO stated,

I felt like I could never get away from it [personal concerns and connections to activism]. I never had an outlet. And then I show up to my new job, and then I also need to be a resource to students and even some staff. So of course when you show up to work, like you know, you have to be present. You have to be there, and you have to be engaging, and there is not a lot a room to shift like your own things and your own feelings, but you sort of have to do that at times to be there for students. (Griffin et al., 2019, p. 682)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

People of color are less likely than their White counterparts to seek professional psychological services. Practitioners who may be subject to individual and institutional racism experience a level of mental strain. "Racism or racial discrimination experienced in society is consequential for those who experience it, as it can cause isolation and marginalisation, undermine trust, exacerbate trauma-related consequences (especially for refugees), undermine social capital and compromise access to essential services" (Gopalkrishnan & Babacan, 2015, p. 7). People of color and those from marginalized groups can also experience what research has shown about the immigrant experience. Pasca and Wagner (2011) explained that immigrant employees commonly experience discriminatory attitudes or negative reactions from native-born colleagues at their place of work. Furthermore, they explained,

These attitudes toward immigrants held by people in the host country affect immigrants' ability to adjust, secure employment, and integrate into the community. Immigrants' experience of discrimination and lack of social support in the workplace can lead to low self-esteem, fear, anger, loneliness, inability to cope, and psychological distress" (p. 2011)

Many factors contribute to stress in the workplace, but acts of discrimination and behavior by colleagues who are resistant to change in order to move forward in the areas of DEI are added dimensions. If seeing a mental health clinician is not an option, other measures can enable the practitioner to take care of himself/herself. Organizations should recommend, suggest, and provide services to assist with the stress of the position. Examples of services to provide and encourage include, but are not limited to: food and nutrition, fitness, transportation, massage therapy, social support, acknowledging life events and accomplishments, flexible hours, extended breaks in the day, a healthy outlet to talk, and personal days for mental health. Due to differences in culture and identity, social support can be enhanced when ongoing multicultural training is in place for all employees. Diversity training builds cross-cultural communication skills and increases understanding of self and identity. It builds the capacity to have healthy relationships with people who live and experience the world differently.

Those who seek social support from others may do it to ensure their well-being by gaining sympathy from people in their environment or to solicit an intervention from someone who can advocate for them and respond directly to the oppressor. (Truong & Museus, 2012, p. 230)

The practitioner will be less likely to stay at an institution if he/she lacks positive connections and relationships, especially with the immediate supervisor (Truong & Museus, 2012).

CONCLUSION

This chapter has outlined the measures to best prepare for, onboard, and maintain a diversity professional. The success of diversity practices is limited without the support of the institution's leadership. Throughout this chapter, research-based recommendations are made regarding how best to support the diversity officer. An important aspect of supporting the work comes down to being an ally. "Being a diversity and inclusion ally means to be willing to take action in support of another person so that any external barrier that could limit their opportunities in the workplace is removed" (Milanesi, 2020, para. 5). Being an ally may elicit some level of guilt because most White-identified people do not recognize

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

their privileged identity. Guilt does not have to be the driving force for partnership, although it may be an important component in developing empathy for disadvantaged groups and the motivation behind becoming a partner (Grzdanka, Adler, & Blazer, 2015). The concept of being an advocate is rooted in support, but it does not come without complications.

Overall, the essence of advocacy has shifted from political, legal, and economic foci, to the use of social power on behalf of vulnerable others, to expectations that unearned social power can be deployed to dismantle systems of unearned advantaging. Similarly, the idea of allyship has shifted to express lateral rather than hierarchical 'helping' relationships, and to expectations that allyship is an ongoing real-time behavior rather than a static identity. (Anicha, Bilen-Green, & Burnett, 2018, p. 163)

The effective advocate goes beyond passive measures to stand with a stigmatized and/or oppressed group. An advocate positions himself/herself to stand with an underrepresented group, but can still return to the privileges he/she holds in everyday life (Grzdanka et al., 2015). Allyship is valuable when there is accountability. An effective ally will first listen intently and examine the messages of superiority and inferiority that create judgmental and harmful biases and stereotypes that shape actions and can interfere with understanding and supporting differences (Anicha et al., 2018). In order to best support the diversity professional, be an ally.

Chapter 42
An Approach to Diversity and Cultural Competence Curriculum in Public Administration

Bridgett A. King
Auburn University, USA

ABSTRACT

There are a variety of approaches that can be utilized to facilitate public administration students and practitioners using culturally responsive approaches in their professional lives. The importance of understanding cultural diversity extends not only to individual interactions but also the structure of organizations and organizational decision making. The chapter presents one approach to providing students with a diversity-focused curriculum in a graduate-level public administration program. This approach includes an overview of the historical legacy of diversity in public administration, legally required and voluntary approaches to organizational diversity, models that can be used to assess the diverse cultural experiences of individuals for more personalized practice, and activities that can be utilized and adapted to educate public administration students and practitioners on issues of diversity and cultural competency.

INTRODUCTION

By 2030, one in five Americans is projected to be 65 and over; by 2044, more than half of all Americans are projected to belong to a minority group (any group other than non-Hispanic White alone); and by 2060, nearly one in five of the nation's total population is projected to be foreign-born (Colby and Ortman, 2015). Given the current and future demographic changes that are taking place in the United States, it is imperative that public administration students and practitioners are equipped with the knowledge, skills, and abilities that will prepare them to interact with individuals from diverse backgrounds and address the needs of individuals and communities in ways that acknowledge differences across culture and identity. In spite of this, many Master of Public Administration programs do not include components

in their curriculum that emphasize the various dimensions of diversity (Sabharwal, Hajal-Moghrabi, and Royster, 2014). Hewins-Maroney and Williamson (2007) find that although most public affairs and administration programs include some form of diversity within the curriculum, it is not standard across all programs. Also, when present the focus is often on socioeconomic class, race, ethnicity, and gender. Other topics like sexual orientation receive little to no attention (Ryan, 2012; Wyatt-Nichol and Antwi-Boasiako, 2008). In some instances, diversity in the curriculum is limited to a minimal part of a course rather than an entire course or courses (Wyatt-Nichol and Antwi-Boasiako, 2008).

There are a variety of approaches that can be utilized to facilitate students and practitioners engaging in culturally responsive approaches in their professional lives. The importance of understanding cultural diversity extends to not only individual interactions but also the structure of organizations and organizational decision-making. This chapter is intended to be a general overview for faculty who are considering explicitly framing instruction around matters of diversity in public administration or for students and practitioners who received minimal formal training on diversity. Although not the specific audience, individuals from a variety of academic orientations and professional backgrounds who want to facilitate conversations about diversity and inclusion in the classroom or workplace might also utilize the chapter as a way to think about diversity and apply, where appropriate, the content and activities discussed.

The information presented, was originally developed for the course, "Diversity in Public Life" which is offered in the Master of Public Administration program at Auburn University[1]. The course was designed to provide students with a broad understanding of diversity in public administration that can be applied to the curriculum that they encounter in other courses, which may not explicitly include components of diversity, and their professional lives. The course structure was rooted in the Carrizales (2010) framework of cultural competency for public affairs curriculum, which includes knowledge, attitude, skills, and community based cultural competency curriculum components.

The chapter, like the course, begins with a foundational overview of diversity in public administration, how it can be perceived, and it's evolution in public administration. The chapter then shifts to a presentation of involuntary and voluntary approaches to diversity in public administration, their advantages, and disadvantages. Next, three models of organization diversity and cultural competence are presented as practical ways to understand and evaluate the diversity and inclusion in bureaucracies. The chapter concludes with the presentation of a curricular approach that was utilized to connect the knowledge-based information about organizational approaches to diversity and models of organizational diversity to assignments and activities. Although intended for an academic setting to facilitate discussion about organizational diversity, cultural competence, identity and perception, these activities can be modified for use in a professional setting.

What is Diversity in Public Administration?

There are a variety of ways to define diversity. Sabharwal, Hajal-Moghrabi, and Royster (2014) suggest that in its simplest form, diversity is synonymous with the concepts of variation and heterogeneity (p. 209). Joshi and Roh (2009), who focus on diversity in work teams, define diversity as an aggregate construct that represents differences among members of an interdependent workgroup concerning a personal attribute. They focus on two dimensions of diversity in the workplace; relations oriented diversity and task-oriented diversity. Relations oriented diversity includes individual attributes such as gender, race/ethnicity, and age; characteristics that are in many ways visible and easy to characterize. Task-oriented diversity includes professional tenure, education, and function in an organization. A similar differen-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tiation between the types of diversity is made by Heijes (2011) who differentiates between visible and invisible diversity. Visible diversity includes characteristics like gender, race, and physical attributes. Invisible diversity includes political opinion, ethnicity (when separate from race), social class, religion, regionalism, sexual orientation, and family history. Diversity has also been defined as, "otherness or those human qualities that are different from our own and outside groups to which we belong, yet present in other individuals and groups" (Loden and Rosener, 1991, p. 18). Although there is variation across definitions, the concept of diversity consistently addresses differences. In public administration, these differences can exist within the client population and between the client population and the population of public administrators, and within the population of public administrators.

The demographic differences between clients and public administrators have not gone unnoticed as an important component of public administration. Kingsley (1944), who advocated for a representative government workforce, argued that a representative body of administrators would help ensure responsible decision making by administrative professionals in public spaces who utilize discretion to make decisions. According to Kingsley (1944) for a bureaucracy to be truly democratic and understand citizen's desires, it needs to reflect the classes of citizens it serves. Although Kingsley (1944) primarily focused on socioeconomic class inclusion in bureaucracies, Mosher (1968) expanded notions of descriptive representation by incorporating race, gender, and ethnicity. Although research initially suggested the population of civil servants was representative of the American public, (Long 1952; Meier 1975), the research that has followed the original work on descriptive representation or representative bureaucracy has found that many sectors of the civil service do not reflect the demographic composition of the American public or client population served. Although it is not a requirement that the demographics of public administrators reflect the demographics of the public to advocate for the needs of clients or provide active representation, descriptive or passive representation or representative bureaucracy has benefits that go beyond advocacy. In bureaucracies, descriptive or symbolic representation contributes to minority citizens believing that they belong, are welcome, and their interests supported. As an example, Theobald and Haider-Markel (2009) investigate the relationship between descriptive representation in a local police force and citizen interactions. They find that when minority citizens encounter a minority officer, they view the actions of the officer as more legitimate than when encountering a non-minority officer.

Although representative bureaucracy can produce both symbolic (the perception that individuals like them are welcome in the organization) and substantive (policies and programs that benefit individuals like them) benefits for minority clients, representative bureaucracy is not without its criticisms. Because the sphere of administration lies within a democratic governance structure, Mosher (1968) expressed concern for what he referred to as, "active representation run rampant." Essentially, he feared the potential for minority interests to be given priority over what is in the best interest for the broader community, as a threat to democracy. Because of this concern, Mosher (1968) recommended bureaucratic agencies and bureaucrats put effort toward passive (descriptive) as opposed to active (substantive) representation. Although passive representation in bureaucracies may not produce the same substantive representation for minority groups, it holds symbolic value.

As organizations in the 20th century began to address descriptive representation and representative bureaucracy, multiple approaches to diversity in public organizations emerged. Although diversity can foster both active and passive representation, historically the primary motivation for policies focused on representation has been increasing the presence of passive or visible descriptive representation in public organizations most notably as it relates to race and gender.

Approaches to Diversity in Public Administration

Many of the policies related to diversity in public organizations stem from federal interventions and policies aimed at preventing discrimination and ensuring that individuals have equal employment opportunities. These policies, more commonly known as Equal Employment Opportunity (EEO) policies, work to ensure the fair and equal treatment of all employees, irrespective of their race, ethnicity, religion, etc. (Gotis and Zortezi, 2015). These anti-discrimination policies slowly began to be adopted in the United States beginning in the mid-twentieth century. As an example, the Equal Pay Act of 1963 was passed to protect men and women who perform substantially equal work in the same place of employment from sex-based wage discrimination. Similarly, Title VII of the 1963 Civil Rights Act prohibits employment discrimination based on race, color, religion, sex, or national origin.

Following this, subsequent pieces of legislation were passed to protect individuals who may face discrimination. Examples include age (the Age Discrimination in Employment Act of 1967) and disability (Section 501 of the Rehabilitation Act of 1973; Title I of the Americans with Disabilities of 1990). Gotis and Zortezi (2015) suggest that EEO policies can be described as a color-blind approach to employment because they require that employers not treat individuals differently, but instead focus solely on their qualifications for employment. EEO policies then, although legally imposed, do not require organizations to actively engage in efforts to increase diversity in an organization.

Unlike EEO policies, affirmative action policies, work to create a more inclusive workplace by increasing the numerical representation of historically underrepresented groups in the workplace (Gotis and Zortezi, 2015). Affirmative action policies typically have very specific objectives. Such objectives might be to increase the number of racial/ethnic minorities employed or to increase the number of racial/ethnic minorities and women that hold positions in senior management. Examples of affirmative action policies include Executive Order 11246 (1965) which requires affirmative action programs for women and minorities and prohibits job discrimination based on race, color, religion, sex, and national origin, Section 402 of the 1974 Veterans Readjustment Act which requires affirmative action to employ and advance the employment of qualified special disabled veterans and veterans of the Vietnam era and prohibits discrimination based on Vietnam-era veteran status or special disabled veteran status in federally assisted programs, and Section 503 of the 1973 Rehabilitation Act which requires affirmative action to employ and advance in employment, qualified individuals with disabilities and prohibits discrimination based on disability in federally assisted programs. Given the nature of affirmative action policies, one might argue that the focus is on fairness, as the policies work to address historical injustices that have produced disparities in employment and professional advancement for marginalized groups.

Both EEO and affirmative action policies are mandatory as they are legally imposed and are accompanied by consequences if organizations fail to comply (Kossek and Pichler 2006). This approach creates an environment in which the normative justice the policies are aimed at creating can result in backlash. Members of the "historically dominant group may perceive the recruitment and promotion of employees by demographic attributes, as a potential threat" (Gotsis and Kortezi, 2015, p. 15). EEO and affirmative action policies also receive criticism because of their punitive and reactive nature and their potential for creating a "gender, cultural, and color-blind" (Gotsis and Kortezi, 2015, pl 15) workplace that focuses more on the assimilation of diverse employees into the dominant cultural orientation of an organization (Thomas 1990; Prasad, Pringle, Konrad, 2006) as opposed to the environment adapting to be more inclusive of the perspectives of minority employees. The assimilation of differences can have negative consequences for employees. While one might expect color-blind approaches to have the best

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

outcomes for minority employees, research suggests that this is not the case. As one study demonstrated, the more white employees in a department, who thought colorblindness was the best approach to diversity, the worse the experience was for minority employees. In such departments, minority employees thought their workplace had more racial bias. By contrast, the more white employees who thought that an approach that celebrates group differences (often referred to multiculturalism) was the best approach, the less minority employees saw racial bias in their workplace (Social Psych Online, 2017). Lastly, EEO and affirmative action policies are criticized for primarily focusing on recruitment and not retention or professional upward mobility and promotion. Thomas (1990) argues that such policies serve as a professional boarding pass, not as an upgrade which addresses the problems of employees being able to meet their full professional potential and breaking the glass ceiling that prohibits promotion.

In spite of the challenges that accompany EEO and affirmative action policies, Dickens (1999) argues that the benefits of such policies should not be underestimated. He argues that they set an equality agenda for employers, determine the conditions under which employers' decisions are made, provide a universal standard regarding the management of a diverse workforce, and alter the cost of discrimination and organization inaction regarding equity and equality issues.

Contrary to EEO and affirmative action which are involuntary, diversity management policies are voluntary and typically designed to recognize, value and utilize differences and generate a process of inclusion for employees from different backgrounds through organizational policies and initiatives (Liff, 1997). These policies are typically advocated in the pursuit of full and equitable treatment of workers, regardless of their race, gender, and ethnicity (Soni 2000). Where EEO and affirmative action focus on addressing discrimination, diversity management focuses on difference and inclusion (Prasad et al. 2006); treating diversity as an organizational resource (Noon 2007). Diversity management has several goals: to understand cultural differences, recognize the importance of diversity, prevent discrimination against disadvantaged groups, encourage cultural interactions across race and gender, and enhance cultural development and leadership practices in the organization.

Organizations often choose to engage in diversity management to succeed in competitive professional environments and attract a diverse workforce (Soni 2000). Thus, the justification for diversity management approaches is often rooted in "connecting diversity to organizational performance. Metrics of performance can include meeting the needs of a diverse customer base, enhancing labor relations, responding to the needs of global markets, securing an increased market share, and improved workforce skills" (Gotis and Zortezi, 2015, p. 17). Although diversity management goes beyond the legal requirements of EEO and affirmative action, there are limitations to the approach. First, because the approach focuses on the practical benefits of diversity, it fails to address how structural discrimination has impacted historically disadvantaged groups and challenge or alter power relations; essentially rejecting the moral arguments for diversity in organizations. Second, it reduces diversity to a commodity, or resource subject to a cost-benefit calculus (Gotsis and Kortezi, 2013). For example, if at some point, an organization deems diversity a resource that is not contributing to the goals of the organization, it may choose to stop engaging in diversity management. Lastly, some argue that there is a lack of evidence to support the relationship between diversity management and measurable organizational outcomes (Gotsis and Kortezi, 2013). Recent research, however, suggests that diversity management is positively associated with perceptions of organizational fairness.

Utilizing data from the 2013 Federal Employee Viewpoint Survey, Kim and Park (2017) assess the relationship between diversity management and perceived organizational fairness. They find that generally, diversity management increases the perception of organizational fairness. Ethnic minorities and

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

employees over age 40 are more likely to perceive diversity management as being positively associated with fairness. Women and employees at a higher pay grade are more likely to perceive diversity management as negatively effecting fairness. Although diversity management may not necessarily result in perceptions of fairness that are consistent across all demographic employee groups, it does generate positive organization perceptions for some employee groups, both which are covered by federal EEO and affirmative action policies.

Various factors can motivate the type of diversity approach that occurs in an organization. Understanding the justification, source, nature, and level of implementation for the approach provides a framework to understand what the consequences of each approach might be for the organization, employees, and clients. Each of these approaches lends itself to different orientations toward diversity in the workplace and the way that individuals and their role or place in the organization are perceived (Table 1).

Table 1. Comparison of approaches to workforce diversity

Initiative/Practices	Justification	Source	Nature-content	Level of Implementation
EEO and Affirmative Action	Moral arguments	Legally imposed	Focus on discrimination and justice	Focus on the group-level
Diversity Management	Business arguments	Voluntary	Focus on differences as an asset	Focus on the individual level

Source: Gotis and Zortezi (2015)

Cultural Competency in Public Administration

While traditional human resource courses can prepare public administration students for the legal requirements of diversity in public administration and organizations based on Equal Employment Opportunity and affirmative action policies, the focus of diversity in public administration has shifted toward a focus on cultural competency.

Cultural competency reflects specific actions or policies within an organization that enable it to more effectively serve a culturally diverse population (Carrizales, 2010, p. 594). The National Center for Cultural Competence defines cultural competency as, "having the knowledge, skills, and values to work effectively with diverse populations and to adopt institutional policies and professional practices to meet the unique needs of client populations" (Satterwhite and Teng, 2007, p. 2). Bailey (2015) suggests that the changing demographics of the nation underscore the need to train more culturally competent public servants. The change will require public organizations to develop more inclusive work cultures that have a better understanding of how people are different from each other and the organization (White and Rice, 2015, p. 3). Although other sectors in higher education (health care—medical and nursing education, and social work) have actively worked to integrate cultural competency into the curriculum, similar strides have not been made in public administration and public affairs. While the connection between cultural competency in health care and social work may be easy to recognize as both have a considerable number of professionals who regularly engage various demographic segments of the public in face to face service delivery, the connection to public administration may not be as evident. Rice (2007) presents several reasons that public administration needs to embrace cultural competency. Cultural competency recognizes the cultural context in which public encounters occur, presents an opportunity to address the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

often inaccurate public service and programs provided to minority populations, and increases the relevance of a public agency's administration, and programs and groups that can use them. Lastly, service delivery officials or street-level bureaucrats are better prepared to do their jobs (p. 44).

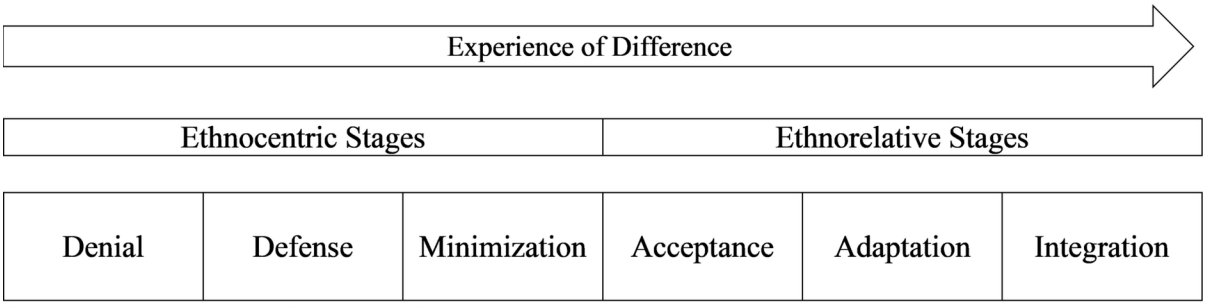
Models of Diversity and Cultural Competency

For public administration and other professional fields, models of cultural competence that have been developed for other areas of service can be utilized or adapted to facilitate students and practitioners thinking about and engaging in service-based practices and policies that facilitate an environment that is culturally competent. Three different models that can be used to help students and practitioners approach their clients from a perspective of cultural competence and also assess their orientation toward cultural competency are the Bennett Model of Cultural Competence, the Purnell Model for Cultural Competence, and the Sunrise model. Each can be utilized by individuals to assess where they are on the continuum of diversity and cultural competency and also as approaches to better understand the individuals they are tasked with serving as public administrators.

The Bennett Model

The Bennett Model was developed by Milton Bennett as a framework to explain how people experience and engage cultural difference (Bennett, 2014). The model includes a continuum that ranges from ethnocentrism to ethnorelativism. Bennett (1986) suggests that by having the different states of development along a continuum, the model can be used to diagnose the level of intercultural sensitivity of individuals and groups, to select appropriate training methods, and to sequence material that facilitate movement toward greater sensitivity (p. 180). Others have also noted the utility of the model in that it allows for the consideration of individuals and organizations operating at different points on the continuum relative to different dimensions of diversity (Creating Positive Dialogue, 2013). Each stage of the continuum represents a different way of experiencing difference for example Denial (of difference), Defense (against difference), Mimiziation (of difference), Acceptance (of difference), Acceptance (of difference), Adoption (of difference), and Integration (of difference). The states of the continuum are presented and briefly discussed below (see Figure 1).

Figure 1. Bennett model of intercultural sensitivity



Source: Adapted from Bennett (1986)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the stage of denial, individuals or organizations essentially deny that differences exist or when acknowledging there are differences, use broad categories of difference. As an example, an individual may understand that those who are Asian are not white, while not acknowledging variation in Asian cultures (Bennett, 1986, p. 185). According to Bennett (1986), this may occur because individuals have minimal contact with others who are different from themselves. Deane (1991) also suggests that those in this group may attribute sub-human qualities to those from different cultures and regard them with extreme prejudice (p.1) Defense refers to attempts to counter perceived threat to the centrality of one's worldview (p. 183). The most common type of defense is a denigration of difference or "negative stereotyping." An alternative approach to negative stereotyping is the promotion of one's culture as superior. Minimization refers to treating cultural differences as superficial. Essentially differences are acknowledged and not negatively evaluated, but are trivialized (p. 183). The stage of acceptance represents a shift from ethnocentrism to ethnorelativism. In acceptance, cultural differences are acknowledged and respected. Acceptance includes the acceptance of both behavior differences (language, etc.) and cultural value differences. Adaptation represents a combination of acceptance that also includes the adaption of behavior and thinking related to difference. Essentially, people or organizations in adaptation can shift their frame of reference (Deane, 1991). The final state, integration, is the adaptation of ethnorelativism into one's own identity. A person who is in the integrative stage can "construe differences as a process, adapt to those differences, and construe him or herself in various cultural ways" (p. 186). Once the stage of an individual or organization has been identified specific strategies, and training approaches can be identified to facilitate moving an individual or organization to a more ethnorelative stage or to strengthen and support ethnorelative perspectives. As an example, cultural awareness activities may be used for organizations or individuals who are in the denial stage to help facilitate them to recognizing differences (see Bennett (1986) and Deane (1991) for more examples).

The Purnell Model

Purnell (2005) suggests that cultural competence is a process. The Purnell Model, which was designed as a "holistic organizing framework with specific questions and a format for assessing culture that could be used across disciplines and practice settings" (Purnell, 2005, p. 10). Although primarily, utilized by health care professionals, the model, which is depicted as a circle, requires practitioners to consider several domains, the way they affect each other, and their contribution to culture. These domains include global society, community, family, and the person. The interior of the circle is divided into twelve wedges that depict cultural domains with a dark center that represents the unknown. Along the bottom of the model is a saw-toothed line that represents cultural consciousness. Although the line, according to Purnell (2000; 2005) primarily relates to health care, he suggests that organizations may also be represented on this line according to their cultural competence (Figure 2). While the model may be health care specific, given the range of services and programs provided by public administrators and the various types of client interactions that may occur, factors which may traditionally be associated with health care can also be relevant for general public administration and administrative and policy decision making.

As many public administrators engage in service delivery that is public-facing, understanding how culture may contribute to how administrators and the services provided are perceived can facilitate more engagement with the public and a heightened awareness of available services. Under the umbrella of culture, Purnell (2005) suggests that providers need be not only culturally competent but also culturally aware and sensitive. Cultural awareness he suggests has to do with "an appreciation of the external signs

Variant cultural characteristics: age, generation, nationality, race, color, gender, religion, educational status, socioeconomic status, occupation, military status, political beliefs, urban versus rural residence, enclave identity, marital status, parental status, physical characteristics, sexual orientation, gender issues, and reason for migration (sojourner, immigrant, undocumented status).

Unconsciously incompetent: not being aware that one is lacking knowledge about another culture
Consciously incompetent: being aware that one is lacking knowledge about another culture
Consciously competent: learning about the client's culture, verifying generalizations about the client's culture, and providing culturally specific interventions
Unconsciously competent: automatically providing culturally congruent care to clients of diverse cultures

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of diversity, such as arts, music, dress, and physical characteristics" (p. 8). Cultural sensitivity is more directly behavior and not saying things or engaging in behaviors that might be "offensive to someone from a cultural or ethnic background that is different from the providers" (p. 8). The model then serves as a tool that can be used to consider the best way to serve and respond to clients and create organizational environments that are more culturally competent; thus enhancing the effectiveness of the organization and the services it provides.

The Sunrise Model[2]

Similar to the Purnell Model, the Sunrise Model was originally developed "as a conceptual holistic research guide and facilitator to help researchers discover multiple dimensions related to the theoretical tenants of the Theory of Culture Care" (deMelo, 2013, p. 21). Although one may focus on care as is relates to healthcare, Leninger (1997) suggests that care can be both abstract and concrete. Care can be defined as assistive, supportive, and enabling experiences or ideas that ameliorate or improve the human condition (Leninger 1988). Care can then refer to actions, attitudes, and practices that assist or help others toward healing and well-being (Leninger 1988). The theory of culture care is embedded in the belief that "worldwide, cultural and social structure factors, environmental contexts, ethnohistory, and language usage, and generic and professional care, along with three types of nursing actions and decisions could provide nurses with new information that had not been considered in the past all contribute the type of professional care or services to provide an individual" (deMelo, 2013, p. 21). The model itself is a visual diagram that presents several factors that can contribute to care in a variety of cultural contexts. Relative to public administration, the cultural and social structure dimensions, environmental contexts, ethnohistory, and language usage components are of particular importance. The model presents several sub-categories of further investigation to understand the dimensions above. The subcategories (Table 3) created by deMelo (2013, p. 22) represent a comprehensive list of descriptions for each dimension that can be used to understand the cultural norms of client populations better. Once understood, organizational policies, programs, implementation, and communication strategies can be adjusted to best suit the cultural norms, and realities of the individuals and population served.

Strategies for Diversity and Cultural Competency Instruction in Public Administration

Having considered various approaches to diversity and models for cultural competency, the challenge in public administration then becomes how to integrate activities that will enhance understanding be it in course curriculum or professional training. The example activities listed below, are designed to specifically touch on three of the cultural competency components presented in the cultural competency curriculum for public affairs (Carrizales, 2010). The framework includes knowledge, attitude, skills, and community-based competency components (Table 2).

Given the nature of the subject, it is important to create an environment where students feel comfortable communicating with each other about the various issues that will be discussed. Because the course was provided for public administration students one of the ways this was achieved was to continually connect the issues we were discussing in class and their perspectives to how they would impact their work as public servants and the subsequent effect that it would have on the clients they serve. In a professional setting, a facilitator may connect diversity to the work of the organization, and the individuals

Table 3. Sub categories of the cultural and social structure dimensions of the sunrise model

Dimensions	Descriptions
Technological Factors	Access to technologies of information, access to means of communication, access to media and press, access to electronic devices at residence, access to health services and technologies, and others
Religious and Philosophical Factors	Religious practices, consultation to traditional healers, meanings of life, individual strength, beliefs, spirituality and health, personal values, norms and religious beliefs, freedom of thinking and expression, institutional values, priorities and goals, social roles, intra-institutional communication, inter-sector communication, inter-institutional communication, and others
Kinship and Social Factors	Familiar structure, birth position in the family, family values, roles of the aged, head of household, composition of family, developmental tasks, social status, bereavement of parents, family disease, family kinship/relations, friendship relations, emotional-sexual relationships, emotional situation, networks and social supports, access to culture, leisure and sports, migration, gender relations, social norms, public security, citizenship, access to means of transportation, conjugality, violence, and others.
Cultural Values, Beliefs, and Ways of Living	Beliefs, responsibility for health, folk practices of cure and care, perception of official health system, perception of health professionals, spirituality and health, cultural references, sexuality, race and ethnic group, access to culture and information, knowledge, attitudes, behavior, tobacco, alcohol, recreational drugs, physical activities, safety, interests, common foods, hygiene, world views, entertainment and leisure, alternative lifestyles, and others.
Political and Legal Factors	Access to public policies (security, health, education, environment, job, transports, social), access to justice, citizenship, political participation, freedom to think and express, intra-institutional communication, inter-sector communication, inter-institutional communication, and others.
Economic Factors	Knowledge, access to education, literacy (read and write), reading and writing habits, type of school (private or public), schooling, access to information, school violence, intellectual performance, solution of problems, attention, and others.
Environmental Factors	Destination of waste, public illumination, access to electricity grid, natural ventilation, drain, asphalt/pavement, septic tank, drinkable water, pollution (air, water, visual, noise), presence of vegetation or forest areas, presence of animals, goods supply (local commerce, to go to other locality, economic self-sufficiency), relations with the natural resources, access to drinking fountain, exposition to pesticide or fertilizers, exposition to chemical, physical agents etc., and others.
Language	Dominant language, contextual use, tone/volume, spatial distancing, eye contact, facial expressions, greetings, touch, language, dialect, and others.
Ethnohistory	Community history, population history, life history, total time living in the community, sense of belonging, social participation in the community, and others.

Source: deMelo (2013)

served. It was also important to communicate to the students that what they got out of the course and the activities we completed would be directly related to the effort they put in and their willingness to make themselves uncomfortable.

We began the semester with a "Privilege Walk." "The purpose of the Privilege Walk Activity is to learn to recognize how power and privilege (or advantage) can affect our lives even when we are not aware it is happening. The purpose is not to blame anyone for having more power or privilege or for receiving more help in achieving goals, but to have an opportunity to identify both obstacles and benefits experienced in our life" (The purpose of the privilege walk" ND). To complete the walk, a variety of statements are read about privilege. The statements range from the obvious to those that are notably less. To begin the walk, students line up shoulder to shoulder with their eyes closed. Statements are then read aloud by the facilitator. When a statement reflects an advantage, students are instructed to take a step forward (Example: If English is your first language, take a step forward). When statements reflect disadvantage, students are instructed to take a step backward (Example: If you have visible or

invisible disabilities, take a step backward). After all the statements are read, students open their eyes, and the facilitator begins a discussion that focuses on privilege and the various ways it manifests. In the context of public administration, we also discussed how the various privileges that individuals experienced could affect how they operate in the public sector particularly as it relates to the creation of programs, designing of policy, and administration of programs. The focus on why privilege matters for public administration was connected to who they would be as administrators and the consequences of their perceptions for clients. Beginning the course with the "Privilege Walk" also provided the students with a sense of how the course was going to be structured and what was going to be expected of them regarding their engagement and involvement.

Knowledge-Based Cultural Competency

As noted in Table 1, knowledge-based cultural competency includes an understanding of terms, demographics, disparities, and policy and legal implications. There are a variety of ways students and professionals to access and discuss this information. Following the historical discussion of diversity in public administration and bureaucracies which include voluntary and involuntary approaches or requirements for public agencies, we utilized *Diversity and Public Administration: Theory, Issues, and Perspectives by* Mitchell F. Rice and also included supplemental readings from *Cultural Competency for Public Administrators* by Kristen A Norman-Major and Susan T. Gooden. The course was broken down into thematic weeks that allowed the students to discuss the legal requirements for diversity in public administration for different groups while simultaneously thinking about cultural competency and what it looks like in public spaces.[3] The readings were typically associated with an in-class activity that involved the students, working in groups, discussing and presenting what diversity looked like under different institutional orientations toward diversity and degrees of cultural competency. One such activity is "Visioning Diversity."[4] In the exercise, students are broken into groups and provided a description of an organization. The description includes the size of the organization, employee, community, and client demographics, the type of services provided by the organization, and background information on

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

challenges the organization has experienced both internally and externally. They are then tasked with discussing the type of diversity the organization appears to value (EEO, Affirmative Action, or Diversity Management), the potential legal and organizational consequences, and the level of cultural competence (based on one of the models). Following this, students are required to discuss what the organization would look like and how it would interact with clients if it truly valued diversity and cultural competency. Students are then instructed to identify three action steps that the organization could implement to create an organization that truly values diversity and is culturally competent. Once the action steps are identified, the students are tasked with designing a logo that would communicate to the public the organization's vision of diversity relative to the services it provides. Students then present their case, diagnosis, suggestions, and logo to the class.

Attitude Based Cultural Competency

As professionals who will or do engage the public, it is important that students are aware of how they may perceive individuals and how this perception may affect the degree of neutrality they use when approaching tasks related to their profession. Because we are often unaware of the way that bias may affect our interactions with individuals, the Implicit Association Test (IAT) can be used to measure attitudes and beliefs that individuals may be unwilling or unable to report. The IATs have been created by Project Implicit housed at Harvard University. Project Implicit which is "non-profit organization and international collaboration between researchers who are interested in implicit social cognition-thoughts and feelings outside of conscious awareness and control" (https://implicit.harvard.edu/implicit/aboutus.html). After completing the selected IAT's students are required to complete a reflection that addresses the following questions:

1. Were you surprised by your test results? Why or why not?
2. What factors related to your life experiences do you believe contributed to your test results?
3. Based on the test results, are there things moving forward that you will change or do differently to confront the bias reported?

One thing that was important to communicate with the students was the IAT was a tool that we were using to facilitate conversation and reflection about beliefs and values, it was not without limitations and controversy (Goldhill, 2017). When responding to the questions, students were reminded that the purpose of the assignment is to think about perceptions, not to criticize the IAT. To contribute to the open environment, I, as the instructor also completed the IAT's and the reflections and shared my results with the students. Although all students were encouraged to share during class, students were not required to share their reflections verbally but were encouraged to think about how what their results suggested might matter in their personal and professional interactions.

Skills Based Cultural Competency

In the course, skills-based cultural competency was included through two projects. The first was a cultural competency assessment. The second was a diversity in public administration curriculum assignment. Both of these assignments placed the student in a professional role other than that of student and required them to think about how to integrate what was learned over the semester for two separate

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

audiences; working professionals and future students. The cultural competency assessment places them in a management role and requires them to think about what an assessment process for cultural competency in an organization includes.

Working with the members of their group students were required to identify a public service agency that engages directly in client services; an agency that works directly with the public. Students were then required to design a cultural competency assessment for that specific agency that was rooted in the Bennet, Sunrise or Purnell Models of Cultural Competency. The project was required to include: an assessment that the agency could use to evaluate the cultural competency of the internal workings of the organization and an assessment that the agency could use to evaluate the cultural competency of interactions with the public. The project was required to begin with an overview of the agency which included: the name, mission, location, services provided, information about the population served and the community (age, income, education, race/ethnicity, etc.).[5] Students were also required to create a process map/flow chart that demonstrates the various points of contact that a client would have when interacting with the organization and include a detailed explanation of the process map/flow chart in the final project. Once completed, the students were required to present the assessment.

The diversity curriculum assignment places students in the role of instructor and requires them to create an activity that could be integrated into a public administration class that is *not* diversity-focused, but in which issues of diversity are important (Example: Budgeting for Public and Nonprofit Organizations). The students then present the activities and walk their classmates through the activity, providing commentary that explains why the themes discussed in the assignment are useful and important for broader issues surrounding public administration. The activities created by the students ranged from in-class simulations that focused on the distribution and allocation of resources to assignments that focused on differences in race, ethnicity, gender, religious affiliation, ability, socioeconomic status, and communication and personality style.

In addition to reflecting on their IAT's, at the end of the semester, students were asked to reflect on the importance of diversity and cultural competency in public administration. One student noted, "As administrators, you are not only serving the public but serving the public in a system that is embedded in a history that you need to be aware of." Another student noted that "It is important for graduate students who are about to enter the workforce to engage in academic and professional dialogue. The creating and presentation of our curricular exercises created an opportunity to do that as well as exercise a great deal of professional autonomy and responsibility." Lastly, one student stated, "It was a great experience and highlighted the importance of focusing on diversity issues in the public sector. It showed that in order to be a successful public servant you need to be aware of the different communities you serve and their needs and recognize that differences should be taken into consideration when creating and administering policies and programs."

Although student outcomes following the completion of the course were not systematically analyzed, research suggests that diversity courses can have positive outcomes for students and practitioners. Probst (2003) finds that when compared to other students, students who completed a diversity course were significantly "more egalitarian with respect to gender roles, more positive with respect to disabled, racial minority, and gay, lesbian, and bisexual workers, and significantly more tolerant of different cultures" (p. 238).

A considerable number of public administration programs are accredited by the Network of Schools of Public Policy, Affairs and Administration (NASPAA).[6] In 2007 NASPAA changed its accredited program competencies and mandated that programs seeking accreditation integrate cultural competence and

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

diversity across the curriculum. Specifically, NASPAA Competency 5 requires that public administration students be able to "Communicate and interact productively with a diverse and changing workforce and citizenry." In spite of this, Sabharwal, Hajal-Moghrabi, and Royster (2014) find that cultural competency and diversity remain negligible components across the public policy, affairs, and administration curriculum. Although there is a clear recognition that diversity and cultural competence are importation for public administration, public administration lags behind other areas in promoting its importance. To effectively address the changing demographics of the United States population, Sabharwal, Hajal-Moghrabi, and Royster (2014) identify three challenges that public administration must addresses. One of these is that schools of public administration and policy must educate and train future public servants on issues of diversity and cultural competency.

Further, as programs consider public service globally, students will also need to understand the various ways in which diversity and inclusion are defined and understood outside of the context of the United States. The Organization of Economic Cooperation and Development (OCED) (2018) identifies three ways in which OCED countries define diversity, diversity as equal opportunity, diversity and a resource, and diversity as inclusiveness (OCED, 2018). The global perspective for cultural competency and diversity in public administration is another area where enhanced cultural competency instruction in public administration programs and knowledge and awareness among faculty, students, and practitioners is important for current and future public and nonprofit administrators.

The chapter has presented one approach to providing students with diversity-focused curriculum in a graduate-level public administration program. This approach includes an overview of the historical legacy of diversity in public administration, legal approaches to organizational diversity, models that can be used to assess the diverse cultural experiences of individuals for more personalized practice, and activities that can be utilized and adapted to educate public administration students and practitioners on issues of diversity and cultural competency. In the semesters that have followed the initial instruction of the course, anecdotal conversations with students have suggested that one course is not enough for students to fully grapple with issues of diversity in public administration. And, while students can think about these issues independent of their assignments, for diversity to be viewed as an integral component of a public administration program, programs must purposely and comprehensively integrate diversity across their curriculum and be willing to consider the role the program and faculty play in preparing culturally competent public administrators.

Chapter 43
The Interactions Between Cultural Intelligence, Job Burnout, and Task Performance of Expatriates

Ufuk University, Turkey

ABSTRACT

In this chapter, cultural intelligence, one of the most crucial capabilities of employees for overcoming the cultural obstacles of different countries, is figured out in depth. This is attained by checking out the relationships between cultural intelligence, job burnout and task performance of expatriates who are employees sent by their company to a host country for a period. Since expatriates are the employees who face actual barriers in adapting and living in different cultures, a quantitative research was conducted among 156 expatriates working at the marketing department of different multinational companies, operating in Turkey. According to the results, expatriates with high cultural intelligence face burnout less at the workplace. Moreover, task performance of these employees tends to increase because of their cultural intelligence. Consequently, with the help of this chapter, a paramount empirical study on cultural intelligence and its correlates is added to the literature.

INTRODUCTION

Stemming from the latest developments in the communication and information technologies as well as transportation services, the earth is becoming smaller in terms of geography. By contrast it is developing at a rate, which has been experienced before recently. According to IMF (2017) total Gross Domestic Product of 190 countries around the world is expected to be more than 83 trillion American dollars by the end of 2018. Owing to this economic setup around the world, companies are operating beyond their

origin countries as a necessity. Trying to achieve their best, they can either hire employees from the host country or they can send their own employees from the origin country to the host country. These employees are mostly named as 'expatriate' or 'expat' in short.

Expatriates are the employees who face the difficulties of cultural and language barriers in host countries. They are exposed to survive in a different environment in terms of language, rules, traditions and customs. That is why 'working in a diverse environment' or 'managing diverse workforce' is up to date issues in both general and human resources management. But sadly, not all the employees are lucky to overcome cultural and language barriers easily. As a result they may have burnout syndrome or they can be dissatisfied with their job as well as their job performances may deteriorate. To overcome these negative results, diversity management should be effective in terms of supplying the help, which expatriates need to adapt to the new work atmosphere. If there is an ineffective adaptation process for expatriates, after a while they lose their self-confidence, dissatisfied with the conditions offered and lastly burnout occurs. But if it is in the opposite way, they feel more satisfied and happier, and they tend to exert extra performance in their company.

The main aim of this study is to find out how the cultural intelligence and linguistic intelligence of expatriates overcome the diversity barriers and investigate whether these intelligences play role in eliminating their job burnout and fostering their task performances. To achieve this, using the most reliable scales in the literature, a quantitative research technique was applied among sufficient number of expatriates working in marketing departments of subsidiary companies operating in Turkey. The results will put forth the links between cultural and linguistic intelligence and job burnout and task performance, which form the scope of this study. So in this chapter, it is intended to both fill a gap in the related literature and to supply valuable information and insight to the practitioners.

BACKGROUND

It is unquestionable that nowadays globalization gains more and more power than it did before. Every day companies search for new opportunities outside their origin country to maximize their profits. They search for new markets as well as penetrating in existing ones abroad. According to United States Bureau of Economic Analysis, US foreign direct investment raised from 1.32 to 6.01 trillion dollars in the period between 2000 and 2017. And sending employees for their operations abroad helped these types of companies to increase their foreign direct investments. From the human resources perspective, these employees who are sent by their parent companies to other countries in order to live and work at these host countries for a time period between two years and seven years, in general, are called as 'expatriates' (Caligiuri, 2000).

Throughout this process companies give emphasize on their expatriates' adjustments to host countries. This is because when employees have difficulties in getting used to working at a host country, their job performance tends to deteriorate which in turn causes a decrease in organizational effectiveness (Liu and Shaffer, 2005). Besides there being many factors affecting an expatriate's adjustment to a new country, at this point, cultural factors take the head. The rationale behind this is, expatriates' facing these cultural factors firstly, and then learning and adjusting to them, since there are important differences from one country to another among the components of culture such as; values, attitudes, beliefs and norms (Van Vianen, De Pater, Kristof-Brown & Johnson, 2004).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In this research, the relationships among cultural intelligence, job burnout and task performance are based on the theory of multiple intelligences (Gardner, 1983), the Job Demands-Resources (JD-R) model (Demerouti, Bakker, Nachreiner & Schaufeli, 2001) and the Conservation of Resources (COR) theory (Hobfoll, 1989). Based on the early studies of Gardner (1983), today it is known that there is not one type of intelligence. Cultural intelligence has roots in both interpersonal and linguistic intelligence out of seven classes introduced by Gardner (1983). From this perspective cultural intelligence plays a vital role on the link between job demands and job resources as a motivating factor. Here working at a host country, which means different culture and different work environment, can be named as a job demand (Bakker & Demerouti, 2007). According to the Conservation of Resources (COR) theory, as a general principle one must invest resources in order to gain more resources or not to lose existing resources (Hobfoll, Halbesleben, Neveu & Westman, 2018). In this manner cultural intelligence acts as an important resource for expatriates to gain resources as pay, promotion, etc. in their company.

MAIN FOCUS OF THE CHAPTER

In this section, the concepts of cultural intelligence, job burnout and task performance are being analyzed in detail and a comprehensive literature scanning is aimed to be conducted.

Cultural Intelligence

In general, an individual's capacity of obtaining, perceiving, absorbing, processing and understanding numerous types of information, stimulants and messages signals to his/her intelligence (Gardner, 1983; Sternberg, 1985). The idea of one general type of human intelligence was eliminated by the work of Gardner (1983) 'the multiple intelligences theory'. According to Gardner and Hatch (1989), multiple intelligences consist of seven intelligences, which are; 'logical-mathematical', 'linguistic', 'musical', 'spatial', 'bodily-kinesthetic', 'interpersonal' and 'intrapersonal'. Among these, cultural intelligence is related to social intelligence which can be defined as, an individual's scope of completing actions with and through other people and emotional intelligence that can also be defined as, the extent to which an individual interpret and transmit human emotions (Earley & Peterson, 2004). But cultural intelligence is apart from these two related types of intelligence. It can be defined as, the capacity and capability of an individual to operate and manage effectively in diversified cultural environments (Earley & Ang, 2003). In another definition cultural intelligence was described as, feeling enthusiasm to learn new aspects of a culture and being flexible and competent to understand features of a new culture (Thomas & Inkson, 2005). Briefly, cultural intelligence (CI) or cultural quotient (CQ) can be defined as, an individual's capacity to perceive, understand, learn, react and adapt to a wide range of features of a new culture.

Additionally, cultural intelligence provides individuals to understand different features in a diversified cultural environment and adapt to it both faster and easier (Alon and Higgins, 2005). Those with high levels of cultural intelligence may adjust to a different culture easier than those with high levels of other dimensions of intelligence. This is because reactions of people mostly differ from one culture to another. For example attitudes toward colors may differentiate in different countries; although the color of red is favorable in India, it is a symbol of mourning in South Africa.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The cultural intelligence framework has been based upon the model of multiple intelligence introduced by Sternberg and Detterman (1986). They drew a frame consisting of four elements for an individual's intelligence from which cultural intelligence concept has been derived. These four components of intelligence are noted as: (1) metacognitive intelligence, (2) cognitive intelligence, (3) motivational intelligence, (4) behavioral intelligence (Earley & Peterson, 2004; Ng, Van Dyne & Ang, 2009).

Metacognitive Intelligence

Metacognitive intelligence essentially refers to competence of attention to intercultural interactions (Earley & Ang, 2003). This type of intelligence provides basis for perceiving and understanding diversified situations related to culture. For example, one with high metacognitive intelligence can easily realize different norms and values during interactions (Ng, Van Dyne & Ang, 2009). According to Early and Mosakowski (2004), metacognitive intelligence dimension of cultural intelligence signals to the intellectual processes taking place in an individual's mind. Moreover, this sub dimension of cultural intelligence consists of appraising progress on adapting to a new culture (Ang & Van Dyne, 2008) and conducting intellectual plans to understand and learn cultural norms (Van Dyne, Ang & Koh, 2008).

Cognitive Intelligence

Cognitive intelligence engages in knowledge of norms, values, attitudes and cultural preferences of a different culture obtained by education or based on personal experience (Ang, Van Dyne & Koh, 2006). In this type of cultural intelligence, an individual interacting with a different culture has a definite perception of norms and values of both original and the new cultures. Based upon this, when he/she faces a new culture, an individual interiorizes the similarities and dissimilarities between the cultures and adapt to the new one easier (Ang, Van Dyne, Koh, Ng, Templer, Tay & Chandrasekar, 2007).

Motivational Intelligence

Motivational intelligence refers to intrinsic motives for adapting to different conditions and situations in a diversified cultural setting (Earley & Ang, 2003). Motivational intelligence is the desire that pushes one to interact with different cultures. This dimension of cultural intelligence signals to an individual wish to communicate with people from different cultures. It reflects the values of an individual about new cultures (Van Dyne, et al., 2008). Without motivational intelligence, establishing strong relationships with different cultures is almost impossible.

Behavioral Intelligence

The last one, behavioral intelligence refers to the degree, an individual behaves in a proper way in a different cultural situation such as, using appropriate words and tones (Ng, et al., 2009). It cannot be separated from cognitive and motivational intelligence as they are providing basis for individuals to behave in an appropriate way when facing a different culture (Ang, et al., 2006). People, who have high levels of behavioral intelligence, act in accordance with the different culture, which they are interacting with. They demonstrate suitable behaviors for example, when they are eating food or greeting each other, or shaking hands.

Job Burnout

One of the most challenging issues faced in todays' organizations is, an employees' psychological ties with his or her job nowadays. Among these, one concept is differentiating due to its effects on many job related issues. It is job burnout. In this section, after a brief historical research, the concept will be defined, its phases and sub dimensions will be discussed and factors affecting burnout and its consequences will be examined.

Historical Development of Job Burnout

The roots of research on burnout, date back to 1970s. This initial phase took place between 1975 and 1980. Due to increasing demand on burnout research, in 1980s the concept was examined empirically. Beginning with the journal of Freudenberger (1975) addressing the issue of burnout in a health-care agency, Maslach (1976) was also among the pioneers of burnout literature who concentrated on emotional stress of human services employees (Maslach, Schaufeli & Leiter, 2001). Following these years, throughout 1980s, empirical researches on burnout expanded. These were mostly on the basis of quantitative research. In this period, some reliable measures consisting Maslach Burnout Inventory (Maslach and Jackson, 1981) were developed. From the 1990s until now, the empirical researches have jumped from the health-care and human service sectors to other sectors including, education, manufacturing and technology, etc (Maslach, et al.,2001).

Definition

The concept of burnout has been well in accordance with job stress since it is thought to be a response to job stressors (Lee & Ashforth, 1996; Maslach, 1982). According to Conservation of Resources Theory (Hobfoll, 1989), burnout takes place when an employee loses a resource or resources, which is perceived as valuable, and he/she has a feeling of inadequacy. So, burnout can be defined as an ailment of mental and emotional debility of employees working mostly in a demanding and stressful work conditions (Maslach & Jackson, 1981). Moreover from a broader view, job burnout refers to the psychological states of employees, which have the possible or actual links with reactions when faced with stressful conditions at work (Swider & Zimmerman, 2010).

Subdimensions of Job Burnout

The existing literature about burnout relies mostly on the multidimensional theory of burnout (Maslach, 1982). According to this theory, burnout has three dimensions, which are, 'emotional exhaustion', 'depersonalization' and 'diminished personal accomplishment'.

Emotional Exhaustion

Emotional exhaustion dimension is the most observed one when compared to other sub dimensions of burnout. According to Shirom (1989), since exhaustion is the predominant phenomena, the other dimensions are needless. But according to Maslach et al. (2001), without depersonalization and diminished personal accomplishment, burnout cannot be understood as a whole concept. Emotional exhaustion

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

occurs when one feels all of his/her energy and emotional resources have come to an end (Cordes & Dougherty, 1993). In general, exhaustion refers to the stress dimension of job burnout. It consists of withdrawal from work mentally and emotionally to cope with the stress stems from the work conditions (Maslach, et al., 2001).

Depersonalization

The second dimension of burnout is named as 'depersonalization', which is the defensive coping behavior of employees with stress at work (Lee &Ashforth, 1996). With depersonalization, an individual treats people around him/her, especially clients as objects, not exactly human beings (Cordes & Dougherty, 1993). This is done by taking customers, tasks or coworkers as impersonal factors (Schaufeli & Enzmann, 1998). In this dimension employees may behave cynical towards other parties through interactions taking place between them (Maslach, et al., 2001). In such cases a depersonalized employee may behave negatively towards people or disregard individuals taking place in his/her work life. All these attempts are for the expectancy of eliminating the negative factors affecting them (Maslach & Pines, 1977).

Diminished Personal Accomplishment

The final dimension of burnout, which is, diminished personal accomplishment, is characterized by one's feeling of diminished job competence and success in the organization (Cordes & Dougherty, 1993). It can be explained in other words as an employee's losing self-trust and accepting himself/herself as a poor performer based on his/her self-evaluation (Maslach & Leiter, 2008). When an employee perceives a lack of progress in job performance or self-development at work, these entail to personal feelings of diminished accomplishment (Cordes & Dougherty, 1993; Lee & Ashforth, 1996; Maslach, et al., 2001).

Besides all of the dimensions of job burnout being separate and concrete structures, in contrast to sequential process perspectives of burnout (i.e., Golembiewski & Munzenrider, 1981), there is no precise sequence among these dimensions (Cordes & Dougherty, 1993).

Factors Causing Job Burnout

There are plenty of work-related factors which cause stress and in turn cause job burnout at workplace. Among them some have attracted more attention from scholars and examined by them. For example, increased workload that exceeds formal assignments has been investigated to cause burnout (Cordes & Dougherty, 1993). Moreover, unpleasant personal relations with coworkers and supervisors have effects on burnout, especially exhaustion (Leiter & Maslach, 1988). Similarly, increased role conflict and role ambiguity cause job burnout among employees (Schwab & Iwanicki, 1982). Moreover, distribution of resources on an unfair and subjective basis among employees, such as pay and promotion is another issue which generates burnout (Riolli & Savicki, 2006). In addition to these, personal characteristics (Bakker, Van Der Zee, Lewig & Dollard, 2006) and personal expectations (Kim, 2011) affect employees' job burnout. Sensitive employees and employees without social support feel burnout more than others. Also, employees with high expectations are more faced with burnout when they can't reach their aims.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Consequences of Job Burnout

Since the importance of burnout is evident for employees' attitudes toward their jobs and organizations, it has been quite essential to search for the possible consequences. Among these the consequences of burnout may be divided into two groups as, 'individual' and 'organizational' (Swider & Zimmerman, 2010). Among the individual outcomes of burnout exist, physical problems (i.e. stomach pain, muscle pain, and headache) and psychological problems, (i.e. minor and major depression) (Peterson, Demerouti, Bergström, Samuelsson, Åsberg & Nygren, 2008) and work-family conflict (Burke & Greenglass, 2001). On the other side, the organization related consequences may be grouped as, an increase in turnover rates of employees (Leiter & Maslach, 2009), absenteeism (Iverson, Olekalns & Erwin, 1998), a decrease in personal interactions with coworkers and clients (Maslach & Leiter, 2008) and furthermore decrease in job performance (Parker & Kulik, 1995) and organizational citizenship behavior (Chiu & Tsai, 2006) and job satisfaction (Jayaratne & Chess, 1984).

Task Performance

Beginning from 1970s until today, job performance has been handled as a multidimensional concept which consists of an employee's starting at a permanent position in the organization, meeting the standards of formal duties and exceeding formal tasks and duties by doing favorable things for the organization (Katz & Kahn, 1978). Built on this classifying understanding of job performance, Campbell (1990) generated a performance model, which breaks down it several pieces. Among these are, job-specific task proficiency, non-job specific task proficiency, written and oral communication, effort, personal discipline, promoting team and peer performance, supervision and leadership and management and administration. Based on this study, Motowidlo and Van Scooter (1994) classified job performance into three general themes. The first is the differentiation between prescribed and discretionary role behavior. The second is, cooperation and helpfulness behaviors in organizational citizenship behavior and the last one is, the differentiation between behaviors related to task proficiency and behaviors not related to task proficiency.

So based on these three themes, Borman and Motowidlo (1993) separated task performance from contextual performance. Contextual performance consists of role behaviors beyond core tasks, which are being helpful and cooperative with coworkers, following and supporting organizational rules and volunteering for extra duties. Apart from this, task performance includes behaviors, which directly relate to main duties of an organization by conducting technical processes or maintaining its technical needs (Motowidlo & Van Scooter 1994).

Hypotheses

In this research, the relationships among cultural intelligence, job burnout and task performance of expatriates are analyzed based on theoretical foundations. In this sections, both stemming from the theories and the previous work by other researchers in this field, hypotheses of the research are developed.

Firstly, according to Chen (2015), cultural intelligence was found to be related to general interaction and work adjustment of foreign workers. Moreover, cross-cultural motivation, an element of cultural intelligence, was found to have a link with expatriate work adjustment (Chen, Kirkman, Kim, Farh & Tangirala, 2010). Additionally, since cultural intelligence has positive effects on job stress of foreign

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

workers (Tay, Westman & Chia, 2008), it is expected to have positive effects to decrease job burnout of expatriates. For this reason, it is hypothesized as;

Hypothesis 1: There is a negative and significant relationship between cultural intelligence and job burnout.

Furthermore, cultural intelligence was found to predict cultural adaptation, and task performance (Ang et al., 2007) as well as performance of expatriates (Rose, Ramalu, Uli & Kumar, 2010). Since, it is evident that in order to increase task performance, an expatriate should have high cultural intelligence. So it is expected as;

Hypothesis 2: There is a positive and significant relationship between cultural intelligence and task performance.

Lastly, when an employee is engaged with job burnout, he/she is faced with many negative individual and organizational consequences. One of these outcomes is his/her performance. Since, job stress has negative effects on performance (Arsenault & Dolan, 1983; Jamal, 1984), it is also expected that burnout has the similar effects on performance. According to Bakker, Demerouti and Verbeke (2004) and Freidman (2000), burnout has negative effects on performance. Thus;

Hypothesis 3: There is a negative and significant relationship between job burnout and task performance.

SAMPLING AND PROCEDURE

In order to measure and evaluate the links between cultural intelligence, job burnout and task performance, quantitative research design was chosen in this research. In this research design, surveys were prepared in accordance with the most reliable and suitable measures in the field. As they were English in original, firstly the measures were translated into Turkish and then back into English by the help of a group of linguistic experts in the university.

The participants of the research were chosen to be expatriates working in Turkey as the host country. After a carefully scan in a wide range of sectors in Turkey, it was decided to include expatriates working in the marketing department of the multi-national companies operating in consumer goods sector due to the sufficient number of expatriates working in those companies. Mostly located in Istanbul, there were also participants from Ankara, Izmir and Adana. In sum, a total of 156 expatriates participated in this research. 58 percent of participants were male, and 42 percent, female. The majority of the group, 35 percent were between the ages 40-50 (SD=6,45).

Scales Employed

Cultural Intelligence

So as to measure cultural intelligence, the 20-item measure developed by Ang, Van Dyne, Koh, and Ng, (2004) was used. The original measure consists of four sub scales, which are metacognitive (4-items), cognitive (6-items), motivational (5-items) and behavioral (5-items) dimensions on a 7-point Likert

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

type scale. Sample items are like; 'I am conscious of the cultural knowledge I apply to cross-cultural interactions.' for metacognitive dimension, 'I know the legal and economic systems of other cultures.' for cognitive dimension, 'I enjoy interacting with people from different cultures.' for motivational dimension and lastly 'I change my non-verbal behavior when a cross-cultural situation requires it.' for behavioral dimension. The cronbach's alpha coefficients were .85 for metacognitive, .88 for cognitive, .78 for motivational and .90 for behavioral dimension of cultural intelligence.

In order to maintain validation of the cultural intelligence scale, exploratory and confirmatory factor analyses were done. Kaiser-Meyer-Olkin and Bartlett sphericity test results were, in the accepted range by Field (2000). (KMO: 0,825; X^2: 635,20 /Sd: 25) Moreover, all the factor loadings for the cultural intelligence scale were higher than 0.500 and validating a 4 components structure as, metacognitive, cognitive, motivational and behavioral. The goodness of fit indices is well in the range accepted by Hu and Bentler (1999) (χ^2/df: 2.78, GFI: .93, NNFI: .95, CFI: .97, RMSEA: .074).

Job Burnout

In order to measure job burnout, the 22-item burnout scale developed by Maslach and Jackson (1981) was used. The measure consists of three sub scales, which are exhaustion (9-item), depersonalization (5-item) and personal accomplishment (8-item) on a 7-point Likert type scale. Sample item for exhaustion sub scale is, 'I feel used up at the end of the work day.' Sample item for depersonalization is 'I feel I treat some recipients as if they were impersonal objects'. Sample item for personal accomplishment is 'I can easily create a relaxed atmosphere with my recipients'. The cronbach's alpha coefficients were .82 for exhaustion, .80 for depersonalization and .89 for personal accomplishment dimension of burnout.

After exploratory and confirmatory factor analyses it is understood that, all the factor loadings for the burnout scale were higher than 0.500 and validating a 3-components structure as, exhaustion, depersonalization and personal accomplishment. The goodness of fit indices is as; χ^2/df: 3.18, GFI: .92, NNFI: .94, CFI: .95, RMSEA: .082). So, it is understood that, this scale is both reliable and valid.

Task Performance

In this research, self-reported task performance of expatriates was measured by the 9-item sub-scale of task performance generated and validated by Goodman and Svyantek (1999) on a 7-point Likert type measure. A sample item is 'I am competent in all areas of the job and I handle tasks with proficiency.' The cronbach's alpha coefficient for this measure was calculated as .84. According to exploratory factor analysis, it was verified that task performance scale was accepted as one component with no sub-dimensions. The goodness of fit indices is as; χ^2/df: 2.68, GFI: .94, NNFI: .95, CFI: .98, RMSEA: .054.

RESEARCH FINDINGS AND DISCUSSION

With the help of the statistical package programme of IBM SPSS 20.0, analyses were conducted to reveal the links between cultural intelligence, burnout and task performance of expatriates working at the marketing departments of multinational companies in Turkey. Firstly, means and standard deviations of answers given by these expatriates were evaluated and shown at Table 1. And then, the correlations between cultural intelligence, job burnout and task performance were obtained and shown at Table 1.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Means, standard deviations, correlations and reliabilities

Variable	Mean	*SD*	1	2	3
1. Cultural Intelligence	4.02	2.08	(0.83)		
2. Job Burnout	3.65	1.52	-0.26*	(0.86)	
3. Task Performance	4.28	1.95	0.38**	-0.51**	(0.85)

*:p<0.05 **:p<0.01 ***:p<0.001

According to the results, it has been revealed that, there is a significant and negative relationship between cultural intelligence and job burnout (r= -0.26; p<0.05). Due to this, H_1 is supported. Moreover, as seen on Table 1, there is a positive and significant moderate relationship between cultural intelligence and task performance (r= 0.38; p<0.01). Accordingly, H_2 is also supported. Lastly, there is a moderate, negative and significant relationship between job burnout and task performance (r= -0.51; p<0.01). As a result, H_3 is supported, too. The results demonstrate that, expatriates of multinational companies face less burnout when they have higher cultural intelligence. This shows, cultural intelligence is a capability for overcoming culture-based stressors at work. Similarly, expatriates with higher score on cultural intelligence, tend to perform better at work. On the contrary, when they face job burnout, their task performances deteriorate due to negative consequences of burnout.

A more detailed, correlation analysis, showing the relations between sub-dimensions of the structures discussed above, can be found at Table 2.

Table 2. Correlations among sub-dimensions and reliabilities

Variable	1	2	3	4	5	6	7	8
1. Metacognitive	(0.85)							
2. Cognitive	0.42***	(0.88)						
3. Motivational	0.48***	0.21***	(0.78)					
4. Behavioral	0.37***	0.19***	0.53***	(0.90)				
5. Exhaustion	-0.61**	-0.43**	-0.39**	-0.40**	(0.82)			
6. Depersonalization	-0.38**	-0.28**	-0.42**	-0.46**	0.24**	(0.80)		
7. Personal Accomp.	0.44**	0.35**	0.33**	0.27*	-0.62**	-0.38**	(0.89)	
8. Task Performance	0.28**	0.22**	0.38**	0.32*	-0.57**	-0.41**	0.65**	(0.84)

*:p<0.05 **:p<0.01 ***:p<0.001

As seen on Table 2, there are significant and negative relationships between exhaustion sub dimension of burnout and metacognitive, cognitive, motivational and behavioral sub dimensions of cultural intelligence respectively. Among them, beginning with the exhaustion dimension, the strongest negative correlation exists between exhaustion and metacognitive intelligence (r= -0.61; p<0.01). This may occur because; metacognitive intelligence is the key for an expatriate to adapt to a new culture by generating new maps for norms and rules of the new culture. Differently, depersonalization sub dimension of burnout had the strongest negative relationship with behavioral dimension of cultural intelligence (r= -0.46;

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

$p<0.01$). It is because, when behavioral intelligence of expatriates is high, they behave like the people from the host country and host culture, which in turn enables them establish relationships with people. So this behavior is the opposite of the depersonalization and this explains the rationale behind the obtained result. Furthermore, personal accomplishment perceptions were positively related to sub dimensions of cultural intelligence. When an expatriate's cultural intelligence is high, he/she believes himself/herself more to complete tasks successfully. In addition to these, task performance of expatriates is positively related with sub dimensions of cultural intelligence. Among these the strongest correlation occurs between task performance and motivational intelligence. When expatriates have motivation to adapt to a new culture, their task performance increases most. Also, task performance is negatively related with exhaustion and depersonalization, whereas positively with personal accomplishment. When expatriates feel exhausted, depersonalize and lose confidence of accomplishment, their task performance decreases.

FUTURE RESEARCH DIRECTIONS

In this research, very rare relationships in the literature have been tried to figure out. Additionally, the research sample was chosen the expatriates in order to reveal the importance of cultural intelligence to overcome the existing cultural barriers in the host country of Turkey. In the future, the sample should be expanded to refugees and immigrants in the host countries around the world. Furthermore, to adapt to a new culture, beside cultural intelligence, linguistic intelligence should be analyzed.

Moreover, in the future cultural and linguistic intelligence should be analyzed in a way that pointing out the relationships with other types of performances like, contextual performance, creative and innovative performance.

CONCLUSION

During the whole of this chapter, so as to put forth an implication of breaking down the cultural barriers, an important tool, cultural intelligence and its correlates are analyzed. This has been done by conducting an empirical research among expatriates working at the marketing department of multinational companies operating in Turkey. Expatriates were thought to be an appropriate sample, and at the end, it has been proved they were. It is because, since they are away from their original country, they represent employees in case of facing difficulties when adapting to a new culture. In this chapter, to solve cultural difference based work problems, cultural intelligence was found to be an effective capability.

In this chapter, many critical results were introduced to the literature. According to the results obtained from the research, it has been revealed that cultural intelligence has a negative relationship with job burnout. Therefore, burnout syndromes among expatriates can be eliminated by high cultural intelligence. This is because; expatriates with high cultural intelligence feel less exhausted emotionally and less depersonalized at work. After analyzing the sub dimensions of both cultural intelligence and burnout, it has been understood that, especially metacognitive intelligence decreases emotional exhaustion more than other type of cultural intelligence dimensions. When expatriates are more capable in adapting new culture by understanding features of new culture, they feel less exhausted. Additionally, behavioral intelligence is the component, which has the biggest negative correlation with depersonalization dimension of burnout. Expatriates, who behave in an appropriate way in the host countries, for example proper

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

greeting, smiling, shaking hands, etc., are less depersonalized. And again expatriates, who have high metacognitive intelligence, are better at feelings of personal accomplishment.

When the current results are compared with the previous ones in the literature, it is observed that, Ang, et al. (2007) also found significant relationships between metacognitive (r= 0.46; p<0.01) and behavioral intelligence (r= 0.37; p<0.01) with task performance. These correlations are slightly stronger than the results obtained in this study. Present study's difference is that, Ang et al. (2007) didn't find significant correlations between cognitive and behavioral intelligence with task performance, whereas they exist in this research. On the contrary Wu and Ang (2011) found correlations akin to the ones obtained in this research. Furthermore, Lee and Sukoco (2010) found that cultural intelligence needed to be mediated by cultural adjustment and cultural effectiveness in order to affect performance of expatriates. Besides, Bakker, Demerouti and Verbeke (2004) found similar but slighter correlations with burnout and task performance.

To sum up, in today's global world, each day, thousands of employees are sent from origin countries to host countries, facing cultural and linguistic barriers. Throughout this chapter, it is emphasized that these barriers may lead to burnout and expatriates should use their cultural intelligence to overcome both burnout and cultural barriers.

KEY TERMS AND DEFINITIONS

Cultural Intelligence: The capability of understanding and interpreting cultural differences in order to adapt to a new culture.

Depersonalization: Behaving cynical and taking individuals around impersonal and acting like they are not exactly human beings.

Exhaustion: Feeling of lost energy and physical and psychological resources due to stress.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Expatriate: Employees who live and work at host countries, generally for a time period between two and seven years.

Job Burnout: Losing mental and emotional debility to perform well, due to stressors faced at work.

Task Performance: A type of job performance that relates to completing tasks and duties written in the formal job description.

Chapter 44
Relationships Between Mental Workload, Burnout, and Job Performance:
A Research Among Academicians

ABSTRACT

Mental workload is a popular topic for ergonomics, psychology, and organizational behavior-related studies. Difficulties and differences in defining and measurement of mental workload engage the attention of scholars to the concept. Furthermore, the importance of mental workload on performance and burn out increases attention to the topic for empirical studies. In this chapter, the authors reveal the relations between mental workload, burnout, and job performance. Data were obtained from 144 academicians in Turkey. Results demonstrated that mental workload has a 1) positive impact on burn out and 2) negative impact on job performance of academicians. Moreover, it was found that burn out and job performance are negatively correlated. Finally, findings reported that there are differences among some demographic variables in accordance with mental workload, burn out, and job performance.

INTRODUCTION

At the present time, the business work environment is becoming more volatile and competitive. The development of information technologies, rapid changes in organizational structures, changeable customer attitudes are more important for today's organizations. These features of the marketplace direct organizations to be in search of new methods to achieve and maintain sustainable performance. Leadership, employee's favorable work behaviors, technological investments are some of the interesting methods to provide continuity of the organization's existence. Moreover, today's work atmosphere is shaped with several elements of organizational behavior. These elements such as job satisfaction, organizational culture, organizational commitment, empowerment, organizational trust etc. have strong or weak relationships with each other. Furthermore, according to the results of studies in the literature these elements have positive effects on job performance or organizational performance (Akyol, 2014; Campbell et al., 1990; Kirkman & Rosen, 1999; Robbins & Judge, 2011; Spector, 1997; Viswesvaran & Ones, 2000). On the other hand, there exist some elements such as high mental workload, job stress or burnout that result with negative impact on organizational outcomes as productivity loss, reduced performance or lower organizational commitment.

In the last four decades, assessment of the mental workload also takes place in academic studies related with organizational behavior, occupational psychology and ergonomics (Wickens, 2017). Moreover, workload is considered as a major determinant for physical and psychological symptoms (stress, anxiety, sleep problems) occurrence in human's life that catches the scholars' attention to the concept.

In the literature, most part of the workload related empirical studies have been implemented in aviation, transportation, automation related samples (Demerouti et al., 2019; Keser & Yılmaz, 2014; Lee et al., 2015). In this study it is aimed to analyze high-education employees' mental workload, burnout and performance relations to fill the gap about academicians related studies based on mental workload.

It is well known that being an academician needs to show cognitive effort and attention in the work environment (Borghini et al, 2014). Academicians have a multitasking work structure. In addition to teaching courses in their professional areas, they have the duty of conducting academic researches and making the result of these researches useful publications. They also take on administrative duties in various positions in university. For research purposes academicians need to make long hours of search and reading. Moreover, they have to maintain a balance not only between all tasks but also work and life. Therefore, an academician's mental workload issue and circumstances of this subject are worth to investigate. For this reason, in this book chapter it is targeted to measure mental workload level of academicians. It is also aimed to investigate the differences of mental workload, burn out and performance accordance to the demographic groups. In the first part, workload, burnout and job performance were identified detailed. Moreover, studies in the literature related to these variables were summarized. In addition to these, academicians related studies were also evaluated reference to the literature. Then, research model, hypothesis and aims of the study were mentioned. Finally, findings were discussed with the perspective of similar results in the literature.

BACKGROUND

Mental Workload

Mental workload concept goes back to the Cognitive Load Theory (Sweller, Merrienboer &Paas, 1998) that deals with the relations between human mind and its limitations (Wickens, 2008). Accordance to the theory, if human is overloaded or low loaded, learning new things or performing tasks are influenced negatively (Longo, 2018). In this context, Hart (2006) identified mental workload as the adaptation and interaction between work requirements and employee's perception, talents, abilities and emotions. For this reason, if two person perform the same tasks but the outputs are different, mental workload may be evaluated one of the reason of performance deficit (Vidulich & Tsang,2012). On the other side, amount of the information while performing a task is also related to mental workload. Furthermore, information memory capabilities may influence the balance between task demands and cognitive resources (Parasuraman, Sheridan & Wickens, 2008). Comparably, O'Donnel and Eggemeier (1986) stated that mental workload is a portion of employee's limited mental capacity which is required for balancing tasks' supply and demand. Colle and Reid (1999) also defined that mental workload is considered as the average level of mental work. Otherwise, when job demand is covered with time pressure and task complexity, perception of the workload increases (Young et al, 2015). In a such case, mental workload related strains like stress generally impact human behaviors (Schlegel, 1993).

In literature, Spector (1997) classified workload in two general aspects as: qualitative workload and quantitative workload. Qualitative workload is related with difficulty of tasks in physical and mental perspective. Qualitative workload related time pressure, precipitance and multi tasks cause stress and burnout that impact human's life negatively (Schmoldt et al,1994). Otherwise, quantitative workload also defines as the amount of completed tasks by employees (Che et al,2017). On the other hand, Vidulich and Tsang (2012) expressed that mental workload is comprised of exogenous task demands and endogenous supplies of resources. Task priority, task difficulty, situational contingencies are classified under exogenous task demands while updating, perceiving memory, decision making, planning and processing is related with endogenous factors (Vidulich&Tsang, 2012). Moreover, workload is evaluated as a cumulative result of different demands for the job. Therefore, it is hard to identify it shortly (Cain, 2007). In addition to these explanations, mental workload is connected with three main dimensions as: characteristics of the tasks, employee's skills and abilities and environmental features of the workplace and the organization (Young et al., 2015). Cognitive demands for doing tasks also trigger mental workload perception of employees. In this context, mental workload is considered with the complexity of the tasks that are required to perform for daily activities (Young et al., 2015). Furthermore, Vidulich and Tsang (2012) described workload as an interaction between employee's capacity and task requirements. Deviations between structure of the required tasks and human's capabilities affect the occurrence of the workload. In such a case, if there is not a balance between task demands and employee capacity, mental workload comes to exist.

Finally, Longo (2018) defined that cognitive load is generally preferred to measure human's mental workload. Besides, mental workload assessment is important in today's human-machine interacted work environment to provide effectiveness. (Ortiz-Solis et al,2018). For this reason, human factor is an important issue for the betterment of work's sustainability (Soto et al, 2016). In this context, mental workload needs to be evaluated in some periods to prevent unexpected job outcomes for minimizing risk factors. Longo (2018) also stated that mental workload can be measured in three types as: self-assessment measures

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(subjective ratings-self reports), task performance measures and physiological measures. It is often uses self-report measures to assess perception about workload of employees. Moreover, Longo (2018) pointed out that subjective measures are easy to obtain and analyze data's for evaluating mental workload. For these reasons, in this chapter it was also used subjective ratings to measure mental workload.

Understanding the Burnout

Burnout is one of the most important concept of employee perception related studies. Burnout was firstly mentioned in organizational behavior literature by Freudenberger (1974) and Maslach (1976). According to the scholars, main characteristics of burnout are listed as an overwhelming exhaustion; feelings of frustration, anger, and cynicism; and a sense of ineffectiveness and failure (Maslach & Goldberg, 1998). Besides, burnout is generally defined as a state of physical, emotional and mental exhaustion that contains loss of energy, idealism, perspective and purpose, and causes constant stress, hopelessness, helplessness and trapped situation (Pines & Aronson, 1988).

Maslach and Jackson (1981) explained the burnout syndrome in three stages as; emotional exhaustion, depersonalization and reduced personal accomplishment. First one is defined as increased feelings of emotional exhaustion such as emotional resources of person are depleted. Sometimes, work overload or personal conflicts at work may cause such results. This component is basic stress dimension of burnout. Then, negative and cynical attitudes and feelings are developed to other people in contact. This situation is also called interpersonal dimension of burnout and often includes loss of idealism. Last aspect is feeling unhappy and dissatisfied about the job accomplishments and contains inability to cope with demands of job. This situation represents the self-evaluation dimension of burnout (Maslach & Goldberg, 1998). In summary, the principal dimensions of job burnout are listed as: stress component (emotional exhaustion), interpersonal relations (depersonalization), and self-evaluation (personal accomplishment) (Kim, Shin, & Umbreit, 2007).

According to Demerouti and colleagues (2002) burnout may be found in any occupational context and seen both within and outside the human services. Early theories of burnout focused mainly on work-related factors; however recent researchers explain that environmental and individual factors also have an effect on burn out syndrome (Çiçek Sağlam, 2011; Demerouti et al., 2019; Gezer et al., 2009; Kim et al., 2007; Maslach&Goldberg, 1998).

Burnout often occurs as a consequence of a complicated interaction between individual characteristics and factors in the work environment (Kokkinos, 2007). Some existing studies reveal out that causes of burnout with a focus on the work environment implying role stressors, organizational structures, and job characteristics (Kim et al., 2007). It also seems important to take into account individual characteristics in analyzing the relationships between burnout and job performance (Lazaro, Shinn, & Robinson, 1984). In other words, what is stressful for one may not be stressful for another (Kim et al., 2007).

Burnout syndrome has different outcomes than short-term effects of strain. Mainly, burnout develops after repeated, prolonged and unsuccessful confrontations of undesirable working conditions (Demerouti vd., 2002). According to Karabay, Tezergil and Köse (2014) initiators of burnout syndrome among people are mainly work related stress factors. These factors trigger the existence of burnout situations at work and then create damaging circumstances. Besides, burn out related these factors also influence performance of employees at work and result with low productivity.

Job Performance

Performance is considered as a concept that is fulfilled in the direction of completing the task and accomplishing the purpose in a way to meet the pre-determined criteria within the framework of the task (Pugh, 1991). Employee's job performance is generally defined as an effort of individual that serves for organizational performance (Akyol, 2014). According to Campbell and colleagues (1990), efforts contribute organizational goals through the appraisal of an employee's performance on job-related attitudes and outcomes in comparison with her/his colleagues. In today's business environment, organizations need highly performing employees: i) to achieve their goals ii) to sustain daily activities, iii) to have a competitive advantage (Sonnentag & Frese, 2002). In this context, job performance is evaluated as a key factor for researchers as well as for organizations, managers and employees. In order for organizations to get their corporate goals and gain competitive advantage (Soto et al, 2018) in the industry they are in, they need high performance employees (Realyvásquez et al,2015). High business performance is also important for employees as well as for organizations. Completing their duties as required and show high success in their work, as a source of pride, skill and satisfaction for employees; is the basic condition of many work results that are important for individuals such as job performance, higher income, better career and social reputation (Sonnentag & Frese, 2002).

In competitive working environment, individuals have a big portion in the success of organizations. In some cases, if employees succeed in achieving success through effective and efficient work, rewarding them may be necessary to ensure continuity of performance. On the other hand, it is important to motivate employees who do not have the same performance as their colleagues (Erdoğan, 2011).

According to Borman and Motowidlo (1993), there are two main components of business performance which are called as task performance and contextual performance. The task performance deals with the main technical processes or on going activities in a company. For example; production operations, delivery operations of finished goods, material supplying, and relationships with subordinates or service operations. On the other side, contextual performance includes behaviors that develop and contribute organizational culture and climate which affect employees who carry out daily activities in company. It includes trust building, calming hostility and conflict situations (Bang & Reio, 2017).

Shortly, performance is a concept about achieving tasks and responsibilities that contribute to the manufacture or service production or management duties. As a multidimensional concept, employee performance includes both accomplishment of task and positive organizational citizenship behavior that contains avoiding counterproductive behaviors for a good performance outcome (Robbins & Judge, 2011; Viswesvaran & Ones, 2000).

In addition to the upper explanations, job performance is considered as one of the most important organizational outcome incorporated with burnout concept (Brandes et al., 2008; Wright & Cropanzano, 1998). In literature, there are some researches which investigate the impact of burnout on performance. Actually, results of burnout have serious impacts on organizational performance. Reference to the literature, burnout causes higher turnover and absenteeism, diminished organizational commitment, health problems, poor quality etc (Gandi et al., 2011; Kar&Suar, 2014; Keratepe&Uludağ, 2008; Lazaro et al., 1984; Liu&Lo, 2018). Some job characteristics also trigger burnout syndrome such as workload, time pressure, lack of support and control, autonomy (Keser & Yılmaz, 2014). Wright and Bonett (1997) also found that emotional exhaustion leads to subsequent poor performance. According to Maslach and Jackson (1981), as a consequence of burnout syndrome, a person feels himself unhappy and unsatisfied due to the his/her job accomplishment.

Studies About Mental Workload, Burnout and Job Performance

Mental workload get attention for being a significant occupational risk factor in the workplace that leads to loss of performance, productivity, welfare and well-being (Keser&Yılmaz, 2014; Liu&Lo, 2018). Moreover, high workload negatively impacts job satisfaction that causes burnout, health problems and intention to quit (Rubio-Valdehita et al,2017). Hancock and Caird (1993) also emphasized that mental workload is an indicator of job performance. However, he noticed that performance failure also may rises up the perception of the workload. On the other side, it was expressed that mental workload is connected with mental fatigue (Demerouti et al., 2002). Overload and fatigue speed up to make errors and failures in the job (Brookhuis & de Waar, 2010). Moreover, it is often believed that when mental workload increases, control variability and errors pick up but individual performance tends to decrease (Huey and Wickens, 1993). Especially, when time pressure merges with capacity problems, variations in the performance enhances (Wickens, 2017). All in all, when mental workload is one of the important elements of employee performance.

Studies About Burnout, Personal Characteristics and Job Performance

In recent years, researchers pay attention to antecedents and consequences of burnout syndrome. Numerous studies have been made during the past decades. Regarding burnout there are studies focused on different populations such as doctors (Turgut et al., 2016), nurses (Gandi et al., 2011) and other health staff (Portoghese et al., 2014; Yıldırım & İçerli, 2010), hotel staff (Keratepe & Uludag, 2008; Kim vd., 2007), insurance company employees (Schaufeli & Bakker, 2004), call-center employees (Keser & Yılmaz, 2014), teachers (Çapri, 2006; İnce & Şahin, 2015; Kokkinos, 2007) academicians (Ardıç, 2008; Çavuş, Gök, & Kurtay, 2007; Gezer, Yenel, & Şahan, 2009; Toker, 2011) and students (Schaufeli et al.; Tümkaya, Çam, & Çavuşoğlu, 2009).

In early studies, Lazaro and colleagues (1984), investigated the relationship of burnout and job performance. Moreover, scholars also worked on individual characteristics in a sample of child care workers in residential programs for youths. According to the findings, burnout was associated with job performance; however individual characteristics were unrelated to most of the indicators of burnout and job performance. Keratepe and Uludağ (2008) also analysed the effect of burnout on job performance. Results showed that only reduced personal accomplishment has a significant negative effect on job performance.

Kokkinos (2007), analyzed the relationships between burnout, personality characteristics and job stressors in primary school teachers and revealed out that relative contribution of these variables on the three dimensions of burnout – emotional exhaustion, depersonalization and reduced personal accomplishment. Furthermore, Turgut and colleagues (2016) searched for correlation between burnout and years of residency among residents. Scholars reported that burnout syndrome is a common problem during residency period and there are significant relationships between some dimensions of burnout and years of residency.

Lee, An and Noh (2015) made a research among 230 flight attendants of a global airline company in South Korea. Scholars aimed to find out the impacts of emotional display rules on the emotional labor strategies, burnout and work performance. They suggested important outcomes to improve performance and reduce burnout. Another study was performed with airline pilots to investigate work characteristics

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and outcomes which are related to burnout of this occupation. First of all, scholars pointed out that high amount of pilots (%40) were suffering from burnout syndrome that effects negatively pilots' happiness with life. Scholars also highlighted the significance of psychosocial factors in the existence of the burnout syndrome (Demerouti, Veldhuis, Coombes, & Hunter, 2019).

Furthermore, Mo and Shi (2017) performed a research in a pharmaceutical retail chain company. Their study was consisted of 45 team leaders and 247 employees to measure the impact of ethical leadership on employee burnout, deviant behavior and task performance. As a result, researchers found significantly positive relationships between ethical leadership and employee burnout, deviant behavior and task performance. Moreover, Virgolino, Coelho and Ribeiro (2017) analyzed the impact of burnout syndrome on the employee's individual performance with using survey method to obtain data from 407 employees. Interestingly, the first two dimensions of burnout as emotional exhaustion and depersonalization on individual performance were not significant. On the other hand, there was a negative relationship between the reduced personal accomplishment and individual performance. Findings of the study indicated that when reduced personal accomplishment increases, individual performance also decreases.

Nevertheless, burnout and performance relationship with career path gap was investigated in another study with the participation of 210 employees from four different technology companies. According to results, burnout level was the lowest degree when employee experiences career path fit. However, performance level was also the lowest degree among employees who were currently on the technical career path but would prefer the managerial path (Biron & Eshed, 2017).

Studies Among Academicians and Students Regarding Academic Burnout

In literature, there are plenty of researches from different populations regarding burnout syndrome. Different sectors with various reasons create stress, emotional fluctuations and depression on employees. Therefore, researchers aim to introduce burnout concept and its relationship with other organizational behavior elements or company specific outcomes from different point of view. One of these areas is academic population. There are many papers discussing burnout of academicians as calling the subjects as "academic burnout". On the other hand, "academic burnout" is searched among students ranging from college to postgraduate degree. This section refers to some of mentioned studies.

Academicians have multi-tasks in the workplace that sometimes lead to workload. Course preparation, article writing, consultation of students, international coordination about cooperation, committee tasks, teaching, administrative duties, invigilation are some of academicians' daily works in the workplace (Mustapha, 2013; Porter &Umbach,2000). Rahayu and colleagues (2012) also pointed out that lecturers' tasks are comprised of education, teaching, consultation, mentoring and academic working. For this reason, it was emphasized that mental intensity and workload is generally observed because of the job's nature. In addition to these duties, in some countries as Turkey, period of courses for one lecturer is on the average of standard values. As a result when course period increases load of academician tends to pick up. Moreover, student number for one academician is also high in Turkey. Consultancy duties have also major role on overloading of academicians. And finally, administrative jobs related faculties impact academicians workload. Lack of administrative staff play a significant role in this situation. There is a common problem in Turkey about employment policies and appointments in administrative staff. For this reason, it is assumed that mental workload of academicians in Turkey is high. In this context, in this study it is focused on academicians and mental workload related literature is summarized below.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Ardıç (2008), aimed i) to determine burnout levels of academic staff at Gaziosmanpaşa University in Turkey and ii) to reveal out the relationship between burnout levels and some variables. In the study with the participation of 202 academicians, some personal characteristics and their impact on burnout were analyzed. Moreover, in the light of the data obtained from the research, it was tried to offer solution suggestions to prevent burnout of academic staff. Iraz and Ganiyusufoğlu (2011) also conducted a study with 151 academicians to examine perceptions of burnout sub-dimensions in terms of gender, age, marital status, seniority and title. Similar studies were performed to determine whether burnout levels of academic staff differ according to some socio-demographic variables (Budak & Sürgevil, 2005; Çiçek Sağlam, 2011; Gezer et al., 2009; Toker, 2011). Interestingly, emotional exhaustion score of the teaching staff varied significantly by geographic region. On the other hand, personal achievement scores differed significantly in terms of age, administrative task, academic level and geographical region. There was no significant difference between the depersonalization scores and the personal and professional characteristics of the lecturers (Gezer et al., 2009). The results showed that research assistants had higher scores on emotional exhaustion than professors. Besides, research assistants had higher levels of desensitization than associate professors and lower personal performance scores than other academicians. However, marital status and age of demographic variables had a significant relationship with occupational burnout, gender did not have a significant relationship with burnout (Toker, 2011).

Naktiyok and Kaygın (2012) investigated the relationships between workaholism and physical, mental and emotional exhaustion. The findings showed that the rise in the level of occupational activity also increases mental, physical and emotional exhaustion. Researchers also performed another study to determine the levels of burnout and job satisfaction of academic staff. They found negative relationship between burnout and job satisfaction (Naktiyok & Kaygın, 2012). In another study, the burnout levels of the academic staff working in the vocational schools were examined according to some variables by Çavuş and colleagues (2007). Emotional exhaustion and depersonalization scores of the academic staff were low and the personal success score was high. Reference to the results of the study, significant relationships were found between emotional exhaustion and some organizational behavior elements as; administrative task, total course load, job satisfaction and between personal achievement and satisfaction from work. Furthermore, burnout and performance relationship was examined with master students as naming the concepts academic burnout and academic performance. Data from 361 students were analyzed and researchers found significant and negative relationships of emotional exhaustion and depersonalization with student's academic performance. Reference to the findings, when burnout of students increases then learning and performance degree tends to decrease (Rana, 2016). Similar studies realized among students by scholars (Kutsal & Bilge, 2012; Nikodijević, Labrović, & Đoković, 2012; Rostami, et al., 2013). Scholars pointed out that high expectations from students cause stress and burnout and resulted with less concentration, decreased attention and low grade levels.

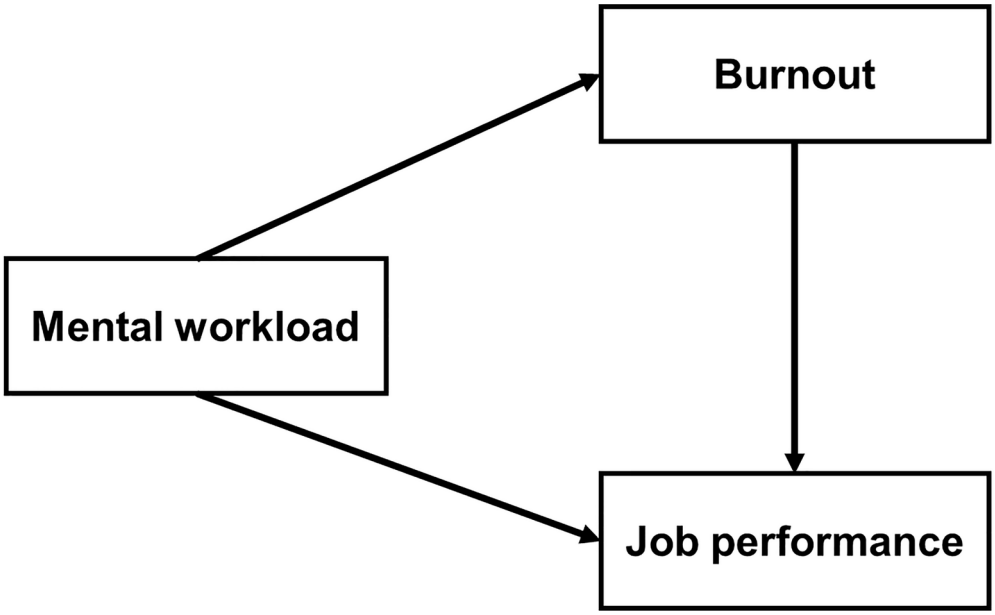
METHODOLOGY

Gopher and Donchin (1986) noticed that there is not a unique and universal method for measurement of workload. Wierwille and Casali (1983) also explained that if workload is not able to measure easily, it should be focused on its impact on individual's behaviors and psychological strains. Therefore, evaluation of mental workload of academicians is preferred to measure with individual outcomes.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Reference to the summarized studies in the first part, research model and methodology designed in detail to find out the relationship between mental workload, burnout and job performance of academicians. Shortly, in this book chapter it is aimed to explain these relationships between variables. For this purpose, research model of study is shown below in Figure 1.

Figure 1. Research model



The sample of this study is comprised of academicians in Turkey, city of Edirne. Respondents of sample comes exist from Trakya University's academicians. Trakya University was established as a state university in the northwest of Turkey and has a growing profile as a regional leader in the Balkans in higher education, research and technology. It has a multitasking structure with different disciplines and there are 12 faculties, 5 institutes, 6 collages and 10 vocational schools, 30 research and application centers. There exist almost 1700 academicians from various branches. Therefore, Trakya University offers an opportunity with its academic staff diversification in order to research about mental workload, burnout and job performance. It was also preferred to use convenience sampling method for the study and the questionnaires sent to public university academician. Ease of distribution and collection of questionnaires, cost and schedule advantage impact to choose of this public university for the empirical study. Population of this research becomes from academicians who are research assistant, lecturer and faculty members, which are assistant professor, associated professor or professor. Academician numbers were obtained from university web-site and activity report. It was stated that there was 1804 academician in the university by May 2019. According to the sample size formulation (Mendenhall, Sincich& Boundreau, 1996) with error margin 0.10 it was calculated that 96 questionnaires is suitable for the study. Error margin preferred as 0.10 due to the academicians sometimes may not intended to participate about work related studies. Because they have some hesitations that questionnaire answers may be analyzed by

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

managers. 250 questionnaires distributed to the faculties in line with the ratio of academicians in each department. Finally, it was obtained 144 valid questionnaires to use in statistical analyses.

Survey items for each variable derived from literature. In this book chapter, it was used CarMen-Q Questionaire (Rubio-Valdehita et al., 2017) to measure perception of mental workload cognitive demands with 10 items. Moreover, Maslach Burnout Scale (Maslach & Jackson, 1981) was preferred to measure emotional exhaustion with 9 items. Finally, Employee Performance Scale (Kirkman & Rosen, 1999) was used to assess job performance with 7 items. All items within the survey were scored on a 5-point Likert scale with an agree/disagree continuum (1= strongly disagree, 2= disagree, 3= neither agree nor disagree, 4= agree, 5= strongly agree). Survey also had some demographical items such as gender, age, job experience and academic position of respondents.

Reference to the literature and research model hypotheses of this study are listed below as;

H1: Mental workload (cognitive demands) has a significant impact on burnout (emotional exhaustion).
H2: Mental workload (cognitive demands) has a significant impact on job performance.
H3: Burnout (emotional exhaustion) has a significant impact on job performance.

Data gathered from 144 academicians were analyzed with IBM SPSS 21.00 Statistical Program. First part of survey includes some descriptive information of respondents. According to the descriptive analyses, information about respondents is shown in Table 1 below.

Table 1. Descriptive information

Descriptive information	Frequency	Percent (%)
Gender		
Female	64	44,4
Male	80	55,6
Age		
26-35	62	43,1
36-45	52	36,1
>45	30	20,8
Total job experience		
<3 years	8	5,6
3-5 years	12	8,3
6-8 years	28	19,4
9-11 years	30	20,8

Second, third and fourth parts of survey have mental workload, burnout and job performance items respectively. For each variable, validity and reliability analyses were made. Moreover, construct validity of scales was tested with Factor Analyses. Findings reported that all scales have good Kaiser-Meyer-Olkin and Bartlett values that show sample size is suitable and statistically significant for Factor Analyses. Thereby, mental workload scale explained %64.842 of total variance. No items were deleted and in total 10 items presented the scale. Cronbach's alpha value of scale was 0.937. Burnout scale also explained %65.99 of total variance with 9 items in total. According to reliability analysis Cronbach's alpha value was found as 0.930. Job performance scale explained %76.295 of total variance with 7 items. Cronbach's alpha value was obtained as 0.746 of this scale.

When the average values of each variable in the research model were examined, the average value of the mental workload variable was obtained as 4.1444. In addition to this, the average value of the burnout variable was calculated as 2.4630 and the average value of the job performance variable was achieved as 3.9325. Reference to the findings, it is observed that academicians' mental workload and job performance values are around 4.00 and burnout level is under the average value of 3.00.

In the next step, the relationships between variables were examined. The relationships between variables in the study were investigated by Pearson Correlation Analyses. Findings showed that there is a poor and positive correlation between mental workload and burnout while there is a poor and negative correlation between mental workload and job performance. On the other hand, there is a medium-level and negative correlation between burnout and job performance. It is important to note that all correlation values were statistically significant.

Table 2. Results of Pearson correlation analysis

	Mental workload	Burnout	Job performance
Mental workload	1	0,242**	-0,195*
Burnout		1	-0,381**
Job performance			1

**Correlation is significant at the 0,01 level (2-tailed)

*Correlation is significant at the 0,05 level (2-tailed)

In order to test first hypothesis "Mental workload (cognitive demands) has a significant impact on burnout (emotional exhaustion)" regression analysis was performed. According to the results of regression analysis, the effect of mental workload on burnout was found statistically significant. ($p = 0,003<0,05$). Moreover, it was obtained that just % 5.2 of the change in burnout levels of academicians was explained by mental workload. Moreover, positive impact coefficient was similar with correlation coefficient (Beta) as 0.242. In accordance with the findings, H_1 hypothesis was accepted.

Reference to the regression analysis to test the second hypothesis, the effect of mental workload on job performance was found statistically significant ($p=0,019<0,05$). Accordingly, the hypothesis "Mental workload (cognitive demands) has a significant impact on job performance" was accepted. Moreover, negative impact coefficient is similar with correlation coefficient (Beta) as -0.195.

According to regression analysis that performed for the third hypothesis "Burnout (emotional exhaustion) has a significant impact on job performance" and burnout explained %13.9 of the change in job

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

performance level (p=0,000<0,005). Besides, negative impact coefficient was similar with correlation coefficient (Beta) as – 0,381. By this, H_3 hypothesis was also accepted.

It was also used Independent T-Tests and One Way Analysis of Variance Tests (Anova) to find out any difference on research variables for gender, age, academic rank, total job experience and current job experience. According to the findings, there was no significant difference for gender on mental workload, burnout and job performance variable. Secondly, Anova analysis for age groups of academicians was made. There was also no significant difference for age groups on research variables. Third control variable was the academic rank of respondents for difference analysis. Academic rank referred to the academic degree of university staff and includes research assistant, lecturer, assistant professor, associated professor and professor (p<0,05). For burnout, there was difference between associate professor and professor and burnout level of professor was more than associate professor (Burnout; Aveasso. prof.=2,0833, Aveprof.=3,1556). Also for job performance it was found several statistically significant differences (p<0,05). There was difference between assistant professor and other groups and the average value of assistant professor was more than other groups (JobPerformance; Aveasst.prof.=4,1905, Averes.ast.=3,6714, Aveprof.=3,3714). Furthermore, current workplace experience was also asked to the respondents. For this control variable there was no statistically significant difference for both mental workload and burnout (p>0,05), on the other hand, for job performance there was difference between <3 years with 3-5 years and 6-8 years' groups; between >11 years' group with 3-5 years and 6-8 years' groups (p<0,05). Average values of <3 years and >11 years' groups were less than mentioned groups (JobPerformance.; Ave<3=3,6746, Ave3-5=4,2653, Ave6-8= 4,0982, Ave>11=3,6476).

Another and last control variable was the total job experience of academicians. For mental workload variable there was significant difference between <3 years and the other groups (3-5 years, 6-8 years, 9-11 years and >11 years groups; p<0,05). Average value of <3 years group was found less than the other groups (MentalWL.; Ave<3=2,6750, Ave3-5=3,9667, Ave6-8=4,0573, Ave9-11=4,3133, Ave>11=4,3152). For burnout, <3 years' group had significant difference with other groups (3-5 years, 6-8 years' groups; p<0,05) and average value of <3 years' group was less than these groups (Burnout; Ave<3=1,4444, Ave3-5=3,0370, Ave6-8=3,0238). Also difference was found between 6-8 years and >11 years' group (p<0,05; (Burnout; Ave6-8=3,0238, Ave>11=2,2727). Lastly, for job performance there were differences between groups of <3 years and the other groups (9-11 years and >11 years' groups; p<0,05). Average value of <3 tears group is less than other two groups (Job Perf.; Ave<3=3,2143, Ave9-11=4,1429, Ave>11=3,9870).

FUTURE RESEARCH DIRECTIONS

In this chapter, it was aimed to demonstrate the relationships between perceived mental workload and i) burn out and ii) job performance. Moreover, it was tested the relationship between burnout and job performance. It was also mentioned about differences among demographic variables accordance with mental workload, burnout and job performance. In future researches, it is advised to use other sampling methods and comprehensive sample size. Besides, in coming studies testing relations with stepwise regression analysis will explain better results.

As this study was performed among academicians, in order to generalize results of this study for the other organizations, same study should be made in the future as including respondents from different industries. Moreover, it will be beneficial to repeat this research for other organizational behavior subjects.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Limitations

Selection of only one university is one of the main limitation of this study. Besides, convenience sampling method may be sometimes considered as a limitation. Sample size is also required to rise up in next studies.

Practical Implications

According to findings, it was revealed out that mental workload has a positive and significant impact on burnout (β=0,242) while has negative and significant impact on job performance (β= -0,195). Furthermore, it was found that burnout also affect job performance negatively (β= -0,381). Results demonstrate that H_1, H_2 and H_3 were accepted.

Moreover, it was deduced that there is not a significant differences between age and gender groups in the basic workload, burnout and job performance. Likewise, it was seen that burnout level rise up with the increase of academic rank. Assistant professors' job performance is also higher than other groups. Besides, it was revealed out that increase of job experience raise the mental workload of academicians. Finally, it was found that academicians who have less than 3 years of experience have less burnout and job performance than other groups. Reference to the upper findings, it is important to emphasize some issues about academicians in Turkey.

Generally, raise of academic rank triggers the administrative duties of academicians. Moreover, collateral duties increase with the experience and rise of academic title. In addition to that, consultancy for firms or coordinator roles in projects affect perception of workload of academicians. It is also significant to point out that academicians sometimes need to have duties as mentioned previous explanations to have extra incomes. Academician salary level is low in Turkey than other countries. For this reason, extra loads (teaching in private universities, special courses, weekend jobs, consultancy etc.) may trigger the perception of workload. Furthermore, competition in the academic life also have a major role on working of academicians. Besides, staff policies and condensation in universities also impress academicians. On the other side, new regulations for being an associate professor force assistant professors to study harder. Due to the things have changed for being an associate professor, assistant professors need to work intensively that may impress physical and mental workload. Therefore, it is estimated that performance of assistant professors may have higher than other groups.

CONCLUSION

Mental workload, burnout and job performance are main topics of this study and our research area. Literature on these subjects is quite fruitful and presents lots of research results. There are plenty of researches that investigate separately or together of some combinations of workload, burnout or job performance (as work outcomes, innovation performance, efficiency etc.). Specially, mental workload subject is a developing concept in social sciences. Moreover, these studies are lack of analysis about control variables such as age, gender, job experience, academic positions or university status.

Consequently, this study examined the relationships between mental workload, burnout and job performance. Accordance to the findings, statistically significant relationships were found between the related variables. Moreover, the impact of mental workload on burnout and also burnout's effect on

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

job performance was confirmed. Besides, the results showed that mental workload has an effect on job performance. In this respect, all hypotheses of the study were accepted.

Findings of this study was found similar to the results of other studies. Naktiyok and Karabey (2005) reported that the rising of workaholic level increases mental, physical and emotional burnout. Liu and Lo (2018) confirmed relationship between workload and job burnout. Scholars also analyzed relationships of job burnout with job satisfaction and turnover intention which effects job performance. It was obtained that job burnout has negative correlation with job satisfaction and positive correlation with turnover intention. On the other side, Demerouti and colleagues (2002), examined short-term consequences of mental strain and burnout relationship. In their study, mental strain consists of mental fatigue, stress sensation, satiation and monotony. Moreover, scholars classified burnout as exhaustion and disengagement dimensions. They found that each burnout dimension was related to short-term consequences of mental strain. Similarly, Portoghese and colleagues (2014) found positive interactions between workload and exhaustion.

According to Maslach and Jackson (1981) and Arabacı (2010), if employees display symptoms of burnout, they reduce motivation for work and they stop making an effort altogether, hence decreasing their feelings of job competence and productivity (Kar & Suar, 2014; Siu, Cooper, & Phillips, 2014). Ahsan and colleagues (2009) also found that workload pressure, role ambiguity, performance pressure are related with academicians' job stress and dissatisfaction. Kamel (2009) stated that role overload of academicians leads job stress in the workplace. Furthermore, Panatik and colleagues (2012) revealed out that job demand of academicians positively related with turnover intention. Mustapha (2013) also expressed that huge job demands can lead academicians to burn out and intention to quit. Nevertheless, Mustapha (2013) found that there is a negative relationship between workload and job satisfaction of academicians. Besides, Shahzad and colleagues (2010) obtained that there is a negative relationship between workload and job satisfaction on lecturers. In another study with the participation of 294 employees it was found that burnout is related with mental strain. It was also reported that exhaustion is positively related with fatigue (Demeroutie et al, 2002).Finally, Rahayu and colleagues (2012) stated that mental components related health problems impact individual's performance. Otherwise, it was stated that to increase work performance and teaching abilities it is required to provide good workplace conditions and social support that lead better well-being of academicians.

Moreover, it seems valuable to control for individual characteristics in analyzing the relationships of burnout and job performance (Lazaro vd., 1984). Another result of the study is related to demographic variables. Possible differences in research variables were investigated in terms of gender, age group, work experience and academic titles. It was found no significant difference between male and female academicians and also among age groups for three research variables. Also Toker (2011) implied that gender did not have a significant impact on burnout. However, regarding academic degree, there were statistically significant differences for burnout and job performance. Also, for job performance variable according to current and total workplace experience groups, it was found significant differences. Khan and colleagues (2015) also obtained that young academicians had the highest burnout level. Moreover, it was stated that they found some differences about burnout based on age and experience groups of academicians however they could not find any significant difference based on gender and marital status about burnout.

Finally, it is advised that; workload related regulations need to be revised. Academicians' working conditions and income levels are also required to regulate detailed. Moreover, job related loads should

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

be distributed to the academicians more balanced. Academicians also should be supported with stress, time management related workshops to minimize individual conflicts.

Chapter 45
Defective Decision Making:
Beginning Teacher Early Burnout From Catastrophic Career Choices

Unoma B. Comer
National University, USA

Suki Stone
National University, USA

ABSTRACT

Teacher burnout as the result of poor career choice and decision making plagues new teachers in the field of education, as well as special education. This chapter introduces theories of moral development and self-efficacy that explain the thought processes of teachers whose expectations in the field do not match the reality of teacher practice. Therefore, their decision making to enter the field contributes to early teacher burnout. Three case studies are described as examples to understand how the psychology of choice determines the factors that result in burnout. The chapter describes how the teachers' decisions relate to the psychology of moral development theory and self-efficacy theory for their career choice. Their behavior and attitude as a teacher relates to their catastrophic choices. The chapter presents suggestions that teachers can implement to make better decisions for their career choice.

INTRODUCTION

Teacher burnout as the result of poor career expectations and decision making plagues new teachers in the field of education (Fernet, Lavigne, Vallerand, & Austin, 2014) especially teachers in special education (Brunsting, Sreckovic, & Lane, 2014). According to Fernet, et al., (2014) the question of people entering a profession with the passion to teach who experience burnout, perhaps as early as the first 1-3 years, may be related not only to their passion, but their perception of what they thought teaching would be for them. This result was not what they expected.

The purpose of this chapter is to identify the conflict some teachers face and decide teaching is not a viable career path for them. The three individual case studies from the literature (Brownell, Smith, McNellis & Miller, 1997; McCann & Johannessen, 2004; Schaefer, Downey & Clandinin, 2014) explain how their conflict contributes to burnout and decision to leave the profession. Additionally, the purpose of this chapter is to review the research on teacher burnout and those who believe they have a mismatch of career choice. Suggestions are provided how teachers can identify their decision arising in response to their burnout and change their outlook to move to a new career direction.

Teacher conflict has a basis in the literature. Fernet, et al. (2014) addressed the feelings of people who have a passion to teach and pursue the teaching profession because of their passion. When a teacher thinks he or she has decided on the right career path, but becomes frustrated, disappointed and unsure of what to do, their decision results in blaming themselves as a failure which is a symptom of burnout.

BACKGROUND

Teacher Conflict

There are teachers' perceptions regarding factors that contribute to their stress level which cause teacher burnout. Collingsridge (2008) reported that even with passion to teach, teachers are leaving the profession because of a myriad of issues. They are overrun with paper, harassed by the administration, (Makala, Hirvensalo, & Whipp, 2014) and experience isolation (Bardo, 1979; Wong, Ruble, Yu, & McGrew, 2017) interfering with teachers' psychological investment in their job.

Blasé's (1986) qualitative study interviewed teachers who expressed deep feelings of stress that contributed and interfered with their psychological well- being. Examples of these 77 categories or themes were related to negative descriptors of the teacher's experiences in the classroom and association with administration. These included anger, resentment, disgust, distrust, exploited, abused, hostile and irritated. Blasé (1986) also identified elements of a depressive state within the various categories. These factors most frequently stated by teachers included apathy, alienation, loneliness, isolation, discouragement, and disappointment. Another category that expressed the teachers' physical states of stress referred to exhaustion, fatigue, overwork and burned out. One specific teacher example reported by Blasé, (1986) was expressed by this statement:

When I first started teaching I was excited.... I would try all kinds of things to make the class interesting. I was learning, growing myself.... Teaching drains you! I've lost a lot of my enthusiasm for the subject. It's hard to keep up a facade of excitement when so many kids and parents don't give a damn about education.(p. 32)

Fernet, et al (2014) supported the premise of job autonomy and passion for teaching. However, the reality was teachers believing, as a classroom teacher, they have job autonomy and find that there are so many factors that challenge their autonomy (Skaalvik, & Skaalvik, 2017). These factors include an overabundance of paper work, long meetings that are not satisfying, and administration that doesn't understand the child with special needs (Richards, Levesque-Bristol, Templin, & Graber, 2016). Teachers' expectations of their job as a teacher are tarnished. The teacher perceives an inability to perform in spite of the decision to choose education as their career. This perception reinforces the conflict in their

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

job expectations. Fernat, et al., (2012) have devised a model that observes teacher autonomy and self-efficacy to counter teacher conflict. Faced with incomplete or erroneous information, beginning teachers often react to a flawed system of decision making causing burnout that impacts their career choice.

Burnout

The terminology associated with burnout, defined as exhaustion, and making overabundance demand on strength or resources was initially developed in the early 1970's by Herbert Freudenberger (1974). This definition at its core was the phenomenon of physical and emotional exhaustion associated with negative attitudes (Helms- Lorenz, Slof, & van de Grift, 2012). Freudenberger (1974) used the framework of institutions and staff members in the hospital environment for originating the definition of burnout. Some of the key researchers on burnout is Maslach, Schaufeil and Leiter (2001) who created a series of three dimensions to explain the conceptualization of how burnout materializes as a psychophysiological effect that changes "an individual's positive, motivational state of fulfillment (p.190). Teacher burnout has evolved over the years with varying definitions from modern researchers, all of which contributes to the existing literature. Maslach and Jackson (1981) presented burnout as having three components. The primary being emotional exhaustion followed by depersonalization and reduced personal accomplishment. Emotional exhaustion (EE) manifests itself as physical deterioration, emotional overburden and a lack of enthusiasm and energy. Depersonalization is (DP) defined as conscience effort to distance and detach from others. The dimension of reduced personal accomplishment (PA) the feeling of being ineffective and hopeless all contribute to the issue of burn out and poor decision making.

Maslach and Jackson (2003) wrote that:"Burnout is a syndrome of emotional exhaustion, depersonalization and reduced personal accomplishment that can occur among individuals who do "people work of some kind." (p.2). Maslach's, et al., (2001) first dimension concept of burnout encompasses the "physical attribute of exhaustion as the central foundation for burnout" (p.190). Exhaustion includes traits of being psychologically tired in addition to being physically tired and emotionally drained (Maslach, Schaufeli, & Leiter, 2001). Seferoğlu, Yıldız, and Yücel, (2014) supported the attribute of exhaustion from Maslach's seminal research based on the "excessive demands" (p. 350) of teachers, but also reinforced other researchers conclusions (Fernet, Genevieve, Vallerand, & Austin, 2012) who has reiterated the difficulty teachers have with job demands. A variety of results addressed the autonomous motivation for the teachers, when they did not believe they had autonomy, they were more inclined to experience burnout (Deci & Ryan, 2012; Wolgast & Fischer, 2017). Burnout is an outcome of teachers' frustrations usually addressing the regular education teacher. However, teachers working with children with special needs also have experiences and expectations that can cause them to face the emotional, physical and psychophysiological effects that cause burnout.

Special education teachers have a definite reason to experience burnout because of the responsibility and the energy they exert to teach children with special needs (Langher, Caputo, & Ricci, 2017). Since a teacher's job, especially teachers in the area of special education, is to develop strong relationships, they have an emotional investment which contributes to their exhaustion as they engage in teaching children in their classroom (Brunsting, Sreckovic, & Lane, 2014). This emotional investment is an integral part of their exhaustion related to burnout (Wong, Ruble, Yu, & McGrew, 2017) and their realization of their career choice not going according to their plan. In addition to exhaustion as a dimension of burnout, Maslach, et al., (2001) also introduced the concept of cynicism.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The second dimension presented Maslach et al., (2001) that contributes to burnout is the concept of cynicism. Depersonalization related to cynicism "is an attempt to put distance between once self and service recipients by activity ignoring the qualities that make unique and engaging people" (p. 403). Maslach et al., further explained depersonalization, by stating "distancing is such an immediate reaction to exhaustion that a strong relationship from exhaustion to cynicism (depersonalization) is found consistently in burnout research across a wide range of organizational and occupational settings "(Maslach 2001 p.403). Maslach et al., (2001) also explained the result in a work situation with chronic overwhelming demands that contribute to exhaustion or cynicism is likely to erode ones sense of effectiveness" (p.403).

Friedman (2003) reiterated the factors that contribute to burnout but acknowledged teachers' unexpected reality of being inundated with disruptive and non-achieving students. Teachers believed that parents, administration, and other colleagues are complicit in the contribution to burnout. As a result of unexpected expectations, the teachers find themselves in a moral position of conflict between what is real and what are the imagined stories of their career choice (Schaefer & Clandinin, 2011).

Freudenberger (1974) specified physical signs of frequent headaches, sleeplessness, and stomach pains as the contributing factors to a person who is experiencing burn out. An individual who shows the signs of anger and frustration may be due to feeling overwhelmed. Teachers who feel overwhelmed and experience emotional turmoil resulting in crying or yelling shows signs of behavioral burnout.

MAIN FOCUS OF THE CHAPTER

Issues, Controversies, Problems

The Psychological Effects of Burnout and Fear of Decision Making

The behavioral and emotional effects of burnout are the results of a deeper conflict that causes the teacher to exhibit the behaviors. Brown (2012) explained that Bandura's (1997) social cognitive theory was the impetus for concluding that burnout the teachers were experiencing was due to a deeper psychological phenomenon. Dworkin (2001) has acknowledged that research on Maslach's et. al., (2001) three dimensions of burnout, but adds to the research by introducing the aspects of the missing link to burnout as the ability of teachers to cope with their emotional well-being. Maslach, et al.,(2001) explained this inability to cope as feeling of not being worthy, having the fear of watching the children they teach not improve and blaming their children for not accomplishing the work.

Dworkin, (2001) however, views the inability to cope, which leads to burnout as a psychological form of alienation, related to how teachers view their position within the societal structure. He relates their feelings of psychological weakness within a deeper conceptualization of how teachers are treated in society. Dworkin investigated school reform in Texas as it related to teacher burnout. He concluded his investigation by acknowledging that teachers need a strong self-efficacy and the opportunity in the work environment as a teacher to have autonomy in their work situation. The framework for the self-efficacy and decision making opportunities for teachers to address the outcome of burnout is found in theories that are the impetus for understanding teachers' decisions. The theories of Bandura's (1997) self-efficacy and Kohlberg's (1958) seminal work in moral development will be explained to address the understanding of teachers decision making processes as it relates to burnout.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Theoretical Framework Underlying Burnout

Bandura (1997) has developed the theoretical framework of the phenomenon of self -efficacy as an underlying theory from social cognitive theory. Decisions individuals make according to Bandura (1997) originate from self-efficacy theory into four distinct states. Bandura explained the four states as the impetus for individual's decision-making. Inactive mastery experiences are the first state of our personal authentic experiences whereby individuals tell themselves they will do anything to succeed. Vicarious experiences are the second state whereby the individuals' perceptions of how they view themselves are through the lens of others. The third state verbal persuasion reflects how people see themselves through the conversation manifested from other individuals. The last state is psychological and affective refers to individuals' perception of enhancing their physical status resulting in the reduction of stress levels so that they believe that their physical status is a reflection of their own image. Applying the theoretical framework from Bandura (1997) related to self-efficacy, teachers find themselves in a position of unrealistic self-talk, and a false sense of personal belief resulting in unrealistic career expectations (Leiter,1992).

This decision of career choice becomes unrealistic because of the teachers' feelings of a lack of accomplishment in student achievement, frustration with administration, and self-doubt that contributes to burnout. These factors are evident as explained by Williams and Dikes (2015) who conducted a study focusing on exploring special education teachers "emotional exhaustion, depersonalization and personal accomplishment (Maslach, Schaufeli, & Leiter, 2001) related to ten demographic variables" (p.339) Williams and Dikes (2015) used Maslach *Burnout Inventory – Educators Survey* for their study. Their findings indicated several specific results. Single special education teaches were found to experience higher levels of burnout. Another result of their study indicated that teachers with advanced degrees might experience a higher level of burnout. Findings also indicated that there was a positive correlation between burnout and the length of the teacher's total years of experience. The longer that a teachers stays in the field, the more stress they encounter leading to burnout. Those specific demographic factors are an integral part of teacher's decisions that creates unrealistic career expectations.

Burnout is the outcome of the mismatch in the teacher's decision making, moral and ethical development, and their developmental schema. Kohlberg's (1958) dissertation delves into the idea of " individuals developmental schema which contains such varied elements of orientation; as roles, rules self -image, punishment, approval, sympathy, exchange, and authority." (p. 339). Each of those elements contributes to the decision-making process teachers experience as they formulate their decisions based on the mismatch of unrealistic career expectations. When individuals have difficulty evaluating the event based on his or her own perspective and considers another persons' belief regarding whether the event is considered advantageous or detrimental; the moral decision becomes questionable and the effect on the individual can be detrimental.

Therefore, based on Kohlberg 's (1958) underlying premise for understanding moral decision making related to moral development, teachers may make decisions based on views and opinions of others or a reflection of how they approached decisions as children. The theoretical framework of Bandura's self-efficacy and Kohlberg's moral development regarding decision-making is interrelated within the following case studies. These case studies highlight teacher decision-making and the individual's perception of their self-efficacy regarding their encounters as teachers to decide that they are still experiencing burnout.

Case Studies Related to Teacher Burnout

This chapter presents studies that reinforce the correlation between self-efficacy and teacher burnout. Supporting the premise of this chapter is to show the relationship of Bandura's theory of self-efficacy and how it applies conceptually to teacher burnout. Bandura (1997) looks at moral decision making from the social cognitive theory whereby adults base their decision making from a sense of self-efficacy. Although the previous consideration in this chapter defines burnout, Fredenberger (1974) and Friedman (2003) considers teacher burnout to be a result of an individual's low self-efficacy. Brown (2012) conducted a literature search on the relationship of self-efficacy and burnout and teachers. Brown researched articles that conducted statistical studies that resulted in a "negative correlation between self-efficacy and depersonalization in teachers." (Brown, 2012, p.60).

The foundation of moral development (Kohlberg,1958) and self-efficacy (Bandura, 1997) contributes to an individuals' ethical decision making based on their life experiences as children and their circumstances that contribute to their lack of self-efficacy as adults. The culmination of both factors contributes to burnout as an outcome of poor decision-making and catastrophic career choices. The factors which are the impetus to these lack of independent choices relate to Piaget (1952) and Kohlberg (1997) who examined how moral and ethical development originated in childhood. Children observe their parents who embraced certain values and beliefs. These values and beliefs were carry overs from observing their parents and embracing and accepting those values (Turiel, 2008). As a foundational part of their ethical belief system, adults who became teachers, embraced those fundamental values without consideration for their own opportunities to make decisions based on their current situation, self-efficacy, and career choice.

Friedman (2003) conducted a study of self-efficacy and burnout and teaching to investigate the importance of self-efficacy and its relationship to burnout. The study took place in Israel with 21 elementary schools. His sample consisted of 322 teachers from 21 elementary schools. Friedman's (2003) results included correlations between burnout and self-efficacy variables were statistically significant the lower self-efficacy belief the higher the burnout. Another result of his study identified influence and consideration which had relation efficacy as significantly predicting burnout. A strong link between self-efficacy was found through depersonalization.

Depersonalization from Maslach et al. (2001) was mainly affected by consideration which is a component of self-efficacy. Friedman refers to consideration as "attribution of responsibility" (Friedman 2003, p.207). Friedman noted that relationships with students was important to consider (classroom interpersonal relations) when establishing strong self-efficacy which is organizational interpersonal relations. The results of his data predicted unaccomplished exhaustion contributing to: teachers' difficulty creating the relationships with the students in their classes, perceiving them as individuals to teach and not accepting them as having their own knowledge. Aspects of these correlations contribute to teacher burnout (Friedman 2003).

Brown's conclusion originated from studying results in the literature of 11 articles that summarized the data and emphasizing the correlation between self-efficacy and burnout. Brown (2012) found that if the teachers have high levels of exhaustion the level of self-efficacy decreases. The lower the teacher self-efficacy the more detached the teacher can become to the children. The lower the self-efficacy the more the teacher becomes depersonalized. The more depersonalized a teacher becomes the more their plans and career choice goes awry.

As we began to look at the three cases studies we began to see a pattern of poor decision making that concludes with career expectations that don't line up with envisioned life choices and plans. The

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

case studies presented in this chapter are examples of how teachers are conflicted with their decisions to leave their chosen profession. They reflect a disappointment in themselves, but find the circumstances are a mismatch of what they believed teaching would be and the reality of what they wanted their story or life choice to reflect. These case studies involve either self-efficacy decisions (Bandura, 1997) or moral development decisions (Kohlberg, 1958). The discussion of theories will be in the analysis of the case studies.

The First Case Study

The first case study by Schaefer, Downey and Clandinin (2014) presents a young lady who the authors call Natalie who describes her reluctance on leaving although she is aware that leaving teaching will be the right decision following a disastrous career choice. The first indication from Natalie's conflict was noted by her conversation on February 13, 2012 (Schaefer, Downey, & Clandinin, 2014). Part of her conversation was as follows:

…so one of the reasons I still kept going to work and was relative happy was because I loved being in the classroom. I loved the interactions there. Different things would happen every day …so different dynamic things happen and I like that. That's why I loved classrooms. (Natalie's personal communication, February 13, 2012.)

Schaefer et al (2014) also revealed that Natalie wanted to leave the teaching profession because she was not recognized and other people were given credit for what she had accomplished. She also had a frustration with contacting the administration to alert her of her decision to leave. Specifically, Natalie said," I tried to get in to see her and couldn't. I finally saw her in the hallway and I just said, "Oh by the way, I'm leaving next year". The principals' decision to share the reason for Natalie's choice to leave was to announce that she was leaving to attend graduate school which was fulfilling her dreams. The principal changed the reason for Natalie's departure in order to save face. Natalie's true reason to leave was based in reality of the disastrous career choice that she had made

Natalie's case study (Schaefer, Downey, & Clandinin, 2014) illustrated her inability to live out her imagined story of teaching. Natalie's case is only one example in a qualitative study. Since the study was looking at commonalities among her 4 teachers who left teaching in their first 5 years, researchers found all the participants were living out their imagined stories. Based on the study, although not necessarily generalizable, the concept imagined stories was created based on their in-depth description of their life experiences as beginning teachers who experienced burnout (Schaefer, Downey, & Clandinin, 2014). "We learned that individuals enter teaching embodying stories to live by and as a part of their stories to live by they also carry forward looking stories of their imagined lies as teachers which are part of their imagined lives as people" (p.14).

The Second Case Study

Brownell, Smith, McNellis and Miller (1997) conducted a mixed method study on why special education teachers leave the classroom. Authors are identifying this study as an individual case since the teachers were given the opportunity to not only answer survey questions but also share their individual reasons of why they decided to leave the profession. A portion of the study involved a survey that was given to 93 teachers who had left teaching special education. The results of the questionnaire reflected that 73.1% of the teachers changed to an education related career. The special education teachers who left

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the profession reflected 26.9% and choose a non-education related field. Brownell et al also interviewed seven teachers regarding their specific reason for leaving special education. These individuals were very direct about the specific reason they chose to leave. For example, Karen left after three years stated:

There were too many preps I had to do and too much paper- work. I had no aide. I was at school a lot of times until 10:00 at night doing paperwork. Also, when I accepted the position, I was told I would be co-teaching there after I had the job a week, they told me "you are teaching them all by yourself." I was lost and I felt like I was unprepared. I had a very big discipline problem. At one time I had up to15 kids in my class. The school sent me to some workshops but that was about it. The discipline in my class was very poor. (p.149)

Brownell et al., (1997) reflected on Karen's interview with the conclusion that she was disgruntled, felt non-supported and overwhelmed. They also said she did not realize she was unprepared. Another example from the study presented Jackie an emergency certified teacher who stated that she liked teaching the students but the amount of paper work that was expected was unrealistic. Jackie emphatically said she would become a special educator again because of the excruciating paperwork. The necessity of redoing the paperwork for small errors and the red tape contributed to her stress. The system is failing the kids and because of that I cannot support it. (p.149)

The Third Case Study

The third case study that addresses the issue of new teachers leaving the classroom was conducted by McCann and Johannessen (2004). Their qualitative study investigated teachers concerns and attitudes that create patterns underlying the reasons that they chose to leave the profession. McCann and Johannessen (2004) conducted 11 interviews of English teachers over a two year period of time. Their study generated five headings and eight categories. The headings were: relationships, workload/time management, knowledge of subject/ curriculum, evaluation/grading, and autonomy/control. Four subcategories included relationship with students, relationships with parents, relationships with colleagues, and relationships with supervisors. The interviews generated information from each of the 11 teachers that show how the teachers question their own abilities. One specific aspect is their admitted concern that "…a major difficulty that beginning teachers face is the challenge to define for themselves their teacher persona" (McCann & Johannessen, 2004, p. 2). They struggle with how they are supposed to know exactly how to act how to interact with children. Beginning teacher said, "what do I need to do to manage a class, am I overreacting and am I insisting on unrealistic standards" (McCann & Johannessen, 2004, p. 2).

An example of their self-reflection is demonstrated by Jonas, who was a very successful student, but he questioned himself to the extent that he became physically ill teaching in his class. Jonas also acknowledged that he was questioning his authenticity because he was not good at faking excitement about teaching material or sharing knowledge. Jonas also believed that other teachers were good a faking their emotions. Another example, Brendan, as a second year teacher, did not believe his student teaching experience presented a clear picture and understanding of being a teacher. He was assigned a partner for four of his five periods. The fifth period he taught by himself.

Brendan had the same confusion and apprehension as Jonas regarding his responsibility as a teacher, especially when he had to teach alone. Brendan compared his teaching with a partner when he was required to teach alone and questioned his capabilities. During an interview Brendan stated "I thought

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

boy, I don't know if I can do this maybe I am doing this wrong. I don't know if this is going to work, I don't know if I can do this by myself." (n.d).

Another example is Clara who was considered very prepared because her mentors in the teacher education program informed her how to manage the classroom and gave her specific strategies that support the management. When faced with the real life situation as a beginning teacher she tried all of the strategies to manage her class but the strategies failed. "Clara expected reasonable interventions to solve the intolerable situation" (McCann & Johannessen, 2004, p. 3). Because of her failure, Clara was confused and frustrated. She feared entering her classroom every day to be faced with children who were unmanageable. What Clara faced was a lack of decision making when the decision she made failed. Therefore, when things don't go as one plans the resulting effect is a mindset that creates the conditions where one believes she or he has made a catastrophic career expectations that continue to contribute to a lack of self-concept, not trusting one's self, questioning ones authenticity which results in a continuous circle of bad decision making which could lead to poor career choices. How do we break that cycle?

Analysis of the Case Studies

This chapter presented three case studies that examined teachers' poor decision making to enter the teaching profession based on their perception of what they believed teaching would be and the reality of what teaching encompasses. The authors presented these studies to acknowledge the fact that some people are not meant to teach. The ethical implications of these case studies included the teachers understanding of the reasons they entered the teaching profession, the belief system they embraced as to their own reality of their expectations, which was their imagined stories that Shaefer, et al., (2014) described in their research study. The participants told themselves stories of what teaching was and wanted to live up to those stories even if they were not true. The untrue stories imply that ethically the teachers did not want to face the reality of the teaching environment. The ethical implication of the case studies applies to Kohlberg's moral development theory.

There are separate ethical implications for the acceptance of the teachers' self-efficacy as explained in Bandura's theory of self-efficacy. The research on the theory understanding why people are not making the correct career choice is based on Kohlberg's (1957) work with moral development and Bandura's (1997) work with self-efficacy. Each case discussed was taken at the face value of the researchers study data. Therefore, in the first case study, Natalie's decisions were based on both the self-efficacy theory and moral development theory. Natalie created a situation for herself that involved her morality of standards in which she accepted lies about what teaching was to her. This was a decision she chose to make in order to believe her imagined stories instead of what the true reality represented. Her decisions were based on the lack of self-efficacy since she resented people who were given credit for her work. She did not take the initiative to come forward, but rather felt cheated because she wasn't recognized or acknowledged for her work. Therefore, her self-efficacy was not a strength in her decision making process and she chose to leave the profession. Natalie's morality lead her to create her imagined stories.

The second case stud, a mixed method study, included both quantitative and qualitative data. The study involved seven teachers who left the profession primarily because their workload and lack of administrative support were a hindrance to their perception of what they expected from their teaching career. However, this chapter addresses the results of three of the teachers. The categories created from the study data are relationships, workload/time management, knowledge of subject/ curriculum, evaluation/grading, and autonomy/control.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The theory that applies to the second case study is Kohlberg's (1958) moral development. They had certain moral standards of how teachers were expected to be treated and what they believed the responsibilities entailed. When they carried out their responsibilities they did not receive the support, recognition or consideration of administration or colleagues. Therefore, they chose to embrace the moral values of their personal beliefs being they were not going to receive what they deemed was morally right for supporting beginning teachers. Their choice was to be forthright of the situation and leave the profession.

The third case presented implications for both Bandura's (1997) self-efficacy and Kohlberg's (1958) moral development theories. Three individuals were interviewed to understand why they left the profession. Jonas was a very good student as he completed his education. However, he questioned himself on a regular basis because he felt unsure of how to teach. His self-efficacy was poor since he really didn't feel comfortable having to carry out some of his responsibilities. In addition, he also was questioning why other teachers could fake their emotions every day as they interacted with students. Jonas felt very uncomfortable and dishonest because he was unable to fake his emotions as he interacted with his students. The self-reflection he practiced on a regular basis was related to Kohlberg's (1958) moral development theory. Jonas had strong moral development because he was unable to follow through with behaviors that compromised his values. His decisions were also related to his strong self-efficacy explained by Bandura (1997) when he chose to leave the profession.

Brendan, another teacher in the third case study was frustrated with his teaching career because he felt unprepared. When he was hired he was told he would collaborate with another teacher. However, he taught by himself and felt isolated and unsupported. He then began to question himself and his abilities. His behavior was a result of the lack of self-efficacy (Bandura, 1997) whereby Brendan felt completely alone, something he did not anticipate. He chose to leave the profession based on his lack of feeling strong in his abilities related to his self-efficacy.

Clara was also part of the third case study and believed she was very prepared for her teaching career since she had strong experiences in her college preparation. However, when she began to teach the strategies she was provided, did not work. Her students became disruptive and she could not control them. She was very frustrated because she counted on the use of what she had learned. She also believed that she was not prepared when nothing worked and did not know how to solve the problems she encountered. Clara did not have the self -confidence to create new strategies or address the problems encountered. The lack of self-confidence was the impetus for lack of her self-efficacy (Bandura, 1997) whereby Clara felt betrayed by her mentors and did not believe she had the skills to develop her how strategies. Instead, she chose to leave the profession than rather pursue creating new approaches to solve her problems in the classroom.

All three cases demonstrate the practical application of both Kohlberg's (1958) and Bandura's (1997) theories. Since there was a relationship between the concepts of moral development and self-efficacy related to teacher burnout the application of the theories presents a picture of the practical decisions that were made by the individuals in each case. On the basis of all three cases and the decisions that the teachers made from a global perspective, they had difficulty with reflecting on their moral fiber of why they wanted to teach.

They may have not researched the teaching profession as a viable means for a career. When they became teachers, they were faced with not realizing that the moral decision that they made was not beneficial to them. This decision of becoming a teacher also influenced their self-efficacy of who they are as individuals and what they truly wanted for their life's work. When they entered the profession, they entered with expectations and their expectations were not grounded in strong self-efficacy. Therefore,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the psychology of their decision making was not of prime importance resulting in a poor career choice based on incongruous perceptions about the reality of classroom teaching.

SOLUTIONS AND RECOMMENDATIONS

Suggestions for Better Decision Making

The three case studies that have been presented in this chapter have shown how the theories of moral development (Kohlberg, 1958) and self-efficacy (Bandura, 1997) can be practically applied and have implications for new practices which help beginning teachers make better decisions for their career so that they are not faced with burnout. This section will include several suggestions based on the poor decisions that teachers made within each case study.

One suggestion is to write down a couple of bad decisions. Dissect the decisions to choose something in that decision that can be salvaged. Think about recreating another decision which can be tried under the same circumstances. For example, in the third case study, Clara had strategies that did not work in her classroom. If she wrote down the exact details of the strategy, and choose one or two details to address, Clara could use those details to create her own new strategy and experiment with the new strategy looking forward to the new outcome. This example serves to help Clara with increasing her self-efficacy because she is creating something new. It also related to the theory of self-efficacy increasing her self -confidence to fulfill her goal of being successful in the classroom. Both of these positive outcomes may prevent burnout and give her a renewed sense of self.

Another suggestion is the use of a self-reflective journal. Using a spiral notebook or any book that has blank pages for writing will serve as a journal. The advantage of a journal is the individual's practice in noting what was frustrating that day and thinking of how to change that frustration. Many people have several journals for different purposes. In this example, the teacher or individual writes about circumstances that are frustrating to them on one side of the book and what they believe they could do to make a better decision on the other side of the book. Hopefully, the next day they won't face the same frustration. The most important outcome of the journal suggestion is personal honesty. If individuals are not honest with themselves they will face what one case presented as creating imagined stories.

An additional suggestion is to choose another teacher with whom the individual can feel safe and confide to help him or her role play a problem which they confront in their classroom. Role playing can also be used across disciplines. Role playing is beneficial because it gives individuals an opportunity to look at a problem from multiple viewpoints. An example of an effective role playing situation is from the case study of Brendan who was fearful of teaching alone after he was told he would be collaborating with another teacher. Brendan could have chosen a teacher friend who he felt comfortable sharing his frustration of teaching alone. Within this context, Brendan could have explored different alternatives and suggestions for reaching his students as a solo teacher. His role play would offer practical opportunities to reach his students without having to count on another teacher in the room to assist him. Role playing is also a great opportunity to use video so Brendan could watch the exchange more than once and continue to learn and review the experience.

A final suggestion is to hire a life coach or a teacher mentor. Having regular session with a mentor/ coach can assist the teacher to be self-reflective and problem - solve using their own ideas. The mentor/ coach is a person who asks questions and provides feedback that opens the teacher to his or her own ideas.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The mentor/coach is not meant to substitute for a person that provides all the answers. The answers come from the teacher in the form of feedback which becomes self-reflective for the teacher. An example of the mentor/coach relationship is from the case study of Natalie. If Natalie had hired a mentor/coach she would get the chance to role play a conversation with the administration. She would make the administration aware of her accomplishments and inform them so that others would not get credit for her work.

CONCLUSION

The objective of this chapter was to explore the effects of defective decision making that contributes to the phenomenon of beginning teacher burnout. The authors have presented three case studies that address the problem of beginning teacher burnout as a result of poor decisions. This chapter also addressed the psychological effects of burnout. The theories of moral development from Kohlberg's (1958) study and Bandura's (1997) self-efficacy were the impetus of how the examples of situations that impact an individuals' decision making result in burnout. Bardo,1979) noted,

This does not mean we shall ever to be able to erase all the stressors. Most of them are direct reflection of ourselves. We must teach ourselves new coping mechanisms for what will not go away. We have to work around our weaknesses and find our strengths.(p.253)

The authors offered practical suggestions that are solutions helping individuals be better decision makers. The goal of being a better decision maker is to decrease teacher frustration and circumvent factors that lead to burnout. The stronger teachers decision making skills, the less likely that they will experience burnout. The objective of the suggestions to help others use ideas that promote better decision making.

Chapter 46
Association of Occupational Burnout and Nursing Errors With Patient Safety: A Systemic Review

Despoina Pappa
Hygeia Hospital of Athens, University of West Attica, Greece

Chrysoula Dafogianni
University of West Attica, Greece

ABSTRACT

During the daily nursing practice, dangerous situations might appear that, if not recognized and treated early, can lead to fatigue and professional burnout, causing detrimental consequences for the patient's safety and the adequacy of the healthcare quality of the provider. This article aims to synthesize existing research investigating the association between burnout in healthcare professionals with the safety of patient care in the last decade. The authors herein examined specific nurse surveys that involve burnout assessment and association with clinical errors throughout nurse provided care. Results from this search indicate that patient safety culture must be cultivated towards nursing errors and burnout reduction. The prompt recognition of burnout signs is the critical parameter for nursing errors prevention and patient safety, in the long term. Nursing error management is oriented towards investigation of the burnout symptoms and exists as an integral and essential issue for nursing administration to ensure excellent and qualitative patient care.

INTRODUCTION

The mental health statue of healthcare professionals is an important issue (Mark & Smith, 2012) and must be of great concern to health care organizations and researchers (Kirwan, Matthews & Scott, 2013). Nurses are called upon to deal with situations of severe psychological stress that could lead to occupational distress syndrome over an extended period (Baier, 2018). Such situations are the lack of human resources in hospitals, the quality of interpersonal relationships among team members (Aiken et al., 2002), the attitude of administration to the healthcare centers (Sims, 1997; Robinson et al., 1991). Occupational stress and burnout can have adverse effects on both professional behavior (Bakker et al., 2000) and patient health and safety (Dewa et al., 2017).

When providing nursing care, errors or adverse events are likely to occur. The Institute of Medicine defines error as the failure to complete a planned task or use of a wrong method to accomplish the goal. The World Health Organization (WHO) reports that one out of ten patients has been affected by a human error. Also, the Institute of Medicine adds that between 44,000 and 98,000 deaths are recorded each year due to medical errors (Mohammadfam & Saeidi, 2014; Kopec et al., 2003). Professional qualifications, nursing workload, the patient severe situation can turn into risk factors for patient missed care. Nurses coordinate and accomplish interventions to be directly near the patient (Garcia & Fugulin, 2012) and, thus, health organizations reorient their interest to patient safety culture, something that ''must'' be apparent during health care and not ''nice to have'' (Koppenberg J., 2012).

Burnout Syndrome

Bradley (1969) first mentioned the term ''staff burnout'' and Freudenberger (1974) is stated to be the founded father of occupational burnout. Furthermore, Maslach et al. (1981) gave the frequently cited definition describing it as a syndrome of emotional exhaustion, depersonalization, and personal accomplishment among individuals who do ''people work''. The updated 11th International Classification of Diseases (ICD-11) listed burnout among ''Factors influencing health status or contact with health services'' describing it as the workplace stress that has not been effectively managed including it at the Section "Problems associated with employment or unemployment'' not forming a medical disease, though (WHO, 2019).

Burnout in The Nursing Profession

Burnout syndrome affects the general behavior, the productivity level and the professional turnover of nurses. Work-related stress results from the lack of human resources, high workloads, interprofessional conflicts leading to mental fatigue, anxiety, lack of motivation, work absence and job dissatisfaction (Kacmar et al., 2009; Laschinger et al., 2007). In a few studies, sociodemographic factors have been assessed (Gómez-Urquiza et al., 2017; Ayala & Carnero, 2016) while others studied psychological factors such as the five personality traits (Hudek-Knezevic et al., 2011) or occupational factors (Vargas et al., 2014). Nurses at specific departments are more likely to experience higher prevalence rates of burnout. Emergency department nursing personnel seems to face high levels of burnout due to overtime workday (Albendín et al., 2016). Remarkably increased level of burnout is stated by Gómez-Urquiza et al. (2016) for oncology nurses.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Nurses often witness scenes of death and bereavement. So, this exposure, may lead to the appearance of this phenomenon (Ferreira & Lucca, 2015). Nurses in oncology departments face severe levels of burnout (Russell, 2016). Vimantaite & Seskevicius (2006) revealed a huge percentage of 84,4% of nurses that mention emotional stress, unevaluated work and low salaries. ICU nurses were evaluated according to burnout appearance, and revealed a percentage of 14,3% of 91 nurses who suffered from burnout (Vasconcelos & Martino, 2018). Pediatric nurses appeared to have moderate to high levels of emotional exhaustion and depersonalization demonstrating that those nurses may have already burnout syndrome or are at possible risk of experiencing it (Pradas-Hernandez, 2018). A different term of exhaustion is called fatigue and can be of sudden appearance with more effortless ability to be recovered of. A prolonged stay in fatigue can lead to burnout syndrome. It may be derived from a post-traumatic situation (Schwam, 1998) and it can alter the job performance, nurse's personality (Vahey et al., 2004) and result to an increase of adverse events.

A different term of exhaustion is called fatigue and can be of sudden appearance with more natural ability to be recovered of. A prolonged stay in fatigue can lead to burnout syndrome. It may be derived from a post-traumatic situation (Schwam, 1998) and it can alter the job performance, nurse's personality (Vahey et al., 2004) and result to an increase of adverse events.

Burnout and Nursing Errors

Every year, healthcare systems face a serious problem and that is the preventable deaths that happen by medical errors (WHO 2004). The World Alliance for Patient Safety estimates that 10% of hospitalized patients come up with an adverse event every year (WHO 2004). Needleman et al. (2001, 2002), defined fourteen variables as clinical Outcomes Potentially Sensitive to Nursing (OPSN) such as length of stay, infections, hospital-acquired pneumonia, sepsis, thrombosis e.t.c. Distractions during work tasks, heavy workload, the inadequacy of supervision, inexperience are found to contribute to errors, as Karga et al. (2011) studied. Interruptions to nurses during the preparation of medicine and administration are quite often leading to undesirable events (Karga et al., 2011). Effective nursing leadership, organizational issues, adequate staffing and effective nurse/physician communication can affect nursing practice (Aiken et al., 1994). The most frequent adverse event reported was patient complaints (Leiter & Laschinger, 2006). Quality of care is disturbed when the number of tasks and patient turnover are increased (Duffield et al., 2011). High levels of burnout were associated with lower patient safety scale (Halbensleben et al., 2008). Nurses that suffer from burnout are more likely to make errors and those experiencing burnout do not report near misses too, which is very important if a healthcare system wants to create a complete database of incidents and apply preventable measures (Hoskins, 2013).

Patient Safety

Health institutions try to promote unusual behaviors and attitudes to shape the culture of their mission (Kaufman & McCaughan, 2013). According to the Institute of Medicine, it is very essential for every healthcare institution to synthesize a specific safety culture, which includes beliefs, values and guidelines to safe clinical health practice and promote its members to follow the principles. These organizations were developed to help and heal patients and not harm them (Stefl, 2001). Mortality and morbidity are increased when medical errors are occurred (Zencirci, 2010). British health services support the promotion of reporting and analyzing errors to develop an active safety culture and apply safe nursing prac-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tices (National Health Service, 2004). In the USA, the Department of Health acknowledges the 'blame safety culture' remains dominant in healthcare (Agency for Health, 2012). Some countries use specific measures to reduce medication errors and improve patient safety. Computerized and digital programs (Watts & Parsons, 2013) are practices that if remain updated and being followed by all staff members, they could promote healthcare services efficacy. The American Society of Clinical Oncology and the Oncology Nursing Society created safety standards for the administration of chemotherapy (Jacobson, 2012). The reporting system is a useful method to gather information about errors, but the frequency of non-reporting is quite high (Grenier-Sennelier et al., 2002). Nurses have a short amount of time facing understaffing issues at the same time, so they do not have the essentials to record such events along with the fear of punishment (Stratton et al., 2004).

AIM

This systematic review aimed to explore the impact of nurses' burnout on patient's safety, and precisely, on adverse events occurring in the last ten years (from 2010 to 2019). The review had two specific aims:

1. To collect and synthesize the existing research data on this topic.
2. To present the search results in a way that could raise awareness of nursing administrations to develop strategies targeting to nurses' and patients' well-being.

METHOD

This systematic review was completed following the guidance of Kitchenham and Bacca (2004) methodology, which divides the process into three parts: planning, conducting and reporting results. Firstly, we came up with a search plan related to nurses' burnout and how this affects the possibility of personnel to make errors threatening patient safety. The following step was to conduct the research process and after careful examination of the results, we had to report the appropriate and most relevant items. The precise research question was how the burnout syndrome of nurses affects the patient safety by making errors in clinical practice. The search strategy is described below.

Search Strategy

In this research procedure, we used two academic databases (PubMed, Medline) and one academic search engine (Google Scholar) along with reference searching of all related articles. Keywords were used in an advanced search for descriptive, prospective and cross-sectional studies based on common terms in the field of Nursing. Reports were searched containing both in title and abstract at least three of the following blocks: (burnout) AND (nurses) AND (errors OR nursing errors) AND (patient safety). Nursing errors was the most essential term in our research. The years to be examined included the last decade and that is from 2010 to 2019. Only papers in English language were investigated, despite the initial origin. For example, if a Spanish article was found, it could be encountered in this review, provided that it is published in English language too.

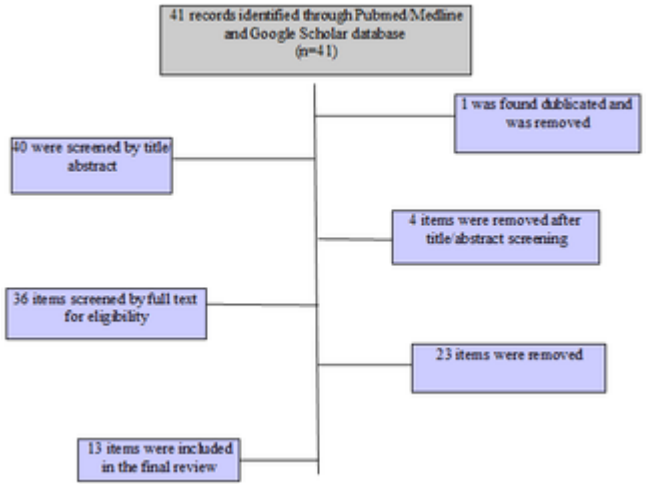
Table 1. Electronic databases searched and number of results

Database	Papers Identified
Medline (through PubMed)	38
Google Scholar (Academic Research)	3
Total	41

Search Outcome

Throughout the literature search process we came across with a total of 41 items (*Table 1*). A flow chart documenting the selection process can be viewed in *Fig.1*. One item was found twice and has been excluded from the search. Then we examined the titles and abstracts due to similar topics combination. Four reports were excluded at this phase, continuing with the assessment of the full texts of the remaining items. So, according to the eligibility of the review topic, we examined carefully the subjects of the other items and a total of 13 papers were concluded in this review.

Figure 1. Flow diagram illustrating the search and screening process



RESULTS

The main findings are oriented towards the relationship between nurses' burnout and errors occurrence. Studies with nurses population are presented (*Table 2*). According to Bao et al. (2014), nurses who presented high levels of emotional exhaustion and depersonalization, revealed their involvement in an adverse event (p=.009 and p=.030 for each dimension). Analyzing each dimension univariately, worsening scores for errors appeared. Regarding emergency units, with the participation of 284 nurses, 75,4% of them were found to suffer from exhaustion, fatigue and burnout leading to medical errors (Kiymaz & Koç, 2018). On the other hand, a report of the nursing workload and how it affects nurse and patient outcome, found out that burnout and job dissatisfaction are correlated in a significant degree. However,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

these factors did not seem to have an impact on the occurrence of the medical error (p=1.10)(Holden et al., 2011). Burnout symptoms are non-significant independent risk factors for such errors, as depression's were and was not associated with medical errors (percentage of staff with burnout >2,6% with 0.41)(Garrouste-Orgeas et al., 2015). German nurses doubled their emotional exhaustion levels within a decade concerning more about the quality level of care given (Zander et al., 2013). The frequency of infections is an essential indicator of a safe healthcare system. Cimioti et al. (2012) stated that nurses with burnout were found to come up with quite frequent urinary tract and surgical sites infections (p<0.1). For 1 out of 1,000 patients, one urinary tract infection and two surgical site infections can occur, if there is a 10% increase in nurses with high levels of burnout. By lowering burnout levels, infections and additional health costs were decreased too. Using just numbers, a health institution can save about 69$ million from this kind of infections, if prevented (Cimioti et al., 2012). Medical errors and patient falls are found to be more favorable than infections. Researchers analyzed results from 96 units revealing that one out of eight units appears to have high or very high percentages of personal accomplishment. Interclass correlations show ranges of .26, .13, .09 for the three dimensions of burnout and .10 for medical errors (Van Bogaert et al., 2014). Kirwan, in 2013, published a study by using a multilevel approach to investigate the impact of the nurses' work environment on patient safety. During ward level variables apposition, emotional exhaustion was added as for nurse characteristics linked to patient safety outcomes with .120 significance range (Kirwan, 2013). Nurses approximately mentioned three pressure ulcers and three medication errors within the last four months. The same population reported moderate levels of emotional exhaustion (Squires et al., 2010). Extended working hours contribute to the staff's exhaustion. Positive correlation among working hours, emotional exhaustion and depersonalization were found in a recent study (Kunaviktikul et al., 2015). Also, four specific outcomes were related to extended work hours: communication errors, patient identification errors, pressure ulcer and patient complaints. Emotional exhaustion and depersonalization appear with .001 and .002 P values respectively. Bao (2012) had a research concern on economical and ethical value incongruence, which were correlated to burnout and accident propensity, consequently, using a population of 234 nurses. The negative correlation between patient safety attitude and emotional exhaustion was found adding the fact that when there was a patient safety decrease, emotional exhaustion of nurses was increased (Bilal & Yildirim, 2019). Finally, 33,1% of a studied nurse population, nurses who involved in a patient safety incident, suffered a risk of burnout. The extend of patient harm was a significant factor for nurses to develop negative daily habits, such as alcohol and medication use (Van Gerven et al., 2016).

DISCUSSION

Burnout has been associated with quality of care affecting the whole interdisciplinary team. Interruptions during work performing, interpersonal relationships, psychosocial individual's reasons may affect one's attitude towards risk of burnout (Holden et al., 2010). A multifactoral situation can lead health professionals to errors. Healthcare settings, through managerial perspective, should realize this phenomenon and develop a patient safety culture which can contribute to a positive correlation between the balanced mental statue of nurse and quality of care given (Laschinger & Leiter, 2006). The three dimensions of burnout (emotional exhaustion, depersonalization, and personal accomplishment) began to be investigated separately in order to make correlations with many variables. Nurses that experience higher emotional exhaustion and depersonalization are more vulnerable in involving in patient errors (Schelbred et al.,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

2007). Researchers include patient falls, ulcers, complaints, infections and medication errors at preventable adverse events list (Kunaviktikul et al., 2015) while others found no association of burnout with medical errors (Garrouste-Orgeas, 2015). Working environment, heavy workload, conflicts among staff, individual units (Garrouste-Orgeas, 2015) contribute to the burnout appearance and likelihood of medical errors making. Patient harm has reversal effects on nurses burnout so nurses experiencing burnout can make an error during job performance and adversely, when an error occurs, depending on the extent of patient's harm, can have an impact on burnout's appearance to the nurse. Researchers who study nurse's fatigue, mention that tired nurses were one of the three factors of error causes (Mayo & Duncan, 2004). The appearance of occupational exhaustion and subsequent error, through an organizational view, can provoke costs imbalance to an institution, not only from the patient incidents but also from nurses absenteeism, negative mental status, physical problems with further treatment (Health Do, 2000). Errors reporting system ought to be applied within healthcare providing settings, and health professionals must be trained and encouraged to document errors and near misses not to be blamed and ashamed for, but for cultivating a patient safety culture.

Table 2. Summary table of included papers

Author, Year & Country	Design	Aim of the Study	Sample	Findings
Bilal & Yildirim (2019) Turkey	Observational, descriptive and cross-sectional study	Determine the relationship between patient safety attitudes and pediatric nurses' burnout	104 nurses	Emotional exhaustion was identified in more than half of the participating nurses, with a negative correlation between the attitude towards patient safety
Kiymaz et al. (2018) Turkey	Descriptive cross-sectional study.	Determine individual and professional factors affecting the tendency of emergency unit nurses to make medical errors and their attitudes towards these errors	284 nurses	Factors that caused medical errors in the emergency unit: 91.2% of the nurses stated excessive workload as a cause; 85.1% stated an insufficient number of nurses; and 75.4% stated fatigue, exhaustion and burnout.
Van Gerven et al. (2016) Belgium	Cross-sectional survey	Investigate the prevalence of health care professionals being personally involved in a patient safety incident (PSI)	5788 nurses (79.4%) and physicians (20.6%)	Nine percent of the sample in this study was involved in a patient safety incident (PSI) during the past six months. PSI involvement was related to a higher chance of problematic medication use, excessive alcohol consumption (among nurses) and risk of burnout

Table 2. Continued

Garrouste-Orgeas et al. (2015) France	Prospective, observational, multicentre study	Staff behaviours to optimise patient safety may be influenced by burnout	779 ICU nurses	Burnout was not associated with medical errors but other independent risk factors were related to it..
Kunaviktikul et al. (2015) Thailand	Descriptive predictive study	Examine nurses' extended work hours and its relationship to the patient, nurse and organizational outcomes.	1524 registered nurses	Fatigue could be a likely explanation for extended working hours and patient outcomes
Lewis et al. (2014) USA	Cross-sectional study	Examine RN involvement in preventable adverse events and how burnout is associated with RN and system characteristics	218 nurses	High levels of emotional exhaustion and depersonalization were associated with involvement in a preventable adverse event (p=.009 and p=.030)
Bogaert et al. (2014) Belgium	Cross-sectional study	Investigate the impact of nurse practice environment factors and burnout on nurse reported job outcomes and patient adverse events.	1108 nurses	Frequency of adverse events such as falls and medical errors were rated favorably than hospital infections associating with High mean values for three burnout dimensions.
Bao et al. (2013) Spain	Cross-sectional study	Report the relations of value incongruence to the individual and organizational well-being variables of self-rated health, turnover intention, and accident propensity, as mediated by burnout	234 nurses	Burnout was significantly correlated with accident propensity.
Kirwan et al. (2013) Ireland	Cross-sectional study	Explore the relationship between the ward environment and specific patient safety outcomes	1397 nurses	Emotional exhaustion did not significantly contribute to the number of adverse events reports.
Zander et al. (2013) Germany	Longitudinal, cross-sectional survey	Analyze whether the diagnosis- related groups implementation had measurable effects on the quality of patient care and safety	4192 nurses	High patient safety is asscosiated with emotional exhaustion
Cimiotti et al. (2012) USA	Cross-sectional study	Linear regression was used to estimate the effect of nurse and hospital characteristics on health care–associated infections.	7728 nurses	Staffing-infection relationship was mediated by burnout and burnout was associated with UTIs and SSIs

Table 2. Continued

Holden RJ., et al. (2011), USA	Cross-sectional study	Conceptualized a human factors model for the workload at three distinct levels of analysis	199 nurses	There was not a significant association with the possibility of medication error occurrence.
Squires et al. (2010) Canada	Cross-sectional study	Test and refine a model examining relationships among leadership, quality of the nursing work environment, safety climate and patient and nurse safety outcomes.	267 RN in acute care	Emotional exhaustion significantly correlates with medication errors.

CONCLUSION

Nurses' burnout and errors during practice are two terms interconnected. More studies should turn their interest to them regarding patient safety. Nurses face emotional exhaustion, depersonalization and personal accomplishment because of work factors. The individual can manage difficult or stressful situations that could lead to a patient's adverse event. However, administrators must apply measures and educational programs to maintain professionals' physical and mental wellbeing and patient safety. Error and near misses reporting could help in understanding the reasons and the circumstances under which the error occurred. Interviews with nurses to promote a safe and friendly communication would be a valuable measure for individuals to accept the fact and be more conscious and aware of the dangers. Managers, though, must develop the attitude of ''not to blame, just to share'' in order to realize all the risk factors in an institution that could put in danger the attendees. Burnout levels should be measured quite often to all staff members due to correlations with negative or positive results, accordingly. Nurses are the members-key towards proper and effective health care providing. Attention must be given to this population and its general wellbeing and motivation to be more productive enhancing patient safety and total benefit for the healthcare organization.

Chapter 47
Burnout and Stressors as Influencers on Work Engagement Among Law Enforcement Agents in Selected Cities

Mihir Joshi

Gurukula Kangri Vishwavidyalaya, India

ABSTRACT

Burnout is an underlying issue that has an adverse effect on the working enthusiasm of the employees. In this chapter, the researcher has attempted to assess the influence of stressors on burnout and work engagement in the context of the Indian law enforcement agents. The study evaluates the correlations between burnout factors—emotional exhaustion, cynicism, low professional efficacy—with vigor, dedication, and absorption. For the purpose of this study, items from MBI-GS for assessing burnout, scale for stressors, and employee engagement are adapted. The construct of the scale developed was established using confirmatory factor analysis. The study was carried out for 145 law enforcement agents in the selected cities of a North Indian state. T-test results applied on stressors between male and female groups show varying results. A significant negative effect of burnout factors on work engagement factors is observed through the empirical examination using SEM AMOS.

INTRODUCTION

Every law enforcement agent has to deal with stress related elements that could be interpersonal (family matters), workplace (organizational levels) and those related to tasks (job demand) such as issues related to encounters, investigative search and fear of injury (Toch, 2002; Carson, 1987; Violanti&Aron, 1994; Malach-Pines &Keinan, 2006). The Burn out issue has been a center point of the study for researchers

in varying fields Nursing (Havens, Gittel, &Vassey, 2018), police officers (Dick, 2000;Malach-Pines &Keinan, 2006; Kwak, McNeeley, & Kim, 2018), neurologists(Miyasaki et al., 2017), firefighters (Lee etal.,2018; Smith et al.,2018) and teaching(Hakanen, Bakker, &Schauefeli, 2006). Burnout is an aftermath of stress and related factors that diverges an individual's interest towards work (Hakanen, Bakker, &Schauefeli, 2006). It is considered to induce a feeling of extrication from work and creates exhaustion and skepticism towards work (Maslach et al., 1996). Burnout disengages people from all those roles at work which are considered as effective, involving and energetic (Maslach&Leiter, 1997;Maslach, 2001; Cole et al.,2012). However, researchers have considered Burnout as an independent activity(Schaufeli& Bakker, 2001, 2004; Bakker, Demerouti, &Schaufeli, 2005). It is a concept which can only be explained by having a separate set of measures. According to Schaufeli& Bakker, (2003, 2004) Maslach's Burnout Inventory (MBI) does not clearly assess Burnout empirically as well as conceptually.

Work engagement is a positive expression of feelings towards work and aspects related to work. The expression constitutes of vigor, dedication and absorption. "Vigor is characterized by high levels of energy and mental resilience while working, the willingness to invest effort in one's work, and persistence also in the face of difficulties." "Dedication means a sense of significance, enthusiasm, inspiration, pride, and challenge." The third factor of work engagement is absorption, "which is characterized by being fully concentrated and happily engrossed in one's work, whereby time passes quickly and one has difficulties with detaching oneself from work."(Schaufeli, Salanova, Gonzalez-Romá, & Bakker, 2002). It is also considered as a feeling that generates commitment towards job and a sense of responsibility. Further researchers posit engagement to be behavioural aspect inclusive of trait features reflecting to an individual's efforts towards work(Crawford, Le-Pine, & Rich, 2010). Thus, work engagement is a constituent to the contributions made to organization through an individual's gusto withstanding the hurdles in achieving targets. Additionally, researchers have different explanations to engagement, which is a physical, cognitive and emotional expression to the roles in organization.

In this study however, the researcher utilizes the MBI as a measure of Burnout to understand the intricacies involved in work engagement of law enforcement agents. Moreover, a number of stressors are also associated with the law enforcement job holders (Malach-Pines &Keinan, 2006). The stressors cause an imbalance to the empathetic and authoritative combination of the agents. Organizational Stressors involve the challenges faced at the administrative, organizational structure and daily task related. The command chain followed in law enforcement departments sometimes impair decision making. Lingering stressors are related to the timely execution of goals and meeting the deadlines. Shifts are usually oddly placed owing to the nature of job and overload is common. External stressors are the most accrued for law enforcers. The cooperation with other departments is minimal and police officers have to invest additional time to meet the necessity of job like accompanying a high profile criminal for hearing to court and handling press. Further the researchers have designated the burnout symptoms like alcohol abuse, personal unresolved matters, job dissatisfaction, social disconnection, extreme public exposure, aggressive attitude (Kwak, Neely, & Kim, 2018).

Past researchers have considered Burnout to be different in case of law enforcement agents as it involves not just the stress conditions but display of multiple emotions that should not be expressed socially. The stressors aggravate such emotional display which consequently effects the work engagement. Some police officers happen to shift to different departments as a result of dissatisfaction or dissonance with work. Studies have revealed that cynicism increases with extreme public exposure. This increase in cynicism creates work disengagement and also limits the social interaction of law enforcement agents (Kwak,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Neely, & Kim, 2018). The stressors create emotional outbursts among police officers besides nervousness (Malach-Pines &Keinan, 2006). The purpose of this study is to understand the role of stressors that aggravate burnout. Furthermore, the study explores the burnout and stressor effect on work engagement. It is necessary to understand the relationship of stressors with burnout factors of MBI in Indian context.

LITERATURE REVIEW

Burnout

Law enforcement officers have to face several stress situations every day that mulls out energy, patience and make them repress emotions (Hillgren& Bond, 1975; Jovanovic, Krajnovic & Marinkovic, 2018). Past literature has defined Burnout in both fictional and non-fictional terms that shows loss of desire, a work generated craving and optimism associated with job (Maslach, Schaufeli, &Leiter, 2001;Atouba & Lammers, 2018). It is the day to day challenges that are faced by individuals at work particularly police officers who have to remain both agile and more fixated to solve civil issues (Maslach & Schaufeli, 1982). Burnout is an after effect of the stress that has been persistent in professional arena to an individual and is unavoidable (Maslach, 1982). It is therefore, considered as a negative outcome of the stress that has accumulated in the attitude of the individuals. The corpus of time spent on work along with stress left untreatable creates assumptions related to job that subsequently confounds confidence and questions objective doing what the person is intended to do (Maslach & Schaufeli, 1982). This creates a pattern in the consciousness of the individual which is fabricated into several negative thoughts and breakdowns. Further, it propagates negative thoughts and later individual starts dejection of self -accomplishments and job(Maslach, Schaufeli, &Leiter, 2001). The origin of the term burnout is credited to the work of fiction in a novel "A Burn-out Case" (Greene,1961;Maslach, Schaufeli, &Leiter, 2001) and the research conducted on human amenity workers in whom the forfeiture of drive and obligation was studied(Maslach, Jackson, &Leiter, 1996). Past studies display that Burnout has its fundamental beginning from the services based jobs that have high performance expectations and require perfect time execution (Maslach& Jackson, 1984).

Police force job is civil service that requires persistent nimbleness and effective response to the incidents in surroundings. Effective response designates to the ideal use of emotional and cognitive reflexes. Burnout leads to negative and abating service from an individual leading to depression, absenteeism and meager productivity(Kop, Euwema&Schaufeli, 1999). Additionally, Burnout may lead to increased use of alcohol, abusive rambling, insomnia, creating personal and professional distance from colleagues and even family members (Maslach& Pines, 1977; Maslach& Jackson, 1985).Gender differentiable study has also been conducted in relation to Burnout that (Purvanova&Muros, 2010). Studies concerning Job Burnout among law enforcement agents in India are very scarce (Ranta&Sud, 2008;Bawa &Kaur, 2010; Suresh et al., 2014) but have been widely studied in other countries around the globe (Carlson, Anson & Thomas, 2003; Moustert&Joubert, 2005; Storm &Rothmann, 2003;Queirós, Pereira, & Martins, 2012;Odedokun, 2015;Chappelle et al.,2014). Past explorations based on Burnout in Indian context have been carried out on software developers (Advani et al., 2005; Singh, Suar, &Leiter, 2012), call center associates (Surana, Singh &Saxena, 2011; Surana& Singh, 2012), manufacturing and other sectors (Sharma, 2002; Anand&Arora, 2009; Mehta, 2012).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Past studies have promulgated the constituents of Burnout as emotional exhaustion, cynicism and low personal worth (Maslach, 1982;Maslach, Jackson &Leiter, 1997). Emotional exhaustion is considered as a prolonged situation where an individual gets worn-out of emotions and physical aspects such as interaction with public, criminals, performing day to day roles as per expectations of the higher authorities and duties of the crime scene and point of impact(Maslach& Jackson, 1985). These result in psychological grumbling situations, early fatigues at work, depression and anxiety(Bakker, Nachreiner, &Schaufeli, 2001). An interpersonal interaction to meet ever increasing emotional demands results in enervation of resources for further communication. In cynical state an individual feels the need to distant self from the source of demotivation. This distance is so created to make self-aware of the causes of emotional depletion(Maslach& Pines, 1977; Maslach& Jackson, 1985).Cynicism and low personal efficacy are associated to the experiences of emotional exhaustion(Maslach, Jackson &Leiter, 1997). The demanding nature of the job in services sector including the civil services results in exhaustion at some point. At this stage the individual engaged in services reduces the efforts to interact with the receivers by creating a distance in offering distinctive services. Additionally the individuals use perceptive responses when they experience fatigued behavior(Cropanzano, Rupp, & Byrne, 2003).Past researches in different contexts have staged cynicism to be an abrupt retort to the exhaustion state (Cropanzano, Rupp, & Byrne, 2003**;**McCarty& Garland, 2007).Further, low personal efficacy is suggestive of low self-respect in perspective to the job performed by an individual. The individual experiences paucity towards the work due to exhaustion and depersonalization. It is quite complex to realize the low personal worth towards the work when facing depersonalization and exhaustion as in several instances they are the causes of the feeling of inefficacy (Maslach & Jackson, 1985; Maslach, Schaufeli & Leiter, 2001). Further, it feels irrelevant to work with the same enthusiasm when a sense of emotional exhaustion seeps in. Gradually, individual starts undermining and evaluating all deeds of the past and present as negative. It also points to extreme demotivating behavior of self (Maslach & Jackson, 1985; Cropanzano, Rupp, & Byrne, 2003; Wiese, Rothman & Storm, 2003). For the purpose of this study the researcher utilized the statements from MBI scale and MBI-GS(General Survey) (Maslach & Jackson, 1981; Schaufeli et al.,1996; Salanova&Schaufeli, 2000). The statements used in the study were like “I feel I am working too hard on my job”. A seven point scale was employed in this study where the respondents were asked to respond from 0 indicating “Never”, 1 “A few times a year”, 2 “ Monthly”, 3 “A few times a month”,4 “Every Week”, 5 “ A few times a week”, 6 “ Every day”.

Stressors

Since the mid-1970s, various studies have been conducted to identify the reasons for law enforcement agents work pressure and their stress level as law enforcement is accepted as the most stressful occupation worldwide (Reiser, 1974; Kroes, 1976; Violanti & Aron, 1994; Toch, 2002; Mikkelsen & Burke, 2004**;** Haque, 2016; Naz & Gavin, 2013; Nix & Wolfe,2017). On the basis of available literature job stressors in law enforcement can be broken down into four main categories i.e. task related stressors (Anshel, 2000**;** Aldwin, 1984; Dick, 2000; Carson, 1987; Violanti &Aron, 1994), organizational stressors (Brown & Campbell, 1990, 1994; Ellison, &Genz, 1983; Molloy & Mays, 1984, Toch, 2002), personal stressors(Brown & Campbell, 1994; Mikkelsen & Burke, 2004), external stressors (Davidson &Veno, 1980; Kroes, 1976, Mikkelsen & Burke, 2004).

In Defense forces, task related stressors also designated as acute stressors include the way in which police officers act and think differently in more stressful situation as compared to less stressful situations

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Anshel, 2000; Dick, 2000).Law enforcers have to maintain their macho image besides being polite and deal efficiently with stress situations (Perrier & Toner, 1984). Moreover, law enforcement agents are anxious of being killed or injured, shooting, dangerous situations, physical and mental error because of acute stressors (Loo, 1984; Territo & Vetter, 1981; Toch, 2002; Carson, 1987; Violanti & Aron, 1994). Other than fear of being injured or killed the most stressful situation for them is death of their colleagues on duty (Sewell, 1981, Carson, 1987; Violanti & Aron, 1994) and informing the family of deceased officer adds to the stress level (Brown & Forde, 1989; Toch, 2002). Encounters of criminals also enhance the stress level of agents since killing a human being requires a lot of self-conscience, test of wisdom and moral strength (Paton & Violanti, 1999; Toch, 2002). Chronic stressors include structure of law enforcement agents and overload of work such as both qualitative and quantitative work and continuous shifts rotations (Brown & Campbell, 1990, 1994; Davidson &Veno, 1980; Leonard & Tully, 1980). Quantitative work includes performing a number of different tasks simultaneously and qualitative work is related to performing highly complex and dangerous task. This overburden becomes more frustrating when it combines with inadequate utilization of their skills and abilities as they have to perform the task for different ethnic groups and social class and have to handle their personal problems (Leonard & Tully, 1980). Many times police officers feel that they are influenced by concerns that have nothing to do with their own functioning on the job (Kaufman &Beehr, 1989; Kroes, 1976; Reiner, 1991). Staying focused on the objective besides sympathizing with others is difficult and challenging (Bull, Bustin, Evans, &Gahagan, 1983; Sewell, 1994).

Stressors related to organizational structure of the law enforcement agents are known as organizational stressors (Brown & Campbell, 1990, 1994; Molloy & Mays, 1984) such as lack of administrative support of seniors, participation in decision-making, and of opportunities for advancement (Alexander, 1999). Brown & Campbell, (1994) and Alexander, (1999) found that organizational and managerial stressors have more impact as stressors than the daily routine tasks. Studies have additionally demonstrated that absence of sensitivity, lacking supervision and maintaining a lot of paperwork material is evaluated by law enforcement agents as intensely hostile and more stressful (Brown & Campbell, 1994; Toch, 2002; Molloy & Mays, 1984; White, Lawrence, Biggerstaff & Grubb, 1985). Law enforcement agents also have stress related to the way their promotion will be determined. Furthermore, investigating the most difficult and frustrating cases also create very stressful environment for them. These situations require explanations and reporting to the internal agency about their actions and reasons associated with those actions (Toch, 2002; Terry, 1981).

External stressors are created outside the precinct where the external powers come into action like aggravated assaults, public comments, public aggression, media and news reporting, court judgment that might increase tensions and retaliation by public (Perrier, 1984; Davidson &Veno, 1980; White et al., 1985; Kroes, 1976). Law enforcement agents also have to deal with the psychological stressors or personal stressors that encompass the price police officers pay for the conflict between their work and family demand (Brown & Campbell, 1994; Perrier, 1984; Mikkelsen & Burke, 2004).

Reaction of law enforcement agents while they are in stress can be segmented into three primary classes: physiological, emotional, and behavioural reactions. Physiological reaction enhance the chances of increase in number death due to heart attack, cancer and other sever disease (Davidson &Veno, 1980 ; Vena &Petralia, 1998) and various health problems related to stress including obesity, high blood pressure, headaches, stomach problems, sugar, high cholesterol, and various skin problems, anxiety (Davidson &Veno, 1980; Perrier, 1984; Vena &Petralia, 1998). Other, more common emotional reactions to police stress are job frustration, boredom, nervousness, restlessness, anger, emotional exhaustion, depression,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

alienation, and emotional cut-off from various aspects of daily life (Perrier, 1984; Davidson &Veno, 1980; Donovan, 1981 On-the-Job Stress in Policing, 2000; Perrier, 1984). Other than this due to stress there is lack of concentration power and pay they feel more difficult to pay attention to their work, aggression increased among them, marital complications, violence, excessive smoking and drinking, alcoholism, and drug abuse (Beutler, Nusslaum, &Mereddith, 1988; Davey, Obst, & Sheehan, 2001;Terry, 1981; Davidson &Veno, 1980; Violanti et. al.,2017), Behavioural reactions leads to quitting the force, in few cases officers prefer voluntary retirement, increase in number of absenteeism and unpunctuality, reduced efficacy in job performance, errors of judgment, low morale and reduction in the attractiveness of police work as an occupation (Brown & Campbell, 1994; Cooper, Kirkcaldy, & Brown, 1994).

Work Engagement

Vigor, dedication and absorption are the constituents of a positive, gratifying and job oriented state of mind associated with Work Engagement (Schaufeli, Salanova, Gonza´lez-Roma,& Bakker, 2002; Crawford, Lepine& Rich, 2010). Engagement includes cognitive, emotional and physical efforts to enhance performance of the employee where they show dedication towards their job role (Maslach&Leiter, 1997). An individual displaying responsible behavior towards the job role also shows a positive impact on the job performance (Schaufeli, Taris, &Rhenen, 2008). Increased positivity in work engagement leads to better productivity, low non-appearances at work, better quality work and higher profitability. Further, personal principles and values aligned with the work also influence the engagement (Maslach&Leiter, 1997; Maslach, Schaufeli&Leiter, 2001; Brit,2003). According to Kahn (1990), work engagement is that psychological state in which employees are not only cognitively involved in work but also emotionally for the assigned role. Work Engagement is also considered as an obligation that requires intellectual or cognitive and emotive contribution by an employee towards the job role (Rothbard,2001; Shaw, 2005; Saks, 2005; Richman, 2006). Work engagement and Burnout are considered as the two ends of continuum where the former displays positivity throughout the job assigned and the latter shows the negativity that creates subjectivity and improper action in an individual (Schaufeli et al.,2002; Storm &Rothmann, 2003). Work engagement for employees is a part of the field that covers indisposed circumstances of employees to their well-being (Maslach, Schaufeli & Leiter, 2001; Schaufeli, Taris, &Rhenen, 2008). Employees positively engaged in job perform better even under odd circumstances and effectively execute their duties where in three fundamentals of engagement Vigor, Dedication and Absorption (Schaufeli et al.,2002).

Perseverance during challenging situations, employee enthusiasm towards the job, inclination towards the assigned roles, applying necessary determination to the job with higher mental pliability and energy are the constituents of *Vigor* (Schaufeli, Salanova, Gonza´lez-Roma,& Bakker, 2002; Storm &Rothmann, 2003).The resilience incorporated by employees at work increases their capacity to endure tough situations. Employees display willingness to endow effort in completion of everyday tasks at work without getting exhausted. The state of fatigue is not achieved with high levels of energy(Gonzalez-Roma et al., 2006;). The second dimension in defining engagement is *Dedication* that entails stimulus, self-importance, passion and challenges. This dimension shows a strong level of importance given to the work by employee where tasks are accomplished with great enthusiasm (Storm &Rothmann, 2003). The third dimension in assessing the Engagement is *Absorption*, which is characterized by being completely focused and happily immersed in one's work. Past researches propound that the individual is not able to easily disengage self from the work whereby the time passes swiftly (Schaufeli, Salanova, Gonza´lez-Roma,& Bakker, 2002; Storm & Rothmann, 2003; Maslach, Schaufeli & Leiter, 2001; Jena & Pradhan, 2017). In this study the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

scale item for measuring the work engagement were derived and adapted from Utrecht Work Engagement Scale (Schaufeli, Salanova, González-Romá, & Bakker, 2002**;** Schaufeli& Bakker, 2003) as can be observed through table 1. A seven point scale was utilized in the study that varies from 0 indicating "Never", 1 "A few times a year", 2 " Monthly", 3 "A few times a month",4 "Every Week", 5 " A few times a week", 6 " Every day". Table 1 shows the factor loadings of the items sets.

Table 1. Factor loadings

Item sets and factors		***Factor loadings***
Burnout		
BT1	I feel emotionally drained from my work.	.714
BT2	I feel used up at the end of the work day	.716
BT3	I feel fatigued when I get up in the morning and have to face another day on the job.	.781
BT4	Working with people all day is really a strain for me.	.747
BT5	I feel I am working too hard on my job.	.718
BT6	I have become less interested in my work since I started my job	.861
BT7	I have become less enthusiastic about my work	.678
BT8	I doubt the significance of my work	.696
BT9	I doubt whether my work contributes anything	.615
BT10	In my opinion, I am good at my job.	.748
BT11	I can effectively solve the problems that occur at work.	.648
BT12	I feel confident that I am effective at getting things done.	.629
Stressors		
ST1	I feel my salary is insufficient.	.850
ST2	I receive too much supervision and instructions from seniors.	.887
ST3	I think Bureaucracy/paperwork causes additional work strain.	.855
ST4	Public negative verbal comments create more stressful atmosphere.	.922
ST5	I think about the risk of getting injured on duty.	.682
Work Engagement		
WE1	My job inspires me.	.787
WE2	I am proud of the work I do.	.527
WE3	To me, my job is challenging.	.788
WE4	When I get up in the morning, I feel like going to work.	.738
WE5	At my work, I feel bursting with energy.	.718
WE6	I can continue working for very long periods of time.	.561
WE7	Time flies when I am working.	.775
WE8	When I am working, I forget everything else around me.	.768
WE9	I feel happy when I am working intensely.	.658
WE10	I am always immersed in my work.	.708
WE11	I get carried away when I am working.	.718

Note: Significant at p=***

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

On the basis of the above review the researchers hypothesized:

H1: Stressors have a significant influence on Burnout.
H2: Stressors and Burnout have a significant influence on work engagement.

Method

Data collection was carried out in the 4 major cities of Northern state in India where the respondents were chosen on the basis of systematic sampling. The self-report questionnaire was circulated from November 2017 till April 2018. Of the 200 questionnaires circulated only 155 questionnaires could return giving a response rate of 77.5%. Out of 155 samples 145 samples were found suitable for the study as rest 10 questionnaires were incomplete and were rejected during data cleaning.

Table 2 displays the descriptive of the characteristics where it can be seen that 68.3% of the respondents are male and 31.7% of the respondents are female (n=145). The identity of the respondents is secluded for maintaining the ethical privacy. The designation section shows a higher percentage of constables in the study (42.1%). Years of service was taken from less than 5 years to greater than 10 years which is shows 59.3% respondents with less than or equal to 5 years of experience.

Table 2. Descriptive statistics

Characteristics		*Frequency*	*Percentage*
Total sample		145	
Gender			
Male		99	68.3%
Female		46	31.7%
Age			
25–35		38	26.2%
36–46		75	51.7%
47/above		32	22.1%
Years of Service			
Less than or equal to 5 years		86	59.3%
5-10 years		50	34.5%
Greater than 10 years		9	6.2%
Designation			
Constable		61	42.1%
Asst. Commandant		47	32.4%
Commandant		15	10.3%
Inspector		9	6.2%
Senior Superintendent		12	8.3%
Director		1	.7%

Analysis

In this study the validity and reliability of the measures is tested through KMO and Bartlett's test of sphericity and Cronbach's alpha respectively. Moreover, the factorization of the predictor and outcome variable is done by applying Exploratory Factor Analysis and to establish the factors Confirmatory Factor Analysis is applied using IBM AMOS 21 version. Table 3 shows the KMO achieved for the MBI-GS measureis .753, for UWES (Utrecht Work Engagement Scale) is .815 and for Stressors is .858 which is in a good range (above .6) and shows decent construct validity of the measures (Cavana et al.,2001; Kaiser, 1974; Nunnally, 1978). Cronbach's Alpha was applied to test the reliability of the scales. The alpha value for theMBI scale is .902, for UWES is .912 and for Stressors is .834 which is above the acceptable range of .7 and is considered good (Field, 2009).

Table 3. KMO and Cronbach's Alpha

	MBI-GS	*UWES*	*Stressors*
Kaiser-Meyer-Olkin	.753	.815	.858
Cronbach's alpha	.902	.912	.834
No. of items	12	11	5

Note: Significant at $p < .000$.

Further in order to establish the factors a measurement model was generated using the Confirmatory Factor Analysis since in Indian settings studies on the three factors considered in this study are scarce(Ranta&Sud, 2008; Surana& Singh, 2009). Measurement model achieved is a good fit model with indices values in acceptable range Cmin/df=1.779; Comparative Fit Index, (CFI)=.922; Normed Fit Index, (NFI)=.841;Tucker Lewis Index, (TLI)=.909;Incremental Fit Index, (IFI)=.902; Root mean square error of Approximation, RMSEA=.07 (Netmeyer et al.,2003).

The three factor model shows acceptable fit to the data for structural model with Cmin/df=1.890, Comparative Fit Index, (CFI)=.911; Normed Fit Index, (NFI)=.830.;Tucker Lewis Index, (TLI)=.897;Incremental Fit Index, (IFI)=.912; Root mean square error of Approximation, RMSEA=.07. Additionally the results display a significant negative influence of Stressors exhibited on the endogenous variable Burnout (β=-0.082,p<.003). Therefore, the hypothesis (H_1) that stressors have a significant influence on Burnout is accepted. The influence of stressors on Work engagement was negative but insignificant (β= -0.07,p>.000;p=.719). The results show that work stressors have no significant negative influence on work engagement. Moreover, the results also show that Burnout has a significant negative influence on the outcome variable Work engagement (β=-.17; p<.002). Hence, the hypothesis (H_2) instituting the impact of burnout and stressors on Work engagement is accepted.

Additionally, the researcher assessed the correlations among the Burnout factors comprising of emotional exhaustion, cynicism and low professional efficacy with the Work engagement factors Vigor, Dedication and Absorption. The results show that emotional exhaustion has a negative relation with Vigor (r= -.065, p<.000) and Absorption (r= -.047,p<.000) whereas the direction of correlation with dedication is positive but insignificant (r= .070; p=.403). The correlation of second factor Cynicism is negative with Vigor (r= -.147;p=.007), dedication but insignificant (r= -.08; p=.249) and Absorption (r=

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

-.138; p=.009). Low professional efficacy displays negative correlation with Vigor (r= -.075; p=.003) and Absorption (r=-.048) but the relation with dedication is in opposite direction and insignificant (r= .11; p=.161). The pattern of correlation results shows negative relation of the factors of Burnout with the work engagement in context to the law enforcement agents. T-tests were applied on stressors with gender as a grouping variable. The results of the analysis show a significant difference within the groups in relation to public negative verbal comments (N=145; Mean, Male=4.50, Female=3.92;Sig=.04;p<.000) as can be observed through table 4. Further statistics also show that salary insufficiency points to higher mean (Male=4.33;Female=4.08) and there is no significant difference between the groups (sig=.15;p>.000). Mean of supervision and Bureaucracy or paperwork is close with no significant difference (p>.000). The findings show that both male and female law enforcement agents are equally afraid of getting injured at work (Male=4.00; Female=4.08;sig=.10;p<.000).

Table 4. T-test descriptive

Items		Gender	N	Mean	T-test statistics	Sig (2-tailed)
ST1	I feel my salary is insufficient.	Male Female	99 46	4.33 4.08	.902 .895	.15
ST2	I receive too much supervision and instructions from seniors.	Male Female	99 46	4.00 3.85	.318 .315	.36
ST3	I think Bureaucracy/paperwork causes additional work strain.	Male Female	99 46	4.08 3.92	.393 .388	.20
ST4	Public negative verbal comments create more stressful atmosphere.	Male Female	99 46	4.50 3.92	2.455 2.425	.04
ST5	I think about the risk of getting injured on duty.	Male Female	99 46	4.00 4.08	.212 .207	.10

CONCLUSION AND IMPLICATIONS

Studies pertaining to the law enforcement agents globally show that stressors have an adverse influence on officers (Malach-Pines &Keinan, 2006). Studies show that getting hurt has higher hostile psychological effect on the law enforcement agents (Violanti &Aron, 1995). In this study the purpose was to assess the impact of stressors on burnout and work engagement among law enforcement agents or police officers. The results of the study show a negative influence of the stressors on work engagement. Besides, the results also show that stressors tend to aggravate Burnout levels among the police officers. The outcomes of the study are in alignment with the past studies conducted in the context to law enforcers (Wiese, Rothmann, & Storm,2003; Mostert, &Rothmann, 2006; Rothmann, 2008; Wasserman,Meiring& Becker, 2018) that show a significant contribution of stressors to Burnout. Table 1 shows a high factor loading (.922) of the public verbal comments or obscene remarks to be a high level of stressor followed by the salary insufficiency. Additionally, the study evaluates the impact of Burnout on the work engagement which is found to be negative after the empirical evaluation. Past studies in this context have shown high levels of Burnout among the police officers (Rothmann, 2003; Malach-Pines &Keinan, 2006). The outcomes of the current study align with the past studies carried out in varying countries (Mostert, &Rothmann, 2006; McCarty, Zhao & Garland, 2007, Malach-Pines &Keinan, 2006). The results re-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

veal that law enforcement agents are inspired by their jobs (WE1= .787) and job challenges show their dedication towards the work (WE3=.788), as can be observed through the factor loadings in table 1.The results of the t-tests applied on five stressors items show no significant difference between the groups except for the use of negative and abusive verbal comments.

Through the results it can be observed that law enforcers feel that their salary is insufficient as per the nature of job. It can also be seen that both the male and female agents equally think about getting injured in the line of duty since, facing dangerous criminals always poses a threat. The supervision and bureaucracy seem to equally influence as stressors on the law enforcers. Few studies show that work participation is an important determinant in reducing the effect of burnout (Atouba & Lammers, 2018) and career satisfaction has also been found to related to burnout among neurosurgeons (Miyasaki et al., 2017). Further studies can consider communication adequacy and employee participation as mediator to Burnout. The results show that there is no significant difference between the groups over the stressors involving security, paperwork and bureaucracy. The results of the study are in line with the previous studies conducted in this context (Storm & Rothmann, 2003; Schauefeli & Bakker, 2004; Mostert & Rothmann, 2006;McCarty,Zhao, & Garland, 2007; Rothmann, 2008). The study is significant for the researchers working in this field in Indian scenario. However, future studies can take stressor dimensions on a broad level which is one of the limitations of this study. Study also doesn't discuss the coping mechanisms that can be considered in impending studies. Further, a larger sample size can be collected from different zones of the country due to diverse culture and ethnicity that will provide extended insights to the Burnout and Stressors.

Chapter 48
The Contribution of Neuroscience and Health Psychology to Macroergonomics:
Focusing on Workers as Active Agents

Universidad de Valencia, Spain

Francisco Molins
Universidad de Valencia, Spain

ABSTRACT

When a work system is considered we must focus on people that are part of the system as an active agent that can participate and interact all along the working process. In this process, stress contributes to increasing the probability of diseases and accidents. Therefore, one of the main objectives, from a preventive perspective, is to reduce stress levels. Related to this, the characteristics of healthy organizations will be described as a model to promote health. The objective of this chapter is to offer a broad and multidisciplinary perspective of prevention risk in the workplace centered in the worker, taking the view of neuroscience and health psychology. For that purpose, stress interventions in the organizations and in the individuals will be outlined. Finally, this chapter would finish proposing a preventive intervention to improve healthier work environments, taking into account neurosciences and health psychology. This proposal will be based on improving lifestyle, education for health, and self-respect.

John Henry he hammered in the mountains
His hammer was striking fire
But he worked so hard;
it broke his heart
John Henry laid down his hammer
and died, Lord, Lord
John Henry (trad. Adapted by Pete Seeger)

GENERAL PERSPECTIVE

John Henry is a traditional character from the history of the United States of America that represents the fight between the man and the machine. The man, John Henry, fighting against the machine to prove that men can defeat the machine; at the end, John Henry wins but finally, due to the great effort, dies. From a humanistic point of view, the need to be superior to the machine is a good view to preserve the supremacy of men in front of the machines; but, this "romantic" view finishes with John Henry's dead. Is it worth it? It is worthwhile dying to demonstrate that one can be better in his job? Is it worthwhile dying/getting sick for a job? That's the point. Fatal injuries related to work are usual and it is necessary to take actions to reduce these fatal consequences.

Considering that macroergonomics is a subdiscipline of Ergonomics which is concerned with the analysis, design, and evaluation of work systems, it is necessary to consider that a new vision of work systems, analyses and evaluation should be done within a wide perspective, trying to avoid mistakes and difficulties from the "classic ergonomics". Recently, Thatcher, Waterson, Todd and Moray (2017) have asserted that "ergonomics should move beyond a Westernised view of worker-organization-technology fit, taking a multidisciplinary approach which engages with other social and biological sciences". From neuroscience, when a work system is considered researchers must focus on people that are part of the system, but not as a mere "mechanical and passive elements" but as an active agent that can participate and interact all along the working process. In this sense, when the authors of this chapter talk about healthy workplaces, they refer to these people that participate of an interactive system. Moreover, every day is increasingly the necessity of person-to-person interaction to increase productivity, due to an important part of the jobs are based on social relationships. Therefore, workers should be the focus to have healthy workplaces. Thus, from a macroergonomic perspective, environmental elements have been related to psychological characteristics and performance (Realyvásquez, Maldonado-Macías, García-Alcaraz, Cortés-Robles & Blanco-Fernández, 2016). Therefore, a new perspective seems necessary to have a more comprenhensive vision of sociotechnical systems and its relation to performance and health.

The main aim of Ergonomics is to find the harmony between efficiency and workers' well-being (health, security and satisfaction) by means of changing or improving working conditions. Considering that Ergonomics is a multidisciplinary discipline that gathers from other disciplines to address more efficiently the problems in workplace, it is surprising that despite taking knowledge from other disciplines there is a lack of addressing more comprehensive of psychosocial factors, especially stress (Serrano & Costa, 2018). Thus, it is considered that broaden the ergonomic perspective would help to cope with workplace issues. Therefore, a prospective view should be defended, not to beat the classical ergonomic perspective, but to contribute with a modern perspective gathering updated knowledge from the world of biopsychosocial sciences. It is well known that scientific knowledge and organizational practices are

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

not close as they should (Caetano & Santos, 2017). In this sense, if human being is the central point of workplace more attention must receive neurosciences that dedicate their efforts to investigate human beings' processes.

On the other hand, from a Social Psychology perspective, organizations are complex constructions of the human being. These complex organizations are created by humans, beyond the individual. Thus, the consideration of context emerges as an increasingly exciting dimension; that is, "the substrates of cognitive functions cannot be studied in isolation but that insight into their mechanisms and consequent outcomes can be gained only from the full contextual setting in which they develop and operate" (Aminoff et al., 2009). In this line, social neuroscience seeks to specify the neural, hormonal and even, genetic mechanisms underlying social behavior. All behaviors under work contexts are social behaviors that have consequences at individual, group and the organizational level. In fact, social neuroscience is trying to understand the associations between social behaviors and biological changes and *viceversa* (Cacioppo, Bernston & Decety, 2010). In this sense, one the major concerns in workplace is the healthy factor; that is, the amount of diseases and injuries that occur in workers. Additionally, as it is stated by the World Health Organization (WHO) health is a complex concept that includes psychological and social health. Therefore, neuroscience comprises an important conceptual approach to understand global mental health (Stein et al., 2017). Complementary, a good performance is necessary for an organization; in this regard, self-regulation and goal pursuit should be taken into account due to be an important part of a good performance (Gallo, Cohen, Gollwitzer & Oettingen, 2013).

But what is needed to prevent from diseases or accidents? A great part of the diseases/accidents come from the high levels of experienced stress (Adler, 2007). One important issue about stress is that people are not good to recognize the own stress state. Usually, stress is recognized by people after months or even years of suffering, when the consequences are present. Associated with stress, there is an increase of mental load that is another important risk in work environments (Serrano & Costa, 2018). Therefore, one of the main objectives, from a preventive perspective, is to reduce stress levels and make workers conscious about their levels of stress. In this regard, from a psychosocial perspective, jobs require abilities (i.e. communication, social skills, conflict management, decision making, relaxation, social abilities, self-control, and others) that are necessary to cope with stress, mental load and the diseases related to (cardiovascular diseases, injuries, stress, burnout, among others).

Considering all above, the objective of this chapter is to offer a broad and multidisciplinary perspective of prevention risk in the workplace centered in the worker, taking the view of social neuroscience (including social psychology) as a basis that, to the knowledge, has not been employed in ergonomics, in spite that is a comprehensive sight of human beings in social contexts. Finally, from the Psychology point of view, individual differences will be emphasized as an important factor that should be considered when human behavior is studied. All of this will be considered, with the assumption that productivity should be one of the main objectives (together with the health and satisfaction of workers). In fact, taking care of workers increases *per se* productivity. To carry out this aim, this chapter will dedicate the first part to explain and show what is needed for a healthy workplace, from the point of view of Positive Organizational Psychology. In the final part, a broad conception of prevention risk factors will be addressed integrating neuroscience and health psychology into ergonomics, to offer a long-term prevention based on the worker responsibility and the ability to detecting psychosocial risks.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

HEALTHY ORGANIZATIONS

Trying to optimize the functioning of an organization is not new. In the nineteenth century, with the Second Industrial Revolution, with the rise of companies and new forms of work, it was considered essential to use scientific knowledge to study and optimize each position, so that workers could reach their maximum performance and satisfaction. This idea came up with the engineer Frederick Winslow Taylor and the concept "scientific management" (1984), who firmly believed in the existence of "one best way"; that is, to analyze the characteristics of the work to assign it to the worker that best fits in it. However, it was considered a reductionist proposal focused on mechanical aspects, such as the division of tasks, which forgot intrinsic characteristics of human being, such as motivations, goals or needs (Waring, 2016).

Human factors began to gain importance after the studies of the psychologist Elton Mayo at the beginning of the 20th century (Hawthorne Plant experiments). These studies began with the aim of studying what working conditions favored performance: schedules, luminosity, temperature, ...; however, to the surprise of Elton Mayo, the performance increased in any of the conditions that were tested; then, improvement was interpreted to the fact that all workers were being supervised by the researchers (Sedgwick & Greenwood, 2015). Thus, if the mere fact that a worker felt "special" served to increase their performance, it was evident that Taylor's rational approach, where the worker worked solely for money, lacked complexity.

Therefore, and despite its limitations and methodological criticism (Peiró, 1983; 1984, Veen and Korver, 1998), Hawthorne's studies served as a starting point to studying human nature in its total complexity within the organizational context, something that, would lead to the development of the Psychology of Organizations and Human Resources. The European Network of Organizational Psychologists (ENOP) defines the Psychology of Organizations (or Organizational Psychology) as a subdiscipline of psychology that is responsible for the study of collective behavior in relation to the sociotechnical system called "organization" (Martínez, Ramos and Moliner, 2015). This discipline analyzes and studies all the components of the organization, both individually and collectively, on the basis that workers are people that have personality traits, values, attitudes, cognitive limitations, objectives, etc.

On the other hand, thanks to the contribution of Martin Seligman with the development of Positive Psychology or the "scientific study of the optimal functioning of the human being" (Seligman, 2000), Positive Organizational Psychology has also begun to be discussed (Negruti, Hristova, Larsen, Krumov, 2015). This discipline goes beyond the weaknesses of the organization, also influencing its potential to promote its optimal development and achieve a healthy organization (Salanova, Martínez & Llorens, 2014; 2005).

How to Get Healthy Organizations?

As defined by Salanova (2008), healthy organizations are all those organizations that "make systematic, planned and proactive efforts to improve the health of employees through good practices related to the improvement of tasks (i.e. designing and redesigning of positions), the social environment (i.e. improving communication) and the organization (work / private life conciliation strategies)". But why is it convenient to get a healthy organization? Some results have been associated with these organizations at different levels (Martínez, et al., 2015):

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Individual: the presence of resources in the workplace is associated with employee welfare, such as high levels of engagement, job satisfaction and performance. Other results also mentioned in the literature are the commitment of the worker and the low turnover and intention of abandonment.
- Group: organizational resources and engagement (measured at the team level) are related to collective outcomes such as the service climate and collective performance.
- Organizational: a key result of healthy organizations is the satisfaction and loyalty of clients, social responsibility and economic-financial results.

Based on these results, it is essential to promote healthy organizations. However, this goal is not simple. There are many variables to consider and it seems complicated to be able to address them all. Therefore, in order to simplify the task and based on the Empirical-Comprehensive Healthy Work Organization (ECOLS) model (Wilson, DeJoy, Vandenberg, Richardson & McGrath, 2004), the authors of this chapter will offer a perspective to detect the main variables and explain what strategies to use to address them.

Job Design

Job design involves, on the one hand, (1) the characteristics of the task; that is, its complexity, duration, physical conditions in which it will develop (temperature, luminosity, noise, etc.) and (2) the personal characteristics of the worker.

Today, it is known that human beings show a limited rationality (Thaler, 2016; Tversky and Kahneman, 1974, Simon, 2000, Sunstein and Thaler, 2003) and are influenced by their emotions, values, attitudes, personality and experiences when interpreting their work context. After this conceptual evolution, it is understood that, in reality, the objectivity of the characteristics of work is not as important as the worker perception. In addition, not all workers have the same motivations. While some people may aim for a higher salary (extrinsic motivation), there will be others who value more a job that allows self-actualization (Maslow, 1954; 2016), be creative, have autonomy, assume responsibilities and feel that their work is being productive (intrinsic motivation). Therefore, if an optimal work design is intended, the objective characteristics of the position and the personal characteristics of the worker must be analyzed in interaction. All of this point to the need to individually address each specific situation, taking into accounts both dimensions to achieve the greatest possible adjustment.

Organizational Climate

By organizational climate is understood the individual perceptions that members of an organization have regarding their social environment (Martínez, et al., 2015); that is, their personal experience, although to some extent shared with some or all of the other workers, regarding to the work environment. Many studies relate different perceptions of climate to work performance, the involvement of workers, satisfaction (eg Patterson et al., 2005, Parker et al., 2003, Ostroff & Bowen, 2000, Reichers & Schneider, 1990; Vaca, Vaca & Quintero, 2015; Zambrano, Véliz & Barzola, 2017) and, ultimately, with its importance to maintain a healthy organization (Prado, 2014; Vega, Gálvez & Santamaría, 2017). Work climate is related to three relevant constructs: social support, communication and participation and involvement.

Social support is "the feeling of being appreciated and valued by other people and of belonging to a social network" (Barra, 2004), and it has been frequently linked to maintaining health and overcoming the disease (Almagiá, 2014; Hakulinen, et al., 2016; Holt-Lunstad & Uchino, 2015; Brodman, 1993;

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Kaplan, Sallis & Patterson, 1993). The lack of social support within an organization is an important risk factor in the emergence of Burnout (Aranda, et al., 2004). Therefore, it is a key to favor a climate of warmth and companionship that allows employees to feel integrated into the social network of the organization. For this purpose, it is proposed to increase accessibility, for example, through group leisure activities or self-help groups within the work, which favor the link between employees.

On the other hand, communication is the process by which members of an organization are interrelated by exchanging information, establishing links and commitments, delegating, supervising and assuming functions (Moriano-León, 2005). Optimal communication is necessary to maintain a good organizational climate and employee's satisfaction (Pellegrin & Curry, 2011). Finally, participation consists in an active role in the activities and decisions that are made within the work environment. There is a clear relationship between those employees who participate and autonomy and the increase in motivation (Martínez, et al., 2015). Being motivated is the key to developing engagement, "a psychological state characterized by vigor, dedication and absorption or concentration at work." (Schaufeli, Salanova, González-Roma and Bakker, 2002; Bakker & Albrecth, 2018). Those people who experience engagement, are more committed and involved and strive more in their work, establishing a link with it and valuating more their role and tasks (Norton, Mochon & Ariely, 2010). In addition, engagement would be related to higher performance, well-being and the decrease in absenteeism (Schaufeli, Salanova, González-Roma & Bakker, 2002). Therefore, it seems appropriate to promote the delegation of responsibilities and the decentralization of authority so that workers participate in the organizational decisions in order to experience greater autonomy, involvement and motivation.

Labor Perspectives

Labor perspective refers to the perception that workers have about the stability and security in their job, as well as the possibility of advancing in their professional career and feeling satisfied. In relation to this construct, in this chapter the authors will refer to the perception of justice and self-realization.

The perception of justice refers to the "personal evaluation of the ethical and moral standards that characterize the organization" (Omar, 2015), and will depend on organizational practices and policies, mainly focused on leaders (Peña-Ochoa & Durán, 2015). Many authors (i.e. Omar, 2015; Cheng, 2014; Moon, Hur, Ko, Kim, & Yoon, 2014; Bal, de Lange, Ybema, Jansen, & Van der Velde, 2011) point to a clear relationship between the perception of justice and a greater commitment and involvement with the organization. In addition, perceiving a climate of justice maintains the confidence of workers, an aspect that, according to Wei-Yuan, Shang-Ping, Chwei-Jen, & ChinFang (2013), links organizational justice with commitment. Omar (2015), also highlights, that justice is directly related to an increase in performance and job satisfaction. Some practices that contribute to developing the perception of justice would be transparency, explanation and justification in decision-making, attention to employees, or the exercise of voting to promote an organizational democracy.

On the other hand, self-actualization would be the need that, according to Maslow (1954; 2016), many individuals express that, far from wanting a higher salary, they prefer to transcend, develop their skills, be creative, and leave their mark. It is necessary, therefore, to analyze the real motivations of workers to identify which elements is an incentive for them and to improve their satisfaction and performance. Otherwise, wages can be raised and economic bonuses can be provided that do not produce beneficial effects, or even harm (Ariely, Gneezy, Loewenstein, & Mazar, 2009; Chib, De Martino, Shimojo, &

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

O'Doherty, 2012), when it would be better to promote tasks according to this intrinsic motivation of self-actualization.

Central Organizational Attributes

This domain is mainly related to the attitudes, values and policies adopted by an organization (Martínez, et al., 2015), that deals with the culture and organizational practices in more detail.

Pellegrin & Currey (2011) defined the organizational culture as values and beliefs that guide behavior in the workplace, whose strength and stability is related to the performance of the organization (Salas-Arbeláez, Solarte & Vargas, 2017; Sorensen, 2002). Culture goes beyond people (Ashkanasy, Wilderom & Peterson, 2011), so, unlike climate, it is a much more stable element that complicates its approach to the point of suggesting a preventive proposal: people who want to access to an organization should know their culture and if it is related to their beliefs to decide if it is convenient to enter, before being immersed in it. In the case of organizacional culture, each intervention must be developed *ad hoc*, depending on the particular needs that require modification. For example, to flexibilize a highly controlled and hierarchical organization, it would be useful to apply group dynamics that help establish links and for supervisors to trust subordinates more, granting them greater autonomy and flexibility. Or perhaps, it would be useful to provide formation that develop the ability to manage stress and pressure so that employees can better adapt to a culture of innovation that constantly faces moments of uncertainty and risk decisions.

On the other hand, organizational practices refer to all those strategies that are exercised in the workplace by the leaders and/or supervisors that influence the employees. Throughout the chapter the authors have already mentioned several practices that would favor the development of healthy organizations, for that reason, here, besides inviting to review those already commented, the authors will limit themselves to mention the distinction of organizational practices proposed by Salanova (2009): organizational (selection and socialization of new employees, work-life balance strategies, employability development), social (creation of open channels for organizational communication, promote healthy leadership styles, foster a culture of quality customer service and to the citizen) and of task (to combine tasks to avoid boredom, development of feedback channels, propose challenging tasks). It should be noted, however, that there are no ideal practices and that, as stated by Salanova (2009), "each organization should develop its own menu of good practices taking into account its own culture and values".

All the above aspects are basic when it comes to understanding the welfare of organizations and workers, and they entail the need for a psychosocial adjustment between the worker and his work. In this sense, psychological adjustment can be reach with a balance between (1) the needs and competencies of the employee and (2) the demands of the work environment (Cullen, 1995). This relationship necessarily reminds the demands-control model (Karasek & Theorell, 1990). Demands-control model (also called the "job strain model" or DC) emphasizes different aspects in the relation between jobs and health. Work stress and its effects on physical and mental health are not only the result of aspects of the job, but rather of the joint action between the demands ("job demands") and the degree of perceived control ("decision latitude"). Thus, the model identifies two basic aspects within the work situation: work demands and the possibility of control. According to this model, job stress appears when a situation is characterized by high demand and low latitude decision (reviewed in Serrano & Costa, 2018). When people talk about the possibility of control, in reality they are talking about the subjective perception of control, that is, it is the worker who perceives that there are insufficient resources to face demands. Lazarus and Folkman (1984), affirmed that an event would only be a stressor (or will be perceived as a

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

demand) when people perceive it, and this evaluation "will depend on the coping strategies, the individual and their previous experience". In this sense, stress, although it is an adaptive response of the organism (can cope with and solve a situation), can become chronic and harmful if it is frequent; that is if the working conditions are not adequate or the demands are always perceived as very high. Thus, chronic stress is related to various pathologies and negative moods that affect the health and performance of the worker (Serrano & Costa, 2018). For example, many studies point to its immunosuppressive effect (i.e. Borrás, 1995, Gómez-González & Escobar, 2006; Pellicer, Salvador & Bénet, 2002; Selye, 1936, 1950), facilitating the appearance of diseases and difficulting their cure; others relate stress to the greater risk of the appearance of cardiovascular pathologies (i.e. Cohen, Edmondson & Kronish, 2015; Kivimäki & Kawachi, 2015; Lagraauw, Kuiper & Bot, 2015). In addition, stress has also been linked to the feeling of demotivation and dissatisfaction, lack of involvement with work, poor performance and the desire to leave (i.e. Barkhuizen, Rothmann & van de Vijver, 2014; Gracia, 2015; Padula, Chiavegato, Cabral, Almeid, Ortiz, & Carregaro, 2012; Sonnentag, Mojza, Demerouti & Bakker, 2012).

However, it is important to remember that a stress must be perceived by the worker and this will depend on their individual characteristics. Therefore, the employees should be empowered; that is, provide coping strategies and improve their abilities, so that they feel more effective to cope with stressors (Grau, Salanova & Peiró, 2012) or even prevent their appearance.

A NEW PREVENTION PROPOSAL TO BENEFIT OF HEALTHIER WORK ENVIRONMENTS FOR HUMAN WELL-BEING

Previous section has finished emphasizing the need to provide empowerment and coping strategies that reduce the likelihood of stress and, as a consequence, of accidents, errors and reduction of workers' performance. For this, there are numerous effective interventions. However, accidents and workplace deaths continue, which makes believe that a broader approach is necessary. Thus, as stated at the beginning, the purpose of this chapter is to optimize organizations to be healthy places where workers do their jobs efficiently without compromising their health, and even improving it. Only in that case, companies will get healthy employees. Thus, healthy employees are characterized by high self-efficacy, optimism, resilience, energy, motivation, confidence and engagement. Therefore, promote these types of employees seems the smartest option to increase the success of the company. However, instead of worrying about promoting healthy workers, organizations and workers are usually limited to trying to reduce stress through organizational or individual interventions (Colligan & Higgins, 2005). The following section is dedicated to show strategies to reduce stress.

Strategies to Reduce Stress

Although stress is a problem that is perceived individually, when talking about work stress, the authors of this chapter mean that a significant number of workers are submitted to stress and that it is due to working conditions. Therefore, it is assumed that these are not optimal and are susceptible to intervention. In this sense, interventions are usually carried out to solve a problem already generated. On the other hand, work stress can be difficult to specify in an organizational intervention, as well as assessing whether this has been successful, and this generates distrust when investing in interventions that improve the management of the problem. However, when the problems begin to translate into negative consequences

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

regarding productivity and benefits, the need for intervention begins to be recognized. In fact, the new trends in business management go in the direction of emphasizing and protecting "human resources".

The organizational strategies of intervention can be classified based on different aspects (Michie, 2002): worker control, information and communication systems, management styles, task interest, conflict regulation, socialization process and training.

- **Worker Control:** One of the measures that can be taken to reduce the risk or impact of work stress is to increase the degree of control. This will positively influence health and satisfaction. The degree of control should be about what the employee should do (his / her competences and functions, results, among others) and how he / she does it. In addition, the worker should be able to regulate their work and rest times, as well as participate in aspects related to their work. Obviously, this is the ideal and always taking into account that the worker meets the objectives assigned to him. Control involves good training and responsibility, so the worker has to be well trained.
- **Information and Communication Systems:** The information systems of companies must be precise as they affect all workers. Thus, the information that workers have must be precise (this does not necessarily mean giving all the details), consistent with other information, as well as with the decision making of the organization. The language must be adapted to the receiver (so the level of complexity must be varied depending on the worker). On the other hand, the treatment and transmission of information must be adequate and accessible. In this regard, an information system must allow the worker to know what is expected from him (tasks or objectives to be met) and get feedback on the work done. In this sense, workers and managers must be trained in communication so that exactly what is transmitted is conveyed and not what is understood. Therefore, messages must be clear in a context where there is no noise and the worker is receptive to that message. All this will greatly reduce the risk of work stress due to communication mistakes.
- **Management Styles:** In an organization an appropriate design of the hierarchy is required and a normative and regulatory system that is accepted by the workers. For this purpose, it is recommended to have an effective style of leadership focused on the democratic and participative direction. Therefore, the manager must allow the worker's effective participation making him see that he is part of the organization. On the other hand, the regulations within an organization must be affordable and logical and understood by all employees. In this line, working with clear objectives is of great acceptance since it allows to reach the objectives giving a certain degree of freedom to the worker.

In short, the most effective supervisory styles are those that focus on employees considering their characteristics. For this, managers should be trained in human resource management skills, and specifically in social skills, to avoid management styles that may be negative to subordinates. All of this ends up impacting on a greater identification of the worker with the company, increasing their sense of responsibility, as well as increasing the degree of autonomy, which will result in greater control and in a reduction of stress (provided that the work is well planned and workers have the necessary skills to perform the tasks).

- **Interest of the Task:** One aspect that greatly increases the feeling of stress is the monotony and boredom at work. Thus, in those jobs that have a high degree of monotonous or tedious tasks it is recommended the rotation of positions (that the workers do not do the same task throughout the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

day), modifying the way of doing the work or increasing the degree of complexity of the work. In this sense, involving the worker in decisions about their tasks will increase the feeling of belonging and will give a greater degree of satisfaction (reducing the degree of stress).

- **Conflicts:** A basic aspect to reduce work stress is to reduce the number and degree of labor conflicts. Any conflict will cause an increase in the stress response and a reduction in well-being. Therefore, proper management of the conflict is necessary. For this, the adequate training of the workers, as well as the clarity in the definition of positions, will allow the reduction of labor conflicts. On the other hand, the implementation of mediation protocols will allow conflicts to be resolved based on rules.
- **Socialization and Training Processes:** In general, all the above strategies are aimed at the organization. However, there are other interventions focused on the individual that are also very effective. In this sense, the processes of socialization of the new workers are basic actions for the integration and knowledge of the new incorporations. This greatly reduces the stress of the "new" worker by having contacts (including a "guide") that will make it easier to know the company. On the other hand, giving the right training for the position that is going to be covered is fundamental for the reduction of stress. Training refers to training in job-specific skills and training in social skills and management of the position itself. In addition to these "formal" skills, knowing the ins and outs of the organization will also allow the worker to predict possible changes in the organization. In short, for the reduction of stress the worker must have skills that allow a better adaptation to the position and the company.

In summary, increasing the degree of control, reducing conflicts, knowing how to manage people and adequate training are factors that help reduce the level of stress in organizations. However, all this does not guarantee success. For an intervention to be effective there are a number of aspects that will increase the probability of success. In particular, any intervention must be ordered and reflected, in addition to having the medium / long term support of the management staff. On the other hand, an adequate risk analysis must be carried out, identifying them adequately, analyzing them and assessing the causes. With this, the intervention proposal must be designed in detail: knowing how to do it; who and where it will take place; when; what stages it will take; to which groups it will be directed, etc. Then carry out the intervention as planned and later evaluate if the intervention has been successful. Finally, it is essential that there is a follow-up and subsequent control to avoid that the risk factor turn again. All this must be complemented with a specificity of solutions regarding the context and using professionals with experience in the field of organizational intervention. Last but not least, there should be worker participation allowing their collaboration in the intervention. In short, a global and integrated intervention within the organization would be the most appropriate to prevent or solve the problems of stress in companies.

Measures of a global, organizational and collective nature are the measures that are usually recommended in organizational environments. However, there is another type of individual intervention that would consist of providing workers with strategies to adapt to the work environment. All individuals are exposed to stress and its consequences. Therefore, stress prevention is the optimal option. But, what are some of the preventive strategies that can serve as protective factors? Here there are some of the stress prevention strategies that, from Psychology, are recommended most frequently:

- Having social support: as mentioned previously, social support buffer stress.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Training of social skills: being able to relate more efficiently, be assertive and properly handle criticism would be protective factors against stress.
- Change negative thoughts into positive ones: negative thoughts have a direct influence on how people value their self-concept and self-esteem, reducing them and believing themselves less able to cope with stress, with its consequent harmful consequences.
- Interpret properly difficult events: assess them as a challenge and not as a threat.
- Time management: a good distribution of tasks helps to keep calm and reduces anxiety and stress.
- Time for leisure: leisure is necessary to break the monotony, which also generates stress, and it is important to free oneself from the burdens for a while.
- Maintain an active style of coping: it is possible to request help and even receive training to know how to perform a task better, or solve a problem, but it is convenient to face it and not procrastinate, otherwise, it will last over time and its effects will be worse.

Both preventive and intervention strategies on stress are intended to increase control in workers. However, although many companies know and follow the guidelines mentioned above and aim to achieve such objectives that would result in health, employees are at the same time facing with contradictory results: in the 21st century a real pandemic of stress is raging and causing harm. These facts lead researchers to think that, perhaps, due to many efforts to intervene in organizations, the focus should be placed on the knowledge provided by the behavioral and neurosciences as key disciplines to understand the human being in interaction with their psychosocial and organizational environment.

Beyond the Interventions That Reduce Stress

From Psychology and Neuroscience many and very diverse techniques are known that people can use to learn how to manage and reduce stress. However, generally within organizations, this knowledge is not usually taken into account or is unknown. These facts lead to think that, perhaps, in spite to many efforts made to intervene in organizations, the focus should be placed on the individual, going beyond a much more preventive level.

From the psychology point of view, there are several stress interventions programs that are effective to reduce the consequences of stress or to cope with it. All of them are adequate to teach workers in order to reduce the negative effects of stress. Briefly, stress interventions can be classified depending on the principal effects: physiological effects (reducing the levels of physiological arousal produced by the stress; i.e relaxation or breathing techniques) or cognitive effects (modify the coping of people in stressful situations; i.e. inoculation of stress, mindfulness, problem-solving, among others). All these techniques are adequate to reduce the negative effects of stress or improve coping. However, these techniques are relegated to the individual. Thus, it is found that work stress generates many negative consequences such as stress-related diseases (cardiovascular, metabolic), performance reduction and job dissatisfaction. In the case of diseases related to stress, science is emphasizing the importance of encouraging healthy life habits to avoid or reduce diseases such as cardiovascular, metabolic or psychological that are directly related to stress. In this sense, the promotion of a healthy lifestyle entails the realization of physical activity and a healthy diet. It has been demonstrated that the performance of moderate and regular physical activity prevents the appearance of cardiovascular and psychological diseases (Mikkelsen, Stojanovska, Polenakovic, Bosevksi & Apostolopoulos, 2017), as well as a healthy diet reduces the risks of cardiovascular and metabolic diseases (Dawson, Dash & Jacka, 2016; Hoerr, Fogel & Van Voorhees, 2017).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Therefore, in addition to the actions that can be taken by organizations to reduce stress for workers, certain behaviors or a healthy lifestyle can reduce the likelihood of stress-related illnesses or allow a better coping with stress (Adler, 2007). In this regard, from the perspective of the authors of this chapter, it is considered that stress reduction or prevention programs should be complemented with distal prevention programs from the work situation itself; that is, the proposal of this chapter would be that, given that a healthy lifestyle prevents the appearance of some diseases related to stress and that there are psychological techniques that improve stress behaviors, prevention should be focused on anti-stress lifestyles, that at least, reduce the probability of the appearance of the negative consequences of stress. We consider that these healthy behaviors should be part of the lifestyle of people, so it should be taught from school, fostering in children physical activity and healthy eating as basic elements of health in general, as well as teaching of psychological techniques (for example, relaxation, problem solving or mindfulness techniques, among others) that would be useful to shape a healthy psychological lifestyle. All this would result in a better coping with work environments, based on a lifestyle that would be contrary to stress and therefore its negative consequences. In this sense, Neuro-education is a promising new perspective (Monfardini, Reynaud, Prado & Meunier, 2017) that links neuroscience and education in order to "to create a better understanding of how people learn and how this information can be used to create more effective teaching methods, curricula, and educational policy" (Carew & Magsamen, 2010).

Therefore, the proposal of this chapter aims at a distal prevention, educating people from the school in healthy lifestyle (physically, psychologically and socially), using the knowledge of neurosciences, who will later face their jobs and sources of stress in a more efficient way and who will also have an organism more prepared to suffer the negative consequences of stress. On the other hand, and associated with the above, it is also considered that it would be necessary to train in a "universal" occupational risk prevention from school in order to teach children their labor rights and to avoid, for example, the abuses / excesses that may be committed in the work context, as well as, his obligations and responsibilities. This section emphazises the need to train workers in the limits of what is healthy and what is not; from the experience of the authors of this chapter, they have detected workers who consider normal tolerate high levels of stress or labor conflicts, which gives them to understand that workers assume certain working conditions as normal, when they may not be. That is why, in such risk prevention training it would be necessary to emphasize self-awareness about the protection of one's health; that is, working people must know discern when working conditions can cause health problems.

In short, the proposal of this chapter proposal aims to promote healthy lifestyles to have workers who know to manage their work so that reduce the negative consequences. In this way, employees would have committed, and they would know their rights and that would make them more active in their jobs and in the long run they would get sick less, producing, ultimately, greater benefits.

CONCLUSION

In conclusion, this proposal is based on improving life-style, education for health and self-respect, considering that a long-term prevention will be more effective than a short-term preventive approach. The reach that are expected from this proposal is not only prevent psychosocial risk factors (stress or burnout) but physical risks, taking into account that the proposal is focused on the individual as an active agent that is worried (and responsible) about his health; that is, the most important thing is that workers must take care of their own. This perspective goes beyond organizations but governments, trying to capture

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the attention of politicians to propose a complementary model of education useful to learn behaviors about healthy work behaviors and, in consequence, to have healthy workplaces.

In short, the most effective is to make global interventions that reduce psychosocial risk factors but that take into account the worker in terms of their abilities to cope with stress. Consequently, this comprehensive intervention will improve the functioning of stressed people making it more efficient in the environments as well as improving the organization, in terms of productivity and quality.

Chapter 49
Industry Process Safety:
Major Accident Risk Assessment

Ales Bernatik
https://orcid.org/0000-0002-2625-0441
VSB – Technical University of Ostrava, Czech Republic

ABSTRACT

This chapter deals with the issue of process safety in industrial companies and major accident prevention. In the present-day technologically advanced world, industrial accidents appear ever more frequently, and the field of major accident prevention has become a dynamically developing discipline. With accelerating technical progress, risks of industrial accidents are to be reduced. In the first part, possible approaches to quantitative risk assessment are presented; and continuing it focuses on the system of risk management in industrial establishments. This chapter aims at providing experiences, knowledge, as well as new approaches to the prevention of major accidents caused by the implementation of the Seveso III Directive.

INTRODUCTION

In the past and also recently, major accidents have represented, owing to their consequences on human health, property and the environment, important events that should be avoided. The need to assess objectively the risk, to which employees or populations are exposed in connection with the production, processing, storage and transport of hazardous materials, appears. What will enable the regulation or management of risks to employees and the surrounding environment is only adequate evaluation.

The aim of major risk prevention is to operate process installations at an acceptable societal level. Risk acceptability limits can differ depending on the maturity of the state, the size of establishments and a number of other factors that must be, however, included into the analysis and assessment of risks.

The chapter describes benefits of carrying out the risk assessment. The results of risk assessment brings information on the identification of hazards to possible targets of impact; the targets can be employees and installations of the establishment, the surrounding human population and the environment. Risk assessment presents information on possible preventive means and risk reduction priorities. Results of analysis assess preparedness for accidents and it is a source of information for emergency plan preparation.

The area of major accident prevention represents a relatively new branch of science. Nevertheless, transportation accident prevention requirements are an outgrowth of this branch. The first approach is to evaluate stationary risk sources with the largest amount of dangerous substances. However, dangerous substances limits have been decreased (amendments of Seveso Directives) and current attention was moved to so called "unclassified risk sources" and to mobile risk sources. Greater and greater amounts of dangerous substances are transported by road and rail. A growing interest in the subject area is also related to the threat of terrorist actions, possibly involving the stationary risk sources or the transport of dangerous substances.

The objectives of the chapter are to promote area of process safety for prevention of industrial accident.

BACKGROUND

Process safety focuses on preventing fires, explosions and accidental chemical releases in chemical process facilities or other facilities dealing with hazardous materials. Process safety considers a wide range of technical, management and operational disciplines coming together in an organized way. Main focus is on design and engineering of facilities, maintenance of equipment, effective alarms, effective control points, procedures and training. Process safety generally refers to the prevention of unintentional releases of chemicals, energy, or other potentially dangerous materials during the course of chemical processes. The consequences of so call major-accident can have a serious effect to the plant and environment.

By Seveso III Directive (Seveso, 2012) 'major accident' means an occurrence such as a major emission, fire, or explosion resulting from uncontrolled developments in the course of the operation of any establishment covered by this Directive, and leading to serious danger to human health or the environment, immediate or delayed, inside or outside the establishment, and involving one or more dangerous substances.

In the world, a number of major accidents have occurred; to the best known of them, FEYZIN (France – 1966), FLIXBOROUGH (Great Britain – 1974), SEVESO (Italy – 1976), BHÓPÁL (India – 1984), HOUSTON (USA – 1989), and others belong. The majority of significant accidents are described in the specialized literature in detail, see e.g. (Lees, 2005). Information on major accidents taking place in the countries of European Union is collected in the Joint Research Centre, MAHB (Major Accident Hazards Bureau) in Italian Ispra. The Major Accident Reporting System (eMARS) was established to handle the information on major accidents submitted by Member States of the European Union to the European Commission in accordance with the provisions of the Seveso Directive (eMars, 2019). Currently, eMARS holds data on more than 980 major accident events (by September 2019, see Figure 1).

In some countries, statistics on accidents involving the transport of dangerous substances are recorded. For example, in the U.S. Department of Transportation (DOT), PHMSA - the Pipeline and Hazardous Materials Safety Administration has public responsibility for the safe and secure movement of hazardous materials to industry and consumers by all transportation modes. Argonne National Laboratory (ANL, 2000) also reports on transport risk in the USA. The purpose of this National Transportation Risk As-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

sessment (NTRA) study was to quantitatively characterize the risks associated with the transportation of selected hazardous materials on a national basis. Considering fatality risks on a per-ton-mile basis, the risks from LP gas substantially exceed the risks for gasoline, TIH materials (TIH - toxic by inhalation), and explosives (see Figure 2).

Figure 1. Numbers of EU major-accidents in database eMARS (eMARS, 2019)

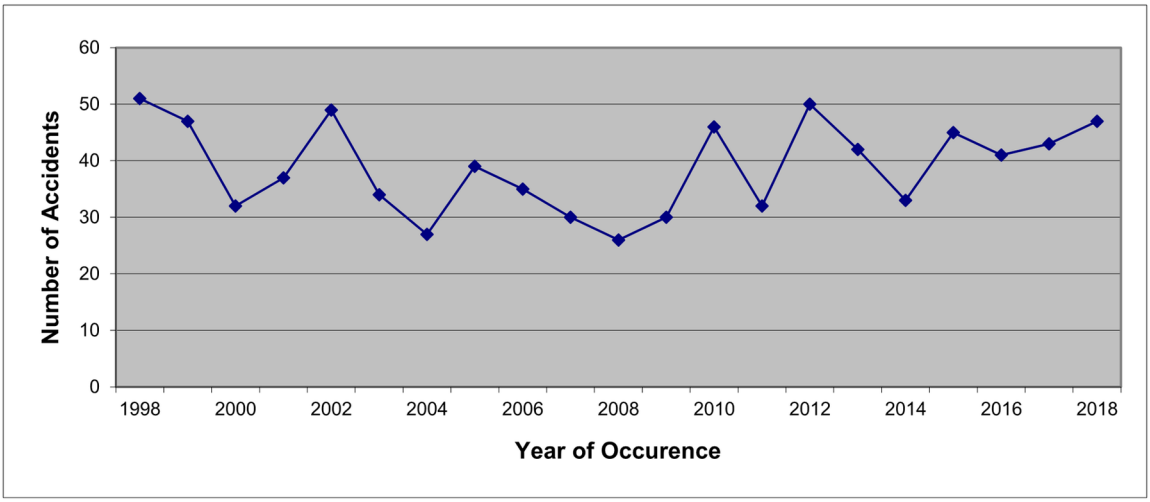

Figure 2. Fatalities normalized by commodity Flow (ANL, 2000)

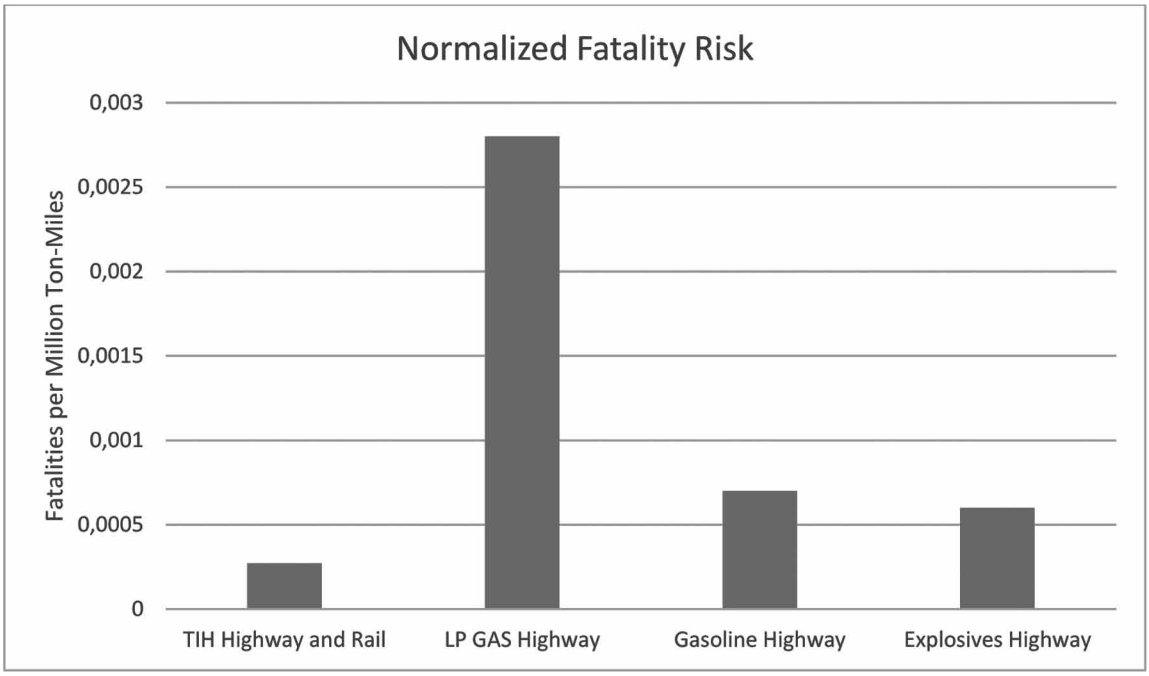


EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Well known database is ARIA - the Analysis, Research and Information on Accidents Database operated by the French Bureau for Analysis of Industrial Risks and Pollutions (BARPI). ARIA coverage geographically mainly France and Europe, but is well documented for accidents anywhere worldwide, covers more than 30 000 accidents. (Salvi, 2017)

Accident databases are an important source of information for risk analysis, especially for determining the probability of scenarios.

After a lot of accidents in the world and especially after an accident in Italian Seveso (1976), the Directive 82/501/EEC on the Major Accident Hazards of Certain Industrial Activities – designated as Seveso Directive was prepared and issued in the framework of European Union. In the year 1996, an amendment to the Seveso Directive 96/82/EC - Control of Major Accident Hazards Involving Dangerous Substances – known under the name Seveso II was made. Modifications in the Seveso II Directive in the year 2003 (No. 2003/105/ES) are connected with reactions to major accidents in previous years – the release of cyanides from a tailing pond of a mine at Baia Mare in Rumania (2000), a fire in a firework storage facility in Enschede in the Netherlands (2000) and a fire and explosion in a French factory for fertilizer production in Toulouse (2001). Finally, the so-called Seveso III Directive (Council Directive 2012/18/EU of 4 July 2012 on the control of major-accident hazards involving dangerous substances) entered into force.

Legislation now covers twelve thousand industrial sites across the EU (Salvi, 2017) where chemical substances are used or stored (upper / lower tier establishments). The latest modification of this Seveso Directive brought about the unification of the classification of dangerous chemical substances in the area of prevention of serious accidents in accordance with so called CLP (Regulation (EC) No 1272/2008).

More recent major accidents exerted a novel impetus on process safety, for example:

- Texas City Refinery explosion (March 23, 2005): An explosion occurred at a BP refinery in Texas City, Texas. Over 100 people were injured, and 15 employees were confirmed dead.
- Fukushima Daiichi nuclear accident in Japan (March 11, 2011): A Nuclear accident, where no direct deaths but a few of the plant's workers were severely injured or killed by the disaster conditions resulting from the earthquake and tsunami.
- Fertilizer plant explosion in West, Texas (April 17, 2013). An explosion occurred at the West Fertilizer Company storage and distribution facility in West, Texas, while emergency services personnel were responding to a fire at the facility. At least 14 people were killed, more than 160 were injured and more than 150 buildings damaged or destroyed.
- Binhai, Tianjin, China (August 12, 2015): Two explosions within 30 seconds of each other occurred at a container storage station at the Port of Tianjin, 173 people died as a result.

Examples of large-scale industrial accidents warn us of postponing the solving of these problems. As follows from accident statistics, the most frequent cause of accidents is a human error (up to 80%).

GENERAL PRINCIPLE OF MAJOR ACCIDENT RISK ASSESSMENT

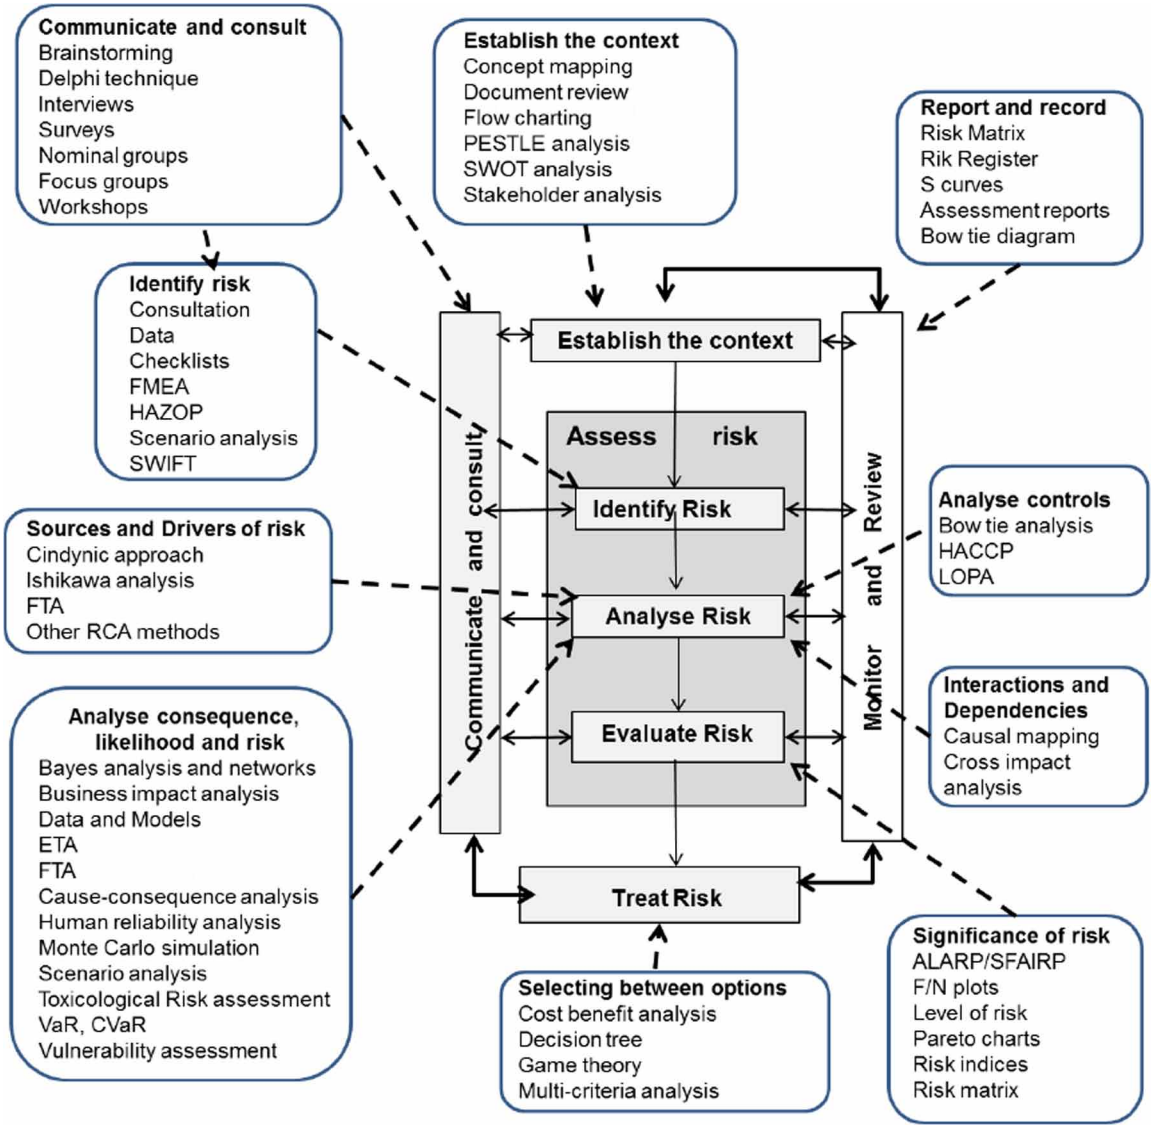
Appropriate partial methods are recommended for individual risk management steps. An overview of the world-recognized techniques appropriate for each risk management step is given in the following

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

diagram (see Figure 3). The scheme is based on the risk management process diagram in ISO 31010, some techniques can be used in multiple risk management steps.

These methods of Figure 3 in ISO 31010 are characterized in detail, it is clearly reported their utility, time-consuming and demands the specialists input data and the application. Methods are divided into qualitative and quantitative.

Figure 3. Methods / techniques in risk management process (ISO, 2019)



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Generally, the following steps are to be taken in the major accident risk analysis and assessment:

Step 1: Identification of sources of risk (hazards) and formation of possible scenarios of events and their causes that may lead to major accidents.
Step 2: Estimation of probability of major accident scenarios.
Step 3: Estimation of effects of possible scenarios of major accidents on human health and lives, on the environment and property.
Step 4: Determination of risk level and assessment of acceptability of major accident risk.

The key question of risk analysis is the selection of a suitable method. That is why a brief overview of available methods is given below. A whole series of methods that are modified versions of several most widely used methods enables the making of risk analysis; the publication (Tixier, 2002) gathers 62 methods of risk analysis known best. In this place, it is necessary to emphasize that the majority of the methods are designated as partial methods because they merely assist in particular steps of the whole process of risk analysis, e.g. in hazard identification, assessment of consequences or probability assessment (see Table 1).

Table 1. Overview of most widely used partial methods of risk analysis

Method name	Abbreviation
1. Identification of risk sources	
Checklist Analysis	CL
What-If Analysis	WI
Hazard and Operability Analysis	HAZOP
Relative Ranking	RR (F&EI, CEI)
2. Probability estimation	
Fault Tree Analysis	FTA
Event Tree Analysis	ETA
3. Consequences estimation	
Selected programs for consequences modeling	2D models - ALOHA, EFFECTS, SAFETI, PHAST, etc.
	3D models (CFD) - FLUENT, FLACS, etc.

These most widely used methods have various applications depending upon the extent and complexity of the process, provide various kinds of results, and differ in demands concerning the working team and time. Some methods are interrelated or overlap each other, others are incomparable. The selection of the method is influenced by several factors, such as the goal and the type of study, experience of the working team, availability of required information and of course, economic costs of the study.

Methods of risk assessment can be divided into qualitative and quantitative ones. Another division of the methods can be done, namely into the following three categories:

- **deterministic** – based on the quantification of accident consequences;

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **probabilistic** – based on the probability or frequency of accident;
- combination of deterministic and probabilistic approaches.

Generally, it can be stated that the deterministic methods are used for the analysis of the whole industrial establishment, whereas the probabilistic methods for the analysis of a chosen part of the establishment requiring a more detailed and thus more demanding analysis. A trend in risk assessment is the hierarchization of results, especially in easily applicable methods; results are presented as hazard level indexes (so-called indexing or screening methods). For the risk sources that have the worst indexes it is then recommended to make a detailed analysis by using high precision methods. A similar new approach to the risk assessment of whole industrial establishments consists in the selection of major risk sources in the first phase and in the second phase, the detailed quantitative risk assessment (QRA) of most hazardous installations selected like that. Both these approaches aim at limiting the number of installations assessed in detail that are there in the industrial establishment, to simplify the whole risk analysis and to concentrate attention especially to the most major risk sources. It must be said that one method for making the whole risk analysis does not exist yet; in practice it is necessary to combine several methods.

The quantitative risk assessment (QRA) of major accidents has been published in various handbooks; with the most significant of them the following publications can be ranked: (Lees, 2005), (CCPS, 1989), (CCPS, 2001), (TNO, 1997) and (TNO, 2005). For the detailed assessment of major accident risks to the population, the below presented methodologies are used oftenest.

What enables an integrated risk analysis is the methodology CPQRA - Chemical Process Quantitative Risk Analysis (CCPS, 1989). This methodology was developed for the needs of chemical industry on the basis of experience of nuclear, aircraft and electronics industries, but its recommended procedure for the analysis is also applicable to other kinds of industry. CPQRA is a tool for risk quantification and reduction by means of partial methods and procedures.

Another acknowledged approach to the comprehensive risk assessment is a Dutch methodology "CPR 18E Guidelines for Quantitative Risk Assessment" known as Purple Book (TNO, 2005). This methodology consists of two parts, namely risk assessment for stationary installations and risk assessment for the transport of dangerous substances. In the further parts of this text, chosen chapters dealing with the assessment of stationary sources of risk will be presented briefly.

The methodology ARAMIS (Accidental Risk Assessment Methodology for Industries in the framework of the SEVESO II Directive) was invented as part of a project of the EU Fifth Framework Program in the years 2002 – 2004. The project ARAMIS proposed a harmonized methodology for risk assessment. The goal of it is above all to reduce uncertainties and variability in results and to include the assessment of risk management efficiency into the analysis. It is thus necessary to take ARAMIS as a global tool for carrying out effective risk identification and analysis with a whole series of pre-prepared and recommended steps (ARAMIS, 2004).

Industry needs a method to identify, assess and reduce the risk and demonstrate the risk reduction as required by the Art.9 of the SEVESO directive. This method and the demonstration have to be accepted by the competent authorities. The approach also has to bring useful information about the ways to reduce the risk and to manage it daily (ARAMIS, 2004).

ARAMIS is divided into the following major steps:

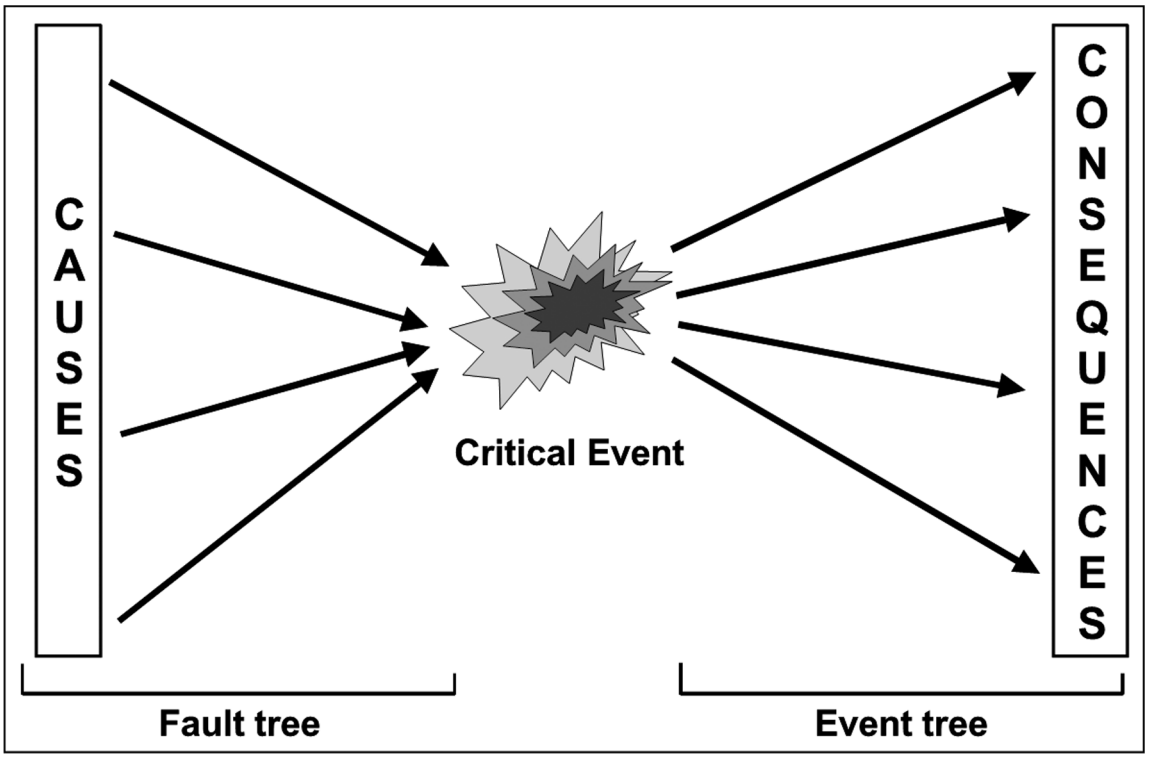
- Identification of major accident hazards (MIMAH).
- Identification of the safety barriers and assessment of their performances.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Evaluation of safety management efficiency to barrier reliability.
- Identification of Reference Accident Scenarios (MIRAS).
- Assessment and mapping of the risk severity of reference scenarios.
- Evaluation and mapping of the vulnerability of the plant's surroundings.

The main idea of the ARAMIS methodology is based on the so-called bow-tie diagrams, the connection of the fault tree and the event tree (see Figure 4).

Figure 4: General scheme of the bowtie (ARAMIS, 2004)



Step 1: Identify of Risk Sources and Scenario Creating

To identify hazards, it is appropriate to divide the hazard into several groups and subgroups, e.g.:

1. Mechanical hazards.
    a. Unprotected moving parts of machines.
    b. Dangerous surfaces (sharp edges, corners, protruding parts, etc.).
    c. Equipment under pressure.
    d. Equipment with necessary handling.
    e. Moving transport equipment.
    f. Falling, slipping, tripping.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

   g. Falls from a height.
2. Electrical hazards.
   a. Electric shock.
   b. Electric arc.
   c. Electrostatic charge.
3. Chemical hazards.
   a. Chemical reactions.
   b. Use of flammable and explosive materials.
   c. Use of toxic substances.
   d. Irritants.
   e. Lack of oxygen.
4. Biological hazards.
   a. Infections caused by microorganisms.
   b. The presence of allergens.
5. Fire and explosion.
   a. Open fires.
   b. Hot surfaces.
   c. Sparks.
   d. Autoignition.
   e. Explosions of solids and liquids.
   f. Explosion of gases, vapors and dusts (explosive mixtures with air).
6. Other physical factors.
   a. Electromagnetic radiation (thermal, x-ray, ionizing radiation).
   b. Lasers.
   c. Noise and ultrasound.
   d. Vibration.
   e. Cold substances and environment.
   f. Media under pressure.
7. Factors of work environment and work organization.
   a. Inappropriate lighting.
   b. Inappropriate temperature, humidity, ventilation.
   c. Factors of work process (night work, physical exertion, rest, etc.).
   d. Monotonous work.
   e. Human factor errors.
   f. Insufficient work organization.
   g. Neglected maintenance, especially on safety equipment.
8. Other factors.
   a. Dangerous acts of other persons (terrorism, sabotage, crime).
   b. Working with animals.
   c. Unfavorable weather conditions.
   d. Natural disasters.
   e. Surrounding transport and neighboring industrial enterprises.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The list of hazards may not be complete, may be divided into other groups according to other criteria, but for the purposes of risk analysis it constitutes a useful default list for identifying sources of risk.

The most commonly used methods for hazard identification at the beginning of the risk analysis are briefly described below.

Selection Method

The selection method according to CPR 18E Purple Book (TNO, 2005) was developed for revealing such installations that contribute to a risk most. The installations selected in this way must be considered in the detailed quantitative risk analysis (QRA). Individual steps of the selection method are as follows:

1. An establishment is divided into independent installations (separated units).
2. A hazard related to each installation is determined on the basis of quantity of a substance, operational conditions and properties of dangerous substances. The indication number A expresses the level of real hazardousness of the installation.
3. A hazard related to the installation is determined for a set of points in the surroundings (on the boundary) of the establishment. The hazard related to the installation within a certain distance is determined on the basis of a known indication number and distance between the point being assessed and the installation. The level of hazard in the point being assessed is deduced from the value of selection number S.
4. For the analysis QRA, installations are selected on the basis of relative value of selection number S.

Dow's Fire and Explosion Index

The method "Fire and Explosion Index" (F&E Index) has been improved already for more than 30 years to get into the form of a complex index that is predicable to the relative level of risk of losses of the unit or installation being assessed from the point of view of a possible fire and explosion. In a broad conception, it represents a method for the relative classification of hazard of key units and installations. The stated index is used both by the Dow company and other users. It occupies the leading position among indexing methods in the chemical industry. The current version of F&E Index furnishes key data enabling the assessment of overall fire and explosion risk.

The goal of study using the method F&E Index is as follows (FEI, 1994):

1. To quantify expected damage as a consequence of a fire and explosion (not maximum loss, but maximum probable loss);
2. to identify the installations that could contribute to the occurrence and escalation of an accident;
3. To present obtained results of F&E Index to the management.

Each installation with the F&E Index higher than 128 requires another risk analysis. Table 2 is a listing of the F&EI values versus a description of the degree of hazard that gives some relative idea of the severity of the F&EI (FEI, 1994).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. F&E Index degree of hazard (FEI, 1994)

DEGREE OF HAZARD FOR F&EI	
F&E INDEX RANGE	**DEGREE OF HAZARD**
1 - 60	Light
61 - 96	Moderate
97 - 127	Intermediate
128 - 158	Heavy
159 - up	Severe

Dow's Chemical Exposure Index

The chemical exposure index (CEI) is a relatively simple method for the assessment of potential exposure of people in the vicinity of chemical plants, where a realistic possibility of release of dangerous chemical substance exists. It is very difficult to determine an absolute level of risk, the method CEI enables the relative comparison of various risk sources (CEI, 1994).

CEI can be used for installations intended for the storage and/or treatment of toxic substances both for new projects and existing installations. If the value of CEI is greater than 200, the unit requires another assessment of hazardousness.

In the text below, the methods HAZOP, FTA and ETA will be introduced because they oftenest follow the screening and indexing methods to specify possible causes of accidents or probabilities of accident occurrence.

Hazard and Operability Analysis (HAZOP)

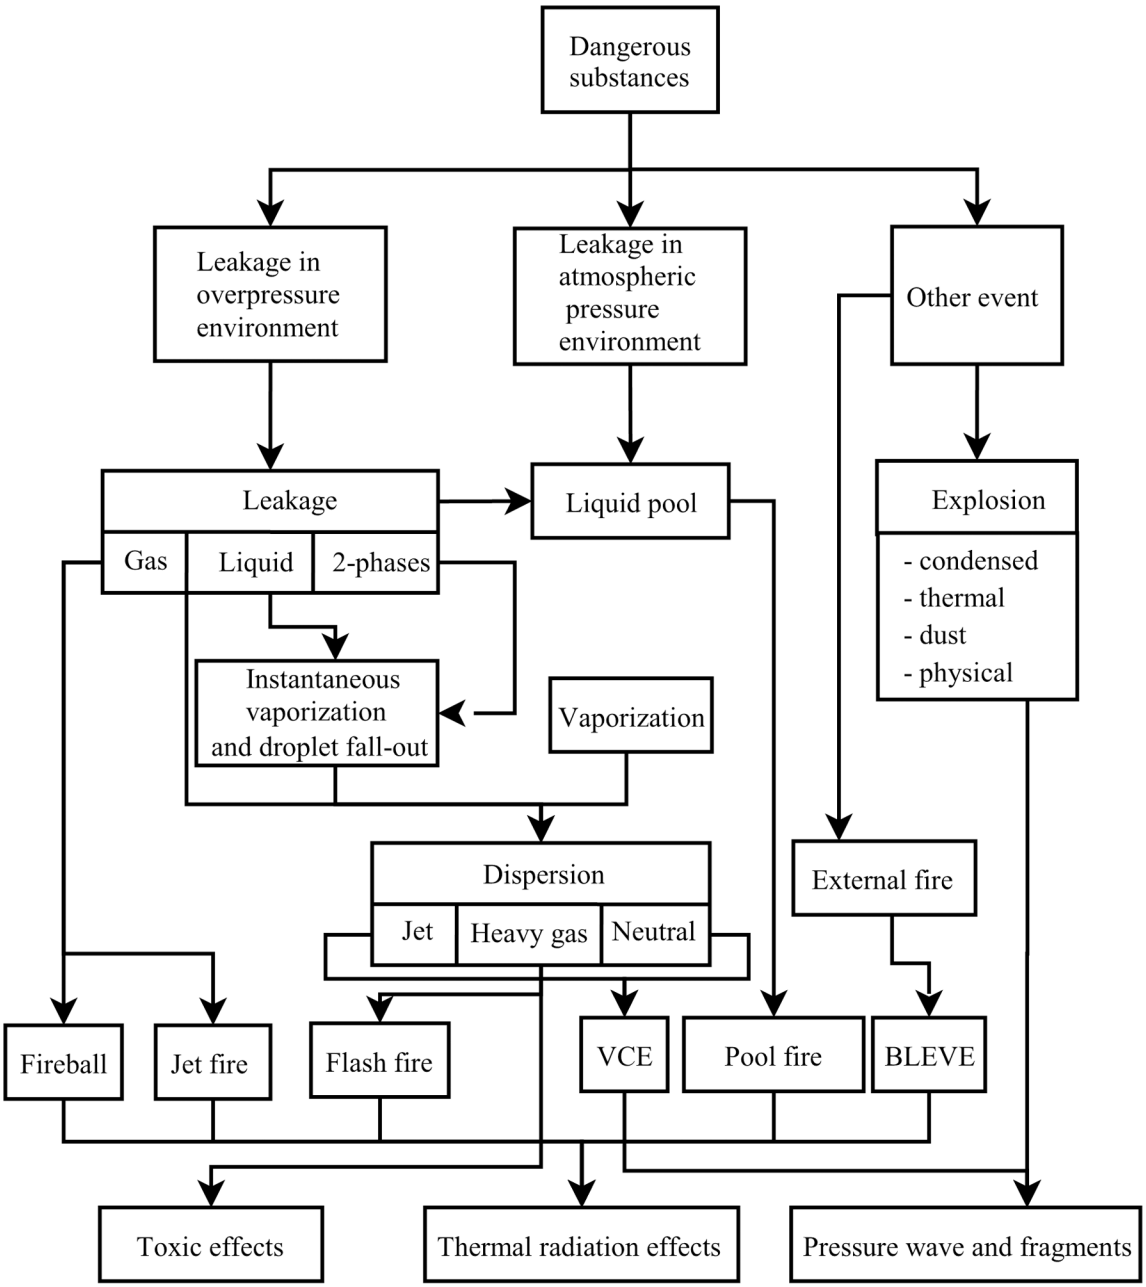
This method was developed to identify and assess process hazards and to identify operational problems. It is used most frequently in the course and/or after the design stage of process; it is also used advantageously in existing processes. An interdisciplinary team (5 - 7 members) utilizes creative, systematic steps to reveal deviations from the project that may lead to undesirable consequences. For revealing, fix determined words are used (so-called key words – less, more, no, also, part, other, reverse, early, late) that are combined with process parameters. For instance, the key word "No" in conjunction with the parameter "Flow" gives a deviation "No flow". Results of team discussion are written into a table where individual columns represent causes, consequences and protective measures for process deviations. What is a disadvantage of this method is high time consumption as well as labour intensity (AIChE, 1992).

Creating of Scenarios

In case of accidents caused by dangerous substances, a lot of accident manifestations can occur. Basic forms of accident scenarios are summarized in the following diagram (see Figure 5) according to the methodical instruction of the Czech Ministry of Environment (MZP, 2017).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. Diagram of physical effects and possible accident expansion (MZP, 2007)



Three main categories of accident effects exist: toxic gases effects, thermal radiation effects, and pressure wave effects with possible flying debris. These effects can impact human lives, property damage, and environmental damage. From the synergetic effects (so called. domino effects) point of view, especially the effects of fires, explosions and flying debris are significant.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Step 2: Assessment of Scenario Probability

Failure and event trees are most commonly used to assess probability.

Fault Tree Analysis (FTA)

It is a deductive method that looks for individual accidents and system failures and determines causes of these events. FTA is a graphical model of various combinations of failures in installations and human errors that may result in a main system failure called "top event". It is also suitable for extensive systems, is able to determine a complete list of minimum failures. The model is based on Boolean algebra (gates "and", "or", and others) in looking for a minimum failure leading to a top event; outcomes are types of failures and quantitatively assigned probabilities of system failures, if we know probabilities of primary causes. The study can be carried out by one or more analysts who can recommend safety improvements in the process. The method is not suitable for early phases of design and is time-consuming; demands increase depending upon the complexity of the system (AIChE, 1992).

Event Tree Analysis (ETA)

The method graphically expresses possible consequences of an accident following from an initiation event. Outcomes are sequences of accidents, a series of failures and faults leading to an accident (system function success or failure is assessed). Sequences of accidents represent logical combinations of events, can be transferred to a fault tree model and further quantitatively assessed. The method is suitable for the analysis of comprehensive process that has several kinds of safety systems. The analysis can be made by one analyst, but 2 - 4 analysts are often preferred. Analysts can utilize outcomes for recommendations for reducing the probability and/or mitigating consequences of potential failures (AIChE, 1992).

Scenario Probability Assessment

To determine the probability of individual scenarios for major accidents, generic values stated in the special literature based on historical data are often used. One of the most frequently utilized publications is the Purple Book (TNO, 2005), where events in the course of which installation damage and a release of dangerous substance, so-called Loss of Containment (LOC), occur, are described. For these cases of failures, assumed frequencies of occurrence determined on the basis of accidents in the past are stated. The methodology thus presents the failures in installation that contribute to a societal risk and must be taken into account during quantitative risk assessment.

As examples of data on failure frequencies, values for atmospheric tanks are there in the following Table 3.

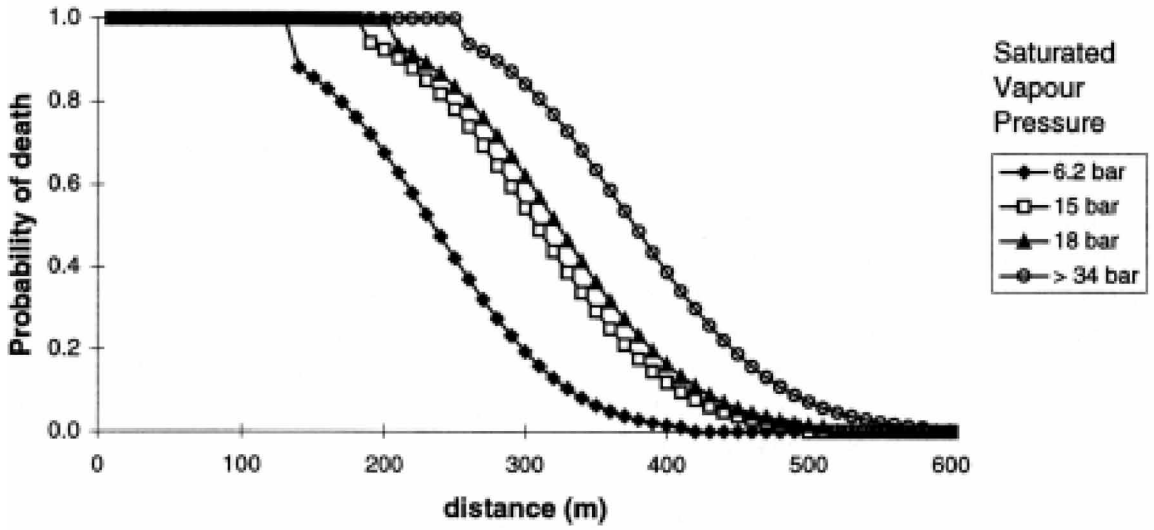
A single leak with immediate ignition may cause a BLEVE event and a fire ball. Example BLEVE type explosion effects (the probability of death of persons depending on the distance from the source) is shown below (Fig. 6) for storing 100 tons of propane.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. The failure frequencies for atmospheric tanks (TNO, 2005)

LOCs for atmospheric tanks						
G.1 Instantaneous release of the complete inventory a: directly to the atmosphere b: from the primary container into the unimpaired secondary container or outer shell G.2 Continuous release of the complete inventory in 10 min at a constant rate of release a: directly to the atmosphere b: from the primary container into the unimpaired secondary container or outer shell G.3 Continuous release from a hole with an effective diameter of 10 mm a: directly to the atmosphere b: from the primary container into the unimpaired secondary container or outer shell						
Installation (part)	**G.1a Instantan. release to atmosphere**	**G.1b Instantan. release to secondary container**	**G.2a Continuous 10 min release to atmosphere**	**G.2b Continuous 10 min release to secondary container**	**G.3a Continuous Ø10 mm release to atmosphere**	**G.3b Continuous Ø10 mm release to secondary container**
Single containment tank	5×10^{-6} y^{-1}		5×10^{-6} y^{-1}		1×10^{-4} y^{-1}	
tank with a protective outer shell	5×10^{-7} y^{-1}	5×10^{-7} y^{-1}	5×10^{-7} y^{-1}	5×10^{-7} y^{-1}		1×10^{-4} y^{-1}
Double containment tank	1.25×10^{-8} y^{-1}	5×10^{-8} y^{-1}	1.25×10^{-8} y^{-1}	5×10^{-8} y^{-1}		1×10^{-4} y^{-1}
Full containment tank	1×10^{-8} y^{-1}					
In-ground tank		1×10^{-8} y^{-1}				
mounded tank	1×10^{-8} y^{-1}					

Figure 6. The probability of death as a function of the distance for a BLEVE of a storage tank containing 100 tons of propane (TNO, 2005)



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Step 3: Assessment of Scenarios Consequences

1. Thermal radiation
   a. Continuous radiation
   b. Instantaneous radiation
2. Blast effects
3. Missiles
4. Toxic effects

All the effects represented in Table 4 make reference only to humans or structures but not to the environment.

Table 4. Definition of the thresholds for the diverse levels of effects (ARAMIS, 2004)

Level of effects	Radiation (1) (kW/m^2)	Instantaneous Radiation	Blast (mbar)	Missiles (2) (%)	Toxic effect (3)	Description
1	< 1,8	< 0.5 LFL	< 30	0	< TEEL-1	Small or non effects
2	1,8 - 3		30 - 50		TEEL-1 - TEEL-2	Reversible effects
3	3 - 5		50 - 140		TEEL-2 - TEEL-3	Irreversible effects
4	> 5	= 0.5 LFL	> 140	100	> TEEL-3	Start of lethality and/or domino effects

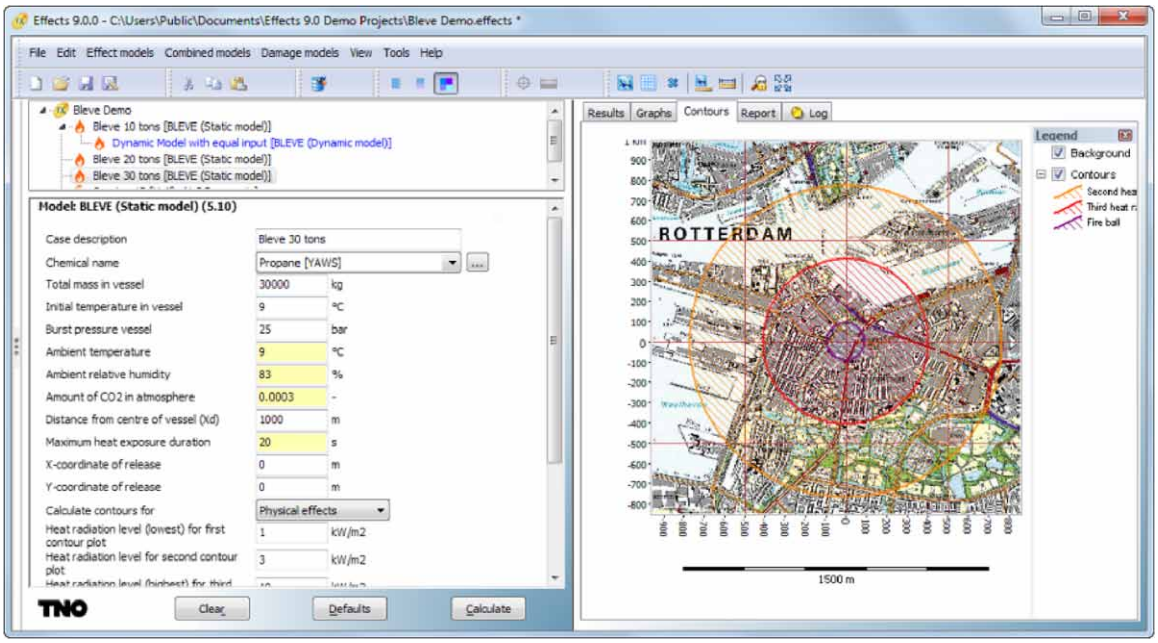
(1) For 60 s exposure
(2) Range distance of the indicated percentage of missiles
(3) TEEL values (Temporary Emergency Exposure Limits)

For the detailed modeling of releases of dangerous substances and consequences of fires, explosions and spreading toxic clouds, a whole series of computer programs can be used (Bernatik, 2008). To the best known programs ALOHA, RMP Comp, SAFETI, PHAST, EFFECTS, CHARM, and others belong. Some programs are freely available on the Internet (e.g. ALOHA, RMP Comp), others are commercial products of significant companies concerned with risk analyses (e.g. company TNO / Gexcon– EFFECTS or company DNV – PHAST, SAFETI). In the further text, the program EFFECTS is described as an example.

The EFFECTS model represents a high standard of modeling the consequences of major accidents. The program combines two accepted models for the calculation of physical effects after a release of dangerous substances EFFECTS and DAMAGE. The model EFFECTS make it possible to determine manifestations of accidents, such as pressure wave, heat radiation, gas concentration, the model DAMAGE makes it possible to determine consequences of accidents, e.g. human death rate, first-degree and second-degree burns, lung injury, eardrum damage, and others. The advantage of connection of these two models in one program is the inclusion of comprehensive calculations covering the range from initiation physical effects to accident consequences. Results are presented in text and graphical forms (EFFECTS, 2018). An example of monitor of the program EFFECTS is shown in the figure below (see Figure 7).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 7. Example of monitor of software EFFECTS (Effects, 2018)



Step 4: Risk Evaluation - Risk Acceptability

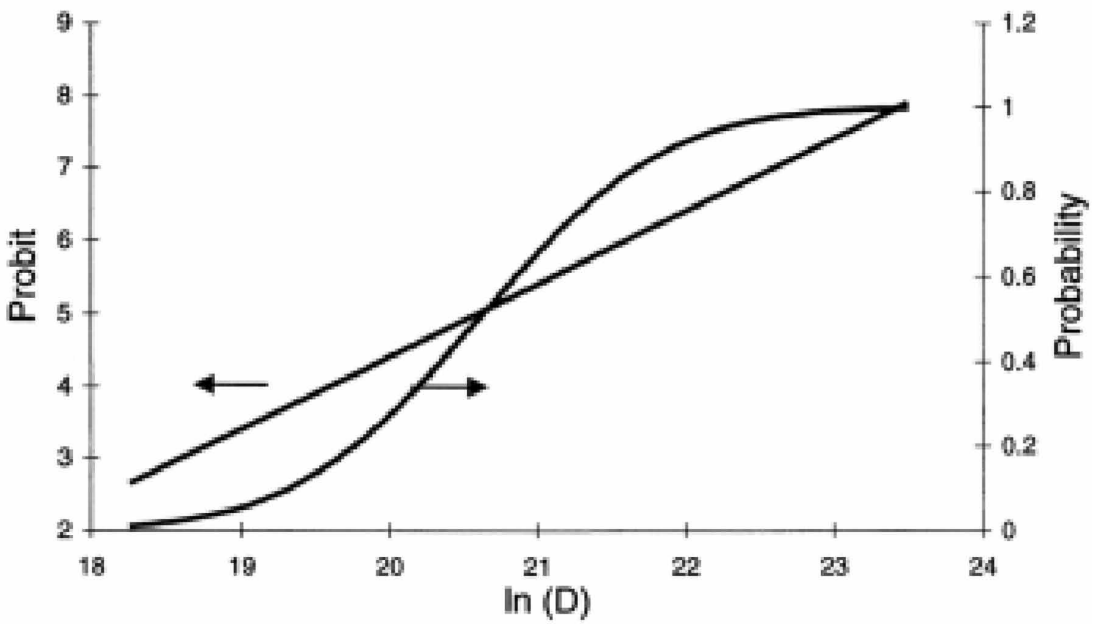
The calculation of individual and societal risks includes the calculation of probability of human death for given exposure. The probability of death is calculated by using the probit function (kind of dose–response model dependence expressed by an equation). The relation between the probability of an effect and the exposure usually results in a sigmoid curve. The sigmoid curve is replaced with a straight line if the probit is used instead of the probability (see Figure 8 and Table 5).

Table 5. The probit, Pr, as a function of the probability, P (TNO, 2005)

P	0	0.01	0.02	0.03	0.04	0.05	0.06	0.07	0.08	0.09
0	-	2.67	2.95	3.12	3.25	3.36	3.45	3.52	3.59	3.66
0.1	3.72	3.77	3.82	3.87	3.92	3.96	4.01	4.05	4.08	4.12
0.2	4.16	4.19	4.23	4.26	4.29	4.33	4.36	4.39	4.42	4.45
0.3	4.48	4.50	4.53	4.56	4.59	4.61	4.64	4.67	4.69	4.72
0.4	4.75	4.77	4.80	4.82	4.85	4.87	4.90	4.92	4.95	4.97
0.5	5.00	5.03	5.05	5.08	5.10	5.13	5.15	5.18	5.20	5.23
0.6	5.25	5.28	5.31	5.33	5.36	5.39	5.41	5.44	5.47	5.50
0.7	5.52	5.55	5.58	5.61	5.64	5.67	5.71	5.74	5.77	5.81
0.8	5.84	5.88	5.92	5.95	5.99	6.04	6.08	6.13	6.18	6.23
0.9	6.28	6.34	6.41	6.48	6.55	6.64	6.75	6.88	7.05	7.33

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 8. The probability and the probit as a function of exposure to ammonia (TNO, 2005)



As example, the probability of death due to exposure to a toxic cloud, P_E, and the fraction of people indoors and outdoors dying, $F_{E,in}$ and $F_{E,out}$, is given in Figure 9.

The probability of death, P_E, is calculated with the use of a probit function and relation 1. The probit function for death due to toxic exposure is given by (TNO, 2005):

$$Pr = a + b \times \ln (C^n \times t) \quad (1)$$

where:

Pr probit function corresponding to the probability of death (-)
a, b, n constants describing the toxicity of a substance (-)
C concentration ($mg.m^{-3}$)
t exposure time (minutes)

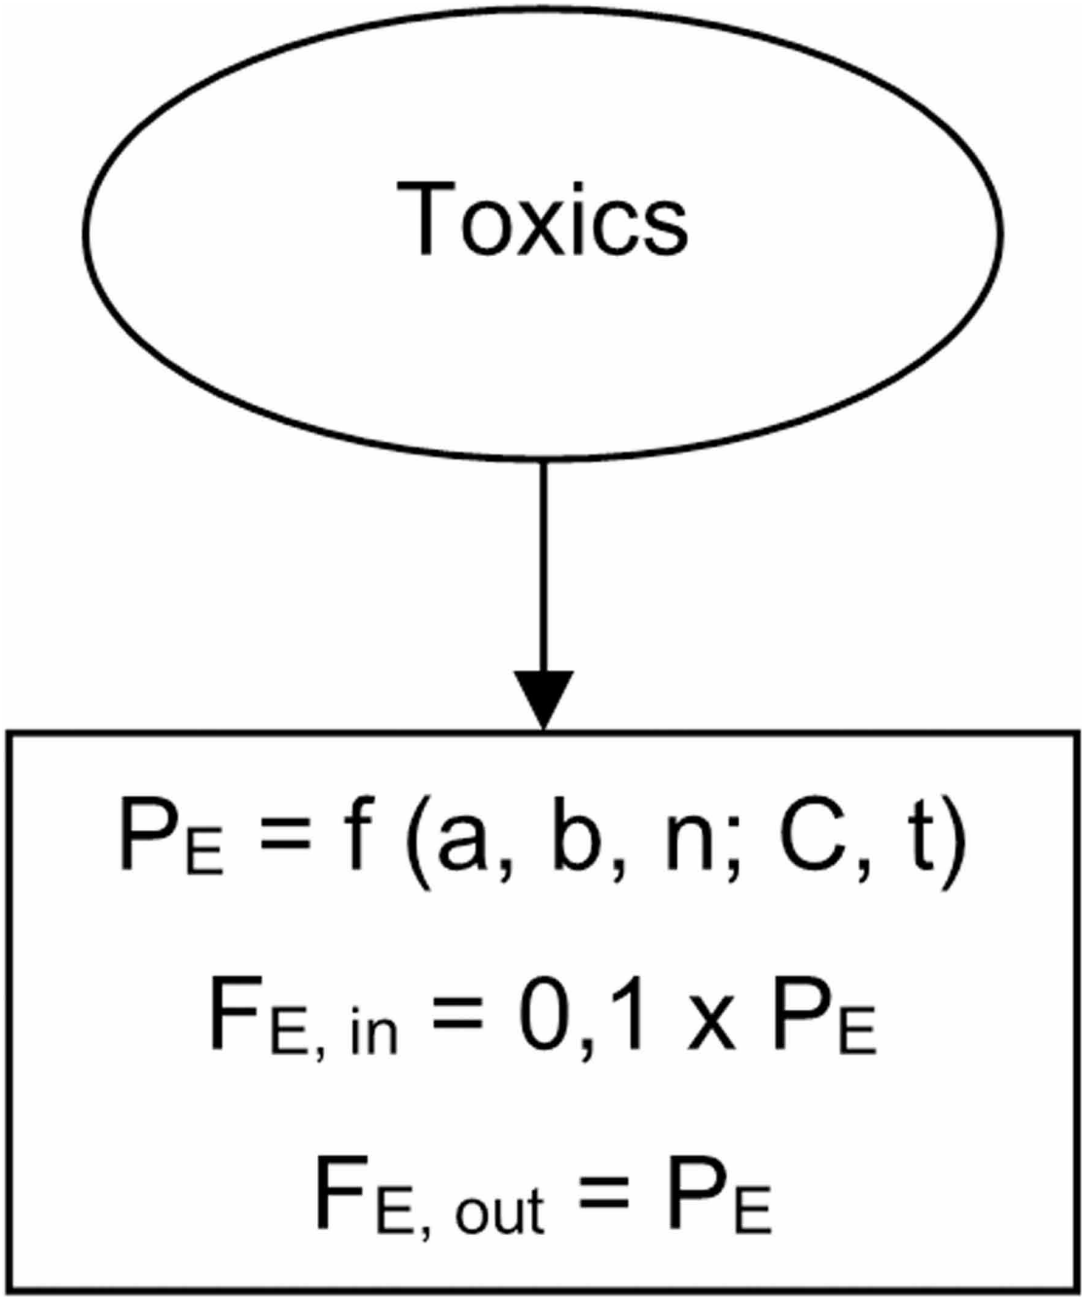
Notes:

- The value of the constant, a, depends on the dimensions of the concentration, C, and the exposure time, t. The dimensions of the concentration and exposure time must correspond to the value of the constant, a, in the probit function.
- The probit is a function of the toxic dose to an individual. The toxic dose, D, is equal to $D = C^n \times t$ if the concentration, C, is constant during the time of exposure, t. If the concentration is not constant in time, the toxic dose is calculated as $D = \int C^n \, dt$; the probit, Pr, should be calculated correspondingly.
- The exposure time, t, is limited to a maximum of 30 minutes, starting from the arrival of the cloud. The arrival of the cloud can be defined as the moment when the probability of death, PE, exceeds 1%.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Staying indoors reduces the toxic dose since the concentration indoors is lower than the concentration outdoors during cloud passage. This effect is accounted for by a generic factor 0.1 in the fraction of people dying indoors. (TNO, 2005)

Figure 9. Calculation of the probability of death, P_E, and the respective fractions of the population dying indoors and outdoors, $F_{E,in}$ and $F_{E,out}$, due to exposure to a toxic cloud. The function f (a,b,n;C,t) is the probit function for exposure to toxic substances (TNO, 2005)



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Similarly, the probit approach is recommended for evaluation of consequence to fire and explosion. For example, the probability of death from heat radiation exposure is calculated by means of the probit function that is given by a relation presented bellow (TNO, 2005):

$$Pr = -36.38 + 2.56 \times \ln (Q^{4/3} \times t) \quad (2)$$

where:

Pr probit function corresponding to the probability of death (-)

Q heat radiation ($W.m^{-2}$)

t exposure time (s)

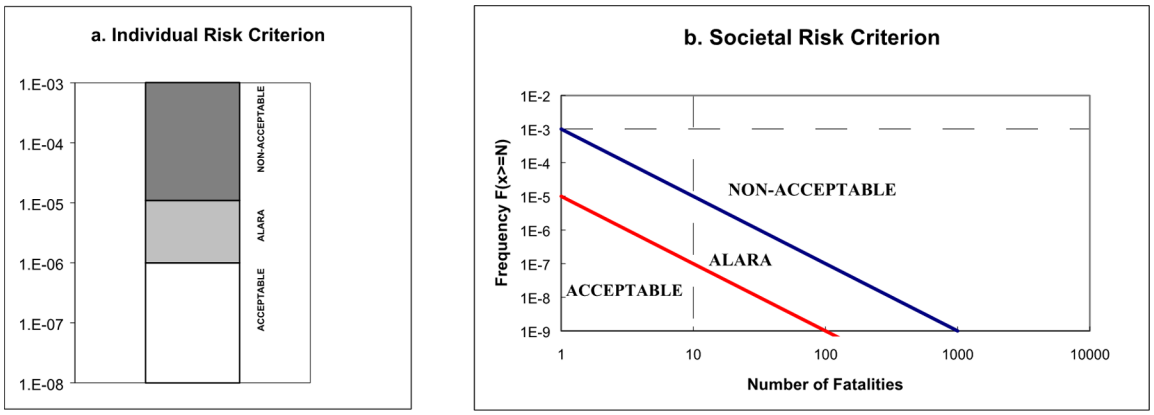
Calculation and Result Presentation

From the comprehensive point of view, a risk is understood to be a relation between the expected loss (health damage, loss of life, loss of property, and others) and the uncertainty of loss considered (usually expressed by the probability or frequency of occurrence of an unexpected event). The results of quantitative risk analysis (QRA) are the individual risk and the societal risk.

- The individual risk represents the frequency of death of an individual in connection with a case of installation failure (LOC). One can assume that the individual is not protected and is exposed to unfavorable conditions for the whole time of exposure. The individual risk is represented by contours in a topographic map.
- The societal risk represents the frequency of such events in the course of which more persons lose their lives together. The societal risk is represented by means of F-N curves, where N stands for the number of deaths and F is the cumulative frequency of events accompanied by N or more deaths.

Criteria for the determination of individual and societal risks are illustrated in Figure 10.

Figure 10. Theoretical examples of criteria for (a) individual and (b) societal risk (Christou, 2006) Note: ALARA - As Low as Reasonably Achievable

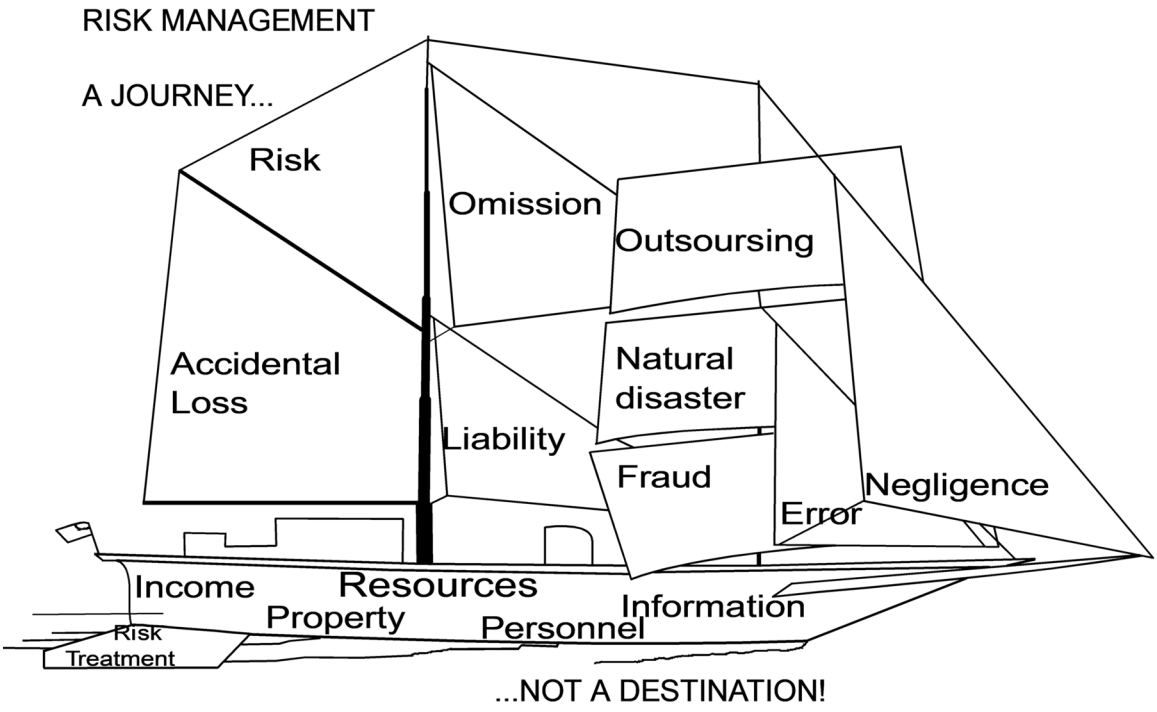


EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

MAJOR ACCIDENT RISK MANAGEMENT

Risk management is the process of identifying, analyzing and responding to risk factors throughout the life of a project and in the best interests of its objectives. Proper risk management implies control of possible future events and is proactive rather than reactive (Stanleigh, 2016). The whole process of risk management is an endless journey ... (see Figure 11).

Figure 11. Risk management (Knight, 2010)



Risk management involves understanding, analyzing and addressing risk to make sure organizations achieve their objectives (IRM, 2016). Figure 12 presents the cycle of risk management processes as well as the basic idea of generally all methods.

The process safety management system program is divided into 14 elements. The U.S. Occupational Safety and Health Administration 1910.119 define all 14 elements of the process safety management system plan (OSHA, 2013).

- Process Safety Information
- Process Hazard Analysis
- Operating Procedures
- Training
- Contractors
- Mechanical Integrity
- Hot Work

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

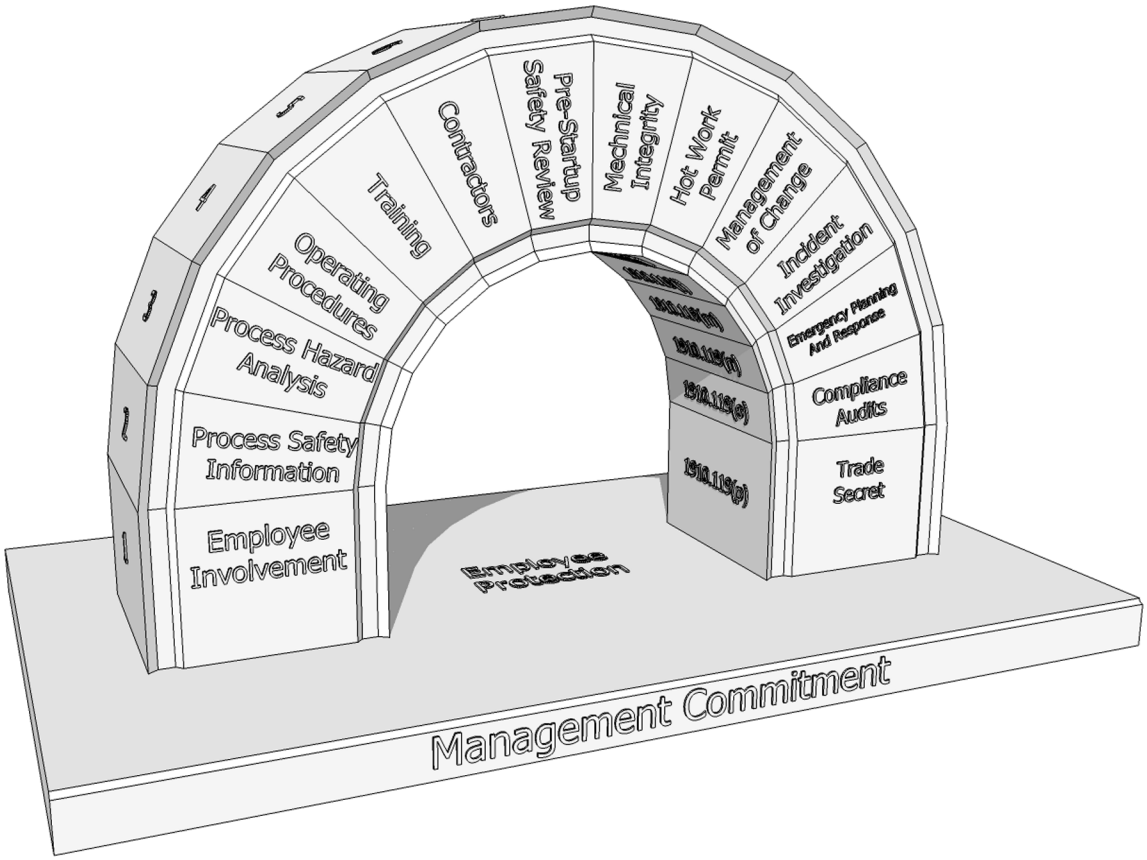
- Management of Change
- Incident Investigation
- Compliance Audits
- Trade Secrets
- Employee Participation
- Pre-startup Safety Review
- Emergency Planning and Response

Figure 12. Planning for risk management (Rahim, 2016)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

All of those elements mentioned above are interlinked and interdependent (see Figure 13). There is a tremendous interdependency of the various elements of process safety management (PSM). All elements are related and are necessary to make up the entire PSM picture. Every element either contributes information to other elements for the completion or utilizes information from other elements in order to be completed.

Figure 13. 14 Elements of Process Safety Management (Khamar, 2016)



The problematics of risk management is extensive, complex, with large number of individual elements and connections between them. Therefore, there is no way how to formulate a general method for all applications.

The need to assess and manage major accident risks follows from several factors, especially from a large number of accidents occurred in the past, leading to pressures to reduce risks associated with various process installations. Furthermore, this need is initiated by the necessity of prevention against accidents in land-use planning, i.e. approving the location of new establishments in relation to inhabited and protected areas, by the necessity of improving emergency preparedness, and others. Carrying out a risk assessment and following measures to reduce the risk can contribute to the prevention of accidents, the mitigation of accident consequences on human lives, property and the environment, and also can

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

prevent the unsuitable location of a new establishment in the vicinity of population centers and areas protected from the environmental point of view. Risk assessment should be done in the preparatory phase of building of a new establishment and during a major accident investigation to prevent accident re-occurrence, and in the phase of establishment operation when the risk assessment contributes to better awareness on risk sources, accident consequences and threatened target groups. Prepared accident scenarios are used for improvements in emergency plans and preparedness for effective interventions in case of accident.

SOLUTIONS AND RECOMMENDATION

On the basis of results of risk assessment, priorities in reducing the risks can be decided in the phase of risk management. This area of risk management is necessary for the sustainable development of a mature society. Basic approaches to the reducing of risks associated with process installations are as follows:

- The replacement of a dangerous substance by a substance less dangerous,
- A change in technology to become more advanced, with the presence of a smaller quantity of dangerous substances,
- Decreasing the stock of dangerous substances to a necessary minimum,
- The effective separation of the quantity of dangerous substances in the establishment (e.g. by remote-controlled valves) – decreasing the quantity of a releasing substance.

Safety approach based on inherent safety has developed since 1991 by Trevor Kletz. The four main methods for achieving inherently safer design are: (Khan, 2003)

- **Minimize**: Reducing the amount of hazardous material present at any one time, e.g. by using smaller batches.
- **Substitute**: Replacing one material with another of less hazard, e.g. cleaning with water and detergent rather than a flammable solvent.
- **Moderate**: Reducing the strength of an effect, e.g. having a cold liquid instead of a gas at high pressure or using material in a dilute rather than concentrated form.
- **Simplify**: Eliminating problems by design rather than adding additional equipment or features to deal with them. Only fitting options and using complex procedures if they are really necessary.

Two further principles are used by some: (Khan, 2003)

- **Error tolerance**: Equipment and processes can be designed to be capable of withstanding possible faults or deviations from design. A very simple example is making piping and joints capable of withstanding the maximum possible pressure, if outlets are closed.
- **Limit effects** by design, location or transportation of equipment so that the worst possible condition produces less danger, e.g. gravity will take a leak to a safe place, the use of bunds.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In terms of making plants more user-friendly Kletz added the following: (Kletz, 1991)

- Avoiding knock-on effects;
- Making incorrect assembly impossible;
- Making status clear;
- Ease of control;
- Software and management procedures.

Further, the recommended precautions and measures for risk reduction are given, where the field of risk management follows up with risk assessment. Basic division of safety precautions for risk reduction:

- **Technical Measures**: Such measures in equipment construction that lead to the increase of plant safety (examples: safety valves, sprinklers, automatic regulation, safety reservoirs, double-skin storage tanks…)
- **Organizational Measures**: Measures in work organization, regulations, technological procedures (including pertinent technical equipment) leading to the increase of plant safety.

Synergetic effects and domino effects can be also prevented using barriers limiting the possibility of initiation of consequent accidents and emergencies initiated by "covered" risks. Such barriers can be:

1. **Passive Barriers**: Functioning permanently without human intervention, energy sources, and without sources of information. Passive barriers can be physical (safety reservoirs, walls…), permanent barriers (corrosion prevention system) or internally safe design of equipment/facility.
2. **Active Barriers**: Must be activated to function. Active barriers always require the sequence: detection - diagnostics - action.
3. **Requiring Human Intervention**: Broadly interpreted, includes monitoring of all senses, communication, thinking, physical activities, emergency activities, etc. Human intervention can be part of the sequence: detection - diagnostics - action.

Automatic systems that eliminate a human factor are more suitable (e.g. detection and alarm systems, automatic systems like blocking and stop systems, fire and explosion protection systems, protections against releases of dangerous toxic substances, further safeguards against intrusion and unauthorized manipulation, central stations including the indication of protection system functionality). The majority of these technical safety measures are called preventive (precautions) because they contribute to a reduction in major accident occurrence.

Another group of safety measures consists of protective means and emergency response means that mitigate and limit the consequences of a major accident. Generally, e.g. fixed technical means (fixed extinguishing systems, ventilation systems), mobile technical means (pumps, fans, telescopic platforms, scum boards), transport means and special mechanisms (earth moving machines, truck tanker fuels, fire extinguishing tankers), emergency response and emergency materials, personal protective equipment, staffing (strength of staff ready to respond) can be stated. Into the safety measures, employee alarm and warning systems and methods and systems and methods of notification of entities concerned in case of emergency must be included.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Complete summary of safety measures from the point of view of effects risks minimization is given in the following list of barriers ranked into individual groups:

Safe process management

- Spare energy sources
- Cooling
- Emergency standstill
- Computer driven process
- Operational instructions /procedures
- Summary of reactive compounds
- Performs risk assessment
- Assembly of safety valve
- Safety valve against under pressure (vacuum)
- Regular maintenance and cleaning of equipment
- Protective work aids (for employees)

Separability of materials

- Remotely controlled armatures
- Reflux valves for the prevention of reverse flow
- Safety valves in pipelines
- Discharges / purge
- Drainage
- Blocking / Interlock
- Safe distances between equipment

Elements of explosion protection

- Control of potential explosion
- Explosion-proof instruments
- Flame fuses
- Usage of inert gas

Elements of fire protection

- Detection of gas leakage
- Construction steel / fire resistant finishing
- Fire water supply
- Special systems (CO_2, halons, smoke detectors, etc.)
- Water drench systems / sprinklers
- Automatic water curtains
- Foam spray
- Handheld fire extinguishers / fire annunciators
- Cable protection

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Measures against dangerous liquids leakage

- Measurement of surface level in storage tank / equipment
- Double-skin storage tanks
- Place storage tanks with liquids into safety reservoirs or tanks
- Fitting the safety reservoirs by pump connected to plant sewage
- Sewage water control before leaving the plant

Measures against gaseous substances leakage

- Toxic gas detectors
- Devices detecting the oxygen concentration
- Fitting water drench systems to equipment (hand operated or automatic sprinklers)

Measures against external influences

- Flood and inundation protection
- Protection against natural external effects
- Monitoring cameras
- Registration of entry to the area
- Sensitive equipment must be locked and protected against unauthorized intrusion

Emergency planning

- Internal emergency plan for the evacuation and protection of employees
- Outer emergency plan for the protection of neighboring population

Below is a summary of the "Golden Rules" for the prevention of major accidents, as stated in the OECD publication (OECD, 2003).

ROLE OF ALL STAKEHOLDERS

- Make chemical risk reduction and accident prevention, as well as effective emergency preparedness and response, priorities in order to protect health, the environment and property.

While the risks of accidents are in the communities where hazardous installations are located, requiring efforts by stakeholders at the local level, there are also responsibilities for stakeholders at regional, national and international levels.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Communicate and co-operate with other stakeholders on all aspects of accident prevention, preparedness and response.

Communication and co-operation should be based on a policy of openness, as well as the shared objective of reducing the likelihood of accidents and mitigating the adverse affects of any accidents that occur. One important aspect is that the potentially affected public should receive information needed to support prevention and preparedness objectives, and should have the opportunity to participate in decision-making related to hazardous installations, as appropriate.

ROLE OF INDUSTRY (INCLUDING MANAGEMENT AND LABOR)

Management

- Know the hazards and risks at installations where there are hazardous substances.

All enterprises that produce, use, store, or otherwise handle hazardous substances should undertake, in co-operation with other stakeholders, the hazard identification and risk assessment(s) needed for a complete understanding of the risks to employees, the public, the environment and property in the event of an accident. Hazard identification and risk assessments should be undertaken from the earliest stages of design and construction, throughout operation and maintenance, and should address the possibilities of human or technological failures, as well as releases resulting from natural disasters or deliberate acts (such as terrorism, sabotage, vandalism, or theft). Such assessments should be repeated periodically and whenever there are significant modifications to the installation.

- Promote a "safety culture" that is known and accepted throughout the enterprise.

The safety culture, reflected in an enterprise's Safety Policy, consists of both an attitude that safety is a priority (*e.g.,* accidents are preventable) and an appropriate infrastructure (*e.g*., policies and procedures). To be effective, a safety culture requires visible top-level commitment to safety in the enterprise, and the support and participation of all employees[20] and their representatives.

- Establish safety management systems and monitor/review their implementation.

Safety management systems for hazardous installations include using appropriate technology and processes, as well as establishing an effective organizational structure (*e.g.,* operational procedures and practices, effective education and training programs, appropriate levels of well-trained staff, and allocation of necessary resources). These all contribute to the reduction of hazards and risks. In order to ensure the adequacy of safety management systems, it is critical to have appropriate and effective review schemes to monitor the systems (including policies, procedures and practices).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Utilize "inherently safer technology" principles in designing and operating hazardous installations.

This should help reduce the likelihood of accidents and minimize the consequences of accidents that occur. For example, installations should take into account the following, to the extent that they would reduce risks: minimizing to the extent practicable the quantity of hazardous substances used; replacing hazardous substances with less hazardous ones; reducing operating pressures and/or temperatures; improving inventory control; and using simpler processes. This could be complemented by the use of back-up systems.

- Be especially diligent in managing change.

Any significant changes (including changes in process technology, staffing, and procedures), as well as maintenance/repairs, start-up and shut-down operations, increase the risk of an accident. It is therefore particularly important to be aware of this and to take appropriate safety measures when significant changes are planned - before they are implemented.

- Prepare for any accidents that might occur.

It is important to recognize that it is not possible to totally eliminate the risk of an accident. Therefore, it is critical to have appropriate preparedness planning in order to minimize the likelihood and extent of any adverse effects on health, the environment or property. This includes both on-site preparedness planning and contributing to off-site planning (including provision of information to the potentially affected public).

- Assist others to carry out their respective roles and responsibilities.

To this end, management should co-operate with all employees and their representatives, public authorities, local communities and other members of the public. In addition, management should strive to assist other enterprises (including suppliers and customers) to meet appropriate safety standards. For example, producers of hazardous substances should implement an effective Product Stewardship program.

- Seek continuous improvement.

Although it is not possible to eliminate all risks of accidents at hazardous installations, the goal should be to find improvements in technology, management systems, and staff skills in order to move closer toward the ultimate objective of zero accidents. In this regard, management should seek to learn from past experiences with accidents and near-misses, both within their own enterprises and at other enterprises.

Labor

- Act in accordance with the enterprise's safety culture, safety procedures, and training.

In the discharge of their responsibilities, labor should comply with all the procedures and practices relating to accident prevention, preparedness and response, in accordance with the training and instruc-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tions given by their employer. All employees (including contractors) should report to their supervisor any situation that they believe could present a significant risk.

- Make every effort to be informed, and to provide information and feedback to management.

It is important for all employees, including contractors, to understand the risks in the enterprise where they work, and to understand how to avoid creating or increasing the levels of risk. Labor should, to the extent possible, provide feedback to management concerning safety-related matters. In this regard, labor and their representatives should work together with management in the development and implementation of safety management systems, including procedures for ensuring adequate education and training/retraining of employees. Labor and their representatives should also have the opportunity to participate in monitoring and investigations by the employer, or by the competent authority, in connection with measures aimed at preventing, preparing for, and responding to chemical accidents.

- Be proactive in helping to inform and educate your community.

Fully informed and involved employees at a hazardous installation can act as important safety ambassadors within their community.

ROLE OF PUBLIC AUTHORITIES

- Seek to develop, enforce and continuously improve policies, regulations, and practices.

It is important for public authorities[21] to establish policies, regulations and practices, and have mechanisms in place to ensure their enforcement. Public authorities should also regularly review and update, as appropriate, policies, regulations, and practices. In this regard, public authorities should keep informed of, and take into account, relevant developments. These include changes in technology, business practices, and levels of risks in their communities, as well as experience in implementing existing laws and accident case histories. Public authorities should involve other stakeholders in the review and updating process.

- Provide leadership to motivate all stakeholders to fulfill their roles and responsibilities.

Within their own sphere of responsibility and influence, all relevant public authorities should seek to motivate other stakeholders to recognize the importance of accident prevention, preparedness and response, and to take the appropriate steps to minimize the risks of accidents and to mitigate the effects of any accidents that occur. In this regard, the authorities should establish and enforce appropriate regulatory regimes, promote voluntary initiatives, and establish mechanisms to facilitate education and information exchange.

- Monitor the industry to help ensure that risks are properly addressed.

Public authorities should establish mechanisms for monitoring hazardous installations to help ensure that all relevant laws and regulations are being followed, and that the elements of a safety manage-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ment system are in place and are functioning properly, taking into account the nature of the risks at the installations (including the possibilities of deliberate releases). Public authorities can also take these opportunities to share experience with relevant employees of the installations.

- Help ensure that there is effective communication and co-operation among stakeholders.

Information is a critical component of safety programs. Public authorities have an important role in ensuring that appropriate information is provided to, and received by, all relevant stakeholders. Public authorities have a special role in facilitating education of the public concerning chemical risks in their community so that members of the public are reassured that safety measures are in place, that they understand what to do in the event of an accident, and that they can effectively participate in relevant decision-making processes. Public authorities are also in a position to facilitate the sharing of experience (within and across borders).

- Promote inter-agency co-ordination.

Chemical accident prevention, preparedness and response is, by nature, an inter-disciplinary activity involving authorities in different sectors and at different levels. To help ensure effective prevention, preparedness and response, and efficient use of resources, it is important that all relevant agencies co-ordinate their activities.

- Know the risks within your sphere of responsibility, and plan appropriately.

Public authorities are responsible for off-site emergency planning, taking into account the relevant onsite plans. This should be done in co-ordination with other stakeholders. In addition, public authorities should ensure that the resources necessary for response (*e.g.*, expertise, information, equipment, medical facilities, finances) are available.

- Mitigate the effects of accidents through appropriate response measures.

Public authorities (often at the local level) have primary responsibility for ensuring response to accidents that have off-site consequences, to help reduce deaths and injuries, and to protect the environment and property.

- Establish appropriate and coherent land-use planning policies and arrangements.

Land-use planning (*i.e.,* establishing and implementing both general zoning as well as specific siting of hazardous installations and other developments) can help to ensure that installations are appropriately located, with respect to protection of health, environment and property, in the event of an accident. Land-use planning policies and arrangements can also prevent the inappropriate placing of new developments near hazardous installations (*e.g.*, to avoid the construction of new residential, commercial or public buildings within certain distances of hazardous installations). Land-use planning policies and arrangements should also control inappropriate changes to existing installations (*e.g.*, new facilities or

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

processes within the installation). They should also allow for the possibility of requiring changes to existing installations and buildings to meet current safety standards.

ROLE OF OTHER STAKEHOLDERS (E.G., COMMUNITIES/PUBLIC)

- Be aware of the risks in your community and know what to do in the event of an accident.

Members of communities near hazardous installations, and others that might be affected in the event of an accident, should make sure that they understand the risks they face and what to do in the event of an accident to mitigate possible adverse effects on health, the environment and property (*e.g.*, understand the warning signals, and what actions are appropriate). This involves reading and maintaining any information they receive, sharing this information with others in their household, and seeking additional information as appropriate.

- Participate in decision-making relating to hazardous installations.

The laws in many communities provide opportunities for members of the public to participate in decision-making related to hazardous installations, for example by commenting on proposed regulations or zoning decisions or providing input for procedures concerning licensing or sitting of specific installations. Members of the public should take advantage of these opportunities to present the perspective of the community. They should work towards ensuring that such opportunities exist, whenever appropriate, and that the public has the information necessary for effective participation.

- Co-operate with local authorities, and industry, in emergency planning and response.

Representatives of the community should take advantage of opportunities to provide input into the emergency planning process, both with respect to on-site and off-site plans. In addition, members of the public should co-operate with any tests or exercises of emergency plans, following directions and providing feedback, as appropriate. (OECD, 2003)

FUTURE RESEARCH DIRECTIONS

The need to solve the issues of major accident prevention follows from long-term development in this area, when at the beginning, stationary risk sources with the greatest content of dangerous substances were dealt with; at present, limits on dangerous substances covered by the Seveso III Directive drop and simultaneously, attention turns to the mobile risk sources, with which the number of accidents in the course of transport of dangerous substances grows. In the next phase, attention will be surely paid to risk sources unclassified in the context of Seveso III Directive that may, above all owing to their locations, represent significant societal risks.

Risk analysis is encountered in individual areas of security; from the point of view of the causes of emergencies, the whole area can be divided into two parts - Safety and Security.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the area of "Safety", these are accidental phenomena such as accidents at work, major accidents, natural disasters, etc., and risk analysis can be used in the following areas:

- Work risks (occupational health and safety, hygiene, ergonomics)
- Process safety (prevention of major accidents)
- Fire protection
- Population protection (natural disasters)
- Environmental protection (environmental risks)

In the area of "Security" it is arbitrary abuse with the aim of harming, such as crime, sabotage, terrorism, etc. and risk analysis can be used in areas such as:

- Physical security of persons and property
- Information security (cyber security)

The risk analysis methods presented in this chapter can be used in the above areas of safety and related issues.

Future research direction could follow a new holistic approach and supporting tools according to the Process Safety Research Agenda 21st Century prioritized research topics and categorized to their main character. (De Rademaeker, 2014):

Technical safety topics:

- Hazardous phenomena, properties of substances
- Inherently safer design
- Safety technologies, protection layers, drilling
- Risk assessment, consequence analysis, NaTech
- Complex systems, resilience

Organizational safety topics:

- Process and occupational safety
- Human factors, safety management, safety culture
- Knowledge transfer, learning, standards, easy methods
- Risk management, decision making
- Complex systems, resilience

Current trends of process safety and risk related development show that research is mainly focusing on challenges such as data uncertainty, scarcity of information and complexity of process systems. It is clear that the current research trend has been in the area of inherent safety, dynamic and operational risk assessment, incorporation of human and organizational factors into risk assessment and integration of a safety protection layer (safety instrumented system) into risk assessment. Transition from traditional quantitative risk assessment (QRA) to dynamic quantitative risk assessment (DQRA) is a natural evolution. DQRA enables implementation of inherent safety principles, features most desired in hazardous processes. (Khan, 2015)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

Risk assessment is defined as a comprehensive process of determining the severity and probability of an undesirable situations and deciding what safety measures will be taken to eliminate or reduce the risk to an acceptable level. A key question for risk analysis is the choice of an appropriate risk assessment method. Therefore, an overview of selected available risk analysis methods used worldwide has been included in this chapter. The aim of the text was to present basic information about the principles of risk analysis methods that can be used in various areas of safety and security, especially in process safety.

In the first part, possible approaches to quantitative risk assessment are presented; in the further part it focuses on the system of risk management in industrial establishments. The aim of major risk prevention is to operate process installations at an acceptable societal level. Risk acceptability limits can differ depending on the maturity of the state, the size of establishments and a number of other factors that must be, however, included into the analysis and assessment of risks.

That is why the benefits of carrying out the risk assessment are summarized here:

- Risk assessment brings information on the identification of hazards to possible targets of impact; the targets can be employees and installations of the establishment, the surrounding human population and the environment.
- Presents information on possible preventive means and risk reduction priorities.
- Assesses preparedness for accidents and is a source of information for emergency plan preparation.
- Contributes to the satisfaction of conditions of existing legislation.
- Can ensure advantages when making agreements with insurance companies.
- Contributes to prevention against accidents, and thus to lowering the costs of mitigating accident consequences, compensation to affected people, paying penalties for pollution of the environment.
- By suitable publishing the results of risk assessments, the awareness of employees and population will be increased, and thus also the image of the establishment will be improved.

KEY TERMS AND DEFINITIONS

Hazard: The potential of a physical situation or a chemical to cause harm to human health, property or the environment.

Major Accident: An emergency event such as an explosion, fire or leakage of a toxic substance in an industrial plant that causes death or personal injury, property damage or environmental contamination.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Process Safety: It deals with the prevention of major accidents in technologies where dangerous chemical substances occur.

Risk: Combination of consequences and probabilities of undesirable event.

Risk Assessment: Hazard identification and consequence and probability assessment process that determines the level of risk.

Risk Management: An overall risk management process involving both risk assessment and risk reduction through technical and organizational barriers.

Safety Barriers: Risk reduction measures that may be a technical and organizational nature.

Chapter 50
Knowledge Management Influence on Safety Management Practices: Evidence from Construction Industry

M.D. Deepak
National Institute of Construction Management and Research, Pune, India

Mahesh Gangadhar
National Institute of Technology, Karnataka, India

Medi Narotham Kumar
National Institute of Technology, Karnataka, India

ABSTRACT

Many studies have been conducted in relation with knowledge management (KM), indicating the benefit associated with KM; among which safety management (SM) improvement is one of them. So, the aim of this article is to assess the influence of KM on SM practices in construction industry. In this regard, various factors that affect KM and SM are identified through literature review. Then, a questionnaire survey was facilitated to collect data based on the identified factors. These factors are ranked using a relative importance index (RII) to ascertain the level of importance among its group. Further, correlation analysis and multiple linear regression analysis are carried out to test and measure the strength of the relationship between KM and SM factors. Results indicate that there exists a definite and significant relationship between the factors of KM and SM in construction industry. Overall, the results obtained from the study will assist practitioners and professionals to develop and upgrade KM and SM practices in construction industry.

1. INTRODUCTION

Construction industry is a project-based industry where team members of a project work together and this team often disintegrates at project termination (Esmi & Ennals, 2009). Due to this dynamic nature of the industry, learning new concepts happens every day by way of addressing certain issues that lead to project success (Karagoz, 2017). However, these new learnings are not captured and result in "re-inventing the wheel" on occurrence of similar issues in the near future. Recommended good practice is to capture these new learnings at the project termination stage (Grover & Froese, 2016). This can reduce significant amount of time spent on solving problems and thereby increases work efficiency by reusing the existing knowledge which is attained through past experience. Recently, there is an increase in number of construction organizations that perceive knowledge management as an integral aspect of business improvement (Robinson et al., 2005). This process is associated with establishing strategies, identifying the necessary resources and evaluating its benefits. One of the associated benefits is improving health and safety aspects. Increase in knowledge level results in better performance and fewer errors and subsequently enhances organizational health and safety (Shirouyehzad et al., 2017). Indeed, capturing knowledge leads to decrease in the rate of accidents and injuries (Floyde et al., 2013). As a result, organizations can apply this captured knowledge to improve their safety management practice. In fact, knowledge management practice has effect on safety management in organizations (Fargnoli et al., 2011; Shirouyehzad et al., 2017).

Proficient knowledge management is vital from a safety perspective for learning purposes to keep mistakes from happening frequently (Gressgård, 2014). Knowledge management implementation strategies can decrease the rate of accidents and injuries, and thereby improve organization safety (Movahedi et al., 2015). This accident repetition phenomenon can be mitigated by effective implementation of knowledge management strategies in construction organizations (Hallowell, 2011). Clearly, there is an association between managing and sharing knowledge among construction professionals as this is of great significance towards benefiting safety performance in organizations. Therefore, this study aims to understand the relationship between factors of knowledge management and its influence on safety management practices in Indian construction industry. By doing so, the study attempts to underline the importance of these factors in order to promote the level of knowledge management as an effort to improve the level of safety in construction organizations.

A theoretical framework is proposed to understand and evaluate factors affecting knowledge management and safety management practices in construction industry. The framework considers the influence of knowledge management factors (knowledge culture, organizational knowledge, effective and systematic approach towards knowledge management, and knowledge management measures) on safety management factors (organizational context, social environment, and individual characteristics) relevant to construction industry. These factors comprise of measurable elements that influence the proposed relationship. In this regard, research hypothesis has been formulated to test these proposed relationships.

1.1. Research Hypothesis

Research hypothesis is defined as a rationally speculated association between two or more variables which needs to be tested and expressed in the form of simple statements (Sekaran & Bougie, 2016). Influence of knowledge management implementation factors on safety management factors is formulated as hypothesis statements as shown in Figure 1.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The hypothesis for this study is:

H_1: Knowledge management implementation factors have an influence on safety management practices in construction industry.

The null hypothesis is:

H_0: Knowledge management implementation factors do not have an influence on safety management practices in construction industry.

Figure 1. Research hypothesis

2. LITERATURE REVIEW

2.1. Knowledge Management in Construction Industry

Construction is a dynamic and project-based industry where common practice is to capture lessons learned through project reviews that happen at the end of the project (Grover & Froese, 2016). Reuse of existing knowledge picked up through past experience can enormously decrease the time spent on critical thinking and will boost the quality of work. Yusof and Bakar (2012) describe that knowledge management practices are being increasingly acknowledged for much-needed innovation and to improve business performance. Knowledge management is defined as "the practice of selectively applying knowledge from previous experiences of decision making to current and future decision-making activities with the express purpose of improving the organization's effectiveness" (Jennex, 2005). There are two types of knowledge that are present in organizations: tacit knowledge and explicit knowledge. Examples of tacit knowledge include individual experience, rules of the thumb, intuition etc., and explicit knowledge are codified into regulations, instructions, standards reports, guidelines, manuals, databases, etc. Substantial

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

efforts have been made by numerous industries to manage, implement and improve systems to capture, store and retrieve project related explicit knowledge (Newel et al., 2006).

However, ample consideration has been paid towards managing tacit knowledge (Lin et.al, 2006). Managing tacit knowledge is extremely important in the construction industry due to its uniqueness and fragmented nature which creates exceptional amount of knowledge amid its execution. Also, due to these qualities, new challenges emerge every day for which the project team react to these issues with possible solutions. In any case, this knowledge mostly remains in the minds of project staff and does not get exchanged within the organization for reuse in upcoming activities (Dave & Koskela, 2009; Shokri-Ghasabeh & Chileshe, 2014; Leal et al., 2017). The main purpose of knowledge management activities is to transform individual and group knowledge to build organizational knowledge that leads to development of knowledge management process in the organization (Lin, 2014). Successful implementation of knowledge management activities in construction creates in business performance and ultimately for collective learning (Ribeiro, 2009). Hence, there is a need to identify the factors influencing knowledge management strategies that construction firms consider for continuous improvement.

2.1.1. Factors Influencing Knowledge Management

Elements supporting the accomplishment of knowledge management can be recognized from authors who have looked into and composed specifically regarding this matter. Holsapple and Joshi (2000) defined a framework for understanding elements that impact the success of knowledge management activities in an organization. Their study has identified and described key elements in three levels; management, resource, and environmental aspects. Davenport and Völpel (2001) established an extensive list of knowledge management success factors comprising of knowledge sharing processes, organization policy frameworks, measuring performance, training initiatives and benchmarking processes. Jennex and Olfman (2006) proposed a knowledge management success model derived from longitudinal study of an engineering organization. This model provides a definite link between knowledge usage and organizational effectiveness. Key dimensions of the model are system quality, knowledge quality, service quality, user satisfaction, perceived benefits, and net impact on individual and organization. Teerajetgul et al. (2009) examined knowledge management practices at the project level in Thai construction projects. The main objective was to identify whether or not knowledge factors influence on-site execution of works. Some of the key factors include established information technology, teamwork, trust, leadership, incentives for knowledge sharing, individual and group level skills and competencies.

The success of knowledge management implementation is determined by identifying influencing elements and understanding their nature. Several elements as identified from review of literature are grouped under four factors are shown in Table 1. The four factors are: (1) knowledge culture: Some of the key elements are - possessing adequate leadership skills and adopting organization leadership policies, emphasis given on communication strategies, providing incentives for knowledge sharing processes, storing and using knowledge assets in the organization; all these factors benefit in developing a knowledge-based culture in the organization; (2) organizational knowledge: variables concerned with the management role for providing necessary commitment to work, managing knowledge with strong vision and objectives for managing future knowledge to improve performance are considered under organization factors; (3) effective and systematic approach towards knowledge management: creating a knowledge environment to update employees, managing human resources, designated roles and responsibilities for employees, providing adequate training and development, effective documentation process of knowledge activities,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

motivational aids for enhancing productivity and usage of proper systems and resources to effectively manage knowledge management processes within the organization; (4) knowledge management measures: knowledge management success can be achieved by setting participative goals, individual commitment of employees and their appreciation. These are some of the key elements concerning the implementation of knowledge management that have an effect on its benefits.

2.2. Safety Management in Construction Industry

Safety in general means a state of being protected against accident, injury, damage, fatality or similar such undesirable event. Safety management can be defined as "the policies, objectives, organization, management controls, and recourses, which are in place to manage safety, health and environment in all parts of the business" (Zhang et al., 2015). This majorly comprises of manpower, efficient resources and guidelines/policies that intend to decrease accidents and injuries occurring in work process. More recently, management of risk follows an organization's activity in a way that decreases the number of incidents and fatalities and also enhances organizational efficiency and its monetary outcomes (Fernández-Muñiz et al., 2007). Possessing suitable knowledge of organizational safety activities leads workers to safely work in a secure condition. Accordingly, the manager's attitude must lean towards giving adequate training towards safety of workers (Movahedi et al., 2015). Employees can have improved access and knowledge exchange if suitable safety management system is created in the organization.

The purpose of managing safety is to prevent recurrence of accidents or incidents. For this reason, safety management of the organization aims to foresee the occurrence of these accidents and tries to control them. Hence, there is a need to properly identify safety management factors that contribute to enhancing organizational health and safety aspects in the construction industry.

2.2.1. Factors Influencing Safety Management

Safety management for safer work environment is usually carefully designed and implemented based on standard practices being applied in different countries. Number of safety management factors greatly influence the outcomes of its performance.

Aksorn and Hadikusumo (2008) identified safety management success factors that broadly comprise of safety attitudes, teamwork, safety goals, participation in safety programs, communication, evaluation of safety programs, providing safety training, and allocation of resources. These factors were grouped under four headings, namely: management commitment, safety prevention and control system, worker involvement and safety arrangement. Jokkaw and Tongthong (2016) presented factors affecting the status of safety management and its assessment approach in Cambodia's construction projects. Some of the important factors that greatly influence safety management practices are: safety policy and regulations, use of personal protective equipment, budgetary allocation, training and accident investigation.

Elements related to safety management aspects as identified from several literature sources have been grouped into three factors as shown in Table 2. The groups are: (1) organizational context: the organisational context component includes top management involvement and support for safety practices, sufficient resource allocation to safety, clear and realistic goals to comply with safe practices, timely evaluation of safety performance, requirements of health and safety policy within the organization and providing rewards and incentives for safe work practices; these are some of the important variables in relation to the context of organization safety; (2) social environment: this majorly includes behavioral safety in the organization that is needed to define exact roles and responsibilities for safety actions, providing adequate safety education and training to employees of the organization, maintaining proper communication channels for individuals, reporting incidents and analyzing them by taking preventive measures; (3) individual characteristics: this factor deals with safety at the individual level which comprises of an individual's attitude to safety, job satisfaction, and continuing participation of workers in safety programs. Worker's safety attitudes can be shaped by appropriate supervision, working in teams,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and can be directed by safety meetings and talks for creating awareness among employees. These are some of the key elements that influence safety management practices in the organization.

2.3. Relationship Between Knowledge Management and Safety Management Aspects

Several studies suggest that knowledge attained from adequate experience can be effective for elucidating certain problems (Supyuenyong & Swierczek, 2011; Thalmann et al., 2014). The main essence of knowledge management is to capture the lessons learned and implement the best practices associated with the reuse of knowledge. However, safety management practices are implemented with the sole purpose of avoiding recurrence of accidents and injuries (Movahedi et al., 2015). In order to avoid recurrence of accidents or incidents, safety events that possibly cause these issues are carefully dealt by identifying the root cause of the problems. Then a strategy is made to understand the problem and the same is captured with the intention of reusing it in the future. This lesson learned is then applied to problems of

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

a similar kind. In the construction industry, significant problems arise due to lack of information about safety practices, lack of compliance with latest laws and regulations, lack of usage of personal protective gears, lack of information on execution of work with sophisticated equipment and devices (Fargnoli et al., 2011). The role of knowledge management in supporting the creation of a learning culture has been a key aspect for preventing accidents both in workers and manager's perspective (Törner & Pousette, 2009).

Studies suggest that managing risks conforms to organization's processes such that it reduces incidents and accidents, and thereby improves both financial and economic outcomes of the organization (Fernández-Muñiz et al. 2007). Possessing suitable knowledge of an organization's safety events aids workers to work safely and create a safe working environment (Movahedi et al. 2015). Possession of this knowledge related to safety can be termed as safety knowledge. Safety knowledge is defined as "employee's understanding of the safety procedures within an organization" (Jiang & Probst, 2016). Effective dissemination of safety knowledge is essential for successfully managing health and safety in the organization (Järvis et al., 2014). Floyde et al. (2013) suggested a model among small and medium enterprises for improving knowledge management through e-learning about job health and safety. This study also suggests that knowledge facilitates the learning process and has a positive impact on safety knowledge and its practices. Nonetheless, employees might have good access and effective knowledge exchange if appropriate safety management system is created in the organization (Håvold & Nesset, 2009).

In recent years, managing and improving knowledge has become a critical issue for which supervisors have shown increasing interest in industrial organizations (Jha & Pandey, 2016; Nguyen & Islam, 2018). Development of this knowledge can be achieved if there is proper support from the management towards allocation of resources, providing training to the employees and thereby cultivating a learning culture in the organization (Jennex & Olfman, 2005). Also, knowledge management greatly influences the learning process within the organization and this, in turn, impacts organizational effectiveness (Jennex & Olfman, 2002). This effectiveness makes the organization perform critical activities that benefit organizations to a greater extent and thereby making it competitive (Jennex, 2008).

In this regard, exploration of knowledge management factors is essential for effective implementation in order to achieve the associated benefits (Nguyen & Islam, 2018). Moreover, knowledge management in the construction industry is required so that duplication of work is minimized and information is easily available and disseminated. This management process includes acquisition, storage, and dissemination of safety knowledge which can be centralized safety capital. Another important benefit and necessity of implementing knowledge management is to improve the working methods and improve the safety status of the industry. Besides, this can facilitate organizational safety thereby reducing accidents and improving safety results.

The gap in literature as found from this review is the influence of knowledge management implementation on safety management practices in the construction industry. Moreover, there is pressing concern for achieving a sustainable competitive advantage by reducing accident rates, improving working conditions, increasing employee motivation and productivity which influences firm's image, reputation, productivity and innovation (Fernández-Muñiz et al., 2009). In this regard, the use of knowledge (i.e. learning and knowledge sharing) is regarded as a critical asset for an organization's competitive advantage (Robinson et al., 2005); and also, as a source of income generation (Teerajetgul et al., 2009). Likewise, construction safety increases organization's competitiveness and profitability (Agwu, 2012; Okoye & Okolie, 2014). In other words, assessment of safety management is crucial to reduce the possible risks to create a safe working environment. The integrated effort needs to be assessed for improving the overall performance

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of organizations. Therefore, assessment of the influence of knowledge management on safety management practices needs further exploration.

3. RESEARCH METHODS

This section highlights the research methods adopted in the study. First, in order to explore the underlying influence, a thorough literature review is carried out to identify the important elements and hypothesis statement has been formulated indicating the theoretical relationship; i.e. influence of knowledge management on safety management practices in construction industry. Following this, a questionnaire-based survey is conducted among stakeholders (client/owner, contractor, consultant, etc.) of the construction industry. Finally, the hypothesis was tested to understand the relationship through statistical analysis.

3.1. Questionnaire Survey Design

Questionnaire survey is preferred as the main method of data collection as it is an effective instrument for acquiring data on approaches toward relationships between variables of interest (Hair et al., 2007). Questionnaire survey covers the following sections: first section covers general information about the respondent and about the company; second section covers statements for each element of knowledge management and safety management pertaining to construction industry. Respondents were asked to rank these elements based on the level of importance with respect to their organization. Likert's five-point measurement scale is used for assessing these elements between 1 = no importance; 2 = little importance, 3 = moderate importance, 4 = important and 5 = extremely important. Initially, a pilot study was done to check the effectiveness of the survey instrument. Following this, necessary modifications was incorporated, and main study data collection was facilitated.

3.2. Sampling Technique and Sample Size for the Study

In India, there are infinite number of working professionals from different companies and hence it is difficult to collect responses from this study area. Hence, a sample that defines the population is considered for this study. The study population considered in this study are individuals operational among stakeholders of Indian construction industry. This study uses purposive sampling; which is a non-probability sampling method for collecting survey responses from some of the stakeholders in Indian construction industry. The sampling frame considered for the study includes stakeholders such as clients/owners, contractors, consultants, etc. The unit of analysis is construction professionals and practitioners in Indian construction industry. The iterative formulae to ascertain the suitable number of participants for the survey as adopted by Hair et al. (2007) was utilized, and is calculated by Equation 1:

$$\mathrm{SS} = \frac{\mathrm{z}^2 * \mathrm{p} * \left(1 - \mathrm{p}\right)}{\mathrm{c}^2}$$

Where: SS = sample size; z = standardized variable (z = 1.96 at 95% confidence interval); p = probability of picking a choice (p = 0.5); c = confidence interval (c = 10%)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The sample size of 96 is estimated based on the above formula. Generally, in construction industry it is difficult to obtain responses for questionnaire-based survey. As a result, a range of 30-40% response rate is adequate for research in construction industry (Oyewobi, 2014). The new survey sample size is calculated by Equation 2:

$$\text{New sample size} = \frac{\text{SS}}{0.35} = 275 \text{ responses}$$

Therefore, based on the above calculation, 275 questionnaires were circulated for data collection.

3.3. Analysis Methods

The analysis methods focus on identifying the significant influence of knowledge management and safety management attributes. These established factors are ranked using Relative Importance Index (RII) to ascertain the level of importance among its group. Then, correlation analysis is done to find the significant impact among the identified groups. Multiple regression analysis is used to define and establish the relationship between dependent and independent variables. Statistical analysis is carried out with SPSS v.21 software.

3.3.1. RII Analysis

RII analysis is utilized to decide relative importance of different variables of knowledge and safety management. RII is particularly valuable when variables that are compared are on different scales and the resulting indices are utilized to compute a measure of importance. RII's are calculated for each factor as in Equation 3:

$$\text{RII} = \frac{£\text{W}}{\left(\text{A*N}\right)}$$

where 'RII' denotes relative importance index, 'W' denotes weights assigned for variables, 'A' denotes the maximum weight, and 'N' denotes total number of responses.

RII value ranges from 0 to 1; and an element with higher RII value is considered more important than others. The highest RII value corresponds to most critical variable with "Rank-1", followed by second most critical variable with "Rank-2" and so on. The overall ranking is based on considering all the respondent groups (including contractor, client, and consultant). Ranks of the respondent's group were used to determine Spearman's rank order correlation coefficient for elements of knowledge and safety management using the following Equation 4:

$$\text{R}_{\text{S}} = 1 - \frac{6£\text{d}^2}{\text{n}\left(\text{n}^2 - 1\right)}$$

where, 'n' denotes paired ranks, 'd' indicates difference of rank orders.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Spearman's rank order correlation test is carried out to check agreement level among various respondent groups. This value ranges in between -1 to +1. If 'R_s' value is statistically significant at a significance level ($p < 0.05$), then it indicates that there is no significant correlation between the respondent's group and therefore the defined null hypothesis can be rejected (Tripathi & Jha, 2018).

3.3.2. Correlation Analysis

Correlation analysis is done by determining the Pearson correlation coefficient to check whether the factors of knowledge management and safety management were statistically correlated. This is a measure of determining the strength of relationship between two variables (Hair et al., 2007). Equation 5 is to compute correlation coefficient (r) and is given by:

$$r = \frac{n\left(£xy\right) - \left(£x\right)\left(£y\right)}{\sqrt{\left[n£x^2 - \left(£x\right)^2\right]\left[n£y^2 - \left(£y\right)^2\right]}}$$

where, "x" and "y" are any pair of variables whose level of correlation is being sought.

The coefficient value of +1 represents a perfect positive correlation between the variables. On the contrary, value of -1 represents a perfect negative correlation between the variables.

3.3.3. Multiple Linear Regression (MLR) Analysis

Multiple linear regression (MLR) analysis is an approach for investigating the relationship between a dependent variable with two or more independent variables (Hair et al., 2007). The extent to which each factor of knowledge management contributes to safety management factors is predicted by Multiple Linear Regression (MLR) analysis. This analysis is used to define the relationship of each dependent factor of safety management to that of each independent factor of knowledge management.

4. RESULTS AND DISCUSSION

4.1. Demographic Profile of Survey Respondents

A total of 275 questionnaires were circulated for data collection, among them 123 valid responses were obtained (Response rate = 42.4%). The demographics of survey respondents are as shown in Table 3. The minimum criteria of survey respondents to be considered for the study possession of minimum two years working experience in the industry. In general, the survey respondents were familiar with knowledge and safety management practices in the industry, which improved the quality of the survey data collected and this articulates the analysis results to a greater extent.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Demographics of survey respondents

Variables	Category	Frequency (n = 123)	Percentage (%)
Gender	Male	93	75.6
	Female	30	24.4
Years of experience	2 to 5 years	101	82.1
	6 to 10 years	18	14.6
	>10 years	4	3.3
Type of organization	Client/Owner	20	16.3
	Contractor	35	28.4
	Consultant	61	49.6
	Others	7	5.7
Size of company	Small (Less than 200 employees)	31	25.2
	Medium (200-500 employees)	56	45.5
	Large (More than 500 employees)	36	29.3

4.2. RII Analysis

RII values for each of the variables is computed using equation 3 as explained in the earlier section. The detailed ranking of KM and SM variables are highlighted in Table 4 and Table 5 respectively. Results of RII show that attributes such as intra-team communication skills (RII = 0.8813), individual commitment (RII = 0.8764) and knowledge sharing and storage (RII = 0.8650) carry more weight among KM implementation factors; and safety education and training (RII = 0.8829), incident reporting and analysis (RII = 0.8813), and timely evaluation (RII = 0.8732) play a prominent role in improving SM practices in construction industry.

Ranking of KM and SM variables is tested among various respondent groups to test the level of significance among stakeholders in construction projects. The correlation among various respondent groups on knowledge and safety management variables is shown in Table 6 and Table 7 respectively. Results indicate that there is significant relationship in rankings between the respondent groups. Weak correlations are observed in KM respondent group and moderate correlations exist among SM respondent groups. This may be due to the fact that the knowledge exchange between the respondent groups is comparatively less and participation and feedback towards effective knowledge sharing is minimum (Jha & Pandey, 2016; Nguyen & Islam, 2018) and thereby creation of new knowledge is limited among different stakeholders of construction projects. However, there exists good safety compliance with specific roles and responsibilities for active participation and involvement with established regulatory health and safety policy among different stakeholders to work safely on construction projects.

Sl. No.	Rank comparison of respondents group	Spearman's rank correlation coefficient, R	Significance level, p	Conclusion
1	Contractor versus Client	0.50	0.00	Reject H_0 at p = 5%
2	Contractor versus Consultant	0.50	0.00	Reject H_0 at p = 5%
3	Client versus Consultant	0.45	0.00	Reject H_0 at p = 5%

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

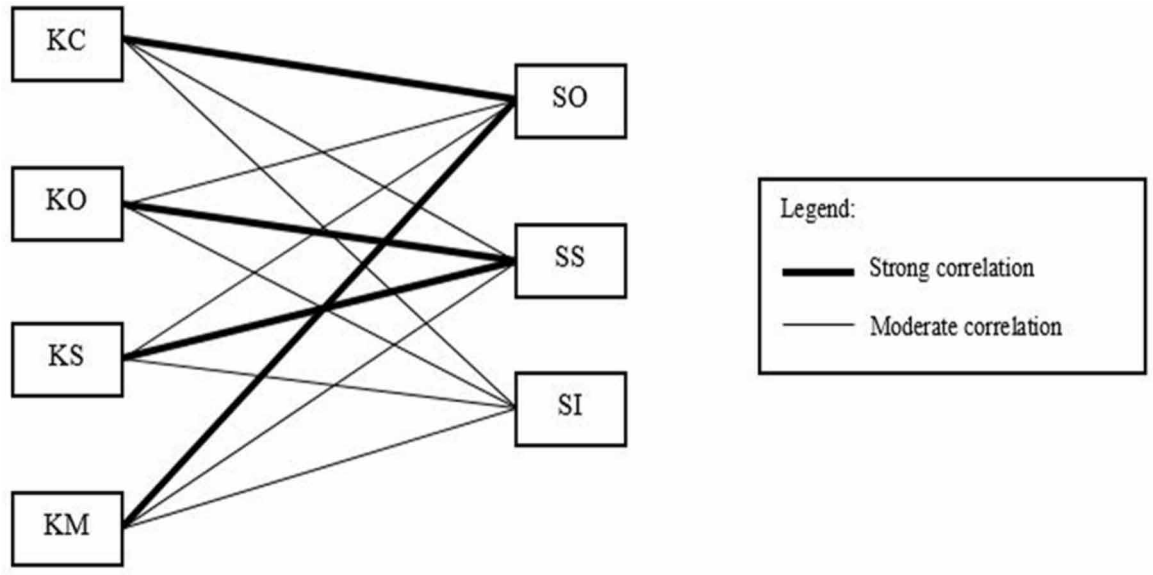
Results indicate that all variables under knowledge and safety management factors are positively correlated. Results of correlation analysis yielded knowledge culture (KC) was strongly correlated to organization context (SO) [r (123) = 0.712, p<0.01]. Organization knowledge (KO) was strongly correlated to social environment (SS) [r (123) = 0.661, p<0.01]. Effective and systematic approach towards knowledge management (KS) was strongly correlated to social environment (SS) [r (123) = 0.703, p<0.01]. Lastly, knowledge management measures (KM) was strongly correlated to organization context (SO) [r (123) = 0.523, p<0.01]. The perceived statistical relationship (Figure 2) obtained by Pearson correlation was conducted to examine the relationships between factors of knowledge management and safety management. These findings indicate that KC explains much more of the variability in SO than other significant correlations among factors of knowledge management and safety management.

Table 8. Correlation matrix of knowledge management and safety management factors

Factors	KC	KO	KS	KM	SO	SS	SI
Knowledge culture (KC)	1						
Organizational knowledge (KO)	0.718**	1					
Effective and systematic approach towards knowledge management (KS)	0.628**	0.691**	1				
Knowledge management measures (KM)	0.486**	0.482**	0.414**	1			
Organizational context (SO)	0.712**	0.658**	0.620**	0.523**	1		
Social environment (SS)	0.668**	0.661**	0.703**	0.495**	0.729**	1	
Individual characteristics (SI)	0.556**	0.514**	0.367**	0.411**	0.619**	0.493**	1

Note: **Correlation is significant at the 0.01 level (2-tailed)

Figure 2. Perceived statistical relationships between KM and SM factors



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

4.4. Multiple Linear Regression (MLR) Analysis

Multiple linear regression (MLR) analysis is done to evaluate the strength of the relationship between factors of KM and SM. In this regard, factors of KM i.e. KC, KO, KS and KM are considered as predictor variables/independent variables and factors of SM i.e. SO, SS and SI are considered separately as dependent variables. The regression models are presented in Table 9.

As shown in Table 9, four factors defined in the established knowledge management model explain at least 59.5% of the variance in most of safety management factors. This is considered to be satisfactory. Both Model 1 (SO) and Model 2 (SS) are defined by knowledge management factors, viz. KC, KS, and KM; as they are statistically significant in explaining the models. An exception can be found for Model 3 (SI), which is indicated by only two knowledge management factors, viz. KC and KO; as they are statistically significant in explaining model 3. In Model 3, four knowledge management factors explain only 35.7% of the variance for SI factor. Also, from Table 9, knowledge management factor KC makes the strongest impact in explaining most safety management factors. Therefore, in order to excel safety management practices, organizations should aim to develop and maintain a positive knowledge culture (Fargnoli et al., 2011; Zou, 2010). This is also consistent with the results of correlation analysis.

Given these inferences, hypothesis H_1 is accepted ($p < 0.05$) i.e. knowledge management implementation factors have an influence on safety management practices in construction industry subject to some minor deviations in individual characteristics factor of safety management. Therefore, the following two sub-hypotheses will be accepted ($p < 0.05$):

$H_{1.1}$: Knowledge management implementation factors have an influence on safety management practices that is measured by organizational context and social environment.

$H_{1.2}$: Knowledge management factors - knowledge culture and organization knowledge are responsible for safety management practices that are measured by individual characteristics factor alone.

5. RESEARCH IMPLICATIONS

Knowledge management studies primarily focus on creation and management of an environment that urges knowledge to be acquired, shared, learned and utilized that benefits the organization. In the construction industry, developing effective knowledge management needs; developing a central database as a collection mechanism (forms, formats and reporting) from different projects, analyzing the collected information and storing it based on its appropriateness; dissemination through training and development; and finally devising a mechanism to monitor and control the system. Results of analysis show the importance of different activities that are grouped under four factors (knowledge culture, organization knowledge, effective and systematic approach, and knowledge management measures) for development of the system as perceived by the respondents. Knowledge management effectiveness is greatly influenced by intra-team communication process which drives knowledge transfer in organizations (Alavi & Leidner, 2001). Efficient and effective knowledge generated is key to project success and requires commitment from individuals of all stakeholders in construction projects (Ruikar et al., 2007). The role of management in sustaining knowledge management process is by providing adequate training to the employees and thereby generating and maintaining constant flow of new information or knowledge (Teerajetgul et al., 2009). On the other hand, organizations need to educate and train employees so that workplace accidents and incidents may be prevented. These events may be eradicated with proper reporting systems and analyzing the causal factors. The process may be evaluated at regular intervals to enhance safety outcomes. Active involvement of employees in understanding roles and responsibilities is required for successful implementation of safety practices in the organization. Also, sufficient safety resources need to be allocated to construction projects as it is essential in achieving goals of organizational health and safety. Achievement of the above needs understanding the benefits of knowledge management and commitment by top management. These are some of the areas which should be considered for improving the benefits associated in implementing knowledge and safety management practices in the construction industry.

The ultimate aim of the study is to understand and evaluate the causal relation between knowledge and safety management practices in the construction industry. This benefits the organization in numerous ways. It helps in building policies and regulatory frameworks (Toh et al., 2016), timely evaluation of organizational effectiveness which is measured by developing key performance indicators (Jennex, 2012; 2017), organizational culture is developed resulting in learning and sharing of knowledge (Jennex et al., 2012), improving productivity of workers engaged in construction work or activities (Jennex, 2008); and thereby building the reputation of the company and ultimately results in the growth of the industry. These are some of the benefits associated with implementing knowledge management practices in the construction industry. For effectively understanding the influence of the benefits, measuring the underlying variables is required to predict the outcomes. Therefore, measuring some of the key elements in knowledge management aspects is necessary as it helps to evaluate knowledge management processes in construction industry which will also take into account the evaluation of safety activities in the organization. If a company does not have effective knowledge management processes, then it is advisable to develop and integrate knowledge management processes into a company's policies, as it can assist managers in utilizing knowledge during the project and also for successive projects (Jennex et al., 2003). And at a later stage, companies can focus on safety management features and strive towards its development. This helps the company to focus on sustaining safety at workplace by complying to safety standards and thereby creating a safe work environment. Once there exists a safe working environment, there is always room for improvement in correcting mistakes and learning within the organization

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Jennex & Olfman, 2002). The need to have knowledge management process within an organization ensures that knowledge gained from previous projects is effectively captured and reused. If companies do not have knowledge management implementation strategies, then it is quite difficult to capture and reuse the knowledge and attain the desired benefits (Jennex, et al., 2003). However, KM implementation practices have an impact on both individual and at organization level. Overall, the results obtained from the study will assist practitioners and professionals to develop and upgrade KM and SM practices in the construction industry.

6. LIMITATIONS AND FUTURE SCOPE OF STUDY

The study adopts a cross-sectional approach (i.e. data is collected at a specific time) to collect and analyse the survey data. The generalisability of the study findings could be increased by future studies based on larger samples of participants from diverse industry sectors and cultural backgrounds. In addition, qualitative investigations with larger scope could also provide more insights into the phenomenon under investigation and provide further evidence for validating the quantitative findings. The factors considered in this study can be further tested for their effectiveness in implementation in similar such construction organizations. This would highlight the strengths and weaknesses of knowledge and safety management practices in those construction organizations. The present study was carried out by exploring the influence of knowledge management factors on safety management practices in Indian construction industry (from a specific geographical region i.e. India). This can be further taken ahead by comparing the study outcomes with other countries and a generalized framework can be formulated to conceptualize the study findings.

7. CONCLUSION

Construction industry operates differently from other industries and is regarded as a competitive business with high risk and low profit margins. In this case, organizations face the challenge of how to best manage their knowledge to increase competitiveness. This is because knowledge management is regarded as a fundamental process of managing organizations. Utilizing key knowledge attributes helps to minimise the risks associated in construction safety practices contributes to effectively manage organizations. In this regard, researchers have focused on understanding the factors affecting knowledge management and safety management separately. However, this study focuses on identifying the influence of knowledge management factors on safety management practices in construction industry. This is facilitated by identifying knowledge and safety attributes that exhibit a significant relationship.

The main contribution of this study can be summarized as ranking of knowledge and safety management variables considering their significance as perceived by different stakeholders of the construction industry. This enables us to identify critical variables which have significant level of agreement among the respondent groups that affect industry practices. Perception of different stakeholders (including clients, contractors, and consultants) are compared and assessed in detail. This assessment provides a good view of the ability of organizational culture to support and implement KM practices in the organization. Additionally, the assessment also shows the impact of stakeholders on perceiving KM and SM factors by indicating the strengths and weaknesses across different areas. Analysis revealed that intra-team com-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

munication skills, individual commitment, and knowledge sharing and storage carry more weight among KM implementation factors; and safety education and training, incident reporting and analysis and timely evaluation play a prominent role towards improving SM practices in the construction industry. Analysis results also show that statistically there is a strong positive correlation between factors of knowledge management and safety management from the perspective of practitioners in the Indian construction industry. Positive correlation existing between safety and knowledge management factors indicates that organizations strive to develop knowledge culture for fostering individual and group level safety. The greatest barrier in capturing knowledge related to safety at the individual and group-level is influenced by knowledge culture. Developing knowledge culture in the organization has shown positive influence towards individual, behavioral and organizational safety. Safety at the individual level solely depends on established knowledge management practices imposed by the organization. This can be achieved by adopting a systematic approach to effectively managing the knowledge management process within the organization. Systematic approach towards implementing knowledge management practices impacts safety at both worker level and at organization level. Effectiveness of measuring knowledge management practices need to be evaluated in order to create safe working environment for the employees. Furthermore, the proposed models indicate that safety management factors are supported and explained by knowledge management factors thus validating the proposed relationship. This established relationship could allow an in-depth study of the influence of knowledge management on safety management practices, as well as describing the relationship between the underlying factors. Findings of the study enable industry practitioners and professionals to find out which issues should be focused for beneficial action towards knowledge management and safety management in construction industry.

8. ACKNOWLEDGMENT

This research received no specific grant from any funding agency in the public, commercial, or not-for-profit-sectors.

Chapter 51
Regulating Occupational Health and Safety in EU and China:
From a Comparative Law Perspective

Kai Liu
Jiangsu Normal University, China

ABSTRACT

Occupational health and safety (OHS) is an important aspect of the labour protection field. This chapter compares OHS legal regimes of China and EU. Comprehensive workplace health and safety legislations of the two systems are described, and the different aspects, including for example, legislative aim, the legislation structure, general obligation, OHS insurance, moral harassment, law enforcement, etc., are detailed. Based on the analysis, conclusions are made and policy recommendations from both legislation aspect and enforcement aspect are provided.

INTRODUCTION

The EU Workplace accident and disease prevention have been the focus of law-making activity in European Union (EU) since the creation of the common market in 1950 when the European Coal and Steel Community begins to unite European countries economically and politically in order to secure lasting peace. In more than half a century, the EU occupational health and safety (OHS) law grew from nothing into the present legal system (Liu & Liu, 2015), which centers on the Framework Directive 89/391(see hereafter). The modern Chinese occupational health and safety law started from the foundation of the People's Republic of China in 1949 and has formed system centering on the Work Safety Law (WSL) and Occupational Disease Prevention Law (ODPL). This research is set to compare the two systems and see from what aspects the Chinese system may benefit from the EU system. To serve this purpose, the OHS rules and their application in the EU law and the Chinese law are compared in this chapter. The aim of the comparison is to investigate whether what convergences and divergences exist between the EU system and the Chinese system. Answering these questions might provide some clues to under-

stand how the OHS are regulated respectively in China and EU, and as such is requisite for providing potential recommendations for improving the Chinese system. As commented by Örücü, the comparative lawyer must discover and describe uniformities and differences on the basis of the information s/he has collected and described. (Örücü, 2006). This comparative research is ordered in three topics: the convergences, divergences and the variables between OHS systems of the two jurisdictions. Among them, the variables concern the differences, as divergences do. However, variables concern the factors that are of either non-legal nature or legal nature but not OHS law nature. Based on the comparison, a conclusion would be drawn.

Before analyzing the legal systems, it is necessary to know some information about their economic and labour market contexts in order to better understand the differences between the two jurisdictions. Here three important economic labour market indicators are presented. Regarding EU, according to the data published by the EU's statistical agency --- the Eurostat, the total number of labour force was 218,375,000 people in 2016 (Eurostat, 2016), the unemployment rate was 9.6% (Eurostat, 2017), and the labour participation rate 72.9% (Organisation for Economic Co-operation and Development, 2015). Correspondingly, the data's of China are 806,460.14 (World Bank, 2016), 4.02% (People's Congress, 2017), and 71.0% (World Bank, 2016).

LEGAL SYSTEMS

The EU

EU's regulation of OHS was traced back to the foundation of the European Coal and Steel Community. (Hale,1984; Liu & Liu, 2015; Majone, 1993). According to Liu and Liu, the evolution of the EU/EC has defined the progress OHS protection. Over the decades spanning from the beginning of ECSC, through establishing EEC and through several rounds of enlargements, to the final establishment of the EU, it can be observed that the technique of legislative intervention evolved from safeguards, based on detailed and highly technical normative acts, to a different kind of regulation which is more based on general protection duties and principles (Liu & Liu, 2015).

Nowadays, OHS has already become one of the key focus areas of law-making activity since the creation of the common market (Liu & Liu, 2015). The EU OHS system is built the landmark Directive 89/391. In general, the Directive 89/391/EEC lays down employers' general obligations to ensure workers' health and safety in every aspect related to work, 'addressing all types of risk' (Sabel & Zeitlin, 2008; Liu & Liu, 2015). It is also a Framework Directive that established general principles, including risk assessment, avoidance, substitution and prevention. The Directive served as a basis for later individual directives dealing with specific issues such as those on workplaces, personal protective equipment, work equipment, manual handling of loads and display screen equipment (Nicholson, 2002; Liu & Liu, 2015). The individual Directives define how risks are to be assessed, and the setting and measuring limit of values at the workplace. Article16 paragraph 3 of the Framework Directive states that its general provisions shall apply in full to all the areas covered by each individual Directive (See Article16, paragraph 3 of the Framework Directive). Until the day of writing, in total 19 directives have been adopted, which are compiled in the European Agency for Safety and Health at Work (EASHW) 's website (European Agency for Safety and Health at Work, 2017). According to EASHW, these directives are categorized into six topics: (a) Workplaces, equipment, signs, personal protective equipment; (b) Exposure to chemi-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

cal agents and chemical safety; (c) Exposure to physical hazards; (d) Exposure to biological agents; (e) Provisions on workload, ergonomical and psychosocial risks; and (d) Sector specific and worker related provisions (European Agency for Safety and Health at Work, 2017), as shown in the following table. The individual directives define how to assess these risks and, in some instances, set limit values for certain substances or agents. According to EU system, all the directives shall be transposed into domestic law of Member States (MS), in order to ensure that national law is fully in alignment with EU OHS legislation.

Table 1. Daughter directives under the framework directive

Workplaces, equipment, signs, personal protective equipment	Directive 2009/104/EC – use of work equipment
	Directive 99/92/EC - risks from explosive atmospheres
	Directive 92/58/EEC - safety and/or health signs
	Directive 89/656/EEC - use of personal protective equipment
	Directive 89/654/EEC - workplace requirements
Exposure to chemical agents and chemical safety	Directive 2009/161/EU - indicative occupational exposure limit values
	Directive 2009/148/EC - exposure to asbestos at work
	Directive 2006/15/EC - indicative occupational exposure limit values
	Directive 2004/37/EC - carcinogens or mutagens at work
	Directive 2000/39/EC - indicative occupational exposure limit values
	Directive 98/24/EC - risks related to chemical agents at work
	Directive 91/322/EEC - indicative limit values
Exposure to physical hazards	Directive 2013/59/Euratom - protection against ionising radiation
	Directive 2013/35/EU - electromagnetic fields
	Directive 2006/25/EC - artificial optical radiation
	Directive 2003/10/EC - noise
	Directive 2002/44/EC - vibration
	Directive 96/29/Euratom - ionizing radiation
	Directive 90/641/Euratom - outside workers in controlled areas (ionizing radiation)
Exposure to biological agents	Directive 2000/54/EC - biological agents at work
Provisions on workload, ergonomic and psychosocial risks	Directive 90/270/EEC - display screen equipment
	Directive 90/269/EEC - manual handling of loads
Sector specific and worker related provisions	Directive 2010/32/EU - prevention from sharp injuries in the hospital and healthcare sector
	Directive 94/33/EC - young workers
	Directive 93/103/EC - work on board fishing vessels
	Directive 92/104/EEC - mineral-extracting industries
	Directive 92/91/EEC - mineral-extracting industries – drilling
	Directive 92/85/EEC - pregnant workers
	Directive 92/57/EEC - temporary or mobile construction sites
	Directive 92/29/EEC - medical treatment on board vessels
	Directive 91/383/EEC - fixed-duration or temporary employment relationship

Generally, the EU OHS system formulation is seen as a social dimension of European integration (Majone, 1993) --- which has been actively pursued during the past fifty years. It is at least partly through the adopting of OHS legislations that the capacity of the European Union to effect patterns of social exclusion is potentially deployed (Walby, 1999). The FD where the system centers on establishes general principles for managing safety and health, such as responsibility of the employer, rights/duties of workers, using risk assessments to continuously improve company processes, and workplace health and safety representation. All subsequent Directives within the meaning of Article 16 (1) of the Framework Directive follow these common principles. The Directive 89/391 established a general duty for employers to assess and prevent or reduce risks to safety and health at work. Indeed, the general duty fails expressly to mention against moral harassment at work. Yet, according to Liu's research, the current position of the European Commission is that moral harassment is covered under this directive. This is because, under the terms of Article 6(1), employers are obliged to assess all the risks, including, inter alia, those related to chemical agents, work equipment and the design of workplaces. The list is not exhaustive and the national legislation enacted in application of this directive has been extensively used in relation to workplace violence (Liu, 2015). The EU system has paid considerable attention to occupational health and safety in small to medium-sized enterprises (SMEs), which are a key sector in EU's economy and are vital to achieving EU economic goals (Hämäläinen, 2008).

According to Champoux and Brun, the nature of the OHS problems in small firms and the factors explaining the higher relative risk level are a topic of primary interest, for two reasons: firstly, they are more fragile financially; and secondly, their owner-managers tend to be personally responsible for virtually all management functions in their firms without any management training (Champoux & Brun, 2003).

To combatting this problem, the EU advocates the OHS services, which are external services and can provide professional OHS preventative services to SMEs. The model of preventive OHS service advocated by the EU Framework Directive 89/391 is an integrated one in which the pro-vision of occupational medicine, safety, hygiene, ergonomics, and work psychology is part of a 'holistic' approach towards the prevention of injury and ill-health and the improvement of working conditions and the working environment (James & Walters, 2002). A further distinctive feature of this approach is that workers and their representatives are centrally involved in both the oversight of the operation of such services and in carrying out the risk assessments that are the procedural basis to current approaches to health and safety management (James & Walters, 2002). The transposition of the EU directives led many countries to produce and to implement new laws and regulations, in order to conform to EU system. According to Jacinto and Aspinwall, the EU member states acted at different speeds and with different levels of detail, mostly depending on their own ''state-of-the-art'' and stage of development (Jacinto & Aspinwall, 2004).

China

The legislative structure of OHS in China is based on the Constitution. Its Article 42 provides:

By using various means, the state creates conditions for employment, strengthens labor protection, improves working conditions and, on the basis of expanded production, increases remuneration for work and social benefits… The state provides necessary occupational training to citizens before they are employed.

Furthermore, the structure consists of laws, administrative regulations, local regulations, departmental rules, local rules and OHS standards. Among them, two major OSH laws are Work Safety Law

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(WSL), and Occupational Diseases Prevention Law (ODPL), which functions as the foundation of the whole OHS system and deal respectively with safety and health issues at workplace (Brown, 2009). Other relating laws include Mines Safety Law (MSL), Labour Law, Labour Contract Law, Fire Protection Law, Emergency Response Law and Criminal Law. The major regulations are Regulations on Coal Mine Safety Inspection, Special Regulations of the State Council on Preventing Coal Mine Accidents, Regulations on Safety Management in Construction Projects, Regulations on the Safe Administration of Hazardous Chemicals, Regulations on Fireworks and Firecracker Safety Management, Regulations on Work Safety Licenses, Regulations on Civil Explosive Products Safety Management, Regulations on Special Equipment Safety Inspection, Regulations on Safety Supervision and Management of Agricultural Machinery, Regulations on Ascertaining Administrative Responsibility in Extraordinarily Serious Safety Accidents, Regulations on Work Injury Insurance, and Regulations on Reporting, Investigation and Handling of Work Safety Accidents, as compiled by International Labor Organization in its LEGOSH database. (LEGOSH Database, 2014).

With respect to the two primary laws, namely the Work Safety Law and the Occupational Disease Prevention Law. According to Pringle and Frost's compilation, the Work Safety Law stipulates 14 basic systems and/or measures. The important ones are: (a). A production unit must meet all the relevant laws, regulations, and industry-specific laws (such as the Coal Safety Law), otherwise it may not undertake production activities; (b) An enterprise must appoint an individual who is responsible for all aspects of safety; (c) An enterprise must also implement a safety management organization or individual; (d) An enterprise must implement a system of education, training, and assessment of safety knowledge of OHS directors (that is, personnel with overall responsibility), OHS managers, and workers; (e) Enterprises must implement a system of three simultaneous [OHS] measures at all stages of all projects; that is, OHS measures should be evident at the planning stage, during construction (of plant and so on), and when production is under way; (f) Production units must register exceptionally dangerous hazards with the local safety inspectorate; (g) Enterprises must implement a safety management system specifically addressing workplaces where explosives, working at height, and other dangers are involved (Pringle & Frost, 2003).

According to Su's compilation, the Occupational Disease Prevention Law (ODPL), adopted in 2001, defines the occupational health rights of workers, the obligations and duties of employers to protect the health of their employees, the responsibilities of the governments at various levels, and trade unions' representation in workers' health protection. The law stipulates basic principles governing the prevention and control of occupational disease, protective measures, hazards monitoring and management in workplaces, diagnosis of occupational disease, health authority inspections, and the liabilities incurred by those violating the law and control of occupational disease, protective measures, hazards monitoring and management in workplaces, diagnosis of occupational disease, health authority inspections, and the liabilities incurred by those violating the law (Su, 2003).

COMPARATIVE OBSERVATION

In the previous sections, the legal systems in regulating OHS in EU and China were discussed. The legislative frameworks and how the laws are implemented in the two countries with regard to what respective roles played by public enforcement agencies, the workers' representing bodies, as well as the individual workers are identified. Following the comparative methodology proposed in the first Chapter, this sec-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

tion summaries the convergences and divergences by 'analogy, distinction and contrast' and identifies the variables that may give rise to the divergences presented above. By situating China in its current transitional phase, the context of contemporary China is also assessed by referring to the experiences of the EU to produce a better understanding of the uniqueness of Chinese problems.

Convergence

Mapping out convergence is important. The comparative study would benefit from the findings of convergence because it can help understand to what extent the Chinese system is similar to that of the EU. The OHS legal systems in the EU and China present some converging features, which are summarized below. This converging process is advanced both by domestic demands, such as increasing publicity of industrial accidents and emerging new occupational risks, and by the common OHS legal norms.

First, based on an examination of the legal policies in the China and EU in the field of regulating OHS, it is clear that the protecting workers from occupational hazards are gaining prevalence in the two jurisdictions' political and legal agendas, which can be observed in three aspects. First, both jurisdictions have adopted a statutory framework to combat occupational hazards and to secure a healthy and safe working environment. OHS in China are mainly legislated into two distinct systems, namely the safety work system and the occupational diseases control and prevention system.

Second, both systems are of relevance with prescriptive approach. Since its creation in 1950s, the EU witnessed a prescriptive approach, which focused on providing in some cases OHS technical standards directly and in many more cases mandating the Member States to provide technical standards (Liu, 2015). The prescriptive approach was dominant until the introduction of the Framework Directive 89/391, (Liu, 2015), which was influenced by the UK's Health and Safety at Work etc Act 1974. The latter adopted goal-oriented elements recommended by *the Robens Report*. One prominent character of the Chinese legislation is of large number of prescriptive provisions. The difference is that the EU traditionally took use of the prescriptive approach, while China still utilizes it.

Third, both jurisdictions have endorsed some commonly accepted principles and underpinning values that govern the protection and promotions of OHS. These principles and values include the realization of the imposition of the OHS obligation primarily on the employer, the establishment of specialized public agency to enforce OHS laws, and the realization of adopting a comprehensive legislative system to battle occupational hazards. Although the EU and China show different attitudes toward the way of formulating the provisions in their respective legislation systems, both of their approaches indicate an attempt to realize the requirements of securing a healthy and safe workplace.

Fourth, both jurisdictions are of political will at the central level. Even at its creation, the EU saw OHS as an essential area to regulate and an area of relevance with the community's integration. The development of EU OHS also implies that OHS has been one of the few social domains, which remain highly centralized. (Liu, 2015). In this context, it is arguable that EU is of great political will to regulate the OHS. Protecting workers against occupational hazards is highly of interests of a socialist country as China. This is already stipulated as in the supreme law, the Chinese Constitution. In different congress meetings and state council meetings, preventing occupational accidents and "securing the safety of labors' lives and property" have been addressed. In this context, China is never short of political will at least at the central level to protect and promote OHS, although there has been a lack of driving force --- including factors of different aspects (the legal aspect is a well-functioning legal system) --- which would turn political will into effective OHS management.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Fifth, OHS regulating in the EU and China faces some common challenges. The emerging potential OHS hazards introduced by new technologies, materials, and substances, have threatened OHS regulating. Although psychological and psychosocial problems are becoming dominant occupational risks, both of the two systems have not recognized these hazards in their legislations. However, it should be noted that some EU Member States, for example, Sweden, the Netherlands, France, UK, Germany, and Austria, among other things, have already statutorily recognized these risks as workplace hazards, and moreover there are academic speculations that the EU law would in the not far further recognize these risk as workplace hazards. The EU's trend at this point would be further discussed in the following part.

Divergence

Despite the converging features between the EU and China, the legislation and the adopted approaches in the two jurisdictions present different answers to the research questions formulated in Chapter 1. hese differences include the role of worker participation, the regulating mental health at workplaces, the attitude towards the psychological and psychosocial problems at the enforcement level.

Economic Interests May Not Endanger the Health of an Employee

As a developing country as China, would the economic growth inevitably a priority in the social-economic context. However, this is also presented in the legal wording of OHS regulations, including the two primary legislations, the Safety Work Law and the Occupational Disease Prevention Law. In comparison, this is not observed in the OHS legislations at both the EU level and the Member States level. According to Barnard's analysis, the EU bases its OHS legislative activities also partly on the economic concerns: one of the main economic justification is to create "a level playing field", by depriving those countries with low OHS standards of a perceived competitive advantage over those countries with higher standards and thus greater costs (Barnard, 2013). Nevertheless, in no case would the OHS legislations be enacted for promoting economic growth, and would the economic growth be expressly provided as the legislative purpose. Also, through the examinations of the Member States' national laws, which should be at least theoretically in line with the EU legislations, no wording relating economic growth promoting is found. The rationale behind is simply because the OHS law is of nature social law. It cannot protect the workers' OHS rights, while promoting the economy, as the two issues are in industrial practice contradictory to each other, and could not be made at the same time. As stated in the *1974 Council Resolution on Social Action Programme*, which sees OHS law as a measure aimed at the humanization of the workers' living and working conditions with particular reference to improvement in health and safety conditions at work.

The System: Unified vs. Separated

The EU legislative system is built based on an integrated approach, reflected in its integrated framework Directive 89/391. This legislative system deals with both the OH and OS. Correspondingly, the transposed legislations in Member States are of unified nature and deals with both the OH and OS. This involves a basic framework of primary legislation establishing general principles and some specific requirements (Barnard, 2013). Examples include the Denmark's *Working Environment Act 1975*; Greece's *Health and Safety of Workers' Act 1985*; Ireland's *Safety, Health and Welfare at Work Act 1989*; the Netherlands' *Working Environment Act 1980*; and UK's *Health and Safety at Work Act 1974* (Barnard, 2013). It is

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

also the case with their respective enforcement systems, which are also integrated and responsible for implementing the whole OHS laws and securing the compliance by inter alia the employers.

OHS issues are dealt with in a different way in China. The legislative framework is statutorily divvied into OH and OS systems, respectively headed by two basic laws: the Occupational Disease Prevention Law and the Safe Production Law. Under this legislative framework, the supervision system is correspondingly separated, and mainly include health administrative department and work safety administrative department. And, these two regulatory departments are both authorized by laws and respectively assume their duties and responsibilities.

Both Chinese scholars and scholars from outside have different opinions vis-à-vis whether the Chinese system is adaptive and elastic enough to meet current and future challenges. Zhou holds that the OH enforcement power distribution to the health department is not in line with the need of actual development of OH, and the objective administrative system in China. (Zhou, 2010). Instead, the primary OH enforcement responsibility should be distributed to safety administration. Only OH issues relating to the occupational disease treatment, and rehabilitation would be left to the health department as the health system, in his view, possesses sufficient expertise and resources for the above issues (Zhou, 2010). Li and Zhang argue that separation approach in OHS has caused contradictions and overlaps in two parallel legislative systems (Li & Zhang, 2012). Bingan Li thinks the separated legislative framework has caused unnecessarily rising size of the OHS standards as different administrative departments are empowered according to the legislative framework to promulgate standards within their respective jurisdictions (Li, 2013).

From the enforcement perspective, Zong et al hold the view that the segregation in the OHS system has caused has caused the unnecessary rise of the cost of enforcement, as well as the cost arising from compliance with laws on the part of the employers (Zong. et al., 2011). This viewpoint is also shared in: Zhang et al.'s research. (Zhang et al., 2010). From the OHS management perspective, Wu and Chi points out that the separation of OH and OS may cause ineffective convergence of occupational hazards source management, early prevention, process management and consequences response (Wu & Chi, 2015). In the legal domain, the above mentioned ineffective convergence in the enforcement of occupational health and safety laws may weaken the supervision capacities. Furthermore, they point out that the lack of harmonized legislation and unified supervision would result in the conflict of regulatory departments' function and poor coordination (Wu & Chi, 2015).

Based on the above opinions, it is arguable that the lack of harmonized legislation and unified supervision has caused to some extent the conflict of regulatory departments' function and poor coordination, and also from the compliance perspective, the ineffective convergence of occupational hazards source management, early prevention, process management and consequences response.

General Obligation Approach

Although the regulating OHS by the EU/EC started as early as its creation, the approach that was adopted was based on binding normative instruments with the aim of standardizing national laws, and this technique was widely used until the 1990s (de la Vega, 2013). Since the 1989 Directive 89/391, the general obligation approach has been put in place, together with greater use of soft law instruments. In the EU system, general obligation, the general obligation provisions have all been introduced to ensure that the principal parties involved (primarily the employer, and to a less extent, the employee, and other parties) in all work processes are subjected to a range of overlapping and interlocking duties requiring

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

them to ensure the workplace is safe and without risks to health. Under the general obligation approach, both employers and employees have specific statutory obligations in relation to workplace health and safety that must be followed. This is combined with the greater role of private individuals (workers and/or their representing bodies) in the drafting of the workplace instruments (de la Vega, 2013). Moreover, this ideal of general obligation may not be easily achieved without the EU's desire for risk assessment. As a matter of fact, the EU puts risk assessment as one of the primary means underpinning the general obligation approach. In this sense, it is seen as the key method in self-regulation, and is presented as one of the crucial means in order to avoid occupational accidents.

The general obligation approach can hardly be found in the Chinese system. The present legal provisions are mainly detailed, restrictive and prescriptive, specifying the minimum standards that the employers should comply. The minimum standards are mostly prescriptive technical requirement of the production activities, such as scaffolding safety, prevention of falls, etc. Most standards for health and safety are compulsory. This sharp difference with the EU system is because the Chinese regulations and standards are based on the perspective approach rather than general obligation approach. The prescriptive approach is also called "deemed to comply" or "command and control". The Chinese legislation under this approach is, as opposed to ends, primarily concerned with type and quality of materials, method of manufacturing, and workmanship. The system attempts to standardize the work process using prescriptive rules and procedures usually backed by the monitoring of compliance and by sanctions for non-compliance. In parallel, due to absence of general obligation, the Chinese system fails (also does not need) to adopt risk assessment mechanism.

The Role of Occupational Insurance

Although the EU legislative system does not include providing occupational insurance as mandatory requirement, all the Member States have mandated so in their national legislations, although the differences in doing so are found. The legislations of in some EU countries have included workplace insurance as integral part of "social security health insurance schemes", and those of the other countries have prescribed a separate insurance scheme specific for OHS. In the first case, if a work-related illness, or an occupational accident injury occurs, the rules on sickness apply. Many of the legislations of the Member States include the occupational insurance in the mandatory health insurance, for example, the Netherlands, Sweden and UK; the others in the social security scheme. Despite the differences, one character at least is common. That is

In the three countries, which are chosen for study in this research, if the workers think there is a gap between the amount they are compensated by the occupational insurance scheme and that they expect, they can go to court to seek extra compensation to fill the gap. It should be kept in mind that the frequency of going to court varies among the three countries. In the Netherlands, and Sweden, as discussed before, it is very rare that workers start the procedures by themselves. Instead, the trade unions will do this on their behalf.

In comparison, the occupational accident insurance scheme commenced implementation as late as in 2004. China fails to run a mandatory universal health insurance system, as the legislative framework has itself limits in relation to the coverage of employees and the nature of injury. According to the current Chinese system regulating the insurance, the most fundamental requirement for the employee is to prove they have or had a labour relationship with the employer at the time of the accident or onset of illness. In this context, the employer is reluctant to sign written labour contract, which would become the most

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

obvious proof for the existence of the labour relationship in order to not avoid providing the insurance for the workers, for the reason that the insurance is financed by employer-paid.

According to a 2010 published literature, in the Delta River industry area, only 65 percent of the workers had labour contracts and only 73 percent had work injury insurance (Brown, 2010). For those who are not covered by occupational insurance, have to seek compensation by "unusual means", such as attracting public social media's attention, which is reflected in the case of Tseng Hei-tao (Liu, 2013).

The Role of Moral Harassment

At the union level, the Community has until now not adopted special legislation vis-à-vis moral harassment (Liu, 2015). As discussed before, the Framework Directive fails to include moral harassment as workplace hazards. However, it does require employers to 'adapt the work to the individual, especially as regards the design of work places, the choice of work equipment and the choice of working and production methods, with a view, in particular, to alleviating monotonous work and work at a predetermined work-rate, developing a coherent overall prevention policy which covers technology, organization of work, working conditions, social relationships and the influence of factors related to the working environment'. In this sense, there is a reference to, and provision for, risks related to the psychosocial work environment. Also, the European legislators have taken use of policy approaches - to define moral harassment as a violation of dignity, as well as to combine sexual and gender harassment with "mobbing," and bullying of all workers (Liu, 2015). Furthermore, according to the compilation by Martino et al., the European Parliament's 'Resolution on Harassment at the Workplace 2001/2339 (INI)'includes the following:

calls on the Member States, with a view to counteracting bullying and sexual harassment at work, to review and, if appropriate, to supplement their existing legislation and to review and standardize the definition of bullying;

urges the Commission to consider a clarification or extension of the scope of the framework directive on health and safety at work or, alternatively, the drafting of a new framework directive as a legal instrument to combat bullying and as a means of ensuring respect for the worker's human dignity, privacy and integrity; emphasizes in this connection the importance of systematic work on health and safety and of preventive action;

In this context, although without specifying what form it should take, the EU commission recognizes that psychological harassment and violence at work require legislative action (International Labour Organization, 2004).

At the member state level, countries such as UK, Sweden, the Netherlands, Belgium, Germany, Austria, Spain, Luxemburg, and France have developed specific legal regimes to expressly protect in their laws the workers from harassment at work. In Member States like Greece, there is still no specific legislation to combat the phenomenon. However, the victims can be fully protected by the institutional anti-discrimination law (Vlagopoulou, 2017). According to EU's report, as of 2004, as many as twenty three then Member States (Austria, Belgium, Cyprus, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Hungary, Ireland, Italy, Lithuania, Luxembourg Malta, the Netherlands, Poland, Portugal, the Slovak Republic, Slovenia, Spain, Sweden and the UK) stated that they had employment legislation that dealt with Sexual Harassment/Harassment based on sex (McGolgan, 2004).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In contrast, moral harassment is until the day of writing never considered an occupational hazard in China (Liu, 2015). China has adopted a legal system against this concern based on not specific OHS moral harassment provisions, but instead provisions of other non-OHS laws, including mainly the right to reputation provisions in General Principles of Civil Law (Article 101) and in the Penal Code (Article 246). Moreover, in this system, the scope of moral harassment is much narrow, compared to that in the EU Member States' system, as it is largely limited to including no much more than sexual harassment.

The Quality of Law Enforcement

Rule of law constitutes one of the EU's essential elements and good governance. The EU has a good reputation in terms of the rule of law, the law is generally enforced to a satisfactory level in the EU Member States, particularly in the "old members". It should be noted that there is a noted imbalance existing within EU regarding this issue, because the *status quo* in the "new members" --- the Member States ascended since 2004 --- is basically not equitably at a high level as in the old members. Nonetheless, generally, in combination with that the EU strengthens the protection of the rule of law and fundamental rights in the EU, the non-compliance with the law is not commonly observed in the Community.

In comparison, although the situation is continuously improving, there is a well-known gap between the 'law in books' and the 'law inaction' in China (Li, 2014). That is so called in Chinese "laws are not well executed or strictly executed although they are well enacted"(有法不依,执法不严). To develop the economy, local governments tend to avoid strengthen the inspection and control to compel the employer's compliance with laws, in order to make way for promoting economic growth. This problem is closely related to and aggravated by the problem mentioned in the section 3.2.1 in this chapter. That is, economic growth is statutorily recognized that as a priority.

The Role of Workers' Representing Bodies

In Europe, civil society has been traditionally playing a vital role in promoting the whole society's advancement. This role has begun to play even before it was recognized by legislations. It is also the case with the worker's representing bodies which play a vital role in the OHS enforcement system. Public awareness of occupational protection has been raised by constant social movements, including the early working class movements of the late 19th century and, to add a further dimension to this, the modern social movement beginning in the 1970s when the number of work-related accidents and illnesses remained high, after twenty years from the launch of the fundamental freedoms of movement (de la Vega, 2013).Nowadays, it is argued that a prominent feature of the EU model is its emphasis on encouraging civil society to participate in the development, implementation, and enforcement of OHS policy, as demonstrated in the employer-employee cooperation approach in its system. In other words, the EU system relies not exclusively on a centralized state inspectorate to enforce OHS laws, by supplementing the inspectorates with mandated workplace OHS committees. There committees, though bearing different titles in different Member States, generally operate with delegated public powers, including for example the monitor, and in some measure, are empowered to enforce, compliance with the regulatory regime.

In contrast, the awakening of public awareness of the OHS protection in China occurred later, especially after the occurrence of serious occupational accidents or outbreaks of occupational diseases. Nevertheless, public awareness of OHS protection remains at still a considerably low level. In a largely Party-state country as China (Yu, 2007), civil society (i.e., individuals and organizations that are outside

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the governmental apparatus) is seen as being "relatively underdeveloped" (Percival, 2013; Nicholas, 2012; Yu, 2007). Trade union system is basically of half-official status, and not granted independent position. The relationship between the Chinese trade union system, and the communist party and the state is seen in the research by Hishida et al. (Hishida et al., 2010)

At the workplace level, trade union is not empowered to be actively involved in OHS, neither is any other form of worker's representing body, if any. Therefore, the role of workers' representing bodies in participating in OHS is not observed in China in the same way that it is in the EU.

Variables

OHS is never merely a separate material sphere; instead, they are interconnected with their surroundings and enmeshed in social-economic and legal contexts. Having observed the divergences between the EU and China regarding OHS legislation and practice, this section identifies several variables in the contexts that may explain the divergences found above.

OHS Policy-Making in Social-Economic Contexts

Although both jurisdictions have conducted intensive OHS policy-making, their starting points differ significantly. In a post-developed society as the EU, OHS protection is deemed as an intrinsic component of civic life and a crucial means of achieving public welfare of not only the workers but also the whole society members. OHS protection is firmly grounded as a fundamental purpose of the industries, whereas the economic growth is considered a by-product, at least secondary to the public welfare.

In comparison, in China, the social-economic contexts in which OHS is situated are, however, not similarly opportunistic and poetic. Instead, the GDP-based assessment model of local officials' performance pushes these officials to expressly or implicitly allow the employer enterprises in their jurisdictions to bypass OHS requirements to reduce production costs and in some cases even help the employers avoiding potential compensation liabilities to injured or ill workers. For example, see case Tseng Hei-tao (Liu, 2013).

Compared to the OHS protection in EU, this issue in this East Asian country is seen as being more pressured. Well-documented factors include the increasingly expanding size of industries, the large working population, a comparatively poor economic basis and the comparative poverty. The following statistics may be illustrative: The size of China's GDP is exceeding10 trillion USD as of 2014. China processes 21% of the world's population, and around 400 million workers. The China government has until the day of writing never published statistics over the total number of the workers. So, it is made reference here to the statitiscs by China Labour Bulletin, a Non-Government Organization with high credibility. (China Labour Bulletin, 2017).

The annual GDP growth rate, though decelerating since 2012, has been on average nearly 10% in the past three decades (International Monetary Fund, 2017; World Bank, 2017). China has achieved a rapid economic development, especially in industrial field. China has become the world's largest manufacturer, with its manufacturing output surpassed the U.S. and Japan (Wu & Chi, 2015). Despite their benefits, the expanding industries have been increasingly put the workplace at risk and hazards to human health arise. In this context, China is facing unprecedented pressure with regard to OHS protection.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Operation of Administrative Power and Public Trust in General

Although reforms have been initiated in recent years aimed at the transformation to a limited government, China has a long history of an omnipotent government (Fan. et al., 2014; Morgan. et al., 2010). Lacking a separation of powers, the government historically served the administrative as well as the judicial functions (Morgan. et al., 2010).

In China, however, multiple factors impede the exercise of administrative power in an accountable way, including the absence of laws specifying procedural rules governing the administrative power exercise, a lack of channels through which citizens may seek to enforce the rights given to them by law, and a lack of public participation and transparency. The impediments are elaborated in a more detailed way in the research by Ostry et al. (Ostry. et al., 2003). In this context, the government can freely, though to a varying extent from region to region, switch between roles as the exerciser and the supervisor of power, which creates room for rent seeking.

Judicial Independence and the Predicament of the Courts

Indeed, the state of judicial independence in China remains elusive (Michelson & Li, 2012; Peerenboom, 2010; Kinkel & Hurst, 2011). Yet, Michelson and Li argue that most scholars agree that the Chinese legal system remains fundamentally fused to the state bureaucracy and subject to some important measure of political interference and control (Michelson & Li, 2012). This is also the case for OHS-related cases in China. In contrast, this deferential attitude does not derive from judicial respect for agencies' professional knowledge under the rationale of rule of law, as it is in the EU. In the Chinese system, this attitude derives from the courts' comparatively inferior role in terms of administrative power (Peerenboom, 2010). As a result, the courts are supposed to work in tandem with governments for the purposes of policy advocacy and social control.

Inappropriate interference in judicial work by governments has led to a phenomenon in which local courts are not willing to handle cases against where governments explicitly or implicitly protect the enterprise because of economic development concerns and do not have the ability to adjudicate such cases neutrally and independently (Liu, 2013). The predicaments and impediments that courts confront in China are not found in the EU, where the rule of law and independency of courts are well respected (Sadurski. et al., 2006).

Assessment of Contexts: Understanding the Transition in China

Having analyzed the convergences, divergences and variables between the EU and China, the next question will address how to assess these contextual similarities and disparities to better understand the distinctive features of the current transition in China.

Since 1978, China has stunned the world with its one of the world's biggest economic booms. The Chinese economic miracle closely relates to the development model to which China adheres (Ma, 2015). However, the "China model" has, in the recent years, received more criticism on inter alia democratic representation, and human rights issues (Chang, 2014) and the cost is seen as huge and unsustainable (Huang, 2008). In the OHS field, this cost would be that economic growth also increases occupational risks without inter alia enough increasing legal protection (Zhao. et al., 2012).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Examining the EU's OHS policies, one can observe a clear shift in the late 1980s. Before that, the prescriptive approach to rule-making, with focus on specification standards, intensively shaped the landscape of the EU's legislations. However, the following shift in regulating OHS signaled an awareness of fundamental problems akin to the prescriptive approach, when it comes to prevention of workplace accidents.

In comparison, China began to introduce reforms in the late 1970s with the end of the Cultural Revolution, which had brought about immeasurable economic losses and social turbulence to the China. Since then, China has made economic growth its main priority (Dorn & Wang, 1990). This priority was also echoed by massive grass-rooted people; they were desperately in desire of improving their livelihoods and quality of life. In parallel, the economic growth priority is systematically established in the Chinese administrative system, where economic growth performance has significant impact on the promotion prospects in the local officials promotion tournament (Wang, 2007; Cao, 2006). In the other words, the whole Chinese society from both the government and the civil society are to some extent "kidnapped" by the imperative of economic growth for the preservation of political stability. In this sense, OHS regulating should be considered not only as a material entity but also as a basis for economic growth and furthermore as a basis for the sovereignty's legitimacy.

Nonetheless, with society becoming increasingly pluralized and workers beginning to desire a better quality of life and a better workplace, economic growth cannot completely sustain the legitimacy challenge in the new era. The derogation of the workplace health and safety and the occurrence of the industrial accidents, and the prevalence of the occupational diseases are occurring at an alarming rate. In order to alleviate the social conflicts and smooth China's transition, the authority has revitalized and employed traditional values and ideologies. The most recent one is 'harmonious society' brought forward in 2004 as the governing ideologies for contemporary China (Guo & Guo, 2008; Zhao & Lim, 2010; Ma, 2015). Yet, it can be asserted that harmony may only be a mirage as long as it is built on the current OHS regulating model. In this context, making a commitment to workplace health and safety and delivering on its promise before it is too late might be the foremost priority for furthering the unavoidable transition process in China.

CONCLUSION

Through the compression observation between the Chinese system and the EU system, this section will conclude what conditions would be reached in order to establish an effective OHS legal system. The results arising from this section would be the basis for proving legal and policy recommendations for improving the Chinese system.

General Obligation Approach Plays a Vital Role in Improving the Effectiveness of OHS Law

First, general obligation approach can bring down the size of the OHS laws as shown in the EU OHS system part. The causes of workplace incidents are typically complex and may involve a series of events, which are of varying probabilities. Under the prescriptive approach, to cover the situations as many as possible, a regulator has write rules or standards as many as possible, correspondingly. However, with the introduction of general obligation, the regulator does not need to provide rules to cover all the situ-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ations (which is also impossible to achieve). Instead, the regulator only need to mandate the general obligation applicable to parties (primarily the employer) in all workplaces.

Second, the operation of modern businesses involves the use of sophisticated management and technical systems. It is unlikely that a regulator, no matter how well versed he or she may be in the businesses, will possess sufficient knowledge to be able to write and enforce regulations that keep up with all of the latest technical developments. However, under the general obligation approach, the general obligation would be the primary line to check whether the employer and the other parties have complied the law, and as such simplify the process of formulating the law and enforcing the law, as repeatedly shown in the EU part, the Sweden part, the Netherlands part, and the UK part.

Third, there is no means of designing or operating to a calculated level of risk. Even if it could be shown that the use of a different type of ladder is of very low risk, for example the OHS rule has to be followed. In this context, the prescriptive approach is very labor intensive and costly both to the regulator and the regulated industry and can be cumbersome for mature industries, as shown in the Chinese system part. The general obligation approach allows for the overlaps of accountability. It mandates all the employers have a duty to identify hazards, assess risks, and eliminate or control risks to the OHS of the workers. Given the resource restraints, it can be useful for organizations to prioritize risks and plan their actions so that they can make their workplaces healthier and safer.

A Harmonized OHS Legal System

A harmonized system would regulate OHS more effectively and protect workers against workplace hazards more efficiently. First, the harmonized legislative system would lead to a harmonized enforcement system. As demonstrated in the EU system, the EU and its Member States (for example, the three countries chosen in this research) have adopted a harmonized law, dealing with both health and safety, and correspondingly, the Member States have established a harmonized enforcement system to implement the laws. In contrary, separated legislative system would lead to separated enforcement system, as is presented in the Chinese system part. That the statutory protection of OH and OS, which are presented in two important existing laws: Production Safety Law and the Occupational Disease Prevention Law, two enforcement systems are responsible for implementing the two laws respectively.

Second, a harmonized system helps to avoid public agencies' function conflicts and unnecessary confusions to the employers. As a matter of fact, the OH and OS are closely related, which cannot be artificially separated, and both of them are serving the workers' safety and health. The Chinese approach to separate the two parts results in the conflict of regulatory departments' function and poor coordination. This further lead to that the enterprises sometimes would confuse that which department assumes regulatory function. Like in the China's case, regarding the supervisory power distribution between the work safety department and the health department has caused confusions to the employers. In parallel, the regulatory vacuum would be induced because of this status. However, a harmonized system would effectively avoid this problem because of the existence of only one legislative system and one supervision system.

Third, at the enterprise level, a harmonized system can protect workers better. According to Wu and Chi, the separation of occupational health and occupational safety in China has in fact caused to the employers the ineffective convergence of occupational hazards source management, early prevention, process management and consequences response (Wu & Chi, 2015). The ineffective convergence at the enterprise level in turn leads to degrading the actual protection level the employer could provide for the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

workers (Wu & Chi, 2015). In contrast, a harmonized system would effectively avoid the above situation by ensuring the uniformity and consistency of hazards source management, early prevention, process management and consequences response, and ultimately helps the employer provide a satisfactory level of protection.

Workers Actively Contribution to Health and Safety Workplaces Can Lead to a Lower Occupational Risk Level and Accident Rates

The previous discussion has shown that a resolution to the effectively promoting workplace OHS is not as simple as ensuring the law compliance while according the public inspectorate more powers or vice versa. In contrast to the traditional focus on command-and-control as presented in the Chinese system, and in the before-1980s EU system, the regulation of OHS activities necessitates: a more delicate balance between the state and the workplace, and the employer and the employee; and a deeper quest for the cooperation at the workplace level.

Previous studies have shown that the prevalence of the command-and-control would eliminates the link between thinking and doing: at the country level, the government thinks- the workplace parties do, and at the enterprise level, the management thinks - workers do, and lead to that employees and unions are kept at arm's length from decision making because their interests are assumed to be limited to achieving higher pay and benefits. This is not in line with the fact that the employer does not have the solutions to all health and safety problems, while workers and their representatives have the detailed knowledge and experience of how the job is done and how it affects them (European Agency for Safety and Health at Work, 2012). Workplaces in which workers actively contribute to health and safety often have a lower occupational risk level and accident rates (European Agency for Safety and Health at Work, 2012). According to the previous studies, this is also witnessed in the European system. Some countries as Sweden and the Netherlands have begun to promote workers' participation in OHS as early as the end of WWII. At the EU level, since the shift, the countries witness a growth in worker's participation, although in the country as the Netherlands it might be also partly caused by the labour inspectorate being understaffing (Jaspers & Pennings, 2013). The need to promote worker involvement in OHS is widely accepted not only at the EU level, but also at international level (see International Labour Organization Convention concerning Occupational Safety and Health and the Working Environment, No 155 of 1981).

The participatory mechanisms usually provide for the workers and/or the workers presenting bodies (in most cases, in the form of OHS delegates and OHS committees) the right to be consulted when any changes to the workplace affect, and the right to (together with the employer) produce agreements, and other forms of supporting documentation produced that regulate the workplaces. This documentation may even create mandatory rights and obligations as long as it is empowered by the statutory laws. For example, as shown in the Netherlands case, the agreements can deal with workplace moral harassment issues.

In this sense, promoting workers' participation can be a powerful tool to improve the existing OHS system to be adaptive enough to workplace needs, effective to combat against OHS hazards, and stable enough to accommodate diversified workplace interests and claims.

The Key to Sufficiently Compensate the Occupationally Injured or Ill Workers Rests in Occupational Insurance

Priz brothers note that the occupational insurance is by nature a crafted "historic compromise" and "the compromise established that the liability of an employer towards workers who were injured or made ill on the job was essentially no-fault" (Priz & Priz, 2010). They further point out the workers receive, through the insurance mechanism, the compensation for their medical costs and lost wages (Priz & Priz, 2010). Prior to the introduction of this solution, injured and/or ill workers had to take legal action based on tort system against their employers for compensation, which created a system where workers found it difficult, costly and time-consuming to get compensated for the costs of occupational injury and illness (Priz & Priz, 2010).

In this sense, the divergences between the EU and China in terms of occupational insurance indicate gap between the two jurisdictions in compensating the workers, in cases that they are injured and/or become ill. The Chinese system fails to establish a comprehensive insurance system. As commented by Larson and Larson, the right to compensation benefits depends on one simple factor: the existence a work-connected injury and/or illness. (Larson & Larson, 2008). However, a mere elevation of the emphasis on the occupational insurance in name, such as dictation of the legal wording that a universal occupational insurance be established, does not necessarily increase the capacities of the insurance scheme. Instead, corresponding measures must be taken to improve the general context in which a particular institution is situated.

First, desirable effective scheme needs to be built on the premise that the employers are financially motivated to provide the employees the insurance. The current scheme that put the premiums paying liability completely on the employer would definitely reduce the employer's motivation as the employers might become financially overburdened. It is also not fair if this responsibility is shifted to the employee. Given the general situation that China has a rich government and a poor working class. (The Economist, 2015; Zhou, 2010; Wang & Zheng, 2013). In this context, a practical solution might be the government provides subsidies for the insurance premiums. As a consequence, the law should impose a statutory a subsidy-providing responsibility on the employer. Second, the various involving parties should be accorded the powers in case insurance is not provided. This means that the labour inspectorate, employers, employees and/or their representing bodies need to be equipped with their respective institutional functions. Particularly, the trade union should be accord sufficient powers to compel the employer provide sufficient insurance.

KEY TERMS AND DEFINITIONS

Convergence: A similarity between different legal systems.

Divergence: A difference between different legal systems.

Ergonomical Risks: The aspects of a job or task that impose a biomechanical stress on the worker.

General Obligation: An occupational health and safety law approach that focus more on imposing obligations of general nature rather than providing prescriptive rules.

Moral Harassment at Workplace: Vexatious behavior that manifests itself in the form of conduct, verbal comments, actions, or gestures at the work environment.

Occupational Health and Safety: A multidisciplinary field concerned with the safety, health, and welfare of people at work.

Psychosocial Risks: The aspects of a job or task that impose psychosocial harm to working population.

Chapter 52
Gender Awareness and Women Managers in Tourism:
Perceptions of Inequality and What Could Be Done

Inês Carvalho
Universidade Europeia, Portugal

Carlos Costa
GOVCOPP, University of Aveiro, Portugal

Anália Torres
University of Lisbon, Portugal

ABSTRACT

The purpose of this chapter is to reveal women top-level managers' gender awareness in relation to two aspects: 1) perceptions of discrimination and 2) views of what could be done towards gender equality (by the state, organizations, and women themselves), so that more women can advance their careers. Women top-level managers in the Portuguese tourism sector were interviewed. The interview data suggests that discrimination might still be pervasive in the Portuguese tourism industry. However, many women do not perceive it as "real" discrimination and have contradictory discourses about it. Informants were also asked what could be done so that more women advance in their careers. They place the solution to the problem of gender equality mostly in women's hands. While some of the strategies proposed by women confront the gender order, others align with the status quo by ensuring that women "fit in" without challenging existing structures.

INTRODUCTION

The increasing participation of women in employment was the most radical change in the labor market over the last century. Although female employment was initially the result of a need to complement family earnings, it slowly became a crucial part of women's identity (Goldin, 2006). Nowadays, women's involvement in the labor market seems to be irreversible (Casaca, 2010).

Although a lot has been accomplished in the field of gender equality, the pace of change has been slow and equality *de facto* is still far from being achieved. This reflects the gender order which permeates all spheres of society including labor. Several inequalities remain in this field. Work is still horizontally and vertically segregated, the gender pay gap remains and women's jobs tend to hold lower quality (Collinson & Hearn, 2005; García-Pozo, Campos-Soria, & Sánchez-Ollero, 2015; Santero-Sanchez, Segovia-Pérez, Castro-Nuñez, Figueroa-Domecq, & Talón-Ballestero, 2015; Scott, Crompton, & Lyonette, 2010). The traditional ideology of domesticity persists, and women are normatively assigned the work of caring and nurturing (Scott et al., 2010a).

Such gender stereotypes and cultural barriers work particularly against women with management aspirations. They are frequently stereotyped as weaker and less committed to long-term careers than their male counterparts (Brownell & Walsh, 2008; Li & Leung, 2001). As a result, they often feel that they have to work harder than men in order to prove themselves and avoid being sidelined. Several studies have revealed that despite the centrality of male practices and behaviors that lie at the core of most organizations, management is often perceived as 'gender neutral' (Acker, 1998; Mavin, Bryans, & Waring, 2014).

Management and organizations are often perceived as 'gender neutral' by women themselves. Several studies have revealed that women managers may downplay the role of discrimination (Clark, Caffarella, & Ingram, 1999; Kantola, 2008; Wahl, 1992). When carrying out a broader study on gender, discrimination and the tourism sector (Anonymized), the authors of the present study observed the same pattern, since their respondents – women managers – also tended to downplay the role of discrimination. This aspect revealed a certain lack of gender awareness, which was also noticeable in women's suggestions of how to make the tourism sector more gender equal. Hence, the present article not only analyzes women managers' discourses on discrimination, as previous studies did, but it goes beyond that, by analyzing with a gender lens women's suggestions of how gender equality could be achieved.

On a global scale, tourism is a highly gendered sector (S Mooney & Ryan, 2009; Segovia-Pérez, Figueroa-Domecq, Fuentes-Moraleda, & Muñoz-Mazón, 2018). However, it is frequently conceived as an industry that "opens doors to women", since women comprise the majority of its workers in most countries (UNWTO, 2011; WTTC, 2013). Therefore, it is relevant to study gender awareness in the tourism sector.

Portugal was chosen as the setting for this study, partly due to the importance of tourism for the Portuguese economy. Besides, Portugal is a country whose high levels of female participation in paid employment (which are among the highest in the European Union) can be largely explained by an economic rationality, rather than by an effective change in traditional gender beliefs (Sackmann, 2002). Moreover, previous studies have revealed the genderedness of the tourism sector in Portugal (Carvalho, 2017; Costa et al., 2017). Therefore, it is of interest to investigate women managers' gender awareness in this context.

Hence, this study analyzes women top-level managers in tourism (hotels, travel agencies and tour operators) and their gender awareness. Women's gender awareness was analyzed in relation to two

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

aspects: i) their perception of discrimination; and ii) their views of what could be done towards gender equality (by the state, organizations and women themselves). Women's discourses tend to reveal a lack of gender awareness. They also tend to overemphasize the role of individual career-making, while broader gendered structures are minimized in their discourses. underpinned by the invisibility of broader gendered structures.

Background

It is often stated that tourism offers many employment opportunities, particularly for women or ethnic minorities. Besides having a large employment multiplier effect, it has low entry barriers and offers opportunities for income-generating activities that can be conciliated with women's traditional gender roles and responsibilities in the household (UNWTO, 2011; WTTC, 2013). These characteristics of tourism employment generate some over-optimism about the potential of tourism for the integration of women in the economy (Gentry, 2007; Obadić & Marić, 2009).

Despite the optimism surrounding tourism employment, it may not necessarily confront the gender order, and may in some cases reinforce it. Connell (1987) uses the phrase 'gender order' to refer to 'a historically constructed pattern of power relations between women and men and definitions of femininity and masculinity' in the society as a whole' (p. 98-99). This gender stratification system legitimates women's subordinate positions in relation to men. Although gender differences (in contrast with sex differences) are socially constructed, they are used to reinforce the idea of 'essential' differences between women and men and thus 'naturalize' the gender order. All organizations also have a gender order that reflects the power balance between men and women. This gender order is related to the gender order of the society and cannot be separated from it, because both reproduce each other (Wahl & Holgersson, 2003).

Therefore, it is important to go beyond the argument that tourism opens doors to women, in order to analyze what kind of doors it opens, and how such labor opportunities challenge the gender order. In fact, over-optimistic arguments overlook the fact that tourism provides low pay, low status and low-skilled jobs in typically female occupations with few development opportunities (Adib & Guerrier, 2003; García-Pozo et al., 2015; S Mooney & Ryan, 2009; Santos & Varejão, 2007). Besides, due to the seasonality of tourist activity, tourism jobs often fail to provide workers with regular income the whole year. Due to their precarious nature, these jobs are also more likely to offer less employment rights (Purcell, 1997). Several studies have reported that there is a marked gender pay gap in the tourism industry that remains even after controlling for several variables, which is suggestive of pay discrimination (García-Pozo et al., 2015; Santos & Varejão, 2007). Hence, tourism labor may reinforce rather than challenge the existing gender order.

Tourism employment is also sharply segregated along gender lines. The typical gender pyramid is present in the tourism sector, and it is underpinned by traditional gender roles and sociocultural barriers. While men are over-represented in managerial positions, particularly in top-management, women are usually employed in typically female areas, or 'pink ghetto' jobs (Woods & Viehland, 2000), which are regarded as less skilled, and therefore have worse employment conditions and lower wages (Costa, Carvalho, & Breda, 2011; Jordan, 1997; Parrett, n.d.). Besides, the tourism industry tends to exploit perceived 'feminine' skills, and perpetuate traditional gender roles in sex-typed jobs such as cooking and cleaning (Purcell, 1997). Sexual harassment and sexual exploitation are also a common problem in the tourism sector. Female employees are required to look attractive and, in some cases, even flirt with

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

customers (Gilbert, Guerrier, & Guy, 1998; E. J. Hall, 1993; Tsaur & Tang, 2013) because sexuality is sold as part of the tourism product. This reinforces gender power relations that can be potentially harmful.

Although women's representation in high-level positions has increased in the tourism industry, they are still underrepresented at the top. The main reasons that have been pointed out in the literature for women's underrepresentation in management have been old-boy networks, lack of mentor support, work-family conflict, hiring practices and gender discrimination, and the requirement for long working hours and geographic mobility (Boone et al., 2013; Li & Leung, 2001; S Mooney & Ryan, 2009; Ng & Pine, 2003).

In its usual definition, discrimination is seen as a 'singular' or 'exceptional' situation. It presupposes that it is visible and clear, and that there is someone, a specific individual, who discriminates against (Kantola, 2008; Wahl, 1992). It can be related with the gender pay gap, sex-segregated job advertising, verbal abuse, sexual harassment, sexist language, violence against women or violation (Benokraitis & Feagin, 1995). However, some authors contend that this definition of discrimination is too narrow, since it ignores behavior that may not be intentionally discriminatory or not perceived as such by the individuals doing the discriminating, while it may be perceived as offensive by the person being discriminated against. Besides, discrimination is not always visible or easy to pinpoint (Benokraitis & Feagin, 1995; Husu, 2001; Kantola, 2008; Wahl, 1992).

Several studies highlighted the importance of analyzing 'indirect' discrimination (Wahl, 1992), 'hidden' discrimination (Husu, 2001; Kantola, 2008), or 'subtle' and 'covert' discrimination (Benokraitis & Feagin, 1995). According to Wahl (1992), indirect discrimination is related to conditions in organizations and is more structural than personal. Indirect discrimination can be associated with a demand for long working hours, impossibility of taking career breaks or the existence work patterns that are adequate for most men but are discriminating for women (Wahl, 1992). Benokratis and Feagin (1995) distinguished between subtle and covert discrimination, which are hard to document, in opposition to overt discrimination. Covert sex discrimination concerns unequal and harmful treatment of women that is hidden, maliciously and consciously motivated, in order to ensure women's failure. In contrast, subtle sex discrimination is not conscious and may be unintentional. Although it is harmful, it is not usually perceived as 'real' discrimination' because certain behaviors are 'traditionally' acceptable (Benokraitis & Feagin, 1995). Husu (2001) combined subtle and covert discrimination into hidden discrimination. Several studies have concluded that while direct or overt discrimination has become less frequent, namely due to legislation prohibiting it, indirect or hidden discrimination is still pervasive (Bruschini & Puppin, 2004; Kantola, 2008; Wahl, 1992). Despite the pervasiveness of gender inequality and gender discrimination, some studies have revealed that women lack gender awareness and struggle to identify hidden discrimination (Clark et al., 1999; Kantola, 2008; Wahl, 1992). Kantola (2008), Wahl (1992), Oliveira et al. (2010) and Patterson et al. (2012a, 2012b) have shown that women tend to downplay the role of discrimination, deny the importance of gender and refrain from portraying themselves as 'victims'. However, these studies have unveiled how women's discourses are marked by contradictions, since they reveal situations that show how gender discrimination is still pervasive, despite their initial denial of gender.

The tourism industry is a sector particularly relevant for studying gender awareness and subtle forms of inequalities due its paradoxical characteristics, i.e. being simultaneously a feminized and gendered industry. Besides, although Portugal has remarkably high rates of female employment, economy has been the main motor for gender equality in the country, rather than a change in mentalities. Hence, it is a particularly relevant setting for the analysis of the research question proposed in this chapter.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Female activity and employment rates in Portugal are among the highest in the European Union, particularly in full-time work (Casaca, 2010; Chagas Lopes & Perista, 2010). Moreover, Portugal has one of the highest rates of mothers of young children working full-time in Europe, despite the scarcity of childcare facilities and insufficiency of family networks (Plantenga & Remery, 2009; Torres, 2009). It can be said that economic rationality is the main motor behind women's integration in the Portuguese labor market, since an option and a necessity coexist (Cardoso, 1996; Sackmann, 2002). However, despite the legislation, the equality discourse and women's participation in employment, the traditional gender ideology persists, the gender division of labor at home is only slowly changing, inequalities in the labor market prevail and the gender pay gap is still far from being closed (Ferreira, 2010; Perista et al., 2016). Therefore, it is important to analyze what visions of gender equality persist in the Portuguese society, in particular to analyze the gender awareness of women managers in one of the most important sectors for the Portuguese economy – tourism.

GENDER AWARENESS IN PERCEPTIONS OF GENDER INEQUALITY AND VISIONS OF WHAT SHOULD CHANGE

The Study

This chapter reports results of a broader study on women managers in tourism. The broader mixed methods research study aimed to analyze to what extent gendering processes influence women's career and life paths (Anonymous). It combined the quantitative analysis of a dataset comprising all workers in the Portuguese private sector with the qualitative analysis of in-depth interviews to 24 women top-level managers in hotels, travel agencies and tour operators. Other articles were also published reflecting other partial results of this study (Anonymous). Both quantitative and qualitative results revealed gendered patterns of employment. In addition, qualitative results revealed the existence of a male culture in organizations, and persisting beliefs about women's lack of competence and availability (Anonymized).

In the present chapter, only qualitative data were used. The purpose of this chapter is to analyze women managers' perceptions of discrimination in tourism and their views about what could be done to tackle gender inequality and enable more women to advance in their careers. Table 1 provides an overview of the women managers interviewed in the qualitative part of the study. Informants were selected based on stratified purposeful sampling combined with snowball sampling. The purpose was to select information-rich cases and to capture major variations in the population. This sampling method sets limits to the generalization of the results to a broader population. The sample reflected the distribution of women managers across several categories of business dimensions according to the database used in the quantitative part. The semi-structured in-depth interviews were carried face-to-face and by Skype. In terms of data analysis, thematic analysis (Braun & Clarke, 2006) was combined with elements of narrative analysis (Czarniawska, 2004) in order to retain a sense of individual continuity across accounts. The software NVivo was used to sort the interview data into themes.

Perceptions of Gender Inequality

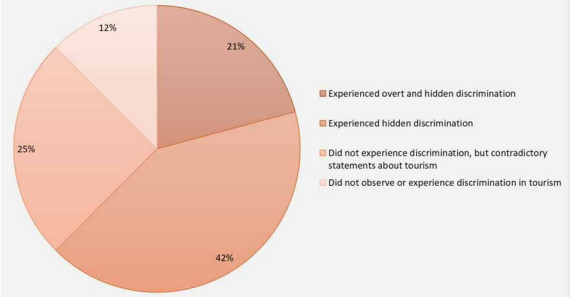
Figure 1 summarizes informants' experiences and perceptions of discrimination in the tourism industry. Research participants were not only asked about discriminatory situations that they experienced, but also about their perceptions of gender-based discrimination in the tourism industry.

Five research participants reported experiencing situations of overt and hidden discrimination, while ten experienced hidden discrimination (Figure 1). Hence, almost two thirds of the participants were discriminated against on the basis of gender. While at first some of these interviewees seemed to deny the importance of gender, as the interview unfolded, they acknowledged situations of hidden discrimination,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

which they, however, refrained from labelling as discriminatory. In order to make hidden discrimination more visible, women were asked whether they had felt ignored, less visible, excluded or treated differently in their organizations for being women. Women's discourses were contradictory since, in some instances, they denied the importance of gender, but some statements revealed that they recognized the importance of gender or that they were treated differently.

Figure 1. Women's experiences and perceptions of discriminations in the tourism sector
Source: developed by the author



Only three women consistently denied having felt or observed any sort of discrimination (Figure 1). They did not describe any discriminatory situations either in their organizational settings or in the tourism sector more broadly. However, two of these women considered that women in general still do not have the same opportunities as men to exercise power, while one considered that opportunities are the same, *provided women prove their capability and availability.* Still, this is a contradictory statement. If women have to prove themselves in order to be regarded as equals and to deserve the same opportunities, then there is hardly gender equality from the start.

The remaining six women did not experience gender discrimination, but they either observed it in the tourism industry or their statements concerning what they observed in the tourism sector were contradictory (Figure 1).

It is relevant to analyze such contradictions. In fact, about half of all the informants contradicted themselves throughout the interview. They gave contradictory statements concerning both their experiences and their perceptions of discrimination and gender inequality in the tourism sector (Table 2):

Women's discourses about discrimination are filled with contradictions, since they rejected the existence of discrimination, while simultaneously recognizing situations where women received less favorable treatment. The same trend was also observed by Patterson et al. (2012b). The contradictory statements are mostly related with the paradoxical nature of tourism. On the one hand, informants stated that there is no discrimination in tourism because women are the majority, and certain (supposed) "feminine characteristics" are preferred in the sector; on the other hand, as the interviews unfolded, some of the informants recognized how the macho mentality was imbued in the sector, how women were not taken as seriously as men, and therefore had to make a greater effort than men and work twice as much if they wanted to advance in their careers. The denial of discrimination by some of these women and their contradictory statements revealed their lack of gender awareness. Most women only recognized the existence of inequalities when further probing questions were asked.

Table 2. Research participants' contradictory statements on discrimination

Inter-viewees	Denial of discrimination or gender inequality	Perception or experience of discrimination or gender inequality
I01	Belief that the sector is more favorable for women because of their (supposedly) feminine characteristics.	Perception that a macho mentality prevails in the tourism sector, and as a result women's conditions in the tourism sector are not favorable.
I02	Perception that there are no gender inequalities in the tourism sector because women are the majority of the workforce.	Perception that working condition in the tourism sector are not favorable for women because of the existence of peak periods that demand availability and possibly generate work-family conflict, and that women end up being discriminated against for being less available.
I03	Belief that being a woman was positive for her as an entrepreneur and for her business.	Perception that, in many situations, employers prefer hiring men because they are more available.
I04	Denial of discrimination: she has never given others the opportunity to treat her differently.	Experience of discrimination in salaries and promotions at the beginning of her career; Perception that women are often excluded from sport events or informal outings ('Yes, this discrimination exists'); Perception that women need to be better than men in order to be recognized.
I05	Denial of experiencing exclusion, different treatment or lack of visibility for being a woman.	The realization that she had to be firmer in order to get recognition, that women managers still need to make greater efforts to assert themselves, and that women in managerial positions are still regarded in a less positive way.
I06	Denial of experiencing or witnessing gender discrimination in her current or previous organizations.	Witnessing supervisors selecting only the CVs from male job candidates. Perception of women's exclusion from informal outings (e.g. going for drinks), and of male clients' preference to do these activities with other men; Experience of sexual advances from clients during business dinners (as a consequence, she only has business lunches now).
I07	Denial of discrimination, exclusion, lack of visibility or recognition for being a woman.	Recognition that women need to make more efforts to be recognized; Male subordinates' refusal to follow her orders.
I08	Denial of discrimination.	Perception that men have more credibility for negotiating banking arrangements.
I09	Denial of different treatment by clients and suppliers.	Perception that clients often take her less seriously when she addresses them.
I10	Perception that the tourism sector is more favorable for women because there are many female entrepreneurs.	*In larger businesses, I see many men at the top, even in the travel agencies association, I see that at the top of that association there are practically only men… so I think that above a certain level there are more men.*
I11	Denial of experiencing discrimination; Belief that women create their own barriers and get lost in their emotionality; Refusal to consider that she is treated differently for being a woman.	Observation of pay discrimination (a female director in a different company earning a much lower salary than the previous male director); Perception that managers and employers prefer hiring men; Tendency not to take women as seriously as men in the tourism sector (in many countries, if a male director is hired, the company pays for his family's travel, but that it is not the case if it is a female director who is hired instead).

Interestingly, when the word 'discrimination' was not used in the questions asked, research participants were more likely to recognize the existence of structural constraints in the tourism industry. For example, when asked whether men and women have the same opportunities to exercise power, almost all interviewees answered negatively. The word 'prejudice' was consistently used in their discourses, while the word 'discrimination' was much less frequent, except in situations related with pregnancy or, in some cases, with female managers' comparatively lower salaries.

According to Patterson et al. (2012b), women deny discrimination because they do not want to portray themselves as victims. In the present study, these women regard themselves as highly professional, and it is possible that they tried to detach themselves from a victimizing discourse. They justify their advancement with basis on meritocracy and highlight the obstacles that successful women have to overcome individually in order to reach the top, in particular being capable of balancing outstanding professional achievements with the role of pillar of the family.

Views of What Should Change

Research participants were asked what could be done towards gender equality, so that more women reach the top of organizations. This section presents the main solutions proposed by the interviewees in terms of public policies, organizational measures and individual strategies, and whether the solutions proposed by women challenge or not the gender order. A more in-depth analysis of women's proposed solutions can be found in (Anonymized).

Women regarded the role of the state and organizations mostly in terms of provision of childcare (e.g. subsidies, childcare facilities) and flexible work arrangements (e.g. telework, less emphasis on working a fixed schedule, implementation of banks of hours), respectively. They believed it is crucial to provide women with the conditions to have more time to invest in their careers.

While some believed that the state could play a role in overcoming prejudice, mostly by setting an example, others were less optimistic that something at all could be made to speed up the pace of change. Most of them were against measures such as quotas for women in parliament. Some women were convinced that changes would occur 'naturally'. Despite recognizing that tourism is still a male world, some informants did not regard either discrimination in organizations as the root of the problem. Therefore, they do not think that it is tourism organizations that should change:

Travel agencies aren't different from other private companies, and to reach goals you need effort, and I don't think that it's companies that have to change.

In fact, the main way of dealing with gender prejudice and the *macho* mentality proposed by informants was through individual strategies – some of which undermine prejudice, while others ensure adaptation to the environment. Hence, interviewees considered individual strategies to be more important than institutional ones to overcome gender prejudice. Although the problem is not individual, they focused more on solutions at the individual level than at a more structural level. Many women literally said that the solution is 'in the hands of women':

Regardless of being a woman or a man, it's you who have to hold on to your job (…) and we should stop complaining all the time. You have to work, that's it.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

At the state level, I don't see which measures could be implemented… I think it's more at the individual level, women being prepared, having a good CV, showing that they can be as good as any man, that it's completely irrelevant being a man or a woman, what matters is professional experience and the ability of the person to carry out a certain task.

Some women recommended strategies that confront gendered structures, beliefs and prejudice, and that challenge the prevailing gender order. For example, at the organization level, some women argued that it is important to fight and be assertive:

When we really want to change something and really want something, we have to fight for it, we have to assert ourselves and we have to present arguments that we're an added value for the company. When you think that you really deserve something, you must be able to approach your supervisor or the general manager and negotiate your own conditions.

Other informants mentioned aspects related with protecting one's family and personal lives from excessive work demands, 'taking the lead in one's life' and not letting the company decide one's path. One participant underlined that women should not be afraid of not putting in extra hours or of getting pregnant. Another interviewee explicitly advocated the importance of not feeling guilty for wanting both a career and a family:

My first advice is to be psychologically ready, not being afraid… if you want to have a family, ensure that you don't feel guilty, my daughters are very happy children. Sometimes they don't see me for three or four days, a week, but they know that I come back… and this gives me stability, it allows me to concentrate on my work, because I know they're fine and happy, because they also know that I'm fine.

She further emphasized how women feel burdened by guilt in Western societies, and how this should change:

The Western Catholic or Christian woman still lives with the guilt… and, in more industrialized societies, she also lives with the pressure that she has to be the best, and we have to be much better than men.

Another set of individual strategies proposed by informants was related with challenging gender roles at home, and the importance of having a supportive partner:

The best thing is to find a partner that is not afraid and that is self-confident, that understands you and that helps you if you want to have children, or if you already have a family.

However, other strategies proposed do not address the gendered status quo. They focus either on submission and resignation, or on 'improving women' so that they can be regarded as equals with men. The underlying idea is that women need to be 'fixed' and adapt themselves to the system, e.g. through education, so that they can make their way up. Several women pointed out the importance of investing in education for promoting women's career advancement and attaining gender equality. Some women had themselves invested significantly in their education and had pursued or were pursuing graduate degrees

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and MBAs. The following quotes reveals that education may be more important for women than for men in terms of attainment of recognition:

Unless I have the medals [i.e. academic degrees] on my shoulders and on my forehead, then they [other CEOs or business partners] don't even look at me. (…) Sometimes I have meetings at the embassies, and they look at me like 'Are you the secretary? Are you the cleaner?' (…) So education is one of the trumps you need to use. (…) Until they get to know you and your credibility, they don't have any other way to know your competence. So the first thing they see is if you have a degree and your title.

Some informants suggested that the only way for women to be less discriminated against is to be successful and more hard-working than men:

I think that the only way of a woman asserting herself and feeling less discriminated against and more approved of, is to be successful and commit herself to work, but this requires redoubled efforts, because… she'll always have that burden of… 'she's a woman and may get pregnant'…

I have the feeling that sometimes it looks like we have to work more to prove we are as competent or more competent…

Another example of strategies that are hardly critical of the gender order were that women should learn time management:

I think that one of the things we should teach to women is time management. Women are not very well structured or organized. I think that for them to do so many things they have to be highly disciplined and organized… I think that if women were more structured and disciplined, they would be able to advance much more than they have until now.

Other examples were that women should show their availability, sacrifice family needs and delay motherhood:

We make our own success, it's our dedication, our effort, our availability, our sacrifices, mostly sacrificing family life.

[The travel sector] is a field that isn't easy, because you have to give up a lot of your personal life, it demands a lot of dedication, and I think that all this dedication, effort and professionalism with which I faced my responsibilities, partly putting my personal life aside, was what led me to be recognized and that's what allowed me to grow in the company.

Some interviewees also suggested not having children or having children later to advance in one's career.

Regardless of the type of individual strategy suggested, it is clear from women's discourses that they privilege solutions at an individual rather than at a structural level. In addition, women seem to face contradictions between wanting changes to take place, and refusal that equality be achieved through measures that can be construed as non-meritocratic (e.g. quotas), since they want these changes to occur

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

because women's value and capabilities are recognized. Table 3 summarizes the individual strategies proposed by women. While some of the strategies proposed challenge the gender order, others reinforce it. Such strategies for 'fitting in' do not aim to challenge gender structures or the male career model, but instead that women adapt themselves to the *status quo* without disrupting it. Instead of rebelling against the prejudice of women as less career-oriented, the male career model or the inequality in the distribution of tasks at home, these strategies align with the prevailing gender order without addressing the gendered structures and beliefs in their organizations, family and society. Besides, the framing of gender inequality as an 'individual responsibility', namely women's responsibility, can be disempowering (Verloo et al., 2007). Hence, such strategies reveal on the one hand a lack of gender awareness and, on the other hand, a belief that career-making should be up to individual women, regardless of how constrained they are by societal structures (Carvalho, Costa, Lykke, & Torres, 2018; Shelagh Mooney, 2014).

Table 3. Individual strategies for career advancement proposed by women

Strategies that confront gendered structures and beliefs	Strategies that do not challenge the gender order
• it is important to fight, be assertive, not feel compelled to be constantly available or to put in extra hours • women should not be afraid of getting pregnant • women should not feel guilty for wanting a career or for wanting to have a family • tasks at home should be divided equally between partners	• the only way for women to be less discriminated against is to be successful and more hardworking than men, and invest more in education than men • women should learn time management • women should show their availability • women should sacrifice family needs and delay motherhood

SOLUTIONS AND RECOMMENDATIONS

Although the tourism industry in Portugal is feminized and, to a certain extent, may 'open doors' women, it is still far from being a truly 'women-friendly' industry. In a context where even women themselves managers themselves lack gender awareness to a considerable extent, it is important to raise gender awareness of all the stakeholders in this field, so that it is possible to see through the apparent gender-neutrality of the sector, and gradually attain structural and cultural changes in organizations, and improvements in terms of gender equality. Making subtle processes visible may have an impact on the daily workings of organizations (Kantola, 2008). In fact, high visibility and low legitimacy of inequalities may enhance the possibilities for change, while social movements may contribute to both high visibility and low legitimacy (Acker, 2006).

Stainback et al. (2010) argued that changes towards equality are more likely to be linked to pressures on organizational fields than to direct pressures on specific workplaces. There is evidence of 'mimetic isomorphism' across industries, which, through inertia, leads to the institutionalization of gender and other social inequalities. Hence, it is important to act not only at the level of individual workplaces, but also at the industry level (Stainback, Tomaskovic-Devey, & Skaggs, 2010, p. 240).

Overtime, it is essential that mentality and cultural changes take place. This can be achieved not only through awareness-raising practices, but also by setting an example. Despite the central role of organizations as places of production and reproduction of gender in our society, this does not mean that the responsibility for gender equality should be displaced from the state to organizations. Women's balanced representation in political and decision-making bodies is crucial to achieve change and undo

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

gender prejudice and gender stereotypes. Education can also be an important tool to impart such values to citizens from a young age. Esping-Andersen (2005) contended that if men had a more 'female' life cycle by also having interruptions in their careers, employers' gender-asymmetric expectations would be neutralized, and gender-specific discrimination in the labor market would be weakened.

Work-life balance and gender equality measures, whether at the state or organizational level, should question the status quo and be transformative, rather than a mere tool to disguise and conceal more structural and deep lingering inequalities. Research participants considered that flexibility is important. However, some types of flexibility benefit more the employer than the employee, and they are a means of ensuring constant availability from the employee to respond to work demands under any circumstance (Costa et al., 2017). Still, some sort of flexibility is part of a supportive work environment and is important for work-family balance. There should be more flexibility in scheduling, and it should be adapted to each one's individual needs when possible (Magnini, 2010).

One measure that is beneficial, but simultaneously questionable, is that kindergartens and other childcare services have longer opening hours, and that they are also open during weekends and holidays. Although this may reinforce the prevalence of the professional sphere over the family sphere, a change in organizational procedures and the way the sector works might be less realistic. However, it is also possible to challenge the way work is being done. For example, it should be discouraged to schedule meetings outside normal working hours. In addition, we believe that it is important to discourage the practice of carrying out important negotiations outside the workplace during the weekend or at night, since such practices are likely to have a negative impact on workers with family responsibilities. In fact, such practices are not family-friendly, perpetuate traditional gender roles, and are exclusionary towards women. Besides, business trips should be scheduled whenever possible with considerable antecedence, so that workers can make the necessary arrangements in their private lives to accommodate that work requirement.

The gender pay gap is a problem that persists despite legislation that prohibits pay discrimination. Therefore, our proposal would be either to discourage such individual negotiations, which may not be very realistic in business terms, or to make such negotiations more transparent. In order to promote gender equity, Williams et al. (2012) also proposed that workers should be informed about the salaries of their colleagues.

Other measures could be creating mentorship programs for women tourism professionals, giving more visibility to successful women to speak at tourism events, and ensure that women are well-represented on public-private tourism councils, committees and advisory boards (UNWTO, 2011).

It is also crucial to monitor the evolution of women's representation in leadership positions in the tourism sector, as well as their distribution across all hierarchical levels. Wider sectorial organizations, such as UNWTO or the WTTC could also be involved in such actions. In addition, it is important to approach power structures and not only engage in a 'quantitative' discourse about the percentage of women on boards or collect data as a goal in itself (Lombardo & Meier, 2007). Therefore, it is also important to include gender experts and civil society actors in the change process.

FUTURE RESEARCH DIRECTIONS

Future research on gender and tourism labor should bring gender power relations to the forefront of analysis and engage in gender-aware critique. Gender-aware research in the tourism field has only 'ignited'

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

in the last few years (Figueroa-Domecq, Palomo, Flecha, Segovia-Perez, & Vico, 2017). A greater focus on the gendered nature of organizations would improve understandings about gendered tourism careers.

The present study focused on women managers' gender awareness of the tourism sector. Longitudinal studies are also important in order to understand how women's perceptions about the industry change as they advance in their careers. Future studies could also analyze the gender awareness of other groups of workers, namely men and workers in non-managerial positions. Another avenue for future research is the inclusion of intersectional analysis (Acker, 2006) in order to study workers' awareness of other "axes of power", such as nationality, ethnicity, race, class, or disability, and their intersection with gender.

Subsequent research on gender, management and tourism organizations could go beyond the analysis of women's views and perceptions of gender equality, to investigate how women effectively confirm and/or challenge the gender order both at work and at home.

Another important area of research is the analysis of the effectiveness of gender awareness campaigns in different contexts, in particular in organizations. Kantola (2008) noted that merely making subtle processes of discrimination visible had an impact in the daily workings of a department. Hence, the power of raising gender awareness should be harnessed, rather than neglected.

CONCLUSION

The purpose of this article was to analyze the gender awareness of women managers in the tourism sector in relation to two aspects: perceptions of gender inequality and views of what could be done so that more women advance in their careers. Most women denied the existence of discrimination in tourism, while recognizing situations of discrimination. These contradictions in women's discourses reveal a lack of gender awareness. Although two thirds of the interviewees experienced hidden discrimination, most of these women did not label hidden discrimination as "discriminatory" behavior. Hidden discrimination may thus be considered as "natural" behavior, in the context of a society where gender prejudice still prevails. Several studies have shown that women tend not to label situations of hidden discrimination as "discrimination" (Kantola, 2008; Wahl, 1992). Discrimination remains hidden because of the gender blindness and the lack of tools for analyzing gender (Kantola, 2008). Certain behaviors are not labelled as discrimination and go unproblematized because they correspond to the norm, and not to the exception, in organizations (Wahl, 1992). Benschop and Doorewaard (1998) also concluded that gender inequality prevails in organizational practices, despite a dominant perception of equality.

The relative invisibility of inequalities and the rejection of the victimization discourse were also observed by Kantola (2008). The author pointed out that for women paying attention to the gender equality problems could make 'life difficult' or the 'situation might turn nasty' (p. 217). Kantola presented some possible explanations for the phenomenon: refusal to believe that the very existence of gender was even possible; difficulty to regard oneself as a victim of discrimination; assumption that women who pay attention to gender equality and talk about gender discrimination are 'difficult', 'troublesome', 'inappropriate' or 'pitiable'; and perception that worrying too much about gender inequality could harm their positions. Hence, it can be emotionally and socially demanding for women to regard themselves as victims of discrimination, which is a further reason why discrimination remains hidden. Patterson et al. (2012b) also observed that some women attempted to keep gender out so as not to affect their credibility as leaders. Olsson and Pringle (2004) noted how extremely successful women had internalized the domi-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

nant discourse and supported it, and how they did not acknowledge the existence of a gendered barriers. Their focus was rather on opportunities. Our results seem to be line with those of these previous studies.

The present study went beyond the analysis of women managers' discourses on discrimination. It also analyzed women's discourses on what should be done to facilitate women's career advancement. It was concluded that research participants' lack of gender awareness was noticeable to some extent in the measures they proposed. Informants focused mostly on individual strategies, rather than on organizational or public policies. Framing gender equality as an individual responsibility ultimately blames women for their problematic position (Verloo et al., 2007). Besides, while some women had a transformative vision of gender equality, and proposed policies and strategies that confronted gendered structures, beliefs and prejudice, other women conformed to the existing gendered norms, or focused on 'improving women' so that they can be regarded as equals with men. The underlying idea is that women need to be 'fixed' and adapt themselves to the system, so that they can make their way up. These approaches leave non-gender-neutral structures unanalyzed and ultimately blame women for their underrepresentation at the top, thus further entrenching gender stereotypes. Discourses that over-emphasize individual strategies and individual career-making end up de-emphasizing the role of societal and structural constraints which should be addressed, if the gender order is to be truly challenged.

This study revealed the persisting lack of a gender awareness among women managers. Although some women were more aware of gender than others, certain gendered structures in organizations were still largely invisible for most women managers themselves. Making visible some of the subtle processes through which such gendered structures are maintained can have some impact on change processes in organizations (Kantola, 2008). Otherwise, if gender structures remain invisible, the continuous bolstering of the gender order might harder to tackle. Therefore, it is urgent to make hidden discrimination more visible and to address the lack of gender awareness. Raising awareness of gender structures would facilitate the implementation of gender equality policy at the organizational and state levels. Individual strategies "target only one-half of the participants and not the game" (Benschop et al., 2011, p. 280). However, if gender equality continues to be seen as mostly women's individual responsibility, there may be greater resistance to change efforts at a more structural level.

KEY TERMS AND DEFINITIONS

Gender Order: Socially and historically constructed pattern of power relations between men and women, establishing a hierarchical difference between them and between definitions of masculinity and femininity. It is present in the society as a whole and is usually regarded as the result of natural, biological differences, rather than the result of a historical construction.

Hidden Discrimination: Behavior that may not be intentionally discriminatory or not perceived as such by the individuals doing the discriminating, while it may be perceived as offensive by the person being discriminated against. It can be subtle and/or covert, and it is usually more structural than personal. It is not usually perceived as "real" discrimination.

Overt Discrimination: Visible, clear, and intentional discrimination, usually presupposing a specific individual who discriminates against. It can be related with the gender pay gap, sex-segregated job advertising, verbal abuse, sexual harassment, sexist language, violence against women, or violation.

Chapter 53
Women's Employment in Turkey's ICT Sector:
An Examination From a Social Inclusion Perspective

Selda Gorkey
https://orcid.org/0000-0002-2760-3667
Istanbul Kultur University, Turkey

ABSTRACT

Women constitute one of the risk groups vulnerable to poverty; therefore, enabling their participation in the labor force is crucial to promoting social inclusion in a society. Employment in the information and communication technology (ICT) sector is widely known for being male-dominated, and recently women's participation has become an important subject. This chapter aims to examine women's employment in Turkey's ICT sector from 2009 to 2016, from a social inclusion perspective, by using various indicators. Comparisons with European Union (EU) countries provide perspective on tracking the progress of employment structure and education choices for ICT by gender. All indicators signify the existence of a gender gap resulting in low rates of inclusion of women in Turkey's ICT employment during the period. Examination of the reasons leads to making some policy recommendations to promote social inclusion of women in Turkey's ICT employment.

INTRODUCTION

Information and Communication Technology (ICT) is a rapidly growing sector throughout the world, and hence its weight and importance in the overall economy is rising. This expansion requires an examination of various aspects of the sector (Palvia, Baqir & Nemati, 2018). Employment represents the use of potential resources in an economy, making it one of the main economic issues, but it is also a social issue. The contribution of women to the labor force is crucial, both economically and socially (Dreze & Sen, 2002; Oxoby, 2009; Atkinson, 1998; Balaban, 2014).

The motivation for this study mainly arises from two facts. One is the exclusion of women from social and economic life, even in developed countries. In developing nations or less developed countries, the degree of exclusion of women is even greater. (Daly, 1989; Dedeoglu, 2009; Tezgel & Gokbayrak, 2013). Increasing the well-being of women and fostering economic and social development requires eliminating exclusion through social inclusion policies (Oxoby, 2009). In this context, encouraging women to participate in the labor force is crucial for fostering not only economic, but also social development. The other fact is that perceptions of jobs in ICT sector are generally accepted as men's jobs (Hodgkinson, 2000). Female participation in labor in the relevant sector is significantly low in many countries, signaling the exclusion of female labor. Both of those facts are even more crucial in emerging economies with respect to their dynamism. Indeed, the topic of social inclusion is not limited only to gender, employment, or the ICT sector. It is a broad concept that encompasses the exclusion of any individual or group from access to or participation in any right or institution (Balaban, 2014; Genc & Cat, 2013; Gunduz, 2007). However, this study focuses on ICT-sector employment from the perspective of gender, in the context of social inclusion.

Turkey is an emerging country that experiences high growth rates in the ICT sector, in parallel with the world (Dube, Dube, & Turan, 2015). Hence, the analysis of employment in the sector from the perspective of gender is crucial for such an emerging economy to comprehend the current state of the gender gap in sector employment. Determining the gender gap in the sector can lead to social policy recommendations for increasing the contribution of women to the ICT labor force. If Turkey succeeds in reducing the ICT employment gender gap in the future, its progress can serve as a success story for other emerging or developing countries. Turkey is specifically chosen for examination because of its cultural structure as a patriarchal country in which women are not expected to engage much in economic life. Hence, the cultural structure is another factor that results in exclusion of women from working life, causing women to live in poverty unless they live under the protection of men (Dedeoglu, 2009). This situation makes it even harder for women to engage in working life. In this context, by examining women's participation in Turkey's ICT employment, this study approaches social inclusion from the perspectives of gender, employment, and the ICT sector. Since the literature lacks studies from all these perspectives, to the best of the author's knowledge, focusing on a single emerging country such as Turkey would contribute to the existing literature. In addition, this study would create benefits for practical use by policy designers.

This study aims to analyze the contribution of women in the ICT sector in Turkey from 2009 to 2016, to examine the participation of women in the labor force and the change in female employment in the sector. Since education shapes future employment structure, the study also analyzes female participation in education in the relevant field. After that, Turkey's position is compared with European Union (EU) countries for the period. The proxies used in this study are the share of women in employment and among ICT specialists, the share of women with ICT education, and the share of women in ICT-related education.

The objective of this study is to seek answers to the following research questions:

Research Question 1: How did female employment in ICT in Turkey change from 2009 to 2016?

Research Question 2: How did the position of Turkey change in terms of social inclusion, compared to EU countries in the period analyzed?

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The findings show that the sector experiences a clear gender gap, and the female participation in Turkey's ICT sector is lower than that in the EU. Education choices show that ICT-related education is mostly preferred by males; however, that gender gap is even larger in the EU than in Turkey.

The rest of the chapter is organized as follows. The concepts of social and economic inclusion and exclusion, their relationship with women's employment in ICT, and the literature review are presented in the background section. Then, the methodology of the paper is explained. Thereafter, Turkey's ICT-sector employment from the gender perspective is examined, with comparisons to EU countries. Then, some solutions and policy recommendations are offered, along with some future research directions and the conclusion.

BACKGROUND

Women's Employment as the Key to Poverty and Social Exclusion

Some societies alienate or deprive certain individuals or groups of individuals of access to certain activities, rights, or institutions. Such deprivation is regarded as social exclusion. However, the coverage and the scope of this concept are generally vague. The vagueness of the concept stems from determining excluded individuals or groups (e.g., elderly, women, children, the disabled) and the reasons behind such exclusions (Atkinson, 1998; Behera, 2013; Genc & Cat, 2013; Gunduz, 2007; Balaban, 2014).

Oxoby (2009) authored a very detailed literature review on the topic of social inclusion, pointing out the definition of social exclusion by Avramov (2002): *a feeling of not belonging and not having been given a chance to be included in society* (p. 26). This definition emphasizes that exclusion is not solely limited to access of individuals to certain rights and institutions; it also affects the behaviors and decisions of those individuals. If any individual believes that he or she will not be accepted into an activity or an institution, or that he or she will not be able to take advantage of a right, then that individual may choose not to become involved in such an activity, right, or institution, effectively self-excluding. In this regard, exclusion is not only an outcome, but also a reason that shapes individual behaviors. Such beliefs generally stem from cultural aspects or from identities (e.g., gender, age, race, ethnicity) (Akerlof & Kranton, 2015; Oxoby, 2009).

The strict relationship between exclusion, unemployment, and poverty signals that excluded groups generally face obstacles to participating in the labor force. If this process continues in the long run, these groups may be at risk for poverty—in short, exclusion may result in poverty (Atkinson, 1998). Women's exclusion from the social and economic aspects of life is well grounded at this point, because of their identified roles in the society as mothers, wives, and daughters. In some cultures, contributions of females in social life are strictly opposed, which in turn results in their nonparticipation in the labor force. Associated with low participation levels or nonparticipation of women in employment, women are prone to be at-risk for poverty. This situation forces women to live under the protection of another person, generally a father or a spouse. It is also a fact that even if women are not excluded from economic life, they may work in "womanly jobs" with low wages, or they are often paid less than men when they undertake equal jobs to those that men hold (Daly, 1989; Dedeoglu, 2009). These explanations clearly show that exclusion and poverty affect each other. Exclusion may result in poverty, and poverty may result in exclusion of an individual from society, because not only is he or she not able to earn enough

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

income, but also his or her social status and morale are affected. From this perspective, exclusion and poverty create a vicious circle (Gunduz, 2007).

Policies aimed toward reducing social exclusion are regarded as social policy, and efforts to eliminate deprivation of risk groups are referred to as social inclusion. This approach supports protecting excluded groups through the implementation of relevant policies (Oxoby, 2009; Avramov, 2002). Complicating the design and implementation of social inclusion policies is interrelation of the process with many aspects of life, such as sociology, economics, psychology, policy, law, and human rights (Gunduz, 2007). Oxoby (2009) uses the term "economic exclusion," which focuses on poverty, unemployment, nonparticipation in the labor force, low school enrollments, and obstacles to consumption. In this context, employment is the key in the relationship, insofar as it can break the vicious circle of poverty and exclusion. If social inclusion policies succeed perfectly, deprivations in a society will end, and all individuals will have equal access to work and the same right to participate in the labor force. In turn, this will lead to reduction, and possibly elimination of poverty (Atkinson, 1998; Genc & Cat, 2013). In this context, the examination of female employment in a country would contribute to the academic research by analyzing both women and employment to evaluate the current state of gender employment and offer necessary inclusion policies.

The Necessity of Focusing on ICT Sector

ICT is a rapidly growing sector throughout the world, including in Turkey, and hence its weight and importance in the overall economy are rising (Deloitte, 2012). This expansion requires examination of various aspects of the sector. As one of the crucial dimensions of such analysis, employment plays a key role in understanding both the current state and the future dynamics of the sector. When employment in the sector is analyzed from the perspective of gender, it is obvious that ICT is generally accepted as a male dominated field by various disciplines in academia (Hodgkinson, 2000; Huyer & Mitter, 2003; Arun, Heeks & Morgan, 2004; Vodanovich, Urquhart, & Shakir, 2010; UN, 2002). This perception exists not only in usage, but also in creation and production of goods and services. The situation results in lower female participation in labor in the sector, which signals exclusion of female labor. When various studies for different countries examine the issue with respect to the labor side of economics, it is clear that male dominance is more than just a perception. Hence, there are numerous studies that examine the gender perspective on ICT employment in the literature (Arun & Arun, 2002; Arun, Heeks, & Morgan, 2004; Moore, Griffiths, Richardson & Adam, 2008; Kelan, 2008; Mumporeze & Prieler, 2017; Gonzalez, Revelles, Almeda, Bosch & Garcia, 2016; Annabi & Lebovitz, 2018; Yeganehfar, Isfandyari-Mogghadam & Famil-Rouhani, 2018).

Despite numerous studies exploring the gender gap in ICT employment, only a limited number of studies analyze the gender gap in Turkey's ICT employment. In Turkey, the examination of the subject of ICT usage and its spread—i.e., the digital divide—occurs from the perspective of gender (Torenli, 2006; Aypay, 2010; Yildiz, 2010; Kilinc-Savrul, & Kilic, 2011; Karakaya Polat, 2012; Bilgel-Asici & Kocak-Usluel, 2013; Erdogdu & Erdogdu, 2015). In other words, the literature lacks a sufficient number of studies that focus on the gender gap in Turkey's ICT sector from an employment perspective, to the best of the author's knowledge. Since Turkey is an emerging country, the current state of the subject and any prospective progress could function as a case study for other emerging countries. Hence, this study aims to fill this gap in the literature by examining social inclusion from the perspectives of women, employment, and the ICT sector at once.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The studies that examine female employment in Turkey's ICT sector are Torenli (2010), Atik and Altiparmak (2011), and Dube et al. (2015). Torenli (2010) examines the impact of ICT and internet usage on female employees. This study specifically focuses on home-based workers from the gender perspective, and finds that the use of ICT does not significantly bring any advantage to women home-based workers in Turkey. Atik and Altiparmak (2011) examine the employment structure of the ICT sector in Turkey in comparison to the 27 countries of the EU from 1990 to 2008. This study aims to analyze the share in overall employment of information-sector employment, and examines the weight of female employment in the sector. The study finds that female employment in the relevant sector in Turkey is remarkably lower than that in EU-27. Dube et al. (2015) examine the relationship between the growth of the ICT sector and the unemployment rates by various aspects in Turkey, such as gender, age, and educational levels, from 1990 to 2013. Among many results of the mentioned study, those from the perspective of gender show a positive correlation between female unemployment rates and growth of domestic production.

WOMEN'S EMPLOYMENT IN TURKEY'S ICT SECTOR

Methodology

This study aims to analyze the progress of female participation in Turkey's ICT-sector employment. Using annual data collected from 2009 to 2016, the study seeks answers to the following research questions:

Research Question 1: How did female employment in ICT in Turkey change from 2009 to 2016?
Research Question 2: How did the position of Turkey change in terms of social inclusion, compared to EU countries in the period analyzed?

This study answers these questions by using various measures. Those measures are the share of females in ICT employment, the share of women as ICT specialists, the share of female employees with ICT education, and the share of women with ICT-related education. The first three measures are generated by the author's own calculations from the European Union Labor Force Statistics (EU-LFS) Household Survey. This is micro data collected from households in 33 countries, 28 of which are EU countries, two candidate countries (Macedonia, and Turkey), and European Free Trade Association (EFTA) countries (Iceland, Norway, and Switzerland). The EU-LFS dataset includes employment, unemployment, and inactivity statistics by economic activity, sex, age, and educational attainment (Eurostat, 2018a). The last measure is author's own calculations from Organization for Economic Cooperation and Development (OECD) Statistics (OECD, 2018b). The relevant subsections present details of those measures and their method of calculation.

To evaluate the progress of Turkey and its position, comparisons with EU countries are made. EU countries were selected for comparison because social policies in Turkey were mainly designed according to European experiences for Turkey's cohesion to EU after 2000, especially during the adjustment process for EU membership (Kilic, 2008). The period is limited to 2009 to 2016, since data before 2009 are not comparable with data after 2009 in the EU-LFS dataset, and the data beyond 2016 are not available for most of the countries analyzed.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Before directly focusing on the female employment in the ICT sector, the employment structure of the country is examined. Hence, the subsequent section examines the overall employment structure from the perspective of gender, using the author's own calculations from the Turkish Statistical Institute (TurkStat; Official Statistical Institute of Turkey) dataset. After that, the chapter's main focus is addressed.

Employment Structure in Turkey from a Gender Perspective

It is necessary to examine the structure of employment in Turkey before focusing on the ICT sector and the gender perspective. In 2016, TurkStat (2018) reported the population older than 15 years old was approximately 58,720,000 persons. The labor force, sum of employed and unemployed, in all the sectors was approximately 30,535,000 in the same year; hence, the labor force participation rate (the proportion of labor force to population over 15 years old) was only 52% in 2016.

OECD (2018b) and Eurostat (2018b) measure labor force statistics slightly differently than that of TurkStat, by limiting both the employment and the population by ages between 15-64. OECD refers to this age group as the "working-age population." Thus, it calculates the labor force participation rate as the proportion of labor force between 15-64 ages to total population within the same age group. OECD (2018b) reports that the labor force participation rate was 57% in Turkey, 71.7% in OECD total, 73.2% in EU-28, and 74.1% in G7 countries, in 2016. These rates clearly show that the relevant measure is remarkably low in Turkey compared to other OECD and EU countries.

Figure 1 depicts the share of women in total employment in Turkey and selected countries in the EU for the years 2009 and 2016. The difference between 100%, and the values in Figure 1 corresponds to the share of men in total employment. The figure shows that the proportion of females in total employment is prominently lower than for men in EU countries, except for Lithuania in 2009 and 2016, and for Estonia in 2009, among the countries examined. However, the gender gap is more viable in Turkey, compared to selected EU countries. Even though there was slight recovery from 27.57% in 2009 to 30.66% in 2016, in Turkey, women's contribution to the work force is remarkably low compared to men, which is indicative of an obvious employment gender gap in Turkey.

Figure 1. The share of women in employment (% in total employment, 2009 and 2016)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Share of Women in ICT Employment

The primary and most relevant measure used in this study to analyze the gender gap is the percentage of women in ICT employment, i.e. the percentage of women in the ICT sector in Turkey.

The ICT sector comprises some sub-industries, and it may be measured and announced differently in several databases. For this reason, it is necessary to compile statistics from different sub-industries and take the sum of those in order to accurately quantify the relevant indicator. Before focusing on and interpreting the measures in Turkey and other EU countries, there is a need to make define the ICT sector in order to construct series.

The coverage of the ICT sector has changed throughout time, and it has reached its final and agreed upon definition to the OECD's definitions in 2006 and 2007. OECD (2006, 2007, 2011) defines the ICT as, *The production (goods and services) of a candidate industry must primarily be intended to fulfill or enable the function of information processing and communication by electronic means, including transmission and display*. With the use of this agreed upon definition, data can be gathered in the same way in different countries, thus, comparisons can accurately be made at the international level. In order to fit internationally comparable indicators, data on the ICT sector need to be collected and added together, depending on three sub-categories: ICT manufacturing, ICT trade, and ICT services industries. Different economic variables, such as employment and growth, are measured and reported depending on this industry categorization. Therefore, to properly analyze the ICT sector, ICT-related data must first be obtained from different industries, and then added together to reach a measure that reliably reflects the dynamics of the ICT sector. OECD (2006, 2007, 2011) also mentions these specific sub-industries in terms of ISIC (International Standard Industrial Classification of all Economic Activities), which is an industrial classification system of the United Nation (UN), aimed at grouping goods and services under specific codes, so that international comparisons can be made accurately (UN, 2008). Constituted by EU, statistical classification of economic activities in the European Community (NACE) is another classification system, which groups commodities under specific industry categories (Eurostat, 2008). Both ISIC and NACE announce some revisions when necessary. These two industry classifications are frequently used worldwide, thus correspondence lists between these two classifications are available (Eurostat, 2018c).

Since the percentage of female employment in the ICT sector data is not available for Turkey in terms of ISIC, the relevant indicator is compiled from NACE Revision (Rev.) 2 classification. Depending on the correspondence of economic activity between ISIC Rev. 4 and NACE Rev.2 classifications (UNCTAD, 2015), total employment data is gathered as the sum of the following sub-industries classified according to NACE Rev.2 two-digit level: manufacture of computer, electronic, and optical products; telecommunications; computer programming, consultancy and related activities; and information service activities. The correspondence table of NACE from ISIC is provided in Appendix 1.

The proxy generated from the relevant sectors indicates that total ICT employment has increased remarkably from approximately 140,500 persons in 2009 to approximately 219,200 persons in 2016, resulting in a 56% increase in seven years in Turkey. Among the 140,500 total ICT employees in 2009, 106,900 employed were men, whereas the remaining 33,700 were women. The distribution of 219,200 total employed in the ICT sector between the sexes in 2016 was as follows: 162,900 men and 56,000 women. The share of females in ICT employment in Turkey and some selected EU countries is presented in Table 1, in order to compare Turkey's ICT sector with other EU countries from the gender perspective.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. The share of women employees in ICT sector (% in total ICT employment)

Country	2009	2010	2011	2012	2013	2014	2015	2016
Turkey	23.99	21.26	19.77	24.16	23.59	23.49	25.57	25.55
EU-28	28.93	28.68	28.75	28.45	28.04	27.87	27.53	27.44

Source: (Eurostat, 2018d), own calculations

Table 1 shows the percentage of women's employment in the ICT sector for EU countries and Turkey from 2009 to 2016. The data is constructed by dividing the number of women employees in ICT sector by the total number of employees in the sector. Thus, the difference between 100% and the values presented in the table correspond to the percentage of men's employment in the sector. The percentage of women employees in Turkey did not change much, except for the years 2010 and 2011. The statistics indicate a gender gap in Turkey, showing that approximately only one fourth of employees in the sector are women, except for the years 2010 and 2011. The table clearly shows that the contribution of women to Turkey's ICT sector is remarkably lower than men's, confirming the presence of a gender gap between 2009 and 2016. The contribution of women is even lower in ICT employment than in total employment, which was presented as 30.66% in the previous section. The values of EU-28 also signify that the share of female employees in the sector is remarkably lower than that of males; however, the gender gap is slightly narrower than that of Turkey. The share of women employees is the highest in Hungary and in Romania during the period examined. Female employment in Turkey's ICT sector is slightly below EU-28, which reveals that a gender gap, and therefore female exclusion in the relevant sector's employment is not limited to Turkey's economy.

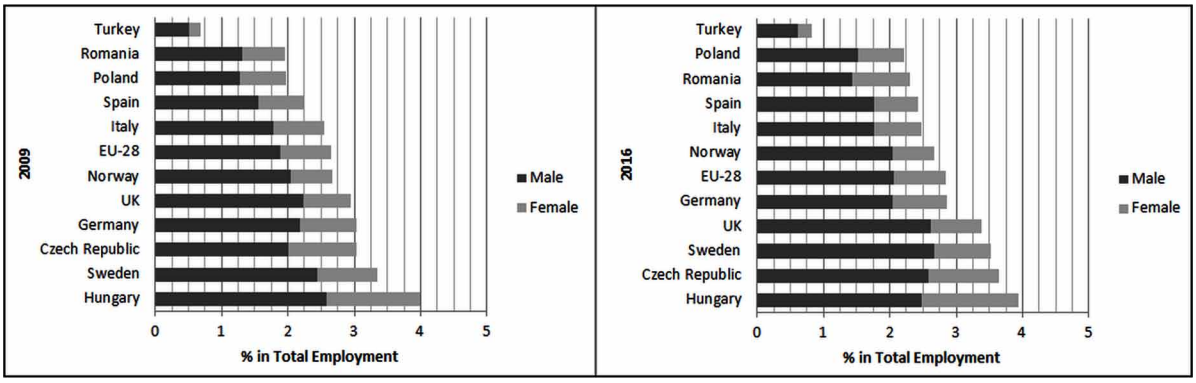
Figure 2 shows the share of women and men employees in the ICT sector in total employment in the economies of selected EU countries and Turkey for 2009 and 2016. Hence, the sum of men and women's shares in ICT presents total ICT employment in overall employment in economies.

Figure 2 shows that the share of ICT employment is remarkably lower in Turkey than in other selected EU countries. The progress from 2009 to 2016 had been very weak, showing that the gender gap had been viable in the period analyzed. The share of males in total employment had risen from 0.52% in 2009 to 0.62% in 2016; and the same share for females had changed from 0.16% in 2009 to 0.21 in 2016

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

in Turkey. Even the two closest countries to Turkey's ICT sector employment structure, Romania and Poland, have much higher employment shares for women, as well as for total employment of both sexes. Even though total ICT employment is lower than other EU countries, women's share is significantly lower in Turkey, indicative of a gender gap, and hence low social inclusion of women in employment in the relevant sector.

Figure 2. The percentages of ICT sector's men and women employees in total employment (2009 and 2016)
Source: (Eurostat, 2018d), own calculations
Note: For Romania, 2014 instead of 2009; for Poland, 2010 instead of 2009; for Hungary, 2012 instead of 2009.



The Share of Women in ICT Specialists

Another important measure is the share of employed female ICT specialists in relationship to the total employment of ICT specialists. The OECD (2004) defines ICT specialists as individuals *who have the ability to develop, operate and maintain ICT systems. ICTs constitute the main part of their job* (p.219). This measure is particularly important since it represents ICT-intensive employment and the capability of using digital skills in an economy. Not only is the analysis of the current situation important, but also examination of indicators throughout time is also crucial to evaluate the trend of relevant employment (European Commission, 2015).

The classification of occupations is built upon a widely known job organization system, the International Standard Classification of Occupations (ISCO), offered by the International Labor Organization (ILO). ISCO classifies ICT specialists by certain groups of occupations, and announces revisions when necessary (ILO, 2012). Detailed information about occupations is provided in Appendix 2.

The data gathered in this study to analyze the share of females in ICT specialist positions is collected from the Eurostat EU-LFS, which collects data depending on OECD (2004) definition in terms of ISCO. A new revision of relevant classification, ISCO-08, was released after 2010, causing a severe change in datasets beginning in 2011. In order to keep the data comparable throughout time, the data used in this study does not start from 2009 as the other data. Figure 3 shows the percentages of females in all ICT specialist positions for the years 2012, 2014, and 2016.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The number of ICT specialists for both sexes in Turkey was 245,200 persons, and women constituted only 24,300 of the specialists in 2016, signaling the existence of a gender gap among ICT specialists in Turkey. Figure 3 shows the gap clearly, not only in 2016, but also in 2012, and 2014, by comparing the percentages of female ICT specialists in all ICT specialist positions for Turkey and selected EU countries.

Figure 3. The percentage of women in all ICT specialist positions (2012, 2014, and 2016)
Source: (Eurostat, 2018e)

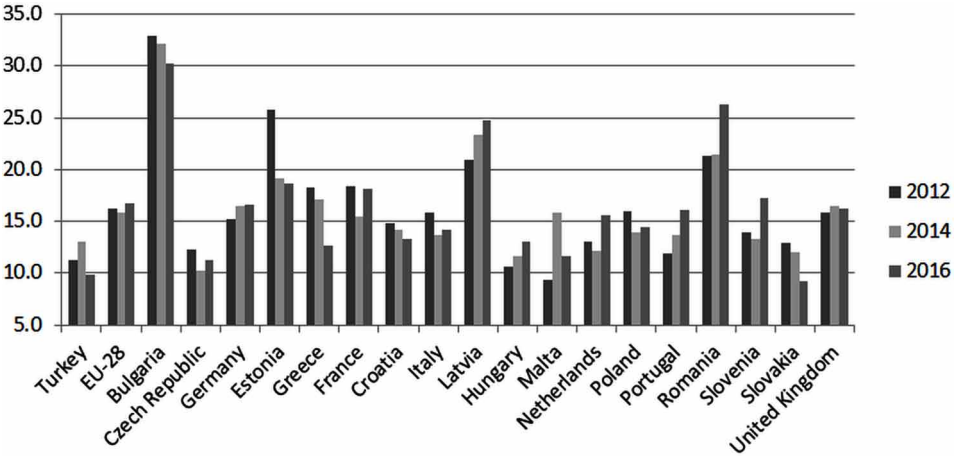


Figure 3 shows that the percentages for 2012, 2014, and 2016 were 11.3%, 13.1%, and 9.9%, respectively, following a fluctuating trend between approximately 10% and 13% in Turkey. The percentages reported for EU countries also reflects a gender gap showing that the position of ICT specialist is an occupation that is male dominated in practice. However, the share of female ICT specialists in Turkey is remarkably lower by comparison. These measures reveal that there is a considerable gender gap in the employment of ICT specialists in Turkey, and this disparity is greater than in other selected EU countries. The Czech Republic, Hungary, and Slovakia are the other countries in the analysis that remarkably differentiated from the remaining countries by gender perspective for the years examined.

The Share of Female Employees With ICT Education

Further understanding the gender gap is facilitated by examination of female employees who are equipped with ICT training. The data depicts employed persons with ICT education, focusing not only on the ICT sector, but all sectors, by examining employees who were educated in ICT disciplines. In other words, the data does not differentiate these employees depending on their sector of employment (Eurostat, 2018f).

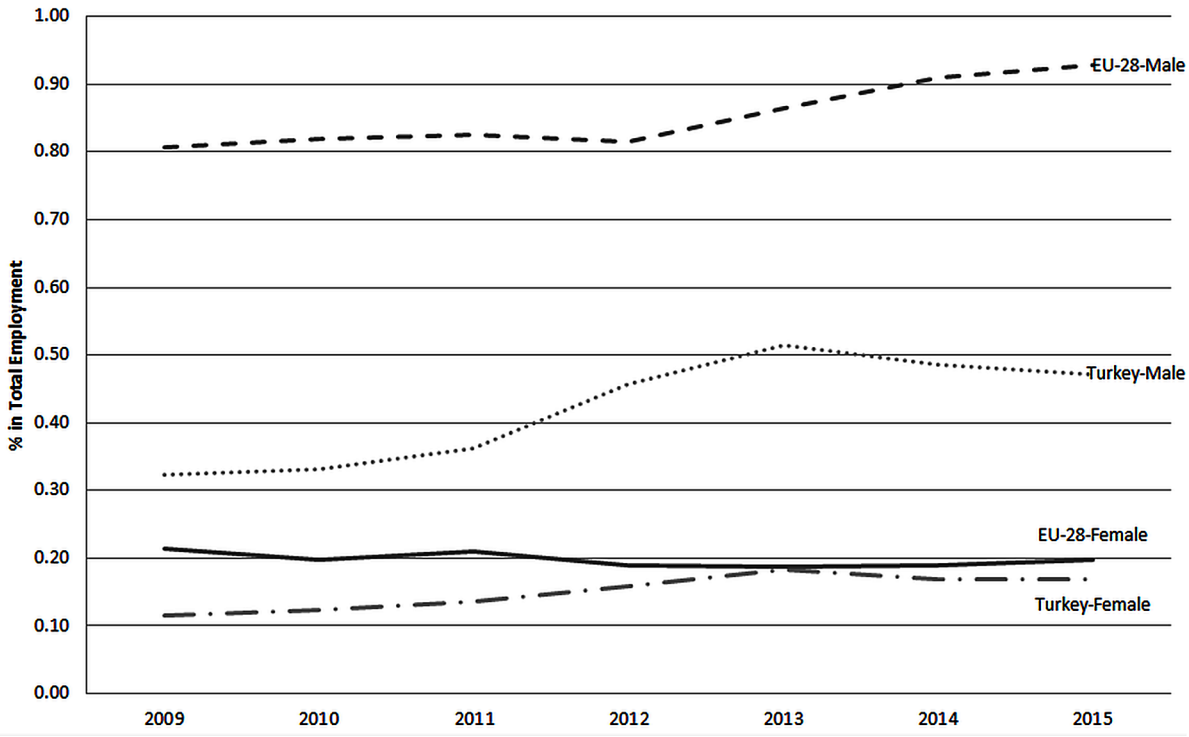
The classification of the disciplines that correspond to ICT education is made according to United Nations Educational, Scientific and Cultural Organization's (UNESCO) The International Standard Classification of Education (ISCED). UNESCO approved ISCED at the beginning of 1970s by classifying education according to two aspects: level of education and field of education. The classification aims to create comparable statistics both at the international and national levels (UNESCO, 2006).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4 presents the percentage of female and male employees with ICT education in all employees aged between 15-74 in Turkey and the EU-28 countries. The data is constructed by dividing male and female employed persons with ICT education by total employment. The data was collected from Eurostat, and education classification was based upon UNESCO's ISCED. A new version of ISCED (ISCED-2011) is applied to datasets 2016 onwards. Hence, in order to keep the data comparable throughout time, Figure 4 presents data from 2009 to 2015 according to ISCED-1997. According to ISCED-1997, ICT education corresponds to the highest educational levels attained in the following fields: 48 Computing, 481 Computer Science, and 482 Computer use. The numbers before the fields show the ISCED-1997 codes (Eurostat, 2018f).

Figure 4 shows that the percentage of male employed persons who are equipped with ICT education constituted 0.32% of the total employment in all sectors by both sexes in 2009. The value reached its maximum at 0.51% in 2013, and then decreased slightly to 0.47% in 2015. The relevant measures for female employed persons is remarkably lower than males in Turkey, with 0.12% in 2009, hitting a maximum by 0.18% in 2013, and decreasing slightly to 0.17% in 2015. However, the data for EU signifies an even larger gender gap than that of Turkey. The percentage of male employed persons with ICT education increased from 2009 to 2015, whereas the female percentage decreased slightly. These statistics on employed persons with an ICT education further confirm the gender gap that is more obvious in EU countries than in Turkey.

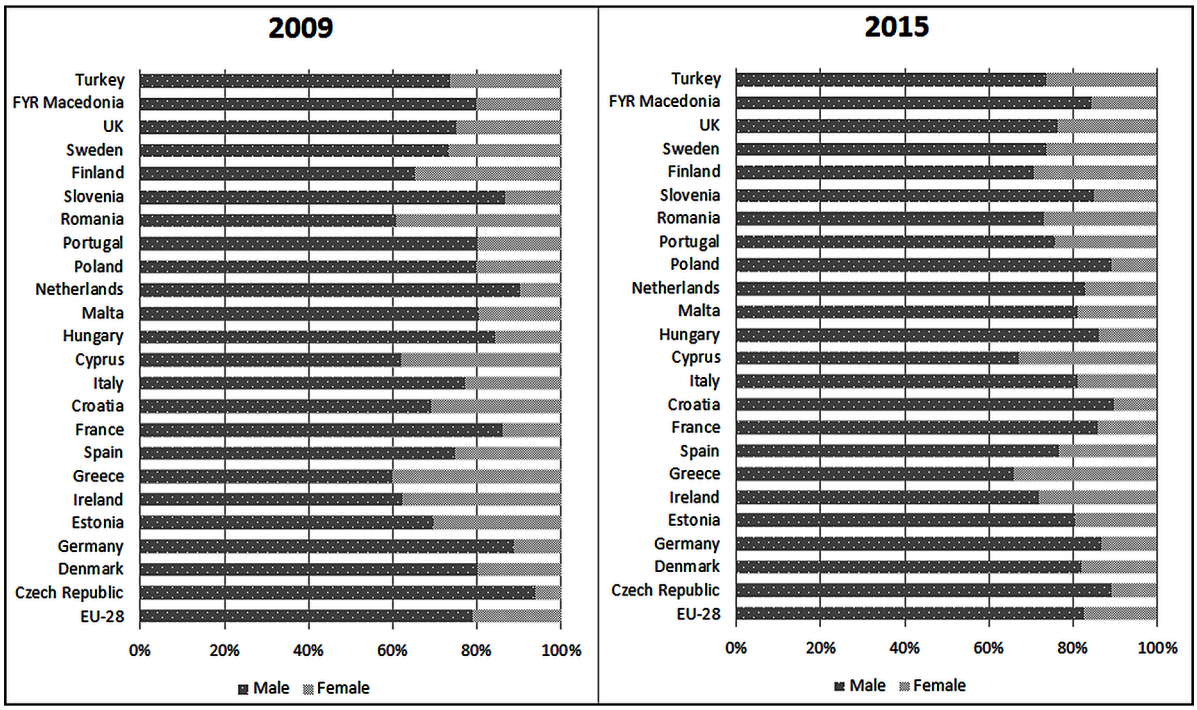
Figure 4. The percentage of male and female employed persons with ICT education in total employment from 2009 to 2015, in Turkey and EU-28
Source: (Eurostat, 2018d; EuroStat, 2018g), own calculations



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

In order to see the gender gap more clearly in Turkey and the EU countries, the distribution of all employed persons with an ICT education by gender as percentages is presented in the Figure 5. The data is from Eurostat's EU-LFS, and was calculated by the author as the percentages of male and female employed persons with an ICT education, in total employed persons with ICT education. Thereby, the sum of percentages of males and females total 100%.

Figure 5. The share of women and men employed persons with ICT education in total employed persons with ICT education
Source: (Eurostat, 2018g), own calculations



Among all employed persons with ICT education, women constitute 26.3% and men 73.7% in 2009, in Turkey. The relevant percentages changed to 26.4% for women and 73.6% for men in 2015; the percentages of women for the same indicator for the EU-28 countries were 21.0% in 2009 and 17.5% in 2015, showing a decrease in the period analyzed. The statistics show that the percentages of male employees with an ICT education are higher in EU-28 than in Turkey in both years, and the shares of female employees with an ICT education are lower in the EU-28 than that of Turkey. This comparison indicates that a gender gap is more viable in the EU-28 than in Turkey from the point of employed persons with an ICT education. Among the countries examined, the UK, Sweden, Romania, Portugal, Spain, and Ireland have closer female percentages to Turkey. The countries that have made progress in favor of the share of female employed persons with ICT education are Portugal, Netherlands, and the Czech Republic. These countries have made progress in narrowing the gender gap from 2009 to 2015.

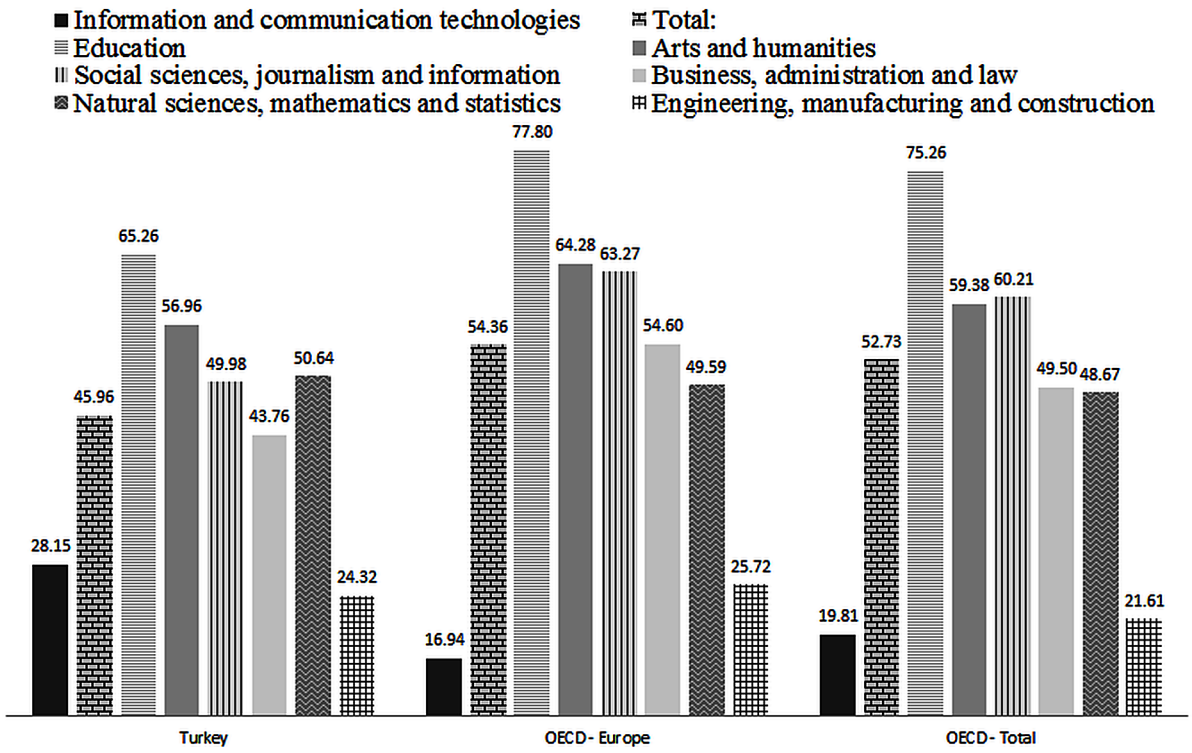
EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Share of Women in ICT-Related Education

Another measure used in this study is the proportion of women in ICT education, which quantifies the percentages of females currently receiving their ICT education. Since current education choices influence the labor force of the future, education statistics are crucial for analyzing trends in gender employment dynamics. Montagnier and Welsum (2006) emphasized that education in ICT measures also matter, since it represents the individuals acquiring relevant skills to perform ICT-related occupations after graduation. Their study listed computing as a proxy for ICT education, and they revealed that the share of women in computing was lower than that of other fields in 2004 in OECD countries.

In order to analyze the current situation of inclusion of women in ICT education, this study uses data from OECD for 2015. OECD's relevant database currently categorizes ICT education as a specific field that includes the following as sub-fields: computer use, database and network design and administration, software and applications development and analysis, ICT not elsewhere classified, and interdisciplinary programs (OECD, 2018a). Data presents education at the tertiary level. According to the ISCED 2011, tertiary education includes the following degrees: short-cycle tertiary education, bachelor's or equivalent level, master's or equivalent level, and doctoral or equivalent level (UNESCO, 2012). Since the dataset is from OECD database, the comparison is made with OECD member countries (OECD-Total), and European countries that are also members of OECD (OECD-Europe).

Figure 6. The share of women in education by fields (% in both sexes), tertiary education, 2015
Source: (OECD, 2018a), own calculations



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 6 shows the percentages of enrolled female students in tertiary education in Turkey, OECD-Total, and OECD-Europe in 2015. In Turkey, female students are of a lower share in the total; education; arts and humanities; social sciences, journalism, and information; business, administration, and law; and engineering, manufacturing, and construction, than OECD-Europe countries. Only ICT; natural sciences, mathematics, and statistics are the fields in which the share of female students are higher in Turkey, compared to OECD-Europe countries. The figure clearly indicates a gender gap in ICT education in all OECD countries; however, the gender gap is much more viable both in OECD-Total and OECD-Europe than in Turkey. These statistics also indicate that the share of female students is higher in total fields, as well as in education, arts and humanities, social sciences, business, and law disciplines in OECD countries. Based on the proxies on current ICT education, the dominance of men in the ICT sector is likely to continue, keeping the gender gap visible in the near future in Turkey, as well as in OECD-Total and OECD-Europe.

Some Comments on the Employment of Women in Turkey's ICT Sector in Comparison to EU Countries

The share of female employment both in total employment, and in ICT sector, did not change much from 2009 to 2016. The viable gender gap at the beginning of period examined showed only a slight recovery, and it continued up to 2016, signifying that women are weakly included in ICT employment, as well as in total employment. The gender distribution of ICT employment, in which female employees constitute only 25.55% in 2016, shows this gap clearly at the end of the period examined. The share of women ICT employees in total employment in the overall economy is only 0.21% in 2016. In other words, among all employed persons, only 0.21% of those are women employees who worked in the ICT sector in 2016.

From this point, this is the indicator that shows the existence of the gender gap, and hence a low degree of social inclusion of women's employment in ICT sector the most clearly. Women's employment in Turkey's ICT lags behind EU countries significantly, as well. There is a need to place a special emphasis by highlighting the low participation of men in ICT as well, with only 0.62% in total employment. The share of women ICT specialists was very low during the period analyzed in Turkey, reaching approximately 10% in 2016. This indicator, too, confirms the gender gap in the sector clearly, since Turkey lagged behind all selected EU countries. Even though education-related indicators, the share of female employed persons with ICT education in total employment, all employed persons with ICT employment, and the share of women in ICT education, signifies the existence of a gender gap, it is narrower than that of EU-28. However, the low social inclusion of women in ICT education indicates that the gender gap in Turkey's ICT sector is likely to continue in the near future, as well.

The proxies reflecting the female contribution to the ICT sector clearly indicate a gender gap in Turkey. However, the gender gap in employment is a pervasive problem affecting most sectors of the Turkish economy. The issue is slightly different in EU countries where the gender gap in overall employment is not as extreme as in Turkey. However, female participation in the ICT sector in EU countries is remarkably lower compared to female participation in overall employment. In other words, the gender gap in the ICT sector is higher than the overall employment in EU countries, whereas Turkey's female ICT employment indicates a narrower gap with the overall employment in the economy.

This study answers the following research questions: How did female employment in ICT in Turkey change from 2009 to 2016? How did the position of Turkey change in terms of social inclusion, compared to EU countries in the period analyzed? Depending on the indicators, this study answers the

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

first research question as follows: The contribution of women's employment in Turkey's ICT sector did not change significantly from 2009 to 2016. There is only a slight recovery in all indicators related to both female employment and education during the period analyzed. The second research question is answered as follows: The position of Turkey in women's employment from the gender perspective had been behind those of EU countries during the period analyzed, showing that women are not included much economically in ICT employment. There had been a slight recovery in Turkey, but it is still behind EU countries. The education side of the issue, too, signifies that, the inclusion of women in ICT education is very low in Turkey. However, when its position among EU countries was examined, Turkey was ahead of the EU-28, and most of the EU countries in the period examined. This situation shows that, women are socially more included in ICT education in Turkey than that of the EU-28.

SOLUTIONS AND RECOMMENDATIONS

ICT is a rapidly growing sector; therefore the share of its employment in overall employment is expected to increase in economies. Moreover, the employment structure (i.e. by age and gender) of the relevant sector is crucial to track the future growth of the sector. The structure of women's employment in ICT in Turkey has been examined in the previous section, and it is clear that the contribution of women's employment in Turkey's ICT sector is remarkably low; the relevant ICT education statistics did not change significantly from 2009 to 2016.

In order to experience progress in women's participation in ICT employment, there is a need to examine the reasons behind it. In Turkey, the problem starts with women's low participation in the labor force. The main reason may be the *norms* in Turkish society. Pareto (1920, 1980) puts forward that people get utility depending on their tastes, however, usefulness also depends on the view of others in a society. Based on norms, individuals are categorized depending on the types of people from different aspects such as gender, age, race, ethnicity, etc., and different identities arise in societies. The views of others shape the norms in a society, and norms can change by means of formal and informal education, over the course of time (Akerlof & Kranton, 2005). These norms and categorizations build perceptions, and those perceptions may create exclusions in societies. Turkey is a patriarchal country in which most of the population is Muslim. In such countries, women face difficulties in participating in social and economic life, and in entering the labor force (Cherayi & Jose, 2016; Tariq & Syed, 2017; Vodanovich, Urquhart, & Shakir, 2010). In Turkey, the role of women is being mothers, wives, or daughters whose main responsibilities are taking care of housework and members of the family, as well as the older relatives (Gunduz, 2007). Thus, their contribution in the labor force is sparse, confirmed by the statistics provided in the previous section. Moreover, the Social Security Institution (SSI) of the country provides social services to citizens if they are employees or relatives of an employee. The social security system is structured to offer more benefits to wives, and daughters compared to sons (Kilic, 2008). This structure indicates the existence of a vicious cycle of social exclusion in Turkey from the gender perspective. Such that the culture and the perceptions affect exclusion of individuals, and this situation in turn affect the behavior of individuals, as well as the working mechanisms of institutions. Therefore, first of all, there is a need to change the perceptions in Turkey by viewing women's roles differently, so that they should be perceived equal to men. With this regard, priority should be given to women's role as employees and must be given by social policies.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

A special emphasis needs to also be placed on the perceptions of the ICT sector, which is widely accepted as a male dominated field in the Turkish economy. Women should be encouraged to work in the ICT sector or in ICT-related jobs. However, the current gender gap cannot be closed suddenly, since it takes time to change the structure of employment in an economy. The current gender gap in the sector can be reduced in the near future by increasing the share of women in ICT education. In order to eliminate perceptions towards ICT employment and education, female students can be encouraged to attain ICT education by social policies. In this manner, Turkey does not only need to provide higher female participation rates of employment in overall economy, but also needs to encourage female students to attain in ICT education. These goals can be achieved by designing coherent social policies, which aim at reducing economic exclusion of women in the society, and implementing such policies in a decisive way.

FUTURE RESEARCH DIRECTIONS

Future research may be directed to ICT education from the gender perspective in Turkey, as parallel to the solutions and recommendations offered in the previous section. Since education statistics signal the structure of employment in the future, an emphasis needs to be placed on the training aspect. The indicators show that even though the ICT employment of women is significantly lower than that of EU countries, the share of female students in ICT disciplines is higher than that of the OECD-European countries. This situation, which can be interpreted as the gender gap between Turkey and the EU countries, is likely to be narrowed in the future. However, this interpretation does not reflect an optimistic view since Turkey remarkably lags behind many European countries with respect to female participation in the ICT sector of employment. In order to close the gender gap in the long run, Turkey must attach importance to encouraging young individuals to be trained in ICT-related disciplines. However, as Akerlof and Kranton (2005) emphasized, expectations about the future shape the current decisions of individuals. If young individuals believe that they will not be able to find jobs in the relevant sector, they will not prefer to be equipped with ICT education. From this point of view, there is a need to change perceptions towards ICT occupations, which is generally accepted as a "man's job." This can be achieved by analyzing the perceptions of individuals at the micro level. Depending on the result of such analysis, appropriate educational policies should be designed and implemented under the leadership of government institutions.

CONCLUSION

This study analyzes women's employment in Turkey's ICT sector with regard to social inclusion from 2009 to 2016, with an attempt to seek answers to the research questions proposed in the previous sections. Depending on the indicators of this study, it is pointed out that participation of women in ICT sector employment is remarkably low. The progress during the period had been little in the relevant sector. Indicators related to the ICT education of women are also remarkably lower than that of men, and the progress in the period analyzed was very weak. This situation confirms the existence of a gender gap, and low social inclusion of women both in ICT sector employment and in ICT education attainment in Turkey from 2009 to 2016.

When Turkey's position in female employment in the ICT sector compared to EU countries is examined, the indicators show that Turkey has been obviously behind those in the relevant sector from 2009 to 2016. However, the position of Turkey compared to EU countries from the points of female employed persons with an ICT education, and females in ICT education attainment, is different. Even though the education indicators confirm the existence of a gender gap, and low inclusion of women in education, Turkey is ahead of most of the EU countries, and this was maintained during the period analyzed.

Turkey is a patriarchal country in which most of the population are Muslim. In such countries, women are not included much in the economic life since their identities in the society are generally based primarily on maternity and housewifery, rather than on their productive role in employment. As a consequence, female employment is significantly low in Turkey, not only in the ICT sector, but also in the overall economy. In addition to this, occupations in ICT sector are widely accepted as being men's jobs in Turkey. When these two situations come together, the degree of women exclusion in Turkey's ICT employment is high. In order to reduce and eliminate the perception, and lower social inclusion, social policies that aim at changing the role of women in society should be designed. Moreover, it is known that education equips individuals with the necessary information for any occupation, and those individuals build up the future's labor force. For this reason, an emphasis should be placed on the encouragement of female students to attain an ICT education. In short, coherent social policies regarding shaping the role of women in society, and encouraging female students to be equipped with an ICT education should be designed and implemented simultaneously. Pursuing these policies will promote the social and economic inclusion of women employment in Turkey. However, the effects of such policies are expected to be apparent in the long run. Therefore, pursuing those policies in a decisive way over the next several years is necessary in order to experience positive, long-term effects both in the society and economy.

KEY TERMS AND DEFINITIONS

Economic Exclusion: Barriers that limit or block the access or participation of individuals in economic life, more precisely in labor, education, consumption, or economic transactions.

Economic Inclusion: Enabling individuals the right to access and participate in economic life.

Employment: The condition of working, generally emphasizing the paid work.

Gender Gap: Difference between males and females regarding any subject.

ICT Employment: The condition of working in the ICT sector, generally emphasizing the paid work.

ICT Sector: An industry that aims at producing, processing, and transmitting information, as well as creating communication with the use of electronic tools, and technology.

Labor Force: The sum of employed and unemployed persons in an economy.

Social Exclusion: Alienation or deprivation of any groups or individuals from social life.

Social Inclusion: Efforts that aim to eliminate alienation or deprivation of individuals from social life.

Women's Employment: The contribution of women to working life, generally emphasizing paid work.

This research was previously published in Gender Gaps and the Social Inclusion Movement in ICT; pages 63-86, copyright year 2019 by Information Science Reference (an imprint of IGI Global).

APPENDIX 1

Depending on OECD's most recent definition of ICT sector (OECD, 2006, 2007, 2011), the sector comprise from three industries: ICT manufacturing, ICT trade, and ICT services industries.
2-digit NACE Rev.2 (corresponds to 3-digit ISIC Rev.4):

- C26 Manufacture of computer, electronic and optical products
- J61 Telecommunications
- J62 Computer programming, consultancy and related activities
- J63 Information service activities

According to United Nations Conference on Trade and Development (UNCTAD) (2015), the most accurate correspondence between ISIC to NACE for the ICT sector is from 4-digit ISIC Rev.4 to 3-digit NACE Rev.2. However, due to lack of data for some countries; this study uses correspondence from 3-digit ISIC Rev.4 to 2-digit NACE Rev.2

APPENDIX 2

A new revision of ISCO, ISCO-08, was released after 2010, and the change was applied to the dataset of Eurostat's EU Labor Force Survey from 2011 to date. According to ISCO-08, ICT specialists are the employees who work in the following occupation fields (Eurostat, 2018h):

- ICT service managers
- Information and communications technology professionals (software and multimedia developers and analysts, and database specialists and systems administrators)
- Information and communications technicians (ICT operations and user support technicians, and communications technicians)
- Electronic engineers; telecommunication engineers
- Graphic and multimedia designers; information technology trainers
- ICT sales professionals
- Electronics engineering technicians
- Electronics mechanics and servicers
- ICT installers and servicers

ABSTRACT

The authors explore how the milieu of workplace diversity affects the relationship between employee and performance. In particular, we theorize and empirically examine the moderating effects of four (4) categories of diversity context variables: age, gender, ethnicity, and educational background. The authors perform analyses on 175 out of 320 respondents consisting of academic and administrative staff of four selected private universities in Ghana. The results showed, for example, that workplace diversity has an overall influence on employee performance, however, educational diversity has more effect on employee performance in the universities compared to the other competing variables used in this study. Age and educational diversity had a significant impact on employee performance in the universities whilst gender and ethnicity diversity had no influence on their performance. We discuss future research directions regarding diversity, workgroup context, and performance outcomes and outline some recommendations for administrators and university leaders.

1. INTRODUCTION

With the world that is changing or revolving constantly, diversity management has become a popular term used in modern society and management practice. Many organisations around the world have developed policies that aim to promote and manage diversity. Diversity management refers to the voluntary organizational actions that are designed to create greater inclusion of employees from various backgrounds into the formal and informal organizational structures through deliberate policies and programs (Hays-Thomas, 2004; Kaiser & Prange, 2004; Nyambegera, 2002; Özbilgin, Mulholland, Tatli, & Worman, 2008; Palmi, 2001; Shifnas & Sutha, 2016).

Emuze and James (2013) are of the view that organisations which adopt diversity as a source of innovation, growth and development are more likely to show behavioural support and facilitate its implementation with greater focus, persistence, and effort. With respect to current realities threatening organisations today, it might be concluded that workforce diversity may create opportunities or pose challenges to the workplace (Osita-Ejikeme; Ugwuzor, 2014). In a Nation like Ghana with various ethnic nationalities and dialects, as well as different social and religious backgrounds, the subject of diversity in the workplace, particularly among groups, cannot be over emphasized. The study therefore seeks to find out the relationship between workplace diversity and employee performance.

2. LITERATURE REVIEW

2.1 Concept of Diversity

According to Green, López, Wysocki, and Kepner (2002) citied from Esty, Griffin, and Hirsch (1995), diversity is defined as recognizing, accepting, accommodating, appreciating, and celebrating differences among people with reverence to age, class, ethnicity, gender, physical and mental ability, race, sexual orientation, spiritual practice, and public assistance status whilst Naqvi, Ishtiaq, Kanwal, Butt, and Nawaz (2013) defined diversity as the existence of a workforce in which personalities come from different socio-cultural and religious backgrounds.

Workplace diversity is similarly defined as intergroup relations, which play out alongside one another in communication and interaction. It develops a host of complexities related to diversity (Brouwer & Boros, 2010). Lee and Gilbert (2014) further clarified that workforce diversity based on age, gender and ethnicity cannot be viewed in a similar way as workforce diversity that is based on organisational roles and individual aptitudes.

Roberge, Lewicki, Hietapelto, and Abdyldaeva (2011) was of the opinion that managing a diverse workforce is complicated and thus needs organisations' total attention in terms of implementing proper and clear practices that will enhance the performance of the organisation in the short and long term. In addition, Mahadevan, Primecz, and Romani (2014), explained that dysfunctional workforce diversity management arises due to lack of communication between management and employees on how workforce diversity benefits the organisation.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

2.2 Concept of Employee Performance

According to Okoro and Washington (2012), employee performance is the effective discharge of duty for which one is hired. That is, how well an employee is fulfilling their requirement for the job. In the words of Tinofirei (2011) as citied by Zhuwao (2017), employee performance is the "successful completion of tasks by a selected individual, as a set and measured by a supervisor or organisation, to pre-defined acceptable standards, while efficiently and effectively utilising available resources within a changing environment".

Mwatumwa (2016) sees employee performance as a self-perceived performance of an employee in doing their day to day activities

2.4 Workplace Diversity Challenges

Embracing diversity solely cannot help organisations achieve success; organisations need to manage it well (Farrer, 2004). According to Oyewunmi (2018), a major challenge of the diverse workforce is the omission of certain individuals or groups grounded on differences such as, gender; age; ethnicity or cultural affiliation; religion; social class; disability etc.

2.5 Gender Diversity

Gender diversity implies psychological disparities and experience that socially or culturally attached to being a male or a female within the organization (Ali, Kulik, & Metz, 2011). Connell and Messerschmidt (2013) view gender as the description of masculinity or femininity of people. According to Ngao and Mwangi (2013), gender often plays a significant role in affecting employee performance, performance ratings, and related human resource decisions.

Ivanova-Stenzel and Kübler (2011) in their research examined the influence of gender differences in teamwork and team competition using wages. They discovered that performance depended on both the combination of gender and incentive scheme not just the incentive scheme. They also identified a gap between the performance of men and women; men performed better than women when paid according to joint output and when the competition is between teams of the same gender. They advised that combinations of incentive scheme and gender composition in teams should be avoided.

Some researchers also indicate that the absenteeism rate among women is higher than men, which requires the development of initiatives to manage diversity to overcome these problems, such as flexible working hours initiatives and telework. Jayne and Dipboye (2004) argued that gender diversity does not automatically bring positive result such as increased motivation, improved talents, build commitment, and decline conflict.

2.6 Age Diversity

Backes-Gellner and Veen (2009) define age diversity as generational differences among individuals or employees in a corporation and the values and perspectives attached to each. People tend to share a place with their generation no matter the experience they share (Akpakip, 2017). Johnson and Johnson (2010) and Zemke, Raines, and Filipczak (2013) view generation as a set of individuals born and living in the same period, who have mutual attitudes, preferences, knowledge and experiences that affect their

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

thoughts, values, beliefs and behaviors. Pitt-Catsouphes, Matz-Costa, and Besen (2009) categorised the age group present at work into six, namely: traditionalists (born before 1946), older boomers (born 1946 to 1954), younger boomers (born 1955 to 1964), older generation X'ers (born 1965 to 971), younger generation X'ers (born 1972 to 1980) and generation Y/millennials (born after 1980).

Backes-Gellner and Veen (2009) observed that age diversity can negatively affect productivity due to differences in the values and preferences of distinct age groups. Joshi and Jackson (2003) observed that there was no impact of age differences on reports of work group or objectives measure group performance.

However, Boehm and Kunze (2015) disputed that an age heterogeneous workforce yields a host of numerous skills, intellectual styles, morals, and preferences that may result in increased productivity. Josef (2010) was of the opinion that older employees have the tendency of opposing change and due to advancement in age, they might have failing memories and are more likely to be absent from work due to ill health and injuries, which could be the result of their being less energetic and enthusiastic unlike the younger employees. Additionally, since jobs are performed the same way by all the different generations of employees of an organisations, the unwillingness of the older employees to learn new skill and acquire new knowledge affect decline in work capacity and performance The resulting effect of these are the main causes for their decline in work capacity and performance (Akpakip, 2017).

2.7 Ethnicity Diversity

Ethnic diversity refers to the heterogeneity in the mother religion, languages, cultures and races that exists among employees in a firm (Hoogendoorn & Van Praag, 2012). Rasul and Rogger (2015) claim that ethnic diversity has an effect on productivity by influencing how people feel motivated about their jobs, the level of efficiency in the firm, employee satisfaction with their job and the quality of products and services that a firm produces.Østergaard, Timmermans, and Kristinsson (2011) observed that ethnic diversity boosts creativity and innovativeness in the firm by expanding the perspectives and viewpoints in the firm. Please cite refrences to suggest that it can also decline same.

2.8 Education Background Diversity

Conferring to Combs (2002), organisational leaders implement educational diversity initiatives in efforts to motivate and encourage individuals to work effectively with others so that organizational goals are achieved. Tracy and David (2011) in their study about the effects of education background diversity towards the employee performance in Britain found that employers commonly reject employing employees whose training, experience, or education is judged to be inadequate.

bestowing to Eduard (2010), employees who are less educated are prone to suffer inferiority complex which affect their performance to a large extent. He argued that such employees who develop a persistent feeling of being inferior end up feeling socially insecure and less confident at work. He concluded that the lack of confidence would greatly damage their performance and could even make them develop a negative attitude toward other employees and the entire organisation.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

2.9 Diversity and Employee Performance

Chew, Lee, Tan, and Tee (2011) investigated the effect of work force diversify (gender, age, ethnic and education background of the employees) on employee performance. The results showed there is increased performance in a diverse workforce. They observed that age diversity has no influence on performance.

Selvaraj (2015) in his study "The Effects of Work Force Diversity on Employee Performance in Singapore Organisations" was of the opinion that workforce diversity yields positive benefits when properly managed; if not, it could lead to negative results. His analysis revealed that age, gender and ethnicity had no statistically significant impact on the performance of employees. He recommended that human resource programmes suggested by the employees to improve the effectiveness of workforce diversity should be worked on.

Magoshi and Chang (2009) in their research found workforce diversity to be a significant factor in explaining a variation in employee performance. Whilst Mwatumwa (2016) in his research found out that workforce diversity does not influence employee work performance at the County Government of Mombasa as ethnicity, gender and educational background did not portray significant effect on performance, positively nor negatively.

Maingi and Makori (2015) showed that, work diversity in terms of education and ethnicity had and influence employee performance. They however suggested that there should be effective policies and strategies regarding the education background diversity and ethnic diversity in the workforce for better employee performance.

3. METHODOLOGY

The population of the study consisted of academic and administrative staff of four (4) selected private universities in Ghana (Table 1). The questionnaire was developed to measure diversity on the basis of instruments used by Chew et al. (2011). The sample size was selected using Krejcie and Morgan (1970) sample size determination table for a finite population. A sample size of 175 out of 320 was utilized for the study. The sample for individual universities was attained by implementing the stratified sampling technique which ensures better coverage of the population.

Table 1. Population and sample size

Universities	Population	Sample
Data Link Institute	86	46
Fountain Head University College	69	38
Central University	122	67
Methodist University College	44	24
Total	320	175

Source: Field work (2019)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The questionnaire comprised of three sections. Section 1 consisted of demographic attributes like gender, age, level of the respondents and institution. Section 2 comprised of questions related to gender, age, ethnicity and educational diversity measured on a 5-point Likert scale anchored by "Strongly Disagree" (1) to "Strongly Agree" (5). Section 3 comprised of questions related to employee performance also measured on a 5-point Likert scale. The Statistical Package for Social Sciences (SPSS) was used to calculate the Pearson's Product Moment Correlation Coefficient and Multiple Regression Analysis.

Ethical issues that were taken into account in this study were respecting the rights of the research participants, acknowledging the research sites and reporting the research fully and honestly (Stuart & Barnes, 2005). Participants were informed about the nature and purpose of the study. The researcher sought the consent of the participants and assured of their confidentiality and anonymity of the information that was given. The study was done in four Ghanaian private universities due to proximity as the four universities were in the same community. Provide geographical location.

4. FINDINGS AND DISCUSSION

4.1 Demographic Analysis

Sharma (2004) states that demography is the study of the size, territorial distribution, and composition of population, changes therein, and the components of such changes, which may be identified as natality, mortality, territorial movement (migration), and social mobility (change of status).

The distribution presented in Table 2 shows that approximately 68.6% of the respondents are males while 31.4% were females. It can be deduced from the pattern that majority of the respondents were males. The age distribution indicates 23.4% of the respondents were within 20-29years, 52% were within 30-39years and 24.6% were within 40-49years. From the pattern, majority of the respondents were within 30-39years.

The ethnicity of the respondents shows that 9.7% of the respondents were Gas, 19.4% were Fantes, 11.4% were Ashantis, 16.6% were Ga Dangbe, and 13.7% were from other ethnicities. The educational level of the respondents showed that 37.7% of the respondents have obtained bachelor's degrees, 53.1% have obtained master's degrees and 9.1% has obtained doctoral which can be deduced from the pattern that majority of the respondents have obtained master's degrees.

The name of the institution of the respondents indicates that 25.3% of the respondents were from Data Link Institute, 22% were from Fountainhead University College, 38.7% and 14% were from Methodist University College.

4.2 Reliability Test

Cronbach's Alpha and Kaiser-Meyer-Olkin Measure (KMO) of Sampling Adequacy and Bartlett's Test of Sphericity was used to measure the reliability of the questionnaire. Cronbach's alpha is a measure of the internal consistency of a test or scale (Taber, 2018). It is stated as a digit amid 0 and 1. A reliability coefficient of 0.7 or greater is considered acceptable. The Cronbach alpha of 0.908 shows that our instrument is reliable (Mohajan, 2017). This is shown in Table 3.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Demographics

VARIABLES	RESPONSES	PERCENTAGES
Gender	Male	68.6
	Female	31.4
Age	20-29years	23.4
	30-39years	52.0
	40-49years	24.6

KMO and Bartlett's Test to scrutinize sampling adequacy see whether the data was fit to use factor analysis in data analysis. Table 4 shows KMO measure of sample adequacy as 0.671 which is close to 1. Furthermore, Bartlett's Test of Sphericity significant value of 0.000 was less than 0.05.

4.3 Relationship between Workplace Diversity and Employee Performance

H_1 there is a significant relationship between workplace diversity and employee performance

Pearson correlation analysis was conducted on workplace diversity and employee performance in order to establish the relationship among the variables. The correlation shows that there is strong positive relationship between workplace diversity and employee performance at the 1% level of significance (Table 5). Therefore, an increase in workplace diversity would lead to an increase in employee performance and a decrease in workplace diversity would lead to a decrease in employee performance and its p-value (0.000) which is lesser than the level of significance (0.01) shows that the relationship is statistically significant.

Table 5. Correlations

		Employee Performance	Workplace Diversity
Employee Performance	Pearson Correlation	1	.897**
	Sig. (2-tailed)		.000
	N	175	175
Workplace Diversity	Pearson Correlation	.897**	1
	Sig. (2-tailed)	.000	
	N	175	175

**. Correlation is significant at the 0.01 level (2-tailed).
Source: Field Work (2019)

4.4 Relationship between Various form of Workplace Diversity and Employee Performance

Table 6 shows the relationship between various forms of workplace diversity and employee performance. It was observed that there was a moderate positive relationship between gender diversity and employee performance. Thus, an increase in gender diversity will increase employee performance and a decrease in gender diversity will decrease employee performance. Also, the relationship is statistically significant as its p-value (0.000) is lesser than the level of significance (0.01) which was consistent with Alghazo and Al Shaiban (2016) and Akpakip (2017) findings.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 6. Correlations

		Gender	Age	Ethnicity	Educational	Employee Performance
Gender	Pearson Correlation	1	.399**	.473**	.668**	.567**

	N	175	175	175	175	175

**. Correlation is significant at the 0.01 level (2-tailed).
Source: Field Work (2019)

There was a moderate positive relationship between age diversity and employee performance. This means that an increase in age diversity will increase employee performance and a decrease in age diversity will decrease employee performance. Also, the relationship is statistically significant as its p-value (0.000) is lesser than the level of significance (0.01) which was in contrast with Selvaraj (2015).

There was a strong positive relationship between ethnicity diversity and employee performance. Thus, an increase in ethnicity diversity will increase employee performance and a decrease in ethnicity diversity will decrease employee performance. However, the relationship is statistically significant as its p-value (0.000) is lesser than the level of significance (0.01).

Finally, there a strong positive relationship between educational diversity and employee performance. Thus, an increase in educational diversity will increase employee performance and a decrease in educational diversity will decrease employee performance. Also, the relationship is statistically significant as its p-value (0.000) is lesser than the level of significance (0.05) which was consistent with Akpakip (2017) findings.

Table 7 generated the specific regression equation as

EP = -0.050GEN+ 0.267AG- 0.231ETH+0.928EDU

The regression coefficient for gender diversity of employee performance (B_1) = 0.050 implies that 1% increase in gender diversity will decrease employee performance by 5% holding AG, ETH and EDU constant and its P value of 0.417 which is greater than the 0.05 level of significance shows that there is not enough statistical proof that an increase in gender diversity will decrease employee performance and

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

vice versa, thus the null hypothesis has to be accepted. This findings was in line with YISRAK (2017) and Kerga and Asefa (2018) research and in contrast with Chew et al. (2011), Eshegbe and Dastane (2015), Zhuwao (2017) and Akpakip (2017) findings.

Table 7. Regression Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	2.504	2.785		.899	.370		
	Gender	-.067	.083	-.050	-.814	.417	.475	2.106
	Age	.991	.177	.267	5.599	.000	.786	1.273
	Ethnicity	-.357	.139	-.231	-2.564	.011	.220	4.539
	Educational	1.161	.131	.928	8.852	.000	.163	6.144

a. Dependent Variable: Employee Performance
Source: Field Work (2019)

The regression coefficient for age diversity (B_2) = 0.267 implies that 1% increase in age diversity will increase employee performance by 26.7% holding GEN, ETH and EDU constant and its P value of 0.000 which is lesser than the 0.05 level of significance shows that there is enough statistical proof that an increase in age diversity will increase employee performance and vice versa, thus the null hypothesis was rejected. This was in harmony with (Alghazo & Al Shaiban) and contradictory to Chew et al. (2011), Eshegbe and Dastane (2015), Zhuwao (2017) and Kerga and Asefa (2018) findings.

The regression coefficient for ethnicity diversity (B_3) = 0.231 implies that 1% increase in ethnicity diversity will decrease employee performance by 23.1% holding GEN, AG and EDU constant and its P value of 0.011 which is lesser than the 0.05 level of significance shows that there is enough statistical proof that an increase in ethnicity diversity will decrease employee performance and vice versa, thus the null hypothesis was rejected. This was comply with (Maingi & Makori, 2015) and Kerga and Asefa (2018) results

The regression coefficient for educational diversity (B_4) = 0.928 implies that 1% increase in educational diversity will increase employee performance by 92.8% holding GEN, AG and ETH constant and its P value of 0.000 which is lesser than the 0.05 level of significance shows that there is enough statistical proof that an increase in educational diversity will increase employee performance and vice versa, thus the null hypothesis was rejected. The omission of the constant value in the regression equation shows that employee performance cannot be achieved in the study without the influence of the independent variables. Chew et al. (2011), Maingi and Makori (2015) and (Akpakip, 2017) had similar findings whilst Eshegbe and Dastane (2015), Alghazo and Al Shaiban and Kerga and Asefa (2018) findings were in contrast.

Finally, the tolerance value of less than 0.20 or 0.10 indicates a multicollinearity problem. In Table 7 the tolerance values of all independent variables (0.475, 0.786 and 0.220) except educational diversity (0.163) is greater than 0.20 tolerance value which shows that the tolerance level is moderate and good and there is no problem of multicollinearity. The reciprocal of the tolerance is known as the Variance Inflation Factor (VIF). The VIF of 5 or 10 and above indicates a multicollinearity problem. The VIF

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

values of independent variables also shows that there is no problem of multicollinearity as all values except the educational diversity are less than 5, thus independent variables have no influence on each other and will not influence the outcome of employee performance in the study.

4.5 Discussion

The purpose of this study was to investigate the impact of workplace diversity on employee performance. The impact of workplace diversity was measured in terms of age, gender, ethnicity and educational background. The results of the study are discussed below:

From the results, majority of the respondents were males. This was in contrast with Zhuwao (2017) and Kossek, Lobel, and Brown (2006) findings.

With regards to ethnicity, there were various ethnicities in the Universities though the Ewes are majority. One can resolve that the workforce is ethnically diverse at the higher education institution. The institutions has an aged diverse workforce which was consistent with Kunze, Boehm, and Bruch (2011) findings who claimed that age diversity has become an unavoidable feature of many organisations.

For educational qualification, Bachelor's degree holders were the least of all. A study conducted by Hoff (2014) found that organisations usually reject hiring people with insufficient educational qualifications, for example primary and secondary qualifications. Gender diversity had a negative and insignificant relationship. Age had a positive and significant relationship with employee performance whereas, Kyalo and Gachunga (2015) had a weak negative and insignificant relationship between age diversity and employee performance.

Ethnicity had a significant effect on employee performance which can be supported by Opstal (2009) ethnic diversity can have both advantages and disadvantages for the organisation.

Educational diversity had a significant and positive relationship with employee performance.

5. CONCLUSION AND RECOMMENDATIONS

A diverse workforce is an indication of a changing world and marketplace. Based on the overall result, workplace diversity has an influence on employee performance, however, educational diversity has more effect on employee performance in the Universities compared to other variables. Age and educational diversity had a significant impact on employee performance in the Universities whilst gender and ethnicity diversity had no influence on their performance.

The study recommends higher educational institutions to make use of common languages such as English to cater for all different ethnic groups as this circumvents communication difficulties and ethnic related conflicts.

Chapter 55
Cultural Diversity and Performance of Cameroonian Companies

Joel Stephan Tagne
University of Ngaoundere, Cameroon

Jean Pierre Evou
University of Yaounde II, Cameroon

ABSTRACT

The objective of this study is to highlight the effects of ethnic, linguistic, and religious diversity on business sustainability in Cameroon. To achieve this objective, the authors used data from a survey conducted in the cities of Douala and Yaoundé by the Laboratory for Research in Fundamental and Applied Economics (LAREFA) of the University of Dschang. Using a censored Tobit model, the following results were obtained: (1) Ethnic diversity and linguistic diversity each have a positive effect on the sustainability of Cameroonian companies. However, when the linguistic diversity index is too high, its effect becomes significantly negative. (2) Whatever its level, religious diversity has a negative effect on the sustainability of Cameroonian companies.

INTRODUCTION

Economic growth theories largely recognize that new firms are the driving force of economic growth, that is, creating jobs, stimulating competition, fostering innovation that stimulates economic growth in a society (Acs & Szerb, 2007; Audretsch, 2007; Rothwell & Zegveld, 1982; Schumpeter, 1934). However, to achieve this goal requires both new and old companies must be successful (Tsambou & Fomba, 2017).

Performance is a polysemous, complex and difficult concept to define. According to Villarmois (1998), performance is defined through two almost independent dimensions: an objective dimension of an economic (efficiency) and systemic (sustainability) type and a subjective dimension that is both social (human resources) and societal (legitimacy). In the organizational design of performance, Scott

(1987) suggests three main models: the rational model, the natural model and the systemic model. The rational approach would tend to focus on the number of units produced for a given period (productivity) and for the number of factor units (efficiency). This approach is consistent with Villarmois' (1998) idea of objective economic performance (efficiency). The natural model, in addition to considering the production function, integrates support activities, which justifies the interest in employee cohesion and morale. The systemic model highlights the elements related to resource acquisition and adaptability.

In 1992, Cameroon underwent a labour market reform. The main objective of this reform was to improve business performance. Unfortunately, it has led to an increase in job insecurity. Thus, in 1992, statistics show that the informal sector contributed to the creation of more than 8 out of 10 jobs. Today, it employs nearly 90% of Cameroonian workers (OIT, 2017). However, according to the latter author, informal enterprises in Cameroon are just surviving enterprises where profits and efficiency remain very low and cannot compete and as a result, they remain inefficient.

Research on the determinants the performance of a firm focuses on two types of sources ; while the first focuses on the firm's external environment and market characteristics (Porter, 1979; Geroski & Masson, 1987; Cano et al. 2004; Grinstein, 2008), the second puts an accent on firm-specific resources such as innovation, organization, marketing, human resources management... (Barney, 1991 ; Peteraf, 1993). Regarding the internal source and particularly human resources, it was mentioned that employee creativity has an impact on company performance (Jaussi & Dionne, 2003). However, this strong creativity among employees is often explained by the existence of diversity within this group (Maznevski, 1994).

Diversity studies (for example, Maznevski, 1994; Milliken & Martins, 1996; Pelled, 1996; Boeker, 1997; Peterson, 2000; Timmerman, 2000) have been conducted using two approaches ; cognitive diversity (knowledge, education, values, perceptions, affection and personality characteristics) and demographic or cultural diversity (gender, language, age, race and ethnicity)

Cultural diversity refers to the degree of dissimilarity between the cultural backgrounds of the members of a social grouping (Périac, 2014). It thus refers, generally, to the absence of the concentration of a particular cultural attribute within a group. This attribute may be ethnic (Lee & Nathan, 2011; Fearon, 200 ; Ely & Thomas, 2001), linguistic (Fearon, 2003), religious (Fearon, 2003), country of birth or nationality (Ottaviano & Peri, 2006; Niebuhr, 2010; Lee & Nathan, 2011). Ethnic diversity refers to the probability that two people randomly selected from a group are of different ethnic origin. Similarly, religious diversity refers to the probability that two people randomly selected from a group belong to two different religions. Finally, linguistic diversity refers to the probability that two people randomly selected from a group speak two different languages.

Reviewing the ethnic map of Cameroon, it can be seen that the country is traversed by cultural diversity. Indeed, this country is home to three major ethnic groups: Bantu, semi-bantu and Sudanese. Similarly, the country has two official languages, English and French. In addition, 256 local languages are spoken in the country. However, although the constitution stipulates that Cameroon is a secular state, there are Muslims, Christians, animists and many other religious groups present in the country.

Much work has focused on the impact of cultural diversity on different forms of performance (Collier, 2000; Ely & Thomas, 2001; Ottaviano & Peri, 2006; Niebuhr, 2010; Lee & Nathan, 2011). Most of this work is based on a theory called "Theory of Homogeneity and Heterogeneity". According to this theory, members of culturally homogeneous groups are more likely to communicate with each other more often because of a unique culture (Blau, 197; Earley & Mosakowski, 2000). As a result, companies with culturally homogeneous groups do not necessarily have to suffer the negative effects of social identity processes (Cheong & Sinnakkannu, 2014). Although Tsui et al. (1992) found that increasing cultural

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

diversity within a group leads to social comparison and categorization, Blau (1977) shows that as cultural diversity increases, social barriers weaken as group members are more evenly distributed over a larger number of subcultures (Blau, 1977). The susceptibility of each group member to identify himself with a particular category and conform to its norms decreases, reducing internal tension that prevent social interaction with members of the external group (Blau, 1977).

Empirically, current literature reveals a negative, positive or no relationship between cultural diversity and business performance (Marimuthu, 2008). In some situations, cultural diversity generates conflicts that could lead to political instability and civil wars (Easterly & Levine, 1997; Collier, 2000). These conflicts could negatively affect the performance of companies at the national level. According to Bjornskov (2008), cultural diversity leads to a decline in trust within the group. In addition, in groups where several cultures coexist, coordination is more difficult, communication is slower (Anderson et al., 2011; Doney et al., 1998). Therefore, Knight et al. (1999) argue that team performance tends to reduce as the level of diversity increases.

In other situations, cultural diversity is seen as an essential tool for business performance. According to the latter idea, cultural diversity generates cognitive diversity (Thomas & Ely, 2001; Jehn et al., 1999; Page, 2008). The confrontation of cognitive perspectives within a group, as well as the encounter of distinct areas of knowledge, creativity and innovation, are beneficial to the group's performance (Berliant & Fujita, 2009; Ancona & Caldwell, 1992; Nederveen Pieterse et al., 2013; Somech & Drach-Zahavy, 2013). In addition, foreign nationals can bring specific knowledge of their country of origin, which may be advantageous for the company if it operates in this market (Maznevski, 1994).

In addition, Michel and Hambrick (1992) argue that heterogeneity is positively related to better problem solving and solution creation. As a result, culturally diverse firms tend to become more competitive (Watson et al., 1993). Other authors have based their analysis on the diversity of the management team and have shown that it has a significant effect on business performance (Hambrick & Mason, 1984; Wiliams & O'Reilly, 1998; Awino, 2011). Although Wiliams and O'Reilly (1998) have shown that a homogeneous management team is more beneficial to business performance, Hambrick and Mason (1984) argue that business executives could, with greater demographic diversity, influence the decision-making process and contribute positively to business performance (Hambrick & Mason, 1984). Companies must therefore diversify their workforce to achieve adequate worker performance (White, 2005).

Other authors have been involved in analysing the differential impact of different dimensions of cultural diversity. Thus, many studies deal indirectly with the question of the link between cultural diversity and business performance, laving emphasis on the effect of a particular dimension of cultural diversity: ethnic, religious and linguistic diversity.

Work on ethnic diversity most often focuses on the diversity arising from migration. However, it has been mentioned that the mobility of individuals, a source of ethnic diversity, promotes a process of brain circulation, facilitating the exploitation of their knowledge to create new businesses (Sexenian, 2005). Ethnic diversity is however associated with high rates of business creation (Rodriguez-Pose & Hardy, 2015). Similarly, immigrants can be self-selected in terms of intelligence, creativity, risk appetite and other characteristics that can affect the productivity and creativity of existing businesses (Borjas, 1987; Feyrer, 2008). In addition, highly skilled immigrants are more likely to become high-growth entrepreneurs, partly because they have access to sufficient resources to exploit opportunities (OECD, 2010). They are more mobile and mobility of labour is an important source of innovation for firms and regions (Faggian & McCann, 2009; Simonen & McCann, 2010). In cases where immigrants are highly educated, they can substantially alter the local stock of human capital, which in turn is linked to the productivity of

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

the firm (Sanroma & Ramos, 2007; Cowan & Zinovyeva, 2013). Thus, ethnic diversity attracts multiple forms of human capital and undoubtedly encourages creativity, technological and scientific innovation but also business competitiveness (Fainstein, 2005).

Language problems are a major problem facing many companies today (Lambert, 2001). In this regard, language can be an obstacle or facilitator to business performance. However, language barriers can arise between individuals from different cultural backgrounds (Worman, 2006). These barriers then influence various aspects of the business (Imberti, 2007). For example, language barriers can be key factors that prevent market information from reaching company executives (Brannen & Doz, 2012). Katz and Pesetsky (2011) state that employees who do not master the main language used at work may have difficulty expressing their needs or responding to requests from colleagues and clients. Similarly, a client who is unable to clearly understand his or her supplier due to a lack of language proficiency may be frustrated and may go elsewhere (Levinson et al., 2002).

All these can lead to low production, low creativity and poor company results (Levinson et al., 2002). In the same manner, Galbraith and Benitez-Galbraith (2009) show that linguistic diversity is also associated with higher failure rates. To them, countries with high levels of linguistic diversity will have higher start-up rates than linguistically homogeneous countries and similarly, countries with high levels of linguistic diversity will have higher failure rates than countries that are more linguistically homogeneous.

To our knowledge, Cannirella and Streb (2015) are the only authors who have highlighted the link between religious diversity and business performance, especially in terms of innovation. These authors argue that the presence of different cultures, skills and abilities from different religions could encourage business innovation. They find that religious diversity and patented activity have an inverted U-shaped relationship.

From this literature, one observation can be made ; there is a lot of work showing the effects of cultural diversity on business performance. However, theses studies have focused on the cultural diversity of the northern countries, most often due to migration, forgetting that African countries, and particularly Cameroon, have several closed cultural groups (ethnic groups, linguistic groups, religious groups) within their territories. However, the following research question deserves to be asked: what are the effects of cultural diversity on the performance of Cameroonian companies ?

To answer the above question, we set an objective to analyse the effect ethnic, religious and linguistic diversity on the sustainability of companies in Cameroon

METHODOLOGY

This methodology starts with a presentation of the data and ends with a presentation of the econometric model.

DATA

The data used for this work are those collected by the Laboratory for Research in Fundamental and Applied Economics (LAREFA) of the University of Dschang. In 2017, this laboratory conducted a survey among 504 individuals in the towns of Douala and Yaoundé to profile individuals and their businesses. The choice of these two cities was justified by the fact that they are the country's two major towns and

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

are home to a little more than 90% of businesses in Cameroun (INS Cameroun, 2010). Random sampling was used for each town.

ECONOMETRIC MODELS

Econometric modelling is based on the nature of the dependent variable. This dependent variable is the sustainability of the company, represented by the time between the date of creation of the company and the day of the survey. It should be noted that this duration is a linear variable that cannot be less than zero. This leads to a censored data model since the dependent variable is in an interval. In this case, a censored Tobit has to be used. If we note the actual $y_{1,i}$ as the actual duration of company *i*, then it is defined by:

$$y_{1,i} = \begin{cases} y_{1,i}^{*} & \text{if } y_{1,i}^{*} > 0 \\ 0 & \text{if } y_{1,i}^{*} \leq 0 \end{cases}$$

where $y_{1,i}^{*} = x_{1,i}\beta + \varepsilon_{1,i} \quad \forall i = 1,...,N$; $x_{j,i}$ denotes the vector of observable characteristics, β vector of unknown parameters and ε the error terms. The variable $y_{1,i}$ is only observable when $y_{1,i}^{*} > 0$. We are therefore in the presence of a model with a limited dependent variable. It is a model for which the dependent variable is continuous but can only be observed over a certain interval.

The starting equation to be estimated is as follows:

$$D_e = \alpha_0 + \sum_{j=1}^{J} \beta_j DIVcul_e + \sum_{k=1}^{K} \lambda_k ent_e + \sum_{l=1}^{L} \gamma_l ter_e + \varepsilon_e$$

where *e* represents the company, *D* represents duration, *β, λ, γ* parameters, *α* the constant, *DIVcul* all variables related to cultural diversity, including control variables related to the company, *ter* all control variables specific to the territory.

Cultural diversity is often captured by a Herfindhal index that is calculated as the probability that two randomly selected individuals belong to the same culture.

$$DIV_j = \sum_{r=1}^{R} S_{rj} * \left(1 - S_{rj}\right)$$

$$\mathrm{DIV_j} = \sum_{\mathrm{r=1}}^{\mathrm{R}} \mathrm{S_{rj}} - \sum_{\mathrm{r=1}}^{\mathrm{R}} \mathrm{S_{rj}^2}$$

where S for example is the proportion of workers in company j who are of the cultural origin r and R is the number of cultures represented among the workers in that company.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Given that $\sum_{r=1}^{R} S_{rj} = 1$

then

$$DIV_j = 1 - \sum_{r=1}^{R} S_{rj}^2$$

This index will approch zero when heterogeneity is low and close to one when heterogeneity is high (Kemeny, 2017). An index value of zero indicates that all workers in the company are entirely individuals from the same culture. Lee (2014) considers cultural diversity at the enterprise level as the proportion of owners or managers born outside the country. It is a measure of the diversity of the management structure rather than the diversity of the company's workforce. This measure has a great advantage because management is the most important group in decision-making at the company level. The introduction of new ideas and processes leading to the company's performance requires this group. Given that nearly 90% of businesses in Cameroon are very small and have only one owner/manager at their top, the measurement of business diversity based solely on the company's executives has a major limitation. We will therefore measure the actual diversity of the company, which takes into account not only the management structure but also and above all the diversity of the employed staff.

Unlike developed countries, Cameroon, like most countries in the South, is characterized by a high level of cultural diversity. However, apart from the flows of immigrants that the host country receives each year, Cameroon is witnessing the coexistence of several ethnic, linguistic and religious groups. By splitting the cultural diversity variable into three components, the equation becomes:

$$D_e = \alpha_0 + \beta_1 DIVeth_e + \beta_2 DIVling_e + \beta_3 DIVrel_e + \sum_{k=1}^{K} \lambda_k ent_e + \sum_{l=1}^{L} \gamma_l ter_e + \varepsilon_e$$

Ethnic diversity is considered as the probability that two individuals (employee, manager, owner) randomly selected in the company belong to two different ethnic groups.

$$DIV_j^{ethn} = 1 - \sum_{r=1}^{R} S_{rj}^2$$

where S is the proportion of the employees (owner, manager and simple employee) of company j who are of ethnic origin r. Thus, r = Bantu, Semi-bantu, Sudanese, hence R=3.

Similarly, linguistic diversity is considered as the probability that two individuals randomly selected in the company (owner, manager, employee) speak two different languages.

$$DIV_j^{ling} = 1 - \sum_{k=1}^{K} S_{kj}^2$$

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

where S is the proportion of employees (owner, manager and simple employee) of company j who speak the language k. Thus k= English, French hence K= 2.

Similarly, religious diversity is defined by the probability that two people randomly selected from the company (owner, manager and simple employee) belong to two different religions.

$$DIV_j^{relig} = 1 - \sum_{h=1}^{H} S_{hj}^2$$

where S is the proportion of the staff (owner, manager and simple employee) of company j who are the religious affiliation h. Thus, h = Catholic, Protestant, Muslim, other, hence H = 4.

Referring to the work of Peteraf (1993) and Grinstein (2008), the control variables related to the company are the age of the promoter (*tap*), the education level of the promoter or manager (*nip*), the attitude of the promoter and/or manager towards risk *(ris), the* size of the company (*tai*), the business sector the company (*sa*), the legal form of the company (*fj*), the use of ICT (*tic*), the source of financing *(sf)*. The control variable related to the territory is mainly the level of corruption (*corr*). The existing literature justifies the introduction of age into the model by the fact that older individuals often have more experience in good business management. Educational attainment is included in the model to reinforce Becker's (1975) idea that education has an effect on an individual's career orientation.

According to Kihlstrom and Laffont (1979), the least risk-averse individuals become entrepreneurs and digest the largest firms. Thus, the attitude towards risk must be included in the model. The need to include firm size, legal form and sector of activity is justified by the generally accepted view that large industrial firms are able to achieve economies of scale, have better access to financial markets (Titman and Wessels, 1988) and are better able to prevent new entrants from operating in the market (Maças Nunes et al., 2009), which could facilitate their sustainability. ICT is included in the model to reinforce Koellinger's (2005) idea that the use of ICT leads to efficiency gains resulting from reduced transaction costs, improved business processes, better coordination with suppliers and increased diversification. According to Amore et al. (2013), financial development, as reflected in the openness of the financial system to transactions, is essential for corporate performance. Therefore, the source of finance can be included in the model. To control for unobserved heterogeneity in economic structure and institutional quality, we introduced the corruption variable. Thus the final equation to be estimated becomes:

$$\begin{aligned} D_e = {} & \alpha_0 + \beta_1 DIVeth_e + \beta_2 DIVling_e + \beta_3 DIVrel_e + \lambda_1 agp_e + \lambda_2 nip_e \\ & + \lambda_3 ris_e + \lambda_4 tai_e + \lambda_5 sa_e + \lambda_6 fj_e + \lambda_7 tic_e + \lambda_8 sf_e + \gamma coor_e + \varepsilon_e \end{aligned}$$

ECONOMETRIC RESULTS

Reading the table below, the authors found that the model explains nearly 33% of the variability of cultural diversity in relation to the sustainability of companies. The results of these estimates also show that the company's sustainability model is globally significant at the 1% threshold (Prob>chi2 = 0.0000 < 0.01).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

They note the significance of one of the variables related to cultural diversity. This is linguistic diversity. However, if we vary linguistic diversity from zero to low, then the duration of the company will increase by 30.89 months. Although the coefficient assigned to the high level is insignificant, it is consistently negative, which means that a high level of linguistic diversity contributes to reducing the duration of a company. Thus, the relationship between linguistic diversity and the company's sustainability is in the form of an inverted U. Therefore, the more linguistic diversity increases within a company, the more it tends to be a long-term business, but there is a maximum level of linguistic diversity where exceeding this level would rather contribute to a reduction in the lifespan of the company. This could be explained by the fact that linguistic diversity provides a wide range of networks that the company could use to easily access more information, more credit and more labour. However, interactions between individuals from different backgrounds also involve costs associated with creating an environment that ensures cooperation, which can reduce business performance in terms of time.

Although ethnic diversity is not significant, the authors find the signs attributed to its coefficients to be all positive. This means that when a company is ethnically diversified, it is more likely to be sustainable. This result can be justified with Fainstein's (2005) argument that ethnic diversity attracts multiple forms of human capital and undoubtedly encourages creativity, technological and scientific innovation and also the competitiveness of companies. Concerning religious diversity, though not significant, whatever its level, it has a negative impact on the sustainability of Cameroonian companies.

The age of the promoter or manager also plays a significant role in explaining the duration of the business. However, if we vary age of the promoter and/or manager of a certain age group, for example, from [18-29] age group to the [30-44] age group, then the duration of the business increases by 22.87 months or for the [18-29 year old] tranche for the [45 year old and over] tranche, then the duration of the business will increase by 76.38 months. The authors therefore note that, as the age of the promoter and/or manager increases, the company tends to become more sustainable. They used Arrow's (1962) idea that experience is acquired through learning over time to explain this result. Additionally, the authors' result could be explained by the fact that, as the individual's age increases, he or she has more opportunities to acquire more management experience, which will fully contribute to the objectives of cost minimization or profit maximization while satisfying customer desires. This could make the company more efficient and therefore leads to longevity.

The level of education of the promoter or manager also plays a significant role in explaining the company's sustainability. However, when the educational level of the promoter or manager increases lightly, for example from primary to secondary level, then the duration of the company will tend to decrease by 23.82 months. Similarly, when the promoter's or manager's level of education moves from primary to secondary level, the duration of the company will tend to decrease by 29.38 months. Thus, the higher the level of education, the more the duration of the enterprise tends to decrease. One of the reasons for this ambiguous result on the relationship between educational level and longevity of the firm is the existence of firm-specific characteristics that can determine its longevity.

The attitude of the promoter or manager towards risk also has a significant influence on the company's sustainability. If the company's promoter or manager slightly changes his attitude towards risk, for example from a risk-averse attitude to a risk-loving attitude, then the company's duration increases by 21.81 months. However, the less risk-averse the promoter or manager is, the more likely his company will tend to besustainable. This could be explained by the fact that individuals who are less risk-averse are much more likely to explore certain identified opportunities. These opportunities could then contribute to the company's longevity.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The last variable that significantly determines longevity is the size of the company. However, the authors' results show that if a company that employs five or fewer individuals increases its workforce to employ more than five individuals, then its duration will increase by 21.68 months. Thus, the duration of a large company is slightly longer than that of a small company. The role of size in explaining the longevity of the company can be supported by the ideas of Jelic et al (2001), which highlight the importance of economies of scale. Baumol (1967) also supports the advantages of market power. Thus, large companies, because of their better access to resources, increased market power and economies of scale, seem to be able to generate stronger competitiveness, which may contribute to their longevity.

Table 1. Effects of variables on the duration of firms

Variables	Duration of business

CONCLUSION

The objective of this study was to highlight the effects of ethnic, religious and linguistic diversity on the sustainability of businesses in Cameroon. To achieve this objective, the authors used data collected from 504 individuals in the towns of Douala and Yaoundé by the Laboratory for Research in Fundamental and Applied Economics (LAREFA) of University of Dschang. These authors used the censored Tobit model and, following this methodological approach, the following results were obtained. Linguistic diversity significantly determines the sustainability of companies in Cameroon. However, if we vary linguistic diversity from zero to low, then the duration of the company will increase by 30, 89 months. Although the coefficient assigned to the high level is insignificant, it is consistently negative, which means that a high level of linguistic diversity contributes to reducing the duration of a company. Although ethnic diversity is not significant, the authors find that the signs attributed to its coefficients are all positive. This means that when a company is ethnically diversified, it is more likely to be sustainabel. Concerning religious diversity, although not significant, whatever its level, it has a negative impact on the sustainability of Cameroonian companies.

Following these results, some recommendations can be made: i) Given that linguistic diversity and ethnic diversity have a positive impact on the sustainability of companies in Cameroon, the authors argued for a relaxation of xenophobia tendencies at the entry level. ii) Given that religious diversity does not favour the sustainability of Cameroonian companies, the authors argued for an improvement in political and economic institutions because it could transform the negative social strength of religious diversity into a productive strength.

Chapter 56
Measuring the Different Facets of Diversity Using Quantitative Methods

Gargi Banerjee
Xavier University, India

ABSTRACT

The aim of this chapter is to provide quantitative techniques and guidance for analyzing different problems related to the measurement of diversity and inclusion practices present in organizations. The example of only one dimension of diversity; viz Gender diversity is given in this chapter. However, these Quantitative tools can be used to explore other facets of diversity as well. In this way, this chapter shall seek to provide a basic understanding of how to analyze and study the data collected for research on Diversity and Inclusion practices in organizations.

INTRODUCTION

A wise scholar has said, "Research consists in seeing what everyone else has seen but thinking what no one else has thought."

Research is a continuous and rigorous process to study a particular topic as meticulously as possible. It calls for inquisitiveness, perseverance, commitment and hard work for a quite a number of years. The decision to start on this difficult journey should be made after careful consideration. A good institution and the support of its research community, matter a lot in this journey.

Mostly this chapter will adhere to University level students or doctoral scholars who have embarked on their research journey. However, researchers affiliated with different organizations too can benefit from the methodology described here.

The chapter shall deal with quantitative methods to measure different facets of diversity. Throughout the chapter, as an example, a study conducted by a researcher on gender diversity and the glass ceiling phenomenon in organizations shall be highlighted. This example shall help readers to understand better, the different statistical methods that can be used to conduct research on diversity.

Gender Diversity is a dimension of workplace diversity, which we shall be taking as an example in our chapter. Similarly, other dimensions of diversity too can be researched and analyzed using the tools given in the chapter. With the help of these methodologies and tools, researchers need to find their own unique approach to the study of management of diversity or analysis of diversity dimensions in an organization.

The layout of the chapter is as follows. In the first section, a general introduction to the chapter is given; in the second and third section, the topic of workforce diversity is explained with special emphasis on gender diversity in the workforce; in the fourth section, the researcher's induction into the research journey is highlighted; the third section talks about framing the research question and identification of the research population. The fourth section talks about how to approach research on diversity. The fifth section talks about framing the research Question and formulating the hypothesis. The sixth section discusses identification of the population while the seventh section talks about the different Sampling Methods that are used by researchers. The eighth section, follows up on this, by discussing data collection tools and techniques and the ninth section talks about ways to frame a basic questionnaire. The tenth section talks about certain basic quantitative methodology to analyze the collected data and the eleventh section takes this further by touching upon the different parametric and non-parametric tests used by researchers in their studies. Finally, the twelfth section sums it all up by providing a guideline on how to write the complete research report on the study conducted. Through these different sections, this chapter tries to give an overall view of some of the quantitative methods that may be used for analyzing research data on diversity.

WORKFORCE DIVERSITY

What Is Diversity?

In simple words, diversity is the individual quality which differentiates a person or group from others around them. Some of these differences like race, gender and age may be visible and distinguishable among different individuals while some others like educational levels, sexual orientation, opinions, beliefs, etc. may be invisible. Cox (1993) defines diversity as "a mix of people in one social system who have distinctly different, socially relevant group affiliations." Other researchers have defined diversity as organizational efforts which don't focus on any one particular group but rather on all employees for the overall benefit of the organization (Fraser-Blunt, 2003). Researchers like Hill, Lorbiecki and Jack and Mor Barak define diversity as efforts which move beyond tolerance to celebration of a heterogeneous workforce in an organization. According to them, diversity exists not because some groups are underrepresented but rather for celebrating plurality of the heterogeneous workforce so that everyone must be included while at the same time honoring the 'difference' that exists among individuals (Hill, 2009; Lorbiecki and Jack, 2000; Mor Barak, 2000)

Workforce diversity is considered to be extremely important in today's world. Researchers have pointed out that diversity helps an organization to increase acquisition of resources and marketing, creativity, problem solving and flexibility (Cox and Blake, 1991). Research on diversity has also found that having a workforce that is culturally diverse can help organizations make better quality decisions (Cox, 1994; McLeod et al., 1996), help to improve performance in an organization (Leonard et al., 2004) and lead to an increase in organizational creativity (Jackson, 1992). Due to all these benefits, organizations

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

today are aggressively supporting and promoting different dimensions of diversity in the workplace, including gender diversity.

Certain researchers advocate the origin of diversity as a topic of organizational studies to the US (e.g. Ashkanasy et al., 2002; Ivancevich and Gilbert, 2000; Lorbiecki and Jack, 2000; Lorbiecki, 2001). In the year 1964 in the US, the civil rights act was enacted. This act made it illegal for US companies to discriminate on the basis of race, color, religion, sex or nationality. Similarly the EEOC (Equal Employment Opportunity Commission) and other acts such as the Age Discrimination in Employment Act of 1967, the Rehabilitation Act of 1973, the American with Disabilities (ADA) Act of 1990 and the ADA Amendment Act of 2008 all guaranteed the protection of worker's rights at the workplace, and prohibited discrimination so as to create a culture of diversity at the workplace.

Researchers advocating diversity have suggested that organizations needed to break away from their narrow definition of equal representation in employment as propagated by affirmative action programs and instead use broader concepts that capture individual differences and celebrated all the ways in which people can differ (Mor Barak, 2000)

Diversity as a term got impetus in the management discussion in the 1987 Hudson Institute report, 'Workforce 2000' (Ivancevich and Gilbert, 2000; Lorbiecki and Jack, 2000). This report predicted that the US workforce was going to get extremely diverse as women, blacks and Hispanics would make up about 85 percent of the workforce by the year 2000. Although this report was not accepted by the entire research community, it had given birth to the idea that the US workforce would soon be a heterogeneous one. In fact, researchers began to predict with the advent of the US economy more and more individuals would soon find themselves working with people who were demographically different from them in age, race, ethnicity, etc (Tsui et al., 1992). By the late 1970s and early 1980s, private companies in the US even began to realize that the legal mandates were not enough to effectively manage diversity in organizations and they themselves began to offer training and evaluation programs for promoting and managing diversity in the US workforce (Herring, 2009). It was also during this period that researchers started to suggest the different benefits that diversity provided to organizations. This included the ability to retain and attract the best talent in the market, reduced costs due to lower turnover and fewer lawsuits, increased market understanding and marketing ability, increased innovation, increased problem-solving and idea generation, better decision making, and better overall performance. (Cox, 1993; Cox and Blake, 1991; Cox, 1991). Due to these varied benefits, organizations in the US started making diversity a part of their internal DNA so as to keep themselves abreast in the changing global economy.

A Note on Diversity Policies in India

India is a founding member of the ILO and has been a permanent member of the ILO governing body since 1922. The establishment of the International Labour Organization in 1919, its conventions and recommendations, influenced considerably the labor laws which were formulated in India. Consequently, laws were passed which not only regulated the hours of work but also contained provisions for health, safety, welfare and equal treatment of workers irrespective of gender, race, religion, etc.

The Constitution of India also supports and promotes equality in the workplace. The term diversity, when used in the Indian context mostly, encompasses regional, linguistic, religious, cultural, socio-economic status and educational diversity as compared to diversity as understood in the western context which includes other dimensions like race, gender identity, gender choice, etc. One of the approaches that the Indian government has taken for managing diversity in its workforce was to give 'reservation'

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

quotas to its historically discriminated groups, the Scheduled Castes (SCs), the Scheduled Tribes (STs) and the Other Backward Castes (OBCs).

India is a booming economy with a big middle-class population having a high spending potential. It is a very attractive destination for foreign investors from all over the world. Many multinational companies have opened operations in India. They have brought along different ethnocentric diversity assumptions of their host country culture into the Indian workplace (Nishi and Ozbilgin, 2007). MNCs have also brought more awareness to the diversity aspects like gender diversity, age diversity, LGBT diversity, etc., in their Indian operations. Indian employees have assimilated these western perspectives of diversity into their eastern values of equality and fraternity (Cooke and Saini, 2010). Thus, with the phenomenal growth of the Indian market and the globalization of the Indian workplace, 'diversity' has also become an important part of the Indian workforce.

GENDER DIVERSITY

WHO or the World Health Organization defines "gender" to be "the socially constructed characteristics of women and men – such as the norms, roles, and relationships that exist between them." Gender roles are "the set of arrangements by which a society transforms biological sexuality into products of human activity, and in which these transformed needs are satisfied" (Reiter, 1975). In other words, society sets some expectations and standards which influence the work done by each sex. Women do certain activities based on their gender while men do some other activities based on the fact that they are men. Having gender diversity in the workforce means that both men and women in the workforce will have equal work opportunities, compensation, growth options, and fairness in the organization

According to Kochan et al., 2003, women need to be provided equal job opportunities in the workplace as it helps in improving the performance of employees in an organization. Furthermore, a study by Wentling and Palma Rivas (2000) shows how organizations that have diversity in their workforce provide better services to their customers because they can understand their customers better. Certain other studies have talked about how hiring woman employees will help organizations tap niche markets globally (Kundu, 2003). Professor Klaus Schwab, Founder and Executive Chairman of the World Economic Forum (WEF, 2010) has said that women constitute approximately one-half of the potential talent base throughout the world and therefore, over time a nation's competitiveness in the global forum will depend on how much it educates and utilizes its female talent in the workforce.

As more and more women enter the workplace, organizations have started embracing diversity and inclusion practices to create a gender-neutral workspace. However, women are still largely under-represented and undervalued at work. Across managerial levels, they are inequitably employed and face discrimination. Women face a number of workplace barriers which cause many of them to take career breaks or leave their jobs. These barriers also become a deterrent to other women who seek to join the workforce. At the same time, different initiatives have been taken up by organizations to make the workplace more gender inclusive. In the ideal inclusive workplace, all employees would feel valued rather than just being represented. Such an organization would have fairness and equal opportunities for all its employees.

A Note on Gender Diversity and Equality Policies in the Indian Workplace

Article 39 of the Directive Principles of State Policy states that all citizens, men or women, have the right to an adequate means of livelihood while article 42 of the directive principles of state policy state that the state shall make provisions for just and humane conditions of work and maternity relief. Keeping these principles in mind, the government of India formulated the following acts for the working women in Indian organizations.

The Equal Remuneration Act which was passed in 1976, emphasized that men and women shall be paid equally for equal work done by them and that no discrimination shall happen in the workplace based on gender, physical ability, caste, religion, etc except where employment of women is prohibited or restricted by the law. The government also passed the Equal Opportunities, Protection of Rights and Full Participation Act in 1995 for equal treatment of all workers, including women, employed in an organization. Similarly, the Maternity Benefits Act passed in 1961 and amended again in 2008 and recently in 2016, provides all women employees with a maternity leave of 26 weeks and certain other benefits which have made a better place for the working mother in the Indian workforce. All these laws and acts are regularly monitored by the Central Ministry of Labour and Central Advisory Committee of the Government of India.

For safety of women at the workplace, the historical case of the supreme court of India (Hon'ble Supreme Court in Vishaka and Others Vs. State of Rajasthan and Others (JT 1997 (7) SC 384)) held that the sexual harassment of women in the workplace amounts to violation of the rights of Gender Equality and should be punishable by law. In the year 2013, the Sexual Harassment of Women at the Workplace (Prevention, Prohibition, and Redressal) Act, was passed which created a safer and more secure workplace for the working women in the Indian workforce. All these acts are constantly evolving and becoming more flexible and diverse with the changing times and the changing role of women in the modern Indian economy.

Now that we have provided a brief idea about the field of workplace diversity and of gender diversity, in particular, let us look at how a researcher shall begin her journey, be it in the field of gender diversity or any other diversity dimension of her choice. Starting with deciding on a research question to conducting a survey to collecting and analyzing the data and finally making a report using quantitative methodology, this chapter shall explain the different steps that are involved in the journey to conducting a good research.

DOING RESEARCH ON DIVERSITY

Once the course work had finished, scholars should totally concentrate on reading and broadening their spectrum. They should try to read various articles, books, blogs, dissertations, magazines, etc., related to their area of interest. These books and articles will help researchers in all the steps of their research journey. They say books are a student's best friend. In this Ph.D. journey, books shall certainly be one's best friend and reading is certainly the best exercise one can do.

The first step in this journey is to find a topic of interest. Choosing a topic ought to be one's own decision as otherwise, it will lead to a lack of motivation in the long run. It is recommended to read extensively and identify a topic of interest which is important to the researcher and which she can be passionate about. Identifying a potential supervisor and writing a research proposal usually comes next.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Usually, students choose supervisors among those who have worked previously in this field or who have an interest in the topic of choice. In certain cases, students correspond with their guides well in advance and enter the Ph.D. program at a certain University with the topic and guide in mind.

Reading is an exercise which needs to be continuously taking place during the research program. Some supervisors might insist on a research proposal before they agree to work with you. Keep in mind while submitting the research proposal, that it should not be overly ambitious or impractical. Often a considerable time is spent in writing a research proposal and then it might need to be altered completely or at least funneled down to reduce the scope. The research proposal should refer to a subject, the scope of which is neither too broad nor too narrow so that the work can be completed within the typical time-frame of a doctoral program, that is, around 3-4 years.

Once the supervisor has been fixed and a broad reading of the literature in your field of interest is done, the next crucial task is to find out the research question. It needs an enormous study on the area of interest along with a considerable amount of time to find a gap in the existing literature. Many books and articles from different sources have to be read and a thorough review needs to be done by devoting sufficient time before deciding the research question. Students may first start with a rough notion about a researchable topic, based on their educational background, personal and professional experience and personal interest in that area. Next, they may explore a variety of sources to understand the broad area and develop the research question. They may also need to write a complete review of the literature in their field and show how they have developed the research question from gaps left in the literature. Some universities insist on the literature review as part of the doctoral coursework, others do not. But ultimately, doing a review of the literature is beneficial as it helps researchers be aware of the past and present debates concerning their research area.

Students should attend all kinds of seminars and workshops, along with University coursework during this period. The most important characteristic that should be present in a scholar is patience and readiness towards new possibilities. Also, scholars need to be innovative and tentative towards every possible aspect of the journey. Research is a process of personal growth where scholars need to be open-minded enough to welcome unexpected results.

Reading, writing, listening, and thinking constitutes important skill areas for early-career researchers to develop. The importance of reading has already been highlighted in the chapter. Writing stimulates thinking, imagination, and learning and helps the researcher pen down her thoughts on paper. Moreover, academic writing needs intensive practice and it is only by trying again and again that students can become good academic writers. The skills of listening are known to be important in any form of communication. It assumes importance in research because communication is involved in many stages of the research process. Hence to be good researchers, we need to be good readers, we need to be good writers and we also need to be good listeners.

It is important for researchers to have and follow a timetable for deadlines in their research work. This timeline should be further revised and updated as they proceed further along the research journey. This timeline helps researchers keep track of the progress that they have made and also keeps them from falling back or procrastinating on their research journey.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

FRAMING THE RESEARCH QUESTION AND FORMULATING THE HYPOTHESIS

Having a broad research area is good as it serves as a starting point for researchers, but specific research questions need to be developed from here. In our example on gender diversity, our student decides to concentrate more on barriers women face in the workplace at upper levels of management after researching on the broad overall topic of gender diversity in organizations. She feels the glass ceiling is a phenomenon she would like to look at. This becomes her research problem. This research problem should have a clear sociological angle and the scope of the research question should not be too broad or too narrow. A few sub-questions need to be framed which the student shall explore in her research journey. In our example, the student may come up with the following research questions with regard to her area of interest on glass ceiling in organizations:

1. Does the glass ceiling exist in organizations? Is it specific to any particular sector?
2. Do women in middle management perceive a glass ceiling at the top?
3. Does this perception of the glass ceiling effect their organizational commitment?
4. Are women leaders in organizations able to cross over to the other side of the glass ceiling?
5. Do these women leaders continue to face such barriers in the top management?
6. Does this crossover effect their organizational commitment?

This may be a broad list of the research questions that the student has thought of. These questions may be more or less, depending on the depth of the subject and the scope of the research.

Another way to approach the research problem is to have a theoretical construct and let the thesis be guided by findings and developments, instead of beginning with a specific hypothesis and trying to prove and disprove it.

The research question should ultimately be such that it helps to make some kind of contribution to the field of study, however big or small.

In statistical data analysis, we first decide on a hypothesis. A hypothesis is a proposition or an assumption which the researcher wants to test through her research. A null hypothesis is a statement that the effect or the relationship that we are looking for is absent. The question that we need to find an answer to, through our research is whether according to the data we have collected and analyzed is the null hypothesis true. If it is true then we reject the alternate hypothesis and if it is false, then we accept the alternate hypothesis.

So, in our example, the null hypothesis would be that the glass ceiling does not exist in the Indian IT sector. We mostly reject the null hypothesis if the confidence level is 95 percent i.e we only reject the null hypothesis if we can be 95 percent sure that the association is a real association, In other words, we can say with 95 percent confidence that the glass ceiling does exist in Indian industries. We call this acceptance of the alternate hypothesis.

There are two types of errors which can be made with regard to acceptance or rejection of the null hypothesis:

Type 1 Error: The null hypothesis is rejected, when in fact it is true
Type 2 Error: The null hypothesis is accepted, when in fact it is untrue.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

IDENTIFICATION OF THE POPULATION

After conducting the literature review and deciding on the research question, we come to the identification of the population. In our example, the student has conducted a literature review on the topic of gender diversity and has formulated her research questions on the glass ceiling in organizations. Now she needs to decide upon the population that she wants to study and decide what sample design should be used to draw a sample from the total population. These two terminologies, the population and the sample may be defined as:

Universe or Population: The total group of people of interest to us whom we wish to study for our research. E.g. All women managers in India.

Sample: A segment of the total population which we have chosen to study for our research purpose. The sample should ideally be representative of the population.

In our example, the researcher might have an in interest in the Indian IT sector as she may have previously worked in that sector or have acquaintances in that sector or may have read literature on the topic which would have created in her an interest to understand whether the glass ceiling is present in Indian IT organizations. So, the total number of women in the Indian IT Industry becomes her population and it is from them that she will draw a sample since it is about them that she wants to draw inferences from her research.

SAMPLING METHODS

It is obviously not possible to administer the research on the entire population because the number of women in the Indian IT Sector is huge. So, a sample needs to be drawn. The sample is a segment or subset of the population.

Non- biased sample or probability sample is when each and every unit in the sample has a known chance of being selected. An example is a simple random sample, which can be likened to something as simple as pulling names out of a box; every article in the sample has an equal and fair chance of getting chosen.

In stratified random sampling, the articles in the population are divided into different clusters and then a simple random sample is drawn out of each stratum. This ensures better representation of each cluster within the population.

Multi-stage sampling is when the researcher goes through different stages of simple random sampling to arrive at the final sample.

Similarly, there are other methods of probability sampling which are preferred by researchers so as to get a non-biased sample for their study. But during research on cross-cultural or diversity management, many researchers prefer to use non-probability sampling.

Non- probability or biased samples are those when one or more parts of the population are favored over others. Examples of biased samples are Convenience samples, Voluntary response sample, Snowball sample etc.

A convenience sample is a sample which is administered by the researcher on people whom the researcher can more easily approach or on participants who are easily accessible; hence it is not a fair sample.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

A voluntary response sample is a sample where people who choose to include themselves in the sample, become part of the sample. People with a strong interest in the research topic will usually respond to such a sample. Hence it is a biased sample.

Snowball sampling is a sampling technique when one study participant participates in the research and then refers another participant for the survey. This participant, in turn, refers another participant for the sample and so on, thus leading to a snowball of respondents. However, since these respondents are all socially connected, they may have some variable in common, which may interfere with the research findings.

Judgmental sampling is when the researcher judges and decides which of the people are to be included in the sample. So, it is up to the judgment of the researcher on who should be part of the sample and hence there is no randomness in the sample.

When samples are not random, there may be a confounding variable which may become a part of the study unintentionally. Thus, these samples may not be a true representative of the population.

Let's say that the student researcher that we are considering in this chapter, conducts her survey and collects data on women managers in Indian IT organizations, by using snowball sampling which is a non-probability sampling method. The student may call up her old colleagues or acquaintances and mail them the questionnaire. Similarly, she may look up women leaders and managers in organizations and mail them the questionnaire. She may then ask these colleagues or acquaintances for contact information of other women managers and forward them the questionnaire. This way her sample size keeps increasing and the depth of her sample also widens.

DATA COLLECTION TECHNIQUE

Data collection can be done in two parts. We can collect primary data or secondary data. Primary data are original sources of data, collected firsthand by the researcher. Secondary sources are when the data has already been collected by some other researcher and we are simply using the data for our research purpose. This can be published and unpublished data. The benefit of secondary data is that they are readily available and do not need to be collected again but the disadvantage may be that they may not help the researcher in their particular research need.

Now that the student has decided on the population and the sampling technique that she will use to reach to her respondents, she needs to decide how she will collect the data. There are a number of ways by which she can do that. She can interview respondents face to face or over the telephone or the internet, send them a questionnaire, observe them in their natural or specified settings or have a focus group interview or discussion. The interview, questionnaire, and other data collection tools may further be structured, unstructured, semi-structured, in depth, etc. Further, the questions may be open-ended, close ended or both. Each of these methods has its own defects and merits and it is up to the researcher to decide what tool is ideal for their research. Two or more methods may be mixed up. There are no hard and fast rules for collecting data. Whatever method is best for your research, should be adopted by you to conduct your study. Neither are there any black and white lines between quantitative and qualitative data analysis. Students may adopt a combination of both in their research to get desirable results. For the purpose of this chapter, we are focusing on quantitative data analysis.

Quantitative Questions used in Questionnaires, Surveys, Interviews, etc., are of three kinds and generate three types of data – Nominal, Ordinal and Continuous. In nominal or category type questions,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

participants choose from two or more options, given to them. For e.g., Questions on Gender (1 for male and 2 for female) or Questions on Ethnic origin (1 for African American and 2 for Indian). In Ordinal type of questions, there is a relationship between the different variables or some kind of order or ranking between them. For e.g., Age (1 for 20-30 years of age, 2 for 30-40 years of age, 3 for 40-50 years of age, 4 for 50-60 years of age). Continuous questions are those which are identified by a number and this number defines the intensity or frequency of a particular occurrence. For e.g., how many women have had promotions in the past three years in your organization?

Designing the Questionnaire

From our continuing example of the scholar who wants to understand whether women managers in organizations, face the glass ceiling and what are the reasons for such barriers, let's have a look at the steps that she takes to design a questionnaire for this purpose.

The researcher needs to decide how the questionnaire shall be administered. For the purpose of our research, and because we want to reach out to a large number of people, we decide to use online questionnaires. The method of administration affects the type of questions that shall be asked and should be decided in light of needs and resources.

Questionnaire structure is very important. A good questionnaire should be interesting, easy to answer and respectful. It should have an informative title and description, so that the respondent knows why the data is being collected and for whom. The questions should be such that through them, we are able to find answers to the research objectives we have in mind.

The questionnaire should always be pre-tested or pilot tested. Focused groups, cognitive interviewing, split ballot experiments, field testing and many other methods exist for pre-testing of the questionnaire and determining its reliability and validity.

Once the questionnaire results are out, these need to be computed. There are two ways of calculating and analyzing the results. One way is using quantitative methodology and the other is using qualitative methodology. In this chapter, we shall be focusing on quantitative methodologies that can be used.

A Sample Questionnaire

This is a sample questionnaire handed out to employees working in different management positions in the IT sector of India:

Name of the Employee:
Gender (1 for Male and 2 for Female): _____
Age (1 for 20-30 years of age; 2 for 31-40 years of age; 3 for 41-50 years of age; 4 for 51-60 years of age; 5 for 61 years and above): _____
Your position in the organization (1 for junior manager; 2 for middle manager; 3 for senior manager; 4 for Senior Executive roles):
Your Salary (1 for below Rs 40,000; 2 for 40,001-70,000; 3 for 70,001 to 1,00,000; 4 for 1,00,001 to 1,30,000; 5 for 1,30,001 to 1,60,000; 6 for 1,60,001 and above)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Kindly answer questions with a response from 1 to 5

1 – Strongly agree
2 – Agree
3 – Neutral
4 – Disagree
5 – Strongly disagree

1. Women and men are equally respected in my workplace: _____
2. Women and men are rewarded/ promoted based on their performance, in my workplace: _____
3. An employee who can travel for work and work on weekends or night shifts, when required has a better chance for promotion in my organization: _____
4. Women must perform better than a man to be promoted in my organization _____
5. There are sufficient opportunities in my organization for women to advance into leadership roles _____
6. In my organization, women are usually employed in support roles _____
7. Men have their own networks at work which limit a woman's chances of growing in the organization _____
8. Sufficient guidance and mentorship is given to women who are trying to move up the corporate ladder in my organization _____
9. In my organization, there are a number of women leaders who are inspirations to the other women in the workplace _____
10. My organization inculcates a sense of diversity and inclusion in the workforce culture by regular diversity awareness seminars, diversity and inclusion workshops, training and/or other methods _____

ANALYSIS OF DATA

When talking about statistics, we refer to two types - Descriptive and Inferential.

Descriptive Statistics: Statistics which describe the sample or summarize it. An example would be if we say that 85% of the population agrees that glass ceilings exist in organizations. This would be descriptive statistics since this is a fact which is describing the population.

Inferential Statistics: Statistics which make inferences about the larger population using the results of the sample data given. Inferential statistics uses statistical analysis and interpretation to infer the data. Statistical tests and significance tests are then used to check the degree to which we can rely on the sample to make inferences about the population

For a quantitative study, we need to further summarize and describe the responses that have been generated through our research. For category type and ordinal type questions, like gender and age, we can count the number of responses and determine their frequencies. Further by using percentages, bar charts, and pie charts, we can report our findings. For eg, in our research, we shall count the frequency of the employees who are females (for the nominal variable of gender) or frequency of women who are above 30 years of age in the organizations (for the ordinal variable of age), and represent them via pie charts or bar graphs in the analysis.

Let's say from our questionnaire, we collect data which looks like that shown in Table 1.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1.

Gender	Age	Salary per Month
Male	35	40,000
Female	28	32,000
Female	32	38,000
Female	36	38,000

For representation of continuous data, however, we can use measures of central tendency. In day to day language, this is called average or more academically – the mean, the median, and the mode. For example, if we want to understand what is the average earnings of a woman in a particular organization, we should find out the mean of the group of women working in the organization. This figure would then give us an idea about the average earnings of a woman working in that organization.

The formula for the mean is

$$\text{Mean, } \overline{x} = \frac{\sum x}{n}$$

So in our example, the average salary of the woman would be 32000+38000+38000 = 108000 and we will divide this by the number of woman i.e. 3. Hence the mean salary for a woman in the organization would be 36000.

If we want to understand the distribution or dispersion of the salary in this group of women, we would have to find out the range of their salaries. This can be done by simply subtracting the largest salary amount from the smallest one, i.e., finding the difference between the smallest and the largest responses. Similarly, we can also use the standard deviation method, to get a more accurate idea of the dispersion. In our example, the range of the salary for women would be 38000-32000 = 6000

Variance is a measure of how spread out is the distribution. It gives an indication of how close an individual observation clusters about the mean value. The variance of a population is defined by the following formula:

$$\sigma^2 = \sum \left[x_i - x\right]^2 \Big/ N$$

where σ^2 is the population variance, x is the population mean, x_i is the i^{th} element from the population mean and N is the number of elements in the population. The variance of a sample is defined by a slightly different formula:

$$s^2 = \sum \left[x_i - x\right]^2 \Big/ n - 1$$

$$s = \sqrt{\left(\sum \left[x_i - x\right]^2 \Big/ n - 1\right)}$$

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

where s^2 is the sample variance, x is the sample mean, x_i is the i^{th} element from the sample and n is the number of elements in the sample. The formula for the variance of a population has the value '*n*' as the denominator. The expression *'n−1'* is known as the degrees of freedom and is one less than the number of parameters. Each observation is free to vary, except the last one which must be a defined value. The variance is measured in squared units.

All this looks too complicated, so let's understand with the help of our example. As per our example, the average salary of the women in the organization is 36000.

Now the next step is taking every value that we have, subtract it from the mean, square the result and add all such results formed. So as per our example, the equation would look like

(32000-36000)^2+(38000-36000)^2+(38000-36000)^2

4000^2+2000^2+2000^2

16000000+4000000+4000000 = 24000000

24000000 /2 (3-1) = 12000000

To make the interpretation of the data simple and to retain the basic unit of observation, the square root of the variance is used. The square root of the variance is the standard deviation (SD). The SD of a population is defined by the following formula:

$$\sigma^2 = \frac{\Sigma\left(X_i - X\right)^2}{N}$$

$$\sigma = \sqrt{\Sigma\left[x_i - x\right]^2 \Big/ N}$$

where σ is the population Standard Deviation, x is the population mean, x_i is the i^{th} element from the population and *N* is the number of elements in the population. The Standard Deviation of a sample is defined by a slightly different formula:

$$s = \sqrt{\Sigma\left[x_i - x\right]^2 \Big/ n - 1}$$

where *s* is the sample Standard Deviation, *x* is the sample mean, x_i is the i^{th} element from the sample and *n* is the number of elements in the sample.

Hence the standard deviation of our sample is simply the square root of the variance of the sample calculated i.e. the square root of 12000000 which is 3464.10162

All these statistical methods are called univariate i.e. dealing with a single variable. This is because they look at only one question or variable at a time. A univariate is an individual fact about one particular data group. It simply states a fact about the sample, there is little to contextualize that fact or draw

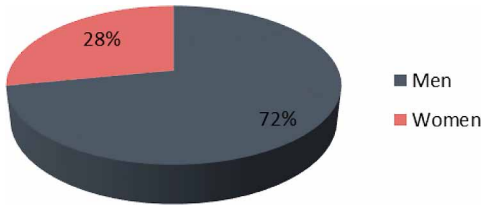
EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

inferences from it. For e.g. 320 women managers have been promoted last year in the organization. This is an example of univariate data.

A more useful way of looking at descriptive statistics is to look at two or more variables at a time. This is called bivariate analysis of data and it allows us to draw some hypothesis or conclusion and infer some kind of relationship between these variables. Bivariate analysis helps us to explore whether the variation in one variable brings about any significant change in the other variable. For e.g. if the number of men who got promoted last year was 640 and the number of women who got promoted was 320, then we can say that the number of men who got promoted last year was double of the number of women who got promoted.

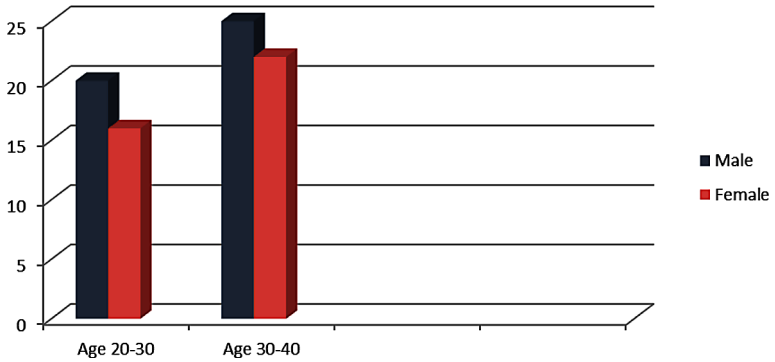
When Bivariate data is represented graphically, like a pie chart or a bar graph, they show a picture of how much the two variables differ. Such a representation can be very insightful and important. For e.g., a bar graph or pie chart showing how many more men are in top management positions when compared to women in top positions, shows the glass ceiling phenomenon being exhibited at higher rungs of the management.

Figure 1. Management representation



In bivariate analysis, we look at pairs of questions and find how they interact or are different from each other. For e.g., we may find out how the nominal and ordinal data of age and gender are related to each other in the data that we have collected. Through bivariate analysis, we can find out the number of individuals in the bracket of age 30-40 who are females. A stacked bar chart helps to graphically present this data.

Figure 2. Stacked bar chart of management representation



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Similarly, bivariate analysis can be used to find the relationship between a nominal and continuous data, for e.g. we may try to find how many individuals who have had any promotions in the last five years are women. In statistical terms, this is simply a comparison of means of the two kinds of data. We first divide our questionnaire into two parts - male and female, then we calculate the mean and standard deviation of people who got promoted in the last five years, for just the data of females. Then we compare the mean and standard deviation of the people who got promoted in the last five years for just the data of males and then we compare these results. This helps us to understand the relationship between the two variables.

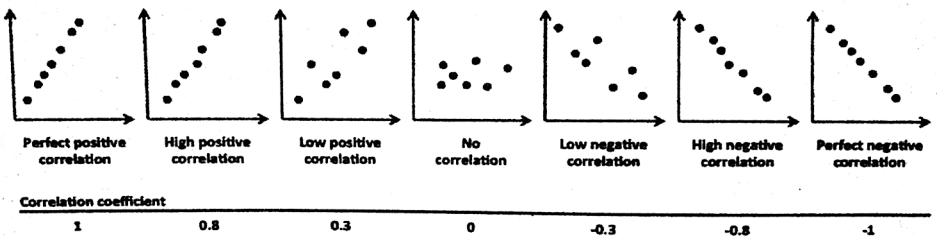
Coefficient Correlation

However just showing variables side by side, only shows that there is an association between 2 variables, it doesn't tell us the strength of that association. If we need to understand the intensity of that association, there are a number of statistical tools which we shall need to apply. A way to understand this strength is to go for correlation. Correlation is a measure of the strength and direction of association between two variables. When measuring correlation, we use a correlation coefficient, most commonly known as R or r. This correlation coefficient will always be on a scale from -1 to +1 with 0 in the middle showing no association. -1 is a perfect negative correlation and +1 is a perfect positive correlation. An easy way to demonstrate correlation graphically is to use a scatter plot. This places one variable on each axis and visually demonstrates the relationship between the two. Strong positive correlation means that as one variable increases, the other increases in the same way. Strong negative correlation means that as one variable increases, the other decreases. The nearer to zero lies the coefficient, the lesser the relationship between the two variables.

An example would be finding the correlation between organizations which have women in higher positions and organizations which have gender diverse policies at work. It may be seen from our analysis that there is a strong correlation between organizations which have gender diverse policies and organizations who have women leaders in top management i.e (a value close to +1). This shall help in making correct inferences about the association between these two variables.

The line of best fit is a straight line drawn through the center of a group of data points plotted on the scatter plot. The steepness of the line indicates the strength of the relationship between the variables and the direction of the line indicates, whether it is a positive or negative correlation. Correlation doesn't however always imply cause and effect. There may be a third variable which may be related to these two variables and which may be the reason for the effect. Similarly, through correlation, we are not able to know the direction of causality i.e which variable is causing the change in the other.

Figure 3. Correlation



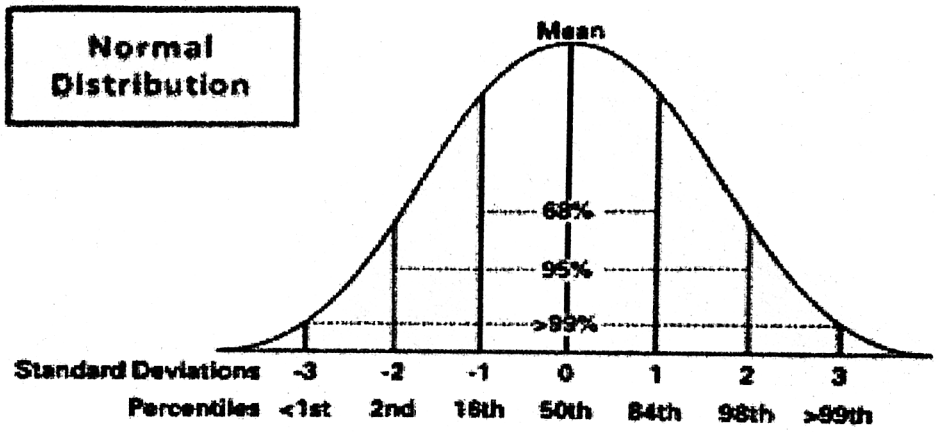
EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The level of significance is the confidence level which is required to make sure that the findings can be generalized to the population. Usually, 95 percent confidence level is preferred for scientific studies i.e. one should have 95 percent credibility in their research findings.

What Is Normal Distribution?

Most variables usually cluster around a single central value, with either positive or negative deviation from that value. The standard normal distribution curve is a symmetrical bell-shaped curve. In a simple normal distribution, 68 percent of the scores are within one standard deviation of the mean, 95 percent of the scores are within 2 standard deviations of the mean and 99 percent of the scores are within 3 standard deviations of the mean.

Figure 4. Normal distribution



What Is a Skewed Distribution?

A skewed distribution happens when the data collected is asymmetric about the mean or central value. If most of the data fall to the right of the central value, then it is a negatively skewed distribution having a longer left tail. On the other hand, if most of the values fall to the left of the central value, then it is a positively skewed distribution with a longer right tail.

Probability is a measure which states how likely it is that an event will occur. Probability is quantified as a number between 0 and 1 (0 indicates that the chances of the event occurring is impossible and 1 indicates that the chances of the event occurring is certain). The numerical value between 0 and 1 is called the *P* value or calculated probability.

This *P* value helps researchers to reject or accept the null hypothesis. If the P value is less than the significant level, the null hypothesis is rejected else it is accepted.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. Skewed distribution

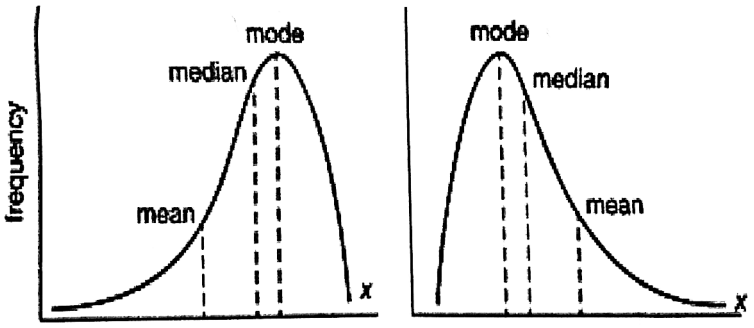


Table 2.

P value	Result	Null Hypothesis (H0)
< 0.01	Highly Significant	Reject H0
>= 0.01 but <0.05	Significant	Reject H0
>= 0.05	Not Significant	Do not reject H0

PARAMETRIC AND NON-PARAMETRIC TESTS

Parametric tests are those that assume that the data to be analyzed is on a numerical scale with a normal distribution. All variables collected have the same variance i.e., they there is homogeneity in them. The sample is randomly drawn from the population and observations within the sample are independent of each other. In those conditions, parametric tests are used.

Here we consider two most commonly used parametric tests, T-Test, and ANOVA.

T-Test

The t-test is used to test the mean value between two groups. There are three types of T-Test:

One Sample T-Test

One sample T-Test is used to check if the sample means differ significantly from the population mean.

The formula for one sample *t*-test is

$$t = \frac{X - U}{sE}$$

where X = sample mean, u = population mean and SE = standard error of mean

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Unpaired T-Test

The unpaired T-Test is used to test whether the population means of two different and independent populations differ significantly from each other.

The formula for unpaired *t*-test is:

$$t = \frac{x_1 - x_2}{sE_{x_i - x_2}}$$

where $X_1 - X_2$ is the difference between the means of the two groups and SE denotes the standard error of the difference.

Paired T-Test

Paired T-test is used to test whether the population means estimated by two dependent samples differ significantly from each other.

Usually, a situation where a paired T-Test would be used is when measurements made on the same subject both before and after a particular phenomenon are compared.

The formula for paired *t*-test is:

$$t = \frac{d}{sE_d}$$

where *d* is the mean difference and SE denotes the standard error of this difference.

ANOVA (Analysis of Variance)

The T-Test cannot be used for comparison of more than two groups. Anova helps to compare the means of two or more groups and find any significant differences.

In ANOVA two group variances are studied – between group variability and within group variability.

The within group variability, known as the error variance, is a variation that cannot be accounted for in the study design. It is based on random differences present in the sample.

The between-group variance or the effect variance is the result of the treatment of the researcher. These two estimates of variance are compared on random differences present in the sample.

These two estimates of variances are compared using the *F*-test.

A simplified formula for the *F* statistic is:

$$F = \frac{Ms_b}{Ms_w}$$

where MS_b is the mean squares between the groups and MS_w is the mean squares within groups.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Non-Parametric

When the distribution of variables in the distribution is skewed to one side or the assumptions of normality are not met and the sample means are not normally distributed, parametric tests can lead to errors. In such cases, non-parametric tests are used. Non-parametric tests are usually used to analyze ordinal or categorical data. As is done for parametric tests, the non-parametric tests also compare the test statistic with known values of the sampling distribution leading to acceptance or rejection of the null hypothesis.

The most commonly used non-parametric test is the Chi Square Test.

Chi Square Test

We use this test when we want to compare bivariate data. For e.g. we may want to understand whether men and women in similar job roles in an organization have the same salary or not. The Chi-square data compares the data of the job roles of men and women employees in an organization to the data of the salary that they receive. The null hypothesis would be that male and female employees in similar roles would have the same salary while the alternate hypothesis would be that they do not receive the same salary.

The Chi-square test compares the frequencies and tests whether the observed data differ significantly from that of the expected data if there were no differences between groups (i.e., the null hypothesis). It is calculated by the sum of the squared difference between observed (O) and the expected (E) data (or the deviation, d) divided by the expected data by the following formula:

$$x^2 = \sum \frac{\left(0 - E\right)^2}{0}$$

The Research Report

After we have interpreted and analyzed the data that we have collected through our report, we need to write the finished report. The last step in the research process is the presentation and preparation of the research report. If the report is not well written, all the effort in preparing, gathering and analyzing the data shall be of little value. Hence to write a good report, the following points need to be kept in mind:

1. Write in clear and lucid English which is grammatically correct. Have the distinguishing touch of your own style of writing. Avoid plagiarism at all costs.
2. Write in a language which your intended audience shall be able to understand. For example, if your audience does not understand technical jargons, try to avoid technical language as much as possible.
3. Be objective in stating the aim of your research and presenting your findings in a clear and concise manner
4. Present your arguments, data, and findings in a clever, logical and ordered way.
5. Although there is no particular format for presenting a research report and it differs according to the study and the researcher, we present here a general outline of the research report

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Title of the Report

The title should explain the purpose or intent of the study and should be brief yet should sound interesting and catchy to the readers of the report. For our research, the title of the paper can be "The Glass Ceiling: Does it really exist in the Indian IT Sector?"

Table of Contents

The table of contents sequentially lists the different sections of the report along with their page references, for the ease and comfort of the readers.

The Objective

This section talks about the objective of the report. It defines the aim of the report and gives an idea about the focus of the study. It helps the readers to get a clear idea about the scope of the research.

Have an Outline

Outline helps to visualize how your essay will look. Outline can be a flowchart of ideas or a concept map. It helps the researcher as well as the audience to understand how the report shall present the ideas that have been generated through research.

Introduction

Introduction may include the literature review of the field of study and explain how the gaps left in previous literature, has led to the present study take place. It also explains why the present study is important or required. The researcher should get to the point and the target audience should be identified. The introduction should be clear and interesting so as to capture the attention of the researcher.

Background

Background helps to present the setting of the research being conducted. The problem statement behind the research should be highlighted in the background. The reason why the problem is important should also be explained in this section. Finally, the motivation behind the research question should be emphasized here. All this should be covered as a preface to the main research problem.

The Body of the Paper

In the body, we give literature for backing up the research statement. Each paragraph in the body should have the main statement and the ensuing paragraph should explain that statement. In this way, the body is linked to the thesis statement. In the body statement, we also specify the methodology that we shall be used for obtaining data for the research. The purpose of the methodology section should be to used to explain the research design, the data collection, and analysis design. It would explain to the readers

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

whether the design is exploratory or conclusive. Basically, the body of the paper helps in understanding the nature of the research problem and explains the methods that shall be used to solve this problem.

Results and Findings

The bulk of the research report talks about the research findings which should be organized around the main research question and objective of the research. The data that has been found should not be written as a haphazard series of tables or figures, rather it should be categorized and presented in a manner in a logical manner which should be both interesting and insightful to the readers.

Limitations

It is obviously not possible that your research will not have any shortcomings. All research has certain limitations, which needs to be communicated to the readers clearly and concisely. Whatever gap is identified in the research should be written in this section. This does not mean that the research is being belittled but rather it enables the researcher to judge the validity of the results and be truthful to their audience.

CONCLUSION

This section summarizes the major findings of the research and provides the final thoughts of the researcher on the topic. It basically states the take away from the research conducted. The researcher may also make any recommendations to the research question that they have arrived at, after a complete analysis of the research findings.

Bibliography

The bibliography section helps to list the publications or sources that have been consulted for the purpose of the research. MLA, APA and Chicago are the most common styles to be used for referencing of an article. Moreover, the font size, the font type etc are other things to be kept in mind while writing the bibliography.

After finishing of writing of the report, we need to analyze the report for accuracy and precision. It is a good idea to read the report from an outsider's perspective. We need to ask ourselves whether the flow of the report is logical and whether it is lucid enough to be understood by someone, who is reading the paper for the first time.

All these steps provide a basic guideline on how to conduct research on diversity using quantitative methods. The quantitative tests and statistical techniques given above, attempt to assist researchers in conducting research on different facets of diversity. It is hoped that through these methods, students and researchers shall be encouraged to conduct a quantitative study on different diversity dimensions and contribute to the growing research in this field.

Chapter 57
Employee Welfare Measures:
The Impact on Employees' Efficacy and Organizations Productivity

ABSTRACT

The welfare measures for employees in an organization have always and will keep playing a pivotal role in enhancing the morale of the employees. These schemes facilitate thrust for both the employee and employer relations. An employee's welfare is inherent core component, as they act as life blood for achieving the objectives of an organization. The main intention behind implementing the welfare measures is to secure the employee force by providing proper human condition of work and minimizing its hazardous effect on the life of the employees and their family members. This chapter determines the various welfare measures implemented with its impact on the employees' work efficacy in different public and private sector manufacturing organizations. This chapter also articulates the importance of welfare, symptoms of frustration, standards set by the employees, implications of welfare measures and its effectiveness on employees' and the organizational productivity.

INTRODUCTION

Welfare is the ultimate goal for which every being in this world strives for and when humans seek welfare wishes from God why should an employer be spared when it comes to welfare of employees. The term welfare refers to an act of seeking physical, mental, moral and emotional well-being of an individual. According to Hopkins (1955), Welfare is fundamentally an attitude of mind on the part of management, influencing the method in which management activities are undertaken. Employers concerned with

introducing or extending welfare programs now or in the future must be concerned, not only with the past and current experience, but with developing trends (Nanda& Panda, 2013). Labour is any physical or intellectual activity applied in industrial production and one who performs it is a worker (Patro & Raghunath, 2016). According to the traditional economic theory, labour is referred as a factor of production which consists of manual and mental exertion and receives some return in form of wages, salaries or professional fees (Railkar, 1990).

The concept of 'Labour welfare' is flexible, elastic and of course is interchangeably used with changes in time, region, industry, country, social values and customs, the degree of industrialization, the general social economic development of people and political ideologies prevailing at particular moments (Srinivasa, 2013). In general, the term labour, worker, workman or employees are all used to refer to the wage earning human agents in various industries and organizations.

Patro (2017) assert that staff welfare includes providing social club and sports facilities as appropriate, supervising staff and works' canteens, running sick clubs and savings schemes; dealing with superannuation, pension funds and leave grants, making loans on hardship cases; arranging legal aid and giving advice on personal problems; making long service grants; providing assistance to staff transferred to another area and providing fringe benefits (Ramesh, 2012). However, the Committee on Labour Welfare (GOI, 1969) referred as such facilities and amenities as adequate canteens, rest and recreation facilities, sanitary and medical facilities arrangements for travel to and from and for accommodation of workers employed at a distance from their homes, and such other services, amenities and facilities including social security measures as contribute to conditions under which workers are employed.

Employee welfare has two aspects i.e. negative aspect and positive aspect. On the negative side, employee welfare is concerned with counteracting the baneful effects of the large scale industrial system of production especially capitalistic, and so far as India is concerned on the personal or family, and social life of the employee (Satyanarayana, 2015). On its positive side, welfare deals with the provision of opportunities for the worker and their family for a good life as understood in its most comprehensive sense (Moorthy, 1968). Thus, improving the quality of working life by providing the employee welfare facilities would go a long way in achieving the goals of the organization.

Employee Welfare in Public and Private Sector

Employee welfare implies the setting up of minimum desirable standards and the provision of facilities like health, food, clothing, housing, medical assistance, education, insurance, job security, recreation etc., (Nanda and Panda, 2013). Such facilities enable a worker and his family to lead a good work life, family life and social life (Sarma, 1996). A proper organization and administration of welfare facilities can play a vital role in promoting better working conditions and living standards for industrial workers, and also increase their productivity (Kohli and Sharma, 1997). Welfare measures should be provided by the organizations, whether public or private sector as it raises the morale of employees, reduce risk and insecurity, eliminate turnover and absenteeism, and increase the production and productivity ((Patro, 2017). In general, the public sector consists of governments and its controlled or funded enterprises. This includes federal, provincial, state, or municipal governments, depending on where the people live. Privacy legislation usually calls organizations in the public sector a public body or a public authority. The private sector is usually composed of organizations that are privately owned and not a part of the government. These usually include corporations, enterprises, companies or business, regardless of size, ownership and structure. It may cover all sectors of the food, agriculture, forestry and fisheries systems

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

from production to consumption, including associated services like financing, investment, insurance, marketing and trade (Priti, 2009).

In the present competitive environment the private sector organisations are playing major role in the overall development of the economy. So, it is essential to focus on the welfare measures which enhance the employees quality of work life and also helpful in increasing the organizations productivity (Patro, 2015). Generally in public sector, the funds are organized and provided either by central or state government. So, they are able to provide the welfare measures effectively to their employees without any hesitation. In private sector, large scale organisations can pool more funds and provide the welfare facilities as effectively as public sector organizations provide to their employees (Robinson, Sparrow, Clegg & Birdi, 2006). But, small scale organizations may have limited funds, so they may not be able to take care of the welfare facilities effectively, when compared with public sector.

Employee Welfare Status in India

The transference of rural population to the urban areas, as a result of industrialization, brought with it certain sociological problems. Having been up rooted from their rural mornings the new class of industrial workers required welfare services to be provided to them in their new surroundings so as to enable them to adapt themselves to changing situations (Reddy, 2004). The crux of the problem of employee welfare, whether under legislative compulsion or otherwise, is to determine the respective roles to be played by the State, the employers, trade unions and voluntary agencies (Agalgatti, 2008). Apart from social responsibility, the State as an employer has the basic social responsibility of acting as a model employer and to provide all types of welfare amenities to its workers.

However, employee welfare activities started gaining ground after the Second World War, when the British Government revised and introduced many labour laws that aimed at improving employment conditions, including welfare of the working class (Satyanarayana, 2015). It was only after independence that the problem of employee welfare was given due attention when the socialistic pattern of society was adopted for achieving various socio-economic goals of the country. In addition to the above scenario, Wage committee has pointed out that "unless the precise responsibilities of employers in regard to welfare work are defined by law, such employers are not likely to fall in line with their move enlightened and far sighted conferrers" (Rao, 2008).

The Government of India in view of enhancing welfare and wellbeing of workers has laid down provisions for employee welfare under different labour laws. One of the important laws in this regard, is the Factories Act, 1948 which was also amended in 1987, elaborates various provisions in relation to health, safety, and welfare of employees, provisions regarding working hours including weekly hours, daily hours, weekly holidays, regarding employment of young persons, canteen facilities, first aid, shelters, rest rooms and lunchrooms annual leaves with wages and provision regarding employment of women and young persons in every organization (Ghosh and Nandan, 2015; Patro, 2017). Finally, the Act makes provision for the employment of Welfare Officer in manufacturing organizations and service sector also. Thus, it is clear that the Act makes very elaborate and unambiguous provisions regarding the minimum welfare standards to be followed by the management (Ramesh, 2012). But laying down the standards alone is not enough. It must also to be ensured that these provisions are implemented successfully. The non-implementation leads to dissatisfaction of the employees working in the organizations.

BACKGROUND

The literature related to the provision of welfare measures that influence the employee's satisfaction and efficacy are discussed in this chapter. According to Reshma and Basavaraj (2013) the prime aim of a nation is to achieve maximum possible economic development so as to achieve higher standard of living for workers in the country. Aswathappa (2010) discussed the various types of benefits and services provided to employees in terms of payment for time not worked, insurance benefits, compensation benefits, pension plans etc. He also discussed the ways to administer the benefits and services in a better way. Ahuja (1988) emphasized the need for labour welfare and social security in India. He felt that provision of welfare and social security measures makes the employees satisfied with their jobs leading to their improved performance. The various problems faced by the enforcement machinery in the implementation of these welfare and social security measures. The social security measures in terms of medical care, sickness benefit, unemployment benefit, maternity benefit etc., besides explaining the social security system in India (Tripathi, 1998). Provision of intra-mural and extra-mural welfare facilities help in improving the quality of work life of employees' thereby good human relations will develop among different cadres of employees (Michael, 2001).

The need for labour welfare arises from the very nature of the industrial system. Employers need to provide welfare facilities to employees as the latter are exposed to various risks and at the same time they have to work in an entirely strange atmosphere (Kudchelkar, 1979). Monappa (1995) emphasized that labour welfare is an important facet of industrial relations, the extra dimension, giving satisfaction to the worker in a way that even a good wage cannot. With the growth of industrialization and mechanization, it has acquired added importance. The worker cannot cope with the pace of modern life with minimum sustenance amenities. He needs added stimulus to keep body and soul together. Employers have also realized the importance of their role in providing these extra amenities. The state only intervenes to "widen the area of applicability". A study by Kumar and Yadav (2002) revealed the overall satisfaction level of workers from welfare schemes was low in both the private and State sugar factories. Further, the workers in both sectors ranked the four employee welfare schemes according to their importance in the following order housing scheme, medical scheme, followed by education and recreation schemes. Robinson, Sparrow, Clegg, and Birdi (2006) identified the key behaviours, which were found to be associated with employee engagement. The behaviours included belief in the organization, desire to work to make things better, understanding of the business context and the 'bigger picture', being respectful of and helpful to colleagues, willingness to 'go the extra mile' and keeping up to date with developments in the field. Joseph, Joseph, and Varghese (2009) points out that the structure of a welfare state rests on its social security fabric. Government, employers and trade unions have done a lot to promote the betterment of worker's conditions.

Manzini and Gwandure (2011) argued that, welfare services can be used to secure the labour force by providing proper human conditions of work and living through minimizing the hazardous effect on the life of the workers and their family members. A research in different organizations by Patro (2012), acknowledged that the employees are assets of any organization. The needs of the employee must be satisfied in order to meet the goals of the organization. Any organization would be effective only when there is high degree of co-operation between the employees and their management. Parul and Ashok (2013) proved that different welfare provisions provided to the employees working in an organization under Factories Act, 1948 are having positive relation with the employee satisfaction. The reasons behind this are the factors that lead to satisfaction and if these facilities are not present, it sometimes leads

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to dissatisfaction. Nanda and Panda (2013) stated that adopting better kind of welfare activities create an effective working environment and thus better productivity. The different kinds of welfare schemes like medical allowance, death relief fund, insurance, housing, transport, recreation club facilities, etc., are provided by the company to the employees to maintain better industrial relations (Mohan & Panwar, 2013). Mwiti (2007) pointed that welfare services may not directly relate to an employee's job but the presence or absence of the services is notable through employee performance, attitude, high or low labour turnover.

According to Priti (2009) the role of welfare activities is to promote economic development by increasing efficiency and productivity with the underlying principle being making workers give their loyal services ungrudgingly in genuine spirit of co-operation and the general well-being of the employee. Burchardt (1997) examines the balance between public and private sector welfare activity in five areas: Education; Health; Housing; Personal Social Services; and Income Maintenance and Social Security. Satyanarayna and Reddi (2012) stated that the overall satisfaction levels of employees about welfare measures in the organization cover are satisfactory. However, a few are not satisfied with welfare measures provided by the organization. Logasakthi and Rajagopal (2013) revealed that the employees enjoy not only the satisfaction of their jobs but also various facilities given by the firms. The labour extends their maximum support for the improvement of the company. The management provides health, safety and welfare measures to employees that help for better performance in the work and working environment. Patro and Raghunath (2016) found that the needs of the employee must be satisfied in order to meet the goals of the organisation. Any organisation would be effective only when there is high degree of co-operation between the employees and their management. Meena and Dangayach (2012) discovered that satisfied employees made positive contributions to the organizational effectiveness and performance. Staff well-being and engagement has direct impact on organizational performance and ultimately organizational success. It is an obvious statement, but high employee satisfaction levels can reduce employee turnover (Sinha, 2013).

Sabarirajan, Meharajan, and Arun (2010) argue that welfare measures play an important role in employee satisfaction resulting in improved quality work life. Employee welfare facilities enable workers to live a richer and more satisfactory life. After employees have been hired, trained, and remunerated, they must be retained and maintained to serve the organization better (Laddha, 2012). Srinivasa (2013) emphasized that labour welfare covers an ample field and connotes a state of well-being, happiness, satisfaction, protection and enlargement of human resources and also helps to motivate the worker. Lalitha and Priyanka (2014) ideated that the welfare measures need not be in monetary terms only but in any kind/forms. Employee welfare includes monitoring of working conditions, creation of industrial harmony through infrastructure for health, industrial relations and insurance against disease, accident and unemployment for the workers and their families. Mishra and Manju (2007) in a study found that the police service provides essential service to the public in Kenya and thus their labour welfare activities need to address the same. Welfare services may be provided for matters concerning employees in terms of supplementing the income of the workers by providing services such as housing, medical assistance, canteens and recreation facilities. Patro (2015) in a comparative analysis of welfare measures in public and private sector found that an employee's welfare is the key dimension to smooth employer-employee relationship. These welfare facilities improve the employees' morale and loyalty towards the management thereby increasing their happiness, satisfaction and performance.

IMPORTANCE OF EMPLOYEE WELFARE

Healthy organizational relations are necessary to have well defined policies and procedures as because reactive policies cannot continue for long period. Growing competition among companies, complex economic environment, rising labour costs, etc., compel organizations to adopt proactive strategies towards organizational relations, while having proactive strategies; the organizations have to ensure achievement of corporate objectives through cooperation and commitment of employees (Sundaray, Sahoo and Tripathy, 2010). Organizational relations assume that the most delicate and complex issue in the present day company set up is the principle of democracy and its influence in the management of labour. The conflicts between employers and employees are inherent in any economic activity. Conflict is permissible, if it aims at minimum interruption in economy. In India, welfare has much significance and the equitable settlement is its ultimate objective. Considering the importance of manufacturing organizations, sincere attempt has been made to find out the link between employee welfare measures and organizational productivity (Patro, 2017).

Employee welfare activities have become a key factor for the overall development of the organizations. The organizations provide welfare measures to their employees to increase their efficiency and reduce absenteeism. Employee welfare schemes improve the employee-employer relations also. It helps to improve the recruitment process as the job becomes more attractive and more effective. Voluntary efforts for the welfare of the employees by the management may reduce the thought of government and others parties intervention in future. The employee welfare schemes can be classified into two categories viz., statutory and non-statutory welfare measures.

The statutory schemes are those schemes that are compulsory to provide by an organization as compliance to the laws governing employee health and safety. These include provisions provided in industrial acts like Factories Act 1948, Dock Workers Act (safety, health and welfare) 1986, and Mines Act 1962. The statutory welfare measures include the provisions such as drinking water, facilities for sitting, first aid appliances, latrines and urinals, canteen facilities, spittoons, lighting, washing places, changing rooms, rest rooms, etc. The non-statutory welfare measures differ from organization to organization and from industry to industry. The non-statutory welfare schemes may includes personal health care, flexi-time, employee assistance programs, grievances policy, maternity & adoption leaves, medi-claim insurance scheme, employee referral schemes, etc. The chapter analyzes the implementation of statutory and non-statutory welfare schemes, and its impact on organizational productivity and employee efficacy. The chapter discusses the peculiarities of the labour management situations and suggests ways and means for the improvement of the organizations.

RESEARCH HYPOTHESES

The statistical analysis was carried out on the data collected in order to test the hypotheses framed. A descriptive statistical method was used to analyze the data. To measure the satisfaction level of the employees on the implementation of the welfare measures in different public and private sector organizations, a 5-point scaling technique is proposed which ranges from Excellent (5), Good (4), Satisfied (3), Poor (2) and Not Inforce (1). In the study six important welfare dimensions such as Housing facilities, Education benefits, Medical benefits, Recreational facilities, Retirement benefits, and other facilities are identified for collecting the opinion of the employees and an in-depth analysis was done. A statistical

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

technique, Pearson Chi-Square test is used to test the hypothesis and certain parameters to demonstrate the influence of welfare facilities on employee efficacy, for which the following hypothesis is constructed:

H_{01}: Housing Facilities have a significant impact on employee's efficacy and organizational productivity.
H_{02}: Educational Schemes have a significant impact on employee's efficacy and organizational productivity.
H_{03}: Medical or Health Benefits have a significant impact on employee's efficacy and organizational productivity.
H_{04}: Retirement Benefits have a significant impact on employee's efficacy and organizational productivity.
H_{05}: Working Environment have a significant impact on employee's efficacy and organizational productivity.
H_{06}: Other welfare measures have a significant impact on employee's efficacy and organizational productivity.

METHODOLOGY

The present research is an enquiry into the various employee welfare measures implemented by different public and private sector organisations in Visakhapatnam city, and the satisfaction experienced by the employees working in these organisations. The chapter aims to draw a comparison on level of satisfaction experienced by employees and its influence on their efficacy and organizational productivity. The data presented in the study are collected from both primary and secondary sources. The primary data was collected from the respondents i.e. employees by distributing questionnaires, through personal interviews, and direct personal observation. The information was collected from the employees who are working in different public and private sector manufacturing organisations individually and taken their views and suggestions. The purpose of the study was explained to them and they were asked to fill up the scales. They were assured of confidentiality of their responses.

The questionnaire was distributed to 400 employees' personally to know their views regarding the satisfaction level on the implementation of various welfare measures from different organizations. These questionnaires were selected on random basis. The number of valid filled in questionnaires selected for the study from various organizations is 200; out of which 100 respondents are from public sector and 100 respondents from private sector organisations. The collected data is used to compare the opinion regarding the impact of the employees on the provision of welfare measures. The secondary data was collected from various published sources such as, books, news paper publications, journals, company magazines, official websites of various industrial and service sector organisations, and some other sites are also searched to collect the relevant data. The information collected from various sources are carefully computed, classified, tabulated, analyzed and interpreted. The statistical technique used for analyzing the data collected from the tabulated data are analyzed with tables, so as to draw inferences based on findings, suggestions and conclusions on employee welfare schemes. The main objective is to know the various employee welfare measures and to spotlight on the areas that the management of both the public and private sector organizations needs to pay attention.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

STATISTICAL ANALYSIS AND DISCUSSIONS

The employees of various public and private sector organizations are contacted for their opinion regarding the satisfaction level on the various welfare measures implemented in their organizations along with its influence on their efficiency. The questionnaire consists of six questions (each consists of different options related to the question) along with comments and suggestions. The opinions collected from the employees, based on the questionnaire are used for comparative analysis and test the hypothesis. A Pearson Chi-Square statistic test was conducted to test the hypothesis regard the various welfare schemes implemented in both the public and private sector organizations. The results and findings regarding the impact of each welfare measure on the employees' efficacy are discussed.

Housing Facilities or Allowances

Housing or Quarters facility has direct bearing on the health and efficiency of the employees. The provision of quarter facilities at low cost with basic amenities such as, adequate space, ventilation, electricity facilities, water facility, transport facility, maintenance facilities (roads, lighting, drainage systems, lavatories), and other sanitary arrangements. The organizations may also provide housing allowance to the employees. Under housing facilities four options were provided in the questionnaire namely; (a) Provision of Staff Quarters, (b) Housing Allowances, (c) Transport Allowance, and (d) Transport Facility. The opinions of the employees regarding these housing facilities are shown in Table 1 and 2.

Table 1. Opinion of employees' on welfare measures (In percentages)

Sl. No.	Dimension	Sector	Excellent	Good	Satisfied	Poor	Not Inforce	Total
1	Housing Facilities/ Allowances	Public	17	40	32	9	2	100
		Private	3	6	15	47	29	100
		Total	20	46	47	56	31	200
2	Educational Schemes/ Benefits	Public	8	17	25	30	20	100
		Private	7	19	26	32	16	100
		Total	15	36	51	62	36	200
3	Medical and Health Benefits/ Schemes	Public	19	43	33	5	0	100
		Private	1	10	19	45	25	100
		Total	20	53	52	50	25	200
4	Retirement Benefits	Public	20	52	25	3	0	100
		Private	1	4	8	41	46	100
		Total	21	56	33	44	46	200
5	Work Environment	Public	5	25	43	21	6	100
		Private	8	30	55	5	2	100
		Total	13	55	98	26	8	200
6	Other Welfare Facilities/ Services	Public	15	37	41	5	2	100
		Private	8	21	39	21	11	100
		Total	23	58	80	26	13	200

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Results of chi square analysis (n=200)

Sl. No.	Dimension	χ^2	Liklihood Ratio	Linear-by-Linear Association	Sig.
1	Housing Facilities/ Allowances	90.381	101.655	78.428	0.000
2	Educational Schemes/ Benefits	0.706	0.707	0.128	0.951
3	Medical and Health Benefits/Schemes	97.516	117.203	88.963	0.000
4	Retirement Benefits	145.909	181.94	128.673	0.000
5	Work Environment	14.462	15.307	7.744	0.006
6	Other Welfare Facilities/Services	22.671	24.133	19.002	0.000

It is observed that in public sector almost 89 per cent and in private sector only 24 per cent responded positively. The housing facilities provided by the private sector organizations are very poor when compared with the public sector organizations. The Pearson Chi-Square statistic test shows that, $\chi^2 = 90.381$, and $p = 0.000 < 0.001$; i.e., a very small probability of the observed data under the hypothesis is of no association. Hence, the hypothesis (H_{01}) is supported. It is observed that the housing facilities provided by the organizations have significant impact on the employees' efficacy. It is clear that public sector employees are satisfied with housing facilities to a large extent, whereas under private sector almost more than half of the employees are not provided with adequate housing facilities. So, the private sector organizations need to take major steps to provide housing facilities to their employees.

Educational Schemes or Benefits

Education plays a very important role in motivating and enabling the progress of employees for their mental and physical development. The educational needs in any sector are two-fold i.e., adult/ employees education schemes and schools/colleges for their children. To know the influence level on the employees regarding the implementation of Educational schemes, five options are included, such as: (a) Sponsoring for employees' higher education, (b) Reimbursement of children tuition fees, (c) Permission for part time education, (d) Schools or Colleges in the organization premises, and (e) Training and Development programs. The opinion of the employees on these educational schemes provided in both the public and private sector organization are shown in Tables 1 and 2.

It is found that 50 per cent from public sector and 42 per cent from private sector have responded positively regarding educational schemes in their organizations. Almost half of the employees are satisfied and influenced by the educational schemes provided by their organizations. Based on the Pearson Chi- Square statistic test, it is observed that $\chi^2 = 0.706$, and $p = 0.951 > 0.001$; i.e., the probability of the observed data is more than the hypothesis. Therefore, the hypothesis (H_{02}) is not supported. It is observed that there is no significant impact of the educational schemes provided by both the public and private sector organizations on the employees. So, it is clear that educational schemes or allowances provided by both public and private sector organizations need to be improved and provide better facilities to motivate the employees.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Medical and Health Benefits/Schemes

The employees' health should be given utmost importance, as it also results in development of an organization. Health care for employees helps to reduce the incidence of sickness, absenteeism and increases their efficiency and productivity. The private or public organizations have to provide medical facilities for the employees and their family members also. Medical benefits include five options i.e., (a) Medical reimbursement, (b) maternity benefits, (c) Emergency services, (d) Frequent medical checkups, (e) First-aid kits and treatment at company hospital. The influence of medical or health benefits on the employees of both the public and private sector organizations is shown in Table 1 and 2.

The responses of the employees take on medical facilities shows that, almost 95 per cent of public sector responded positively in contrast to only 30 per cent in private sector. It is also observed, that the medical benefits provided by the private sector are very remote when compared with the public sector organizations. The Pearson Chi-Square statistic test, $\chi^2 = 97.516$, and $p = 0.000 < 0.001$; i.e., a very small probability of the observed data under the hypothesis is of no association. Therefore, the hypothesis (H_{03}) is supported. It is found that there is much impact of the medical benefits provided by both the public and private sector organization on their employees. Therefore, the private sector has to initiate necessary steps to provide proper medical and health benefits to their employees to increase their efficiency.

Retirement Benefits

Retirement benefit is one the important welfare scheme, which is to be provided to the employees in any organizations. These benefits increase the satisfaction level of the employees towards the organizations and motivate them to achieve the organizational objectives. In the study Retirement benefits also includes five options namely: (a) Pension, (b) Retirement or Death compensation, (c) Leave encashment, (d) Medical facility after retirement, and (e) Insurance benefits. The influence of retirement benefits and schemes on the employees of both public and private sector organizations are shown in Table 1 and 2.

The response of employees concerning the retirement benefits reveals that 97 per cent in public sector and only 13 per cent in private sector responded positively. It is found that the retirement benefits provided by the private sector rare when compared to public sector organizations. The Pearson Chi-Square statistic test shows that $\chi^2 = 145.909$, and $p = 0.000 < 0.001$; i.e., a small probability of the observed data under the hypothesis has no influence. Therefore, the hypothesis (H_{04}) is supported. It can be concluded that there is progressive influence of the retirement benefits provided by both the public and private sector organization on their employee's efficiency. Therefore, the private sector organizations need to put much effort to provide retirement benefits to their employees to increase their satisfaction level.

Working Environment

A positive work environment makes employees feel good about coming to work, and this provides the motivation to sustain them in the organization. The management should provide information and resources to assist their employees to make healthy lifestyle choices and to achieve and maintain good health. It promotes work-life balance by creating a healthy physical, social and psychological work environment as a core business goal. A healthy work environment makes the employees' more satisfied and improves their work efficiency. The present study includes the six options such as, (a) Transparent & Open communication, (b) Cooperation by management, (c) Autonomy at work, (d) Recognition and Appreciation

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

for hard work, (e) Grievance settling, and (f) workload and Job stress. The impact of working environment on the employees of both public and private sector organizations are shown in Table 1 and 2.

The influence of work environment on the employees shows that in public sector 73 per cent and in private sector almost 93 per cent responded positively. Almost both public and private sector employees are satisfied with the working environment in their organizations. The Pearson Chi-Square statistic test states that, $\chi^2 = 14.462$, and $p = 0.006 < 0.006$; which shows that probability of the observed data under the hypothesis has an association. Therefore, the hypothesis (H_{05}) is supported. It can be said that there is a significant impact of the work environment provided by both the public and private sector organization on their employees. The organizations are providing good working environment and the public sector organizations need to improve these conditions as it helps in maintaining healthy relations with the management.

Other Welfare Facilities or Services

Finally, the questionnaire regarding the implementation of other facilities include eight options like; (a) Canteen or store facilities, (b) Drinking water, (c) Sanitary facilities, (d) Recreation facilities, (e) Post office or bank facilities, (f) Co-operative societies, (g) Telephone communication facilities, and (h) Restroom and Locker facilities. These facilities should be given much importance in all types of organizations, as it increases the employees' quality of work life and thereby increasing their efficiency level. In the study, these other facilities are also covered to know the opinion regarding its influence on the employees in various public and private sector organizations as shown in Table 1 and 2.

The response of employees on the execution of other facilities reveals that 93 per cent in public sector and 68 per cent in private sector responded positively. The comparison shows that the private sector employees less satisfied than the public sector employees, regarding these facilities. The Pearson Chi-Square statistic test states that, $\chi^2 = 22.671$, and $p = 0.000 < 0.001$; i.e., a small probability of the observed data under the hypothesis has significant impact. Therefore, the hypothesis (H_{06}) is supported, since $p < 0.05$ (i.e. $p < 0.001$). It can be concluded that there is much influence of the other facilities provided by public and private sector organization on their employees' efficacy. Therefore, the private sector organizations need to put a little effort to improve these other facilities for their employees in their organizations.

Table 3. Summary of the hypotheses results

Sl. No.	Hypotheses	Result
1	**H_{01}:** Housing Facilities have a significant impact on employee's efficacy and organizational productivity.	Supported
2	**H_{02}:** Educational Schemes have a significant impact on employee's efficacy and organizational productivity.	Not Supported
3	**H_{03}:** Medical or Health Benefits have a significant impact on employee's efficacy and organizational productivity.	Supported
4	**H_{04}:** Retirement Benefits have a significant impact on employee's efficacy and organizational productivity.	Supported
5	**H_{05}:** Working Environment have a significant impact on employee's efficacy and organizational productivity.	Supported
6	**H_{06}:** Other welfare measures have a significant impact on employee's efficacy and organizational productivity.	Supported

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The welfare measures such as housing schemes, retirement benefits, medical benefits, work environment and other welfare schemes have shown significant impact on the employees work efficiency, whereas educational schemes have shown no association with the employees based on the Pearson's correlation analysis in different public and private sector organizations. Therefore, the welfare schemes are considered as critical factor in influencing the efficacy of the employees'. The employees' working in public sector organizations are highly satisfied with the welfare measures provided to them when compared to those working in private sector organizations. The public sector offers superior employee welfare facilities to their employees than those provided in private sector. Proper implementation of both intramural and extramural welfare measures increases the employees' work efficiency and therefore helpful in overall productivity of the organization.

SYMPTOMS OF FRUSTRATION DUE TO INADEQUATE MOTIVATION

The most common symptoms of frustration as a result of inadequate motivation in the form of employee welfare measures in an organization are (Teryima, Timothy, Faajir, John, & Vivien, 2016):

- **Anger Displacement:** Displacement can be defined as moving something from its place to another place. When employee welfare measures are denied for a long period of time, anger displacement seems to be common phenomena in contemporary employees, which means they end up taking out their anger on another person or may be his or her subordinate at workplace the primary source of frustration being lack of motivation derived when welfare measures are put in place.
- **Aggression:** Aggression, in general, is any behaviour an individual carries out with the intent to harm another person or group of people. Aggression can occur in a variety of situations mainly resulting from dissatisfaction. One important field to understand aggression is in the workplace. Workplace aggression is considered as specific type acts like, physical assault, threatening or coercive behaviour that causes physical or emotional harm in a work setting
- **Regression:** Regression results in a sudden changeover of employee behaviour from constructive to childish behaviour. Over a point of time employees start behaving like children. Other characteristics of regressive behaviour are; having petty fights and arguments, following the leaders for everything, lack of responsibility, unreasoned fear, ganging up.
- **Work Fixation:** Work fixation is another phenomena where employees stop being productive and try and work with a fixed frame of mind (i.e. employees not working to their full potential). An act to continue and give limited unproductive results.
- **Rationalization:** Offering socially acceptable excuse or reason for one's failure to achieve in place of the real reason has yet another reason put forth for their lack of satisfaction.
- **Negativism:** Employee negativism can be defined as an employee tendency to resist external commands, suggestions, or expectation by doing nothing or something contrary or unrelated to the stimulus. It also goes by interpreting every action in the wrong way to undo it.
- **Participation Withdrawal:** if employee fixation was one of the consequences of dissatisfaction, employee withdrawal is yet another way to show dissatisfaction by removing oneself from participation *and* to become socially or emotionally detached in workplace.
- **Work Alienation:** This is also a common problem as a result of dissatisfaction in organization. It is a feeling of self-helplessness. It happens when employees feel that organisation is doing nothing

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

great towards employee welfare. According to Faunce (1968) powerlessness, normlessness and meaninglessness are predisposing conditions to alienation. Alienation steps in when an employee perceives that he cannot achieve his goal or objective through the organization.

STANDARDS SET BY EMPLOYEES IN RETORT TO WELFARE BENEFITS

There are certain standards set by the employees in retort to the various welfare measures provided by the organizations. Yalokwu (2006) identified performance categories and standards of performances that a motivated employee need to adopt in courtesy to employees' welfare measures in an organization are:

- **Work Quality Standard:** Standard can be defined as a benchmark in the area of your specialisation. When employee satisfaction is in place they provide accurate, thorough, professional work regularly automatically or may be with reference to the standards set by the organisation.
- **Job Knowledge Standard:** Though job knowledge is the basic idea every employee will have with a lot of employees having a high level of satisfaction employees always stay well informed and educated in performing to the level expected for the job.
- **Organization and Planning Standard:** A organisation can become successful only with a proper vision in place and this becomes much more easy with a happy at heart employee batch who tend to organize, plan, and forecasts work skilfully to meet their given job description.
- **Analysis and Judgment Standard:** Analysing problems skilfully, using logic and good judgment to reach solutions will always be inherent quality of a efficient employee and of course, all organisations will agree with the fact that efficient employees is by product of fair treatment of employees.
- **Interpersonal Akills Standard:** Employee when frustrated may end up having a very bad time but with employees of high morale aftermath of satisfaction work well with others, get things done with people and keep information open at all levels required to take the organisation to its set vision.
- **Initiative Standard and Team Work Standard:** Well a good employee can be distinguished easily two important things a) Imitativeness b) Teamwork both which Helps to determine the needs of the work place; help all to meet the goals. Coordinates own work with others, seek opinions, values working relationships.
- **Quality Service Work Standard:** The end point for every organisation is not just reach their set goals but also to provide a exquisite service standard and regularly seek to provide quality service to achieve customer satisfaction.
- **Attendance and Punctuality Standard:** Well a happy employee can of course be picked up based on his attendance and punctuality standard and this majorly depends on the employer, on how well the employees are give fair treatment in the organisation. Being regularly present and punctual gives organisation a sense of trustworthiness.

Organizational commitment on the other hand is defined as a state in which an employee identified with a particular organization and its goals and wishes to maintain membership in the organization (Langton, Robbins and Judge, 2010). The measures of commitment include:

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Affective Cmmitment:** In this case there is an individual relationship to the organization: his or her emotional attachment to, identification with and involvement in the organization.
- **Normative Commitment:** This is the obligation an individual feels to staying with the organization.
- **Continuances Commitment:** This is an individual's calculation that it is in his or her best interest to stay with the organization based on the perceived costs of leaving the organization.

A positive relationship appears to exist between organizational commitment and job productivity, but it is a modest one. Several researches have reveals that, the relationship between commitment and performance is strongest for new employees, and it is considerably weaker for more experienced employees.

IMPLICATIONS OF WELFARE MEASURES

*"*Beneath every ocean underlies valuable things beneficial to a human being.*"* In the same way the philosophy of employee welfare services is based on the theory, that success of an organization depends upon harmonious relationship and co-operation between the employee and employer, which in-turn has scope for many future prospects beneficial to both the parties (Patro, 2016).

1. **Allegiance:** Apparently an organisation can seldom ask for allegiance from employees unless they show concern to the people working in the organisation, when welfare facilities are provided to employees apart from other essentials, it seeds a sense of togetherness in the minds of employees. An organisation which is strong with a sense of loyalty and togetherness with its employees, that itself is a big step forward towards ultimate goal.
2. **Job Commitment:** Commitment is a phenomena which is very difficult to have in everyday life, and in an organisation it is one of the key factors of success and when organisations are committed to employees by providing them what they need it reciprocates with a opposite job commitment from employee side. Job commitment can be simply defined as psychological frame of mind where employees are being connected to their Goals, Organisation, and Job.
3. **Company Goodwill:** Ensuring good care of employees have many benefits or can be called as by products to an organisation, some tangible and others intangible. Good will is one intangible benefit an organisation gets for being faithful to employee and fulfilling their needs over a long period of time.
4. **Employee-Employer Relation:** When an employee starts his journey with a organisation or employer, it's not an obligation but a start of relationship as an employer and employee often move together and take the organisation to its goals. Effective employee welfare measures adopted by organisation, makes this relationship stronger and efficient.
5. **Employee Self-Actualization:** Self-actualization is synonymous to words and concepts such as self-discover, self-realisation and self-exploration. In this context it becomes much more important for given situation as once employee feel that the organisation is being like a family to him/her time and again, employees not just become committed and faithful but also explore themselves within the organisation which is good for organisational health.
6. **Reduced Employee Turnover:** Well of many evils haunting modern organisation the most threatening one is employee turnover i.e. number of employees leaving organisation for number of reasons.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Given the fact the causes are many if organisation treats you like a family and cares for you, the same will be reciprocated to us from employees in longer run.

7. **Development of Nation:** The ultimate outcome of anything should be to be happy and achieve progress in one's life. Having a happy and satisfied workforce is not just step forward towards organisational goal but also towards one of important resorts of any organisation that is development of nation and a happy nation.

EFFECTIVENESS OF WELFARE MEASURES

Employees are the assets of every organisation. The needs of the employee must be satisfied in order to meet the goals of the organization. Any organization would be effective only when there is high degree of co-operation between the employees and their management. The welfare facilities go a long way stimulating interest in the employees to produce their full capacity and pay a good return to management in the long run. The Committee of experts on welfare facilities for employees constituted by the International Labour Organization (ILO, 1963) has initiated to provide the intramural and extramural welfare services to the employees by the employer in every organization whether public or private sector. The various facets of this study are not from no man's land and thus everyone acknowledges this area. The purpose is to provide them better quality of work life and to keep them happy (Patro, 2015; Bhardwaj 2012).

- Welfare facilities provide scope for better physical and mental health to the employee.
- Employee welfare brings organizational peace and cordial relations between employee and management.
- The social evil in the employee force such as gambling, drinking, etc., are reduced.
- Employer gets stable employee force due to provision of welfare facilities.
- Employer secures the benefits of low employee absenteeism and minimum employee turnover.
- Facilities like housing, medical benefits and education facilities help to increase productivity of employees.
- Welfare facilities provide great satisfaction to the employees and also help in maintaining industrial peace.
- Welfare facilities provide an attraction to the employees to stay longer in the organization enhancing loyalty.
- Welfare facilities make the employees happy and contented both at home and the organization to improve their general efficiency.

Thus, employee welfare is very comprehensive and embraces activities provided by employers, State, trade unions and other agencies to help workers and their families to lead a happy work life.

FURTHER RESEARCH DIRECTIONS AND LIMITATIONS

An employee's welfare is the key dimension for smooth employer-employee relationship. The organizations should take necessary steps to solve the problems in those measures so the employee can perform more effectively. New schemes and facilities should be added to existing ones to improve the efficiency

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

of the employees by the management of all organizations. This chapter is expected to help other researchers to consider various welfare schemes that influence the employee's performance and organizational productivity. Further research with regards to other public and private sector and also industrial and service organizations can be considered as provision of welfare schemes has become important in every type of organization.

The organizations should make pragmatic efforts to enhance the employees' work life and their general welfare in order to elicit job satisfaction and motivation for increased efficiency and performance. Limitations are part and parcel of any study, and the present study is no exception which includes constraint of geographical coverage, since the study was conducted only in Visakhapatnam district and the result articulates the viewpoint of different employees working at these organizations.

CONCLUSION

The concept of employee welfare has have reached many milestones in improving the efficiency of employees since work related problems compliment poor quality of life for employees and a decline in performance. The Welfare measures are perquisite for every employee, without welfare measures employee is isolated in the organization. The objectives of the study have been achieved after conducting relevant statistical test and results obtained. The organizations are encouraged to be a driving force regarding these welfare facilities in motivating the employees and increase their work efficacies. India introduced literal industrial policy aimed at increasing industrial growth, promoting modernization, and enhancing technological advancement to make industrial competitive in both domestic and global markets. In this perspective, companies can improve their productivity which is possible with the satisfaction of labour. Even today's scientific development of modern techno-production methods higher productivity depends on workers.

The multiple dimensions of employee welfare facilities such as education facilities, medical facilities, retirement benefits and others facilities are indicative of the employees' efficiency in both public and private sector organizations. The management of all types of organizations should concentrate on welfare facilities outside the work place also, so as to increase the quality of work life of the employees. A welfare officer can be appointed to solve all the problems of the employees and maintain good relation between the employees and employer. Private units have to take necessary efforts to find out the employee pre-requisites and initiate those welfare facilities for the success of business units. New schemes and facilities should complement the existing ones in improving the competence and work life quality of the employees by the management of all organizations.

KEY TERMS AND DEFINITIONS

Absenteeism: An employees' habitual and regularly practice of staying away from work without appropriate reason.

Employee: A person who enters into a contract of employment with another in returns for wages, salaries or other valuable considerations.

Employer: A person or institution that hires employees and offers wages or salaries in exchange of his work or labour.

Frustration: The feeling of being upset or annoyed as a result of being unable to change or achieve something.

Industrial Relations*:*: It refers to the relationship between employees and employer which stem directly or indirectly from union-employer relationship.

Motivation*:*: It is referred as one's direction to behaviour or what causes an individual to want to repeat behaviour and vice versa.

Productivity: It refers to the efficiency of industrious exertion, as measured in terms of the rate of output per unit of given input.

Turnover: It is the rate at which employees leave a workforce during a course of year and are replaced.

Welfare: It is an organized effort to ensure the basic well being of people in need. It is also a wide variety of services provided by companies for employee and in some cases for members of employee's families.

Work Environment: It indicates the physical geographical location as well as the immediate surroundings of the workplace or place of employment.

Chapter 58
Examination of Quality of Life in Workplace Environments

Lesley Clack
University of Georgia, USA

ABSTRACT

Healthcare organizations are commonly known to be high-stress environments due to the life-or-death nature of the work. Thus, examining the quality of life in healthcare professionals is of significance to the field. Quality of life is a common measurement in healthcare, typically in determining the effectiveness of treatment on patients. But, quality of life in healthcare workers is often overlooked. A review of the literature was conducted regarding factors that impact quality of life of workers in healthcare environments. The areas of occupational stress, burnout, and workplace violence were explored in depth in order to understand the potential negative consequences of each on quality of life in healthcare professionals. In comparison to other industries, healthcare professionals are at an increased risk for occupational stress, burnout, and workplace violence. Effectively managing these areas could have a positive impact on quality of life in healthcare workers.

INTRODUCTION

Understanding how to enhance satisfaction of employees in the workplace is of significance to managers, and quality of life is an important construct that relates to job satisfaction and overall wellbeing of employees. Quality of life is an estimate of an individual's health status, defined as satisfaction or happiness within eight dimensions: vitality, physical functioning, bodily pain, general health perceptions, physical role functioning, emotional role functioning, social role functioning, and mental health (Ware, Kosinski, & Gandek, 2000). Quality of life is a common measurement in healthcare, in determining the effectiveness of treatment on patients. But, quality of life in healthcare workers is often overlooked. Healthcare organizations are commonly known to be high-stress environments due to the life-or-death nature of the work. Thus, examining the quality of life in healthcare professionals is of significance, and is related to one of the Healthy People 2020 Occupational Safety & Health Objectives, which is to

"increase the proportion of employees who have access to workplace programs that prevent or reduce employee stress" (Office of Disease Prevention and Health Promotion, 2017).

The objectives of this article are to identify and examine the factors that impact quality of life in healthcare professionals and to identify solutions and recommendations for how healthcare managers can assist in reducing the impact of these factors in the workplace. This topic is timely because the well-being of healthcare professionals is important to the effective functioning of the health system (Selanu, Thornicroft, Fekadu, & Hanlan, 2017). While there are many factors that impact quality of life, this article will focus on four factors that are most prevalent in healthcare settings: occupational stress, burnout, workplace violence, and employee well-being. Research has shown that occupational stress, burnout, and workplace violence all can have a significant impact on employee well-being and overall quality of life (Brandstatter, Job, & Schulze, 2016).

BACKGROUND

The Institute for Healthcare Improvement (IHI) introduced the Triple Aim- enhancing patient experience, improving population health, and reducing costs- as the model for optimizing performance in the health system (Berwick, Nolan, & Whittington, 2008). Recently, there has been increased interest in changing the Triple Aim to a Quadruple Aim, thereby addressing the goal of improving the life of healthcare professionals (Bodenheimer & Sinsky, 2014). This push for a change even further highlights the significance and timeliness of exploring the negative consequences that affect quality of life in healthcare professionals.

Often healthcare professionals find it difficult to seek help for their health problems for a variety of reasons, such as workload and the fear of stigma and adverse effects on their career (Brooks, Gerada, & Chalder, 2016). Particular types of healthcare professionals are even more susceptible to negative consequences that impact quality of life. For example, healthcare professionals working in an Intensive Care Unit (ICU) are at higher risk of stress, burnout, and anxiety (Vandevala, Pavey, Chelidoni, Change, Creagh-Brown, & Cox, 2017). Workplace violence is also an area of concern.

Healthcare managers have a pivotal role in healthcare organizations as they set the professional standard, oversee quality and training, and serve as role models (Maza, Shecter, Eizenberg, Segev, & Flugelman, 2016). According to the World Health Organization (WHO), "a healthy workplace is one in which workers and managers collaborate to use a continual improvement process to protect and promote the health, safety, and well-being of all workers and the sustainability of the workplace" (Burton, 2010). Thus, implications for how managers can assist in reducing stress, burnout, and workplace violence, and enhance employee well-being, will be explored.

FOCUS OF THE ARTICLE

Occupational Stress

Stress has been reported to be increasing in all full-time employees in the U.S. by as much as a 31% increase from 1983 to 2009 (Cohen & Janicki-Deverts, 2012). Stress can have a negative impact on individuals, such as mental health issues or burnout, and an impact on organizations, such as reduced

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

performance and increased absences (Oginska-Bulik, 2006). Prior studies have surveyed healthcare workers and found that 28% reported stress to be a work-related health problem (Oginska-Bulik, 2006). In 2012, 63% of physicians surveyed reported they were more stressed than three years prior, and 34.3% reported being much more stressed than three years prior (Privitera, Rosenstein, Plessow, & LoCastro, 2014). A 2006 study by Oginska-Bulik concluded that there is a need for programs aimed to prevent work-related stress in healthcare organizations.

Occupational stress is the negative psychological response to job demands in the workplace and has been defined as a feeling of unease and discomfort that workers may experience when presented with extraordinary work demands and pressures (De Sio, Cedrone, Saruta, Ricci, Corbosero, Di Traglia, Greco, & Stansfeld, 2017). Occupational Stress has been reported at a prevalence of 52.7% in healthcare professionals (Kazmi, Amjad, & Khan, 2008). Other studies have also noted the significance of occupational stress and its relation to negative consequences in healthcare professionals (Gaither & Nadkarni, 2012). In a survey conducted in 2011, 87% of physicians reported that the leading cause of their occupational stress was due to paperwork and administration, and 63% reported that their stress is increasing (Bodenheimer & Sinsky, 2014). Healthcare managers should devise strategies to reduce the level of occupational stress and should provide support to healthcare professionals in order to help them deal with job-related stress (Sharma, Davey, Davey, Shukla, Shrivastava, & Bansal, 2014). If healthcare managers implement programs to reduce occupational stress in the workplace, the impact on quality of life in healthcare professionals could be significant. Intervention programs should be aimed at reducing an employee's experience of stressors (Awa & Plaumann, 2010).

Burnout

Burnout in healthcare professionals threatens the Triple Aim, as dissatisfied healthcare professionals are associated with lower patient satisfaction (McHugh, Kutney-Lee, Cimiotti, Sloane, & Aiken, 2011; Haas, Cook, Puopolo, Burstin, Cleary, & Brennan, 2000). Burnout has been defined as "physical or emotional exhaustion, usually caused by stress at work" (Felton, 1998, p. 238). Burnout is typically assessed in terms of three dimensions that develop in response to chronic work-related stress: emotional exhaustion, depersonalization, and reduced personal accomplishment (Maslach, Schaufeli, & Leiter, 2001). Emotional exhaustion refers to the draining of emotional resources (Rasumussen, Turnell, Butar, Juraskar, Kirsten, Wiener, Patenaude, Hoekstra-Weebers, & Grassi, 2016). Depersonalization is characterized by negative and cynical attitudes towards patients (Demerouti, Bakker, Nachreiner, & Schaufeli, 2000). Burnout is associated with a reduction in motivation, job satisfaction, and job performance (Parker & Kulik, 1995). Burnout can occur when individuals fail to effectively control work-related stress (Langade, Modi, Sidhwa, Hishikar, Gharpure, Wankhade, Langade, & Joshi, 2016). Prior studies have identified a relationship between quality of life and job performance (Rastegari, Khani, Ghalriz, & Eslamian, 2010). Another study attempted to explore the relationship between burnout, occupational stress, and anxiety symptoms. The results of the study found a positive correlation, thus authors recommend burnout management in order to reduce the impact of occupational stress (Ding, Qu, & Wang, 2014).

Prior research has found that as many as half of all U.S. physicians meet the criteria for burnout syndrome (Shanafelt, Hasan, Dyrbye, Sinsky, Satele, Sloan, & West, 2015). In a study conducted by Shanefelt et al in the U.S. in 2012, 7,288 physicians completed a survey in which 45.8% of the physicians reported at least one symptom of burnout. The results of the study showed an approximately 10% higher level of burnout in physicians as compared to the general study population (Shanafelt, Boon, Tan,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Dyrbye, Sotile, Satele, West, Sloan, & Oreskovich, 2012). In addition, a 2011 study by the American Academy of Orthopedic Surgeons reported that, out of 2,000 North American physicians, 87% described themselves as being in a state of burnout on a daily basis (Rosenstein, 2012). Other studies have reported that the prevalence of burnout among all categories of healthcare professionals ranges anywhere from 12.6% to 29.9% (Abdulla, Al-Qahtani, & Al-Kuwari, 2011; Abdulghafour, Bo-hamra, Al-Randi, Kamel, & El-Shazly, 2011). Emotional exhaustion, which is a component of burnout, has been reported to affect 20.1% of healthcare professionals (Johnson, Osborn, Araya, Wearn, Paul, & Stafford, 2012).

Burnout syndrome is a public health issue, considering its impact on quality of life (Gil-Monte, 2009). Since burnout is linked to patient safety and quality of patient care, examination of the impact on quality of life is warranted (Carta, Preti, Portoghese, Pisanu, Moro, Pintus, Pintus, Perra, D'Oca, Atzeni, Campagna, Fabrici Pascolo, Sancassiani, Finco, D'Aloja, & Grassi, 2017). Particular specialties, such as pediatrics (Al-Youbi & Jan, 2013), oncology (Rasmussen, Turrell, Butar, Juraskara, & Kirsten, 2016), and ICU workers (van Mol, Kompanje, Benoit, Bakker, & Nijkamp, 2015), are at increased risk for burnout. Other studies have found burnout to be particularly prevalent in emergency department physicians, general internists, neurologists, and family physicians (Shanafelt, Boone, Tan, Dyrbye, Sotile, Satele, West, Sloan, & Oreskovich, 2012). In a survey conducted in 2014, 68% of family physicians and 73% of general internists reported that they would not choose the same specialty if they could start their careers over (Kane & Peckham, 2014). In a study conducted in 2011, 34% of hospital nurses and 37% of nursing home nurses reported burnout, compared with 22% of nurses working in other settings (McHugh, Kutney-Lee, Cimiotti, Sloane, & Aiken, 2011).

Burnout syndrome may be associated with negative consequences, such as anxiety (Ding, Qu, Yu, & Wang, 2014). Prior studies have found that healthcare workers have a greater risk of developing anxiety due to occupational stress (Fiabane, Giorgi, Sguazzin, & Argentero, 2013; Patel, Weiss, Chowdhary, Naik, Pednekar, Chatterjee, Bhat, Araya, King, Simon, Verdeli, & Kirkwoods, 2011) Anxiety is a psychological and physiological state that has been described as "a feeling of fear related to some uncertain or future event or mental distress that is caused by a threat to a person or his/her values" (Ding et al, 2014, p. 1). Other research has investigated whether burnout and depression are essentially the same thing and cover the same symptoms. Findings suggest that while similar symptoms may accompany both burnout and depression, that burnout is indeed a distinct problem (Bianchi, Schonfeld, & Laurent, 2014). Managers may be able to more easily recognize symptoms of anxiety and depression, which could indicate potential burnout in employees. The challenge for healthcare managers is to understand factors that would increase or decrease an employee's response to burnout (Rafii, Oskouie, & Nikraesh, 2004). If managers can identify employees who are showing signs of symptoms of burnout, anxiety, and depression, they can potentially implement interventions that could have a positive impact on the employee's quality of life.

Workplace Violence

Workplace Violence, such as bullying and harassment, is an occupational hazard in healthcare organizations that can lead to negative consequences, such as burnout and mental health issues (Lin, Wu, Yuan, Zhang, Jing, Zhang, Luo, Lei, & Wang, 2015). Workplace violence is defined as incidents where staff have been abused, threatened, or assaulted in job-related circumstances which impacted their safety, well-being, or health (ILO, ICN, WHO, & PSI, 2003). The World Health Organization (WHO) categorizes workplace violence into 2 types, physical violence and psychological violence (ICN, PSI, WHO, & ILO, 2002). Physical violence is defined as beating, kicking, slapping, stabbing, shooting, pushing,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

biting, and pinching; and psychological violence is defined as the threat of physical force against another person or group that can result in harm to physical, mental, spiritual, moral, or social development (Zhao, Liu, Ma, Jiao, Li, Hao, Sun, Gao, Hong, Kang, Wu, & Qiao, 2015). Prior studies have identified a relationship between workplace violence and quality of life (Wu, Lin, Li, Chei, Zhang, Wu, & Zhu, 2014; Chen, Huang, Hwang, & Chen, 2010), and have reported the incidence of workplace violence in the U.S. to be 78% (Benham, Tillotson, Davis, & Hobbs, 2011).

In 2010, the healthcare sector employed approximately 18.9 million workers (13.6% of the total workplace) making it the largest industry in the U.S. (Bureau of Labor Statistics, 2011). Additionally in 2010, the healthcare sector accounted for 11,370 nonfatal workplace violence injuries, with approximately 67% of nonfatal violent injuries occurring in all industries (Bureau of Labor Statistics, 2012). Over the last eight years, healthcare professionals on average accounted for 62% of the nonfatal workplace violence injuries that required time off from work (Bureau of Labor Statistics, 2012). The risk of healthcare professionals experiencing an assault that requires time off from work is 4.5 times greater than that of the general workforce (Bureau of Labor Statistics, 2012). The literature also suggests that the number of assaults is greatly underreported by healthcare professionals (Hartley, Ridenour, Craine, & Morrill, 2015).

Workplace violence has been reported to be a major problem for healthcare professionals globally (AbuAlRub & Al-Asmar, 2014). Prior studies have reported the prevalence of workplace violence to be as high as 89% (Boafo, Hancock, & Gringart, 2016; Franz, Zeh, Schablon, Kuhnert, & Niehaus, 2010). A study by Boafo in 2018 surveyed 592 nurses and found that 52.7% of participants reported having been abused verbally, and 12% reported having been sexually harassed in the workplace in the previous 12 months (Boafo, 2018). Workplace violence should not be tolerated, and managers should both recognize the issues and implement strategies in order to reduce occurrence and discipline the culprits.

Employee Well-Being

Occupational stress, burnout, and workplace violence can all impact employee well-being. Negative experiences and stress from workplaces often spill over into employees' personal lives, which impacts employee well-being (Yoo & Lee, 2018). Employee well-being (emotional and psychological) can be defined as employees' attitudes and lived experiences within the organization (Diener, 2000). Employee well-being can be conceptualized as subjective well-being, which refers to an individual's own cognitive and affective evaluation of their lives in terms of satisfaction with certain aspects, such as job satisfaction (Pasamar & Alegre, 2015). The fast-paced, demanding work environment in healthcare, and increasing demand for learning and using the latest technology, can lead to significant occupational stress and burnout in employees that impacts employee well-being (Raya & Panneerselvam, 2013). Burnout, in terms of exhaustion, has been most commonly used as a measure for employee well-being (Petrie, Gayed, Bryan, Deady, Madan, Savic, Wooldridge, Counson, Calvo, Glozier, & Harvey, 2018). Higher levels of burnout and exhaustion are more typical of lower levels of employee well-being. Prior research investigating the link between workplace violence and employee well-being found that employees who had greater exposure to workplace violence reported lower levels of quality of life (Yoo & Lee, 2018).

Managers play an important role in employee well-being. Research has consistently shown that a good social environment in the workplace is associated with employee well-being (Daniels, Watson, & Gedikli, 2017). Prior studies have found that creating an organizational culture that supports employees in their work and family roles is important for employee well-being (Odle-Dusseau, Herleman, Britt,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Moore, Castro, & McGurk, 2013). Other research examining the importance of different aspects of manager support in healthcare settings highlighted the significance of the role of management in using organizational and team-level interventions to promote employee well-being (Petrie, Gayed, Bryan, Deady, Madan, Savic, Wooldridge, Counson, Calvo, Glozier, & Harvey, 2018).

SOLUTIONS AND RECOMMENDATIONS

Research studies have noted that the well-being of healthcare workers is dependent on the quality of their work environment (Portoghese, Galletta, Coppola, Fince, & Campagna, 2014), which is within a managers span of control. Studies have found that social support from managers can modify a healthcare professional's response to negative consequences, such as burnout (Rafii, Oskouie, & Nikravesh, 2014). Managers should focus on how to reduce stress, burnout, and workplace violence. In order to control risk of burnout, healthcare managers should use strategies aimed at increasing an employee's sense of control and reducing employee workloads (Portoghese, Galletta, Coppola, Finco, & Campagna, 2014). Healthcare managers can improve workers' sense of control by promoting their autonomy in the workplace, as job autonomy is considered an important coping strategy for decreasing occupational stress (Karasek & Theorell, 1990; Hausser, Mojzisch, Niesel, & Schulz-Hardt, 2012). Other recommendations for managers include providing support to employees to assist them in better dealing with the demands experienced in the workplace, and providing employees with training to help them deal with challenges faced at work (Gauche, de Beer, & Brink, 2017). Managers can also implement training programs in areas such as stress management and conflict management. There is some evidence that individual-focused web-based interventions relaxation and mindfulness techniques are effective for supporting employee well-being and reducing occupational stress (Ryan, Bergin, Chalder, & Wells, 2017).

FURTHER RESEARCH DIRECTIONS

Additional research in the area could explore further ways in which managers can improve each of these areas in order to reduce the impact on quality of life in healthcare professionals. Future research should also examine the impact of stress and burnout in healthcare managers, and how the stress level of managers impacts the quality of life in healthcare professionals. A lot of emphasis in research is placed on the support that employees need from managers, but one area that has not received a lot of attention in the support that managers need in order to know how to support employee well-being. Further research investigating how best to train and support managers in creating a supportive culture for employees is needed.

CONCLUSION

Quality of life in healthcare professionals can be significantly impacted by negative consequences in the workplace, such as occupational stress, burnout, and workplace violence, which can in turn impact employee well-being. Improving quality of life in healthcare professionals can have a substantial impact on their job satisfaction, thus improving patient care delivery.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

While there are many factors that contribute to quality of life, research has consistently studied the impact of occupational stress, burnout, and workplace violence on employee well-being and quality of life. Many researchers have noted the significance of the impact that issues such as stress and burnout can have on well-being and quality of life. The involvement of healthcare managers in identifying these issues and reducing their impact in the workplace may be the key to improving quality of life in healthcare professionals.

KEY TERMS AND DEFINITIONS

Anxiety: A feeling of worry or fear that is associated with nervousness and restlessness.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Burnout: A state of physical or emotional exhaustion that is typically the result of stress.

Occupational Stress: Stress that is particularly related to a person's job.

Quality of Life: The overall well-being of an individual in terms of things such as physical health, life satisfaction, and job satisfaction.

Stress: Physical, mental, or emotional tension caused by a situation.

Well-Being: The overall physical, mental, and social wellness of a person.

Workplace Violence: Verbal or physical threats against a person in a workplace.

Chapter 59
Effects on Employee Motivation of Working Conditions in National/International F&B Enterprises: Kirklareli Case

İlke Başarangil
Kırklareli University, Turkey

Emre Altıntaş
Kırklareli University, Turkey

ABSTRACT

The purpose of this research is to examine the effect of variables on the working conditions of national/international chain F&B enterprises on employee motivation. One hundred and sixty-four people working in 11 chain F&B enterprises in Turkey, in Kırklareli province, participated in the survey. The sampling method was used easy sampling for research. The research was conducted by applying survey technique from quantitative research methods. Regression analysis, factor analysis, Mann Whitney U, and Kruskal Wallis analysis were performed in the analysis of the obtained data. As a result of the factor analysis performed, two different components were obtained under working conditions and three different components were obtained in the context of motivational variables. As a result of the simple linear regression analysis performed, it is found that a significant part of the change in the motivation variable depends on the working conditions. Research results are thought to be beneficial to F&B managers.

INTRODUCTION

In rapidly changing world economies, the consumption habits of individuals are also rapidly changing. Food and beverages also have their share in this development. This change has made it crucial to examine the working conditions and motivations of employees in these service-based businesses. The improvement of working conditions leads to the increased motivation of businessmen, to improve their jobs, and thus to increase the quality of services they offer to foreign customers.

In particular, managers can improve employee productivity by improving working conditions, and promote occupational motivation in the positive direction. Increased motivation of the employees and increase in organizational performance will also be achieved. In other respects, it will be possible to reach the goals and objectives of the enterprises more effectively and in a short time. Managers will be able to make positive changes by utilizing various motivational tools in line with the needs of their workplaces. It is important for the managers to increase the confidence in the workplace in terms of working conditions in order to increase the motivation of the employees in the food and beverage sector, to ensure the satisfaction of the worker on the wage satisfaction, to remove the inequalities by the justice perceived in the workplace, to improve the quality of work and life of the occupation and finally to be appreciated in the workplace. The discovery and examination of these elements play a vital role in the success of both managers and businesses.

For this reason, in this research, the working conditions of the national/international chain food and beverage companies in the province of Kırklareli were determined to influence the motivation of the employer and the aim of contributing to both the managers and the field writers was taken into consideration. In the first part of this study, a literature review of working conditions and motivation theories in the business were included, then to research methodology, analyzes, findings and finally results.

LITERATURE REVIEW

Today, when the situation of the labor market is examined, it is known that positive physical working conditions positively affect work performance and business productivity. There is a wide range of elements within the working conditions in the subject (Yüksel, 2003 car. from İzgi & Olcay, 2008). While working conditions are assessed in different sectors, they are considered as fees, working hours, job security, vocational training opportunities and the physical working environment when they are considered in terms of food and beverage operations (Albayrak, 2012: p. 34). Within the context of working conditions, Küçükoğlu (2015: p. 177) states that there is a positive relationship between organizational trust and ethical values and between employee productivity and organizational trust and ethical values. As a result, it is formed in the expectation of "equal pay for equal work", and it is possible for the employees who do the same job to receive the same salary fee. As a result, it is possible to provide a fee-paying feeling for employees who work in the same job, which is shaped in the expectation of "equal pay for equal work" (Yıldırım & Demirel, 2015: p. 137). It is known that various research is based on working conditions and motivation in the literature (Hayta, 2007; Soykenar, 2008; Avcı, Çubukçu, & Çalmaşur, 2014). Motivation is discussed and conceptualized by many researchers. The concept of motivation is often reflected in similar definitions by many scientists (Rahman, Shamsudin, & Karim, 2014: p. 298). According to the definition of Eren (2008: p. 494), motivation is defined as efforts to mobilize one or more individuals for a specific purpose. According to Özkalp and Kırel (2013), it is called motivation

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

for people to behave with their own desires and wishes to realize a specific purpose. In other words, motivation means to influence the occupation in order to perform its duty in the desired way (Başaran, 1984 nar. from Ergül, 2005: p. 69). Motivation is addressed in two ways as internal and external (Özgener, 2000: p. 177). Usually, internal motivation is defined as doing something for its own good (Reiss, 2012). Workers are motivated by the work itself (Brief & Aldag, 1976 nar. from Dündar, Özutku, & Taşpınar, 2007: p. 108). Also, internal motivation includes success, promotion, development, and responsibility (Kaş, 2012: p. 16). According to Vom Diemer (1994), an external motivation which is an impulse for certain purposes directly affects behaviors (Özgener, 2000). Indeed, wage, working conditions, job security, company management and politics, conditions that are required in the workplace such as status are included in external motivation (Kaş, 2012: p. 16). Eren (2003) indicates that some points below should be explained with regard to motives (Bolat, Seymen, Bolat, & Erdem, 2014: p. 229-230):

- It is a force to reveal the true meaning of the motives behind human behavior. Some similar behaviors may be shifted from different motivations, and some different behaviors may result from the same instinct. For example, similar individual efforts to promote may result from different motives in different individuals. For one of these, success is the predecessor, while in the other the motivation to win is decisive. On the other hand, two people who are motivated to achieve self-esteem and respect can behave differently in this common motive direction. For example, the one is trying to achieve this by showing a high performance; the other can be used as a means of being close to the direction time.
- The motives influence each other and human behavior by either completing the other or reducing the power. For example, the motivation to achieve and gain power can complement each other, while the ability to achieve socialization and power can diminish each other's influence.
- Motives may increase/decrease as they are satisfied or not satisfied, as they appear at different violence ratings. For example, the severity of the organizational security need of an experienced and experienced employee will not be the same as the person who starts the new job. Some needs do not disappear with satisfaction, and they are even stronger. Satisfaction may not affect this motive. For example, while the motivation for success is getting more and more satisfied, the intensity of the basic motives (eating and drinking) decreases as they are satisfied.

Motivation is an important factor in organizational behavior as a factor that significantly influences, directs, and causes human behavior in an organization. As a result, research on organizational behavior has been carried out on a daily basis, and various approaches have been developed (Örücü & Kambur, 2008: p. 85-86). It is seen that the managers who have accepted modern contemporary business approach have started to investigate in a scientific way that motions can be motivated effectively and efficiently in the workplace. It is known that the economic and psycho-social motivation components, which are two important components of motivation during these research, cause different theories to emerge (Özkalp & Kırel, 2013). These theories are divided into content and process theories (Bilge, Bal, & Gönlügür, 2015). The focus of content theories is on individual needs (Tınaz, 2006; Keser, 2006). Maslow's Needs Hierarchy is one of the most well-known of the content theories, characterized by five steps: physiological needs, security needs, belonging and love, value need, and self-realization (Kula & Çakar, 2015: p. 193). According to Maslow, as long as the lower level needs of the individual are not overcome, the upper-level needs do not act for individual behavior. In addition, completed the needs diminishes the power to motivate the individual (Güney, 2011). Another content theory is Herzberg's

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Dual Factor Theory. Herzberg summarizes the motivation factors in two groups as motivating factors and hygiene factors. While motivating factors include responsibility, status, achievement, and recognition, the hygiene factors contain wage, working conditions, premium and supervisory style (Bolat, Seymen, Bolat, & Erdem, 2016). Alderfer (1969), on the other hand, expanded ERG theory to redefine Maslow's basic needs and rearranged as the need for existence, the need for improvement and the need to build relationships. Alderfer proposed ERG theory according to the results of empirical studies to explain the relationship between human desires and needs satisfaction (Yang, Hwang, & Chen, 2011: p. 7886). Finally, McClelland's theory of achievement requires comprising the need to establish relationships with others, the need for empowerment, and the need to succeed (Koçel, 2001: p. 515). Tolman's "Expectancy Theory" suggests that motivation depends on the individual's specific needs (goals) and the expectation that these needs are met through productive behaviors. In other words, productivity should be seen as a way of achieving worthwhile goals; Behavior is dependent on the output the individual values, and the individual is the anticipation of a particular behavior, the individual will direct this output. For example, if the individual needs more money, and if there is an expectation that more money will be paid for his or her work, we can assume that this individual will work harder; The opposite is true (Huczynski & Buchanan, 1991 nar. from Bolat, Seymen, Bolat, & Erdem, 2014: p. 239).

On the basis of process theories, there is a discussion of the handling and examination of all variables over the period from the onset of behavior (Tınaz, 2006; Keser, 2006). One of the process theories, Vroom's Theory of Expectations establishes a direct relationship between rewards and performance in order to understand the needs of organizations, as well as determines the effect of the awards in direct proportion to the extent to which individuals who will receive the prizes want the prize (Şeker, 2014: p. 15). Another process theory is Lawler-Porter's Motivation Model. This theory has examined the relationships among many of the components previously discussed separately. These variables are the prize worth, the perceived effort-prize potential, effort, talents, job performance, role perceptions, prizes, perceived equal prizes and satisfaction (Onaran, 1981). The other motivational process theory is Adams' Equation Theory and Hackman and Oldham's Job Characteristics Model (Ball, 2012: p. 4-5). According to the theory developed by J.S. Adams, the success and satisfaction of an individual depend on the equality or inequality he/she perceives in the workplace (Koçel, 2001: p. 524).

While the above-mentioned theories constitute the theoretical background, some incentive tools emerge for increasing motivation for occupations. These incentive tools do not always show the same effect everywhere. The motivational tools that are determined as the result of the research are examined under four headings: economic tools, psycho-social tools, organizational and administrative tools. While economic instruments are divided into wage increase, premium wage, profit participation and economic reward, psycho-social tools are defined as independence, social participation, value and status, development and success, adaptation to the environment, proposal system, psychological assurance and social endeavors. Organizational and managerial tools are divided into purpose group, education and promotion, transfer of authority, participation in decisions, communication, business expansion and enrichment and improvement of physical conditions (Sabuncuoğlu & Tüz, 2008). According to Ferman (1966), motivation, job satisfaction and commitment to employees can be grouped into three groups:

1. **Economic and Fiscal Measures:** Job appraisal and measures to pay salaries and wages (according to the liaison) as employees deserve;
2. **Physical and Material Measures:** Efforts to improve work or workplace working conditions;

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

3. **Spiritual-Social Measures:** Are measures to ensure that personnel can establish the most appropriate human relations within the enterprise.

For example, creating a warm friendly atmosphere, providing a sense of belonging provides integration (Mucuk, 2003: p. 346). It is necessary for managers to provide and protect organizational justice in order to increase the welfare of employees in organizations. If employees do not operate and evaluate managers fairly; demonstrate significant negative behaviors such as escape from responsibility, showing social, spiritual, bodily discomfort and disorders, showing hostile attitudes, leaving work (İyigün, 2012: p. 60). Özgen (2002) points out that the quality of work-life is related to the self-life; Motivation, level of satisfaction, personal experience, etc. (Kılıç & Keklik, 2012: p. 148). Kılıç & Keklik (2012: p. 158) suggest that work-life quality and motivation are two inseparable concepts and that a positive development in a variable will affect the other in a positive way. In the study of Yıldız et al. (2014: p. 241), it is seen that the factors that motivate the employees are the work itself, the relations with the supervisor, the possibilities of promotion, wages, and working conditions, rewarding and appreciated. According to research results of Ölçer (2005), job security, good relations with supervisor, wage and appraisal system based on a fair performance, cooperative and trust-based relationships with colleagues, appropriate working environment, teamwork, giving important/attractive jobs appropriate to the individual ability and job rotation affects the level of motivation of service personnel positively. It was also found that there was a significant positive correlation between motivation level and performance level. As a result, the de-motivated individual does not want to produce information, can't exhibit their skills fully and avoid taking responsibility. It is necessary to create awareness to awaken instinct so that it can reveal its own abilities (Altındağ & Akgün, 2015: p. 282).

METHODOLOGY OF STUDY

Aims, Objectives, and Hypotheses

Satisfaction levels of today's customers seem to be closely related to the behavior of employees in F&B enterprises. Businesses should utilize incentive motivational tools to improve work conditions of employees in order to increase customer satisfaction. In this way, managers will increase the motivation of the employees and ensure that the employees will work more efficiently and efficiently. For these reasons, it has been tried to determine the effect of working conditions on motivation on the F&B enterprises. Theoretically, the hypotheses for F&B enterprises are as follows:

H1a: The attitudes of the employees in the national/international chain F&B enterprises to their working conditions differ according to gender.
H1b: The motivational attitudes of employees in national/international chain F&B enterprises differ according to gender.
H2a: The attitudes of the employees in the national/international chain F&B enterprises to their working conditions differ according to marital status.
H2b: The motivational attitudes of employees in national/international chain F&B enterprises differ according to marital status.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

H3a: The attitudes of the employees in the national/international chain F&B enterprises to their working conditions differ according to the way they work.
H3b: The motivational attitudes of employees in national/international chain F&B enterprises differ according to the way they work.
H4a: The attitudes of the employees in the national/international chain F&B enterprises to their working conditions differ according to age.
H4b: The motivational attitudes of employees in national/international chain F&B enterprises differ according to age.
H5a: The attitudes of the employees in the national/international chain F&B enterprises to their working conditions differ according to income.
H5b: The motivational attitudes of employees in national/international chain F&B enterprises differ according to income.
H6a: The attitudes of the employees in the national/international chain F&B enterprises to their working conditions differ according to the working time.
H6b: The motivational attitudes of employees in national/international chain F&B enterprises differ according to the working time.
H7: There is a positive and significant relationship between working conditions and motivation variables of national/international chain F&B enterprises.

Population and Sampling

This research was conducted to measure the motivational effect of the working conditions of the employees in national/international chain F&B enterprises operating in the province of Kırklareli. A purposeful sampling method has been applied to the research because it is the method of purposeful sampling that will reach the researcher's purposes quickly and easily (Kozak, 2014: p. 118). Within the scope of the research have been reached all of the employees working in national /international chain F&B enterprises in the province of Kırklareli (Center) and a total of 12 national/international chain F&B enterprises and 164 employees in these enterprises have participated in the research. The research is limited to April-May 2016.

Data Collection Tool

In this study, survey method was applied as data collection tool. The questionnaire refers to a method of data acquisition by responding participants to a set ranking and structured questions (Coşkun, Altunışık, Bayraktaroğlu, & Yıldırım, 2015). The scale items in the study of Albayrak (2012) were used for this study. The questionnaires were applied face to face with the employees. The scale items obtained from the studies were reviewed by three faculty members and made more understandable and faster to perceive. Thus, the content validity of the scale was ensured (Ural & Kılıç, 2013: p. 67). In the first part of the questionnaire, there were 19 items related to working conditions while in the second part there were 20 items related to motivation. In the last section, there are statements about the demographic variables of the employees. Variables involving working conditions and motivation in the questionnaire are presented with the Likert scale of 5 (1 = Absolutely not, 2 = Not agreeing, 3 = Neither agree nor disagree, 4 = Agree, 5 = Absolutely agree) (Churchill & Iacobucci, 1999: p. 249). The Likert scale is a metric that is equally spaced to show the extent to which participants participate in certain expressive forms (Kozak,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

2014: p. 77). The data for the study were collected from 164 employees working in national/international chain F&B enterprises in the province of Kırklareli between April-May 2016.

Table 1. Names of F&B enterprises and employees numbers

Names of F&B Enterprises	Employees Numbers
David People	20
Kahve Diyarı	13
Kahve Tiryakisi	14
Big Mamma's	15
Burger King	7
Dominos Pizza	10
İzabella Pizza	20
Kahve Durağı	12
Gönül Kahvesi	8
Henry Jones	20
Kahve Kültürü	25
Total	164

Analysis of Data

Method part of the research includes the population and sample, the validity and reliability of the data collection method and technique, descriptive statistics, Factor Analysis, Mann-Whitney U and Kruskal Wallis Analyzes. First of all, missing data analysis was performed for the scales included in the questionnaire. Lost values are filled with average. In addition to this, extreme value controls have been made. In order to determine whether the factors are appropriate for parametric analyzes, it was tested whether the items showed normal distribution. The skewness and kurtosis values of each item were decided not to meet the normal distribution criterion as they were not within the desired limits, 2.0 and 7.0 (Curran, West, & Finch, 1996), respectively. Kolmogorov-Smirnov and Shapiro-Wilk test results were also examined. Since the significance level of these tests is smaller than 0.05, the normal distribution is not suitable (Yazıcıoğlu & Erdoğan, 2014: p. 246-247; Çokluk, Şekercioğlu, & Büyüköztürk, 2010: p. 14) and thus non-parametric analyzes have been decided.

Analysis and Findings

40.2% of the respondents were female, 59.8% were male and the most participating age range was 26-30 (57.9%). 15.2% of the employees are married, 84,8% are single. Most of the respondents were working less than 1 year (61.6%) while working, and most of them were working full time (62.2%). While most of the respondents work in the service department, the highest income range is TL 1251-1500 (45.7%).

Factor Analysis

For the research, data collected from 164 employees in national/international chain F&B enterprises operating in Kırklareli province were evaluated with the help of SPSS for Windows 22 statistical package program. Principal Component Analysis was used to find factor structures of working conditions and motivation scales, and Varimax was chosen as the rotation method. As a result of the Factor Analysis applied to the items containing working conditions, the items with less than 0,40 items, 6 overlapping items (6,17, 19) and the items with no load value were excluded from the analysis and there are remaining 16 items including two factors (F1: Confidence, F2: Wage Satisfaction). As a result of Factor Analysis applied to the motivational items, the items that are below 0.40 from 20 items, the overlapping items (3,14,19) and the items with no load value (item 2) are excluded from the analysis. As a result, there are 16 items including three-factor dimensions remaining from 20 items (F1: Workplace Justice, F2: Quality of work life, F3: Appreciation). It is seen that the contribution of the two factors constituting working conditions to the variance is 33,162%. It is accepted that the sample size was 0.736 with the KMO value being appropriate for factor analysis (Alpar, 2011: p. 286) and according to the Bartlett Sphericity test ($x^2 = 816,520$, df = 171), it was assumed that the data came from a normal distribution (Şencan, 2005: p. 384). It is seen that the contribution of the three factors forming the motivation to the variance is 43,821%. It was found that the sample size was fit to the factor analysis with a value of 0.777 (Alpar, 2011: 286) and according to the Bartlett Sphericity test (x^2= 634,476, df= 136), it was assumed that the data came from a normal distribution (Şencan, 2005: p. 384). The reliability coefficient (Cronbach Alpha) takes a value between 0 and 1, and if this value approaches 1, reliability increases (Ural & Kılıç, 2013: p. 280; Coşkun, Altunışık, Bayraktaroğlu, & Yıldırım, 2015). The Cronbach Alpha values of the following table are between .806 and .503. Alpar (2011: p. 815) express that Cronbach's Alpha coefficient is high between 0.80-1.00, very reliable between 0.60-0.79, low between 0.40-0.59 and in not reliable between 0,00-0,39. Factor load values 0.60 and higher load values are high; the load value between 0.30-0.59 can be defined as moderate magnitudes (Büyüköztürk, 2002: p. 474). When Table 3 is examined, it is seen that the factor load values are between .811 and .442.

According to the result of factor analysis, F1: Confidence dimension with 23,096%, which explains the highest variance within the Working Conditions, was formed by combining 9 items. The F1: Workplace Justice dimension, with 25,562% explaining the highest variance in motivation, was formed by a combination of 7 items. Factor dimensions of the Working Conditions are F1: Confidence dimension (x = 3.9512) and F2: Wage Satisfaction (x = 2.8206). Motivation factor dimensions are F1: Workplace Justice (x = 3,3249), F2: Quality of Work-Life (x = 3,8122), F3: Appreciation (x = 3,0915). As a result, participants' attitudes towards Confidence from Working Conditions are higher than Wage Satisfaction. In terms of motivational factor dimensions, the attitudes of employees towards Quality of Work-Life were found to be higher than those of Workplace Justice and Appreciation.

Analysis of Working Condition Components Within Hypotheses

Mann Whitney U test was used to test for the differences in gender, marital status and working style of the workers, and age, duration of work, differences between the departments and the genders were tested with the Kruskal Wallis test.

My fee is very high.	,743					
The wage I have received is exactly what I am doing.	,683					
My fee is raised very often.	,574					
My fee is sufficient for my normal expenses.	,489					,646
My Fee is suitable when compared to another employee.	,468					
I have free transportation in my business.	,461					
I believe that you will receive severance pay when it comes to taking off work.	,442					

continues on following page

According to Table 4, it is seen that the p values are larger than 0.05. For this reason, Working Conditions and Motivation variables do not change according to gender. “Confidence”, “Wage Satisfaction”, “Workplace Justice”, “Quality of Work-life” and “Appreciation” are not significant factors in terms of gender. According to these results, $H1_a$ and $H1_b$ hypotheses were rejected.

According to Table 5, it is seen that the p values are larger than 0.05. For this reason, working conditions and motivation variables do not change according to marital status. While the $H1_b$ hypothesis is rejected, it is seen that the dimensions of “Confidence”, “Wage Satisfaction”, “Workplace justice”, ” Quality of Work-life ” and “Appreciation” are not important factors in terms of marital status. According to these results, H_{2a} and H_{2b} hypotheses were rejected.

When p values according to Table 6 are examined, it is seen that only p values of "Wage Satisfaction" (U=2989,500; z= -3,372; p=,001) and "Appreciation"(U=2145,000; z= -3,463; p=,001) variables are less than 0.05. There is a significant difference between the Wage Satisfaction and "Appreciation" variables and Working Style groups. Accordingly, although the H_{3a} and H_{3b} hypotheses are accepted, the "Wage Satisfaction" and "Appreciation" dimensions appear to be important factors in terms of Working Style. Full-time employees have a higher "Wage Satisfaction" than part-time employees, but lower attitudes towards "Appreciation".

Table 7. Kruskal Wallis analysis results by age

Factors	Age	N	Mean Rank	sd	x^2	p
Confidence	Less than 25	95	79,93	5	5,655	,341

A statistically significant difference (p>0.05) was not found between the working conditions dimensions and age according to Table 7. Accordingly, although the H1e hypothesis is not accepted according to the age, it is seen that "age" is not an important factor in terms of the Working Conditions. However, as seen in Table 7, " Quality of Work-Life ", a statistically significant difference was found between age groups (p <0.05). The Mann Whitney U test was used to determine which groups were significant differences in the Kruskal Wallis test. Statistically significant difference (p <0.05) was found between less than 25 and the age group of 26-30 (U = 16446,500; z = -3,054; p =, 002). In this respect, it was found that the persons with less than 25 years of age (M.R. = 65.33) had lower attitudes in terms of "Quality of Work-Life " than the persons in the age group of 26-30 (M.R.= 87.57). According to these results, H_{4a} hypothesis is rejected and H_{4b} hypothesis is accepted.

Table 8. Kruskal Wallis analysis results by income

Factors	Income	N	Mean Rank	df	x^2	p
Confidence	Less than 750 TL	2	143,00	4	4,160	,385
	751-1000 TL	16	74,66			
	1001-1250 TL	55	79,45			
	1251-1500 TL	75	83,71			
	1501 TL and over	16	87,56			
Wage Satisfaction	Less than 750 TL	2	69,75	4	11,170	,025*

(*p<0,05)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

According to Table 8, there was a statistically significant difference (p <0.05) in the variable of "Wage Satisfaction" according to income variable. Accordingly, "Wage Satisfaction" seems to be an important factor in income variable. The Mann Whitney U test was used to determine which groups were significant differences in the Kruskal Wallis test. In terms of "Wage Satisfaction", between TL 751-1000 and TL 1251-1500 (U = 333,500, z = -2,788, p =, 005), between TL 1001-1250 and TL 1251-1500 (U = -2,456; p =0,014) statistically significant difference (p <0.05). In this respect, it is seen that people whose income level is between 751-1000 TL (M.R.=29,34) have lower Wage Satisfaction than people with income level between 1251-1500 TL (M.R.=49,55), it was found that people with income levels between 1001-1250 TL (M.R.= 56.05) had lower Wage Satisfaction levels than people with income level between 1251-1500 TL (M.R.=72.43). According to these results, the H_{5a} hypothesis is accepted and the H_{5b} hypothesis is rejected.

Table 9. Results of Kruskal Wallis analysis according to working time

Factors	Working Time (year)	N	Mean Rank	df	x^2	p
Confidence	Less than 1	101	76,75	3	4,170	,244
	1-3	51	90,16

(*p<0,05)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

According to Table 9, the statistically significant difference (p <0.05) was found in "Appreciation" variable. "Appreciation" seems to be an important factor in the Working Time variable. The Mann Whitney U test was used to determine the groups in which the significant differences in the Kruskal Wallis test were found. There was a statistically significant difference (p <0.05) between the groups of 4-6 years and less than 1 year (U = 281,000; z = -2,320; p =, 020 with the "Appreciation". Individuals who worked less than 1 year (M.R. = 53.78) in this regard appeared to have lower attitudes toward "Appreciation" than those who worked 4-6 years (M.R. = 78.40). According to these results, H_{6a} hypothesis is rejected and H_{6b} hypothesis is rejected.

Analysis Result Measuring Motivation Effect of Working Conditions

According to Table 10, the simple linear regression analysis between working conditions and motivation was significant, but the H7 hypothesis was accepted. In other words, it was found that 49.2% of the motivational change (F = 157,010, p <0,000) was dependent on working conditions.

Table 10. Simple linear regression analysis results measuring the effect of working conditions on motivation

Independent Variable	Beta	Stand. Beta	T Value	Significance
Working Conditions	,777	,702	12,530	, 000

(* p<,001, R^2=,492)

CONCLUSION AND SUGGESTION

In today's rapidly developing F&B industry, innovations are added to national and international chains. Managers working in these chains are required to provide a suitable environment for the functioning of the workforce effectively and efficiently. With the improvement of the physical working environment and the motivational tools, the managers can help their employees to provide better quality, efficient and efficient. As seen in this research result, working conditions affect motivation positively. This result is in agreement with the results of Albayrak's (2012) study. The important results of the study are listed below;

- According to the results of the research, while Working Conditions constitute Confidence and Wage Satisfaction dimensions, the dimensions of motivation are defined as Workplace Justice, Quality of Work-Life and Appreciation dimensions.
- The other end result of the research: attendees' attitudes towards Confidence are higher than Wage Satisfaction. The fairness of the managers, the efficient passing of the meetings, the efficient operation of the business are the basic issues of working conditions. Wage Satisfaction plays a significant role in satisfaction and in the loyalty of the employees (Türkay, 2015: p. 254). The attitudes of employees towards Quality of Work-Life were found to be higher than those of Workplace Justice and Appreciation. The fairness of the managers is one of the important factors affecting the workplace loyalty (Türkay, 2015: p. 252).
- Among the other results of the study, Working Conditions and Motivation variables do not change according to sex, marital status variables. These results are in agreement with the results of

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Albayrak (2012: p. 109-110), Ertan and Kaya (2012). On the contrary, research results of Duman et al. (2006) revealed that it was found that males had higher average scores than women in their desire to make a career in the sector, person-industry harmony and promotion opportunities, subsidiarity and motivation, managerial and colleague dimensions.

- There was a significant difference in terms of factors between full-time and part-time occupational groups according to their working styles. According to this, while full-time employees are more attitudes towards Wage Satisfaction than part-time employees, attitudes towards appreciation are lower. Parlak (2016) suggests that it is important but not sufficient to work flexibly in terms of a healthy Quality of Work-Life and that various measures should be taken to reduce the negative.
- Another result is that there is no statistically significant difference according to the age of employees. This result is in contrast to the research results of Albayrak (2012: p. 112). However, in the results of the study, in contrast to the Working Conditions, Quality of Work-Life from Motivational dimensions shows a statistically significant difference between age groups. In this respect, the age group with less than 25 years of age appears to have a lower attitude towards Quality of Work-Life than the 26-30 age group.
- Besides these results, the wage satisfaction shows a statistically significant difference according to the income variable. In this respect, it was found that people with an income level between 751-1000 TL had lower Wage Satisfaction than people with an income level between 1251-1500 TL, and people with an income level between 1001-1250 TL had lower Wage Satisfaction than those with an income level between 1251-1500 TL. These results are in agreement with the results of Albayrak (2012: p. 112).
- When the results of the research are examined, Appreciation variable shows statistically significant difference according to the Working Time (year). In this respect, it was found that individuals with less than one-year working time had lower attitudes toward appreciation than those with 4-6 years working time. On the other hand, Türkay (2015: p. 251) indicates that job satisfaction will decrease as the number of years of work increases.
- Finally, it was found that 49.2% of motivational change depends on working conditions. According to Hayta (2007: p. 22), productivity decreases due to motivation and fatigue in employees arise due to long working hours and poor working conditions. Workplace conditions including physical environment, time, groups, social facilities, management style, etc. affects employees' motivation factors and creates a complicated situation in terms of motivation (Karakaya & Ay, 2007: p. 55).

Considering the research results, the following suggestions have been developed for business managers in the F&B enterprises:

- Administrators' continuous improvement of working conditions can be useful for employees. It is known that the managers who attach importance to the workplace recreation, especially today, have increased the efficiency of their workplaces.
- Managers should increase the quality of work-life as an element of motivation, organize physical conditions, educational opportunities, monetary rewards, premium and so on.
- Based on the results of the research, managers should take into consideration that managerial trust comes first of all.
- Managers should re-examine their motivational tools according to younger age groups.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Employees who are new in the first year of their working period can often make mistakes, they may show beginner behavior, and they may think they are not appreciated. However, it is very important for managers to decide whether or not the employee will continue to work if they are role models that show more motivating behaviors to the new employees.

FUTURE RESEARCH DIRECTIONS

The fact that it is impossible to reach the whole of the population due to labor, time and cost pressures constitutes the limitation of the research. Since this research is carried out with a limited number of samples and includes only national/international chain F&B enterprises in Kırklareli Province, it is not possible to generalize the results obtained under the working conditions and motivation literature. For this reason, future research may include new research with a larger target population of the study, including national/international chain food and beverage businesses in other countries.

KEY TERMS AND DEFINITIONS

Appreciation: Feelings of gratitude for things done.

Confidence: The concept of confidence is the belief that someone is behaving correctly.

F&B Enterprises: F&B enterprises are independents establishments that provides food and beverage services.

Motivation: The motivation is the continuity of the individual's efforts to reach the target.

Quality of Work-Life: Work-life quality is aimed at improving the quality of life of employees by increasing the effectiveness of organization.

Wage Satisfaction: The wage/pay satisfaction is satisfaction level of employees' salaries.

Working Conditions: Working conditions are the basis of paid employment and employment relations. In general, working conditions include subject and subject matter in a wide range of physical conditions and mental demands at work as well as hourly wages.

Workplace Justice: The concept of workplace justice is provided for every individual who works for organizational justice.

Chapter 60
The Effect of Wellness Programs on Long-Term Contract Employees' Workplace Stress, Absenteeism, and Presenteeism

Desree S. Valentine

Susan Ferebee
Purdue University, West Lafayette, USA

Keri L. Heitner
All Aspects Research, Amherst, USA

ABSTRACT

The quasi-experimental study reported in the present article is aimed at increasing the understanding of the effects of long-term contract employees participating in wellness programs. The reported study examines the effect (if any) that a wellness program has on workplace stress, absenteeism, and presenteeism for long-term contract employees participating in a wellness program. A one group pretest-posttest design was used. Convenience sampling was conducted in a hospital in the New York City Metro area. Data was collected from 19 participants. Paired sample t-test and a Wilcoxon signed-rank test were used to determine if there was a significant statistical difference before and after a dance aerobic exercise intervention. The instruments used to gather data were the Perceived Stress Scale (PSS) and the World Health Organization Health Performance Questionnaire (HPQ). The results indicated a statistical difference for workplace stress, but no statistical difference for absenteeism and presenteeism.

INTRODUCTION

Stress in the workplace is a common and perennial issue. High levels of stress are strongly associated with a myriad of health problems. White-collar professionals, who account for 51% of the total United States (US) workforce (Department of Professional Employment, American Federation of Labor-Congress of Industrial Organization, 2015) are at a higher risk for chronic disease such as diabetes, heart attacks, and obesity (Corliss, 2015; The University of Kansas Health System, 2017). Chronic disease is one of the leading causes of death in the U.S. (Lee, Pierre, Zhu, & Hu, 2014) and results in high annual health care spending including $432 billion on heart disease and stroke, $245 billion on diabetes, and $154 billion on lung disease (Lee et al., 2014). Following increased costs associated with chronic disease, health insurance spending has significantly increased (Sambamoorthi, Tan, & Deb, 2015). Health insurance spending was estimated at $330.9 billion in 2003, and $850 billion in 2010 (Office of the Assistant Secretary for Planning and Evaluation [ASPE], 2005; Schoenman & Chockley, 2013). From 2003 to 2010, the annual employer premium contribution for health insurance for employees with families increased by 73%, and for single employees by 60% (Collins, Radley, Schoen, & Beutel, 2014).

The monetary costs of stress related chronic diseases are not constrained to the cost of health care. Within organizations, costs associated with stress and illness manifest as high rates of employee absenteeism and presenteeism. Absenteeism undermines organizational success. Absenteeism, as defined by Senel and Senel (2012, p.1144) is the "lack of presence of an employee for planned work" and does not include absence that is planned. Swarnalatha and Sureshkrishna (2013, p. 1) define and explain absenteeism as "failure to report to work… Absenteeism is a type of unscheduled activity which threatens the organization to fall in danger as it leads to the disruption of the daily process." Absenteeism usually refers to habitual or conscious decision to not be at work and is considered a type of deviant workplace behaviour (Sureshkrishna, 2013). There is evidence that wellness programs can significantly reduce absenteeism (Abdullah & Lee, 2012).

Presenteeism, can be considered opposite to absenteeism. It refers to being present at work even if ill or unfit for attending work (Dew, Keefe, & Small, 2003). While presenteeism might be viewed in a more positive light than absenteeism, it can be just as destructive as absenteeism, to both organization and employee (Dew, Keefe, & Small, 2003). Presenteeism results in greater morbidity and other illnesses such as depression, and evidently productivity during the workday is reduced (Dew, Keefe, & Small, 2003).

Both employers and employees suffer when an employee is absent from work. According to Society for Human Resource Management (2015), productivity loss due to unplanned absences is 36.6%, planned absences 22.6%, extended absences 34%, and hiring replacement workers 31.1%. The SHRM (2015), has shown employees' absence contributes to increased workload of other employees by 69%, with an additional 61% increase in stress, 59% increase in disruption of other work, 40% decrease in quality of work, and 29% increase in overtime.

The productivity loss cost to employers of employees suffering from chronic illness totals $225.8 billion annually: $1,685 per employee, per year (NCCDPHP, 2016b; CDC, 2017e). Adults with one or more chronic diseases accounted for 86% of health care expenditures in 2010 (NCCDPHP, 2016a). According to Lee et al. (2014), the cost per year of treating individuals with no chronic disease was $2,137; one or more chronic diseases costs $2,243 per year, compared to $21,183 per year for treatment of individuals with five or more conditions. Adults with no chronic conditions cost Medicare $211 per year, whereas adults with one or more chronic conditions cost Medicare an average of $13,973 per year (Lee et al., 2014). According to CDC (2017e), the U.S. healthcare expenditure in 2015 was $3.2 trillion,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

with 75% ($2.5 trillion) going toward treatment of chronic diseases (Koh, 2011; Lee et al., 2014). During testimony before the U.S. Senate Committee on Health, Education, Labor, and Pensions, Harold Koh, Legal Adviser for the United States Department of State, stated "chronic disease causes the loss of $1 trillion in economic output annually" (Koh, 2011).

Given the negative impact of both absenteeism and presenteeism on individual and organizational success, and that wellness as a factor which reduces both, it is small wonder that organizations have brought into focus employee well-being. Organizations have turned to wellness programs as a way of addressing workplace stress and reducing employee absenteeism and presenteeism (Harris & Strauss, 2016; Purcell, 2016; Rossi, 2010). The 2009 Affordable Care Act (ACA) provides initiatives built upon expanding existing corporate wellness programs. The U.S. Department of Health and Human Services (HHS), Department of Labor (DOL), and Department of the Treasury (DOT) implemented new rules in January 2014 supporting workplace wellness programs.

Employee stress is strongly associated with chronic health issues and other illnesses. Stressed or unwell employees have high rates of absenteeism and/or presenteeism during which their productivity falls. For organizations, reduced productivity is very costly. In addition, there are the healthcare costs that are borne by the nation. Long term contract employees constitute as a significant portion of employees, and their stress and resulting absenteeism and/or presenteeism is very costly to both organizations and the nation. For non-contract employees, there is solid evidence that participation in wellness programs has positive health and well-being effects.

Research has exposed a positive correlation between employees who participated in a wellness program and reduction of workplace stress (Berry, Mirabito, & Baun, 2010). According to Bloom (2008), United Parcel Service's wellness programs and safety education programs have decreased absenteeism, increased productivity and morale, and reduced on-the-job injuries by 60%.

Staffing companies employ 3.21 million temporary and long-term contract people per week; a total of 14.49 million temporary and long-term contract employees were hired in 2016 (ASA, 2017). The direct and indirect costs of employees missing work due to stress negatively impact on an organization's financial success. Direct costs include employee's wages/salary earned during absence, overtime costs, and replacement worker costs. Indirect costs are lower productivity of replacement workers, and productivity loss of co-workers and supervisors (Society for Human Resource Management [SHRM], 2015). Direct cost accounted for 30.8% of total costs, with 15.4% going to payroll, 8.1% paid time off, 5.7% overtime cost, and 1.6% replacement workers (SHRM, 2015). Wellness programs provided options to lower health premiums and deductibles, while at the same time decreasing workplace stress, thus improving employees' well-being, self-image, and self-esteem, as well as job satisfaction (CDC, 2017b; NCCDPHP, 2016b). Organizations are investing in wellness programs to counteract loss of productivity, and to lower health insurance premiums (CDC, 2017d).

Yet, despite their importance, the effects of wellness programs on long-term contract employees are under-explored and remain poorly understood. Studies conducted on the effects of wellness programs on workplace stress, absenteeism and presenteeism did not include long-term contract employees (Bierla, 2013; Merrill et al., 2012; Yang et al., 2015). It cannot be assumed that wellness programs will have the same effect on long-term contract employees as non-contract. The implications of this are that wellness policy and organizational decisions may be misaligned with the specific needs of long-term contract employees, and therefore be ineffective or not as effective as can be. Since long-term contract employees make up a very significant portion of the workforce, the consequences of poor-decision making with

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

respect to wellness programs has the potential for far-reaching negative impact on organizations and individuals.

It is from the above described background that the reported study emerges. The aim of the study is to shed further light on the effect of wellness programs on the neglected subgroup of employees – long term contract employees. A population of 19 long-term contract employees in the healthcare industry were exposed to a wellness intervention, and the effect (if any) on workplace stress, absenteeism and presenteeism was investigated. The researcher sought to ascertain if there was a difference in dependent variables on workplace stress, absenteeism, and presenteeism before and after participation in the wellness program. Prior to discussing results and their implications the research design and methods are presented.

RESEARCH DESIGN AND METHODS

The study was designed as a one group pretest-posttest non-randomized trial. Participants were given two surveys, a Perceived Stress Scale (PSS) and Health Performance Questionnaire (HPQ). One group pre-test and post-test research design was used. Pre-, Post-, test research designs are commonly used in behavioral sciences to assess change in behavior (Gliner, Harmon, and Harmon, 2003). The test was administered pre-intervention and 30-days post-intervention.

Recruitment and Participants

The population of interest for the study was long-term contract employees who work in healthcare organizations, offering wellness programs in the New York City Metropolitan Area. Long-term contract employees were identified as employees who have an active employment contract with a company for one to two years at 40 hours per week. An invitation to participate in the study was sent via email. A total of 20 individual agreed to participate in the study.

Before the intervention, all participants were emailed survey links to complete the PSS and HPQ. Afterwards, they underwent the dance aerobic intervention. They participated once a week dance exercise for one hour. After 30 days another email with the survey links were sent to the participants, to complete the PSS and HPQ.

Intervention

The intervention for study consisted of dance aerobic exercise. The intervention was a 60-minute dance aerobic classes that was given once a week by a trained and certified instructor. The number of days and the amount of time the participants attended the wellness program during the 30-day intervention were tracked.

Measurement and Instruments

Two survey instruments were used in the study: HPQ and PSS. Survey items consisted of both numeric-completion, and Likert-based responses. The HPQ is a three-part questionnaire with 91 questions: Part A (health), Part B (work), and Part C (demographic). Part A has 57 questions that evaluate participants' self-rated health and self-rated mental health, physical health status, mental health, new physical health

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

status, and their history of medical visits within the last year. Part B has 23 questions that focus on hours worked, sick leave, and occupational accidents, and self-rated productivity in the four past weeks; and lastly, Part C asked eight demographic questions (Pournik et al., 2012).

The PSS is one of the most common psychological instruments used for measuring individuals' self-perceived and non-specific stress. The instrument was chosen for its effectiveness in gauging participants' pre-intervention and post-intervention workplace stress levels. The survey is a 14-item self-report questionnaire designed to assesses an individual's determinates of stress (Cohen, 2016). Using the five-point Likert scale score, PSS ranges vary from "never" to "very often"; with seven value questions (4, 5, 6, 7, 9, 10, & 13). All 14 items are added to score PSS (Cohen, 2016).

Data Analysis

Data analysis was performed using the IBM SPSS 25. Initial analyses were performed, including assessment of the data for normal distribution and outliers. For small samples (<30), K-S and Shapiro-Wilks is the recommended test for normal distribution (Ghasemi & Zahediasl, 2012). The variables, workplace stress, absenteeism, and presenteeism were tested for normal distribution. A p-value that is greater than .05 indicates normal distribution, less than .05 the data is not normally distributed. The paired sample *t*-test was used for workplace stress, and the Wilcoxon Signed Rank test for absenteeism and presenteeism. The Wilcoxon signed-rank test is a non-parametric test applied to two dependent variables (Rey & Neuhäuser, 2014). The paired sample t-test is used to determine if the mean difference between two observations on the same data set is zero, or in other words to test if there is a statistically significant difference between pre- and post-intervention scores.

Limitations

Several limitations were identified during this study including sample size, duration of the intervention, length of HPQ, employment agency relocation, lack of random selection and random assignment to treatment and control group, statistical test. Data analysis showed there was an effect cause by participating in a wellness program and reducing workplace stress, but there was no effect on absenteeism, and presenteeism among participants. There was only one campus that was used for this study; therefore, the sample size for long-term contract employees involved was small.

Using a non-parametric test is ideal for small sample size that is not normally distributed and have outliers that the researcher cannot removed from the data. However, a non-parametric statistical test is less robust than a parametric test. Nonparametric test lacks statistical power compared a parametric test. Unlike parametric test that estimates the effect of the intervention, nonparametric test focused on hypothesis testing (Whitley & Ball, 2002).

According to Cohen (1992) the statistical power is based on the significance criterion, sample size, and the effect size. Cohen (1992), stated a small effect size is .20, the medium effect size is .50, and large effect size is .80. Replicating the study with a larger sample size and a longer intervention could show a significant differences pre-and-post intervention. With a large sample size, the researcher is more likely to reject the null hypothesis, however, the small sample size for this study was the probable cause for Research Question 2 and 3 null hypotheses not rejected due to a Type II Error occurring (Cohen, 1992; Jack, 2017). According to Cohen (1988), the researcher will use the power to make a correct decision to reject the null hypothesis. To determine the sample size the power analysis is necessary (Cohen, 1992).

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

For the intervention, 30 days was not enough time to effect long-term contract employee's workplace stress, absenteeism, and presenteeism. Another drawback associated with this study was the timeframe. At the end of the summer and close to the first day of school, participants with family are more likely to take a vacation, which created delays in collecting data before and after the intervention. A third limitation identified was the length of the HPQ survey. Participants were either skipping questions or taking several days to complete the survey. Using the seven-day HPQ questionnaire would be more beneficial for collecting data before and after for a short intervention.

A quasi-experimental designed was adopted for this study, as it afforded the researcher the ability to determine whether there are any significant changes from the intervention. However, limitations associated with quasi-experimental design is the inability for the researcher to use random selection and random assignment to treatment and control groups. Unlike true experiment, the researcher could only make casual inference that the intervention had an impact on workplace stress but cannot determine whether any outside factors contributed to the changes pre-and post-intervention.

A lack of control group was also a limitation for this study. A control group is identical to the treatment group, except the control group is not subjected to the treatment. Having a control group in the study would strengthen the researcher ability to draw conclusions from study. The researcher could determine whether the intervention has a significant effect on the treatment group. Furthermore, a control group will help reduce the researcher from drawing an inaccurate conclusion that the intervention had any effect on the treatment group.

The final limitation is the relocation of participants. One participant was lost to follow-up, because of relocation by their agency. With a small sample size (N=19) losing participants would affect the power, effect size, and significant of the study. Increasing the sample size may provide a statistical difference.

Results

The majority (70%) of respondents were above 40 years of age. Just over half of the respondents were female and half the respondents completed more than four years of college. Half of the participants reported as single. Sixty percent of respondents had children with most (35%) having just one child. All participants rated their general health as good or better. Ninety percent of participants rated their mental health as good or better (see Table 1).

Workplace Stress

Paired samples statistics displayed workplace stress scores from pre-dance aerobic exercise intervention ($M = 22.1$, $SD = 9.81$) and post 30 days dance aerobic intervention ($M = 30.26$, $SD = 6.78$). The mean increase was -8.16 with the 95% confidence interval for the difference between the means of -3.07 to -13.24. The means demonstrates a statistical difference between the levels of workplace stress among participants post-dance aerobic exercise intervention compared to pre-dance aerobic exercise intervention (see Table 2).

The results of the paired sample *t*-test show that there is a statistical difference in workplace stress among the group represented in this study, $t(18) = -3.37$, $p < .05$, $d = .77$, indicating there is a significant effect on workplace stress. The null hypothesis for this research question was rejected. Thus, the mean scores for workplace stress was statistically significantly higher post-intervention than the pre-intervention.

Absenteeism and Presenteeism

The finding for the Wilcoxon signed-rank test showed that a 30-day, dance aerobic exercise did not elicit statistically significant in absolute absenteeism in long-term contract employees (Z = -1.58, p = .804), relative absenteeism (Z = -.517, p = .1.00), absolute presenteeism (Z = -1.324, p = .388), and relative presenteeism (Z = -.377, p = 1.00). Therefore, the null hypothesis was retained (Table 3).

DISCUSSION

The results of the data presented in this study revealed no statistical differences pre- and post-intervention for absenteeism and presenteeism. With a small sample size, and relatively short timeframe, the researcher could not determine that the intervention had an impact on long-term contract employee's absenteeism and presenteeism. However, there was a statistical difference for workplace stress. The differences in mean for workplace stress pretest - posttest is evident in the increase of 30.26 in the posttest mean. The pretest – posttest mean scores indicated that participating in the intervention affected the dependent variable. The difference in mean scores between the group pretest- posttest was -8.16.

There is evidence of the benefits of wellness programs have on employee job productivities (Miller, 2015). These studies also showed that a comprehensive wellness program have a positive effect on employee's health, stress, absenteeism, and presenteeism (Abdullah, Yin & Lee, 2012). But surprisingly, the effect of exercise in the reported study was an increase in post-intervention stress. This is contrary to what is reported in literature around workplace stress and exercise. Although this is not an expected result, it does prove a useful outcome in that stimulates thinking about why this might have been the case and provides direction for some further research.

One potential explanation for the outcome relates to the promotion of exercise to employees. The health facility has a wellness program for their employees, however in this research context the wellness program was not effectively promoted to employees. Moreover, some aspects of a wellness programs that do exist in the facility primarily focused on patients, and not employees. The wellness programs that did exist consisted of yoga, meditation, smoking cessation, and nutrition and weight loss programs. It may be that the dance program did not align well with the needs of this particular context.

For a wellness program to be effective in changing the hospital culture, there are several factors that should be considered. Hospitals and healthcare system that have effective wellness programs have aligned the program to the strategic goals of their organization, supported participation by providing incentives, provided a strong multiyear financial commitment to sustain the program, and include an evaluation process (Health Research & Educational Trust, 2015). The success of a wellness program relies on strong support and commitment from senior leadership of the organization (Health Research & Educational Trust 2015).

An effective wellness program can help the hospital achieve the Occupational Safety and Health objective of Healthy People 2020 in the United States (Health Research & Educational Trust, 2015; Office of Disease Prevention & Health Promotion, 2018).

In light of the result that workplace stress increased after the dance class intervention, one question that might be raised is: "Are there differences in preference between long term contract and non-contract employees as to the type of wellness program? The need for further research to compare the effect of

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

different wellness programs between long-term contract, and non-contract employees, is now evident. Furthermore, the result of the research also points to the need for studies which collect contextual data as well as intervention data. A mixed methods research methodology is recommended as it will give depth of insight into quantitative results. Mixed methods will give important insights into contextual factors and address questions such as "Were there other significant events occurring in the workplace at the conclusion of the intervention which lead to increased stress levels?"

CONCLUSION

The purpose of study was to investigate the effect (if any) of long-term contract employees participating in an intervention on workplace stress, absenteeism and presenteeism. This study focused on whether long-term contract employees stress levels, absenteeism and presenteeism were affected by the aerobic dance intervention from August 1, 2018, to August 31, 2018. Results showed effect on stress levels but no effect on absenteeism and presenteeism. The most valuable outcome of the study is identification of potential further research considerations on wellness and long-term contract employees.

Limitations that were identified were sample size, duration of the intervention, length of HPQ, employment agency relocation, lack of random selection and random assignment to treatment and control group, and lack of control group, statistical test, and job relocation. Consequent recommendations include future research, which expands the number of long-term contract employees, and number of campuses, to increase the sample size. The use of a mixed method design would be beneficial to future research to further insight into the effects of a wellness program and any phenomena that influences participants' behavior and attitudes.

Chapter 61
Leisure and Wellness Perceptions of Tourism Workers in Work-Life Balance

Gülseren Yürcü
Akdeniz University, Turkey

Ülker Çolakoğlu
Adnan Menderes Üniversity, Turkey

ABSTRACT

In this study, the concepts related to leisure and wellness perceptions will be discussed in order to provide the work-life balance of tourism workers. With a descriptive analysis, it will be discussed how leisure time evaluation and wellness perception contribute to the work-life balance of tourism employees as strategies to cope with work and non-work problems. The fact that the work-life balance of tourism employees is at an optimum level is of great importance for the tourism industry where business factor and service quality are critical. Factors such as uncertainty environment, low labor morale, and high turnover rate constitute the general business life characteristics of tourism employees. As a result, the effect of leisure and wellness perceptions of tourism employees on coping with these factors and establishing work-life balance will be discussed in the light of related literature.

INTRODUCTION

The low level of well-being of tourism employees in business and non-business life is an important factor that will adversely affect business performance. Difficult working conditions brought about by intense and uncertain competition environment in tourism enterprises, stress and similar negative emotions caused by radical changes in social structure and family life, it causes individuals to be "unhappy". It is impossible for a person to be in full well-being in societies where work and life safety cannot be ensured, there is no possibility of finding a job, and the unrest created by the imbalance of income distribution is not resolved (Kesgin and Topuzoğlu, 2006, p.47; Araz et.al.,2007, p.112). The biggest strength of the

tourism enterprises in the service sector is its employees. Akıncı (2002) states that the factors that affect the job satisfaction of the employees of tourism enterprises are psycho-social factors. The voluntary / self-sacrificing behaviors of employees beyond the normal defined job descriptions in their relations with the guests of enterprises will increase the competitiveness of the enterprises. This situation depends on the high \ balance of well-being of tourism workers not only in their work but also in their non-work lives.

Work-life balance is primarily related to the ability of the employee to maintain control between work and non-work life and to balance these two different living spaces so that they do not adversely affect each other. The intense pace of work and uncertainty in tourism enterprises may cause this balance not to be found. Therefore, wellness perceptions of tourism workers are negatively affected. The American Council on Exercise (2000) states that creating free time during the day enables employees to renew themselves psychologically and emotionally and increases their work performance. Tourism enterprises have long working hours, dynamical structure, stress caused by service problems developing beyond the control of employees, problems in customer relations are problems in maintaining work-life balance. These factors lead to unhealthy and low moral morale, conflicts and stress levels. The most important help of the employees in coping with such promotions is the recreational activities they participate in work or non-work time (Mokaya and Gitari, 2012). Abe et al. (2016) found that there is a significant relationship between wellness programs and work-life balance strategies.

Recreation can be defined as all kinds of activities that individuals do in order to increase their well-being in leisure periods (in business life or non-business time) reserved for them. Individuals who have achieved awareness of the physiological, psychological and sociological positive effects of the activities as a result of participation in recreational activities can achieve long-term happiness. The benefit of achieving a balance between leisure and work has been demonstrated by examining many variables, such as spending time with family and friends in leisure, important factors of goodness, social and family adjustment (Brown et.al. 2011, p.45). Mbaabu (2013) found that physical fitness programs improve job quality, job performance, productivity and morale, mental health programs reduce stress and anxiety, improve mental ability awareness, and entertainment programs increase group commitment, team performance and productivity. It showed that fitness, mental health and entertainment have an impact on employee performance and well-being.

Wellness refers to optimal health rather than disease-free health (Rančić et.al., 2013). Individuals deal with many chronic diseases (sugar, heart, blood pressure, obesity, etc.) in their daily lives, as well as psychological (anxiety, anxiety, stress, etc.) and social (loneliness, social interaction anxiety, etc.). The point of dealing with these problems and encountering is the fact that the incidents seen at certain ages in the past are encountered at every age and area today. Therefore, it is also important to adopt preventive treatment / therapy practices and to increase awareness of individuals on these issues and to support them with state policies. The perception of classical health in individuals physician, operation medication and so on. has evoked concepts such as regular nutrition, ati-aging, beautification, and being fit with changing health consumer awareness. Healthy living is an active process that enables people to become conscious and make choices against a more conscious existence. (www.nationalwellness.org). Stress factors (irregular nutrition, environmental pollution, unfavorable working conditions, deterioration of family unity, economic uncertainty, etc.) that individuals encounter and cannot overcome or manage in their daily lives cause problems in socio-psychological well-being as well as negative physiological consequences (Zengin, 2018). Wellness plays an important role in evaluating the leisure time of individuals from past to present, preserving and improving their health (physiological, psychological, sociological). Wellness focuses on minimizing the effects of the three dimensions of stress that individuals are most

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

exposed to today's conditions and that adversely affect their health, p. physical stress (causing irritation to the nervous system), chemical stress (causing body toxicity), and mental stress (especially triggering hormonal changes in the adrenal glands) (Rančić et.al., 2013). Employee wellness reflects the reality that an employee is in contact with others and the world and finds meaning in work and life. Employees are often unable to leave work-related issues at work, but also carry them out of work (Bumhira et.al,2017, p.223). Therefore, leisure activities play an important role in ensuring the work-life balance of the employees and contribute to increasing their well-being.

It is stated that the relationship between individuals' participation in leisure activities and wellness perception is positive. Because the individual's well-being is closely related to his lifestyle. Wellness aims to identify health-enhancing factors and to make changes in the way individuals live in this direction. Leisure activities, on the other hand, make a significant contribution to the positive changes in the lives of individuals and to increase their well-being at this point.

Particularly, individuals have the opportunity to participate in open leisure activities, to eat healthy foods, to do their daily physical activities, to get rid of the stresses caused by their daily lives, to clean and improve their bodies. Outdoor leisure program participation helps individuals to be free from alcohol, drugs, tobacco and even refining from processed food (detoxification) (Carpenter and Harper,2016). Many studies in the relevant literature indicate that the participation of leisure activities in young people (or disabled youth) provides many positive benefits such as prevention of metabolic problems, development of physical functions, prevention of obesity, strengthening of friendships, development of skills and competences, and support for creativity (Voruganti et. al.,2006; Murphy and Carbone,2008; Trainor et.al.,2010). Granello (2001) found that between 18-22 young adults and adults aged 35-77 years, younger adults had higher levels of well-being.

In this study, the concepts related to leisure and wellness perceptions will be discussed in order to provide the work-life balance of tourism workers. With a descriptive analysis, it will be discussed how leisure time evaluation and wellness perception contribute to the work-life balance of tourism employees as strategies to cope with work and non-work problems. The fact that the work-life balance of tourism employees is at an optimum level is of great importance for the tourism industry where business factor and service quality are critical. Factors such as uncertainty environment, low labor morale and high turnover rate constitute the general business life characteristics of tourism employees. As a result, the effect of leisure and wellness perceptions of tourism employees on coping with these factors and establishing work-life balance will be discussed in the light of related literature.

WORK-LIFE BALANCE IN TOURISM WORKERS

Tourism enterprises are undergoing continuous change and renewal process due to changing consumer tendencies and environmental factors that directly or indirectly affect tourism. In this process, businesses are constantly improving their service quality in order to attract new tourists and to protect existing tourist profiles, and to provide their employees with an appropriate working environment and to make them available and to attract qualified personel. Poor conditions in hospitality businesses, low wages, low probability of retention of qualified personnel and low status make it difficult to attract and retain employees. With these features, hospitality businesses host high levels of stress factors for employees (Mansour and Tremblay,2016). Hospitality is a highly stressful sector due to its highly labor-intensive, includes intensive rotations, work overload, anti-social working hours, intensive contacts with custom-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ers, and highly emotional labor characteristics (Tsaur and Tang,2012). The length of workplace hours determines the extent to which employees are exposed to hazards such as unfavorable working conditions and toxic substances. The length of working hours and overtime causes shorter employee renewal times. If employees cannot charge themselves mentally and physically, this leads to physical and mental deterioration. Overtime and shift working hours in the workplace lead to disruptions in the sleep patterns of the employees, as well as disruption of circadian rhythms (sleep / wake cycle) associated with biological functions such as hormone disorder and sleep (Brauner et al, 2019, p. 2). Burnout is one of the most important problems arising from the negative workplace conditions of tourism workers. Burnout causes loss of resources in the process of managing work and leisure roles. Individuals with scarce resources are less likely to solve work-leisure problems and psychological well-being levels (Tsaur and Yen, 2018, p. 122). It is stated that there are differences between generations of tourism workers and job satisfaction, loyalty and turnover rate (Park and Gursoy,2012; Tsaur and Yen,2018). Compared to the Baby Boomers and X generations, Millennians say they have a greater desire for flexible work, greater relaxation and enough time to participate in leisure activities (Park and Gursoy, 2012). When Millennials are interfering in their spare time and their perceptions of inability to relax, their level of satisfaction decreases and their psychological well-being is negatively affected (Tsaur and Yen,2018). Lin et al. (2014) found that work-leisure conflict positively affects job burnout, negatively affects leisure time participation and well-being, leisure time participation is positively related to well-being, and burnout is negatively related to well-being. Similarly, Tsaur and Yen (2018) found that work-leisure conflict negatively affects leisure satisfaction, psychological well-being and job satisfaction in their study of Taiwan tourism workers.

Work-life balance involves the effective management of multiple responsibilities at work, at home and in different living spaces (Naithani, 2010). Darcy et al. (2012), the work-life balance "one size fits all" state that is not a concept. They state that work-life balance is a subjective concept that needs to be designed in accordance with the goals of individual satisfaction, participation and time balance. Therefore, each employee should use strategies that will contribute to work-life balances in all career stages. An individual's life is not limited to family life, but also includes other aspects of work, sports, personal development and leisure. Work-life balance is the harmony between the amount of time, commitment and effort when an individual devotes to work and non-work activities (Lazar et al., 2010). Good management of work-life balance leads to an increase in job and life satisfaction due to positive impact on employee health (Malik et al., 2014). World Health Organization (2003) reported that physical activities at work reduce sick leave by 32%, health care costs by 20-55% and increase productivity by 52% (Mokaya and Gitari, 2012; 177). Work-life balance has many organizational and individual benefits. These benefits are shown in Figure 1 and Figure 2.

Organizational barrier in maintaining the work-life balance of employees are managerial support, career results, organizational time expectation, genders perceptions, co-worker support, lack of communication and education about work-life balance strategies (Cieri et al.2005; 93, Lazar et al., 2010).

- **Managerial Support**: business managers play an important role in ensuring work-life balance by encouraging and discouraging employees' efforts to balance their work and family life.
- **Career Consequences:** Another factor that prevents the success of work-life balance is the perception of negative career outcomes. The perception that work-life balance practices will negatively affect career expectations by employees appears to be a strong barrier for their use.
- **Organizational Time Expectation:** The existence of "come in early and stay late" success criterion for employees in organizational time planning is accepted as a work-life balance barrier.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Therefore, businesses that want to increase their work-life balance success need to use new performance measures that focus on goals, results and outputs.

- **Genders Perceptions:** İn order to increase the success of organizational work-life balance, practices that will cause negative affect of the opposite sexes should be avoided.
- **Co-worker Support:** İt is considered that the employees' who use the work-life balance practices perceive their corporate commitment as low and affect the allocation of organizational rewards such as opportunities and salary increases in their career progression. Making the necessary adjustments and balances related to these factors which will negatively affect the success of work-life balance will reduce work-life conflicts.

Source: Beauregard and Henry,2009;10, Lazar et al., 2010;207.

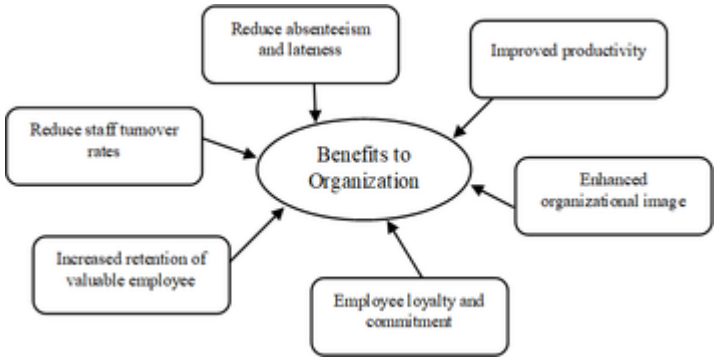

Figure 2. Employee Benefits of Work-Life Balance
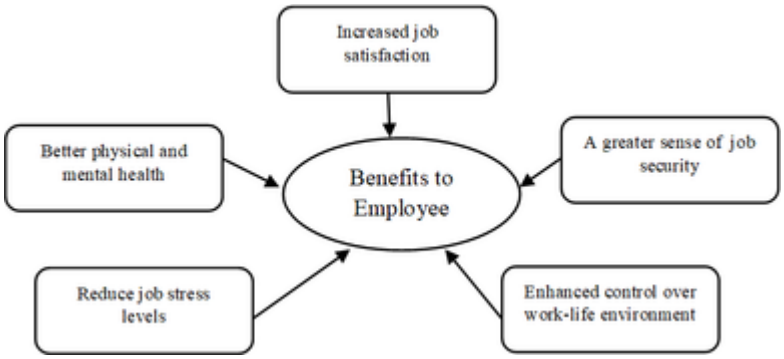
Source: Lazar et al., 2010;208.



Work-life balance strategies such as temporal flexibility, interpersonal relationships have the potential to reduce stress on workers with life responsibilities (Cieri et al.,2005). Leisure and leisure activities can be considered as a strategy for coping with problems arising from work and non-work situations (Iwasaki and Mannell, 2000). Business managers benefit from the intangible advantages of recreation programs such as improved staff morale and productivity of leisure activities, retention of staff and

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

improved corporate image (Goetzel et al., 2001). The individual's well-being affects the physical and mental conditions in subjective terms as well as external factors such as manager's behavior, working hours and workload. Wellness programs provide important contributions to employees in maintaining work-life balance (Bumhira et al., 2017).

LEISURE

Leisure is defined by Dumazedier (1962) as the freedom to choose enjoyable activities in which the individual is freed from work, family and social time obligations (Veal,2019). Recreation, on the other hand, can be defined as all kinds of activities that individuals do in order to increase their well-being in all time periods (in business life or non-business time) they have reserved for themselves. Recreational activities play an important role in the conscious evaluation of leisure time. Individuals can participate in recreational activity programs to feel good at work and in their non-work lives. Participation in recreational activities primarily activates the hedonic (Tütüncü, 2012) affect of the individual. The fact that individuals carry out recreational activities with their own free will and their free choice and make them into lifestyles contributes significantly to their long-term happiness. The need for recreational activities by Karaküçük (2001) is expressed as, in personal terms; physical health development, mental health, socialization of people, creativity, personal skills and ability to develop, work success and impact on work efficiency, economic mobility, make people happy, socially; social solidarity and integration and creation of a democratic society. Recreational activities may have different characteristics and importance for individuals of any age group or profession. The level of individual readiness, viewpoint to life and the perception of events cause changes in the degree of interpersonal importance of recreational activities. Individuals are expected to acquire certain learning and make positive changes in their lives rather than merely participating in recreational activities. Tekin et al. (2009) found that participation in physical exercise (step, folk dances) in their spare time was effective on students' depression and assertiveness levels, Yiğit et al. (2013) decreased body weight, body mass index, body fat amount, daily energy needs, body age and parameter in women doing aerobic and fitness exercises for recreational purposes, was determined.

Although individuals' leisure time learning is formal and informal (Tütüncü 2012; Kızanlıklı 2014), it is generally informal learning. Recreation learning of individuals, can be explained by social and transformational learning that expressed as "personal and intellectual development and mature to develop their own assumptions, beliefs, feelings and perspectives to learn to question purposefully, and individuals' attitudes, beliefs and assumptions through critical reflection of the world to find new ways to recognize and apply" (Akpınar,2010, p.186). Informal leisure time learning of individuals is also the result of a culture. In the study of Yeniçeri et al. (2002) to determine the leisure time tendency of civil servants in Muğla city center, the leisure time of the civil servants was generally coffeehouse and so on. places, sports fields, and open areas for sightseeing purposes. Türker et al. (2016) found that Safranbolu people generally spend their free time with passive activities by watching TV with family, listening to rest, walking, listening to music, and the participants generally prefer to spend their time with their friends.

Recreational activities have a feature that increases the performance of employees (Lazar et al., 2010). Mokaya and Gitari (2012) found that recreation positively affects employees' well-being by creating positive effects on job satisfaction, service delivery, customer satisfaction and productivity as they increase employee performance and commitment. In addition, it was found that the employees who participated

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

in the recreational activities were useful with 0.61 relationship in their work-life balance management. In addition to the impact of participation in recreational activities on employees and operational efficiency, strengthening socialization and value creation in relationships with customers improves the interaction, communication and leadership skills necessary for effective service delivery (Mokaya and Gitari, 2012). In the work of Becker and Tews (2016) for the workplace entertainment activities of tourism employees in the USA, the most frequently participated activities of hotel employees are; food at work, special events and recognition of personal milestones. Unlike; the least frequent activities of hotel employees; personal development opportunities, stress relieving activities and games at work.

WELLNESS

Wellness is a dynamic process of being aware of psychological, physiological, sociological well-being and satisfying life and making the right choices. While the classical health perceptions of individuals evoke concepts such as doctors, operations and medicines, they have evoked concepts such as balanced regular nutrition, ati-aging, beautification and fit with changing health awareness in today's conditions. Individuals deal with many chronic diseases (sugar, heart, blood pressure, obesity, etc.) as well as mental (anxiety, anxiety, stress, etc.) and social (loneliness, social interaction anxiety, etc.). What is remarkable in dealing with these problems is the fact that the incidents seen in certain ages and areas in the past are encountered in all ages and occupational groups. At this point, the adoption of preventive treatment / therapy practices in the early stages and raising awareness of these subjects and supporting them with state policies are also important for healthy individuals and societies in the future.

The concept of wellness began to be used in the United States in 1930 as a combination of the words being well-being "and" fitness " (Rančić et al., 2013), refers to being fit in the mind, body, soul and relationships of the individual. Wellness practices treat the individual as holistic in many ways such as beautification, fit, health, well-being, socialization and relaxation. All kinds of sports activities, massage, skin care, mud-algae-plant baths, balneotherapy, thalassotherapy and healthy living methods such as massage, skin care, thalassotherapy and well-being are included in the scope of wellness. There are many definitions of wellness that deal with the individual with a holistic approach;

- Wellness is a self-directed consciousness that improves the process of achieving full potential.
- Wellness is multidimensional and holistic, covering lifestyle, mental and spiritual well-being and the environment.
- Wellness is positive and supportive (www.nationalwellness.org), andis expressed as.

Wellness & SPA applications date back to Greek civilization. It spread from the Romans to many parts of the world. Mesopotamians, Greeks, Romans and other cultures have experienced the full healing power of regular bathing. This trend has increased in the 21st century in the comfort and rewarding of working individuals. Wellness as a new style of living, a new style of holiday and a new style of nutrition is nowadays. Wellness is no longer just a trend but also a lifestyle philosophy (Ergüven, 2010, 87).

According to 2017 reports, the wellness economy is reported as 4.2 trillion dollars. 4.2 trillion dollars of the economy; $ 1,083 million in beauty and anti-aging, $ 702 million in healthy food, nutrition & weight control, $ 639 million in wellness tourism, $ 595 million in fitness, bodybuilding, $ 575 million in preventive, individual and public health, $ 360 million in complementary and alternative medicine, $

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

134 million of wellness lifestyle-specific real estate, $ 118.8 million SPA industry, 56.2 million dollars thermal facility market, constitutes (Wellness Now, n.d)

The total number of wellness visitors in the world reached 830 million people in 2017. The total expenditure of wellness visitors in 2017 is 639.4 million dollars. America (176.5 million people, spending 226 billion dollars), Germany (66.1 million people, spending 65.7 billion dollars), China (70.2 million people), and China (70.2 million people), Spending $ 31.7 billion). Considering the average growth rates of 2015-2017, Slovakia ranks first with a growth rate of 36.9%, Pilipins with 31.1% and Chile with 29.3%. Global Wellness Institute in Turkey according to 2017 data is 19. Values in the wellness tourism market in the first 20 countries in the world (9.1 million people, spending $ 4.4 billion) (Global Wellness Institut, 2018).

Wellness Dimensions

Wellness also refers to a complex situation consisting of overlapping levels of health (Dunn, 1959, p. 786), therefore, the number of models developed regarding the concept of wellness is quite high. The reason for this is that although there is much interest in wellness in the related literature, it cannot be met in a common definition from different perspectives (Roscoe, 2009, p. 216). In the first definitions of wellness, the concept health was stated as the absence of any disease, and psychological and sociological health was also mentioned by redefining health. Egbert (1980) summarized the focus areas of healthy life as an integrated sense of identity, an integrated personality, a perspective for reality and a clear meaning and purpose in life. Travis and Ryan (1988) conceptualized healthy living as individual responsibility and love. Witmer and Sweeney (1992) and then Myers, Sweeney and Witmer (2000) described a holistic concept of well-being consisting of spirituality, self-control, work, friendship and love (Roscoe, 2009, p. 217). Myers et al. (2000) "The Goodness Wheel Model" (Korkut-Owen and Owen, 2012) (WOW, The Wheel of Wellness) is based on Adler's theory of individual psychology and is based on the individual's most important vital tasks, p. work, friendship and love. comprising. Spirituality is stated as the central feature of the Goodness Wheel Model. In addition, 12 tasks were conceptualized that function like fingers in a wheel-column, providing self-direction (essence of emotion, sense of control, realistic beliefs, emotional awareness and management, problem solving and creativity, sense of humor, nutrition, exercise, personal care, stress management), gender, cultural identity). The WOW model has been united in a contextual framework that defines global influential forces (family, society, government, media, business, industry, education, religion) and many interactions in society and the environment that can affect the overall functioning of the individual (Myers et al., 2004).

- **Physical Wellness:** Refers to the physiological well-being of individuals. Hettler (1980) state of physical well-being, flexibility, strength and degree of development and prevention of cardiovascular health, Renger et al. (2000), the individual's level of physical fitness and nutrition as well as avoidance of harmful behavior is defined as (Roscoe, 2009, p. 219). In the physical wellness dimension, the important thing should be prevented before it occurs, not after the disease occurs. In order to maintain and improve the level of physical well-being, it is necessary to eat balanced and regular diet, to exercise regularly, to consume organic food, to avoid harmful habits such as cigarettes, alcohol, to recognize the symptoms of illnesses and to prevent accidents.
- **Psychological Wellness:** Adams et al. (1997) define the state of psychological well-being as having optimistic thoughts about the results of individuals about their experiences and events. In

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

order to develop and maintain psychological well-being, it is necessary to keep emotions and thoughts under control, to develop an optimistic attitude, to have time management skills, to know yourself well and to use stress management techniques.

- **Emotional Wellness:** İt includes the ability of an individual to cope with stress, to adapt to change, to maintain sincere friendships (Zorba and Gönülateş, 2016, p. 115), to be aware of their emotions and to maintain and express their feelings in a healthy way. The emotional dimension of wellness includes three different areas, p. awareness, acceptance and management. Emotional awareness, individual's own feelings as well as others' awareness of emotions, emotional acceptance; emotional control of the individual's personal abilities and realistic limitations; it means the control of individual emotions and the ability to cope with them, and how and when they can be supported when necessary (Zorba and Gönülateş, 2016, p. 115).
- **Social Wellness:** Hettler (1980) is defined as the relationship between the individual and others. Social wellness is a movement towards the integration and balance of the interaction between individual society and nature and expresses an effective communication and healthy relationship with other individuals around the individual (Roscoe, 2009, p. 218). Social well-being will be at a high level as long as the individual establishes intimate friendships, joins the community, develops close family ties (Zorba and Gönülateş, 2016, p. 116), develops his talents and skills, and conveys his sincere feelings and thoughts to the other party.
- **Intellectual Wellness:** Hettler (1980) defines the state of intellectual well-being, the extent to which an individual engages his mind with creative and stimulating activities, as well as the use of resources to improve the level of knowledge (Roscoe, 2009, p. 220). This means that you can apply what you have learned, create opportunities to learn more and engage your mind in a very lively interaction with the world around you (Ertüzün, 2016; 567).
- **Economic Wellness:** İt refers to the individual's consumption possibilities and their use on resources. In addition, when individuals consider the well-being of both themselves and future generations, they want to consume some of their current income and save the rest (Osberg and Sharpe, 2002).
- **Occupational Wellness:** İt refers to the individuals' satisfaction with paid and unpaid jobs, their ability to balance their attitude and several roles, how they can use their skills, their ability to contribute to society, and to what extent these values can be expressed (Foster and Keller, 2007).
- **Environmental / Climatic Wellness:** İt has a broad dimension (eg balance, influence, control) that determines the individual's interaction with the environment on a global level. The environment includes home, work, community and nature (Foster and Keller, 2007). The climatic dimension is; individual's climatic (climate change, depletion of resources, increasing world population, disease outbreaks, technological anarchy and geopolitical tensions, economic instability and social turmoil) as a result of changes in the state of well-being (Fritze et al., 2008).
- **Spiritual Wellness*:*** İt is defined as an innate and continuous process of finding meaning and purpose in life while accepting and exceeding the place of the individual in the complex and interrelated universe. Spiritual wellness is a shared connection or community with others, nature, the universe, and a higher power (Foster and Keller, 2007).

RECREATIONAL ACTIVITIES AND WELLNESS RELATIONS

Wellness plays an important role in evaluating the leisure time of individuals from past to present, preserving and improving their health (physiological, psychological, sociological). The relationship between individuals' participation in recreational activity and wellness perception is reported to be positive (Torkildsen,2006;62). Because the individual's well-being is closely related to his lifestyle. Wellness aims to identify health-enhancing factors and to make changes in the way individuals live in this direction. At this point, participation in recreational activities contributes significantly to the positive changes in the lives of individuals and the promotion of their well-being. Koçyiğit and Yıldız (2014, p.216) state that the benefits of recreational activities to individuals and society; to allow the individual to express himself, to increase creativity, to provide new experiences to people, to establish friendship relationship and to expand the social environment, to create happy and healthy individuals, to increase productivity, to contribute to the development and regulation of mental health of individuals, contribute to the improvement of life level. Individuals especially have the opportunity to participate in outdoor recreation activities, to eat healthy foods, to do their daily physical activities, to get rid of the stresses caused by their daily lives, to clean and improve their bodies. Outdoor recreation program participation helps individuals to be free from alcohol, drugs, tobacco and even processed foods (detoxification) (Carpenter and Harper, 2016). Employee wellness programs help employees to overcome and deal with stress from drug / alcohol addiction, financial/debt problems, medical and chronic illnesses, career crises and job demands (Tuwai et al., 2015). In addition, in the organizational sense, wellness programs play a role in enhancing employee morale, commitment and productivity. Through participation in wellness programs in the workplace, employees aim to feel better and have more energy. In addition, these programs raise the awareness of employees about their health and strengthen their responsibility to take responsibility (Rančić et.al., 2013). Business managers should organize corporate, environmental, financial, intellectual, physical wellness programs and support the participation of employees to increase employee well-being (Tuwai et al.,2015).

Chapter 62
Foreign Education, Underemployment, and Wellness: Lived Experiences of African Immigrants in the USA

Joseph O. Otundo
University of Arkansas at Little Rock, USA

Jane A. Opiri
University of Arkansas at Pine Bluff, USA

ABSTRACT

Although the number of African immigrants in the United States has steadily increased, there remains a gap in understanding their lived experiences in the context of employment and wellness. Using qualitative method, this study investigated underemployment and wellness among six foreign-educated African immigrants. The purpose of this chapter is to discuss three themes that emerged from this study. Study design utilized was grounded theory. Participants in this study held professional jobs before relocating to the US. Results suggest that despite excitement of migrating to the US, African immigrants experience myriad life events from the time they land until when they settle down. Yet, the adaptation mechanisms reported include social networking and social support. Thus, three themes that emerged from this study are occupational, emotional, and social wellness. From the findings, the authors developed underemployment versus wellness conceptual framework that can be used for future studies.

INTRODUCTION

Recent studies (PEW Research Center, 2020) show that more than 13.6% (40 million) people living in the United States were born in another country. Evidence shows that the immigrant population in the United States is very diverse with every country represented. Notwithstanding, 27% of the immigrants are permanent residents. However, despite this representation, the same is not reflected in employment. A recent study exploring employment in the USA found that majority of African immigrants are underemployed (Tesfai, 2017). On account of this, underemployment is a situation in which individuals get employed in workplaces they are overqualified (Caicedo, van Gameren, & Amuedo-Dorantes, 2018). Thus, it is when individuals whose academic qualifications, experience, skills, and knowledge exceed what they need for the jobs they are doing.

Authors for this study identified a gap in understanding African immigrants' lived experiences in the context of underemployment. More specifically, the study sought to understand African Immigrant feelings about employment opportunities and effects on their life. Therefore, the objective of this chapter is to present research findings from a qualitative study done with African immigrants exploring their lived experiences in the context of underemployment and wellness.

BACKGROUND

Underemployment

Batalova, Fix, and Bachmeier (2016) define underemployment as workplaces that highly skilled persons work in low-skilled jobs requiring moderate or less on-the-job training. Low skilled jobs typically require a high school diploma or less, for example, personal-care aides, housekeepers, and truck drivers. Research findings show that 40% of African immigrants and 36% of the US born white population aged 25-40 have at least a bachelor's degree (Tesfai, 2017). But with regard to employment, African immigrants are disproportionality underemployed and continue to be part of the population segment that is significantly underemployed (Hailu, Mendoza, Lahman, & Richard, 2012). Whereas US experienced significant decrease in underemployment between 2010 and 2019, there still exists disparity based on race and country of birth (Batalova et al., 2016; Nunn, Parsons, & Shambaugh, 2019). In a recent annual report, America's Health Rankings (2019) revealed 11.6% and 6.1% underemployment rate among black adults and white adults, consequently. It has also been suggested that African Immigrants experience more occupational segregation than other races (Tesfai, & Thomas, 2020).

Despite the fact that academic credentials are supposed to help secure employment opportunities, this has not always been the case with African immigrants. Highly skilled immigrants often find it hard to transfer their knowledge from home country to the United States (Batalova et al., 2016). A qualitative study with immigrants describes frustration felt by African immigrants when their foreign education and work experience fail to help them secure descent jobs (Baran, Valcea, Porter, & Gallagher, 2018). Evidence shows that of the total number of unemployed people in the USA, foreign born and educated immigrants account for 60% (Batalova et al., 2016). Consequently, immigrants experience perceived broken promises and pleasant surprises.

Studies show that there many factors that account for this unemployment. It is appalling that immigrants are discriminated based on accent, rather than looking at the skills and qualifications required

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

for the advertised positions (Hosoda, 2016). Also, it is unfortunate that language fluency and cultural knowledge indirectly limit immigrants' acquisition of jobs (Guerrero & Rothstein, 2012). Accordingly, employers tend to connect and hire individuals that exhibit language and cultural competency.

In their study, Lane and Lee (2018) provide four lived experiences of immigrant workers: loss of community; lack of voice; frustration with U.S. educational and regulatory systems; and pride in their vocation. Immigrants are frustrated when educational credentials seem not to help them navigate the US system to secure good jobs. Loss of community also points to frustrations of working in an unfamiliar territory surrounded by strangers. Immigrants lack the social support to lean on. Immigrants feel they are on island with individuals or neighbors who seem not to understand their plight. Lack of voice is felt because accent or language barrier make it hard to express concerns and frustrations (Hosoda, 2016). As much as majority of immigrants from Anglophone countries are fluent in written and spoken English, there is the issue of assent. In addition, immigrants suffer from imperfect transferability and queuing approach (Tesfai, 2019). That is, employers discount immigrants' educational qualifications and work experience; and rank applicants on racial 'hierarchy' rather than academic qualifications.

Economic Burden

Underemployment rate has often been used as one of the indicators of economic health of a nation, state, and individual families (US Bureau of Labor Statistics, 2019). Evidence shows that there is economic burden of unemployment both to individuals and governments (Pettinger, 2019). Economic effect on individuals include loss of income and lower on job-training. Underemployment has been linked to low income as workers on full time jobs do not receive wages that are enough to significantly raise their income above poverty line (Thomas, Horton, & Henderson, 2019). Evidence shows that 71% of immigrant workers are engaged in service industry which is often dirty, demanding, and demeaning, and professional work (Moyce & Schenker, 2018; Quandt et al., 2013). Recent study found 25% foreign born graduates in the USA is either unemployed or underemployed (Batalova et al., 2016). Basically, skilled workers forego $39.4 billion earnings between 2009 and 2013. Another scientist reported that underemployment rate among African Immigrants has huge economic burden (Wiltz, 2015). At personal levels, a study with African Immigrants revealed association between underemployment and material deprivation, limited participation in social events, limited access to social rights, and insufficient cultural and community integration (Saasa, 2019).

Albeit African immigrants being generally more educated than US-born workers, they earn lower wages (Waters, Kasinitz, & Asad, 2014). Lower wages are associated with low socioeconomic status for the families. Interestingly, there is association between time of stay in U.S., employment opportunity, and earnings (Frankenberg, Gansey, & Thomas, 2015). Immigrants that cope and stay longer tend to find upward paths, better jobs, and increase in income. On the other hand, immigrants that are frustrated and dissatisfied with their current jobs or are underemployed decide to be self-employed (Frankenberg et al., 2015).

Economic burden on underemployment to governments include loss of tax and higher benefit spending (Pettinger, 2019). In addition. Studies have shown that underemployment has led to economic slack in the US (Bell & Blanchflower, 2018). Underemployed persons make less money which indirectly stagnates or slows down economic growth at county, state, and federal level.

Finally, scientists point to relationship between economic and social health (Akhmat, Zaman, Shukui, Javed, & Khan, 2014). Even though Akhmat et al. (2014) revealed direct relationship between education,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

economic empowerment, and social health, there seems to be disconnect with immigrant population (Waters et al., 2014).

Social Health, Social Networks, and Social Support

World Health Organization (WHO, 2020) defines Health as "a state of complete physical, mental and social wellbeing and not merely the absence of disease or infirmity." Being one of the categories of personal health, social health entails establishment of strong and healthy relationships with others. With the massive economic and social health challenges faced by immigrants, the role of social networking and social support cannot be overlooked. While social networking and support enhance social health (Heaney & Istrael, 2008; Shinyshiny, 2020), their absence has profound negative effect on individuals, families, and community.

Undoubtedly, immigrants lean on family members and community for social support (Premji, & Shakya, 2017). In addition, researchers (Heaney & Israel, 2008), suggest the use of social networks as linkages among people to provide social support and social capital. Primarily, social networking becomes handy as a tool that can be attained by the local community by reaching out to immigrants and vice versa (Kyeremeh, Arku, Mkandawire, Cleave, & Yusuf, 2019). Albeit refugee organizations liaising with local organizations to provide social support to immigrants (Bran et al., 2008), non-refugee immigrants rarely benefit from such services. An approach that is accessible and often used by immigrants is establishing social networks and joining religious organizations such as churches (Saasa, 2019).

CONCEPTUAL FRAMEWORK

A recent review of interventional studies in social health suggest that one approach to understanding connection between economic issues and social health is conceptual model for the relationship of social networks and social support to health (Heaney& Israel, 2008). Social networks are either dyadic, that is specific relationship between individual and others, or whole. Whole networks is characterized by members with similar demographics, living in close geographic dispersion, and knowledge and interaction with each other.

According to Heaney and Israel (2008), the functions of social networking are social capital, social influence, social undermining, companionship, and social support. Hence, social support is the functional content of relationships that is categorized into emotional, instrumental, informational, and appraisal. Studies show that studying social networking helps to understand how change in social networking affects social capital and social health (Burke, Marlow, & Lento, 2010). It has also been shown that social networking and social support positively impact community and organizational competence, and ability to utilize human resources in solving community problems.

From the literature, there seems to be a gap in understanding the lived experiences, economic burden, and social health of underemployed foreign educated African Immigrants. Using qualitative research design, this study investigated lived experiences of African Immigrants in the United States. Specifically, authors sought to understand immigrants' experiences in the US.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

METHODS

Research Questions

a. What is the perception of Immigrants before and after arrival in the USA?
b. What is the feeling of foreign educated immigrants about working in the US?
c. How does underemployment affect individuals and families?
d. What is the perception of social health?

Design

For this chapter, authors used grounded theory design. Grounded theory is a qualitative research design that allows theories to emerge from the data collected (Astalin, 2013). Specifically, grounded theory design follows a flexible systematic method that entails data collection, coding, drawing connections, and determination of emerging theories.

Data Collection

Participants were recruited from African immigrants in the US. The process entailed recruiting participants and then asking interviewed participants to recruit or refer new potential participants. Participants were contacted using online platforms (email, what app, messaging, and phone calls). Interviews were conducted via telephone and what app video calls. Participation was voluntary and there was no compensation for participating in the study.

Participants

After IRB approval, participants (Table 1) were contacted. Eligibility criteria is: adults (+18); permanent residents and U.S. citizens; Immigrants from Africa; foreign college education; and Professional work experience prior to migration. Participants' level of education varied from two years of college after high school to Master's degree before they moved to US.

Table 1. Participants' Demographics

Participant	Gender	Career before Migration	Current Level of Education	Career Today
X	Male	K-12	PhD	Higher Ed
C	Male	Engineering	BSC	Engineering
T	Male	Craftsmanship	Assoc. Degree	Self-Employed
G	Male	IT	PhD	Higher Ed
Q	Female	K-12	PhD	Higher Ed
w	Male	K-12	Masters	K-12

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Measurement Instruments

Data were collected using telephone interviews. Interview questions were 5 questions with pros. Sample questions are: "What are your experiences with job search and placement in the US? Did anything surprise you? If so, what in particular did you find surprising? What resources helped you the most and why were they helpful?"

Data Analysis

Data analysis utilized grounded theory, an approach in which data are collected and simultaneously analyzed to reach a point of saturation to construct a theory (Charmaz, 2014). All telephone interviews were recorded and transcribed verbatim. Steps followed in the analysis process were: Coding the data; identification and making connections; interpretation of patterns; assessment of emerging themes; and development of a new theory. Coding conceptualized and analyzed, and identified patterns in the data. Coded data were then inserted into the table.

Results

The purpose of this study was to investigate underemployment and social health among African immigrants. In response to research question 1, overall outcome is that majority of immigrants encounter disconnect between their perception of US before and after arrival. All the participants had an assumption that life in US is easy and well-paying jobs are readily available. However, from these findings there is feeling of regret, home sick, hopelessness, and home sick.

Responses to research question 2 revealed that majority of immigrants initially find it hard to secure jobs that are equivalent to their academic qualifications. Due to economic demands, immigrants end up picking up jobs well below their educational level (also called underemployment). For instance, a participant with K-12 teaching qualifications started working as a cashier in a local retail store.

Responses to research question 3 point to occupational, emotional, and social impact of underemployment. Underemployment makes it hard to meet economic obligations such as paying bills. Findings revealed a link between occupational, emotional, and social health

Participants' responses to question 4 indicate two aspects of social health, that is, social support and networking. Results show meaningful relationships and bonds between individuals and family members, friends, and community. Bonding helped immigrants adapt to difficult social situations in addition to a sense of belonging. Networking became more useful after individuals settled down and began to know their neighbors, community members, and religious organizations. Immigrants extended their social contacts by making connections through individuals and other platforms such as Facebook.

Using grounded theory, three themes emerged from this study. Data organization was based on three themes (Table 2) that address research questions:

a. Occupational Health
b. Psychological Health
c. Social Health

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Themes and Sub-Themes

Theme	Sub Themes
Occupational Health	· Underemployment · Job search · Barriers
Emotional Health	· Stress · Life events
Social Health	· Social Networking · Social support

Occupational Health

According to WHO (2020), occupational health is improvement of working conditions and other aspects of environmental hygiene. Other scientists regard occupational health as a sense of satisfaction with choice of work (Roddick, 2016). Specifically, occupational health includes policy instruments, protection and promotion of worksite health, and access to health services. In this study, all the participants had professional training and work experience prior to migrating to the US. Sub-themes under occupational health that emerged are underemployment, job search, and barriers.

Upon resettlement in US, first jobs were not in the field of training, but rather low paying jobs that enabled immigrants to earn little money to pay bills and provide for basic needs. Participant Q said: "… so I had to lower my standards and apply for a cashier job in a local store because I really needed to put food on the table and pay the bills". This approach was common among all the participants. Some participants said they took a very long time before getting a job. For instance T said, "I came in the middle of recession. It took me four months before I got a job with Walmart. It was hard since my family also depended on me". Another issue raised was learning new job and adjusting to the shift. Four participants expressed the challenges of learning new skills, adjusting to new environment, and same time having either long shift or night shift.

Participants also discussed barriers they encountered in job search. Issues discussed included overqualification, distance to work places, foreign education, and certification, and discrimination. It was frustrating when immigrants could not be hired for jobs they qualified, and yet they were still turned off from minimal wage jobs for being too qualified. It was particularly interesting when one participant said as follows:

I didn't even use my experience to apply for the job so I just used my high school diploma to apply for jobs because I was told if I use my degree then I'll be overqualified for the job and I won't get the jobs. (Q).

Three participants explained how lack of personal cars made it hard to apply for jobs that were far away. Immigrants had to seek for jobs with employers along the bus line. This in itself made it hard to get jobs.

Four of the participants discussed the process of evaluation and recognition of their international education qualifications. Majority of them went through World Educational Services (WES). WES is an agency that evaluates and equates foreign academic credentials to US credentials. Having documents equated helped in job search. For instance three participants said through WES, they were able to get

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

teaching jobs. Participant C said, "…beginning was tough. But I was lucky to get a teaching job. After a long process, my foreign academic credentials were accepted by the local school board. I also think I was hired because of teaching STEM field."

All the six participants said they were surprised and frustrated to find that they needed US certification to be considered for the certain jobs. To navigate job search, all the participants said they had to enroll in US colleges either for degrees or certification credits. Participant C said this: "I have the knowledge, I have the skills, and experience, but I was told to get engineering job I needed certification. Employers refused to recognize my degree." It was surprising to learn that most professional jobs in US required certification.

Three participants said among the barriers they encountered was discrimination based on race or country of origin. One participant said despite having acquired a PhD in the US, it never helped him to get a job in his field of specialization. This could be attributed to race or country of origin. A female participant Q said:

I remember going to look for a job in one place and the line was so long and I just wanted a job. Among the requirements was applicant's photo. I mean, when you fill the paperwork and they ask for picture and that was already a red flag for a teaching job. We never go that job.

Emotional Health

Participants discussed stress and life events the major emotional issues they are facing. All the six participants mentioned experiencing stressful life especially during their early stay in the US. Three major causes of stress mentioned are non-employment and unemployment, 'Home sick', and life events. When probed about what stressed him most, participant C had this to say: "For my knowledge it is underpayment… some jobs are not paying well… You go up and expectations are not met". Likewise participant C said, "Life was not easy… I thought I would get jobs the following day. I stayed home for three months before getting jobs". Primarily, the above two participants describe how frustrating and stressful it was to be jobless or underemployed.

Four participants expressed how they were stressed doing odd jobs with minimal wage. One participant summarizes the conditions and feeling as follows:

I worked day and night. Moving from place to place. Only slept for 2 hours per night for four years. I had two days off per week. I felt bad… wanted to go back home but had family to support. (Participant C).

In addition, all participants expressed missing their previous lifestyle and felt homesick. Hence, on various occasions each participant thought of going back to their countries of origin. Participant X bluntly said "Felt lonely… thought of going back to Kenya". Feeling of homesickness seem to be associated with the circumstances in which African immigrants find themselves.

Life events was another sub-theme that came out from the interviews. Life events included feeling of economic insecurity, demeaned, and uncertainty due to lack of health insurance. Participant G said, "money is not enough… might not meet the needs. Having a spouse was challenging especially when you cannot help meet family needs". Another participant expressed life event related to health insurance. He said, "I became sick. I did not have health insurance. Going to emergency unit I had to wait for three hours". A female participant Q felt the life she was leading demeaned her status. She summaries

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

as follows: "my life… my parents…I did not want my relatives in Africa to ask me what I'm doing. I would never tell them what I was doing because I felt like this was not something that is expected of me".

Social Health

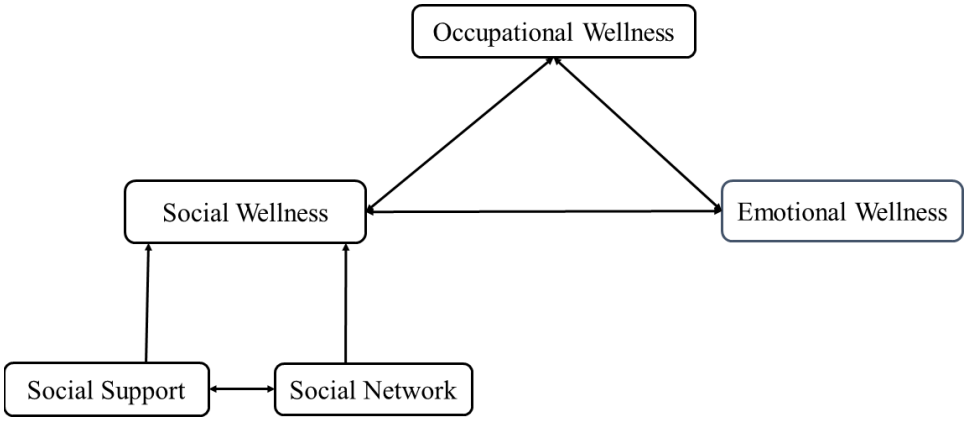
Social health had two sub-themes, namely: social networking and social support. Five participants talked about how they used social networking techniques to connect to jobs. When asked about source of support, participant C said, "My support came from my spouse… Had connections…church connections". That is, family member and church helped cope with challenges as well in job search. Four participants discussed internships and graduate assistantships to earn them permanent positions later. After getting USA certification, participant T interned with a local company. Here is what he said: "I was hired with a local company. I was a good employee. My supervisor recommended me to bigger company that suited my skills".

Second sub-theme is social support. During the stressful moments, immigrants seek for social support from church, friends, and family. Six participants expressed getting social support from church. Participant X, a university professor said: "I was connected to a Kenyan family on Sunday and took me to church…sponsored track phone and church members used to pay for my bundles". Five participants said they got social support from family by talking and encouraging each other. Social support also helped participants cope with stressful life. From this conversation, family members were stressed due to life events and talking to each other accorded the social support they needed.

DISCUSSION AND RECOMMENDATIONS

Overall, three themes that emerged from this study have implications for future interventional mechanisms. To that end, the authors developed 'Underemployment verses Wellness Conceptual Framework. (Figure 1).

Figure 1. Underemployment and wellness conceptual framework



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

This conceptual framework explores the relationship between occupational, emotional, and social health in the context of underemployment. Findings also showed that authors' model is different from 'Conceptual Model for the Relationship of Social Networks and Social Support to Health' (Heaney & Israel, 2008). This chapter revealed overlap between determinants of occupational, social, and emotional health. In addition, the three dimensions of health had both positive and negative impact on Immigrants. For example, occupational health is negatively impacted with underemployment, unemployment, and low wages.

In support of other studies, foreign-born persons have a slightly higher rate of underemployment than US-born white labor force (Wang & Lysenko, 2014). From emotional health perspective, immigrants are stressed by uncertainty and life events. On the flipside, social support and social network provide avenues to meet emotional needs. Similar to other findings, church members connecting with immigrants help address some of their concerns (Saasa, 2019). An example given in this study is a participant who talked of how church members helped with phone bills.

Immigrant social health was curtailed by language barrier and accent. Also, being far away from family members causes anxiety and stress. Findings from this study suggest existence of symbiotic relationship between social networking and social support. For example, social networking such as connecting with employers through friends and social media platforms can open doors for employment opportunities. There is evidence that African immigrants have either been underemployed or are currently underemployed (Batalova & Bachmeier, 2016). It is also apparent that underemployment impacts occupational, emotional, and social health. In nutshell, many immigrants find themselves facing stressful life when they move to US.

Upon migration, immigrants' experience disconnect between their expectations and reality. In other words, many immigrants migrate expecting many job opportunities and easy life. However, transitions proved stressful to all of the participants in this study. It takes a while to settle down, get a good jobs, and adapt to new culture and way of life. Results suggest that new environment takes toll on immigrants' occupational, social, and emotional health. In nutshell, results from this study support previous findings suggesting association between emotional health and social health (Umberson, Crosnoe, & Reczek, 2010).

Findings from this study show how social networking and social support can be useful in addressing occupational, emotional, and social health. Also, results support previous studies that identified connection between social networking and occupational health (Burke, Marlow, & Lento, 2010). Through social networking, community members get good and well-paying jobs that positively impact quality of life. Discoveries suggest that there are solutions to immigrant occupational health.

First, it is recommended that immigrants conduct some kind of research to understand the states they plan to move. For instance, they should find out job opportunities, social health of the people, government and private support of immigrants, and community response to immigrants. Immigrants could seek for evaluation and accreditation of their academic credentials. If necessary, it is recommended those individuals with desired qualifications seek for certification. As discussed earlier, earning a US certifications is an added advantage in job search. It cushions immigrants from discrimination or denial of jobs based on foreign education.

Also, it is recommended that immigrants take advantage of educational opportunities and financial aid to enroll in US colleges to further their education. As reported in this study, US college education increases probability for better employment opportunities. Nevertheless, precaution should be taken to ensure individuals enroll in courses that have high probability of employment. That is, immigrants could use online resources to identify careers that have high employment prospects.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Moreover, it is worth the trial for immigrants to seek for internship opportunities or graduate assistantships depending. Internship and graduate assistantship helps gain skills by learning on the job in addition to social networking and social support. In addition, this chapter advocates for provision of affordable wellness services to the immigrants by governments and private sector. This chapter findings collaborate other studies showing how immigrants suffer from enormous stress (Saechao et al., 2012) that sometimes result into mental health deterioration. Addressing this potential health issue ensures that the society is healthy and hence more productive.

The interrelationship between social network and social support was evident in this study. It seems important for immigrants to get out of their homes and connect with the community. Social networking can be done through personal referrals, social media, and attending community events.

The fact that immigrants take long to be hired in well-paying jobs shows the challenges of establishing or continuing with a career in a new country. Therefore, identifying measures that establish social networking and social support may help address occupational health issues affecting immigrants.

Lastly, testing the Underdevelopment verses Wellness Conceptual Framework on larger scale might help understand the immigrant lived experiences in the context of underemployment. Additionally, this framework could be tested in both qualitative and quantitative studies.

LIMITATIONS

Discuss future and emerging trends. Provide insight about the future of the book's theme from the perspective of the chapter focus. Viability of a paradigm, model, implementation issues of proposed programs, etc., may be included in this section. If appropriate, suggest future research opportunities within the domain of the topic. While this research explored underemployment among Immigrants, several limitations should be considered. First, being a qualitative study, the number of was smaller which limited demographic variation. Designing a study with more participants might increase diversity of ideas and experiences. Hence, more themes or sub-themes might emerge. In addition, majority of the participants being males, it is difficult to tell if equal gender representation might have provided more information. This is so because lived experiences of males and females are not necessarily the same (Hailu, Mendoza, Lahman, & Richard, 2012).

Second limitation emerged from telephone interviews, even though it was the preferred mode by all the participants. Use of telephone interviews cuts off face-to-face connection that is important for capturing non-verbal cues. Thirdly, qualitative study design limits the ability to infer the results. Study findings may only be inferred to populations with similar characteristics. Using quantitative approach with larger sample might shed more light to this topic.

CONCLUSION

This study investigated immigrants' lived experiences in the context of underemployment and social health. Six participants took part in this study. We employed grounded theory research design. From the study, three major themes emerged: occupational, emotional, and social health. Under occupational health participants discussed underemployment, unemployment, and economic burdens to their families. Emotionally, participants explained how underemployment and low wages contributed to stress,

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

and negatively impacted life events. An example of life event was sickness and lack of medical checkup because they did not have health insurance. Also, some participants felt bad that they could not afford to enroll their kids in sports clubs.

Social health had two sub-themes, social networking and social support. Being in a foreign country made it hard for immigrants to establish connections with the local community. From the study, it is evident that immigrants establish connections beyond immediate family members and friends. Religious organizations, especially churches, are handy in linking immigrants to the community. In line with previous findings, it is recommended that policy makers incorporate health education and promotion measures to address all determinants of health (Agyekum & Newbold, 2016).

Finally, this study developed underemployment verses wellness conceptual framework that can be used to explore the relationship between occupational, emotional, and social health. Even though this study was done in the context of underemployment, this framework can be tested in other settings and populations with characteristics that are different from out study population. Overall, this research contributes to understanding of occupational, psychological, and social health of immigrants in the context of underemployment.

KEY TERMS AND DEFINITIONS

Barriers: Conditions that make it difficult for people to get employment.

Emotional Health: Personal conditions that enable a person be in control of individual thoughts, feelings, and behaviors.

Job Search: The act of searching for job due to unemployment, underemployment or discontented with a current position.

Life Events: Experiences that interrupt an individual's usual activities and cause considerable alteration and modifications.

Occupational Health: Promotion and maintenance of overall wellbeing of workers and improvement of working environment.

Social Health: Ability to form meaningful relationships with others and to have positive interactions.

Social Networking: Practice of expanding social contacts by creating connections through individuals and/or social media.

Social Support: Having people around you that turn in in times of need and crisis to provide buffer.

Stress: Physical, mental, and emotional factors that cause physical or mental tension.

Chapter 63
Workplace Incivility and Job Satisfaction:
Mediating Role of Emotion Management

Rose Opengart

Thomas G. Reio Jr.
Florida International University, Miami, USA

Wei Ding
Florida International University, Miami, USA

ABSTRACT

Workplace incivility is common in organizations across the world and can have negative effects on individuals and organizations. The purpose of the reported study is to examine the effects of supervisor and coworker incivility on job satisfaction and examines emotion management as a mediator of these relationships. Data from 268 working adults were collected by survey battery and analyzed via a number of multivariate techniques. The model was supported in that both supervisor and coworker incivility had strong direct negative effects on emotion management and job satisfaction, and emotion management partially mediated the incivility-job satisfaction relationship. With supervisor and coworker incivility, the participants reported lower levels of job satisfaction. However, the participants' emotion management mitigated the negative effect of incivility on job satisfaction partially. The findings suggest that organizations need to be aware of the unfavorable consequences of incivility. Organizations need to discover ways to reduce incivility and implement efforts to help employees develop positive emotional management strategies. These actions may help reduce the negative influences of incivility on important organizational outcomes like job satisfaction.

1. INTRODUCTION

Emotion management is a process used to modify one's emotional expressions, experiences, and physiology and the circumstances eliciting the emotions to produce appropriate responses to environmental and organizational demands (Aldao, 2013; Hochschild, 1990). The use of emotion management is especially true in the service industry, where there are rules for emotional expression (Diefendorff, Richard, & Croyle, 2006) and the workplace will govern when and how specific emotions should be expressed. The process of emotion management typically involves two practices: behaviors suppressing any negative emotions one is feeling and faking positive emotions that one is not truly feeling (Glomb & Tews, 2004; Sliter, Jex, Wolford, & McInnerney, 2010).

One reason an employee may have the need to engage in behaviors where faking positive emotions is required is when dealing with rudeness and incivility, a growing problem that can have notable consequences at the individual, group and organization level (Porath, 2018). Researchers (e.g., Pearson Andersson, & Porath, 2000; Sears & Humiston, 2015) have found that nearly half of workers report having been treated rudely at work weekly, while Reio and Ghosh (2009) discovered that 54% of respondents in their study admitted to instigating uncivil behaviors, such as saying something hurtful towards someone in the workplace, once a year or more. Workplace incivility is defined as low-intensity deviant behavior that departs from norms of mutual respect, with ambiguous intentions to harm (Andersson & Pearson, 1999). Workplace incivility can come from a number of sources, ranging from supervisors and coworkers (Reio & Sanders-Reio, 2011) to customers and vendors (Hochschild, 1990). Importantly, it has been shown to have negative influences on those who either witness, directly experience, or instigate it (Cortina, Magley, Williams, & Langhout, 2001; Reio & Ghosh, 2009). As posited by Andersson and Pearson's Tit-for-Tat Theory of Incivility, isolated instances of uncivil behavior can lead to responses-in-kind to instigators. For example, Rosen, Koopman, Gabriel, & Johnson, (2016), using an experience-sampling design, found experiencing incivility earlier in the day was linked to decreased self-control (ego depletion), which in in turn was linked to instigated behavior later in the day. Overall, these responses-in-kind from targets to instigators can lead to the escalation of more intentional, harmful patterns of behavior like bullying, and eventually physical violence, as predicted by incivility theory (Andersson & Porath, 1999; Cortina et al., 2001).

Incivility has been associated with many negative occupational, psychological, and organizational outcomes, as well as issues with physical health (Lim & Cortina, 2005; Sears & Humiston, 2015). Regulating emotion is associated with stress, emotional exhaustion and negative physical symptoms (Schaubroeck & Jones, 2000) that can dampen job satisfaction (Welbourne Gangadharan, & Esparza, 2016).

This paper contributes to the research literature in two ways. First, while prior research indicates that being the target of supervisory and coworker incivility is negatively associated with a number of organizational outcomes (Porath, 2018; Rosen et al., 2016), little research has examined the effects of both supervisory and coworker incivility in one study on job satisfaction. This research employs a structural modeling equation approach to examining these links and provides evidence that each type of experienced incivility has a negative effect on job satisfaction. Second, this study sheds light on the mechanism through which incivility influences job satisfaction. Prior research suggests that experiencing incivility can elicit negative emotional reactions (e.g., Porath & Pearson, 2012), and these emotional reactions can dampen job satisfaction (e.g., Penney & Spector, 2005). To our knowledge, no research has examined whether employing strategies to manage one's emotions (i.e., emotion management) mediates the effect of both supervisor and coworker incivility on job satisfaction. Therefore, the purpose of this study was

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

to examine the effects of supervisor and coworker incivility on job satisfaction and investigate emotion management as a mediator of these relationships.

2. REVIEW OF THE BACKGROUND LITERATURE

Pertinent to the reported study is an understanding of workplace incivility, job satisfaction and emotion management, each of which is now briefly discussed.

2.1. Workplace Incivility

Workplace incivility is on the rise and creates toxic work environments with negative consequences in workplace settings across the world (Montgomery et al., 2004; Pearson & Porath, 2005; Porath, 2018). For example, in a Swedish study utilizing a stratified sample that mirrored the Swedish work population, Torkelson et al. (2016) found that 52% had been the target of supervisor incivility and 73% some form of coworker incivility in the past year. Similarly, with a group of U.S. healthcare workers, Reio and Trudel (2013) found that 75% had experienced incivility over the past year and that roughly 30% had experienced such behavior sometimes to always. Notably, as the multiple regression analyses revealed, being the target of uncivil behavior was strongly linked to poorer organizational commitment and contextual (interpersonal) performance and greater turnover intent. Moreover, in a large study conducted in six Asian countries (China, Hong Kong, India, Japan, South Korea, Singapore), Yeung and Griffin (2008) discovered that worker engagement suffered decidedly as a result of experiencing incivility, particularly if experienced once a month or more. In China, for instance, among those who experienced high incivility, their engagement was but 30% versus 73% for those who experienced none; in Japan and Hong Kong, when being exposed to high levels of incivility, engagement dropped to 13% and 12%, versus 24% and 29% for those experiencing no incivility, respectively. Demonstrating further that incivility can be a concern in a wide range of cultural contexts, Sharma and Singh (2016) found that incivility was negatively related to job satisfaction and positively to turnover intent among Indian restaurant employees. Further, Nitzsche, Ribeiro, and Laneiro (2018) found that supervisor incivility was far more prevalent among Portuguese hotel employees than coworker incivility, but each powerfully predicted emotional exhaustion and cynicism.

Frequent incivility from supervisors, coworkers and customers can lead to greater employee anxiety, depression, nervousness, and sadness (Hochschild, 1990), which can lead to lower job satisfaction, higher psychological distress, and higher rates of turnover (Andersson & Pearson, 1999; Zia-ud-Din, Arif, & Shabbir, 2017). Thus, incivility can be initiated from both inside (e.g., supervisor, coworker) and outside the organization (e.g., customer, vendor). For the purposes of this research, we focused on supervisors and coworkers because these tend to be the major sources of uncivil behaviors in most organizational settings (Nitzsche et al., 2017; Rosen et al., 2016).

Coworker incivility is uncivil behavior instigated by coworkers, such as giving you a dirty look, making mean comments about you, and excluding you from professional camaraderie. Most if not all of the same uncivil behaviors associated with coworkers can be instigated by supervisors. Being the target of supervisor incivility in particular has been linked to increased worker perceptions of loss, iniquitousness and bias (Rosen et al., 2016). Thus, supervisor incivility is troubling because of the supervisor's power to not only influence the day-to-day work lives of supervisees, but also the supervisee's careers

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Nitzsche et al., 2017; Yeung & Griffin, 2008). This troubling state-of-affairs is true also for coworker incivility, but to a lesser extent because a coworker's power tends to be less than a supervisor's in most cases. This power issue can be further exacerbated negatively by gender and race (Cortina, Kabat-Farr, Magley, & Nelson, 2017; Montgomery et al., 2004). To be sure, when a supervisee perceives bias or injustice, the likelihood of uncivil behavior towards supervisors, coworkers and clients can increase (Lawrence & Robinson, 2007).

2.2. Job Satisfaction and Workplace Incivility

Job satisfaction is defined as an employee's positive emotional state resulting from the appraisal of his or her job or job experiences (Locke, 1976). Job satisfaction can be dampened by workplace incivility (Schilpzand et al., 2016; Sharma & Singh, 2016). Welbourne et al. (2016) found that targets of incivility experienced lower job satisfaction and sense of community. However, those who used emotion-focused coping strategies (avoid the stressor, praying) at work versus problem-focused coping (taking action and making a plan) to respond to work stressors (incivility) experienced fewer negative outcomes. Seeking emotional support to handle being the focus of uncivil behavior was unequivocally not beneficial for women, however, but using a religious coping style was. The authors noted that it might be that emotional-support seeking elicits negative responses (e.g., accusation, condemnation).

Laschinger, Wong, Cummings, and Grau (2014) found a negative relationship between coworker incivility and job satisfaction among a group of Canadian nurses. In addition, Reio and Ghosh (2009) researched instigator job satisfaction and perceived physical health and their association with incivility, positive and negative affect, socialization-related learning and development and organizational productivity. The authors found that establishing relationships with coworkers and supervisors and having positive affect positively predicted job satisfaction, whereas negative affect and incivility was associated with lower job satisfaction. Therefore, as predicted by incivility theory and the extant empirical research, we expect that:

H1: There is a negative relationship between supervisor and coworker incivility and job satisfaction.

2.3. Emotion Management

There are several terms, often used interchangeably, that refer to emotional processes. Emotion work, also referred to as emotion management or emotional labor, was defined by Hochschild (1983) as the effort to control or change emotions in oneself or in others in order to meet social guidelines. Hochschild (1990) first defined emotion work as two processes - evocation or suppression. This occurs when organizations require people to show a particular emotion or if people feel compelled to manage their emotions and to either induce or suppress feeling to display the appropriate emotional expression. Hochschild (1983) first identified potential negative outcomes from managing emotions at work, including increased stress, burnout, absenteeism, headaches, and decreased job satisfaction. High levels of stress as well as emotional exhaustion can have negative consequences on individuals such as illness, decreased quality of sleep, and fatigue (Dahlgren et al., 2005). Whether resulting in a positive or negative outcome, conceptualized as either job-focused or employee-focused emotional labor (Brotheridge & Grandey, 2002), emotion work is intended to meet workplace demands where employees learn the required emotion rules. Display

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

rules, the "behavioral expectations regarding which emotions should be expressed or hidden in a given situation" (Davis, LaRosa, & Foshee, 1992, p. 513), have even been incorporated into job requirements.

Aldao (2013) defined emotion regulation as" a process by which individuals modify their emotional experiences, expressions, and physiology and the situations eliciting such emotions in order to produce appropriate responses to the ever-changing demands posed by the environment" (p. 155). Emotion regulation often refers to one who is interested in regulating his or her own emotions. Gross (2015) referred to this as intrinsic emotion regulation. Alternatively, a person can be interested in regulating another person's emotions, which the author refers to as extrinsic emotion regulation. A predominant point in all theories of emotional labor is the notion that employees follow emotional display rules that define the appropriate expression of emotions on the job (Diefendorff & Richard, 2003).

Shuck et al. (2013) confirmed Diefendorff and Richard's (2003) findings that being able to manage one's emotional displays through using strategies like keeping a positive attitude despite difficulties and not allowing negative events to affect one's mood increases the likelihood of positive outcomes. Supervisor and coworker incivility, however, depletes emotional resources and may make the targeted individual less able to manage their emotions appropriately at work because incivility elicits negative emotions (e.g., anger and fear) that can provoke aggressive, counterproductive responses (Niven et al., 2013; Porath & Pearson, 2012). Thus, we argue that:

H2: There is a negative relationship between supervisor and coworker incivility and emotion management.

2.4. Incivility, Emotion Management and Job Satisfaction

Some research has examined emotion management as a mediator between workplace incivility and employee outcomes. Due to the increasing number of service-related jobs, for example, customer incivility has become an increasingly common workplace stressor. Employees exposed to customer incivility and aggressive behaviors have been shown to experience emotional exhaustion, burnout, depression, and poorer health, well-being, which have negative associations with job satisfaction, organizational commitment, and job performance (Boyle, Koritsas, Coles, & Stanley, 2007; Grandey, 2003).

The theoretical reasons behind the links between emotion management and employee outcomes like job satisfaction can be traced to Hochschild's (1990) work that linked emotion management in the form of evocation and suppression to employee outcomes. When organizations require the employee to induce or suppress feelings to meet a display rule for appropriate emotional expression, despite one's true feelings, this can increase stress and decrease job satisfaction. On the other hand, in an extension of Hochschild's work, Humphrey et al. (2015) pointed out that emotion management or emotional labor in the form of deep acting (display of true feelings) versus surface acting (faking positive emotions) can have positive outcomes on job performance, organizational commitment and job satisfaction. Therefore, when employees are permitted more autonomy to use positive emotional display strategies that entail the expression of true, positive emotions, then positive outcomes are more likely.

Sliter et al. (2010) examined customer behaviors, such as when customers were rude, impolite, and/or discourteous, and found that customer incivility was related positively to emotion exhaustion and negatively to employee customer service performance. The researchers also found that incivility was negatively associated with emotion management, and emotion management acted as a partial mediator between customer incivility and customer service performance. If an employee was being treated in an uncivil fashion, surface acting (faking emotions) likely ensued to manage negative feelings, and displayed

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

a positive emotional expression despite the incivility and true feelings. Yet, for individuals that were able to express their emotions or otherwise express them without active suppression, negative outcomes were less likely. In this research, as with Slater et al. (2010), we contend that emotion management will be a partial mediator of the incivility-job satisfaction relationship.

Based on the above, we hypothesized that:

H3: Emotion management will partially mediate the relationship between supervisor and coworker incivility and job satisfaction.

3. METHOD

This research used a nonexperimental quantitative design to test the three hypotheses. Nonexperimental designs can be particularly useful in the early stages of research for empirically testing the magnitude and direction of relationships among the research variables (Howell, 2002).

3.1. Participants and Procedures

The final sample consisted of 268 full-time working adults; 51.2% men; mean age = 36.70 years (SD = 11.78) attending a large university in the southern United States. Trained graduate students collected the sample of working adults for this research. The students were guided by a 2 hour and 45 minute research methods lecture, which was part of a doctoral-level course. No extra course credit was provided. A pilot study was first conducted with 20 working adults to seek information about instruction and item clarity, and completion time. No issues arose when piloting the survey battery. The paper-and-pencil survey batteries then were administered over a one-month period during class times; completion time was roughly 20 minutes. Because of incomplete data, 12 of the surveys were excluded, leaving the final sample of 268. Roughly 15% of the participants were supervisors, 15% administrative aids and the remainder workers of various types (e.g., social worker, banker, waiter, soldier, delivery). The data revealed that 68.9% of the participants were White, 19.1% Black, 5.6% Hispanic, 3.3% Asian, and 3.1% "Other."

3.2. Research Instruments

Each of the instruments used in this research was supported by reliability and validity evidence presented by the respective instruments' authors from similar research samples, as well as the research literature.

3.2.1. Job Satisfaction

This study measured job satisfaction using Hackman and Lawler's (1971) global job satisfaction scale. The Cronbach's alpha for this instrument was .71, with items measured on a 5-point Likert scale that ranged from 1 (strongly disagree) to 5 (strongly agree). Higher scores represented greater job satisfaction. A sample item was "I get a great sense of personal satisfaction when I do this job well."

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

3.2.2. Incivility

Incivility was measured in two ways; that is, supervisor and coworker incivility. Participants were asked if they were the target of either supervisor incivility or coworker incivility. Onlooker incivility was not measured in this research. Each of the two 12-item scales was developed by Ghosh, Reio & Bang (2013). The items were identical for each scale, but the instructions differed. For supervisor incivility, participants were asked how often they were in situations over the past year where supervisors were uncivil toward them. For coworker incivility, the participants were asked how often coworkers were uncivil toward them over the past year. The responses to the incivility items were assessed on a 5-point Likert-type scale from 1 (never) to 5 (most of the time). The Cronbach's alphas for the supervisor and coworker incivility scales were .94 and .95, respectively. Example items were "Made demeaning or derogatory remarks about you?" and "Gave you the silent treatment?"

3.2.3. Emotion Management

Emotion management was measured using a modified version of the Emotion Management Behavior scale (EMB; Diefendorff & Richard, 2003). The scale is in essence a measure of the behavioral strategies one might employ to manage their behaviors at work (e.g. "I display excitement and enthusiasm at work"). Instead of coworker or supervisor ratings, which were not possible for this study, we opted to make the measure a self-report to be consistent with the other measures in this research. The Cronbach's alpha for this instrument was .85 in the current study, with items measured on a 5-point Likert scale that ranged from 1 (strongly disagree) to 5 (strongly agree). This result mirrored Diefendorff and Richard's (2003) reported reliability of the original instrument. The items assessed how well one expressed positive emotions and suppressed negative emotions in their emotion displays at work. Higher scores represented an employee's ability to manage emotional display behaviors better, while lower scores suggested an employee's lack of ability to manage emotional display behaviors at work.

3.2.4. Demographic Characteristics

The survey battery also included five demographic questions: sex, age, ethnicity, education level, and job title to address demographic characteristics of the participants.

3.2.5. Control Variables

We did not include control variables in this study. Research methodologists suggest the use of control variables requires a sound theoretical and/or empirical rationale for doing so (Howell, 2002) and the literature is unclear about the relevance of demographic variables to this line of research. For instance, Diefendorff and Richard (2003) did not control for demographic variables in their original study. Notwithstanding, we conducted a two-way MANCOVA to investigate the possible effects of gender and race on supervisor incivility, coworker incivility, emotion management behavior and job satisfaction, while controlling for age. Using SPSS 20.0 to conduct the analyses, the MANCOVA results suggested no significant interaction between gender and race (Wilks' $\Lambda = .952$, $F(16, 1320) = 1.343$, $p = .162$). Further, the covariate (age) did not significantly influence the combined dependent variables (Wilks' $\Lambda = .984$, $F(4, 432) = 1.745$, $p = .139$). Last, gender (Wilks' $\Lambda = .972$, $F(12, 1302) = 1.035$, $p = .414$) and

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

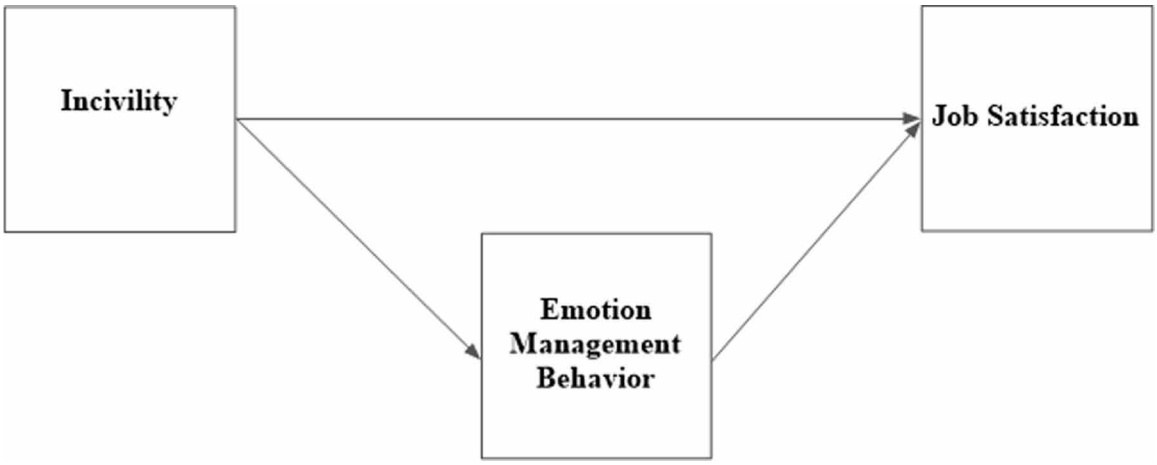
race/ethnicity (Wilks' $\Lambda = .961$, $F(16, 1320) = 1.081$, $p = .368$) did not demonstrate main effects on the combined dependent variable. Thus, because the demographic variables did not demonstrate significant effects, no control variables were included in the final analyses of the conceptual model.

4. DATA ANALYSIS

Because the data were self-reported where information was collected from the same data source at one point in time, we took a combined procedural and statistical approach to reduce the likelihood of common method variance bias (Podsakoff et al., 2003; Reio, 2010). First, we pilot tested the survey battery to certify the directions were clear, the items were unambiguous, and all the responses required equal effort (e.g., avoided double-barreled questions). Second, we counterbalanced the order of questions with each participant. Third, we safeguarded the anonymity of the participants and informed them there were no preferred or correct answers; to be more precise, we desired honest appraisals of each item. Fourth, as a statistical diagnostic procedure, we used Harmon's single-factor test to detect the presence of one or more factors. If there is more than one factor, as was the case for this research (three with eigenvalues greater than one; 61.2% of variance explained), then CMV bias is less likely. The combination of both approaches supported the notion that CMV was not likely a problem in this research.

Next, we used confirmatory factor analysis (CFA) to verify how well the variables defined their respective constructs (Guarino, 2004) using the LISREL 8.72 program. Structural equation modeling (SEM) was then performed to test the first three research hypotheses, assessing how well the data fit the proposed model (see Figure 1).

Figure 1. Hypothesized model of incivility, emotional management and job satisfaction



5. RESULTS

The following represents the analyses conducted to test the three hypotheses.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

5.1. Testing the Measurement Model

The measurement model included 36 items comprising the two incivility scales (12 items each), supervisor and coworker incivility, emotion management (6 items) and job satisfaction (6 items). The CFA results revealed that the items for each construct significantly loaded on their corresponding construct with their factor loadings above .4 for the respective manifest variables. The chi-square test was significant ($\chi^2 = 1688.02$, $df = 610$, $p < .001$), which is regarded as unacceptable. However, the chi-square test of absolute model fit tends to be affected by large sample sizes and non-normality in the underlying distribution of the input variables (Kline, 1998). Several other measures of fit were subsequently used to examine the overall fit of the model to the data as well. The alternative fit indices indicated that the measurement model had a reasonable fit to the data: RMSEA = .09, dG (geodesic discrepancy) = .04, and the dULS (unweighted least squares discrepancy) = .08 (Dijkstra & Henseler, 2015a). The RMSEA, dG and dULS met the recommended criteria of .10 or less (Dijkstra & Henseler, 2015a) for a reasonable fit. Therefore, the results indicated that the measurement model achieved an adequate fit for the proposed factor dimensions, providing evidence of factorial and convergent validity of the study's measurement (Bagozzi & Yi, 1988).

5.2. Descriptive Statistics

Skewness and kurtosis statistics revealed that the data were reasonably normally distributed (values were less than \1.00\); therefore, there was not a need to transform the data (Tabachnick & Fidell, 2013). Investigation of the intercorrelations among the supervisor ($M = 20.51$; $SD = 10.10$) and coworker ($M = 26.89$; $SD = 11.78$) incivility, emotion management ($M = 21.75$; $SD = 3.28$), and job satisfaction ($M = 21.58$; $SD = 4.10$) variables, along with their means and standard deviations (see Table 1), indicated that all the correlations were significant and in the direction suggested by theory and research (see Table 2). As expected, supervisor and coworker incivility overlapped somewhat, but modestly so ($r = .44$, $p < .001$). Supervisor ($r = -.24$, $p < .001$) and coworker ($r = -.18$, $p < .05$) incivility were negatively related to emotion management. The dependent variable job satisfaction was significantly related with supervisor ($r = -.36$, $p < .001$) and coworker ($r = -.16$, $p < .001$) incivility and emotion management ($r = .40$, $p < .001$). Overall, the combination of the correlation and CFA results suggested initially that the two incivility components, emotion management and job satisfaction constructs were sufficiently distinct from each other; thus, they represented unique constructs.

5.3. Structural Model (Testing Hypotheses)

Considering that the previous MANCOVA analyses did not indicate significant effects of the demographic variables (gender, race, age) on the combined dependent variables, the control variables were not included in any subsequent analyses in this research. We use the Sobel test (Sobel, 1982) instead of bootstrapping to test for mediation. Koopman, Howe, and Hollenbeck (2014) decry the mistaken notion or "urban legend" that bootstrapping is somehow superior to the Sobel test. Actually, in their research, they found that the Sobel test was superior for use with small samples, and was adequate for samples larger than 140 as in this research. They found no evidence that bootstrapping was superior; rather, it was prone to Type I error with moderate or large effect sizes, while the Sobel test was not. In light of this information, we focus on the Sobel test.

Intercorrelations among Research Variables

Variables	Satisfaction	SuperInciv	CowInciv	EMB
Satisfaction	1.00			
SuperInciv	-.36***	1.00		
CowInCiv	-.16***	.44***	1.00	
EMB	.40***	-.24***	-.18*	1.00

Note. $N = 268$. SuperInciv = Supervisor Incivility; CowInCiv = Coworker Incivility; EMB = Emotion Management Behavior.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

5.3.1. Hypothesis 1

The SEM results showed that the path addressing the negative effect of supervisor and coworker incivility with the dependent variable had a reasonable fit to the data. Although the chi-square value ($\chi^2 = 2001.14$, $df = 133$, $p < 0.001$) was significant, other fit indices indicated a good fit of the model (RMSEA = .087; dG = .03; dULS = .07). The direct negative effect of experienced supervisor and coworker incivility on job satisfaction was accepted ($\beta = -.24$; $p < 0.001$). Thus, the hypothesis was fully supported.

5.3.2. Hypothesis 2

The results revealed that the model had an acceptable fit to the data (RMSEA = .08, dG = .03; dULS = .07), ($\chi^2 = 8146.62$, $df = 123$, $p < 0.01$). Supervisor and coworker incivility was found to have a significant, direct negative effect on emotion management ($\beta = -.25$; $p < 0.001$). Thus, the hypothesis was fully supported.

5.3.3. Hypothesis 3

According to the SEM results, the data had an acceptable fit to the proposed model ($\chi^2 = 828.49$, $df = 427$, $p < 0.001$, RMSEA = .080). Supporting the third hypothesis, all the relationships were found to be significant. The absolute value of the Sobel test (Sobel, 1982) statistic $4.53 > 1.96$ indicated that the indirect effect of experienced supervisor and coworker incivility on job satisfaction via emotion management was significant. This corroborates the notion that although the incivility (negative effect) and emotion management (positive effect; $\beta = 0.34$, $p < .001$) variables have direct effects on job satisfaction, incivility also has an indirect effect on job satisfaction occurring through emotion management. Considering that the direct effect of incivility on job satisfaction was significant, then emotion management partially mediated the incivility-job satisfaction relationship (see Figure 2).

6. DISCUSSION AND IMPLICATIONS

This research investigated the role of emotion management in mediating the relationship between incivility and job satisfaction. As hypothesized, emotion management partially mediated the relation between experiencing supervisory and coworker incivility and job satisfaction. Further, incivility had a direct, negative effect on emotion management and job satisfaction, while emotion management also had a direct positive effect on job satisfaction.

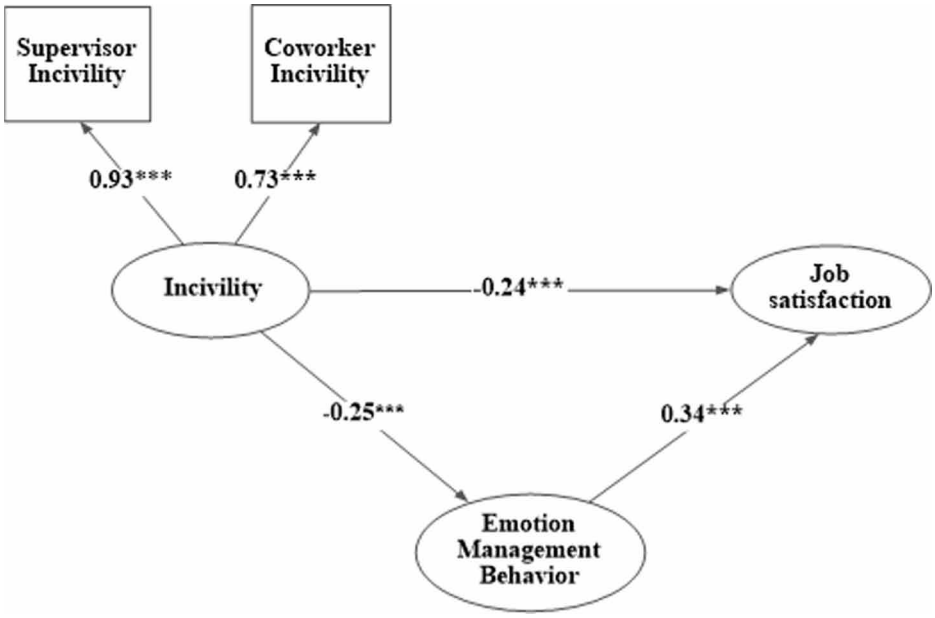
These results integrate theory on incivility, emotion management and job satisfaction. First, finding that incivility originating from both supervisors and coworkers had a negative effect on emotion management behavior supports Hochschild's (1990) theoretical notion that experiencing uncivil, unpleasant behaviors can influence the target's emotion management behaviors in that one's ability to somehow express positive emotional displays, while concurrently suppressing negative emotional displays, can be lessened significantly. Moreover, the finding that emotion management had a positive effect on job satisfaction also supports Hochschild's theoretical work. Being able to successfully manage one's positive emotional display behaviors indicates that positive outcomes may be more likely in workplace settings. In this case, job satisfaction was enhanced. Second, Andersson and Pearson's (1999) Tit-for-Tat Incivil-

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

ity theory was enriched because we found evidence that uncivil behavior originating from two sources, supervisors and coworkers, negatively influenced job satisfaction directly, as predicted by this theory, but its effect was carried also through the emotion management variable. In an extension of Tit-for-Tat theory, uncivil behaviors are linked therefore to not only one's positive and negative emotions (Fox & Stallworth, 2005), but also to being able to employ strategies to regulate one's emotion display behaviors (Welbourne et al., 2016). This understanding should better inform future research and practicing managers about how emotion management skills can minimize the negative consequences of incivility.

Although not a primary focus of this study, some of the demographic analyses warrant discussion. First, similar to Cortina et al. (2001) and Reio and Trudel (2013), the large majority of participants experienced supervisor and coworker incivility at least a few times over the past year. Being "paid little attention to" and "putting you down" were the two most frequently occurring incivilities from supervisors. Being "snapped at" and "doubting one's judgment on a matter over which you have responsibility" were the incivilities instigated most by coworkers. Importantly, a significant number of participants experienced supervisor incivility (13%) and coworker incivility (11%) frequently to most of the time. This is alarming as this arguably demonstrates that the uncivil behavior can stray from being ambiguous as to harmful intent to an intentional pattern of harmful behavior, which constitutes bullying (Andersson & Pearson, 1999). Interestingly, after controlling for age, the MANCOVA results failed to reveal significant gender or race differences in experiencing either kind of incivility, or emotion management and job satisfaction as outcomes of incivility, which is in contrast to prior research. For example, Reio and Ghosh (2009) found that younger White men instigated uncivil behavior more than women, and any age or ethnic group in their research. Montgomery et al. (2004) found sex and race differences in the outcomes of incivility. Notwithstanding, the women in this study engaged in as much emotion management and were just as satisfied as the men. These findings speak to Lim et al.'s (2008) contention that women were no less resilient than men when being treated inappropriately in the workplace.

Figure 2. Final model of incivility and emotion management linked to job satisfaction



EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Our conceptual model hypothesized that the effects of supervisor and coworker incivility on job satisfaction were mediated by emotion management. The results of our SEM analyses certainly revealed direct negative effects of supervisory and coworker incivility on emotion management and job satisfaction. Thus, holding all else constant in the model, a standard deviation increase in incivility would "cause" a .24 standard deviation decrease in emotion management behavior and a .25 standard deviation decrease in job satisfaction. On the other hand, the results also demonstrated an indirect effect, in that incivility had a direct effect on job satisfaction, but also an indirect effect carried through the emotion management variable. While the direct negative effect of supervisory and coworker incivility on job satisfaction was found, corroborating earlier research (e.g., Lim et al., 2008), the negative consequences of incivility may not necessarily be as harmful as previously argued (Lim & Cortina, 2005; Montgomery et al., 2004; Pearson & Porath, 2005; Reio & Ghosh, 2009) if the effect can be mitigated through the presence of a mediator variable like emotion management (Lim et al., 2008).

The results suggest there may be potential emotion management strategies that could be leveraged to combat and reduce incivility's negative effects. For example, employees could be trained to develop emotion management skills and strategies (these skills could be evaluated as part of the hiring process) for coping with stressful situations, like those times when being targeted for uncivil behaviors. Hochschild (1990) and Schmidt and Diestel (2014) recommended helping employees develop the use of evocation and deep acting strategies instead of suppression and surface acting strategies to manage one's emotions when dealing with organizational stressors. Introduction to and refinement of additional proactive coping strategies like the use of humor, praying, positive thinking, developing greater professional competency, and stressful situation avoidance could also be beneficial (Rafati et al., 2017).

7. LIMITATIONS AND IMPLICATIONS FOR FUTURE RESEARCH

As in any study, there were limitations. First, because this was a nonexperimental quantitative study, the nature of the data precludes strong claims concerning causality and time-related changes. Still, extensive theory and research supported both the use of such a research design and our interpretations of the findings. To extend this research, the model could be tested experimentally through introducing an intervention designed to implement positive emotion management strategies to corroborate the outcomes of this study. The study could also be extended by using a longitudinal design where the variables could be examined over time. Second, although the research design was consistent with most quantitative organizational research, the study used single-source data collected at one time, possibly introducing CMV bias into the study. However, the researchers followed recommended procedures to reduce its likelihood and conducted statistical procedures to test for its presence (Podsakoff et al., 2003; Reio, 2010). By counterbalancing the items, ensuring clarity of instructions and items in combination with conducting Harman's single-factor test, little evidence suggesting CMV bias was found. Future organizational research that includes steps to collect data at least two times (separate collection of data associated with the independent variables from data associated with the dependent variables; dependent variables should be collected first) with differing source data (e.g., self, coworker, supervisor, client) would further substantiate the outcomes of this research without the possible hindrance of CMV bias.

Another limitation might have been the use of full-time working adult students as participants, although this method has been employed effectively numerous times in prior organizational research. An alternative method might be targeting full-time employees in select profit and nonprofit workplace

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

settings, both nationally and internationally to extend this research further. Moreover, because it was impossible to calculate response rates in this study, new research could be conducted in settings where response rates could be determined and possible nonresponse bias could be evaluated to guard against introducing systematic bias into the study.

Because of the possible sensitivity of collecting incivility data and the existence of a number of well-validated measurement tools, we used self-reports in this study. However, examining notions about the process of emotion management and how and why experiencing supervisor and coworker incivility may be linked to job satisfaction and other organizational outcomes (e.g., job performance, engagement, voluntary turnover) could be augmented more by mixed-method and qualitative research. Case studies and phenomenological inquiry designed to acquire a richer, deeper sense of how and why the often-deceptive influences of being treated uncivilly can have negative short-and long-term consequences.

7.1. Implications for Practice

Understanding that this research was nonexperimental and not causal in nature, recommendations for practice based upon these findings should be made tentatively. Still, preliminarily, there is sufficient evidence to indicate that uncivil behavior is occurring all too often and that employees at all levels of the organization need to be aware that it is associated with negative outcomes. Such behavior is not just some silly, private interpersonal issue; rather, it is unnecessary and can spiral into bullying and physical violence (Andersson & Pearson, 1999; Rosen et al,. 2016). Organizations need to find ways to discourage such behavior or face the consequences. Perhaps some training and education of employees in this matter can have a positive influence.

Pearson and Porath (2005) suggested some useful proactive strategies to discourage incivility including: having senior leadership set expectations for appropriate, respectful conduct, recruiting and select civil employees, and soliciting and listening to feedback and acting as needed. Trudel and Reio (2011) suggested training activities could be designed to increase incivility awareness and reduce interpersonal conflict. Counseling services could be provided also to help employees deal more effectively with stress arising from being the target of uncivil behavior. Finally, emotion management strategy training could be offered to help employees manage their emotional displays properly, even when experiencing uncivil behavior. Schmidt and Diestel (2014) recommended training to help employees employ psychologically healthy deep acting on a daily basis to help cope with stressful situations, such as being the target of uncivil behavior. Thus, the suppression and surface acting strategy would be identified and subsequently eschewed in favor of an evocation and deep acting strategy.

8. CONCLUSION

Workplace incivility demonstrated two paths to job satisfaction. One was a path with a strong, direct negative effect and the other was through the partial mediation of emotion management. Organizational researchers and practitioners can do much to help managers and organizations through conducting research that can inform the practice of reducing and preventing the seemingly insidious effects of incivility on managing emotions and being satisfied with one's job.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Training in the workplace can reduce negative behaviors and consequences. In addition, business educators preparing the next generation of managers can raise awareness of incivility and its effects, as well as how emotion management can mediate the effect of workplace incivility on job satisfaction.

Chapter 64
Discrimination Against People With HIV and AIDS in the Workplace:
A Lagos State Example

Chinwe Rosabelle Nwanna
University of Lagos, Nigeria

ABSTRACT

The main thrust of the chapter was to explore the discrimination experienced by people living with HIV and AIDS (PLHIV) in the workplace in Lagos State. A purposive sample of 80 PLHIV was selected from two local government areas (LGAs) of Lagos state: Epe, a rural setting, and Lagos Mainland, an urban one. Secondary data were obtained from internet sources while primary data were collected through structured interviews September 2005–April 2006. Data were analyzed using SPSS versions 11 and 13. Data between and within the rural and urban areas were also analyzed comparatively. The results indicate that PLHIV experienced instant dismissal from offices, mandatory HIV tests, alienation, denial of promotion, and exclusion from insurance schemes. This indicates that PLHIV's rights were violated. The study recommends intensive HIV education and enforcement of national HIV policy and international legal instruments in the workplace to protect PLHIV's rights.

INTRODUCTION

According to Joint United Nations Programme on HIV/AIDS (UNAIDS) Data (2017), 36.7 million people were living with HIV and AIDS (PLHIV) in 2016. Sub Saharan Africa bears the highest burden of the pandemic with about two-thirds of the global number of PLHIV. Nigeria has the second largest HIV epidemic in the world with 3.2 million people and has one of the highest new infection rates in sub-Saharan Africa in 2016 (UNAIDS, 2017). HIV has decimated world population. Globally, many people have died due to AIDS and about one million died of the disease in 2016 alone (UNAIDS, 2017).

HIV attacks and interferes with the immune system. It can progress to AIDS if not diagnosed early. This will make infected people vulnerable to infections. Although HIV cannot be cured, it can be effectively controlled with antiretroviral therapy (ART) so that it may not progress to AIDS. This implies that PLHIV can continue to be productive members of the workforce (Fit for Work Team, 2015). However, its incurability and association with promiscuity and homosexuality has accentuated social discrimination. Furthermore, ignorance of the disease and the phobia it provokes in people have resulted in self-defence mechanisms among the public including employers and colleagues in the workplace and have occasioned the rejection of the PLHIV by segregation, exclusion, or the denial of equal opportunities (Nwanna, 2011).

Discrimination may occur in different forms and in various settings including the workplace, healthcare facilities, local communities and the family. In Nigeria, people care for one another when sick but when one is living with HIV, people tend to run away from that person. HIV-related discrimination has become a powerful tool of social control. It can be used to marginalize, exclude or manipulate PLHIV covertly or openly. Studies have shown that PLHIV were dismissed from their jobs due to their HIV status (Owolabi, Araoye, & Osagbemi, 2011). The study in this chapter would contribute to the formulation of policies that would favour PLHIV and protect their rights.

HIV-discrimination undermines HIV prevention efforts and the ability of people to access and adhere to treatment. Acts of discrimination deny people's rights to information, to services to protect them against HIV infection, and to receive appropriate treatment, care and support when HIV-positive. Although discrimination is not experienced by every PLHIV, it may bring about conditions of stress, low self-esteem, suicide, job losses, unemployment, and dislocation among PLHIV who have experienced it (Nwanna, 2011). Shosanya (2015) reported that there had been cases of employers terminating services of infected persons and there were few or no known employers who were willing to employ identified PLHIV. Most of the employers always hinged on the fact that it was their prerogative to employ whoever befits their organizations. Shosanya (2015) went on to state that the stigmatization of the PLHIV had continued to hang on the necks of PLHIV like an albatross, despite their hues and cries to the society to morally rekindle their survival and support them to live a worthy life. In view of this, Lagos State government enacted a law in 2007, to protect persons living with HIV and affected by AIDS and to prevent discrimination of any type against any PLHIV particularly in matter of employment (Shosanya, 2015). Discrimination against PLHIV continues to be pervasive in Nigeria to the extent that in 2014, the immediate past president, Goodluck Jonathan, signed into law an Antidiscrimination Bill that protects the rights and dignity of PLHIV (Shosanya, 2015). Despite these laws, discrimination continues unabated. Furthermore, there are very few empirical studies on the forms of discrimination against PLHIV in the workplace particularly from the perspective of PLHIV. In the light of the afore-stated, this study set out to investigate the forms of discrimination experienced by PLHIV in the workplace in Epe and Lagos Mainland local government areas (LGAs) of Lagos State.

BACKGROUND

As far back as 1958, the UN International Labour Organization (ILO) Discrimination Convention (No. 111) in Article 1 subsection1 (1a) defines discrimination as "any distinction, exclusion or preference made on the basis of race, colour, sex, religion, political opinion, national extraction or social origin, which has the effect of nullifying or impairing equality of opportunity or treatment in employment or occupation as may be determined". However, in the context of HIV and AIDS, Aggleton and Parker (2002)

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

assert that discrimination occurs when a distinction is made against a person that results in his or her being treated unfairly and unjustly on the basis of belonging or being perceived to belong to a particular group. According to UNAIDS protocol (2000 cited in UNAIDS, 2005) discrimination is defined as any form of arbitrary distinction, exclusion, or restriction affecting a person, usually but not only by virtue of an inherent personal characteristic or perceived belonging to a particular group—in the case of HIV and AIDS, a person's confirmed or suspected HIV-positive status—irrespective of whether or not there is any justification for these measures.

The concept of stigma will help in understanding the concept of discrimination because discrimination is the acting out of stigmatising attitude. Goffman (1963) describes stigma as an attribute that is deeply discrediting within a particular social interaction that reduces the bearer from a whole and usual person to a tainted, discounted one. His explanation of stigma focuses on society's attitude toward people who possess attributes that fall short of public expectations. Contrary to Goffman's description, Weiss and Ramakrishna (2001) define stigma as a social process or related personal experience characterized by exclusion, rejection, blame, or devaluation that result from an adverse social judgment about a person or group.

In this chapter, therefore, discrimination is presented as negative attitudes, beliefs, attributes, behaviours, activities and experiences that occur in social interactions.

Earlier Studies

In this section, earlier researches will be reviewed beginning from studies conducted in other countries before focusing on Nigeria.

Population Council (2002) reported a qualitative research that was carried out to explore the manifestations of stigma and discrimination in the workplace, family, and community; contribute to the development of appropriate quantitative measures for stigma; and inform stigma reduction intervention activities. The study revealed that many workers expressed fear that they would be isolated, avoided, and ridiculed if their co-workers and managers knew about their sero-positive status. The main manifestation of stigma is social isolation and ridicule. A higher proportion of male respondents (73%) than female respondents (65%) reported cases of social isolation. Similarly, a greater percentage of the male workers (49%) than the females (44%) reported rumours and gossips (Population Council, 2002).

UNAIDS (2011) reported a study that used PLHIV Stigma Index as the instrument in 9 countries in Asia and the Pacific Region namely Bangladesh, Cambodia, China, Fiji, Myanmar, Pakistan, Philippines, Sri Lanka and Thailand. According to UNAIDS (2011), between 16% in Fiji and 50% in Cambodia lost their employment or sources of income while 19% in Fiji to 38% in Philippines were denied opportunity to work while 8–52% had promotion denied or the nature of work changed. Furthermore, many respondents decided to stop work due to discrimination or decided not to apply for a job or promotion. UNAIDS (2011) also revealed that discrimination was pervasive in 3 countries where employer and managers (13–55%), colleagues (15–50%) and clients (0–50%) were not likely to be supportive or more likely to change their behaviours. In conclusion, UNAIDS (2011) asserts that stigma and discrimination are key factors responsible for loss of employment among PLHIV.

Corroborating the above findings, another study that applied PLHIV Stigma Index in 9 countries from 4 regions: Kenya, Nigeria and Zambia from sub- Saharan Africa, Estonia and Poland from Eastern Europe, Malaysia and the Philippines from Asia-Pacific, and Argentina and Mexico from South America, was conducted by The Global Network of People Living with HIV (GNP+), ILO, The PLHIV Stigma

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Index (2012). The research revealed that discrimination was the commonest factor responsible for job loss. The study revealed that many respondents had lost a job or source of income during the preceding 12 months of the study ranging from 13% in Poland to 40% in Kenya and Zambia. It also indicated that many of these PLHIV lost employment as a result of their sero-positive status alone. This ranges from 8% in Estonia to 45% in Nigeria. The results further showed that there are little differences between rural, small and big towns. In most countries, people living in rural areas were more likely to have lost employment as a result of HIV or HIV combined with another reason, however, it was alleged that this did not apply to all countries.

ML dos Santos et al. (2014) adapted The PLHIV Stigma Index and applied it to 500 PLHIV in ten HIV clinics in South Africa. The study found that 12% of the respondents indicated that they had lost their jobs in the 12 months pre-ceding the time of the study. Out of this proportion, more than half declared that their job losses were at least partially due to their sero-positive status either due to discrimination or/and being too sick to work. Also, 8% of them affirmed that they were denied employment opportunity because of their HIV status. ML dos Santos et. al. (2014) therefore concluded that the HIV status negatively affected the working life of PLHIV.

Poni-Gore et al., (2015) conducted a cross-sectional research in Juba, South Sudan from 102 PLHIV and 70 people from the public using standardized well-structured questionnaires and interviews. The study revealed that 60% of PLHIV who were employed did not disclose their HIV positive status at their work places due to fear of losing their jobs. The study also showed that 80% of PLHIV were not denied their jobs implying that about 20% of them suffered denial of employment.

In Nigeria, discrimination in the workplace manifests, most times, in the loss of employment in Nigeria. Akparanta – Emenogu (2002 cited in Nwanna, 2011) and Durojaiye (2003 cited in Nwanna, 2011) conducted qualitative studies and found independently that a naval officer was denied admission into one of the Naval Training Colleges in Rivers State, Nigeria, after being successful at the recruitment test. He was refused admission because of his sero-positive status. The respondent reported that he was admitted as a squadron leader and was later sent to Calabar, the capital of Cross River State for his assignments. An HIV test was run without his informed consent. He was later dismissed claiming that he was HIV+. Similarly, Adirieje (2003 cited in Nwanna, 2011) reported that a nurse was dismissed due to her sero-positve status. According to Adirieje (2003 cited in Nwanna, 2011), the nurse was tested for HIV without her knowledge and consent and was instantly dismissed when the laboratory result declared her sero-positive. Iwuagwu et al. (2003 cited in Nwanna, 2011) found that a Nigerian police woman living with HIV was demoted by the Nigeria Police when her sero-positive status was publicly declared by a media house without her consent.

Another study conducted by Iwuagwu et al. (2003 cited in Nwanna, 2011) showed that human rights of PLHIV have been violated in Nigeria. The study demonstrated the pattern of human rights abuse of PLWHA in Nigeria (Iwuagwu, 2001; 2003 cited in Nwanna, 2011). In this study, three states namely Lagos, Kano and Anambra were studied using focus group discussions (FGDs) that involved 53 PLWHA. The study found that an auxiliary nurse's appointment was terminated because of her sero-positive status. She had worked for five years in the hospital before she became pregnant. She developed boils which led to a laboratory test by the employer. The result of the test showed that she was HIV positive and she was instantly dismissed because the management claimed that they could not afford to put their staff and patients at risk.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

From the above researches, it was observed that empirical evidences from PLHIV about their discriminatory experiences in Nigeria are scant. Most of the existing studies are qualitative. However, The Global Network of People Living with HIV (GNP+), ILO, The PLHIV Stigma Index (2012) investigated PLHIV in Nigeria among nine other countries. Nigerian results will be reviewed here. For Nigeria, 45% of respondents lost their jobs or sources of income due to HIV+ status. The study further revealed that 27% of Nigerian PLHIV lost their jobs or sources of income because of stigma while 26% lost due to stigma and poor health and another 26% due to poor health alone. About 53% lost jobs due to discrimination. Around 27% of the Nigerian respondents were denied employment or work opportunities due their HIV+ status. These findings therefore suggest that HIV-related stigma and discrimination in the workplace are causes of unemployment or a denial of work opportunity in Nigeria. Many Nigerian respondents (62%) had had their job description or nature of work changed, or had been refused promotion as a result of sero-positive status. Nigerian PLHIV respondents reported that 28% and 33% of their employers and colleagues respectively reacted discriminatorily when they became aware of respondents' HIV status (the Global Network of People Living with HIV (GNP+), ILO, The PLHIV Stigma Index, 2012).

From the above literature review, it is obvious that there is a dearth of quantitative studies on the forms of discrimination against PLHIV in the workplace therefore this chapter tends to fill this gap

Theoretical Anchorage

Discrimination is perceived to be an intergroup and interpersonal phenomenon which is related to fundamental processes associated with social categorization and the development of in-group favouritism. This chapter is anchored on social identity theory (SIT). SIT is a cognitive social psychological theory developed in Europe by Tajfel (1982 cited in Mor Barak, 2008). The theory postulates that people tend to classify themselves into social categories that have meanings for them, and this shapes the way individuals interact with others from their own identity group and from other groups. Mor Barak (2008) uses SIT to explain workplace exclusion and discrimination. According to her, social identification, categorization and comparison are very important aspects of SIT relevant to workplace exclusion and discrimination. Social identification leads to activities that are congruent with the group's collective identity, that support institutions that embody their identity, and that foster stereotypical perceptions of self and others (Mor Barak, 2008, p. 245). Social categorization is a cognitive tool that is used to "segment, classify, and order the social environment, and thus enable the individual to undertake many forms of social actions" (Mor Barak, 2008, p. 246). After people categorize themselves within a group and identify themselves as being members of that group, they tend to compare their group (the in-group) against other groups (out-groups). To maintain their self-esteem, they and group members will compare their group favourably against other ones. This helps to explain prejudice and discrimination, since a group will tend to view members of competing groups negatively to increase self-esteem. In this chapter therefore, employers and colleagues of PLHIV will see themselves as being members of in-group while they see the PLHIV as members of the out-group thereby excluding and discriminating against them.

This SIT explains why colleagues and employers exclude and discriminate against the PLHIV from participating in some social activities and use of official facilities particularly when they do not have full knowledge of the modes of transmission and prevention of HIV infection.

MAIN FOCUS OF THE CHAPTER

Methodology

The study was conducted in two local government areas (LGAs) of Lagos State namely Epe and Lagos Mainland. Epe LGA is a rural riverine area with 95 localities and a population of 181,409 by 2006 census (Federal Government Printer [FGP], 2007). It was considered to be an urban in 2010 (Federal Ministry of Health (FMOH), 2010). The people are predominantly Ijebus (a Yoruba sub-ethnic group), farmers, polygynyous, and Muslims. The LGA was chosen because of her high HIV prevalence rate which was 6.9% in 1999 (NIMR, 2000a) although it has dropped to 2.7% by 2010 (FMOH, 2010). Factors identified as driving the HIV infection then include poverty, promiscuity, low economic status of women, early marriages that often lead to early separation, polygyny, changing of spouses, skin scarification (FHI, 2001) and fishing (Elwange & Nahamya, 2005).

Lagos Mainland LGA, an urban setting, has 17 localities with a population of 317,720 by 2006 (FGP, 2007). Lagos Mainland LGA was selected because of the presence of Nigeria Institute of Medical Research (NIMR), Yaba, one of the popular centres for the National ART Programme in Nigeria that assisted in accessing the PLHIV. Its HIV prevalence rate has not been established but it is estimated to fall within the range in Lagos metropolis i.e. between 3.3% in Ikeja LGA, the state capital and 6.3% in Lagos Island LGA (FMOH, 2010).

Sample Size

The sample size was intended to be 100 (50 from each LGA) but 80 PLHIV were accessed: 30 from Epe LGA and 50 from LM LGA. Among the 80 PLWHA surveyed, 30 (37.5%) were men while 50 (62.5%) were women.

Ethical Considerations

Research ethics were fully observed with the approval of Institutional Review Board (IRB) of Nigeria Institute of Medical Research (NIMR), Yaba, Lagos. The respondents gave their oral informed consent and were also reassured that their data would be treated with strict confidentiality.

Data Collection

Four research assistants (RAs) who were graduates of the Department of Sociology, University of Lagos, were recruited based on their possession of adequate social research skills and experience. The RAs were trained for two days to enhance the quality of the data collected. Secondary data obtained from internet sources, books, reports etc. were reviewed while the primary data were collected from September 2005 to April 2006 using structured questionnaires. Besides the background data, the questionnaire contained other questions like: if the employers and co-workers knew about the HIV positive status; their employers' and colleagues' attitudes and behaviours towards them when they got to know their status; if PLHIV were mandated to have HIV tests; whether they were deployed to other departments or units on the basis of their HIV status; If they were isolated in separate offices because of HIV status; if their movements were ever restricted to certain areas within the premises; whether they shared toilets, canteen, etc. with

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

other workers; whether they have ever been denied access to sports/recreational facilities; Ever been denied promotion because of their HIV status; if their organisations had health insurance scheme and if they were allowed to participate in the insurance scheme if available.

Data Analysis

Data were analyzed using the Statistical Package for Social Sciences (SPSS) versions 11 and 13. Analyses were run for quantitative and comparative data using descriptive, bivariate and Chi square statistics at 0.5 level of significance.

Fieldwork Challenges

Identifying the PLHIV in Epe was a major challenge. Only 30 PLHIV out of 50 of Epe respondents were investigated. Out of these, 20 were reached in Epe General Hospital while 10 were studied at NIMR, Yaba. NIMR is one the major sites for ART in Lagos State. It was gathered from Epe General Hospital that when people tested positive, they would be referred to NIMR for confirmatory tests. It was reported that some of them never reverted to Epe General Hospital. By such, they would be lost. The probable reason for this could be that they chose to continue with NIMR for anonymity and/or to avert facing discrimination.

Findings

Table 1 presents the profile of the respondents. The ages of the PLHIV ranged from 18 to 61 years. More than two-fifths of the respondents were between 30 – 39 years with a mean age of 36.26 years. More Epe respondents (48%) than Lagos Mainland (41%) were aged 30 – 39 years category with mean ages, 36.31 years and 36.22 years respectively. This difference is not significant. Almost one-third of respondents (33%) were never married and more of these were from Lagos Mainland (34%) as against and 30.0% of the Epe LGA respondents. Among the married respondents, 50.0% were from Lagos mainland while 23% came from Epe. A significant proportion (28%) of the PLHIV was divorced, separated and widowed. There was a higher percentage of the divorced, separated and widowed PLHIV in Epe LGA (46.6%) than in Lagos Mainland LGA (16%). The difference between the two LGAs is statistically significant at $p< 0.5$.

Majority of the respondents could be said to be well educated as 44% and 36% had secondary and post-secondary education respectively. Lagos Mainland LGA had more of this category than Epe LGA. This is expected since Lagos Mainland LGA is an urban setting. However, Epe LGA had more PLHIV with primary education (30%) than those with tertiary education (27%). The difference between the two LGAs is statistically significance with X^2 of 9.386; degree of freedom ($df = 3$) at $p < 0.05$. Employment status indicates that 42% of the respondents were unemployed. This proportion represents 43% and 42% of Epe and Lagos Mainland respondents respectively. Around 57% were employed disaggregated into 41% of self-employed PLHIV and 16% of PLHIV in paid employment. Comparing the two LGAs shows that Epe LGA had more self-employed PLHIV (47%) than Lagos Mainland (38%). A higher proportion of Lagos Mainland respondents (20%) than Epe (10%) were engaged in paid employment. These differences between the LGAs are not statistically significant.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

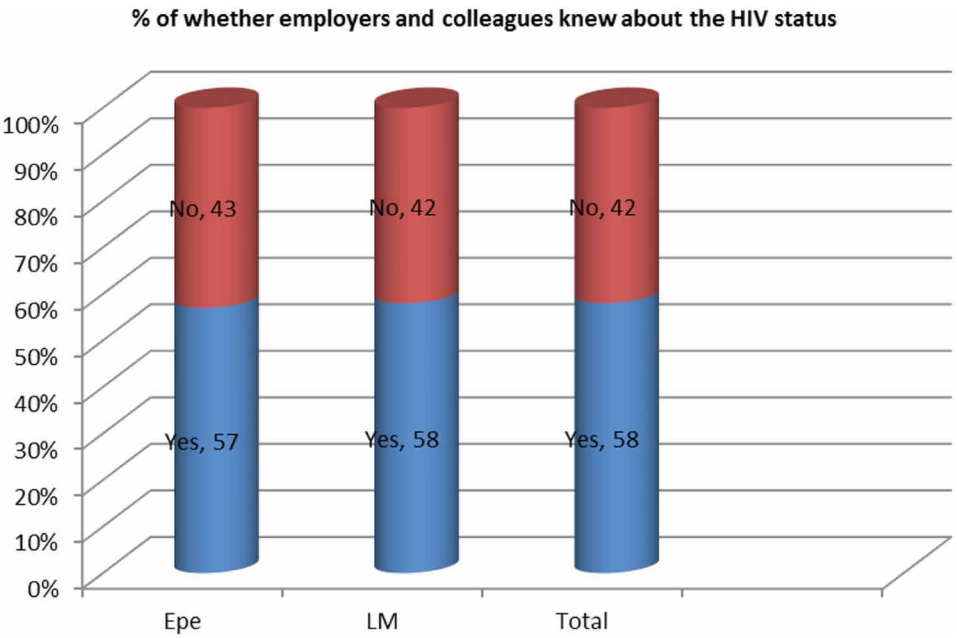
With respect to income, equal proportion of unemployed PLHIV (42%) was also not receiving any income at the time of the study. Moreover, a significant proportion (24%) earned less than N10, 000.00 a month. The average income of the PLHIV was N9,198.55. This is below the current national minimum wage of N18,000 therefore many of the respondents belong to the lower income group. Disaggregating the respondents into LGAs shows that 37% of Epe LGA respondents compared to 16% of Lagos Mainland LGA respondents earned less than N10,000 per month. On the other hand, more Lagos mainland respondents (26%) than Epe respondents (10%) earned more than N10,000 per month. The differences are statistically significance ($X^2 = 5.782$; df = 3; $p > 0.05$).

Forms of HIV-Related Discrimination Experienced by PLWHA in the Workplace

The study examined the different forms and levels of discrimination in the work place. Before HIV-related discrimination could be explored in the work place it was pertinent to consider if the employers and co-workers of the PLHIV knew about their sero-positive status. The respondents were asked to declare if their employers and colleagues were aware of their sero-positive status and if they were, to describe their attitudes towards the PLHIV.

The column chart in Figure 1 presents the knowledge of the respondents' HIV positive (HIV+) status by the employers and colleagues in percentages. Out of the total respondents and out of those who had worked or who were still at work at the time of the study, 58% admitted that their colleagues and employers knew about their HIV+ status. Similarly, 58% and 57% of these PLHIV were from Lagos Mainland and Epe LGA respectively. This indicates that there is no difference between the proportions of PLHIV from the rural setting, Epe LGA and those from the urban setting, Lagos Mainland LGA who affirmed so.

Figure 1. Whether the employers and colleagues knew about the respondents' HIV+ status

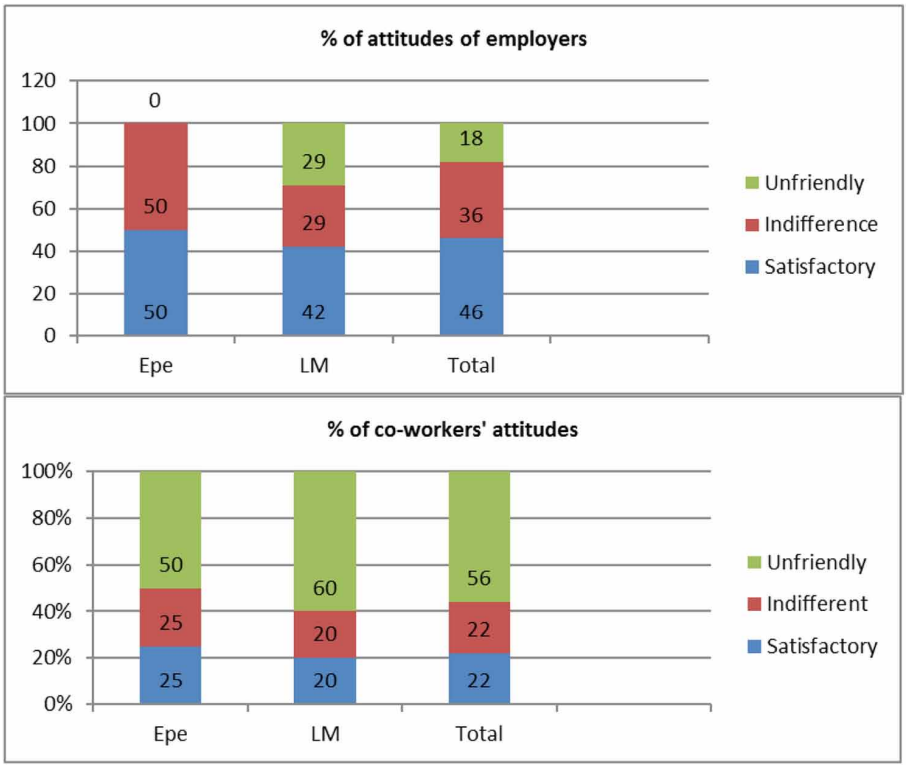


EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Column charts in Figure 2 present attitudes of employers and colleagues towards PLHIV after they (the employers and colleagues) got to know that their employees and colleagues were living with HIV respectively. About 18% of the total respondents who were involved in this analysis found their employers' attitudes unfriendly after knowing their HIV positive status. Only Lagos Mainland LGA respondents (29%) constitute this proportion. On the other hand, 36% of the respondents said their employers' attitudes were indifferent or neutral after they had learnt of their HIV positive status. More Epe respondents (50%) than Lagos Mainland ones (29%) were in this category. Meanwhile, more than two-fifths of the total respondents reported that their employers' attitudes towards them were satisfactory. Among these are one half of Epe and more than two-fifths of Lagos Mainland respondents.

For colleagues, more than one half of the total PLHIV respondents reported that their colleagues' attitudes were unfriendly. It could be said that respondents' co-workers were more unfriendly than their employers because only 18% of the respondents reported that their employers were unfriendly compared with 56% of the respondents who said that their co-workers were unfriendly. About three-fifths of Lagos Mainland respondents reported that their colleagues were unfriendly while one-half of Epe respondents were so classified. More than one fifth of the respondents indicated that their colleagues' attitudes were indifferent. Similarly, the same proportion reported that their colleagues' attitudes towards them were satisfactory. Similar patterns of reporting were observed in both LGAs. One-quarter of Epe respondents reported that their co-workers were indifferent, and another one-quarter said their co-workers' attitudes were satisfactory. With respect to Lagos Mainland LGA, one-fifth of the respondents were satisfied with their colleagues' attitudes while another one-fifth said their colleagues' attitudes towards them were indifferent or neutral. The differences are not significant.

Figure 2. Attitudes of employers and co-workers

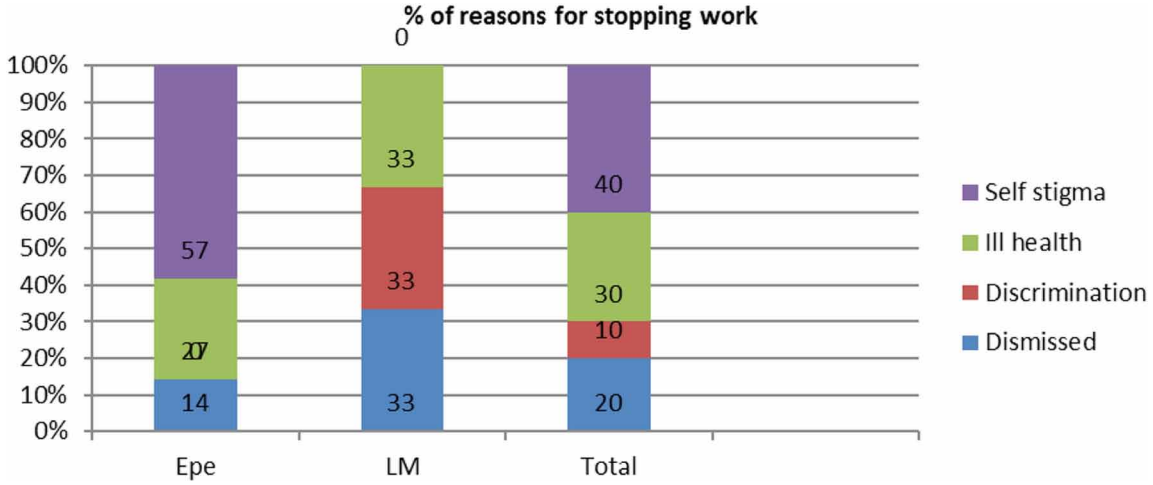


EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The column chart in Figure 3 presents the distributions (in percentages) of reasons why some PLHIV engaged in paid employment had stopped working. About 13% of the respondents admitted that they had stopped working. Among this percentage, 20% were dismissed instantly as their sero-positive status became known to the employers. This proportion is made up of 33% of Lagos Mainland and 14% of Epe respondents. One in ten PLHIV resigned because of stigma or discrimination and this is represented by one-third of Lagos Mainland respondents only and none of the Epe PLHIV was involved in this. It could be said that urban PLHIV suffered more than the rural ones in this respect. Ill health was responsible for about 30% of the total respondents in stopping work. Again, higher proportion of Lagos Mainland respondents (33%) than the proportion of Epe respondents (27%) stopped work due to ill health. Many respondents (40%) stopped work because of self-imposed discrimination and this comprises only Epe respondents (57%).

The PLHIV respondents who were self-employed were also considered. The traders among them were asked if people were still buying goods from them. The results showed that 28% of those who were traders complained that people had stopped patronizing them because of the HIV positive status. Among these PLHIV, 50% of Epe against 10% of Lagos Mainland respondents reported this. It implies that these PLHIV have lost their sources of income. Epe respondents who are traders are therefore, more likely than Lagos Mainland respondents to be avoided by people. This could be explained by the fact that many Epe respondents were self-employed.

Figure 3. Reasons for stopping work

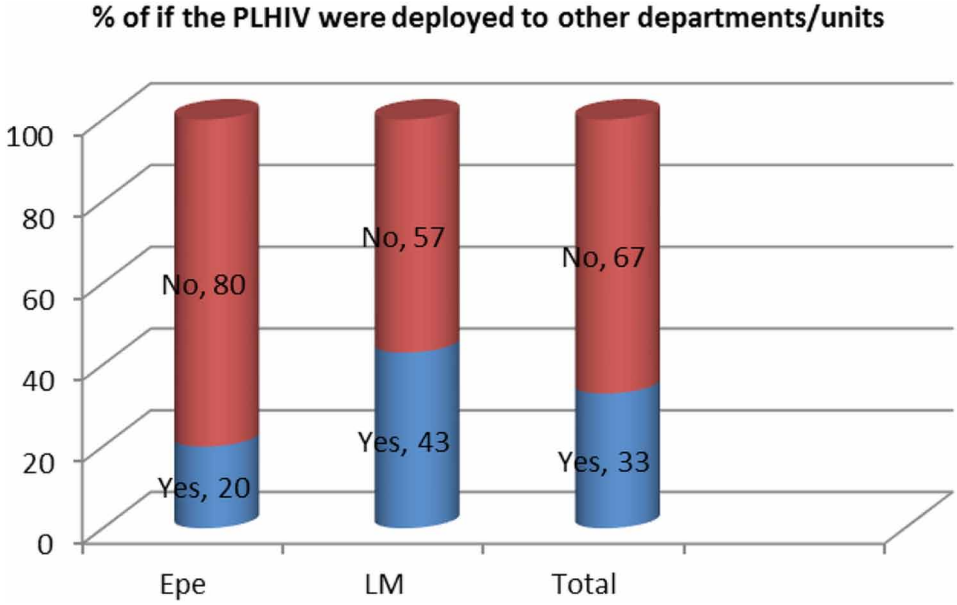


Other forms of discrimination investigated in the workplace include deployment to other units, mandatory HIV testing, prohibition of sharing toilets with other colleagues, denial of promotion and participation in the insurance scheme.

Column chart in Figure 4 presents data on if the PLHIV were deployed to other departments or units based on their sero-positive status. One-third of the total respondents reported that they had been deployed to other departments or units. Among them are 43% of Lagos Mainland respondents and 20% of Epe respondents. In this case, a higher proportion of Lagos Mainland respondents than Epe respondents

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Deployment of PLHIV respondents to other departments or units



were affected. Therefore, Lagos Mainland respondents are more likely than Epe ones to experience this form of discrimination (segregation) in the workplace.

Before the respondents could be assessed to know whether they were forced to do the HIV tests or not, it was necessary to explore how they got to know that they were HIV positive. Earlier studies have suggested that the circumstances of diagnosis of PLHIV's infection entail some forms of social discrimination (Iwuagwu 2001; 2003; cited in Nwanna, 2011). In view of this, the study examined how the HIV status of the respondents was diagnosed. The PLHIV were asked to describe what circumstances led to their diagnoses. Almost two thirds of the total PLHIV respondents said they became aware of their status after they became ill and underwent blood tests in hospitals. Around 66% of Lagos Mainland and 60% of Epe respondents constitute this proportion. Only about 18% found out through voluntary HIV testing representing 17% and 14% of Epe and Lagos Mainland respectively. Six women out of 50 female PLWHA surveyed representing only 8% of the total PLWHA respondents and 12% of the female respondents; were diagnosed during antenatal care. Seven respondents (8%) were diagnosed HIV positive at pre - employment and pre -admission tests.

The column chart in Figure 5 presents percentage distribution of PLHIV respondents who were mandated to have HIV tests by the employers. About 27% of the total PLHIV had been forced by their employers to do the HIV tests. Among these are 50% of Epe and 11% of Lagos Mainland respondents. Therefore, it could be said that more Epe respondents than Lagos Mainland respondents were affected by this form of discrimination (mandatory HIV tests) in the workplace.

The column chart in Figure 6 presents the percentage distribution of PLHIV who were denied the use of same toilets with other colleagues. All the respondents who were involved in this analysis enjoyed sports facilities in their offices but 15% of the total PLHIV respondents were not allowed to share the same toilets with their co-workers. More of Epe respondents (17%) than Lagos Mainland respondents (14%) were prohibited from using the same toilets with others.

Figure 5. PLHIV respondents who had been mandated to HIV tests

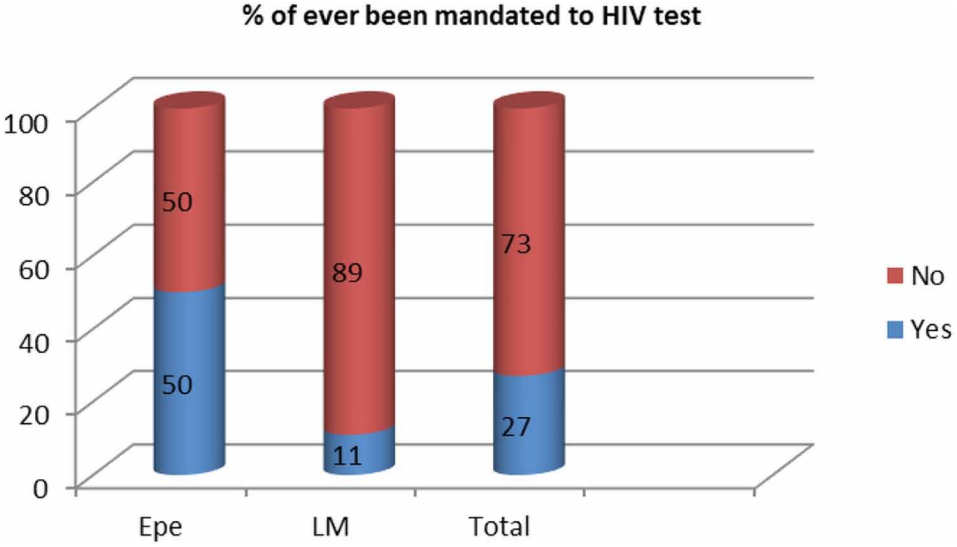

Figure 6. Share toilets with other workers

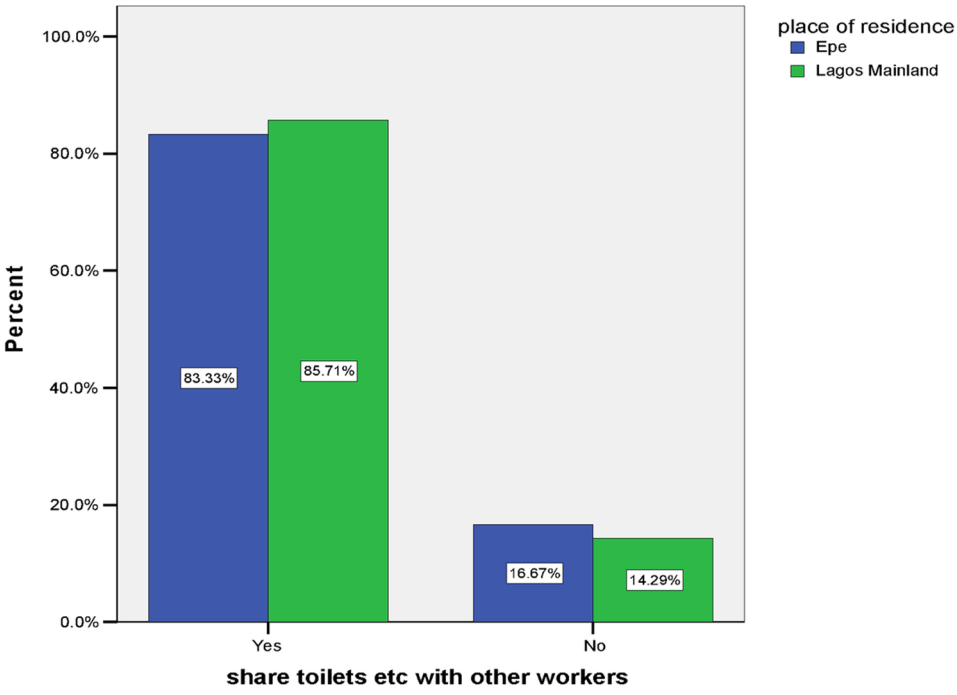
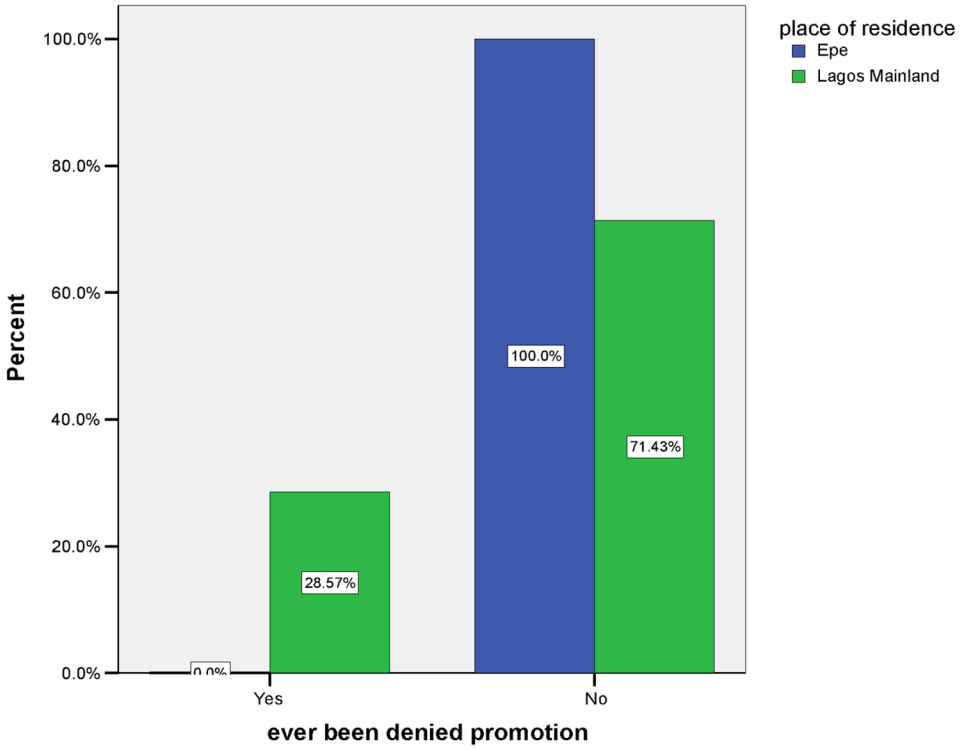


The chart in Figure 7 presents the percentage distribution of denying the PLHIV respondents promotion in the work place. About 18% of them reported being denied promotion on the basis of their sero-positive status. Only Lagos Mainland respondents (29%) were affected. Epe respondents were not affected.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 7. Ever been denied promotion



The respondents were asked to state if their offices were operating health insurance schemes. Among those PLHIV respondents who had worked or were working at the time of the study, 43% of them confirmed that they had health insurance schemes in their organizations. About three-fifths of the Epe respondents admitted that their organizations operated health insurance schemes against one-third of the Lagos Mainland respondents. The chart in Figure 8 presents the percentages of PLHIV who were or were not allowed to participate in insurance scheme. Although 43% of the PLHIV admitted having health insurance schemes in their offices, only 50% of this proportion were allowed to participate in the scheme. Among those who were not allowed to participate in the health insurance schemes, majority (67%) came from Lagos Mainland LGA compared to 33% of them that came from Epe LGA. More Lagos Mainland LGA respondents than Epe respondents were denied benefiting from health insurance scheme. One of the PLHIV who were provided with the health insurance cover said she was already benefiting from the scheme before her diagnosis. She therefore reiterated: "It is for all staff, irrespective of your sero-positive status. I was already benefiting from it before I was infected with the virus".

From the above findings, the forms of HIV-related discrimination in the workplace include mandatory HIV tests, exclusion from toilet facilities, isolation, denial of promotion and participation in the insurance scheme.

Discussion and Implications of Findings

The study revealed that more than half of the total respondents were employed and many were self-employed while the rest were in paid employment. Majority of Epe respondents were self-employed while Lagos Mainland respondents were more than Epe respondents among those in paid employment. This is probably due to the fact that Lagos Mainland respondents had higher educational level than Epe respondents. Similarly, Lagos Mainland respondents earned higher income than Epe respondents.

The results also showed that more than a half of the total respondents admitted that their colleagues and employers were aware of their sero-positive status with almost equal proportions of Lagos Mainland and Epe LGA respondents saying so. With this awareness, the study was able to assess the attitudes of the employers and co-workers towards the PLHIV. The findings revealed that almost one fifth of the employers were unfriendly towards the PLHIV and that these employers were from Lagos Mainland LGA respondents (29%) constitute this proportion. The probable explanation of this is that Lagos Mainland respondents are more likely to engaged in paid employment that those from Epe. Their employment status discussed under the respondents' profile indicated that many of the Epe respondents were self-employed and the few involved in the study might not have experienced this. The study further revealed that their colleagues' attitudes were also unfriendly. It was demonstrated that their co-workers were more unfriendly than their employers. This might be due to the closeness of co-workers to the PLHIV. A higher percentage of Lagos Mainland respondents than Epe respondents reported that their colleagues were unfriendly. This could be explained by urban factor. In urban centres individualism predominates and therefore people care less about other people while in rural settings relationships are more enveloping. These findings corroborate with that done by UNAIDS (2011) which revealed that colleagues and clients were not likely to be supportive or more likely to change their behaviours.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The results indicated that some PLHIV lost their jobs or sources of income as those who were engaged in paid employment stopped working and the self-employed PLHIV lost patronage from people respectively. It was revealed that more Epe respondents than Lagos Mainland ones lost their sources of income. This could be explained by the fact that many Epe respondents were self-employed and were traders and so were more likely to be avoided by people who knew their HIV status. Some PLHIV were dismissed instantly as soon as their employers got to know that they were living with HIV. This study confirms earlier studies by Adirieje (2003 cited in Nwanna, 2011) and Iwuagwu et al. (2003 cited in Nwanna, 2011). These studies found that some PLHIV were instantly dismissed when their sero-positive status became known to the employers. This type of treatment towards the PLHIV undermines HIV prevention and care and violates the human rights of the PLHIV.

Another reason for stopping work found in this study is stigma or discrimination. It was revealed that only Lagos Mainland respondents stopped work because of discrimination. While more urban PLHIV than the rural ones stopped work due to discrimination from other people, more rural PLHIV than urban ones stopped work because of self-imposed discrimination. In rural areas, primary relationships predominate where most people are familiar with one another. Therefore, the PLHIV would prefer to avert discrimination by stopping work. Contrary to rural relationships, urban relationships are secondary and individualistic and therefore, the PLHIV suffered more of discrimination in the work place. Another reason for stopping work is ill health. Ill health was responsible for about 30% of the total respondents in stopping work.

All these findings corroborate the results of earlier studies by UNAIDS (2011), The Global Network of People Living with HIV (GNP+), ILO, The PLHIV Stigma Index (2012) and ML dos Santos et al. (2014).

Other forms of discrimination found in this research include deployment to other units, mandatory HIV testing, prohibition of sharing toilets with other colleagues, denial of promotion and participation in the insurance scheme.

They research indicated that Lagos Mainland respondents are more likely to be deployed to other departments or units based on their sero-positive status. The finding validated the study of the Global Network of People Living with HIV (GNP+), ILO, The PLHIV Stigma Index (2012). Dismissing and deploying PLHIV to other departments or units indicate that the employers and colleagues lack full knowledge of HIV infection. Perhaps, they thought or perceived that HIV could be contracted through casual contact.

The study found that six women out of 50 female PLWHA surveyed representing only 8% of the total PLWHA respondents and 12% of the female respondents were diagnosed during antenatal care. This finding challenges the reliability of the sentinel data. The National HIV Sentinel Surveys of pregnant women visiting public antenatal clinics/hospitals provide data that are used as a representation for the general population. Therefore, the national prevalence rate may be grossly underestimated. The implication is that the Sentinel data do not accurately reflect the HIV pandemic in Nigeria.

Furthermore, seven respondents were diagnosed HIV positive at pre - employment and pre -admission tests. It is important to note that these two circumstances are among the various forms of social discrimination particularly when informed consent is not obtained. If seven out of 80 PLWHA respondents reported having gone for medical examinations for either employment or admission into schools, it is equivalent to 28,000 persons in about 3 million PLWHA in Nigeria. This is quite high.

Mandatory HIV test is another discriminatory attitude of the employers towards the PLHIV employees. It was revealed that more of Epe than of Lagos Mainland respondents were mandated to have HIV tests.

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

The findings indicated that PLHIV were excluded from the use of same toilets with other co-workers. It was revealed that Epe respondents were more likely than Lagos Mainland ones to be barred from sharing the same toilets with the other colleagues.

The study also showed that some PLHIV respondents were denied promotion due to their sero-positive status and this affected only the Lagos Mainland respondents. Once again, Lagos Mainland respondents are seen to be more likely to be discriminated against in the work place.

Also discovered was a significant proportion of PLHIV was not permitted to participate in health insurance scheme in their offices. One plausible reason for this is that insurance companies generally regard PLHIV as high risk insured (regarding cover) for them because it is deemed that the HIV-infection significantly increases the risk of early liability which does not augur well for their businesses which can only be mediated by increased premium payment to be borne by the prospective insured. A greater proportion of Lagos Mainland PLHIV than Epe respondents were denied participation in the health insurance scheme.

All these results demonstrate the different forms of discrimination PLHIV suffer in the workplace. The implication is that the human rights of the PLHIV are violated.

These negative attitudes of employers and co-workers towards the PLHIV could be explained with SIT. All these forms of discrimination were perpetrated by employers and co-worker because they perceived themselves as members of an in-group PLHIV as members of an out-group. The employers and colleagues of PLHIV identify, categorise and compare themselves against the PLHIV and with that perspective; they exclude and discriminate against PLHIV.

SOLUTIONS AND RECOMMENDATIONS

Identifying that using pregnant women as proxy in sentinel surveys underscores the problem of measuring HIV prevalence in Nigeria and would inform the policy decision to expand the scope of sentinel surveys. The Government should re-strategize the mode of data collection in order to include other subpopulations such as males, non-pregnant females and high-risk groups and to provide a more accurate measure of HIV prevalence in Nigeria

The rural- urban dichotomy, which shows that urban PLHIV are more likely to suffer discrimination in the work place would influence policy decisions on how to design culturally acceptable programmes that will help sensitize and enlighten the urban populace on the HIV pandemic and also protect the rights of rural PLWHA.

The identification of the different forms of discrimination should inform the policy decisions on issues related to discrimination within the workplace that should help in designing programmes that will elicit support for organisations where these PLHIV work to better handle them.

This is followed by a government's anti-discrimination policy supported by a law that will ensure the protection of the rights of PLHIV.

Identifying that using pregnant women as proxy in sentinel surveys underscores the problem of measuring HIV prevalence in Nigeria and would inform the policy decision to expand the scope of sentinel surveys. The Government should re-strategize the mode of data collection in order to include other subpopulations such as males, non-pregnant females and high-risk groups and to provide a more accurate measure of HIV prevalence in Nigeria.

Recommendations

Based on the findings the following are recommended:

- There is need to empower PLHIV through life-skill training, counselling, and education so that they can litigate when faced with discrimination.
- The PLHIV should speak out and be open about their status particularly the healthy-looking ones amongst them to demystify and dispel misinformation and generate empathy which will reduce the level of discrimination. More PLHIV should be trained extensively and engaged in public education as educators and advocates. They should also be involved as HIV policy makers at every level of decision making and engaged in equal partnerships with policy-makers.
- PLHIV who are already active in their communities should be encouraged because it will not only empower other volunteers by restoring dignity and status, but would also give a face to the epidemic and thus facilitate greater involvement of people living with HIV/AIDS.

There is need for employers to adopt and implement appropriate workplace policies.

HIV/AIDS voluntary counselling, testing and prevention/treatment services should be provided as part of regular health facilities.

Organizations should adopt legislations to prohibit mandatory-HIV testing.

- Formulate labour laws that will make organizations responsive to the challenges of HIV/AIDS and effectively guarantee to PLWHA the right to work, protection against unfair dismissal and other employment-related rights.
- Organisations should enforce the anti-discriminatory policies formulated by Lagos State and Federal governments.

FUTURE RESEARCH DIRECTIONS

This research indicates that PLHIV suffer different forms of discrimination in the work place. It will stimulate further studies in this area because it only provides the levels of the different types of discrimination. Future researches in this area should consider increasing the sample size, perhaps study different localities, and test hypotheses that may find out the categories of PLHIV who suffer these forms of discrimination since not all PLHIV are discriminated against.

CONCLUSION

This chapter investigated the people living with HIV in two local government areas of Lagos State, Nigeria, to assess the different forms of discrimination. It considered various studies done in this area and found that very few empirical researches were carried out in this area therefore this study set out to fill this gap. Secondly, it was revealed that discrimination was major factor of loss of employment or loss of sources of income, denial of promotion, change of attitudes towards PLHIV and exclusion from social activities in the work place. The chapter was premised on social identity theory of Tajfel (1982). The

EBSCOhost - printed on 2/8/2023 11:28 PM via . All use subject to https://www.ebsco.com/terms-of-use

theory was able to explain why employers and colleagues of PLHIV could discriminate against PLHIV. Using structured questionnaires, data were collected from a purposive sample of 80 PLHIV from the two LGAs – Epe and Lagos Mainland. The results showed that the forms of HIV-related discrimination experienced by the PLWHA were instant dismissal from offices, mandatory HIV tests, alienation and exclusion from insurance scheme. The implication is that most organizations have not yet formulated HIV policy in their offices and thus do not care for their infected employees.
